There were two main trends in the criticism of the report. First were the protests from the delegates of under-developed areas—India and Brazil—who argued that the experts had not paid enough attention to the problem of "under-employment" which in their countries took the form of excessive agricultural populations and insufficient opportunities for those trained as white-collar workers. Mr Kaldor, speaking for the experts, met their complaints with sympathy and was able to enlist the support of these critics when he came to deal with the second line of attack on the report.

Among the policies advocated by the experts was reform of the International Monetary Fund and the International Bank. The experts felt that these organisations had failed to use their resources in a manner which justified faith in their capacity to help maintain international full employment. They recommended that these two bodies should meet disturbances in international trade by an automatic and, if necessary, lavish use of the currencies of creditor nations (the United States was clearly intended). These funds would be used to enable debtor nations to maintain their purchases from the creditors. Not all representatives from the under-developed areas followed these details closely, but they agreed in feeling that the Bank and the Fund had not given them as much assistance as they would have liked.

The American delegation took sharp exception to the approach of the experts. In the first place they pointed out that the Fund and the Bank were only two among various institutions concerned with the maintenance of full employment and that the primary function of these two bodies was to promote non-discriminatory, multilateral trade. Another and more substantial criticism flowed from the belief that the American people would never accept such a change in the character of the Bank and Fund, since it would mean that the American government would have to play a controlling role in the life of the American economy comparable with the role played by the British government in its own economy. In rejecting these suggestions of the experts, the United States delegation expressed the view that any country which decided to pursue a policy of internal full employment should look first not to outside aid but to its own efforts.

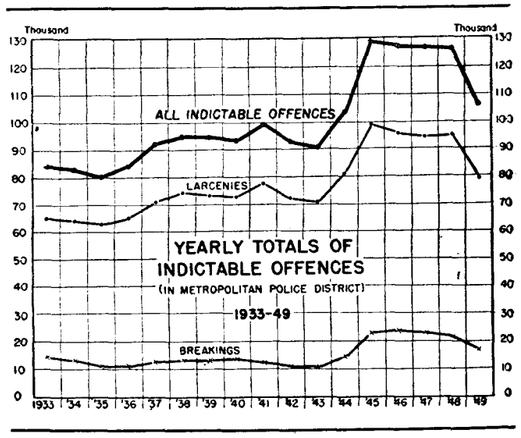
* * *

Planning World Employment

The agreed resolution on full employment that has finally emerged at Geneva is a remarkable blend of the conflicting ideas put forward in the course of the debate. It calls upon all member governments to publish annually a statement of their economic objectives, internal as well as international. Information on domestic matters should include forecasts of employment, production, consumption and investment; and governments are further asked to define precisely what, in quantitative terms, they will take as a standard of full employment in their countries. They are also to outline the specific methods they intend to follow in order to promote expansion, prevent recession, avoid inflation and encourage mobility of labour.

At the same time each government is asked to say how it plans to achieve equilibrium in its balance of payments during the next four years, and this balance sheet is to show the composition of its estimated trade by main commodity groups. In setting out these plans, each government is to indicate to what extent it has assumed progress toward liberalisation of international trade, the building up of reserves of convertible currencies and gold, and the free flow of international investment funds. These reports will then be analysed by a group of three independent experts, whose comments will be submitted to the next session of the Economic and Social Council for possible action.

Apart from these requests for crystal gazing, the resolution contains a series of somewhat loosely worded recommendations. Governments are advised to "strive to prevent lapses in the flow of international investment resulting from . . . economic recessions." Or again, they are recommended to "seek to avoid measures which would be likely to have seriously adverse effects on the balance of payments or employment levels of other countries." Most of the recommendations, in fact, leave it up to each member government to adopt its own definitions of many important concepts.



On the subject of the International Bank and the International Monetary Fund, the resolution is equally amorphous. It proposes no change in the constitution of the Fund but merely urges that it use its resources "as fully as its articles of agreement permit." It calls on the Bank "to utilise in case of recession, all practicable opportunities of increasing its resources, in order to expand the volume of its lending." In order to meet the special needs of under-developed areas, the resolution asks the Secretary-General to appoint another group of experts to prepare a report on under-employment in such countries and on the international measures that might be adopted to counter this problem.

It is unlikely that the resolution as adopted will entirely please those who wanted more thorough-going international planning and reform of the Bretton Woods institutions. The resolution is much less vigorous than the original British draft which forthrightly accepted the general line of the experts' report. But even as it stands, the resolution commits the United States to a minor revolution—an undertaking to set out quantitatively the directions and purposes of the American economy in relation to the rest of the world.

* * *

London's Criminals

The Commissioner of the Metropolitan Police has every right to be proud of the achievement of his force last year. In his annual report for 1949 (Cmd. 7985) he shows that, in spite of a shortage of more than 4,000 policemen, crime in London decreased by 16.2 per cent compared with the previous year. The total number of indictable offences known to the police is still high by prewar standards, but there has been a sharp fall from the peak figures of the postwar years and the number of crimes is still decreasing steadily. The Commissioner attributes the decline to the longer sentences which can now be awarded to habitual criminals under the

Criminal Justice Act of 1948. Copies of the Act have been found on a number of criminals after they have been arrested, and it is reported that some have even sold up their housebreaking tools, having decided that the rewards of their trade are no longer worth the risks. The number of offences against the person has also declined in London, although in the rest of England it is higher than ever before.

The record of the Metropolitan Police in the rest of their many duties is equally high. Public functions, political processions, strikes and traffic problems were all handled with surprisingly few disturbances. The ban on political processions had to be renewed and traffic congestion is still acute, but there has been no slackening of the effort to improve matters.

The Commissioner, however, has had to report once more his failure to fill more than a handful of the 4,000 vacancies in his force. In spite of better pay and the promise of better housing conditions, there was a net increase during the year of only 54 constables. It is at least worth considering whether the emphasis in the recruiting drive has not been too much on the material incentives of a career in the police force and not enough on the value of the work to the community. There is very little in the shape of pay or living conditions that the police will ever be able to offer which industry cannot better. Might not the Commissioner achieve better results if he were to emphasise instead the usefulness of the work, the high reputation of his force and perhaps even the exceptional qualities demanded of the men and women in it?

The Ambulance Service

Ambulances and their substitutes—sitting case cars and the hospital car service—account for only a small proportion of the total cost of the health service. According to the third report of the Select Committee on Estimates, in the present financial year the estimated cost is £7,986,000, a figure which, it may be pointed out, is not disclosed in the civil estimates where the ambulance service is rolled up in an omnibus item called "Grants to local health authorities." Of this cost, half is borne by the ratepayers in England and Wales, whereas in Scotland the whole amount is paid for by the taxpayer—an anomaly on which the Select Committee makes a caustic comment.

But although relatively to the £400 million odd that is spent on the whole health service the cost of the ambulance service appears insignificant, it is nevertheless disquieting. In the first place, there is the all too familiar rise in the cost since the health service was introduced:—

£000		
1948-49	1949-50	1950-51
5,851*	7,045	7,986

*calculated on an annual basis.

The cost of the London County Council's service, excluding the services provided by agencies in its area, has risen from £295,356 in 1947-48, the last year before the health service was introduced, to an estimate of £466,565 in 1950-51. Part of the rise in cost has been due to an increase in prices and wages, but by far the greater part is due to the additional work undertaken—over the whole country the number of patients carried in ambulances and sitting case cars increased, for instance, from 365,859 in January, 1949, to 488,899 in December, 1949.

This increase in the work of the ambulance service reflects in its turn the increase in the work of the hospitals, particularly in the work of out-patient departments. But it also shows, as the increase in the cost of the whole health service has shown, how difficult it is to control the demand for the facilities of any part of the service. Flagrant abuse of the ambulance service has occurred, but it has been rare. Abuse in the sense of over-use, of use in cases which barely justified it, has been far too common—journeys to distant hospitals, for instance, although equally good hospital facilities are near at hand, and journeys, particularly by the hospital car service, which could be made by public transport without undue hardship. Before 1948, a patient's liability to pay for an ambulance often caused hardship, and doctors consequently sometimes hesitated in ordering one even in cases where it was clearly needed. Now the pendulum has swung too far the other way. The Select Committee is right in saying that it is time the Ministry of Health, which controls the hospitals and is in contractual relationship with the doctors, the source of the demand for the ambulance service, attempted to instil a sense of proportion.

Forced Labour in Russia

In the war of words, as in other wars, attack may be the best defence. The British delegation at Geneva is to be congratulated, therefore, on the spirited onslaught which it has made, at the current Economic and Social Council meeting, on the existence of forced labour in the Soviet Union and the satellite states. Organised workers throughout the free world should know what is meant in Soviet phraseology when the claim is made that the "abolition of unemployment" has been achieved in the Soviet Union, and assess the part played in that policy by penal labour camps and compulsory employment. The documentary evidence of this form of slavery is now telling and was impressively presented on Tuesday by the British delegate, Mr Corley Smith. He was able to call on the evidence provided by the Soviet Criminal Code—under which mere carelessness can cost a worker ten years of his freedom—and on fresh evidence that the system is being extended to other countries within the Soviet sphere—even Czechoslovakia, once so famous for its workers' legislation, has had to comply. Lastly, eyewitness accounts were given of the camps in which at a minimum 10 million people are housed and enslaved, mainly in the bleakest and hardest sectors of the Soviet economy.

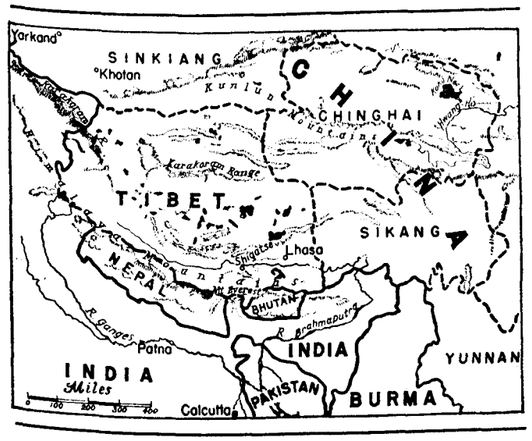
The British and American delegations have now asked Mr Trygve Lie to set up a body of inquiry, to include a jurist accustomed to weighing evidence, an expert on labour relations and someone with a wide knowledge of concentration camp practices. A report produced by such a team would be of value as evidence, uncoloured by propaganda. Reproduced in simple sentences in popular pamphlets, it would inform the free world of the treatment which, on the other side of the Iron Curtain, awaits those who deviate—for any reason whatsoever—from Soviet political philosophy. If the British evidence is correct—and there seems no reason to doubt it—names such as Dalstroi and Karaganda should become as familiar and opprobious as is that of Belsen.

* * *

Communism in India

Whatever the neutrality claimed for India's foreign policy, Sardar Patel, the Deputy Prime Minister and Minister for Home Affairs, told Parliament last week that India would give the Communists no quarter on the home front. He reminded the House of Mr Nehru's statement of policy in February, 1949, when the Prime Minister flatly declared that the Government of India would not tolerate sabotage and violence. "I am sure it is clear," Mr Patel went on, "that whatever shifts may have taken place in the tactics of the Communist party, there has been absolutely no change in its fundamental strategy of seizing power" if necessary through violent revolt. In certain provinces the Communist party has already had to be banned, and in Hyderabad, Communist terrorists have murdered 2,500 people in the last two and a half years. The Indian Government, Mr Patel concluded, will not hesitate to counter force with force.

During the course of July, Mr Rajeshwar Rao succeeded Mr Ranadive as Communist party secretary in India. The chief significance of this change was that the old policy of concentrating upon a policy of industrial strikes and violence was abandoned in favour of combining constitutional action with greater attention to organising the peasantry. The Communists are by no means satisfied with their very modest progress in India, and they now aim at improving their chances in next year's general elections. They have also been told by Moscow to model their rural tactics on those which have brought success to the Chinese Communists, and to re-embark on the tactics of the popular front which seeks to unite "all anti-reactionary elements."



The chances of eventual Communist success in India, at first sight excellent in view of widespread poverty and overpopulation, are nevertheless far less good than they were in China. India has inherited from the British one of the most efficient and least corrupt administrations in Asia. Moreover, the people of India, having emerged from one era of imperial rule, are by no means inclined to let another fasten itself upon their backs. It must, however, be admitted that there is a popular revulsion against some of the activities of the western powers in Asia. It has lately been stimulated by the heavy American bombing in North Korea and the logic of the argument—that an Asian power brought this on itself by aggression—is increasingly lost on the Asian mind. Mr Nehru claimed with some justice the other day that the West did not properly understand the effect of some of its actions in his continent; and there is indeed a real danger that the anti-Communist forces in Asia itself may be weakened by their association in people's minds with the Western

Powers. As Mr Patel's stand has shown, Indian policy has, in fact, more in common with the western cause of defending national independence against Communist imperialism than its Prime Minister is always either willing or in a position to admit. But it is far from certain that the significance of this fact is as clear in Washington as the interests of all the western powers would demand.

* * *

The Invasion of Tibet

The Chinese Communists have repeatedly affirmed their intention of "liberating" Tibet, and it now seems that they are putting their plans into effect, for two Chinese columns are reported to be moving towards Lhasa, from the Chinese provinces of Sikang and Chinghai respectively. The months of late summer and early autumn are the only ones suitable for a campaign in Tibet, and the difficulties of supply across high mountain plateaux are in any case formidable, but, without some almost miraculous occurrence, it appears probable

that Tibetan independence, which has survived since the revolt of 1912—though without ever receiving international *de jure* recognition—will shortly be brought to an end. China, whether Kuomintang or Communist, has never abandoned its claim to sovereignty over Tibet, and the fact that China has bowed to Russia's insistence on the "independence" of Outer Mongolia is not admitted to strengthen the case of Tibet for a similar independence. In any case the social and political system of Tibet is "reactionary," so there is no room for argument as far as Communists are concerned.

The Chinese Communists say they are going into Tibet to purge it of British and American imperialist influences. Their imagination, fed on Marxist-Leninist textbooks, no doubt peoples the mysterious highlands of this vast and thinly inhabited territory (once exalted by Madame Blavatsky as the home of the Theosophist mahatmas) with hard-faced capitalists and warmongers who have flocked there from Wall Street and the City of London. Actually there is no British or American investment or enterprise of any kind in Tibet, and Britain has had no direct contact with the country since the transfer of power in India. India and Nepal are the only states having even quasi-diplomatic relations with Tibet, and they alone might be in a position to provide military support for Tibetan independence. But they are understood to have adopted a policy of non-intervention, and there appears to be no ground for an appeal to the United Nations, as Tibet has never been recognised as a sovereign state. Tibet's only hope, therefore, lies in its own strength. The Dalai Lama is believed to have a poorly equipped army of 10,000 men under the command of an Austrian soldier of fortune. With skilful handling such a force might do much to harass an invader in a terrain giving great advantages to the defence. But in addition to their armies, the Chinese have their fifth column in Tibet—the followers of the Panchen Lama whose traditional ecclesiastical rivalry with the Dalai Lama was described in an article in *The Economist* of February 18, 1950. The Communists of China show a most engaging tactical solicitude for the weaker faction of the Buddhist hierarchy in Tibet, and as a reward they may soon have the voice of a living Buddha added to that of the Russian Orthodox Church in exhorting all the simpletons of the world to sign the Stockholm Peace Petition, so that Russia may be free to use its 25,000 tanks without fear of atomic retaliation.

Industrial Life Assurance Disputes

The Industrial Assurance Commissioner is, by statute, the authority to whom all disputes concerning moneys payable under industrial assurance policies are referred for arbitration. The Stationery Office has now resumed publication of reports of selected disputes on which the Commissioner has given a ruling and the volume just published covers the years 1938 to 1949. Amongst other things, this volume is valuable evidence in the perennial argument on the advantages and dangers of special *ad hoc* arbitration tribunals.

The Industrial Assurance Commissioner is not an administrative tribunal. It is his duty in his arbitrations to find the facts and to interpret the Acts and the documents in the case, usually the proposal form and the policy. He is not required to make any administrative decisions, nor is he any more concerned with public policy than a judge is. From that point of view, a normal court, such as a county court, could do—in fact does—all that the Commissioner does in this one field. But it is arguable that his unique and restricted jurisdiction creates its own advantages. The Commissioner inevitably builds up an unrivalled experience of industrial life assurance, its standard policies and its standard practices. If he is a trained lawyer (as he is) and if he applies the accepted methods of interpreting legal documents (as he does), he becomes the real equivalent of a court of law. There are other genuine advantages. The facts of the disputes themselves are the raw material from which realistic legislative action can be taken later, if necessary. Further, the Commissoner is a far less expensive tribunal than any court of law, and that is important, for many of the disputes involve sums as small as five pounds and families with few assets and small means, and the fear of the costs of a normal action against a wealthy assurance company might prove a complete deterrent. The parties to a dispute may employ lawyers if they wish. It is clear from these decisions that they are not seriously handicapped if they do not.

The picture of industrial life assurance given by these reports is reassuring. There was a time when all industrial life assurance companies were suspect. That should have gone by now. The worst one can say is that some agents are still too casual in collecting the facts on which the assurance proposal is based, but on the whole it is the company that suffers more from the consequences of that than the policyholder. And there is evidence enough that some at least of the policyholders are as adept as any company ever was in trying to get from the policy more than it ever contracted to give. Nor is this misplaced ingenuity all that the companies have to face. A claimant was entitled to £34 10s. 10d. under three matured policies. He attended at the company's office to collect the money, and his wife, son and daughter came with him. The company's official counted out the money and placed it on the counter. Before the claimant could touch it, his wife picked it up and made off with it. Was the company liable to pay the claimant another £34 10s. 10d.

or had the claimant to find his wife and compel her to disgorge what she had collected ?

Science or Soft Option?

The days are past when geography was an arid discipline which involved learning lists of capital cities and exports and imports as glibly as Latin gender rhymes. Political geography has also suffered a temporary decline owing to the kaleidoscopic movement of frontiers since 1939. The Royal Geographical Society, in a new memorandum on "Geography and 'Social Studies' in Schools," has now attacked the latest phase of the teaching of geography in primary and secondary modern schools, which comes under the umbrella of social studies and is in danger of becoming an "activity" rather than a discipline.

Geography is a relative newcomer to the universities and at the older universities attracted only a small number of students before the war. Its popularity and prestige have grown over the last ten years ; there have been eleven new professorships since 1939, and in 1947-48 469 students took honours degrees in geography compared with 257 in 1938-39. But the quality of university work must depend largely on the quality of teaching in the schools. So far, the report states the grammar schools have not succumbed to the current fashion of mixing up geography in a hotch-potch of social studies, but the fear that they will do so underlines the report.

The fate of geography in many of the primary and secondary modern schools is a part of two prevailing trends of educational thought: the first, that children should only learn what they like instead of learning to like what they learn; the second, that the frontiers of subjects should be broken down and that, under the title of a "local survey" or "social studies," history, geography, economics and even mathematics and science, are mixed up together and used in some joint enterprise. Like so many educational theories both have a great deal to be said for them, but at the present time both are being run if not to death at least to the detriment of the subject and of the pupils concerned. A local survey employing geographical data, or social studies which relate historical, geographical and scientific material, can be most useful, but as a supplement to the more general methods, not as a substitute for them. Geography, like other serious subjects, has a method and a unity of its own. It cannot prosper if its students borrow only such bits of it as will fit the design of a study drawn for another purpose.

* * *

Poland's Six Year Plan

The Polish Government has set its sights remarkably high for the new Six-Year Plan, the draft of which was recently passed—of course, unanimously—by the Seym. Mr Minc, vice-president and chairman of the State Planning Commission, has declared that, with its completion,

> Poland will be more than half-way towards the level of industrialisation in the United States and will eliminate the capitalist element in the towns as well as in the countryside.

He made it clear, too, that his past misgivings about outright collectivisation of agriculture exist no more: "socialist team husbandry" will displace "small, dispersed, individual husbandry," and the Soviet model will be copied on the land as in the factories. For the Six-Year Plan closely follows the broad outlines of the Soviet Plan of the period after NEP, and it means the quick and ruthless end of private enterprise. Mr Minc has, in fact, re-established himself in a key position after several months of semi-retirement, apparently at the cost of some of his convictions.

By the end of 1955 industrial production is to increase by 158.3 per cent and agricultural production by 63 per cent over that of 1949. This is a much higher figure than was originally envisaged by the Communist Party, but it is necessary—said Mr Minc—to get away from "erroneous theories of cautious planning" in order to intensify industrialisation. The target for coal production in 1955 is set at 100 million tons and that of steel at 4½ million tons—which is three-and-a-half times that of 1938. High targets—in some cases a fourfold increase—have also been set for all varieties of machine tools and of heavy machinery not previously made in Poland, such as steam-turbines, high-pressure boilers, high-efficiency lathes. Poland is also to have by 1955 11,000 tractors, 12,000 motor cars and about 25,000 heavy and light lorries. The shipbuilding industry is to increase its present output by nearly tenfold.

With the help of Soviet-supplied machinery, Mr Minc stated, 35 new modern ore mines are already under construction, which will eventually produce 300,000 tons of iron ore annually. Extraction of copper ore would reach 3,200,000 tons by the end of 1955, and production of oil would be stepped up to 400,000 tons a year. What such rapid industrialisation and the transformation in the villages will mean for the individual Pole remains to be seen. He has been promised lavish supplies of consumer goods by his Communist masters—which was more than the Russians could do at the same stage ; but there is bound to be much human suffering behind this grandiose plan. Its political and military significance is clear: it will add to the war potential of the Communist bloc and increase Poland's dependence on the Soviet Union.

Too Much Legislation

On Thursday Her Majesty closed in person the long and laborious session which began on January 31st. . . . No time has been lost. Up to August 1 the House of Commons had sat 1,049 hours ; and—besides constituting several committees, entering into long details on foreign policy, and debates on motions which could not be carried, even if those who brought them forward intended they should be—had taken into consideration no less than 153 public bills. . . . What effect the legislation of the session may have on the country, it is impossible to say, but to the health of the members such unremitting toil cannot be beneficial, and we are scarcely authorised in requiring annually such a sacrifice. The necessity now apparent of repealing old enactments, because they are positively injurious—though passed, if not with equal knowledge to that possessed by hon. members at present, with at least equally good motives—suggests much caution in accumulating, session after session, vast masses of crude legislation. At least they confuse and disturb the public mind, encourage unnecessarily the desire for change, and are on the whole a great evil. Far from blaming Parliament for doing too little, we are disposed to blame it for doing too much. Lord John Russell's praise, that it had transacted a greater amount of public business than any Assembly in the world, is scarcely a recommendation ; and, tiresome as the public find many of its debates, posterity would probably be better served by its talking more and doing less. . . . To comply with all the suggestions of all the would-be legislators of the empire is obviously impossible. Parliament is already too much influenced by such suggestions, and it would be better for the public if it deserved still more the reproach of doing too little. That it annually takes up too many subjects, and so deprives itself of the means of effectually maturing any one, is obvious ; and it is certainly desirable that the Parliament should have fewer bantlings than that every year it should massacre a great number.

The Economist

August 17, 1850

Traveller's Education

In the bad old days of *laisser faire* it used to be thought that the task of a railway and its employees in relation to passengers was to provide them with transport and any services they might need *en route* for their comfort and convenience. But in Communist East Germany such old-fashioned ideas are no longer permitted to corrupt the minds of railwaymen. Their principal duty, they are now informed—and one which will give them a position of key importance in the political system—is to "influence passengers' discussions." In a pamphlet entitled "Directives on Ideological Preparations for the Central Delegates' Conference" the East German railwaymen's union criticizes the political apathy of train conductors and other train staff and their failure to direct conversations among travellers. It is implied that when Germans travel by train between Berlin and Leipzig—they cannot of course travel to Breslau or Stettin—their talk is not always of the kind which Mr Pieck would like to hear, and the railway employees are now to be made responsible for putting this right. To this end they are to receive special political training courses, and "ideological centres" are to be set up at the twenty-six largest railway stations in East Germany to prepare them for their new work—for which, however, there is no indication that they are to receive extra pay.

So far British Railways have shown no similar concern for the political education of their passengers, but we cannot be sure how long so promising a field for propaganda will continue to be neglected by party organisers. The approach would have to be made with a suitable diffidence and politeness in the absence of any shadow of the concentration camp to deter the recalcitrant passenger from talking back—but there is nothing to prevent the ticket-collector, as he enters the compartment, from intervening in conversation with "Excuse me, madam, but I heard you criticising the National Health Service ; please allow me to explain where you are in error." Or perhaps Billy Brown of London Town might be brought out of the well-deserved retirement which he has enjoyed since the war and put to walk the trains in defence of the less popular members of His Majesty's Government, breaking in on the chatter of the uninformed public with his well-known "I trust you'll pardon my correction—." The only difficulty which seems to lie in the way of such a development in our nationalised transport services is that, if railway employees are to spend their time in dispelling the darkness of political error from the minds of passengers, it is hard to see how they can perform the functions which at present occupy them. We do not know how this problem is to be solved in East Germany, but in any case conditions there are not quite like ours. In this country it may be that the NUR would insist on the employment of extra staff to handle passenger-influencing work and that the further rise in fares thus rendered necessary would be a factor extremely adverse to the success of the propaganda.

Shorter Note

Fifteen months after the existence of a 400 million ton coal deposit was proved in the Lichfield area of South Staffordshire, a second deposit of at least 200 million tons has been proved in an area lying between Lichfield and the Cannock coalfield. It is probable that the seams join up with those of the Leicestershire coalfields. At a conservative estimate, these two finds have added 600 million tons to the country's known coal reserves, which the National Coal Board believed to be about 43,000 million tons. The final figure for the new fields may be larger. The coal has a low ash content and is described as a good household coal. Unfortunately it lacks the coking properties that have now become scarce in British coals.

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.' But . . . have you stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

*Introducing Harry Rolls, general foreman and chief colour-matcher in a London paint factory where he has worked for 53 years. Machines have replaced men on most paint processes, but a trained eye and skilled judgment will always be in demand for colour matching. Paint and Varnish are leading items among our list of Exports.**

But..does craftsmanship mean only hand-craftsmanship? Consider the production of the pigments, plasticizers and other materials which are blended into paint. If there has not been craftsmanship in their production also, then the skill of the paint maker and of the painter will surely be wasted. And if the finished article is to be a masterpiece must there not be craftsmanship at every stage of its production?

Monsanto think so and they follow this rule in making chemicals for a long list of British industries. Monsanto plasticizers, preservatives and basic chemicals play an important part in the preparation of paints and finishes for goods of many kinds.

Illustration: Courtesy of Mr. H. W. Rolls and Messrs. Walter Carson & Sons Ltd., Battersea, London, S.W.11

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

Letters to the Editor

A Tithe for Safety

Sir,—May I be allowed to comment on one passage in the editorial article of *The Economist* of August 5th. In your assessment of our immediate military requirements on land you give priority to tanks and second place to anti-tank weapons. I submit that the more urgent requirement is the other way round.

If war comes in the west there is every indication that pathetically small forces are going to be faced by a highly mechanised invasion deploying a large part of the 25,000 tanks which it is announced that Russia already possesses. In Europe there is no terrain suitable for the tank versus tank actions resembling naval warfare which were a feature of the Eighth Army's campaigns in the Middle East during the last war. Tanks are a mobile weapon, designed to be deployed against a suitable spot upon the enemy's front. They have to be pulled back at intervals for maintenance and fresh action elsewhere. Their inevitable and frequent withdrawal from the forward areas always brings a feeling of bitter despair to the infantryman who feels himself abandoned. Further, the presence or even the rumour of hostile armour at once produces in the best trained infantryman an acute realisation of his own nakedness and a half involuntary glance over his shoulder to see which will be the quickest way out. I remember vividly on one occasion in Normandy a regular battalion of a famous Scottish Regiment in a state of near panic because they had no anti-tank guns and could hear a Tiger prowling round their area, but could not see it; they settled down quite happily on the arrival of a handful of self-propelled 17-pounders. The answer, surely, is as great a mass of anti-tank guns as possible, which cement the front and form innumerable points round which the infantry can rally with confidence, while they in turn provide the local defence which the guns themselves require.

There must be a front firmly held by infantry and anti-tank from which tanks can emerge into offensive action. And if western infantry without suitable and sufficient anti-tank weapons were overwhelmed by a deluge of armour and driven into the Channel, there would be nowhere for our excellent Centurions to operate.—Yours faithfully,

Richard Crittall Judgment

Sir,—At page 285 of your issue of August 5, 1950, you made a brief comment on the judgment in the Crittall case. You stated that "the prospectus included an estimate that the company's profits for the year ending December 31, 1947, would be in the region of £100,000 whereas an actual loss of some £600,000 was incurred." In the next sentence you referred to Mr Justice Humphreys' observations on the responsibility of auditors and gave an abbreviated report of his remarks concerning the appointment of partnerships instead of the appointment of individual auditors. You then concluded with the statement "Although Mr Steven signed the offending statement, it was his partner who had made tests and satisfied himself of its accuracy."

It should be noted that the charges against Mr Steven had no connection whatsoever with the directors' estimate of the profits for the year 1947, it being no part of an auditor's duty to give a report on such estimates. The charges against him related to the report made by his firm on past profits and the statement of net assets at December 31, 1946—in particular as to the treatment of an item of £99,746 described as "expenditure in connection with development and expansion of export trade and newly-formed subsidiary and associated companies—carried forward." The case against Mr Steven rested on whether or not the carrying forward of this sum and its description warranted the charge of having recklessly made statements which were misleading. The jury gave a clear answer in acquitting Mr Steven.

In view of your reference to Mr Steven's partner on whom he is said to have relied, the following extract from the summing-up of Mr Justice Humphreys should be quoted in fairness to Mr Steven, his partner (Mr Morton) and the firm of Singleton Fabian and Company, chartered accountants, in whose name the auditors' report was signed:—

> It seems to me a very serious matter for consideration whether you can possibly say that Mr Steven, having handed that matter over to his partner, and his partner having in fact made tests and satisfied himself, rightly or wrongly—as we now know wrongly—but satisfied himself at the time as an honourable man, as an accountant, and a careful accountant, that the document was right—can you say that Mr. Steven was reckless in accepting Mr Morton's explanation of that?—Because as I see it the whole of this case now depends, as far as he is concerned, almost entirely on that document [i.e., the schedule of development expenditure carried forward]. That is the one thing that is said to be against him. There is plenty of evidence that in the other parts he took meticulous care in trying to ascertain whether the books of this company were reliable or whether they were not. In this particular [the development expenditure] his evidence is "I relied upon Mr Morton." . . . In this case there is the sworn evidence of Mr Morton, who of course was not challenged upon this matter, that he did himself make inquiries which satisfied him. What Mr Steven had done was to find out that his partner had made tests and that his partner was satisfied with that document.

I appreciate the difficulties which arise from limitations of space, but I have no doubt that you would welcome the opportunity of publishing this letter, as it seems inevitable that incorrect inferences will have been drawn from your necessarily abbreviated note on this case.—Yours faithfully,

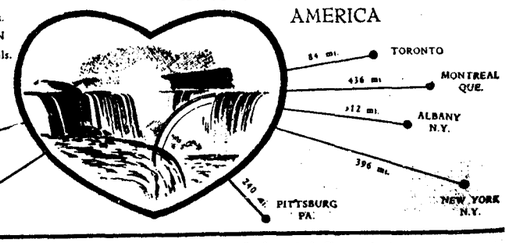
ALAN S. MACIVER
Secretary

Institute of Chartered Accountants in England and Wales

[It is proper that any "incorrect inferences" from our note should be corrected. But it is also proper to recall that the note was careful to say that Mr Steven was found not guilty of making misleading *statements*, and that his name was not associated with the *forecasts* of profits concerning which other defendants were charged.—EDITOR.]

West African Press

Sir,—One can understand expressions of concern over the shortcomings of the West African Press, but no one who has more than a superficial knowledge of the subject would care to endorse the remedy suggested by Mr Hugh Rom in your issue of July 29th.



Nothing could be more misleading than to say that "These scurrilous publications are practically alone in the field, there being hardly any moderate press." How wide of the mark is Mr Rom can be judged from the circulation figures of the leading newspapers published in

An Invitation from --- NIAGARA FALLS

Nigeria. For the most powerful newspaper in West Africa is the *Nigerian Daily Times*, excellently edited, excellently produced. This is a "moderate" —despite Mr Rom's assertion that there "is hardly any moderate press"—and circulates more than 25,000 copies a day, which is more than the combined circulations of all the other English-language newspapers published in Nigeria. The admirable vernacular newspaper, *Gaskiya Ta Fi Kwabo*, too, is a powerful influence in the Moslem North and is more widely circulated than any of the anti-British publications which provide the heaviest ammunition for those who mistakenly believe that some form of press censorship is desirable or even practicable in West Africa.

In the Gold Coast, the situation is less favourable, but it is easy to over-estimate the influence of the broadsheets of which Mr Rom complains. The Gold Coast now has 17 daily newspapers—far more than Nigeria, which is several times larger, and by no means all deserve to share in the general indictment. Also, it has been announced that a new paper, the *Gold Coast Daily Graphic*, will appear in Accra in October. This is to be published under the same management as the *Daily Times* of Lagos, and there is no reason to suppose that it will be less valuable or less successful than its Nigerian contemporary.

In the remaining two countries of British West Africa, Sierra Leone and the Gambia, the press has its editorial and technical shortcomings, but it is loyal to a degree. Any suggestion to the contrary would be deeply resented in both places.

In the periodical field, the weekly *West Africa* and the monthly magazine the *West African Review* provide readers throughout West Africa with a picture in right perspective of the problems affecting their various countries. Both are held in high esteem by Africans and Europeans alike—not an easy achievement in West Africa.

To say, or to suggest, that there is no alternative to the extreme Nationalist press in West Africa is simply not true, and does injustice to the fine publications which are doing so much for good Anglo-African relations.—Yours faithfully,

W. F. CLARKE,

The Working Team

Are Workers Human? By Gordon Rattray Taylor. *Falcon Press*. 196 pages. 10s. 6d.

Of the old, well-tried apparatus of carrot-and-stick incentives, the full-employment welfare state has left only an ineffective shadow; while of that new spirit of zealous community solidarity on which Socialists have always relied to replace it there is as yet little sign. Public opinion opposes, for reasons both good and bad, any return to the old regime; economic necessity demands that an effective substitute be found well before the millennium of universal devotion to the common weal. Mr Taylor believes that the genuinely effective substitute, or rather the genuinely human solution for which carrot and stick are themselves substitutes of the most regrettable sort, can be found in recognition of the working team as a social unit with all that that implies. The humanity of workers, their resentment at being "pushed around" and treated as automata, their concern with their standing among their fellows, their loyalties and group values, do not constitute a merely negative mass of irrational frictions in a tidily working economic mechanism, but a positive force; to work with this force rather than against it is to achieve at once better economic results and renewed social harmony. This thesis Mr Taylor expounds and illustrates with a combination of vigour, horse sense, occasional indignation, more frequent humour, and decent forthright English, which makes his book as hard to put down as is a fast-moving novel.

He pitches his claims, it is true, a great deal too high; one cannot, however much one prefers sociology to economics, give the latter a complete brush off. Quoting the experience of those firms in which, whether by the native wit and sympathy of management or through the advice of sociological experts, the methods which he advocates have been applied, he declares that were these universally adopted Britain could probably expand its national income by one-half within five years without any additional capital investment; thus he stumbles into the same pitfall as the "technocrats" of the thirties, the fallacy of composition. Because one "happy ship" can double its output while other firms struggle in a morass of non-co-operation it does not follow that all firms, and the whole economy, can do likewise; too big a part is played by raw materials, transport, and service undertakings in whose production there exists no comparable slack to be taken up. Some of Mr Taylor's psychological generalisations, too, are to say the least unconvincing. "To lay an employee off because there is no work for him is psychologically fantastic," he says.

> What would one say of a family which when its income was reduced threw one of the children out on the street in order that the others could continue at their usual standard of living?

Apart from the astonishingly static notion of industrial structure implied, this equalling of the responsibilities and emotional bonds uniting parent and child to those between worker and factory indicates a curious sense of relative values. One can hardly avoid, either, an uncomfortable feeling that carrot and stick may still be needed.

> O that the nets wad mend themselves,
> The fish jump on the shore,
> And that I in my bed might lie
> And sleep for evermore!

These are not the sentiments of a victim of the soulless industrial economy; they express the unfortunate but fundamental fact that Man needs to work harder than he likes to keep alive at the standards he likes—a fact not to be brushed away by references to the gruelling but pleasurable (because intermittent) activities of footballers, mountaineers and week-end gardeners.

When all is said, however, it remains overwhelmingly true and important that the younger social sciences should come to the rescue of the human working environment wrecked by a short-sighted economics. Mr Taylor demonstrates the principles according to which, and the often homely and commonsensical techniques by which, this necessary reconstruction can be accomplished; and no incidental over-optimism or occasional lack of balance can seriously detract from the value of that service.

Liberal Advocacy

Trial by Ballot. By Ivor R. M. Davies. *Christopher Johnson*. 194 pages. 8s. 6d.

This book is conducive to speculation beginning with: "If only . . ." If only Asquith and Runciman had not been irrevocably determined to put Lloyd George in the wrong; and Baldwin and Chamberlain had not suffered from the same preoccupation with regard to Mr Churchill; if only the Liberal Party had grasped the climate of opinion during wartime by-elections, and seized upon it to make a forceful come-back, instead of a near miss; if only the Conservatives had granted electoral reform in the day of their supremacy; if only Baldwin had had the courage of his convictions about rearmament; if only the Labour Party, with its overwhelming majority returned from a cross section of the whole community, had not been dominated by Transport House, and an artificial fomentation of a class antagonism which was already in process of rationalisation—how different our present situation might have been! Or would it? A writer of the late nineteenth century said:

> It is a fallacy very dear to the British elector that legislation emanates primarily from him. It would be folly to dispel so harmless an illusion, because it makes him manageable. But as a matter of fact, legislation is the joint product of the perplexities of an administration and the spite of the opposition.

Nevertheless, the impression left by this survey is that however much prejudice, lack of foresight and disunity may disrupt the business of Parliament, the electorate maintains a dogged determination to redress the balance. When stampeded by sentiment, as in 1918, its second thoughts were

"TIME-MASTER has streamlined my day!"

YOUR SECRETARY too will find that the new Dictaphone Time-Master proves a real blessing. It saves so many interruptions, and so much running about.

Time-Master gives her time to become a *real* assistant to you: she can get more done in far less time. She need never be called in from whatever she is doing to take a letter. Dictation interrupted by a caller never wastes her time. Letters and memoranda—there they are, perfectly recorded on Memobelts for her to transcribe when it's most convenient.

PERFECT RECORDING ON THE MEMOBELT

The little plastic Memobelts—each one taking 15 minutes dictation—give crystal-clear recording. They fold flat for filing and can be posted in a standard envelope—up to ten at a time for a 2½d. stamp.

EASY TRANSCRIBING

There are simple controls for volume, tone and speed; a pedal to backspace and repeat dictation as often as required. Backspacing is uniform, measured and instantaneous.

ONLY THE TIME-MASTER OFFERS ALL THIS

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Memobelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd., Dept. O. 107 Kingsway, London, W.C.2.

promptly demonstrated in by-elections. This same acid test later proved that the voters who returned Labour to power in 1945 were not moved by pressing hysteria, but by a conviction that reflected its verdict in every by-election of the lifetime of that Government—although diminishing majorities at the polls were an indication of the gradual disillusionment of many of its partisans.

The fall of the Liberals was due to lack of solidarity, and that of the Conservatives to over-confidence. If there is to be an eclipse of the Labour party, Mr Davies considers it will be through lack of adaptability, because Labour has absorbed the lesson not to split the vote only at the expense of closing the door upon initiative.

> Unless the Socialist movement realises its own weakness almost immediately, and changes course in a manner that would be distasteful to its extremists, it would seem to be doomed to a short period of ineffective Government followed by at least a decade of sterile opposition.

He thinks that the present deadlock could be resolved by whichever of the Parties sponsors Proportional Representation:

> The key to the future lies with those who voted Liberal in 1950. That is generally realised. The key will be turned by those who are prepared to make concessions to the historic mission of the Liberal Party, and who understand that in compromise lies the secret of good government.

Projection of Sweden

The Debate on the Foreign Policy of Sweden, 1918-1939. By Herbert Tingsten. Translated by Joan Bulman. *Oxford University Press.* 325 pages. 21s.

The author of this remarkable book is now the outspoken editor of the largest and most influential newspaper in Sweden, the Liberal *Dagens Nyheter*. To read this book—the English edition of a work which appeared in Sweden in 1944—is to understand why one of the most erudite professors in Sweden has taken upon himself the Socratic role of gadfly to his country's conscience. For his thorough analysis shows that, with exceptions which can be numbered on one hand, the Press alone of the various centres of opinion and policy in Sweden maintained a consistent interest in foreign affairs between the wars.

Just how that interest was expressed it is the aim of Professor Tingsten's book to record, analyse and criticise. It is a masterly effort. Indeed, it is so good that one would wish the author had permitted himself to stray a little from the strict terms of reference he laid down for himself. For the book is not an account of Swedish foreign policy in the period covered, but, as the Preface is at pains to make clear, "an account of the debate on central questions of foreign policy in Sweden . . . not only the main outline of the debate but also its influence on public opinion." The narrative is lucid even when complicated, and the whole work is distinguished by an impartial—almost Olympian—approach. The last short section in which Professor Tingsten sets out his "Views and Conclusions" is a brilliant and valuable analysis of the ingredients of Swedish foreign policy, as cogent to-day as it is when applied to the inter-war years.

The book then has a dual value. It is secondary source material in a somewhat rare field. It is also a new and interesting experiment in political science and one which, although it has been made in related fields, has seldom been made in relation to any country's foreign policy. Professor Tingsten promises us a similar study of the Swedish foreign affairs debate during World War II. It is to be hoped that it will be as well produced as his present book and that it will be available to English readers with less delay.

Inland Waterways

The Inland Waterways of England. By L. T. C. Rolt. *Allen and Unwin.* 221 pages. 21s.

British Canals. By Charles Hadfield. *Phoenix House.* 259 pages. 16s.

Books about canals are infrequent, yet two have just appeared within a fortnight of each other and just in time for the first rally of inland waterway craft organised by the Inland Waterways Association this weekend at Market Harborough.

Mr Rolt's book is the more interesting of the two for the casual reader. The author is an enthusiast, something of a moralist and an advocate of any measures which will prolong the life of canals. His enthusiasm stimulates him to give an attractive account of life on the canals and to illustrate his text with a large and very good selection of photographs. His moralising is a bore; his homilies on the virtues of the good old days and the vices of modern life and nationalisation trip up the narrative infuriatingly. His advocacy of the canals and their ways is infectious and he is persuasive about the pleasures of a canal holiday. But his advocacy takes no account of economics and his plea for preservation is made without any proper attempt to estimate the costs of maintaining the canals or their competitive advantages and disadvantages against road and rail.

Mr Hadfield is less picturesque and more factual. He has no axe to grind and for the student of canal history he provides plenty of material. But it is raw material—an agglomeration of facts with very little cement to joint them. Contemporary records are quoted extensively and are interesting; large numbers of figures are given about costs and profits which give the book an economic flavour up to about AD 1900. But these figures peter out when it comes to recent costs and earnings, and, like Mr Rolt, he gives no sound comparison with railway costs for recent years.

Mr Hadfield appears to have given up the future of canals as hopeless; he does not look into their prospects at all, but concentrates on a minute and rather bewildering record of their growth and decline with too much detail and too little perspective. Mr Rolt is more optimistic, not because he proves any business-like case for survival but because he hopes to move others to share his enthusiasms—even his enthusiasm for the mechanics of locks and the minutiae of boat-building. It yet remains for someone to write a book about how canals can be made to pay now. This is the most difficult task of all.

Shorter Notices

The Home Market, 1950 Edition. The Book of Facts about People. By G. Harrison and F. C. Mitchell. Revised by Mark Abrams. *Allen and Unwin.* 82 pages. 15s.

The new and third edition of this book follows the same general lines as the previous one of 1939, but the information has been revised and brought up to date. There are sections dealing with changes in the population of Great Britain, its age and sex, regional distribution, and urban concentration. Other sections discuss regional employment, size of households, and distribution of purchasing power. The statistical tables are well set-out and some are helped by pictorial diagrams. But in one respect, the new edition is less useful than its predecessor for there is no longer any mention of the sources of the statistics nor of methods used in arriving at some of the estimated figures. The reader, therefore, has no indication of the reliability of the statistics. In some cases, these are obviously derived wholly from government sources but in many instances there is a large element of private estimation.

La Démocratie Industrielle et les Comités D'Enterprise en Suède. Charles Leger. *Cahiers de la Fondation Nationale des Sciences Politiques. Librairi Armand Colin.* 228 pages. 350 francs.

This is a comprehensive, thorough and up-to-date survey of the various methods evolved by Swedish industry for settling its family disputes and increasing its efficiency. From the groping experiments in syndicalism in the 1880's the book traces the growth of industrial democracy up to the Saltsjöbaden Agreement of 1938, which, modified and renewed, still governs labour relations in Sweden and is largely responsible for their unusual smoothness. Other reasons, to which the book gives less prominence, are the absence of the irritation and destruction of war and the strong innate respect for the law which the Swedes possess. In the last section of this useful, though specialised, book the practical application of the various conventions and regulations is described in some detail.

Broken Thread. Major General F. S. G. Piggott. *Gale and Polden.* 424 pages. 21s.

This is the story of a soldier's life, told with painstaking detail and meticulous accuracy in respect of names, careers and places. General Piggott passed into Woolwich in 1899, and many of his generation will find in his book the echoes of their own earlier days. To the more general public, the interest of the book lies in the author's lifelong association with Japan. Anglo-Japanese friendship is the thread that has been broken—largely at American instigation—and the present situation is not the first in which the British and Americans have found it hard to co-ordinate their policies in the Orient. The author gives an intimate picture of many leading Japanese of the past thirty years which would not be perceived by the normal globe-trotter or travelling journalist.

AMERICAN SURVEY

Deficit Diplomacy

Washington, D.C.

"IN the final analysis," the President said in his mid-year economic report, "there are no limits except our total strength to guide us in our determination to resist aggression and thus to strive for peace. But the question remains as to how much of our total economic strength must be shifted from peacetime production to defence purposes in the current situation." And, even after the increased programmes for which Mr Truman has asked Congress, the question still remains to plague those who try to compile a political and strategic balance-sheet for the United States. Mr Walter Lippmann recently used the phrase "deficit diplomacy" to describe the way in which Mr Truman had allowed American commitments to increase while the power to meet them had been allowed to decline. The decline has now been reversed and the power of the United States is being built up again. But the commitments are increasing too, and neither the balance-sheet at present nor the projected one for next year gives much hope for diplomatic solvency.

This tendency towards insolvency is probably a relic of the good old days when the United States could adopt attitudes, either by resolution of Congress or by Presidential pronouncement, for which it took no further responsibility. Today every attitude, official or Congressional, carries responsibility with it. Some Congressmen are still ignorant of the change which has come over their position; others prefer to go on behaving as if it did not exist; others, again, consider their personal fortunes more important than the policy of their country in a moment of crisis. The result is that the United States goes on collecting commitments like a magpie—some on moral grounds, some for domestic political reasons—while leaving political expediency to decide how they shall be met. Mr Truman is not the first American President to allow this to happen, or to be unable to stop it happening, but he is the first whose bills show signs of coming due for payment without the warning of prior calls on the European friends of the United States.

There has been some argument about the Korean commitment, and Mr Acheson has been blamed for giving the Russians official notice that the United States was not interested in South Korea when he said in his speech at the Press Club on January 12th that the United States defensive perimeter "runs along the Aleutians to Japan and then goes to the Ryukus. (It) runs from the Ryukus to the Philippine Islands." But it is forgotten that, later in the speech, after finishing the discussion of the needs of American defence, he turned to another question—that of commitments—and said: "We have direct responsibility in Japan and we have direct responsibility to act. The same thing to a lesser degree is true in Korea." In the light of what has happened it is easy to complain that he did not make the distinction clearer and explain what he meant in words which the Soviet Union would understand. It is even more reasonable to inquire why the State Department acquiesced in a military establishment which could not meet the calls likely to be made on it by even the unavoidable minimum of political commitments.

Had the Republicans in Congress concentrated their fire on this weakness in the Administration's conduct of its policy, they would have a good case to argue—though not necessarily an honest one, since much of the deficiency in American diplomacy comes from Congressional refusal (or well-justified Administration fears of Congressional refusal) to balance the diplomatic books. It was the Republicans in the House who voted earlier in the year to stop economic aid to South Korea; it was the Republicans in the Senate who made any kind of constructive action in China impossible. Nor did the Republicans in 1945 recognise any more clearly than did the Administration the "true aims and methods of the rulers of Soviet Russia." Such considerations justify Senator McMahon's attack on the analysis of foreign policy issued by the Republicans in preparation for the election, as "an attempt to cut themselves in on the victories of our foreign policy and to divorce themselves from our defeats."

★

The attitude of fifty-one members of the United Nations proves that the United States was justified in assuming a moral commitment in Korea. And the plans of the Defence Department for the expansion of the armed forces are, for the first time, based on the possible existence of other commitments (such as the Mutual Defence Assistance Programme) which are more than financial and entail less than total war and general mobilisation. In addition to the ten divisions which, before June 25th, undertook occupation duties in Germany and Japan and provided the "mobilisation base" in the United States, there will be the Korean force and another task force which, in the imagination of the planners, at least, will, when trained, be always ready to embark at a few hours' notice if some similar "police action" is needed. There are many who criticise this plan on the grounds of its inadequacy, but it is one which recognises the nature, if not perhaps the size, of the emergency. And until the Russians give some indication of future moves it is, in all probability, all that the economy can stand for an unspecified number of years without dislocation.

It may seem to provide very few troops for very many dollars, but that is the way of the United States. However, it will be found to be too small if the Congress continues to add new and unwanted commitments to appease the Irish Catholics, the cotton growers, the China lobby or any other group whose spokesmen can persuade frightened Senators that its votes are for sale in job lots. In the case of the Spanish loan, it is true, there were some, if not many, among those voting in favour who had been won over by the arguments of certain politicians in the armed forces who would have only themselves to blame if they found they had bereft

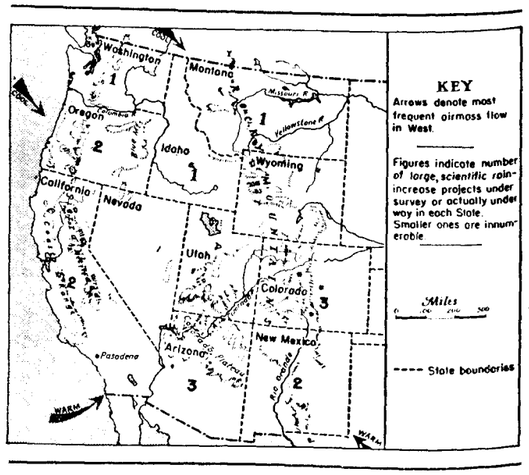
"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

themselves of some important old allies in the hope of acquiring a new one. Hope is the only word to use in this case because the spotlight which the Economic Co-operation Administration is, by statute, required to turn on the economies of the countries it assists can be expected to illuminate much that the Franco regime would prefer to keep hidden. Senator McCarran's $100 million may well do little good to Spain and even less to improve relations between the United States and General Franco.

★

Much more serious is the intricate pattern of intrigue over Formosa. Mr Acheson did not include that island within the defence perimeter of the United States, nor did he mention any special responsibility towards it or the Nationalist Government. It is still not within the defence perimeter. The Defence Department does not want, nor does General MacArthur, to have American troops tied down there or to occupy it. There has been a revision, rather than a reversal, of official policy towards Formosa since the January furore because there has been a revision of the official estimate of Russian intentions. It can no longer be assumed that Soviet expansionism will use only the method of infiltration and will not court war. Therefore it has become necessary, in the view of the Chiefs of Staff (who remember where the planes which bombed Manila on December 7th, 1941, came from), to see that Formosa does not fall into hostile hands. From this necessity sprang the idea of neutralisation—of neither allowing the Chinese Communists to invade Formosa nor supporting, or even tolerating, General Chiang Kai-shek's attacks on the mainland.

This was the policy which the President enunciated on June 27th, and it might have worked smoothly—despite the suspicions of some non-Communist countries who believe in the myth of American capitalist-imperialism—if General MacArthur had not taken his inordinately tactless trip to discuss military matters with General Chiang Kai-shek and been photographed kissing Madame Chiang's gloved hand. Partly for domestic political reasons and partly because he has fought and is still fighting a brilliant defensive campaign, the Administration has been unable to utter a single word of criticism of General MacArthur's action. Mr Harriman had to describe it as "entirely natural"—which was, to say the least, a surprising description of a performance which perturbed every Foreign Office west of the Iron Curtain.



The decision of the Administration to cover up the General's tracks is understandable and should be accepted as necessary since there has been an assurance that Mr Truman has not changed his stated policy. But the whole episode has given Chiang Kai-shek's friends in the Senate the chance to start their dangerous campaign again, and Senator Knowland began it on August 10th. Mr Truman at the moment is faced with the unfortunate fact that any policy which is politically possible in his own country is unlikely to be acceptable to its allies and to the United Nations. It is doubtful how firm he can remain in the face of demands which, because they have the support not only of the McCormick, Hearst and Scripps-Howard press (none of which have influence in proportion to their circulation), but also of the *Time-Life* group, will scare the Democrats in Congress into claiming the right to campaign on level terms. The President's closest advisers in the executive branch must know how disastrous this would be to the United Nations and to the western alliance, but Congress, preoccupied with re-election, might negligently trade Spain for France, Belgium and Holland and Chiang Kai-shek for the rest of Asia, and throw the balance-sheet far into the red again.

Weather to Order

[FROM A CORRESPONDENT IN COLORADO]

In America today people not only talk about the weather, but actually do something about it. Four years ago a scientist employed by the General Electric Company discovered that, if dry ice were dropped through suitable clouds, they could be made to snow. Precipitation in America comes almost entirely from "super-cooled" clouds, colder than freezing, but with their constituent droplets still liquid. When Nature is in charge these droplets freeze upon sub-microscopic ice-crystals, dust particles or other natural nuclei and grow into snowflakes, which fall and, in warm weather, melt into rain. When the temperature is below minus 40 degrees the droplets congeal spontaneously into ice crystals. The dry ice system works by lowering the temperature around itself to below minus 40 degrees, and the ice crystals thus formed then spread far through the cloud.

In 1947 another employee of the General Electric Company found a way of improving on Nature. He seeded the clouds with silver iodide crystals, so like ice crystals that they

"fool the moisture" into collecting on them at temperatures far above minus 40 degrees. Moreover, while ice crystals may melt or evaporate, silver iodide crystals are permanent and remain aloft until each can form a snowflake and bear it to earth. Dry ice must be dropped on the clouds from an aircraft, an expensive proceeding. But silver iodide can be smoke-borne upwards from the ground, more cheaply and more efficiently, by burning coke saturated with it in portable generators. Stationed to windward of the cloud to be treated, these float 30 quadrillion crystals a minute into the air, each one a potential raindrop.

Clouds over New York have been seeded this year to help fill reservoirs depleted by the demands of a city population that has temporarily outgrown its water-supply. But the western States, with only 20 per cent of the country's precipitation and 40 per cent of its area, are permanently short of rain, and here the new process seems like a dream come true. The dream has been brought down to earth by hard-headed business men, who sell "rain increase" to other business men who find it pays dividends—ranchers, farmers, hydro-electric companies and city councils with water problems. Billions of dollars, both public and private, have been spent in the west to provide the stored water without which there can be no farming in that arid region. Even so, most of the western half of the United States remains, and was expected to remain, desert, or at best pastureland, so scantily provided with fodder that it could support only a few cattle on each square mile. Now it seems that, if the clouds are seeded on a regular and sustained basis by those who know how to do it, precipitation may be increased by a minimum of 50 per cent a year. What the maximum may be, no one knows. There is real hope that through scientific methods the rainfall over many million acres may become sufficient to allow farming of the type possible in humid regions, and that the supply of water for the irrigation reservoirs may become larger and more certain.

★

The first firm to exploit the idea of rain increase is the Water Resources Development Corporation of Pasadena, California, organised by Dr Irving Krick, one of the war's famous weathermen. Now he is using his own long-range forecasts to increase rainfall where it is wanted—and this year it is wanted in many places. Word is sent from headquarters in Pasadena to representatives in the field when a cloud that will repay seeding is coming their way, so that the smoke generators can be started up. Since it began operations last March, WRDC has been uniformly successful. The key to this success lies in the successive waves of high-pressure air pushing down from the North Pacific at regular intervals across the western States, to contend over the continent with warm, moist air masses from elsewhere. Where these meet there is likely to be rain or snow, and Dr Krick's experts place their generators so that the smoke-borne silver iodide will increase the amount of rain that would naturally fall.

A wheat farmer in the State of Washington got 2.3 inches from two June storms, while his neighbours outside the down-wind smoke plume got half-an-inch. In Idaho the corporation has a contract which involves not only providing enough rain to increase the wheat yield, but trying to keep clouds over the fields as a protection against the frosts which catch the grain before it is ripe. Dryland ranges in New Mexico got so much rain as a result of the firm's activities that a reporter flying over the district said it looked as though a green ribbon, 100 miles wide, had been laid across the dun semi-desert. A Californian electricity company has noticeably increased the flow through its hydro-generators, and next winter clouds will probably be seeded over the Colorado watershed to increase the snow-pack and therefore the spring run-off. The city of Santa Barbara, on the Pacific coast, perpetually short of water, is negotiating an annual programme with WRDC.

There are several other groups in the field. One of them has a contract with the Navajo Indians, who have thus insured against a failure of their rain dances. There are other interesting possibilities, which may make the proverb—"it never rains but it pours"—seem out of date; the idea is to dissipate hail and thunder storms by seeding them, and so causing them to dissolve into gentle rain before they build up to their full fury. Already this method has been used to protect Oregon pears from being bruised by hail, and the US Forest Service is trying to dissipate lightning storms before they can set fire to the forests. Success is also claimed for the government's Project Cirrus, a military venture which works away in secrecy both as to its methods and its purposes. The State of New Mexico has an official programme and neighbouring Colorado has a committee studying the subject. But the Weather Bureau, which carried out its own experiments in 1948, remains sceptical about the economic value of rain increase.

Nor is the general public as yet universally convinced; there are still vivid memories of the fakirs and magicians who for centuries have professed to make rain. Then, since there is no regulation, hundreds of amateurs with "a bucket of dry ice, an airplane and a desire to do something about the weather" have spread their wings. Such haphazard efforts do little good. In fact, Dr Irving Langmuir of General Electric says that over-enthusiastic "seeding" may put so many artificial nuclei in a cloud that they soak up all the moisture and leave none to grow into snowflakes and fall to earth; alternatively such seeding may drive the clouds away from where they are wanted to where they are not. Finally, potential moisture is necessary if rainfall is to be increased; over hot, dry regions like the Sahara, the system might not work at all.

The political and legal implications are endless. The General Electric Company stopped its own experiments long ago, for fear of lawsuits, and has become merely a consultant to the government. One unsolved legal problem is whether those who take rain for themselves steal it from their down-wind neighbours. Dr Krick answers that no one can bring down more than one per cent of total cloud moisture over any one area, so that the down-wind effect is negligible. Rain increasing is not yet quite respectable enough to be a plank on any political platform, but it may not be long before the sky ceases to be the limit of inter-state arguments over water rights. The new science may eventually be strictly regulated, or even end up with the government as rain-maker-in-chief. Dr Langmuir believes that weather control should be on an international basis. The transformation of deserts into green fields is a dream long dear to the hearts of men.

Back in the Democratic Fold

With more than half the candidates chosen for next November's campaign, this would be the season for election forecasts if developments in Korea had not upset the political almanack. In New York, however, these same developments have cleared the air a little. There the American Labour Party, the local left-wing organisation, can no longer conceal its red underwear from the voters ; the tattered cloak of respectability draped around it by its alliance with the Progressive Party has been finally torn to shreds by Mr. Henry Wallace's resignation from the leadership of that party. When it officially opposed United Nations' intervention in Korea, even he could not close his eyes to the fact that the Communist line was being toed with a consistency that was more than a coincidence. Mr Wallace and other reputable Progressives have now decided that they can best serve the cause of peace by abandoning both the party they founded and the ALP too ; as a result, the anti-Republican vote in New York this autumn will not be as divided as it was in 1948, when Mr Wallace took enough support from Mr Truman to give the State's presidential votes to Mr Dewey.

Mr Wallace has not yet announced whether he hopes once more to serve the cause of peace within the Democratic Party, but his running mate in 1948, Senator Glen Taylor, of Idaho, was long ago readmitted to the Democratic fold. He was nevertheless still too black a sheep to get the official endorsement from Mr Truman that might have given him victory in last week's Democratic primary in Idaho for his Senate seat. He lost the nomination by just over a thousand votes to Mr Worth Clark, his predecessor. Mr Truman, however, put a large thumb in the primary pie in his home State of Missouri, but failed to pull out his candidate, Mr Emery Allison, who is more distinguished for his connections with the Pendergast machine than for his personal qualifications. Missouri Democrats, somewhat embarrassed at having rebuffed their President, can at least feel that the man they have chosen, Mr Tom Hennings, has a better chance of defeating the incumbent Republican Senator next November.

*

Amongst other incumbent Senators who have been beaten already in their party primaries is Mr Elmer Thomas of Oklahoma. His defeat, after 24 years in the Senate, is explained partly by the greater energy and ability of his rival, Representative Mike Monroney, and partly by his own reputation for flirting with the private electricity interests and for using his position as chairman of the Senate Agriculture Committee to the advantage of his speculations on the commodity exchanges. Both Senator Thomas and Mr Monroney have been true to the Fair Deal in their fashion. In the neighbouring and even more safely Democratic State of Arkansas the young Fair Dealing Governor, Mr McMath, held the nomination against a conservative, anti-Truman States' Righter—a Dixiecrat, in fact. And in South Carolina the Dixiecrat presidential candidate in 1948, Governor Thurmond, lost the Democratic nomination for Senator.

But this does not mean that the right-wing black sheep have repented as those who strayed to the left have done. Mr Thurmond was defeated by Senator Olin Johnson, who denounced the Administration in general, and its civil rights programme in particular, just as violently as his opponent. The only difference was that Mr Johnson argued that the Democratic flock could be more effectively infiltrated from within the fold than from without. And South Carolina has also provided the conservatives with a bell-wether ; the State's new Governor is to be Mr James Byrnes, the ex-Secretary of State, who has now broken with Mr Truman and who will give the right wing of the Democratic Party a prestige and a leadership that it has not had before.

Excess Profits

Skimming off rearmament profits from a brimming civilian economy may prove to be much more difficult than it was during the war, when profits rose sharply. The first half of 1950 has shown that no war stimulus was needed to revive corporate incomes, which wilted somewhat during the 1949 recession. The Council of Economic Advisers, on incomplete returns for the first six months of 1950, estimates that profits were running at an annual rate of $18.4 billion after taxes, compared with $17 billion in 1949, $20.9 billion in 1948, and $18.5 billion in 1947. The National City Bank, tabulating final returns from 500 corporations, mostly the larger manufacturing ones, finds that profits after taxes were 27 per cent higher in the first half of 1950 than in the first half of 1949, and that in the second quarter alone they were 50 per cent higher. This is on the assumption that taxes are not raised retroactively, an assumption that seems safe since the Senate Finance Committee has turned down the President's request that new corporate taxes should apply to the whole of 1950 and proposes that they should apply only to income earned after July 1st.

Leading this year's expansion were the textile and apparel, metal products, electrical goods, chemical and cement industries. Some, but not all, owed their good showing to last year's bad record, but the automobile, iron and steel, and chemical companies have gone from strength to strength. In the recovery, capacity production, improved plant, rising sales and stable or rising prices have all played a part. Investors in one corporation, General Motors, are to share in this prosperity. The corporation has announced a special dividend of $2.50 a share, which brings dividends in three quarters of this year to $7 compared with $8 in the whole of 1949. But this one swallow does not make a golden age ; most investors are resigned, if not reconciled, to skimpy pickings. Dividend payments, though at a record rate, have only doubled since 1939, while profits have tripled. Undistributed profits have financed expansion and internal improvements, and have brought working capital to the peak figure of $69 billion.

The demand that Congress " take the profits out of war " has already been marked in Senate discussions and will become irresistible if ceilings are put on prices and wages. The Administration would prefer, however, to postpone this complicated and controversial issue until the next session, feeling with Senator George that to introduce it now might mean no tax legislation at all at this time. Senator George also suspects that the left wing would like to take the profits out of peace as well as war, for Senator O'Mahoney would rank as excess profits any earnings above 75 per cent of a company's 1947-49 level. Before the excess profits tax is revived, the Treasury would also like to try to discover a formula that might avoid the inequities of its predecessor.

Community Colleges

The United States has become increasingly college-minded since the war. The cost of a college education has risen, but, thanks to good times, so have the number of those who can afford it. College enrolment is likely to settle down at about 2,500,000, 1,000,000 more than the number on the campus in 1941 and 1942. The most remarkable growth has come, however, not in the traditional four-year institutions, but in a peculiarly American phenomenon, the two-year college. Of the 150 colleges and universities established in 1948 and 1949, half offered a two-year course, bringing the number of such junior and community colleges up to 500, with 500,000 students. Only one State, Nevada, lacks a two-year college, and communities in 24 States are planning to establish new ones.

The junior college has been an accepted part of the educational system for twenty years or more, particularly in the west. It offers a shorter course, either technical or in the liberal arts, for those without the money or inclination to embark on a four-year investment. The community college, a postwar phenomenon, goes much further toward bringing higher education within everyone's grasp. It is designed to serve all the educational needs of the community in which it is situated and, by enabling its students to live at home, it does away with the heavy residential expenses that prevent many boys and girls from attending even the universities provided by the States. Unlike the junior college which is often a stepping-stone to the university, the community college is primarily for those who intend to go directly into business, public service, farming, or semi-professional jobs. Finally, it also caters for adults who wish to continue their education while at work or who, having set out on the wrong foot in life, need a foundation for a fresh start. In New York, the new master plan for higher education is based, in large part, upon the expansion of two-year colleges ; the State will pay half the capital costs and a third of the running costs of colleges set up by local authorities. A further stimulus has been provided by the approval of two new college degrees for two-year courses, Associate in Arts (AA) and Associate in Applied Science (AAS). Forty-two other States recognise these degrees.

The community college is one method of satisfying the growing demand for free higher education. The President's Commission on Higher Education emphasised a different solution ; it proposed that the number of four-year institutions should be expanded to accommodate 50 per cent more students by 1960. There is much scepticism, however, as to whether so many will ever be able to afford a four-year residential course, even if the number of scholarships is increased. There is even more doubt whether such a flood of would-be graduates—even if it could be financed—might not swamp the colleges and universities and prevent them from giving first-rate instruction to those who have professional ambitions and the equipment for book-learning. The speed with which the community college idea has spread shows the need for a new institution to fill the gap between the high schools and the four-year colleges. Whether the community college provides the answer depends on its ability to attract teachers with an imaginative grasp of the possibilities and without too rigid an academic approach.

How Bomb-proof a Shelter ?

A brisker business in cave reservations and homes " outside the radiation zone " is not the only proof that the leisurely tempo of civilian defence planning has been rudely jolted by the fighting in Korea. Until the invasion, and the American decision to resist it, 1953 had been the year by which defence against the bomb, like so many other things, was to be ready. Now city mayors and State Governors await with impatience and open irritation the interim guide the Federal Government promises to publish early in September, and some, refusing to count on Russian restraint until then, are going ahead on their own. Congressmen, startled to find that even they would not know what to do if an atom bomb fell on Washington, have hastily passed a model civil defence law for the District of Columbia ; the $30,000 tentatively mentioned in June to finance preparations has been raised to $290,000. Governor Dewey has appointed General Clay to supervise New York's plans ; already wardens are being appointed and an observation network created. Chicago is sponsoring a " walking blood bank " scheme by tattooing blood types under, not on, the arms that might be blown off.

By and large, however, despite loud complaints of Federal delay, sharpest in the West Coast cities conscious of being only ten hours flying time from the nearest Soviet base, plans remain on paper, if they exist at all. Only twenty-one States possess a civil defence law ; nineteen have taken no steps whatever. Most, though not all, of these, are unlikely ever to experience an attack, but mutual aid pacts are desirable if bombed areas are to secure effective aid from their neighbours. At present Newark's fire-fighting apparatus, for example, would be useless across the river in New York because of coupling differences, and New Jersey's nurses and doctors are forbidden to practise in Pennsylvania —though the latter refinement would hardly survive an atom bomb.

Even more urgent, in the view of Mr James M. Landis, director of civil defence in the last war, is the need to designate a single authority to issue defence regulations and ensure the best use of all resources. Dr Larsen, the national director of civilian defence, is only a planning officer ; he has no enforcement authority. Moreover, there have been jurisdictional quarrels between committees, and the National Security Resources Board only recently received the information from the Atomic Energy Commission that is necessary to formulate its guide against atomic attack. Prolonged bombardment by conventional weapons is not regarded as a serious threat ; it is the relatively unknown, and more terrifying, effects of atomic weapons that monopolise attention and have made the new guide issued this week a best-seller overnight.

Among the general measures that the report recommends, and which incidentally would add to the peace-time amenities of dwellers in large cities, are the provision of more parks and the clearing of slums, to reduce the density of population and fire hazards, and the building of better highways, as escape routes and fire-breaks. The implication seems to be that the $450 million some New Yorkers would like to spend on vast shelters under the parks might better be invested in these other ways. The NSRB already has a plan for moving key Washington agencies to new towns 50 miles from the centre, and filling the vacancies with less precious personnel—the exact obverse of what happened in the last war. The dispersal of industry is another matter ; few cities, even under the shadow of the bomb, will willingly see their bread and butter depart—perhaps for ever.

Shorter Notes

President Truman has sought shelter from the gathering Congressional storm over the Reconstruction Finance Corporation and has refrained from renominating two of the existing directors for a new term. The chairman, Mr Harley Hise, had been especially hard hit during the Senate inquiry into the RFC and he is one of those now dropped.

*

With the new defence programme a new defence investigating committee has also got under way in the Senate and is hoping to do as good a job as its predecessor in the last war. Its chairman, Senator Lyndon Johnson of Texas, may also hope to follow in the footsteps of his predecessor, ex-Senator Truman.

*

The American soldier in Korea may feel that as yet his weapons show little improvement over those of the last war, but at least his combat rations are better. The famous C ration has become the C-4 and now contains tinned fruit—a choice of cherries, peaches, pineapple or fruit cocktail—as well as pork sausages, chicken, stewed meat or ham and eggs, bread, cigarettes, a spoon and a cake of soap.

*

In the interest of the national security, the du Pont Company, which withdrew from atomic energy projects in 1946, has been prevailed upon by the Atomic Energy Commission to take the responsibility for some new plants of advanced design to produce materials " which can be used either for weapons or for fuels." It is taken for granted that this new project is connected with the hydrogen bomb.

THE WORLD OVERSEAS

Pakistan's Third Birthday

(From Our Karachi Correspondent)

PAKISTAN was three years old last Monday. These three years of existence have put Pakistan firmly on the map and have secured for it recognition as the strongest and most stable Muslim State. In terms of population it is, of course, by far the largest and, being divided into two portions one thousand miles apart, it has a special strategic importance in that it has one foot in the Middle East and the other in South-east Asia. It is interesting to compare the attention now paid to Pakistan by foreign governments and press with the indifference with which the country was regarded in its early struggles. Obviously in the early days the world was inclined to regard Pakistan as a figment of Jinnah's brain which might not survive his death, and would at best have a hard job to establish its economic viability.

Pakistan's foreign policy from the outset has been almost entirely dictated by its fear of India. There has already been an undeclared war in Kashmir, and full-scale war very nearly broke out last March. Pakistan's grievance against the Commonwealth—of which it has all along been disposed to be a genuine member—has been that the United Kingdom and associate countries have not been fulfilling their moral responsibility of settling disputes within the family, and of taking a firm line against India when called for. Hence, the brief Russian flirtation last year ; nothing earned so much kudos for Liaquat Ali Khan in his own country. By accepting the Russian invitation—which still stands—the Prime Minister made it quite clear to the Commonwealth countries, and America, that Pakistan was not prepared to be treated as a camp-follower. At the same time it must be recognised that there is no real enthusiasm in Pakistan for the combined action against aggression in Korea, and that Pakistanis take a very cynical view of the United Nations. They contrast the speed with which it acted when American interests were threatened with its spineless attitude towards the Kashmir, Junagadh and Hyderabad affairs.

Relations with the Commonwealth

Although the present tendency is for Pakistan to align itself with the Commonwealth, it must be remembered that it stands committed to nothing. It is for the Constituent Assembly, which is still only at the early stages of constitution making, to decide whether Pakistan remains a Dominion, or a Republic within the Commonwealth, or even quits the Commonwealth altogether. The odds are that it will follow India's example and become a Republic within the Commonwealth. Pakistan has not, however, finally found its political niche. On the other hand, it has determined its ideological status. It regards itself as an Islamic democracy based on "Islamic Social Justice." This means a "third way," lying between capitalism and communism, which has much in common with British socialism and the concept of the welfare state. Concentration of wealth in the hands of a few individuals is to be avoided, though private enterprise is to have its place. Communism on the Russian model is regarded as repugnant to Islam, but public utility concerns are likely to be completely nationalised within the next ten years.

It was fortunate for Pakistan that it had the leadership of Mr Jinnah for its first year. Jinnah was meticulously constitutional, but was nevertheless a dictator in the sense that his authority was absolutely unchallenged and his lightest word was law. There might have been a serious crisis at his death—for there were disgruntled elements in political life—but Mr Liaquat Ali Khan carried the day successfully and now occupies almost as secure a position as Jinnah did. Being Prime Minister, he can exercise his power even more constitutionally than Jinnah did. His government is a Muslim League Government, and the League is by far the most important party in the country. Various splinter parties have come and gone, and at present, there is only one party which can be regarded as in any sense a rival to the Muslim League. This is the Awami Muslim League, led by Mr H. S. Suhrawardy, the former premier of undivided Bengal. Suhrawardy has gathered various dissident elements under his banner ; but he started under a disadvantage inasmuch as he had originally continued his citizenship of India, and only came over to Pakistan when it suited him.

Financially Strong

Pakistan has always taken great pride in having balanced its central budgets during each of the three full financial years for which budgets have been presented. This has certainly been a *tour de force* on the part of Mr Ghulam Mohammed, the Finance Minister. Nor should it be thought that the very high level of defence expenditure has squeezed out expenditure on development. In 1950-51, Rs 25.34 crores have been budgeted for capital expenditure on development —almost exactly twice as much as in the previous year. The Pakistan Government has sometimes been criticised for paying too much attention to industrial development and too little to its natural resources, that is, to agricultural development. There is not much basis for this criticism, which arises from the fact that industrial development steals most of the news ; every new factory gets into the headlines, while agricultural schemes seem to lack news value. Actually, Government have, so far, approved 105 special development schemes, estimated to cost about Rs 112 crores over a period of 5 years. Of the total expenditure of these schemes, the heading "Communications" accounts for Rs 33.12 crores, even though this does not include the bulk of the Rs 14.5 crores, which is being spent on the development of Chittagong Port. "Electricity" accounts for Rs 29.53 crores, and the approved schemes for the generation of electric power will bring the total output up from 40,000 kW to 200,000 kW. "Irrigation" accounts for Rs 22.16 crores, and "Agriculture" for Rs 16.04 crores. "Industry" accounts for only Rs 7.50 crores. These figures do not include provincial schemes to the extent that the latter are being financed by the provinces out of their own resources. The huge Lower Sind Barrage scheme, for example, is not included.

Three years have proved that Pakistan is not merely economically viable, but, if left in peace, is capable of attaining a level of prosperity which would be unusual in an over-populated Eastern country. It has the inestimable advantage of starting on a thoroughly sound basis for general development—self-sufficiency in foodgrains, plus valuable cash crops for export which bring in the necessary foreign exchange to pay for requirements of manufactured goods from abroad. "If left in peace," is however a big "if." Even in the present state of uneasy relations with India, Pakistan is spending between 60 and 70 per cent of central revenues on defence: this, of course, includes expenditure charged to capital as well as expenditure appearing in the revenue budget. No country can afford to spend so high a proportion of its income on unproductive expenditure if it is to attain a well balanced economy, least of all Pakistan, which has a vast programme ahead of it. Mr Ghulam Mohammed makes no secret of his belief that both India and Pakistan are heading for bankruptcy, unless they can reduce defence expenditure—unless, to put it another way, they can come to an agreement over Kashmir. The future of both countries depends on this thing more than anything else.

Italy's Fifth Column—II

[FROM OUR ROME CORRESPONDENT]

IT is in practice evidently impossible to treat eight million voters, or a third of the population, as a fifth column. Nor, however, can two and a half million persons (the present alleged membership of the Italian Communist Party), knitted together by an intricate organisation and dominating strategic points of the national society, be carried along as an actively hostile organism within the body politic. Recent Communist statements have it that 20,000 persons pass yearly through the Party's various schools of political and ideological leadership and that another 4,000 take courses by correspondence. In Northern Italy a cell has an average membership of about 40, in Southern Italy of above 90, but a campaign is in course for the "bolshevisation" of the Party—that is, its articulation into a far greater number of cells. Comrades are told not to be shy of establishing a cell of four or five persons. This process is to bring many thousand more comrades into responsible positions. The Youth Organisation (now claiming nearly half a million members) has been bidden to exert itself in forming small sporting, cultural, and entertainment units for the attraction of non-Communist youth. Reproofs have been administered at various levels to Party organisers for failure to understand the Party's position as the advanced part of the nation, and for treating Catholic or Social Democratic workers as foes, instead of as less fortunate brethren to be guided subtly to the light. An examination of recent Communist documentation indicates an intense effort to radiate the Party's doctrine, way of life, and organisation for mutual assistance and discipline into the recesses of Italian village, workshop, farm, and family life, coupled with a recognition that in recent perplexing times many weak brethren have fallen away—and all for the best. In the very latest months, however, the paid-up membership is said to have expanded sharply (in Rome province by 10 per cent in six months, to 100,000). It is common form, in Italy, to assume that the membership claims of all organisations are grossly exaggerated. There has so far been no spectacular purge in the Italian C.P., but the scrutiny of individual conduct in the Party is severe.

The question of how to confront "the Communist menace" in Italy—in case of grave international events and consequent internal crisis—resolves itself, in the short run, into the possibility of segregating a manageable number of persons whose removal from political activity would cause their agitatory machine to run down ; and secondly, into the possibility of giving the operatives and landless peasants a channel, other than those controlled by the Communist Party, for making their weight felt in the national life. For the events of 1943-45 have bequeathed to the Communist Party a *prima facie* identification with organised labour which has not been successfully challenged.

Partisans and Patriots

How many Communists can be considered as dangerous carriers of the fifth-column germ? One may reasonably suppose that the infectious hard core consists in the main of men (and some few women) who participated conspicuously in the anti-Fascist guerillas of 1943-45. The Party's Vice-Leader and Military Chief, 50-year-old Luigi Longo, claims that 462,000 "partisans and patriots" took up arms in that struggle. Making allowance for enthusiastic exaggerations, for the inclusion of numbers of occasional helpers, and for the fact that large portions of the partisan forces were non-Communist, it must yet be supposed that some thousands of present-day Communists have behind them an experience not merely of handling arms but of exercising some military command in partisan warfare. It is perhaps today as fully assumed in Communist circles that a political leader should be capable of thinking and acting in military terms, as it was that an eighteenth century landlord should be able to command a body of militia. Since 1945 Italy has, of course, re-formed a not contemptible army and a strong police corps. Yet there has been some surprise in Italy that Signor De Gasperi's mettlesome Defence Minister, Signor Pacciardi, should in July have talked confidently in the presence of foreign Military Attachés of "four hundred or so" persons whom it would suffice, in an emergency, to deprive of opportunities for harm. The fifth column can hardly be so slender. Yet, however difficult the problem of segregating the Communist politico-military *élite* in case of extremities it is on the other hand clear that the present Ministers would not easily be deflected from a stern policy. It is presumed that in the case of real trouble there would be a mass rally to the stronger side, and it is presumed that the stronger side would be the one which controls the police.

The most important of all considerations, for those who are attempting to lead Italy against all Marxist aspirations into a peaceful "Western" evolution, is how the factory workers on the one hand, the landless peasants on the other—twin pilasters of the present fifth column—can be shown a way to participate creatively in the national society. The General Confederation of Labour, resuscitated in 1944 as the sole central syndical organisation, with a Communist,

a Socialist, and a Catholic Secretary-General, survived in that form uneasily through the year which passed between the "expulsion" of the Communists from the Government (as that episode is described by themselves) and the electoral victory of Signor De Gasperi in 1948. By that time the Marshall plan was in operation and the anomaly of a monopolistic labour organisation effectively organised by the Communists to frustrate the Marshall plan, coexisting with a Government pledged to the Marshall plan, no longer appeared tolerable. The first inclination, on the Government side, was to try to wrest control of the Confederation from the Communists by compelling the component unions to elect their officers (and so, at the top of an electoral ladder, the Central Union's officers) by democratic secret ballot. But before this democratically correct solution could be attempted the Catholic officials, under the impulse of the Vatican's Catholic Action, threw in their hands and formed a separate Catholic Union. In course of time this body has gained, or claimed, about one and a half million adherents. The Catholic secession left high and dry inside the General Confederation the considerable portions of the Socialist sections which had prepared to respond to the call to break the Communist control. Later, two distinct groups of Socialist Unions broke away, first the FIL, which after a dim separate career on American money has recently joined the Catholics in the CISL. This joint organisation now backs the Government more or less to the hilt. The second defection created the new but potentially more substantial UIL, hostile both to the Communists and to the Government. Ostensibly the General Confederation, with its claimed membership of well over five millions remains a pure preserve of the Communists and the rump of Nenni Socialists, and acknowledges a net loss of about one million members as the result of these defections.

Failure of Political Strikes

The big losses to the Communist unions have been in Lombardy and Venetia, regions where small textile factories employing many women are specially prevalent. State employees, bank employees, and school teachers have for the most part adhered to the secessions, but also quite substantial groups in the tougher industries. There has been open criticism of the syndical side of the Party's activities at recent meetings of the Communist executive, and the General Secretary of the Confederation, Di Vittorio, though Moscow-trained and a Spanish War combatant, walks on a tightrope between party obedience and the public opinion of his Union, which strongly objects to a purely political and ideological treatment of labour questions. The many local and temporary general strikes called since 1948 for political motives have been progressive failures, and none has been attempted since the spring, when the protest strike against the unloading of Atlantic arms was purely nominal.

In short, it may be suggested that the syndical situation of the Communists is weaker than it appears, and has not allowed them much real opportunity for frustrating the Government in the day to day field. The support given to the Government by the CISL has lately proved adequate to save it from the humiliation of total labour stoppages. If, however, the Government were to attempt to conduct the country quickly along a full-blooded line of policy upon which no moral unity has been achieved in the nation, such a course, however necessary, would entail a most perilous political operation.

The observer of Italian affairs is bound to express anxiety when contrasting the suddenly increased urgency of the military co-operation which it is suggested that all "Western" nations must offer as a counterpart to economic assistance, with the slow and broken progress in Italy of the policies which would make the Italian masses feel that a "Western" evolution offers them better hopes than the dictatorship of Togliatti, or of Togliatti's tougher replacement.

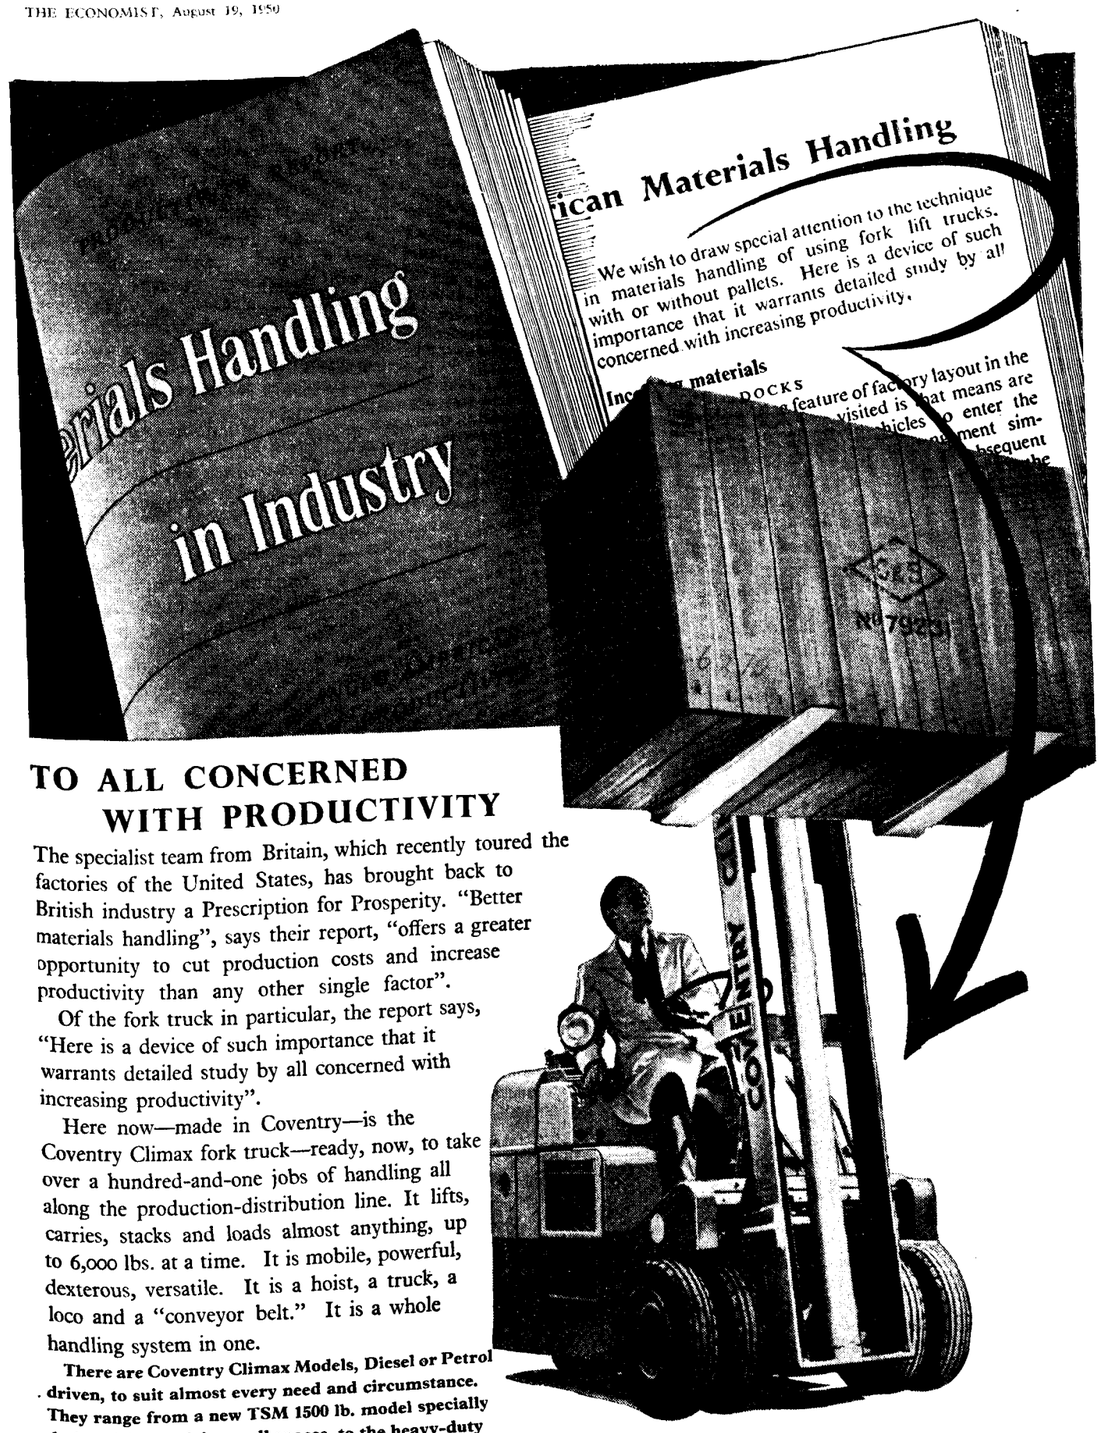
Canadian Trade with the United States



[FROM OUR OTTAWA CORRESPONDENT]

THE United States rearmament programme promises to accelerate the trade trends between Canada and the United States which were already becoming very pronounced before the Korean crisis. Before the war Canadian exports were equally divided between the United States and Britain: 37 per cent of the total exports went to each. In 1949 the United States took 51 per cent of Canadian exports and the United Kingdom took only 24 per cent. In the first half of this year the United States took 64 per cent of total Canadian exports, and Britain's share was down to 17 per cent. The import picture has not changed so drastically. The United States was always Canada's chief supplier. Between 1935 and 1939 it supplied 61 per cent of Canadian imports, against Britain's 18 per cent. The US share rose to 70 per cent in 1949, and just under 70 per cent in the first half of this year. Britain's share dropped to 11 per cent in 1949, and was recovering in the first part of this year: for the first five months it was 12.8 per cent.

In 1947, Canada's balance on commodity trade with the United States ran a deficit of more than $900 million. The reserves of gold and US dollars dropped to the dangerously low point of $500 million. Before the end of the year the Government had been obliged to impose a strict import control programme. It banned the import of a range of goods amounting (on 1946-47 trade figures) to $150 million; it applied quotas to categories amounting to another $250 million; and it required import permits for the whole range of capital goods, motor vehicles and production materials on which Canada had spent $572 million in US dollars in 1947.

The balance of payments responded immediately. The reserves shot up to $997 million by the end of 1948 and $1,117 million at the end of 1949. At the end of June this year they had increased to $1,255 million. Many factors have contributed to this increase. No doubt the import restrictions were a vital factor in tipping the scale, but they have been progressively relaxed for the last two years without altering the favourable trend. On July 1st the banned list was reduced to a few minor items, whose total 1946-47 value was only $25 million. The quota list was down to some $200 million on the same basis; but there were a good many signs that it was affecting very much less than that volume of trade. The backlog of demand which so inflated Canadian imports in 1947 has by now been largely satisfied; the sources of supply, which in 1947 were largely restricted to the United States, have now widened; and in some items such as textiles it appeared that the competitive appeal of the US products had to a considerable extent worn itself out. It is doubtful whether the full quotas permitted for US imports will be used. Very much the same story applies to capital goods, where the Government has always tried not to refuse permits for any essential imports which had to be obtained from the United States. Permits granted in 1949 had crept back to about the same level of imports as 1947.

If import restrictions are not enough to account for the improvements in reserves the next obvious answer is ECA. Commentators in the United States have attributed nearly all the Canadian improvement to offshore purchases under ECA. This has certainly been an important factor, but US observers seem to exaggerate its effect. It is in fact difficult to determine what ECA funds are actually spent in Canada: expenditures frequently vary very widely from the allocations. Nor is Canada very much concerned; so long as the ERP countries raise the funds from somewhere to buy Canadian goods it does not matter whether they are ECA dollars or "free dollars." Britain's dollar deficit with Canada in 1949, for instance, was about $400 million. $120 million of this was covered by a Canadian credit. It may be argued that the

TO ALL CONCERNED WITH PRODUCTIVITY

The specialist team from Britain, which recently toured the factories of the United States, has brought back to British industry a Prescription for Prosperity. "Better materials handling", says their report, "offers a greater opportunity to cut production costs and increase productivity than any other single factor".

Of the fork truck in particular, the report says, "Here is a device of such importance that it warrants detailed study by all concerned with increasing productivity".

Here now—made in Coventry—is the Coventry Climax fork truck—ready, now, to take over a hundred-and-one jobs of handling all along the production-distribution line. It lifts, carries, stacks and loads almost anything, up to 6,000 lbs. at a time. It is mobile, powerful, dexterous, versatile. It is a hoist, a truck, a loco and a "conveyor belt." It is a whole handling system in one.

There are Coventry Climax Models, Diesel or Petrol driven, to suit almost every need and circumstance. They range from a new TSM 1500 lb. model specially designed for work in small spaces, to the heavy-duty FTF series lifting 4000, 5000 or 6000 lbs. in a single load.

COVENTRY CLIMAX *fork lift trucks*

COVENTRY CLIMAX ENGINES LTD., WIDDRINGTON ROAD WORKS, COVENTRY

remaining $280 million could not have been covered without ECA offshore allocations. But Canada's net gain from ECA dollars is limited to that amount.

A third factor, besides import controls and ECA offshore purchasing, which accounts for the improvement in the Canadian position, is increased exports to the United States. They have risen from a monthly $83.7 million in 1947 to $125 million in 1948 and 1949, and $146 million in the first five months of 1950.

Conscious policy has helped this rise in two ways. At the same time that the import restrictions went into effect in November, 1947, the Geneva tariff concessions were announced. These new rates gave Canada in many important lines the lowest US duties in living memory. It has taken advantage of the opportunity. At the same time the import controls were consciously used by the Canadian Government to provide incentives for export to the United States. Many of the larger Canadian firms which are subsidiaries of US parent companies were persuaded to co-operate with the import control programme by allowing the Canadian plants to make parts for export to the United States. The permits given for import of capital goods and production materials do not therefore tell the whole story. Although certain firms may have imported as much as ever from the United States some of them achieved the same balance-of-payments result by the more desirable method of exporting more.

Both these factors have helped. But neither of them has been the major influence, which is the astonishingly high level of continuing demand in the United States. Despite all the attempts to increase the export of manufactured goods—some of which have been successful—the rising exports to the United States consist principally of the raw or semi-raw products of forests and mines. Wood and wood products, with newsprint as by far the most important item, amounted to almost half the Canadian exports to the US in 1949.

Effect of United States Rearmament

There are, however, many disadvantages about being primarily a supplier of raw materials to the United States. Canadian policy has been constantly directed towards increasing the sale of more processed or manufactured goods. But the supply of raw materials has the advantage that it tends to be more stable than that of processed goods. Moreover, in times of tension and rearmament, the American demand for Canadian raw materials is increased. It is also very possible that US rearmament may produce a demand on Canadian factories which no amount of peacetime persuasion could bring forth. At the time of writing it is not yet known what war supplies the United States may want from Canada. It is, however, clear that the demand is likely to be considerable. The figure of $25 million a year had been set by Defence Secretary Johnson as a maximum for military purchases in Canada. Korea has certainly changed all that.

It must be foreseen that when Canadian rearmament also begins to get under way, there will be an increase in Canadian defence purchases south of the border. But from the balance of payments point of view Canada may very well come out on the right side of the account. The time-lag, which between 1939 and 1941 kept Canadian demand ahead of US demand, now operates the other way round. The United States is setting the pace and leading the way. It is reasonable to suppose that the "defence account" will start with Canadian earnings of US dollars which will be quite adequate to cover later Canadian expenditures in the United States.

The effect of the new rearmament drive may very well be to bridge the difficult period which Canada, like everybody else, was looking forward to at the end of the ERP programme in 1952. In spite of the very favourable results of the last few years' trading, no one would have dared to prophesy before the Korean crisis that Canada would be able to balance its US dollar account by 1952.

Before the last war, sales overseas were predominantly a means of earning US dollars to pay for the excess of imports from the United States. Now it no longer seems fanciful to suppose that Canada's own exports to the United States may in the near future be enough to balance its imports from there. This must always depend on a high level of demand in the United States, either from peacetime prosperity or from defence needs or, as now, from both. In such a situation the problem of the British market becomes much more self-contained. It is to maintain the traditional exports which cannot find a ready market on this continent. The range is fairly wide, from wheat to fish to rubber goods; but Canadian overseas exports may merely have to find a balance in Canadian imports from overseas. They may no longer have to carry the burden of paying for Canadian imports from the United States.

Elections in Denmark

[FROM OUR COPENHAGEN CORRESPONDENT]

THE Danes are going to the poll for a general election to the Lower House (*Folketinget*), on September 5th. Early in the morning on August 9th, Hr Hedtoft, who is the head of the Social Democrat minority Government, threw over the reins, not even taking a debate or a vote in the House. He simply stated that, as the majority (Agrarians, Conservatives, Radical Left and Single Tax Party) in a sub-committee set up during the night to deal with the Government's proposals for a series of currency regulations had refused to accept these, he would appeal to the country. It was indeed evident from the very beginning of the emergency session of the *Rigsdag*, which was summoned to consider rearmament proposals and Denmark's economic crisis, that the Social Democrats looked forward to a conflict with the Opposition, and they had no intention of listening to tempting invitations to form a Coalition Government.

The Government succeeded, however, in carrying through one bill before Parliament was dissolved—the new defence measures. In its reply to Washington the Danish Government had stressed that Denmark, at the end of the German occupation, had been stripped of all its weapons, warships and aircraft. Immediately after the liberation, 100,000 men had been trained in the Army, 20,000 in the Navy, and 30,000 in the Home Guard—altogether twice the number of men who had been called to the colours before the war, and all with an extended period of training. Expenditure on defence had risen from 60 million kroner (£3,000,000) in 1938 to 358 million kroner this year, or 2.1 per cent of the national income (16.9 per cent of the total state budget). As Denmark's contribution to the greater measure of collective defence now necessary, the country would spend an additional 300 million kroner on the armed forces, and 100 million kroner on civil defence during the next two years. This would bring defence expenditure to the equivalent of 3.6 per cent of the national income (the same as Sweden, who is not a member of the Atlantic Pact) or 29.1 per cent of the state budget.

But all the Government's proposals for covering the increased expenditure on defence, as well as on the measures to meet the economic crisis, were flatly turned down. A situation, probably unique in democratic countries, thus exists. The *Rigsdag* has passed a bill involving amounts that are far from negligible, but has refused to sanction payment. This problem will be entrusted to the new *Folketing*.

The expenditure for defence, totalling 400 million kroner over a period of 18 months, was to be met by a special defence tax on all incomes over 10,000 kroner (about £500) a year, and a compulsory 3½ per cent loan to be obtained from all with a capital over 50,000 kroner (about £2,500).

The Government also needed two hundred million kroner in cash for meeting other increasing expenses, and it intended to impose as well drastic restrictions on imports to close the gap between exports and imports. The "National Budget" for 1950-51, published in April by the Minister of Economic Co-ordination, Hr Wilhelm Buhl, revealed a new gap in Denmark's foreign currency position. Compared with the year before, Denmark was 500 million kroner worse off as regards foreign currency. This was mainly due to the devaluation of sterling, which had made a large part of Denmark's raw materials much dearer. At the same time, export prices were unchanged—a problem having a special bearing on relations with Great Britain. The deficit on the balance of payment for the year 1950 was at that time estimated to be approximately 200 million kroner. But when Parliament met this month the situation was even worse: the deficit was now calculated to be about 350 million kroner. Imports had cost 450 million kroner more than estimated, while exports had only risen by 200 million kroner. Giving the prospects for 1951, the Minister of Trade, Hr Krag, had no consolation to offer. Developments in prices, the reduction of Marshall aid, increased interests on foreign debt, and so forth, would mean a further considerable deficit in the balance of payment, probably 500 million kroner.

Austerity Ahead

In these circumstances, the Government submitted proposals to Parliament to introduce austerity measures. First of all it would be necessary to cut imports by 280 million kroner for a period of eighteen months. The goods affected included paper, wine, spirits, machinery, clothes and woollen goods. This could all be done through transferring goods from the free list to the controlled list. The Minister of Trade said, with reference to the European Payments Union, that Denmark had made explicit reservations as regards the 60 per cent rule for the liberalisation of trade, mainly on the argument that Denmark had the lowest tariffs in Europe. Furthermore the state, by indirect taxation, proposed to obtain 200 million kroner from taxes on tobacco, spirits, paper, chocolate and petrol. Even with the new taxes, these goods would be cheaper than in Great Britain.

When the four democratic opposition parties (the Communists not included) turned the Government's complex of bills down, it was, of course, not from the same motives. But all parties agreed that the Government's economic and financial policy had been confused. During the last six months, the Minister of Trade had one week given a very rosy picture of Denmark's economic situation, promising the population that it would find prosperity just round the corner, while the Minister of Economic Co-ordination the following week had nothing to offer but new sufferings.

The election campaign's two major subjects will be the increase of defence and the economic policy. The opposition parties object to the transfer of goods from the free list of imports to the controlled list. They want, on the contrary, the free list to be extended. The Social Democrats reply that, if imports are not checked, it will soon be necessary to reintroduce rationing of several goods. (Today, only butter, margarine, sugar and coffee are rationed.)

Hr Hedtoft's Government took office in November, 1947, after the elections in October the same year. Normally, fresh elections would not have been held until October, 1951. Now they have been brought on prematurely, but there is no doubt of the importance of the disagreements that have caused this, disagreements on which both the country and Denmark's allies will welcome the opportunity of a clear-cut decision.

THE BUSINESS WORLD

Retirement and Taxation

THE first question that any businessman or employee asks today when he is confronted with a change in his circumstances is likely to be simple and cynical: "How do I stand for tax?" An article in *The Economist* a fortnight ago claimed for the British tax system that it was as equitable as ingenuity could make it. But there are still great differences in the treatment of different tax-paying subjects. It has been said that Schedules D and E of the Income Tax are not two different schedules, but two different taxes. The man who enjoys a high gross income from industry or the City can enjoy the pleasures of "clean boot farming" and pay less surtax. Employed persons can save for their retirement out of untaxed income; the self-employed professional man cannot do so. It is this last question that provides Mr J. Millard Tucker, KC, with part of his second task of inquiry, to which the Chancellor of the Exchequer referred in his Budget Speech. The committee* is to review the treatment for income tax of superannuation and pension fund schemes. It is also asked to consider whether further tax relief should be given for payments made by individuals for retirement or for their dependants after death—that is, the committee will pay special attention to the position of self-employed persons and others not at present covered by a pension scheme.

There are thus two separate points for the committee to consider. The first is to review the present tax law governing voluntary and contractual pensions schemes; this law is complicated, inconsistent and arbitrary. The second is to seek remedies for the long-felt grievance of professional men and self-employed persons who enjoy no opportunity to share in the considerable tax advantages of pension schemes, and must struggle as best they can to save out of taxed income—which means in many cases no saving at all. For employed persons, the burden of providing maintenance after retirement has been largely lifted by the great development in this generation of "retirement benefit schemes," as they are known to the Finance Acts. These are now part of the normal pattern of remuneration and conditions of service for great numbers of wage and salary earners.

It cannot be said that income tax principles have kept pace with the rapid development of such schemes. Three groups of specific provisions in the tax statutes govern retirement benefits for employed persons. Section 32 of the Income Tax Act, 1918, grants life assurance relief for sums deducted from remuneration to provide for a widow or dependant; such relief is not limited to the normal life assurance relief of two-fifths of the standard rate of income tax on the premiums paid, but is granted at one-half the standard rate for incomes up to £1,000, at three-quarters between £1,000 and £2,000, and at full standard rate for incomes above £2,000. The allowance is limited to tax on £100 a year for contributions for a widow's pension. The second set of provisions is found in Section 32 of the Finance Act, 1921, and in the regulations issued under that section; these deal with the tax treatment of funds held in trust to provide pensions, and provide that the investment income of such funds is exempt from tax, that contributions are mainly exempt, and that all payments from the fund are taxable in the hands of the recipients. The third group consists of the complicated provisions of Sections 19 to 23 of the Finance Act of 1947; these deal—or attempt to deal—with the case of retirement benefits provided by employers, as distinct from benefits towards which the employee makes a contribution, and their main intention was to prevent employers from paying large annual contributions to provide tax-free lump sums to employees.

It is impossible to trace any consistent taxation principle in these various attempts to deal with different facets of employees' pension schemes. Anomalies and inequities abound. Here are some examples:

(1) An employee's contribution towards a widow's pension is not allowed for surtax. But the same employee's current contribution towards his own old age pension under an approved scheme within the 1921 Act may be deducted both for income tax and surtax.

(2) An employee's contribution towards a lump sum benefit in a provident fund is not deductible for tax purposes but an employer's contribution for the same purpose is deductible. If the employer's contribution exceeds £100 a year or 10 per cent of the employee's salary and the scheme is not confined to persons receiving less than £2,000 a year, the contribution is taxed as income of the employee for income tax and surtax.

(3) An employee's contribution to a life endowment policy obtains life assurance relief at two-fifths of the standard rate. An employer's contribution for the same purpose is tax free. If the employer's contribution exceeds £100 a year or 10 per cent of the employee's salary and the scheme is not confined to persons earning less than £2,000 a year, the contribution is treated as income of the employee for income tax and surtax and the employee is given life assurance relief.

(4) A member of a Statutory Superannuation Scheme—which includes most persons in central and local government employment—may receive a tax free gratuity when he retires. So can an employee of a business, provided that he has no contractual right to receive the payment; but if his terms of service entitle him to receive a lump sum payment on retirement, he is taxed on it.

(5) A member of a staff pension fund approved under Section 32 of the Finance Act, 1932, may receive a retirement benefit only in the form of pension, limited to £2,000 or two-thirds of salary after 25 years of service. He may not receive a lump sum benefit under such a scheme. But the Commissioners are prepared to approve a supplementary scheme created by the employer, at his expense, to provide lump sum benefits; these benefits are tax free provided that the lump sums do not represent more than one-quarter of the combined benefits of both schemes.

(6) A civil servant who elects to contribute to a widow's pension obtains no tax relief for his contribution, yet the pension is taxed as income when it arises.

(7) An employer can pay a voluntary pension of unlimited amount. He may deduct the payment as a business expense and the pensioner pays tax on it. But if the employee has a contractual right to receive a pension and the pension is considered to be excessive in comparison with his salary and length of service, a notional annual premium has to be calculated that would purchase that pension (or such part as the Commissioners deem to be excessive) and the employee is taxed on it during his service. He also pays tax on the pension when he gets it.

(8) The investment income of a pension fund approved under Section 32 of the Finance Act, 1921, is exempt from tax. This applies also to Friendly Societies and Trade Unions that pay annuities not exceeding £104 a year. The investment income of all other pension and provident funds is taxed.

*

The tax regulations are thus full of anomalies and contradictions because piecemeal legislation has been grafted on an Income Tax code designed long before retirement benefits began to be developed. Hence the committee's first problem is to settle the tax principles that should govern the treatment of pension schemes for employees, on the footing that they confer deferred remuneration for services and that tax should be paid once only on the income accruing to or set aside for the employee. To achieve this broad purpose, two alternative courses can be followed. The first would be to exempt the cost of building up the benefits, by allowing all contributions, whether annual or capital sums, as deductions from taxable income and by exempting from tax any investment income of the fund; then, all benefits whatever their form would be taxed when they fall due, so far as they exceeded the tax allowances of the recipients. The second would be to tax all the costs of building up the benefits, and then to exempt the benefits when they arise. The two principles are mutually exclusive, in the sense that the use of one rules out the use of the other for a particular form of benefit, though it would still be possible to apply one principle to one type of benefit and the other to another type.

The adoption of either principle involves difficulties in treating lump sum contributions or payments, since lump sums are normally outside the scope of the income tax. To adopt the first principle—that is, allowing as deductions from taxable income all costs of providing benefits and taxing all benefits as they arise—would mean permitting tax allowances in respect of lump sums contributed to pension funds, exempting the income of the fund from tax, and taxing lump sum benefits (as well as annual benefits). To tax lump sum benefits fairly, they would have to be treated not as a single payment (vulnerable to the highest scales of tax applicable in that particular year) but as a benefit to be enjoyed during a period of succeeding years and subject to tax at an average rate appropriate to such a period. The contrary principle would involve taxing all contributions to pensions funds and premiums for life assurance, and exempting all pensions and annuities, as well as lump sum benefits from provident funds and endowment policies.

To state these principles in general terms is easy. But the tax exemptions that now exist have acquired a sanctity of usage, and their restriction or cancellation would cause a good deal of outcry, even if existing contracts were fully protected. Yet it would seem illogical to ask for the rationalisation of the tax treatment of retirement benefits and at the same time to insist on the retention of a particular form of exemption that could not be justified by reference to principle. For instance, it seems to be inconsistent to deny to civil servants the right to deduct contributions to a widow's pension from their taxable income, but to insist on taxing the pension when the widow receives it. But is it consistent to let their leaving gratuities escape tax? Some underlying principles of tax treatment are clearly needed, but they can hardly be rigidly applied to the exclusion of social justification. For instance, pure logic would lead to the withdrawal of tax relief for endowment assurance premiums, since the benefits of maturing policies are untaxed; in this case, insistence on a tax principle would obviously have to give way to the social desirability of encouraging thrift and personal provision for personal security. The important point is that any deviation from principle should be justified on other sufficient grounds.

If underlying principles can be laid down for retirement benefits of employed persons, the work is then half-done for other persons. Controlling directors of companies are treated by the 1947 Finance Act more as proprietors than as employees, and an assimilation of the tax treatment of employed persons and other persons in connection with retirement benefits would automatically remove the existing prejudice against controlling directors. For self-employed persons, taxation is so high that it is quite impossible for them to save for retirement or for dependants. This would surely justify the conclusion that the income tax principle that requires saving to be made out of taxed income should be lifted to enable a proper amount of saving for retirement or dependants—and no more—to be made tax free. If such relief is to be given, it would no doubt have to be limited to provisions for sustenance in old age and for dependants during their dependency, but it could be extended generally to the rentier, the professional man, the business proprietor, and to the unprotected employee.

No formidable technical difficulties appear to stand in the way. The insurance industry could provide cover at a cost governed by prevailing rates of interest and mortality experience. The tax allowance could be granted by deducting premiums from gross income for tax purposes, making it allowable for surtax as well as income tax. Some limitations of benefit would, however, be necessary, because there would be no automatic check such as can be applied in cases where the employer himself bears the cost of retirement benefit in whole or part. Five limitations suggest themselves. First, benefit should be in the form of a taxable annuity. Secondly, the benefit should not mature until a normal age for retirement, with suitable relaxation for earlier retirement caused by ill-health; a dependent pension should not mature until the death of the provider. Thirdly, the benefit should cease on death in the case of a pension; a dependent benefit should cease when dependency ends—on the re-marriage of the widow or the attainment of employable age by a child. Fourthly, the benefit should be non-commutable and non-assignable. And fifthly, the benefit should not be excessive in comparison with the income of the provider.

This last condition is the most difficult to define in terms of annual premiums, because the period over which the benefit is accumulated may be shorter than the working life of the provider, and his income may fluctu-

* The members are:—Mr J. Millard Tucker, KC (chairman), Mr W. S. Carrington, FCA, Member of Council of Institute of Chartered Accountants; Sir John J. Cater, late Chief Inspector of Taxes; Mr H. Weston Howard, CBE, Chairman of Hayward-Tyler and Co. Ltd.; Mr George Woodcock, MA, Assistant General Secretary of the TUC; Mr R. C. Simmonds, FIA, Past President of the Institute of Actuaries and Past Chairman of the Life Offices' Association.

ate considerably during that period. Some limit of premiums in relation to annual income seems to be required—perhaps one-sixth, including life assurance premiums and state pension contribution—and also some maximum amount—perhaps five hundred pounds in any one year. In broad effect, the need is to defer income from working years to the years of retirement. Whether the benefit is in the form of an annuity (where some outside party underwrites the risk of death) or in the form of capital (which the beneficiary must spread over his remaining life) is immaterial provided that no capital remains at the date of death, and provided that any payments in the form of capital sums are taxed at the rate applicable to the annuities that they could purchase.

These are no more than broad suggestions towards resolving the technical tangles of taxation on pension schemes. If the new Tucker Committee succeeds in producing a consistent scheme of tax treatment for such schemes that would remove the present anomalies, and is able to extend their advantages to persons other than employees, it will earn the gratitude of employed and self-employed persons alike.

Industry's Assets

REASONS were given last week for questioning the comfortable assumption that the cost of rearmament can be found from a continued expansion of industry's productivity during the next three years. If it can be so covered, it will be due in no small part to the expanded scale of investment in new fixed assets during the past year or two. Broadly speaking, the growth of productivity in industry is particularly marked in those sectors where new capacity was laid down during and since the war, though to this generalisation (as to all others concerned with industrial productivity) there are significant exceptions. It is not a simple matter to measure the extent of industrial investment in new fixed assets. The official estimates in the "Economic Survey" examine the projected programmes of a number of basic industries that are directly or at one remove subject to some form of governmental supervision, but they rightly include a large margin of several hundred million pounds for new investment schemes that are likely to be undertaken by miscellaneous industries on their own initiative. These estimates, moreover, are concerned with projected expenditure, and circumstances may alter the shape and size of many schemes before they are completed.

Nor, unfortunately, are the balance sheets of industrial companies as complete a guide to the facts about new industrial investment as could be wished. Indeed, it is now clear that one of the important gaps in the 1948 Companies Act (so far as the economist and student of industrial finance is concerned) is the lack of any obligation on the part of companies to state unequivocally how much they have spent on new capital outlays during each accounting period. The nearest approach to such a figure is to compare the gross book values of fixed assets in successive accounting periods, and to have regard to movements in the total amounts set aside for depreciation. This method does not give perfect results. Fixed assets may be increased in a company's group balance sheet because it covers an increased number of subsidiaries, and not because of any physical increase in buildings or plant. And the year-to-year movements in depreciation provisions are nowadays so dependent upon directors' decisions in the matter of treating initial allowances in their accounts that they are often hard to explain. These reservations, and others besides, must be kept in mind in examining the movement of the fixed assets of the 917 companies whose reports appeared in the second quarter of this year. This group of companies represents about one-third of the total number whose reports are analysed each year by *The Economist*. The figures given in the accompanying panel show that the gross book value of their fixed assets has risen during the past year by a tenth from £1,401 million to £1,537 million; their accumulated depreciation provisions have also increased by about the same proportion, from £406 million to £446 million, and net book values are up from £995 million to £1,091 million.

An increase of one-tenth in the physical framework of British industry in a single year would be an astonishing achievement; but that is not the meaning that has to be attached to these figures. All new investments in fixed assets has to be shown in company balance sheets at cost, but the Companies Act allows assets existing before July, 1948, to be shown at cost, less accumulated provisions, or at net book value, or at valuation. These various methods of treatment make it impossible to compare the rise of gross and net book values of assets with the original figures. All the figures have a pound sign in front of them, but the pounds used to measure recent increases in assets are very different from those used in stating the bulk of existing assets in industry's books. The fact remains, however, that these companies — and they are a representative cross-section of British industry — have expanded their fixed assets in a single year by £136 million, and this represents an appreciable slice of the total outlays on new industrial plant and buildings contemplated in the Government's economic planning for 1949. It is, of course, to that year that the figures mainly relate, for the notional accounting year that they cover ended in January last.

MOVEMENT OF FIXED ASSETS (£'000)

Group (and No. of Companies)	Previous Balance Sheet: Fixed Assets	Previous Balance Sheet: Depreciation Provisions	Previous Balance Sheet: Net Book Value	Latest Balance Sheet: Fixed Assets	Latest Balance Sheet: Depreciation Provisions	Latest Balance Sheet: Net Book Value
Food and confectionery (52)	60,565	20,361	40,204	66,128	22,422	43,706
Tobacco (10)	31,021	12,218	18,803	37,394	13,342	24,052
Building (47)	63,679	32,359	31,320	72,725	37,130	35,595
Engineering (73)	62,357	23,904	38,453	71,538	27,687	43,851
Iron and steel (30)	157,685	51,142	106,447	175,948	59,700	116,248
Chemicals and paint (28)	150,297	51,691	98,606	179,854	58,058	121,796
Electrical manufacturing (20)	52,248	24,859	27,389	58,550	27,885	30,665
Motors, cycle and aircraft (27)	55,556	29,361	26,195	61,626	32,440	29,186
Miscell. manufacturing (105)	123,994	55,106	68,888	135,337	56,214	79,123

Approximately £100 million of these capital expenditures were undertaken by nine industrial groups, whose separate figures for fixed assets and depreciation provisions are to be found in the second table; gross book values have increased from £757 million to £859 million. (Complete figures for over thirty groups are given as usual in the *Records and Statistics* Supplement.) These groups happen to include several of the industrial giants —Unilever in "Food and Confectionery," British American Tobacco, and Imperial Chemical Industries—but they are none the less representative for that. The progress of major schemes of industrial equipment is reflected in gross additions to fixed assets of over £18 million by iron and steel companies reporting last quarter and of no less than £29½ million for chemicals. Miscellaneous manufacturing industries have increased their fixed assets by nearly £11½ million, building and engineering by £9,000,000 each, and electrical manufacturing, tobacco and the motors, cycle and aircraft groups by about £6,000,000 each. Of the total increase in fixed assets, roughly one-third has been written off in the latest year, for accumulated depreciation provisions have been raised from £301 million to £335 million. But the individual provisions for depreciation vary rather widely—for instance, the engineering and electrical groups seem to have provided reserves last year against half of their new expenditure, whereas the chemical group's write-offs represented less than a quarter of its new outlays. Such comparisons cannot be pressed too far, and they are likely to be modified by movements in capital and revenue reserves.

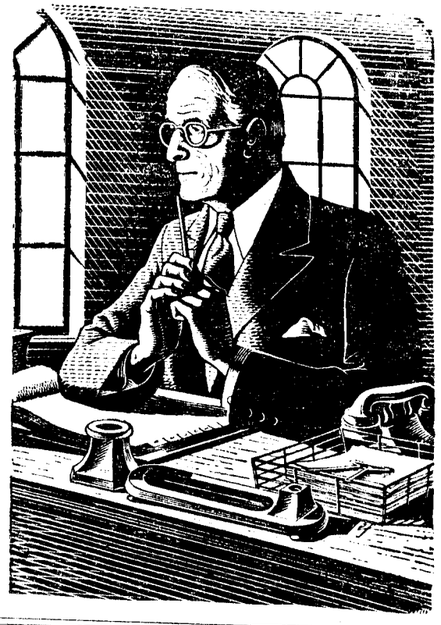
For the 917 companies whose summary balance sheet is set out in the panel, such capital reserves increased by £52 million during the year, and revenue reserves by £81 million. Together with a significant increase in issued loan and share capitals (£56 million) there was thus an expansion of the long-term resources of these companies as a whole of £189 million, well over half of which has been applied in the expansion of net fixed assets. The remainder has been required (together with an increase of £44 million in current liabilities and provisions) to finance an increase in current assets of no less than £130 million. Here the key fact is the increase in stocks (£57 million) and in debtors (£48 million). The behaviour of prices since the beginning of the year has removed all fears about the possible consequences of a fall in stock values; indeed, on present indications, company profits during the coming year are bound to be considerably augmented by so-called "inventory profits." It is to these profits (after the tax collector has taken more than half) that industry must look for the main part of the new resources that will be required to finance the higher cost of its inventory holdings. And apart from this need for current finance, there are still large investment programmes awaiting completion and permanent finance. Hence it is probable—given favourable market conditions—that the recent flow of industrial debenture issues may continue in the autumn. The relatively recent emphasis on such industrial borrowing finds a certain reflection in the rise of £16½ million in the debenture capital of these second quarter companies. Given the relatively high cost of new ordinary capital, and the inhibiting effects of Profits Tax on equity and preference share issues, it is likely to become more marked in future.

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in

INDIA PAKISTAN CEYLON BURMA KENYA ZANZIBAR UGANDA TANGANYIKA and ADEN

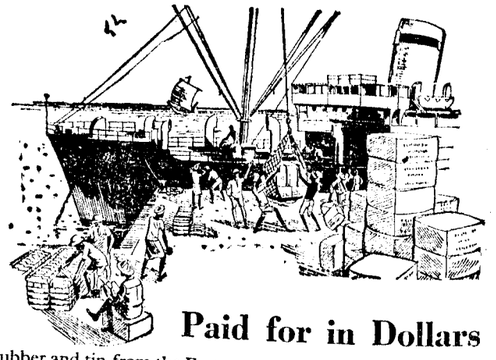


NATIONAL BANK OF INDIA LIMITED

Head Office: 26 Bishopsgate, London, E.C.2.

Banking is his business

For advice and help in matters of personal or business finance you should see the Manager of your nearest branch of Barclays. Banking is his business and it is a business he thoroughly understands. His experience can help to clarify complex problems and to solve your particular worries. But please do not wait for difficulties to arise before finding out what Barclays can do for you. An enquiry made today may provide tomorrow's answer and save you much unnecessary worry—and your enquiries will be most welcome at any of our branches.



BARCLAYS BANK LIMITED

"They tell me Brown's retiring next month."

"Lucky chap to be able to afford it!"

Not lucky, really — just sensible. He had a Scottish Temperance Personal Pension Policy easily paid for from his annual income. Now he will enjoy a reasonable standard of living in his retirement. Write for further details to the Scottish Temperance and General Assurance Company, Ltd., Dept. N, 109 St. Vincent Street, Glasgow.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners—there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

The Chartered Bank of India, Australia and China

(Incorporated by Royal Charter in 1853)

HEAD OFFICE: 38 BISHOPSGATE, LONDON, E.C.2.

Manchester Branch: 52 Mosley Street, Manchester, 2. Liverpool Branch: 27 Derby House, Exchange Buildings, Rumford Street, Liverpool, 2. West-End (London) Branch: 28 Charles II Street, London, S.W.1. New York Agency: 65 Broadway, New York.

The Bank's branch system, under British management directed from London, serves

INDIA · PAKISTAN · CEYLON · BURMA · SINGAPORE AND FEDERATION OF MALAYA · NORTH BORNEO AND SARAWAK · UNITED STATES OF INDONESIA · INDO-CHINA · THAILAND · THE PHILIPPINE REPUBLIC · HONGKONG · CHINA · JAPAN

Business Notes

The Rise in Gilt-Edged

An unexpected but outstanding feature of the stock markets during the past week has been the increasing and quite pronounced firmness of gilt-edged securities. Since Wednesday of last week these have advanced day by day, culminating in rises of up to $\frac{5}{8}$ on Wednesday of this week, and bringing the week's gains in some stocks to as much as $1\frac{1}{4}$. Significantly, this gain was scored by one of the longest stocks in the market—the 3 per cent British Gas Stock 1990-95, now quoted at $90\frac{1}{8}$. The ground had been prepared for this advance by the calmness of the investing community's response to the Korean bombshell. Only in a few stocks did the impact knock more than two points off the pre-Korean prices—and most of this decline was due to the jobbers' precautionary marking-down of prices rather than to any general pressure of sales. Thereafter, several weeks of narrow markets and minor price changes seemed to confirm that, despite the day-by-day pronouncements on defence plans and possibilities, there was little danger that the public would be stampeded into a rush for liquidity.

Meanwhile, first impressions about the probable effects of world rearmament suggested that, thanks to American buying in the world markets, Europe's dollar problem will be, if not solved, at least deferred to an indefinite future. On top of this came the argument that, if the Government now faces a long phase of rising defence expenditure leading to deficit-financing, it may wish, as in 1939/45, to borrow on comfortable terms and will prime the gilt-edged market accordingly. With all these reflections in mind, investors began to take heart afresh, and some of the institutions quietly resumed their pre-Korean policy of extending the average life of their portfolios.

Interest Rates and Defence

The authorities, moreover, have not been slow to take advantage of these conditions. In the very thin market that obtains at present, even moderate buying exerts a perceptible effect, and the Departments seem to have been deliberately accentuating it. There is no evidence that they have been net buyers, but the Govvernment broker has made his presence very definitely felt—mainly by switches that, so far from being complementary to, have often competed with those of the institutions. In particular, there has been a tendency to dry up still further the limited supplies of the longer-dated stocks. This apparently mainly explains the week's good gains in Transport and Gas stocks, and the rise in the premium on the new partly-paid BEA stock (1976/79) from $\frac{15}{16}$ to $1\frac{1}{4}$ points—a quotation that compares with $1\frac{5}{16}$ on the eve of the Korean assault and with $\frac{1}{8}$ in early July. This comparison, however, is not quite typical of experience in other stocks over the whole period: Gas and Transport stocks are just back to their pre-Korean prices, but other stocks in this section of the market still show small net losses.

Although the recent strength of the market can be thus explained, it cannot be regarded as an entirely rational movement. The activities of the Government broker have, of course, had a psychological effect transcending their direct effect, and have been widely interpreted as confirming the hypothesis that the authorities are planning, even thus early, to return to former techniques of managing the market. This assumption surely takes a great deal too much for granted. In the first place, there is no evidence yet that the actual scale of defence expenditure can become really formidable in the early future, and—in the absence of a new and greater emergency—would be unlikely in any case to be strongly felt before well into 1951. Apart from this, there is at the moment a more serious flaw in the City's line of argument. So long as the Government adheres to its present clearly indicated approach to the defence problem—a "business-as-usual" approach, with the *minimum* of new controls and emergency measures, no retrenchment and no special budget—any additional defence outlay is bound to aggravate the underlying strains upon the nation's capital account and to increase the inflationary pressures. The more reluctant the Government is to depart from this attitude, the stronger will be the case for allowing interest rates to play some part in exercising restraint, and the more hazardous will it become to pursue the opposite gilt-edged policy of trying to force rates down—for this can be done only by new creations of credit that will feed the fires of inflation.

The Winter's Coal

Lord Hyndley's appeal to the miners to start their autumn production drive a month sooner than usual is undoubtedly needed. Experience has shown that the miners can be relied upon to produce more coal in the last quarter of the year than at any other time, but the extent of their autumn effort is never fully predictable. Last year they saved the situation by a sustained effort as unexpected as it was welcome. But there were then 20,000 more miners in the pits than now. Unless the reduced labour force responds even better to appeals this year, the unpleasant choice will have to be made between cutting remunerative exports and facing the winter with what are considered dangerously low stocks. Responsibility for that decision would lie less with the Coal Board as the producer than with the Board of Trade, which negotiates the trade treaties under which coal is exported, and the Ministry of Fuel, which is concerned with the country's stocks.

In the Economic Survey it was estimated that coal production would be between 218 and 223 million tons and home consumption between 199 and 201 million tons, leaving 19 to 22 million tons for export. Both production and consumption are running within the margins allowed, but production is at the lower end of the estimate and consumption at the upper end. Figures for output up to August 12th show that 131,465,300 tons of coal had been

produced, only 1.7 million tons or less than half a week's output more than in the same period last year. By August 5th consumption had reached 131,725,000 tons of which 11,563,000 tons were exports and bunkers. This is 4,900,000 tons more than in the same period last year and exceeds the production increment by 2,866,000 tons.

Comparisons made at this season of the year tend to give an unduly pessimistic picture because it is in production that the seasonal fluctuations are the greater, and the trough of the holiday season is hardly over yet. Another unknown factor in the stock position is the extent to which householders may have taken advantage of the reduced summer coal prices. Still, the position is clearly not bright, and the continuing fall in manpower in the mines may tend to aggravate it further. This fall has not yet been checked by the influx of juveniles that is expected at the end of the school year. There have been suggestions that the call-up of certain classes of reservists to the forces has taken face-workers from the mines in recent weeks. This, if true, is disturbing even though the numbers so far involved are small. The Coal Board has lately as a deliberate policy been relying less on wholesale recruitment than formerly, and more on improving the effectiveness of deployment at the coal face of its existing labour force. There may be some danger that withdrawals of men for the forces may introduce an incalculable element that will upset the production plans. Some reassurance seems to be needed that the Government is aware of this danger.

Argentina Bets on a Boom

Argentina's confidence that a new world inflation is about to pull its economic chestnuts out of the fire found some small reflection this week in the announcement that a sum of 30.8 million pesos is to be made available for purchasing new railway equipment in London—and for paying at long last for railway equipment already received. It is impossible to say how much sterling this 30.8 million pesos represents. If it is converted at the remittance rate of 25.25 pesos to the £, it amounts to about £1,200,000 ; if converted at the Government import rate of 10.45 pesos, it would be about £2,950,000. The probability is that Argentina will pay as little sterling as it can consonant with its need to buy new equipment to keep its railways running in good order. The same criterion of short-term advantage is likely to influence its decision whether to pay off other portions of its outstanding £15 millions of commercial debt to this country—as and if its imports from the sterling area mount. Argentina's lack of any sense of obligation in such matters was shown anew last week when a Bill was suddenly slipped through the Senate raising the profits tax imposed on foreign companies (many of which are long-standing creditors of Argentina) from 24 per cent to 30 per cent ; at the same time profits tax imposed on Argentine companies was raised from 15 per cent to 24 per cent. The precise incidence of the tax on British companies trading in Argentina will, of course, be affected by the relief they gain under the double tax concessions in the last Finance Act ; but they are likely still to be appreciably out of pocket.

The background to Argentina's resurgence of confidence —and therefore its resurgence of chauvinism—was clearly seen in a recent decree authorising the Ministry of Technical Affairs to resume publication of trade statistics now that "the country's fight for economic independence has been won." (Freely translated, this means "now that the statistics do not make such a bad showing.") The Ministry's statistics purported to show that Argentina had a trade surplus of 259 million pesos in the first four months of this year compared with a deficit of 486 million pesos in the same four months of 1949 and a deficit of 928 million pesos in 1949 as a whole ; they suggested, moreover, that Argentina was in viable surplus with both the United Kingdom and the United States. In view of the odd things that can happen to Argentine trade statistics in the course of their translation from foreign currencies to peso values, these figures must be treated with reserve. The fact that publication has been resumed, however, suggests that the Argentine Government is optimistic about its future trade prospects. The same optimism, incidentally, has now induced neighbouring Uruguay to follow Argentina's lead in suspending meat shipments to Britain until the dispute about prices is settled.

* * *

Aircraft Production in the Commonwealth

The announcement that the newest British fighter (which is thought to be the fastest in the world) is to be built in Australia under licence from the Hawker Aircraft Company, is the latest development in the dispersal of aircraft production over the Commonwealth. There are three aircraft companies in Australia. One is a subsidiary of de Havilland and is primarily concerned with producing Vampires. The second is the Commonwealth Aircraft Corporation, in which Rolls-Royce recently bought a minority interest. It is here that the new fighter, the P.1081, is to be built. CAC are already building Rolls-Royce Merlin and Nene engines under licence ; the Nene is used in the Vampire fighters from the de Havilland factory and will go into the new fighter as well. Production of Avon engines will start soon. The third plant is operated by the Australian Government's Division of Aircraft Production. The Canberra jet bomber will be built here and will use Avon engines from the CAC factory.

The slow progress in Australia reflects the difficulties of a dispersal policy when no pool of appropriate technical skill exists in the districts chosen. Although aircraft were built in Australia during the war in considerable quantities, the majority were, and still are, made to designs licensed from British and American manufacturers. No team of designers has emerged of the calibre of those discovered in the Hawker Siddeley group's new company in Canada. The military aircraft under development in Australia since the end of the war are only now approaching the stage when their first flights can be expected. The production of engines can be handled in stages. Rolls-Royce, who have considerable experience now in training foreign engineers, have men from the licensee companies working in their factories in Britain for eighteen months. When they return, work starts on assembling components sent from Britain. Only in slow stages does the factory take over the entire construction of the engine. The building of airframes cannot be handled in this manner and it is almost certain that Hawker engineers will have to go to Australia for the building of the P.1081, even though Australian engineers have been working in Hawker's factories, as they have in the English Electric factories building the Canberra. It has always been intended to build the Canberra in Australia, as its name suggests, but it is unlikely that either will actually be produced for a year or two. The position at the moment is that the Australians have a considerable engine manufacturing potential without the airframes in which to fly the engines. Delays in getting into production mean that only the most advanced types of aircraft are worth undertaking. This in itself presents difficulties ; advanced types tend to need modification with experience, and such modifications may be difficult to carry out when the parent company of the design is far distant. It is also unlikely that the aircraft can be produced in these conditions as cheaply as they can by quantity production in Britain. The average cost of a Meteor fighter is now about £30,000 ; cost cannot be ignored. For such reasons the extension of aircraft construction to New Zealand or South Africa seems unlikely.

We've solved some problems in our time!

TIME—1939 : PROBLEM—the magnetic mine. The answer came quickly: sweep with a loop of cable carrying heavy impulses of direct current, thus generating a magnetic field to detonate the mines. But the means ? Every available mine-sweeping trawler must be fitted *at once* with batteries capable of enormous output—3,000 to 4,000 amperes at 150 to 200 volts. That was Chloride's part of the problem.

¶ The trawlers got their equipment. Car batteries by thousands, with new connections hurriedly burned in to put the cells in series-parallel, provided each ship with a fearsome make-shift battery of 1,134 cells. Later, our special 400 volt mine-sweeping batteries, designed for the job and produced in very great numbers, made sweeping safer and more certain. But the magnetic mine, as a decisive weapon of war, was already beaten—by brave men and a battery that looked like an ' electrician's nightmare.'

¶ For over 50 years we have been designing & making special types of Chloride, Exide and Exide-Ironclad Batteries for every branch of industry, transport and communications. Our battery research and development organisation, the largest & best equipped in this country —if not in the world—is at industry's service always: ready at any time to tackle another problem.

Trends in Dollar Exports

The threatening strains of competition for defence production have not, of course, yet begun to impinge upon Britain's exports. The latest figures show that the export drive maintained its momentum during July. Total exports for the month reached £182 million—£6,000,000 more than in June, £40 million more than in July, 1949, and £12½ million above the monthly average for the second quarter of this year. The month's imports, provisionally valued at £225 million, equalled the monthly average for the second quarter of this year but were £38½ million more than those of July last year. For the first seven months of this year the excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) was £257 million compared with £239 million in the corresponding period of 1949. The sharp rise in the cost of imports has thus tended to mask the success of the export drive as far as the overall balance of payments is concerned, but the expansion in exports to dollar markets in recent months has certainly been encouraging. Last month's exports to the United States were valued at £11.3 million an all-time record, while exports to Canada (£10.5 million), though not a record, were above the average for the second quarter. This, no doubt, has been partly attributable to the efforts of the Dollar Export Board, the third of whose series of practical guides to the dollar markets, dealing with capital goods, was published this week.

* Provisional.

A comparison of British exports to the United States and Canada in the first half of this year with those in the same period of 1949 and 1948 shows a considerable change in the detailed pattern. Total exports to the United States amounted to £45 million, or 64 per cent more than in 1949 and 33 per cent more than in 1948. To maintain their dollar value at the level ruling before devaluation, an increase of 44 per cent was required; thus it appears from these figures that dollar earnings from exports this year have risen appreciably above last year's level but are not yet back to that of 1948. Exports to Canada have also shown an increase in dollar earnings whether reckoned in Canadian or American currency. The half-year's total of £57 million was 45 per cent larger than in 1949 and 78 per cent larger than in 1948.

Whisky is still Britain's largest export to the United States, though its increased value has been almost entirely due to its higher sterling export price. Vehicles, however, are no longer second on the list; their place has been taken by wool textiles, which this year amounted to £4,100,000 against £6,900,000 for whisky and spirits. Strangely enough, woollen tissues have surpassed worsteds in both value and quantity. The quantity of wool textiles shipped to the United States this year was almost double that of last year. Textiles other than cotton form the third most important export; the volume of linen exports, the largest single item of this group, has this year been running at 80 per cent above its 1949 rate. Vehicles now come fourth; their sterling value is only 10 per cent larger than last year and still appreciably below the level of 1948. Among the less important groups, pottery, leather manufactures and apparel were larger than in either 1949 or 1948; cotton goods and chemicals, though higher this year, are still below their level of 1948.

* * *

Canada takes more Motorcars

The pattern of exports to Canada has also changed materially. Vehicles are now by far the outstanding group, accounting for nearly 30 per cent of the total; previously they were second to wool textiles. During the past year the sterling value of these exports has more than doubled, while the number of motorcars shipped to Canada has increased threefold. The trend, moreover, has been fairly steadily upwards during the past six months. Exports of each of the textile groups other than apparel have declined, and were smaller than in 1948. Cotton piece goods, for example, which have been declining for the past two years, were this year 50 per cent smaller than in 1949. Shipments of woollen and worsted tissues have also declined, but not so markedly, while those of carpets have increased. Machinery exports have almost doubled and are now the third largest group, while exports of iron and steel manufactures have more than doubled; they now rank equally with pottery for fourth place. Machine tools and textile machinery are the main items in the machinery group but practically all sections have expanded during the current year. Among iron and steel manufactures the main items are tubes, plates, heavy sections and rails, for which there seems to be more than a temporary demand.

This new pattern of trade with the dollar markets deserves close scrutiny in the light of Britain's rearmament programme. Canada has hitherto been Britain's chief dollar market, with the United States second, and this order is not likely to be permanently changed by the fact that in July exports to the United States were the larger by a small margin. Whereas the United States demand is becoming focused upon consumer goods—in the first six months of this year, these comprised 65 per cent of Britain's exports to the United States against 55 per cent in 1949—British trade with Canada is increasingly taking the form of capital goods, particularly vehicles. The proportion of consumer goods out of total exports to Canada fell from 58 per cent last year to 43 per cent this year. If large-scale rearmament means a reduction in the output of vehicles, exports to Canada might be affected. British cotton goods were competitive in Canada last year because for a limited period they enjoyed a lower tariff. But it would require a most determined effort to make Canada a large-scale market for British consumer goods.

Ups and Downs in Tin

The equivocal position of the tin market, dependent for its spot supplies on releases from Government-held stocks, has been vividly demonstrated during the past week. After the Government broker's announcement (reported in last week's issue) that the tin market could no longer rely on the Ministry of Supply's stock for cash supplies there was a complete dearth of spot tin. Since November when dealings in tin were resumed in London, the market had been content to let the Ministry bear the risk of carrying stocks. This policy was certainly convenient so long as cash tin was being released. As soon as those supplies were stopped the market was faced with the problem of trying to cover short positions and the price rose very sharply. Last Wednesday week, the London spot price was quoted at £762 a ton and three months' delivery at £752½. By Tuesday this week the price had risen to £838 a ton—a record price—and backwardation had disappeared. The New York price rose during the same period from 101½ cents a lb. to 108 cents. On Thursday, however, one smelter which hitherto had sold directly to consumers placed 65 tons of tin for cash on the market. That offer, coupled with hints that the Ministry of Supply might be willing to help brokers to cover a short position, caused the spot price to drop by £91 to £744 a ton in the morning session. A slightly firmer tone was evident in the afternoon and the market closed at £767½ a ton.

In the first six months of this year, world tin production has been provisionally estimated at 83,000 tons and consumption at 70,500 tons, leaving a surplus of 12,500 tons. The surplus for the full year might thus be of the order of 25,000 tons against 50,000 tons last year when production reached 168,800 tons and consumption 118,400 tons. If American purchases for the stockpile are put at 20,000 tons for the current year, the actual increase in producers' stocks will, indeed, be small. But whether the prospect of such a small increase in supplies would justify the maintenance of even the present price of tin for any length of time is another matter.

* * *

Unsettled Rubber

Rubber prices are still feverish. A fortnight ago, the London price touched 4s. 2d. a lb.; last week it was down to 3s. 9d. and at close of business on Tuesday it had fallen to 3s. 1d. a lb. A steadier tone then developed and by Thursday the price had risen to 3s. 3½d. At 4s. a lb., it was obvious that the market had overreached itself. Certainly the statistics of production and consumption given on page 333 of last week's issue strongly suggested that rubber was too dear. But the sharpness of the fall this week was not altogether foreseen. The main contributory factor was the suggestion last Monday that the American Government had decided to impose control on the use of natural rubber in the manufacture of tyres and inner tubes as from September 1st. No official announcement has yet been made, but if the "leak" was deliberately intended to bring prices down to a more reasonable level, it has certainly achieved its object.

According to American reports, consumption of natural rubber will be fixed at the level which obtained for the twelve months ending last June. That would mean an annual consumption in the United States of about 650,000 tons compared with an annual rate in the past three months of 750,000 tons. A reduction of 100,000 tons in the annual consumption of natural rubber would not spell disaster for rubber producers; the American stockpile could absorb such a quantity without difficulty, and earnings of rubber producers in the sterling area would thus be fairly well maintained. The main effect of the new control will be to ease the pressure of demand on current supplies.

Future of Iraq Oil

The announcement from Baghdad of the new agreement on oil royalties to be paid by the Iraq Petroleum Company throws useful light on the part Iraq can expect to play in the development of Middle East oil. Iraq, though its potentialities for expansion as an oil producer are vast, is of all the important Middle East producing countries the only one that showed no expansion of output between 1938 and 1949. The delay in developing these fields has been due to the need for pipelines to carry the oil to the Mediterranean coast; and it has been aggravated by the political

Vitamins

More than two thousand years ago Hippocrates, the Father of Medicine, recorded that night-blindness could be cured by eating liver. The significance of this observation only became clear during the first decade of the present century through the researches of Sir Frederick Gowland Hopkins. He established the fact that the human diet must contain minute quantities of certain substances, known as vitamins, in addition to proteins, fats, carbohydrates, salts, and water. Knowledge of vitamins is still far from complete, but their general properties are now known.

Until chemical research began to reveal their true nature, vitamins were identified by letters of the alphabet. There are two important groups—A, D and E, soluble in fats, and B and C, soluble in water. Vitamin A, which prevents night-blindness, is found in cod-liver oil, butter and liver; vitamin B, in cereals and pulses, cures beri-beri; vitamin C, in fresh vegetables, prevents scurvy; vitamin D, also found in liver oils, protects against rickets. As important as the realisation that vitamins existed was the discovery that many of them could be made synthetically. British scientists played a leading role in this vital research. The British chemical industry now makes many tons of synthetic vitamins every year, and thus has a direct influence on the health of millions of people.

ICI

folly that has kept the Haifa leg of the Kirkuk pipeline out of action in the last two years.

The Baghdad statement shows that the prospects for the Iraq fields (though not necessarily for Haifa) are now getting brighter; the government in Bagdad has estimated at £17 million the additional revenue it expects to secure from oil royalties between last January and October, 1954. The figure is only in part attributable to the increased royalty per ton that the Iraq Petroleum Company has agreed to pay. The new royalty is 6s. (gold) a ton instead of 4s. (gold). This does not mean that the royalty is paid in gold; it is paid in sterling, but in terms of the pre-1931 gold standard. Since the price of gold has gone up from 88s. a fine ounce before 1931 to 245s. a fine ounce today, 4s. (gold) now means about 12s. and the new royalty of 6s. means about 18s. a ton in sterling.

But the bulk of the increased revenue is to come from a projected increase in output to 18 million tons a year by 1954. The first step in bringing this about became effective in November, when the new 16-inch pipeline to Tripoli came into operation. This more than doubles the northern leg of the old 12-inch line. In a common-sense world the next step would be to bring back into use the southern leg of the old pipe-line (the line to Haifa) together with the new 16-inch line which has been laid alongside it as far as the border of Israel. But when will this happen? It seems entirely doubtful. The output of 18 million tons a year by 1954 can be achieved by bringing into full operation before then yet another line, the big 30-inch line which will terminate at Banias, on the Syrian coast some way south of Latakia. Deliveries of pipe for this line are to start at the end of this year, partial operation is expected by the end of 1952 and full operation by 1954. If the old and new pipelines to Haifa were brought in as well the figure of 18 million tons a year could be raised to 24 million a year by 1954. It would be absurd to suppose that the oil interests concerned are content to sink money in new pipelines while accepting passively the disuse of the existing line because it terminates in Israel. But there is no sign that the ridiculous deadlock over Haifa is near solution.

A Development Council Dropped?

The long wrangle over the application of the Industrial Organisation and Development Act to the wool textile industry appears at last to be approaching, though it has not yet reached, a happy end. For well over two years the employers in the industry have been resisting attempts by the Government to proceed with the setting up of a Wool Textile Development Council, and for the last year or more feelings have been bitter enough to make it evident that the proposed council, if the Government did insist on having it, would be a poor thing. A state of deadlock on the matter persisted through the early months of this year, but at the end of July the Board of Trade laid before Parliament an Order for a compulsory levy to be raised from the industry for export promotion. This step was occasioned by the shortage of funds for the work of the Wool Textile Export Corporation, a body that was supported during the war by a levy collected by the Wool Control but has lately been carrying on its useful work without apparent means of support.

The Order could have meant no more than that the Government wanted to make interim provision for the export corporation until the industry could be brought to heel on the larger matter. Still, it did mean that the Government had accepted the necessity of applying section 9 of the Act —the section permitting action for specific purposes in industries "for which there is no development council" —and it was understood that similar action would soon be taken under the same section for another purpose, the financing of research. Further, these measures were concerted by the Board of Trade and the industry in full agreement, and in this sector of the Government's dealings with industry agreement is a novelty that can hardly be disregarded. In the circumstances, the Wool Textile Industry (Export Promotion Levy) Order has been widely taken to mean that the Development Council project is being quietly dropped.

*

Two further steps are needed to confirm the correctness of this view. The first is an agreement between the employers and the trade unions in the industry to set up a voluntary body to take the place of the obnoxious statutory Development Council. Meetings to this end have been going on in recent weeks, and agreement in substance is now believed to have been reached in Bradford; the trade unions, though they have in the past expressed a preference for a fully-fledged Development Council, have never really objected to having a voluntary body instead. The resultant proposals have still to be formally agreed and will then have to be put up to the Board of Trade for its approval. Little doubt appears to exist, however, that the Board will now be willing to receive the proposals favourably. If these arrangements go through without any unexpected hitch there seems no reason to doubt that anything they may lack in constitutional perfection will be more than made up in regained harmony and good will.

* * *

Limited Freedom for Tea

The London tea market is to be reopened next April, but rationing, price control and the subsidising of the retail price will all continue. The framework of the scheme to be introduced was published by the Ministry of Food last weekend, and many of the details have still to be worked out. The market is to be confined to the sale of first-hand teas offered on producers' account, but the auctions will be open to buyers of tea for re-export. Merchants will not be able to buy in Calcutta or Colombo, as they did before the war, for re-sale at the London auctions. The rate of subsidy, as in the past, will vary according to the countries and districts of origin of the tea offered for sale. The different rates will be announced some time before next April and will be maintained throughout the first year. The subsidies will not come into play until after bargains are struck on the market, so that prices there should reflect world prices. A buyer of tea for home consumption will bid at a price undistorted by subsidies, but he will be invoiced at that price less the appropriate subsidy. The Ministry of Food will pay the subsidy to the broker, who will then remit the full price—as bid by the buyer—(less the usual charges and commissions) to the producer.

To fit the auctions into the present rationing scheme, primary wholesalers will be given quotas stipulating the maximum amounts they can buy from the market for home consumption. The quota will depend on the quantity of tea that the wholesaler is permitted to sell on the home market, the direct imports made by the wholesaler, the allocations made to him from Ministry of Food stocks and the amount of tea he has re-exported. As at present, maximum retail prices will be fixed for the various grades of tea.

Before the war the retail price of tea kept surprisingly steady, despite the wide fluctuations in Mincing Lane, so that, superficially, it might appear that the maintenance of price control might not be any very serious obstacle to the freedom of the market. But there is no doubt that the new system will involve greater rigidity than obtained before the war. London was always considered the "spot" market for tea, and as such its prices tended to be higher than those ruling in either Calcutta or Colombo. But now that buyers in Britain for home consumption will have to work to a rigid

ceiling price, it is possible that during the season London prices might not reflect the appropriate premium between spot and forward delivery or might even be at a discount on those in the local markets. If such a risk seems at all probable to the tea-growers, they are unlikely to consign large quantities to London. Under these conditions, Mincing Lane cannot be expected to function as smoothly as before the war, though the friction will be greatly lessened if brokers and wholesalers co-operate to the utmost. At least it will be a welcome fact that another of London's terminal markets is allowed to operate after a lapse of ten years—even though its operations will be so artificially constricted.

* * *

Cover for Converters

Until this week cotton converters have had to bear the brunt of fluctuations in raw cotton prices. When cotton prices have risen during the period of weaving and finishing cloth on order, the converters have gained, and when prices fell the converters lost. Since the war this particular trading risk has increased owing to the lengthening of delivery dates. Over any long period these windfall profits and losses may tend to balance each other out. But in any extended period of falling prices converters might be badly hit. Thus some time ago the Raw Cotton Commission approached the Cotton and Rayon Merchants' Association and the Cotton Spinners' and Manufacturers' Association to discuss the possibility of a cover scheme for converters. The agreed scheme was introduced this week.

In the discussions between the Commission and the trade two points became clear: that it was impossible for converters to keep their position balanced as the spinners do in their cover scheme, and that converters must have discretion about the transactions they cover and for what period—in other words, any scheme must enable them to take a view of the market. Thus although the scheme is similar in principle to the spinners' one, it differs greatly in detail. The converter can choose his cover, though the total amount of cover offered by the Commission is limited, and if all the requests together exceed this sum they will be scaled down. There are also provisions against what is termed "speculation": cover must be for a minimum of three months and not more than twelve months; cover must be asked for on the day on which the cloth contract is booked; a cash margin or an approved bond is required, and the Commission reserves the right to inspect the converter's record.

The procedure is that a converter, having booked an order for loomstate cloth on a particular day and wishing to cover that transaction, sells to the Commission at the forward price the weight of raw cotton equivalent to his loomstate order. When the cover matures the converter will buy back the cotton at the spot price then ruling. If, therefore, the spot price has fallen below the futures price ruling on the date on which the original order was made, the converter will get the appropriate compensation from the Commission less an administration charge of one per cent. If on the other hand the price has risen, the converter in effect pays to the Commission what he has gained.

The scheme is ingenious and the Raw Cotton Commission deserves credit for tackling a difficult problem. But at first sight it is difficult to see how the Commission will balance its books unless through the errors of human judgment. If converters were always to take a correct view of the market, the Commission would be likely to be always on the paying side. No doubt that risk has been considered.

* * *

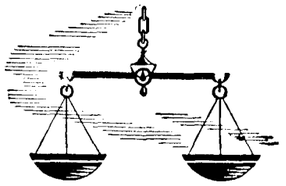
Blackburn Aircraft Dispute

Shareholders of Blackburn and General Aircraft are not in an easy position to judge between the two contesting sides in the company's boardroom. The chairman has issued one circular, and the two former managing directors have published a reply. There are gaps between the two accounts and, indeed, a number of flat contradictions. The two managing directors were removed from office because—according to the chairman's account—they declined to furnish a full report to the board on the action to be taken to avoid losses; this is denied by the managing directors, who say that they submitted a report which was accepted. They also complain of interference by the chairman, and of failure to provide information about the Dumbarton subsidiary for which they had asked. Equally confusing and contradictory are the different accounts of discussions about the possibility of liquidation.

When two sides of the boardroom table are thus at odds, it is clear that only an independent enquiry by a committee of shareholders can clear the air—and independence in this case would imply that the parties to the controversy should be prepared to rest upon the committee's findings. The possibility of an application for a Board of Trade inspection under Section 164 of the Companies Act may perhaps be regarded as a possibility in the background if an accommodation between the two sides is not quickly reached. But matters may already have gone too far for that; evidently there are deep seated differences of view about the future policy and management of the concern, and about the wisdom or otherwise of liquidation. On this last point, it would be strange if the events of the past two months had strengthened the arguments—whatever force they might have in other respects —for liquidation.

* * *

Holiday Spending and Saving



All the signs suggest that the British public is spending heavily on its holidays this year—and is drawing freely on past savings in order to be able to do so. In the twelve weeks between May 17th and August 9th the active note circulation increased by £48.4 million; the corresponding increase between the mid-May low and the August Bank Holiday peak last year was £39.6 million. In the week following August 9th £9,800,000 of notes came back from circulation, compared with £10,300,000 in the same week last year. It is probable, however, that the rise in the note circulation this summer is not wholly due to seasonal influences. The active note circulation this year did not show the usual seasonal decline after the Easter rise, and since then the price level of goods of a kind generally bought with notes has undoubtedly been rising. This tendency must be expected to increase in the next few months and to exert an upward pressure on currency holding habits.

Meanwhile, the "small" savings figures have also deteriorated this year. Since April 1st the National Savings Movement shows a net deficit of repayments over receipts amounting to £52.5 million—nearly £30 million more than the deficit in the same period in 1949. The peak summer deficit in the week preceding the Bank Holiday was nearly £6,500,000 this year, compared with £5,700,000 in 1949. Last year's savings deficit was widely explained as being due to the withdrawal of "hot" savings that had been stored away against the day when goods previously in short supply came back to the shops. The continuing deterioration of these savings figures suggests strongly that the deficits are in fact due to more general pressure of prices on present incomes and past savings; the prospects for an improvement of this trend can hardly be said to be bright.

* * *

New Anglo-German Trade Pact

Since the end of the war, trade between Britain and western Germany has been conducted under the auspices of a series of make-shift trade pacts largely dictated on the British side by the necessity to avoid dollar losses to Germany. This unsatisfactory and extended interlude should be terminated by the new pact initialled in London this week.

HOW DO YOU MEASURE "SERVICE"?

"SERVICE" is a word that is used very freely these days — often, it must be admitted, by people who seem to have very little understanding of what it really means.

At Hoover Limited we measure Service — our own or anyone else's — by the extra care and effort that is given to the customer's interest *over and above what is necessary from a purely commercial viewpoint.* Service is attention to a customer's needs at the right time and at the right price. Service means taking as much interest in a customer's requirements *after* making a sale as when he or she is being persuaded to buy. Service in the Hoover sense of the word means providing customers with expert technical assistance in their own homes, offices, factories or anywhere else Hoover products are used.

In short, Service is to Hoover much more than a word. It is the cornerstone of Hoover policy.

Yes, he's late again. Late to leave the office. Late to get home. Late to realize that yesterday's business machines and methods cannot keep pace with the tempo of today's business.

The irony is—that the answer to his problems is no farther away than the telephone on his desk. Some day, instead of calling his wife to say he won't be there for dinner, he'll pick up that phone and call Burroughs.

the late Mr. J.

Together, he and the Burroughs representative will make plans to put the "book-keeping" of business on a production basis, to produce promptly the day-to-day figures he must have to make the right decisions. Modern, time-saving Burroughs machines will replace time-wasting relics of another day. New methods and procedures, based on Burroughs experience with British business leaders, will be applied. In short, the office will be mechanized to get work done *on time,* at less cost, with less effort.

If this puts a B in your bonnet, reach for the phone book and look up Burroughs Adding Machine Ltd. (in London, REGent 7061).

Wherever there's business there's

ADDING · CALCULATING · ACCOUNTING · STATISTICAL MACHINES

The negotiations that have been proceeding on and off since the beginning of the year, and that before the establishment of EPU were bogged down with payments problems, have lately centred in the removal of the discriminatory measures that have been impeding a wider range of trade between the two countries. When Britain liberalised its trade with Europe last year under the OEEC agreement, Belgium, Switzerland and Western Germany were excluded to avoid hard currency losses. Germany in its turn has discriminated against Britain and has unduly favoured Holland and Scandinavia and a number of other European countries.

One result of this has been that Britain has recently been importing German goods via Dutch traders, while German importers have used Dutch agents to purchase sterling goods. Under the new agreement this discrimination will come to an end. British exporters will now be able to compete on free lists or for quotas on equal terms with other OEEC countries; in particular exports of machinery to Germany should be stepped up. In return German manufactures, in particular of optical instruments, will be marketed in Britain either under open general licences or without discrimination under quotas. Dominion markets will also become more accessible to Germany. The new arrangements will come into force as soon as possible. They are likely to do so long before January 1st when the EPU ban on discrimination within Europe becomes effective.

* * *

The Marking of Furniture

The Board of Trade has accepted in principle the idea of compulsory marking of furniture with the name and address of its manufacturer. Both the Furniture Development Council and the employers' organisations have pressed for such a scheme on the ground that it would give the public a means of redress against shoddy furniture, the defects of which become apparent only with use. It might therefore act as a deterrent to manufacturers who are tempted to cut quality. Somewhat surprisingly many retailers have objected to the plan; some go so far as to remove identifying marks which many manufacturers now put on their furniture. The selling methods of many shops depend on a suggestion of personal responsibility for the goods shown, and they feel that compulsory marking would destroy this. Few shops, however, carry the suggestion to the point of taking actual responsibility for the performance of the goods in use.

Legislation would be necessary to make marking compulsory, and Mr Wilson has told the chairman of the Furniture Development Council: "It is impossible at this stage to say when it might be possible to consider legislation." This is unfortunate. The furniture industry has become resigned to accepting the Board of Trade specifications for utility furniture as a means of maintaining quality. The specifications are effective within limits but they were designed to meet a temporary need; their continuance stifles developments in design and construction which are essential to the vitality of a consumer industry. Compulsory marking is only a partial solution, but the more effective means of supervision, such as the evolution of performance tests for standard items of furniture, will take a long time to work out and the industry cannot afford to let things go on as they are.

* * *

Ferguson and Ford

The latest development in the claim by Mr Harry Ferguson and his American company against the United States Ford Motor Company and other defendants over the Ferguson tractor is the arrival in the British Isles of a Commission from the United States Federal Court. The Commission, headed by a Master of the New York Federal Court, sat in Belfast and has since gone on to Coventry to take further evidence there. The purpose is to record for the purpose of the trial of the action the evidence of witnesses who otherwise would have to cross to New York to give their evidence.

The Ferguson-Ford case is outstanding if only because of the size of the sum involved, no less than 251 million dollars. It is also remarkable in that the core of the case is an agreement made between Mr Ferguson and the late Henry Ford in October, 1938, which was never reduced to writing. It was on the basis of that agreement, so the Ferguson case alleges, that Mr Ferguson entrusted the whole production of the Ferguson tractor in the United States to the Ford Motor Company, with the result that the Ford Motor Company was the sole manufacturer of the tractor in the United States from the summer of 1939 until June, 1947. The substance of the Ferguson claim for damages is that, with the change in management of the Ford Motor Company when Mr Henry Ford II assumed control, the Ford Motor Company, its executives and subsidiaries began deliberately to annex the Ferguson system as their own and to manufacture and sell what were in substance Ferguson tractors on their own account. That allegation, of course, is disputed by the defendants. During the two and a half years the action has been under way (not an inordinate length of time by American standards), the last noteworthy event was the visit of Mr Henry Ford II to England last year in an attempt, so it was suggested, to effect some settlement with Mr Ferguson. Whatever the purpose of the visit, no settlement was made.

Lawyers are likely to throw up their hands with horror at the very idea that a project of this size could have been launched, in America or anywhere else, without the parties recording their terms of their arrangements in writing; it is, however, only fair to add that written agreements have never deterred the parties to them from disputes as to their meanings and effects, nor have they deterred lawyers from conducting, and defending, equally sizeable actions based upon their contents.

Double Tax Agreement With Ceylon

When Sir Stafford Cripps recently added to the 1950 Finance Bill provisions for granting a unilateral measure of "double taxation relief" to British companies operating abroad, he expressed confidence that these new provisions would not prejudice the United Kingdom's efforts in negotiating double-tax agreements with other countries. This confidence has proved justified in the particular case of Ceylon, which was mentioned in debate. An agreement now concluded after prolonged discussion provides that the total taxation levied on British companies operating in Ceylon will be appreciably reduced from between 66 and 71 per cent of trading profits to something over 50 per cent.

The main weight of concession under this agreement will fall on the British Exchequer. The companies concerned will apparently continue to pay full income tax, profits tax and an additional 6 per cent foreign companies' tax at present levied by the Ceylon Government (amounting in sum to just over 40 per cent of profits) and will pay to the British tax collector the difference between this 40 per cent and the 50-56 per cent which is the present combined levy imposed by British income and profits taxes. The Ceylon Exchequer for its part will forgo the revenue at present received from United Kingdom residents as a result of the taxation of the earnings of ships and aircraft operating in Ceylon, together with the proceeds of taxation of copyright royalties, non-government pensions and the earnings of temporary residents in Ceylon. It will, however, continue to tax the proceeds of tea sales in London, the income of United Kingdom residents trading through agents in Ceylon and to levy super tax on rupee company dividends remitted to this country. This particular convention may seem to lay a disproportionate burden on the British as distinct from the Ceylon Treasury; but it certainly lifts a heavy burden from the back of British firms operating in Ceylon and will encourage them to seek more business there.

Stock Exchange Yardsticks

The promise held out by recent measures that the Stock Exchange Council has introduced, and others it has mooted, for more facts and figures about the security market have not been fulfilled in time to make any improvement in the content of the "Stock Exchange Statistical Tables for 1949-50." Those interested in such matters have again to content themselves with a statistical exercise that epitomises the lack of adequate information about Stock Exchange business.

On April 3rd this year the value of the 9,711 securities then quoted on the London Stock Exchange was £25,067 million against a market valuation of £26,523 million for 10,053 securities quoted on April 4, 1949. The nominal value of the stocks quoted on the two dates was £22,949 million and £23,054 million respectively. The fall in the number of securities quoted is primarily due to the consolidation of individual gas securities in Gas Stock; gas companies' securities now number 52 against 466 a year earlier. Between April, 1949, and April, 1950, the *Financial Times* ordinary share index fell from 115.0 to 105.4, and the fixed interest securities index from 133.45 to 120.52. In the "Commercial, Industrial, etc." group of the Stock Exchange Table, market values fell from £4,324 million (£1,905 nominal) for 4,172 securities to £4,097 million (£2,018 nominal) for 4,282 securities. The nominal value of government and government-guaranteed securities has risen from £14,395 million represented by 53 issues to £14,589 million in 55 issues. This further growth of the gilt-edged sector of the market was not matched by market performance, for market values fell by no less than £1,000 million from £14,613 million to £13,682 million. The only important market to register a significant improvement between the two dates was the mining market, where values rose from £1,069 million for 469 issues to £1,322 million for 463 issues. Of this improvement, a considerable portion has of course been lost since April.

Markings recorded during the year were 1,566,280 against 1,730,213 for the previous year and 2,816,353 in 1946-47. But these are no adequate guide to the volume of business. Perhaps the long-needed improvement in Stock Exchange statistics will eventually be achieved; certainly London's figures bear no comparison with the comprehensiveness and the speed of Wall Street's regular output of market data.

Shorter Notes

A further credit to finance purchases of wool from sterling sources during the 1950-51 season has been placed at the disposal of the French wool industry represented by the Groupement d'Importation et de Repartition de la Laine. The credit as in previous years is granted by a London syndicate headed by Messrs Lazard Brothers and Co. It again takes the form of a revolving acceptance credit but the line this year is limited to a maximum of £5,000,000 except in the peak buying season when it may be raised to £10 million, which was the limit of last year's credit. The new credit is finally repayable by October, 1951.

★

A table on page 327 of last week's issue of *The Economist* gave some figures described as "rough productivity estimates." This title and the accompanying description of the way they had been prepared were intended to emphasise their crude character. The aim, as stated in the article, was to demonstrate that different industries had achieved different improvements in productivity, and we were not concerned with the precise figures for individual industries. But the comparison shown between the second quarter of 1948 and the first quarter of 1950—unavoidable because of the lack of comparable employment figures before June, 1948—involves some distortion owing to seasonal differences, which is particularly marked in the estimate for shipbuilding and repairing component based on the London and Cambridge production index. Over a longer period, shipbuilding productivity has shown some increase in recent years.

★

This week the price of lead in the United States rose by one cent to 13 cents a lb. and the Ministry of Supply raised its selling price by £8 to £104 a ton. For some days prior to this rise, lead had been selling unofficially at 13 cents a lb. Zinc and copper prices have remained unchanged, though zinc has been sold for as much as 18 cents a lb. compared with its official price of 15 cents. A two-cent premium for copper on its official price of 22½ cents a lb. is quite common, while certain reports have quoted copper as selling at 27 cents a lb. Many consumers unable to get American-produced copper are importing foreign copper and paying the 2 cents a lb. duty rather than reduce their output of manufactures.

COMPANY MEETINGS

LAND SECURITIES INVESTMENT TRUST

INCREASE OF RENTS

The nineteenth annual general meeting of the Land Securities Investment Trust, Limited, was held on August 17th in London, Mr Harold Samuel, F.R.I.C.S., F.A.I. (chairman and managing director), presiding.

The following is an extract from his circulated statement:

The value of properties at cost to the group, after providing for amortisation to date, stands at £4,169,836, as compared with a figure of £2,391,908 for the previous year. This substantial increase has been brought about by the acquisition of Mayfair Court, Stratton Street, W.1, and other properties in the West End of London.

Current assets amount to £778,970, including cash at bank of £719,869, and compare with a total of current liabilities amounting to £511,084. Rents, etc., receivable for the current year amounting to £282,299 are greater than the combined income of last year from rents, etc., receivable, less expenses, of £214,753, plus profits on sale of properties of £50,955.

The balance attributable to the Land Securities Investment Trust, Limited, excluding profit on sales of £86,963, less tax £45,066, which has been taken to capital reserve, amounts to £62,165, as compared with £57,042. The latter figure, however, included profit on sale of properties.

An interim dividend of 32 per cent., less income tax, has been paid on the ordinary share capital, and your directors now recommend the payment of a final dividend of 48 per cent., less income tax.

SUBSIDIARY COMPANIES

Mr Harold Samuel also presided at meetings of United City Property Trust, Limited, and Lansdowne House (Berkeley Square), Limited, held on the same day. In his circulated statement to shareholders of the former company he said, *inter alia*: The purchase of the entire share capital of the following property-owning companies has been made:

ROCK PROPERTY TRUST, LIMITED.—The building known as "Clive House" is proceeding satisfactorily, and it is anticipated that the Ministry of Works will take possession next November.

BELFORT TRUST, LIMITED.—The Ministry are already in occupation on long leases of Ariel House and Lacon House, which have a total net floor area of 290,000 sq. ft.

DEVONSHIRE HOUSE, LIMITED.—This company owns a lease for 150 years on Devonshire House, Piccadilly. The present satisfactory yield should increase considerably when the upper part, which is used as Government offices, is de-requisitioned.

The value of the properties at cost to the group has increased from £900,435 to £2,818,937, and there are mortgages secured on these properties amounting to £2,200,672. The company has only received during the year a small income from the newly acquired properties which will increase during the current year, but the full benefit will not be apparent for a few years to come.

In the course of his statement circulated to the Lansdowne House shareholders, he said: The 4¾ per cent. mortgage debenture stock has been replaced by a mortgage at 4 per cent. The Minister of Works has leased approximately 75 per cent. of the lettable area at a rental of £72,500 per annum exclusive, tenants being responsible for all outgoings. This lease is for 35 years from December, 1948, without option to break, and includes the sections of the building originally requisitioned and held on lease.

In each case the report and accounts were adopted.

AMALGAMATED ANTHRACITE COLLIERIES, LIMITED

DIVIDEND PROSPECTS

The 26th annual general meeting of Amalgamated Anthracite Collieries, Limited, was held on August 15th in London, Mr John Waddell, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1949:

The income available to the stockholders now becomes that arising from the operating group of Anthracite Holdings Limited, which, after providing for depreciation, income tax and other items, leaves a sufficient sum to provide for the annual charge on Funding Certificates, the cumulative preference dividend and to add a small amount to our carry-forward.

Broadly, the company is almost being compelled to mark time until such time as the division of the global sum or colliery compensation can be ascertained, and the only satisfactory feature is that during this period we are not slipping back but are managing to hold our own and consolidate the position.

THE HOLDING COMPANY

Anthracite Holdings may be the sole asset, and certainly will be the major asset, represented by the share capital. Fortunately this company hived off to Anthracite Holdings Limited, the non-colliery activities in 1942, and it started off with and still has a capital of £1,150,000. I consider the trading record of this company to be excellent and that the management of it has shown considerable capacity in meeting a set of difficult circumstances.

The average profits over the period 1942-1949, if fully distributed, would be sufficient to pay the full cumulative and participating dividend on the preference stock of 7½ per cent. and 2 per cent. to the ordinary stockholders, but only if the penal profits tax is abolished. I should like to emphasise the complete unfairness of this profits tax upon the equity stockholders in a company like this which has a heavy preference capital. I hope it will not be long before the Chancellor of the Exchequer realises the unfairness of the present method.

PRESENT ACTIVITIES

Broadly, the basic activities of Anthracite Holdings Limited, are in wholesale and retail coal distribution and exporting and shipping. But in addition we have other activities of many years' standing in engineering and manufacturing, wagon repairing, brickworks and various other small products. Our policy of becoming less and less dependent on one particular activity is bearing good fruit, and a substantial proportion of the profits is now derived from activities other than those of coal distribution and exporting, which are, to a large extent, dependent on the policy of a nationalised industry.

We have two new brickworks, which we have been building for two years, coming into completion during 1950 and we expect good results from them. Our coal export and shipping organisations are feeling the brunt—particularly on shipping—of very low freights. Our coal exporting business is expanding. The Holdings group is managed energetically and well and is constantly meeting fresh forms of competition and fresh economic conditions and meeting them successfully, and I think this Group will maintain its already good record and surmount these difficulties successfully.

The report was adopted.

OLDHAM AND SON LIMITED

CONTINUED PROGRESS

MR JOHN OLDHAM'S REVIEW

At the thirty-first annual general meeting of Oldham & Son Limited, which was held on August 18th at the company's head office, Denton, Manchester, the chairman, Mr John Oldham, O.B.E., J.P., who presided, said that the results now disclosed covered a period of only ten months, a change in the accounting date having been made for taxation and other reasons. Net profit to March 31st last amounted to £210,161, which was at the annual rate of £252,192, thus showing a substantially proportionate rate of profit to that of last year.

It was proposed to adjust the final dividend for the ten months to March 31, 1950, proportionately, so that the yield to Ordinary shareholders remained unchanged.

A very substantial part of the company's business was derived from essential industries at home and overseas—mining and transport. Present-day methods of mining demanded the most modern portable lighting equipment, in which the company had specialised for over forty years. Total of Oldham miner's lamps in use amounted to many hundreds of thousands, and the firm were now leading manufacturers of this equipment in the world.

Continued growth of road transport requirements for public, commercial and private purposes had raised to high levels demand for electric storage batteries, and the number of Oldham batteries supplied to home and export markets continued to expand.

FURTHER DEVELOPMENTS OVERSEAS

Developments concerned with their associated company, Oldham & Son Africa Limited, were proceeding very satisfactorily, and this company were now the largest suppliers of portable lighting equipment to the gold mining industry in the Union.

The French subsidiary, Société Française des Procédés Oldham, was now established in full manufacturing operation, and the entire supply of many thousands of Oldham lamps used in the French coalfields, as well as spares, batteries and technical service, was derived from this subsidiary.

In India, manufacture of Oldham batteries and mine lighting equipment was foreshadowed by completion of negotiations with the Indian Government for the establishment of a company under the title of Oldham & Son India Limited. Premises and land had been acquired in Madras, and manufacturing was expected to commence early in the New Year. Oldham & Son England would have a 55 per cent. interest in the new project, the remaining equity being held jointly by the company's Indian selling agents, the South Indian Export Company of Madras, and Mousell & Company, Limited, of Bombay and Calcutta.

Concluding, the chairman said that the developments to which he had referred illustrated the broad-based character of the company's business, the essential industries it served, and the increasing spread of its sales and services at home and overseas, and added that these factors were of importance in assessing the firm's future prospects. Shareholders could, in his view, derive considerable confidence in the continued progress of the company.

The report and accounts were unanimously adopted, and a final dividend of 10 per cent., as recommended, was approved, making with the interim dividend of 15 per cent. paid on April 1, 1950, a total of 25 per cent. for the ten months, or at the rate of 30 per cent. per annum.

UNITED DOMINIONS TRUST LIMITED

SERVICES TO COMMUNITY

MR J. GIBSON JARVIE'S SPEECH

The twenty-eighth annual general meeting of the United Dominions Trust Limited, was held in London on August 14th

Mr J. Gibson Jarvie, the chairman, in the course of his speech, said: The parent company is a banking concern and holds the shares of several subsidiaries, certain of them being specialised financing companies restricting their operations within particular industries. Our several but related activities create a unique and—subject always to Government policy and tactics—profitable arrangement for stockholders, as the following information will show.

At the end of the last financial year the figure of total group outstandings increased by £2,274,200 to £12,682,156 or by roughly 22 per cent. Investment income at £59,375 was practically the same, but gross profits of the group (excluding investment income), increased by £117,712 to £456,873 or by nearly 35 per cent.

NEED FOR FURTHER CAPITAL

The time is approaching when, subject to the approval of the Capital Issues Committee (to whom we have already made application), the issued capital must be increased if we are to respond to the expanding demand for our services. Through the varied facilities we furnish to industry and commerce we have rendered invaluable service to the country. Given reasonable freedom of action, under any sort of ordinary conditions, we can be of still greater and essential use to the community.

To maintain and even improve our already strong position on our present capital resources is, your board believe, something which we are entitled to expect.

GOVERNMENT'S OBJECT

When the war ended the Government's duty—and their great opportunity—was to create the conditions under which we, as a nation, could replace the capital destroyed by the war; refill the depleted national treasure chest; re-establish our position as the world's bankers; rebuild our invisible exports; maintain our armed strength; and, generally, recover our old place as a world power. But it was not to be. That grand comprehensive objective was subordinated to the Socialist ideal of a regimented State based on exploded Marxist theory.

The present Government promised immediate demobilisation; high wages and short hours; and unlimited social services. They set out to kill capitalism—the only system which could have made their grandiose schemes even remotely possible. They are still determined to kill private enterprise; they are out to punish by penal taxation those who may have inherited fortunes and those who may have been diligent enough to build fortunes in happier days.

Surely we must see that, if we wish to regain our pre-eminence and to recreate the wealth-producing services on which even the maintenance of our common standard of living depends, the class vendetta of the Socialist Government against the producers of wealth—as exemplified by punitive taxation and Government controls—must cease before consequential inertia sets in.

If our country is to survive, and with it your group of companies as an integral part, I believe it is essential that a change of Government economic policy cannot longer be delayed.

The report was adopted.

GLOBE TELEGRAPH AND TRUST COMPANY, LIMITED

CAPITAL REORGANISATION SCHEME

SIR EDWARD WILSHAW'S SPEECH

The seventy-seventh annual general meeting of this company was held on August 17th in London.

Sir Edward Wilshaw, K.C.M.G., the chairman, in the course of his speech, said:

The profit for the year is £5,671 higher at £191,155. I feel certain, however, that your interest is less in the past, as represented by the accounts, than in the future as represented by the capital reorganisation scheme to consider which meetings have been convened immediately following this meeting.

I should like to correct an impression which appears to have gained some currency regarding the rate of dividend to be anticipated in the future and also to make clear one statement in the circular concerning which I have received letters from some stockholders. My justification for doing so now is that both points relate to the income which stockholders may expect to receive in the future.

The impression to which I refer is that the dividend to be anticipated on the ordinary stock in the future is 4 per cent., less income tax. I know of no grounds whatever for this assumption; in fact, it ignores the assurance given by the directors regarding the future income which stockholders may expect to receive from the company.

I have been asked by stockholders to clarify that part of the explanatory statement which reads: "Whilst the earnings attributable to his £150 ordinary stock are estimated to be at least £9 15s.—that is, at the rate of 6½ per cent. per annum before deduction of income tax; also to say whether this means that the payment of a dividend of 6½ per cent. is to be anticipated.

FUTURE EARNINGS

It is in my opinion generally dangerous to prophesy as to the rate of dividends to be paid in the future, and for this reason care was taken in wording the sentence in question with the express object of indicating that while no firm forecast was made as to the rate of dividend to be paid, the earnings out of which any dividend could be paid was equivalent to at least 6½ per cent. of the revised ordinary capital. I will now read the relevant part of the written reply sent to a stockholder who wrote to me on this matter: "... the words are intended to imply that the estimated future profits of the company—after meeting all charges—are equivalent to not less than 6½ per cent. of the ordinary capital of the company as increased under the proposed capital reorganisation scheme.

"This statement you will thus see refers to estimated earnings, not to dividend to be paid, and obviously the directors would not commit themselves in advance about dividends to be declared in the future.

"You will note that it is confidently expected that the future income (this means debenture interest and dividend to be received) from the company will exceed the present income (or dividend) received, in spite of the fact that the holder will have already received a cash distribution of 20 per cent. on his existing stock. It is, of course, obvious that this expression of opinion by the directors is capable of realisation only if a dividend at the rate of approximately 5 per cent. or more is paid by the company.

The report and accounts were adopted, and the proceedings terminated with a vote of thanks to the chairman.

NOTICES

UNIVERSITY COLLEGE, EXETER

Applications are invited for the post of LECTURER IN ECONOMICS

The post is open to men and women.

An honours degree in Economics is a requisite. Candidates may be preferred who desire to teach Economic Theory, but candidates who can offer other specialities will be considered.

Circus Place, London Wall, E.C.2. August 14, 1950.

CANADIAN PACIFIC RAILWAY COMPANY—(Incorporated in Canada with limited liability)—DIVIDEND NOTICE—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors, held today, a dividend of two per cent (fifty cents per share) on the Ordinary Capital Stock in respect of the year 1950 was declared payable in Canadian funds on October 2, 1950, to shareholders of record at 3 p.m. on August 23, 1950. Net Earnings from railway operations for the six months ending June 30th, though showing a substantial improvement over the corresponding period of last year, are still insufficient for the paying of any dividend. While hopeful that better results may be achieved in the last half of the year, the Directors point out that the dividend declared today is attributable solely to the Company's income from other sources.—By Order of the Board. FREDERICK BRAMLEY, Secretary. Montreal, August 14, 1950.

ADMINISTRATION—Chartered Accountant and A.C.W.A. (42), wishes senior appointment with progressive organisation offering scope and prospects. Extensive experience, professional, commercial, trade associations, financial investigations.—Box 471.

Postal Tuition for B.Sc.ECON.

Shaping the Schuman Plan

FROM the moment of its first announcement, the Schuman Plan has been treated as a political rather than an economic initiative. This is partly due to the controversy on the highly political question of national sovereignty which at once arose between London and Paris. But it is not due to this alone; the authors of the Plan themselves presented it as a means of contributing to the solution of an eminently political problem, the long-standing and mutual fear between the French and German peoples. It is thus only natural that it is on the political aspects of the negotiations that have been going on in Paris between the six participating countries (France, western Germany, Italy, Holland, Belgium and Luxembourg) that public curiosity has mainly concentrated. Everyone has wanted to know to what extent the French delegation has been able to maintain its original proposal for a definite surrender of national sovereignty. As matters stood when the Paris negotiations were adjourned for the delegates to report home, the answer would be that there has been some retreat from the simplicity of the original proposal for a High Authority independent of political control, but not nearly as much retreat as would be necessary to appease the original critics of that proposal, especially the British Government. On one issue there has been dogged resistance—no one Government is to have a veto over what the High Authority can do within its territory. The effort to retain this principle, and yet to recognise that the High Authority cannot be utterly uncontrolled, has led to the devising of a constitution complex enough to do credit to the abbé Siéyès. There are to be no less than four main organisations: the High Authority itself, of 6 to 9 members named collectively by all the governments on a basis of individual qualities without national representation; a Common Assembly of delegates from the national parliaments, whose main duty will be to consider the annual report of the High Authority, with power to impeach the whole Authority but not to interfere with its decisions; a Council of Ministers, with no powers of general control over the High Authority, but with powers (as yet ill-defined) to make recommendations on certain specific issues; and finally a Court of Justice, whose duty, in principle, will be to see that the High Authority conforms to the letter of the treaty, but which may well find itself straying from defined legalities into the more disputable ground of economic expediency and commercial judgment.

To picture how such a structure would actually work in practice would strain the most versatile imagination. So much depends on definitions and personalities. One is tempted to make the criticism that the famous principle of the pooling of sovereignty has been turned into a negative rather than a positive thing; that there has been more anxiety to take their present powers away from governments than to convey them intact to anyone else; and that the checks and balances provided are rather ominously reminiscent of the doctrine of the separation of powers, which so easily becomes the frustration of

powers. But the initiative remains clearly with the High Authority, and, after all, the First Consul made even Siéyès's constitution work. If the High Authority can proceed with a Bonapartean mixture of firmness and moderation—rather than with Napoleonic arbitrariness—the system will work. But the same qualities might equally make an inter-governmental scheme work.

Theory of the Single Market

But what does "working" mean? When the powers have been settled, what is the Schuman Plan to do? Its original merits may be political, but it will redeem itself, or not, by its economic performance. The whole business will be a sad disappointment unless, in the end, something is done to the coal and steel industries of western Europe that can be counted as a benefit to the public interest. It is astonishing how little public discussion there has been of this central issue. Most of it has consisted of simple assertions that the replacement of six or more small national markets for the products of heavy industry by one large market must conduce to higher efficiency, lower costs of production and lower selling prices. This argument is very strongly held by many influential Americans, particularly in the Economic Co-operation Administration. It is indeed natural for Americans to point to the undeniable fact that much of their own matchless industrial productivity is due to the development of a virgin land as one market.

It does not follow quite so simply that what was done in one continent in one century would have the same results in another continent in another century. A great part of the success of the American experiment lay precisely in the fact that it was a virgin country; Europe already has its national industries. If a larger market has virtues in comparison with a smaller, it must be because it permits of larger units of production and a greater degree of specialisation and division of labour. If Europe had no heavy industries and they were developed on these lines from the start, they would doubtless be more efficient than what does in fact now exist. But since the existing plants are there, it would be bad economics, as well as most unpopular politics, to scrap them and start again. It follows, not that there are no virtues in having a large market, but that they would only emerge in Europe slowly, as new construction was located in the most economic places and designed in the most economic forms that large-scale production permitted.

There is a second qualification that must be made to the theory of the single market. A large market will not bring about the economic location of industry or concentration on the most efficient producer if it is cartellised or controlled. The essential characteristic of the American market—certainly in its formative years and to a large extent still today—is not only that it is large, but that it is so strongly competitive. It may or may not be possible to create a large market in Europe; but is it possible to create conditions of real competition, in which the most efficient producer is allowed to expand, and the high-cost producer, and his employees, go to the wall? It is, to say the least, highly doubtful. What is certain is that competitive conditions cannot be created simply by sweeping away national customs barriers. It may have been true in the nineteenth century that import duties were the chief obstruction to the fluidity of demand and supply; it is certainly not true of Western Europe today. Nor is it the result of the wickedness or stupidity of governments. It is in the main a response to the basic desire of the ordinary man for security in his job, or at least in his trade and locality. It may be true that he could produce more if he would move to another trade and a strange place. But he does not want to move; and he uses his vote to ensure, so far as he can, that he does not have to. This is not a national passion, which could be exorcised by making all peoples one; it operates within every economy, national or international. Nor is it an aspect of Socialism; it was a Conservative government which induced Messrs Richard Thomas to build their strip mill at Ebbw Vale rather than in the most economic location. The theory of the single market, if it is to be valid, must be re-phrased in terms of the single competitive market, and the addition of that word makes it a very much more difficult thing to accomplish. Any plan whose merits repose upon the creation of a single market must be judged not only—not even mainly—by the progress it would make in sweeping away barriers to international trade, but chiefly by the proposals it makes for restoring competition within its single market.

Abolition of Tariffs

This analysis is strikingly borne out by the results that have so far been achieved in the Schuman negotiations. The conference divided itself into five committees, of which the first concerned itself with the "institutional" questions, which have already been discussed. The fourth and fifth, concerned with wages and social questions and with the definition of exactly what is meant by such terms as coal and steel, have not yet reached any conclusions of which details are available. The two main economic committees were the second, on commercial and tariff policy; and the third, on prices, production and investment. The fact that, in the time available, the second committee has been able to reach reasonably precise conclusions, while the third is still apparently at an early stage of its labours, is a reflection of the fact that it is the questions of prices and production—in short, of the degree of competition—that are the really difficult and important ones.

This does not mean that the decisions on commercial policy are insignificant. They are, in fact, much more far-reaching than might have been expected. It has been decided—subject to what the six governments may have to say—that all import duties and quota restrictions on coal and steel, as between the six participating countries, shall be suppressed at one blow instead of progressively. In this sense, the "single market" is to become a reality within a few months after the treaty, now in the course of drafting, is ratified—though one of the undecided questions is whether the single market shall extend to the overseas possessions of members. There is also to be, in due course, a common tariff on coal and steel products round the six countries; it is apparently the intention that there shall be no imports of steel into the area and that imported coal shall not have a competitive advantage anywhere in the area over coal produced within it.

The abolition of duties will, of course, raise questions of the most-favoured-nation treatment guaranteed by existing commercial treaties, both the network of bilateral treaties and also multilateral engagements such as the General Agreement on Tariffs and Trade (GATT). Perhaps the negotiators are over-confident that, by presenting a common front, they will be able to get over these hurdles. Non-participating countries—specifically Great Britain—will hardly be anxious to abandon their most-favoured-nation rights, nor can they be compelled to do so, unless a "common front" by the Schuman nations means, as it hardly can do, a willingness by all of them to denounce their existing commercial treaties with Great Britain. Nor has anything emerged about the effect that such behaviour would have on their exports to the world at large—indeed, the whole subject of exports appears to have been somewhat neglected.

There may, therefore, be rocks ahead on the path to the single market. But it is a considerable achievement to have secured the agreement of the six countries to the suppression of tariffs and quotas as among themselves. Its effects—if it comes about—should not be underrated. But though it is an essential preliminary to the creation of a single competitive market, it is not in itself decisive. After all, the most restrictive and anti-social cartel could also afford to dispense with customs duties and import quotas, since it would make its own arrangements for the division of the market.

Price Policy

The core of the whole scheme, in fact, lies in what will eventually emerge from the third committee. There is much here that is still very vague. But it must be said to the credit of the negotiators that, under French leadership, they are making a genuine effort to stick to the ideal of a single price for each product to all purchasers and complete freedom for each purchaser to buy from whom he will. It is, of course, recognised that these conditions cannot be created at once and that there must be a period of transition. But so far as intentions can secure the result, the transition will be a short one.

Everything, of course, turns on the prices that will be fixed. It is clearly the intention that prices will be fixed well below the costs of the least efficient producers, for provision is made for a number of equalisation funds (*caisses de péréquation*) out of which subsidies will be paid to those producers who cannot exist on the prices fixed. There is to be a separate fund for each country, fed in equal proportions by a levy on production and by government grant. In the first year, these subsidies are to cover 90 per cent of producers' needs, but thereafter the proportion is to diminish rapidly. If a producer cannot adjust itself sufficiently quickly to the common price, then assistance is to be provided either for re-equipment or else for a complete change of activity, including the re-training of the workers and their maintenance during the transition. This help would be provided by the High Authority out of the proceeds either of levies on sales or out of the loans that it should be able to raise on favourable terms.

The theory is thus of a price fixed to cover the costs of the more efficient producers plus a loading to cover the costs of either re-equipping or sterilising the less efficient producers. It is, in theory, a genuine attempt to reproduce within the planned economy the pressures that *laisser faire* exerts towards the expansion of the efficient and the removal of the inefficient. It is an attempt to secure the virtues of competition without its cruelties. As such it is a great improvement on the enforced stabilisation of the *status quo* that has too often been the fruit of the planned economy.

Nevertheless, one cannot help feeling doubtful about the degree of success that such an estimable theory would have in practice. The doubts fall under three heads. First, would the High Authority in fact be free to pursue the policy as, in theory, it should be pursued? Everything depends upon fixing a relatively low price and rapidly reducing the rate of subsidy. But the fact that the governments will have to contribute half the cost of the subsidies will ensure heavy pressures for fixing a relatively high price. And it does not require much imagination to foresee the special reasons that will be adduced for postponing the annual reductions in the rate of subsidy. The whole scheme, without great courage on the part of the High Authority, could rapidly degenerate into a guarantee fund for inefficient producers, and if the consumer got his steel any cheaper, it would only be because he was called upon to pay more in taxes.

Secondly, although a scheme of this sort would be difficult to administer within any one country, it would be much more difficult internationally. There is to be a separate equalisation fund in each country, and no provision seems yet to have been made for equalisation between countries. This is, at once, a serious derogation from the theory. Moreover, equalisation as between countries brings up the whole question of differing wage levels, which has been found so delicate that no summaries of the fourth committee's work are being issued for the present. And if the working of the single market looked like bringing about a marked transfer of production from one country to another, the government of the losing country would be almost certain to intervene on grounds of national safety. There is, in fact, provision for special levies to prevent just such transfers, which is certainly necessary on political grounds, but is hardly in accordance with the theory of the free market.

Thirdly, a scheme such as this can be imagined to work satisfactorily only in "normal" conditions, when productive capacity is in excess, but not largely in excess, of demand. In a period, such as rearmament looks like bringing back, of chronic shortages, there is no question of closing down inefficient producers, or of bringing pressure to bear on them to do anything but go on producing, at almost any cost. And contrariwise in a period of slump, the working of a scheme such as this would require the loading on top of the "economic" price of quite impossibly heavy levies if every existing labour force was either to be maintained or transferred to non-existent other jobs. This is, indeed, a basic criticism of any attempt, national or international, to plan a particular industry, especially a highly cyclical one, without reference to the general economic climate. Whether or not that climate can be controlled by any human agency, it will certainly not be susceptible to control by the High Authority of the Schuman Plan.

On all these questions there is, therefore, a great deal more thinking to be done. The scheme, as it is taking shape, is a very French conception, with an eloquent statement of admirable general principles, but increasingly vague the nearer it approaches practical application. Perhaps the only judgment that can usefully be pronounced at this stage is to express satisfaction at the total absence from the documents thus far emerging of any of those restrictive proposals that were expected by those who thought the Schuman Plan would be "just another cartel." The intention to cheapen and expand is beyond question. The Schuman Plan's heart is in the right place; what is not yet clear is whether its feet are on the ground.

Watch on the Elbe

AT last all the talk about what the Germans of the west might be allowed—or asked—to do towards defending themselves is coming out into the open. As has happened so often in Germany, events have overtaken and passed policy. While the occupation powers cautiously dotted the i's and crossed the t's of a pronouncement which would give the Federal Republic a less modest police force, the Council of Europe heard Mr Churchill asking for a European army in which there would be German contingents, and German representatives protesting that they want no independent army, but might contribute to a European one. While Mr Shinwell has been reaffirming the Goverment's opposition to German rearmament, the Deputies of the North Atlantic Council have been adding up the number of divisions needed to prevent Germany being overrun, and have found that they are much more than what is being offered. The Chancellor of Western Germany has asked to be given the counterpart of the "people's police" in Eastern Germany. Clearly self-defence for democratic Germany is no longer ruled off the agenda. That is a good thing; for the question lies heavy on the minds of most thinking people in Europe, and it causes fear as well as argument.

The important thing to decide now is what precisely Western Germany is to be defended against. If it is assumed that the threat is of an aggressive attack by 100 Soviet divisions in the near future, then the problems of defending Germany and of defending Western Europe merge into one. Against any military attack of this kind the main burden of immediate defence rests—and will continue to rest for four or five years—on the Americans and the British. But the self-interest of the Soviet Government, hard economic facts and logic—even the logic of the Kremlin—suggest that Stalin would regard such a method of winning Germany as dangerous, crude and extravagant. The more practical question is: could Western Germany be attacked and won by proxy, without a platoon of the Red Army moving, either by the Korean method or by some other method which Communist ingenuity might devise? The answer clearly is Yes. It is not only possible—indeed probable; the Communist leaders of Eastern Germany are avowedly preparing to do it. Backed by the famous telegram of last October, in which Stalin assured them that the German and Soviet peoples "possess the greatest potentials in Europe for accomplishing great actions of world importance," they are appealing to the Western Germans to join in a movement of "national resistance" against the occupying powers in the west. The National Front (the latest activities of which are described on page 416 of this issue) is to be the setting for a joint effort by the Socialist Unity (Communist) Party of the East and all "patriotic" Germans who wish to "liberate" their country. There is clear evidence that strikes, sabotage and active resistance to the occupation troops—the Americans are singled out—will be attempted. Grotewohl has publicly declared that there will be a resistance movement and that an explosion must come. When he says that, he knows that Germans in the West hear him and think of the 50,000 fully trained and equipped guard troops that he has behind him, the *Bereitschaften*.

Thus notice of what is coming has been served on the occupying powers. There is no sign that the Western Germans will take the National Front seriously unless it looks like succeeding. They realise that a straight imitation by Grotewohl of the tactics of the North Koreans is unlikely; because it would run headfirst into superior allied forces of highly trained troops and air forces. But they cannot feel certain—indeed, nobody can—that joint action by the East Germans and by well-organised supporters in Western Germany could not take a form in which the occupying forces would be at a disadvantage—not to say at a loss. Korea has shown the great difficulty of distinguishing friend from foe in an occupied country. Five years of occupation have shown the impossibility of controlling movements across the border between Western and Eastern Germany. The future may see forces now dormant in Western Germany turning against the occupation because their idea of the equality of status to which they are entitled may not be that of the Americans, the British and the French. If—as is not impossible—there is some withdrawal of Soviet troops from the eastern zone, Communist propaganda could make great play against the Americans with the demand "Ami, go home." The stage would be set for what is regarded in the Communist doctrine as a "war of liberation," which means civil war with help from Moscow.

*

If this is the real threat—and there is no lack of evidence that it is—then the approach to the problem of letting Western Germany play some part in its own defence takes on a special form. Action by the East Germans could, of course, be part of a general Soviet offensive as well as something quite separate from it. If the Russians hoped to overrun Germany they would find the *Bereitschaften* very useful for infiltration. They would have the political sense to know that German police—even if they are a red imitation of Himmler's Black Guards—would be less distasteful to the Germans of the west than the MVD. If the "war of liberation" were conducted by Germans only, the Americans and British armies of occupation might be forced into measures which would play the Communist game, as the Americans on occasions are forced to play the Communist game by controlling, searching and otherwise interfering with South Koreans. An army that fears spies and saboteurs on its line of communications will not be gentle in its search for suspects. In short, the occupation forces, which are more and more becoming frontline formations for the defence of Europe, might find themselves faced with a resistance movement and carrying out security duties of a kind which play havoc with an army's dispositions and organisation.

Here, then, is an aspect of the German problem which is seldom mentioned in discussions about rearmament. Yet it is one of the most serious of all because it is quite clearly one that the western governments and forces cannot solve on their own. That they are aware of it—or at least of the need to give the Bonn Government the power to keep order—is shown by the preparations now being made to allow the eleven western *Laender* to increase their police forces. What is to be the scale of that increase and what kind of security forces will it produce? There is to be an increase of about 10,000 men, which would bring the total police force in western Germany up to about 95,000. They would be allowed small arms but no heavy equipment. They would be at the disposal of the central government only in case of serious trouble. This proposal, which has caused dismay in Bonn, has to be compared with the fact of over 200,000 armed police in the Soviet zone, under the direct control of a Communist Minister of the Interior. They include the *Bereitschaften* already referred to, which are known to have military transport, tanks and artillery, and to control airfields.

The comparison is disturbing to anyone who is aware of the mistakes in such estimates made in the past—for instance, the complete miscalculation by the Americans of the strength of the North Korean army. East German strength may be considerably larger; if it is not, it could certainly become larger. The young material for it has paraded in Berlin at Whitsun, bearing banners showing its readiness for such tasks as "liberation." It is hard to believe that a police force split up among eleven states, denied adequate military training and arms, could cope with the emergency which it is the Communist intention to create.

It seems, in fact, only too probable that the occupying powers are once again months behind the time. There is no immediate question of creating in western Germany an army, capable of taking part in real war. That may come in time, but two facts prevent it now—the fact that the French will not agree to it, and the fact that the arms for equipping it could only come out of somebody else's quota. What is now needed is not an army to fight in a total war, but a civil guard or armed gendarmerie sufficiently strong to make it clear to the German Communists and their Soviet masters that it would not pay to start a civil war. There are obvious advantages in keeping the west German force slightly smaller than the eastern force, but not with odds of one to three. It should be publicly explained to the Soviet Government—which has not replied to Notes of protest about the *Bereitschaften*—that the strength of this force will be directly related to that of the eastern force and will increase if that increases.

Such measures, to many people in the western countries, will seem bold, even rash; and it is the measure of the gravity of the western defence problem that what is barely adequate should seem bold and onerous. But they are not so bold as the kind of measures that would be needed to execute the ideas that have been aired at Strasbourg: the idea, for instance, that German contingents should be integrated with western forces under one command. If such ideas are to come to anything in time to be useful, the Atlantic Council will have to clarify a great deal its conception of collective balanced forces; and the American, British and French Foreign Ministers will have to make much clearer, both to themselves and to the Germans, precisely how the people of the free German Republic are to be convinced that they want to be, and can be, integrated with a western partnership that is strong enough to protect them. For the working out of these ideas, time is still needed—though not much can be spared. The urgent thing is to prevent the present nucleus of a democratic Germany from disappearing under the eyes of the powers that occupy it.

Democracy in the Works

INDUSTRIAL democracy has been one of the most effective slogans of the social revolution of our times. To a greater extent than is often appreciated, it has been realised. Like political democracy, of course, it does not, in practice, bear much resemblance to the rosy pictures that the prophets drew. But at least there has been an enormous change in the atmosphere and practices of industry in the past generation or so. Cartoonists may still depict the old struggle between capital and labour in the old terms; propagandists, for their own purposes, may choose to pretend that industrial relations are still the old master-and-servant business; but in fact the conduct of the human side of industry is now everywhere and in every aspect a matter of consultation. There are very few major undertakings indeed which do not consult with trade unions or which have not set up the machinery of joint consultation. Works councils, production councils and, on a national scale, joint consultative councils of employers' federations and trade union leaders exist in profusion. Progress in these respects has been particularly rapid in the past ten years.

There are several reasons for the change. First, whether he wants to be or not, the employer today is in no position to be a dictator. The power of the trade unions, the scarcity of labour, the moral force of an almost universal liberal conscience, all prevent him from being the unscrupulous ogre which figures so prominently in socialist mythology. Second, the workers themselves show few signs of striving for the dictatorship of the proletariat. Very few indeed—and those few are Communists—are seeking power for the sake of power; the great majority want security, some say in affairs in which they are directly concerned and what they regard as a fair share of the material comforts available. There is no general desire among the rank and file to assume responsibility for running the businesses in which they work; most of them, indeed, dislike bosses who have been promoted from among their ranks. In short, the motives of managements and workers alike are neither so wicked nor so Marxist as has been presumed.

Yet the results are disappointing. It is not that there are many open disputes—outside one or two well-known trouble spots—the record of days lost is outstandingly good. It is not that there is any fundamental conflict between workers and managers, inherent in the different positions they occupy. On the contrary, the reconciliation of the direct interests of the two parties is, on the whole, carried out amicably enough—perhaps too amicably, since there is a distinct tendency to believe that both sides can get what they want at the expense of the ultimate consumer, who can be kept in his place by the devices of combination or state protection. If there are two opposing sides in industry today, it is much more a case of management and workers *versus* the consumer rather than one of Capital *versus* Labour. Six years of war and five years of Labour government have served to show both employers and workers what they stand to gain if they work together. The result has been an almost headlong rush to establish industrial democracy—perhaps not quite in the sense envisaged by the Webbs, but none the less deserving of the name.

The sense of disappointment comes from the fact that

industrial democracy, at least as practised in Britain, seems to be such a negative affair. It goes a long way to ensure that nobody's direct interests are hurt, and that nobody is pushed around against his will. The worker gets a sense of security and of immunity from disagreeable surprises ; the employer gets some immunity from "labour trouble." But, save in a few outstanding exceptional cases, industrial democracy of this sort has the reverse of an inspiring effect on industry itself. It contributes to, rather than clears away, the slightly soporific, suet-puddingy, vaguely complacent air that hangs over far too much of British industry. For all the consultation, there seems to be far too little genuine enthusiasm for industry as such. The negative questions revolving round who gets what out of the proceeds are managed fairly smoothly ; what is lacking is the active belief that what comes out of the process is directly related to what is put in ; there is too much comfortable assurance (on both sides) that some mysterious "They" will pay for the benefits that managers and workers derive from industry. Industrial democracy is certainly a good thing for the workers, and, perhaps, even better for the managers ; what is not yet established is whether it is a good thing for industry.

*

The solvent of these doubts does not, of course, lie in trying to build up an attitude of hostility towards industrial democracy, but rather of breathing into the practice of it some of that urgent concern for the dynamic efficiency of industry which is now lacking. The spread of consultation has eaten away much of the harsh discipline that made industry effective in the past, but it has not so far provided a substitute. "Discipline," in any case, is a dangerous analogy to use in an industrial context, since it inevitably suggests something unpleasant. It would be more accurate to speak of the nerve system, by which industry's decisions of policy get transmitted to where they are carried out on the floor of the plant, or of the steering mechanism by which the course set by the man at the wheel is transmitted to the rudder that actually steers the ship. By whatever name it is called, labour discipline today is poor. The condition of overfull employment has removed the fear of the consequences of dismissal. Most factories are short of men, and a worker who is dismissed from one, whatever the reason, can find employment immediately in another. Moreover, the feeling of equality on the part of workers with managements—which is a byproduct of joint consultation—also militates against simple, unquestioning obedience to orders. Nor, as Socialists hoped, have full employment and joint consultation yet engendered a greater sense of responsibility. Private ends, but this time more on the part of individual workers, still prevail to the detriment of the public good. But, in spite of appearances, the change is not necessarily for the worse. Blind obedience has no place in normal civilian relationships, and the sooner it disappeared the better. Unfortunately, the attitude of willing, intelligent obedience—one might almost say co-operation—which should have taken its place, so far exists in only a few firms.

The average management is by no means free of blame for this state of affairs. For all the care which employers have lavished on the machinery of joint consultation and on strengthening the new alliance with their workers, they have failed to ensure that the new type of leadership which is required is available at the place where it is wanted—the workshop floor, not the board room. However progressive the directors of a firm may be, they can achieve nothing unless their foremen and supervisors are competent to carry out their wishes. The foreman, alone of the management side, is in constant daily touch with the employees ; he is responsible for putting the policy of the management into practice ; he gives the orders and sees that they are carried out. And the point where orders are given is now very often the weakest link in the chain ; it is here that most of the unrest among workers has its roots.

It is difficult to blame foremen as a class. During the past fifteen years or so there has been a steady whittling away of their responsibilities and powers. Specialists have taken over a large number of their functions: the order of work is laid down by a planning department, piece-rates are determined by a rate-fixing department, processes are costed in a cost-office, and in some cases even the way of doing the job itself may be decided by a methods engineer. Furthermore, the foreman is no longer responsible for hiring or firing the men under him ; that is now the function of the personnel manager, who has also taken over welfare and trade union matters. In a large number of firms the foreman is left out of works councils and joint production councils, having no part in their decisions and usually only hearing about them at second-hand from one of the men under him. He is also hedged about by shop-stewards who, if they dislike him or if they wish to stir up trouble for their own ends, can make it almost impossible for him to do his work. His position is one of the least secure in industry, and changes in wage rates and in direct taxation have cut deep into the reward that he gets for his heavy responsibilities. The result is that the general standard of foremen is low, and few enterprising young men are now prepared to accept the position if it is offered to them. The wonder is not that discipline is poor, but that there is any discipline at all.

Promoted, in most cases, from the ranks because of his proficiency and seniority as a workman, the foreman may have little or no ability as a leader of men. His training for his new position is usually inadequate, and he often has no understanding of the larger organisation of the company into which he must fit. He is set apart by his position from the workers under him, but he is also too often bypassed by managements who are more and more inclined to deal directly with the men on the workshop floor—thus undermining his influence still further. Yet in the workers' eyes the foreman is associated with the management ; his faults are blamed—and rightly blamed—on the directors and factory managers, and there can be no hope of peaceful labour relations until those faults are corrected.

The remedy is self-evident. Foremen should be far more carefully selected—for their leadership rather than for their skill. Their training should be the best that their firms can afford to give them and should fit them for resuming some, at least, of the functions they have lost. Given such encouragement, and as much security as possible, the right sort of men may come forward for the job ; without the right sort of foremen, labour discipline, under present conditions, is bound to deteriorate still further. The first step towards improving labour relations and cementing the new alliance between managements and workers is to improve the standard of foremen.

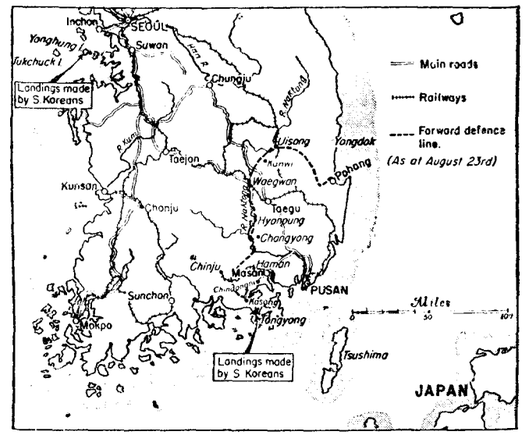
NOTES OF THE WEEK

Principles or Scrapbook ?

It is difficult to see what purpose can be fulfilled by the publication of the statement called "Labour and the New Society" issued by the National Executive of the Labour party. It is called a statement of principles, but it is much more like a pleasant little scrapbook in which each of Labour's leaders has pasted his own pet illusions—and delusions. It was Mr Bevan, presumably, who revived the old fable of "big business men, aristocratic landowners, bankers and merchants" directing the economic life of the country and deciding whether there should be prosperity or slumps, work or unemployment. It was, on the other hand, probably Mr Morrison who insisted that Labour does not believe in dead-level equality. But even he has not prevented the inclusion of the paradox which declares that inefficiency in industry must be eliminated—if necessary by nationalisation—and at the same time attacks profits, the rewards of efficiency.

As a vote-catching document, the statement will be a complete failure. There is nothing in it to convince the doubtful that the Labour Government is as good an administrator as it was an ardent legislator. The one new proposal of any substance is for a "world plan for mutual aid" to succeed the Marshall Plan in 1952. But one's enthusiasm for this, which is indeed an admirable objective, is tempered by the grandiose phrases in which the proposal is couched. There is to be an all-out attack on poverty everywhere. Diseases are to be rooted out ; there is to be a revolution in primitive agriculture ; irrigation would make the deserts fruitful—and so on. The machinery of the plan, says the pamphlet, would have to be worked out by the countries taking part. It is quite clear that very little working out has so far taken place at Transport House.

But it is mainly to the faithful that the statement is addressed, since it is to be considered at the party conference in October. Doubtless these will be moved by the pictures of the ideal life that the scrapbook reveals, and will cheer heartily the asserted determination to continue with the nationalisation of iron and steel. But to the ordinary citizen the statement is a little alarming. There was always a suspicion that the Labour Government, once it had completed its main nationalisation schemes, would find itself wondering what on earth to do next. Today, when it is faced with the supremely difficult task of superimposing a big new defence programme on an economy painfully climbing back to normal, this poverty of practical and constructive ideas becomes more strikingly apparent.



* * *

More Even Odds in Korea

It is now two months since the North Korean government launched its attack. Only an incurable optimist could hope that it will take only another two months to drive the North Koreans back to the 38th parallel, for the physical difficulties in the way are great ; but it is at least reasonable to believe that the United Nations will not now be driven out of Korea altogether.

A week of Communist attacks and United Nations counter-attacks has caused very few changes in the ring of defences round Pusan. The crisis of August 18th, when there were real fears that the defences might collapse, has been overcome by the gallantry and determination of the South Korean and American forces. Since then a steady stream of reinforcements has begun to move. Two British battalions have sailed from Hongkong and an Australian battalion is about to sail from Japan. A Royal Marine Commando unit is being sent by air. Together with the troops which are being sent from America, these reinforcements must now bring the number of United Nations troops to nearly the same as the number of North Koreans, but it will certainly be some time yet before General MacArthur will be able to go properly over to the offensive.

Meanwhile, the news of United Nations landings far up the west coast, on islands opposite Inchon, is particularly welcome. It has been a puzzling feature of General MacArthur's strategy that he has hitherto failed to take

advantage of the immense superiority of sea power that he possesses. Major diversions on the coast far behind the enemy front would seem to be an obvious method of distracting the Communists and relieving some of the pressure on the ring round Pusan. Such a diversion has at last been made, and if General MacArthur can keep the enemy guessing about his next few moves, he may with luck oblige the Communists so to disperse their forces as to enable him to begin taking the initiative.

* * *

What Should be the War Aims ?

As the military situation in Korea turns in favour of the forces of the free world some excited and puzzled discussion of "war aims" may be expected. So long as the issue is in doubt, it is necessary to insist that the primary aim is to win and to teach the aggressor a lesson ; when success is likely the question arises—what to do with the victory? The orthodox answer is, of course, that Korea should be united under an independent government, chosen in properly supervised and free elections, no easy matter to arrange in a war-torn country. This answer coincides with the declared policy of the United Nations and it is probably what the majority of Koreans on both sides want. Something of this kind should be said, with the authority of the United Nations behind it, before Soviet propaganda gets the political initiative by calling for an armistice and a settlement by conference.

Yet the more such a policy is examined the more perplexing are the problems it reveals. Are the Uno forces to stop at the 38th parallel when they get there, or is it a necessary part of their task that they should liberate North Korea from the regime that started the war ? If there are to be really free elections some non-Communist forces must be allowed sooner or later into North Korea. But it is difficult to imagine the Soviet and Chinese Governments agreeing—either in the Security Council or in negotiation outside—to allow forces that are predominantly American to come up to their frontiers with northern Korea. On the other hand, if the Uno

operations stopped at the 38th parallel everybody would be back where they started. South Korea would need a force to protect it; if that force were composed of white men Moscow would go on telling Asia that South Korea is a bridgehead for western imperialism. The Korean situation would become almost identical with that in Germany: the country would be still divided with the Communists left as the champions of unity and nationalism.

The defeat of the invasion might, of course, so weaken the Communist regime that peaceful amalgamation of North and South might be possible—if the Russians would agree—and both would be eligible for the economic aid needed to repair the ravages of the war. Here, at any rate, are the makings of an effective war aims programme which, joined to the insistence on free elections, might persuade many North Koreans that they have bitten off more than they can chew. It is for the free nations to take over the Communist slogan of "liberation." And this is the kind of result that Mr Acheson presumably hopes to attain with his policy of creating situations of strength out of which agreements may grow.

* * *

Scramble for Asia's Rice

It is not easy to share the relative optimism of the Food and Agriculture Organisation of the United Nations (FAO) expressed in a summary of the world rice position issued this week. Dealing with the effect of the war in Korea, FAO predicts that "there will be substantial needs of rice for the people of Korea when the fighting ends." FAO hopes that the impact of this additional demand from a war-damaged country, which in normal times used to export 40 per cent of its output to Japan, will not affect the world rice situation too adversely, "since there are indications that additional rice may be forthcoming within the next six to twelve months."

The supply and price of rice have great political significance. There is still a shortage of this basic food in the Far East and, even if supplies next year are slightly better than they have been this, an extra demand from Korea and Japan —which would otherwise have been partly supplied from Korea—is likely to have a considerable effect. For one thing, a falling off in available supplies may increase the difficulties of those who are fighting Communism in an area like Malaya, which has to import rice. For another it would tend to send prices up. The latest reports from Siam, for instance, indicate that rice covenanted for British areas under existing inter-governmental agreeements is still coming forward, but that there will be very little left over for private commerce; consequently, local merchants are already paying a premium, and this does not augur well for next year's inter-governmental price level.

Until the Korean war broke out there had been hopes that commercial trading might begin again next year. Provided exportable supplies were adequate, this would probably have suited the British well enough, since they might have been able to obtain more rice at a better price. Now, however, the picture has been entirely altered by the pressure of demand from Japan and by the need to ensure that supplies are not drained away to Communist China, leaving South East Asia short. Some form of international agreement is again necessary, and it should be drawn up at a conference attended by all the interested powers during the next month or two. Moreover, even before the Korean war, Japan was trying to increase its rice purchases in Siam and Burma. One of the most acute problems which therefore needs tackling, whether international control of rice is to be renewed or not, is the clash between Japanese and other rice buyers. If American-backed Japan tries to buy too much, the price will go up and shortages will occur in South-East Asia. This is surely the kind of serious political mistake that Washington and London can and should prevent by reaching at least a preliminary agreement before a conference is called.

The Colchester Court Martial

The secrecy which has surrounded the whole trial by court martial of three soldiers at Colchester is disturbing. Common sense, as well as security, demands that in any trial in any court no witness shall be required, or allowed, to repeat the offence with which a defendant is charged and make public information which is a security secret. But it is very difficult to see that security is helped by suppressing the very nature of the charge itself. Clearly justice is not. It could not happen in any other criminal court and some very good explanation is needed as to why it should be allowed to happen in a court martial.

In a recent volume "Current Legal Problems" (published by Stevens & Sons and edited on behalf of the Law Faculty at University College, London), Mr. Holland, a lecturer in law at the college, contributes a paper on the law of courts martial. He points out, with regret, that the High Court has recently, and in his view mistakenly, surrendered a great deal of the jurisdiction it once exercised over courts martial. The High Court has never let fall its right to examine the proceedings before an administrative tribunal, although equally it has never claimed the right to upset a decision unless some essential element of natural justice had been ignored. But, in two cases last year, Mr Holland suggests that the High Court was prepared to say, in effect, that what goes on in a court martial is not a matter for this Court. That is unfortunate. The search by service officials for water-tight security can, as experience in America has shown, too easily become a denial of elementary justice to the individual. The Colchester decisions reinforce the feeling that court martial practice and procedure will be made neither just nor efficient until responsibility for policy is laid on some civil authority, such as the Lord Chancellor.

Marshall Aid for Malta

The grant of $2,300,000 to Malta from the special reserves set aside by the Economic Co-operation Administration for the development of overseas territories of countries participating in the Marshall plan should go some way towards helping the Maltese Government out of its acute financial difficulties. The grant is to be used to cover half of the cost of a new electric power station, a project which Sir George Schuster described in his interim report* on Malta's finances as "very urgent." Yet the Maltese Government was asking for the whole of the cost to be met by an allocation from ECA. As it is, Dr Boffa and his Ministers will have to find not only the balance of the cost of the plant, which will come to about £832,000, but also funds to cover the local expenditure on constructing it, which in Sir George Schuster's report was estimated at £438,500.

Sir George recommended that the cost of Malta's economic development projects, which it is not possible to estimate exactly but would amount to over £4 million, should be met by a loan except in so far as it would be covered by a grant from ECA funds and from the Colonial Development and Welfare Fund. But, in addition to expenditure on economic development, large expenditure is also contemplated on social welfare projects. The capital cost of these, which include hospitals, schools, sewers, and roads and bridges, was originally estimated by the Maltese Government at £4,418,000. Sir George Schuster recommended cuts under every head, with the result that in his report the cost of "social equipment projects" is put at £3,000,000, and he considered that even this reduced total should be carefully scrutinised with a view to lowering it further. To meet this £3,000,000, the resources of the Maltese Government are not expected to cover more than half, leaving £1,500,000, which Sir George recommended

* Colonial No. 260. HMSO. 3s. 6d.

should be met by a grant from the British Government—a grant which has in fact been made.

*

Sir George Schuster's report has a much wider application than might be apparent. For, although Malta has special claims to assistance arising from its special sufferings in the war, and from its special strategic importance, its financial problems are typical of other colonies—particularly those which, like it, are achieving responsible government. How can their economies be made productive enough to support the social services that a modern government feels obliged to provide? In particular, how can this be done against a background of rapidly increasing populations? The outcome of Sir George's further discussions with the Maltese Government this autumn will be awaited with interest.

* * *

Seretse and Tshekedi

The arrival of Seretse Khama with his wife and daughter in London this week to begin their five years' exile from Bechuanaland has drawn attention once more to Seretse's unhappy dispute with the Government. There have been, however, a number of developments during the five months since the Government's decision was made. The legal validity of the banishment order is being questioned before the court at Lobatsi; Seretse's law suit against his uncle, Tshekedi, appears to have been settled amicably; and, more important still, Seretse and Tshekedi have announced their willingness to try to reach an agreement about the Khama dynasty and about the present government of their people, the Bamangwato. This announcement is significant because the chief reason for the Government's order of banishment was the quarrel between Seretse and his uncle and the consequent danger of dynastic feuds.

Tshekedi's position in the affair is gradually becoming clearer. He is undoubtedly an outstanding African leader who will not easily be diverted from his self-imposed task of lifting the Bamangwato out of their present poverty and weakness. Up to the time of Seretse's marriage, his plans for the development of his country—mainly agricultural and irrigation schemes—had met with little positive encouragement from Whitehall, but his persistence and obstinacy were beginning to have effect. The Seretse case temporarily blew his hopes sky high. Apart from his own colour prejudice, he must have been dismayed, as the British Government was, at the prospect of trouble with South Africa at this stage in his country's development. Now that the turmoil has died down and Seretse's wife has given birth, not to a son, but to a daughter who cannot succeed to the chieftainship, Tshekedi seems to have had second thoughts. He has always regarded Seretse as his natural successor and as the man who would finish the work which he had begun; he should not find it too difficult to find some suitable solution to the problems raised by Seretse's marriage. Moreover, if Tshekedi is prepared to run the risk of an angry South Africa on his doorstep, the British Government can hardly refuse to support him. In any event the whole case should be reviewed, and for the sake of the Bamangwato, if for no other reason, an attempt should be made to speed the reconciliation between Seretse and his uncle.

Minimum Wage in France

"Unless an adequate programme be put into effect to better the lot of the working class with the aid of the employers, the government and the Marshall Plan, the French people will not be strong enough to face a totalitarian aggression." This statement by American trade unionists who recently toured French industrial centres throws into perspective an extremely important event of this week—the new minimum wage scale that has been agreed by the French Government.

The figure has not been easily reached. It will be remembered that collective bargaining between worker and employer was re-introduced in February of this year, in response to the unions' complaint that freedom from price controls had returned but no corresponding freeing of wages had taken place. At the time, the National Assembly set up a Wages Commission to determine what wage should be the nation-wide legal *minimum vital*. This body could not agree, and handed the problem, unsolved, back to M. Bidault's government. The demands ranged from 19,000 francs per month (£19 8s. 0d.)—the Communist figure—to 12,500 francs, proposed by the employers. It proved impossible to fix an absolute nationwide figure on account of the difference between costs of living in Paris and in the provinces. The position of the present coalition government in the matter was complicated by the fact that M. Guy Mollet had made Socialist participation in it conditional upon a 16,000 franc minimum, whereas other ministers were more concerned with the effect on budget equilibrium of the new claims that it might stimulate among civil servants. The figures as finally settled are as follows:—

	Minimum Wage	
	New Wage francs	Old Wage francs
Paris	16,400	15,800
Group 2	14,820	13,600
Group 3	14,040	12,600
Group 4	13,260	11,800
Group 5	12,800	11,400

Will this new and higher minimum provide a satisfactory basis for all the collective bargaining that now impends? Will it produce moderation and contentment, or will it lead to a spate of claims from the whole hierarchy of more highly paid skilled workers—defending the "differentials"—that will swamp industry and start the familiar upward spiral? Had it been awarded three months ago, in a calmer international atmosphere and before the current rise in food prices started, it might have produced what M. Pleven lately called an "economy of security"—that is, a scale "adequate to allow the French workers of factory and field a well-being that would be worth defending if need be." Now, it is difficult to avoid the impression that too little has come too late. Much will depend on the course now taken by collective bargaining.

* * *

Looking Back to Liberation

The organ of the MRP, *L'Aube*, says quite bluntly that a continued failure to give the French worker "a well-being worth defending" is "an invitation to Stalin." This is true in the sense that genuine economic grievances enable the Communists to carry on with their work of neutralising the strength of the French people in the cold war; but they also exploit discontent with the workings of parliamentary government which seeks political expression and distracts attention from French foreign policy. The average Frenchman is not emotionally interested in the various pacts and plans which are signed in his name. He quite often believes that the Third Force is *vendu* to the Americans. He may realise that the standard of living he has is largely due to American aid, but he suspects that it has done too much to bolster up an obsolete party-system of which he is heartily sick.

Today, six years after the liberation of Paris, the chief political emotion seems to be a yearning for the old Popular Front days and for a more spirited Republicanism. This sentiment, which is perfectly compatible with a deep interest in the life of the British Royal Family, finds no real political expression. If M. Schuman's dogged persistence in trying to make something of the European idea fails, it is difficult to see what else could succeed in disturbing political apathy. It is depressing for the mass of the population, after the radical dreams of the liberation, to see the old, drab Third Republican

types resurgent. For them the symbol of the well-to-do is still the middle-aged and mediocre businessman, with his Citroen 15, his broad-brimmed hat, his brief-case, girl friend and liver troubles. Behind him loom *les trusts*, real or imaginary, controlling everything from toothpaste to beetroot.

The way out of this depression is hard to see. Perhaps something will come out of the revival of the French army which is now under way. Certainly something is achieved with its recruits. A technically superb army, democratic in the way that only an army can be democratic, even if it were small, might give something French the stamp of personality. There is energy and talent in plenty ; and if one French organisation could achieve excellence by the highest modern standards there would be others to follow suit. This, at any rate, is how many Frenchmen think as they see themselves called on once again to resume the military leadership of the Continent with a deeply divided society behind them.

* * *

Kashmir Unsettled

It is bad news that Sir Owen Dixon, the United Nations representative, has had to abandon his efforts to bring about a solution of the dispute between India and Pakistan over Kashmir. In a statement made in Karachi on Tuesday, just before leaving to report to the Security Council, he admitted that "it became futile to call further conferences." Sir Owen was charged primarily with trying to get the two governments to agree to hold a plebiscite—or several local plebiscites—in Kashmir. When this failed, he tried to secure agreement on a scheme for partition, possibly combined with a limited plebiscite in certain areas, notably the Valley of Kashmir. In this he found, however, that "Pakistan continued to stand upon the agreed United Nations resolutions specifying an overall plebiscite as a manner of settlement."

Fortunately, Sir Owen's departure is not necessarily the end of the matter. He declared finally: "I am unwilling to suppose that after all the examination which the problem has received the governments will be unable to resolve it by direct negotiation." Mr Nehru and Mr Liaquat Ali Khan are expected to meet again soon ; it is still hoped that this may be during the next few weeks. If so, their first duty to their people will be to begin where Sir Owen has had to leave off, and even at this eleventh hour to reach a successful conclusion. The main indictment against them revealed by Sir Owen was that they never produced proposals of their own ; all the initiative had to come from him.

* * *

The "Altmark"

The Foreign Office has now published (Cmd. 8012) the correspondence that passed between the United Kingdom Government and the Norwegian Government in 1940 with regard to the *Altmark*. The *Altmark* was returning to Germany after the action off the River Plate with some 300 British prisoners on board. About February 14, 1940, she entered Norwegian territorial waters in the vicinity of Trondhjem. On February 16th she was in Jossingfjord where she was intercepted by H.M.S. *Cossack*, boarded, and the prisoners released. The Norwegian Government at once protested at what it claimed was a violation of its neutrality and the British Government delivered a long reply on March 15, 1940. The German invasion of Norway put an end to the correspondence, which is a pity, for the British Note of March 15th is so well written that it deserved an equally elegant rejoinder.

The *Altmark* case is, under international law, a debatable one and there has been much debate over it. It raises two questions ; was the Norwegian Government justified in allowing the *Altmark* to spend three days in Norwegian territorial waters, and use some 400 miles of them (600 miles by the time she completed her journey) for the sake of eluding interception by the British Navy ? (The fact that she had prisoners on board was largely irrelevant, save for the fact that the German captain lied about it when stopped by a Norwegian torpedo-boat.) Was the British Government justified in ordering H.M.S. *Cossack* to enter Norwegian territorial waters to board the *Altmark* and release the prisoners in her holds ? The answer to both those questions is probably "No." The British Government's contention was that the right given by Article 10 of the Hague Convention of 1907 was no more than the right for a ship to follow a normal navigational course from one spot to another even though that course did involve passing through the territorial waters of a neutral. Clearly, the *Altmark* was not on any normal course back to Germany. But it is also true that, if there were any breach of neutrality by the *Altmark*, it was for the Norwegian Government to put a stop to it, not for the British Government to do so. That is a point from which the British reply slides gracefully away.

The correspondence emphasises one of the failings of international law, the fact that it depends for its force on the conviction by all countries that every other country will abide by the rules. It is obvious that the Norwegian Government did not exercise its full rights over the *Altmark* during those three days because Hitler would have bitten the carpet very furiously if, in 1940, a small neutral country had so insulted his Reich as to ask it to observe the rules of war. If any one country shows by its conduct that it does not regard any rules which interfere with its ends as binding, then the rules themselves are dead, for their enforcement is not automatic ; it becomes a matter of policy. Perhaps that, too, is the moral to be drawn from the fact that the correspondence is published for the first time in full in August, 1950.

* * *

Parliament and the Professors

Whether Parliament should have a tighter control over the universities' expenditure is a question raised in the latest report of the Committee of Public Accounts* which comments on the freedom allowed to the universities in spending their Exchequer grants. The committee raised the same question last year, and Sir Edward Bridges, Permanent Secretary of the Treasury, sought to allay the committee's anxiety and to defend the financial autonomy of the universities. His efforts appear to have been in vain; the committee has now returned to the charge.

The estimated Exchequer grant to the universities for the year 1950-51 is £23 million, compared with a little over £2 million in 1938-39. This tenfold increase in grant now provides for many universities the bulk of their income, and even Oxford and Cambridge are dependent on public money for nearly 50 per cent. of their expenditure. Yet in spite of this financial dependence on the state the universities have not become subject to any detailed financial control and would most bitterly oppose any attempt to enforce it. The Public Accounts Committee, while it expresses its unwillingness to subject the universities to the usual procedure of Treasury control, has now felt itself bound to investigate further "any means of assuring Parliament that the taxpayer's money is not wasted." The Treasury has, therefore, been asked to discuss with the University Grants Committee and the universities themselves what further information could be made available in order to provide such an assurance.

It may be that, since the time is approaching when the Treasury is in any case due to review the universities' expenditure as a basis for the next quinquennial grant which starts in 1952, the matter will be shelved for the time being. Nevertheless it raises one of the big dilemmas of the modern state —how to combine financial accountability, when public money seeps into almost every corner of national life, with liberty. Independence is vital to the universities. Make them answerable to bureaucracy for every penny of government grant, and originality and creative thought will be endangered. Logically the taxpayer has a right to know what happens to his money, and if more information can be provided in the annual reports of the University Grants Committee, particularly about the results of earmarked grants for new developments, so much the better. For the rest it is far better that the taxpayer should lose one or two million pounds by inefficiency than waste far more through misplaced curiosity.

*Fourth Report. Session 1950. HMSO 9d.

* * *

Illiberal Greek Liberals

The present Greek political crisis is unnecessary, and the action that caused it unwise and irresponsible. The coalition government under General Plastiras, which was forced to resign after the secession of its Liberal members last week, enjoyed a wider measure of popular support than most of its immediate predecessors. In its four months in office it had begun to tackle the appalling legacy of problems left by the civil war with energy and initiative. General Plastiras, moreover, realised the importance to Greece's security of resuming friendly relations with the Jugoslavs. Although his first attempt at a *rapprochement* failed at the last minute, there have been signs recently that Marshal Tito was willing to try again—with General Plastiras. He is most unlikely to wish to negotiate with anyone as far to the Right as Mr Venizelos.

The ostensible cause of the Liberal defection was disagreement over the degree of clemency to be granted to the former guerrillas and their sympathisers. General Plastiras believed in a more lenient policy towards them than did his Liberal colleagues ; although he modified his Leniency Emergency Law to meet their objections, they still were not satisfied. This is, of course, no trivial matter ; it is a problem in which the passions aroused by the civil war are deeply involved ; and it is impossible to reach any agreed solution without a great deal of give-and-take by all parties. In the present state of international tension, with the "Free Greece" radio pouring out an endless stream of suggestive propaganda about the "war preparations" of the Anglo-American imperialists in Greece, it would be folly not to maintain adequate security precautions. But it is obvious that the pacification of the country and the successful reconstruction of its economy require also a certain measure of leniency. In fact, the law passed at the beginning of this month seems to have been a pretty fair compromise.

Mr Venizelos's action appears to have been dictated not so much by fear for the security of the country as by his dislike of the present coalition government, which was set up after the failure of his own attempt to form an acceptable government after the elections last March. He has never taken his place in the coalition under General Plastiras of which his party was an integral part. For weeks past the stability of the government has been impaired by speculations about his intentions and by rumours of the impending defection of the Liberals. He has now announced his intention of widening the basis of the present all-Liberal government which, with Populist support, he has formed. All the same it looks as if Mr Venizelos is more interested in furthering his own ambitions than in the welfare of his country. Such behaviour discredits parliamentary government.

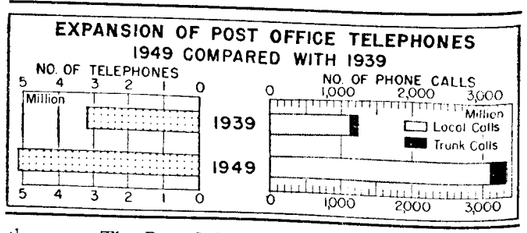
unnecessary excitements. President Soekarno's continual harping on the subject of New Guinea, and the tendency to thrust this issue into the forefront of Indonesian politics, unfortunately seem to show that he may be one of those politicians who believe that the manufacture of a national grievance against a foreign power is the best method of maintaining national unity in support of a precariously established government.

President Soekarno's latest pronouncement on New Guinea —or Irian, as the western, Dutch half of the island is now called—coincides with the transformation of the United States of Indonesia, the federation set up by agreement with the Netherlands, into a unitary Republic of Indonesia with control centralised in Java. The political realist may consider that this development has been inevitable, and that it was foolish of the Dutch negotiators to expect that a federal structure could be maintained against the Javanese political preponderance after Dutch troops had been finally withdrawn. Nevertheless, it now seems that the Indonesian Republican leaders never intended to carry out the terms of their agreement with the Dutch, and it is not a good omen for the future of a newly independent state that it should start its career with such an act of bad faith.

*

The concentration of power at the centre in Indonesia renders even less valid than before the Indonesian claim to western New Guinea, for it excludes any idea of autonomy within a loose federation. The primitive negroid inhabitants of New Guinea have nothing in common in language, religion or culture with the people of Java or even with those dominant elements of East Indonesia who may reasonably be called Indonesian ; the claim of Jogjakarta to New Guinea is based solely on the fact that it was annexed by the Dutch and formerly administered as part of their East Indian colonial empire. On any rational estimate of capacity for self-government, the people of New Guinea are at a stage of development in which they must remain for a period under some kind of colonial administration.



The only question is whether this should be carried on from Java or the Netherlands. When it is taken into consideration that Indonesia is itself badly in need of foreign economic and technical aid, and is desperately short of officials competent to staff its own administrative services, there can be no question which regime in New Guinea would be for the greater benefit of the inhabitants. Nor is it only with the Dutch that the loudly voiced Indonesian claim produces dangerous friction. Australia has been greatly alarmed by the agitation, for if Indonesia can make good its claim that the New Guinea natives are Indonesians, it can demand the eastern, Australian half of the island no less than the Dutch half. The Australian Government has now made it known in no uncertain terms that it is vitally interested in the future of New Guinea and will resist any Indonesian attempt to force the Dutch out of Irian.

Waiting Lists for Telephones

Of all the matters dealt with in the report of the Select Committee on Estimates on the Post Office it is telephones that will arouse the most interest. The Post Office has come in for much criticism from an exasperated public for its slowness in expanding and improving the telephone service, and it is useful to have the facts set out. The whole service is half as large again as it was before the war, but in spite of this the net annual demand for new subscribers to be connected is 63 per cent above the prewar average, and a waiting list of over half a million has piled up in the last two years—excluding the "concealed" demand of those who do not, in these circumstances, even bother to apply.

But in spite of the public's eagerness to be "on the 'phone" the rate of provision of exchange and other equipment has actually fallen, and fallen heavily, since before

the war. The Post Office is not to blame ; all its capital expenditure is obliged by Act of Parliament to be incurred on the basis of loans sanctioned by the Treasury, and is therefore subject to the full weight of the Government's capital investment policy. While the Treasury keeps a tight hand on the purse strings it is impossible to expand permanent equipment at more than a snail's pace, or to overload the existing equipment with fresh subscribers, and the plea that more subscribers mean more revenue is irrelevant to the motives behind the Government's policy.

There are two observations to be made on the present situation. The first, made by the committee, is that the industry supplying telephone and cable equipment is almost entirely dependent on the Post Office for its home market, and since export orders are now falling off heavily it looks to an increase in Post Office investment to maintain full employment. If skilled workers have to be laid off this may well appear to the present Government to constitute a special case for the release of more capital.

The second—which does not concern this committee—is that at present there are a great many private subscribers enjoying "squatters' rights" who would relinquish them without great hardship if the price were relatively as high as before the war, while many of the half million people on the waiting list are only in the queue to have a telephone in their homes because at three shillings a week it is cheap at the price. The whole "rule of thumb" structure of the telephone tariff and the price differential between business and private use might very well repay thorough investigation.

Moscow in Islamic Clothing

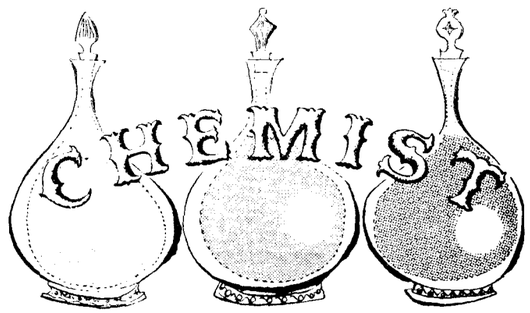
From time to time since the war, appeals from Moscow to Islam, uttered through mouthpieces in the Moslem Soviet Socialist Republics, have been used to some effect. Towards the middle of this month, the tap from which they pour was turned on to publicise the Stockholm peace pledge. "Offering prayers to Allah for the peaceful co-existence of nations," runs the broadcast address of the chief Mufti of the Moslem republics of the USSR, "I call upon you to join the movement of the Moslems of central Asia and Kazakhstan for the defence of world peace." Caucasian leaders—Azerbaijani and Kurdish—have also been called into service, "I appeal to all Moslem believers in Iraq and Iran to join this great movement for peace and put their signatures to the Stockholm appeal." From these beginnings it is scarcely a step to the announcement that the peace appeal "has made greatest progress in Syria and Libya, countries which rid themselves of the French and British occupiers four years ago." One step further leads to the news that "the Korean people's struggle represents part of the general struggle in Asia and Africa for national liberation."

The western world is apt, with a shrug, to write off all such matter as too contrary to fact to be effective. To do so is to underrate its potency. Even when the United Nations wins in Korea, the Americans will remain, in the eyes of Asians, intruders on their continent. However oppressively Asiatic Russians may behave, it is to the westerner that the epithets "unwanted" and "imperialist" are still most readily applied.

There is further evidence of this fact in a warning uttered this week by Abd-el-Krim, the ex-leader of the Moroccan Riff who is now a guest-exile in Cairo. He proclaimed that South Korea, the Indo-China of Bao Dai and the situation in French North Africa are all manifestations of the same phenomenon—western imperialism. Abd-el-Krim is not an important figure; he is a spent warrior, surrounded by exiles who feed him with talks that France is finished ; the weight his word carries is not great. But the same message is on other Moslem lips. One of the biggest and most difficult tasks before western propagandists is to prove that the imperialism of today bears a Russian trade mark.

Shorter Notes

British emigrants benefit from three useful, if minor, amendments to exchange control regulations that have been announced this week. In future they may draw up to £50 each year from their sterling accounts for payments in this country without restriction ; payments into their accounts will be subject to no greater restriction than those into the accounts of other residents in their new country ; and, subject to official approval in each individual case, assets in their accounts can now serve as collateral for loans or overdrafts.



*

A recent article in the American *Oil and Gas Journal* discloses that the Saudi Arabian oilfield of Aboaio is now producing at the rate of 450,000 barrels a day—a rate equivalent to an annual output of 22 million tons, and the highest output of any single field in the world. The output comes from only 45 wells, out of a total of no more than 65 so far completed, in an area 30 miles long and about three miles in average width. The field, exploited by American interests, was discovered in 1941.

Marriage and Prosperity

The increase of marriages amongst the labouring classes . . . implies a proportionate increase of the capital of the country directed to provide for the future supply of that labour which is the source of all wealth. Its prospective advantages are very great, as well as its immediate advantages. So many more new and, in the great majority of cases, comfortable homes are established ; so many more young people are settled and the means provided for their fulfilling duties as parents ; so many more bonds are given for good behaviour and for an attachment to order ; in so many more instances are the restraints of married life with its enjoyments imposed on youthful passions, and they are directed to their most appropriate and most beneficial end. To the very opulent, who have the means of amusement at their command, whose houses have in them every comfort, provided by servants, marriage is of comparatively little importance ; but to the working classes—as establishing homes for them, and finding mutual and mete helps, without which they could scarcely continue their labour, must want their meals or have them inefficiently provided, and must want a place for rest and ordinary recreation—marriage is essential to comfort and almost to existence. It is not generally amongst the labouring classes, but amongst the classes that hang on the skirts of gentility and aspire, without success, to be enfolded in its robes, that we find the most celibacy. Marriage, whatever cares it may bring, provides for the welfare of the labouring classes as well as the future supply of labour ; and every increase in the average number of marriages which must, as the rule, be marriages amongst them, is a sure sign of their prosperity.

Letters to the Editor

School Leaving Age

Sir,—Mr Molson's suggestion for increasing productivity in the armaments drive is to reduce the school leaving age. It is difficult to believe the suggestion is seriously made, for there are others besides the Government responsible who regard the raising of the age as one of the worthwhile reforms of the postwar years. There is an element almost of panic in the proposal. The teachers who have had to deal with the "extra year" (including myself) will agree that, despite the difficulties and the shortages, it has been worth while. To take the suggested step backward would imply either that we are not really interested in the children's welfare or that we are not prepared to make a long-term investment in them.

It is not desirable or necessary to follow Mr Molson's argument point by point: but one must take note of his claim that the easiest way to increase production is to increase the labour force. Has, then, the principle of diminishing returns suddenly become obsolete? And is it not tacitly admitted in the Government's statement that there is still a gap between actual and potential production of the existing labour force? Again, Mr Molson's proposal, he claims, would cause a minimum of social inconvenience; it is disturbing to hear one of our responsible legislators speaking thus of a group of people not adult enough to wield any influence such as a vote might give.

Mr Molson does not specify whether he would apply his suggestion to all children. It is difficult to believe he intends to compel public, independent, and grammar schools to restrict their terms by one year, with disastrous results on examinations and university entry. It is to be presumed therefore that he has the "modern" school pupils in mind. The bulk of these children belong to the lower-income class; were the suggestion adopted, therefore, it could easily be interpreted as legislation aimed at one class; political reverberations would undoubtedly follow.

In my view it would be deplorable if this major educational reform became a political football. I suggest Mr Molson's proposal should be turned down—and firmly.—Yours faithfully, A. Gooch

Estate Duty on Private Companies

Sir,—In your article on "Income Tax Reform" you mention the tax and estate duty difficulties of private companies, and state the problem:

> To find a way of strengthening the contribution of small businesses to the nation's output without opening the door to tax avoidance.

I write to call attention to an estate duty situation which must impair not only the contribution of small businesses, but their prospects of survival, in cases where the element of avoidance of duty is wholly absent.

The attack on "private companies" (using the expression, as you have done, in a fiscal sense) originated in Section 21 of the Finance Act, 1922, the declared object of which was to prevent the avoidance of payment of super-tax (as it then was) through the withholding from distribution of the income of such companies (as therein defined). Some regard to the question of tax avoidance has continued to be paid in that legislation as it has evolved; e.g., it did not at first apply to any such company unless it appeared that there had been a failure to distribute "a reasonable part" of the company's income, and it was open to a company on appeal to show business reasons for non-distribution, and later, when it was made more drastic, a distinction was made between investment companies and trading companies and the provisions as to automatic apportionment of income, for example, applied (and apply) only to the former.

The Section 21 concept of a fiscal "private company" was "lifted" for estate duty purposes by Part IV of the Finance Act, 1940, polished up to make it more far-reaching, and harsh new estate duty provisions were applied to such companies, but without the slightest regard to whether or not there was any element of avoidance of duty. By Section 55 (as extended), if the deceased had "control" (widely defined) of such a company at any time in the five years ending with his death his shares must be valued by reference to the value of the company's assets. The normal "market value" basis of valuation, laid down in 1894, is thus swept aside and no regard is paid to the type of company, the saleability of the shares, or whether any element of avoidance of duty arises. This provision is being applied strictly to the everyday case of family business incorporated, purely for reasons of family or commercial convenience, as a private company.

Section 46 of the same Act deals with transfers of property by the deceased to private companies and contains serpentine provisions for deeming the company's property (in defined proportions) to be the property of the deceased passing on his death. So Draconian are these provisions that official assurances have been given that they will be applied "reasonably." Thus we have statutory provisions so oppressive that the executive admits (at least by implication) that their general application would be "unreasonable"—the executive being the judge of what is "reasonable."

These provisions, and their effect, deserve close scrutiny in the light of the test laid down in your article. If those questions fall outside the scope of the Royal Commission, as appears likely, it is to be hoped that they will be made the subject of a separate inquiry.—Yours faithfully, Tax Counsel

Temple, E.C.4

The Soviet Budget

Sir,—In your article in your issue for August 12th, the budget figures, given in astronomical numbers of Russian roubles, would be difficult to comprehend unless they could be reduced to a medium with which we are all acquainted. Your correspondent does this by informing us that 11.2 roubles equals £1. But, if this rate of exchange is applied to the budget figures, the Russian budget revenue is about £39,000 million or ten times the budget revenue of Great Britain. If we assume that the population of Russia is nearly five times as large as this country's, and that the Soviet budget is somewhere around 60 per cent of Russia's national income, we must still conclude that the national income of Russia per head of population is greater than in this country. Thus, the average Russian citizen must enjoy a higher standard of living than his counterpart over here. Are we, therefore, to believe that all assumptions that we were relatively economically better off than the regimented masses of Russia have been false?

A rough and ready measuring rule for the economic strength of the modern industrial state is its steel production, as steel is the cardinal raw material in modern industrial development. Working on this basis we find that, as the United States' steel production is about six and a half times the United Kingdom's, the former's national product should be as proportionally large, which in actual fact is approximately true. Thus, if we take Russia to have a modern industrial economy, which the Communists would be the last to deny, and that her steel production is 26 million tons per year, her national product would be about one and two thirds that of the United Kingdom's. Although this comparison almost certainly errs on the small side, it is vastly removed from the result obtained if the rouble is taken at its fictitious exchange value of 11.2 roubles to the £1.—Yours faithfully,

K. R. H. Allen

Ringley Road, Whitefield

[We agree with Mr Allen that the exchange rate of 11.20 roubles to £1 is completely fictitious. Any worthwhile comparison between the budget expenditure of the Soviet Union and that of any other country must be carried out in relation to their respective national incomes. Unfortunately the national income of the Soviet Union is always given in 1926-27 "constant" prices and it is extremely difficult to establish a satisfactory conversion rate between 1926-27 and current prices. The difficulty of making international comparisons of national output is shown in the case of the United Kingdom as against the United States. At pre-devaluation rates, the national product of the United States in terms of sterling is about 5½ times as high as that of the United Kingdom; devaluation alters the ratio to 8 to 1.—Editor.]

Books and Publications

The Wealth of Nations

Le Grand Espoir du XXme Siècle. By J. Fourastié. *Presses Universitaires de France.* 220 pages. 320 francs.

M. Fourastié, in his closing paragraph, modestly describes his book as a "rough essay," and invites criticism. It is indeed a vulnerable piece of work, with at least as many holes in its argument as Malthus's "Essay on the Principle of Population"; but in its stimulating and illuminating quality, in its historic sweep, in its power to link apparently disparate social phenomena in the light of a few guiding principles, it shares with the "Essay" other characteristics besides those of a cockshy. Very broadly, M. Fourastié's thesis is as follows. The chief expansive and shaping force in the modern economy is technological progress, the growth in physical yields per man hour. That progress is highly uneven; significant in primary economic activity, enormous in manufacturing, virtually absent in tertiary or service activity. At the same time as the production pattern changes in accordance with this powerful but uneven influence, the consumption pattern changes in accordance with the uneven satiability of different categories of the human want; as total wealth increases, a rapidly falling proportion of the gain is taken out in foodstuffs, a rapidly rising proportion first in manufactured goods and then in services. From the difficulty in adjusting these two patterns, thus constantly and inevitably tending to diverge, arise the strains, the growing pains, which afflict the economy the more severely the more rapid the tempo of progress.

This state of affairs, however, is a transitory historical phenomenon. Prior to the Industrial Revolution, the pace of technical progress was slow enough for necessary adaptations to take place without acute social and economic malaise; crises were crises of nature or of politics rather than of maladjustment between production and consumption patterns. And in the not far distant future the pace must inevitably slow again, since even were primary production to have progressed to the land of Cockaigne and secondary production to a press-button Utopia, tertiary production would constitute the irreducible hard core of necessary labour and its products would be insatiably demanded.

From this general outline of economic morphology M. Fourastié, armed with a formidable statistical apparatus (his regard for Mr Colin Clark is only very little this side of idolatry), deduces explanations of the nature of depressions and crises, of the course of international trade, of the structure of industry, of the plight of postwar Europe, and particularly of France and Great Britain, of the relations of classes, indeed of virtually every major problem engaging the attention of economists. On none does he fail to throw a new and stimulating light; chapter by chapter there emerges the outline of nothing less than a new economic interpretation of history.

If one could only leave it there. But M. Fourastié's weaknesses are as striking as his strength. It is not only that, despite disclaimers, he is as confident in his projection of existing trends as Malthus himself—or that he surprisingly ignores the at least possibly menacing Malthusian problem of today; nor that, having departed from general usage by applying the terms primary, secondary and tertiary not to extractive, manufacturing and service activities as such but according to the comparative pace of technical progress, he slips disconcertingly to and fro between the old definition and the new. It is that his economic theory in the usual sense, his grasp of the processes of value equilibrium, is naïve and amateurish almost beyond belief.

He may be forgiven easily enough for not having the very latest, the post-Keynesian, developments of trade cycle theory at his fingertips; less easily for dismissing in a paragraph, as entirely secondary, the whole question of adequate or inadequate monetary demand. His view of international trade takes no account whatever of comparative costs within each of the three sectors. One is constantly being pulled up short by evidence of such gaps in his intellectual armoury.

When all is said, however, it remains true that "Le Grand Espoir du XXme Siècle" is more worth reading and more worth thinking about than many more impeccable works. Economists who dismiss M. Fourastié because, not to put too fine a point on it, he not infrequently makes a fool of himself, may well find eventually that the laugh is on them.

Revenus Nationaux et Paix Mondiale. By J. R. Boudeville. *Librairie du Recueil Sirey.* 162 pages.

M. Boudeville's book is a plea for an approach not only to economic but also to political problems from the angle of National Income. Only such an approach, he argues, can enable statesmen and planners (whether in the "planned society" or otherwise), to pursue realistic and internally and externally harmonious policies. The plea goes a good deal further than a mere emphasis on the collective economics, the "macro-economics" as it is often called, of Keynes as compared with the economics of individual transactions analysed by the "orthodox" economists; it is based on the belief that the most important facts about any nation, the facts determining its role in the world, are those concerning its national income—absolute size, amount per head, rate of growth, distribution. He should not on that account be accused of a narrowly materialistic interpretation of history; on the contrary, he shows himself acutely conscious of the social and psychological forces that influence those economic changes in which he is primarily interested. (His admiration for those British characteristics which have made possible the Crippsian puritanism of the last three years is touching, and one would like to be certain that it was entirely justified.)

Perhaps the most valuable single fruit of the study of national incomes is the sense of possibilities—and politics has been defined as the art of the possible. It is the national income figures, for states and for groups of states, which demonstrate most incontrovertibly the impossibility of getting quarts out of pint pots, which establish the quantitative limits of policy, which isolate incom-

Central Banking M. H. de KOCK

patibilities; and as M. Boadeville demonstrates (notably in his discussion of French fiscal policy) fallacies can be detected from this angle which are hard to pin down from any other. He is less convincing when he argues or appears to argue, that the spiritual malaise of the west could be dispelled if only the peoples concerned could be brought, through study of the National Income, to understand the economic evolution through which they are passing; and it is frankly distressing to find him maintaining, in his concluding chapter, that the economically intermediate regimes of western Socialism, midway between the Russian and American models, correspond in some almost mystic sense to a political Third Force. This is not the hard-headed objectivity which he has elsewhere demanded of economists and politicians, but the grossest and most wishful argument by analogy.

The Scope of the Assembly

A Commentary on the Charter of the United Nations. By N. Bentwich and A. Martin. *Routledge and Kegan Paul.* 239 pages. 18s.

Kelsen's recently published "Law of the United Nations" is a work of mammoth size; even Goodrich and Hambro's well-known commentary now runs to 551 pages. Professor Bentwich and Dr Martin have provided a more manageable commentary primarily to assist laymen to understand the impact of the Charter on current events.

A surprising amount of helpful information and comment is pressed into the 192 pages which suffice to cover—both text and commentary—the preamble and 111 Articles of the Charter. Naturally, discussion of controversial issues has had to be limited. In general, the authors simply give their own opinion without citing authority but with a caution that the point is controversial. The object and scope of the book being what they are, such recourse to dogmatism is inevitable and legitimate. A commentary article by article cannot always give a clear picture of structure and general principles, but the non-specialist will find this book a useful guide to an understanding of the United Nations.

The comment on page 46 concerning the legal effect of recommendations of the General Assembly for the "peaceful adjustment of a situation" seems to require qualification. Recommendations addressed direct to member governments, it is there said, are not binding, but those addressed to organs of the United Nations must be complied with; even the Security Council is expected to act upon a recommendation of the Assembly provided that it does not invade the Council's special sphere of security. A footnote states that, although the United Kingdom was opposed to the partition plan for Palestine, the *duty* of the Council to carry out the part assigned to it was not challenged. But in the Palestine issue more than one member of the Council, including the United States, insisted that the Assembly's recommendations carried moral, not legal, force. The point is a big one because the governmental powers of the Assembly would be enormously enlarged if it could impose obligations on members by the simple expedient of addressing its recommendations to a relevant organ of the United Nations. The consequences in the fields covered by the Trusteeship or Economic and Social Councils would indeed be startling.

The authors stress the illusory character of the collective security provided by the Charter in view of the fact that the military obligations of individual states have not crystallised into the special military agreements which the Security Council was intended to negotiate with each member. During the transitional period, before a sufficient number of these agreements have been concluded to enable the Council to assume responsibility for military enforcement action, the Charter gives to the five Permanent Members a Mandate to consult together with a view to joint action on behalf of the organisation. The Charter simply does not envisage a situation like the present one when no special agreements exist to clothe the Council with authority and there is no possibility of fruitful consultation between the five Powers. The assistance given by individual members to Southern Korea has its own justification as collective self-defence; but some members at least appear to regard the voluntary *ad hoc* provision of military forces by individual States as a sufficient basis for the assumption of responsibility by the Council for military enforcement action.

Logic and Insight

A Scientific Autobiography and other Papers. By Max Planck. Translated from German by Frank Gaynor. *Williams and Norgate.* 192 pages. 8s. 6d.

The publication by Planck of his quantum theory of radiation in 1900 is universally recognised as the turning point of modern physical science; its consequences were revolutionary and profound to a degree with which no other single event of the era can compare. Yet Planck was so typical a "classical" physicist that the suspicion persists that he was not fully aware of the implications of his hypothesis. The matter has been settled by the decisive evidence of his son, but it remains true to say that Planck strove for the remainder of his life to reconcile "classical" physics with the new physics he had called into being, as though in penance for his iconoclasm. Unfortunately, the title essay of this small collection is rather too slight to give much insight into Planck's attitude to the later developments of quantum theory, and serves more to emphasise the character of the author as the very epitome of the nineteenth century German school of physicists—uncompromisingly rigorous, single-minded and persistent. His epoch-making discovery owed far more to iron logic than to mercurial insight, and he repeatedly emphasises his impatience at the slow recognition of his "conclusive theoretical proofs," in a way rather surprising in one of such established reputation in his revered old age. Perhaps a slightly bitter note is inevitable when one can distinguish true from false as clearly as Planck did.

The other essays in this book discuss, in various ways, the nature of the truths and the limitations of exact science. Planck was a true believer in the "real" world, and the quest to discover its laws appeared to him as the most sublime pursuit. But the rigour of his methods made it all the more necessary for him to be sure of their range of application, and the true meaning of their conclusions, because he would not be willing to claim "conclusive" proof of anything beyond that. In effect, while being quite certain that he can see beyond the end of his own nose, he is trying to prove it to his own satisfaction; but the reader, also quite certain, may not find the proof quite satisfying, though the fault will probably be his own.

Aboriginal Economics

Economic Structure and the Ceremonial Exchange Cycle in Arnhem Land. By Donald F. Thomson. *Macmillan.* 106 pages. 12s. 6d.

Dr Thomson's monograph is tantalisingly short. It reports the discovery, among the most inaccessible of surviving Australian aborigines who still live in the manner of their ancestors, of an institution that has long intrigued students of primitive economic life. Commonly called "gift exchange," it was first described in detail by Malinowski, who observed it in Melanesia. It is the answer to the question: how do goods produced in one part of a large area occupied by numerous small, mutually hostile tribes circulate over the whole area in the absence of organised markets and a medium of exchange? The goods travel by means of ceremonial exchange of gifts between members of different tribes who are usually linked as life-long partners for this purpose. Most significant is the fact that the articles of fundamental importance in these exchanges are not of utilitarian value but only of display and prestige value and that they must not be permanently retained by any one person. Tools, weapons, foodstuffs are exchanged by gift under cover of the magically sanctioned exchange of the valuables. Such a system involves not only regional specialisation of production but also a premium on the skills used in making the valuables and strong incentives for producing and acquiring them.

The occurrence of this system of exchange among a race at so low a level of economic life as the Australian aborigines is noteworthy. Dr Thomson performs a valuable service in emphasising the high degree of practical knowledge and craftsmanship as well as the sustained labour displayed by the aborigines in keeping the system going. But his account is disappointingly sketchy. It is to be hoped that he will follow it up with a comprehensive study of the subject.

AMERICAN SURVEY

Paying for Korea

Washington, D.C.

THE economy of the United States is so strong that the new programmes of military expansion need cause no serious trouble unless Congress and the public between them make trouble inevitable. If the public chooses to show a little self-control, other controls will be unnecessary. The domestic market will not be short of consumer goods, there will be enough to satisfy all normal demands and, except in a few cases, even the swollen demands of any boom less exigent than that of the last few months. But the public did not begin by showing self-control. It began by buying up all the types of goods which memories of 1942 suggested that it would be hard to get in an emergency. Sugar is the supremely ridiculous example.

Department store sales, which had, for the week before the Korean war began, been only 1 per cent above the same week of last year, were, for the next week, 10 per cent higher. Two weeks later they had increased to 25 per cent over 1949 and by July 22nd to 46 per cent. Since then the pace has slackened a little. Part of this increase was due to influences under way before the Korean invasion, but at the same time prices started to go up to a level much higher than could be justified by anything but popular hysteria. The index of 28 spot commodity prices rose by 16½ per cent in seven weeks—from 264 before the war began to 307.6. Even food prices went from 329.7 to 371.6, nearly 13 per cent, in five weeks, before dropping back a few points, although for months the chief preoccupation of the Department of Agriculture has been the problem of storing vast surpluses.

It was these artificially induced shortages and price increases which led to the astonishing spectacle of Congress trying to thrust on the President more and greater powers than he had asked or wanted. "America," Mr Alfred Friendly said in the *Washington Post*, "has been watching a temperance society trying to make a man take another drink." It was, on the part of the Republicans at least, a not very subtle political manœuvre. If prices continued to go up and they had given the President no powers to control them, they could be blamed by the electorate for what had happened. If, on the other hand, they gave him an embarrassment of power, which he could not—lacking any organisation in being—possibly use before November, he could be called a muddler for not having kept prices down.

But no Congressman would ever have thought of such a political manœuvre if the Pied Piper which leads him to so many decisions, letters from constituents, had not suggested it. The public, having itself brought about artificial shortages and a rise in prices, was demanding that something should be done about them. The something, thanks to the testimony of Mr Bernard Baruch before the Senate Banking and Currency Committee, was rationing and price and wage controls. At one time there was an idea of forcing all these on the President, but the Bill as finally passed did no more than give him the power to impose them at his discretion.

It is the opinion of most economists that nothing of the kind is needed. The increase in the military budget, large as the figure may sound, is not one which should cause shortages so intense that rationing is the only solution. At present, including foreign aid, between $16 and $17 billion of new money have been asked for and the total will probably reach $20 billion in the end. It is likely that about $13 billion will go for stockpiling of raw materials or in orders to industry, though it will be some time before the effect of any large proportion of the orders will show in the retail market.

The General Motors Corporation estimated ten days ago that production of motor-cars and trucks would be reduced by 10 per cent only in 1951, which would still leave it higher than ever before. And additional military consumption of steel will be about four million tons—less than 6 per cent of last year's production. Where the "local" shortages, which can have an effect which is by no means localised, will be felt first is in such metals as copper, manganese and platinum. Aluminium, which was so troublesome in the last war, is unlikely to be such a headache this time; at present productive capacity is well ahead of demand.

★

Any comparison with 1942 and the succeeding years is merely misleading and would remain so even in the event of other small wars. Nothing less than another world war would bring such shortages again and even another world war would find the United States in a much better position. As the President pointed out in his midyear economic report, steel production in 1939 was 55 million tons; today it is at an annual rate of 100 million. Aluminium was 164,000 tons; today it is 743,000. Electric power output has risen from 128 billion kilowatt hours to 317 billion, that of crude petroleum from 1¼ billion barrels to nearly 2 billion and the index of food production from 106 to 139. And, in Mr Truman's words,

> an economy which is employing 61½ million civilian workers, with less than 3½ million unemployed, is stronger than if it were employing only 58 million workers and had about 7 million unemployed. It is easier to divert the production of skilled workers to new purposes or even to put them on new jobs, than it would be to train millions of workers whose skills had been lost through years of enforced idleness.

Any comparison with 1942 is also misleading because the increase in military spending, in terms of percentage of gross national product, is infinitely smaller. In 1939 1½ per cent of the gross national product went into the budgets of the army and navy; by 1945 it was 37 per cent. In 1949 the armed services accounted for 6½ per cent; next year they will want about 11 per cent. The difference between these ratios of increase is so vast that it ceases to be a difference of degree and becomes a difference of kind.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

It is clear that all that is needed is a method of rationing money and controlling credit, but these are sometimes politically the hardest controls to adopt. The President asked Congress for about $5 billion in new taxes and he seems likely to get it. Between $2.5 and $3 billion will come from increased income taxes (there is a disagreement between Executive and Legislature as to how much the new rates will produce), another $1.5 billion from larger corporation taxes and the last half billion chiefly from the elimination of loopholes in existing methods of taxation. Since he is getting what he wanted, Mr Truman cannot complain.

But there are many who think that a greater proportion of the additional military expenditure should come out of current revenue. Since at least $10 billion of the expenditure appears likely to recur annually for many years to come, there is good cause for aiming to collect at least as much from additional taxes. There are some forms of indirect taxation which have never been tapped. Petrol, for example, has always been left as a source of revenue for state and local authorities. A Federal tax of 10 cents a gallon would have many advantages beyond the raising of a considerable sum for budget purposes. It would cut down the mileage driven each year, thereby saving petrol, steel and rubber, all materials on which a large military budget makes substantial calls. It would allow the postponement of many road-building projects and divert some goods traffic to the indigent railways.

There is another school, however, which is not concerned with mopping up excess buying power, but rather with keeping it in storage until the time when, or if, military demand has died down and delayed consumer demand is needed. Professor Sumner Slichter is concerned because the Korean crisis

> is causing individuals and business concerns to accumulate goods in excess of their immediate needs—in other words, it is causing an accumulation of supplies instead of an accumulation of demand.

It was the demand that accumulated between 1942 and 1945 which at the end of the war took the place of government spending and allowed the economy to adjust itself. To encourage the postponement of demand, Professor Slichter suggested in the *New York Times* that the Treasury should offer savings bonds repayable at maturity in terms of the purchasing power of June 1950 dollars.

The Federal Reserve System, having regained control over the terms of consumer credit, will be able to go part of the way with Professor Slichter. It will not be able to deny anyone the right to spend his income, but it will be able considerably to curtail his ability to anticipate it. Something like $12 billion a year is now outstanding on hire-purchase agreements, excluding mortgages, and, if this total were drastically reduced, it would go a long way towards releasing to the Government the additional supplies of crucial materials it needs, since the greater part of all instalment buying is applied to motor cars, television sets, refrigerators, washing machines and such durable goods.

One thing, at least, is clear by now. An increase in military spending, which, in absolute terms, would bankrupt any other country, need have very little effect on the United States. What effect it does have will be caused partly by the timidity of Congress and the Administration, neither of whom will contemplate paying the whole bill out of current earnings, and partly by a deeply ingrained inflationary philosophy. This philosophy, which can be summed up as a belief that it is less important to balance the budget each, or, indeed, any, year than it is to leave the taxpayer enough to allow him to save, invest and expand, sends shivers down the spine of Senator Byrd and other financial Puritans. But the retribution they prophesy has so far failed to materialise.

Controls at a Price

Just over a month has elapsed since the President asked for the speedy passage of a simple Bill authorising him to expand defence production and suppress the resulting inflation through the use of loans, allocations, priorities, credit controls, and requisitioning. Two days might have been saved if the Senate had not been unwilling to force Senator Lucas to forgo a lightning trip to bolster his somewhat shaky candidacy in Illinois, and if Senator Neely, a Democrat held in somewhat slighter esteem by his colleagues, had not insisted that a party rally in his native State, and his presence at it, were more urgent than any other consideration. The final vote, however, brought to an end the luxury of a free economy by an overwhelming majority of 84 to 3; it gave the President most of what he wanted—and a great deal more besides. Fortunately, the Senate draft does not carry as a rider the Mundt-Ferguson Communist Registration Bill, but this restraint was ensured only by the promise that a similar measure, which the Administration would have preferred to choke off, will be debated before Congress adjourns.

The two casualties, in both the House and Senate versions, are the controls over margin requirements on the commodity exchanges, which the Administration was seeking long before the Korean crisis, and over credit on existing houses. In the President's view, the stand-by price, wage and rationing powers thrust upon him represent a poor exchange. This is particularly true since in the Senate version the President loses the right to apply price controls by themselves, and must either freeze wages with prices over the whole economy, or hold his hand altogether. Suspicion of the way controls might be administered was also apparent in the vote to confer the allocation and priority powers exclusively upon the Secretary of Commerce. The present Secretary, Mr Sawyer, can be relied on to turn a sympathetic ear to complaints from business. The Administration had already decided, tentatively, that Mr Sawyer should exercise these controls, but if the provision survives the conference between the House and the Senate, it would prevent the President from altering the arrangement with changing circumstances.

It was in the debate on price controls, however, that the special interests showed their hand. Most of the sixty amendments offered, and the thirty accepted, tried in some way to protect privileged groups against the rigours of the powers for which the President never asked. For example, the meat packers, in the Senate version, are guaranteed a reasonable profit, ostensibly to prevent black marketeering. Farm prices are protected against the effects of a short crop. Ceiling prices on agricultural commodities must be based on parity or prices received during the period May to June—whichever is higher. The first of these amendments may not survive in the agreed version, but the last has the support of both House and Senate. It is little wonder that the Congress of Industrial Organisations is complaining that the price provisions are designed to stabilise profits, not prices. Fortunately, this rather shabby gift-horse is likely to remain in its stable unless a greater emergency arises.

* * *

Green Light for Republicans

When the Republican members of the Senate Foreign Relations Committee declared last week that the Administration's Far Eastern policy gave the Kremlin "a green light to grab whatever it could," they themselves gave a green light to all Republicans to grab whatever political advantage they could out of the evident public disquiet over the Far Eastern situation. Senator Wherry promptly built a bonfire for the Administration and put Mr Acheson on top of it. Not even detailed accounts of the $495 million worth of American aid sent to Korea since 1946 will damp the flames of Mr Wherry's assertion that only $200 worth of wire was received; nor will the President's severe condemnation—"a contemptible statement and beneath comment"—take the heat out of Mr Wherry's remark that "the blood of our boys in Korea" is on Mr Acheson's shoulders.

Senator Lodge can hardly have been surprised that his less responsible colleagues took literally the permission to fight with no holds barred, but he hastened to point out that the Republican statement was not nearly so uncompromising as the Democrats seemed to think. Certainly it begins and ends with impressive tributes to the desirability of national and international unity, but the filling of the sandwich, a detailed account of the "ineptitude" of the Administration's foreign policy, past and future, will poison bi-partisanship for a long time to come. Senator Lodge insists that the statement was intended to be constructive, but a Republican victory is more likely to be built out of it than is a new foreign policy.

The story is that the Republicans on the Foreign Relations Committee issued their statement to forestall a much more violent one from the Republican National Committee, and that it represented the best that the internationalist half of the Republican representation on the Senate Committee (Mr Lodge and Mr Smith) could do in face of the isolationism of Senators Hickenlooper and Wiley. This may be true, but the statement is far more damaging than anything the Republican National Committee might have produced, just because it comes from a normally non-partisan source and especially because Senator Vandenberg, still absent through illness, expressed general agreement with its viewpoint. It was always inevitable that unscrupulous and isolationist Republicans would exploit the country's obvious unpreparedness for the Korean war during the coming election campaign. But now reputable and internationalist members of the party have joined in a pincer movement against the Democrats' whole foreign policy. This may be clever political tactics, but it can hardly fail to weaken America's international strategy.

Uneasy Money

The importance of the increase in its discount rate by the New York Federal Reserve Bank, from 1½ to 1¾ per cent, lies not in the increase itself, even though it is being extended to other Federal Reserve districts, but in the evidence it offers that the Federal Reserve Board intends to do something, as well as to talk, about the need for general controls on credit, in addition to the specific controls on consumer and housing credit contained in the Defence Production Bill. The importance of the Treasury's announcement on the refinancing of $13,570 million of government securities falling due in the next few weeks lies not so much in the terms of the new bonds—two 13-month issues at 1¼ per cent, the rate now being paid for similar issues—as in the evidence it offers that the Treasury still thinks the immediate advantages of "easy money" outweigh the long-term benefits of tight credit. However, the Treasury held out a very small olive branch to the Federal Reserve Board, by raising from $100,000 to $1,100,000 the amount of certain saving bonds that institutional investors will be permitted to buy during the current year.

The Treasury wants easy money because it makes it cheaper to carry the government debt, which is bound to increase during the coming months. The FRB wants dearer money as a restraint on the expansion of bank credit, and because it believes high interest rates have an essential part to play in relieving inflationary pressures. It had already urged banks and other lending agencies to refuse loans which, although sound, would have inflationary effects, for example, loans for purposes of speculation or inventory accumulation. Now it has declared that it is prepared to use all means at its command to restrain any further expansion of bank credit to ask Congress for additional authority should this prove necessary.

The members of the Joint Committee on the Economic Report should be sympathetic to the FRB view, for one of the sub-committees proposed last January that the freedom of the FRB to raise interest rates should be restored for the sake of general stabilisation, even if it meant an increase in the cost of servicing the Federal debt. The Treasury cannot keep that cost down without the help of the FRB, which has until now been given, although often unwillingly. The raising of the discount rate seems to be a warning to the Treasury that it can no longer count on FRB support for government securities at current prices, and that the FRB is digging in its toes for the final round of the long tug-of-war on credit policy. The Treasury has now replied with a warning of its own which, in effect, tells the FRB that it is expected to do its duty by the new issue.

Long Haul on the Railways

The endemic labour troubles of the railways flared up again this week, with a token five-day strike of yardmen in Louisville, Cleveland, and Minneapolis which spread a day later to Chicago and Pittsburgh and threatens to spread to the whole country next week. The two operating Brotherhoods involved are determined that their yardmen shall share the 40-hour week, with 48 hours' pay, that the non-operating unions won last year, but which a fact-finding board approved only in part. The dispute is of eighteen months' standing, and the unions are convinced that only by courting Federal seizure can they obtain better terms. This the President is reluctant to authorize, yet, if the strike spreads and steel production is cut, he may have no choice.

Any concessions beyond those recommended would make the task of subsequent fact-finding boards even more thankless than it is now; they would also be unwelcome additions to the railways' costs at a time when they are contesting Government suits for a return of $2 billion "overcharged" in the last war and when, at last, they are taking seriously

the need for new equipment. The sudden demands put on the railroads' supply of freight cars by the Korean crisis has shown that the president of the Association of American Railroads was sadly mistaken when he assured Congress a few months ago that the railroads were better prepared than ever to meet a national emergency. Today, before the new arms programme has even begun, the railways are being asked daily for 31,000 more cars than they can supply and the shortage is likely to grow worse before it grows better. The optimism of Mr Faricy, the president of the AAR, may have been stimulated by a desire to block a proposal that the government should buy, and stockpile against an emergency, another 200,000 freight cars. That figure hardly seems grotesque today; on July 31st the railways possessed 1,727,000 freight cars, fewer than at the end of the war, and although their capacity is greater, the spread of the five-day week and less rigid controls have reduced the use that can be made of them. By the end of July, the AAR itself was urging the industry to buy an additional 122,000 cars. Some 40,000 of these are already on order and another 25,000 are being built, leaving new orders of about 56,000. Government observers doubt whether even this belated repentance is adequate, since the railways have been scrapping about 96,000 over-age cars a year.

The present target may well be not only too little, but belated, since it will require 2 million tons of scarce steel. But it could hardly be undertaken at all, without government aid, if the large insurance companies, many of them with heavy investments in railway securities, had not embarked upon schemes of purchasing freight cars and leasing them to the railways. The pioneer was the Equitable Life Assurance Company, which has added diesel locomotives to its lending list; the Prudential Life Insurance Company more recently announced a similar plan of providing the railways with a new type of freight car that, thanks to shock-absorbing snubbers and under-frames, is expected to avoid damage to the cargo and to make heavier and speedier loading possible.

Waterfront Diplomacy

In theory longshoremen and stevedores should certainly not step in where diplomats fear to tread and veto foreign trade arrangements by refusing to unload imports from the Soviet Union. But in practice this declaration of economic war was taken very lightly as long as the only shipments affected were crabmeat consigned to a British government agency for resale. When it became a question of furs consigned to a private American firm and already paid for in dollars, the matter became more serious. It can hardly be ignored now that the longshoremen, with the encouragement of their union leaders, have threatened to refuse to unload even the manganese which the American steel industry needs so badly. However, it may turn out that the longshoremen have only been quicker in the uptake than the diplomats, for it is being suggested that, in present circumstances, an official ban on imports from Russia might be imposed in order to keep American dollars out of Soviet pockets.

Except perhaps for this reason, no controls on imports are expected at present. The recent tightening in export licensing regulations is also a form of economic warfare, one which some European countries, in the opinion of their American competitors, are not waging as wholeheartedly as

they might be. It may not, however, be long before export controls are needed to safeguard domestic supplies of scarce materials. The dollar gap has been narrowed during the past year more by a decline in American exports than by a rise in imports, but the two have been climbing hand in hand this summer. What happens to exports in future will depend on the net effect of shortages at home combined with increased shipments of defence materials to America's allies. It is certain that the United States will need to import more raw materials from abroad, probably in sufficient quantities to bridge the dollar gap entirely for the time being. Such imports do not compete seriously with American products and, in any case, the present boom has given American businessmen more profitable things to do than protest.

Indeed, it is rather surprising that the Administration should have chosen this moment to denounce the Swiss trade agreement of 1936 for the sake of American watch-makers. If the treaty lapses, as it will do if the Swiss refuse to include the escape clause that is obligatory in more recent agreements, the quotas under which the Swiss buy most of such necessities as grain and automobile tyres from America will lapse too, and numerous American interests will have been butchered to make a watchmen's holiday. This threat to an important part of the dollar earnings of one of the few countries which has never begged for dollars is an inauspicious prelude to the Torquay conference on tariff reductions. The United States, by announcing that it will negotiate there with an additional country, Cuba, and publishing a further list of commodities on which it is prepared to lower duties, has dashed the hopes of the wishful thinkers who had been suggesting that the uncertainties of the foreign trade situation made a postponement of the conference desirable.

THE WORLD OVERSEAS

British Colonialism and Uno

(By a Correspondent recently at Lake Success)

THE Trusteeship Division of the United Nations is an impressive affair. Dozens of officials, of all races and creeds, analyse reports covering about 60 dependent territories with a population of 200 million souls—a tenth of the inhabitants of the world—and prepare documents for the detailed discussion of the administration of these lands. But the British visitor to this Division at Lake Success is in for an uncomfortable time. No matter to whom he speaks, the question is shot at him. "Why is the United Kingdom always opposed to everything?" "But we have had a magnificent record in colonial policy during these last years"—says the visitor, his patriotic feathers ruffled. "That may be," reply the critics, "but you make a pretty poor showing."

It is only too true. Britain is in the position of the problem child, its hand against everyone (except one or two other problem children) and everyone's hand against it. The tragedy is that the British are right in what they are doing—from the technical and legal point of view. In a court of law they could make out an unassailable case in self-defence. But morally, they appear hopelessly in the wrong. They oppose resolutions for proscribing prostitution, for eradicating illiteracy in the colonies, for inquiring into slavery. They refuse to transmit information on certain points. They vote against the most beneficial-sounding recommendations, and if they do not actually vote against, they abstain in injured dudgeon. The Polish delegate, with a side-glance at the United Kingdom representative, fulminates against "those Powers who, in a revolutionary age of social change, are trying to uphold the heritage of the Dark Ages of colonial exploitation." "The United Kingdom's experience and record," replies the British representative, "as an architect of the institution of self-government, is unrivalled—and I make no apology for my immodesty." But—at least in this instance—the majority sympathy rests with the Pole.

Vagueness of the Charter

How has this sorry state of affairs come about? It stems primarily from the vagueness of the UN Charter. Chapter Eleven of that Charter deals with all non-self-governing territories apart from the Trust territories for whom special arrangements are made. It lays an obligation on the administering powers to transmit information on the social, economic and educational conditions in their territories, to the Secretary-General of the United Nations. It deliberately excludes "political" information; and it provides no machinery by which the information transmitted shall be discussed. In fact, the principle of international supervision over these colonies is nowhere established. On this legal position the British stand pat. But the whole history of colonial discussion by the United Nations, ever since its creation, has been to breathe life—albeit an unruly life—into the bare bones of Chapter Eleven. At first a Special Committee was set up—against the British will—to consider the information transmitted. It was set up for one year. When it came to renewing its term, the British opposed; this happened three times in three successive years. Each time the British were defeated. There have been many proposals to make the Committee a permanency; Britain will have none of it. Last year the permanency proposal would have gone through had it not been for American support for a three-years-life compromise. The British opposed that also, but the proposal achieved its majority. Britain acquiesced with sulky hauteur. It now appears, however, that the British have made up their minds to make the best of the Committee. Mr Fletcher-Cooke announced at Lake Success last week that the British Government was prepared to co-operate with the Committee as fully as possible—although it still maintained its view that the Charter did not give the United Nations any right to supervise the administration of colonial—*as distinct from trust*—territories.

Then there has been the battle over the transmission of political information. Basing its arguments rigidly on the Charter, Britain refuses to lay this information before the Special Committee, whose very existence it abhors. The information is all there, it claims, in dozens of reports in the library; there is no shred of secrecy. But the Committee has no right to have this information on the table, and Britain will not supply it direct. Year after year this argument has gone on. Resolutions have been passed over Britain's head that political information should be voluntarily transmitted. Other nations agree to do so, but Britain will not. The discussion then centres not on the content of the information produced by the others but on all the sinister reasons for Britain's refusal.

Honesty or Policy?

Last December, at the General Assembly, the matter reached something of a climax. Ten resolutions had come forward from the Special Committee; Britain voted against, or abstained, on every one of them. They were quiet innocent-sounding resolutions, on the whole, even though the first two dealt with the delicate questions of the three-years-life of the Special Committee and the voluntary transmission of political data. Three dealt with educational matters, one with international collaboration for the betterment of colonial conditions, one was a proposal to define a non-self-governing territory, and so on. Britain rejected all on grounds of principle. They were based, said the British representative, on "the completely invalid assumption that, in subscribing to the Declaration in Chapter Eleven, member-states which have responsibility for the administration of non-self-governing territories, have accepted the principle of international supervision over the administration of these territories." The British emphatically disagree that there is anything in the Charter which obliges them to account to world opinion in this way.

There is another difficulty that the British find themselves up against—the simple issue of honesty. It is easy enough to vote for resolutions which sound well, but what if they really have not the power or the possibility of carrying them out? Do they then vote for them regardless, earn popular commendation, and take no effective action? To avoid this, the British have tried to amend certain international conventions by introducing the "colonial application" clause. This means that the convention is accepted, subject to the colonies themselves agreeing to apply it. A typical example of this occurred last December, when a draft convention for the suppression of traffic in women and children came before the General Assembly. Some colonies, the British representative argued, are all but self-governing in internal affairs;

they must be allowed to take decisions for themselves. "My government," said the British spokesman, "stands firmly by the principle that each colonial government shall itself decide whether it wishes to accept the terms of this convention, and my government will not use pressure or force to influence such a decision. . . I should like to point out that if this amendment is rejected, the General Assembly will not be depriving the Government of the United Kingdom of certain rights; it will be depriving the governments of the non-self-governing territories of *their* right. . . . And even if the rest of this convention is unreservedly acceptable to my government, my delegation will not hesitate to recognise its clear obligation to vote against the convention."

This attitude, so reasonable to the British, was received with the utmost condemnation by others. Said the Ukrainian delegate, "The representatives of the colonial powers quite obviously do not intend to fight this social evil. . . . They would tend not to stop but to promote the exploitation of man by man, the traffic in persons and the exploitation of the prostitution of others." In contrast to this wickedness, the Ukraine was a paradise of justice. "Such a disgraceful social evil as traffic in women and children and the exploitation of the prostitution of others has long since been abolished in the Ukrainian Socialist Soviet Republic, together with the disappearance of the exploitation of man by man, national discrimination and all other forms of discrimination." Most delegates simply would not admit that a colonial territory which was still a colony could be anything but completely subject to the imperial power. In the end, two nations—Britain and France—voted against adopting the Convention. Is it surprising that the newspapers should declare to the world—"Britain votes against the suppression of traffic in persons?"

But behind all this there is something more than mere British obtuseness. There is a sharp resentment at the way international discussions on colonial affairs have been turned into baiting-grounds of the administering powers. An arena has been provided for bitter and unjust allegations, made for political reasons, by nations who refuse any investigation into their own affairs. When it suits these opponents to extend the Charter, they bring the battery of public opinion into operation to gain their ends—but they object violently to any stretching of the Charter in their own disfavour. It is fast becoming obvious that trouble is positively invited the moment colonies are dealt with in a separate category—yet, as long as colonies are not themselves represented at Uno, how is this to be avoided?

In the meantime, Britain, with the best colonial record of any power, finds itself in a thoroughly untenable position. It feels it all the more keenly, simply because its record is so good. If the critics keep up their attitude and the "neutral" powers continue to condone the badgering, the British Government will be faced with some very painful alternatives. The "neutrals," of which the United States is the chief, might well ask themselves whether it is in their interest to force an open split among the free nations.

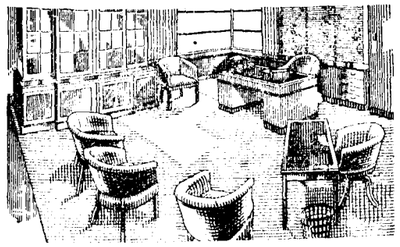
New Broom in the Czech Army

[FROM OUR VIENNA CORRESPONDENT]

WITH the proverbial zeal of the new broom, Dr Alexei Čepička, who succeeded General Svoboda as Czechoslovak Minister of Defence last April, has recently been setting about the task of Sovietising the Czechoslovak army. As General Svoboda was in good standing with the Communist Party when he was kicked upstairs to the post of Vice-Premier, Dr Čepička has been in the—for him—unaccustomed position of having to sweep with some degree of tact. He has based the inevitable purge among the officers, not on the timeworn accusation of political unreliability, but on their having failed to take sufficient care of the common soldier.

The first to go was the head of the Army Supply Department, Major-General Bruno Zapletal, who was summarily dismissed on a charge of not having spent all the money allocated to him to provide the rank and file with rations, uniforms and other necessities. Seeing that goods of all kinds in Czechoslovakia have been, and still are, in short supply and that the rank and file consisted mostly of anti-Communists, to whom it was not thought desirable to give priority, the charge can safely be described both as verbally correct and factually monstrous. If General Zapletal had not been a "Londoner" it would never have been made. As it is, he can consider himself lucky to have been merely dismissed without a trial. Two other officers, Colonel Antonin Poštulka and Lieutenant Josef Šimane, were soon afterwards sentenced to nine and four years' rigorous imprisonment respectively for having allegedly misappropriated rations. A third, Lieutenant Jaroslav Filip, was overheard publicly criticising these sentences. A commission therefore went to his rooms and found army property to the extent of half a litre of oil and some medical instruments. He is now serving a sentence of seven and a half years' rigorous imprisonment, deprivation of rank, confiscation of property, loss of citizenship rights for 10 years and a fine of Kcs. 10,000 on charges of mutiny, sabotage and theft of army property.

In constituting himself the champion of the poor, bewildered Czech and Slovak infantryman, Dr Čepička may be backing a winner. Not being politically reliable, the army has hitherto been deliberately neglected by the Communists. Its equipment is mostly a hotch-potch of British, American, Russian and even German cast-offs; the only up-to-date arms in the country belong to the Security Police, which has at least one mechanised division with modern Russian guns and tanks. Dr Čepička has declared, however, that henceforward the Army is to have "only the best" because "only the best is good enough for the defenders of socialism."



Comrade Colonels

Meanwhile, the whole framework of the Army is being remodelled so that when the next batch of conscripts are called up on October 1st they will be trained entirely on Russian lines. The "servile western title of Sir" has been abolished and the soldier will in future address all officers and NCOs as "Comrade" followed by the rank. Off duty he may use the familiar "thou" when speaking to an officer. On duty, however, he must say "you." So must the officer.

In one of his first Orders of the Day, Dr Čepička said that discipline is "the indivisible responsibility" of the military officer, and he called upon Army political education officers to help the military officer to enforce it. Dr Čepička has also warned the common soldier that he has not only the right but the duty to report all "inadequacies" on the part of his superiors to the local branch of the Communist Party. Dr Čepička went on to complain that the occasions on which the common soldier had carried out this duty were so far "disturbingly few." Unless the rank and file reported all the inadequacies of their officers, he declared, the latter would be unable to appreciate the need for "self-criticism," and until they had mastered this essential element of their training they could never be efficient officers in a People's Democratic army.

The army will in future be under the new criminal code in respect of some major breaches of discipline and for all treasonable offences. In purely military matters, however, soldiers will still be accountable to the military machine. There is also a new type of disciplinary court, called the

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

SIMON ENGINEERING GROUP

Simon exports are no mere post-war growth. Though immensely increased since the war, they began over sixty years ago. Simon machinery was first installed in foreign flour mills in 1885; the first Simon grain elevator in the Argentine was built in 1909; Simon-Carves built coke ovens in Spain in 1900 and coal washeries in Canada in 1911. To-day there are Simon representatives in most of the principal countries of the world, and Simon associated companies in France, Belgium, Holland, Australia, New Zealand, South Africa and South America. Simon exports of machinery and technical services have gone to forty countries in the last five years.

Honour Jury, which will deal with any charge brought by one officer against another and will be entitled to impose very severe penalties including reduction to the ranks. A further significant change, noted for the first time when a batch of officer cadets graduated from the Hradnice military academy in July, is that, henceforward, allegiance is sworn not to the President only but also to the Government.

How this attempt to rehabilitate the Czechoslovak Army in its own eyes and make it an efficient addition to the Soviet fighting machine will work out is a matter for surmise. Taken in conjunction with the parallel efforts in Poland and Hungary, it is a clear indication that the Soviet Government means to take as few chances as possible in the event of a war. But it is quite certain that, militarily speaking, the Czechoslovak army of today, far from being all right, is completely useless, and it will take at least a year, perhaps three or four, to get it into fighting trim. And it is anybody's guess whose side it will then want to fight on.

Plan for the Fourth Reich

Moscow's determined effort to extend its domination over the whole of Germany by political means is receiving a new impetus this week-end from the holding of the National Front Congress in Berlin. This is being attended not only by delegates elected by the National Front Committees throughout eastern Germany but also by a large number—according to one estimate 1,500—of delegates from western Germany who have succeeded in overcoming the "obstructionist tactics" of the Bonn Government.

The National Front movement has come a long way since it was first launched by the third People's Congress in May, 1949. The driving force behind it is the Communist-directed Socialist Unity Party (SED); but, unlike most Communist-inspired movements, the appeal of this one is directed to people of all classes, all beliefs, and all professions—to everyone, in short, "who has Germany's interests at heart." Grotewohl, the east German Premier, has said that the essential qualification for those seeking admission to the movement is their

> present attitude in the great struggle for the liberation of the German people . . . Those demanding additional qualifications, such as anti-fascism or genuine democracy, dangerously narrowed the platform of the National Front, and deprived the movement of its all-embracing mass character.

This is the classic Communist technique of getting all sorts into one ship in order to drop all undesirables overboard later. Grotewohl has also stressed how necessary it is to draw all other parties and organisations into the movement.

It is hoped that the contacts which the remnants of the east German "bourgeois" parties still have with their counterparts in the Federal Republic will provide valuable channels through which the National Front propaganda can spread in western Germany. It is therefore especially important that the east German Liberals and Christian Democrats should be persuaded to give their enthusiastic support.

The movement will now be used to get the stamp of popular approval for what is in fact a Communist dictatorship and to present the east German regime in the most favourable light to the people of west Germany. The election programme proclaimed by the National Front Congress this weekend will be supported by all candidates in the east German elections on October 15th. It is hoped that this joint programme—which in effect destroys the last vestiges of independence of the "bourgeois" parties—may gain a little more popularity than it has so far, if it is given a grand send-off by a mass national organisation. Grotewohl has shown how the National Front election programme is also designed to show the people of the west that the real enemy of Germany is not another political party but "foreign capitalism, which seeks to enslave and colonise Germany." It is true that there are no foreign capitalists in the German Democratic Republic, but "we care just as much about western Germany as we do about progress in our Republic. We are concerned not with one part of Germany but with the welfare of the whole German people." The joint election programme might be supposed to be applicable to the whole of Germany, since so many of the National Front Congress delegates are supposed to be coming from the west; and when the people of western Germany have observed its triumphant and enthusiastic acceptance in east Germany on October 15th, it is hoped that they will demand the holding of similar elections throughout the whole of Germany.

Aims of "National Resistance"

Meanwhile the National Front Congress must become a "beacon of resistance" in western Germany. The "legal" basis of this resistance has already been defined by Grotewohl in a speech to the SED Congress in July. It is claimed to derive from the failure of the western Allies to observe the Potsdam decisions. The spearhead of the resistance will be the west German Communist Party (KPD) which, it appears, has now once more been brought firmly under the control of the more efficient and more successful Socialist Unity Party. The general objectives of the "national resistance" are calculated to attract west Germans. They include the repeal of the Occupation and the Ruhr statutes; the abolition of the Allied High Commission; and the return of the Saar. Herr Ulbricht, the east German vice-premier, has now described some of the detailed acts of resistance which it is the duty of every patriotic German to carry out in order to achieve these general objectives. These include the prevention of all American imports of food and goods for which a German substitute can be found; the prevention of any further dismantling by "any available means"; the fostering of business relations with eastern Germany in spite of Allied restrictions; and resistance to "all kinds of Anglo-American influence on the German economy or on individual factories."

The people of western Germany are being incited to support this policy of national resistance by indignant diatribes against the American "imperialists" and "colonisers"; by high-sounding phrases about winning lasting peace and achieving once more the economic, political and cultural unity of Germany; and by the lure of vastly lucrative eastern markets stretching to China and beyond. But behind all this propaganda lies the scarcely-hidden warning that the west Germans had better hurry up and throw in their lot with the Russians before the attempts of the western Powers to rearm western Germany forces the Russians to forestall them by armed force.

THE BUSINESS WORLD

Free Markets under Exchange Control

THE problem of marrying free commodity markets with the inevitable restrictions of sterling exchange control has occupied the attention of the authorities in Britain for some time past. It will continue to exercise them as one commodity after another leaves the fold of state trading and returns to the greater flexibility—with all its advantages and dangers—of private trading. This problem, which is peculiar to Britain because of its old-established international commodity markets, was presented to the Authorities for a brief period in the very early months of the war. At that time the Liverpool Cotton Market remained open, so that measures had to be devised to fit its operations into the then prevailing structure of exchange control. The problem presented no great difficulty at the time because exchange control was still wearing its "phoney war" trappings; and up to mid-1940 a considerable volume of internationally used sterling was in fact free sterling. When free sterling disappeared after the tightening up of exchange control, the Liverpool Cotton Market was closed down.

Despite this prewar experience, it is only in the past two years, upon the reopening of the rubber, tin and coffee markets—and in coffee the market still operates only for international business—that this problem of devising machinery by which a free commodity market could function within the framework of exchange control has become really important. To solve it under present conditions of exchange control has required the setting up of rather elaborate machinery, but the authorities concerned—the Treasury and the Bank of England—seem to have steered successfully between the two conflicting difficulties. In the first place, they have striven to give individual operators in the reopened markets the utmost possible freedom of action. Secondly, they have succeeded in preventing the freedom given to these operators from leading to an export of capital or to undesirable speculation.

★

So long as exchange control is necessary, operations in these markets must be subject to *post-facto* supervision and control, and this control must be buttressed by sanctions against those who may abuse the freedom they are given. In order to satisfy these conditions some formal system of reporting transactions to the authorities has had to be devised and this in its turn has meant that the Bank of England, in operating the control on behalf of the Treasury, has had to deal with recognised market organisations and has delegated to these organisations some of the power of applying the necessary sanctions.

The decision to work the controls through a market organisation—for rubber, it is the Rubber Trade Association; for tin, the London Metal Exchange; for coffee, the Coffee Brokers' Association—has inevitably involved the danger of establishing "closed shops" in the trades concerned, and of giving these bodies official sanction and powers. The authorities seem to have been alive to this danger. In their dealings with these market organisations they have always emphasised that the associations must be open to anyone with a genuine claim to be a member of the market. The final decision upon eligibility is, however, left to the association itself—an arrangement obviously convenient for the authorities, but rather undesirable in principle. The executives of the associations have been enjoined by the authorities to equip themselves with the powers necessary to enforce decisions on the participating firms and to be responsible for using those powers in accordance with the arrangements agreed from time to time with the Bank of England.

The principle of delegation of authority applies not only to the established and recognised organisations of each market, but to the banks that keep the accounts of the participating firms. These banks are given a blanket authority by the Bank of England to pass transactions in the sterling accounts maintained by the participating firms. But these accounts are carefully segregated from transactions not falling within the ambit of the schemes. All payments and receipts directly concerned with each participant's purchases, sales, storage, movement, etc. of rubber, tin or coffee, must be centralised in a single account. This account thus includes payments and receipts for commodities, insurance, shipping, warehousing charges, but excludes items such as wages and salaries, London overhead expenses and so on. Every item entered in this account must be duly attested and documented by receipts.

The system of *post-facto* control at the Bank of England is based on the submission to it of two sets of monthly returns. Each market firm participating in the scheme furnishes full information on the very detailed form reproduced with this article. This is a confidential return, but every firm knows that the information contained in it, when aggregated by the Bank of England to show the position of the market as a whole, will be revealed to the executive of the market organisation. In addition, the banks holding the rubber, tin, or coffee scheme accounts submit monthly statements of these accounts to the Bank of England—again under the usual terms of secrecy and confidence. The banks' statements are compared with those submitted by the participating firms and each set should corroborate the other. The task of inspecting and checking these monthly returns, of looking for discrepancies and watching whether the market position is showing signs of undesirable speculative development falls to the commodity department of the Bank of England. This department has the right to inspect the books of the participants and it has in fact carried out a virtual audit of each firm concerned. The firms in question agree that it has performed this inevitably invidious task with tact and discretion.

There are two danger points upon which the authorities concentrate their scrutiny. The first danger

is that the freedom given to the participating firms might be abused in order to achieve an unauthorised export of capital. The second is the possibility that the freedom of the markets may lead to the emergence of unhealthy speculative positions. The freedom with which the participating firms may deal in their particular commodity is complete. They may buy and sell anywhere in the world, and therefore can at their own discretion pay sterling to any non-resident account. In consequence, in these operations the restrictions that normally apply to sterling payments to American or to bilateral accounts cannot apply. The transactions are reported monthly and are justified after the event, not before they take place. The risks involved are obvious. Warehouse warrants are negotiable documents. It would need very little ingenuity for a resident in Britain to purchase a warehouse warrant entitling him to tin or rubber and then to sell it to the United States and thus convert sterling capital into dollars. That risk has been run—and the authorities agree that no perceptible damage has resulted from it. Any serious use of this loophole would readily be detected in due course, but in the interval considerable flights of capital might have been made possible by the facilities provided under these commodity schemes. So far, however, no such flight has occurred.

Something must now be said about the steps that have been taken to prevent free markets from leading to unhealthy or undesirable speculation. The dangers of such developments under present conditions are obvious. A hard-currency commodity such as coffee would have offered a perfect medium for hedging against the devaluation of sterling. Similarly, in recent weeks rubber must have appeared a most promising war-hedge to the speculatively inclined. It is clear, however, that any development of such purely speculative positions would be quickly revealed by the monthly returns. As will be seen from the appended specimen, these are extremely searching. They show where payments are made and whence they are received and measure both the forward position and the stocks of each participating firm. As already noted, the totals of the aggregated returns are shown to the Executive Committee of each market organisation. If these totals suggest that unhealthy speculative positions are being built up, the Bank of England, acting for the Treasury, would inform the market that in the national interest members should show more discrimination in accepting buying or selling orders. If the succeeding batch of monthly returns showed that one or more firms had disregarded this hint and had further inflated the forward position, the Bank of England would then have the right to pass the name of the firm or firms in question to the market organisation with a request that it should take such action as it deemed necessary. This is the only occasion on which any information arising from these confidential monthly returns would be allowed to pass out of the Bank of England ; even then, although the name would be passed on, the relevant figures would not. On receipt of such information, the market organisation would apply its rules to deal with the " offender." The committee or the association would have the right to call for the figures of the firm in question and in the last resort to expel it from the market—and, incidentally, from all the benefits of the commodity scheme. It should be pointed out, however, that no such expulsion—indeed, no exercise of any of the sanctions involved in this particular control mechanism—has yet occurred.

The use of sterling in these international commodity market transactions is steadily expanding. The latest annual report of the Bank of England points out that in 1949 £37 million was transferred under the coffee and

INDUSTRIAL AND COMMERCIAL
I.C.F.C.
FINANCE CORPORATION LTD.

I.C.F.C. was set up in 1945 by the English and Scottish Banks, with resources of £45,000,000, to supplement existing facilities by providing an accessible source of share capital and long term funds for well conducted businesses of small or medium size. It applies to all proposals the usual canons of sound finance and is not averse from supplying risk capital. I.C.F.C. so far has made available over £20,000,000 for British Industry, divided among some 330 concerns of many kinds.

Full particulars of the facilities offered may be obtained from the General Manager,

rubber scheme and in merchanting transactions under the so-called FE 24 facilities (these are "third-country" trade payments under which purchases of commodities can be made in one country provided the goods are sold to a country with a currency at least equally hard). The tin scheme began to operate only towards the end of 1949. It will help to lift the 1950 turnover well above the totals attained in these commodity schemes last year.

The wider transferability of sterling achieved by the reopening of international commodity markets in Britain is a logical line of approach to the convertibility of sterling. By freeing commodity markets and devising mechanisms through which they can function unhampered by exchange control, some of the conditions in which sterling was a truly international currency are recreated. This free convertibility of sterling into commodities wherever they may be bought is a much surer approach to full convertibility and is much more firmly embedded in the historical tradition of sterling than was the attempt of 1947. The relaxation of exchange control that is required by this freeing of commodity markets creates certain loopholes, both for capital exports and for undesirable speculation. Those risks have so far been taken without damage. The British facility for reconciling incompatibles, for evolving a middle way in which free markets can operate within an overall framework of exchange control, has again found expression. The British tradition is seen, too, in the dependence of these arrangements so largely upon loyal co-operation between the markets and the authorities and so little on predetermined statutory formulæ and procedures.

The Cement Shortage

SUPPLIES of cement have become increasingly difficult in the past twelve months and are unlikely to get easier before next year. The shortage, which manifests itself in temporary local famines rather than in any national scarcity, runs contrary to the general improvement in supplies of construction materials. Imported softwoods are still scarce but the other materials, notably steel, bricks and coal, are in relatively free supply. The fact is that home and export demand for cement have together outstripped productive capacity by quite a wide margin. There has been a genuine increase in the market for cement and a succession of fine winters has produced further local shortages by preventing the seasonal accumulation of cement stocks which would usually take place when bad weather holds up building. Increases in demand have come from a number of quarters. While the rate of house building is lower than before the war, more cement is being used per house. The prewar average was about 4 tons for a council house. It is now nearer 8½ tons. This is cement in bags; the aggregate tonnage in all forms is probably nearer 10 tons a house. The housing schemes, including the necessary roads and sewers, are estimated to take about 37 per cent of all deliveries. Big projects like those for the Atomic Energy Research Establishment need large weekly deliveries. An average of 600 tons a week has been going to the plutonium plant at Sellafield during the past two years, and the plant going up at Capenhurst is taking about 400 tons a week. London Airport had used 330,000 tons by the beginning of August.

The growth in demand was not unexpected: by 1945 cement producers had prepared schemes which together would have increased productive capacity by 1,600,000 tons a year. Under normal conditions there would be an interval of eighteen months between the decision to erect new plant and its completion. But it has taken nearly five years to bring the first of these new plants into operation. Two more should be finished by the end of the year. They will together add 710,000 tons to the industry's annual capacity, but they are unlikely to contribute more than 300,000 to 400,000 tons to output this year. The balance of 1,600,000 tons of new capacity should be working by the end of next year; it is made up of extensions to existing plants. The resultant total capacity of more than 10,700,000 tons a year will probably be more than is needed to meet demand at that date and so some of the oldest plant can be retired.

Several factors delayed the installation of new plant. There has been some difficulty in getting deliveries of machinery although much of it was ordered in 1945. By an unlucky coincidence the Town and Country Planning Act came into operation when the firms were applying for permission to put up their plant and there appears to have been over-meticulous scrutiny of the applications in the interests of local amenities. It took three years and three public inquiries to get permission for one project. Formalities have become so slow, and their outcome so uncertain, that firms are thinking seriously of putting up new plants in their overseas markets rather than in this country.

*

Last year the industry raised its output nine per cent by reopening a number of old plants. Total production was 9,287,000 tons. Cement-making plant comes within the "stationary" category, which does not deteriorate to the same extent as other types of capital equipment. Comparatively small replacements will bring it back into working condition. In the ordinary way some surplus capacity is kept in reserve to meet increases in demand that cannot be met from stocks. This enables plant in service to be run to capacity, an essential condition for economic working. Because all available plant is now working, this device for ensuring smooth deliveries no longer exists.

Output this year is expected to be not less than 9,500,000 tons. The first of the new plants, built by the Tunnel Portland Cement Company in North Wales, came into full production in the spring and has a planned capacity of about 240,000 tons. The second new plant, consisting of a doubling of the Rugby Portland Cement Company's Rochester plant, is ready for its trial runs. It will add 120,000 tons to the industry's potential, but it cannot make any great contribution to supplies this year. The third and largest of the new plants, which the Associated Portland Cement Company has built at Shoreham, is rated to produce 350,000 tons a year. It will not be ready until the end of 1950.

Before the war the home market consumed a little less than 7,000,000 tons of cement a year, and about three-quarters of a million tons a year was exported. By 1949 exports had risen to nearly 2,000,000 tons a year and were limited to that figure only by shortage of supplies. The urgent needs of the home market have led to a deliberate limitation of exports this year; the industry

BRITISH CEMENT OUTPUT AND DELIVERIES
('000 Tons)

	Production	Deliveries to Home Market	Exports
1930-34 average	4,754·8	4,032·8	671·9
1935-39 "	7,157·0	6,493·6	686·9
1945	4,051·0	3,303·0	595·3
1946	6,574·0	5,479·0	1,162·5
1947	6,960·0	6,175·0	887·8
1948	8,521·0	6,929·0	1,551·0

1950 (6 months)	4,644·0	3,964·0	887·0

plans to sell less than 2,000,000 tons abroad. The biggest deliveries go to East and West Africa. A good deal went to South Africa until last October when Associated Portland opened a plant capable of supplying all the Union's needs. Other British colonies are big consumers, and a fair tonnage has been going to western Europe. Some cement is being sent this year to Canada and the eastern United States.

The price of cement in London is 73s. a ton compared with 80s. 2d. in Brussels, 95s. in Sydney, 157s. 6d. in Buenos Aires and 175s. in New York. Thus in many markets British firms can cover the disproportionately high freight charges on their bulky product and make a substantial profit as well. They can, for example, deliver cement in Florida more cheaply than can the nearest American factory. The Rugby Portland Cement Company alone has deliveries now on their way to Florida, Virginia, Baltimore and Montreal and sales appear to be limited only by availability of shipping. British exports last year were valued at £8,079,514.

Small quantities have been imported into Britain in the past two years to meet local scarcities. The tonnage coming from Belgium this year is about a third of one week's output of the British industry. Such imports are subsidised by the Cement Makers' Federation; unsubsidised they would sell at £6 10s. a ton. An extensive programme of imports to relieve home shortages is, therefore, hardly feasible.

*

It is not certain for how long high export prices will continue. Last year they were not expected to outlast the winter, but they have still shown no tendency to fall. The reasons why British prices are so much lower than world prices are worth examining: at the beginning of the war the Cement Makers' Federation inaugurated a system of voluntary price control which still continues. It is administered in conjunction with the Ministry of Works. Prices are not uniform over the country. A base price is fixed for areas within a five mile radius of each works or coastwise importing centre. There is no great variation in these prices, but the variations outside these areas are considerable, depending on the distance from the nearest source of supply. In this way a series of circles is drawn round each supply centre, the price rising by 1s. a ton from zone to zone. Since the beginning of the war prices have risen by 58 per cent, the latest addition being a flat rate increase of 2s. 6d. a ton to meet higher transport costs. The price of building materials in general has risen 108 per cent.

In the same period, the price of coal to cement producers (the largest single item in their costs) has risen by 150 per cent and its thermal content has fallen by perhaps 8 per cent. Labour costs have risen by nearly 80 per cent per ton of cement produced, but are one of the less significant cost items. British selling prices probably cover direct production costs, leaving little or no margin for depreciation or capital replacement.

The industry started the war with its plant in good condition. Some 2,250,000 tons of new capacity had been put in since 1934 and the more obsolete plant had been scrapped. In view of the length of time for which this plant has been working to capacity, and the even longer time during which the much older plant has been in service, it seems unlikely that any great allowance has now to be made for its depreciation. At the same time, large profits are being earned on cement exports. Associated Portland Cement Manufacturers Ltd., the group that produces about 87 per cent of the industry's total output, last year earned only 19 per cent of its gross profits on cement sold at home, although home sales represented nearly 79 per cent of output by weight. (The group showed a gross trading profit of £6,130,000 before tax.) Besides profits earned on direct exports, the sale of special cement products such as paints gives a good return, although the tonnage is small in proportion to total sales. Some profits come from the sale of lime and whiting.

Such facts as these suggest that real production costs may be higher than prices would suggest. Today's situation arises largely because the industry is working with plant carrying only nominal depreciation charges and

because it can earn abnormally high profits abroad. Capital costs have increased so much that any firm now entering the industry would need to sell at 22s. to 25s. a ton more than the prevailing prices. This would be more in line with world prices. Naturally the penalty is not so heavy for established producers, but even for them, as their new plants come in, their heavy capital costs must begin to be reflected in their apparent costs of production, and may therefore have repercussions on the price structure. It is estimated that depreciation has risen from £2 15s. a year per ton capacity on the most modern of the prewar plants to £8 per ton capacity on the plants now being built. Within limits, the extra cost of plant extensions can be spread over the whole plant, but in the case of the three biggest schemes, some price review seems unavoidable.

The Tunnel Portland Cement Company's new plant in North Wales supplies an area that has no other plants. Therefore, although it is believed to be producing at a cost of 7s. a ton more than the plant which previously served the district, local prices have fallen by 1s. to 4s. a ton. The difference is a saving on transport. The Rugby Portland Cement's plant at Rochester will probably be less costly to operate, being, in effect, an extension to one of the most modern of the prewar plants. A price review is not anticipated, but should it prove necessary, it will be complicated by the proximity of several other, older cement plants belonging to Associated Portland. The biggest decisions will have to be made when the Associated Portland Cement Company's Shoreham plant starts working. The company has a very old plant of 80,000 tons capacity now supplying the area; it will not, as originally planned, be taken out of service when the new one opens. Some increase of local prices seems inevitable, though its extent cannot be predicted until it is known what proportion of these higher costs can be spread over the output of the company's 28 other plants. Some members of the industry think that a price increase over the whole country will become inevitable during the next eighteen months. They have been driven to this conclusion by the ever-rising cost of the routine replacements needed to maintain a plant's technical efficiency—a factor for which little or no allowance is now made. Needless to say, the prospect is unwelcome to the Government, and it may be that the industry will find it politic to forbear to press its case.

Business Notes

Waiting for a Lead

Men and women in industry, looking for that resolute and skilful leadership that it is the privilege of governments to give in times of crisis, have been able to draw little light from the official and party pronouncements on industrial matters in the last week or so. What does the imminent rearmament programme require industry to do? Mr Gaitskell, the Minister of State for Economic Affairs, held a series of meetings last week with representatives of the British Employers' Confederation, the FBI, and the TUC. But the purpose seems to have been no more than a preliminary canter over the field of industrial problems that will arise from the rearmament programme. There seems to have been no suggestion of any great hurry. "Officials," said the Government statement, "were now carrying out an examination of the possible impact of the programme on the national economy," but there has been no hint that the impact might be sharp. Even the aim of policy was stated in a fundamentally ambiguous way:

> The aim must clearly be to secure the increased output of equipment as rapidly and efficiently as possible, while at the same time causing a minimum of interference with economic recovery.

No doubt: but what does "as rapidly as possible" mean? What is "a minimum" of interference? And, if the maximum of speed and the minimum of interference prove to be incompatible aims in practice, which aim will take second place? There are to be further meetings between representatives of specific industries and the production departments, and a committee of the National Production Advisory Council for Industry will meet the Minister again. But industry can hardly make a great united effort or indeed undertake any new departures at all unless it gets better guidance than this.

* * *

Labour's Intentions for Industry

The policy (new style) of the Labour movement on the nationalisation or regimentation of industry can hardly fail to be read in relation to the danger of war and the need for rearmament. Industry is to be required to work at more than capacity, producing the tools of war in greatly increased volume without (it appears) relaxing its efforts to supply the tools of peaceful economic progress. This is the only possible reading of the Government's production programme at the stage it has now reached. It is a programme that will require much united effort and the making of many plans looking some way ahead; this makes it all the more reasonable to ask for clarification of the Government's other intentions towards industry. Is nationalisation to be extended to new fields, or not?

Labour party and TUC pronouncements have not yet begun to relate the two questions. A "statement of policy and principles" by the party appeared on Monday under the title *Labour and the New Society*. This statement (discussed in its other aspects on page 399) reaffirmed the intention to put the Iron and Steel Act into effect. Because the only other specific project of nationalisation that it reaffirmed was the innocuous one of water, some readers assumed (not unreasonably) that the proposals to nationalise cement and sugar and "mutualise" industrial assurance had been dropped. But the party secretary, Mr Morgan Phillips, said at the press conference at which the new pamphlet was released that they had not been dropped at all; they were still in the programme, and it had merely been thought better not to pin the Government down to a timetable. Mr Phillips could hardly have done more to rob the pamphlet of its one notable virtue or neutralise the one piece of good that it might have done. The industries concerned have been alarmed once again, and Lord Lyle has once more been thundering his defiance against "the boys from Bloomsbury." The high entertainment value of Lord Lyle's utterances should not deflect attention from the fact that industry would seriously find it useful to know what treatment it has to expect.

The Government's expectation of life is uncertain, and no one knows what the character of its successor will be. But if the successor should be another Labour administration, what will be in the programme? Foreign exchange control and the control of investment are in the programme. As things stand at present, they can hardly be expected to disappear, though their desirability as permanent instruments of policy, which the Labour party now affirms, is

A sensible policy for process steam—No. 17

Steam pressures under control

BY SPIRAX

A common feature of the majority of process steam pressures is that they are higher then they need be.

They are high because the standard of heat transfer is lower than it ought to be.

The causes of poor heat transfer and the measures for improving it are described in earlier notes (Nos. 8 to 16). An improved rate of heat transfer will give a higher rate of plant output, or the same output at a lower steam pressure. Indeed *both* are possible, as is often the case.

A change to lower pressures reduces steam costs, yet makes available *a larger proportion of that heat in the steam which is most readily usable in process plant*; it eases the call upon boiler capacity and helps to reduce peak demands.

A sensible policy for process steam might well begin with an examination of all process steam pressures. Find out the theoretical *minimum* pressure at which process requirements and rate of output can be met, then so improve heat transfer conditions that the pressure can be reduced as nearly as possible to that minimum.

A HANDFUL OF TROUBLE

Scale in steam boilers is an unnecessary cause of trouble and expense. It can be avoided altogether by the use of Calgon or other suitable phosphate in the boiler water — the modern way of preventing the trouble by curing its cause. First determine the composition of the feed water and then decide on the correct phosphate to use — a matter on which Albright & Wilson's Technical Service Department provide all the necessary information and help. Phosphate treatment saves far more money than it costs, and consultation with Albright & Wilson costs nothing at all.

Steel looks ahead

What will our exports be in 1960!

In 1950 exports of steel and steel goods are more than twice what they were before the war.

How can we keep this up? The steel industry is spending millions every year on research to develop new steels for new uses. £130,000,000 has been spent by the industry in the last three years on new plant and buildings. And all the time the firms in the steel industry are competing to keep production up and costs down.

In 1960 expanding exports and full employment will call for the enterprise and efficiency of a progressive steel industry just as they do today.

STEEL is serving you well

BRITISH IRON AND STEEL FEDERATION

60

another matter. But on the intention of promoting further measures of nationalisation or not, it cannot really be said that any light has been shed at all.

* * *

TUC on Public Ownership

In sudden contrast, the general council of the TUC has produced for submission to the Brighton congress a report on the public control of industry in which there is some plain speaking. This report examines briefly the working of nationalisation in the industries to which it has been applied, and while it speaks kindly of the efforts that have been made, it refuses to pronounce a verdict or draw any general conclusion that might be held to justify any new adventures in nationalisation at present. It defends the Coal Board against charges of unreasonable price increases. Nationalisation of electricity is given credit for having "made it possible to begin a planned expansion of generating plant and services." Public ownership of civil aviation has permitted the building up of air services at a time when "they were inevitably uneconomic." These are not lavish praises, and on nationalised gas and transport the report refuses to pronounce any opinion at all. In general it is held to be too early yet to judge the results with any confidence, and in any case they provide "little basis for judgment on the likely results of nationalisation in more competitive industries." Finally, there is a plain hint to the draftsmen of political programmes:

> It is certain that there is a great deal still to be done to Improve the structure and operation of the publicly owned industries and common sense indicates that at the present time efforts should be concentrated on making such improvements.

The report shows a rather more positive interest in the possibility of using other forms of public control to achieve the industrial purposes of the Labour movement—purposes that it takes to be "economic stability" (or full employment), better wages and conditions, the greater equalisation of incomes, and "industrial democracy." It gives guarded approval to the idea of "selective" and "competitive" public ownership—but declares with emphasis that if the State is to venture into industry in competition with private firms, then the competition must be genuine, with no concealed subsidies. It recognises raw material controls, licensing, and price controls as emergency devices that can be fully effective only in conditions of war or shortage; "an ordered relaxation" may be all that is possible now. It looks at the Monopolies Commission and finds it depressing. With some penetration it picks out the structural weakness of the Development Council—

> the apparent contradiction in the statutory character of a body set up to promote voluntary action by an industry to reorganise itself

—and recognises the fear of employers that development councils may prove to be a step to public ownership.

The biggest surprise in the document is its selection of the statutory Board of Control as "an alternative method of public control over private industry which deserves further consideration"; the Iron and Steel Board, now deceased, is bravely quoted as an example. This would be an alternative to public ownership and to development councils alike. But, the report says, such boards would need one power that the Iron and Steel Board did not have—"the power to set up their own undertakings, either to promote development which would not otherwise take place or to act as a yardstick of efficiency for the rest of the industry." Can it be that the TUC and the British Iron and Steel Federation are not, after all, so far apart in their views?

Dollar Loan for Australia

Mr Menzies' recent mission to Washington has borne some early fruit. The International Bank for Reconstruction and Development has announced that a loan of $100 million is to be made to the Australian Government so that the Dominion can buy certain capital goods and equipment needed for public and private development projects over the next two years. The loan is for a term of 25 years and will carry interest at 3¼ per cent plus the usual World Bank commission charge of 1 per cent per annum. This seems to be the largest single loan made by the World Bank since its pre-Marshall Aid loans to France and the Netherlands in 1947.

It is certain that the Bank has made no loan with less misgivings or fuss. Australia, with some £400 million of accumulated sterling funds, with a large (though dwindling) active balance on current account, and with an undisputed right of recourse to the sterling area's rising dollar reserves, is clearly a very good credit risk. Whether the development programme that this loan will assist is wisely timed from Australia's own point of view is more open to doubt. In a recent article in the *Financial Times*, Sir Douglas Copland, the doyen of Australian economists, declared that "Australia has not yet solved the problem of limiting the level of government expenditure in boom periods" since the "Australian temperament is not altogether well suited to deflation." If this means that the Dominion is temperamentally obliged to buy capital equipment at the very moment when the price of that equipment is likely to be soaring to a peak, then hopes that a sound economic basis will be laid to the development of its under-populated areas are likely to be disappointed. Mr Menzies reveals this week that plans for their development are very far-flung indeed; when the present World Bank loan is exhausted another of $150 million is apparently in prospect.

* * *

Confusion in Base Metals

Confusion has been the dominant note in the base metal market this week. On Monday the tin market recovered some of its poise after the setback of the previous week; the London spot price jumped by nearly £50 to £820 a ton, against £768 on Thursday last week. Wednesday saw another relapse—the price slumped by £30, but recovered nearly half this loss on the following day. The market is, of course, operating under completely artificial conditions and it is bound to be erratic. Much will depend on whether the United States will once more restrict the industrial use of tin, or whether it will refuse to purchase for the stockpile at above a certain price. Arrangements are being made for the tin conference, which is to discuss the proposed commodity scheme in Geneva towards the end of October. In present circumstances this conference must seem somewhat unrealistic and the American Government is more likely to press for the resuscitation of the Combined Tin Committee than for a scheme to guarantee profitable prices to producers.

At the beginning of the week, the official New York price for copper at last started to rise. American copper consumers have been paying a premium of anything between 2 and 5 cents a lb. above the official price of 22½ cents a lb. (£180 a ton) for some weeks. On Monday a small smelter raised its selling price to 24½ cents a lb. (£196); some other producers followed this lead, though the big concerns kept their official selling price at 22½ cents a lb. The Ministry of Supply, raised its selling price by £16 to £202 a ton. By Wednesday, however, the fear that the higher price might induce President Truman to impose price control caused the smelters to cut their price back to 22½ cents a lb., and the Ministry of Supply had no option but to reverse engines and its price to £186 a ton.

Lead also became dearer this week. Its price in New York rose 1 cent to 14 cents a lb. (£112 a ton) and the Ministry raised its selling price correspondingly by £8 to £112 a ton. Zinc has so far remained unchanged but many consumers have to pay anything up to 3 cents above the official price of 15 cents a lb. (£129 a ton).

Copper Price Quandary

The higher copper price put the Rhodesian producers in a dilemma—a dilemma happily resolved two days later when the price returned to its former level. But the principle involved was an interesting one. Six weeks ago when the American import duty of 2 cents a lb. was re-imposed on copper, the producers agreed "not to take advantage in their pricing arrangements with the Ministry of any increase in the American price due to imposition of the U.S. import duty." The question was whether the recent rise in price was a reflection of the recently re-imposed import duty. Most American consumers have been paying more than 24½ cents a lb. for copper irrespective of the import duty. American base metal market, dominated by integrated concerns which are interested both in producing and consuming the metals, has found it politic to hold the price at a lower level than would have obtained in a more highly organised market. On this basis, Rhodesian producers tend to receive a lower price than they might otherwise get. But that is no argument for passing on to them the benefit of an American import duty. The British purchase price clearly should be equivalent to that which the Rhodesian producers could earn by selling their copper in the American market. Such difficulties as these would not arise if dealings in copper were permitted on the London market.

COPPER RESULTS
YEARS TO JUNE 30TH

	Roan Antelope		Mufulira	
	1949 £000's	1950 £000's	1949 £000's	1950 £000's
Revenue from sales	6,581	7,895	8,618	8,761
Operating expenditure	3,990	4,553	3,790	4,149
Stock differences	+ 188	+ 98	− 43	+ 345
Operating surplus (estimated)	2,779	3,440	4,785	4,957
London expenditure and interest (net)	116	108	92	72
Provision for replacement and obsolescence	700	700	500	500
Estimated profit before taxation	1,963	2,632	4,193	4,385
Sales of blister copper (long tons)	54,662	62,059	70,966	69,350
Production of blister copper (long tons)	56,162	63,557	70,966	76,848

This situation helps to explain why prices of Rhodesian copper shares have been slow to reflect the possibility of such an increase in the price of the commodity as occurred this week. Nchanga has been an exception, with a rise from 62s. 6d. to 82s. 6d. since the Korean war started; this is explained by the company's decision to raise its annual milling capacity to 108,000 tons from the recently attained level of 64,000 tons a year. Nor did the publication this week of satisfactory results of Roan Antelope and Mufulira for the full year up to June 30th (summarised in the accompanying table) give the remainder of the share market the fillip it has been looking for, though some advance has been made. The most hopeful aspect of these results is the expansion in production, most marked in the case of Roan Antelope—which also succeeded in increasing its profit, before taxation, from £1,963,000 to £2,632,000. The modest rise in profit of Mufulira is due to the small increase in sales; but since its output increased from 70,966 long tons to 76,848 long tons of blister copper, a bigger profit is possible in future periods. Rising production on the Rhodesian copper belt, most marked in the latest quarterly results, is a reassuring sign that the shortage of fuel which has dogged the efforts of the producers in recent years, has been eased.

* * *

Legerdemain in France

It is at first sight peculiar, and really remains so even upon closer scrutiny, that to secure command of francs the French Treasury should have to borrow dollars in the United States. Yet that seems to be the reason for the $225 million of loans that the French Treasury arranged last week with a syndicate of twenty-five American banks headed by the Chase National Bank and J. P. Morgan and Co. The first loan is for $200 million in three portions—$50 million for three years, $50 million for four years, and $100 million for five years. The shortest portion carries 2¼ per cent, and the others are at 2½ per cent. The second loan of $25 million is also at 2½ per cent, and is by way of unsecured 90-day bills renewable three times.

The curious explanation of these borrowings is that the Banque de France cannot lend any more francs to the French Treasury without specific approval from the Assembly, but it can lend more to the French Stabilisation Fund as and if the latter's foreign exchange reserves increase. The Treasury has, therfore, resorted to borrowing dollars in the United States. It will sell these dollars to the Stabilisation Fund, which will invest them in United States Treasury bills or certificates of indebtedness; it seems in fact to be a condition of the $200 million loan that such bills or certificates should be bought and deposited with the lending banks as collateral. The Stabilisation Fund will pay the Treasury for these dollars by borrowing French francs from the central bank on the strength of the increase in its foreign exchange holdings. All this is apparently being done in the name of orthodox finance—in fact, of course, the inflationary significance of the real outlay to be "financed" in this way will not be decreased by the paraphernalia of this borrowing in New York. The French Government, however, is faced by the fact that public response to a bond issue would certainly be poor and that the commercial banks are unwilling to increase their holdings of Government paper. So long as the level of "real" savings out of current income (whether lent for active use or hoarded in idle cash) permits the Government to step up its real investment programme, some way to break through the legal and psychological shackles on its borrowing powers must be found.

Auction or Allocation for Wool?

Wool prices during the 1950-51 season are expected to reach new high levels. The war-time stocks held by the Joint Organisation had by the end of June been reduced to under 500,000 bales, so that almost 10 million bales have been sold within five years. The remaining stock consists largely of inferior types, and in the first half of the current season only 250,000 bales of it will be offered against 550,000 bales in the first half of last season. If world wool production in-

creases by three per cent as expected, available supplies would still be a million bales less than the actual rate of consumption in 1949-50. Hence if no allocation scheme is introduced for raw wool, prices will tend to rise until effective demand is curtailed to this reduced level of available supplies. But demand during the current season is likely to expand—first, because a high level of incomes is being maintained in the United States and Europe; secondly, because demand for service uniforms will almost certainly increase; thirdly, because America—if not other countries too—wishes to accumulate a strategic reserve.

If the reduced supplies of wool are to be channelled to cover military requirements, then one of three things must take place. The price of wool at the auctions could be bid to such a height as to make its use unprofitable for certain civilian purposes. The auction system could be replaced by an international allocation scheme. Or countries such as the United States that desire to increase their demand for wool for strategic purposes could at the same time limit their commercial demand for wool by restricting domestic production of certain civilian manufactures. The American Government is known not to favour the maintenance of a free market under present conditions, if only because it would permit other merchants to outbid American buyers in the hope of later reselling the wool to the United States at even higher prices.

* * *

America and the Wool Market

The American Government suggested to Mr E. McCarthy (the Australian Deputy High Commissioner in London), during his recent visit to Washington, that some method should be instituted to enable purchases for strategic purposes to be made outside the market and at fixed prices. Mr McCarthy actually went to the United States to get American backing for the Commonwealth scheme to "stabilize" wool prices. This scheme is virtually the same as that operated by the Joint Organisation: it would guarantee a minimum price to the wool grower without providing any ceiling for the consumer. The American Government was not very sympathetic, since wool prices are likely to remain at a very profitable level for wool growers for some time to come: it was more concerned with securing an adequate supply at reasonable prices.

As a method of allocating scarce supplies during a phase of urgent rearmament, the unfettered price mechanism may have its disadvantages. But it is very questionable whether they outweigh those of the only alternative methods. A system of "planned" allocations might prevent prices from rising sharply, but on what basis would a country's legitimate needs be assessed? None of the postwar years can be regarded as normal, and the pattern of trade prewar was vastly different. The political difficulties inherent in any international allocation scheme would be almost insurmountable. During the recent war allocation was successful because Britain and America were the only large wool consumers and their aggregate demand was much smaller than available supplies. Indeed, by the end of the war Britain had accumulated a stock of 10.4 million bales of wool—a stock that the Joint Organisation has now almost liquidated.

* * *

Malaya Earns More Dollars

In the six months ending June, 1950, Malaya has recorded a favourable trade balance for the first time since the war. Imports were valued at £129 million and exports at £140 million, giving a surplus of £11 million compared with a deficit of £17 million in the corresponding period of 1949. Malaya has in fact gained from the higher price of rubber, particularly in the second quarter of the year. Rubber exports amounted to 458,000 tons and were valued at £68 million, while tin exports (38,300 tons) yielded £22 million. These two commodities alone accounted for 70 per cent of Malaya's total exports during the period.

Malaya has fully maintained its position as the Commonwealth's largest dollar earner. Exports of rubber to the United States (167,085 tons) were valued at £24 million and shipments of tin (27,034 tons) at £15 million. As imports from America amounted to only £4 million, Malaya's net dollar earnings totalled over £35 million or U.S. $103 million at the present rate of exchange. Thus despite the devaluation of sterling, Malaya earned approximately U.S. $38 million more than in the first half of 1949. Judging from present trends in both the rubber and tin markets, it is likely to make an even more substantial contribution to the dollar earnings of the sterling area during the second half of the year.

Although the United States is Malaya's largest market, Britain is its largest trading partner. In the first six months of this year, Britain took £20 million of its exports, of which £14 million was rubber. On the other hand Britain provided £27 million worth of its imports consisting mainly of consumer goods and metal manufactures. Indonesia is Malaya's third largest trading partner. During the period Malaya received £27 million worth of goods from this source, mainly in the form of primary products for transhipment from Singapore. Malaya's exports to Indonesia totalled £11 million. Britain, the United States and Indonesia together accounted for almost half of Malaya's total trade.

* * *

Export Volume in 1950

The detailed trade figures for July add little to the impression gleaned from the provisional data that were discussed in a note on page 382 of last week's issue. The volume of exports for the month has been estimated at 163 per cent of the 1947 level compared with 153 per cent in the second quarter and 157 per cent in the first quarter. Exports of the three categories food, drink and tobacco, chemicals, drugs and dyes and non-ferrous metals and manufactures each reached record proportions. The main item in the non-ferrous group was the shipment of 3,092 tons of tin—the largest quantity for about four years—most of which went to the United States. Exports of motor cars declined somewhat owing to a sharp fall in shipments to Australia. But exports to Canada continued to increase and Canada became Britain's chief market for new cars and chassis for the first time in history. Among textiles, exports of wool manufactures continued to expand—particularly to the United States and Canada—while exports of cotton goods continued to decline.

The buoyancy of the export drive can be seen from the accompanying table, which shows the volume of exports based on the Board of Trade's index numbers. In the second quarter of this year, the volume of exports declined slightly but it was appreciably higher than twelve months ago. The full force of the export drive is perhaps better appreciated when it is realised that the volume of exports in 1947, the base year for the index numbers, was approximately the same as that in 1938. In other words, the quantity of goods shipped abroad this year has been some 50 per cent larger than in the prewar year. That is indeed an achievement. Most of the rise in the value of exports has in fact been due to the larger quantity. The volume of exports in the first half of this year was 11 per cent more than in the corresponding period of 1949, while prices of exports during the period rose on average by between 4 and 5 per cent.

The much larger volume of raw materials exported is due almost entirely to increased shipments of coal and home grown wool; exports of both of these commodities were very small in 1947. During the past three years, manufactures have increased by 55 per cent. Vehicle exports have expanded rapidly during the past nine months. Machinery has also

TRADE INTRODUCTIONS FOR IMPORTERS AND EXPORTERS

The Bank of New South Wales offers a valuable trade introduction service placing importers and exporters in touch with their counterparts in Australia and New Zealand.

As the largest commercial bank in these territories, it offers the best medium for developing trade with Australia and New Zealand.

Ask your bank to consult and use

DOES YOUR FILING DO THIS?

House Correspondence, etc., SAFELY.
Prevent Misfiling.
Reveal Facts at Sight.
Provide for Forward Action.
Give Name, Address, 'Phone No., etc.
Hang Neatly—Last Indefinitely.
Signal Days and Months in Colour.
Reveal Borrowed Documents.

It's worth your while to check your filing.

Because nowadays your filing system *should* be the nerve centre of your business—not just a place to store papers.

Try to visualise your present cabinets with shannographic filing . . . Instead of flimsy files which demand thumb-fumbling you can *see all* the files . . . Flat . . . Box-like . . . with the contents totally enclosed against (*a*) dust (*b*) misfiling.

Each file is separate, hanging from a metal frame by metal hangers. The flat top goes right across the whole of the file. Which means you have far more room for the name of the company, its address(es), 'phone number(s), executives' names.

Colour-charting makes mistakes impossible. Coloured signals make forward dating easy. And ready-printed numbers 1 to 12 and 1 to 31 can be used for dates (or as a code for progressive action).

On the front of each file there is also provision for a slotted-in card. It can be used to note papers borrowed from the file—by whom, and when. It is also used for cross-references or for annotating data.

And these files don't wear out—need no frequent replacement. Once in position they last for years.

Your business can have *this far* more comprehensive filing system. First-cost is moderate. It fits all standard cabinets. And since your business *needs* filing of some sort why not have the system that earns its way in several different directions?

Attach the slip below for the full story of shannographic filing for general purposes. Tick the *extra* service(s) it gives from the list below. Full details will be sent you by return.

increased but not so sharply, while exports of iron and steel have been rising steadily since the end of the war and now occupy third place in value. The volume of cotton goods exported was much smaller than in the first half of 1949, but exports of wool manufactures were larger. Other textiles were also above their 1949 level, though exports of apparel were less. Cutlery and electrical goods were smaller than last year, but pottery exports have been increasing steadily during the past six months.

The volume of imports in the first half of this year was some 7 per cent higher than in 1949 while import prices have risen by about 10 per cent. Larger quantities of food (in particular grain and dairy produce) have been received, but the main increase has occurred in raw materials. Exceptionally large quantities of rubber have been imported during the first six months and of oilseeds and paper-making materials during the second quarter. Imports of raw wool and iron ore and scrap have also been larger than a year ago. On the other hand receipts of raw cotton, timber and non-ferrous metals have been smaller.

Shorter Notes

The Austin Motor Company has confirmed the receipt in the last few days of an order for "some thousands of British light four-wheel drive vehicles exclusive of engines" to be made to the specifications of the fighting vehicles division of the Ministry of Supply. The order for the engines has not yet been placed. The company states that production to this order will be additional to the normal work of the Longbridge factory and "will not affect home and export markets."

*

Another electric power contract at Seattle, the second this year, has been awarded to an American firm in preference to a British firm which had submitted a much lower tender. The (American) General Electric Company's tender to supply two transformers at a price of $370,000 has been accepted; the British competitor, Ferranti, Ltd., had quoted $232,000, but it has been stated in Seattle that the British firm was not able to meet the delivery date requirements.

*

Plant for the manufacture of silicones is to be installed in Britain by Albright and Wilson Limited. For the past four years the firm has been acting as British distributor for the American Dow Corning Corporation which developed the silicones and is the largest producer in the United States. Silicones are used in a number of forms, including varnishes, rubbers, greases, fluids. Their most remarkable and most valuable characteristic is the wide range of temperatures within which they maintain their properties. Silicone rubber remains flexible over the entire temperature range between *minus* 110 deg. F. and 500 deg. F.

*

In the face of opposition from a group representing 35 per cent of both classes of preference shareholders the Tunnel Portland Cement scheme for segregating the group's overseas assets has been abandoned.

*

Offers of 10 year convertible notes are shortly to be made to shareholders of Freddies North Lease Area and Freddies South Lease Area to finance the increased cost of bringing the mines to the production stage. The notes will carry interest at 5 per cent and the right to convert into 10s. ordinary shares at par up to the end of 1952. The amounts of the issues will depend on the extent to which the present options to take up 10s. shares at par by September 12, 1950, are exercised.

Redemption yields are worked out on the assumption that all dated stocks will be repaid at latest date. Such yields are marked 'f'. To this rule there is one exception (Funding 4 per cent) on which the yield is taken to earliest date and marked 'e'. (*n*) Net yields are calculated after allowing for tax at 9s. in £. (*f*) Flat yield. • Assumed average life 14 years 3 months.

(*a*) Interim. (*b*) Final. (*c*) Whole year. (*d*) Int. paid half-yearly. (*f*) To latest redemption date. † Free of tax. (*m*) Yield basis 35%. (*n*) Yield basis 26⅔% after capital bonus.

COMPANY MEETINGS

BLEACHERS' ASSOCIATION, LIMITED

JUBILEE YEAR

TAXATION UNDERMINING EFFICIENCY AND PROGRESS

SIR WILLIAM CLARE LEES' REVIEW

The fifty-first annual general meeting of Bleachers' Association, Limited, was held on August 18th in the Assembly Room, Blackfriars House, Parsonage, Manchester.

Sir William Clare Lees, Bt. (the chairman), presided.

In proposing the adoption of the report and accounts, Sir William said:

Ladies and gentlemen,—May I take it that the report and accounts, which have been circulated, be taken as read?

Since we last met we have suffered the loss of our chairman, Sir Alan Sykes. Sir Alan was the last of the original directors of the company and had been chairman for 34 years. He was greatly looking forward to presiding at this jubilee meeting but, to our great regret, he died on May 21st. Your directors have done me the honour of appointing me to the chairmanship in his stead.

During the year Mr T. H. Cooke has been elected a director of your company. Mr Cooke has already been closely connected with us in his capacity of managing director of one of our associated companies. We are well assured from our knowledge of him and experience of his energy and ability that his appointment to our board will be of material advantage to the company. You will be asked at a later stage in the proceedings to confirm this appointment.

This is our jubilee year. I am glad that it happens to coincide with a year in which the trading results have not only maintained but have improved upon the increase recorded last year. As this is the second year in which the accounts have been presented in accordance with the requirements of the Companies Act, 1948 we are able to supply you with the comparable figures for last year, and these you will find printed in red on the balance sheet.

INCREASED RESERVES

The association's balance sheet, after the additions made during the year and the deductions in respect of sales of property and the provision for depreciation, shows a small reduction in the value of the fixed assets. Shares in subsidiary companies show an increase of about £75,000—reflecting the cost of an addition to one of our subsidiary groups—and the total of our investments appears at the fairly substantial figure of £1,473,700. Current assets are increased this year by nearly £325,000. There is an increase of £143,000 in advances to subsidiary companies representing the additional working capital required by our branches. Tax reserve certificates are increased by £100,000 and cash at the bank by £117,000.

On the other side of the balance sheet it will be seen that the reserves have again been strengthened—the general reserve by £100,000 and the contingencies fund also by a further £100,000. The need for this reserve is emphasised by the inadequate amount we are allowed to deduct for the depreciation of our assets before taxation. I shall have something more to say upon that subject a little later on. You will see that in the profit and loss account the total charge for income-tax and profits tax against the year's profits amounts to £418,223—an increase of more that £88,000 over the amount charged in the previous year.

In comparison with the large amount required for taxation, the balance of the profit and loss account, available for distribution and reserves is only £364,117—an increase of £67,000 over last year.

MODEST RETURN ON CAPITAL

There are no important changes in the consolidated accounts other than those recorded in the balance sheet of the association, and these, in the main, reflect the increased liquid resources of the company.

There is, however, one fact to which I should like to refer and which is best illustrated by reference to the consolidated accounts. If we add to the balance of the consolidated profit and loss account the amount paid in debenture interest and the amount transferred to the taxation allowances equalisation account, we arrive at a figure of £484,260, which represents the profit available to remunerate the whole of the capital employed in the group. In this capital I include the debenture stock, which is an essential part of the capital employed, as also are the capital and revenue reserves and the undistributed profits.

The amount of capital so employed in the business is nearly £8,500,000 and the profits available for its remuneration are equivalent to rather less than 6 per cent. on that amount. By no stretch of imagination can the profits of the business be termed excessive.

You will have observed from the report of the directors that we are proposing the payment of a dividend on the ordinary stock at the rate of 5 per cent., so repeating last year's payment. In addition to that it is recommended that a special jubilee bonus at the rate of 2½ per cent. shall be paid on the ordinary stock, and we have provided a sum of £25,000 for the payment of a bonus to the employees of the association in proportion to their length of service. I feel sure we can count on your approval of this proposal which enables our employees to join with the stockholders in celebrating the jubilee of the association.

CLOTH OUTPUT

We have had many ups and downs in our fortunes during the 50 years which have passed since the formation of the Association. For the first 12 years the output of the looms of Lancashire steadily increased until in 1912 the production reached the colossal total of 8,000 million yards. Of that production of cotton piece goods in the grey state 31 per cent. (roughly 2,500 million yards) was bleached, mainly for export, and we got our share of that very large volume of cloth. Over 1,000 million yards of that output was exported in the white state to the three main piece goods markets of the world at that time—India, China and South America. By 1937 the total output of the looms had dropped to 3,600 million yards, the proportion bleached having fallen to 25½ per cent. of that greatly reduced total. Since the end of the war the average annual output of grey cloth has been about 1,745 million yards, but latterly it has been at an increasing rate and in 1949 amounted to just over 2,000 million yards. When the figure giving the proportion bleached is published, it will probably be rather less than 500 million yards—barely one-fifth of the maximum attained in 1912. Little wonder that under these conditions it was found necessary to concentrate our output into a much smaller number of units. Had we not done so, we should not have been in the sound position in which we find ourselves today.

Over the last 20 years we have branched out into a number of activities of various kinds, and this has enabled us to open up some of the works which had been closed in addition to embarking upon other enterprises in different places.

During the year several of your directors and members of the staff have made journeys abroad in the interests of your company. The United States, Canada and several European countries have been visited, thus keeping us in touch with what is going on in other places.

PENAL TAXATION

The question of taxation, to which I referred a moment or two ago, is one of most serious moment not only for the shareholders of limited liability companies but, above and beyond that, it is undermining the efficiency and progress of all manufacturing industries. It is not primarily a political party question. Whichever party may be in power, great and fundamental changes must be demanded if the industrial fabric of the nation is to be modernised and maintained in an efficient condition.

There are two factors which are operating against industry at the present time—the first is the tax on profits, distributed or reserved, which is unsound in principle and discriminatory in its incidence. The penal tax of 30 per cent. on dividends paid to shareholders has no justification on the ground of checking inflation. On the contrary, it is a not unimportant contributory to the maintenance of the inflationary trend. In many instances it is extracting money which would have been retained in the business either for additional working capital required on account of higher prices or for extension or replacement of plant, thus maintaining and building up the capital structure of the nation. Instead of being directed to those objects the money so extracted is being dissipated through excessive Government expenditure, which is encouraging the country to live above its means. A standard of living in excess of that which is justified by the volume of national production is being maintained in part by distributing in benefits the working capital of industry and the funds it needs to maintain its fixed capital. That cannot go on indefinitely without serious consequences. The tax on undivided profits is even less defensible.

The other factor is the inadequacy of the amount allowed for depreciation in the computation of profits for assessment to taxation. In earlier times the present basis of allowing depreciation on the original cost did not work out too badly, the cost of machinery did not vary a great deal and so replacement was provided for more or less at the end of the life of a machine. But today, with the present cost of replacement, which is most unlikely ever to return to the original cost, the depreciation allowed before taxation is quite inadequate.

This dual attack on the financial structure of industry must in time undermine its stability and delay replacement which should be effected, thus lowering the whole efficiency of the country.

The total abolition of the profits tax, a lower differential rate of income tax on profits retained in business and a realistic revision of depreciation allowances in order to provide for replacement are urgently called for if this country is to maintain its competitive place in the markets of the world.

ECONOMIC DANGERS

Although inflationary pressure has not been halted, it has been held somewhat in check by the combined effect of increased

production, the slowing down of the demand for wage increases and the stabilisation of dividend distribution, though the Government has made no corresponding effort to reduce national expenditure. This salutary display of national self-discipline is now threatened by the abandonment by the T.U.C. of their firm advocacy of this policy during the past two or three years—a course of action clearly against their better judgment. Retail prices in the home market have only increased by 1 per cent. during the first six months of this year. Where, then, is the justification for the abandonment of a policy based upon the economic dangers in which the country is involved and a clear realisation of the safeguards needed if we are to come through those difficulties unscathed? The dangers of this weakness in leadership may be grave in consequences in the years to come. These tendencies, coupled with the strangulating effect of the discriminatory taxation levied on that part of the capital of the nation which is risk-bearing, must have a depressing effect upon those who heretofore have been the driving force of the industrial enterprise upon which this country has thrived in the past, and in the long run will tend to dry up those sources of revenue upon which the Exchequer relies to balance the Budget.

THE OUTLOOK

The volume of our own production has again been somewhat greater than in the preceding year, aided, as it has been, by a somewhat larger output from the weaving section, coupled with the importation of a considerable volume of foreign-made grey cloth brought in by our customers for finishing and re-export to those of their regular markets in which the demand could not be met by the output of British looms. It is upon the continuance of both these sources of supply that the fortunes not only of the export trade in cotton piece goods but also those of this Association depend. Should the volume of cloth available for bleaching and finishing be reduced, that would undoubtedly have a detrimental effect upon our results.

It is with these uncertainties in my mind that I find it even more difficult than usual to give any indication as to the prospects of the year we have now entered upon. So far the results are encouraging, but much may happen before March next year. One thing you can rely on; every one working in the Association will continue to put forward the whole of those energies which have in the past year yielded such satisfactory results and which will doubtless be equally successful, given an adequate supply of raw material to work upon. Without this, however hard we work we cannot produce results.

In conclusion, I wish to express, not only on my own behalf but also, as I am sure you would wish it, on yours, our thanks to the management board and their co-directors, to our branch and departmental managers, and to that large and loyal body in the administrative and operative fields, collectively and individually, for their work during the past twelve months

In moving this resolution, which I will ask Mr Reynolds to second, I should like to tell you that I have received several letters from stockholders criticising the smallness of the dividend and the provision for the bonus to the workpeople. One stockholder has suggested that an amendment should be moved reducing the amount set aside for the bonus for the workpeople and, alternatively, making a reserve for the ordinary stockholders.

I would remind you that it is not within the competence of this meeting to consider any resolution going outside the business of an annual general meeting as defined in the articles, nor can the accounts be amended—they can only be received or rejected. I would also remind you that under article 116 of the articles of association, no dividend shall exceed the amount recommended from time to time by the board. It is, however, competent to this annual general meeting to reduce the dividends recommended should they so desire.

With regard to the rate of dividend, the directors are not prepared to entirely disregard the Government's request for the limitation of dividends even if they were so disposed, although they have felt justified in recommending the Jubilee bonus distribution to stockholders. The need for retaining substantial sums to meet the heavy cost of replacements, the increased value of stocks and the normal requirements for the progressive development of the business would in itself compel us to restrict our dividend policy for the time being in the long-term interests of the stockholders.

With regard to the bonus to the workpeople, it should be borne in mind that during the period to which I have already referred, the workers suffered long years of hardship and loss of wages owing to short-time working and many lost their jobs, while we were losing some of the nominal value of our capital. We cannot do anything for those who permanently lost their employment, but we did feel it was only right that we should join those of our workpeople who had stood by us and weathered the storm with us in our Jubilee celebrations. I am confident that the vast majority of our stockholders will approve of our action.

Mr R. C. Reynolds seconded the resolution and the meeting approved the report and accounts.

The retiring directors were re-elected and the fees of the joint auditors, Messrs Jones Crewdson and Youatt and Messrs. P. and J. Kevan, were fixed.

A vote of thanks to Sir William Clare Lees, Bt., for presiding was moved by Mr E. R. Clark, J.P., and carried unanimously.

TELEPHONE RENTALS, LIMITED

SUCCESSFUL YEAR: HIGHER PROFITS

IMPORTANT SERVICES TO INDUSTRY

AUTHORISED CAPITAL INCREASED

MR FRED T. JACKSON ON THE OUTLOOK

The twenty-first annual general meeting of Telephone Rentals, Limited, was held on August 21st at Caxton Hall, Westminster, S.W., Mr Fred T. Jackson, O.B.E., Comp. I.E.E., chairman and joint managing director, presiding.

The secretary, Mr G. H. Field, read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1949:—

Your directors are very pleased to report a successful year, which has yielded a higher profit than the one reviewed ending December 31, 1948.

PROFIT AND LOSS ACCOUNT

The profit of the company for the year, before providing for taxation, is £366,475, as compared with £322,034 for the previous year. The various appropriations made from this profit are detailed in the profit and loss account and the income-tax charged, amounting to £113,390, includes a reserve based on the profits for the year now under review.

You will observe that we have debited against our profit the sum of £88,175, representing the writing off of the balance of our goodwill, after having reduced the total by the amount of our free capital reserves.

We have not considered it necessary this year to add to the appropriations of £50,000 which we made last year to a contingencies reserve, nor to the £10,000 reserve for supplemental pensions. I should, however, tell you that when the current year ends, that is 1950, we shall most probably pass a further sum to supplemental pensions reserve for the reasons stated in my address to you for the year ending December 31, 1948.

In the case of pensions, I would just mention in passing that we introduced a revised pension and life assurance scheme on July 1, 1950, which is more in keeping with the present-day conditions and adequately caters for those members of our staff who will be eligible to join.

We have transferred a further £20,000 to the general reserve, bringing it up to a total of £320,000. After making these appropriations, providing for the dividends on both the preference and the ordinary shares, and setting aside £34,740 for distribution to employees under the company's profits participation scheme, there remains an unappropriated balance of profit of £67,158 to be carried forward to the current year.

BALANCE SHEET

The value of our revenue producing installations has been increased during the year by £356,744, and the reserve for depreciation by £126,341, so that the net total value now stands at £1,803,897. The ratio of our rentals to the net total value of our installations represents approximately 1.75 years' rent.

We have decided to eliminate the figure of goodwill from our balance sheet, thereby fulfilling the intention expressed in my statement to you on June 29, 1948. In order to accomplish this purpose you will see from the balance sheet that we have utilised the whole of our capital reserve account, and our development reserve, which we consider is no longer required, and the balance required to liquidate the total of £196,926 has been charged against our profit and loss account.

Under the heading of subsidiary companies the only figure which has altered is the amounts due from subsidiary companies. The substantial increase in the debt due to the parent company is attributable to the appreciable expansion of our three main subsidiaries, Electro-Rentals. Limited, whose work lies in the refrigeration field and is a vital necessity in these days of food shortages, and our Irish and South African companies.

STOCKS

The only other figure which calls for comment on the assets side of the balance sheet is that of stock and work in progress, which shows a reduction of £64,207 from that of the previous year. It is our constant endeavour to reduce our stocks still further, for they have of necessity been large on account of the long delivery period required by our manufacturers. However, now that the delivery position is showing considerable improvement it should be possible gradually to reduce the amount of stock held and thus release some of our capital to help meet current commitments.

Referring now to the other side of the balance sheet, our issued capital was increased in March, 1949, by the issue of 400,000 4½ per cent. cumulative preference shares, details of which I gave you in my statement last year. As a result of this issue the share premium account shows an increase of £12,624, though our total capital reserves have been depleted to the extent of £108.751 by the transfer of the two items to goodwill already mentioned. The total of the company's capital, reserves and surplus is £2,223.866, as compared with £1,906,484 at the end of 1948.

Current liabilities are greatly reduced from the 1948 figure as a result of the abovementioned issue, and the nature of the items comprising the total of £473.041 shows that there is small scope for further reduction.

CONSOLIDATED BALANCE SHEET AND PROFIT AND LOSS ACCOUNT

The consolidated balance sheet and consolidated profit and loss account follow a similar form to the accounts of the holding company, and this year include a full year's working of the South African subsidiaries.

It is not necessary for me to comment in detail on the consolidated accounts as the items are quite straightforward and can readily be followed.

Finally, the profit of the group before taxation is £388,286, and after making the various appropriations, the balance of unappropriated profits carried forward applicable to the holding company's shareholders amounts to £86,454.

CAPITAL

You will doubtless have noted that we propose to increase the authorised ordinary capital by the creation of 2,000.000 ordinary shares of 5s. each. We have no intention of issuing these immediately, but as the business grows it is essential that we should have these available as and when required.

Our reserves now reach a substantial figure, even though we have written off the item of goodwill. These reserves are not liquid but they are employed in the business and, subject to the consent of the Capital Issues Committee, we propose in due course to make a free bonus issue to shareholders of 400.000 ordinary shares of 5s. each, paid up by utilising £100,000 of such reserves.

THE YEAR IN REVIEW

I should like to emphasise that the business carried on by your company is a highly specialised one and is of such a nature that we need continually to be training executives for the more important positions. Because it is so specialised, we, unlike many other businesses, have no trained reservoir from competing businesses on which to fall back and so are dependent on our ability to attract progressive young men to our organisation for training. It is a business which on the high level administration requires great attention to detail and concentration of thought as to the best way in which we can promote business and industrial efficiency throughout the country.

I do not know if it is generally realised how important are the services we offer to the industrial community as a means of reducing overheads and expediting internal and external transactions in every kind of organisation.

During the year under review we have been successful in obtaining a high average of additional annual rents, month by month, so consolidating and improving the stability of the business to such an extent that we can look forward to further success in the future.

Looking forward into 1950, of which over seven months have already expired, the new business secured is very satisfactory and I can safely state that the current year will be at least equal to 1949.

GOOD SERVICE TO SUBSCRIBERS

Last year at our annual meeting I told you something of our organisation. I need not repeat this, for the organisation I outlined then is still in existence and very little change has been made, apart from minor details where possible weaknesses in service to our subscribers have shown themselves. Good service to our subscribers is, in our opinion, the most important service we can render not only to them, but also to you as shareholders, in the future interests of your company. As an example I might mention that we have a very large number of subscribers in the London and Home Counties areas.

In order to give the best service we are decentralising our organisation in the London and Home Counties area and setting up four areas. In effect, these are four branches, each with a separate manager and chief engineer and staff, all under control of head office. This is something which cannot be done by a stroke of the pen We believe in going slowly and safely, and one London branch is already operating very successfully within its own area.

SUCCESS OF PROFIT SHARING

I think I ought to mention that we take great pride in your company being a good company as far as employees and staff are concerned. Some of you may remember that a few years ago we introduced a profits participation scheme, in accordance with which employees who qualified were entitled to a share of the profits in proportion to salaries earned and length of service. This scheme has been a very great success and our employees who are participants in the scheme are most enthusiastic, regarding themselves practically as shareholders in the business. We confidently hope that you regard them in the same way. That is not to say that those who are not yet participants in the scheme are less enthusiastic, for they put forward their best endeavours to qualify for participation.

You will remember that we opened a subsidiary company in South Africa. I am pleased to inform you that this company, too, has been a success right from inception, and already a very substantial rental has been built up in that country. In addition, we have been able to instil into our staff there the same high ideal of service as that which exists throughout the whole organisation in this country.

TRIBUTE TO EMPLOYEES

In concluding, I would like, on behalf of the management, to express our keen appreciation of the very excellent work put in by all our employees throughout the organisation. Yet this is only to be expected when many of them are the equivalent of shareholders, and the remainder hope to be in due course.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Mr Campbell Cochran, B.L., was re-elected and the remuneration of the auditors, Messrs. Chas. W. Rooke Lane and Company, was fixed.

A resolution increasing the capital of the company to £2,000,000 by the creation of 2,000,000 ordinary shares of 5s. each was unanimously passed.

EDGAR ALLEN COMPANY, LIMITED

MR W. H. HIGGINBOTHAM'S REVIEW

At the fifty-first annual general meeting of Edgar Allen & Company, Limited, held on August 23rd at Imperial Steel Works, Sheffield, the chairman (Mr W. H. Higginbotham, F.S.A.A., F.S.S.) said that the total value of sales, though less by some 4 per cent. than the record level of the previous year, was maintained at the average of the three exceptional years 1947-1950, recession in certain sections being made good by improvement in others.

As compared with the previous year the "net worth" of the business (i.e., the aggregate of capital and reserves) had increased by £159,081 to £1,487,443. Total assets at £2,095.524 were higher by £152,299 and external liabilities, totalling £543,031 were less by £6,782, while the excess of current assets over those liabilities had risen by £128,261 to £959,503.

CURRENT ASSETS INCREASE

Under the head of current assets, now totalling £1,502,534 and showing a net increase of £121,479, stocks and work in progress valued at £743,718 were higher by £12,313, sundry debtors were lower by £83.110 and were practically back to the 1948 level, while cash balances had gained by £192,276 and now stood at £198,673 which compared with a bank overdraft of £81,253 two years ago.

Current liabilities and provisions on external account amounted to £237,157 and showed a reduction of £32.207. This was offset by an increase of £22,449 in the amount due for income tax and profits tax (£110.246) and of £1,976 in the net dividend appropriation. The total of current liabilities thus showed an over-all reduction of only £7,782.

The paid-up value of ordinary share capital was now restored to £430.945 by the addition of £143,648 derived as to £90.000 from the excess profits tax refund account, and as to £53,648 from general reserve in accordance with resolutions passed on March 30th last. Total revenue reserves now stood at £750,454 as compared with a paid-up capital of £730,945, and showed a net increase of £105,557.

ESTIMATE OF "NET WORTH"

Any estimate of "net worth" of capital employed in the business on the basis of present-day values should have regard to the surplus of roughly £950,000 over book values shown by professional valuation of their fixed assets two years ago. Adding this to the aggregate of capital and reserves gave a total of £2,437,000, and if from this be deducted the capital employed in subsidiary companies and in the form of trade investments (in total £194,188) they were left with a figure of some £2,250,000 as the currently-valued net worth of their undertaking as a going concern, apart altogether from the value of goodwill.

The profit and loss account showed a net gain for the year of £437,083. Of this, net trading income, after depreciation, staff pension contributions and remuneration of directors (five of whom were full-time executives) amounted to £384,988 which was less by £15,791 than the previous year's figure. On the other hand, income from investments and from subsidiaries at £52,095 was larger by £23,832. After providing for taxation of the profits to the extent of £240,000 (or roughly 55 per cent.) there remained as taxed income £197,083.

The volume of orders on hand was satisfactory though less in total value than a year ago. Arrears of deliveries were being reduced and competition was keener both in regard to price and delivery dates. They had continued their research activities.

The report was adopted.

Statistical Summary

EXCHEQUER RETURNS

For the week ended August 19, 1950, total ordinary revenue was £44,150,000, against ordinary expenditure of £45,350,000, and there was a net exchequer deficiency of £1,200,000, against which there was a net repayment of £1,775,000 of outstanding Treasury bills, leaving a net surplus of £575,000 for the week. The total amount raised since April 1st is £2,445,000 compared with £32,662,500 in the corresponding period a year ago.

The Economist

Established 1843

September 2, 1950 — One Shilling

The dispute between the London Master Printers' Association and the London Society of Compositors, which has been smouldering for months, has broken out into the open. The story is an involved one; but the effect, so far as we are concerned, is that compositors were not available to set the type for this week's issue of The Economist.

This emergency edition has accordingly been produced without any type-setting whatever. We are painfully aware that it is only a token issue, but we take some pride in being able to preserve the tradition of unbroken issue in a week that marks our 107th birthday. Unfortunately, the Records and Statistics *Supplement will have to be suspended for the duration. Last week's delayed issue has gone out to subscribers this week.*

It is perhaps natural that we, as the victims of the dispute, should feel aggrieved against the union, who were its initiators. But even apart from this natural bias, we think any fair-minded person would deem the course of action taken by the London Society of Compositors to be so devious and disingenuous as to deprive them of any right to public sympathy. We have no better friends than the compositors who set our pages week by week. But their union leaders would do well to observe that it is possible to get along without any compositors at all.

POWER AND PROGRESS

The British Association has never led a cloistered life; but with every year now it seems to concern itself more with problems of public policy. Last year Sir John Russell's Presidential address on the problem of feeding the growing population of the world set the theme for the meeting. This year's President, Sir Harold Hartley, chose the subject of "Man's Use of Energy". It is a theme which few men living are as well qualified to expound. There were some notes of warning in Sir Harold's address - particularly in his mention of the fact that only about 30 per cent of the world's present power consumption comes from current revenue and all the rest from the capital resources of coal and oil, which will not last for ever. But the conclusion was optimistic. There is plenty of latent power still available, with nuclear energy only just beginning and the direct utilisation of solar radiation almost non-existent. And Sir Harold is not one of those scientists who think that Man cannot be trusted with his discoveries.

Vol. CLIX No. 5584
THE ECONOMIST, 22, Ryder Street, St. James's, London, S.W.1. *Telephone:* Whitehall 1511.
ANNUAL POSTAL SUBSCRIPTION £3
Registered as a Newspaper. Entered as Second Class Mail Matter at the New York, N.Y., Post Office. Authorised as Second Class Mail, Post Office Dept., Ottawa.

It is interesting, however, to notice what Sir Harold Hartley sets as the task of science - not the advancement of knowledge by itself but "the more efficient use" of Nature's resources - in short, the economist's aim of raising the standard of living. There is more than a hint in several passages of the address - though Sir Harold is too urbane to make them explicit - of a claim by the scientist to be the "onlie begetter" of the modern world's material wealth.

There is, of course, a very great deal to be said for such a claim. It is certainly true that unless the scientist and the engineer had shown how to harness natural power there could have been no increase in production and therefore none of the great rise of the past two hundred years in the average westerner's standard of living. Furthermore, it is true, as Dr Parker, the Director of the Fuel Research Station, showed in another public lecture at Birmingham last week, that

> in general, those countries with the greater fuel and energy consumptions in relation to size of population have the higher average incomes.....In comparison with the world average of the equivalent of between 1.4 and 1.5 tons of coal per person annually, the figure for the United States is now over 8 tons, while that for Great Britain is little more than 4 tons.

> In countries such as India and China it is less than 0.5 ton.....
>
> (The American consumption of power) can be considered as providing each individual with more than 30 servants to assist him in meeting his needs. (The British consumption) is equivalent to providing each individual with 13 or 14 servants. Take these servants away, or employ them less efficiently, and the standard of living must fall.

It is, indeed, a powerful argument. But it is not the whole of the story. For as Professor G.C. Allen pointed out in his Presidential Address to the Economics Section of the Association, it is necessary to ask "Why do these differences exist?" Is it the utilisation of power that has created the wealth, or the wealth that has made possible the utilisation of power? Is scientific discovery not merely an essential condition of material progress, but the chief regulator of its speed? Is the state of scientific knowledge the key factor, the essential bottleneck the widening of which would open the way to universal riches? This can hardly be so; for if all scientific discovery were to stop forthwith, the world could still reap an enormous harvest of wealth and welfare by applying universally the techniques that already exist. What, then, is the limiting factor, the speed governor, of progress?

> Professor Allen's conclusion is that while material progress is affected by numerous circumstances, it is fertility in resource and imaginative enterprise which lie at its root -

qualities that are more likely to be affected by the deliberations of the Education Section of the British Association than by the others. Professor Allen argued his thesis with great force and a wealth of contemporary example. It is, indeed, hard to challenge. And yet it is difficult to believe that it also is more than part of the story. For if innovation were the basic regulator, one would expect material progress to proceed by fits and starts. But in fact it is very regular. (Mr W.B. Reddaway has recently demonstrated in the London and Cambridge Economic Service that the much discussed increases in industrial productivity of

recent years in this country, when they are spread over the whole output of the community, are reduced to a rate of progress very much the same as has prevailed for many decades). This regularity suggests that the *average* rate of progress depends not only on the scientist and his discoveries or on the industrial innovator but also on the rate at which past discoveries and past innovations can be spread across the whole community. That, surely, depends upon the supply of capital. Professor Allen rather sweeps that aside:

> It is erroneous, in my view, to look to the side of savings for a leading cause of any deficiency in capital equipment, for enterprise generates its own savings out of the higher incomes which it makes possible.

That may have been true in the past; though by no means certainly. It is very doubtfully true of the present or the future.

The scientist, the entrepreneur, the provider of capital - all have their part to play in material progress, and it would be wrong to claim primacy for any one of the three. But while, in this country, scientific research is being fostered as never before, industrial innovation is hardly encouraged and the provision of capital - certainly of venture capital - is at a discount. It is not necessary to be a political partisan to view these trends with alarm. As Professor Allen points out, many of the "forceful pioneers" who have played "the major part" in the development of economically progressive countries have been salaried officials, and monopoly (including public monopoly) in established industries may do little harm provided "the channels of innovation" are kept clear. But what is essential is that the activities of innovators should not be seriously impeded, and that the "special form of strength" of the entrepreneur (the phrase is Alfred Marshall's) should be held in respect by society. These things are far more fundamental than the issues of public or private ownership; they are the part that the human sciences of economics and politics can play to keep pace with the progress of natural science.

The Hideous Gap

Mr. Churchill was right, in his party political broadcast last week-end, to focus attention on the 'supreme peril' of Europe. And Mr. Atlee's reply this week-end will fall far below public expectation, if it can give no assurance that everything possible is being done to fill what Mr. Churchill called the 'hideous gap' in the defences of the west. For, while people in the west have watched the campaign in Korea, appalled at the weight of men and machines needed to check the onslaught of one Soviet satellite, they have not forgotten the danger nearer home, a danger that occupies a vast concourse of committees and produces a steady flow of secretive communiques - but little else. They do not see how such formulae as 'balanced collective forces' and 'the incorporation of Germany into a Western European system' measure up to a situation in which, Soviet forces outnumber those opposite to them by at least eight to one.

The fact is that these committees and phrases represent a pre-Korea way of thinking, in which the possibility of aggression by proxy had not been taken into account, in which it was assumed that the west had three or four years to build up the perfect integrated force, as efficiently an

cheaply as possible, with business in each country going on very much as usual. The assumption was rash - but it was one which fitted conveniently into the domestic plans and political hopes of statesmen in Britain and in other countries. It must now be reviewed, thoroughly and fearlessly, and the consequences must be faced by the only men who have all the facts - the Ministers of the Crown. It is not enough to pass it over to the Atlantic Council.

What precisely is it that Europe needs - and wants - of its two great Atlantic allies, the United States and Britain? It is, first, evidence - evidence that the ordinary man and woman can understand - of their intention to regard the Elbe as the front line of their position in Europe. On this, at any rate, French and Germans are agreed. Second, Europe asks for evidence that the strategy of the western powers is so integrated that there can be no question of divided counsels in a moment of crisis, with each country looking after itself. Third, they argue that such integration of military plans and decisions cannot be certain until there exist political ties between governments to ensure that statesmen are as much a team as are the fighting commanders. Whether those ties are formed within Mr. Acheson's Atlantic Community or Dr. Adenauer's western system is not regarded as an important issue by most Europeans.

On these three points the challenge to British policy is as direct as it could be. It was offered, and has been turned aside by Mr. Bevin, in the Schuman Plan. It was offered again at Strasbourg and turned aside by the Labour Party delegation. It will certainly be offered again, when execution of the Atlantic Pact plans demands political, industrial and financial pledges beyond what Mr. Bevin and his colleagues are ready to accept. Is the issue again to be evaded?

Let us be quite clear what is involved. There are good reasons why any British Government should move with caution towards political and economic integration with the west European governments. They are now understood by most Continental statesmen. There are good reasons, too, for arguing - as British representatives are now arguing in the Council of Deputies - that the best should not become the enemy of the good, that the ideal way of sharing the burden of defence, the ideal way of standardising arms and equipment, the ideal way of balancing forces, is for the time being less important than to form the forces and see that they are equipped. The British are being both practical and zealous in insisting that emergency action comes before long-term planning. But to the Continental ally this zeal is just another proof that Britain will help Europe but will not be bound to Europe heart and soul.

The indictment is vague enough but it is important, because it rests - notably in France - on the belief that the British have no real faith in the recuperative power of their allies and regard them more as a liability than as an asset. And French logic goes on to state, more clearly than any British statesman dare, the dilemma of British policy. That dilemma is this; if western Europe is incapable of a sustained effort to create some thirty or forty divisions in the next two or three years, and if its governments cannot guarantee the loyalty of its working populations in wartime, then it is suicide for the British to commit the cream of their ground and air forces to a defensive position on the Continent. In short, it seems to the continental mind that Britain's political interest and strategic interest are in direct conflict.

In a very important sense this is true. There are obviously grave risks in committing British forces to the front line in Germany; at first sight to do so looks like throwing good money after bad. But are they any greater than the risks of not doing so? Can the French people be expected to take seriously their task of training and equipping fifteen divisions, so long as there is only one British and one American armoured division in Germany? Can the Germans be expected to throw in their lot with the west unless they see on their own soil evidence that they will be successfully defended? And if there is to be no speedy and strong French - and in the longer run no German - contribution to this defence, what happens then? The fact is that the defence of Britain now depends on the defence of western Europe, and that can be achieved only be a military revival of France; without that revival the rearmament of Germany could not be contemplated. That revival - and the utmost effort by the smaller allies - depends on a transformation of morale such as can be stirred only by a British and American decision to have ready between the Channel and the Soviet Union something more than the present divisions and the atomic bomb.

If we ask ourselves what this means in practical terms there can be only one answer; that everything necessary should be done to reinforce the British formations in Germany without delay. If this were done, as a gesture of belief in Europe's reviving strength, the effect would be enormous throughout the Atlantic alliance. With such a decision taken, Mr. Bevin would be entitled when he meets Mr. Acheson next month in New York, to ask - as an equal and not as a suppliant - that the United States, too, should reinforce its German garrison by the same numbers. If it is not done, on the grounds that it cannot be done without emergency measures for which the Government are not ready, then the public will judge for itself whether they have been guilty of that 'lack of prevision' and 'infirmity and disconnexion of thought and action' which were alleged by Mr. Churchill last Saturday.

NOTES OF THE WEEK

Strasbourg Disappointments

However one looks at it, the session of the Consultative Assembly of the Council of Europe that has just ended in Strasbourg cannot be judged a success. The divisions that appeared last year have deepened; the federalists are as far away as ever from the non-federalists; the British have left the impression of bringing to European affairs a meticulous common-sense that they do not always show in their own affairs; and Dr. Dalton has demonstrated once again that it is inadvisable for Ministers to take part in these proceedings, especially if they are Socialists. It is true that there were some debates that caught the public ear, notably that on the need for a European army, but the shape that Europe's political unity might take is as unclear as ever. Strasbourg has not yet found its Alexander Hamilton.

It is a serious matter that the German delegates should have witnessed the weakness and divisions of this European body rather than its strength and unity. They must be wondering what precisely is to be the system into which Allied policy seeks to draw them. They hear the French declaring that European unity without the British is impossible, but they see the British opposed to anything but the piecemeal and practical approach. And when the practical and functional method is tried in the Schuman Plan they see the British standing aside.

It is evidently time for Mr. Bevin to state quite explicitly his preference for the Atlantic Community and to urge those who want - or think they can create - executive bodies for Europe to go ahead and try without Britain. What is true of the Schuman Plan is true of European unity: if it works Britain cannot stand completely out; if it does not work it is the task of the British and Americans to see to it that the Atlantic Community offers a reasonable and workable alternative.

* * *

The Formosa Imbroglio

It is essential to keep clear heads about Formosa. The essential issue, whose importance overrides all others, is to preserve the unity of the world alliance against Communist aggression. This puts on the United States an obligation to consult the wishes of its allies; but it also puts upon America's allies the obligation not to quibble unnecessarily at decisions that are forced upon the United States by strategic necessity. Communist aggression having broken loose in the Far East, it is essential that Formosa should be 'neutralised'. Those who ask that Chiang Kai-shek be turned out of the island (by whose force?) and the Chinese Communists admitted to it would sing a very different tune if the Communists chose, as they well might, to go for Hong Kong instead. On the other hand, General MacArthur and the Chinese lobby in America, with their talk of recognising Chiang as an ally, are endangering unity, and therefore peace, even more. The attitude of those Republicans in Washington whose only interest in Formosa is as a stick to beat Mr. Acheson is merely contemptible.

In this confusion, the right attitude is that which President Truman has at last clarified. Formosa must be neutralised for the present; but its future is a matter for the United Nations. This attitude deserves the support of everybody, in America, Britain and other countries, who puts policy above politics.

* * *

Action for the Services

The Prime Minister's broadcast on Wednesday night, together with the two White Papers on national service and on service pay, shows that the Government has at last conceded the truth of the view that only far reaching and dramatic action can correct the deficiency of trained men in the services. The period of compulsory national service is to be increased from eighteen months to two years and the amount of money devoted to service pay is to be increased by some £70 million, or about 40 per cent. The increased period of national service - which has been urged for some time by the Chiefs of Staff as a categorical imperative - will have the immediate effect of increasing the size of the forces by 37,000 men, of which 55,000 will be for the army. It will also mean that the forces will have the use of the national service men during a time when being fully trained they will be of some use in active operations.

It is impossible to judge whether the improvement in the scale of pay is sufficient

to create the necessary increase in the number of regulars. It has the merit of being simple, since it falls on the basic pay and not as in the past on allowances; the need for more pilots has been met by reintroducing into the RAF a generous scale of flying pay; and there are bounties - albeit rather niggardly ones - for men who re-enlist or extend their engagement. At first sight it can be judged that the increase in the pay of other ranks will have a marked effect upon enthusiasm for the services. On the other hand, the increases in the pay of captains (who get only the same increase as do warrant officers) and majors, the ranks in which the widest gap between emolument and responsibility exists, do not seem generous. However, now that the prejudices of the Government have been overcome, the present increases provide a working basis for criticism and adjustment.

Child Actors

The eminently human and realistic report of the Departmental Committee on child dramatic performances (Cmd 8005) will, if implemented, sweep away a mass of anomalies. These arise partly from the fact that acting, singing and dancing, whether on a stage or elsewhere, partake at once of the nature of an art and recreation, delightful to performers as well as to audience, and of a profit-making industry. As an industry these activities are comparable with other kinds of gainful employment; as an art and recreation they must be treated as a case apart. The law as it stands penalises art (in so far, that is, as it is effectively enforced; Shakespeare's Mammilius must be an improbable adolescent, but a child film actor carries any fines on his expenses sheet). On the other hand it exposes industry, in the shape of the pantomime troups, to conditions which few adults would put up with. Further anomalies arise from the varying standards of licensing authorities and the different legal position of theatre, film and broadcast and television work.

Threading its way through these, and resisting such startlingly idiotic suggestions as those for the wholesale application of the licensing system to school plays and for a 'closed shop' for juvenile actors, the committee recommend among other things the raising of the age for licensing to 16, the tightening of existing welfare and educational provisions, and the end of the touring troups system. On the other hand, it recommends the abolition of the lower age limit for child actors, subject to the concentration of the relevant licensing power in the hands of a special authority. Applied in the same reasonable and commonsense spirit in which they have been drafted, these recommendations should both open new opportunities to dramatic art and clean up some unsavoury corners of the entertainment industry.

Diversion in the Philippines

The increasing activity of Hukbalahap guerillas in the Philippines is further evidence of how well Communist plans are co-ordinated throughout the Far East. The raids last week on towns near Manila and on other parts of the islands coincided with critical events in Korea and with the presence of an American mission which is investigating the economic state of the country. There are said to be some 15,000 Hukbalahaps in the islands; with the Philippine Government as weak and as ineffectual as it is, they would have little difficulty in seizing control, temporarily at least, were it not that some 90 per cent. of the population are Catholic and anti-Communist. But even as much popular opposition as this might not be enough to prevent the Hukbalahaps from creating a major diversion in an area where American reactions are bound to be particularly sensitive.

The trouble in the Philippines, as in other territories in the Far East, is that the government falls far short of western, and even of Communist, standards. President Quirino has been far from successful in his efforts to set up an efficient administration since the grant of independence in 1946. The financial and economic state of the country has been critical for some months. Internal security has been bad, and reports of the corruption of the administration are appalling. The Americans have refused to give more help without a thorough investigation of Philippine affairs.

The American mission is not due to report until September 15th, but it seems unlikely that it will recommend that President Quirino should be entrusted with the task of putting his own house in order. The only alternative, however, is for American administrators to return to the islands, and this would inevitably rouse strong feelings in a country which has so recently become independent. It would, moreover, give the Hukbalahaps a rallying cry which few Filipinos could resist. The dilemma is becoming all too familiar in the Far East.

Cold Water on Cold Cures

In the last few years, the antihistaminic drugs, which are normally used in the treatment of allergic conditions such as hay fever, have been widely publicised, particularly in the United States, as a cure for the common cold. Recent studies there have thrown considerable doubt on the value of the drugs for this purpose, and the results of three carefully controlled trials in this country, which are described in the *British Medical Journal* of August 19th, should dispose of the claims made for them altogether. At the common cold research unit of the Medical Research Council, antihistaminic drugs were found to be of no value in preventing colds in the volunteers inoculated with cold virus. In a large-scale field trial, undertaken by the council to assess the value of treating colds with the drugs, as compared with preventing them, there was again little difference between those given an antihistaminic drug and those given a control tablet. Another large-scale, controlled experiment, undertaken privately, also failed to establish any therapeutic value for the antihistaminic drug used.

It is important that wide publicity should be given to the results of the trials, for there have been cases where children have died as a result of finding the drugs in home medicine chests and eating them. Pilots, moreover, have already been warned that they should not fly within 48 hours of taking the drugs because of the serious side effects sometimes caused by them. So one more cold cure goes the way of many before it. 'Tis true, but 'tis a pity.

Government Publicity

The Government's information services have again been under fire, this time from the Select Committee on Estimates. Their fifth report gives the impression of a group of hard-headed business men looking sceptically for value for money, and refusing to be hypnotised by the mere costliness of any form of publicity into taking its effectiveness for granted. They suggest, for example, that the use of films - the most expensive medium of all - should be confined at home to strictly technical subjects and that their suitability for enlightening backward peoples ought to be investigated. Recruiting campaigns by poster, they feel, should be tested for effectiveness, and Road Safety and Savings propaganda conducted on more experimental lines.

Despite its appearance of cheeseparing, this committee's plea is the very reasonable one for less blind faith in mass advertisement and a more pragmatic approach to the legitimate objectives of government information and persuasion.

Shorter Notes

The controversy over Seretse Khama had two aspects: his dispute with his uncle, Tshekedi, and his dispute with the British Government, which banished him from Bechuanaland for five years. As was reported in *The Economist* last week, there is a good chance of a reconciliation between Seretse and Tshekedi. It has now been announced that Seretse has withdrawn his lawsuit contesting the legal validity of the order of banishment. There seem, therefore, to be good prospects of a satisfactory settlement of the whole affair.

* * *

The Haifa refinery came back into production this week. Output is expected to be limited to between 500,000 and 800,000 tons annually, enough for Israel's domestic requirements. The refinery's capacity is between 4 and 7 million tons a year.

The text of this issue of The Economist *has been Vari-typed and we are glad to acknowledge the excellent service that we have received, at very short notice, from:*

Triumph of the Press

While the franchise was narrowed or annihilated, the Press restrained, and industry kept under onerous restrictions in France, in England the franchise has been continually extended, the freedom of the Press more and more consolidated and enlarged, and industry set almost free. Chiefly for the people, and in a great measure by the people, has the Government of England, particularly in the last thirty years, like that of the United States, been carried on. The reverse has even been, and still is, the case in France... One main principle of every administration was to bribe or bind the Press. Its freedom, when it existed for short periods, was found utterly incompatible with the existing government, and it was placed under a censorship or some exceptional laws. It was forced to be the great antagonist, and became the equal, of every Government - and successively triumphed over them all.

Books and Publications

'Decision in Germany' by Lucius D. Clay
New York: Doubleday. London: Heinemann
440 pages. 21s.

Disgruntled army men have often complained that the pen of the diplomat has lost what the soldier's sword has won. But after the second world war the roles - in Germany at least - were reversed: the generals had to deal with the problems which the statesmen had created. One of them, General Lucius D. Clay, has now told the story of his proconsulate. As head of the American zone he formed with his British, French and Russian colleagues, the Control Council which jointly was to rule Germany. It had to enforce Germany's disarmament and de-militarisation, destruction of its industrial war potential, the payment of reparations and the punishment of military and political criminals. Besides keeping order, it had to undertake the moral regeneration of Germany and to fashion the German nation into a democracy, strong enough to stand on its own legs, but incapable of hurting others. It would have been a tall order had all four Allies worked towards the same end.

Notwithstanding his early misgivings, General Clay tried hard to make this policy succeed. He had first to get rid of the Morgenthau concepts which had somehow survived, although both the course of events and the influence of the State Departments had made President Roosevelt renounce them. His next urgent task was to prevent starvation in the western zones. Once he became convinced that Russia did not want a free and reunited Germany, he strove successfully for a reunion of the three western zones. He found it easy to collaborate with the British, especially after Sir Brian Robertson had taken over, but he had to learn that France's insistence on security included a claim for ascendancy in the continental steel industry.

The first part of his book is a dispassionate report of the activities of the Control Council, and of the American army government engaged in this weird experiment of multiple statecraft. An appendix called footnotes, analyses the official documents issued in its pursuit - an invaluable source of information. When General Clay turns to the disruption of the Control Council, to the blockade of Berlin and the airlift which broke it the story becomes highly dramatic. He was convinced, that Russia would not go to war, and he wished to break the blockade by sending a convoy protected by Allied guns. Unfortunately, more cautious plans prevailed. Had the blockade been ended by an Allied military demonstration, the Russians would have understood that President Roosevelt had misled them when he had informed Stalin that he could not keep an army in Europe for more than two years. The last two chapters deal with the founding of the German Bundes Republik. They describe the negotiations of the Allies with the German authorities, and the political struggle going on in Germany between the two leading parties, the Socialists and the Christian Democrats.

'Decision in Germany' is an indispensible guide for all who want to explore the history of a fantastic failure. From its unadorned pages, arises the figure of its author; a strong, just, merciful man, who did his duty, sometimes deeply moved by the iniquities or absurdities his chiefs have asked him to accept as accomplished facts. He was always a little ahead of his government in reversing policies which he had tried hard to carry out, even when he had doubted their wisdom. General Clay led, where he was supposed to be guided, and if ever a strong and secure western Europe comes to pass, he can claim to have been one of the boldest of its architects.

* * *

"Frederick Denison Maurice" by H.G. Wood.
Cambridge University Press. 170 pages. 10s 6d

The Rev. F.D. Maurice is best remembered as the founder of Queen's College, the first foundation for higher learning among women, as one of the originators of "Christian Socialism" and as an advocate in the tradition of Coleridge and Thomas Arnold of a Christian organisation and dogma which could reconcile the sectarian differences of the churches. Professor Wood has attempted, not a biography of Maurice, but an appraisal of his ideas. The layman will not find the theological chapters easy going, but, if he is interested in fitting in another piece into the mosaic pattern of Victorian religious thought, the effort of memory and comprehension is well worth while. The concluding chapter on Maurice's views on Social Ethics emphasises the fact that Christian Socialism as envisaged by Maurice and Kingsley was very much a product of its time, being concerned not with the acquisition of political power by the working class - Maurice deplored universal suffrage as much as Bagehot and mere majority rule as much as Acton - but with placing the emphasis of social and industrial organisation upon co-operation rather than competition. In this sense it was an attempt to restate Owenite socialism in Christian terms, not to advocate arithmetical democracy or state socialism.

AMERICAN SURVEY

MacArthur in the Open

Hardly had the Administration rebuked Mr. Matthews, the Democratic Secretary of the Navy, for enthusiastically advocating a 'war for peace' - the old idea of a preventive war in pacifist clothing - than it was faced by a premeditated defiance from a much more redoubtable ally. General MacArthur, throwing aside all camouflage, chose, in a message to the Veterans of Foreign Wars, to challenge Administration policy on the future of Formosa. His view that the island on which the Chinese Nationalists have taken refuge is an essential part of the American defence line in the Pacific, and should be permanently denied to any potential enemy, was timed to give the utmost aid and comfort to the Chinese Communists. It could only aggravate the fears of friendly nations that, in General MacArthur's hands, the 'neutralization' of Formosa might precipitate a war with China. The ink, indeed, was hardly dry on the Communist allegation that the United States had imperialist designs on Formosa, and on the American counter-move welcoming a United Nations inquiry.

Mr. Truman, whose courage in a crisis is becoming proverbial, insisted upon the withdrawal of this damaging script, and wholly dissociated the Administration from it, but the text had already become public property. This may be no bad thing, though some Republicans have already seized upon the incident as new fuel for the bonfire they believe they can erect under the Administration out of past Far Eastern policy. Taken out of the field of rumour, and put firmly on paper, General MacArthur's views can be weighed; and most impartial observers will suspect something wanting in a case that must go to the length of declaring that, without Formosa, war is inevitable and the battle-lines will be five thousand miles further east, along Americans Pacific coast.

The Administration insists, hopefully, that the incident is now closed. If it is re-opened, it will only be by General MacArthur and his over-zealous Republican friends. The loss of Mr. Matthews from public life would be only a Democratic family affair. General MacArthur may have demonstrated, beyond all doubt, that as United Nations commander in Korea, his political sagacity falls tragically short of his military reputation, but as a Republican martyr the Administration would find him an even greater embarrassment at home.

Economic Battledress

The new suit of overalls which the American economy is to wear to work on partial mobilisation is now almost tacked together and Congressmen are hoping that they will not be asked to do the finishing off until after the November elections. By that time perhaps the present design may not be providing adequate protection against either agression abroad or inflation at home. But meanwhile Congress is cutting its cloth to the President's post-Korean pattern.

The Senate is not expected to make any more objections than the House has done to appropriating the extra $16.7 billion needed chiefly for defence purposes and military assistance to America's allies. The short sighted belief that any ally is worth buying in the present situation explains the loan to Spain that has been included in the pre-Korean omnibus Bill, which appropriates about $35 billion for all purposes. Increased military aid for the Atlantic Pact countries has been made the excuse for reducing European recovery funds by $200 million, to a total of $2.5 billion. The Point Four programme is, however, promised its full $35 million.

Congress has left it to the President to decide how non-defence expenditure can be cut by $550 million this year. He has threatened to veto the Bill because of the irresponsibility of this provision and of the loan to Spain, but it seems unlikely that he will do so now that it has come to the point. Nor will Mr. Truman wish to sacrifice the credit and industrial controls he wants for the sake of refusing the price and wage controls he does not want. Argument over the amount of discretion he is to be allowed in applying the latter led to a deadlock last weekend in the Senate-House conference on the Defence Production Bill.

Until then the conferees had been making good progress on the other controversial items in the Bill. Loans to encourage the expansion of productive facilities had been permitted to the full amount of $2 billion, although Congress insists on keeping an eye on them. And the attempt to concentrate all priority and allocation powers forcibly in the hands of the Secretary of Commerce has also been defeated. Most of them will in fact be in his hands and he is setting up a special department, an embryo War Production Board, to administer them.

THE WORLD OVERSEAS

Dollars for Steel

(By a Correspondent)

The Brazilians are well pleased by the recent announcement in Washington of a $25 million loan to expand their steel production. The Director of the State-owned Volta Redonda steelworks went to Washington about a year ago to press for $17 million from the Export-Import Bank to buy American equipment, and success has come just when Korean developments are stimulating foreign demand for US steel. What has happened in Brazil is a striking illustration of what can be achieved when American technical aid, dollar loans and real energy on the spot are combined in one operation.

Last year Volta Redonda made 227,000 tons of rolled mild steel (of which two per cent went to Argentina and the rest was used at home). Its US technicians estimate the full present capacity at 300,000 tons, and additional furnaces to be built with the new loan should raise this to 467,000 tons - an expansion which, together with the output of older mills, would make Brazil virtually self-sufficient in iron and steel materials. This was pointed out in the Abbink report that was drawn up last year by the Joint Brazilian-US Technical Commission on development.

What this means in round figures is that Brazilian steel production, now almost 500,000 tons a year, can be raised to 700,000 when Volta Redonda's new furnaces are installed - always provided that adequate coal imports are available. There is no lack of the highest-grade ore.

The new loan may be a sign that the Export-Import Bank thinks the largest steelworks in Latin America, and one of the most modern in the world, is through its teething troubles; the Bank has already lent $45 million of the $100 million which the plant cost to build. Certainly this new steel town in the Paraiba valley, between Rio and Sao Paulo, is becoming a magnet for secondary industries of some significance. Partly because of their growth Brazilian imports of certain kinds of machinery have dropped by about a third during the past year.

Of the town's 50,000 inhabitants, 9,300 are employed by the steelworks, and there is a growing influx of labour for other activities. Coal tar, benzol, and sulphate of ammonia are already being produced. Another chemical factory is going up, and works are being erected to build railway trucks almost entirely from domestic materials. Most significant of all, the Ford Motor Company is contemplating a scheme to make car and truck components from local steel.

The industrial trend is important and well established. Much will depend on the growth of a skilled labour force, but the Americans are training recruits thoroughly, and the first fruits are already apparent.

Fear and Fact in South Africa

(From Our Johannesburg Correspondent)

Nationalist utterances have created fear, resentment and uncertainty among nearly all non-Europeans in South Africa and among a great many Europeans as well. The Minister of Native Affairs, Dr. Jansen, who since he took office has not once met the Natives' Representative Council, tells European farmers that he means to introduce legislation to drive urban Natives back to low-wage employment on the farms - from which he admits that many of the Natives have fled. The Minister of Justice, Mr. Swart, boasts that he intends to build more 'farm gaols', to be filled with Native first-offenders and short-term prisoners on whom the farmers can draw for cheap labour. In the Group Areas Act, the Suppression of Communism Act, and by its control of passports, the Government has forged powerful weapons for the possible intimidation of political opponents. Constant and deliberate identification of 'liberals' with 'Communists', by Nationalist speakers from Dr. Malan and Mr. Havenga downwards, have forced many Europeans who share the liberal ideas of the late J. H. Hofmeyr to consider seriously how much longer they will be allowed to express their views.

While there is intense, and perhaps justified suspicion of the Government's ultimate intentions, a real test case is still lacking. The courts continue stoutly to uphold traditional freedoms, including freedom to criticise the Government. The Minister of the Interior, Dr. Donges, lost two passport cases. A Government attempt to suppress a Communist-sponsored pamphlet was defeated in court at the very time the Government was rushing through its anti-Communist legislation. A priest prosecuted for marrying a European man and a Coloured

girl won his case, by convincing the court that blood and pigmentation were not the only tests and that the girl had been 'accepted as white' by Europeans.

Nationalist newspapers have demanded on the strength of those cases that the law should be changed to close such 'loopholes'. But no attempt has yet been made to tamper with the courts, and eminent judges have thrown out strong hints that any such attempt will be most strongly opposed by them. The Johannesburg and Cape Town Bar and Side Bar almost unanimously, and publicly, condemned the Suppression of Communism Bill as a dangerously drafted document threatening democratic freedoms. And, though the Group Areas and Suppression of Communism Bills are both now on the statute book, there has been no move yet to uproot people under the one, while the Communist paper the *Guardian* (it now calls itself 'independent') continues to circulate unmolested.

No Reign of Terror Yet

But it would be dangerous to prophesy how long this will last. If a 'reign of terror' is in prospect, as some believe, it most emphatically has not started yet. It is important to bear that in mind. To do otherwise is simply to play into the eager hands of Mr. Eric Louw, who remains in a constant state of indignation about 'misrepresentations' of the Nationalists' actions (he is discreetly silent about their intentions).

In the large cities, there has been a considerable increase in native crime. This however appears to stem largely from bad social conditions which far pre-date the Nationalist Government. In the countryside and in the smaller towns, life continues in the peaceful South African tradition. Even in the big cities, the ordinary white citizen may only read about crime without experiencing it. The Natives are less fortunate, for the criminals flourish and have their hide-outs in the Native locations, townships and 'shanty towns', where murder is a commonplace. The situation is admittedly getting worse, but the seeds of trouble existed before 1948. Many Europeans in Johannesburg carry revolvers; but widespread 'gun-toting' is unhappily a South African phenomenon of long standing. It is by no means uncommon for a European to shoot dead a Native coming no nearer his house than his fowl-run, and to get off with a small fine, or not be sentenced at all; but that has been the case for many years.

Nationalist actions, and intentions, must be carefully separated from objectionable features of life in South Africa that have existed for a long time. The visitor sees the white South Africans enjoying a comfortable, semi-luxurious, suburbanite life which is kept in being by the 'cheap labour' supplied by the destruction of the Natives' former social structure and the break-up of the Native families. He reads about malnutrition which kills off 35 per cent. of Native babies in their first year, and gives the average Native a life expectancy of only 35 years. He notices obvious discrimination beteeen white and black in the administration of justice, and is easily convinced by the conversation of white South Africans themselves that racial hatreds flourish like rank weeds. But this did not originate with the Nationalists, though they have undoubtedly aggravated it.

As for the ordinary white South African, apart from a few 'liberals', he cannot understand what the visitor is talking about. If he is English-speaking, he may agree that the Nationalists are a danger. But he is generally thinking of a narrowly interpreted political danger, of Afrikaner political domination - not of the general South African picture and certainly not about Native policy. The truth is that the Smuts-Hofmeyr regime of 1939-1948 was only an interregnum in South African affairs. It was anything but typical. Probably Smuts, and certainly Hofmeyr, was far ahead of average white public opinion. By cutting down social welfare for non-Europeans, tightening up pass laws, and so on, the Nationalists are deliberately undoing Hofmeyr's work. But, so far, they have merely restored the conditions which prevailed from 1924 to 1939. In the days of Hertzog, and even at the time of the Hertzog-Smuts Fusion Government, there were revelations of police brutality (condoned twenty years ago, as again today, on the plea that many of the police recruits are young and untrained). There were segregation and immorality laws. There were laws against 'riotous assembly' and against 'agitators'. There were successful attacks on Native and Indian franchise and other rights. There was even an attempt, fortunately unsuccessful, to classify all Jewish South Africans as 'Asiatics'. There were Native and Coloured riots, sternly suppressed with unnecessary loss of life. That is the pattern now being re-established. It is deplorable, but it is not new.

It is true that the Nationalists want to go beyond Hertzog - to put the Coloured voters on a separate roll, abolish the Natives' Representative Council, and enforce segregation, renamed *apartheid,* far more rigidly. Their utterances against other groups, and their philosophy of the State, have a Nazi flavour which the old Nationalist Party under Hertzog lacked. But they have not done any of those things - yet. Only the future can tell whether they really mean to press on towards an Afrikaner Republic and a real political dictatorship.

THE BUSINESS WORLD

Exports and Defence

The problem of guessing the economic implications of the defence programmes still preoccupies all City discussions - and many others besides. But the participants in these debates are still far from reaching any consensus of opinion - least of all about the short-run repercussions. In some quarters, however, there has lately been a tendency to argue that these cannot be of any great weight, because of the sheer physical impossibility of setting any large volume of new defence work in progress in the early future. Against this, one consideration seems so far to have received less attention than it deserves.

It is generally agreed that Britain's balance of payments must face a new and early strain, because the industries likely to be most immediately affected by defence orders are also the biggest exporters. An even more direct influence upon the balance of payments, however, comes from the strong rise in world prices of primary commodities - and this must already be exerting a substantial effect. Most commentators have been quick to emphasise the reinforcement this will bring to the dollar account of the sterling area as a whole, but they have failed to emphasise the corollary, which will be a new pressure upon the "overall" account of Britain alone.

Impetus to Inflation

The prospect of these early pressures makes it more than ever desirable that, even though defence production rises only slightly in the ensuing months, every effort should be made to divert supplies from home use so as to take up some of the strain on the external account. The Government as yet has given no sign that any such measures as these are being matured. But if the necessary diversion takes place, the inflationary pressures upon the domestic economy will be quickly reinforced.

Another reinforcement that will operate even more rapidly will come from the impending increase in service pay and allowances. And if, in addition, the Government decides to extend the period of compulsory military service, the consequential loss of manpower will tend to deplete the supply of goods and services available for use at home. It is impossible at this stage to gauge the weight of these pressures - but there is a chance that, in the very short run, they may be absorbed without undue stress. Britain's overall balance of payments has improved markedly in the current year - indeed, the figures for the first six months may surpass recent expectations. Unless domestic stocks have been running down, this gain must have exerted an inflationary force, yet there has been no very apparent rise in the tempo of domestic inflation.

* * *

Future of The Steel Act

The Labour Party's statement of policy last week made it clear that Labour intends to put into effect the legislation already passed to nationalise the steel industry. It did not, however, give any sign of when the axe would fall. The Act in its final form fixed vesting day (the day on which the securities of the companies are to vest in the Iron and Steel Corporation) for January 1st, 1951, "or such date later but not more than twelve months later, than the date aforesaid, as the Minister may by order substitute". Thus the Minister can postpone the day by making an order at any time before the end of the year, though he cannot postpone it for more than twelve months. But, in postponing it, he will have to fix the new day at the same time. Either of two things might precipitate an announcement of the chosen date. The Minister has to appoint the members of the Iron and Steel Corporation. He cannot do this before October 1st, but on the other hand if vesting day is to be early next year he cannot leave it much later. Unless, therefore, the Government decides on a postponement it will have to announce at least the chairman's appointment on October 1st or soon after. This would leave a bare three months for the new corporation to organise itself to a point at which it could take over the formal ownership of its vast properties. No doubt the process of building up a corporation capable of wielding effective authority and direction over the operations of the industry will take much longer - perhaps years.

If (alternatively) the Government does decide on a postponement, then the silence may continue until Parliament (having, presumably, dispersed after its defence meeting in ten days time) reassembles in the latter half of October. The need for a statement of the Government's intentions will surely become pressing then. It is not impossible, however, that the defence debate itself may act as a precipitant; the Opposition may want to know, in discussing rearmament, whether the change of ownership in iron and steel with the risk of dislocation that it involves is to go through at this time. It can urge, moreover, that when the Government agreed last November to put off the vesting day (which was to have been last May) it gave reasons for the postponement - and those same reasons surely apply no less strongly now.

Base Metals and Pricing Policy

It was inevitable, no doubt, that the radical revision of defence programmes since the Korean outbreak should have produced rather wild price changes and dealing conditions in world markets for the leading primary commodities. But nobody expected quite so high a degree of confusion as that experienced in the base metal markets in the past few weeks. In London, a dominant cause of the trouble has been the rather frenzied effort of the authorities to adapt their tactics and policies to a fast-changing situation. The first shock of this kind was felt in the tin market, three weeks ago, when the Ministry of Supply's decision to withhold cash offerings sent the price soaring. It rebounded violently a few days later, after one smelter had offered a modest quantity for immediate delivery. Since then price movements in tin have been erratic and the storm-centre has shifted to copper.

In this market the confusion reached its climax last week, when the Ministry followed the lead of an American copper smelter and raised its selling price of copper by £16 to £202 a ton - only to reduce it to its previous level within two days, again following American example. Then, after another two days had elapsed, the Ministry very sharply increased its premiums for forward delivery. The premium on three months copper was raised from £1 10s. a ton to £13 10s. and that on six months' delivery from £3 to £15 a ton. Forward prices for zinc were also raised by £12 a ton, while those for lead were raised by £6 a ton. Once the Ministry had reduced its spot price for copper in accordance with its self-imposed policy of keeping in line with American official prices, increases of this kind became inevitable - because the demand for forward deliveries was so heavily intensified that the Ministry had to protect its stocks by raising its future prices.

The root of the trouble lies in the absence of a well organised world metal market. In the United States the metal market is dominated by large integrated firms that are more concerned to hold the price stable than to respond flexibly to the play of market forces. Thus at the present time many buyers of copper and zinc have to pay for spot supplies anything between two and five cents a lb. above the official selling prices. A further complication exists in the copper market in consequence of the recent re-imposition of the two cents a lb. import duty in the United States: it is still not known whether this is a temporary or permanent measure.

These artificial price patterns are, of course, reflected in Britain by the Ministry of Supply's policy of gearing its selling prices to the official New York quotations, regardless of the stock position in Britain.

This year, for example, British consumption of copper has been less than in 1949 and stocks have risen. In the United States consumption has not only been heavier than last year, but has also exceeded current output, so that stocks have declined quite rapidly. Yet the British price has tended to follow the American price upwards. Under normal conditions the policy of following the New York market was perhaps the least harmful of the alternatives open to the Ministry. Its purpose was to prevent British consumers from being at a price disadvantage compared with their competitors. But it remains to be seen whether it will also encourage an expansion in Commonwealth production, and at the same time help the Ministry to accumulate a strategic reserve.

Payments Union Approved

The draft agreement setting up a European Payments Union, the details of which were described in *The Economist* of July 15, has now been dressed up by the lawyers in more binding (and more diffuse) phraseology and has been approved by the council of the OEEC. As this issue went to press it was expected that the agreement would be signed this week - immediately after President Truman gives his approval to the Marshall Aid Appropriations Bill for 1950-51. A fortnight after the agreement is signed, the proportion of each participant's privately-handled imports from other EPU countries that are admitted without any quantitative restrictions has to be raised from 50 to 60 per cent. This obligation is not expected to necessitate any substantial modification of the present British system of import control. Provided that Britain's own definition of intra-European trade is accepted (there seems to be some disagreement about the status of oil imports from the Netherlands Antilles), more than 60 per cent of Britain's privately-handled imports from Europe are free of quantitative restrictions already. Some other OEEC countries, however, are now feverishly recasting their systems of import control. As all concessions must be granted to all EPU members without discrimination, France, for one, has been slipping some commodities back into the controlled list with its left hand, while withdrawing just enough with its right hand to keep within the new rules.

Meanwhile, a White Paper issued in London has revealed the terms of the agreement between Britain and the United States whereby Britain is indemnified against any gold losses that it may suffer to EPU by reason of the drawing down of accumulated European sterling balances. Britain, like any other EPU member, will pay gold to the Union wherever its net debit position is larger than its gold-free borrowing rights. It will, however, receive dollar re-imbursements from ECA so that the net amount of gold it will have paid out at any one moment of time will never be greater than what it would have paid if there had been no use of sterling balances to settle intra-European deficits. After nearly a year of wrangling, therefore, sterling enters a European Payments Union with two strangely assorted testimonies to its 'special position' - a pair of crutches nearby if it needs them and a special load (in the form of the $150 million initial debit) to prevent it from going too fast. Unless mutual defence contributions are to distort the whole pattern of intra-European payments - in which case balance of payments statistics will become largely unreal anyway - it seems much more likely that the load, rather than the crutches, will come into play.

* * *

Britain and South Africa

When Mr. Eric Louw, the South African Minister for Economic Affairs, completed his discussions with the British Treasury at the beginning of last month, it was reported that he would 'clarify' the workings of the Anglo-South African agreement in a public statement on his return to Pretoria. That statement has now been issued but, it seems calculated to conceal, rather than reveal, the inner nature of the arrangements. Hitherto, South Africa has been selling a quarter of its current gold production (now running at an annual rate of £150 million) to the Bank of England for sterling: it has also been making further 'progress' sales from time to time, so that total sterling purchases of South African gold have equalled the value of the 'essential' imports that South Africa has been able to buy from countries that accept sterling in payment. The only two points of real substance in Mr. Louw's recent statement were, first, that South Africa's regular sales of gold to the United Kingdom would be stepped up from a quarter of current production to £50 million a year in the expectation that the sterling area would be able to earn that amount 'in free and fair competition'; and, secondly, that from the beginning of 1951 'importers in the Union will have a wider field of choice'.

At present, South African importers of 'essential' commodities (i.e. those paid for in gold) can buy in any country in the world but importers of 'inessential' goods can buy only in countries that accept sterling. If more goods are now to be switched from the restricted (or inessential) to the open (or essential) list, as Mr. Louw suggested, some manufacturers of sterling products are going to lose their protected position in the South African market, but the sales that they manage to maintain will henceforth earn gold instead of sterling. The new accounting arrangements may merely have been drawn up

in expectation of such increased gold earnings. The tone of Mr. Louw's statement suggested, however, that the decision to make regular sterling sales of £50 million of gold represented a concession by South Africa. It may be, therefore, that the £50 million is to be regarded as a guaranteed minimum annual sale - in which case Britain has presumably provided some *quid pro quo*.

* * *

Boom in Wool

The boom in wool has taken another leap this week. At the first Australian sales of the season the rise in prices was much sharper even than the market had forecast. Prices in general were 40 per cent higher than in June; better quality merinos were particularly strong, fetching 120 per cent more than they did twelve months ago.

It will be some months before these higher prices are reflected in the retail price of cloth in this country and there may be some doubt about what consumers' reactions to them will be. A few months ago there was some concern about the rate at which stocks of wool cloth were building up in the shops. Now, however, retailers have one eye on the (still rather remote) possibility that clothes rationing may be re-introduced; they are therefore more willing to hold larger supplies, and manufacturers may have little initial difficulty in selling their output - though some firms are by no means confident of that. The industry's most immediate problem is likely to be that of securing enough credit to finance its own stock of raw wool and semi-manufactures at this new high level of prices.

Meanwhile, it seems certain that the United States will press more strongly than ever for an allocation scheme for raw wool. It is not yet clear what sort of scheme the Americans have in mind, but any system of allocations would almost certainly put an end to the wool auctions. The American case is based on the fact that available supplies of raw wool at 4,100 million lb. (greasy basis) are some 300 million lb. below the current rate of consumption. Given these figures, it is difficult to see how the additional requirements of the rearmament programmes and stockpiling are to be met without cuts in civil consumption.

EXCHEQUER SUMMARY

(£000)	Aug. 27 1949	Aug. 26 1950
Total Ordinary Revenue	70,539	57,376
Total Ordinary Expenditure	46,069	45,878
Issues to Sinking Funds	Nil	80

Including issues to Sinking Funds totalling £4,818,000 the surplus accrued since April 1st is £88,135,000, compared with £63,132,000 in the corresponding period last year.

Butter Prices - Home and Abroad

Another salvo was fired by the Ministry of Food last week in its campaign against the pressure from overseas suppliers for higher prices for basic foods - but on the home front the Ministry has announced one important increase. The retail price of butter is to be raised by 2d. to 2s. a lb. At first glance this looks paradoxical. Denmark is still shipping butter to Britain at prices agreed well before devaluation. Quite recently, the Netherlands Government, after much recrimination, reduced its price of butter to Britain to below its domestic price, and recompensed producers by an export subsidy. Now the Ministry of Food has refused New Zealand's request for an increase of 7½ per cent in the contract price for butter for 1950-51. The New Zealand Government, however, will continue to ship 92½ per cent of its butter exports to Britain at last season's price - subject to any amendment which may be made at a later date. A dispute is also in progress about the price that Britain should pay for butter and cheese from Australia.

The reason for the latest increase in the retail price of butter therefore has to be sought not in higher purchase prices but in domestic policy, particularly that relating to food subsidies. The subsidy bill has lately been running above the ceiling of £140 million a year fixed by the Chancellor last April - chiefly because the level of rations has been higher than expected. Some relief had therefore to be found, and the Ministry of Food has decided to secure it from butter, which has always been heavily subsidised owing to its importance in the old cost-of-living index. Its present rate of subsidy is still a little over 1s. a lb.

Four months ago, when the butter ration was raised from four to five ounces a week (it is shortly to return to four ounces), the public was given the option to take margarine instead, and the price of butter was raised from 1s.6d. to 1s.10d. a lb. Yet demand for butter has since shown no signs of slackening, while the four-ounce ration of the less-subsidised margarine has not been fully taken up. This inelasticity of demand for butter has, of course, been encouraged by the poor quality of present-day margarine. But, apart from that, butter at 1s.10d. was still, by prewar standards, cheaper than margarine. This latest rise in the price of butter is therefore an attempt to reduce the distortion that subsidies have set up in the pattern of demand for foodstuffs.

Coal Board's Profit

In the first quarter of this year, the National Coal Board made the highest profits since it was formed. After providing from trading profits of £10,613,011 for interest payments to the Ministry of Fuel and for possible profits tax, the Board recorded a surplus of £5,600,011. This is £1,767,361 more than the surplus earned in the comparable quarter of 1949 when tonnage was somewhat lower. The explanation of this improvement lies in the increase in exports, for which the Coal Board receives, on an average, £1 a ton more than it does for coal sold to the home market. Exports and bunkers together amounted to 5,371,474 tons during the first quarter of this year - 1,205,340 tons more than in the same three months last year. It is estimated that had this coal been sold at home instead of abroad, the surplus would have been £4,500,000 smaller.

It is true that the mining costs showed a further slight decline; since the first quarter of 1949 total costs per ton of saleable coal have fallen by 1.3d. to 44s. 5.5d., thanks largely to increased mechanisation. But the solvency of the Coal Board still plainly depends on its overseas markets. Two months ago there were signs that high export prices might not be maintained much longer. Now, under the stimulus of rearmament, the market shows fairly clear signs of hardening again, and it seems probable that only the difficulty of finding enough coal to send abroad will prevent the Coal Board from earning equally high profits in the other quarters of the year. Already, export tonnages have shown a sharp fall, since a belated attempt is now being made to build domestic fuel stocks up to theirminimum safety level before the winter.

OFS Capital Needs

Although the Kaffir market has shared the general lack of enthusiasm in the Stock Exchange this week, active preparations continue for the provision of new capital for the developing mines of the Orange Free State Freddies North and Freddies South, two offshoots of the original Free State Development and Investment Corporation, are now assured of the £5,300,000 required to bring their mines to the production stage. Mr. Kenneth Richardson, the chairman of both companies, announced this week that the underwriting of the offer to shareholders of 10-year 5 per cent convertible notes had established this 'beyond all doubt'. Apart from the £4,500,000 put up by the underwriters - Johannesburg Consolidated, Anglo-American Corporation and De Beers - £800,000 is to be raised on the mortgage of houses. Mr. Richardson made it clear that the extent to which the option-holders of Freddies North and Freddies South exercised their rights would determine what part of the resources committed for underwriting the note issue would be set free for other uses. The intimation that new borrowing powers are being sought by President Steyn Gold Mining and the registration of Harmony Gold Mining Company this week emphasise how important it is that the big mining houses should so far as possible keep their power dry.

The Economist

Established 1843

September 9, 1950 — One Shilling

The dispute between the London Master Printers' Association and the London Society of Compositors has not been settled. A meeting between the two sides arranged by the Minister of Labour last Monday broke down in deadlock. The next stage is the opening next week of the Court of Enquiry to examine and report on the dispute. The circumstances are so complicated that the process of enquiry can hardly be short.

We can but do our best, so long as the dispute continues, to provide as many readers as possible with an emergency issue of The Economist. *For its many inadequacies, we ask forbearance; but we hope it is not mere vanity that leads us to suppose that this substitute is at any rate preferred to no issue of* The Economist *at all.*

CHINA AND KOREA

General MacArthur's latest report to the United Nations on the Korean campaign only confirms the evidence of the week's fierce North Korean offensives. Shortage of ground troops remains the United Nations' gravest danger. The United Nations forces are still heavily outnumbered and although military opinion believes the United Nations base can be held, a fighting return to the 38th parallel is inconceivable without calling on much larger resources from the free world. And even the base itself might be in danger if the North Koreans were to receive reinforcements from outside.

Such reinforcements could come from one source only - from Communist China. Among the alarming possibilities that American military experts must consider is the risk that the war may be extended by Peking's intervention and the United Nations find itself in a state of hostility with the new Chinese regime. The delicacy of the Formosan issue lies precisely in this, that it could provide Mao Tse-tung with an excuse for intervention which would be effective enough to undermine the present unanimity of the free nations. A major aim of responsible American diplomacy must, therefore, be an attempt to keep the issues of Formosa and Korea apart and to convince the Chinese Communists that the way to a settlement of Formosa lies through the ending and not through the extension of the Korean war.

President Truman has done his utmost to make this position clear. In his broadcast to the nation last Friday, he reaffirmed American policy in terms which only Communists, fellow travellers and professional anti-Americans could misinterpret. The American Seventh Fleet would, he said, be withdrawn once the Korean conflict was over and America, having no territorial ambitions of any sort in Asia, would leave the future of Formosa to the United Nations. If any statement of Western policy can reach to Peking and be understood there, the Chinese Communists have been told, almost in so many words, that but for the Korean incident, Formosa might already be theirs and that it is the fact of aggression in Korea, not any United States action, that stands in their way. If, in face of these facts, they choose to intervene in Korea or to move to a seaborne invasion of Formosa, they will show the world at large that they are more concerned with the Moscow-directed strategy of general aggression than with China's own legitimate interests.

It is possible, however, to question whether the facts of the American position do reach Peking. The isolation of the new regime is almost complete. Its only steady source of information is the tainted spring of Moscow. To bring the new Communist regime out of its dogma-ridden seclusion and expose it to the realities of the international scene is an essential preliminary to any successful projection of American policy. Whether this can be done so long as Communist China remains outside the United Nations is doubtful. But it is equally uncertain whether China's admission would alone be sufficient to produce a major relaxing of tension in the Far East. The arrival of a delegation from Peking would make it possible to open up new lines of communication with

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 16, 1950, total ordinary revenue was £43,979,000, against ordinary expenditure of £44,455,000 and issues to sinking funds £540,000. Thus, including sinking fund allocations of £8,653,000 the surplus accrued since April 1st is £90,823,000 compared with a deficit of £379,000 for the corresponding period a year ago.

EMERGENCY EDITION

The Economist

Established 1843

October 7, 1950 — One Shilling

We have attempted with this emergency issue of The Economist *to reach all our readers and to give them slightly better value for their shilling. Its shortcomings, all the same, are painfully obvious, and we cannot hope so long as the dispute in the London printing trade lasts to record and comment on more than a small fraction of the events that would demand attention in normal conditions.*

We are grateful to readers for their understanding of our difficulties and are doing all we can, under conditions of frustration never known before in periodical publishing, to give them the best service. So long as the present obscurity lasts, we hope they will accept a substitute edition and pardon its limitations.

ACROSS THE PARALLEL

The question whether or not the United Nations forces should come to a halt at the 38th parallel and call the North Koreans to a parley is becoming academic. The parallel has been crossed and South Korean forces are advancing rapidly on a broad front. Unless by some unlikely miracle the North Korean command agrees to General MacArthur's call to surrender and lays down its arms, a new phase of warfare threatens in the difficult country in the north; even if full scale fighting does not break out again, a long period of guerrilla warfare seems to be ahead with all the opportunities it offers for veiled intervention by the Chinese Communists. If the first and most dangerous phase of the Korean incident is over, a new and hazardous one opens. The United Nations will need all its strength, unity and diplomacy to succeed as well as it did in the South - first in grim defence and then in lightning victory.

The essential first step is speedy agreement upon peace terms for Korea. That the Russians hope much from confusion and delay has already been shown by Mr Vyshinsky's proposals to the Political Committee of the General Assembly. These purport to show a spirit of compromise by various references to the role of the United Nations in Korea, but they would in fact leave the authority of the North Koreans intact and amount to no more than a return to the *status quo ante* June 25th. At all costs the Soviets and their satellites must be prevented from succeeding in a prolonged filibuster and the British proposals for a Korean settlement - which are also sponsored by eight other nations - must be brought to the vote.

These proposals undoubtedly provide a possible basis for pacification. They aim at the unification of Korea, the holding of new elections under the control of the United Nations and the economic rehabilitation of the country under the auspices of a new and enlarged United Nations Commission. Such a settlement might reasonably be completed by declaring Korea to be a neutral buffer state under permanent United Nations military protection. The Great Powers could undertake to maintain no bases or garrisons of any sort - the United States has already asked that its troops should be withdrawn as soon as possible - and local defence could be maintained by a *gendarmerie* under United Nations command and drawn from the smaller powers. Such provisions would meet any objections that might be put forward by Korea's nearest neighbour, Communist China.

At the same time, the more speedily Peking can be admitted to the counsels of the United Nations, the better will be the chance of achieving some permanent settlement - as opposed to a precarious truce - in Korea. It is quite uncertain whether Communist China is prepared to play the good neighbour, but as long as it is excluded from the community of nations, so long will it be tempted to behave

Mao Tse-tung's government. Something might also be gained from the standpoint of the free nations themselves. The question of China's representation is one of the most important issues dividing east and west and Asia and America within the United Nations. Since unity of view is an essential element in the free world's resistance to Communist pressure, the ending of this rift could not fail to reinforce the side of freedom.

The essence of the argument for Communist China's admission is, therefore, that the Communists as full members of the United Nations may be less likely to intervene in and extend the Korean war and that the free world, with the dispute over China off its hands, may be less likely to fall into dissension. These points are, however, negative - steps taken less worse befall - and some observers are not content to leave the matter there. They argue that Communist China's admission will bring with it the positive advantage of making it easier to settle the Korean war by negotiation. China, so the argument runs, is vitally concerned in the future of Korea. No settlement can be made there without the concurrence of the great power most immediately involved. If China is admitted to the United Nations, it will be more ready to acquiesce and assist in a negotiated Korean settlement.

At this point, the argument becomes, surely, much less convincing. It makes assumptions about the outlook of the Peking Government which are, to say the least of it, unproven. If anything has been conclusively demonstrated by the course of Communist diplomacy in the last five years, it is that no Communist state can maintain 'normal' relations with a non-Communist state, so long as it permits Moscow to dictate its policy. With the possible exception of Finnish-Soviet relations, the normal Moscow attitude towards non-Communist governments is that they have no right to be non-Communist and that every step must be taken to ensure that they become Communist as quickly as possible. The satellites have invariably followed Russia's example. Only when the fatal link with Moscow is broken do more normal relations become possible. For instance, while Bulgaria and Albania continue to send guerrilla forces across the Greek frontier, Jugoslav-Greek relations are taking on a more orderly shape. Before, therefore, anyone can say that Communist China will assist in a Korean settlement 'by negotiation', it must be known what type of Communism flourishes in Peking. If it is of the Moscow stamp, only one kind of Korean settlement will be acceptable in Peking - one which leaves the Korean Communists in a position to take over the government either immediately or within the shortest space of time necessary for local disruption and sabotage. No amount of United Nations guarantees or American undertakings will modify this fact.

Only if Mao Tse-tung begins to show 'Titoist' tendencies will China be likely to tolerate a 'free' government in Korea or to co-operate in establishing its authority. The information is so far quite insufficient to permit any forecast of the most likely line of development in Peking. Until more evidence is available, those who advocate the admission of Communist China by the United Nations on the grounds that such a move will secure Peking's assistance in a Korean settlement tend to overstate the case. It is possible to argue that the admission of Communist China into the United Nations might assist towards the localising of the Korean conflict and might close a dangerous rift between the non-Communist members of the United Nations. It would appear more than hopeful to expect other advantages - yet.

Rearmament and the TUC

This week the Trades Union Congress has been holding its eighty second annual congress at Brighton. The dispute between the London Society of Compositors (whose secretary, Mr Willis, is a member of the general council of the TUC) and the London Master Printers Association has again made it necessary to reproduce *The Economist* by unconventional means, with the result that these words must be written before the full proceedings of the conference are available. The resolutions before the congress cover as usual an enormous range of subjects, and on two of them - the Labour Party's decision to put further measures of nationalisation into cold storage, and the government's decision to support the United States' action in Korea - the General Council has scented the existence of sufficient opposition to issue special, and very sensible, reports. But the chief preoccupation of the delegates is clearly the question of wages. Throughout the summer, pressure for higher wages has increased, and since the conference papers were assembled, the government has decided to spend annually between £300 million and £400 million more on defence, of which some £70 million is to take the form of increased pay for the services.

It is natural enough that trade union leaders should be worried that rearmament will cause a further degree of inflation or, less likely, a pruning of government expenditure on the social services. Either event would hit the pockets of their supporters and reinforce the pressure for a general increase of wages, and responsible trade union leaders are not blind to these dangers. Moreover, they may well feel embarrassment that the first actual rearmament expenditure should take the form of a marked increase in service pay when there are outstanding claims for increased wages affecting over four million people in civil employment. The paradox

that the government has granted to its own employees an increase in wages which it has denied or discouraged in other sectors of employment is an obvious target for the mischievous to aim at. Those unions which are lead by Communists or unscrupulous and intransigent leaders will no doubt make great play with this fact, even to the point of advocating the end of compulsory arbitration and a general trial of strength with the employers.

Mr Attlee attempted to explain to the congress the reasons which have made it necessary to launch a rearmament programme and the economic dangers which may result from it. Since it is the natural consequence of resisting Russian aggression, it can be presumed that all but the Communist minority among the trade unionists will accept the reasons for it. But a prolonged campaign of explanation and a more trenchant use of words will be necessary to convince trade union members that these things give them no title to increased wages. Such increases would be justified neither by the possibility of further inflation nor by the increase in the pay of the armed forces. The only justification for wage increases remains as before rearmament - greater and more economic production. Without any question, rearmament will have an inflationary effect, since the new demands for defence falling on particular industries are likely to outstrip their projected increases in productivity during the next three years. Rearmament, if it is to be done adequately and well, will call for sacrifices in the standard of living of the whole nation. There is no reason why organised labour should rank for any special exemption which is denied to other sections of the community. The same argument would hold if, in order to ward off inflation, the government were to reduce expenditure on the social services.

The particular case of the increased pay of the services is different. Here the government has deliberately used its power to raise the level of pay in the services and as far as the lower ranks of the services go it has done this in full measure. The recruit now gets a basic rate of pay 75 per cent larger than the 1945 rate, whereas average earnings of adult males in industry have increased by 25 per cent in the same period. But the 1945 rate of service pay was very low on any comparison with the rewards of civil employment, and the government having at last decided that it must augment the services by using financial inducements to draw men from civil into military employment, has done the very least that will be effective.

The government, by taking a positive line of action on rearmament and defence, has taken the risk of stirring up resentment in the ranks of the trade unions. It is for the unions to decide whether their reaction will be positive or negative - whether it will be regarded as a challenge or merely as the occasion for grumbling and lobbying. By using the weapon of financial inducement to raise the strength of the forces, the Government has at last shown that it is prepared to recognise the principle of the wage differential in order to shift labour from one occupation to another. Mr Bullock, in his presidential address on Monday, spoke with pride of the sense of responsibility of the British trade unions, and it has been a proud claim that the British unions initiate wage claims with a greater sense of economic realism than say the American or French unions. Is it not time then for the British unions to invest their own voluntary organisation, the TUC, with greater real power to sift and revise their various claims on the basis of a clear understanding that increases in wages should be based on the need, first, to reward skill and, second, to induce labour to flow from the less to the more important industries? The resolutions which stand to the name of the Inland Revenue Staff Association and the National Union of Public Employees - unions which it is true are exceptional in the calibre of their membership and of their leadership - suggest that this idea has already gained some ground among thoughtful trade unionists.

There is also a wider issue than the question of a coherent wages policy. It is quite clear that the present Russian policy of limited aggression has as one of its objects the creation of a state of alarm among the western nations which will force them into a rising defence expenditure and therefore by Marxist calculation into a declining standard of living, which in its turn will result in a lowered resistance to the growth of Communism. In Britain at least, the trade unions have it in their power not only to make the Russian calculations miscarry, but to cause the reverse to happen. The rearmament programme should have removed the remotest fears of any significant unemployment during the next few years and there is consequently no justification for the restrictive practices which still prevent the

Louis Philippe is at last - not indeed gathered to his fathers, - but committed to the grave in the hope that at some future day when the subsidence of old animosities or the occurrence of some new convulsion shall have rendered it practicable, his remains may be permitted to revisit the country he so long governed...With him terminates the race of men who saw the commencement of that great social earthquake, which overthrew the oldest Dynasty in Europe, shook society to its foundation, unsettled the minds of men to their inmost depths, turned up the subsoil of nations with a deeper ploughshare than Destiny had ever before driven, and opened the way for those new political ideas and those new political arrangements which are still operating and fermenting, and the final issue, the "perfect work", of which our children's children may not live to see.

The Economist

September 7, 1850

British industrial machine from running in top gear. If trade unionists were prepared to accept the implications in industrial policy of the resolute international policy which their native good sense leads them to approve, then Britain would be in a far better position to withstand her enemies. Beyond that, the emergency might even mark one of those great advances in general economic thought and practice (as in the United States in the last war) by which intelligent peoples can derive good out of evil.

NOTES OF THE WEEK

Political Backwater

While the world holds its breath to see whether the United Nations' front in Korea will succeed in withstanding the latest onslaught of the North Korean forces, the stream of discussion and leadership in Britain seems to have been diverted in a turgid backwater. Mr Attlee in his broadcast of last Saturday may have been logically correct in stating that there was no point in dating the recall of Parliament earlier than September 12th, but the result of this decision is that both he and Mr Churchill have had to use the BBC to carry on a debate which should have taken place on the floor of the House of Commons, thus perverting the party political broadcast from its proper use.

Mr Attlee may have been justified in some of his attacks on Mr Churchill; the point that he misses is that his government has a very great deal to answer for in its handling of defence, both in the immediate tactical aspect, such as the smallness of the British force so tardily dispatched to Korea, and on the wider strategic aspects of the failure to adapt its defence policy to keep pace with, let alone forestall, events. Although Mr Churchill's assumption that he is the only man who can save Britain may rile the Labour Party, the Labour government has still to prove that it has the capacity and energy to take time by the forelock. It faces a nervous parliamentary situation this autumn with the likelihood of trouble on its own left wing and an insecure majority over the opposition: leadership in ideas and actions will stand Mr Attlee in better stead than a hundred apologias.

Trade with Russia

Clearly it is possible to pick holes in the Prime Minister's broadcast defence of Britain's trade arrangements with Russia. British exports to Russia consist mainly of types of machinery for which delivery dates are long and demand, in present circumstances, virtually inexhaustible; how, then, can Mr Attlee claim with confidence that "these exports have not affected injuriously either our home or export requirements'"? Russian technical inspectors in a British engineering works are likely to see things that may be of interest to the Soviet Government; "conditions which prevent any disclosure of secrets" are not, therefore, easy to assure in any absolute way. But when these points have been conceded it is still true that the deliveries now being made to Russia are in return for deliveries of grains and timber that are not less valuable to Britain. The bargain was made in successive trade negotiations for the mutual benefit of both countries, and the Russians have performed their part of it. In what circumstances ought the British Government to break its undertakings? More is at stake than the wounded feelings of a British machine tool manufacturer.

The Government, in deciding whether to interfere with the British exports, has to consider not only the value of machinery to the Russians but the value of coarse grains and softwood to Britain, and it would be foolish to pretend that the "strategic" value is all on one side. It has to find out whether, if Russian deliveries stop, equivalent supplies will be forthcoming from elsewhere without dollar cost. But further, it has to determine at what point in the deepening international crisis the definition of "strategic" commodities is to be so widened that trade between Britain and Eastern Europe ceases altogether.

Atlantic Defence Takes Shape

The deputies of the Atlantic Council have compiled their reports for the meeting of the full Council which will take place on September 15th and 16th in New York. Certain ideas are known to be gaining favour in the United States - for instance, the setting up of a single Atlantic Command in place of the more limited authority of Fontainebleau, and the stationing of more British and American units in Europe. But these developments must, in American opinion, depend upon the readiness of Europe to contribute its own share. Mr Louis Johnson has made it clear that America will only help those that help themselves.

The week has however brought further evidence that the European powers are no laggards. The British decision to extend military service to two years has been followed by Belgium. In France, the Prime Minister, M. Pleven, has made his long awaited statement on French defence policy and announced that the French contribution to a peacetime European army will consist of 20 divisions. As a first step in the expansion necessary to build up this force military service will be extended to eighteen months.

All this must be heartening news for Mr Johnson, yet it is essential, at this critical stage, that the more powerful Atlantic powers should not seem to be waiting upon their neighbours. France's fears of renewed inflation and of a potent fifth column are inhibiting enough. The real spurt will be lacking unless America and Britain are prepared to give a really generous lead.

Defence of Ireland

The discussion of Irish defence (*writes our Dublin correspondent*) is inextricably bound up with Eire's attitude to the Atlantic Pact. Over the proper scale of defence preparations there are divisions of opinion between the political parties, but there seems no reason to believe that any conceivable Irish government would consider adhering to the Atlantic Pact. It goes without saying that Irish sympathies are not with Russia, but as Mr James Dillon, the Minister of Agriculture, affirmed in a recent speech, these sympathies cannot at present march with the Atlantic powers, the reason being of course that a treaty alliance with Britain would involve recognising the permanence of partition. No party would be prepared to accept foreign commitments without a prior agreement, if not on the whole question of partition, at least on Tyrone and Fermanagh. This does not preclude an appreciation of the fact that the larger conduct of a future war might be considerably aided by the presence of Anglo-American air and naval bases in Eire, and many Irishmen see no reason why Irish troops should not take part in the defence of all Irish territory, Derry as much as Berehaven.

The fact that Eire does not feel able to join the Atlantic Pact makes it peculiarly difficult to frame a sensible defence policy. The forces have been cut down steadily since 1944: the present establishment, which the Opposition considers quite inadequate, calls for a force of 13,000 but its actual strength is only some 8,500. Men, however, are probably not the chief barrier to expansion: the steady flow of time-expired men from the Curragh to the British army suggests that Irish basic training is adequate, and so many Irishmen have fought for or against Britain that the reserves of men with some military experience must be considerable. The problem of expansion would be that of equipment. The Irish army is lacking in weapons and in armoured vehicles, and there are almost no anti-aircraft defences - a fact which colours the diplomatic policy of any Irish government. Moreover ability to pay for equipment will now not amount to ability to obtain it.

Mr. Ehrenburg Explains

The recent visit of Russia's star propagandist, Mr Ilya Ehrenburg, to Western Europe has at least had the effect of making him aware what intelligent people outside the Iron Curtain think of the stunts of the Communist "peace" campaign. This awareness is manifest in an article in *Pravda* in which he admits that "hypocrites" in the West say: "We are against the atomic bomb, but the Russians have large numbers of tanks. Why are you not against tanks?" Mr Ehrenburg's answer is that banning the atomic bomb is only a "first step" and that, of course, the "supporters of peace" will take up the question of other lethal weapons later on.

Unfortunately for Mr Ehrenburg's argument the motives of Russia in launching this campaign have been only too obvious to anyone familiar with the relations of power in the current international situation, and such success as the bogus "peace" petition has had has been with unthinking people who are ready to sign anything claiming to be for peace and against atomic warfare. In seeking to build up in Western public opinion an inhibition against the use of the one arm of warfare in which the West has almost certainly a decisive superiority, the Russians and their Communist fifth columns are merely carrying on a propaganda intended to help their own strategic advantage in the event of war. The most suitable counter-action in the West would appear to be a campaign for the abolition of tanks, a weapon in which Russia appears to enjoy present superiority. And if this motive is thought unworthy, a strong case can be made for the view that the tank is far more essentially an instrument of aggressive war than the atomic bomb. Atomic bombing, even if used without warning, would not win a war against a strong nation, unless there were ground forces powerful enough to follow it up and occupy enemy territory; on the other hand, the *Blitzkrieg* from the Nazi invasion of Poland in 1939 to the invasion of South Korea two months ago consists primarily of a sudden assault by armoured columns with their spearhead of tanks.

Dr. Malan and South-West Africa

The victory of the Nationalist party in the elections in South-West Africa last week was a disaster for everybody save Dr. Malan and his followers. Nationalist candidates were elected in all six constituencies and General Smuts's United party were totally defeated. Dr Malan now has an absolute majority in the House of Assembly and an increased majority in the Senate. He need no longer, therefore, suffer the restraint of the more moderate Mr Havenga on whose support he has hitherto had to depend.

The result means an incalculable loss of prestige for the United party which can now have very little hope of victory in the next general election, and no hope at all of being able to influence the future decisions of the present Government. For the Hereros, on whose behalf there has been so much agitation at Lake Success, the outcome means the certainty of oppression made even more unsupportable by Nationalist attempts to placate their new German supporters. These men have a record in native affairs that is even worse than that of most South Africans.

The gravest consequence is, however, that Dr Malan may now carry out all his plans without the risk of parliamentary defeat and without effective opposition from any quarter. The entrenched clauses of the South

Africa Act will presumably be disregarded; the Cape franchise for coloured voters will be annulled (reducing still further the chances of a United party victory); the three seats of the natives' representatives in the House of Assembly will be abolished; and South Africa will become a republic within the Commonwealth, based, ironically enough, on the Indian model. Dr Malan will probably also begin to enforce the Group Areas Act and the Anti-Communism Act much more strictly than hitherto; liberals are already being labelled as Communists in the public speeches of Cabinet ministers. If such, indeed, is the melancholy sequence of events, progressive opinion throughout the Commonwealth will begin to question the value of a link which appears to associate them - however indirectly - with Dr Malan's disgraceful procedures.

Semi-Public Housemaids

The Annual Report of the National Institute of Houseworkers is a baffling document. No one denies that the Institute's aim - the raising of the status and standards of domestic work - is admirable and necessary; no one criticises its training methods; and if its code on hours and overtime is awkwardly rigid, it has value as a rough standard for general decent practice. Were the Institute a purely private affair, or the public grants which it receives a minor element in its finances, this general impression would be good enough. However, with three-quarters of its income provided by the taxpayer, something more is needed than cheerfully sketchy generalities and optimism. When the report gives definite figures, they are mildly horrifying. That a nine months' course at a domestic training centre should cost as much as a year at a good public school is none the less startling because the student herself gets it gratis. This is raising the standard with a vengeance.

Possibly this is merely a matter of growing pains, of heavy overheads which will become less onerous with expansion. The report vouchsafes no explanation. Nor is any real light cast on the questions, not without importance, of how long the expensively trained diploma-holders stick to domestic service and whether they go where they are really needed. There is general reassurance; "remarkably few" desert domestic work altogether, "most" go into resident employment where there are children, the old, or the sick. These generalisations might mean anything. Obscurity on these points, on the growth of numbers in training, on the respective importance in cost of tuition, administration, board and lodging, and allowances, is not adequately atoned for by quoting testimonials from employers and chatty letters from "pre-diploma workers". The Institute may be making a perfectly sound beginning on a needful and valuable job; or it may be a gaudy example of minor public extravagance. No one could tell from its report which interpretation is correct.

More University Teachers

Perhaps the most encouraging feature of the University Grants Committee's report for 1948-49 is the improvement it shows in the ratio of students to staff. In 1947-48 it was 11 to 1; in 1948-49 it was 10¼ to 1. In terms of individual attention to students this is an important step forward. University teachers are still desperately pressed, particularly at the non-residential universities where so much time is wasted in travelling, but every improvement in the ratio does something to relieve the pressure. The largest increase in numbers is in the ranks of lecturers and senior lecturers, but it is something of a surprise to discover that the number of full-blown professors increased by 85 over the previous year.

Another surprise is the fall in the number of women students. Between 1947-48 and 1948-49 the total number of students rose from 78,000 to 83,000, but the number of women students fell from 19,442 to 19,388. The reason may be that 1948-49 was one of the peak years for students with ex-service grants and the recipients of these grants were predominantly male.

In other respects the developments shown are very much what one would expect: the proportion of students studying arts subjects declined very slightly in favour of science and technology; the dependence of the universities on income from parliamentary grants increased slightly; and every university showed an increase in numbers except Oxford. The next big uncertainty is to know how numbers will be maintained when the number of grants to students begins to fall. Neither the Ministry of Education nor the local authorities have as yet taken steps to fill in with scholarships more than part of the gap left by the ending of ex-service grants. Are there a sufficient number of students of adequate quality and capable of paying fees to make up the balance?

Shorter Notes

An article in *The Economist* of January 7, 1950 drew attention to a forgotten empirical formula on electoral voting which states that if, after a two party contest, the votes have been cast in the ratio $a:b$ then the parliamentary strength of the parties will be in the ratio $a^3:b^3$. The theoretical basis of this formula has now been examined by Professor Kendall and Mr A. Stuart in the September issue of *The British Journal of Sociology*. They show that the formula is only valid if the election results conform to certain mathematical conditions, and that although recent British elections have fulfilled these conditions, there is a great element of uncertainty in using the law for forecasting.

Average prices of exports and of imports both rose by over 1½ per cent in July, the rise in import prices being wholly due to a 4 per cent rise in raw material prices after the invasion of Korea.

Books and Publications

"England before Elizabeth" by Helen Cam. Hutchinson's University Library. 184 pages. 7s6d

England before Elizabeth is a vast subject: indeed, Professor Cam begins it with the Iberians, who visited England from Spain in 2500 B.C. But primarily it is mediaeval history, and it is fortunate that it should be summarised by Professor Cam, - one of the most distinguished of those Cambridge mediaevalists who have rescued the subject from the ecclesiologists, the triviolators, the heraldists and the bores.

"The Englishman of Elizabeth's day", says Professor Cam, "confronted by hazards and opportunities unknown to his ancestors, owed to those ancestors more perhaps than he was willing to recognise"...What was his (and our) greatest debt? Not the Church, for that was cosmopolitan, and the Reformation had radically altered it. Indeed, for reasons of space, Professor Cam deals somewhat lightly with the Church, though she emphasises its service both in organisation and in keeping England from isolation. Our greatest debt is the English law and local government, and these two subjects give to this book the theme which unites so vast a subject: the canon law evolved and extended by cosmopolitan churchmen; the Roman law, introduced by Vacarius under Stephen; the common law, developed from custom and formalised by great legislating kings and the lawyers who followed them. It was the common law which, alternatively championed and challenged by kings and barons, and despised by the humanists of the Renaissance, "was in the next generation to be the first defence of English liberties against the encroachments of the New Monarchy".

But if the law gives unity to her subject, through what diversity does Professor Cam follow it! We see the commercial kingdom of Mercia flourishing under Penda and Offa; the industrial and commercial revolution, under the Angevins; the growth of the wool trade and the cloth industry; and the redistribution of wealth through war, trade and taxation which, dissolving the old concepts of feudalism, turned the higher baronage into an oligarchy and led, in the fifteenth century, to that "bastard feudalism" which the Tudors, conservative at least in this, ultimately corrected. And all this is illustrated by vivid portraits. The great Anglo-Saxon Bretwealdas assume here personality and stature; the genius of Bede is rendered suddenly clear; the humanism of Alfred, the modernity of Henry I, the fiendish energy of Henry II, the great work of Edward I, "the English Justinian", become evident before the reader's eyes.

"Gathering up the Threads" by Florence Ada Keynes. W.Heffer & Sons. 120 pages. 12s. 6d.

Many friends and admirers of the late Lord Keynes will be interested in his mother's simple and attractive account of his ancestral roots, of life and society in Cambridge from the 1880's on, and, of course, in the ancedotes she tells of the youthful Maynard. The main part of her history of the Keynes side of the family she owes to researches carried out when he was at Eton and at Cambridge by Maynard himself, who traced his ancestry back to one William de Cahagnes in Normandy who came over with the Conqueror. Writing after the completion of his labours, Lord Keynes wondered if his ancestors "were as fascinating alive as they were dead". One suspects, however, that it is Mrs Keynes' side of the family to which, though possibly less "fascinating", the spark of genius which burst into fire in Maynard Keynes is to be traced. At any rate, the most dynamic personality of which she gives account is that of her own father, Dr. John Brown, descendant of a Scottish family tempered or steeled by several generations of residence in Lancashire, who became famous as the congregational pastor of the Bunyan Meeting in Bedford. And while her husband, John Neville Keynes, long Registrary of the University of Cambridge, was a man of high culture and attainment, Mrs Keynes' pioneer service in the cause of women's participation in municipal life - she was Mayor of Cambridge in the year of her golden wedding - does nothing to contradict the theory that it is mainly from the mother that exceptional capacity is inherited.

* * *

"Readings in Business Cycle Theory" selected by a committee under the chairmanship of Dr. Gottfried Haberler. American Economic Association Series (Blakiston). Allen and Unwin. 487 pages 25s.

This second volume of "Readings" in the Blakiston series to be republished (and more mercifully priced) on this side of the Atlantic maintains the high quality of its predecessor on International Trade, lately reviewed by *The Economist*. It suffers rather more, however, from the lapse of time; none of the articles here reprinted appeared later than 1940, and even the bibliography goes no further than 1943, since when, after all, a considerable amount of important work has been done - notably, in this country, by Mr Hicks and Mr Harrod. This largely inevitable incompleteness, however, makes no difference to the book's status, which is that of a standard volume indispensable to any serious student's library and the more indispensable the more limited that library's extent.

AMERICAN SURVEY

Democrats at Bay

Washington, D.C.

With Labour Day over and Congress ready to go home, the election campaign can begin in earnest. It is still too early, since the Korean War has dramatically changed the issues, to prophesy what the result will be. But it is not too early, in the opinion of most people in Washington, to admit that the campaign itself will be one of the most unsavoury of modern times. Some part of the coming unpleasantness was inevitable; with each successive defeat the Republican Party becomes more bitter and its Congressional candidates observe fewer of the decencies.

But the greater part will come from the deliberate decision, even at this critical moment, to make American policy in the Far East the chief election issue and to use the McCarthy technique and the MacArthur legend for driving it home. The 'relentless scrutiny' produced by the Republican members of the Senate Foreign Relations Committee was the first product of this decision. For all its false premises and doubtful reasoning, it was a comparatively sober and respectable document. From the Democratic point of view it was also a dangerous one. The truth about the situation could not be denied; the half-truths in the passages apportioning responsibility will be hard to explain. But two days later Senator Wherry gave tongue to what will no doubt be the real keynote of the campaign when he said that 'it is the policy of Mr Acheson to let the dust settle in Asia, and that cannot be denied. The blood of our boys today is on his shoulders.'

Before June 25th the Republicans were generally expected, more because the party in power usually loses seats in the mid-term election than for any more tangible reason, to make some headway; but it was not thought likely that they would regain control of either House. They were in the predicament of conservative parties all over the world in having nothing to offer; what was even worse they were proud of it. Mr Dewey, the most intelligent critic of (and the greatest sufferer from) his party's prehistoric wing, said in February:

> Anyone who thinks that an attack on the fundamental idea of security and welfare is appealing to the people generally is living in the Middle Ages. Everybody wants welfare and security. The man who first used the phrase Welfare State against our present Government did his cause no good, to put it mildly.

The man was Senator Taft and he is in danger in Ohio from a character who, to put it mildly, is undistinguished.

But the Korean War has changed the picture. Despite the warning, again from Mr Dewey, that 'politics should stop at the water's edge and, if it does not do so soon, I doubt if we will long own the water's edge', the Republicans, who have always longed to fight their elections in the Pacific, are going into battle bearing a banner with two very strange devices. 'For Chiang, Formosa and MacArthur' is on one side; on the other is 'Johnson and Acheson must go'.

The tacit approval given to Senator McCarthy and his tactics by the Republicans in a peace-time atmosphere may not have been very reputable politics, but it was honest compared to the present encouragement of a self-opinionated if not rebellious General. It is incredible that the Commander of the United Nations Forces in Korea should have been allowed to become either a catspaw or an accomplice of the opposition party in an internal election in the United States. But, as Miss Doris Fleeson of the *Washington Star* said a week or two ago, 'those people are in the Republican saddle who believe that the only thing that counts in politics is whether you win or lose'.

If the Congressional Democrats had courage, a quality which they conspicuously lack, it would not be too late to fight the kind of campaign which would give them a chance. But many of them, frightened by the Hiss trial, confused by the McCarthy antics, and scared by reports coming in from all over the country, have decided to be more anti-Communist than the Republicans. This has involved them in an open breach with the President's policies. They are trying to outdo the opposition in showing their love for General Chiang Kai-shek and General Franco and their admiration for General MacArthur. And those who know better dare not speak lest they be accused of sympathy for Communism.

If the elections were held today the result would probably be serious for the Democrats. But this may well be the party's lowest point. The American people, who are not used to taking the shock of initial defeats in war, cannot understand why their powerful country cannot polish off the North Koreans overnight. Those in office must take the blame. But, if the tide should have turned before polling-day and the United Nations forces be on the offensive (the timing of the offensive cannot, of course, be decided for political reasons in Washington, but only by the Commander in the field), Democratic prospects would improve. They would improve even more if the Democrats who are running would take the offensive and display the courage of the convictions they are supposed to have. The President, both in his broadcast and his reprimand to General MacArthur, has given them a lead.

THE BUSINESS WORLD

An Autumn Budget?

Reflections upon the economic effects of the increases in forces pay and the extension of compulsory service have led some people to hope that the Government will think again about its evident first decision not to introduce an autumn budget. This decision was apparently based mainly on the assumption that the new defence plans could not, even with the best possible speed in execution, exert any large effect before the fiscal year 1951-52, so that any budgetary action could safely be deferred until next April - and, incidentally, perhaps until after the next election. A second assumption, to which attention was drawn here last week, was that, in the absence of the rise in exports in the first half of this year, the economy might have developed a little of that disinflationary elbow-room that it has lacked for so long.

Now it seems certain that the forces of inflation will be strengthened almost at once, and that any minor slack will be taken up very quickly - unless an undue burden is thrown upon exports, which need actually to be stepped up to keep pace with the worsening of the terms of trade. The increase in forces pay adds forthwith £70 million a year to public spending power *before* the policy begins to do its job of attracting manpower away from civil employment; and, quite apart from that, the civil labour force will henceforth be depleted by the fact that the intake of conscripts will exceed releases. In addition, the new equipment contracts and other outlays for supply will certainly provoke some pressure this year, while there is always the danger of a wave of forestalling purchases by consumers and of redoubled pressure for wage increases. All these are arguments for early disinflationary action - both to provide some immediate correctives and to give due warning of the need for restraint now and of the bigger sacrifices that will be needed next year.

Productivity Not Enough

Unfortunately, there is no sign yet that the Government is giving weight to such considerations. It still seems to be regarding the undoubted need to sustain 'economic recovery' as a licence for sustaining 'business as usual' - which is a very different, indeed a contrary, objective. Upon the special reassembly of Parliament next Tuesday, the Government is expected to reveal something about the conclusions that emerge from the economic stocktaking upon which the planning staffs have been busily engaged. But the portents suggest that the first 'consequential measures' after Korea will be as unrealistic as those propounded on the morrow of devaluation. In these circumstances, it is a pity that some responsible commentators still seem to be lending support to the Government's first comfortable assumption that the extra defence burden can be readily carried by extra productivity. Sir Hubert Henderson, in an article in the latest *District Bank Review*, makes some shrewd comments about the danger of rising inflationary stresses, yet he says that the problem is really only one of ensuring that a sufficient proportion of the fruits of productivity is reserved for defence instead of being absorbed by other claimants such as a rising standard of living.

The reasons for distrusting this facile approach were succinctly stated in these columns four weeks ago. But, even if the arithmetic of productivity were trustworthy and supported this view, it would still be true that the frictions to be encountered in any effort to reserve the increment for defence purposes would be so great as to set up considerable stresses that would prejudice both the defence drive and the export drive, and, even so, would not save the public from the injustices of inflation. It cannot be emphasised too strongly that a reliance now upon productivity to see Britain through will mean too little defence effort, too few exports and too much inflation.

A Coal Crisis?

The Government, in its urgent need for more coal production, cannot find it easy to rouse the miners without alarming the country. Mr. Robens when he spoke last weekend of the risk of a winter fuel crisis if coal stocks are not built up from less than 13 million tons to 16½ million tons by the end of October, was addressing Durham miners at a gala, and his speech was no doubt a call to action rather than a prophecy of doom. But the facts to which he called attention are disquieting facts whether they presage imminent crisis or not.

There is nothing sacred about a figure of 16½ million tons for stocks. In most sets of circumstances such a total would be more than enough; circumstances might, however, so combine that it would prove too little. What is significant is the rate at which inland consumption is persistently tending to rise and the difficulty of getting output to keep pace. Lord Hyndley, when he surveyed in January the coal prospects for 1950, anticipated an inland consumption of between 196 and 201 million tons this year. This figure compared with 195.1 million in 1949, 192.7 million in 1948, and 177.8 million in 1938. In the event inland consumption in the first 34 weeks of this year has shown an increase of 3,400,000 tons over the

same period of 1949. Output, including opencast output, has shown an increase of barely 2,000,000 tons. The export programme will be an inevitable casualty if this goes on. But how is the process to be checked? Anything saved by rationing house coal is more than absorbed by industry and the utilities, which together (Mr. Robens said) took 34 million tons more last year than in 1938.

The growth of these demands is by no means at an end, even apart from any extra stimulus from rearmament; and it is by no means certain that the Coal Board's task in meeting them is a possible task at all. The improvement in productivity is slow and comes largely from injections of capital in the form of machinery and works of reconstruction. The mining labour force is shrinking more rapidly than the Coal Board or the Government expected, and efforts to check the shrinkage have had no visible success. The report of the Ministry of Labour for 1949, published this week, gives an impression of complacency on this subject as on the general question of inducing manpower to flow into the occupations in which it is most needed. Admirably as the Ministry works in detail, there is still no sign of success in applying a general manpower policy, if such a policy exists.

Freer Switching

Since last Monday 'non-resident' holders of sterling securities - that is, holders outside the sterling area - have been allowed to 'switch' into any security quoted on a stock exchange in the sterling area that is not redeemable earlier than ten years from purchase; non-resident holders of blocked sterling balances have been accorded similar freedom to invest their funds. Under regulations introduced in 1948 non-resident holders of British Government securities had not been allowed to switch out of them into industrials - and all non-resident holders were precluded from switching into South African or Rhodesian securities. Permission was also generally withheld from any switches that involved a change in the 'country of borrower'; before last Monday, therefore, the overseas holder of, say, a Chilean mining security expressed in sterling could switch only into another Chilean security.

The new regulations broadly restore the facilities set up during the brief 'dash for convertibility' in 1947. One consequence of them will probably be a movement by non-residents out of gilt-edged into industrials; the gilt-edged market was already reflecting expectations of such a movement on Monday. Another consequence may be that certain Latin American states will be able to retire their sterling securities more rapidly than before; they will be able to buy gilt-edged securities cheaply in New York, sell them at market value in London and then use the proceeds to repurchase their own securities. As a result of transactions in cheap security sterling of this sort, and as a result of the expected switch by foreigners from gilt-edged into higher yielding securities, Britain may lose a little foreign exchange. But the advantages to be gained are certainly worth the small sacrifice involved. Sterling securities should now become much more desirable investment media in foreign eyes; some first sign of this can in fact be deduced from the fact that the four main 'security sterling rates' (gilt-edged, industrial, Rhodesian copper and South African sterling) have merged (as merge they had to) into a single rate near the upper level of the previous spread. The prestige of sterling securities abroad - and the degree to which foreigners use the London market instead of New York or Amsterdam - will be immeasurably increased if switches between residents in different currency areas are now liberalised; the Bank of England's rules about such switches (which still seem to be subject to individual licence) are at present very obscure. Provided such liberalisation takes place, the only barriers still set up to foreign investors by the British exchange control will be those that prevent a withdrawal of foreign capital from the sterling area. Indeed, this latest move towards freedom might have been accompanied by others a good deal more vigorous - if the rearmament crisis had not given more power to the elbow of the cautious spirits who cling to control.

Bank and Fund Concourse

Representatives of the finance ministries and central banks of forty-nine countries, ranging from the United States to Salvador, have now assembled in Paris for the fifth annual meetings of the International Monetary Fund and the World Bank. The reports of these two institutions were due to be presented to the Governing Boards on Thursday and Friday of this week - after this emergency issue of *The Economist* had gone to press. But it is doubtful whether their content will be such as to hoist them high into the headlines. The course of events in the past year has not run kindly for the Fund, which is still faced by a world in "fundamental disequilibrium" (a "temporary" condition that has now outlasted the Fund's fifth birthday), which is still split (more perhaps than appears to the naked eye) on the negative attitude it has adopted to South Africa's request for greater freedom in gold dealings, and which is still nursing a sense of injured pride at the small part it was allowed to play in the exchange rate adjustments of last September and the more recent conception of the European Payments Union. Apart from certain internal staffing problems, the main interest at the Fund's annual meeting may centre in the efforts of some European countries to secure adjustments to their "quotas" and dollar-drawing rights. So long as Marshall Aid lasts, no West European member may draw dollars from the Fund; when Marshall Aid ends, the size of quotas, and the corresponding dollar-drawing rights, will become of greater importance.

The World Bank has had a rather more active year. It has lent more than $200 million - mainly to Australia, India, Turkey, Iraq and Latin American countries. Subjects that may come up for discussion at the Bank's meeting are the very high level of its overhead costs, the possibility of raising and lending currencies other than the dollar, and the liberalisation of the non-financial covenants in its rather stereotyped loan contracts. Some attention might also be paid to whether the Bank should now adapt its lending policy more closely to the renewed need for world wide disinflation - or whether it should merely scrutinise each loan for its individual prospects for repayments. But these narrow discussions of the particular affairs of the Bretton Woods babes are unlikely to be the most important consequences of this week's concourse; men such as Mr. Snyder and Mr. Havenga are unlikely to have come on a European tour without first filling their brief-cases with other and more important matters than those to be formally discussed in the board room of the Bank of France Annex.

New Hope from Argentina?

British firms operating in Argentina - and those now cut off from the Argentine market - may derive some hope from the simplification of that country's exchange system announced last week. These foreign exchange reforms, which include a devaluation of the peso, provide new evidence that the Argentine authorities are now confident that their external economic prospects are again changing for the better as the world political situation changes for the worse. It also provides the first ray of hope that they may be planning to ease the strains imposed on their economy by their policies of the last few years. These policies, as has often been explained in *THe Economist*, sought to jack up the standard of living of the urban proletariat by milking local agriculturists (through discriminatory exchange rates) and to jack up the country's exiguous exchange reserves by milking any foreigner who lay conveniently to hand. The new exchange structure is notable because it throws out a few first crumbs of comfort to these two whipping boys. The export exchange rates for basic agricultural products have been raised from 9.4 pesos to 14 pesos to the £, and those for other agricultural products, semi-manufactured and manufactured goods are raised to 21 pesos - from 13.53, 16.04 and 20.15 pesos respectively. The profits arising from these devaluations, which for most products are of the order of 40-50 per cent, should provide a stimulus to Argentina's flagging agricultural production - provided the profits are passed on by the state purchasing agency; they will also, however, inevitably generate inflationary pressure within the country. Exchange for preferential imports will now cost 14 pesos to the £ (instead of 10.45 pesos); for other essential and semi-essential imports the rate will be the same as the general export rate - i.e. 21 pesos (instead of 15.04 and 17.04 pesos). Inessential imports - a category that includes the great majority of British textiles and other manufactured goods - are to be financed at the free market rate, now about 40 pesos to the £. It is not yet clear whether exchange for these imports can be bought at this rate without prior permits; if it can, there may be a rush to buy British manufactured exports despite the high internal prices that these rates would ensure.

There remains the all-important question of financial remittances. From now on foreign firms operating in Argentina may buy on the free market, and remit abroad, foreign exchange up to an annual maximum of 5 per cent of their investment in the country. The Argentine Government has also announced that it will facilitate transfers of the £20 million odd of accumulated British earnings "as soon as conditions on the free market permit". Meanwhile, British firms holding blocked peso balances are apparently to be allowed to sell them for sterling - if they themselves can find a sterling buyer. Unfortunately, it is not yet clear by what formula the permitted remittance of 5 per cent is to be assessed; if the original sterling investment is to be valued at the pre-war rate of about 12 pesos to the £, while current remittances are valued at 40 pesos or more to the £, the concessions will afford cold comfort. Moreover, it must be emphasised that the Argentinians have been induced to make even these meagre concessions to foreign businesses only because they think they can now increase their exchange reserves by forcing Britain and other countries to pay - in an inflated world market - higher prices for their products.

Bank Advances Rise Again

The clearing banks' statement for August reveals a picture very similar to that painted by most of these statements in the spring - the decrease in Governmental demands on the banks has just, but only just, sufficed to offset the rising pressure of bank advances. In the four weeks to August 16 Government borrowing (as represented by the net change in money market assets, Treasury deposit receipts and cash holdings) ran down by some £27½ million while advances increased by just over £21 million. Net bank deposits declined by £5,600,000. It now seems probable that the apparent check to the rise in advances between April and July was largely seasonal - insofar, that is, as it was a real check and not merely a reflection of special Electricity repayments (from the new issue proceeds) and of the accounting oddities discussed in these columns on August 5. Moreover, the renewed upsurge in primary commodity prices must necessarily lead to an increase in the cost of carrying stocks; wool manufacturers in particular may now be pressing for a higher ceiling to their borrowing powers. In view of this, and in view of the fact that Government borrowing must be expected to increase as rearmament gets into

its stride, the prospect that credit stability can be maintained over the next few months is not at present bright.

Expanding Oil Production

World oil production is well on the way to reaching an unprecedented high level in 1950. Estimates made by the *Petroleum Press Service* put the total world production of crude oil in the first six months of this year at 245,825,000 metric tons - 15,000,000 tons more than in the first six months of 1949 and 6,000,000 tons more than the previous record half-year, which was July-December 1948. These are impressive figures as they stand. Still more significant are the facts that all the principal oil-producing regions of the world have shared in the increase, and that the full recovery of American production has only become apparent in the last two months; the indications point, therefore, to a still higher performance in world oil production in the second half of the year.

Although world output fell slightly last year as compared with 1948, the reduction then was substantially confined to the United States; output in the rest of the world has, broadly speaking, expanded uninterruptedly for some years. The expansion outside the United States has continued and in some regions has been accelerated. Middle East output in the first half of 1950 was 5.2 million tons more than in the second half of 1949. Iran, Iraq, and Kuwait are together responsible for the bulk of this increase, and the putting into service of the new 16-inch pipeline from Kirkuk to Tripoli played a considerable part; but since May Saudi Arabian output has begun to advance rapidly as well. In the Far East, Indonesian and Borneo production have advanced steadily. Venezuelan production was reduced in February and March because of the poor United States import prospects for fuel oil, but rose remarkably in June and July to a rate equivalent to 84 million metric tons a year..

American production has not ceased to be the dominant feature in the world oil picture; and the American market underwent an immense transformation even before the Korean war administered a new impetus. American domestic requirements rose by no less than 12 per cent over the first half of 1949, so that even with the reduced export demand for American oil products the total demand for United States oil advanced by 10 per cent. It has taken some time, and a substantial running down of stocks, before the restrictions on output were removed and the movement of demand fully reflected in production. But American output, at 5.6 million barrels a day, is now 900,000 barrels a day higher than a year ago, and still rising. Refinery runs are higher again, more than 6,000,000 barrels a day; American imports of crude oil are running over 500,000 and of products over 300,000 barrels a day.

Shorter Notes

France last week paid Britain £9,250,000 of the £15,250,000 agreed for final settlement of all wartime debts; the balance will be paid in September 1951. France also paid last week £8.6 million in first repayment of the £100 million loan granted after the war. These payments are being set off against French sterling balances, which stood at £28 million at end-June.

To provide for capital expenditure, Imperial Chemical Industries is arranging a private placing of £20 million 4 per cent unsecured loan stock 1958-1960. The issue price has not yet been disclosed, and ordinary stockholders are not being asked to participate. The ordinary units of ICI were marked down sharply on the news.

A further £2,500,000 is to be raised by Petrochemicals to finance the chemicals-from-oil plant at Partington and repay £900,000 temporary advances from the FCI. Sanction is being sought to create a prior charge up to this amount and ranking pari passu with the existing 5 per cent second secured loan stock 1959.

The payment of a special interim dividend of 3.6d. per 15s. ordinary stock unit of Tate & Lyle in December will be coupled with the creation of a "Prosperity Fund" for distribution to employees. It is understood that the fund will be geared to an incentive scheme to be linked with output and profit.

The British air corporations' operating deficit in the last financial year was £7,790,000 for BOAC, and £1,360,000 for BEA. Internal reorganisation and increased traffic cut the losses of BEA by more than half and those of BOAC by 13 per cent.

The provisional index of industrial production for June, published by the Central Statistical Office, is 143 (1946 = 100). This is a point higher than in May and is equal to the index for March, the highest recorded. The index for manufacturing industries is 149.

Company Meetings

OZALID COMPANY

The annual general meeting of the Ozalid Company, Limited, was held on Aug.23, in London, Mr. C.A.G.Hewson, chairman and managing director, presiding.

The following is a summary of his statement: The profit for the year 1949 was greater than that made in 1948. The result is extremely gratifying and exceeds the forecast of the directors made in the early part of 1949. The turnover for the year under review was greater than that of the preceding year. The turnover for the first six months of the current year has exceeded the figure for the identical period of 1949.

The company's continued success depends upon marketing products of the highest possible grade and the production of improved ones; further, as our products are supplied to the drawing offices of nearly all the leading engineers, shipbuilders, aircraft and armament concerns, municipalities, and building contractors in the United Kingdom, our fortunes are directly concerned with the trading conditions experienced by those in the spheres mentioned.

Your directors recommend the payment of a final dividend of 15 per cent., less income tax, on the "A" and "B" ordinary shares, which provides a dividend of 25 per cent. for the year.

SPURLING MOTOR BODIES LIMITED
Capital Increased

The thirteenth annual ordinary general meeting of Spurling Motor Bodies Limited was held on Aug 31 in London.

Mr. W. F. Spurling (Managing Director) said that the year under consideration had been fraught with frustrations and difficulties. Especially did he refer to the continued shortage in the number of new vehicles for the home market. Secondly they had suffered from the effects of the general shortage of money and those two factors had very definitely affected the profit earning capacity of many businesses.

A third factor in their case had been the nationalisation of the road haulage industry. A considerable proportion of their revenue had always come from the sale of replacement parts.

Their trading profits had fallen from £210,429 to £188,998, a decrease of £21,431, but the net available profit, after charging taxation, had fallen by only £8,157. The directors felt justified in maintaining a dividend of 37½ per cent. for the full year.

The directors were confident that the coming years would be as satisfactory as former years.

The report was adopted, and at a subsequent extraordinary general meeting a resolution was approved increasing the capital to £600,000 by the creation of 500,000 Ordinary shares of 4s each.

SILENTBLOC LIMITED
Record Net Profit

The fifteenth annual general meeting of Silentbloc Limited was held in London on August 30.

Mr. H. Vezey Strong (chairman) in the course of his speech, said:

A year ago I ventured upon a modest prediction, the fulfilment of which is expressed in the report and accounts. After providing £59,823 for taxation, your company retains as net profit for the year the sum of £44,305, which is approximately 58 per cent. above that of last year, and constitutes a record.

It is proposed to place £12,000 to the asset replacement reserve, to pay a final dividend of 4d per share, less tax, making 7d, less tax, for the year, and to carry forward the balance of £36,234.

The Recent Issue

In July last 550,000 new shares were issued at 5s.9d. per share, raising the issued capital of your company from £165,000 to £220,000, and producing approximately £135,000 of new cash. In turn, the nominal capital of the Andre Rubber Company, Limited, has been increased from £36,000 to £250,000. All the shares so created have been issued to the parent company for cash. Thus the capital of the Andre Rubber Company, Limited, has now been brought more into line with its asset position, the loan from Silentbloc, Limited, has been repaid, and adequate working capital provided for its expanding business. The sum of £86,234, which it is proposed to carry forward, is in itself sufficient to provide a dividend of 7d per share, less tax, on your company's capital as it now stands increased. Our three factories are in most excellent shape, and indeed maintained in the best order and condition.

Associated Companies

Our associated companies overseas now begin to forge ahead. In the year under review your company received revenue only from the U.S.A., the royalty earnings paid in American dollars amounting to £3,050, plus £499.10s., being profit on exchange. This is a relatively small sum; nevertheless, when compared with £1,166 for the preceding year, the progressive trend becomes clearly marked. This is not a one-way traffic, for we reciprocate in the fullest sense, so as to help secure an outstanding success for these combined operations.

Our policy here at home for the current year is one of consolidation.

With regard to the current year, the order books of both companies are full, combined sales for the first three months of the year exceed those of the corresponding period of last year by over one-third, and your board views the future with confidence.

The report was adopted.

GEORGE LEE AND SONS, LIMITED

Substantial Increase in Output And Sales

Lord Barnby's Review

The sixty-fourth annual general meeting of George Lee and Sons, Limited, was held on August 23rd at Providence Mill, Wakefield.

The chairman, Colonel Lord Barnby, C.M.G., C.B.E., M.V.O., in the course of his speech, said:-

The results for the year under review can, we feel, be regarded with satisfaction. In addition to the improved financial results recorded in the accounts for the year there was a substantial increase in output and sales.

The steady rise in the price of wool involves, in a business such as this, need for a greater increase in working capital than can be provided out of current profits after providing for taxation requirements and a modest return for shareholders. In addition, there is need of funds to pay for new equipment at to-day's high prices. Up to the present your company has met these commitments by bank borrowings, but your directors now feel that they would be well advised to obtain finance in some more permanent form. They are therefore in course of negotiations for additional capital in a more permanent form.

Wool Prices

Wool prices moved on to a higher level. This made it difficult for spinners to avoid progressively recovering part of the advance by increased prices to customers. Statements after devaluation by the Chancellor of the Exchequer dismissing expectation of resultant price advances undoubtedly resulted in normal provision of raw material by importers being postponed. As a result higher prices were paid later to secure necessary raw material. This is reflected in the rise in Customs and Excise return of imports, to which rise wool, of course, contributed substantially.

Export Field

In the export field we have continued to press sales with customary vigour. We have maintained our proportion in most markets and are recapturing our former volume in others where currency and import restriction had stopped normal flow.

Trading with retail stockists is now returning to conventional seasonal practices. To provide for this stocks at the mill must be built up during the summer months. I would remind shareholders that we sell our products as "Target Wools" under brands long well known at home and abroad, such as, to name only a few leading ones, Campanula, Leemont Crepe, Cherub, Clover Boucle, etc.

The report was adopted.

BRITISH BORNEO TIMBER COMPANY, LIMITED

Termination of Concession

The thirtieth annual general meeting of the British Borneo Timber Company, Limited, was held on September 7th in London, Mr. H.W. Horner (the Chairman) presiding.

The following is an extract from his circulated statement for the year:

The Colonial Office had given formal notice that the company's present concession will terminate on June 30th 1955. We understand that it is the wish of government to start discussions in due time regarding the terms on which this company may continue its business thereafter, without waiting until the period of the five years' notice is nearing its end.

We are continuing to press on with the work of re-equipping our sawmills, engineering works, and slipway in Borneo. The extension of the sawmill was completed in June and is now making a substantial addition to the output of sawn timber.

Demand for timber in our main markets, the U.K. and Australasia, remains steady and sales have been well maintained.

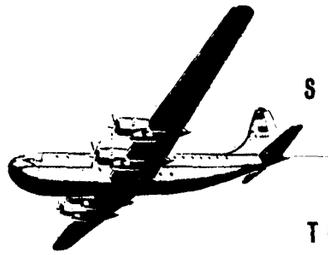
The profit for the year, before providing for taxation, is £104,719 - some £26,000 lower than that of the previous year - which, may be regarded as satisfactory. The board recommended a dividend of 10 per cent.

The report was adopted.

GENERAL CEYLON RUBBER & TEA ESTATES

The fifty-third annual ordinary general meeting of General Ceylon Rubber and Tea Estates, Limited, was held on August 22nd in London, Mr. J. Gilroy Annan (chairman and managing director) presiding.

The following is an extract from his statement:



It gives me great pleasure to be able to report an increase in profits for 1949 over 1948, before making provision for taxation, of £10,246, that is to say £54,140 against £43,894. Whilst climatic conditions did, in fact, improve in the second half of the 1949 season, this improvement was not sufficient to off-set the drought in the early part of the year, and tea crop was less than in 1948 by some 13,000 lbs. The drop in crop was more than compensated by the increase in price obtained of about ¾d. per lb.

Rubber crop showed an increase of 20,000 lbs., which can to a great extent be accounted for by the bringing into tapping of hitherto immature rubber and slaughter tapping of old rubber preparatory to replanting in tea in 1950.

Your directors recommend paying a dividend of 6½ per cent., less income tax.

As regards the current season, there have been harvested to July 31st, this year, 1,387,758 lbs. of tea and 567,882 lbs. of rubber.

The report was adopted.

STRATOCRUISER SLEEPER SERVICES

TO U.S.A. AND Canada

B.O.A.C. Stratocruisers fly you overnight from London to New York and also to Montreal. 9 flights weekly to New York (1 via Shannon, 4 via Prestwick and 4 direct). 4 flights weekly to Montreal (1 via Shannon, 3 via Prestwick).

B.O.A.C. operates the ONLY Sleeper service to Montreal. Sleep your way across the Atlantic in the double-decked spaciousness of the world's largest, fastest, most luxurious airliners. Complimentary meals include drinks. No tips or extras.

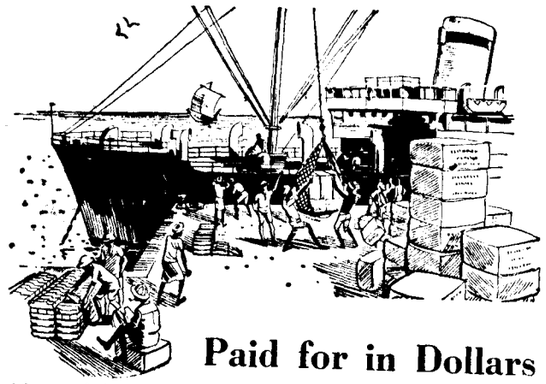
Stand design and construction comes naturally to



OLYMPIA

It is logical that the home of so many famous exhibitions should house a department which creates and builds hundreds of stands a year. They are produced by Olympia's own designers and craftsmen—for exhibitions all over the country or on the Continent. This service is, we believe, second to none. Not least amongst its features is that wise planning makes prices decidedly competitive.

OLYMPIA LIMITED

G.P.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

Footing the Bill

NO Government need be ashamed of an honest reluctance to prepare for the possibility of war. No government, having seen where its duties lie in defending its citizens, would escape the censure of history if it tried to shirk them. It has taken a great deal to convince the British Government, and the British people, of the need for active measures of defence, but if their conversion to realities has been belated the conversion of the other Atlantic nations has been scarcely less so. The question now is whether Britain, in concert with its Atlantic allies, is doing the utmost to make good past deficiencies in the effective organisation of mutual defence. The Prime Minister's account on Tuesday of the defence tasks now in hand struck at any rate a more confident note than the alarming revelations of unpreparedness in the defence debate at the end of July. There is no more nonsense about a fleabite of an extra £100 million; the total projected burden for the next three years is now put at £3,600 million and even if this proves sufficient (which may be doubted) it will represent an increase of more than 50 per cent on the present rate of expenditure on defence.

The first objective, as the Prime Minister stated, is to bring the country's existing fighting units up to full strength and to supply them with the necessary supporting arms. The flow of new manpower into the forces, both of regulars and national service men, will take time, but later next year it should be possible to mobilise ten regular divisions and twelve Territorial divisions. In the meantime, "rather more than three fully trained divisions" are to be stationed in Germany, and an increase is to be made in the home strategic reserve to about two fully armed divisions. No doubt these dispositions are the best that can be made in the circumstances, but even these painfully small forces have still to be built up to full strength. No speed will be too great for the achievement of this task, nor for the building-up of squadrons with new jet aircraft and the provision of defensive craft for the Navy. It is the very urgency of these tasks—the desperate character of the race against time—that prompts the question whether even now the Government's programme represents more than the bare beginning. Are three fully trained divisions in Germany (when they are all in position) a sufficient British contribution towards the common landward defence of the West? How soon will the full capacity of the British aircraft industry be employed in feeding fighters to the front-line air forces of the Atlantic nations? Are the present programmes big enough? Can they be completed soon enough?

In this present twilight of warlike peace, the main danger is that the Government may seek first to secure the gains of peace and to put the needs of defence second. It is right that the Government should shrink from resorting to the drastic apparatus of a war economy at this stage; the country is not preparing for war, but fortifying itself for peace by strengthening its defences. The three-

year defence programme, however, is limited (at this stage) to what the Government conceives to be "physically possible"; it presupposes that assistance from the United States will be sufficient both to provide materials from dollar sources and "to maintain our economic strength." These reservations were explicitly made by the Prime Minister when he turned to the economic consequences of the defence programme. At one point, for instance, he claimed that Britain's defence effort had reached the limit of what could be done unaided without impairing the country's economic position. In any scale of values that recognised the primacy of defence needs, this claim could hardly be accepted as it stands. Not all the country's resources are being devoted to rebuilding its economic strength, and even if they were it would still be possible, though uncomfortable, to use a greater part of them instead for rebuilding our military strength. Under present conditions, it is not disagreeable policies that are likely to prove disastrous.

Nothing that Mr Attlee or Mr Gaitskell said during the debate came near to rebutting the impression that the Government's attitude towards the economics of defence is "business as usual." There would have to be sacrifices, some degree of hardship, fewer cars and television sets, some diversion of labour and some rise in the cost of living. But nothing is apparently to be done to ease an economy already bursting at the seams. There was no mention of any action to modify the existing commitments on the social services and housing. Indeed, the Minister of State suggested that the inflationary tendencies resulting from the new defence programme would be on a "small scale at present," and he announced that the Government did not intend to present an Autumn Budget. To persist in such attitudes is to run the risk of imperilling the defence programme in economic confusion. The extra cost this year may be only £70 million; but in 1951-52 it will be at least £220 million, in 1952-53 perhaps £400 million and in 1953-54 over £600 million. An early Budget would have provided the opportunity both for some modest degree of disinflation by way of retrenchment and for preliminary steps to meet these great burdens.

*

The Government is in the curious position of realising what has to be done on the economic front without, it seems, having any confidence about the means to employ to secure that it is done. The full programme will employ 250,000 people, and civil industry will also lose men to the armed forces (77,000 for national servicemen alone in the next six months). It will need something more than co-operation and good will to secure transfers on this scale, and while the transfers are going on, productivity in civilian industries will suffer. Again, as the Prime Minister clearly showed, the main weight of additional production for defence will fall on those industries which are already fully occupied in making capital goods for home and export needs. It would be a profound mistake to allow the country's export effort to be weakened, or to cut down essential productive investment at home. If this crucial group of industries is to meet, as far as possible, the demands of defence, exports and home investment, the pruning must be done in all home requirements that are not inescapably necessary. Of the machinery to do this, there was no hint in Ministers' speeches. No doubt the Government is right to hesitate to introduce physical controls and allocation of the complicated miscellany of goods that this group of industries produces. Such policies are difficult to apply even when the compelling sanctions of war are present; to rebuild an apparatus of control now would be unwelcome and conceivably unsuccessful. To direct labour into defence jobs is obviously even further from the Government's mind, but it can have little confidence that its renewed appeals for restraint in wage claims will carry much weight.

All experience since the war has shown how much more easy it is in a fully-occupied economy to generate inflationary pressure than to contain it. The defence programme can either be superimposed on the British economy, which has no spare capacity or spare labour to meet it, or room can be found for it by laying aside temporarily other desirable but less important things. The Government's present mood suggests that it is prepared for the first course of action—that it remains optimistic, despite evidence to the contrary, that rising productivity will largely meet the rising demands for defence and that it is not disposed to take unpopular steps that would hurt. Yet, at the same time, it realises, perfectly rightly, that defence must hurt, that the standard of life of the people will suffer. But it is not prepared to admit that the damage will be far greater if a further dose of inflation is allowed to play havoc with the British economy. In war, a community may be justified in moving to the very brink of inflationary disaster if that is the only price of securing military survival. But these are not conditions of war. Great issues still hang on the ability of Britain to earn its own living in the competitive markets of the world. It would be the utmost folly if this country were to allow itself to be inundated by the inflationary tides that are now flowing throughout the world and add to them a new deluge of its own. By its postulates about the defence programme, the Government would apparently have the country believe that not a single penny of existing expenditures—on consumption, the social services, miscellaneous Government expenditure, housing and other civil investment—can be touched. That has been the stock answer to all demands for retrenchment in the past three years. To persist in it now will be to make sure that the real value of these expenditures and of those for defence is cut by the disorderly and dishonest processes of inflation. If the tasks of defence are to be speeded to success, a realistic policy of financial retrenchment is imperative now and for several years to come.

NOTICE TO READERS

Wednesday's resumption of work in the printing trade allows us to reach all our readers for the first time in three weeks, though with a smaller paper than we would wish. Next week should see a normal issue of ***The Economist*** and the resumed publication of the ***Records and Statistics*** Supplement.

We are grateful to readers for their forbearance during the printing dispute. Only limited supplies of two emergency issues of ***The Economist*** of September 2nd and 9th could be produced, but additional copies are being prepared and can be ordered from newsagents or from the publisher at 1s. per copy post free.

The Economist, 22 Ryder Street, London, S.W.1.

Groundwork of the Alliance

IN recent weeks American practice has had a way of catching up on European theory. It is not very long ago that officials and publicists on this side of the Atlantic were suggesting, with all the diffidence that a bold proposal seems to demand, that British and French defence plans might appear more confident if the United States were prepared to station more troops in Europe and if an American officer were appointed to command an integrated North Atlantic force. Now, it seems, these decisions have been taken in the United States and at this week's meeting of the Atlantic Council the powers can take full American participation in European defence as the starting point, not the aim, of their discussions. There can be no question now of European prodding and of a reluctant American response. On some issues, American military thinking has already far outstripped European plans. President Truman is now talking of nearly 3,000,000 men in the armed forces and of annual military expenditure of some $30 billions. If a fear of American half-heartedness has held back anyone in Europe, that excuse has vanished. It is the Americans who now set the pace.

In one field, at least, the pace may be a little too hot for Europe. Reports from Washington suggest that the United States Government is now prepared to consider a limited rearming of Germany, say, to the extent of ten divisions and to propose that such a force should be built up within a general North Atlantic Command. Additional safeguards would lie in supplying the weapons from elsewhere and in forbidding it a separate military staff, but it would be an army, not a disguised police force. The British and French Governments are not now so concerned with the ideological objections as once they were, but they both have in mind the strong practical drawback that if arms for the new force are not to be manufactured in Germany—and everyone agrees on the unwisdom of such a development—they will have to come off someone else's quota. So long as the absolute amount of arms available to Europe is insufficient, there is no point in creating new claimants for them. The European allies, therefore, prefer to strengthen the German police force as an immediate measure, and to leave the question of a German army until the rest of Europe is better armed.

This division of opinion upon the armament of Germany is likely to be one of the few differences on the Atlantic Council's agenda. It is, indeed, little short of astonishing to observe the speed with which a concept of a common integrated Atlantic strategy has become a commonplace in the west. But if the thinking on military matters has been on the whole speedy, clear and united, no such unity has yet been reached on the difficult economic issues which the aim of an integrated defence effort is already raising. Some points are reasonably well agreed—for instance that nations shall be required to make a defence contribution of roughly the same proportion of their means—but on a number of vital questions, allied thinking still seems very imprecise. To what extent, for instance, should the necessity of defence be allowed positively to interfere with the achievement of economic recovery and independence? Much of European policy, and especially of British policy, is still framed with the idea of reducing dependence upon the dollar area and building up non-dollar markets and sources of trade. In particular, a stream of official documents has pointed out that western Europe cannot be economically independent without trading with eastern Europe. Yet the effect of an accelerated defence programme must be to reduce European exports and, in particular, American pressure is directed towards preventing practically all exports to the Soviet Union and its satellites. How then, are these conflicting aims to be solved? There is no easy line such as is imposed by total war. An area of "normal" economy is presumably to continue alongside the defence effort and, indeed, the continuance of Marshall aid proves that the Americans are anxious for both recovery and defence to be pursued simultaneously. Yet unless a much clearer balance is achieved between the two, either the Europeans will succumb to the temptation of still giving recovery too high a priority—British plans appear to be based on such a calculation—or the Americans may push their European allies to the point where economic warfare and siege economics put an end even to a limited area of normal commerce. This is certainly the danger in Anglo-Soviet trade.

Once the scale of the defence effort needed from the European powers has been roughly established, new problems arise. How quickly, for instance, can some central machinery be set up to secure a rational allocation of the raw materials essential both to rearmament and to strategic stock piling? The world is witnessing at the moment a helterskelter grab for essential materials which is sending up price levels in a headlong rush

towards inflation. The prices of tin, rubber, wool, scrap, iron ore, and non-ferrous metals have all reached new records and although the dollars that are flowing out into the world are easing the dollar problem of such areas as the Commonwealth and the sterling area, they are doing so at the cost of an increasingly dangerous inflation of world prices. Moreover, the fact that the United States is in many cases the purchaser makes it more difficult for the European allies to plan their own contribution to defence. It is, for instance, not much use declaring that Germany's extra effort shall consist of 3,000,000 tons of steel, if scrap and iron ore are virtually unobtainable by any European producer. A restoration of the wartime Combined Boards, suitably widened to include the Atlantic alliance, or a very great strengthening of the production and resources committee set up under the Atlantic Council would seem an essential measure to bring some order into the present scramble for supplies.

Yet even if a strong machine is established to allocate scarce materials according to some general plan of production, the problem of financing this integrated effort remains to be solved. The procedure of the last war whereby a rough effort of book-keeping was made both by Britain and the United States and a general settlement postponed until the end of the conflict does not seem entirely applicable to a situation in which all partners hope there will be no conflict and are prepared for a long and sustained effort of defence. The solution lies perhaps in agreeing that, provided each government contributes a share to defence which its allies believe adequate, the money sign should be removed entirely from all expenditure they incur with each other as a result of the defence effort—for instance, by deliveries of munitions or by work done at home for armies from another country. This is the underlying thesis of the American Military Aid Programme and other nations might provide each other with similar facilities. The line is clearly extremely difficult to draw and if the United States were to apply the rule to all its stock piling and strategic purchases, the world's dollar famine would return at once. But it should be possible to work out some sort of agreement which recognises the exceptional financial position of the United States and ensures that finance shall not become an obstacle to the best possible deployment of the allied effort.

In all these problems, it is clear that no single remedy is sufficient to provide solutions to an incredibly complicated set of economic conundrums. What the Atlantic powers need is not so much a hard and fast plan as effective machinery through which constant adjustment and negotiation can continue. At present they would seem to have too much machinery of too dispersed and even contradictory a kind. The first task of the Atlantic Powers at their Council this week might well be to give themselves the administrative structure they need to carry on with the job.

A Question of Evidence

SINCE Russia's return to the Security Council its delegate, Mr Malik, has ceaselessly reiterated the allegation, which for all Communists is a sacrosanct dogma, that the present war in the Far East began with a South Korean attack on North Korea at the instigation of the United States. Sir Gladwyn Jebb quite rightly pointed out at one stage of the proceedings that the Security Council had been listening for nine sittings to a demonstration of the Goebbels' technique, which is to persist in a big lie in the belief that if it is heard often enough it will be believed. The whole Soviet case, Sir Gladwyn said, was based on a "gigantic falsehood."

It may seem strange that Mr Malik should think that there are still people outside the Communist camp ready to listen and believe; but the explanation is quite simple. It is that the vast majority of people have never read or heard of the evidence that shows who started the Korean war. The documents in the case are the reports of the United Nations Commission on Korea (UNCOK) and of its military observers, sent in immediately after the outbreak of the fighting. One would have thought that they would have provided a first-class news story for the British daily press; but they were virtually ignored until they were published in the *Manchester Guardian*. Consequently the kind of person who is anti-American on principle, and the person who dislikes having his mind made up for him without seeing the evidence on which his Government is acting, as well as the Communists and fellow-travellers who must take the party line, have gone on saying or thinking that the American action in Korea is "intervention" and that all the talk about the United Nations opposing aggression is nonsense. The vast majority of people in the free world are content to believe that the Security Council would not have acted as it did on insufficient evidence, and that the campaign has proved long and careful preparation by the North Koreans; but such a conviction is somewhat less than is desirable to inspire the effort now called for by their governments. They should have been able to read them in their newspapers at the earliest possible moment or at least to have them issued in a White Paper now.

Instead, they have been invited to buy and read such pamphlets as that produced early in July—with remarkable speed—by Mr D. N. Pritt, KC, in which he sought to prove the Communist thesis that South Korea had started the war. With a trained lawyer's instinct for a weak point in his opponent's case, he attacked the Security Council for being "stampeded" into passing a resolution condemning North Korea without, as he alleged, having any evidence before it to sustain the view that the North Koreans were the aggressors. He claimed that UNCOK had only passed on what the South Korean Government had told it about the outbreak, and that it was on "this scrap of hearsay evidence from one vitally interested party" that the Security Council majority, consisting of "that part of the world (already little more than half) which the United States seeks to enlist on its side of the not-so-cold war," took its "irresponsible, baseless, illegal decision."

Mr Pritt has been able to get away with the statement that UNCOK had transmitted no testimony except allegations made by the South Korean Government. The UNCOK reports, however, show this statement to be entirely erroneous. UNCOK military observers made a field trip along the South Korean side of the 38th parallel—they were not, of course, permitted to enter North Korea—between June 9th and June 24th, that is to say, during the two weeks before the attack was made. They reported that "South Korea army is

organised entirely for defence and is no condition to carry out attack on large scale against forces of North." Supporting paragraphs of the report contained the following evidence:

> South Korean army in all sectors is disposed in depth. Parallel is guarded on southern side by small bodies. Troops located in scattered outposts together with roving patrol. There is no concentration of troops and no massing for attack visible at any point. . . . So far as equipment of South Korean forces concerned, in absence of armour, air support and heavy artillery, any action with object of invasion would, by any military standards, be impossible . . . no sign of any dumping of supplies or ammunition, petrol, oil, lubricant in forward areas . . . no concentration transport anywhere encountered . . . no indication of any extensive reconnaissance being carried out northward by South Korea army or of any undue excitement or activity at divisional headquarters or regimental levels. . . .

Nothing could be more clear and definite than this. It may, of course, be argued that the report from which these passages are quoted is dated June 24th, and that the real question is whether the Uno Commission had any concrete evidence before it when it recommended action by the Security Council. It is clear that it had. A message dated June 26th, the day after the invasion, says:

> Commission . . . considered latest reports on hostilities and results direct observation along parallel by UNCOK Military Observers over period ending 48 hours before hostilities began. Commission's present view on basis this evidence, first, that judging from actual progress of operation Northern regime is carrying out well-planned concerted and full-scale invasion of South Korea; second that South Korean forces were deployed on wholly defensive basis in all sectors of parallel, and, third, that they were taken completely by surprise as they had no reason to believe from intelligence sources that invasion was imminent.

This is not, and could not be, eye-witness evidence; indeed, it would be very difficult to go to the scene of fighting after an aggression has started and decide on the spot which side had begun it. The North Koreans would not have co-operated with a Commission they refused to recognise. But it is expert evidence that will be rejected only by those who maintain—as Mr Pritt does not—either that the UNCOK members were in the pay of the Americans or that the South Koreans switched from defensive to offensive dispositions in 48 hours. It will convince any open-minded person.

That this evidence should not have been officially published in this country is a serious omission on the part of the Government. The crisis which it illuminates is being used as the spur to an effort of rearmament and possibly further sacrifices that may be demanded. The public should be regarded not just as willing horses but as thinking citizens who like to see the evidence on which great national decisions are based. After the Berlin crisis had been discussed with Mr Molotov in Moscow two years ago, the Foreign Office composed and published an admirable White Paper on the whole negotiations. It is still not too late to do something of the kind on Korea. For there must be much fresh, eye-witness evidence from North Korean prisoners and from South Korean commanders of just how, when and where the attack began, of the guerrilla organisation that had been set up in South Korea and of the caches of arms that had been prepared. It would be best if a specially appointed body were appointed by the United Nations to sift and present this evidence, which will otherwise be pigeon-holed in the American War Department. Failing that, the British Government should take its own steps to provide the documents in the case.

September

There is nothing morbid or depressing about making sensible provision for your family or friends under your will, and you will feel glad when you have done so. The Manager of any branch of the Midland Bank will readily arrange for you to meet a friendly official of the Bank's Executor and Trustee Company, and by appointing the Company you will ensure that your executor is always available.

EXECUTOR AND TRUSTEE COMPANY LIMITED

NOTES OF THE WEEK

A Great Man

The death of Jan Christiaan Smuts at his home last Monday marked not only the passing of a great man but also the end of an era. For General Smuts was the last active participant in the great experiment in liberal imperialism which was launched at the beginning of the century, the last of the elder statesmen who put into practice a theory of Commonwealth relations which has held the British Empire together by ties looser than those which have ever before in human history preserved the unity of a great empire. His death inevitably creates a nostalgic longing for the less complicated relationships of the earlier years of the Commonwealth and for a confident restatement of the liberal policies which Campbell-Bannerman initiated and which General Smuts so strenuously practised.

As a statesman, General Smuts had no equal among his contemporaries. His breadth of vision made pygmies of his colleagues, and his achievements in the half century during which he played a dominant role in world affairs rank among the outstanding events of history. The union of the South African republics, the idea of liberal imperialism, the foundation of the League of Nations, the drawing up of the Statute of Westminster, and even to some extent the foundation of the United Nations, were all largely his work. Yet it was his tragedy to be so far ahead of his time that none of the grand designs upon which he embarked was altogether successful. The union of the South African republics which was primarily intended to bring British and Boers together in lasting friendship only postponed racial antagonisms which have latterly become worse. The League of Nations failed to prevent war. The principles of liberal imperialism are being endangered in General Smuts's own country. The United Nations has been divided by the schism between Communists and the western powers. He cannot be blamed for what others have made of his ideas—he was for the most part surrounded by lesser men—but it is a measure of his stature that in spite of such failures or partial failures he remained, universally acknowledged, one of the great figures in the civilised world.

As a politician in the narrow orbit of South African affairs, General Smuts had many weaknesses. He lacked tact and he was never at ease with, say, a delegation of Platteland farmers. Nor was he ever able to suffer fools gladly. The result was that although he could persuade whole nations to support and carry out his ideas, he only occasionally succeeded in leading his fellow countrymen, particularly the Afrikaans-speaking section, along the paths he knew they ought to take. On racial questions, although he tried hard to promote the development of the Bantu, he was perpetually handicapped by the fear of losing the few votes which were all that ever stood between him and his Nationalist opponents. Indeed, he spent almost more time out of office than in power—to the benefit of the world at large, but to the loss of his fellow South Africans.

As an individual, he never allowed the frustrations of public affairs to interfere with his private life. He was singularly happy in his marriage, and he had an unbounded zest for knowledge which kept him busy and contented all through his life. He never quite lost his awkwardness with strangers, but to his close friends who knew him at his pleasant home at Irene he was one of the most lovable of men.

* * *

Marshall Returns

To all the peoples of the free world, the return of General Marshall to office as Secretary of Defence has come as a profound relief and a profound encouragement. Too often in the course of 1950 it has seemed that forces of dissension and unreason were undermining the moral authority of the United States and at times, Mr Acheson, whose temperate conduct of American policy has been one of the cements of the Grand Alliance has seemed to stand alone, surrounded by critics and enemies and under constant pressure from those who sought to plunge the United States into expensive follies in Asia and even into the supreme folly of preventive war.

General Marshall will not only bring his own great experience and wisdom to the post of Secretary of Defence. He will immensely reinforce Mr Acheson's struggle against the extremists. His knowledge of the realities in China is unrivalled and, as chief architect of the Marshall Plan, he knows that Communism is countered more forcefully by imagination and positive action than by fear, isolationism and panic witchhunts. Once again, American defence policy and foreign policy will advance in step and both will follow the path of wisdom and restraint.

* * *

Obstinacy on Steel

Events have forced the Government and the Opposition so close together in matters of foreign policy and defence that the Government seems to have become alarmed and to have decided that a strictly party gesture was needed in order to console its more depressed or restive members. It is hard to explain on any other ground the announcement on Thursday of the intention to implement the Iron and Steel Act in the shortest possible time. The arguments of commonsense and expediency against going ahead with the nationalisation of iron and steel have never been stronger than at this moment, and if the Government could not bring itself to compromise, a postponement was still within its power. It has been apparent that there would be great difficulty in getting suitable men to serve on the board of the Iron and Steel Corporation until the political outlook was more settled ; but if proof were needed the names that Mr Strauss announced supply it. Of the full-time members only the deputy chairman, Sir John Green, has any visible connection with the steel industry; his connection is a directorship of the relatively small specialist Sheffield firm of Thomas Firth and John Brown. His chief is to be Mr S. J. L. Hardie, the present chairman of the British Oxygen Company. Sir Vaughan Berry was a good commissioner in Hamburg until he was side-tracked into his present melancholy post on the Ruhr Authority. General Sir James Steele is the present Adjutant-General. Even the inevitable trade union official, Mr W. H. Stokes, comes from a union not very closely connected with iron and steel production, the Amalgamated Engineering Union. The part-time members are Mr J. W. Garton (a director of Brown Bayleys Steel Works) and Mr R. A. Maclean. It is hard to imagine this board wielding dynamic leadership or indeed influencing in any perceptible way the network of great undertakings of which it is to be given the control. What can the Government's purpose have been, if not to stir up a party fight at all costs ? The terms of the motion tabled by Mr Churchill which will be debated next Tuesday suggest that the purpose will be fulfilled.

*

On the main question of the rearmament programme the special session of parliament has produced very little political dispute. This is not because the programme is regarded by members as an ideal programme, but as the only one that is practicable in the present circumstances. Since there are now no Communists in the House, opposition has come only from the half dozen or so pacifists, and that in no very coherent or united form, and from the curious Mr S. O. Davies who rests his case on his view that the invasion of Korea was started by the South against the North. The government had the best of the debate throughout its course. The Conservatives are in a difficult position. Mr Churchill was concerned to make it quite clear that his party supports the government's rearmament measures in principle, and was therefore forced to confine his criticism to technical issues and to a general charge of maladministration of defence The quietness of the Conservative opposition is in part due to the sense of a general opinion in the country, among Conservative as well as Labour supporters, that the Labour party is better able to carry through a rearmament programme without finding itself in grave industrial difficulties, and that the chances of avoiding a war are better under the leadership of Mr Attlee than of Mr Churchill, deeply as the latter is respected as a war leader. Perhaps the most significant back bench contribution was that of Lord Hinchingbrooke, which with its note of restraint and reasonable optimism may well have been a warning to the more belligerent and hot-headed members of his own party.

* * *

Wages and the TUC

The action of the Trade Union Congress, in rejecting last week the report of its General Council on wages and adopting a resolution condemning wage restraint and demanding the statutory control of profits, was not wholly unexpected. The policy of restraint received overwhelming support at the 1949 Congress—before devaluation—but was approved by only a narrow margin at a delegate conference in January ; since then the General Council itself has been steadily modifying its conception of the policy. In any case, there are outstanding wage claims, covering more than the number of workers on whose behalf the policy was rejected, which would be pressed whether the vote had gone in favour of wage restraint or not. The voting for and against was an expression, not of patriotism against subversion, but of different calculations of self-interest. The unions representing skilled and semi-skilled labour voted against the official policy. The general unions voted in favour of it, feeling, perhaps, that it is in a period of wage restraint that their efforts to improve the relative position of the lower-paid workers whom they represent have the best chance of success.

What makes the incident depressing is not so much the course of the voting as the flabbiness of the speeches of leaders in the trade union movement who stand for moderation and restraint. Although the arguments put forward by advocates of higher wages and lower profits were naive in the extreme, it is not surprising that they carried the day, since the speeches of the president (Mr Bullock), the general secretary (Sir Vincent Tewson), Mr Arthur Deakin and other members of the General Council show that, for the moment, that body is either entirely bankrupt of ideas or lacks the elementary courage to advocate any rational control over the course of wages. To say that the leaders are bound by the opinion of their rank and file or the earlier decision of individual conferences, is merely to beg the question, since there are very few unions whose members do not take their ideas primarily from the men whom they choose as their paid and permanent representatives.

* * *

Steps Towards Realism

On questions other than wage restraint the Congress showed a considerable advance in enlightenment and realism. A motion demanding the ending of compulsory arbitration was defeated by over two and a quarter million votes, in spite of the persuasive advocacy of Mr J. B. Figgins, of the National Union of Railwaymen. Perhaps no less surprising than the strength of the vote for its continuance was the spectacle of Mr Arthur Horner criticising the National Arbitration Tribunal for the opportunity it gave to malcontents to by-pass the reference tribunal of the mining industry. In the debate on foreign policy only the Communists opposed the action of the United Nations in Korea, and the votes cast against the General Council's supplementary report on the subject were derived almost solely from the unions under Communist control.

By far the most interesting speech of the Congress came, not from a delegate, but from the late secretary of the TUC, Lord Citrine, now chairman of the British Electricity Authority. It was a dispassionate review, from an advocate of nationalisation, of the difficulties and potentialities of nationalisation, the speech of a man who has left the realm of golden ideas for the dusty arena of administration. The quality of Lord Citrine's address was a reminder of the drainage of leadership to which the trade union movement is exposed through the elevation of many of its abler men to public office. A perception of this may have accounted for the weakness of the support for a motion demanding that a third of the membership of the public boards should be drawn from trade union representatives.

* * *

Diplomatic Disunity

One of the most needed reforms in inter-allied procedure would seem at present to be the postponement of the annual session of the General Assembly, together with the meeting of the Atlantic Council which now precedes it, to December or January. September has become a great month for conferences and committees and attempts to hammer out agreed allied policies. Yet it is a month when American diplomacy is, of necessity, at its most rigid and uncompromising. President and Congress have a wary eye on November and its elections and large international issues which involve the fate of states and nations may be decided on the most local calculation of electoral interest.

This year is proving no exception. Twenty-four hours before Mr Bevin and M. Schuman were due to arrive in New York for discussions of great delicacy on such issues as the representation of China in the United Nations and the rearming of Germany, Mr Acheson secured the unanimous support of Congress for the Administration's policy by specifically pledging himself to the rearming of Germany and the support of the Chinese Nationalist regime. No one will wish to minimise Mr Acheson's difficulties in securing undivided approval from a very divided Congress and public opinion nor to underestimate the importance of whole-hearted domestic support for American foreign policy, but the United States is now the centre—and leader—of a great alliance and unanimity between allies is becoming as necessary as unanimity at home. It is difficult to see how, in the present situation, anything like an agreed strategy can emerge and no one can draw any comfort from that fact save the men in the Kremlin.

* * *

Manchurian Incident

The issue of Chinese representation is likely to dog every discussion of the crucial issue of Korea either in the Security Council or the General Assembly. For instance, in the last fortnight, the fact that China is Korea's immediate neighbour has been brought home dramatically to world opinion by the question of an American bomber's alleged trespass across the Korean frontier. The Security Council has agreed to consider the Peking Government's complaint that American aircraft violated the Korea-Manchuria frontier and inflicted damage on Manchurian territory. The Americans have asked that an impartial commission of inquiry conducted by Sweden and India should be sent to examine the charges on the spot and have placed a sum of money with the Secretary-General to cover any damage, should the fact of damage be established. The Peking Government, however, has asked to be heard by the Security

Council and, quite apart from any wider issue of legality, its agreement is clearly necessary if safe conducts are to be granted to any United Nations Commission proceeding to Manchuria.

It was, therefore, disconcerting to find the American delegate on the Security Council giving his vote against the proposal that a representative of Peking should be heard in the Security Council when the Manchurian incident is discussed. The proposal was, in fact, lost by one vote, for although six members, including Britain and France, voted for the invitation and two abstained, Nationalist China, Cuba and the United States voted against, and thus the necessary seven votes were not secured. The United States may regard the arrival of a representative from Peking as an admission of Communist China to the United Nations "by the back door." It is also possible to feel genuine hesitations about the willingness of Communist China, if admitted to the United Nations, to fulfil the obligations of the Charter. These facts have to be weighed in the balance against the growing isolation of the United States in its support of the Chinese Nationalists. Yet it is equally important that the policy of a Great Power should not be made to appear ludicrous, and this in fact is what is happening in the Security Council. The Americans cannot fail to see that their proposal for an impartial inquiry "on the spot" must involve the readiness of Peking, which is in control "on the spot," to accept such a Commission. Thus to vote *for* an inquiry and *against* a hearing of the Peking representative is plainly contrary to good sense, and such contradictions can only undermine the prestige of the Government responsible for them. The matter of the inquiry has, however, now reached deadlock, since the Russians have vetoed the sending of any commission.

Government Expenditure

The cry for cheap government is one which has been so pertinaciously raised for the last two years, it is supported by so active and energetic a party of politicians; it finds naturally such a ready welcome in the popular mind; it comprises so indisputable a nucleus of truth surrounded by such a vast nebula of plausibility; that it becomes necessary seriously and fully to examine what cheap government really is. In public as in private affairs there is a true and a false, a genuine and a counterfeit, a shortsighted and a comprehensive, economy. There is a spirit of shallow, ungenerous, and niggard parsimony, which looks only to the cost of the public service, and not to the mode in which that service is performed; which considers an official salary as excessive if any fairly competent individual could be found to undertake the duty for less remuneration; which would put the service of the state on the same footing as the contract for the supply of a workhouse, and have it *done by tender*; which would starve departments that, to be efficient, require to be managed with a liberal, and even an unsparing hand; which, in a word, looks only to present saving, and disregards the future outlay and the ultimate extravagance which injudicious and untimely saving may entail. And there is a wise, sound, and far-sighted economy which is profoundly convinced that in an empire such as ours the best government is the cheapest whatever be its money cost; which is conscious that where millions are at stake, hundreds must often be disregarded; that expenditure may often be cheaper than saving; that, in fine, it is wise, necessary, and economical for the state to secure the services of its ablest citizens, and to keep every department of the public service in the highest and most perfect efficiency, whatever be the expenditure requisite for these purposes.

Can the United Nations Work?

As the nations prepare for the opening of the General Assembly of the United Nations their leaders have to grapple with a difficult and contradictory situation. On the one hand, it is clear that the prestige of the United Nations, as an instrument of effective international policy, has been tremendously enhanced by the United Nations' action in Korea. The rallying of world opinion to the American initiative has shown that the divisions between Asiatic and western opinion, between the powerful and the weak, between great powers and small, can be overcome within an international organisation which safeguards the essential principle of equality. Yet at the same time, Russia's return to the Security Council makes it certain that nothing but frustration can lie ahead of the United Nations so long as the Security Council is its chief instrument of policy and responsibility.

The view is now being canvassed that a solution can be found by enhancing the role of the General Assembly. It is true that it lacks the specific powers allotted to the Security Council by the Charter, but it represents world opinion in the fullest measure and its resolutions, if passed by a large majority, would carry immense moral weight and would give the full backing of world opinion to any government that took action in accordance with any such resolution. The difficulty that the General Assembly is only irregularly in session could be overcome by extending the experiment of the "Little Assembly"—a committee elected by the Assembly to act as a watchdog between meetings—and by electing a permanent Council of the Assembly composed of all member nations and sitting alongside the Security Council in constant session.

Northern Ireland Asks for More

Northern Ireland (*writes our Belfast correspondent*) has not succeeded in achieving the same degree of full employment as the rest of the United Kingdom. Its distance from markets and sources of raw materials makes it difficult to attract new industries, and tends to make the products of those already established uncompetitive with those in England and Wales. Industry and agriculture are thriving at present, yet the percentage of unemployment in Northern Ireland is between five and six as against 2.5 for northern England and 3.4 for Wales. The rate of industrial expansion is not sufficient to melt the hard core of unemployment, let alone absorb the 2,000 recruits to the labour force who arrive annually in search of work. The Northern Ireland government has concentrated upon the diversification of industry since the war, but has met with only partial success.

With the ending of the sellers' market the question of transport charges has become vitally important to both the old and the new industries. The Northern Ireland government has submitted to Whitehall a case for the subsidising of freight to and from Britain, and there is also some pressure for extending the system of "postalisation" whereby United Kingdom consumers as a whole bear the transport charges. This system already applies to steel and petrol, but not to coal for which the Northern Ireland price is 20s. to 30s. per ton above that at the pit head. On the other hand, many people hold that instead of trying to palliate Ulster's natural disadvantages, it would be sounder to exploit to the full its sole raw material—agricultural produce—to slaughter livestock at present shipped to Britain on the hoof and to develop the industries ancillary to livestock and other agricultural production. The success of such a programme would depend upon a cheap and efficient system of not of external but inland transport, and this in turn would entail reforming the internal road and rail services. At present the Great Northern Railway loses £350,000 annually on its services in Northern Ireland, and the operation of the Government's own subsidiary, the Ulster Transport Authority, constitutes a continuous drain on the economy. Co-operation, even joint planning, in this sphere with the Republic of Ireland would pay dividends, economic as well as political.

Economic Rents in Pimlico

Westminster City Council is among the first of the large urban authorities to face the storm which follows inevitably upon the decision to charge economic rents for postwar dwellings. Their new arrangements go into full operation on October 2nd and they have already met with opposition from the tenants. This is hardly surprising, for neither national nor local propaganda has done anything to bring home to the public the formidable cost of municipal housing at postwar costs of construction.

The Westminster Council's scheme lays down a minimum and a maximum rent—the latter representing the economic rent without subsidy. The present subsidies are to be administered not on all rents but as rent rebates, and the rebate will be calculated to ensure that above the minimum no tenant shall pay more than one-sixth of his income as rent (with certain allowances). The rebate therefore operates between the minimum and maximum rents, and as can be seen from the table below, the minimum is not low and the maximum or economic rent is very high.

Type of Accommodation	Fixed Charges unaffected by Rebate Weekly		Including Fixed Charges		
	Rates	Central Heating & Hot Water	Existing Rent	Proposed Minimum Rent	Proposed Maximum Rent
	s. d.	s. d.	s. d.	s. d.	s. d.
3-room	4 11	8 0	36 11	31 11	68 5
4-room	5 10	9 5	43 9	37 3	81 9

The tenants have sent a delegation to express their objections. Their case is grounded on two points: first, that the economic or maximum rent is more than they can afford, and secondly, that a rent rebate scheme involves a means test. Both these objections are understandable enough. But they do not meet the economic objection that the cost of housing has risen far beyond the capacity of local authorities to cushion the rise, nor the social objection to providing subsidies from the pockets of the less prosperous and ill housed for the better off and better housed. If it is found that there are too few tenants who can afford the economic rents to release a sufficient subsidy for the rent rebate scheme this may stimulate a healthy interest in reducing costs. The fate of the Westminster scheme will be watched with interest by the many other local authorities who are faced with the same problem.

Tito and the West

The visit of a delegation from the British Labour Party to Jugoslavia, at the invitation of Marshal Tito, may show that he is at least considering the expediency of departing a little way from his policy of rigid neutrality in the quarrel between the Soviet Union and the western world. He can, indeed, hardly hope to maintain his present isolated position indefinitely. Across his frontiers the Soviet satellites wage their war of nerves with unabated enthusiasm; at home economic troubles accumulate and the standard of living—already very low—can only be maintained with the greatest difficulty. The three members of the Croat Communist Party who have just been expelled from the party and dismissed from their posts in the Government for sabotaging the five-year plan in the interests of the Cominform may or may not really be Cominform agents. But their disgrace does, at any rate, provide a convenient excuse for some of the country's economic difficulties. Marshal Tito cannot hope to realise the ambitious plans for the industrialisation of the Jugoslav economy to which he has committed all the country's resources and manpower, without further financial assistance from abroad. The Export-Import Bank has recently granted Jugoslavia a loan of $15 million (in addition to the $40 million already granted) and the Bonn Government has agreed to loan $30 million within the framework of a bilateral trade agreement. But neither loan is as large as the Jugoslavs hoped it would be. It is, therefore, probable that Marshal Tito's invitation to the Labour Party was prompted more by the urgent need for more economic aid than by a real desire for a political rapprochement. All the same, it is encouraging to find that a Communist Party which has irretrievably burned its boats with the Soviet Union can overcome any inhibitions it may have against the representatives of those western democrats who are so continually reviled by the Cominform as "traitors of the working class."

How far the Jugoslav overtures to the west will go beyond a display of friendly hospitality remains to be seen. Jugoslav relations with Greece and Italy are still very far from the more cordial understanding the British and United States Governments would like to see introduced. Although the Jugoslav Foreign Minister, Mr Kardelj, has blamed the "Cominform chiefs" and the "hegemonist policy of a foreign country" for the Korean war, he has failed to come down fairly and squarely on the side of the west. On the contrary, he said that his Government considered it best to continue the policy which it has so far pursued in the Security Council debates on Korea and which, in western eyes, cannot fail to appear equivocal. Such a policy will not win much sympathy for the Jugoslavs in the west. But they may perhaps feel that any obvious and open move into the western camp would dangerously weaken their position at home.

Shorter Notes

Owing to a copying error in an office other than our own, the table given in an article on the toy industry in *The Economist* of August 12th, page 302, was incorrect. The difference is not material; but for the sake of accuracy the corrected figures are given below.

BRITISH TOY EXPORTS, YEAR ENDED APRIL 30, 1950
(£'000)

	As in *The Economist*, August 12th		Corrected Figures	
	Exported	Total Output	Exported	Total Output
Dolls	296	1,221	384	2,364
Soft, wooden, metal & plastic toys	3,051	14,631	3,051	14,631
Indoor games and other toys	698	5,500	906	5,578
TOTALS	4,045	21,352	4,341	22,573

*

The Institute of Municipal Treasurers and Accountants and the Society of County Treasurers perform a most useful service in analysing local government financial statistics. Their latest analyses of educational statistics, the first of a new series, show among other things the average cost per pupil per annum.

Year Ending March, 1949	English Counties	London County Council	County Boroughs
	£	£	£
Primary schools	20·02	24·31	18·51
Maintained secondary schools	33·90	37·71	32·19

Of this expenditure 69 per cent in primary schools, and 66 per cent in secondary schools is spent on teachers' salaries.

Letters to the Editor

Democracy in the Works

Sir,—Your article "Democracy in the Works" of August 26th blames the lack of positive virtues in "Industrial Democracy" on the employers who have "failed to ensure . . . the new type of leadership" required to take the place of the old type of foremanship. In this there is some truth; but to suggest that "the first step towards improving labour relations . . . is to improve the standard of foreman" is unfair to management, workers and, not least, to foremen. The root of the malady lies much deeper.

Where employers and employees become grouped in large Unions and Federations with controls, procedures, committees, experts, etc., piled in rival pyramids, discussions vitally affecting the "factory floor" take place in a stratosphere from which not only foremen, but junior managers and even managers of works are inevitably excluded. How then can these be expected, however well trained, to become the dynamic force for practical good which your article envisages? Concentrate as you will on one minor section of its anatomy, the foreman, you will never get the vital spark into the body of industrial democracy until its two main organs, employer and employee, are given the chance to have at least one major common object. In a comparatively uninhibited capitalist system the prosperity of the individual firm, with dividends and wages both linked to profits, provides an effective common urge. In war (and in some countries in peace) fear is the common spur. In the Socialist welfare state "duty to one's neighbour" is proposed as the prime mover—but, alas, how little it moves.

Get back to the fundamental concept of master and servant (which is not so dead or outmoded as your article suggests), reinforce the "moral conscience" of employers with such legal safeguards as may be necessary, and then allow both parties to "do what comes naturally." Real dynamic co-operation is much more likely to be borne in such an atmosphere than in the make-believe world of the industrial democrat.—Yours faithfully,

EMPLOYER.

Sir,—I agree with the general survey of "Democracy in the Works" which you have recently published; the trouble lies, as your contributor has indicated, in the application of this generally accepted ideal. Neither 'side' in industry has any real wish to return to the old set-up, but there is no clear guidance for the future, at least so far as greater productivity allied with democracy is concerned.

It is, I feel, very largely a matter of a "change of heart" on the part of all, whether management or managed, and until there is a general recognition of this one may expect industrial democracy to remain in the doldrums, the object of a tolerant benevolence and nothing more. The key point lies in the frame of mind of the lower ranks of management, the supervisors, foremen and charge-hands, whose job is to interpret top-level decisions to the men at the bench. Equally important is naturally the calibre of the men appointed to such positions. Your contributor is, however, a little less than fair in his analysis of their position, as he makes no reference to two organisations which are doing admirable work to fit the 'foreman' for his job. These are the Institute of Industrial Supervisors (mainly educational) and the Association of Supervisory Staffs, Executives and Technicians, a recognised Trade Union for supervisory grades, both of which are doing good work in re-establishing a position for management.

There is another problem to be solved. Although in today's conditions of full employment the 'foreman' is not likely to be demoted except through his own fault, his position in such an eventuality has never yet been clarified. Does the possession of some rank in industrial supervision at bench level—agreed to be a major management function—militate against the man himself? The foreman appointed on the old franchise can return to his craft; the new-style supervisor "with one foot on the management ladder" may find it less easy.—Yours faithfully,

F. J. BLAYNEY THOMAS

Defence Priorities

Sir,—The emphasis in Mr Flower's letter of August 19th on the priority in the defence of Europe of anti-tank weapons in general tends to obscure his special plea for self-propelled anti-tank guns. A self-propelled anti-tank gun may be an imperfect substitute for an armoured tank carrying the same gun, but an ordinary trailer gun, such as may be understood in lists of "anti-tank weapons" without qualification, is not a substitute at all. I write with direct knowledge limited to a single incident but others with less negligible experience have confirmed my belief that not only is an ordinary naked anti-tank gun or even section with forward infantry cold comfort, but that it is not always fair to rely on gunners being brave enough to serve them and take the consequences when a troop of observant-looking enemy tanks appears.

On the general question of single versus dual purpose tanks a layman of the most limited experience, who has, however, seen a section of Shermans annihilated by a few rounds from German Mark IVs, may be allowed to wonder whether the tolerance in the controversy shown by those who have fought in tanks is influenced by the sort of loyalty which used to make sailors, some three decades ago, defend British battleship design. Another surprising feature of the controversy is the lack of reference to the German experience. A single instance (which I have not seen noted in this connection) is the extraordinary freedom from battle casualties of Tigers and Panthers in the Ardennes offensive.—Yours faithfully,

MICHAEL VYVYAN

The Divorce Laws

Sir,—In the recent discussions in the press on divorce problems one matter which was hardly ever mentioned is nullity. In the view of many, what most needs to be widened is not grounds for divorce, but grounds for nullity. There must be hundreds of marriages which, through no fault of either party, are marriages only in name. Impotence of the husband is now legitimate ground for nullity, but there are other cases of physical and psychological difficulty, both of the husband and the wife, which can destroy a marriage and which, though not intentional "cruelty," nevertheless can cause untold suffering. Such cases are surely not beyond medical and legal competence to define. Should there not be some means whereby medically invalid marriages can be honourably annulled without stigma or publicity?—Yours faithfully,

FRANK P. CHAMBERS

A Tax on Man Hours

Sir,—I read your letter of September 3rd entitled "Power and Progress" with joy because it seemed to me that at last Britain had come to a full realisation of what an attempt to raise the British average standard of living involves.

However, if this new way of thinking is to bear full fruit, may I be permitted to make a suggestion? The inelastic factor in an economy is man-hours. The Labour Theory of Value is invalid, but surely a Labour Theory of Cost is to some extent valid? There is a fixed "national income" of man-hours, and it has to be "spent" to the best advantage if the national standard of living is to be raised.

In America, high wages force employers to "spend" man-hours to the best advantage. Wages are so high that employers are compelled to use their workmen as productively as possible by installing the most up-to-date equipment.

We cannot, however, do that in this country because of the danger of inflation. But would it not be possible to tax man-hours? Thus employers would be induced to spend man-hours to the best advantage, and would be compelled by the resultant economic circumstances to instal more modern equipment. Hence the tax would in effect be a tax on inefficiency.—Yours faithfully,

A. J. A. PECK

Books and Publications

On a Wide Canvas

The British Overseas. By C. E. Carrington. *Cambridge University Press.* Illustrated. 1092 pages. 42s.

Mr Carrington has vision and wide knowledge and both were essential for the successful fulfilment of his formidable task. To complain that a book of over a thousand pages is too short may seem in the last degree unreasonable, but it affords at least most convincing evidence of the range and importance of its theme. It is with the British people and not with the historian of their migrations that responsibility for the length of this history lies. The population of rather less than seven million which inhabited the British Isles in Tudor times has multiplied in the course of four centuries to some 140 million, the great majority of whom live far away from the homelands of their forefathers. The chronicle of their deeds of exploration, of conquest, of settlement, of their trading and not least of their missionary enterprises in almost every part of the world—and Mr Carrington does not restrict his survey to the artificial frontiers of Empire—make a fascinating but highly discursive story. To compress the whole of it without sacrifice of colour and illuminating detail into one volume, however long, demands careful selection and a high degree of compression. As it is Mr Carrington has included no account of English attempts at colonisation in Ireland—an important omission as he frankly recognises—and he might with advantage have devoted a good deal more space to an appreciation of the general consequences of this unparalleled dispersal of a people over the face of the globe. Without it the non-specialist reader for whom the book is primarily intended is not unlikely to get lost, albeit happily, among the trees.

The form and content of Mr Carrington's book is determined by his approach, which is that of the older school of political historians. The orderly narrative of events is at once its aim and its outstanding virtue. While the results of recent research are for the most part duly incorporated the outline conforms to the traditional pattern. The great, familiar events are recorded once again but always with a vivid appreciation of their significance.

Nor are the men who made the Empire forgotten. Many names neglected in more academic histories are here justly recalled, while the more famous are given a greater place than is generally fashionable in this dull, determinist age. Here we have again Sir Walter Raleigh, seen through the eyes of a contemporary 'a tall handsome bold man but . . . he was damnable proud'; Warren Hastings who 'never lacked Roman virtue and could forgo ambition with the piety of Cincinnatus' retiring for the last twenty years of his life to the quiet peace of the Worcestershire countryside; Lord Durham leaving Quebec for the last time through crowded streets in which in deep silence every hat was raised in the general grief at his departure; and Cecil Rhodes writing with boyish enthusiasm 'We are the first race in the world and the more of the world we inhabit, the better it is for the human race.'

Mr Carrington is too balanced to subscribe even to Rhodes' exalted racialism. But he, too, unmistakably shares the prejudice, or the proper pride, which inspired it. For him the British people had a great mission thrust upon them and on the whole they discharged it faithfully and with a high sense of duty. His admiration in earlier times is for the younger son of parsonage and manor house, later for the adventurous middle classes who moved, and still move, around the Commonwealth as much at home in Capetown or Toronto or Auckland as in London. He is restrained in his criticisms of the darker side of the Empire's story though he does not overlook it; but he can hardly conceal his impatience with nationalists in South Africa, in India and in Ireland who preferred, if need be, to run their own show indifferently rather than to have the British continue to do it well for them.

Mr Carrington recognises, not without nostalgic regret, that whatever the future may hold for the British peoples, their great period of expansion overseas would seem to have ended. For the post-Statute of Westminster Commonwealth —'Ramsay Macdonald's Statute of Westminster' as in one place he oddly terms it—he has a flagging enthusiasm and perhaps it is not reasonable to expect the historian of the British people overseas to rejoice in the successive transformation of British Empire into British Commonwealth and then into a Commonwealth that is no longer predominantly British at all. He has told his story with the warmth and the richness it deserved. Its strange sequel is still unfolding though even now one can say with assurance that its character will be determined by something that is implicit in almost every page of Mr Carrington's book—the essential unity of the English-speaking world.

The Traveller's Guide

The Middle East. A Political and Economic Survey. *Royal Institute of International Affairs.* 496 pages. 35s.

Few parts of the world have been so widely "written about" as the Middle East, but never before has there appeared anything as complete and as exhaustive as this latest Chatham House publication, which will clearly become the standard work of reference on the whole or any of the many component parts of the Middle East for many years to come. Every student of the Middle East, all serious-minded travellers, many diplomats and business people will find it a fount of information, objectively approached, sedately written, and accurate. If it is not entirely up to date in all respects, such a venture would have been well-nigh unattainable in a book which has taken five years to compile. It is questionable whether anyone but a student requires quite so much historical detail, which he could obtain from more scholarly sources, but, on the other hand, if this is to be—as it obviously is—the one authoritative guide to the whole of the Middle East, means should be found of keeping it up to date, by the publication, say, of half-yearly addenda.

Most of the writers, (there are two notable exceptions) are the last survivors (in time, not in age) of the class of Englishman and Englishwoman which settled in the Arab countries during the 19th century and eventually knew not only the history of his particular area, but often the full names of all the sheikhs and many of their more important lieutenants. But the sheikh's importance is gradually receding, tribesmen are migrating to the towns and the beginnings of a new, and far less glamorous, middle class are to be seen. It is this class that will one day wield the power—but it is not a very interesting phenomenon and few writers seem to have studied it at all carefully.

An effort to assess the essential nature and scope of the trades union movement in the Middle East, or at least to have compiled a list of the various groups and unions and indicated their affiliations, relations with the local Communist parties, etc. would have made a welcome addition. Information on this increasingly important subject is difficult, almost impossible to obtain. It has been studied and reported upon by the Labour section of the British Middle East office, but this information is considered the exclusive property, and presumably the exclusive interest, of His Majesty's Government. Thus the results of lengthy and painstaking research into social conditions in the Middle East are not available to those who most need the information—students, writers, and businessmen.

This excellent work also tends to slide over "growing female unrest" which is in fact discernible in all Moslem countries, not excluding Jordan and Saudi Arabia where the blatant tones of the radio owned by the local café or tribal leader penetrates the harem. In the cities the politically conscious women are generally turning left, and in the large universities of Cairo and Beirut, at least, Communism is rife amongst the girl students.

Perhaps, however, the most serious omission is that of a study of the social reforms to which the Middle East governments are being driven by a few idealists backed by the universal fear of Communism. The rural social centres of Egypt are a beginning which

merit more attention than the two and a half lines given to them on page 172, for they might well be a prototype for similar centres in other Middle Eastern countries.

Finally, the reader is given no clear picture of the difficulties now experienced by the traveller in this area caused by postal and cable censorships, the endless red tape of visa and passport formalities, and the inordinate delays caused by a mixture of xenophobia and sheer inefficiency. Many of the restrictions were imposed during the fighting in Palestine, but a number of them seem to be becoming permanent additions to the amenities of Middle Eastern travel. These criticisms should not detract from the admiration one must feel for a monumental piece of work, nor from the utility it will have for anyone interested in the Middle East.

Temps Retrouvé

Last Essays. By G. M. Young. *Hart Davis.* 288 pages. 9s. 6d.

Mr G. M. Young has come to occupy a very special place of his own in the firmament of English historians. His name does not stand to important volumes of original research like Neale or Powicke or Clapham, nor like G. M. Trevelyan to great works of popular enlightenment. He is rather a researcher into the process and meaning of history, not following the path of Collingwood or Oakeshott in using the philosophical method to extract new meaning from history, but as an inquirer into the quality, the taste and sound of time past and its relation to time present. In his *Portrait of an Age* Mr Young pinned down, as no other book on no other period has so successfully done, that most elusive of butterflies, the atmosphere of Victorian England. Although he has never subsequently attempted a *tour de force* upon the same scale, his volumes of essays have shown him to be preoccupied with the same problem: how to get inside the skin of past ages, how to trace the thread of development which links the present day to the remote past, and how to apply the permanent lessons of English history as an index to the shape which the English society must or should assume in the future.

Most of the essays in this volume are concerned with the same beneficent preoccupation. "Scott and the Historians" traces the influence of Sir Walter in turning the paths of scholars from the arid highway of great events to homelier records, "knowing that the object of history is nothing less than the setting forth of entire culture." There is an admirable outline of the development of political institutions in his essay on "Government." His own particular form of magic is at work in "The Origin of the West Saxon Kingdom" where the reader finds himself transported to Wilton in the 9th century as naturally but as completely as if he had taken a railway journey through time. There is a castigation of Basic English, and a sharp note to Ruskin for never having applied to England the powers of observation which he used abroad. There is also a review of Mr G. M. Trevelyan's recent autobiography which is a model of all that an informative review should not be.

The most important essay in the book is that called "Continuity," which is a powerful plea for a closer and more profound study of the history of ideas. "I must assert," he says, "that the historic view is not an amiable indulgence of human fancy, but a dominant and imperative necessity of thought." The only basis for a federation of western Europe, the Atlantic community or any other association which demands an extension of individual sympathy and understanding, is a closer study of the origin of the ideas and actions of other people and peoples. Mr Young is a Victorian liberal-conservative who, because he knows the strength of the roots of European culture, has greater confidence in the future than most of his contemporaries. It is fortunate that he is a writer of such vitality as to make it almost certain that the title of his volume, "Last Essays," will prove misleading.

Temps Perdu

Manchester Made Them. By Katharine Chorley. *Faber.* 288 pages. 12s. 6d.

"Sometimes it is only when you have lost some good that you begin to understand its quality." For this reason Lady Chorley has described, with care, honesty, and much charm, the society in which she grew up, seeking to recapture for the record the qualities of middle-class life as it was practised by a certain group of prosperous and civilised Manchester people in the early years of the century. She observes today "the near collapse of English middle and professional class civilisation on its qualitative side." Her concern is that something should be preserved from the wreck of a lost art of living—or at the least that the character of the lost art should be perceived so that a changed society may salvage what it can adapt for use under a changed set of social laws.

Beneath the general purpose there is inevitably a personal motive, the impulse to disentangle the threads of memory. Sentiment no doubt has exercised its prerogative of selection and arrangement, deflecting analysis. The Edwardian figures that pass across the hall into the dining-room are somewhat more than life size, as they might be seen from a child's hiding-place over the stairs. Which elements in the serene picture are cold fact, which arise from the mellowness of recollection? That the society she saw in her childhood was only one of a dozen aspects of the Manchester society of the time Lady Chorley concedes; some of the other aspects were cruder and more cruel. The men and women she describes, leaders in affairs and the stand-bys of a score of distinguished voluntary institutions that have given Manchester its character in the world, exercised great influence through private initiative and example, but on the whole they failed to play their due part in the corporate politics of their city. Much in their elaborate code of behaviour could be related directly to a personal and economic security that their class has since ceased fully to enjoy. When the security was undermined the codes may have begun to crumble. But when all is said, it remains that in this commercial society a form of life did flourish that was ordered, civilised, and productive, and the writer's plea that something should yet be learnt from it is a just plea.

Tax Appraisal

Taxes and Economic Incentives. By Lewis H. Kimmel. *Washington, D.C.: The Brookings Institution. London: Faber and Faber.* 217 pages. $2.50.

In recent years British economists and politicians have devoted increasing attention to the disincentive effects of high levels of taxation. It is not always realised, however, that the problem is by no means confined to this country. It has also emerged in the United States, where roughly one quarter of the national income is absorbed by federal, state and local taxation.

This book is a study of the effects of the existing American tax system on economic incentives, designed to serve as a background for the revision of tax policy. The chief types of taxation employed are corporate income taxes, personal income taxes, property taxes, sales taxes, and payroll taxes. Mr Kimmel discusses the incidence of each, and analyses its effects on the incentives to start new businesses, to expand existing businesses, to invest money savings, and to work. The analysis of both incidence and incentive-effects relies heavily on the results of a questionnaire survey of one thousand manufacturing corporations undertaken in June, 1948. This evidence is not too reliable, since not all companies have the same tax problems and in 1948 few American businesses were greatly worried by the burden of taxation, but Mr Kimmel uses it with appropriate caution.

The chief conclusion which emerges from the study, that "the encroachment of taxes on incentives is primarily an income-tax problem," is not unexpected; nor are the proposed remedies, which relate largely to the elimination of double taxation of corporate income and the introduction of greater flexibility with respect to depreciation allowances and loss carryovers. The conclusions on incidence are more interesting, and in some respects contradict the conclusions on incentives. If it is true, for example, that taxes on corporate and managerial income tend to be passed on to the consumer in the price of the product, what becomes of the argument that such taxes damage incentives?

On the whole, this is a disappointing book. Like other recent publications of the Brookings Institution, it contains some interesting ideas and many useful facts, but no very original or penetrating conclusions. The limited scope of the study is particularly depressing: surely analysis of the effects of taxation on economic incentives should be concerned with the level of taxes as well as the form in which they are collected?

AMERICAN SURVEY

Congress's Contribution

Washington, D.C.

THE harshest judgment passed upon the Eighty-first Congress, now within sight of its end, came the other day from one of its members. "This Congress," said Senator Humphrey, a Democrat, of Minnesota, "has done an awful lot to destroy the faith of the American people in representative government." He was speaking, with considerable bitterness, during the Senate's remarkable debate on the McCarran Bill, a document by coincidence eighty-one pages long, which exhibited the extremes to which those Senators who sponsored and supported it were prepared to go to "control" Communism in a time of national neurosis. The Bill did not actually provide that certain radio performers who had once advertised Polish hams should be held suspect; but since a recommendation to that effect had already been made (according to *Time* magazine) by a group of unofficial witch hunters, this specific threat seemed to be in hand anyway.

It was clear from the debate that the Senators had been receiving a great many letters from their home States, and that they had been left in no doubt that a large and articulate section of the voters who would be exercising the highest privilege of a free democracy on November 7th this year were now angrily demanding that the Communists in America should be slapped down hard. And it was easier and safer to obey this instruction than to explain that what was being demanded might compromise and could seriously imperil many of the liberties which make a free democracy worth protecting from Communism.

That point was in Senator Humphrey's mind too; but what he was complaining about particularly was the "cheap politics" that had led to the use of the Eighty-first Congress as a libel-proof platform from which to confuse and frighten the electorate with charges, unsupported by any real evidence, of disloyalty among high officials of the executive branch of the Government. "The irresponsible, unfounded and foolish charges made in the second session of the Eighty-first Congress," said Senator Humphrey, "have done more to harm American government than (has) the Communist Party."

It may be that in calmer days to come Senator Humphrey will be shown to be right. Since the beginning of 1949, when it assembled in Washington, the Eighty-first Congress has passed many laws and refused or failed to pass many others. But it may be that its best-remembered contribution to American history will be the accusations which Senator McCarthy of Wisconsin and his imitators stirred into a devil's brew of confusion and suspicion at a time when the paramount national need was for sanity and unity.

This was a Congress which came in with President Truman and showed on paper a comfortable Democratic majority. Its predecessor, the Republican-dominated Eightieth Congress, had been denounced by the President as the "second-worst" Congress the United States ever had. (Mr Truman counted as the worst of all Congresses that which in 1868 impeached President Andrew Johnson, one of his personal heroes.) Much had been expected of the Senators and Congressmen who assembled on Capitol Hill in January, 1949, but it is going to be difficult, in retrospect, to argue that their legislative record can be easily distinguished from that of the despised Eightieth.

What Mr Truman and his friends mainly held against the "second-worst" Congress was that it passed the Taft-Hartley Labour Act (to "control" the trade unions) and reduced taxes by $4.8 billion. Yet it also passed the European Recovery Act, supported the President over aid to Greece and Turkey, extended the reciprocal trade agreements programme, revived conscription and voted a lot of money for rearmament. The complaint was that, although its heart turned out in the end to have been in the right place when massive measures of foreign policy were being decided, it maintained a reactionary indifference to the social reforms the President desired to see accomplished.

*

Even a bald summary of the legislative achievements of the Eighty-first Congress ought to sound very different. The perception that in fact it does not is now a matter for some rather gloomy comment in Washington. This Congress has done nearly all the President asked of it in the field of foreign

policy, carrying on the Marshall Plan, agreeing to unprecedented foreign military aid, further extending the trade agreements programme, and providing immense sums for rearmament. The Senate has ratified the North Atlantic Treaty and the International Wheat Agreement. An unbeautiful Displaced Persons Act has become more presentable.

But the two-year-old predictions that the new Congress would accept Mr Truman's return to the White House as a mandate to forge ahead with the Fair Deal have been badly falsified. Social security has been extended to cover some millions of workers who were previously outside the scheme: beyond that there is little indeed of the handsome programme of social reforms, set before it by Mr Truman, which the Congress can claim to have translated from aspiration into action. The Taft-Hartley law, abolition of which was one of the Democrats' most ringing election pledges, is still unrepealed. The health insurance plans of the President have never come within sight of enactment. Mr Truman's civil rights proposals, which seemed once to hold out a promise of notable improvement in the prospects and status of Negroes, could not get past a filibuster by Southern Senators. The Brannan farm plan remained at the starting post; neither the plans for "middle income" housing nor the hopes of retaining watertight Federal rent controls finished the course; and Federal aid to education has run into a complex traffic jam.

In May, when the President was conducting his "non-political" tour, the widely heard argument was that the failure of Congress to bring the Fair Deal to fruition—a failure due, as people could see, to the machinations of a reactionary coalition of Republicans and conservative Southern Democrats and their fellow-travellers—would once again provide the Democrats with a rip-roaring election issue. But all that was before the Korean war began.

Nobody can now believe that the electorate is intensely interested in health insurance, or even that it cares as much as it did a few months ago about the repeal of the Taft-Hartley law. The members of the Eighty-first Congress who in the last few weeks have swiftly voted $16 billion for arms at home and abroad, have turned a tax-reduction Bill into a tax-increase Bill and have thrust upon the President powers (which he had not sought) to impose economic controls appropriate to wartime—they know well enough what people are interested in.

People are interested in whatever will help to win the Korean war, and they are prepared to be angry over anything or anyone that can be shown to be hindering that objective. The great virtue of the Eighty-first Congress is that it understood and, in its way, nourished and satisfied the new American determination to exercise international responsibilities such as no other Congress ever had to wrestle with or even to comprehend.

American Notes

Dropping the Jonah

The replacement of Mr Louis Johnson by General Marshall as Secretary of Defence is a master-stroke on Mr Truman's part. Mr Johnson had become so heavy a political liability that any change would have been welcome to most Democrats. But in General Marshall the Administration has a man whose record, both in peace and war, inspires confidence at home and abroad, and who is not implicated in the disillusionment over the American performance in Korea and its partisan exploitation. Moreover, General Marshall can be relied upon to work with, rather than against, the Secretary of State. The only bar to his appointment is the clause in the Unification Act which provides that anyone who has seen active military service within the past ten years is ineligible for the post, and the fear that once the door is opened the military might usurp what should remain a civilian office. In General Marshall's case, and in a time of such tension, an exception is likely to be approved by Congress.

Ever since the outbreak of the Korean war, Mr Johnson has shared the Republican fire that previously had been concentrated upon the Secretary of State. He has been attacked for carrying out defence economies that weakened the effective strength of the forces, and ridiculed for a boastfulness and complacency that misled the public. His strong-arm tactics were notorious and his lack of tact hardly less so; he possessed none of Mr Truman's engaging willingness to confess an error, which was demonstrated in the President's brush with the Marines.

But it would be wrong to conclude that Mr Johnson has been sacrificed to propitiate the Republicans. No one knows better than the President that, in enforcing economies upon the services, Mr Johnson was carrying out the President's own instructions, though his open relish for the job was certainly unfortunate. Nor is it Mr Truman's way to desert his friends in time of trouble, particularly when it is likely to give the Republicans something to crow about. Mr Johnson's real crime was that, at a time when it was vital for the Defence Department and the State Department to pull together, he was a focus for disaffection against Mr Acheson. The tug-of-war inside the Cabinet gave rise to uncertainties and the fear that foreign policy was being shaped in the Pentagon and in Tokyo rather than in the State Department. Moreover, if the columnists are to be believed, Mr Johnson was not above trying to deflect criticism from himself by secretly handing out ammunition to Mr Acheson's critics. General Marshall, during and after his mission to China, mapped out the policy which has since governed the Administration's relationship with the Nationalist Government. When he was Secretary of State, he worked closely and harmoniously with Mr Acheson. General Marshall's appointment should therefore end a potentially dangerous rift on foreign policy and strengthen Mr Acheson's own position.

* * *

Mobilisation Gathers Speed

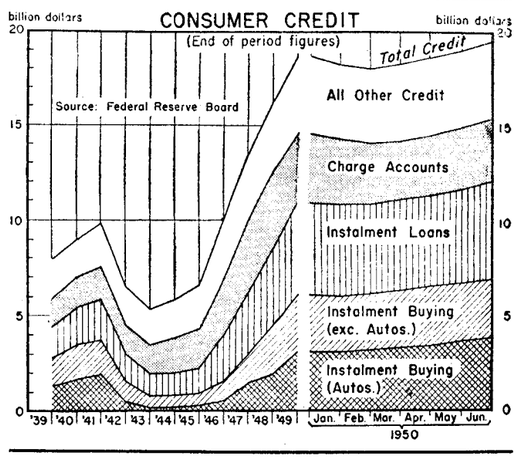
From President Truman's recent broadcasts it appears that by next summer the defence programme will have doubled in size since the Korean invasion, both as regards men in service and money being spent on armaments. America's mobilisation is getting up steam for a longer and faster journey than was expected two months ago, mainly because it is now realised that the international situation requires greater military strength in Europe as well as in Korea and at home. Once the train is travelling full speed ahead at the rate now scheduled, more powerful brakes than were originally planned will be needed to keep it on the rails.

Even the President himself has tacitly admitted that the price and wage controls which he is so reluctant to apply will ultimately be unavoidable. He has ordered businessmen to preserve their records for the month preceding the Korean outbreak, which will be the base period for such controls under the Defence Production Act. And he has set up an Economic Stabilisation Agency, with an administrator, a director of price stabilisation and a wage stabilisation board. To begin with, attempts will be made to hold prices and wages in line without compulsion; if these attempts fail, selective controls will be tried next. The compromise finally agreed by Congress allows such controls to be put on individual products, but in each case price and wage controls must come hand in hand. It is doubtful whether this will turn out to be either practicable or effective and general controls may have to be used before they are really needed, unless the new Congress amends the legislation.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Meanwhile, the post-Korean rise in the cost of living has been checked for the moment, but too late to prevent the second round of inflation, a rush of wage increases. No one in fact tried to prevent them. The Administration wants to keep its labour supporters happy until after the election, at least; employers dare not risk either the loss of the skilled men who are already becoming scarce or strikes at a time of overcrowded order books; trade unions are hurrying to get into the most favourable possible position before wage controls begin. The famous General Motors' contract, with its flexible cost of living clause, looks like such a position, in view of the President's admission that wage increases are, and will be, excused if they are needed to cover the cost of living.

Employees of the General Motors Corporation have already received an increase of five cents an hour since Korea under this escalator clause, and the Chrysler Corporation has more than matched this by giving its work-people increases of from ten to fifteen cents an hour without being asked. The Ford Company, with its existing contract not due to expire until next year, nevertheless leapt to its traditional place at the head of the automobile wage scale with a new five-year contract combining the Chrysler increase, the General Motors' escalator clause and the promise of an annual increment of four cents an hour. The bandwagon is rolling out of Detroit well ahead of wage control, and other unions and companies are climbing on to it as fast as they can. The steelworkers will have their chance in November, when their contract can be reopened, and Mr Lewis is not likely to allow his miners to be left behind.



* * *

Keeping on the Rails

The President has lost no time in using the other powers given him under the Defence Production Act, the powers that he asked for. The terms on which instalment purchases can be made were at once controlled by the Federal Reserve Board; these new regulations are not as strict as those during the war, but "no down payment and three years to pay" is over for the time being. The very liberal terms of some hire purchase agreements had been causing concern even before Korea; although the total volume of outstanding consumer credit was exceptionally high (and went up to over $20 billion in July as the result of the scare buying), it was not in itself unhealthy when related to the growth in population and in disposable personal incomes. The FRB has also been given authority to restrict credit on new construction; the Board has long been critical of the ease with which mortgages have been obtainable.

Such indirect curbs on civilian consumption, however, need to be supplemented for the present by direct controls if adequate materials and industrial facilities are to be available for defence production, although eventually there may be enough for everyone as the result of industrial expansion. Whether the necessary allocations and priorities should be established on a voluntary or a mandatory basis in the first instance is already being discussed with the industries concerned by Mr William Harrison. He has been brought from the presidency of the International Telegraph and Telephone Company to head the new National Production Authority in the Department of Commerce which will be responsible for most industrial controls. Other government agencies, such as the Departments of Agriculture and the Interior, have also got some say in the matter and Mr Stuart Symington of the National Security Resources Board is to act as co-ordinator. If, as happened at the beginning of the last war, too many governmental cooks are found to be spoiling the mobilisation broth, he will presumably be appointed head chef with full powers.

Increased production and the prevention of inflation should enable the economy to achieve the defence programme without going off the rails, but the journey must be paid for. Congress recognises this as clearly as does the President and one of the unexpected results of the Korean

outbreak looks like being a reduced deficit, or even no deficit at all, at the end of the current fiscal year. The high level of business activity means that receipts are running above original estimates and the emergency increases in taxation will be bringing in additional revenue before the full effects of the rearmament programme are shown in government expenditure. Congress is pledged to a further instalment of tax increases, to include the excess profits tax which has so much political appeal that even the President is now ready to turn a blind eye to its economic defects.

* * *

Dewey *ex Machina*

The Democratic machine in New York has only itself to thank for recalling Mr Dewey to active political life—a cause for acute private mortification, but a considerable public service. It was Mr Flynn, the astute boss of the Bronx, who was credited with persuading Mr Truman to swallow his pride and set the stage for a special mayoralty election in New York City by offering Mr O'Dwyer, the Mayor, the Ambassadorship to Mexico, as a handsome inducement to go away quickly. This plum normally would not have dropped into the mouth of a Democrat who had deserted Mr Truman in the dark days of 1948. But the Democratic strategists calculated that a mayoralty election this year would bring out the vote in New York City, which is overwhelmingly Democratic, and sweep the party's candidate into the Governor's mansion in Albany. It would also make it easier for Mr Lehman to retain his Senate seat. Control of these two vantage points would be of material aid in capturing New York's vital electoral vote in the Presidential year of 1952. Mr Truman lost it last time.

But the calculations of the machine backfired badly. Mr O'Dwyer took his exit line with all speed, but the Republicans have proved that in an emergency they can hear the call to duty as clearly as any Democrat. Mr Hanley, the politically ineffective Lieutenant-Governor, who on

Mr Dewey's retirement had hoped to come into his long-deferred reward, heard it and, after some soul-searching, announced his willingness once more to step aside. Mr Dewey heard it on his farm at Pawling; with no noticeable soul-searching at all, he decided that in the country's crisis—and his party's—he could not refuse to serve again. For his self-sacrifice, Mr Hanley has been awarded a consolation prize of doubtful value; he will run against the popular and experienced Senator Lehman.

Meanwhile, the Democrats are hoist with their own petard. The Democratic vote in New York City will have to be heavy indeed to wipe out the lead Mr Dewey has shown he can pile up "upstate"—that is, in the rural areas. Nor have the Democrats, bedevilled by the necessity, real or imagined, of placating the labour vote, the Italians, the Irish Catholics, the Jews, and the local pride of the New York boroughs, found a champion worthy of Mr Dewey's metal. Representative Lynch, from the Bronx, is a Fair Deal regular, which is important to a machine that had its first choice vetoed, with embarrassing publicity, by the New York Congress of Industrial Organisations. But he is almost unknown and has little time to remedy this fault. Worse still, in the New York City election for Mayor, the Democratic vote will be split by a disgruntled independent, and a Negro candidate put up by the Communist-dominated American Labour Party.

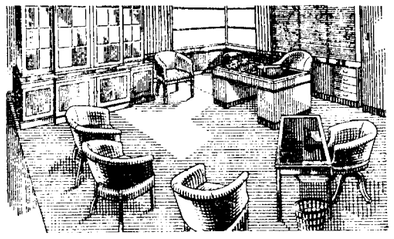
The Democrats have chosen as their chief target the bankers who, they allege, control the Republican party, and who, it is said, finally persuaded Mr Dewey to run. Mr Dewey has already trained his guns on the record of the Administration in foreign policy and defence, though from a platform considerably more elevated than that favoured by the Wherrys of his party. Already there is speculation whether the choice of such issues, following his return to politics, means he will have a third try at the Presidency in 1952, and whether the Old Guard would permit it.

Shorter Notes

Congress is now looking favourably on the universal military training which the President has long advocated, but this change of heart comes too late. Today both military camps and training personnel are otherwise occupied and there is no immediate urgency about a Bill which would require all youths to undergo six months' military training. Most of them will now have to do active service for far longer. The Senate has therefore reluctantly agreed to the President's suggestion that action on stand-by UMT legislation should be postponed until the next session.

★

General Bedell Smith, a former Ambassador to Russia, has very suitably become head of the Central Intelligence Agency, which co-ordinates all military, diplomatic and foreign intelligence activities. He succeeds Admiral Hillenkoetter, who was anxious to get back to sea even before his agency's failure to warn Congress of the imminence of the Korean invasion brought a hornet's nest of criticism down upon his head.



★

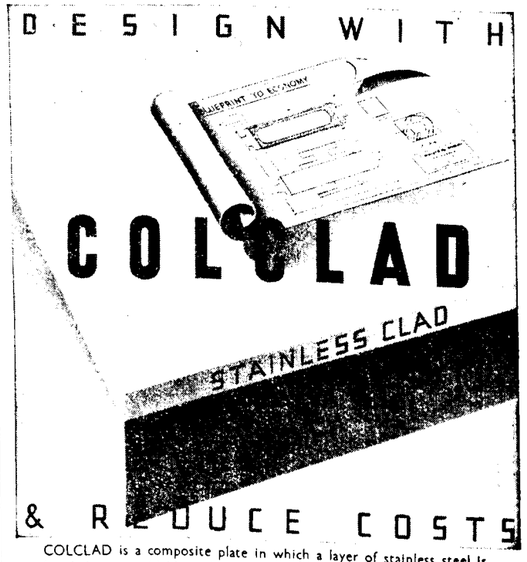
When the Federal Government builds and staffs army camps and government factories, local schools have more pupils and less revenue than before, since state taxes are not paid on Federal property. In order to meet this difficulty, Congress is about to authorise Federal grants for the construction, maintenance and operation of schools in such areas.

★

In the last fifty years, America's automobile factories have produced over 108 million vehicles and there are now about 45 million actually registered. There are nearly 60 million registered drivers in the country and one out of seven employed persons is occupied in road transport.

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.



Your enquiries for floor-coverings, and for any assistance are cordially invited.

DESIGN WITH

& REDUCE COSTS

COLCLAD is a composite plate in which a layer of stainless steel is bonded to a weldable carbon or low alloy steel. Special methods of manufacture ensure a uniform thickness of cladding. If protection is required on one side only COLCLAD offers equivalent corrosion resistance of solid stainless steel at considerable reduction in price. Easier fabrication and availability of plates in sizes larger than can be obtained in solid stainless steel, reduces production costs.

To assist YOU in adapting COLCLAD to YOUR products our technical staff is at YOUR service.

COLVILLES LTD., 195 WEST GEORGE STREET GLASGOW, C.2

THE WORLD OVERSEAS

Strasbourg in Retrospect

(By Our Special Correspondent)

THE aim of the Council of Europe is to achieve a greater unity between its members for the purpose of safeguarding and realising the ideals and principles which are their common heritage and facilitating their economic and social progress.

This aim shall be pursued through the organs of the Council by discussion of questions of common concern and by agreements and common action in economic, social, cultural, scientific, legal and administrative matters and in the maintenance and further realisation of human rights and fundamental freedoms.

Matters relating to National Defence do not fall within the scope of the Council of Europe.

So runs the Statute of the Council of Europe signed in May, 1949, in London by the ten then participating powers. Two questions arise in the infinitely more dangerous world of the autumn, 1950. Is the aim of the Council, "the greater unity between its members," being achieved by it at all? Is "greater unity" being achieved fast enough by all available means, including the Council? It is important to separate these questions. For to assert that European unification is happening too slowly is not or should not be to condemn the Council of Europe. It may well be that the Council, while having little practical or institutional bearing on the achievement of indispensable short-term concrete results in economics and defence, is nevertheless absolutely necessary as a focus of enthusiasm and intellectual magnet to the achievement of these results. In other words, the "greater unity" of conscience and attitude, which is now growing within the Council and which develops at its own speed, contributes decisively to the "greater unity" of action which must, inside or outside the Council of Europe, be attained at all costs here and now.

European Atmosphere Created

There is no doubt at all that the Council of Europe is achieving a greater European unity. Last year its machinery had a trial run. There was a healthy airing of international and inter-party differences and—largely because of the presence of Mr Churchill, the chairmanship of M. Spaak and the verve of the French delegates—a European atmosphere was created in Strasbourg. Following the work of the committees during the winter, the 1950 session has maintained this atmosphere and produced certain definite intellectual results.

This year two main and connected engagements have been fought within the Consultative Assembly: that between the opponents of the Committee of Ministers and its control over the Assembly and the supporters (avowed or unavowed) of ministerial control, and that between the European federalists and the "functional approachers" or inter-governmentalists. The chief success of the 1950 session has been the emergence of a real measure of agreement, or at least of mutual respect after an intensive breaking-down of these issues.

As to the attribution of "limited but real powers" to the at present purely consultative Assembly, the Assembly has passed a resolution, which requests the General Affairs Committee to submit a plan for the reform of the Statute itself before the next session of the Assembly, which is to be held before the end of the present year. Another constitutional resolution (passed by an overwhelming majority) required that the major resolutions of the Strasbourg Assembly should be presented to national parliaments, whereupon those M.P.s who had voted for them at Strasbourg should again do so in their own capitals. As to the first resolution, the Ministers will, when the draft reform emerges, presumably be asked to approve a new voting system, such as the weighted system proposed by M. Spaak, which would weaken their collective veto over the Assembly. These moves might succeed in giving a greater initiative to the Assembly, and thus an impetus towards its becoming eventually a European legislature.

The quarrel between federalism and functionalism had an interesting and important *dénouement*. Early in the session the British (with the exception of Mr Mackay) and the Scandinavians had declared the impossibility of a European Federation Now. The arguments against Federation Now, which were advanced notably by Dr Dalton, were that federation was definitely unwanted by the British Empire and Scandinavia and unnecessary in view of the successes of inter-governmentalism—witness the European Payments Union created by the OEEC. Dr Dalton's message to all Federalists was: "Good luck, get on with it, and keep off"! Any insistence upon Federalism within the Council of Europe would, he said, wreck it. M. André Philip, accepting Dr Dalton's farewell, sought finally to create a federation of all willing Strasbourg nations. M. Philip, supported by M. Reynaud, envisaged, it seemed, the extension of the limited pooling of sovereignty already contracted by the six signatories of the Schuman declaration both to other powers and to other nations. But this thesis (the "functional-federal" approach, which MM. Schuman and Monnet distinguish both from Inter-governmentalism and Federalism Now) did not prevail. This was perhaps the most important outcome of the 1950 session, since it assured both the continuation of the Council and Britain's continued participation in it.

M. Guy Mollet, fellow Socialist of M. Philip and French Minister of European Affairs, flatly refused to accept the idea of a truncated federal Europe. Unlike Dr Dalton, he regarded a partial federation without Britain both as impractical and as the end of the Council of Europe. The French Parliament, he said, would never accept it (M. Philip had, indeed in a moment of heat, claimed general agreement "or else we will make Europe elsewhere"). M. Spaak agreed with M. Mollet, stating in a final press conference that Europe could not be further mutilated by the exclusion of Great Britain or of any other part of it. M. Spaak's own position (he has been the life and soul of the 1950 session) has become increasingly clear. The most active opponent of the Committee of Ministers as at present constituted, he nevertheless rejects outright any schism within the Council's present membership upon this issue. The roof of Strasbourg must be kept over all European activities and beneath it all initiatives might continue towards the establishment of "specialised institutions in political,

economic, social, legal and cultural fields." (To this end the Assembly has passed a resolution asking the Ministers to allow the attachment to the Council of Europe of "functional-federal" schemes adopted by fewer than all its members. M. Bonnefous, Chairman of the Foreign Affairs Committee of the French Parliament, has already proposed the unification of European transport, a piece of federalism in which Britain can hardly be expected to participate!) M. Spaak has, in fact, stated the view that, while European unification is progressing with dangerous slowness (he at once spoke in favour of Mr Churchill's resolution that a European army should be created forthwith) the Council of Europe is none the less playing its part as well as could have been expected. "No one," concluded M. Spaak, "could seriously expect that the unification or federation of Europe could be realised during the month of August, 1950. Even if it had been possible to work out a federal constitution for the nations of Europe, that fact would not in any way have prevented the Russians, if such had been their intention, from launching their tank columns against western Europe."

It was in this mood of relative reasonableness that the Assembly was adjourned. What can be hoped of the next period of the Council's life? There are, of course, a number of technical items which have already appeared on the agenda of the Committee of Ministers such as the formulation of a multilateral convention on the reciprocal treatment of nationals of the member states, relief from double taxation and the alignment of social security schemes. But these matters are rather remote from the public imagination. So, also, is the subject of Human Rights which has for free Europe a somewhat negative tinge. On the other hand a definite symbolic value would attach to small achievements such as the production of a European postage stamp or a European passport. It would also be supremely worth while to hold a youth rally at Strasbourg during the next year's session of the Council, as was proposed by Mr Duncan Sandys and other delegates. It is of the greatest importance that youth, and in particular German youth, should be effectively associated with the Council of Europe. Anyone who has visited the Franco-German university in the Saar will be aware of the new spirit growing among continental youth, a sentiment which is far removed from ideology, national or Communist.

Czech Housekeeping

[BY A CORRESPONDENT RECENTLY IN CZECHOSLOVAKIA]

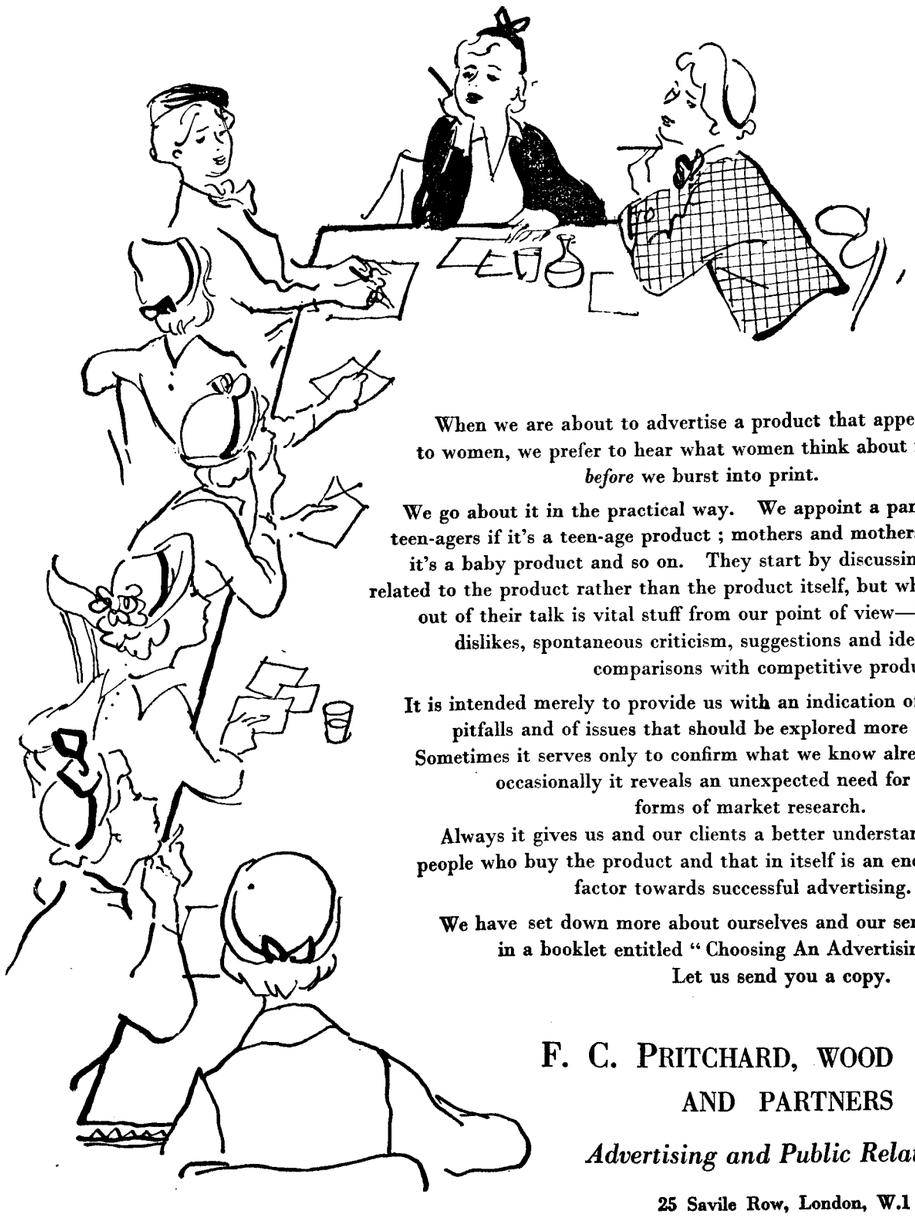
To the not over curious visitor Prague still maintains a certain amount of its pre-1948 atmosphere. Physically, it is still a provincial city of the old Austrian Empire, suddenly promoted to become the capital of a new republic without having really got over the shock. The old palaces on the left bank of the Vltava are still being used by government departments and foreign diplomatic missions; the trams still clang slowly along in tandem through streets hopelessly narrow and winding for modern traffic. The Wenceslaus Square is still lined by a hodge-podge of conflicting architectures and the good King himself continues to ride his horse valiantly at the top of the Square protecting the mass of the Museum behind him from all comers.

But this is only the façade of the great economic and social changes which have taken place during the past two years. To the onlooker the most noticeable change is in retail distribution. After the *coup* of February, 1948, the wholesale trade was nationalised, because, it was alleged at the time, wholesalers were deliberately withholding goods from the shops in order to sell them later at scarcity prices. It was for these same political allegations, rather than for any real economic reasons, that more recently nationalisation has been extended to retail trade, not only shops, but also restaurants, public houses, undertakers and the like, with only the very smallest units being excluded for the time being.

All socialised concerns are classed either under the heading *narodny podnik* (national enterprise) or *komunalny podnik* (communal enterprise), the former being centrally and the latter locally controlled. Shops come under the control of the various state or communal trading concerns specialising in different commodities—thus groceries come under *Masna*, general provisions under *Pramen*, electrical goods under *Elektra*, and so on. The only sector of the economy still remaining in private hands is that comprising professional services, and something less than 5 per cent of the working population is now employed by private employers.

Combined with this socialisation there has been a parallel emergence of the Communist Party (CSK) as the most powerful political force in the country, the other parties giving no more than a semblance of democratic opposition. Though every branch of the CSK and the Czechoslovak-Soviet Friendship Society exhibits on their walls constantly changing sets of photos depicting the wonders of the Soviet Union, the local citizens seem to find little time to stop and look at them. This is not to be wondered at, since both factory and office workers have a 5½ day-48 hour week, beginning at 7.30 a.m. In addition they are expected to put in about 10 hours shock-work a month, plus several more hours at Party or Union meetings. The salaries earned monthly vary tremendously, shockworkers, especially miners, earning up to Kcs. 10,000.* The top scale for office workers is about half this rate, and Kcs. 4,000-5,000 can be considered as average. From these wages are deducted at source not only income tax (which is fairly low), but also union dues and national insurance, the latter being apparently somewhat higher than that paid in this country, though varying with the salary paid. A married worker with two dependent children has about Kcs. 700 deducted from a salary of Kcs. 5,000.

High "Free" Prices



Direct income tax is low, but any inflationary pressure from shockwork earnings is absorbed by the high free market prices, indirect taxes and rail fares. The illegal black market has been replaced by an official "free market" in much the same manner as the two-price system in Poland which lasted until the ending of rationing there two years ago. The amount of food on coupons is being gradually reduced, bread and flour products being the main items removed recently. At present, the rationed foods comprise all kinds of meat (raw and cooked), fats and sugar (but not confectionery); these and all other foods are sold "free" at very high prices, which in practice are little effected by the much publicised reductions of last June. Free sugar, for example, was reduced from Kcs. 160 to Kcs. 140 a kilo, ten times the rationed price. "Free" meals can also be bought in restaurants by paying extra Kcs. 6 for every 50 grams of meat in the meal (the normal ration is 100-150 grams); this affects the cheaper working class restaurants far more than the large hotels. It is such high "free" prices not only of foodstuffs, but also of textiles, footwear, furniture, and so on, which accounts for much of the profusion of goods in the shops. One ironical feature of the system, which contains more than a hint of dumping, is that the Czech chocolate which sells in Britain at 11d. a block (about Kcs. 7 at the current rate of exchange) sells for Kcs. 50 on the free market.

Since official figures are lacking, it is difficult to get an accurate picture of the real standard of living in Czechoslovakia. Some indications are given, however, by the United States Department of Labour estimates of the work time required to buy food in various countries. From these

* The exchange rate of Kcs.140 : £1 is so artificial as to render translation into sterling values misleading.

women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it *before* we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.

Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

We have set down more about ourselves and our services in a booklet entitled "Choosing An Advertising Agency." Let us send you a copy.

it seems that the hourly average earnings in Czechoslovakia at the end of 1948 only bought two thirds of the amount of food they bought in Britain, and this at rationed prices only. Though the figures have since changed, it seems reasonable to assume that the relationship is little different.

Against the mundane background of wages, prices and hours of work must be set the various campaigns of a more political nature, which, though apparently separate, are not altogether unconnected. There is the constant campaign to recruit more labour, especially for the mines. The appeals are for both men and women and it is said that in some industrial centres the shortage is so acute that a statute of 1945 is being invoked to conscript labour of both sexes. Linked with appeals for more labour are those for increased production and productivity from the existing labour force. A far more political campaign, linked with the potato shortage (reflected in the high price of Kcs. 5 per kilo) is the propaganda everywhere directed at "the American weapon against the people's food," the Colorado beetles allegedly dropped by US planes in western Bohemia, an area infested with the beetle. Another "hate" weapon against the Americans is, of course, "the brutal American aggression in Korea." There is also the Stockholm Peace Appeal, in connection with which a meeting was recently held in Prague of the Postal Department of the World Federation of Trade Unions, a meeting which has not received the attention from the west which it deserves. The Czech chairman, Jaroslav Kolar, speaking of the meeting's support for the Appeal, declared that it will seek means for post office and radio employees of the whole world "systematically and emphatically to express their genuine desire for peace by refusing to convey over the telegraph, telephone and radio all the lying and criminal reports and slanders spread by capitalist radio stations against the world camp of the defenders of peace." This may be perhaps one of the most significant actions to come from Prague, where the Soviet flag everywhere flies side by side with the red, white and blue of the formerly independent Republic of Czechoslovakia.

Marxist Shanghai—I

[BY A CORRESPONDENT RECENTLY IN CHINA]

AFTER a night filled with clatter, Shanghai woke to find itself liberated. Uniform of a slightly different shade was the first thing to distinguish the newcomers lying sweating in orderly rows on the pavements. "Pea-green incorruptibles" said a Chinese wit a few weeks later, and incorruptibility no one could deny when even the proffered cup of tea was refused because the army could take no gifts from the civilian population. The radio station had fallen early in the morning, but a scratch programme was already on the air. An underrehearsed chorus, an overworked piano, an eager leader: "Now let's try that just once more ; one, two, three,

The East is red, the sun is rising
China has produced a Mao Tse-tung. . . ."

and so it continued for weeks and months afterwards. In the newspapers, on the radio, in the streets, in the schools ; at public meetings and mass demonstrations ; everywhere the song and the dance seemed the first and remained the most lasting symbol of Communist leadership.

It was more difficult than usual for a foreign observer to perceive the Chinese reaction to this incursion. For once Shanghai had found something within its own borders to stimulate its interest and perhaps even to inspire it ; for once the foreigner and the glamour that still clung to him could be ignored. Backs were turned watching the interesting new spectacle, and the best one could do was to walk round on the outside and listen to the comments. After a long period of expectancy a *mystique* had certainly been built up. "Today I *saw* some, real ones," said one Chinese to another ; or, again, "have you met any yet?" Few had, it seemed, although speeches were made and delegate meetings held. Gradually news began to circulate of fellow-students at overseas universities who, returning to China, had thrown in their lot with the Communists ; now, after years in the hinterland, they had returned to the metropolis democratically clad in pea-green (in spite of the doctor's degrees) and were feverishly administering in back rooms. But it was not long before a new phase had taken for the educated classes the place of the singing and dancing which animated the "broad masses." If the party workers lived a closed life their doctrines were soon in circulation. *Kao t'ung* is not easily translated ; it conveys the sense of shaking up, of taking to pieces and thus by implication of reordering, of reintegrating one's thoughts. Coined in Shanghai and thus endowing Chinese with a new character, it was the key phrase of the mental struggle. One heard it daily. Reports of individuals followed. It was said of one that he was completely *kao t'ung* and had offered his services (and overseas training) to the party, another was on the brink, a third, quick to come to terms with the new doctrine, was wrestling with difficulties. He was doing his best to *kao t'ung* them. Never did one hear of hostility or even indifference springing from a mind already settled, from an existing or comprehensive doctrine. Everyone, it seemed, naturally accepted that one had to come to grips with the "new thoughts."

Crusade of Ideas

Turning away from the difficulties of assessing Chinese opinion, what could the eye record in changing Shanghai? There were the demonstrations of course. Banners, flags, slogans, fireworks, the traditional and popular animated dragons, encouraged with singing and interrupted with dancing for the young, the old, the workers, the petty *bourgeoisie* or the national *bourgeoisie*. "The Union branch at Messrs Blank had to order thirty people to turn out, they couldn't get any volunteers," it was reported, or, on the other hand, "It was magnificent—pouring rain but such a wonderful spirit—the enthusiasm!—and we didn't get back until three in the morning—everyone loved it." Both, one felt, were quite true. A demonstration, in any case, is not the most reliable guide to public opinion. What seemed more reliable and hardly less ubiquitous were the bookshops. As the decline in luxury spending, the blockade and to some extent Communist policy brought a decline to the shops of Shanghai the bookshops by contrast expanded and multiplied. They were invariably crowded with the young. Here, one felt, was the power of ideas most plainly illustrated. The section labelled political philosophy was usually the most prominent and, of course, exclusively Marxist, but looking at the section marked "novels in translation" one saw that the home of the new political philosophy was also in the lead. It is a predominance only partly explained by political sympathies. "How can you expect the Chinese to understand Jane Austen or Thackeray," remarked a Chinese friend, "whereas the background of the Russian nineteenth-century novel is something familiar to all of us."

Other observers have written of the new standards of honesty and efficiency which the Communist-led armies and administration have brought to the new China. But no impression could be more deep or more lasting than that of the immense evangelical force of the movement. As one sees it in Shanghai it is a pill presented with a little coating of jam. The attack is insistent, for new hearts go hand in hand with new thoughts and in this process of regeneration "self-criticism" plays so large a part and seems to be having so considerable an effect that it deserves at least closer attention than the slightly sneering tone in which it is often dismissed in the western press. Above all, is this true of a country with none of the organisations, religious or semi-religious, in which such processes may find a traditional expression? The harassed foreigner reading the wall-newspaper while waiting in the corridors of the police station for his personal letters and photographs to be inspected (before taking them out of the country) may indeed smile at the revelations of a police-

man who was "unable to get to sleep until four or five in the morning" through anxiety lest his "self-criticism" had been "inadequate," but he will none the less agree that he has a much better chance nowadays of recovering his stolen property when before his only hope was bribery. And it is not a new police force though it may be under new direction. After the experiences of Kuomintang rule the earnest puritan atmosphere seemed welcome to the foreigner no less than to the Chinese, though one might well fear the results of such an atmosphere allied to a rigid doctrine. One is glad to be able to record that the Chinese sense of humour, that most endearing of their traits, seems to persist. At a performance of the traditional Peking opera, the story concerned a long lost son who had unwittingly stolen his father's much prized horse. In the happy reunion of the last act the son does obeisance to the horse. "How very *feudal*" interpolated the father with a wink at the audience which roared with delight at this reference to one of the four deadly sins of the new dispensation. At a modern communist-inspired play, on the other hand, the foreman of the cotton mill having treated his workers in the wrong manner and aroused their hostility proclaims his errors and his salvation in the final scene with the cry "How faulty are my bureaucratic thoughts!" a cry echoed by cheers from many of the audience—another soul, one felt, had been saved for the cause. Does one see a contrast in this? Was the audience at one theatre very different from that at the other? I doubt it. It would not be impossible to imagine the same audience reacting similarly to each play.

Rumours of Chiang's Return

The modern theatre and the film, as one might expect, have both become largely propagandist. They had long had links with the left but the Communist wish to maintain and develop the traditional popular art of the Peking opera has been aided by the proclaimed adherence to the new regime of such well-known protagonists as Mei Lan-fang and Ch'eng Yen-ch'iu. "The Song of the Red Flag," mentioned above, is a play dealing with a cotton mill. It is aimed particularly at the Shanghai proletariat who are by no means the most easily won to the cause. "They are contaminated by capitalist thinking, it will take time," one union official remarked. One should mention and in doing so risk the generalisation, that the *mystique* of Communism was more commonly found in the middle classes. Amongst the unorganised workers Chiang Kai-shek remained, for some months after the fall of Shanghai, an omnipotent figure. "He will be coming back in September" said one rumour basing itself on confident leaflets scattered by aircraft from Formosa. Such rumours continued throughout the autumn of 1949 though the prophecies remained unfulfilled. By December the new doctrines had begun to seep into the whole population and many of the early fears had been dispelled, but it was the intensified bombing by the Kuomintang in the New Year which finally destroyed any doubts. It did more. In the press these raids were represented as being quite as much the work of the "American imperialists" as that of the "reactionary, remnant lackeys" of Taiwan, and while the raids drove out any faith in Chiang which might remain amongst the less educated they no less effectively drove out any faith in America in quarters where it was still harboured.

There was certainly every encouragement to the doubters and the hesitant. Questions were answered on the radio each night, on the back pages of the newspapers and in numerous weekly periodicals. Hitherto disagreement seems to have been treated sympathetically and with patience ; light, it seems to be suggested, can be brought to even the darkest heart in time. Questions on relations with Russia are asked and answered though one suspects not always to the satisfaction of the questioner or even to the answerer. One thing at least seems clear in the midst of all this propagation of a new faith—the New Democracy is confidently propounded and by now confidently accepted as a Chinese answer to China's needs.

SIMON ENGINEERING GROUP

Simon exports contribute to the world prestige of British engineering. For example, Simon-Carves coke ovens are used by India's largest iron and steel firms. Two new Australian power stations will have Simon-Carves boilers. Simon Handling Engineers have equipped all four of the Argentine Government's new port granaries and are now equipping the fifth. Simon machinery is found in many of the world's finest flour mills, and Simon soap machinery has won praise in Canada and the United States. Turbine Gears have built gears and gear units for Canadian mines, South African and Mexican cement mills, and steelworks in France and Sweden.

THE BUSINESS WORLD

Business Notes

Bank and Fund Meetings

The fifth annual meetings of Governors of the International Monetary Fund and International Bank in Paris last week brought together the customary galaxy of financial eminence. There were many matters for discussion, though the weightiest of them did not appear on the agendas of the meetings. Of overriding importance is the new trend in world economic affairs set in motion by Korea and its aftermath of intensive rearmament. M. Gutt, chairman of the Fund's executive board, did not flinch from dealing with the subject, though it was inevitably absent from the report of the Fund, covering operations for the financial year to April 30, 1950. M. Gutt spoke of the need to minimise the risk of inflation, but he was careful to point out that "it would be criminal to suggest that the peace-loving nations should reduce their defence programmes because of the danger of inflation." His prescription for the situation is one that deserves—but may not get—general approbation. It is: "increased taxation, investment and credit restricted to essential purposes, Government and private expenditure reduced in accordance with an inflexible schedule of urgency and necessity." M. Gutt described this as a "hard programme" and appeared to have little confidence that inflation could be altogether avoided. The extent to which the dose can be administered to the countries represented at the Paris meeting should surely have provided the substance of this year's discussions behind closed doors.

Two topics falling more specifically within the Fund's agenda have caught the limelight and the headlines. They are the parity of the Pakistan rupee and the currency price of gold. No decision on the Pakistan parity had been announced by the time this issue of *The Economist* went to press, but it is difficult to believe that the Fund could give its approval to the present disparity between the Indian and Pakistan parities. It can hardly extend its benediction to both. Mr Havenga, of South Africa, returned to the charge, begun last year, for a "more realistic" price of gold. He was again voted down, though he received some guarded approval from representatives of European countries such as Belgium and France, where free markets for gold flourish. The main resistance was again provided by the United States, where the authorities are unlikely to accept a proposal for increasing the price of gold at a time when their main concern is to curb the forces making for inflation.

* * *

Exchange Freedom

The annual report submitted to the Governors of the International Monetary Fund is chiefly remarkable for its analysis of the factors responsible for the widespread devaluations of September, 1949. It marshals its explanation in a far-ranging retrospect of the deterioration of the non-dollar currencies against the dollar. It dismisses the American recession of 1948-49 as a relatively unimportant factor in the events of September, 1949. In its explanation of why the dollar problem should have been focused on Europe it emphasises, first, that much European trade with non-dollar countries has to be settled in dollars, and, secondly, that Europe had to meet the impact of the dollar needs and disequilibrium of the large areas for which European countries act as bankers.

All these questions, however, are small beer compared with the issues that were in the offing when the previous meeting of Governors took place a year ago in Washington. If the latest meeting of the Fund and Bank can offer a challenge to its predecessor in point of general interest it is in the discussion of freedom of exchange transactions and more particularly of discrimination against the dollar. Many voices in Paris urged that the justification for any discriminatory application of exchange control has now disappeared. The one voice raised in opposition to the early removal of controls is said to have been that of Britain—though some of the delegates who remained silent were unquestionably on Britain's side. The main issue before the IMF is no longer the disparity of price and cost structures or the consequent artificiality of exchange rates; it is whether most of the members should continue to seek the protection of those transitional provisions of the IMF agreement that allow them for a time to maintain restrictions on their current payments with other members. That debate has only just begun.

The affairs of the International Bank have, as usual, proved decidedly less charged with polemics and politics. The report of the Bank surveyed a year of modest activity, with loans totalling $166,345,000. A long passage of the report is devoted to explaining why the Bank has set such high standards of security for lending operations. The cost of the Bank's loans is to be somewhat reduced in future as a result of concessions in the interest charged during the period intervening between the conclusion of a loan agreement and the time at which the funds are actually paid out.

New Aircraft for Defence

The exhibition of the Society of British Aircraft Constructors at Farnborough showed that the past year's developments have added new categories to the modern aircraft available for the services—which are still equipped in many branches with machines dating from the last war. The development of jet night fighters by de Havilland and Armstrong Whitworth, of a ground attack version of the Meteor by Gloster Aircraft and of a number of specialised naval and anti-submarine aircraft by Hawker, Blackburn, Westland, Short, and Fairey are cases in point. At least one heavy jet bomber was expected to fly this summer, but none has yet appeared.

The sharp increase in the power of the standard engines in production was demonstrated in the flying display, particularly in the rate of climb of some of the aircraft. Less easy to demonstrate was the power to be expected from such new engine designs as the big Rolls-Royce Tay, the Bristol Proteus and the most powerful jet of all, the Sapphire, which was started by Metropolitan Vickers and completed by Armstrong Siddeley; each of these was fitted in an aircraft used as a "flying test-bed" only, since the airframes for which the engines are planned are not yet complete.

The appearance of a small rocket motor for aircraft, the joint work of the Ministry of Supply and Fairey Aviation, suggests what the industry's next line of development will be. The specially designed airframe in which the rocket has been flying was not exhibited. It would have been interesting to compare its performance with that of Vickers

Armstrongs' Supermarine 535, the fastest machine at the show. The Hawker Siddeley Group has interested itself in the development of rocket driven aircraft, but every firm is anxious to stake some kind of claim in this field.

If the aircraft industry is to expand its output—as it must if the flow of standard Meteor and Vampire fighters is to be maintained and new types brought into production—then questions of capacity arise. Some firms working largely on development contracts have factory space that could be used to assemble other companies' designs. But the fact that—with the exception of de Havilland's—all jet fighters have Rolls-Royce engines already throws a heavy strain on one company's engine producing capacity; a bottleneck could occur here.

* * *

Civil Aircraft at Farnborough

Military developments have tended to overshadow the work done in the past year on civil aircraft, which has been mainly concerned with bringing last year's prototypes to the point at which they qualify for a certificate of airworthiness. This is a vital stage to the aircraft companies, who cannot hope without a foreign market to cover the expense of civil developments, even with Ministry of Supply assistance. Until aircraft have such certificates, foreign buyers are reluctant to commit themselves. Moreover, in spite of their unqualified admiration for the new aircraft, foreign operators tend to believe that the British firms are asking too high a price for the aircraft and are exploiting their position as sole suppliers of them. There are signs of a tacitly organised buyers' strike on the Continent.

It is still not settled whether the Brabazon is to be considered as a civil aircraft or merely as an exercise in aeronautical engineering, providing data on large structures. Valuable experience has undoubtedly been gained in constructing and flying the Brabazon I, but the commercial possibilities of the undertaking cannot be judged until the Brabazon II flies in 1952, nor will the prospects of a C of A be seriously considered until then. The future of an airliner of this size may depend on whether operators prefer the high speed, high flying Comet type of aircraft for their long distance operations. Their decision may be influenced—one way or the other—by the degree of success that attends the further experimental work now being done on engines for the Comet.

* * *

Scrap Shortage Ahead?

Events in the last few months have given steelmakers in Britain and in other European countries fresh reason for concern about their supplies of scrap. The British steel industry has had more success in 1950 than in any recent year in getting supplies from abroad; about 1,500,000 tons of iron and steel scrap was imported in the first seven months, most of it from west Germany. The import programme of about 2,000,000 tons in the year seems assured. But the prospect for 1951 begins to look bleak. Even before the aggression in Korea the American steel industry was operating at full stretch, the demand for materials was rising, and so was the price of scrap. By August 22nd the price of heavy melting steel scrap in Pittsburgh had reached the fantastic level of $45.75 a long ton.

It is not surprising that American steel firms should seek to resist prices of this sort by bringing in scrap from Europe; accordingly, American interventions in the German scrap market have been renewed. As an example, the US Steel Corporation has made contracts for the delivery of 200,000 tons of European scrap (mainly from Germany and France) in the last four months of this year, at a price said to be "competitive" with current American prices. The effect for European industry may, however, be unfortunate. The Düsseldorf *Handelsblatt* points out that Germany is now being pressed not only to export more scrap but also to export more steel, and that the two demands may defeat one another. Of the 550,000 to 600,000 tons of steel scrap arising monthly in west Germany, the German steel industry itself now requires (in this German estimate) about 500,000 tons a month to feed the production capacity that has lately been attained. The chances are that German steel output will rise further—though to a modest extent in view of the heavy investment required to bring more plant back into service. Still, the exportable surplus of scrap is more likely to fall than to increase, and 100,000 tons a month is its probable limit.

Heavy American purchases in Europe can have no other effect than to divert scrap supplies from the European—and in particular the British—steel industries at a time when these industries will be called upon to meet sharply increasing demands. It seems doubtful, to say the least, whether it is in the wider American interest to draw steelmaking materials away from Europe at the present moment.

* * *

Wool and the Australian £

The auctions held this week in Australia have shown a continuation of the sharp rise in the price of wool. Prices paid for fine merino wool are now approaching the unprecedented and fantastic level of £1 a lb. If anything like these prices can be held, the wool cheque that Australia will receive for the current year's clip is likely to reach the record figure of £A500 million (which compares with total Australian imports running at £A550 million a year). The impact of this boom in wool prices on the Australian balance of payments has combined with other factors to revive discussions of a revaluation of the Australian pound. The subject does not appear to have been mentioned at this week's meetings of the International Monetary Fund in Paris, but it is still under discussion within the Australian Cabinet, where a complete cleavage of views is apparent. Mr Fadden's Country Party is unwilling to sanction any exchange adjustment that might deprive the farmer of any part of the high income he is now receiving, while the Prime Minister's party is more aware of the inflationary dangers and would be prepared to restore the Australian pound in the direction of parity with sterling. There is no sign yet that these differences can be sufficiently reconciled to permit any definite action; but some consideration is apparently being given to a compromise arrangement involving the imposition of an export tax on wool.

Meanwhile, the Americans—who have been among the principal buyers at the wool auctions—are becoming restive at having to pay these inordinate prices. According to reports from Australia, the United States administration has made tentative proposals for the abandonment of the present auction system and for its replacement by bulk purchase through the Australian Government, which would then distribute the wool in accordance with the directives of a Combined Allocations Board analogous to the machinery set up for this purpose during the war. The purpose of this American proposal would be not only to prevent the abnormal inflation of wool prices, but also to ensure that undue quantities of wool do not get into Russian hands. The Australian reception of this proposal, needless to say, is reported to have been extremely cool. The Australians contend that, in view of the immense variety in qualities of wool offered for sale, the auction system is the only satisfactory means for the disposal of the clip. Well behind the times and overtaken by events of the past few months are the plans for holding a Commonwealth Conference in London at which a price support scheme for wool is to be discussed. The Commonwealth Minister of Commerce, Mr McEwen, is on his way to attend this conference. He will find the agenda strangely altered when he reaches London.

OEEC on International Investment

In this first phase of the western world's new plunge into defence economics, many of the studies now reaching fruition are perforce dominated by assumptions that are fast becoming out of date. This is certainly true of the report on International Investment approved by the OEEC Council on September 4th. The report envisages a continuation of a world dollar shortage that has to be met in the main by substantial exports of capital—if possible, private capital—from the United States. It emphasises that only in such conditions will the countries in receipt of Marshall Aid be able to contemplate a return to completely multilateral trade and convertible currencies. Starting from this basic (if now somewhat questionable) assumption, the report makes certain recommendations which would encourage the export of American capital. Some of these recommendations are aimed at the prospective borrowing countries, others at the lender. To encourage private investment, the OEEC countries are advised to give continuous attention to the possibility of relaxing their controls on foreign investment, especially those concerning the repatriation of dividends and capital and the transferability of securities held by non-residents. The report points out that much has already been done in this field. The most recent example of such relaxations is that provided by Britain's recent concessions on the "switching" of sterling securities held by non-residents.

So far as the lenders, and in particular the United States, are concerned, the report makes many constructive suggestions. The United States should encourage its nationals to invest overseas by such specific measures as preferential tax treatment of investments in areas other than the western hemisphere, a reduction in the cost of registration of investments by the Securities and Exchange Commission, reduction of underwriting charges, and greater co-operation with borrowing countries in the field of double taxation. The most important recommendations made in the report are those referring to the removal or reduction of the non-commercial risks in foreign investment. In the main these are transfer risks and risks arising from political developments such as nationalisation and expropriation. The responsibilities in this particular sphere lie with the Governments of both borrowing and lending countries. The duty of the former is to maintain general economic stability and to pay fair compensation if foreign property is taken over by the authorities. That, however, is highly generalised advice. Of much more specific character is the suggestion that the United States Government should be prepared to underwrite the transfer risk inherent in all foreign investment as it already does for investments made with ECA guarantees. The practice should be extended and carried into the post-ERP period. The report also comments on the lending policies of the Export-Import Bank and International Bank. In particular it recommends that Export-Import Bank loans should be "untied," and that the cost of borrowing from the International Bank should be reduced. All this is unexceptionable advice that deserves to be followed—even if the dollar gap, on the existence of which the whole of this report is predicated, does not remain the world's principal economic problem in the years to come.

* * *

Debenture Placings

Several separate questions are raised by the recent private placings of large debenture issues by industrial giants; since it is unlikely that such placings are at an end, it is important not to get these questions mixed up. The fact that these placings have been of debenture capital need excite little comment; preference or ordinary capital issues would attract Profits Tax at the higher rate on the dividends, and there is no reason why companies should reduce their reserve provisions to satisfy the arbitrary incidence of Profits Tax if they can avoid doing so. That point would be equally true of a public issue of new debenture capital. It happens, in addition, that the private placing offers other material advantages to large borrowers and to institutional lenders; they can avoid all the costs and complication of a public issue, and the institutions immediately acquire large blocks of high-grade stock on favourable terms free of expenses.

Thus both sides to such transactions are well pleased. It is not merely the avoidance of fiscal frictions, such as Profits Tax and the 2 per cent. Stamp Duty, that makes them so. The fact that no public dealings are involved in the placed stocks is no hardship to the private subscribers, for their particular requirements are well satisfied with relatively short-dated stocks that they are quite prepared to hold for the full term, at yields fully comparable with those obtainable in the market. To argue that it is inappropriate for borrowers and lenders to seize such advantages would be absurd. Yet the new method has its dangers. Within the last week or two some £30 million has been so placed—a total almost as great as the whole of the debenture borrowing on the open market by British industry this year. The recent placing of £20 million 4 per cent. unsecured loan stock 1958-60 by Imperial Chemical Industries has been followed by an issue by Distillers, similar in its main elements but containing certain special features. This consists of two series of unsecured loan stock, the first of £4,000,000 3½ per cent. stock issued at par and redeemable in four equal annual instalments from 1952 and the second of £6,000,000 3⅛ per cent stock repayable in six annual instalments from 1956. Conceivably there are other large companies in need of new finance—Unilever may be one—that may have operations of this sort in mind.

From the viewpoint of the capital market, the short-circuiting of such valuable business into private channels is obviously unwelcome. The machinery of the market is not what it was and it may occasionally have lost business on that account. To regain something of its former efficiency, the market needs more business, not less; there may, therefore, be something in its point that by taking the direct route to institutional investors, the industrial giants may obtain a present advantage at the risk of doing permanent damage to the established machinery for providing industrial finance. Of course, the situation would be immediately changed if the inequities and anomalies of the Profits Tax were removed, and if the cost of new investment (particularly the heavy burden of stamp duty) was lower. Then, presumably, industrial borrowers would be prepared to consider equity or preference issues on their own merits, without having their minds made up for them by the arbitrary impact of prejudicial taxation. But the question would still remain whether, in the absence of sufficient institutional support (which presumably would be more difficult to attract to equity issues comparable in size with that of these recent debenture placings) the personal investor would provide sufficient savings to fill the need.

Permanent Settlement with Egypt?

There can be few tasks less congenial than that which is likely to confront the British negotiators in the discussions on a "long term or permanent settlement of Egypt's sterling balances," planned to start in November. These balances amounted at the end of last year to £322 million, of which £253 million was blocked. The Egyptians' efforts recently have been directed not so much to securing releases from this blocked account (since they have plenty of sterling in their Number One account already) as to securing convertibility of their sterling into dollars and to getting "essential goods" (including oil) from the sterling area. When the long term negotiations

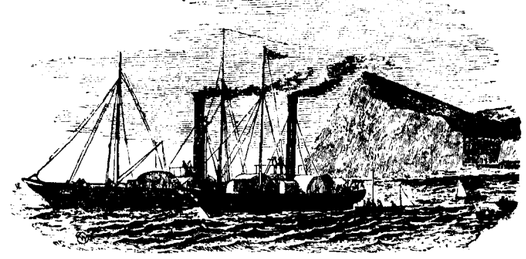
A sensible policy for process steam No. 18

Thermostatic control simplified

BY SPIRAX

The reason why so many heating and cooling installations are still controlled (neither well nor economically) by hand, is an impression that the cost of providing thermostatic control would be out of proportion to the gain. The impression is more often wrong than right.

But it must be said there are other reasons, notably a somewhat quaint refusal to recognise the obvious. (*As an aside from steam we might mention the single large example of controlling Diesel engine cooling.*)



The point emphasised by our notes this week is that for a wide range of steam and allied applications in heating and cooling there are simple thermostatic control systems and devices that are both reliable and comparatively inexpensive.

A great advantage is their self-operating, direct-acting principle; which means they are capable of quite heavy duties without needing any auxiliary power and are just as effective at 0°F. as at 300°F.

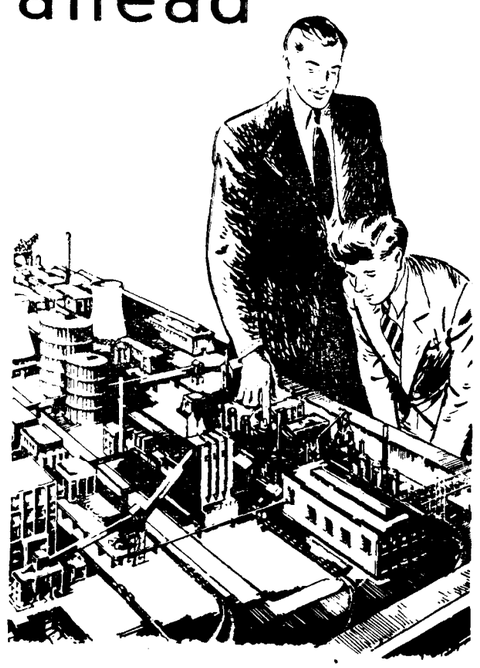
From such small things

Will it work? Shall we be in touch with Calais to-night? These thoughts must have filled anxious minds 100 years ago, as from Dover there started the first attempt to create telegraphic communication with France. The giant drum on the deck of the paddle tug "GOLIATH" coiled with 30 miles of wire began to turn. Within ten hours the cable had been laid successfully and the submarine telegraph had triumphed.



To-day the 155,000 miles of ocean cables, owned and maintained by Cable & Wireless Ltd., are constantly humming with news flashes, business deals and communications of State. The Company operate overseas telegraph stations in the Crown Colonies and many foreign countries. Their cables link United Kingdom postal telegraph offices with the commonwealth cable network.

Steel looks ahead

NEW MACHINES

NEW METHODS for a new world

Progress in the British Steel Industry is shown by the remarkable increases in steel production achieved by managements and workers since the war

This progress must continue. A million pounds a week is being spent on the development of the steel industry — new steel works in the right places for efficient and economical working, new machines and new methods to keep production up and costs down.

Expanding exports and full employment at home calls for the initiative and enterprise of a progressive steel industry.

STEEL is serving you well

BRITISH IRON AND STEEL FEDERATION

start in November the precipitate demands for convertibility should be countered by a British demand for scaling down the debt, which is, after all, largely the consequence of the bill that Britain in effect paid to Egypt for saving Cairo from Axis occupation.

Pending the conclusion of these long term negotiations, the Anglo-Egyptian Financial Agreement of 1949 will remain in force "merely as a working arrangement." Apparently, therefore, Egypt will not be granted any new sterling releases or dollar drawing rights in the remaining months of 1950. Britain has agreed, however, that it will facilitate the supply of £7,500,000 of petroleum products to Egypt in 1950 and that Egypt will be able to buy £43 millions of "essential" and £9,000,000 of "inessential" goods from the United Kingdom this year.

Canada's Defence Budget

The Canadian rearmament effort launched since Korea is expected to lay claim to another 3 per cent of gross national output—much the same order of magnitude as the claim likely to be made in the end by the new defence measures now projected in Britain. The Canadian Minister of Finance has estimated that the additional expenditure to be incurred this year may reach $244 million; it is to meet this immediate expenditure that he introduced a new "pay-as-you-go" Budget last week. This Budget contains proposals for a 5 per cent increase in corporation income tax and in the excise tax on automobiles. In addition, a heavy new tax is to be imposed on sales of soft drinks, candy and chewing-gum, the tax on alcoholic beverages is to be increased, and a number of "inessential" consumer goods are to be brought within the orbit of new and higher indirect taxation. Personal income tax is to remain unchanged at the moment; this important potential source of additional revenue, the Minister sombrely warned, is to be kept in reserve for the present.

The new tax proposals would provide revenue estimated at $59 million for the rest of this year and at $189 million for a full year. Set beside the immediate estimated increase of $244 million in defence expenditure, these figures might suggest that Canada is relying on hope (and on inflation) for the finance of a large part of its defence programme. Against this, however, many Canadians believe that the original Budget for 1950 was drawn up on over-pessimistic assumptions; revenue, production and overseas trade figures are currently soaring well above estimates. Moreover, the Canadian Government intends to set afoot immediate measures to reduce consumer credit and the mounting volume of cheap loans for housing and farm improvements. From this side of the Atlantic British observers might therefore be wise to refrain from drawing too much attention to a certain mote in their brother's eye.

Survey of Steel Usage

The British steel industry is now engaged in drawing up the further development plan—designed to provide the efficient capacity required to meet demand for steel products in 1960—that will need to be undertaken when the industry's present expansion programme is completed. A useful by-product of this work is a survey of the pattern of steel consumption last year, which the Iron and Steel Federation has made as "an essential preliminary to the detailed assessment of requirements" in ten years' time. The results were reviewed in the federation's *Statistical Bulletin* for July. Because of the arbitrary character of the classifications used by the now defunct steel distribution scheme, "estimates of industrial usage based on the old distribution statistics can make no claim to precision"; the federation has made arrangements with steel producers and users which will, it thinks, produce better statistics in future. In the meantime it has arrived "by various laborious processes" at a set of estimates which it thinks are reasonable of the steel deliveries to broad industrial groups in 1949.

FINISHED STEEL DELIVERIES TO INDUSTRIES, U.K., 1949

	'000 Tons	Per cent
Shipbuilding and marine engineering	925	9·0
Building and contract (road engineering)	1,390	13·1
Mechanical engineering	2,430	22·8
Electrical engineering	960	9·5
Motors, cycles, aircraft	1,045	10·2
Railways and rolling stock	850	8·5
Collieries	555	5·4
Hardware, hollow ware, etc.	980	9·5
Rivets, bolts, nuts, springs, etc.	500	4·9
Wire and wire manufactures	685	6·7
Other	475	4·6
TOTAL	10,270	100·0

The accompanying chart and table give an idea of how, in the federation's estimates, the pattern of steel usage in Britain has been changing. It confirms what common observation would have suggested. The demands of mechanical engineering, of the road vehicle and aircraft industries, and of electrical engineering have increased immensely. These metal-using industries are bearing the brunt of the export drive; they have provided for the heavy investments in industrial plant since the war; they are furnishing the equipment for the electric power programme. In contrast the use of steel for building (for example) has been immobile. The increase in "automotive" uses for steel reflects a world-wide trend; already these uses take about a quarter of the entire consumption of steel in the United States, while in Britain they take about a tenth. The collieries, though they produce less coal than formerly, have been investing largely in machinery and they are using more steel and less timber for supports. Apparent consumption of steel per head in Britain rose from about 326 lb. (ingot equivalent) in 1924 to 409 lb. in 1935 and 642 lb. in 1949. This is nearly twice the western European average, but not much more than half of the consumption per head in the United States.

* * *

Odeon Retrenches

The Odeon group is making a first beginning on the long task of restoring a sounder trading position after its disastrous adventures in large-scale film production. New policies of retrenchment have begun to show results—satisfactory as far as they go but not sufficient to demonstrate that the group is now fairly set on a course to financial recovery. The main emphasis in the past year has been the reduction in film-making commitments—"at the same time preserving a nucleus production organisation geared to a modified production programme." To reduce heavy bank borrowing, the group has been putting "non-essential" properties on the market; the Shepherd's Bush studios were one of these. The management has conducted a campaign to reduce overheads.

Film productions are valued in the group's balance sheet dated end-June at £7,050,237; a year earlier the figure was £10,713,579. The basis of valuation—"the estimated ultimate net producer's share of film revenue"—is unchanged, and it is remarked that the aggregate valuation thus determined is less than the films cost to make. There is no hint that production might be made to pay; it is merely being reduced in scale, and the cuts would no doubt have been greater if the precipitate shedding of these commitments were not a costly operation in itself.

If the storm raised three years ago (when Odeon Theatres was saddled with the production commitments of General Cinema Finance Corporation) has abated, the calm is still uneasy. Outside ordinary shareholders in Odeon Theatres, who have watched their shares oscillating between 7s. 6d. and 15s. in the past year, will hardly enjoy the exercise of attempting to learn from the accounts what their position might have been without the GCFC attachment. As it is they have received no dividend and to hold the shares now at 13s. 3d. surely represents a great act of faith, hardly justified by last year's performance. The consolidated trading profit of the Odeon group after production and other losses was £3,293,426—on the face of the figures, more than twice the trading profit of the previous year. But this is not the right point of comparison; even after adding in £1,082,298 profits on the sale of fixed assets, special credits and items relating to prior years, with a further sum of £622,084 from various sources, an adverse balance of £124,828 remains on the year after the deduction of all charges, including taxation and minority interests in subsidiaries.

The group's bank indebtedness has been reduced from £16,286,581 to £12,950,036; of this amount £5,350,000 arises directly and other amounts indirectly in respect of "film production and distribution." It may seem strange that a group already indebted on this scale should be proposing to render financial as well as technical assistance to independent producers. But the financial help takes the special form of distribution guarantees, which have become one of the standard services supplied by distributors to the industry. Such arrangements help to keep the group's cinema screens filled and its studios and film-making equipment in use. But the accumulated burdens of the group and the past year's indifferent experience on the cinema side (no longer, it seems, the handsome profit-earner even when it is not overwhelmed with demands to finance film production) suggest that there is a long way indeed to go before the group can claim that its financial stability is assured.

Prospect for the Radio Industry

The intention of the Radio Industry Council in holding its annual exhibition this year in Birmingham was to stimulate sales of television receivers in the Midlands, where they have been slower than in London. No doubt the exhibition will provide that stimulus. Television manufacturers are reported to have planned an output of 60,000 receivers a month in the autumn; output for the year will be about 500,000 receivers. The question now is what effect the defence programme will have on production next year; none is likely to be felt in the few months that remain of 1950. Apart from any direct orders for military equipment that might be placed with the radio firms, the flow of components may well be interrupted. There are 200 in an average television receiver. The component manufacturers will become increasingly occupied with defence orders because they supply vital parts not only for radar and similar equipment, but for control mechanisms which are now being more widely used on weapons and equipment of many kinds.

There is little immediate threat to the television transmission expansion schemes. Transmitters for the new stations have been ordered and at least two have been delivered and are now in storage. The transmitters themselves and the network of radio relay links and co-axial cables which will run between them are so valuable an asset to communications in war that no obstacle is likely to be placed in the way of their rapid completion. As transmission is expanded the potential market for television receivers will expand. But it may be questioned whether receiver production will keep step.

(Carton Manufacturers)

ANOTHER SUCCESSFUL YEAR

MR FRANK W. J. SMITH'S STATEMENT

The fifty-third annual general meeting of Cropper and Company, Limited, was held on August 31 at the registered office of the company, Tha.cham, Berkshire, Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's statement circulated with the annual report and accounts for the year ended June 30, 1950:

You will have noticed from the report and the accounts submitted herewith that the company has had another very successful year, and with one exception, the year under review has proved to be the best in the company's history. The net profit after making all deductions except for taxation, amounts to £203,141, which is approximately £41,000 more than for the previous year.

In view of the increased profit and the strength of the financial position, the directors recommend that a dividend of 15 per cent. and a bonus of 10 per cent. be paid on the issued ordinary share capital, which, you will recollect, was increased during the year by a bonus of one share for every four shares held.

We have added to reserve, out of the profit for the year, the sum of £44,552, thus replacing the amount withdrawn from reserve on the distribution of the bonus shares, to which I have already referred, and we have added £10,000 to reserve for replacements.

For several years past large sums have been added to reserve each year out of profits with a view to strengthening the financial position of the company instead of distributing such profits by way of dividend. In my opinion the shareholders are entitled to reap some reward for this, and there is ample justification for the payment of an increased dividend this year.

CONTAINERS LIMITED RECORD YEAR

Our wholly owned subsidiary company, Containers Limited, has just completed the best year in its history, both for profit and tonnage of output. The profit is included in the consolidated accounts printed herewith, but we have only brought into the accounts of Cropper and Company, Limited, the actual amount of the dividend received from our subsidiary company.

Colthrop Board and Paper Mills, Limited, in which this company has a large financial interest, has also had a very satisfactory year.

At this point I should like to draw your attention to the fact that the value of our investments in Containers Limited, and Colthrop Board and Paper Mills, Limited, stand in our books at only £138,395, although the actual value is, of course, much greater. Also, you have probably noticed that the current assets amount to £704,358, against current liabilities and provisions of £223,568.

Our company and Containers Limited, have received delivery during the year of additional machinery, which has been on order for some time and the purchase of which has been financed entirely out of profits. Some of this machinery is not yet in operation. More machinery of the latest type is on order, and I am confident that we may expect satisfactory results in the future, providing the demand for our products is not interfered with by events beyond our power to control.

Mr Digby L. Cropper, who has been connected with the company for 54 years, tendered his resignation as a director as from June 30 last. The directors appreciate the loyal service rendered by him to the company extending over such a lengthy period and have accepted his resignation with much regret.

In conclusion, I must thank my colleagues on the Board and the staff and employees for their work during the year. The increased profit is almost entirely due to increased output, and this in turn is due to their unceasing efforts.

CHAIRMAN'S REMARKS

Addressing the meeting, the chairman said: The directors are very pleased to be able to place such satisfactory accounts before you and they trust that you are just as pleased to receive them. Whether we examine the parent company's accounts or the consolidated accounts everything appears favourable, and so far as I can see the outlook is good.

You are doubtless aware that, as requested, we limited our dividend during the last two years to the amount distributed in the previous year. We could easily have declared a higher dividend, as in fact we placed no less than £130,000 to various reserves during those two years. Now we think the time has come to increase the dividend. This does not mean that we are neglecting the reserves, as we are transferring over £54,000 this year, and as the dividend we propose is covered three times by the parent company's profits or four-and-a-half times by the consolidated profits, the distribution is well within our resources.

The report and accounts were unanimously adopted, and the dividend and bonus as commented were approved.

The chairman, in moving a resolution approving the grant of a pension to Mr Digby L. Cropper, said that as shareholders would have seen from the report Mr Cropper had been in the service of the company for 54 years, and he had been a director for the last 34 years. He had always been a full-time executive officer and had been mainly connected with the selling end of the business. Not unnaturally, after such a long time he had expressed a wish to retire and had tendered his resignation as at June 30th last. The directors had accepted his resignation with great regret; and in order to mark their appreciation of his long and loyal services it had been decided, subject to shareholders' approval, to grant him a pension for the remainder of his life.

The resolution was carried unanimously. The retiring director (Mr J. R. Henry, O.B.E.) was re-elected, and the remuneration of the auditors (Messrs Deloitte, Plender, Griffiths and Company) was fixed.

TRIBUTE TO DIRECTORS AND STAFF

Mr E. A. B. Cansdale, in proposing a cordial vote of thanks to the chairman, directors and staff, said he had held shares in the company for thirty years and he was sure all shareholders had complete confidence in the management. He considered that the balance sheet showed a marvellous state of affairs. The issued capital was small, there were no debentures or even a mortgage, and the land on which the premises had been built stood in the balance sheet at cost, £940; as the company had been running for 52 years, he was sure it was worth very much more than that figure. The same remark applied to the shares in Containers, Limited,

which stood in the balance sheet at £69,202, and, according to his calculation, the investment in Colthrep Board and Paper Mills, Limited, was worth about £130,000, against a balance sheet figure of £69,193.

He concluded by expressing his gratitude to the directors and also to the secretary.

Mr E. Royden Alltree, in seconding the motion, expressed the opinion that the continued success of the Group was due to virile leadership, and the fact that the company had experts in charge of every department of the business, and a very hard-working and loyal staff.

The resolution was carried unanimously, and after a brief acknowledgment by the chairman the proceedings terminated.

JAMES HOWDEN AND COMPANY, LIMITED

(Boiler, Auxiliary and General Engineers)

A SATISFACTORY YEAR

RECORD ORDERS ON HAND

MR CRAWFORD HUME'S STATEMENT

The forty-fourth annual general meeting of James Howden and Company, Limited, was held on September 6th at 195, Scotland Street, Glasgow, Mr Crawford W. Hume, M.I.N.A. (chairman of the company), presiding.

The secretary (Mr James S. Niven) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement, which had been circulated with the report and accounts and was taken as read:—

The accounts for the year ended April 30, 1950, have been drawn up on the same lines as before, and you will be gratified to see from these that this has again been a satisfactory year. The profit, before taxation, amounts to £324,234, as compared with £278,822 for the preceding year, and has enabled the directors, so far as taxation will allow, to consolidate still further the company's position.

Provision has been made in the accounts for profits tax for the year to April 30, 1950, as well as a reserve for income tax on the profits for the year to April 30, 1950. The sum of £175,447 has been appropriated for this purpose.

GENERAL RESERVE £350,000

The general reserve account has been increased to £350,000 by the transfer of £40,000.

The directors recognise that the nominal amounts which have appeared in the balance sheet for a number of years under the headings goodwill and patents have been completely unrepresentative of their true value which is very great indeed in a business such as this. They consider that these nominal values should now be extinguished from the balance sheet, and they have applied £60,000 to write these off completely.

The directors recommend that the dividend for the year be maintained at the same rate as last year by the payment of a final dividend of 22½ per cent. (£33,784), making with the interim dividend of 7½ per cent. (£11,261) a total dividend for the year of 30 per cent. (£45,045).

After making these appropriations the balance carried forward amounts to £46,522 as against £42,780 last year.

CONSOLIDATED BALANCE SHEET

Referring to the consolidated balance sheet, it will be seen that there is an increase of £258,119 in the item sundry debtors which, together with the increase of £106,778 in stock in hand and work in progress, is the result expected from the increase in production at the main works and Craigton factory. These increases are also reflected

on the liabilities side by an increase in sundry creditors and accrued charges of £57,154 and a bank overdraft of £96,516.

Both buildings and plant have been maintained at a high standard of efficiency and new plant is being installed as required. The new research buildings referred to last year are now practically ready for use and will be valuable in providing facilities for the technical development of the company's products. Provision has been made in the accounts for depreciation including initial allowances on buildings and plant added during the year.

INCREASED DEMAND

The orders on hand constitute a record and the company continues to benefit from the increasing power consciousness to which reference was made a year ago. The demand both at home and overseas for its special equipment used in power plants both on land and sea continues and increases. This is in direct proportion to the realisation that the standard of living depends not only on the good will and enthusiasm of each individual producer but on the power available behind him to harness to his special production requirements. This realisation is no longer restricted to a few minds in what used to be considered the main industrial countries of the world. Fortunately, in these countries it is now widespread and in this country, at least, it is no longer largely affected by political bias but is recognised as an economic fact. The realisation of this fact is now growing also in countries which used to be considered as overseas providers of raw materials and consumers of finished goods. This overseas awakening increases the demand for the power equipment we make and, it is hoped, should continue to do so because it will be a long time before many of these overseas markets in which we participate will produce or will want to produce the special kind of equipment they obtain from the older industrial countries.

TRIBUTE TO STAFF AND WORKPEOPLE

Close personal touch continues to be maintained with our overseas branches and representatives with results beneficial to the company's business.

It is a pleasure to record again that the company continues to enjoy the loyal co-operation and support of the administrative and executive staff and the workpeople. I should not like to let this opportunity pass without thanking on your behalf every employee for his faithful and friendly service.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr J. J. Craik Henderson and Mr James S. Niven, were re-elected; and the remuneration of the auditors, Messrs. Wm. Hart Jr. and Wilson, having been fixed, the proceedings terminated.

BOULDER PERSEVERANCE LIMITED

DIFFICULT CONDITIONS CONTINUE

The twenty-sixth annual general meeting of Boulder Perseverance, Limited, was held on September 14th in London. Dr K. B. Edwards, B.Sc., Ph.D. (London), F.R.I.C. (chairman and managing director), presided.

The following is an extract from his circulated statement:—

During the period under review the operations of your company and its subsidiary company, Kalgoorlie Enterprise Mines, Limited, have been carried on under very trying conditions. In May, 1949, underground operations on the Perseverance Mine were brought to an almost complete standstill by the breaking of the pinion shaft of the main winding engine. No damage to property or personnel ensued and by very creditable efforts by your staff a repair was made and the stoppage of operations was confined to ten days.

In September, 1949, the devaluation of British currency in terms of the dollar increased the price of gold to £15 9s. 10d. in Australian currency. The price of gold in dollars still remained unchanged and the spiral of inflation continues unchecked with costs chasing wages. The price for gold in Australian currency is now 73 per cent. above the average price obtained in 1938, but any change in the value of Australian currency to British currency will materially affect this figure.

LABOUR TROUBLES

For the first time since the company was re-formed in 1923, labour troubles on the mines themselves arose at the end of January, 1950. In all mines on this field, most of the underground work is done by contract, which is a form of piecework. The contractors refused to continue work on the existing terms and demanded very large increases.

A settlement has been finally arrived at, involving a very material increase of rates, and therefore costs. At the end of the period under review the minimum wage for any worker on the mine was £9 4s. 8d., which is 89 per cent. increase on 1938. Figures recently supplied showed that contract workers on the new rate were making an average of £17 10s. per week, while still further increases of day wages are being granted.

Increases in wages continue to be made at regular intervals, and further wage demands are under arbitration at the moment; therefore it is not possible to make any accurate assessment of the results of future operations, as the price of gold is still fixed and its use and possession subjected to confiscatory regulation.

The report was adopted.

GOLD COAST SELECTION TRUST, LIMITED

MAJ.-GEN. W. W. RICHARDS' STATEMENT

The twentieth annual general meeting of Gold Coast Selection Trust, Limited, was held on August 31st in London.

Major-General W. W. Richards, C.B., C.B.E., M.C., chairman of the company, presided.

The following is an extract from his circulated statement:—

Dealing first with our accounts, it will be seen that on the revenue side we received £78,167 as dividends and interest, and we made a profit on sales of investments of £22,760. The net result for the year was a profit of £71,130. The credit on profit and loss account carried forward is £323,742.

Our investments are represented by shareholdings in Amalgamated Banket Areas, Limited, Ariston Gold Mines (1929) Limited, Bremang Gold Dredging Company, Limited, Gold Coast Main Reef, Limited, and Marlu Gold Mining Areas, Limited. The book value at September 30, 1949, was £1,623,241 and the aggregate value at Stock Exchange prices on that day was £2,262,334.

All five companies are now making very good progress. The net aggregate profit of these companies in 1949 was £415,144, which compares with a net aggregate loss in 1948 of £12,331. There is every indication that the figure for 1950 will exceed that of 1949.

Shortage of labour, and in particular in the underground sections of the mines, has been a difficult problem for most mines.

The chairman announced an interim dividend of 7½ per cent., less tax, for the year.

The report and accounts were adopted.

THE MORGAN CRUCIBLE COMPANY LIMITED

TRADING AND PROSPECTS

MR P. LINDSAY'S VIEWS

The sixteenth annual general meeting of The Morgan Crucible Company Limited will be held on September 27th at Battersea Works, Battersea Church Road, London, S.W.11.

The following is an extract from the statement circulated with the report and accounts by the chairman, Mr P. Lindsay, O.B.E., M.C.:—

The wide range of products of your company has helped in the past to cushion our overall trade against adverse trends in particular lines. This cushion has worn thin nowadays, owing to the fact that current world political factors have so large an influence on national and international trade. Even so, we still experience relative improvement in one section of the business and the reverse in another; this must be taken into account in any general observation I make on trends and prospects.

In my last report I mentioned a droop in the curve of sales which became apparent towards the end of that (1948/49) financial year. This reached a low ebb by the middle of the year under review, after which the tide turned. Curiously enough, whereas the fall applied to home sales and was counteracted to a considerable extent by export sales, the reverse trend set in during the last half of the financial year. The slight fall in our export sales (still an appreciable proportion of total turnover) is due partly to a natural shrinkage of postwar abnormal demand, coupled with more active foreign competition. A more potent factor however results from the national import licensing policies of many of our overseas customers. In many cases such customers, though in urgent need of our products, have been unable to obtain licences to import, in spite of persistent appeals. Against this, thanks to the quality of our products, we have been fortunate in being allocated still a certain volume of business from buying agencies of countries behind the iron curtain.

The nett result of these favourable and unfavourable trends is a drop in turnover, resulting in a reduction of £60,000 in trading profit before taxation. Our barometer of profit is particularly sensitive to changes in turnover, as the capital necessary for the conduct of a business such as ours is relatively high in relation to sales turnover, and the ratio of our indirect to our direct expenses is high also.

Current depreciation of postwar industrial profits disregards the sombre implication of the mountain of postwar fixed or indirect expenses which, like production costs, have been seriously increased by general inflation, new factory legislation and social reform but which, unlike production costs, do not ebb and flow with sales turnover.

It is fair to say that had not an exceptional turnover produced a good profit rate during the period of the postwar sellers' market there would be a record of losses throughout industry under normal market conditions such as now are beginning to be experienced.

Far from being opportunist during the postwar boom, most manufacturers—ourselves included—have been quixotic in not raising prices to keep in step with rising costs; a laudable policy perhaps, but fraught with unpleasant consequences when markets shrink and industry, impoverished by taxation, faces deflation. Subject to this, we are not apprehensive as to future prospects, thanks to the goodwill of our customers and the hope that capital recently spent and reorganisations effected will reduce our marginal cost.

THE TATA IRON AND STEEL COMPANY LIMITED

INCREASED PRODUCTION AND PROFITS

Presiding at the annual general meeting of the Tata Iron and Steel Company, Limited, held on August 24th at Bombay, Mr J. R. D. Tata in his opening remarks referred to the loss sustained by the company and the nation in the death of Sir Ardeshir Dalal, vice-chairman of the company, and to the welcome return to the board of Dr John Matthai, until recently Finance Minister of the Government of India.

ECONOMIC SITUATION

In a review of the economic situation, Mr Tata referred to the taxation relief in the current year's Budget; to the persistence of the severe financial stringency; to the Nehru-Liaqat Ali Pact; to the check imposed in the previous year on inflationary tendencies which, however, were reappearing with the increase in the international tension; and to the temporary spurt given to the export trade by devaluation, the full effects of which were, however, frustrated by the political and trade difficulties between India and Pakistan.

PRODUCTION

The company's production and profits for the year had increased by about 56,000 tons and Rs.75 lakhs (£562,500) respectively as compared with the previous year. Negotiations were still proceeding with Government over the scheme to increase the output of the plant at Jamshedpur from its present capacity of about 750,000 tons of finished steel to about 935,000 tons, at a capital cost of about Rs.12 crores (£9,000,225) excluding skelp and tube mills, and about Rs.16 crores (£12,000,300) including them. Government was also still giving consideration to its own project for the construction of one or two new steel works.

DEPRECIATION ALLOWANCES

Mr Tata dwelt at some length on the need for Government to revise the method of granting depreciation allowances to the industry for tax purposes. As the existing special depreciation allowances were granted only in respect of new plant, and in any case did not exceed 100 per cent. of the original cost, they did not help to solve the problem of replacing old plant at two or three times the original cost. To the extent that deductions allowed for tax purposes did not cover the current replacement value of old assets, the present system resulted in taxing non-existent profits. Mr Tata suggested a special depreciation allowance on plant installed before 1940 approximating to the average increase in costs since the war, such special allowance to be used solely for renewals and replacements. Government should appoint a committee to advise on a solution to this problem.

CONVERSION SCHEME

The scheme for the conversion of deferred shares into ordinary shares, which could not be put through in the previous year, was under active reconsideration at the express request of Government. Shareholders were assured that the board had no intention of raising fresh capital in the immediate future. As regards the conversion ratio, the board were considering a procedure of quasi-arbitration by an independent party to whom representatives of both classes of shareholders would present their case.

The report and accounts were adopted.

NU-SWIFT LIMITED

ADVANTAGES OF PRESSURE-OPERATED FIRE EXTINGUISHERS

APPROVAL BY FIRE OFFICES' COMMITTEE OF PRINCIPAL MODELS

Mr A. Harland, the chairman, presiding at the seventeenth general meeting of Nu-Swift Limited, held at the Nu-Swift Factory, Elland, Yorkshire, on July 10th, said:

The accounts for 1949 justify the policy of intensive research pursued since the company in 1943 came under new management. The new Air Foam Extinguisher, which, like all the other types of extinguishers manufactured by us, is operated by a sealed carbon dioxide charge, has been described by one fire-fighting authority as "the one outstanding advance made during the last 50 years in first-aid fire-fighting of inflammable liquid fires." The Air Foam Extinguisher is protected by master patents throughout the world.

The advantages of operating fire extinguishers by means of sealed pressure charges are enormous. Instantaneous action, increased reliability and fire-fighting efficiency and low maintenance cost are among the valuable features of Nu-Swift pressure-operated extinguishers. Your company is to-day the only concern able to supply such pressure-operated extinguishers for each of the three chief fire risks. All our extinguishers are operated in an upright position. The advantages of a uniform and easy method of operation are self-evident, particularly where several models have to be installed to cover different risks.

Our principal models are now made to British Standard Specifications, and after tests by the Department of Scientific and Industrial Research and the Fire Offices' Committee Joint Fire Research Organisation have been fully approved by the Fire Offices' Committee.

Exports continue to absorb a large proportion of our output, and Nu-Swift Extinguishers are on sale in 32 countries. We are still seeking to extend our overseas representation to countries or territories where we are not represented. We are proud to be able to continue to state that Nu-Swift serve "In Every Ship of the Royal Navy." Nu-Swift Extinguishers are also standardised in the Commonwealth Navies, in several foreign navies and in the fleets of many progressive shipowners. Through our Toronto subsidiary, Nu-Swift (Canada) Ltd., we supply the Royal Canadian Navy.

In every part of the British Isles there is now stationed a Nu-Swift man ready and able to advise industrial and commercial undertakings as well as the general public on their fire-fighting problems. It is true that first-aid fire-fighting appliances cannot put out large fires, but a small fire tackled in its early stages by a rapid, efficient and reliable extinguisher may never become a big one. Unfortunately, few people realise that it is before, and not after, they have a fire that our service to them in checking whether their fire-fighting equipment is efficient and up to date is likely to be of most value.

On the proposal of the managing director, Mr F. Graucob, the retiring director, Mr G. W. Smith, F.C.A., was re-elected, and the report was adopted.

WM. CORY AND SON, LIMITED

LARGER PROFIT

The Rt. Hon. Lord Leathers, C.H., presided on August 24th at the fifty-fourth annual general meeting of Wm. Cory and Son, Limited, held in London.

The following is an extract from his statement circulated with the accounts:—

The net profit for the year is £652,789, representing an increase of some £22,000 over that of the previous year. The year showed a slight fall in the total tonnage of coal distributed by the company in this country, but the volume freighted by our fleet of coasting vessels was greater than in the previous year. Our river discharging stations were helped fully to maintain the previous year's tonnage by a greater number of bulk cargoes other than coal.

COAL AND OIL

While exports of coal from this country were greater in 1949, and were substantially towards the higher target, this year is not so promising, and with additional allocations for domestic and industrial requirements at home, exports are bound to suffer unless the output can be stepped up. It is mainly by a substantial increase in output that our coal-mining costs can be reduced to give this country a better chance to hold its markets overseas in the years immediately ahead, and the miners' response should be in full measure, since their stake in the success of the industry is the major one.

The oil department tonnage in the year covered by this report was 15 per cent. greater than in the previous year, itself a record. In addition to the increase in the bunkering side of the oil department, successful efforts have been made in other branches of the industry.

THE SUBSIDIARIES

The Cory Group's subsidiaries in South Africa had a much improved year in 1949, railway wagons being in more adequate supply both from the Natal Collieries to Durban and from the Transvaal Collieries to Lourenço Marques. In addition to the normal coal exports we are participating in large contracts for shipment to Australia and Pakistan.

The company's subsidiary operating in South America, while active in other directions, has suffered in its coal operations through the greatly reduced coal imports permitted by those countries.

John Kelly, Limited, of Belfast, and its subsidiary companies, which business was acquired jointly by Powell Duffryn, Limited, and your company, continues to maintain its trading with satisfactory results.

The report was adopted.

NOTICES

APPLICATIONS are invited from graduates, preferably in Science, Textiles or Economics, for appointments as a Lecturer on various aspects of Wool in all types of Schools, Training Colleges, Adult Clubs, and Retail Stores throughout the country. Lectures are illustrated with film strips, and the work entails considerable mid-week travelling. Training will be given after appointment. Salary from £400 per annum with superannuation (after qualifying period), subsistence allowance and travelling expenses.—Applications should be made to the Director of Education, International Wool Secretariat, Dorland House, 18-20, Regent Street, London, S.W.1.

THE greatest "names" in business are those whose directors realise—and apply—the power of advertising. Under the direction of highly skilled and experienced Agency executives, Samson Clark's advertising brings *results*.—Museum 6050.

ANGLO-GERMAN legal qualifications and experience offered for Banking, Legal or Commercial post by British Barrister, aged 37. Foreign Office employment just terminated. Good knowledge of both English and Continental business conditions.—Box 492.

COMPUTING and statistical help by experts. Data of all types analysed, with statistical tests if required. LAN. 1187.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 9, 1950, total ordinary revenue was £57,647,000, against ordinary expenditure of £55,746,000 and issues to sinking funds £380,000. This, including sinking fund allocations of £8,113,000 the surplus accrued since April 1st is £91,818,000 compared with £25,198,000 for the corresponding period a year ago.

Mr Attlee's Responsibility

THE debate on the nationalisation of steel on Tuesday followed the expected course to the expected end, strictly party speeches leading to a strictly party vote. The Government, as it will on every grand occasion of which due notice has been given, got its tiny majority. The debate, in fact, served very little purpose but to reveal how completely the Government's decision to hurry on with the nationalisation of the steel industry has broken the sense of national community which had been growing all through the summer—and of which Ministers and their party were inevitably the beneficiaries—and has brought back the dark atmosphere of the bitterest party conflict.

It would be unjust to the Prime Minister to suppose that he did not know that this would be the effect or that he was indifferent to it. He may well have felt that an outburst of bitterness over the steel industry was inevitable at some time in the next twelve months. He naturally intends to remain in office, with or without an election, throughout next year, and to defer the nationalisation of steel beyond December 31, 1951, would require the initiative of an amending Bill, which would be distasteful in the extreme to his party. If an intense party squabble cannot be avoided, there is something to be said for getting it over as soon as possible in the hope that it will soon be forgotten. If this was the reasoning that prompted the decision, it somewhat palliates the immediate offence—but only at the cost of revealing in what a narrow cell Mr Attlee has imprisoned himself and how little freedom he gives himself to do his duty.

It is as well to be clear why the Government's decision is so very wrong. This journal has never held the view that the Act that is now to be enforced would have disastrous immediate effects upon the iron and steel industry. The talk of disturbance and uncertainty is greatly overdone. The very tight central control already exercised and the loose form of nationalisation laid down by the Act together ensure that there will be very little perceptible difference for some time to come. Indeed, now that it is clear how ludicrously weak the Corporation will be, it seems probable that any change is likely to be towards more, not less freedom of action for the steel companies, in fact if not in law. Certainly the vesting of ownership of the steel industry in the state will in no sense be an industrial disaster.

Nor can it be argued that the Labour Party is not within its formal rights. The nationalisation of the steel industry has long been one of its cherished projects, and it made quite a concession to the Opposition in accepting a Conservative amendment, when the Bill was before the Lords last year, to defer its operation until after the election. The Labour Government is correct within the letter in claiming that it has fulfilled those qualifying and delaying provisos which it accepted as reasonable, and that there is now no reason why the process of nationalisation should be further delayed. Ministers of the Crown with a majority in the House of Commons have a clear right, by every rule of the party game, to do what they think wise.

What is very shocking is not that they are doing what they think wise, but that they think it wise to do something to which such a very large proportion of the people —almost certainly a majority—very strongly object, at a time when harmony is unusually desirable. What really disturbs the onlooker is not any violence that Ministers are doing either to the national economy or to the constitution, but the insight that they have given into the state of their own minds and the sort of things they deem important. We are apparently governed by men whose scale of values is very seriously warped—and that, at any time and in any country, and to men of any party, must always be an alarming discovery. Mr Attlee was obviously stung, a few weeks ago, by Mr Churchill's charge that he was sullenly resolved to lead less than half the nation; but he has now himself provided the proof. The Government, which is in the course of appealing to the public to make sacrifices in a common cause, has given half the nation the best possible excuse for non-co-operation and passive resistance. Mr Strauss accused the steelmasters of going on strike against the Government. Why is he either surprised or indignant?

There is nothing undignified in concessions by a Government, even a clear majority Government, to its opponents. Indeed, forbearance by the majority is an even more essential part of free democracy than rule by the majority. Mr Clement Davies, in a most impressive speech, quoted the precedent and the example—the sacrifice by the Liberal Government in 1914 (long before there was any thought of a coalition) of two measures for which it had an unchallengeably clear mandate from the people. That was statesmanship; what we have now is tawdry politics. Indeed, every detail of Ministers' proceedings in the matter seems to be designed to illustrate the levity and irresponsibility with which they approach it. Their speeches were couched in a mixture of flippancy and mock outrage, and the nominations to the Corporation confirm the impression of an elaborate practical joke. The Government professes to be honestly concerned about the quality of management now present in the industry, to be really anxious about the problem of reconciling steel production policy with its own wider economic objectives, to be eager to increase the flexibility, the co-ordination and the efficiency of the industry—and then it hands these enormous tasks over to a scratch collection of mediocrities with very little experience of industry and even less knowledge of the particular trade concerned.

The decision, however, is now presumably beyond revoking. It remains to deal with the bitterness it has left behind. Far worse than anything it will do to the steel industry is what it has done to politics. If Mr Attlee's calculation is that the storm will die down, he is very probably wrong, for within six months there approaches the task of deciding on which sections of the population the burden of increased defence shall be placed, and by what means. This would be a delicate matter even if the government of the day enjoyed wide support. It will now clearly be approached with the utmost suspicion, and with the conviction in the minds of half the people that the Labour Party will exploit the emergency of defence, as they have done the steel industry, as an opportunity to victimise their opponents.

If there were any way out of the very dangerous *impasse* into which British politics have degenerated, then clearly it would be the duty of all patriotic citizens to ensue it. But the tragedy is that none of the obvious remedies seems at all likely to be effective. A national government, or coalition of the parties, is out of the question; the Labour Party will not hear of it. Even if they would formally agree to sit in a coalition government, very little purpose would be served so long as they are in their present mood of refusing to meet anybody halfway.

Many people believe that the way out of the mess is by another general election. An election campaign by itself merely sharpens the party controversies and silences any traces of harmony there may be. It would be worth paying this price only if there were a real prospect that the election would produce a substantially different state of affairs. But would it? Is it at all likely that the Labour Party would improve on its poll of 1945, when it was only 47 per cent of the total? If, without a majority in the country, the accidents of the poll gave the Labour Party a working majority in Parliament, is there any reason to believe that it would stop dividing the country by using legal power without moral authority? Is it likely that the Conservative Party would poll a clear majority of the electorate? Or that they could govern with authority if they had just such a slim and accidental Parliamentary majority as Mr Attlee has now?

If any of these questions can be answered with an honest affirmative, then the sooner the election is held the better. But if not, then the present poisonous paralysis seems fated to continue, horrible though that prospect is. Mr Attlee could have made it otherwise. Even three weeks ago, and even on his tiny majority, he could have built up a policy of national leadership, to which the people would have responded—as, in not dissimilar circumstances, the American people have responded to Mr Truman. He has chosen not to do so. What a heavy responsibility he bears.

Leadership in the Free World

IN the weeks before the assembling of the Foreign Ministers, the prospects for an agreed, rational and joint policy in the West had begun to look somewhat bleak. The United States and Britain could not agree on the representation of China in the United Nations, and, to make matters worse, an influential group in Congress, wholeheartedly supporting General MacArthur, seemed determined to invite war with Communist China over the issue of Formosa. In Europe, the allies were in disagreement on the question of rearming Germany, and it was widely believed that the American military authorities were prepared to station more American troops in Europe—which every allied nation wanted—only in return for the embodiment of a number of German divisions—which most allies did not want at all. Western opinion was still further shaken when, one weekend, the American Secretary of the Navy hinted at the possibility of preventive war, and declared that under certain circumstances, Americans might find it their duty to be "aggressors for peace." Worst of all, more and more circumstantial reports came out of Washington suggesting that the "Asia-firsters," the friends of Formosa, the proponents of a re-established *Wehrmacht* and even the advocates of preventive war had something of an ally in the Secretary of Defence, who agreed with the Secretary of State on nothing and was quite prepared to work with the Republican opposition to lever him out of office. The Republicans in their turn seemed as ready to use even the most delicate issues of international diplomacy as open opportunities for electoral propaganda.

On the eve of the Foreign Ministers' meeting, however, the Washington scene underwent one of those sudden transformations which give American politics, particularly under Mr Truman, a uniquely unpredictable and exhilarating quality. The Secretary of Defence, Mr Johnson, resigned and General Marshall was called back from retirement to take his place. The President's choice was masterly. Every European member of the great alliance was reassured by the return to office of the American they had learnt to know and trust implicitly in the preparation of the Marshall Plan. The fear lest the United States would be involved in war with China was dissipated by the assumption of authority by the statesman who, in 1946 and 1947, had passed judgment on Chiang Kai-shek and found him wanting. Above all, a man had returned to office whose stature, character and record made it impossible—whatever the efforts of certain Republican senators—to accuse him of crypto-communism or to drag him and all his policies into the vortex of an American election. A week before, Washington had begun to resemble "a darkling plain . . . where ignorant armies clash by night." Now, with a flick of the political kaleidoscope, it had become once again the responsible centre of a great alliance.

*

The effects of the change in terms of practical politics can hardly be apparent all at once. The first and most notable consequence is naturally a badly needed restoration of confidence. This is not the only result that is already visible. It is permissible to believe that the measure of understanding reached on the question of Germany at the Foreign Ministers' meeting this week and the decision to postpone the question of a German army for further examination are due in part to the greater ease with which Mr Acheson can negotiate now that he no longer feels the presence of a hostile cabal at his elbow, waiting to pounce on any concession as "weakness" and exploiting any modification as a "betrayal." The question of Far Eastern policy in general and of China's representation cannot be thrashed out in a few days. Here again, however, the decision of the General Assembly to refer the question of Chinese representation to a presidential committee gives time for further negotiation.

In spite of this immediate improvement in the diplomatic atmosphere of the alliance, the experience of recent weeks cannot fail to leave behind a number of queries and hesitations in the minds of America's friends. It was not, apparently, for reasons of high world policy that the President made up his mind to replace Mr Johnson by Mr Marshall, but (so it is reported) on issues of personal loyalty. The benefits to the world alliance were thus in a measure, accidental, and chance might work the other way. Or what if no statesman of General Marshall's standing had been available to accept the President's invitation? Would every issue of American defence and foreign policy then have been dragged through the hustings with every mark of disunity and opprobrium? No nation can rely upon an indefinite supply of General Marshalls. It is indeed very fortunate if such a man appears once in a lifetime. Is the office of Secretary of State or of Secretary of Defence to carry no safeguards in itself? Are foreign policy and defence policy to be as thoroughly immersed in local politics as those domestic issues which concern the United States alone? It is true that no great officer of state should be immune from criticism and the more important the post, the more vital that it should be competently and adequately filled. But there is all the difference in the world between reasonable and responsible criticism and the kind of assault made on American foreign and defence policy in recent months. To measure the difference one has only to compare the conduct of the Republican opposition under Senator Vandenberg's leadership and the confusion that has prevailed since ill health removed him from the scene.

Many Americans will, no doubt, resent the fact that critics in other countries express their doubts about the handling of American foreign policy in Washington. "What," they may ask, "is it to do with other nations how we choose to conduct our affairs? The results after all stand the test of scrutiny. What nation has done more in the last five years than the United States? If we choose to accompany our statesmanship with a good deal of rough and tumble, that is our affair." The crux surely is, however, that it is no longer purely America's affair. The method and manner of American defence and diplomacy are now decisive in every capital in the free world. It is as well to be perfectly clear about the task upon which the free nations are engaged. It is a long task which may last out this generation. It is a

supremely difficult task since it involves containing Soviet power by holding together an alliance of very different outlooks, powers and capacities, in a single and sustained effort. In this alliance there is one unquestioned leader—the United States—and on the quality of its leadership, the stability of the alliance must depend. It may seem, superficially, that this is not a new situation. Ever since 1941, it can be argued, the United States has been, in war and in peace, the leading power in the free world. But the circumstances of the war and even of the Marshall Plan are subtly different from those prevailing in this new phase of the alliance. In the early years of the war and in the economic crisis of 1947, the Americans still had the formal liberty to stand aside and the other nations' need for American help was so desperate that Congress could virtually state its own terms. It is to the eternal credit of America's leaders that that freedom of action was kept within such reasonable bounds and took so much account of the needs and sensibilities of the allied nations.

Today, however, it is not an imminent crisis that is at issue but a long sustained effort of co-operation of a steady and unsensational kind. Moreover, although it may seem to American opinion to be the old story of American benefactor and grateful clients, it does not seem so to other people. Other countries may, in fact, be deriving more benefit from American policy than America itself ; but they do not all think so. They may not in fact have any freedom of action ; but some of them think they have. Indeed, to many of them the picture is that of America urging upon them a policy about which they have grave doubts. The Communists are never tired of proclaiming that the United States is settling its own scores with Russia although it uses Korean—or German—territory for the purpose. It is not enough, therefore, that American statesmanship should be sober, co-operative and unaggressive. It must also have an element of courtship to which Congress is wholly unaccustomed. In the long alliance that lies ahead the moods, the views, the interests and the efforts of America's allies cannot be thrust to one side. To secure their understanding and support is as vital to the success of the alliance as it is to achieve domestic unity in Congress and the United States. It is a commonplace that the national politics of a great nation cannot be conducted in precisely the same spirit as the politics of the small town and the corner store. But in comparison with the immensity of the task world leadership has thrust upon the United States, domestic American issues are becoming " small town " issues while Washington is becoming the capital of the free world.

Whenever nations are at the zenith of their power and influence, they have to discover ways and means of securing continuity and strength in their conduct of foreign affairs. America is not the first to make this discovery and in many ways the task of providing continuity in foreign policy and of giving the necessary leadership to the free world is more arduous than it has ever been before, since the alliance that must be held together now circles the globe. But the difficulty of the task and the burden of the responsibility make not one jot of difference to the basic fact—that the free world's alliance will be dominated by the clarity and strength of American leadership. From the uncertainties of recent weeks the only people to profit are the Soviets and their satellites. Faction in American foreign policy is becoming a luxury which neither the United States nor the free world can afford.

NOTES OF THE WEEK

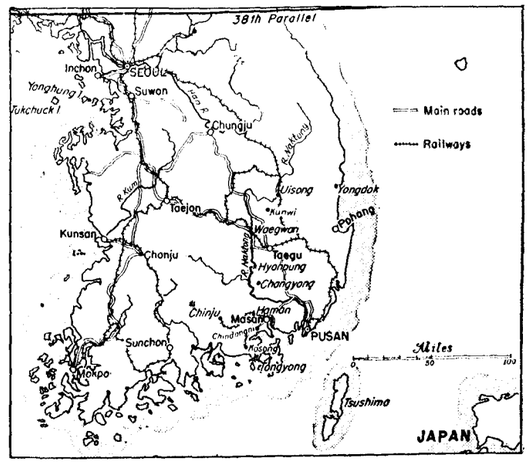
Two Proud Armies

By any standard the American feat of landing two divisions at full strength at Inchon is remarkable. The Marine division had come virtually round the world, from the Mediterranean ; the other had been made up of troops assembled from points all over the Pacific. Men who had been fighting on September 11 at the southern front in Korea were advancing five days later on Seoul, 150 miles to the north. And all this was done by 300 ships assembled from here, there and everywhere. Such a demonstration of mobility by sea and of American ability to improvise against the unexpected has made a deep impression in the world. It will not fail to impress the planners in Moscow, who have even now not ceased marvelling at the scale and success of the sea-borne operation Overlord six years ago. It will reassure every possible victim of cold-war aggression which has access to the sea. The lie has been given in bloody but heroic fashion to the Communist taunt that the " Anglo-Saxons " grudge the *contribution de sang*.

All that can be said with confidence in this fluid and transformed situation is that the United Nations' forces are breaking more quickly than expected out of their defence box through the key point of Waegwan. There the main road and railway line from Pusan to Seoul crosses the river Naktong. The fact that such a key point has been defended with less than the usual fanaticism may indicate a withdrawal by the north Korean forces. There is so far no evidence of any major collapse, although one would expect some weakening of morale among the Communist battalions. For the Americans claim—and are telling them in leaflets—that their industrial potential is destroyed, that vital supplies are not coming through from the north, and that the *elite* of their army—possibly the very units that were hardened in the Chinese wars—has suffered disastrous casualties.

With command of the sea and air unchallenged there seems to be no reason why the operations against Seoul from Inchon should not build up a decisive threat not only to the rear of the main north Korean army but also to their lines of communication across the 38th parallel. But it must not be forgotten that the two United Nations' forces are still 150 miles apart. On Monday next it will be exactly three months since the Communist aggression began ; the more self-critical of western military commentators will doubtless refer to their files and wonder whether they have showed too little faith and too much critical power during those months.

* * *



Over or Under the Parallel ?

The question now arises: will the Chinese and the Russians continue to watch the battle turning decisively against the north Koreans without giving greater and more overt assistance? The odds are that their decision will not be made until it is clear at what point the United Nations operations are to stop. It would pay the aggressors to keep General MacArthur guessing until the last moment just what risks he would run by taking his forces into the Communist-controlled North. Mr Syngman Rhee has said

that South Korean forces will cross the 38th parallel, but is not for him to make such a grave decision.

To say that these intricate and dangerous matters will be settled by the United Nations is to ignore the facts. They will not be unless the Russians publicly abandon their satellite. The decision to fight in Korea was made by the Security Council with the Russian representative absent. Now that he is back at the table he will veto any instructions that the Council may wish to give to General MacArthur. It is true that the Assembly, which set up the UN Korea Commission, is free of the veto, but neither the Soviet Government nor North Korea has recognised the existence or authority of that body. If Uno—as seems probable—is powerless to act, then the Americans may claim a right to decide future policy in consultation with those governments which have supported the military operations—and the most important of these is the British.

Here is a test of the ability of Washington and London to concert policy ahead of events. Presumably no one wants a fight to the bitter end up to the borders of China and Manchuria, or a sudden check at the 38th parallel which would simply restore the *status quo ante*. The political objec-

tive is surely to propose a settlement, a way to end fighting as quickly as possible, which would detach moderates and opportunists from the defeated North Korean regime and bring them together with the more creditable leaders of the south. This would mean strict guarantees against the paying off of scores, pledges of security against further aggression, and a programme of reconstruction for the embittered and devastated country. This in turn would mean long occupation by troops and officials representing the United Nations while the country was unified and found a new balance of political forces.

The prospect of such an onerous burden is deeply disturbing; it might even divide the governments which agreed on the broad principle of opposing aggression. But what alternative way is there of ensuring that Korea is demilitarised, reconstructed and eventually made free and united ?

* * *

The Special Session

The special session of Parliament has illustrated, more sharply than ever before, the permanent contrast in postwar British politics—fundamental agreement on foreign policy and disagreement on domestic policy. In the opening debate on defence, Mr Churchill was careful in expressing his " full accord with the Labour Party "; forty-eight hours later he was describing the Government's intention to put steel nationalisation into immediate effect as " a wanton and partisan act." The defence debate itself was one of the best parliamentary discussions in many years, since the Government were prepared to be reasonable and informative and the Opposition to be conciliatory and constructive in their comments. The two outstanding speeches were by Mr Gaitskell and Mr Eden, whose talents are best displayed in a factual and unrhetorical debate of this nature.

In the steel debate Mr Herbert Morrison signally misjudged the temper of the House and gravity of the issue. The most noticeable result of his jocular remarks was to sting Mr Clement Davies, the Leader of the Liberal Party, into making one of the most vigorous and effective speeches of his parliamentary career in which he all but hurled the Hansard for 1914, containing Mr Asquith's plea for national unity, at the Government front bench. At the end of the debate, when the halt and the fit had passed through the division lobbies to give the Government a majority of six, the course of rumour in the corridors of Westminster, which during the previous week had set strongly towards an autumn election, had begun to ebb, as the " usually well informed sources " busied themselves with spreading a denial.

One noticeable fact during the special session is the different effect produced by the absence of two of the great figures of the Labour quadrumvirate. On the one hand, a major alteration in economic policy has been made without the House having greatly noticed the absence through illness of the Chancellor, Sir Stafford Cripps, who, a year ago, was the centre of all economic discussion. On the other hand, the absence of Mr Bevin has once again made it impossible for the House to have any very profound discussion of foreign affairs. Members are becoming increasingly exasperated at their difficulty in finding a moment when Mr Bevin is not either away from duty or out of the country in which to discuss foreign policy with him.

* * *

Plots and Plotters

Mr Isaacs, the Minister of Labour, said nothing new in his statement last Friday on Communist activities in Britain. It has been common knowledge that ever since the inception of the Marshall Plan in 1948 the Communists have been trying in one way and another to disrupt the economy of the country. Mr Isaacs presumably made his statement chiefly—perhaps only—in order to persuade the strikers at the London bus depots that they were being misled and that they should return to work. At the same time, however, he implied by his dark hints of meetings during the weekend and the possibility of consequent trouble that the Communist plot had suddenly become more serious and more dangerous.

In the absence of further enlightenment from Mr Isaacs or the Home Secretary, it is impossible to say whether the warning was exaggerated or not. With a few exceptions, the Communists have not succeeded so far in causing serious interference. Their immediate aim has been simply to foment a strike on any pretext whatsoever in essential industries at critical periods in international affairs. The dock strike last May coincided with shipments of military equipment from America to Europe and with a critical phase in the campaign against Communist bandits in Malaya ; the Smithfield strike in July and the bus strike last week coincided with critical moments in the battle for South Korea. But no recent strike has been much more than an extremely unpleasant irritant to the national economy or, as far as is known, has in any way seriously affected Britain's international commitments. Moreover, the evidence of the past few months is that the Communists are losing the sympathy of the majority of workers, particularly of dockers and transport workers, and that strikes which are inspired solely by

16286/501
JL
XM56.MU3EC MU3159.

Communists are likely to be of shorter duration and more narrowly confined than before.

It may be that it is this very failure of the Communist Party in Britain, together with one or two other disturbing incidents, that has given rise to fears that the Communists are about to use more drastic methods to gain their ends. There has certainly been an unusual amount of coming and going of Communists between London, Paris, Warsaw, Prague and Moscow under the guise of "peace" rallies and other conventions. If the *agents provocateurs* are about to become *agents saboteurs*, Mr Isaacs was no doubt right to put the nation on its guard.

* * *

Mr Deakin Hits Back

Whether or not Mr Isaacs's warning was justified, the effect on good trade unionists has been unfortunate. Mr Deakin, the general secretary of the Transport and General Workers' Union, which has suffered more than any other union from Communist activities, stated his personal opinion at a press conference on Monday that the Communists should be banned. Indeed, Mr Isaacs himself, in answer to a supplementary question in the Commons, said that "if necessary" the Government would bring in legislation to deal with the situation.

It is not at all clear what precise measures either Mr Deakin or Mr Isaacs have in mind, but if they mean something like the anti-Communist Acts which have been passed in Australia and South Africa, they should be opposed from the outset. As long as there is any substantial support for the Communists or sympathy with them, anti-Communist legislation will do little to diminish such support and may even increase it; if, on the other hand, the active support for the Communist Party is as unimportant as it seems to be in Britain, then anti-Communist legislation is unnecessary. The police possess all the powers they need to deal with sabotage and treason. More important still, the domestic peace and internal security of this country entirely depend on the preservation of its liberal tradition. The sacrifice of that tradition, whatever the immediate advantage, would play directly into the hands of the Communists.

Mr Deakin himself has shown how Communists are best dealt with. His large union of nearly a million and a quarter members is a federation of some of the most important groups of industrial workers in the country. In particular it includes transport workers and dockers, both of which groups the Communists have long sought to control. For the best part of three years, and especially during the past twelve months, the Communists have tried to split the union by making the plausible though unfounded charge that it is too big to be able to keep in touch with its members and by infiltrating into local branches of its different sections. They hoped that out of the chaos which would result from the breaking up of the union they would be able to step in and assume control of the more important splinter groups.

The threat has been largely met by Mr Deakin's recent, energetic counter-attacks. He has met the Communists on their own ground; his union officials and the leaders of the different sections in the union have worked ceaselessly during the last few months, showing the Communists up for what they really are and giving the lie direct to Communist charges. The result has been a large falling off of pro-Communist support among the dockers and transport workers. It is tiring work and foreign to the heart of good trade unionists who dislike political activity, but it is the only way of combating Communism that is likely to meet with lasting success.

* * *

Decisions on Germany

Since the decisions announced on September 19 by Mr Acheson, Mr Bevin and M. Schuman meeting in New York, the defence of western Germany and its political development towards independence enter a new stage. The form and rate of change cannot yet be accurately judged; for there is much to be more closely defined in talks between the Allied High Commission and Dr Adenauer's government. The contribution that the Germans are to make to their own defence has still to be settled between the reluctant French, the somewhat impatient Americans, and the grudgingly realistic British. All that they seem to have agreed on so far is that it would be bad for Germany and for Europe to recreate an independent Reichswehr—which no important body of opinion has ever proposed—that mobile police formations some 30,000 strong should be formed under control of the States, and that the limit on steel production can be raised in cases "where this facilitates the defence effort of the west."

In one respect at least the decisions show real insight: the ministers have understood that the mass of Germans can be bound to western Europe only by ties of strong self-interest. The first necessity is, therefore, to show determination and ability to protect them against all the various forms of aggression that Communist ingenuity might devise. Hence the new security guarantee by the Big Three stating that "they will treat any attack against the Federal Republic or Berlin from any quarter as an attack upon themselves." The inclusion of Berlin is a necessary but bold move: how exactly would a *putsch* against the western sectors of the city by the Communist *Bereitschaften* be dealt with? To put an extra tooth or two into this guarantee the British and French will each send an extra division to Germany and the Americans—according to unofficial reports—two.

From now on the Bonn Government acquires a new authority, although the High Commission goes on. The state of war with the occupying powers will be terminated; a Ministry of Foreign Affairs comes into action with a few diplomatic representatives abroad; and there are to be "far-reaching reductions . . . in existing controls" of internal political and economic matters. Here is a lot to go on with: enough to weaken for the time being the political appeal of the nationalists and to facilitate that slight *rapprochement* between the Chancellor and Dr Schumacher which has recently been a gratifying feature of German party politics.

Printing Dispute

Hostilities have broken out again between the London Society of Compositors and the London Master Printers Association. Going to press later than most of its contemporaries, *The Economist* has been unlucky enough to be caught in the renewed dispute and this issue contains 24 pages fewer than was intended.

It is quite impossible to foresee what may happen next week. As our readers know, we are not a party to the dispute and are quite powerless to prevent these infuriating interruptions to normal publication.

German Vicars of Bray

There are ominous signs that the Evangelical Church in Germany may not prove a faithful ally for the west. In the Soviet German State, the Communists are able to claim increasing support from Protestant pastors, and even some bishops, for their National Front, and the "peace" campaign. Bishop Dibelius of Berlin has, it is true, made a valiant stand against the National Front in a pastoral letter and has committed the crime of visiting the United States. His attitude led Ulbricht to denounce him and his supporters, with the typical Communist threat that "we grant democracy only to progressive democratic forces, not to warmongers." But Communist action has been postponed until after the single-list elections of October 15. In the meantime a considerable number of Evangelical clergy apparently think that Bishop Dibelius has gone too far in defying the state.

In the west, a conference called recently in Dusseldorf by the Evangelical Church passed a resolution to the effect that Germans would never fight Germans, and a statement by one of the leaders condemned the approval of German aid in western defence, expressed by the Catholic archbishops. The protest made by the Bonn minister of the interior, Herr Heinemann, against Dr Adenauer's demand for a force to match the Soviet *Volkspolizei* was due, it is believed, to his leading position in the Evangelical church, as well as to the fact that the chancellor had omitted to consult him.

There are good reasons for this equivocal attitude on the part of the Evangelical church. From the days of Luther it has been taught to submit to the state, whatever its nature, in all but matters of creed. The Evangelical clergy tend to be narrowly nationalistic, as was shown by their widespread support for the Nazi state. At present, another factor makes the Protestants likely to fall victim to spurious propaganda on German unity from the eastern zone. The main strength of the Evangelical church lies in eastern Germany. Not long ago Pastor Niemoeller himself declared that there was nothing in the Bible to condemn Bolshevism and that Germans would prefer a country united under Communism to one permanently divided. It is on such confused thinking that the Soviet cause thrives.

The Defence of Egypt

The lesson of Korea—which is that defenders summoned from abroad take months to muster and arrive—seems to be sinking home in Egypt. Public men are at last beginning to admit that Russian expansionism is a menace, that Egypt is too weak to resist it singlehanded, and that a measure of military preparedness ought to begin now. Until recently, only the late Sidky Pasha was bold enough to say the words aloud. Everyone else merely whispered them, being frightened of the mob that has for some years been taught to boo the Anglo-Egyptian Treaty of 1936 and its provision for a British base in the Canal Zone—a symbol of the hated years of occupation.

The first to speak out was Sadek Pasha, commander-in-chief during the Palestine war. Although he had never been pro-British, he said at the end of August, he now thought the British alliance an "absolute necessity, but with certain reservations." He has been followed by Prince Mohammed Ali—the elderly and sensible heir to the throne—and by Ahmed Attia Pasha, who was Sidky's minister for war in 1946. But the government, with its public following to think of, cannot go so fast. It has reproved both the general and the Prince for speaking as they did. Nevertheless, it has for two months been treating with the British Ambassador, Sir Ralph Stevenson, on the subject of treaty revision. Both parties have now paused for thought while the Foreign Ministers concerned go off to Lake Success.

"Problems of great complexity" have arisen, according to the British communique. But they are surely even more complex for Egypt than for Britain. The Egyptians have been negotiating on the basis of a public longing for the fulfilment of Mr Attlee's statement made in May, 1946, that the British intended to withdraw their troops. But now that the Palestine mandate has disappeared, there is nowhere near by for these troops to go to. Is it really in Egypt's interest that they should go far away? What is the right answer to the British contention that times have changed, and that a free military partnership between equals might be to the advantage of both parties? The difficulty is that these thoughts that are crossing reflective Egyptian minds have not penetrated to the masses. The Egyptian delegate to the current Inter-Parliamentary Union meeting in Dublin has been fulminating against "unequal treaties" in familiar vein; Cairo radio often echoes his sentiments. A revised treaty is, therefore, not just round the corner. Indeed, it looks as if the Government will lack the courage to go ahead until impelled to do so by a danger so obvious that even the bird-witted Egyptian crowd can see it coming.

* * *

Racial Feelings in East Africa

Perhaps, after all, ministers responsible for colonial affairs should stay in London and not travel to the colonies. A Minister of State was appointed so that these visits could be made, with benefit, it was hoped, to both Great Britain and the colonies, but it cannot be said that the recent tour of Mr Dugdale in East Africa has been a great success. He may feel himself to be, and he may well have been, perfectly justified in his behaviour towards certain members of the Tanganyika European Council—from the press reports there appears to have been an unnecessary display of bad manners on both sides. But he may well also ask himself whether striking an attitude does not do more harm than good to the cause of better race relations.

The chief lesson, however, to be drawn from his visit is that the deterioration of race relations in East and Central Africa, demonstrated by his clash with the Tanganyika settlers, ought not to be allowed to go on. Hence the renewed suggestions for a commission to examine impartially the trend of colonial policy in these territories and determine whether it is in the best interests of all their inhabitants, African, European and Asiatic. Before the war, the immediate object of British policy was clear. It was to act as trustees for the African population and prevent their interests being subordinated to those of the far more advanced European minority. Today the position is reversed. It is the Europeans, alarmed at the political promotion given to the Africans in all the British dependent territories, who look to the British Government to preserve their rights. The implications of this reversal for colonial policy are still far from clear, and if a commission can disentangle the truth from prejudice it would be well worth having one. It is important, however, that it should be appointed quickly if it is to do any good. Otherwise prejudice in the territories concerned may reach a point where the impartiality of the members of the commission will be questioned from the start.

* * *

A Courts Martial Appeal Court

The announcement made by the Minister of Defence on Tuesday, that legislation to set up an appeal court for courts martial will be introduced next session, should be generally welcomed. The minister stated that the new court will cover all three services but that its details have still to be settled. What matters most is that the appeal court should be clearly a court of law. Courts martial have suffered in reputation, unjustly in most cases, because they have seemed to be associated as much with discipline as with justice. The court consists of serving officers. The confirming authority, the nearest approach to an appeal tribunal, is a military com-

mander, and the public is left with the impression that justice may be mixed with expediency. Magistrates are indignant when a petty sessional court is called a "police court." Courts martial need the same kind of rehabilitation. One way to make certain of this would be to give the Lord Chancellor responsibility for the appointment of the members of the appeal court, even if the court is under the administration of the Ministry of Defence. The day has gone when the service authorities could claim that no civilian lawyer could possibly appreciate the traditions of the service. There must be very few lawyers in practice today who have not spent long enough in one service or another to have a very fair idea of service discipline and life.

A second requirement is that the powers of the court should be at least as flexible as those of the Court of Criminal Appeal, and that it should not be compelled to quash a conviction on the ground that the court martial made some technical mistake in procedure unless it is satisfied that the accused has been seriously prejudiced by the mistake. The average member of a court martial has even less court experience than the average magistrate and procedure is bound occasionally to defeat them. It would be a pity if the appeal court became the happy hunting ground of the barrack-room lawyer.

Finally, it would seem most desirable that the appeal court should not consist of the one bench sitting only in London. The geographical distribution of men subject to military law is world-wide and so should the appeal court be. The history of the judicial committee of the Privy Council shows how immobility and a long waiting list can damage the reputation of a court, however, eminent its members and however sound its law. The Lands Tribunals provide a better precedent, for they are made up as required from members on a standing panel and they are intended to sit when and where they are needed. The establishment of an appeal court is not the only reform needed in military law but it will be a good step forward. It will also be a reminder that appeal courts from some of the other departmental tribunals are still a crying necessity for the protection of the ordinary citizen.

* * *

The Choice of School

The Ministry of Education has recently attempted to clarify, in a manual of guidance issued to local authorities, the vexed question of who shall decide, parent or local authority, the school to which a child may be sent. The freedom of choice conferred on parents by the 1944 Education Act is contingent on that choice being

> compatible with the provision of efficient instruction and training and the avoidance of unreasonable public expenditure.

The interpretation of this saving clause has varied widely with different education authorities. The Ministry's interpretation of this phrase means that there will now be a reasonable latitude within the state system. But those parents, however, who have sought to obtain financial help for educating their children outside the state system are doomed to disappointment. This manual is concerned only with day schools, and it is made clear that a parent is not entitled to claim the equivalent cost of education in a state school merely because he chooses to send his child to an independent school. Only if the local education authority recognises that the provision in its own schools is inadequate (and this usually means a deficiency of grammar school places) and has the desire or the means to supplement its own facilities by securing places in direct grant and independent schools, can a "free" place in these schools be secured.

Many parents do not necessarily want a completely free place but rather a contribution towards the higher cost of a place in an independent school. It is here that the greatest ambiguities in the regulations exist and that interpretation has most widely varied: the Ministry's latest effort does little to make the situation clearer. The only example quoted is the choice of an independent school on denominational grounds. In such a case, if no direct grant or maintained school of the denomination required were available locally the local authority would be entitled to give assistance with fees on the basis of a means test. There will be other special cases of this kind, but it is obvious that with the usual rigorous test of means, most middle-class parents cannot expect much assistance if they desire to educate their children outside the state education system.

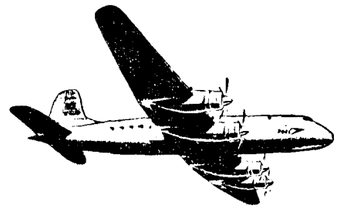
India Slips to the Right

Because Mr Nehru's position has been undermined inside the Congress Party, it would be wrong to suppose that he is necessarily approaching the end of his premiership. But it certainly looks as if the period of his personal ascendancy may be drawing to a close. Mr Nehru bitterly opposed the recent election of Mr Purshottamdas Tandon as President of the Indian National Congress Party, which is to be interpreted as a major victory for the right wing of Congress. For Mr Tandon is an exponent of strict Hinduism, a representative of the religious as opposed to the secular element in the party, and is said to attend frequently extremist Hindu RSS meetings. His success portends a shift in the political balance, but what effect that has had at this week's meeting of the All-India Congress Committee at Nasik was not known at the time of writing. If Mr Nehru stays in office—as he well may, even after the elections next spring—it will be because he still wears, indeed always will wear, the mantle of Gandhi. But Mr Tandon's Presidency will last three years, and with a serious swing to the Right in Congress Mr Nehru might find himself becoming little more than a figurehead.

The unexpected election of Mr Tandon, after Mr Nehru himself and then Mr Rajagopalachari, the last Governor-General, had been rejected for nomination, has crystallised the division between Left and Right inside Congress. With party leadership falling to the Right the trends of the last three years are reversed, and this increases the possibility that the Congress Party will eventually split apart.



The effect on India of the rising influence of the right wing is likely to be unfortunate. It means a stiffer attitude to Pakistan, a retreat from state intervention in the industrial field, and an increased *malaise* among India's forty-million Muslims. Mr Nehru himself has issued a personal statement, making it clear that he stands by the secular state and challenges Hindu theocracy. Delhi's general foreign policy, however, is likely to be little affected.

Rule of Law in South Africa

It is gradually becoming clear that the one thing that stands between the despotic powers with which Dr Malan's government has recently endowed itself and the people of South Africa is the judiciary. In a number of interesting judgments during the last few months, judges in the Provincial Courts, and especially in the Appeal Court, have shown that at least the administration of justice is beyond the influence of the Nationalist party and of the executive. The full bench of the Appeal Court, for instance, has laid down the doctrine that the duty of the courts is to protect all sections of the population, and that parliament must be presumed in all Acts to have willed the equal treatment of all races unless the contrary was specifically mentioned in the Act.

The existence of such laws as the Suppression of Communism Act and the Group Areas Act, therefore, makes the nature and the composition of the courts in South Africa a matter of supreme importance. The Suppression of Communism Act, for example, contains the clause:

B·O·A·C

- GREAT BRITAIN
- USA
- BERMUDA
- CANADA
- WEST INDIES
- CENTRAL AMERICA

ANNOUNCEMENT BY ALMIN LIMITED

...and

S·M·D of Slough

The Dome of Discovery for the Festival of Britain will be the largest structure of its kind ever built. 365 feet in diameter and over a fifth of a mile in circumference, it forms a dramatic illustration of the use of aluminium alloys as a structural material. We are pleased that the contract for the Main Arch Ribs which support the roof, the Canopy and the Apron has been sub-contracted by Horsley Bridge & Thomas Piggott Ltd., to our construction company, STRUCTURAL & MECHANICAL DEVELOPMENT ENGINEERS LTD. OF SLOUGH. This outstanding design by Ralph Tubbs, A.R.I.B.A., in association with the Consulting Engineers, Messrs. Freeman, Fox & Partners, is also an excellent example of the particular suitability of aluminium alloys for use in large span structures to provide entirely clear floor areas—a field in which S.M.D. are pioneers.

Any person who . . .
(b): advocates, advises, defends or encourages the achievement of any . . . object [of Communism] . . . shall be guilty of an offence and liable to imprisonment for a period not exceeding ten years.

Obviously such a clause could be used as a legal weapon against a large number of people who are not Communists and who have never had anything to do with Communism. The only safeguard against the abuse of such law is an impartial judiciary, and although Dr Donges, the Minister of the Interior, has reserved for himself the right to decide whether an individual is a Communist or not, it should nevertheless still be possible to bring the matter before the courts. The Nationalist Government may, of course, attempt to bring the judiciary to heel; but as long as the present judges and barristers retain their positions justice in South Africa may survive.

Norway Grasps the Nettle

If it is the fact that Norway has a common frontier in the north with the Soviet Union that has made its statesmen think so clearly and act so resolutely in defence policy, it is all the more to their credit for it would have been easy to loiter along the path of appeasement. It was Hr Lange, the Foreign Minister, who took the lead among the smaller powers during the early days of the North Atlantic Treaty Organisation; and now it is Hr Gerhardsen, the Labour Prime Minister, who has led the way towards a candid statement of what rearmament means for a social democratic country. Without such an approach it is difficult to imagine how the latest defence plans are to get far beyond the blueprint stage.

Hr Gerhardsen told the Storting last week in a special session to consider the Government's defence plans, that in the present crisis national unity must come before partisan politics; increased defence expenditure could not be met without reducing the standard of living of all. He said that the Government and the Labour Party wanted "to make their contribution towards making relations between the political parties as good as possible." As proof of this the Prime Minister announced that they would take no further action during the present term of office on proposals to nationalise sugar, solid fuel and medicinal supplies. Only the nationalisation of the animal fodder trade would be carried out, because of its great importance for agriculture and foreign trade.

Hr Gerhardsen said that increased expenditure must be met by increased taxation, by reduction in public and private investment, and by a cut in the import programme. Consumption would have to be decreased, and he appealed to all those taking part in the wage price negotiations, due to begin next month, to look at their problems "in a larger context and on a longer term basis, and not only think of immediate results."

In the interests of national unity, the Norwegian Prime Minister has deliberately laid aside the programme which he was elected a year ago—with an ample majority—to carry out. The people of Norway, who have lived far more austerely than their neighbours since the war, are asked to accept cuts in their standard of living, because, as Hr Gerhardsen put it "it is no sacrifice to do what is necessary to safeguard peace and freedom." That is a phrase that should be used at Westminster.

Clerical Statistics

The fourth biennial analysis of clerical salaries undertaken by the Office Management Association,* covering a small but growing sample of the whole clerical population of the country, is a document of interest to economists, statisticians, and employers. Salaries, particularly salaries paid by private enterprise to unorganised workers, constitute a notoriously dark patch on the statistical picture; the work for which clerical salaries in particular are paid is apt to be little susceptible to hard-and-fast definition. Within the limitations of a voluntary sample the Office Management Association's survey throws a great deal of light. Classifying clerical workers not according to seniority nor by the titles necessarily in use in particular establishments, but in grades corresponding to the work done and responsibilities undertaken, it analyses its material first in bulk, then by areas, then by industrial groups, and adds for perspective some figures relating to the salary scales paid by the Government and other large-scale employers of clerical labour.

On the whole the conclusions reached are in keeping with what one would expect from the general movement of earned incomes and from the commonsense generalisations of economics. There has, over the last two years, been a general increase in scales of pay, though slower than in the biennial periods previously covered; with this increase has gone a shrinkage of differentials, the lower paid and less responsible groups gaining on the senior staff and the women, to a lesser extent, on the men. Probably the greatest usefulness of this analysis will be for employers, and, where these exist, employees' organisations, anxious to see how the salaries which they offer or receive compare with others in similar industries or areas; and for students of the wage and salary structure who can set the information provided alongside that relating to wage scales and professional incomes.

*Clerical Salaries Analysis, 1950. Office Management Association, Ltd., Management House, 8, Hill Street, London, W.1. 85 pp. 21s.

Growing Multitudes

What will be the results fifty years hence, should our towns go on increasing as they have increased since 1800 . . . is not for us to predict. Far, however, from the prospect having in it anything to alarm us, it is full of hope, though necessarily vague and undefined. Within the last fifty years some of the most astounding inventions have been made that grace the intellectual faculties of man. Within those fifty years numerous arts have come into existence, or old arts have amazingly improved; the boundaries of knowledge of a useful kind have been rapidly enlarged, and it has been diffused amongst all classes. Within that period the progress of humanity has been as great as the progress of invention and the increase of knowledge. The civilised world has enjoyed peace and security, such as it never knew before, compared to which, the Augustan age, so much vaunted for progress and peace, was a state of retardation and war. . . . It seems quite certain that with the increase of the town population improvements in humanity and political organisation, such as those we have witnessed, will continue. The growing multitude will not be contented with the present accommodation, whether physical or moral, and present enjoyment. The prevalent disposition to defer to the popular voice, and promote the improvement and well-being of the multitude, will insure the requisite improvements, though what shape they may take cannot yet be known. From what has taken place in all these towns, we see that increasing wealth, and not increasing poverty, accompanies the increase of population. Not only a few are in the enjoyment of a great number of luxuries unknown to their ancestors, but the bulk of the people are much better provided with necessaries and comforts than were their predecessors; and the explanation of this fact is full of hope.

The Economist

Letters to the Editor

South Africa and the Commonwealth

Sir,—Will you allow an appeal for clemency? In your issue of September 9th, you made a most justified if somewhat bitter attack on Dr Malan's policies and government. That is only right and proper for a newspaper of your traditions, but what was an unpleasant surprise was to see you echoing the threat that South Africa should be thrown out of the Commonwealth.

You overlook—as do thousands of Englishmen who have the same idea—the fact that this is a government representing not only a small minority of the total population of South Africa, but even a minority of the European population. There are among us many liberal minded people who are even now hoping that we will be able to make a difference to the policies of this country towards its native peoples and so bring it more into line with the democracies of western Europe and America. One of the most important assets we have is the knowledge that we are part of the British Commonwealth which has the greatest of all liberal traditions. To eject South Africa from the Commonwealth would have a very adverse effect and, more noticeably, the English element in the country, from whom most of the liberals are drawn, would severely dwindle in numbers through emigration to Britain and the Rhodesias. What liberals want is a suffrage from which nobody should be debarred from any inherent trait—colour, creed, race, etc. If we achieve a small measure of success in this, you will realise that the political architecture of the country will be radically altered—perhaps against democracy and against the Commonwealth, but much more likely towards stronger ties with Britain.

Many will say in answer that if we are going to form our much vaunted republic anyhow, what matters it if we are thrown out instead of being allowed to walk out. Economically, we can stand on our own feet *now* but politically we are likely to face tremendous problems from opposition from the natives—which could cripple the economic structure of the country. It is possible that Dr Malan has thought of the repercussions of his threat of leaving the Commonwealth. We hope that he has done so, because a republic outside the Commonwealth would be a disaster—whether accomplished by free decision or duress. In short, liberals in South Africa look to your paper and others in Britain rather for constructive and helpful comment, not for articles which will hasten a catastrophe which seems all too imminent.—Yours faithfully,

Johannesburg. A. S. P. TUGMAN

Moscow and Islam

Sir,—Your paragraph headed "Moscow in Islamic Clothing" in the issue of August 26th caused some amusement here. You mention the appeals from Moscow to Islam and seriously warn your readers against writing off "all such matter as too contrary to fact to be effective." Yet in the very next paragraph you yourself "shrug off" the effectiveness of Abdul Krim of the Riff whose word according to you, "carries little weight."

I am afraid that is a view which would not be shared by the people out here whose job it is to observe these matters. Whatever he may be in London, Abdul Krim is a most important influence in North Africa and his messages, sent out regularly from Cairo in Arabic, are distributed and read widely throughout these countries while every statement he makes to the international press receives a very careful study in Paris and Washington. Abdul Krim's statements are certain "news" for the international news agencies and his opinions are always headlines in the Arabic and Islamic press from Casablanca to Indonesia. In fact it is difficult to think of a "name" from the Arab world which travels farther! While the immense respect in which he is held throughout North Africa and Asia (and also in America) and his remarkable grasp of international "situations" and flair for exploiting them make him a man very much to be reckoned with for those, like the French and the Americans, who are uneasy about the present state of the Arabic speaking world of North Africa.—Yours faithfully, MARGARET POPE

Tangier.

Books and Publications

Wealth and Illfare

The Social Costs of Private Enterprise. By K. William Kapp. *Harvard University Press (London: Geoffrey Cumberlege).* 279 pages. 30s. or $4.50.

It is doubtful whether anyone would have thought it worth while, in any country but America, to write this book; Mr Kapp accumulates what it is hardly impolite to call a gallimaufry of evidence, and displays considerable intellectual virtuosity, in order to achieve—what? Proof that unadulterated *laisser faire* fails to achieve the optimum use of resources and the correct imputation of real costs—a conclusion which has been common form with everyone but Professor Mises and the National Union of Manufacturers for at least a generation. Perhaps it is as well that the job should be comprehensively done by someone who, like Mr Kapp, really knows his classics and is not simultaneously trying to prove that some alternative system would automatically achieve that harmony which is impossible under undiluted capitalism. If so, however, it is a pity that Mr Kapp should lay himself quite so wide open to criticism as he does, and so run the risk of discrediting his argument.

For Mr Kapp is not content to demonstrate, inductively and deductively, that a progressive *laisser faire* economy is inherently unstable, concentrating the costs of progress on a fluctuating number of unemployed; or that individual firms unload on to the community at large the costs involved in air and water pollution; or that the time-horizon of the individual farmer, hunter, lumberman or oil firm, particularly in a new country, is likely to be disastrously narrower than what the community interest demands. These well-recognised generalisations he justifies afresh with an amount of statistical and factual evidence which remains impressive even when drawn from *ex parte* sources. Nor does he stop at the possibly still more damaging demonstration—not, however, equally generally accepted—that the degree of imperfection in competition, under no matter what legal system, is fatal to rationality, both in its direct effect on the distribution of resources and through its indirect stimulus to advertising wars. He goes on to load upon the shoulders of private enterprise as such all those costs that arise from lack of knowledge, or improvidence, on the part of consumers and workers; the entire cost, for instance, of industrial injuries and ailments and of the damage to family life involved in married women's work—as if, even under conditions of full employment and mobility, there were no such thing as the calculation of net advantages. He does his level best to demonstrate that technological progress is quite as likely to lead to a Marxian increase of misery as to higher standards. Despite, in fact, his disclaimer of having any political axe to grind, he gives the irresistible impression of regarding any stick as good enough to beat the capitalist with.

This is the more a pity because his final chapters, dealing with the place of the "social cost" concept in economic science and the place of the latter in the general science of society, are, although tentative, both stimulating and realistic. He does not, like so many critics of the existing order, take it for granted that planners will either be able to settle easily what the distribution of resources should be or to achieve that distribution in practice. He does not ignore, though he seems to underestimate, the difficulty of eliciting consumers' preferences outside the market sphere. In short, there is nothing starry-eyed about his attitude to collective action; and it would be a good thing were there a more general understanding on the Left of his reiterated demonstration that the problems of social accounting remain essentially identical whatever the form of society.

Benelux Examined

Les Unions Economiques. By Jean Van der Meusbrugghe. *Institute of International Relations, Brussels.* 396 pages.

Though the title of this work is quite general, its principal theme is the Benelux Union. "The lessons to be drawn from the experience of Benelux can be easily applied to the other unions" says the author. But a chapter is given to the proposed Franco-Italian customs union (presumed abortive), and another to the inconclusive efforts of the study group set up in 1947 arising out of Marshall Aid, and to the position of Great Britain in relation to a European Customs Union.

The story of the efforts made to give practical effect to the Convention of September 5, 1944, signed by the exiled Governments of Belgium, Luxembourg and the Netherlands, is clearly and concisely summarised. And there follows an account of postwar conditions and developments in the three countries, which is perhaps somewhat too long. The statistical and other material is interesting in itself, but not always directly relevant. The conclusion is that, to make the desired union possible, a uniform economic policy is needed, directed to reducing rigidities, to allowing the price system its regulative function, to avoiding both inflation and deflation, to gaining equilibrium in foreign trade by subjecting the national economy to international competition, and to using credit as an instrument of policy. The statistics and facts might have been handled more concisely and significantly if more directly related to these aspects of policy.

The original Benelux Convention of 1944 was primarily for a customs union, but it set up a *Conseil de l'Union Economique* to make recommendations for unifying the restrictions on imports and exports, and the quotas, licences, subsidies, etc. prevailing in the three countries. The customs union itself is not free from difficulty, but it is chiefly in these latter matters that the obstacles to economic union have been found. The problem has been to reconcile the "rigidity" of Dutch economic policy with the relative "suppleness" of Belgian policy. The Netherlands suffered more severely than Belgium from the war. The rigidity of Dutch policy became necessary because the free working of the price system could not enforce the requisite degree of austerity without social consequences which could not be faced.

An important section of the book treats of long-term problems, and indicates many of the measures taken or contemplated to bring the economic institutions of the Benelux countries nearer uniformity. But the author has singularly little to say about the rate of exchange between the Belgian franc and the Dutch florin. The agreement of 1943 continued the prewar rate, and the fact that prices and wages have risen in much higher proportion in Belgium than in the Netherlands would seem to show that this rate undervalued the Dutch florin. The devaluations of September 1949 accentuated the disparity. It has been found necessary to cover the adverse balance for the time being by a Belgian credit. Is not this one of those cases where depreciation of the money unit has been pushed beyond the limit within which it can have any remedial effect on an adverse balance?

Humanists on Trial

The Renaissance—Its Nature and Origins. By George Clarke Sellery. *University of Wisconsin Press.* 296 pages. $3.75.

The author himself states that he has written this book "to straighten out historians and students of European history, who have been and still are bedevilled by the theory that the Humanists were responsible for the upsurge of European civilisation in the so-called epoch of the Renaissance." His contention is that the real seminal force was the natural effort of men to achieve a more abundant life by the application of their wits to the problems of their environment, and that the modern age evolved from the mediæval, whose deep, emotional and creative currents, assisted no doubt by the Revival of Learning, themselves produced the Renaissance.

To prove his thesis, he examines every facet of urban life from the twelfth to the fifteenth century, and gives enlightening thumb-nail sketches, not only of the politics, economics, literature, history, philosophy, fine arts, inventions and discoveries, but also of the outstanding personalities of the period. Humanists are arraigned like prisoners at the bar, and overwhelmed by evidence of prominent witnesses who support the bias of the author, so that the book becomes a symposium of judgments by various authorities, proving beyond a doubt the erudition of the author, but expressing little original thought. The very meticulousness with which Mr Sellery acknowledges his indebtedness, even where no quotation is involved, robs his argument of force, since it would obviously be possible to collect an equally impressive body of witnesses in refutation.

Moreover, the horse is so very nearly dead that the flogging is superfluous. The artificial division of European history into Ancient, Mediæval and Modern, which the author deplores, has long been discarded by eminent historians, who have also abandoned considerations of direct cause and effect for the organic, evolutionary or analogical approach. Nevertheless, the book will prove interesting and provocative to the general reader; though the claim on the dust jacket that "no scholar of the subject will be able to ignore it" is excessive.

A Great Civil Servant

Dialogus de Scaccario. By Roger, Son of Nigel. Edited and translated by Charles Johnson. *Nelson's Medieval Classics.* 144 pages. 15s.

Forty-eight years ago Mr Johnson collaborated with two other scholars in producing the definitive Latin text of the Dialogus de Scaccario. Now he has produced the first translation into English of the whole work by a competent scholar. The translation is clear and surmounts all the difficulties presented by a technical work written by a mediocre Latinist, and the notes are very helpful. The long introduction also adds to our knowledge of the work, though it goes, perhaps, too deeply into certain technical problems of scholarship and does not always bear in mind the general reader for whom this series of translations is intended.

The Dialogus, however, deserves to be read by many who are not medieval specialists. This account of the workings of a government department by a high civil servant is unique in early medieval literature and the details of the financial system which it describes are full of interest. At the time fitzNigel wrote the Exchequer dealt with almost all the revenues of the richest kingdom in twelfth-century Europe (except Sicily, whose Exchequer had been developed with the help of English civil servants whom fitzNigel knew). Much of that Exchequer organisation had been developed in fitzNigel's lifetime, and the chief architect of the department had been his own father.

Much of the financial history of medieval England would be incomprehensible without the Dialogus as a guide, but it is far more than a mere handbook. It is a treatise in practical administration, and from it we can see how much hard thought and inventiveness went into creating an efficient system of account and audit, which would work even when dealing with illiterate officials.

Professorial Torpedo

Russia and the United States. By Pitirim A. Sorokin. Published under the Auspices of the London Institute of World Affairs. *Stevens.* 12s. 6d.

The author of this book is Director of the Research Centre in Altruistic Integration and Creativity at Harvard University. In a brief excursion into practical politics he was a member of the Kerensky Government which preceded Bolshevism in Russia. He was twice imprisoned by the Bolsheviks and once sentenced to death. He left Russia in 1922, and has since then lived mainly in America, with the result that he has now become a zealous advocate in America of American appeasement of Russia.

Professor Sorokin's book is a panegyric on Russia, past and present, in which historical facts are selected, falsified or ignored to suit his convenience. The historian will be surprised to learn from his pages that the Russian empire

has always been distinguished by the peaceful character of its expansion: that Russia between 1906 and 1917 was one of the most democratic countries in the world, and that Russia and the United States never had even a serious diplomatic conflict before the era of President Truman. Professor Sorokin deplores what he calls the "destructive phase" of the Russian Revolution, but he assures Americans that it was finished many years ago and that Russia would now be a land of civil and political liberty but for emergency measures imposed by the struggle against Hitler and by "the excessively tough policy towards Russia on the part of her war allies" (as exemplified, presumably, at Yalta and Potsdam). In any case, according to the author, it is not for Americans to talk about democracy, for the United States also restricted constitutional rights during the war. There is no incompatibility between American and Soviet ways of life greater than that between "advertisements for this or that brand of cigarettes"; on the contrary, America and Russia have a special "sociocultural congeniality" (whatever that may mean). Professor Sorokin presents himself to the American public with much highly coloured rhetoric as a noble-minded apostle of peace and reconciliation, but the only practical conclusion drawn from his lofty idealism is that all attempts to halt or contain Russian expansion, from the Truman Doctrine to the Atlantic Pact, are utterly wrong.

When the Bolsheviks put Professor Sorokin into an "inferno" of a prison, their *regime* was characterised by "barbarism and bestiality." But since he has been installed in the safety of Harvard University, he has been able to admire from afar the virtues of Russia as regenerated by Stalin. He has not, however, been moved to return there to taste the delights of the new Soviet life.

This book is of interest as showing how Russian nationalism can make a propagandist for Stalin even out of a man whom Communism has driven into exile. But just because the author is not a Communist, he can influence many people who would be quite immune to the Pritt-Gallacher approach. If a prize were to be awarded for the book of the year most helpful to the Kremlin's political warfare against the western world, this one would certainly have to be placed on the short list.

Ad Astra

Interplanetary Flight. An Introduction to Astronautics. By A. C. Clarke. *Temple Press* (Technical Trends Series.) 164 pages. 8s. 6d.

The supercilious reader can be assured at once that this is a sober and matter-of-fact little book; it deals almost entirely with the mechanics and logistics of high-altitude rockets, and the technical possibilities of attaining a sufficiently high speed to escape from the earth into outer space. Except for a fine purple chapter ("Opening Frontiers") to close the book, the author keeps his imagination firmly in check, though his enthusiasm and confidence in the ultimate achievement are plain to see. The book is very clearly written, and even an almost complete ignorance of mechanics should not prevent anyone from grasping the author's conclusions; he has, moreover, a light touch which makes this, for a text-book, very readable. To anyone whose curiosity has been aroused by the activities at the White Sands testing grounds, not to speak of Hollywood's latest offerings, this book can be recommended.

The Third Way

The Social Crisis of Our Time. By W. Röpke. *Hodge.* 254 pages. 15s.

It has been said with some justification that the trouble with liberalism in Great Britain is its concentration on the vain attempt to fit itself into a space, between the two major parties, which simply does not exist, that it lacks, so to say, intellectual *Lebensraum*. Any liberal-minded individual who is beginning to feel that this *Lebensraum* is not merely non-existent but inconceivable will be well advised to read Professor Röpke, whose new book, like his "Civitas Humana" which reached English-speaking readers some two years ago, combines philosophic breadth with earthy good sense, historical sweep with political acumen, and profound ethical conviction with the theoretical equipment of a top-flight professional economist.

The policy of "economic humanism," the "third way" of which Professor Röpke demonstrates the necessity and outlines the programme,

> offers battle on two fronts: on the one against collectivism and on the other against that brand of liberalism which developed and influenced most countries during the nineteenth century.

The battle against collectivism is emphatically not a battle against collective action, economic or other; in many fields the state, embodying the civic conscience and implementing civic choices, should be more, not less, active than it is today. *Laisser faire* was an aberration, historical capitalism a social monstrosity. Collectivism, on the other hand, is worse, being dehumanising, megalomaniac, in the long run inevitably tyrannical. Both stand condemned, not primarily on account of economic wastefulness, inefficiency or irrationality but because they destroy the quality of individual and community life; they both upset the delicate balance between the gregarious and the solitary aspects of the human character, the correspondingly delicate balance of idiosyncrasy and social obligation. They attack the living relationships of neighbourhood, workplace and family, everything, indeed, that is organic, spontaneous, and continuing in the social structure.

Again and again, Professor Röpke uses the simile of humus, the fruitful earth with its delicate living balance of organisms, built up over millennia, destructible by human unwisdom in a matter of seasons. It would, however, be wrong to write him down a mere conservative, a sentimental advocate of back-to-the-land. Outside a comparatively few types of industry, he maintains, technical progress coupled with genuinely free competition will not merely preserve but encourage the relatively small-scale production which is socially desirable. The apparent inevitability of mammoth productive and commercial units is a delusion sprung of faulty laws and the maldistribution of property. Where mammoth production is, exceptionally, inevitable, then by all means let it be state-controlled.

To summarise Professor Röpke's thesis is to do him little justice; it is to leave out of account the brilliant and penetrating historical analysis, the shrewd observation of social habits and national traditions, the enormous erudition, which have gone to support it. The diagnostic first section of his book could stand alone as an essay in the history of political ideas; paragraph after paragraph throughout the whole is packed with enough seminal thought to be expanded into a treatise. The reader is warned that he will have to grapple with an awkward style—whether native or due to the translator is uncertain—and to perform some disconcerting chronological gymnastics. The English edition has been revised, but patchily, so that one finds President Roosevelt, for instance, apparently alive after the death of Lord Keynes. These, however, are superficial confusions; underlying them is an essential clarity of thought and, what is more than clarity, wisdom.

Reference and Text Books

The Hospitals' Year Book, 1949-50. Institute of Hospital Administrators, Tavistock House North, Tavistock Square, W.C.1. 1100 pages.

This is the successor to the year book formerly published under the auspices of the British Hospitals Association and the associated Central Bureau of Hospital Information, both of which organisations have now been dissolved. Most of the book consists of a hospital directory, covering every hospital in Great Britain and giving an analysis of the beds provided. There is also a great deal of miscellaneous information. Some of this, giving, among other things, details of hospital purchasing and equipment, will be mainly of interest to hospital administrators; but the patient and potential patient will read with some feeling the sections on noise and hospital food.

The Blue Guide to England. By L. R. Muirhead. *Ernest Benn.* 656 pp. 72 Maps and Plans. 21s.

The first postwar edition of this standard guide book first published in 1920 contains much general information useful to the foreign tourist. The section on Practical Information begins with details of the routes by which to reach England, and contains a glossary of "a few ordinary words the usage in regard to which differs somewhat . . . and so might occasionally lead to misunderstanding."

The descriptive material is grouped by routes based on road systems so that districts which may be easily visited together are presented together; a full alphabetical index is also provided. It is a pity that the need to give such a large amount of information in a book which can be carried without difficulty should inevitably lead to the use of such small type. The most fascinating information is frequently on the pages which look the dullest.

NEW LIGHT ON THE NEWS

The march of events is swift and complex. Thinking men and women feel a growing need for background information and well-informed commentaries. "Public Opinion" meets this need. Independent in spirit, often radical in outlook, "Public Opinion" believes in presenting both sides of problems, seeking the truth from divergent points of view. With a wide range of authoritative contributors, and with trenchant expressions of its own opinions, this thoughtful weekly review throws new light on today's affairs.

Contributors include: Graham Hutton, Paul Rotha, Douglas Houghton, Harold Hutchinson, J. L. Hodson, Dingle Foot, Philip Hope-Wallace, Edmund Rubbra, William Sansom, E. Colston Shepherd, etc.

PUBLIC OPINION

SIXPENCE EVERY FRIDAY

HARRAP

A Social and Economic History of Britain, 1760-1950

PAULINE GREGG, Ph.D.

Dr. Gregg here provides the first social and economic history of the last two hundred years to be written in one volume and on such a scale. The work is divided into three parts and twenty-five main chapters, commencing with a survey of the economic changes implicit in the Agrarian Revolution, and concluding with a report on the scene after World War II. It emanates from the author's experience as both scholar and teacher. With 47 half-tone plates and 13 tables or graphs. E.18/- net

Atlas International Larousse

Although at present our stocks of this unique Atlas are exhausted, fresh supplies are expected shortly and an announcement will be made in due course.

ROUTLEDGE AND KEGAN PAUL

THIS AUTOMATIC SECRETARY

Keeps All Your Papers in Orderly Form
Reminds You of Urgent Matters

NO OTHER means will do more to ease your work and free you from petty details and many minor matters.

For this "Desk Secretary" is a complete desk organiser. It keeps in orderly form and helps you to deal swiftly and systematically with all your papers and correspondence, and automatically reminds you of all commitments and matters to be attended to.

A compact portfolio containing 48 expanding pockets, that take your papers flat, each pocket clearly tabbed, all arranged in classified sections. First the complete alphabetical section, then sections for your daily follow-up, followed by sections for your monthly follow-up. In two sizes: Foolscap 13 in. x 10 in. x 3 in.; Quarto 11 in. x 10 in. x 3 in.

This Almost Human Device

Shows you all letters or papers requiring attention each day; Insures correspondence answered on correct day; Looks after matters pending and brings them continually to your notice until finally dealt with; Prevents loss of all important papers; Keeps your desk clear of litter with all your papers systematically filed.

Supplies Limited - Order To-day

When the present small stocks are exhausted, it may not be possible to obtain replenishments. So make sure of securing your requirements whilst they are available, and POST THE COUPON TODAY.

AMERICAN SURVEY

Exit Johnson

Washington D.C.

"REPUBLICANS have lost a campaign issue," wailed the Scripps-Howard press on the morning after Mr Louis Johnson's resignation. They may have lost even more. Mr Truman's decision, suddenly announced, but hardly taken in haste, to recall General Marshall for one more term of service to his country will no doubt take the sting out of their attacks on the Administration's foreign policy in the Far East. It will be a reminder to the American people that the policy, whether they approve it or not, was General Marshall's—that he stated it after his return from a year in China and never changed his mind during his two years as Secretary of State. The Republicans can continue to argue that it is a wrong policy, as they undoubtedly will, but it will be more difficult for them to persuade their fellow-countrymen that it is a treasonable one, conceived and carried out by Mr Acheson and a sinister group of fellow-travellers in the State Department. That did not stop the incredible Senator Jenner from trying; he called General Marshall a "living lie" and "an actual co-conspirator with the most treasonable array of political cut-throats ever turned loose in the executive branch of Government."

"Johnson and Acheson must go" was a slogan which had some prospects of bringing results; it even had some justification, since it was obvious that one or the other would have to leave. No Government could or should long survive in which the two most important of the President's Cabinet officers agree on nothing. But those who know Mr Truman best had little doubt which of the two would be dismissed in the end. It was not Mr Acheson who was carrying on an underground campaign against his President's policies, who was telling the opposition that he had been overruled when the decision not to support General Chiang Kai-shek on Formosa was taken, or who was trying to stab his colleagues in the back. And it is the Secretary of Defence, rather than the Secretary of State, who, in time of war, must become, as the *Washington Post* put it, "the scapegoat for a nation which had come to expect that opposing armies shall melt on first sight of an American soldier."

The President's decision, when it came, came without warning. Even Mr Johnson himself did not know his fate until the day before it was announced. But once Mr Truman had made up his mind to nominate General Marshall he had to act quickly. The Unification Act had to be amended before Congress adjourned to allow a man who had held a regular commission in the armed forces during the previous ten years to be appointed. It was natural that Republican cries of dismay should go up: they had been hit where it hurt most. They had been able to counter the sending of Mr O'Dwyer, the Mayor of New York, as Ambassador to Mexico (which assured a special election and big vote in Democratic New York City in November) by persuading Mr Dewey to change his mind and run for Governor once again. But they had nothing with which to trump General Marshall. It is open to doubt whether the hundred Representatives and twenty Senators who tried to block his appointment by voting against the amendment to the Unification Act will get much thanks from the country at large, even though they may explain that they were doing it "on principle." And it is permissible to wonder whether Senator Knowland's principles would have been as stubborn had the President proposed as Secretary of Defence a soldier who favoured sending military aid to General Chiang Kai-shek at the risk of war with Communist China—General MacArthur, for instance.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

★

But Mr Truman was almost certainly not thinking of national politics. It is not in his nature to desert one of his lieutenants while he is under fire, whatever the domestic political advantages may be. Had he been thinking primarily of the November elections over the last few months, he would have listened long ago to the appeals of frightened Democrats facing the autumn campaign and replaced the controversial figures in his Cabinet with men more able to win votes than wars and men who had the confidence of the party's hack politicians instead of that of the Foreign Ministers of his country's allies. Or he could have played for "national unity" by choosing a Republican to replace Mr Johnson and worked for some compromise with the opposition over policy in the Far East. Instead, he chose to stand by his refusal to allow General MacArthur and the Republicans to involve him in a Chinese war. He appointed as Secretary of Defence the author of his Far Eastern policy and, perhaps, the only man who can persuade the American people, in the present hysterical atmosphere, that it is the right policy.

The motley collection of "Formosa-Firsters," which includes the McCormick, Hearst, Luce, and Scripps-Howard papers, many of the Republicans in Congress and a smattering of Democrats, sensed the danger at once. The Scripps-Howard leader next day spoke of "the General's legacy of mistakes in State Department policy . . . especially the disastrous China policy." Senator Taft was dubious about the appointment because it "would strengthen Secretary of State Acheson's hand in relation to the Chinese Communists," and Senator McCarthy wanted him to convince the Senate "that he has learned the facts of life about Communism and that he will listen to MacArthur's advice rather than Acheson's on the Far East" before being confirmed in his post. They have every right to be worried. Not only is the new Secretary of Defence unlikely to listen to General MacArthur's advice on matters of foreign policy; he is probably the only man in the United States who can discipline him.

The dismissal of Mr Johnson and, even more, the appointment of General Marshall are the final and unequivocal proof that Mr Truman has no intention of compromising on his policy in the Far East nor of allowing it to be sabotaged. Those who denied that the decision to quarantine Formosa represented a reversal of earlier decisions have been proved right. The proposal to place the Seventh Fleet between the two Chinese factions came from the State Department. To carry further Mr Roosevelt's famous analogy on Lend-Lease, it was like deciding to play a hose on your own house when your neighbour's is burning, which would hardly constitute a reversal of an earlier decision not to have the house washed. And it was fortunate that final proof of Mr Truman's determination was given just at the moment when the Secretary of State had to face the Foreign Ministers of Britain and France, of the North Atlantic Treaty powers and, at the General Assembly, of the United Nations. There must, among them, have been many who were uneasily wondering how far, even after the President's bridling of General MacArthur, American, and particularly Mr Acheson's, assurances could be accepted. After September 13th there was no further need to wonder. It was not Mr Acheson who would go and Mr Truman had secured his rear by giving him, as his closest collaborator in the Cabinet, the man whose policies he had inherited and continues.

Not only will the President now have a team carrying out his political and strategic policy which is individually loyal to him and to his decisions, but also one which can be counted on to work amicably together. General Marshall himself is now 69 and cannot be expected, although he has recovered well from his operation in 1948, to be able to work as hard as he once did. But he will be able to leave a great deal to his Under-Secretary, particularly if it is Mr Lovett, who was also his Under-Secretary at the State Department and an Assistant-Secretary of War while he was Chief of Staff, while he himself concentrates on the larger issues. Foremost among these are the urgent task of placating Congress and of educating the American people and their representatives on "the facts of life about Communism." Meanwhile the Marshall-Acheson-Harriman trio, and two of the three service Secretaries, Mr Finletter and Mr Pace, will be able to concentrate on the main job—winning the present war as quickly as possible and preventing the Asian addicts from starting another.

American Notes

Vision for 1952

Since last April, when the President asked Mr Gordon Gray to analyse "the factors bearing on the present disparity between exports and imports," military developments have put a drawstring round the dollar gap, which may be closed completely before-long. And June 30, 1952, when the European Recovery Programme is due to end, has lost its ominous, special significance, for now American financial aid can hardly be cut off sharply. But 1952 still has general significance as a synonym for the ultimate date when the world's accounts must be balanced and Mr Gray has refused to allow his attention to be diverted from this distant goal by immediate military objectives. He knows, too, that the latter cannot be achieved unless they are backed up by economic measures and that in many countries the Communist temptation will prove irresistible unless democracy offers the hope of future stability.

This, at least, appears to be the line Mr Gray has taken in his long draft report to the President, as far as can be gathered from the "leaks" that have now been published in the press. Mr Gray is said to have set his sights high and to have made few concessions to departmental shibboleths or Congressional prejudices. For example, the "Buy American" law, shipping preferences and the farm price support programme are all condemned for their repercussions on international trade and it is suggested that the Reciprocal Trade Agreements Act should be set up on a semi-permanent, instead of its present hand-to-mouth, basis. Mr Gray's vision for the future seems more realistic economically than it is politically, and the government departments concerned are now engaged in bringing the draft down to earth. The published version will probably contain only the final conclusions, not the detailed arguments leading up to them, but the arguments will be behind Administration thinking for a long time to come.

Mr Gray recommends that some system of international allocations for strategic materials should be set up at once, for he recognises that Europe's economic recovery will be jeopardised if raw material prices are allowed to rise unduly as a result of defence demands. The single new agency—an Economic Overseas Administration—which he favours would co-ordinate all economic aid abroad, but would not deal with military aid as well, as it had been suggested it might. In the opinion of Mr Gray and his advisers, economic assistance for Europe should take the form of a continuation of Marshall aid for several years. In the Middle East, and in South-east Asia, co-operative programmes for economic development should be worked out on a basis of government loans and grants, private investment, and technical aid. This looks like a return to the original Point Four conception; a shadow of this once "bold new programme" has just been handed over to the State Department by Congress after eighteen months of attrition.

★ ★ ★

Anti-Communist Brew

The McCarran Anti-Communist Bill, which the Senate and House have enthusiastically set before Mr Truman, is a triumph of legislative economy, if nothing else, for it is a mixture of all that was on hand in the Congressional kitchen, served up piping hot. Senator McCarran has swept into the pot every anti-Communist device on the shelves: the President's request for a much-needed strengthening of present espionage and sabotage safeguards, and a lengthening to ten years of the period that must elapse before the statute of limitations applies to espionage cases; the two-year-old Mundt-Nixon scheme for forcing Communist and "front" organisations to register with the Attorney-General; some unsavoury ideas of his own on the immigration and naturalisation laws; and finally, even the Kilgore Bill, a last-minute inspiration offered as a rival attraction.

Supporters of the latter hoped that the powers it contained to intern potential saboteurs and spies in time of war, invasion, or insurrection, might direct Congressional attention to the real dangers, and away from the clumsy registration clause. This the Attorney-General declares would be ineffective and certain to impose a "staggering burden of enforcement" upon the overworked Department of Justice. But both Senate and House, after a moment's consideration, decided to have all Senator McCarran offered, and the Kilgore Bill too.

The heavy votes in both houses for a Bill that most impartial observers believe represents a grave danger to freedom of opinion and expression suggests that the *New Republic* was not far wrong when it concluded that the driving force was fear, not of Communists, but of constituents. Only one Senator facing an election this autumn —Mr Lehman of New York—had the courage to vote "no"; many who in the end climbed aboard the omnibus had earlier protested that years of litigation would be required before registration could begin, and that the chief sufferers would be, not the agile Communists, but persons whose only crime was the holding of unpopular beliefs. It is already fearfully easy, in the present state of alarm, to destroy a reputation and a livelihood. The General Foods Corporation has

cravenly dismissed Miss Jean Muir from its television show as a "controversial personality" because she is listed in "Red Channels," a guide to the supposed "red network of the air" produced by a group of warped and irresponsible minds. All the more credit is due to the American Broadcasting Company, which refused to take similar action against Miss Gypsy Rose Lee without further confirmation —which was not forthcoming. In the past it has been the guardians of moral, rather than political, purity that have been after Miss Lee's amply displayed skin.

Mr Truman has said he will not sign any Bill that contains the registration requirement, which he compares to the odious Alien and Sedition Acts of 1798. Some members might welcome a veto, now that they have displayed their staunch anti-Communism to the voters, despite the song and dance the Republicans would make about it. But the votes to override a veto can certainly be counted upon—if the President gives Congressmen a chance to cast them before they go home at the end of this week to their woefully neglected campaigns. When they come back to Washington on November 27th they may be in a more judicious mood. A veto, of course, would mean throwing out the baby with the bath, and postponing for some months measures the Department of Justice considers urgent.

* * *

Road Round the Veto?

Since its great days in June and July, the Security Council has fumed behind the road-block of the Russian veto. Even before the invasion of Korea, innumerable American schemes had been proposed to strengthen the United Nations; since then the American interest has deepened, thanks in part to a revived faith in the capabilities of an international organisation, and, in part, to television, which brought Mr Malik face to face with Americans who normally do not visit Lake Success. Mr Hoover would reform the United Nations, in effect, by destroying it, for his proposal to expel the Russians presumably would have led to the exodus of a number of important countries that are not resigned to membership in an exclusively anti-Communist club.

The Senate subcommittee that has surveyed all these proposals for strengthening international action, either through the United Nations or by creation of an Atlantic Union, decided to sponsor none of them; it concluded that the United Nations as now constituted still possessed vast untapped resources for peace. Mr Acheson has now proposed that this session of the Assembly should tap them by trying to endow the Assembly with some of the responsibilities which the Security Council has shown it cannot discharge as long as the Russians remain obdurate. The Assembly is not plagued by the veto; a two-thirds majority is all that is needed to pass recommendations. And the most famous actions of the Security Council—the resolutions on Korea—were not the less effective because they were couched in the form of recommendations.

The Korean invasion has demonstrated the advantage of having an immediate, impartial report on the background to any aggression that may be committed. But the presence on the spot of a UN commission was a happy accident. The United States therefore has adopted Mr John Foster Dulles' suggestion of a permanent commission, appointed by the Assembly, to visit possible trouble-spots and give the fire alarm when necessary. In Korea, also, the United States, though it has won the applause and moral support of the free nations, is conscious of having received but very little material support. After two and a half months, only a handful of British troops are fighting beside the Americans. The second American proposal is, therefore, that the Assembly recommend its members to earmark forces that would be minutemen for peace, ready to serve wherever Uno decided aggression must be withstood. Thirdly, the Assembly is being urged by the Americans to provide for the calling of a special session, whenever that is necessary, at twenty-four hours', rather than a fortnight's, notice. And finally, Mr Acheson wants a committee of the Assembly to study methods by which the UN charter can be strengthened through collective action.

The prospect that these proposals will be accepted is not very bright. But if the American delegation is rebuffed in its attempts to make the Assembly an effective instrument for peace, more drastic cures will be given a new life in the United States.

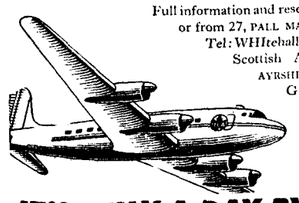
* * *

Making Rubber's Ends Meet

The new urgency of the defence programme, coupled with the Communist threat in the Far East, has not only given the rubber manufacturers what they wanted, the reopening of all the government's synthetic rubber facilities, but something they would have preferred to do without, controls on inventories and on the use of rubber. Rubber could be bounced back on to a wartime basis without waiting for Congressional authority, since it had never been completely demobilised. Such authority would not in any case have been hard to get, for Congress will never forget the rubberless rigours of the last war. Rubber was the first field to be explored by Senator Lyndon Johnson, Mr Truman's able successor as head of the Senate's revived War Investigating Committee. This committee was much perturbed at what it considered to be lack of unreality in the government's plans for stepping up both the output of synthetic rubber and the buying of natural rubber for the stockpile. But the government agencies concerned were already following the committee's advice even before it had been offered.

The possibilities of producing natural latex in the western hemisphere are once again being studied, and the latest of the post-Korean increases in synthetic rubber plans will bring all the government-owned plants back into full activity. This means that some time next year general purpose synthetic will be pouring out at an annual rate of 760,000 long tons, double the rate of three months ago, with 6,000 tons of butyl also being produced each month. Any substantial increase in this rate of production would involve an increase in capacity. The rate at present planned will necessitate the reopening of plants which make butadiene from alcohol and, unless grain alcohol distilleries are also reactivated, Americans may once more have to choose between tyres and whisky. Their wives may have as hard a choice, between tyres and nylons, for the other main ingredient of synthetic rubber, styrene, is made from the benzene which also goes into nylon, soapless detergents and many plastics.

Detailed restrictions on the use of rubber are expected before the end of the year, in order to stretch existing supplies as far as possible. These regulations will probably limit, perhaps very drastically, the quantities of natural rubber that can be used in various products. They will take the place of the general restriction, introduced at the beginning of this month, which sets a ceiling of 90,000 tons a month on consumption of new rubber, about 20,000 tons less than the record amounts that have been used in recent months. The government hopes, and its hopes are likely to be fulfilled, that most of the reduction will fall on the high-priced natural rubber rather than on the cheaper synthetic. The main purpose of the restriction is to ensure that natural rubber is left over for the government stockpile buyers, who are apparently ready to take all that they can get. The American attempt to make its rubber ends meet should not therefore, for the present, mean any decline in the demand for natural rubber, although it is too soon to assess the long-term repercussions.



WHEN IT COMES to taking money from the Canadian domestic pocket —American business men have the "know-how". They operate *on the spot*—because this highly competitive market calls for efficient *salesmanship* and after-sales service! By flying T.C.A., you, too, can be operating in Canada *on the spot* tomorrow!

CANADA WANTS YOUR GOODS!
Every Canadian already spends on average 24 dollars on British goods every year. But they are eager for more—will spend *twice as much!* Fly by Trans-Canada Air Lines, the *only direct daily* service to Canada. Board a Skyliner at London or Prestwick—and less than a day later you'll be in Montreal, ready to earn dollars in this hub of Canada's market. And in the U.S. market, too—note that T.C.A. now fly to New York direct with, if you wish, stop-over in Montreal at *no extra cost.* You'll enjoy your trip by Skyliner—especially the friendly service, twin cabin roominess, deep reclining chairs, piping hot meals and "on time" arrival!

Swift Skyliner Services leave for Canada daily—the *most frequent* direct service. It links you with *every* important Canadian and U.S. city. Let T.C.A. take you there—and *you* will take the orders!

LONDON — 6 Lombard Street
51 Berkeley Square Bush House, Aldwych

"THE WHOLESALER IS IN A STRONG POSITION TO INFLUENCE AND ASSIST

the manufacturer by interpreting to him the needs of the market. By so doing he enables the manufacturer to plan his production on a steady basis thereby avoiding equally periods of slackness and intense pressure. It is not an easy task to interpret the needs of the market especially in the field of apparel where fashion plays a predominant part, and even the experience of years may not always mean that the wholesaler backs a winner. But this is part of the service which he supplies not only to the manufacturer but also to his customer the retailer. Through him the retailer, and this includes the village shop in the most remote part of the country, is kept in touch with new designs and styles and is assured of a reasonable source of supply."

Extract from speech by the Parliamentary Secretary to the Board of Trade, Mr. Hervey Rhodes, D.F.C., M.P., at a Dinner in connection with the International Conference on Wholesale Textile Distribution. London, Monday June 19th, 1950.

THE WORLD OVERSEAS

The French After Korea

(From Our Paris Correspondent)

PRESS comment from Paris and the provinces suggests that Frenchmen finally understand the immediacy of the Soviet threat to the security of Germany, and thence to France. M. Pléven's decision to hold back conscripts due for release in mid-October—the forerunner of a statutory extension of military service from a year to eighteen months—has met with virtually no opposition from the non-Communist press. Even such a newspaper as *Franc Tireur*, which has for long been bitterly antagonistic to the Indochinese war, has accepted a thorough rebuilding of French defences. At the same time, President Truman's declarations and American stubbornness in Korea have enormously raised the stock of the United States, which is now regarded as a real military power not just as a vast, vague industrial potential. The appointment of General Marshall has also been reassuring; not least because some hope is at last offered that his presence will induce American senators to cease their hair-raising essays in amateur atomic strategy. Finally, the promise of increased Anglo-American forces on the continent has greatly decreased the fear of a resurgence of Germany.

Now that the Foreign Ministers' and North Atlantic Council conferences in New York will set in motion the military and economic organisation for Europe's defence, France—which has already agreed to provide twenty divisions as a permanent peace-time contribution—will soon have its tasks allotted to it by some kind of joint war-production staff. Before this international board issues its directives it is scarcely possible to discuss French rearmament with any precision. Already, however, several psychological and economic factors are prominent.

A Chance for Unity

First, there is a danger that some of France's partners —in particular the United States—may misapprehend French motives and possibilities. Publicists in Paris, who before Korea wished France neutral in a world war (and in so doing almost certainly voiced the feelings of millions of Frenchmen) have since come round to the belief that, after all, the Atlantic Alliance can defend Western Europe. The reason for this conversion is, however, simply the emergence of American military power. This phenomenon has for the present concentrated French opinion, but it would be premature to hail the unity of France. For the fed up are still fed up and the Communists still Communists.

What may be said is that for the first time since the resignation of General de Gaulle in 1946, the government of France has a real opening, a real chance, of unifying the country. Its task remains about as difficult as that of any government could be. For there is a great gulf between what a French government knows to be essential and the administrative possibilities. But the great thing is that fear of the barbarian beyond the Elbe and the hope offered by the United States that the barbarian may be warded off are spreading together throughout the population; feelings that have projected the twenty divisions without summoning up a serious challenge to the project's feasibility. Furthermore it seems that deep down the French would like to have an army for its own sake. They are after all a military nation.

France is a very old country which got down to brass tacks a long time ago. The Parisian shop-keeper doesn't believe in democracy's golden future; the Cherbourg docker isn't interested in moral rearmament and the Auvergnat farmer cares little about Scientific Trumanism and Point 4. Ten years hence an idealistic youth, attached to these large Anglo-Saxon notions, may be having its full say in French affairs. In the meantime, the efficacy of the twenty divisions will depend on the personality and invention of France's military leaders. Under General de Lattre de Tassigny much has already been done. Is it too much to hope that General de Gaulle will associate himself with the new army in some practical manner? A defence programme without him would lack drive and prestige and (who knows?) somebody to poke fun at.

Paying for Rearmament

It is the argument of French Socialist-humanists that France's standard of living is too low to be worth defending, that social justice is the pre-requisite of a rearmament programme. This seems both true and untrue: untrue because nations fight not for their standard of living but for sheer survival; true, because economic injustice directs the animosity which should flow outwards towards the enemy, inwards towards the fellow citizen. *Franc Tireur*, for instance, demands "profound and rapid reforms of structure such as those accomplished by Labour Britain." Such reforms can, however, only be effected by a majority party—an impossibility in contemporary France. But much could be done to remedy poverty and banish frivolous riches if the fiscal system were overhauled. M. Maurice Duverger, a young professor from Bordeaux who contributes frequently to *Le Monde*, has drawn attention to the government's dilemma in the matter of the financing of rearmament. As to the part which France itself must finance, the government can do two things: first, economise its civil investment, which would mean a cut in housing, unless (as is most improbable) sufficient "inessential" lines of production could be converted. But this course is scarcely conceivable in view of the unbearable shortage of houses in France today (the main housing effort is still in the war-shattered towns). Or second, the government could have recourse to extra taxation. But, as usual, farmers, tradesmen, industrialists and the liberal professions will find no difficulty in tax-evasion: the brunt will consequently fall, as usual, on the fixed income class. This fiscal fraud, since it robs the government of its revenue, must evoke an increase in indirect taxation; so that once again the poor will be depressed in relation to the rich. Such a development, concludes M. Duverger, would so stimulate Communism as to render rearmament impossible without police repression. Therefore the only way to have rearmament without Fascism is to adopt a genuine policy of redistributing wealth by taxation. The sole other alternative for the government is to employ inflationary measures; these would likewise obliterate the purchasing power of the wage-earners.

It is hard to deny the force of this argument. M. Pléven, in his speech at his constituency, St Brieuc, has promised the most energetic action against inflation: by customs' policy, taxation and restriction of credit. The International Monetary Fund, at its Paris meeting, has also recommended that both governments and persons should restrict their investment to "essential purposes." It is to be hoped at least that the building programme under private enterprise will not be retarded by credit restrictions. For it is already a high-cost industry on account of the lack of skilled labour and should rather benefit from a special credit regime. Another highly welcome line of policy proclaimed by the Prime Minister is the abolition of the famous nationalised railways deficit. As budget follows budget, the poverty of the treasury is always in glaring contrast with the wealth of the merchants, the abundance of luxury goods and the proliferation of purchase-taxless automobiles.

Such until now has been the ramshackle economy and centrifugal tendency of France, in essence a rich farming and vine-growing land of Catholic culture and military tradition with certain industrial interpolations. This is the society which is called to act as the continental pivot of an alliance dominated by Anglo-Saxon, Protestant powers possessing a far more intensive business and industrial civilisation and a far greater social cohesion. The next years will show whether, sustained by transatlantic supplies, France, the pre-industrial European land power, will once again unite and rise to defend its own frontiers.

Marxist Shanghai—II

[BY A CORRESPONDENT RECENTLY IN CHINA]

THE foreigner's glib assertion that Shanghai is not China overlooks one way in which Shanghai has for some decades been peculiarly and distinctively the focus of modern China. For over a hundred years the major port of entry for the west, for its goods and its ideas, Shanghai as a town has grown up without traditions, with little direction from its founders and builders, with a constantly increasing population of uprooted western-educated, upper-class Chinese, who, finding themselves without a pattern of living, made, what the west had made no attempt to supply, their own model. It was in Shanghai that the Chinese took what they needed and created their own superficial model. It could hardly, in such surroundings, have been a very well founded model. The young Chinese wearing an American style suit, a garish tie, armed with a camera, a Parker 51, a refrigerator full of coca-cola and the degree of a minor American university may sound a caricature, but it is a fair approximation of the aspirations of Shanghai. It is not surprising that such a figure could be easily knocked down by anyone equipped with the simplest weapons of Marxist criticism. But the public which needs such a model will not be satisfied until a new one appears. If one dummy is removed another will replace it, and while new doctrines may absorb the seekers after a new faith, those whose intellectual standards are less vigorous and whose enthusiasms operate on the lower levels of fashion will be quick to anticipate the demands of the "new look."

The expression *kao t'ung* is one of many which have sprung from Shanghai. The new dress introduced for government officials in the autumn of 1949 (following the Sun Yat-sen uniform of the Kuomintang) was quickly dubbed *Lieh Ning chuang* (Lenin dress), and it soon became fashionable wear outside the ranks of officialdom or the party. So much so indeed that one of the newspapers saw fit to issue a warning. There was no objection, they assured their readers, to the wearing of this costume, but it was important to realise what it stood for. It should not properly be worn by those who were *kao t'ung*. Was the heart pure and the mind cleansed that lay beneath the uniform?

Fur coats and permanent waves were dismissed by the rigorous fashions of Peking (to the consternation of unliberated Shanghai) until the authorities announced there had been no such edict (though the modern party worker would be unlikely to indulge in either). The subtle operation of this process may have its benefits and its dangers. One cannot but applaud the stirrings of social conscience in the running of children's nurseries and other social services by women who might otherwise be spending hours at the mah jong table, even if one suspects that fashion rather than Marxist teaching has dictated the change, but one must deplore, on the other hand, the earnest toeing of the party line—*plus royaliste que le roi* at times—by newspapers whose traditions need not have been so wholeheartedly jettisoned in the desire to do the right thing long before they had been told what they should do. Such enthusiasms may crush freedoms which are not easily restored once a precedent has been set.

The "mighty friendship" with the Soviet Union is aided by the rivulets of fashion. One might almost hazard, on the part of the Chinese, a desire to pick out from among their imperialist despoilers some one power to play the role of ex-great-Uncle, as it were. The Americans were in some sense so regarded in the years of the war and immediately after; has the Soviet Union now replaced them? There is a story of a railway engineer ordered to make a technical change which had been advised by Soviet experts. "You see," he said, "before it was the Americans. Everything they said was right. Now it is the Russians. But I—do you realise, I have been making this recommendation for twenty years. Has anyone ever listened to me? No! We Chinese seem to have got the idea that only foreigners know anything about technical matters." Which is the stronger, the influence of fashion favouring the Russian or of nationalism which certainly accepts the Communist claim that until their advent China had never been really free and independent? One may expect that the broad basis of the new regime will effectively prevent the oligarchic tendencies of one party rule. It seems that China will follow its own road.

Cousins in Europe

But while the Communist victories were being won the world situation had been changing. The Middle Kingdom, alone, self-sufficient and majestic for so many centuries, shattered by western assaults in the 19th century, now finds itself embraced in the arms of a new family. In the streets of Shanghai the Chinese may see much to demarcate the frontiers in which he is now enclosed. The Cominform journal from Bucharest, the *New Times* from Moscow (both in English) proclaim him part of a brotherhood which stretches solidly westward as far as Prague. If at times he finds it hard to believe in his new found cousins in Bulgaria, Roumania or Poland who now fill so much space in his newspapers, it looks very well on the map and one can well imagine that the Chinese feel some sense of belonging, some gratitude even in having their minds made up for them. Not politically minded by nature, they have become internationally minded by force of circumstance. After the sorry chaos of the post-war years it has not been difficult for the Communists to point to the United States as the God that failed.

But what, one might ask, of the background? Where was the economic and political revolution which could change man? The English observer, fresh from wartime controls and the first pressing statutes of a Labour government, sitting in a restaurant reading of the food shortages which were affecting millions in northern Kiangsu, might be struck by the contrast of a bill of fare of over two hundred dishes at his command. Further reflection answered, of course, that in a country so poorly served with communications control of food and raw materials would be extremely difficult. New buildings? After a year of occupation there were none; nor industries nationalised (but inducements for the capitalist) nor even concentration on material benefits which promised a future paradise for the proletariat.

Communist policy seemed to be divided over this unwieldy metropolis. In the economic pattern of the new China it was

expendable, suggested one school of thought. Peking would become the revised government and intellectual centre, the north and north-east (Manchuria) the industrial centres; Shanghai was an unhappy problem contaminated with decades of soulless capitalism—so it seemed to be argued. But if Shanghai would not fit easily into the new China, some attempt was made to bring China to Shanghai. A large agricultural show was mounted on the racecourse. Not the least interesting section had maps and diagrams of areas affected by flood, pest and resultant poor harvests. There was an interesting selection of peasant industries, of farming implements and a row of munching cows (a fine advertisement for British livestock). Much has been made of an attempt to move Shanghai's industry to inland centres. It is hardly likely to have much effect until power supplies and communications are more favourable. Nevertheless, if the curtain on the window to the west has been drawn, a closer relation between Shanghai and the countryside can only be for the good.

Will businessmen's opposition harden while the enthusiasms of the students, intellectuals and salaried workers fade, or will economic rehabilitation come soon enough to turn resentment into acceptance in the former case, while the religious needs (and they are no less) of the latter continue to find satisfaction in the doctrines of the New Democracy? It would be hard to point to any political opposition in the one, while the evident desire on the part of some Christian leaders to fuse their faith with the new teachings is a significant symptom in the other. One impression certainly remains to the observer of political change. The Liberation army has many of the characteristics of the Salvation Army, and in China today there are no competitors in the field of salvation.

Trade Between Two Germanies

ANOTHER attempt is now being made by the Federal German Government to conclude a satisfactory trade agreement with the East German Republic. The present agreement, which expired at the end of June, has been extended to October. The course of interzonal trade has been increasingly difficult, as the two sections of Germany have become more and more foreign to one another. One has to imagine a situation in which Britain was divided into two—a Communist state, virtually annexed to Russia, south of the river Thames (except for a democratic enclave in west London) and north of the Thames a *laisser-faire* state under the supervision and influence of America. In this Britain the southern branches of Imperial Chemicals and other big concerns would be Russian limited liability companies, channelling their purchases, output and/or foreign exchange direct to headquarters in Moscow. The pound would be worth only a quarter as much as it was north of the Thames, but wages would be pegged at about the same normal level. The southern companies, operating to a strict plan under state or Russian ownership, would be able to manipulate their prices according to central policy and dump in the north to the confusion of local manufacturers, many of whom would be refugees from the Soviet south. A northern movement for protection against the south would arise. While the Governments vainly tried to operate a balanced clearing arrangement, the Thames frontier would be in fact wide open to illicit trading, and the enclave west of Piccadilly Circus would offer an easy channel for evading attempts to prevent goods of military importance from finding their way to the Russian area. Each "country" would build up industries in order to become independent of the other.

In Germany, where the situation is still more complicated than this sketch implies, the official interzonal trade agreement of October, 1949, has proved a failure. Only about half the estimated volume of trade has been registered. Officially trade came almost to a standstill when the embargo on exports of western steel was imposed last February. The embargo, now lifted, came into force ostensibly because the Soviet German side was lagging in its deliveries. It was, however, also due to objections from the Allied High Commission to the fact that the Russian zone was buying very little else but steel, and sold little else but consumer goods. This disparity is now to be eliminated. As a start, Ruhr hard coal is again to be exchanged for Soviet zone soft coal briquettes.

Steel to the Soviet Zone

Large quantities of steel have gone to the Soviet zone in barter deals outside the trade agreement. The Americans estimate that $3 million worth of steel has been smuggled over the frontier in the last six months. On the other hand, the Communist authorities are also concerned at the smuggling of precious raw materials—notably non-ferrous metals—to the west. Berlin forms an ideal centre for such illicit exchanges, and the zonal frontier itself is not policed by zealous officers. The Bonn department, staffed by inexperienced officials, has proved very lax in licensing the export of prohibited goods to Communist countries. Supervision of trade with eastern Germany is naturally even slacker.

The Soviet German Ministers are using every means in their power to increase controlled trade with the western Germans. Their motive is even more political than economic. The eastern zone indeed needs western products for the heavy industry which it is feverishly building up. On the other hand, Herr Ulbricht counts upon the lure of markets to win over western German businessmen for the Communists' National Front. He recently urged western German industrialists and traders to ignore the Bonn regulations, to insist that officials with American sympathies are removed from trade departments, and to prohibit the import of goods which can be produced in Germany.

Channel to Asia

At the same time the Soviet German Ministers are linking interzonal trade with opportunities for expanding markets in the whole Soviet area. They claim that western German trade with the Peoples' Democracies, the Soviet Union, and China will in future have to be channelled through them, and threaten that offers they hold from these quarters cannot long remain open. If this effort were to succeed, the position of the Soviet German Government would be greatly strengthened. So far, however, trade between Bonn and the Soviet sphere has proceeded on the basis of direct bilateral agreements, and there is no trade with China.

At the beginning of this year, the Ruhr was extremely anxious to secure orders from the eastern Germans. This situation has, however, changed as American rearmament has filled German order books to overflowing. At the same time, unemployment has fallen by 600,000 since the winter, and thus weakened another potent Soviet German argument. For this reason, the western negotiators who are now starting work are on firmer ground than they were. They may this time be able to secure consideration for the economy of western Berlin, and a more balanced exchange from their Communist opposite numbers. Both parties hope that the total exchange under the new agreement may reach one billion marks in the year—a figure which, according to eastern German estimates, is still only one quarter of the volume of business done between east and west in the old Reich.

EXPERIENCED TRAVELLERS FLY BRITISH

It is significant that most people in this country who travel by air prefer to fly British. A natural pride in a British concern is of course one reason. But airways cannot depend on patriotism alone. The more definite reasons that have impressed themselves on experienced travellers are the comprehensive schedules on routes all over the world, the all-round efficiency, the courtesy, the thoroughness—and, perhaps above all, that sense of complete confidence that is felt by everyone in the presence of British Airmanship.

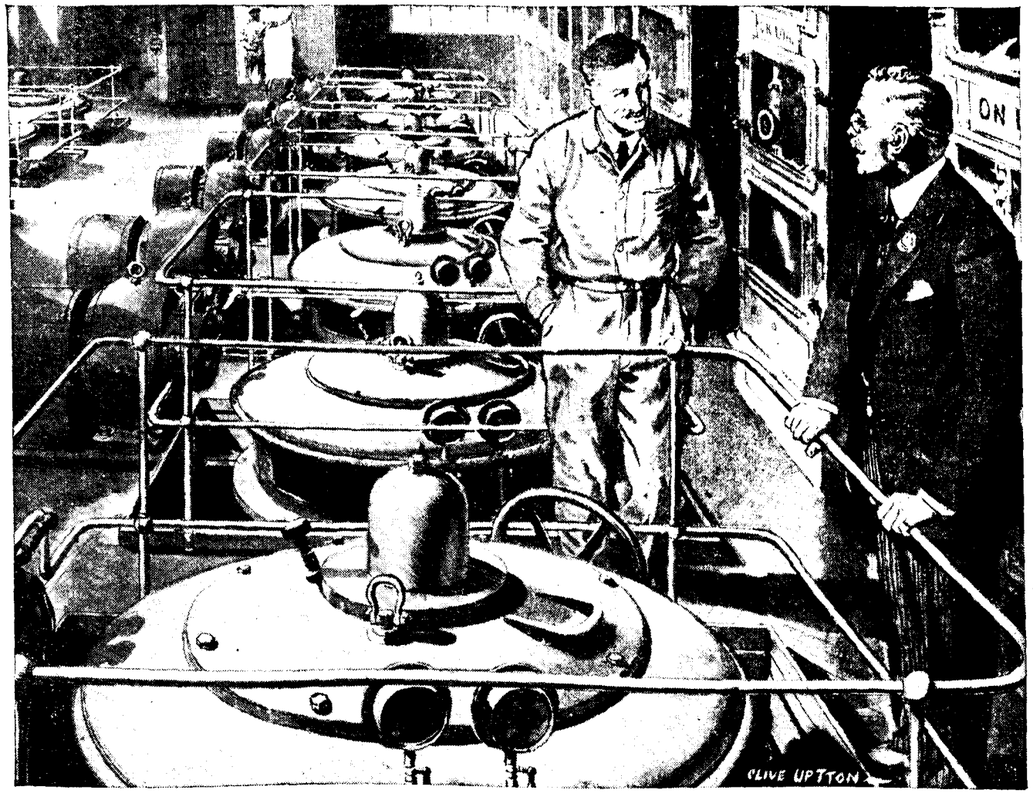
the late Mr. J.

Yes, he's late again. Late to leave the office. Late to get home. Late to realize that yesterday's business machines and methods cannot keep pace with the tempo of today's business.

The irony is—that the answer to his problems is no farther away than the telephone on his desk. Some day, instead of calling his wife to say he won't be there for dinner, he'll pick up that phone and call Burroughs.

Together, he and the Burroughs representative will make plans to put the "book-keeping" of business on a production basis, to produce promptly the day-to-day figures he must have to make the right decisions. Modern, time-saving Burroughs machines will replace time-wasting relics of another day. New methods and procedures, based on Burroughs experience with British business leaders, will be applied. In short, the office will be mechanized to get work done *on time*, at less cost, with less effort.



If this puts a B in your bonnet, reach for the phone book and look up Burroughs Adding Machine Ltd. (in London, REGent 7061).

Wherever there's business there's

We've solved some problems in our time!

In 1927—a Power Station problem. Generators driven by turbines. Turbines dependent on vacuum produced by condensers. Condensers supplied with river water by pumps. Pumps driven by electric motors. And to join the ends of this chain of interdependencies—the motors driven by current from the generators. That circle once broken by stoppage from any cause, the motors had to find power from elsewhere or the turbines could not be re-started.

¶ Obvious answer—a stand-by battery. But batteries idle for long periods are apt to prove work-shy when most needed. We worked out a new system of charging—the continuous feeding of a battery with exactly that fraction of charge which otherwise it must daily lose through standing unused. We called it trickle-charging.

¶ We started something, there. Trickle-charging is universal, now, for stand-by batteries. Our own Keepalite automatic emergency lighting system, using trickle-charged batteries, is in use all over the world.

¶ And the Chloride battery that began it? Dismantled at last after 22 years. Was it worn out? Far from it. Good for many years more service. But the building in which it stood has just been demolished. They're building a new Power Station.

¶ *Our battery research and development organisation, the largest & best equipped in the country—if not in the world—is always at industry's service, ready at any time to tackle another problem.*

THE BUSINESS WORLD

Will the Steel Act Work?

THE Government would have done better to defer action on the Iron and Steel Act, and better still to have compromised on the solution that Mr Eden put forward in Tuesday's debate. It has refused to do either. The members of the Iron and Steel Corporation are to be appointed on October 2nd (the first permissible day under the Act, October 1st, being a Sunday) and are then to be consulted about the earliest convenient vesting day. The Government's commitment is by now irrevocable, and since the considerations of political expediency or economic wisdom that might have urged delay have already been thrown to the winds, it is necessary to assume that the vesting date chosen will be very early in the New Year.

Clearly the Corporation will not by that time be sufficiently organised to take on the active direction and control of the iron and steel industry. It may, however, confine its function in the opening stage to accepting the transfer of title in the shares of the 92 companies that are listed, after the latest deletions, in the third schedule to the Act. The Treasury has enough experience by now to have mastered the mechanics of such mass transfers of title, and the corporation should not find its share of the operation too exacting. Its troubles will start thereafter.

What are the tasks that will confront the new corporation? The Act endows it with certain powers, some of which it need not exercise until events oblige it to do so. The power "to hold such interests in companies as vest in them under Part II of this Act" is clearly as much an obligation as a power, and once vesting day arrives the corporation cannot postpone the assumption of it. It is, however, an obligation that can be discharged in an active or a passive manner. Thus the corporation is further empowered "to exercise all rights conferred by the holding of interests in companies," and such rights no doubt include the right to dismiss directors and appoint new men.

A corporation confident of its authority and having a policy of dynamic change to press on the industry might conceivably begin to use this power to make its will effective. But if there is, instead, a corporation somewhat less than self-confident and in the dark about the industrial purposes that it ought to pursue, it may very well leave the managements of the companies alone for the time being. Similarly, the corporation will have power to form new companies to carry on any of the activities listed in the Act, or indeed any of the countless activities that any of the publicly-owned companies is "authorised" to carry on. But to attempt this in the opening phase of the corporation's life will be to bite off more than its infant teeth can chew; it is fair to suppose that such adventures will have to wait. Of more proximate application may be the clause that empowers the corporation to conduct research and to provide common services for the companies under its control. It is true that those companies already have perfectly good common services provided for them by the Iron and Steel Federation and the Iron and Steel Research Association. But these bodies include in their membership many firms that are not to be taken over, and indeed the number of their member firms left out of the Act is far greater than the number that fall within it. Presumably the corporation will have to produce a policy on this matter at an early stage, and it is fair also to suppose that in the attempt to disentangle the common services of the publicly-owned sector from those of the privately-owned sector, some of the services are likely to be damaged and others are likely to be duplicated needlessly.

★

Urgent as these questions will be, to consider them in detail now would probably be to look too far ahead. When the corporation exercises its initial right and assumes title to the shares of the companies, it will assume financial obligations at the same time; the shareholders in the companies will receive as compensation Treasury-guaranteed Iron and Steel Stock, and their title to this stock commences on vesting day. When the Bill was first published the number of companies affected was 107, their issued capital was estimated at about £195 million, and the amount of stock required to compensate them was put at about £300 million. These figures have been changed by the deletion of 15 companies from the schedule and the hiving-off of parts of others, but they were in any case approximate figures, and the final scale of the operation can hardly be exactly known until it has taken place. All that need be said now is that the basis on which compensation is to be computed is still unjust and iniquitous, and that the effects of shareholders seeking to escape into new industrial holdings from their approaching status of involuntary gilt-edged holders have already become perceptible in the market.

Beyond the power to pay off dispossessed shareholders with Treasury-guaranteed stock, the corporation will have other recourses open to it for raising money. It will be able to raise money by overdrafts or loans and to permit its operating companies to do the same. It will have power to float further Iron and Steel Stock, which may or may not be Treasury-guaranteed. The extent of all this borrowing together is restricted to £350 million. But the corporation can draw on the profits of its companies to build up a reserve for purposes which "include the checking of undue fluctuation in the prices of products . . . and the financing of works the cost of which is properly chargeable to capital." Money could also be raised at need by selling off assets, or indeed whole companies, on the Minister's direction; and the assets which it is about to acquire are so miscellaneous, and extend in many cases so far beyond the confines of iron and steel making, that some such

sales may not seem out of the question. It cannot yet be a settled public policy that the state should enter into competitive trading in all the trades into which the individual scheduled companies have at one time or another been drawn.

Indeed, it will be well for the members of the new corporation to bear in mind in their initial operations that the nationalisation of iron and steel is still not a settled public policy at all. It is to be this winter's adventure, but that is another thing. Mr Churchill reiterated on Tuesday the Opposition's pledge to repeal the Act "if we should obtain the responsibility and the power in any future which it is possible to foresee," before or after the vesting date. With the parties balanced as they are today, this is not an idle pledge. It could involve the recall of Iron and Steel Stock and the return to shareholders of the title in their shares—reasonably simple operation, provided that the time elapsed was not long enough for the identity of shareholders to have become changed and confused, and provided also that the corporation had not been active in the interim in reshuffling the assets of its companies. The more actively the corporation imposes its will on the companies, the more difficult and complex will the disentangling process become. But if it behaves only as a passive holding company, it is possible that the identity of the companies may remain for some time substantially unchanged.

The corporation has from the first been conceived by its authors as a holding company in charge of a decentralised system of undertakings; and one clause in the Act enjoins the pursuit of decentralisation on the corporation as one of its general duties. The Act (unlike the Coal Industry Nationalisation Act) does not automatically throw the company structure of the industry into the melting-pot. But experience has shown that decentralising intentions are more easily stated in Parliament than pursued in action. The Minister of Supply, in a last effort to explain why the Act was necessary at all, restated on Tuesday the expansionist Labour view of iron and steel. Thus, the steel industry in the last war was "inadequate to meet our needs." Nationalisation was "essential in peace-time to maintain full employment, and in war-time to provide adequate defence for our country." In short, Mr Strauss implied plainly that the industry will be blown up bigger under State ownership than would have been likely to happen under private ownership.

*

One of the obligations laid upon the corporation is to act in accordance with a general programme of reorganisation and development laid down with the Minister's approval. Thus, an ambitious Ministerial programme would oblige the corporation to act in an ambitious manner, and to impose its wishes on the companies; and at this point the principle of decentralisation might suffer. Further, the corporation is obliged to use its powers in pursuit of a production policy and a price policy to be determined by itself

> . . . to promote the efficient and economical supply of the products . . . and to secure that those products are available in such quantities, and are of such types, qualities and sizes, and are available at such prices, as may seem to the Corporation best calculated to satisfy the reasonable demands of the persons who use those products for manufacturing purposes and to further the public interest in all respects.

This outline of what the corporation's powers and duties are likely to involve needs to be borne in mind in considering whether the men whom the Government has selected are likely to prove a match for their job. No doubt these are worthy and respectable men, fit perhaps for the formal assumption of power and acceptance of title in the iron and steel undertakings; if they are not, it will not be for lack of accountants among their number. The question is whether they are suitable men to go beyond the formal transfer, to evolve and apply the production policy and the price policy that the Act requires them to have, and to press on with the great schemes of development which the Minister of Supply declares to be urgent. The Act has something to say on the type of men who ought to be appointed, though as in so many passages it indicates an intention without committing itself to watertight language:—

> The chairman and all other members shall be appointed by the Minister from amongst persons appearing to him to be persons who have had wide experience of, and shown capacity in the production of iron ore or iron and steel, industrial or financial matters, administration and the organisation of workers.

How happy is this formula, how fortunate the words "appearing to him"! At least they leave the Minister able, in law, to appoint whom he pleases—or whom he can get. He may have succeeded in getting men of experience and capacity, though even that remains to be demonstrated; but the men who have acquired their experience and shown their capacity in the production of iron and steel are not to be induced to take part so long as the prevailing political uncertainty makes the future of their industry uncertain. Mr Strauss has had bad luck in that one of his selections has already withdrawn because "the intense political controversy surrounding the setting up of the corporation has created an atmosphere in which I could not usefully serve." Mr Maclean's explanation might be easier to understand if more were known of the manner and the timing of the Government's approach to him. On the face of the matter, a man of wide experience and proven capacity might have been expected to foresee that something of a breeze would blow up. Mr Maclean seems hardly to have shown that talent for perceiving the obvious that ought to be the standard equipment for members of public boards.

The remaining members, taken together, make a body of men of no particular eminence who might be expected to do tolerably well in steering an established concern of moderate dimensions on a not too difficult course. None of the appointments is distinguished, none places any great practical knowledge of iron and steel at the corporation's disposal, and neither the chairman nor the trade union member is a tactful choice. All in all, the Government has had as much difficulty since the general election as it would have had before it in scraping together a team that could be presented to Parliament with a straight face.

It is beside the point to blame this fact (as Mr Strauss did) on the present leaders of the steel industry because they refused to help. The Government itself precipitated the position that has now been reached, knowing that it would be an unsettled position in which the leaders of the industry would feel obliged to stand aside. So long as the Government's life is uncertain and the eventual fate of the industry indeterminate, it is by no means clear how they can properly take up any other attitude. There is no question of their having, by withholding their advice, forfeited any "right" as Mr Strauss suggested. It was part of the Government's responsibility to create the conditions in which their advice could decently be asked and given, and this should have been a preliminary to putting the Act into effect, not an afterthought.

If the Labour party's assumptions about nationalisation are for a moment granted, then it is clear that one condition of success in what the Government is trying to do is a strong board, acquainted with its work, respected and, as far as possible, untouched by controversy. Another condition is that the board should have the co-operation and confidence of responsible men in the industry. The corporation, weak as it is, will not be without strong cards to play if it survives the next few months. Its strongest card will be the life-long attachment of so many of the leaders of the steel industry to the enterprises which they operate, an attachment stronger in many of them than any political tie. This is not a card to be thrown away in any fit of Ministerial indignation. If, instead, it is played with skill and care, then it is fair to expect that the leading men in the iron and steel industry will—once the political uncertainty is settled—give what help they can.

Mr Strauss pointed out on Tuesday that he had appointed only seven out of a possible eleven members of the corporation. Mr Maclean's withdrawal leaves him with five vacancies instead of four. The corporation's best policy would seem to be to make its duties as formal and restricted as possible until it becomes redundant or until the conditions are created in which men from the industry can join its ranks without loss of self-respect. At best the corporation's prospects are not bright.

Transport in Trouble

IT is impossible to work up any great excitement about the second annual report of the British Transport Commission for 1949. It apepars even later in the year than the 1948 report, though that may not be entirely blamed on the Commission. Its plums, such as they are, have already been presented in evidence in the two cases for increased freight charges and increased London fares submitted to the Transport Tribunal. There are plenty of prosaic facts and figures galore for those who care to delve into the rather ancient history of 1949. But these tell only part of the story of the serious fix in which nationalised inland transport now finds itself. The deficit of £20.8 million for 1949 was accurately estimated and published before Christmas last year; together with the loss from 1948, this made an accumulated deficit of £25½ million at the end of 1949; an authoritative estimate of a deficit of £15 million for 1950 means that by the end of this year, the Commission will be saddled with accumulated losses of no less than £40 million.

If there was any evidence that this was a passing phase of misfortune, with a fair prospect of recovery and recoupment, even these burdens might not seem too tragic. But one looks in vain for any sign of improvement. Prices continue to rise against the Commission; petrol, tyres and materials of every kind are dearer and are likely to be dearer still. There is the abiding problem of maintaining peaceful labour relations and yet having not a penny to meet claims for higher wages. Traffics are disappointing, although economic activity generally is as high as it has ever been. Charges cannot be increased until the Transport Tribunal has been satisfied by detailed enquiry—a process that is an important safeguard for the public, though conceivably disagreeable to the officers who have to give account for the Commission and its Executives. Nor would it seem expedient to seek another emergency increase in charges so soon after the increase in freight rates last May; the Commission will have in future to submit "charges schemes" designed not merely to fortify its revenue but also to contribute towards that "properly integrated system of public inland transport" that the Transport Act requires it to provide, and the two aims may not be compatible in every case.

Thus the Commission is faced with a financial crisis of serious magnitude. To write off the accumulated deficit within a reasonable period—say six years at the outside—would require an annual net improvement on this year's prospective result of no less than £22 million. That may not sound very much for an organisation with gross receipts and working expenses each between £450 and £500 million; a 2 per cent increase in receipts and a 3 per cent cut in expenditure would do the trick. But it is obvious that no such optimism is entertained. Nor even so would it leave the Commission with any surplus from which it could maintain and fortify its existing capital assets. Indeed, the Commission's capital problem is likely before long to match its revenue problem. In 1949, the Commission's liquid funds fell by more than £75 million to £160 million, and net current assets were reduced by nearly £90 million. Most of the items

responsible for last year's drain of funds have still been operating in 1950—the need to finance the continuing deficit, new capital expenditure beyond the year's provision for depreciation, the overtaking of arrears of maintenance and cash payments for road haulage undertakings acquired by the Commission. By any normal standard, many of them are inseparable from commercial success and financial soundness ; how, it may be asked, can traffic be attracted or operating costs reduced without considerable investment in improved and efficient railway facilities ? The one way to eventual commercial disaster would be to starve the Commission of resources that it could invest to good advantage, but when the report complains that its steel allocation was cut even in 1949, when steel was becoming adequate for the nation's needs (save in some special categories), it seems clear that the railways are treated on a footing of less eligibility compared, say, with electricity. With official connivance, if not indeed under official pressure, they are steadily consuming their capital.

*

The report itself, however, could hardly be more discreet in its references to this topic and to other matters even more fundamental. Integration, for instance, gets a page and a half in the report ; a few minor improvements have been made, and general outlines have been drawn up for the information of the unions, whose co-operation is obviously vital to success. But there is no discussion here of what the Commission conceives integration to mean ; there are references to the building up of " the sense of a common purpose which is essential to a final solution " and to experiments on familiar lines to handle traffic in what are, *prima facie*, the best ways. But even the simplest schemes of this sort involve painful things for staff and customers, such as the displacement of branch railways by road services, or the routing of consignments according to the Commission's ideas rather than the customer's wish. It is quite impossible to expect that such schemes can be applied in the reasonably near future or that, if they could be introduced, they would bring in the net revenue that the Commission so urgently needs. For their full realisation, many years will be needed, with angelic co-operation from the staff, complete understanding by the public, and repeated applications to the Transport Tribunal for sanction for charges schemes of growing complexity as each means of transport is brought in to form the co-ordinated whole. It is, perhaps even now, a little too soon to assume that integration was a meaningless word on which the Transport Act relied altogether too heavily ; but it was the one single idea in the Act that could have been held to justify the wholesale acquisition of the railways, with their large units hard hit by road competition, and of road haulage with its large number of small operators who well knew what competition was but had no use for co-ordination. All that can be said is that the ambitious courage of those who drew up the Act has left the Commission with problems and responsibilities that will take years of work, and will leave fewer energies for meeting the present financial and commercial difficulties.

Nor is it possible to find in the report any realistic discussion of the organisation of the Commission and its Executives. Two years may be too short a period finally to establish what is wrong with the existing form of organisation and to suggest reforms. But the Commission can hardly be so unaware as the report would leave the reader to suppose of deep-seated criticism and restiveness in many strata of the transport hierarchy. Relations between the Commission and certain Executives are not perfect ; that would not matter very much if confidence were being built up, but to the outside observer it seems very doubtful if two parties so conscious of their status as master and servant can work with effective smoothness. The Commission rests on the doctrine that it must operate its various parts as one undertaking ; but its various parts are themselves enormous trading corporations and employers of labour, whose efficiency is likely to vary in inverse proportion to their conviction that daily oversight in detailed matters of commercial policy, staff questions, or financial administration constitutes the main activity of the Commission. No doubt over centralisation is not a criticism that can be levelled exclusively at the Commission (though the centralisation of so-called " common services " such as commercial advertising, films, and law makes it easier to do so) ; the Railway Executive itself has many of the defects of remoteness and tightly-held administration in its dealings with its regions. Some of these defects are inseparable from the mere bigness of the transport system, but it is difficult to believe that all of them are unavoidable.

*

It is time, indeed, to admit the possibility that first thoughts on the transport organisation may have been wrong, and to see how they might be improved. The first improvement—hardly open to dispute, surely, at this stage—is to wind up the Hotels Executive and transfer its responsibilities to the railways, for its separation has involved an increase in overheads with no perceptible gain in efficiency. The second question is whether any advantage has been gained, or is likely to be gained, from a separate Docks and Canals Executive, performing functions that the former railway companies managed to perform with reasonable success and probably greater economy in the ordinary course of their duties. Thirdly, it is necessary to examine how far efforts by the Executives to obtain improved results may be frustrated by attempts to supervise their affairs from above. Is it sensible that the Commission should instruct the Railway Executive about the services it must provide or lay down in detail the content of its financial budget ? Fourthly, there is plenty of evidence that the stranglehold on the railway regions from the centre breeds frustration and unwillingness to accept responsibility, even in cases where responsibility can be clearly defined. A purposeful degree of decentralisation seems to be the only hope for improvement here.

There remains, finally, the most difficult problem of all—the nature of the Transport Commission itself. Few would recognise in the small, overburdened Commission that high-powered deliberative body that was supposed to deal with transport policy. It has, indeed, delegated its operating responsibilities to the various executives (though it has also assumed many administrative functions that might have been left with them) but its supervision in detail of the activities of the executives has left it the less free to do the urgently necessary thinking about the real stuff of transport policy. On this, it can hardly be claimed that matters have progressed much further than the equivocal stage that the railways themselves had reached towards " understanding " with the road haulage industry before the war. Integration is bound to be a slow process, but it is difficult to believe that it can be encouraged by close and detailed supervision of the activities of each executive. To suggest that the old system of part-time directors with general managers responsible to them had solid virtues may sound old-fashioned ; but it is worth consideration whether these virtues are not something of which the Commission stands in real need today. At present there are two if not three separate levels at which the functions of general or technical management are exercised—at the Commission, at the Executives and in the regions. Is it surprising that confusion, duplication, divided responsibility, and complaints of " insubordination " and " interference " are the result ?

These comments, no doubt, will cause pain if not resentment. Let it be said, therefore, that if they are frank they are intended to prompt the re-examination of ideas from which much was hoped in 1947, but which can hardly be said to have succeeded so far in practice.

Anyone who claims to have a solution of the transport problem in his pocket is either dishonest or a fool. Britain is no different from most countries in having a railway system that is economically too big for its needs but which cannot, on that account alone, be greatly contracted. The Commission rightly refuses to admit that subsidies are any satisfactory solution, and proposals such as those of the Federation of British Industries that the cost of unremunerative strategic lines should be transferred from the transport user to the defence votes whatever their merits in principle are not very relevant at a time when the transport system as a whole is losing so much money. The present aim of the Commission is to force the ill-fitting pieces of the transport jigsaw into a consistent pattern. It may be possible, given time and the utmost patience and good will on the part of transport workers and transport users. But time is rapidly eating into the Commission's financial vitals, and before another year is out it may well have to be asked whether the grand conception of integrated transport that informed the 1947 Act is possible of achievement.

Business Notes

Switching from Rails

This week's general advance in the markets is not quite so perplexing as it might seem; its causes are complex and a few of them are perhaps even contradictory, but there is no reason to doubt the substantial accuracy of the investors' judgment in their higher bids for industrials, mining shares and even gilt-edged. No immediate election and the radical improvement in the Korean fighting were enough in themselves to put the funds better, at least for a time. As for equities, the doubts that have been present ever since rearmament was announced are still there—the effect of the defence programmes on the earnings prospect of particular undertakings and the fiscal uncertainties that are nowadays subsumed under ministerial assurances to their supporters of " a fair spreading of the burden." But these questions have been put aside this week, and the conviction that a further inflationary phase is in prospect has held sway.

These factors might have cancelled each other out—as they have often done in recent weeks and seemed again to do on Thursday—but for the confirming vote for the due process of the law to nationalise the steel industry. This provided an immediate signal for holders to switch out of steel shares into other industrials ; simultaneously institutional investors were able to repeat the process, familiarised in earlier nationalisation schemes, of picking up steel shares as gilt-edged options " on the cheap," after of course full allowance for stamp duty and commission. Steel shares have thus fallen to a significant discount on their take-over prices, and a temporary wave of reinvestment business has flowed into other sectors of the industrial market, raising the *Financial Times* industrial share index from 115.9 to 117.7 in two days.

None of these movements could be described as unreasonable, and there was a basis of good sense equally in the speculative bidding for Japanese and German bonds. As for the improvement in Kaffirs, the new freedom for switching operations has played a part if not a major one. There has been substantial buying of South African stocks on Swiss account, but these orders seem to have come almost exclusively from one Swiss banking house whose clientele has always been interested in the South African market. French holders of sterling securities have been rather apathetic, in view of the protests against the old regulations that used to be heard from across the Channel, and New York seems to be too busy with its own boom to spare much time for the London market.

* * *

Commonwealth Economic Policy

The Finance Ministers and other financial authorities of the Commonwealth have been meeting in London this week, as they usually do once a year when they are called together by the meetings of the International Monetary Fund and the International Bank. This week's meetings, which have been held under the alternate chairmanship of Mr Wilson and Mr Gaitskell have had before them a crowded agenda. The Commonwealth representatives have surveyed the broad scene of the sterling area's balance of payments with the dollar world, a scene that has changed out of all recognition since the devaluation crisis of a year ago and since the severe cuts in dollar imports decided upon at that time. The effects of devaluation, and now of rearmament, have created a new situation which may allow the present Commonwealth policy of discriminating against dollar imports to be more leniently applied. There is good ground for arguing that the price mechanism may now be expected to achieve without discrimination what the conscious cuts in dollar imports were intended to achieve a year ago. A second subject that has been discussed is the advance made by Great Britain towards economic integration with Europe in the past year. Britain's membership of the European Payments Union and the consequent abolition of discrimination in commercial policy between the members of the Union has set some delicate problems for the Commonwealth. The principle of non-discrimination applies not only to trade between Britain and the other member countries but also to Europe's trade with the Colonies and dependent territories. This means that the Dominions may now sometimes receive less favourable treatment in their trade with Europe than neighbouring territories in the Commonwealth.

It is but a short step from these considerations to the complex problem of the tariff discussions that are to begin in Torquay next week. The Commonwealth teams that will attend that conference have been arriving in this country and, although the Torquay prospects have not been dealt with in

the meetings of finance ministers, some of the delegates and experts concerned have been meeting in London to exchange views and to decide, if possible, on a common line to be adopted. They have also been able to give one another some indication of the tariff and preference items on which they will be prepared to bargain with other countries, especially with the United States. Next week the Commonwealth discussions will turn to the problems of economic development in south and south-east Asia. The work begun at the Colombo and Sydney conferences will then be taken a step further. Seldom have the affairs of the Commonwealth held so much of the attention of Government departments in London.

* * *

Machine Tools and Russian Trade

After all the excitement that the matter aroused, it appears that there is little real difference between the Government and the Opposition attitudes on the subject of exports to Russia. The Government is preparing somewhat more comprehensive lists of machinery the export of which is to be controlled, and some of the machine tools over which the controversy arose fall within the new list as it is at present drafted. Further, the President of the Board of Trade announced in the Commons on Monday, a new procedure by which the machine tools now being made to eastern European orders, are to be examined to see whether they are needed for the British defence programme; and particulars are to be circulated to the north Atlantic treaty powers and the Commonwealth countries, who may also put in their bids. As Mr Wilson hinted, this process may be lengthy and until it has been gone through the machines will not go to the eastern European customers, who are (principally) Poland and Russia.

These assurances seem likely to satisfy Mr Lyttelton, who in putting the Opposition's case asked a series of direct and specific questions about particular large machine tools. He was concerned with large vertical boring machines and boring mills, heavy planing machines, and very large centre lathes ; some of these, he claimed, were urgently needed for defence work in Britain, and the others were so likely to be used for armament manufacture that their export to eastern Europe ought to be stopped. Mr Lyttelton's information was clearly good. Before the debate ended Mr Freeman, Parliamentary Secretary to the Ministry of Supply, answered that some of the vertical borers being built by Craven Brothers would be requisitioned for the Ministry of Supply or the Admiralty. The other machines would be considered one by one in relation to their end uses, the demands for them in Britain and friendly countries, and the circumstances that might exist as each machine approached completion.

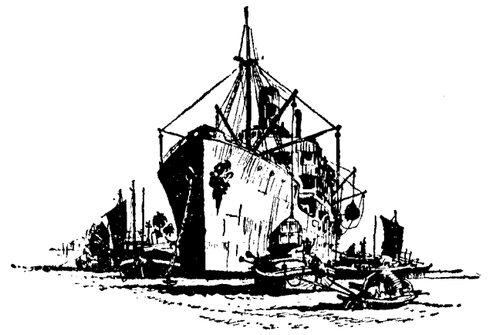
Machine tools can only with difficulty be defined in categorical terms as warlike or pacific objects. Some clarification of the Government and Opposition feelings on the whole question of trade with Russia did, however, emerge from the debate. Neither side wants an economic blockade of Russia, though there have been moments when that appeared to be the result to which the argument might lead. Both sides recognise (what is indeed obvious) that the Russian trade is useful to Britain as well as to the other side. The urgent need for some types of equipment has been forced on Britain, as on other western countries, by Russian foreign policy, and if these are the types of equipment the Russians happen to want it is open to them to correct the situation. Similarly, there are some things specifically useful in war that it may be prudent to deny to a country that is behaving in a hostile manner, but the definition of these things has to change with the quantities of the goods and the circumstances of the time. To keep trade going at all may not be easy while acting on these lines, but a mutual blockade does nobody good.

* * *

Russia's Imports of Strategic Materials

Among the "strategic" materials which Russia has been buying from the sterling area, machine tools have lately had most of the public attention. But Russia has also bought significant quantities of rubber, tin and wool, though Russian imports of such materials, apart perhaps from tin, seem to have been smaller this year than in 1949. To measure the size of Russian imports is a hazardous business, for the Soviet Union publishes no trade statistics. Estimates can be based on exports from the major exporting countries, provided that a standard period for shipment from each supplying country is assumed. This method ought to throw some light on Russia's principal imports, though it is obviously rough and ready and conceivably incomplete ; for instance, shipments to any country of eastern Europe might eventually find their way into Soviet hands. Certain countries such as the Netherlands have an important transit trade in rubber and tin with the Soviet Union, but statistics covering this trade are published and it can be included in an assessment of Russian imports.

The accompanying table is based on such methods. It can only claim to show the bulk of Russian imports of four commodities: rubber, tin, wool and cotton. Russia's imports of rubber have risen steadily since the war and reached a peak in 1949 of 105,000 tons ; this was well over three times the prewar level. On present indications, imports of rubber by Russia during the current year may not exceed 85,000 tons. Until June, Russia seemed to be importing at the rate of 50,000 tons a year—about half the rate of import in 1948 and 1949. But since Korea Russian buying seems again to



IMPORTS OF STRATEGIC MATERIALS INTO THE USSR

Commodity	Unit	Prewar Average	1946	1947	1948	1949	1950* (Annual Rate)
Rubber	'000 tons	30·0	9·5	35·0	100·0	105·0	85·0
Tin	"	11·0	2·0	1·0	0·5	0·3	0·7
Wool†	mn. lb.	19·0	5·0	30·0	35·0	45·0	42·5
Cotton	"	1·5	1·5	1·0	2·5	1·5	2·0

* Annual rate based first nine months for rubber, first eight months for wool, and first six months for tin and cotton. † Clean basis.

have been stepped up to an annual rate of about 100,000 tons. Russian imports of tin this year have been relatively large ; the estimate is over 600 tons in the first seven months against some 300 tons in the whole of 1949. More than 500 tons of tin metal were shipped from Britain during the first half of this year. Imports of cotton into the Soviet Union are so small as to be negligible from the point of view of war preparation. Indeed, in certain years Russia has had an export surplus. Wool is more important and Russia is taking about four times as much as before the war.

The figures show, first, that Russia is importing much more of these commodities (except tin) than before the war and, secondly, that imports this year are probably no larger than last year—if, indeed, they are as large. But any big purchases made since June would not be fully reflected in these estimates except, perhaps, in those for rubber. If, as market reports suggest, Russia has been an important buyer of rubber in the past three months, its imports might well rise above last year's total. Again purchases may be consigned to brokers in third countries and then trans-shipped to Russia. If the third country is in western Europe these quantities are usually published, but not many Asiatic countries publish full details of their transit trade. Even if Russia's imports of rubber were to exceed those of 1949, the quantities involved would not seem alarmingly large, and they do not suggest any very serious attempt at stockpiling. Russia has an active synthetic rubber industry and can also use most of the output from eastern Germany, but imports of natural rubber must also be required in part for current manufacture. Hence the maximum rate of accumulation for stockpiling would hardly appear to exceed 80,000 tons a year. Such a figure assumes a relatively small rate of consumption, and it can be compared with a recent rate of stockpiling of about 125,000 tons in the United States. As

Pearls from Australia . . .

This man dives for pearl and pearl-shell on the tropical north-west coast of Australia and so contributes to the infinite variety of Australian production. But the people of Australia are consumers, as well as producers, and the Australian market constitutes a rich field of opportunity. Essential to any successful business venture is knowledge, and the Commonwealth Bank of Australia places its Information Services at the disposal of all British business houses. They may be used with confidence, for the Commonwealth Bank *knows* Australia. Its branches are widespread and its activities touch upon every aspect of life and industry in Australia and New Guinea . . . Please address your enquiry to the Manager.

COMMONWEALTH BANK OF AUSTRALIA

London Office: 8 Old Jewry, E.C.2. Also at Australia House, Strand, London, W.C.2

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

for tin, the bulk of current imports is likely to be consumed, though the sudden jump in this year's estimate suggests that some accumulation may be taking place.

* * *

Excitement in Wool

London's first wool sale of the season opened on Thursday and prices generally followed the jump which has obtained in Australia during the past month. When the Australian sales opened in the last week of August prices jumped by nearly 50 per cent compared with the closing prices of the old season. Merino 64's, for example, which is a representative grade of the Australian clip, sold at 210d. a lb. against 151d. a lb. in July. In a single day wool had become a fantastically dear commodity. Since then prices have risen only slightly ; in the second week of the Australian sales merino 64's rose another 2d., then fell to 209d. a lb. and this week recovered to 213d. a lb. Prices at the different sales in Australia have swung by 5d. to 10d. a lb. either side of the general average.

The impression of sharply rising prices has, of course, been encouraged by fantastic bidding for small quantities of super-quality wools offered at each of the different selling centres. This week 280d. a lb. was paid at Brisbane for seven bales of highest grade wool. These prices have hit the headlines but they account for only a very minor proportion of the clip. Again, as each selling centre reports its own new record prices, generally at the first sale of the season for particularly high grade wool, it gives an impression that prices have been rising continuously. In a broad conspectus, however, wool prices have risen relatively slightly since the first big jump at the beginning of the season.

Until the London sales opened on Thursday offerings had been mainly of merino types—Australian and South African. But demand for all grades of wool in London proved to be just as keen as in Australia and prices generally rose by fully 50 per cent compared with July. This is a slightly larger increase than was recorded in the opening sales in Australia but the difference represents no more than the usual premium for spot supplies. Merino 64's are now quoted at 224d. a lb. against 151d. in July, fine crossbreds 58's at 178d. a lb. against 111d. a lb. two months ago and medium crossbreds 48's at 115d. a lb. against 71½d.

It will be interesting to see how prices move during the remaining weeks of the London sales. The supplies on offer are, of course, much smaller than last season, now that the Joint Organisation's stock has been almost liquidated. For the whole three weeks of the auctions, only 90,000 bales of wool will be on sale, of which 45,000 bales will consist of Joint Organisation stock. At the opening sales last year, total offerings amounted to 135,000 bales of which the Joint Organisation provided 85,000 bales. Since working stocks in consuming countries are by no means large (to judge from published statistics) a " squeeze " for spot supplies may well take place during the next few months.

* * *

Would Allocation Work ?

Meanwhile discussions are proceeding on the American proposals for an allocation scheme for wool. On Wednesday representatives of the three wool growing dominions and of Britain and the United States met to consider them in greater detail. It appears that the United States had little more to offer than to reiterate its view that since wool is a scarce commodity some form of international allocation should be instituted to prevent prices from rising too sharply. No detailed plan was put forward nor, so it is reported, was any consideration given to the relative allocations to the various importers. Presumably these hard questions will be left to the international wool study group which is expected to meet in London early next month. Arguments that allocation could prevent unduly large shipments of wool reaching Russia and countries of eastern Europe are not very convincing. The quantities so far involved in this trade are not very large and export licensing, properly enforced, could be just as effective.

American proposals to institute international allocation are not confined to wool ; they are intended to cover all strategic materials. But wool, although less important strategically than rubber or tin, presents the test case, since this season's supplies are insufficient to meet even the current rate of consumption. World supplies are provisionally estimated at 2,350 million lb. (clean basis), whereas consumption during the first six months of 1950 has been at an annual rate of 2,525 million lb. Commercial stocks are by no means large—certainly not large enough to cover such a deficiency without reducing the level of output of the wool textile industry.

The price-support scheme for wool proposed by the three southern dominions has perforce taken a back seat in the present discussions. It may have seemed germane some months ago ; now it lacks all relevance. The United States might be willing to agree to such proposals provided that the project was widened to include as a counterpart the allocation of wool supplies when they were scarce. It is unlikely that any of the three dominions could agree to abolish the present auction system, if only because their governments depend on farmers' votes. Wool growers are enjoying unprecedented high prices and prosperity ; any government which denies them their fruits must risk their displeasure at the next elections. If allocation is to be accepted, the United States will have to propose a scheme which will enable the free auctions to continue. And that would be a difficult if not an impossible task.

* * *

Base Metal Price Problems

For the past week or so world prices for base metals have ceased to have meaning. The official New York price for copper, for example, stands at 24½ cents a lb. (£196 a ton), but this is a purely nominal quotation and no supplies are available. To obtain spot supplies users have had to pay up to 5 cents a lb. premium above the official quotation, while European buyers have offered as much as 32 cents a lb. (£256 a ton). The American import duty of 2 cents a lb. on copper is still in force and seems likely to continue for some months. Zinc is also scarce ; the official selling price is 17½ cents a lb. (£140 a ton), but 23 cents is commonly being paid for supplies, and the latest reports from New York tell of a " grey market " price of as much as 25 cents a lb. (£200). A strong demand for lead has so far been satisfied at the official price of 16 cents a lb. (£128 a ton). The Ministry of Supply's prices for base metals have, in accordance with policy, been kept in line with the official American prices ; British consumers can at least buy spot supplies without having to pay a premium, but on forward purchases they have to pay substantial premiums.

The American attitude to the import duty on copper is, to put it mildly, surprising. The United States depends on imports to cover about a quarter of its needs, and the American Government is concerned about the recent sharp rises in commodity prices. The reimposition of the import duty has, in the first instance, merely accentuated the rise in prices ; later it may reduce imports. American domestic producers are at present obtaining most adequate prices for their output without any assistance from a protective tariff, and their output was expanding even before the tariff was reimposed.

The Australian proposal to levy an export duty on lead and zinc may also be open to question at the present time. If the demand for base metals in a rearmament boom is highly inelastic, the effect of the export duty might well be to raise the price which consumers have to pay rather than reduce the income which producers receive. The main needs at present are first to encourage an expansion in output and secondly to ensure that these relatively scarce materials are distributed as equitably as possible to meet the different national rearmament programmes. The United States at any rate believes that the second objective can be achieved only by resuscitating the former combined raw materials board ; other countries seem still to have more faith in the price mechanism.

* * *

Record Exports in August

British exports attained new records in August, and virtually all the main export industries played a part. The most encouraging feature was the sharp rise in textile exports ; these were nearly 20 per cent higher than in the earlier months of this year. Cotton goods rose by £2,500,000 to £13.7 million, and wool goods by a similar amount to £13.2 million, while silk and rayon piece-goods at £3,400,000 were the highest on record. Shipments of wool textiles to Canada were 20 per cent larger than in July. These figures suggest that although textiles have to meet more direct competition in overseas markets than do most types of British exports, they are now able to hold their own against strong competition.

Vehicles are still the largest export group, but their total value in August rose only slightly to £34.8 million. Australia resumed its place as the main market, though shipments to Canada remained large. During the first eight months of the year 53,840 motor-cars were sent to Canada compared with 56,584 to Australia ; total exports for this period were 233,055. The shipment of agricultural tractors again expanded, while exports of bicycles were the highest for about a year. Machinery exports (£27.1 million) also increased. Of the total some £1,300,000 went to the Soviet Union ; Russia was the fourth largest purchaser last month, after Australia, India and South Africa. Since the beginning of the year, exports of machinery to Russia have been worth nearly £7,000,000. Exports of most types of consumer goods increased during August, in particular pottery, glassware, and toys. Iron and steel manufactures and chemicals were the only two important export groups that recorded smaller shipments than in July.

BRITISH EXPORTS
(Monthly Figures adjusted to a Standard Month of 26 Working Days)

1949	£ mn.	1950	£ mn.
1st quarter.....	155½	1st quarter.....	174
2nd "	152	2nd "	178½
3rd "	141	July.....	182½
4th "	158½	August	189½

The August record of £189.5 million, unusual for a holiday month, was some £5,000,000 higher than the previous peak last March ; moreover, the rate of export was also a record. The table above gives the value of British exports on a monthly basis adjusted to a standard working month of 26 days. The expansion has not merely been confined to values ; the volume of exports in August was 69 per cent higher than in 1947, compared with a rise of 55 per cent during the first half of 1950.

Imports last month declined and amounted to only £212.5 million. Arrivals of food and tobacco were much smaller than in July, but receipts of raw materials were maintained at a high level. The excess of imports (valued c.i.f.) over exports and re-exports (valued f.o.b.) totalled £18 million—the lowest figure since February, 1949. The cumulative total for the eight months amounted to £273 million and was less than the corresponding figure for 1949 (£293 million) for the first time this year.

EPU Agreement

The Council of OEEC met in Paris this week to sign the agreement setting up the European Payments Union, of which the outlines were agreed last June. The intervening two and a half months have been spent in translating the June agreement into lawyers' English and this legal document was signed last Tuesday. The Council also announced the appointment of six of the requisite seven members of the management board ; the nominations accepted included that of Mr Hugh Ellis Rees of the British Treasury, who is a member of the British delegation to OEEC. The seventh place may be reserved for Switzerland and will probably be filled when the intricacies of Swiss constitutional procedure have allowed that country to become a fully fledged member of EPU. At the end of this month the Bank for International Settlements in Basle, which is to act as agents for EPU, will tackle the first periodic settlement of intra-European payments to be made under the new machinery. This will cover current payments for the three months from July 1st (from which date EPU comes retrospectively into effect) to September 30th.

The entry into force of EPU has led to some consequential adjustments in sterling payments arrangements with the other members. For some time past these arrangements have been gradually adjusted in anticipation of the fact that the launching of EPU would make the currencies of all members freely transferable for current transactions, and therefore remove any ground for differentiation in their treatment. All bilateral arrangements with OEEC members, such as those formerly governing sterling payments with Belgium and France, have therefore been tempered for some time by the widest possible extension of administrative transferability. For all practical purposes, this extension has placed the countries in question in the transferable account group. That position is now to be formalised and, with the signing of EPU, Britain has agreed to give automatic transferable account facilities to any member country that desires them. Another adjustment consequential upon the creation of EPU is the completion of funding arrangements covering any debts between members that are not to be brought into the periodical compensations. A further agreement of this kind was announced this week. It has been agreed that the Danish debt to Britain, represented by a British holding of £22 million worth of Danish kroner, will not be repayable until July 1, 1952, though the Danish Government retains the right to repay before that date. The funding arrangement will leave some Kr.50 million, equivalent to £2,500,000, in British official accounts in Denmark which will be freely available for current payments.

Australian Export Taxes

When the Australian budget is introduced at the beginning of next month it is expected to include an export tax of either 25 or 33⅓ per cent on wool, lead and zinc. This tax would be an alternative to the appreciation of the Australian pound that local primary producers and their political mouthpiece, the Country Party, have so resolutely opposed. The tax on wool has its origin in a proposal put forward by Sir Douglas Copland, the Australian economist, some three weeks ago. Sir Douglas argued that this tax would be preferable to appreciation of the Australian pound to parity with sterling since such appreciation would cut the incomes of all Australian exporters indiscriminately by 20 per cent ; this cut would bear hardly on exporters of commodities other than wool and also upon Australian industry and it might still not be sufficient to combat the undesirable repercussions of present high wool prices.

The proposed wool tax would, of course, be levied in such a way as to reduce the sums at present received by growers. It is claimed that the tax would not increase the high world

A sensible policy for process steam—No. 19

Intelligent use of "waste" heat from steam

BY SPIRAX

What is called "waste" heat from steam could hardly have been given a less appropriate name.

That part of the heat in steam most readily available to the process is some 70 to 80 per cent. of the total. The remaining 20 to 30 per cent. is in the condensed steam; but as a rule this heat cannot be used effectively in the process. Indeed the presence of the water (hot though it is) in the steam spaces cannot be anything but detrimental to heat transfer and process output. So the condensate must be discharged promptly.

Yet as the heat in the condensate represents a considerable proportion of the coal consumed in generating the steam, its recovery and use is a part of any sensible policy of heat economy.

The ultimate place for hot clean condensate is where it began, in the boilers; and so we have the condensate return system. But it is possible to take an earlier bite at the cherry, before the hot water is sent back to the boiler feed tank.

On leaving the steam traps some of the heat re-evaporates into steam. This is known as "flash steam" and is in all respects a valuable substitute for live steam for any low-pressure heating.

The utilisation of flash steam is a permanent economy which is generally possible without difficulty and for a quite small outlay.

Behind the Scenes

MEN AND MACHINES are the substance of the Laing organisation. By constant care for both, the firm's welfare and plant maintenance systems keep work at its highest pitch.

Welfare means daily provision for over ten thousand men. Trained welfare officers—there is one resident on every remote site—are responsible for food and film shows, religious services and cups of tea..

The maintenance system, radiating from central depots at home and overseas with specialised staff and equipment, provides everything—from the smallest spare part to complete and regular overhaul—to keep millions of pounds' worth of machines and vehicles efficient.

These are two large businesses within one business. They function behind the scenes: but evidence of their constant work is seen in a long succession of jobs completed smoothly and on time.

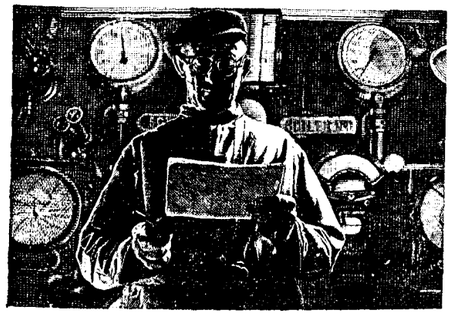
ELEMENTS OF AN INDUSTRY



IN daily speech the word "element" is too often used wrongly or carelessly. "The elements" suggest "the weather," and "elementary" something easy or simple. To men of science, however, an element describes any substance which cannot be split up into a simpler one by ordinary chemical methods. A dictionary definition is that an element is "the simplest known constituent of all compound substances". This recognition is based on a theory first propounded by Robert Boyle, a British chemist, in 1661.

In all nature there are only ninety-two of these "Elements". From these are built up every single thing we eat or use or see. The function of the chemical industry is to discover how to separate elements which in nature exist in a combined form, to find out how they can be made to combine into substances useful to man, and then to evolve methods of making them do so "to order" on a commercial scale. The degree of success which this great industry has attained may be judged from the fact that Imperial Chemical Industries alone uses 50 or so of the more important of the 92 elements known to science to make no fewer than 12,000 different products.

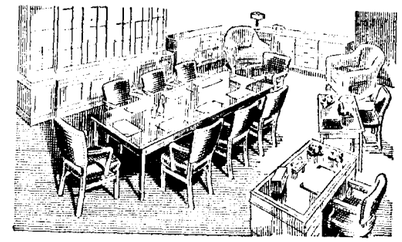
HOLIDAYS FOR BOILERS?



Steam boilers should work efficiently all the time. Unnecessary holidays are to be deplored. But if boilers use untreated water, scale will certainly form, and some sort of holiday however inconvenient and costly to other people must be given in order to dismantle and descale. But scale need never form if the modern method of boiler water conditioning with Calgon (sodium metaphosphate) is used. Calgon prevents scale. It saves endless trouble and far more money than it costs, as you will find if you consult Albright & Wilson's Technical Service Department. A really fit boiler does not need a holiday.

WHEN IT'S A QUESTION OF TIME...

IF YOU ARE seriously concerned with saving time in your business, you might ask yourself three questions — is my Internal Communication system as good as it might be? Is time throughout my organisation accurately recorded, shown and sounded? Could the broadcasting of signals, messages and music increase my workers' interest in their job? If you can't answer 'yes' to all three questions you are wasting time somewhere and TR Service could probably help you.

TR service speeds production

Internal Telephones, Time Recorders and Internal Broadcasting Equipment, installed and maintained under guarantee by Telephone Rentals Limited—that's TR service...

price paid by overseas buyers, for it would be deducted (like the existing 7½ per cent levy) from the proceeds of wool at the time that it is sold; but this claim assumes that the present demand is not already so intense that purchasers would, in effect, be prepared to pay the tax in order to ensure their supplies. Sir Douglas proposes that two-thirds of the proceeds of the new tax should (like the existing levy) be paid into a fund that would provide a cushion for wool producers if future prices fell below production costs; the other third should be used to subsidise the domestic price of wool and to finance certain investment projects designed to promote the long term interests of the wool industry. If this proposed distribution is accepted—and there is no certainty yet that it will be—wool growers should indeed have little cause for complaint. The main import of Sir Douglas's proposal is that a third of their inflated earnings, much of which would normally go in income tax, should be laid aside for their own future benefit.

It is still an open question, of course, whether the fundamental disequilibrium in Australia's balance of payments should not be cured by exchange appreciation. If appreciation is really politically impossible, however, then the sooner the export tax on wool is introduced and the higher it is pitched, the better it will be for Australia's long term interests. The Dominion is now faced by the prospect that the wool cheque for 1950-51 may be as large as £400 million. In consequence, its national income in 1950/51 is likely to amount to about £3,000 million (or over £375 per head) compared with £2,000 million (or about £260 per head) in 1948-49. It is impossible to suppose that imports and domestic production will increase sufficiently to mop up this enormous increase in purchasing power; unless some step is taken quickly, therefore, inflation will gnaw into the vitals of the Australian economy at what should be the moment of greatest prosperity in Australian history.

"Discrimination" in Oil Markets

In practice some of these fears may prove exaggerated because it seems doubtful whether the new ECA regulations will work. This attempt to force prices down goes against the tendency of the world markets, which may not move violently but which seem certain in present conditions to rise rather than fall. The increases just announced for most oil products in Britain are a mild example of this tendency. The new ECA price system would in theory create an exclusive territory for Middle East products, and eliminate western hemisphere products altogether, in an area now supplied from the east or the west as the supply position and the tanker movements of the moment make it convenient. But in fact none of the markets concerned seems powerful enough to insist on a single source of supply; the Mediterranean countries will no doubt continue to take oil products from where they can get them, and in the long run they will no doubt have to pay the market price. Further, there is a curious technical anachronism in the ECA amendment, which bases its price rebates on the freight rates of the US Maritime Commission which operated in the last war. Those rates no longer necessarily correspond to the existing freight markets.

It is worth while to explain how the ECA came to adopt its new policy. Suppliers of oil products from the Middle East have been in the habit of accepting a lower return from those areas (such as Britain) to which the tanker haul from the Middle East is more costly than the tanker haul from the Caribbean. The "rebate" equals the difference in cost between the two tanker hauls. There is nothing sinister about this; a motorist pays the same for a gallon of petrol wherever it comes from. In areas to which the freights are equal, the return is equal, and in areas (say, the eastern Mediterranean) where the haul from the Persian Gulf is the shorter the boot is on the other foot. The "freight watershed" between the two supplying regions is somewhere in the central Mediterranean, though naturally it shifts as tanker rates change in the different areas. ECA seems to have decided that for a Middle East producer to accept a lower return from Britain or Denmark than he accepts from, say, Greece is "discrimination" against the Greek. It has therefore, decided that he must accept the lower return from Greece, too. It is a simple train of thought. It breaks down, however, on the fact that competition takes place in the retail market and tends to equalise prices for identical commodities at the point of consumption, without regarding the origin of the goods.

* * *

ECA Intervenes in Oil

The Economic Co-operation Administration, because of the huge scale and wide geographical range of its transactions in oil, has probably more power than any other single agency to influence the world oil market. Its power has been exercised in the past with discretion; being concerned, understandably, to safeguard the public money which it has to spend, ECA has based its purchase prices on the lowest levels in the world market, but it has previously taken care not to do anything likely to break the market's structure. This is probably to the general advantage. The world-wide system of oil prices based on the US Gulf market does not favour everybody uniformly, but it has produced a reasonable stability in a competitive trade, and in the boom conditions of 1950 oil prices have been steadier than those of almost any other vital commodity.

Controversy and alarm have been stirred up in the world oil industry by the new regulations announced by ECA to govern the prices which it will "pay" for Middle East oil products, and it appears at first glance that ECA has abandoned its customary discretion. The regulations are somewhat complicated, but their effect is to introduce fixed and arbitrary rebates on the prices of Middle East oil products destined for Mediterranean and European ports. These will not change the existing delivered prices in north and north-west Europe, where Middle East suppliers are already obliged to accept a lower return than suppliers from the US Gulf and the Caribbean because the haul from the Persian Gulf is longer and more costly than the haul from the Caribbean, and the selling prices have to be the same. They will, however, cut the existing delivered prices in the Mediterranean—in some areas by as much as $3.50 a ton. Thus they will destroy the relationship that has so far been maintained between US Gulf and Persian Gulf prices. The companies directly affected are the major American groups that produce in the Middle East, and these groups are protesting vigorously. But they produce in the Caribbean and US Gulf as well, and they cannot expect to sell oil from the western hemisphere at higher prices than they are allowed to charge for Middle East oil in the same market. Thus the price structure for exports from the US Gulf and Caribbean will also be affected. Further, the existence of rebates for (say) Greece and Italy may lead to demands for rebates east of Suez. It is obvious, too, that if the prices charged by American companies are forced down the prices charged by other companies are not likely to be immune. In logic the repercussions of the ECA amendment seem endless.

Release from Bulk Purchase?

Is the Ministry of Food changing its ideas about the virtues of centralised purchase? A few months ago, after the Select Committee on Civil Estimates published its recommendations that trade in two commodities—wheat and cocoa—should be returned to private hands, the Ministry took pains to justify its retention of government buying. Last week, the Ministry announced that greater freedom would be given to merchants to deal in both cocoa and wheat.

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

Government purchase of cocoa is, in fact, to cease in the near future, although the actual date has not yet been fixed. Rationing of chocolate and confectionery will continue, and prices of confectionery and cocoa products will still be controlled. But merchants and manufacturers will be free to buy their own supplies of cocoa direct from the Nigerian and Gold Coast Marketing Boards. The trade will thus obtain the great advantage of freedom to buy the quality of cocoa that manufacturers want and will no longer be compelled to accept supplies allocated to them by the Ministry. Manufacturers may also be able to secure lower prices on occasion, though the sharp rise in the price of cocoa in the New York market in recent months suggests that lower prices are not immediately in prospect. The Ministry has pursued a peculiar price policy in its dealings with the west African marketing boards. It has attempted to secure its own purchases at a reasonable price, but it has also been willing on occasion to support the market in order to increase the dollars earned by the export of cocoa to the United States. Private traders will now have to deal with monopoly sellers in the form of the marketing boards, and they may have to acquire a different buying technique from their prewar one.

The grain trade is also to be partially freed, in a way that is significant though limited in importance. The Ministry of Food will remain the sole importer of wheat, but it is now willing to accept offers of North American wheat from private merchants on cost and freight terms as well as on f.o.b. terms. The Ministry will tell the trade what types and qualities of wheat it is willing to buy and will consider offers so long as they are within the upper and lower price limits set by the international wheat agreement. This change will give grain merchants greater flexibility of operation and encourage some element of competition, but the trade will in fact still be acting only as agents for the Ministry of Food. Until July, Canadian wheat was purchased by the Ministry of Food under the four-year wheat contract, and the price was agreed each year by the two governments. Now the trade is open to private merchants as intermediaries of the Ministry. The Ministry has informed the grain trade that the whole position will be reviewed "after a trial period" and that if the purchases on a cost and freight basis are shown to have resulted in a large additional dollar expenditure, the experiment may be discontinued. It might have added, perhaps, that if the experiment worked satisfactorily, further steps might be taken to free the grain trade more completely.

* * *

Coal Stocks

The rate of build-up of distributed stocks of coal has been unsatisfactory this year, but to equate the present position with the position at the beginning of the disastrous winter of 1946-47 would be to exaggerate. Distributed stocks at the end of September, 1946, were 10.3 million tons. On September 16th this year they were 13.7 million tons, and if the present rate of accumulation of some 250,000 tons a week continues, stocks at the end of the month should be nearly 4,000,000 tons greater than they were four years earlier. On the other hand, the Government target of 16.5 million tons by the end of October is not likely to be reached unless there is a very sharp increase in the rate of accumulation, and it seems odd that the Parliamentary Secretary to the Ministry of Fuel and Power should have described the target as "absolutely essential" in the adjournment debate on Monday.

Stocks at the end of October last year were 16.7 million tons; at the end of October, 1948, they were 16.5 million, and at the end of October, 1947, they were 16.3 million. The present definition of what is absolutely essential coincides, therefore, with the average of the past three years, but if the average is not in the event reproduced exactly the fact ought not, perhaps, to cause great alarm. More disturbing are the long-term implications of the fact that the increase in home consumption of coal, (predominantly consumption by industry) is far outstripping the increase in coal production. In the adjournment debate Mr Harold Davies pursued the implications to the point of urging that Britain should begin to import coal now, and he added a pertinent footnote to the debate on trade with Eastern Europe by pointing out that if the present trend continues western Europe will by no means find itself in a position to do without Polish coal.

Mr Robens replied that the Government does not intend to import coal, though he conceded that it might be necessary to think about doing so "under a given set of conditions which I need not at this stage mention." He said nothing to suggest that there is any immediate hope of stopping the drift of manpower away from the mines or of any sharp increase of coal production. As to the prospects of industry for the winter, Mr Robens said that the Government has agreed to get industrial stocks of coal up to a level of about 4½ weeks' supply by the middle of December. But if industrialists were to reach this "good safety margin," some of them would have to accept the coal that is offered to them, and not insist on supplies from their accustomed coalfield.

* * *

Strength of Sterling

Within the next fortnight figures will be published of the British gold and dollar reserves as on September 30th. They should provide further proof of the improvement in the dollar balance of payments of the sterling area and of the strengthening of the central reserve that began on the morrow of devaluation and must have gained further impetus from the rearmament drive of the last three months. Meanwhile day to day changes in the world of foreign exchanges testify to the persistent technical strength and scarcity of sterling. In the New York market the three months' forward rate has risen to $2.81¼. The rate for security sterling which received such significant encouragement from the recent concessions on "switching" has again risen to $1.95, a rise of 10 cents over the past week. Transferable sterling is being traded in New York at over $2.61, which represents the smallest discount on the official rate recorded since devaluation. With the number of British tourists thinning on the Continent and their offers of sterling dwindling, the rates for Bank of England notes have been hardening slightly. In Paris they are now quoted at Frs. 920. The returning confidence in sterling has been fanned by rumours of a possible raising of the official value of sterling in terms of gold and dollars. They have been heard in most of the capitals of Europe, but they testify more to the imagination and gullibility of their creators and distributors than to their sense of realities.

* * *

Cars for the Home Market

The Minister of Supply recently answered a direct appeal from Sir William Rootes by saying that in view of rearmament and the need to maintain exports there was little hope of increasing the supply of cars to the home market. The restriction of supplies to 110,000 cars for the home market is being more faithfully observed than last year, though production has increased considerably—according to Mr Strauss, by 25 per cent over 1949. The industry has been hoping that next year the allocation of cars to the home market might be increased proportionately to the increase in output. Indeed, it did for a time expect that the system of allocation might become wholly unnecessary with the entry of the sheet mills at Margam into full production towards the end of next year.

Rearmament has destroyed that hope. It will employ a considerable amount of the motor industry's capacity and may consume considerable quantities of sheet steel. But re-tooling for defence production will be slow and twelve months at least are likely to elapse before the full effects begin to be felt. Some people have taken Mr Strauss's words to mean that home sales cannot be increased because exports are more than ever necessary to pay for defence. This is no answer to Sir William Rootes, whose argument was that if the industry is to evolve and new models are to be developed, then exports cannot be maintained without large sales on the home market. No one (to take one example) has questioned the wisdom of the Standard Motor Company's decision to restrict the first sales of its new light Triumph model to the home market only. When model changes become necessary throughout the industry—and in some cases they are long overdue—it is hard to see how the Ministry can expect other firms not to take similar decisions.

* * *

Stimulus for Building?

Since the Working Party and the Anglo-American Productivity team published their reports on the building industry at the beginning of May, the Minister of Works has been discussing with the National Consultative Council ways of putting their recommendations into practice. Some progress appears to have been made, although since most of the suggestions dealt with incentives and administration within the industry, the Ministry's field is circumscribed. The most important step has been to drop a regulation by which building work had to start within two months of receiving a licence. The industry has been protesting against this regulation for some time, but the Ministry held that it was the only way of controlling the volume of work in hand. It is now expected that more careful planning of work—described in both reports as an important factor in efficiency—will be possible. The Ministry, in a review of the progress made, points out that structural steel is no longer subject to allocation, that some of the (very minor) regulations of the Town and Country Planning Act have been removed and that "it is the intention of the Government to see that a steady supply of building materials is provided." While the Government's ability to see to this in every case is open to question, the removal of the time limit and the freer supply of some materials should enable firms to get ahead with their work in a more orderly way.

Other steps taken by the Ministry include talks with the British Electricity Authority about supplies of electricity to building sites and discussions with other departments on standardised contracts, the pooling of technical information and a revival of work on standardising by-laws—all recommended as aids to productivity. Discussions are also going on with the bodies concerned to improve the practical training for management and for student architects.

These steps will make things easier for the efficient builder, though they do not provide the missing incentive for the inefficient. Both the Ministry and the employers' organisation are preparing pamphlets on costing, and the Ministry has another on mechanisation, but any firm anxious for such information can already easily obtain it. A point of difference revealed in the two reports was that while the British think of incentives in terms of bonus payments, to the Americans the prime incentive is the contrast between high wages and unemployment benefit. Assuming the case for incentive payments in Britain, there is little the Ministry can do beyond exhorting both parties to more rapid action. The two-year trial period of incentive schemes agreed by the employers and the unions came to an end in November. Although incentive schemes are still being worked by the firms that adopted them during those two years, the future of the scheme is still under discussion.

Shorter Notes

The Mexican Eagle Oil Company has received at its New York bankers $US8,600,000, the third of the fifteen equal annual instalments due from the Mexican Government in compensation for the company's expropriated properties. An official announcement is expected at an early date about the distribution of this latest instalment.

*

In reply to a parliamentary question concerning resumption of service on Japan's external debt, Mr Gaitskell has stated this week that it is "difficult to devise any scheme" under which Japan could resume payments as long as "large scale assistance from the American taxpayer" is required to pay for essential Japanese imports.

THE DISTILLERS COMPANY, LIMITED

RECORD TRADING PROFIT

MR HENRY J. ROSS' REVIEW

The seventy-third annual general meeting of the company was held in the North British Station Hotel, Edinburgh, on Friday, September 15, 1950, when the chairman, Mr. Henry J. Ross, presided.

The chairman said: As usual, I propose to preface my statement with a reference to changes in the constitution of the board which have taken place in the course of the past year, or which are immediately imminent. The report lists the names of three new directors who have been appointed since the last annual general meeting, and you will be asked to give your approval of these appointments later in these proceedings.

Apart from Mr. Connell who retires by rotation but who does not seek re-election, two other directors—Mr. Adams and Mr. Comery—are due to retire from active business at the end of the present month in accordance with the provisions of the company's superannuation scheme.

You will observe from the report that these two gentlemen are to retain their directorships for a period during which they will act in a consultative capacity. As this is a departure from the company's established practice, a word of explanation is necessary. I think it is generally known that the majority of the company's directors are wholetime working executives, and as such, are due to retire at age 65 in terms of the superannuation scheme. It is felt that, with a life-time's experience of our activities behind them, they can still be of great value to the company and the intention is to retain them as directors without executive duties for a period of three more years, during which time they will attend the regular meetings of the board.

The statement of accounts discloses that the manufacturing and trading profits of the company and its subsidiaries for the year ended March 31, 1950, amounted to £12,837,691. This is a record for the company and compares with £10,361,857 for the previous year. To the profit is added income from investments and other sundry items, making a total revenue of £14,082,826. Taxation requires £6,421,948, and after making provisions for depreciation, writings off, and allowance for interest of outside shareholders of subsidiary companies, the net profit attributable to the group is £5,930,557 as against a corresponding figure in the previous year of £4,756,623.

The revenue reserves of subsidiary companies have been strengthened by the transfers thereto of £1,222,814 while the board has agreed to appropriate £512,923 to general revenue reserve in the books of the parent company. At the same time the directors agreed to appropriate £100,000 from the investment reserve and to use it in reducing the book values of certain investments in subsidiary companies.

The balance available is £4,294,820 and after providing for the dividends distributed or recommended, the carry forwards are increased by £1,742,955 making them £5,986,353.

BOARD'S DIVIDEND POLICY

It may be noted that of the net profit attributable to the group—that is after taxation and all charges—42 per cent. was earmarked to stockholders by way of dividends and 58 per cent. was "ploughed back" into the business by way of reserves or increased amounts carried forward. In considering this policy the board had due regard to all relevant factors and particularly that of restraint in declaration of dividend and the necessity of conserving cash resources to meet commitments for capital expenditure, etc. On May 4, 1948, to save any misunderstanding, the board announced that 28 4/7 per cent. was the standard by which a policy of dividend restraint should be measured. Since that date the issued capital has been increased and the equivalent rate works out at slightly over 19 per cent. For the year to March 31, 1949, the dividend rate based on the new capital was 18½ per cent.

In all the circumstances the board decided that the correct course was to recommend a final dividend on the ordinary stock of 7 1/5d. per 4s. unit, which with the interim dividend already paid, made 9 3/5d. per unit for the year, equivalent to 20 per cent., all less income tax. The increase in the amount actually distributed is £206,606.

In view of the small increase granted to the ordinary stockholders, and to mark their appreciation of the services of the works and office staffs in making possible the record level of profits, particularly from desirable export markets, the board decided to grant an export incentive bonus to all employees having six months service in the group and in active employment at the date of payment. This will be at the rate of 2½ per cent. of salary or annual equivalent of normal weekly wage and is additional to the monetary bonus of 7½ per cent. previously granted to the staffs. The board believes that the stockholders will give full endorsement to this decision.

PROFIT FACTORS

The profits of the group increased by nearly £2,500,000 and it is desirable to make reference to two factors which played a part in this result. Firstly, in September, 1949, immediately following the announcement of devaluation of sterling, the company, in accordance with the Government's wishes, adjusted the sterling prices of Scotch whisky exports to the U.S.A., Canada and certain other markets. These adjusted prices brought additional revenue to the blending companies and are still in operation. It must be remembered, however, that as an offset, costs of production and of selling have risen quite substantially. Secondly, the group received a satisfactory and encouraging return from part of the expansion scheme, although it will be some time yet before the full benefits are available.

BALANCE SHEET

The legal balance sheet of the company calls for the following comments:

(1) The issued ordinary stock of the company shows the increase brought about by the capitalisation of £7,512,923 of the revenue reserves and the appropriation of this to the ordinary stockholders by the allotment of one pound of stock for every two pounds held;

and (2) Investments in subsidiary companies and trade investments both show substantial increases since the previous report, and these reflect further payments in connection with the expansion programme. As a consequence the net liquid assets of the company show a reduction.

In the consolidated balance sheet it will be noticed that the amount of fixed assets is higher by a little over £2,500,000 due to the development of the expansion programme. Current assets also show a substantial increase, while current liabilities remain much the same as in the previous balance sheet. While the issue of new ordinary stock during the year required the capitalisation of £7,512,923 of available reserves, the total of reserves and surplus at March 31, 1950, at £29,063,463 is only £3,372,453 less than at the previous balance. Issued share capital and reserves are over £4,000,000 higher, representing the increased strength of the organisation.

FINANCE FOR EXPANSION PROGRAMME

The board when agreeing to undertake the expansion programme gave very careful consideration to the eventual costs. Since then, however, factors have arisen to cause amendment to these figures. These are:—

(1) The costs of the programme are proving to be in excess of the estimates;

(2) As development has progressed certain additional and costly extensions have proved necessary;

(3) The additional working capital required to finance the holding of stocks at increased values and the replacement of plant and machinery;

and (4) The essential allocations for taxation, particularly for profits tax, have been substantially above the estimated amounts taken into account.

In addition, it has now been agreed by the board to extend and to modernise the blending and bottling plants of certain of the large subsidiary companies.

As a consequence the company considered it advisable to make application to the Treasury for permission to borrow £10 million by way of unsecured loan stock for a limited period with repayment starting at an early date. The necessary consent has been granted.

It has been decided to borrow the money from certain corporate investors. The stock is divided into two serials. The first, £4,000,000 3½ per cent. stock serial, issued at par, to be repaid by four annual instalments of £1,000,000 starting in 1952 and finishing in 1955. The second, £6,000,000 3⅛ per cent. stock serial, issued at par, to be repaid in four annual instalments of £1,000,000 starting in 1956, with a final one of £2,000,000 in 1960. It is expected that the money will be available to the company on September 20, 1950.

In connection with the increase in taxation to which reference has been made, it is appropriate to mention that in the past two years the total cost of taxation to the group has been a little under £12 million. Taxation at the present high level is causing considerable anxiety to those responsible for the carrying on of industry, as it is proving a severe drain on the resources of the companies concerned, reducing the amounts they have available for renewals of plant and machinery, the carrying of additional desirable stocks and the development of new projects.

As forecast to stockholders at the previous annual meeting, a pension scheme has been established by an agreement and deed of trust under which the company and certain of its subsidiaries will contribute sums to secure continued payment of pensions existing at April 1, 1950. These companies will also provide for payment in due course of pensions to present and future employees, their widows and dependents. This scheme has received the approval of the Inland Revenue authorities. It is satisfactory that the actuary to the scheme has reported that the superannuation and provident reserves of the group are in the aggregate more than sufficient to cover the amounts required at March 31, 1950. It will be noticed from the

accounts that certain investments have been allocated for transfer to the trustees of the scheme. The board is confident that this policy will have the full sympathy of the stockholders.

WHISKY DISTILLING

During the year under review the company's malt and grain distilleries secured good outputs, and these enabled the blending companies to make very welcome additions to their stocks of maturing whiskies for use in the years to come.

The cask position, however, still gives anxiety, but members may rest assured that everything possible is being done to surmount these difficulties.

SCOTCH WHISKY SALES—HOME AND EXPORT

For two successive years reference has been made to the very meagre allocation of Scotch whisky available to the home consumer, but on this occasion I am able to report some modest degree of improvement in this respect. The usual consultation has taken place between the industry and the Ministry of Food regarding releases for the year ending April 30, 1951, with the result that the releases for the home market may be increased from 2,000,000 to 2,600,000 proof gallons. This relaxation on the part of the Ministry was accompanied, however, by a demand for a similar increase of 600,000 proof gallons in the volume of exports.

While the increase in home trade supplies is by no means large, it will at least provide some degree of relief and should make the obtaining of proprietary Scotch whisky a little easier than it has been for some years.

Under last year's arrangement with the Ministry of Food the releases for home trade consumption were pegged at 2,000,000 proof gallons for the industry as a whole but the actual releases for that period were more than 50 per cent. in excess of the prescribed figure, being in point of fact over 3,000,000 proof gallons. A large part of these additional releases took the form of supplies of Scotch whisky which were only available to the trade and to the public at prices very substantially in excess of the prices at which our brands are sold. It is to be hoped that the permitted increase of 600,000 proof gallons for the current period will have the effect of reducing the demand for these highly priced supplies, and so in some degree regulate what has been a most unsatisfactory position.

At the same time, however, it must be pointed out that the prospect of reaching pre-war volume of sales in the home market is extremely remote—in fact, it seems quite impossible of attainment so long as the present rate of duty continues. In spite of further representations made to the Chancellor of the Exchequer prior to the introduction of the budget in April, no reduction has been made in the fantastically high figure of £10 10s. 10d. per proof gallon. As a result of this, Scotch whisky has been placed beyond the purchasing power of many would-be consumers and is now being regarded as a luxury instead of being within the reach of everyone as it was in the past.

During the year under review the demands for the group's brands in the United States of America and in Canada were well maintained, but business with certain South American countries continued very difficult. The Board regrets that once again shipments to "soft currency" markets had to be curtailed.

In South Africa, good shipments were effected during the second half of the calendar year 1949. Since then importation of alcoholic beverages has been prohibited. It has now been announced, however, that permits will be granted to importers based on a percentage of their imports during the calendar year 1948. Whilst the quantities for entry will prove quite inadequate to meet demands, it is satisfactory that this important market is opening up again to some extent to our products.

GIN

I am happy to report a satisfactory year's trading on the part of our gin companies.

Sales show substantial increases in both home and exports markets which is at once a reflection of the popularity of our brands of gin with the public, and a tribute to their high standard of quality.

As regards our gin plant at Linden, New Jersey, here also it is pleasant to report excellent results. Indeed, our American gin sales during the year under review constitute a record.

YEAST

Production at the company's yeast factories continued at a high level, and reasonable profits were derived from this section. As will be explained later on, the price of molasses for delivery in the near future is uncertain, and it may well prove necessary, in course, to offset the anticipated rise in price of this main raw material by an increase in the price of yeast to the consumer.

INDUSTRIAL SECTION

I am glad to say that the year under review has been a very active and satisfactory one throughout the industrial branch of the company.

Reflecting, no doubt, the general improvement in trading conditions in most industries, the demand for industrial alcohol and the chemical products which we manufacture, has shown a substantial increase during the past year, including an expansion in our direct chemical export trade. In my previous report, I stated that there appeared to be a prospect of securing forward supplies of molasses at reasonable prices, and we were fortunate in covering our requirements for a greater part of the current year. The further outlook, however, is much less favourable, due partly to the shortfall in the Cuban crop last season, coupled with the unexpectedly high demands for molasses from the U.S.A., and, indeed, throughout the world. At the moment, the forward position is obscure, but there appears to be every likelihood of a substantial rise in the price of molasses. Our purchasing arrangements through The United Molasses Company Limited will, we hope, safeguard our position as far as it is possible in an admittedly difficult market.

The major expansion scheme at the Hull factory of British Industrial Solvents is now nearing completion. During the past few months, various sections of the programme have been successfully commissioned, and these are now making an important addition to the range of solvents, plasticisers and chemical intermediates produced at this factory.

GRANGEMOUTH PROJECT

The progress made in the petroleum chemicals project at Grangemouth, under the auspices of British Petroleum Chemicals Limited in which we are associated with The Anglo-Iranian Oil Company Limited, is very well maintained. The operation of this plant will considerably strengthen our position in the supply of important chemical raw materials. Among other products to be produced at Grangemouth, will be a large quantity of synthetic ethyl alcohol which will assist in alleviating the difficult molasses position previously referred to. Some months ago it was announced in the Press that it was proposed to erect a plant at Grangemouth to manufacture styrene monomer, mainly required as an intermediate for the manufacture of polystyrene, a plastic material for which there is a large potential demand in this country. A new company—Forth Chemicals Limited—has been formed to carry through this development, the capital of which is held as to two-thirds by British Petroleum Chemicals Limited and one-third by Monsanto Chemicals Limited. This project is part of our general plan to develop at Grangemouth the manufacture of derivatives from the new materials made available to us from the petroleum chemicals plant to which I have made earlier reference.

Our business in liquid and solid carbon dioxide has continued to expand during the year, and has necessitated further extensions in hand, and planned, to our productive facilities. The unrivalled services which our subsidiary Carbon Dioxide Company, Limited, is able to offer from its many production points strategically located throughout the country, together with the high quality of its products, should ensure that we continue to obtain our share of this expanding trade.

PENICILLIN AND OTHER OPERATIONS

The penicillin factory at Speke, Liverpool, has again had a satisfactory year. The improvements and additions to the plant are practically complete, and the present rate of production and sales is now more than 2½ times the output last year. We have recently marketed two new forms of penicillin, "Distaquaine" (an aqueous suspension) and "Distaquaine Fortified," both of which have been extremely well received by the medical profession, incorporating, as they do, improved methods for administering penicillin. Development work is continuing with results which it is hoped will enable the company to make further contributions to this field in the future.

There has been a marked recovery in the plastics industry generally, from which we have benefited. The full output of the British Geon polyvinyl chloride plant at Barry, South Wales, has proved insufficient to meet consumers' demands, and a 50 per cent. increase in capacity will shortly commence production. The outstanding quality of Geon polyvinyl chloride is widely recognised, and is opening up a constantly expanding field of application.

The British Resin Products factory at Barry is now complete, and their operations at Feltham and Tonbridge have been transferred to Barry. The wide range of products made at this factory includes thermosetting and thermoplastic moulding powders; paint and varnish resins; resins for the impregnation of wood, paper and fabric; and synthetic adhesives. A recent addition is polystyrene, which should prove of value to our trading operations. We are now beginning to derive benefit from the centralisation of our plastics production in South Wales, which provides greater and improved facilities not only for production, but also research and development.

Our associate companies in Australia and South Africa continue to make progress in their respective chemical fields, with satisfactory trading results.

The company's extensive research services continue to play an important part in the development programme in which we are now engaged. Although our research is primarily for this purpose, it is gratifying to record that a number of processes developed by our research department have attracted interest in various parts of the world, particularly the U.S.A., and the licensing of these will, it is hoped, make an increasing contribution to our revenue

FUTURE PROSPECTS

While it is not desirable under present world conditions to make any forecasts, it is

satisfactory to report that, so far as the current year has gone, the profits earned by the company are in excess of the standard of the year to March 31, 1950.

STAFF

During the year several directors and executives paid visits to the United States, Canada, Australia and several other countries. As a result constant contact has been continued with these important markets.

Once again it is a pleasure to pay tribute to the staffs—both in works and offices—for their excellent work, their devotion and their loyalty throughout the past year.

The report was adopted.

THE MERCANTILE AND GENERAL REINSURANCE COMPANY, LIMITED

ANOTHER SATISFACTORY YEAR

LARGE EXPANSION IN PREMIUM INCOME

MR HUGH KENNETH GOSCHEN'S STATEMENT

The annual general meeting of The Mercantile and General Reinsurance Company, Limited, will be held on October 3, 1950, at the company's chief office at 25-31, Moorgate, London, E.C.2.

The following is a statement by the chairman, Mr Hugh Kenneth Goschen, which has been circulated with the report and accounts for the year ended December 31, 1949:—

Before I deal with the accounts, there are two matters connected with the directorate to which I would like to draw your attention. First of all, we are now obliged, under the Companies Act of 1948, to pass a resolution when it is proposed to re-elect a director who has reached the age of 70. This year Mr Hurlimann has celebrated his seventieth birthday and accordingly a resolution to re-elect him will be proposed at the annual general meeting. Mr Hurlimann was one of the founders of this company and has watched over its fortunes ever since with a fatherly interest. The company has profited immeasurably from his wise counsels. I commend this resolution most warmly to your attention.

Mr Anthony Binny has been appointed a director and you will be asked to confirm the appointment at the general meeting. Mr Binny has a wide knowledge, particularly of investment matters, and his advice has already been of much assistance to the company.

THE ACCOUNTS

The accounts for 1949, which are now submitted for your approval, show that the company has again had a satisfactory year. The net premium income, amounting to £4,283,916 against £3,595,388 in 1948, again shows a large expansion. It is satisfactory to note that this rise in premiums has been absorbed without difficulty; indeed, there has been a welcome increase in the company's resources.

It will be seen that the 1949 accounts have been drawn up in a slightly different form. During the year there were wide variations in exchange rates; the devaluation of sterling in September, 1949, was, of course, a factor of major importance. We decided, therefore, that it would give a better picture of the company's underwriting results if we were to pass profits and losses on exchange to the provision for foreign exchange and investment fluctuations which was set up some years ago. Accordingly, in the 1949 accounts, the incoming reserves for unearned premiums and outstanding losses have been revalued at the exchange rates ruling at the end of the year and the resulting differences have been transferred to this account, together with the difference after adjusting the currency balances held abroad. The net exchange loss on the adjustment in the fire and miscellaneous and marine accounts was £87,409 and, as will be seen, this has been made good by a transfer from profit and loss account. These exchange losses could and would have been largely avoided if our Exchange Control authorities had allowed us to hold sufficient foreign currency assets to cover the foreign currency liabilities.

DEPARTMENTAL RESULTS

I now turn to the departmental results. You will notice that the net premium of the fire and miscellaneous account is £3,643,898, against £3,027,749. Thanks to the loyalty of our numerous connections at home and abroad, and to the new contracts arranged in the previous year, we were able to participate in the general expansion of premium income. The enhanced sterling value, following devaluation, of our important business deriving from hard currency countries also contributed to the increase.

The general experience of our fire department in 1949 was good, both in the British home and general foreign field, and also in almost all the oversea countries where we now do business. Notwithstanding this favourable overall result, the future is clouded by the increasing frequency of large fires of doubtful origin. It is, of course, well known that the Communists regard sabotage and arson as important weapons in their campaigns, and one cannot exclude these as possible causes. If the initial Communist successes in Korea should embolden their supporters to extend these methods, the losses to the insurance market may well be considerable. We have accordingly thought it prudent to strengthen the company's internal reserves against such dangers.

ACCIDENT DEPARTMENT

The experience of the accident department has been similar to that of other post-war years. The general third party business has again been heavy, as has the motor business. The derationing of petrol in the United Kingdom and the re-emergence from storage of many worn-out motor cars are prejudicial to our endeavours to secure an early improvement. The aviation loss is still heavy, but fortunately less than in the previous year.

MARINE DEPARTMENT

In the marine department the 1947 account has now been closed with a profit, after deduction of tax, of £5,978. This is retained in the fund, which now stands at 115.1 per cent. of the premiums, as against 103.6 per cent. at the end of 1948. Devaluation, which will adversely affect the cost of hull repairs in hard currency areas, and the lower rates now being quoted for cargo risks give us cause for some concern. Such unfavourable features are reflected in our figures with considerable delay, owing to the extent to which the business reported is derived from years prior to that under review, but we are confident that our fund is fully adequate to meet all contingencies.

LIFE DEPARTMENT

Nineteen forty-nine marks the end of a quinquennium in the life department and the valuation has again been made on the O.M. (5) table using an interest rate of 2½ per cent. Our actuary has reported a surplus of £60,135 and this is being retained in the fund. In spite of the rapid growth of the life account, the department has maintained its strong and healthy position. The net new business written during 1949 amounted to £5,485,000 sums assured; a record total which compares with £4,837,000 in 1948.

During the last quinquennium the total net business in force has more than doubled; a large home portfolio has been built up, but it is in our business with life companies overseas that the expansion has been greatest. In the United Kingdom there is still room, I am sure, for considerable expansion; in spite of the activities over two centuries of companies whose names have now become household words, the British public has not yet become life assurance conscious to anything like the same extent as in America. The latest figures (1949) show that the average amount of life assurance per head in the United States of America was equivalent, at the present rate of exchange, to £520 against £120 per head in the United Kingdom. Although some allowance must be made in the case of the United Kingdom for the life assurance benefits under the National Insurance Act, these figures should surely tempt companies here to make determined efforts to increase their business; the "Mercantile and General" is always ready to help them. I realise, of course, that in the United Kingdom the strength of our long-established life companies makes it possible for them to retain all but the largest proposals, and these companies will always transact a large proportion of the home life assurance business. However, we wrote over £2,000,000 of new business from the home market in 1949, and a growing proportion of this came from some of the larger companies, who are showing greater appreciation of the services which a professional reassurer can render.

INVESTMENT DEPARTMENT

The investment department had a difficult year. Most of the company's portfolio, which at December 31, 1949, amounted to £4,173,031, has been purchased in recent years and there is consequently only a small margin between the balance sheet value and present market value. We were, however, fortunately able to switch a large proportion of our funds into short-dated British Government securities in the early summer of 1949 and so avoided the big fall which occurred in the market shortly afterwards. In the result, our investments showed an actual appreciation of 2.32 per cent., representing a fall of only 4.34 per cent. over the year, which compares favourably with the average depreciation of government stocks (excluding very short-dated) over the year of 6.80 per cent.

NATIONALISATION

Last year I referred to certain proposals of the Labour party which I felt could only be interpreted as a threat to nationalise the insurance industry. In spite of a general election which one would have thought made it abundantly clear that the British public want no more nationalisation, the Labour party, in a recent statement of policy, have not withdrawn these proposals. They may realise the anxiety which this policy causes at home, but they surely do not appreciate the extent to which public opinion oversea has been moved by these threats against the freedom of the British insurance market. Our officials, when they travel and when our many oversea friends call on us here, are constantly being asked about nationalisation. We endeavour to reassure our friends on this subject by our own confidence that British common sense will prevail.

THE OUTLOOK

If I had had to write these notes six months ago, I could have painted a picture of general conditions favourable to our business. The improvement in the gold and dollar holdings of the sterling area; the prospect that the European Payments Union would bring a general easing of restrictions on international payments, so important for this company; the removal of some war-time controls here; the gradual revival of internal trade and of international trade; all these factors had induced a growing feeling of confidence in the future. Alas, that confidence has been seriously undermined by the outbreak of war in Korea, and now, even if no worse disasters befall us, we have to face the expense in manpower, in materials and in finance of a large rearmament programme—and this applies to many of the countries where we carry on business. Even if American buying induced by the necessity for rearmament has helped to solve Europe's dollar problem, the next years will be difficult for insurance; in particular, we have the growth of sabotage to which I have referred and, on the economic side, the inflationary trend that must inevitably result from big defence programmes which so many countries are being forced to undertake. Thanks, however, to the conservative policy which the company has adopted in the past, I believe that it is adequately equipped to meet every call that may be made upon it.

TRIBUTE TO EXECUTIVE AND STAFF

Finally, I would like, on behalf of my colleagues on this board and myself and, I am sure, of all the shareholders, to thank the management and staff for their good work throughout the year; 1949 produced many new and difficult problems, especially those brought about by the devaluation of sterling. Everyone has made his or her contribution to solve them. Mr Calburn, our general manager, has been tireless in his efforts to build an organisation capable of dealing with the increased business in the same efficient manner as has been our pride in the past. I shall have much pleasure in proposing a vote of thanks at the general meeting.

E. W. TARRY AND COMPANY, LIMITED

SATISFACTORY RESULTS

The annual general meeting of E. W. Tarry and Company, Limited, was held on September 15th in London.

Sir H. Fortescue Flannery, Bart. (the chairman), said that despite the drop in net profits of £19,004 they could consider the results satisfactory, having regard to the exceptional trading conditions that prevailed in the Union where their branches had felt the effect of nine months' restricted imports.

Owing to the continuance of import control in the Union, it was to be expected that the stock figure would be lower and it would be observed that it had decreased by £156,200 as at March 31, 1950, to a figure of £622,325. The board had paid particular attention to the valuation of stock, and gave instructions to the management to ensure that all spares, slow moving and obsolete goods were adequately marked down. An increase in debtors was to be found at Lusaka, the Northern Rhodesian branch, where there had been a notable expansion in trade, which had resulted in an increase in the amount of credit given to customers.

The capital reserves now amounted to £152,879. The revenue reserves stood at £218,017 and were higher by £33,730.

Although supplies of overseas goods were severely restricted by import control, the sales at their Union branches were satisfactory, having regard to the unfavourable trading conditions. Their Rhodesian branches, being free from import restrictions on goods from the sterling area, produced higher sales, with the result that the aggregate turnover of the company was only slightly lower. The directors recommended a dividend of 15 per cent. on the ordinary shares,

The report was adopted.

FURNESS WITHY AND COMPANY, LIMITED

BUSINESS WELL-MAINTAINED

SIR ERNEST MURRANT'S STATEMENT

The fifty-ninth annual general meeting of Furness Withy and Company, Limited, will be held on October 5th in London.

The following is an extract from the statement by the chairman, Sir Ernest H. Murrant, K.C.M.G., M.B.E., circulated with the report and accounts for the year ended April 30, 1950:—

From the profit and loss account it will be noted that the amount dealt with in the parent company's account is £557,933, after providing for all expenses, depreciation and taxation. In the final analysis there is a disposable surplus of £803,934, out of which the preference share dividends have been paid, and the directors recommend that £200,000 be transferred to fleet replacement account; that a dividend of 8 per cent. per annum, less income tax, be paid on the ordinary stock, and that £298,684 be carried forward.

DIVIDEND DISTRIBUTION

The question of the dividend distribution has been given most careful consideration. Your directors are not bound by any undertaking to limit the distribution; a dividend of 8 per cent. per annum may well be regarded as a very reasonable return on the ordinary stock of the company, but looked at in a different light it may appear to be very meagre return on the amount of capital actually employed in the business. The main considerations, however, are public policy and domestic policy. In regard to the former, there are potent arguments that a higher rate of distribution would be inadvisable. Your directors are, however, more concerned with domestic policy, and what is best in the interests of the company and stockholders.

Reference to the consolidated balance sheet will give an indication of the strength of our reserves and provisions for taxation and contingent liabilities, etc. Our resources in the shape of cash balances and quickly realisable investments also appear to be ample. But we have still to meet some four and a quarter million pounds for new tonnage contracted for at April 30th and not yet brought into the accounts; substantial amounts which have been provided for taxation have to be met in cash, and the cash balances are needed to a large extent for the working capital of our various organisations throughout the whole world. In these days of high operating costs, etc., the amount of working capital required to carry on a world-wide business of this nature is very heavy.

HIGH COST OF NEW SHIPS

All these things can, however, easily be taken care of without materially affecting the question of dividend distribution one way or the other. But what does concern your directors is the problem of maintaining the company's business having regard to the present high cost of new ships on the one hand and the current methods of assessing taxation on the other hand. Our principal business is to own ships and to operate trades in which the ships are employed. Therefore, in order to maintain our business and to retain our trades—or to put it another way, in order to maintain our stockholders' capital and to earn a reasonable return thereon—we must have ships. With the new tonnage brought into commission in the last few years, and the additional ships contracted for and under construction, our associated fleets are all in a good state of efficiency, but ships have a limited life, and within a cycle of approximately 20 years a whole fleet becomes subject to renewal. During the war years we lost approximately half our combined fleets.

The replacement of those lost ships has been completed but the process has been costly. We have also made a start with the replacement of some of the older ships, and this procedure must be continued. It is a process which is unavoidable; and in the fulfilment of the process, shipowners are peculiarly handicapped by current methods of assessing so-called profits for taxation.

It is a matter of national interest, as well as a shipowner's problem, that our merchant fleets should be maintained in volume and in a state of adequacy and efficiency. Knowing that the problem would have to be faced up to, your company and its subsidiaries have created reserves, and we have conserved our cash resources to the maximum extent possible, but the task of maintaining our fleets in tonnage volume as they should be maintained and as we wish to maintain them is not made easier while vast sums of cash continue to be taken out of our business for taxation.

CALL FOR TAXATION RELIEF

If the Government wish to help industry and could be persuaded that it is the capital assets employed in industry which provide the bulk of national employment, I suggest that a start might be made by allowing some measure of relief from taxation on amounts specifically set aside for the replacement of wasting capital assets.

During the past year seven new ships were added to the combined fleets; in the current year we hope to take delivery of six further ships, which will leave another two ships contracted for, but which will not be completed during the current year.

The past year has not been free from anxieties which are more or less inherent in a changing world. Trade between North and South America has been badly affected by the state-owned and state-aided shipping of South American countries and the United States. The trade between U.K. and the Argentine has encountered various periods of uncertainty due to the difficulties that have arisen in the negotiations between the two countries for the renewal of meat-purchasing agreements. Our trade with Israel has been affected by political differences between Israel and the Arab states and by exchange restrictions, which have also adversely affected the North Pacific/U.K. trade.

NEWFOUNDLAND TRADE

The position which I reported last year in regard to our Newfoundland trade has shown no improvement. The fact remains that in the steamers *Newfoundland* and *Nova Scotia* we installed refrigerator and insulating machinery at a cost of £127,000, the weight of which is 430 tons in each ship, for the particular purpose of transporting Newfoundland fish to the U.K. Due to political changes and exchange problems we have been obliged to carry that expenditure and weight around, to and fro across the Atlantic, for over 300,000 miles without the refrigerator chambers ever once having been utilised for the purpose for which the machinery was installed.

Taken as a whole, however, our business has been well maintained, and in some cases has expanded satisfactorily Indeed, the benefits to be derived from the widespread interests of a group such as ours become daily more apparent.

PINCHIN, JOHNSON AND ASSOCIATES, LIMITED

RECORD HOME SALES

INDUSTRIAL DEMANDS INCREASING

FURTHER OVERSEAS EXPANSION

MR G. R. T. TAYLOR'S STATEMENT

The annual general meeting of Pinchin, Johnson and Associates, Limited, was held on September 12th at the Connaught Rooms, Kingsway, W.C., Mr G. R. T. Taylor (the chairman) presiding.

The following is the chairman's statement circulated with the report and accounts for the year ending March 31, 1950:—

The report of the directors has referred to the resignation as a director of Mr C. G. Heywood, who has been advised by his doctors to curtail his activities.

I am honoured to have been chosen to succeed him as chairman, and before proceeding with a review of the year's operations should like to pay a tribute to your late chairman.

Mr Heywood had been a director of your company for many years, and has had a long experience and possesses a wide knowledge of the paint industry. This he has agreed to continue to place at the disposal of your company by acting in a consultative capacity for approximately the next three years.

Your late chairman has not, therefore, completely severed his connections with the company, and your directors will have the benefit of Mr Heywood's valuable advice when required to assist them with the many problems which arise in a business with such world-wide activities as your own.

I am sure you will join me and my co-directors in hoping that the less onerous nature of Mr Heywood's duties will enable him speedily to regain his full health.

Your attention is drawn to certain items in the accounts as follows:—

PARENT COMPANY'S BALANCE-SHEET

Since the date of our last balance-sheet, the company has issued 876,600 ordinary shares, which were offered to existing ordinary shareholders in the proportion of one share for every five then held, at the price of 26s. a share.

The proceeds of the issue, after deducting expenses, amounted to £1,108,032, against £1,107,580 estimated, and the net premium obtained of £669,732 has been added to the share premium account, increasing this to £1,759,507.

The ordinary share capital now issued is £2,629,800, compared with £2,191,500 in the previous year.

You will note that fixed assets have increased by £190,470 after deducting depreciation, and net current assets by approximately £942,000, most of the latter being represented by cash.

The programme of expansion envisaged when the capital was enlarged has not yet been completed, but substantial capital expenditures have been made since March 31, 1950, to which I will refer later in this review.

CONSOLIDATED BALANCE-SHEET

The increase in the issued capital of the parent company and the premium obtained thereon, mentioned earlier, has substantially added to shareholders' funds, which at the date of the balance-sheet amounted to £7,004,458, excluding the reserve for future taxation.

The ordinary capital of £2,629,800 was therefore covered by net assets having a book value of £6,204,458.

Transfers to share premium account during the year included a sum of £211, representing the company's proportion of premiums obtained on ordinary shares issued by one of our subsidiary companies.

In the last consolidated balance sheet under the heading of "Employees' pension and provident funds" there was an item for £26,250 shewn in the accounts of one of our subsidiary companies. Further information now available has revealed that this fund was misnamed as "employees'" funds and is the property of the subsidiary company itself, created for the purpose of providing a reserve against possible future benefits to employees. In the present balance sheet the parent company's proportion of the fund, i.e., £19,687 (75 per cent.), has been added to "Other revenue reserves."

All other material transfers to reserves are indicated in the consolidated profit and loss account.

The small item of capital issue expenses, amounting to £297, appearing in the previous balance sheet of a subsidiary company, was written off during the year.

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The total net profits of the company and its subsidiaries for the year amount to £1,201,351, against £1,276,435, a reduction of £75,084.

United Kingdom and overseas taxation has absorbed £19,772 less, and a smaller amount is attributable to outside shareholders, leaving the parent company's proportion of the consolidated net profit at £485,234, a reduction of £33,199.

The net profit derived from trading in the United Kingdom has been maintained partly by reason of an expansion in sales and partly by a greater and more economical production made possible by recent factory extensions. Material costs have continued to rise without a corresponding adjustment in selling prices.

The decline in the total net profits of the overseas subsidiary companies is partly due to losses incurred by the new South African company in its first year of trading, accentuated by restrictions on the importation of machinery required to initiate production and by the German company during a period of reorganisation.

This decline was materially increased by the coal strike experienced in Australia for a period of six weeks, which had an adverse effect on the profits of your Australian subsidiary company for the year.

The income from trade investments was affected by the loss in income from our associated company in China, where the position has become more obscure. It is impossible to forecast the ultimate outcome of the present unsatisfactory situation. So far as we are concerned, trading in that country is practically at a standstill.

Your directors are kept well informed of the latest developments, and will take any action that is possible and appropriate to protect your interests.

Of the parent company's proportion of net profits dealt with in the subsidiary companies' accounts, £32,862 has been transferred to reserves and £9,205 added to the carry forward of the subsidiaries.

The appropriation of the final balance of £443,167 has been dealt with in the accounts under review. It is gratifying to note that after maintenance of the dividend on the larger capital, and providing for tax on the profits earned to the balance-sheet date, the amount carried forward to next year in the parent company's profit and loss account will increase by £75,175 to a total of £512,143.

GENERAL REVIEW

During the period under review the volume and value of sales in the United Kingdom again created new records. This was particularly noticeable in the large expansion of our industrial precision finishes.

Competition in the industry has become more acute, and the wide recognition of the superiority of our products is a source of pride to the management and staff.

The directors' report has stated that the trend of rising costs was checked during the past year by more economical productivity brought about by recent replanning and extension of our main factories. Our efforts to combat higher material costs were therefore successful.

It is true to state that turnover must be maintained at a high level to secure a reasonable rate of profit on the real value of the capital employed, because under present competitive conditions the net profit per unit of output is small.

In this connection your management are constantly endeavouring to improve methods of administration and production, for it has become increasingly evident that any growth of profits from United Kingdom trading is only probable by these means or by a larger sales volume.

Further progress has been made in the rehabilitation of your company's works which has led to a substantially increased volume of output and enabled deliveries to be accelerated.

The re-establishment of the company's headquarters at 4, Carlton Gardens, London, has facilitated ease of contact between the various units, factories and offices, and has been instrumental in providing better service to customers.

EXPANSION OF OVERSEAS COMPANIES

Since the close of our financial year your Australian subsidiary company has doubled its issue capital for the purpose of raising the necessary funds to build and equip three new factories, two of which are now approaching completion.

Your company has invested approximately £213,000 in acquiring its due proportion, and a further call of about £150,000 will be payable in the near future.

During the last few years the French Associated Company has substantially expanded its trading activities, and has now rebuilt and re-equipped its Marseilles factory which had been damaged during the war. It is at present operating on a very profitable basis, and we have taken the opportunity to increase our holding in the French parent company on favourable terms at a cost of about £80,000.

These and similar investments made by your company do not yield an immediate return, but continuation of reasonably good basic economic and political conditions should result in the future increase in the income received by the parent company from its overseas interests.

The proportion of your company's capital which has been invested overseas has very considerably expanded during the last few years and it is probable that your directors may consider the advisability of segregating the overseas assets by forming a separate company at some future date.

It is likely that such an operation would lead to simplified administration and control which would result in greater benefits to shareholders.

CONCLUSION

We cannot disassociate ourselves from general political and economic influences, but I am confident that your organisation is well equipped to meet an expanding demand for all types of surface coatings.

Your company has had a fair degree of success in solving its problems of the past year, and I am sure you will agree that our thanks are due to the management, members of the staff and all other workers.

The report and accounts for the year ended March 31, 1950, were adopted, and a final dividend of 17½ per cent. (less tax) was declared on the ordinary shares, making 25 per cent. (less tax) for the year.

The retiring directors were re-elected and the auditors' remuneration was fixed.

LONDON TIN CORPORATION LIMITED

CHAIRMAN'S SPEECH

The twenty-fourth annual general meeting of London Tin Corporation Limited was held on September 8th at the Chartered Insurance Institute, Aldermanbury, London, E.C.

Mr J. Ivan Spens, chairman of the corporation, who presided, said:—An increase in our holdings of quoted investments and the payment of larger dividends by certain of the companies in which the corporation has a shareholding has increased the corporation's income. In consequence the net income of London Tin Corporation Limited was up by approximately 50 per cent. compared with the previous year, and your directors are recommending to you a final dividend of 8 per cent., which, with the 4 per cent. interim already paid, will make 12 per cent. for the year, against 8 per cent. last year. We have put to reserve this year £75,000, as against £125,000 in the previous year, but of this latter sum some £60,000 came from the carry forward. This year, however, the carry forward has been increased by £16,567.

I do not think that there are any other observations on the balance-sheet and profit and loss account which I need make.

STAFF

The staff in the Far East have had another difficult and trying year. I much regret to report that one of our workshop foremen, an old and valued member of our Chinese staff, together with his wife and one of his children, were killed by bandits in a car ambush on June 26th last. One of our oldest Chinese contractors was dragged from his house and murdered on June 10th.

Both production of tin concentrates and the rehabilitation of plant have gone forward, and our thanks are due to the management and staff of Anglo-Oriental (Malaya) Limited for their steadfastness of purpose and successful efforts in spite of the continuing emergency.

Mr Warren, chairman and general manager of Anglo-Oriental (Malaya) Limited, is with us today, having just arrived from Malaya, and I am glad to take this opportunity to express to him our appreciation of all that has been accomplished.

Our thanks are due likewise to the management and staff of A. O. Nigeria, Limited, to which company I refer later in this speech.

MALAYA

Conditions since I last addressed you have shown little or no improvement, but in spite of the serious difficulties encountered the Malayan tin industry improved its output to 54,910 tons of tin in ore in 1949, as compared with 44,815 tons in 1948. This progress, however, would have been more marked had not the emergency delayed rehabilitation. A serious aspect of the position is that prospecting is virtually at a standstill. As a result, when dredges work out their present areas no new areas may be available to them unless the position improves considerably.

The Ministers of State for the Colonies and for War visited Malaya during the end of May and beginning of June to see for themselves at first-hand existing conditions.

The present disturbances in Malaya have now persisted for over two years. It cannot be pretended that they are unconnected with events in other parts of the world. It is imperative that this banditry in Malaya should be suppressed as quickly as possible.

Malaya has to bear the brunt of the heavy expenditure incurred to which the tin industry contributes, as not only is it paying income-tax but a heavy government duty on tin ore. A relaxation of this duty was promised when income-tax was introduced, but so far no steps have been taken to implement this promise. The possibility of a change of system in levying this duty is, however, mentioned in the draft development plan of the Federation of Malaya.

This duty on tin ore can only have a deleterious effect on the future of the industry because it is based on the price of tin metal and not on the grade of ground worked. The latter basis would have, in my view, much to recommend it.

The tin-bearing areas left unmined in Malaya, as elsewhere, must in the main be of lower grade than those now being mined, and the heavy impost of this export duty is likely severely to restrict the amount of ground which can be worked to give a reasonable return on the capital employed taking into account the risks involved.

I have recently had figures taken out based on the present prices of equipment and on present-day working costs. These show that the equipment of a property with two large modern deep-digging dredges, the most economical plants that exist for this type of mining, would need an estimated capital outlay of £2,700,000. On ground averaging 0.4 lb. per cubic yard and with a price for tin metal averaging £600 per ton over the life of the property, the return on the above-mentioned capital outlay would be only 8½ per cent. Moreover, on ground averaging 0.3 lb. per cubic yard, the average of the grade of ground most likely to be found in the future, the return would be 3¾ per cent., which is not a figure likely to attract new investment, unless there is a considerable easement in the duty on tin ore.

The position in regard to war damage compensation is that claims are now being assessed and it is expected that we shall be given shortly provisional figures which will be a welcome guidance to companies as to where they stand financially.

SIAM

Conditions as regards local security bear favourable comparison with Malaya up to the present time. Mining operations have not been hampered by lawlessness, but the future is overshadowed by the whole situation in the Far East.

Rates of import and export duties in Siam are very high and there are proposals to increase income-tax. The duty on export of tin ore at approximately 27 per cent. of the realisable value before deducting working costs detracts from the development of new areas. Import duties of mining machinery average about 20 per cent., and with present-day prices it seems improbable that mining companies would be prepared to do more than make use of their existing plant.

Negotiations in regard to war damage compensation are well advanced, and I hope that finality may be reached soon.

BURMA

The situation in Burma is still unsettled and certain sections of the country are out of the control of the government. The mining areas of the Tavoy Tin Dredging Corporation cannot be visited by European staff for reasons of security. Looting and damage have taken place. Great credit is due to those who have loyally stood by in these trying circumstances. One dredge is still operating under an Asiatic crew.

The Burmese Government express themselves as anxious to promote the development of the country's resources, for which purpose oversea capital is required. It seems unlikely that this will become available until law and order are restored, and until the position is known in regard to compensation for certain existing capital undertakings which were taken over by government as soon as independent rule was established.

NIGERIA

Output of tin concentrate by the companies managed by A.O. Nigeria Limited has been lower. At the end of the period under review lack of rainfall led to a cut in electrical supplies. The higher price for tin gave the opportunity to work to a lower grade of ground than had been previously economical.

Labour conditions on the tin mines during 1949 were settled, but during this current year have become disturbed. As shareholders will be aware there was serious trouble at the government coal mines at Enugu and a commission was appointed to investigate and report. This report has now been issued. What clearly emerges from this is that the trades union movement was introduced into West Africa before the workers there were ready for it. The movement in this country has developed over many years of trial and error to become the great organisation it now is. To superimpose the system on a people who lacked the necessary education and experience could only lead to misunderstandings and the misuse of power by those opportunists who saw in it the chance of personal aggrandisement. During June and July this year the union at the tin mines put forward impossible claims on behalf of labour and eventually called a strike on short notice and against the regulations, hoping to embarrass the employers by withdrawing labour when the rains were at their height and paddocks might become flooded. The strike was only partially successful and the labour soon returned, after which it was possible to hold discussions with the union in a more reasonable atmosphere.

Income-tax on company profits in Nigeria is now 9s. in the £ while the rate of royalty charged by the Nigerian Government remains unchanged, the scale being based on a price range of tin metal which, I suggest, is now out of date. This royalty should in my opinion be revised and due regard should be paid to the grade of ground worked in order to ensure the maximum development of Nigeria's tin resources.

GENERAL

The Tin Study Group has continued its discussions during the year at which I have

been present as an adviser. Statistics which were drawn up point to a surplus of production over consumption of some 100,000 tons in the two years 1950 and 1951. At the moment this surplus appears to be absorbed by stockpiling programmes.

Both consumers and producers need a stable tin price to permit the making of reasonable plans for the future. The prospect of a burdensome surplus of tin, when purchases for stockpiles have been completed, will not encourage producers to replace their diminishing ore reserves. These new reserves are likely to be of a lower grade than those now being worked, while the cost of equipment is now some three times that of prewar and costs of production have also increased. A serious and prolonged fall in price would cause many mines to cease production and would result in substantial unemployment and hardship to the countries concerned. Violent fluctuations in price and an uncertain supply would not benefit consumers, who require a steady supply at an economic price. Safeguards for the future of the industry are desirable both for producing and consuming countries.

In this connection I quote from the speech made by the Secretary of State for the Colonies on July 12th last in the debate on colonial affairs:

"But whatever we do within the colonial territories, all will be in vain if stable markets are not assured for their products. It is vital to do all we can to protect the colonies against those violent fluctuations in demand and price which, in the past, have had such disastrous effects upon their economic and social life."

It is hoped that the United Nations will call a tin commodity conference in October, 1950.

The report and accounts for the year ended April 30, 1950, were adopted and the retiring directors re-elected.

INDIAN COPPER CORPORATION, LIMITED

MORE ORE MILLED

The twenty-sixth annual general meeting of the Indian Copper Corporation, Limited, was held in London on September 13th, Sir Godfrey Fell, K.C.I.E., C.S.I., O.B.E., chairman and managing director, presiding.

The following is an extract from his circulated statement for 1949:—

Net proceeds of sales and adjustment of stocks on hand fell by £116,849 to £1,807,455, while mining, milling and other costs rose by £81,145. The profit on our kyanite sales increased by £22,331 owing to the rise in the sale price of kyanite ore. The profit for the year was less at £593,552 compared with £744,931 owing chiefly to the smaller volume of sales. Taxation at £343,000 is lower by £95,000. The proposed dividend is 12½ per cent.

Although still below the capacity of the plant, the ore treated in the mill exceeded last year's figures by over 6,000 tons, the average grade being slightly lower. The output of rolled brass was higher by 358 tons. The increase of 337,339 tons in the estimated ore reserves is most gratifying. These now amount to 2,798,430 tons. After initial difficulties the 4-high cold rolling mill has operated satisfactorily on a three-shift basis and it may be hoped that the teething troubles have been finally overcome.

During the first half of the current year the mill treated 167,211 long tons of ore compared with 143,111 long tons for the corresponding six months of 1949, an increase of 24,100 long tons. The production of refined copper amounted to 3,163 long tons, an increase of 223 tons. The output of brass products was 3,686 tons, a decrease of 997. The price of copper has risen to £186 per ton, an increase of £53.

The report was adopted.

THOMAS DE LA RUE AND COMPANY LIMITED

IMPROVED PROFIT

The fifty-third annual general meeting of Thomas De La Rue and Company Limited was held on September 13th in London, Mr B. C. Westall, C.B.E. (chairman and managing director), presiding.

In the course of his speech the chairman said:—

The net group profit for the year amounted to £347,770, and the improvement on last year's £113,628 was accounted for mainly by the fact that as a result of recentralisation we are now able to obtain the benefit of tax reliefs which were previously being lost in the subsidiary companies.

Your directors have deemed it prudent to appropriate a sum of £200,000 to a tax equalisation account in order to provide a cushion to the reduction in future wear and tear allowances, which will result from our having obtained the appropriate initial allowances on plant, etc. The sum so appropriated exceeds the reliefs obtained.

We have also appropriated £50,000 to general reserve, making this reserve up to £500,000. A small transfer to capital reserve was necessary to write off the book value of fixed assets in the Far East which had been destroyed by enemy action, and in respect of which we received an ex gratia grant from H.M. Government.

SECURITY PRINTING

In the past year the security printing branch of your company's activities showed reasonably good results. In my speech to you last year I said: "Nevertheless, I do not expect the trading profits for the present year to reach the figure of the year under review." This forecast has more or less been borne out by results.

If world conditions were more stable I think I should have been able to have given you today a promising outlook for the future of this section of your interests. Even as it is, the business we have on hand is considerable and the prospects cannot be regarded as gloomy.

During the past year we continued to make progress in the establishment of our laminated board, known under the trade name as "Formica." A vast amount of educational work has been done, and many new fields have been opened up for future development. On the other hand, there was some decline in demand for industrial grades of laminated board, due to a considerable extent to a diminishing demand by the electrical industry. This tendency, however, has been reversed since the turn of the year and the demand is now increasing again. In particular, the demand for "Formica" and "Traffolyte" is now, as a result very largely of the previous two years' spade work, sharply increasing, and the plastics side of the business is beginning to work at a profit.

GAS APPLIANCES AND STATIONERY

With regard to your interests in gas appliances, we have now completed the closing down of the Gateshead factory, which was a leasehold premises, and have transferred the plant to other factories. This concentration is now beginning to show results.

On the stationery side of the business the sale of playing-cards was maintained, but there was a falling off in the sale of fountain pens. This market is becoming an increasingly difficult one, and although we are doing our utmost by an increased advertising allocation to maintain our position as manufacturers of the "Onoto" pen, the oldest and possibly the best-known pen in the world, we cannot hold out any hope that the current year will show any improvement.

The report was adopted.

THE PALESTINE ELECTRIC CORPORATION LIMITED

INCREASED DEMAND

The twenty-seventh ordinary general meeting of The Palestine Electric Corporation Limited was held on September 7th in London, the Rt. Hon. Viscount Samuel, P.C., G.C.B., G.B.E., the chairman, presiding.

The following is an extract from his circulated statement:

The year 1949 was one of rapid changes in the State of Israel. Hostilities having ended, much progress was made in restoring normal economic conditions; at the same time the population was vastly increased by a great volume of immigration. These developments were reflected in a remarkable increase in the demand for electricity.

The capital expenditure incurred during the year amounted to just over £1,000,000 mainly on the extension of the Haifa Power House and on the extensions of the transmission and distribution lines. The rapid growth in demand, however, may be expected to continue, and it is already evident that the capacity of the Corporation's plant, although extended, as it soon will be, by the second 30,000 kW turbo-generator unit and boiler plant now in course of manufacture, will become inadequate almost as soon as the new plant is commissioned. I might mention in this connection that already in the first four months of the present year the number of units generated is 50 per cent. greater than in the same period of 1949. Your directors therefore contemplate a further programme of extensions during the next three years. These will comprise considerable increases in the generating capacity of the Corporation's power houses, and in both the capacity and the extent of our transmission and distribution system.

THE NEW ISSUE

Last year reference was made to the directors' intention to make an issue of capital as soon as possible in order to finance such large developments. Application was accordingly made to the Capital Issues Committee for permission to make an issue of capital which, after repayment of bank loans, amounting to £800,000, that had been arranged as a temporary measure, would leave a substantial amount for capital expenditure. The consent of the Treasury was, however, granted only in part, and was in effect limited to an issue of shares sufficient to repay the bank loans. In the circumstances the directors decided not to proceed with the proposed increase in the authorised capital and to make the issue of shares, for which consent had been given, out of the ordinary shares authorised but unissued and by reissuing as ordinary shares the 234,934 4½ per cent. redeemable cumulative preference shares which had been redeemed by sinking fund up to December 31, 1949. An issue was accordingly made last April of 800,000 ordinary shares, by way of an offer to holders of ordinary and "A" ordinary stock on the London register to subscribe at par in the proportion of one new ordinary share for every £2 stock held by them. An issue of 224,424 ordinary shares was made simultaneously in Israel, on similar terms.

As will be seen from the profit and loss account, the operational surplus is I£1,047,285. The amount carried forward to the profit appropriation statement, after setting aside I£334,270 to reserve for depreciation (I£226,430 in 1948), I£380,000 as provision for taxation (I£60,000 in 1948) and I£125,000 to general reserve (nil in 1948), is I£170,689 (I£97,511 in 1948). The directors recommend again the payment of a dividend of 5 per cent., free of tax, on the ordinary and "A" ordinary stock.

The report was adopted.

MUREX LIMITED

RECORD TURNOVER

The thirty-first annual general meeting of Murex Limited, was held on September 20th in London, Mr George P. Joseph (the chairman) presiding.

The following is an extract from his circulated statement:—

The consolidated trading profits for the year at £905,494 were about £30,000 higher than in the previous year, reflecting the improvement in the consolidated turnover, which reached a record figure of £6,820,000. Depreciation has been provided at the higher rates adopted two years ago, which your directors regard as adequate to cover the writing off of our buildings, plant and equipment during their useful life.

In 1948 we decided to discontinue our former practice of setting aside out of revenue specific amounts for obsolescence, and the funds so accumulated in past years were transferred at April 30, 1948, to revenue reserve (general). We intend to continue this policy and to regard the revenue reserve (general), which is wholly created out of taxed profits, as being available for the obsolescence of fixed assets and to meet the enhanced cost of their ultimate replacement; after the appropriations for the year this reserve stands at £1,070,000.

After charging taxation on the consolidated profits of the year, making good underprovisions in past years and provision for the extra tax burden which will arise in later years by reason of the advance tax relief given now by the initial allowances, the consolidated net profits available for dividend and appropriation to reserves are £333,496, an increase of £21,946 on the previous year.

The dividends paid and proposed amount to the same as for the previous year, and there is a reduction of £20,000 in the profits set aside to revenue reserve (general) in the consolidated accounts, the amount carried forward being some £3,000 higher than at April 30, 1949.

We have a full programme of capital construction before us. As our business expands we have to carry also larger stocks of raw materials, and at today's level of costs it is essential for us to continue to conserve such liquid resources as are available after meeting the heavy burden of taxation which industry is called upon to bear: your directors will continue, therefore, to maintain a prudent financial policy.

Our plans for the erection and equipment of an up-to-date research block at our Rainham works have been completed, and work on the site has commenced. We anticipate that the building will be ready for use towards the end of 1951.

Further expansion is taking place also at Waltham Cross, and work has commenced on the erection of additional factory premises which will enable us to improve the plant layout and increase manufacturing efficiency.

FACTORY IN THE TRANSVAAL

The factory of Hard Metals, Limited, at Springs, Transvaal, was completed towards the end of 1949, and is now manufacturing tungsten carbide tips for insertion in rock drill stems; a field staff continues extensive research work in order to improve the application of drill stems for mining purposes.

The overall demand for your company's products has continued at a satisfactory level in the opening months of the new financial year. It has never been my practice on these occasions to prophesy, and I should be reluctant to do so at the present time when the world is so disturbed: you may rest assured that we shall continue to do our utmost to maintain the quality of our products and our service to their users, and we look forward with confidence to the future.

The report was adopted.

INTERNATIONAL TEA COMPANY'S STORES LIMITED

SUCCESSFUL YEAR'S TRADING

The annual general meeting of the International Tea Company's Stores Limited will be held on October 2nd in London.

The following is an extract from the annual review by the chairman, Mr Frank Wilson, circulated with the report and accounts:—

You will be pleased to see that we have had another successful year's trading. The trading profit of the group as compared with the corresponding figure last year shows a decrease of £76,000 approximately. This decrease is in part due to the fact that in our efforts to synchronise accounting dates of our subsidiaries, the results of one of our larger subsidiary companies which were included in our consolidated profit and loss account for 1949 covered the profits of that subsidiary for a period of 18 months' trading, whereas in the accounts now under review for 1950, one year's profits only from that source have been included. Turnover has shown a considerable increase in all sections of the company's business, and it was hoped that this in itself would have enabled us, in spite of the difference in trading periods, to have maintained profits of the group at last year's level. This hope was not realised when the accounts were finalised, since the rate of gross profit has continued to decline on many of the commodities we handle. Bearing these factors in mind the results now submitted can be regarded as satisfactory.

TRADING CONDITIONS

Trading conditions throughout the year in individual commodities have changed considerably. Certain lines in great demand twelve months ago now move very slowly in the warehouses and at the branches. The public generally no longer consider that "food" is "anything edible"; they want what they ask for, and substitution is not acceptable to them. This is as it should be, and it indicates a gradual change to greater freedom in selection. This trend is in harmony with our prewar slogan: "We sell all the best goods from all the best makers." Until now it has been difficult to return to this slogan of 1939, but from now on we intend to devote our efforts to living up to it even more so than we did in the past. We remain of the opinion that the "service" we render to our customers, and all that comes within the full meaning of that word in our trade, is a "corner stone" on which our business has been built, but there is no denying that this policy is increasingly expensive in these times.

We have tested the self-service method of trading in certain locations, and the results have been very encouraging. We have further conversions to self service in hand, and we are hopeful that our selections of sites will prove to be correct.

The turnover continues to expand and the cessation of points rationing brings with it still greater opportunity.

With regard to the subsidiary companies, plans are in hand to strengthen co-operation with head office in London, so that we all work as far as practicable on similar lines. This is the desire of the directors of all the companies concerned, and will have the effect of bringing their policy more into line with that of the parent company.

As to the future, who knows today what it holds for us all, but of this I am certain—your company, firmly established as it is and managed as I know it to be, will render a good account of itself.

ASPRO LIMITED

The fifteenth annual general meeting of Aspro Limited was held on September 8th at 16, Berkeley Street, London, W.1

Mr Maurice A. Nicholas, the chairman, presided.

The following is the chairman's circulated statement:

I am happy to report a further year of good progress by the company. Over the year sales have been further increased.

Turning now to the accounts, it will be seen that our financial position has been well maintained, and that the favourable trend of trading results continues.

The profit on trading and income from investments as shown in the consolidated profit and loss account for the year ended March 31, 1950, before taxation and other chargeable items, amounts to £780,376, as compared with £432,457 for the nine months to March 31, 1949, and £585,506 for the year ended June 30, 1948. The surplus after charging taxation is £221,846, and after adding to this the balance of profits brought forward from the previous year, we have a total surplus of £416,619. After deducting £56,375 representing dividends on the preference stock and an interim dividend of 15 per cent. on the ordinary stock, your board propose to allocate £100,000 to the general reserve and £5,000 to the staff contingencies reserve of Aspro Limited, and to recommend a final dividend of 20 per cent., less income tax, on the ordinary stock. The balance remaining to be carried forward on the consolidated profit and loss account will be £180,332, compared with £194,773 as at March 31, 1949.

You will find in the report a chart showing the percentage distribution of the net income of Aspro Limited, for the year ended March 31, 1950, after defraying the cost of services received and the cost of materials furnished. You will note that the distribution of this net income was as follows:—

	%	%
Net Income of Aspro Limited		100.0
Less:		
Wages, Salaries and Superannuation	29.0	
Depreciation of Fixed Assets	4.8	
		33.8
		66.2
We set aside to strengthen and develop the business		11.4
		54.8
Leaving to be absorbed by:—		
The State and Local Authorities	39.9	
The Stockholders	14.9	
		54.8

In the report there are diagrams reflecting the financial position of Aspro, Limited, as at March 31, 1950, and March 31, 1949. These give a clear picture of the increased financial strength of the company.

The continued development of our overseas markets has the constant attention of your board, and in spite of restrictions on imports, still operative in many parts of the world, your company continues to make solid progress in this direction.

Finally, I would say that the company and its subsidiary companies are maintaining their position in the competitive field. I am satisfied that we have an organisation which will assure to the company continued prosperity, subject, of course, to political and economic circumstances which are beyond our control.

I desire to thank my colleagues on the board for their valued contribution to 'Aspro's' continued success and to reiterate my appreciation of the fine work done by the managing director, executives and staff, both at home and abroad, over the year.

Statistical Summary

EXCHEQUER RETURNS

For the week ended September 16, 1950, total ordinary revenue was £43,979,000, against ordinary expenditure of £44,455,000 and issues to sinking funds £540,000. Thus, including sinking fund allocations of £8,653,000 the surplus accrued since April 1st is £90,823,000 compared with a deficit of £379,000 for the corresponding period a year ago.

EMERGENCY EDITION

The Economist

Established 1843

October 7, 1950 — One Shilling

We have attempted with this emergency issue of The Economist *to reach all our readers and to give them slightly better value for their shilling. Its shortcomings, all the same, are painfully obvious, and we cannot hope so long as the dispute in the London printing trade lasts to record and comment on more than a small fraction of the events that would demand attention in normal conditions.*

We are grateful to readers for their understanding of our difficulties and are doing all we can, under conditions of frustration never known before in periodical publishing, to give them the best service. So long as the present obscurity lasts, we hope they will accept a substitute edition and pardon its limitations.

ACROSS THE PARALLEL

The question whether or not the United Nations forces should come to a halt at the 38th parallel and call the North Koreans to a parley is becoming academic. The parallel has been crossed and South Korean forces are advancing rapidly on a broad front. Unless by some unlikely miracle the North Korean command agrees to General MacArthur's call to surrender and lays down its arms, a new phase of warfare threatens in the difficult country in the north; even if full scale fighting does not break out again, a long period of guerrilla warfare seems to be ahead with all the opportunities it offers for veiled intervention by the Chinese Communists. If the first and most dangerous phase of the Korean incident is over, a new and hazardous one opens. The United Nations will need all its strength, unity and diplomacy to succeed as well as it did in the South - first in grim defence and then in lightning victory.

The essential first step is speedy agreement upon peace terms for Korea. That the Russians hope much from confusion and delay has already been shown by Mr Vyshinsky's proposals to the Political Committee of the General Assembly. These purport to show a spirit of compromise by various references to the role of the United Nations in Korea, but they would in fact leave the authority of the North Koreans intact and amount to no more than a return to the *status quo ante* June 25th. At all costs the Soviets and their satellites must be prevented from succeeding in a prolonged filibuster and the British proposals for a Korean settlement - which are also sponsored by eight other nations - must be brought to the vote.

These proposals undoubtedly provide a possible basis for pacification. They aim at the unification of Korea, the holding of new elections under the control of the United Nations and the economic rehabilitation of the country under the auspices of a new and enlarged United Nations Commission. Such a settlement might reasonably be completed by declaring Korea to be a neutral buffer state under permanent United Nations military protection. The Great Powers could undertake to maintain no bases or garrisons of any sort - the United States has already asked that its troops should be withdrawn as soon as possible - and local defence could be maintained by a *gendarmerie* under United Nations command and drawn from the smaller powers. Such provisions would meet any objections that might be put forward by Korea's nearest neighbour, Communist China.

At the same time, the more speedily Peking can be admitted to the counsels of the United Nations, the better will be the chance of achieving some permanent settlement - as opposed to a precarious truce - in Korea. It is quite uncertain whether Communist China is prepared to play the good neighbour, but as long as it is excluded from the community of nations, so long will it be tempted to behave

like any outlaw. The fears and hesitations of India are also given fresh impetus. Pandit Nehru's unwillingness to sponsor the British proposals for Korea undoubtedly springs from his fear - no doubt underlined with considerable emphasis by his ambassador in Peking -- lest a crossing of the 38th parallel should involve direct Chinese intervention. It may be too late to allay that particular apprehension, but all reasonable steps should be taken in other directions to mollify this influential and restive representative of Asiatic opinion.

Fortunately, there is a chance to do so. The Security Council has now decided that after November 15th, the Peking Government shall be heard on the issue of Formosa. This tentative admission that the Peking government exists could lead speedily to full recognition of Communist China and conceivably to its association with the proposed Commission for Korea. The United Nations cannot be expected to go to unreasonable lengths to satisfy Pandit Nehru's hesitations. To stop short at the parallel and leave the aggressors in the north time and opportunity to reform their defences and to confuse the unity of world opinion would not solve the Korean problem. On the contrary, it would make its recurrence certain. But to seek by every means to make Korea a neutral, peaceful buffer state and to convince the Far Eastern governments that the Western powers are not seeking special positions or 'imperialist advantages' under a cover provided by the United Nations is as much in the interest of the West as of China or India itself. Western intervention is still suspect. Three hundred years of history cannot be wiped out overnight. Everything that can be done to meet China's legitimate interests must in the interests of East and West be attempted.

None of these proposals guarantees success in the difficult and dangerous phase of combined military action and diplomacy that lies ahead. Even though China has not intervened already, it does not follow that intervention will not take place if Korea's northern territory is decisively breached. The bait of United Nations recognition and influence may be less potent than fear of 'the armies of imperialism' arriving on the Manchurian frontier. And behind these immediate hazards lies another and even more uncertain problem - the capacity of the United Nations, even with the most generous economic backing from the West, to establish settled and stable conditions in Korea itself. Since the withdrawal of Western colonialism, no really stable order has appeared in Asia save the rigidity of Communist totalitarianism. The 'democratic' solution to the problem of weak Asian states in their new-found independence has yet to be worked out. Korea can perhaps be made a new model, a first successful experiment. Certainly no venture is better worth undertaking. But the Western powers will assist the United Nations in its task if they realise how uncharted are the ways that must be broken.

Labour and Socialism

This week the Labour party has been holding the annual conference that marks the jubilee of its political existence. In the eighteen months that have intervened since the last conference much has happened that was bound to produce a sharp contrast between the temper of the two gatherings. Last year at Blackpool the Labour delegates were principally concerned with a threatened decline in exports and with fears of unemployment and they had a general election to win in 1950. At Margate, the setting has been quite different. Fear of unemployment, first allayed by the effects of devaluation, has been set aside by the rearmament programme. February's election results, at first such a shock to the Labour Party, showed that a large part of the tremendous gains of 1945 had still been held. It is the implications of rearmament and the problem of winning the next election that now provide the main focus of interest.

The other significant difference lies in the greater degree of harmony, idealism and general goodfellowship evident at this year's conference. There were two good reasons for supposing that such a spirit might not prevail. In the first place, it seemed likely that rearmament, and all that is implied in the pursuit of a tough policy in company with capitalist America towards the heirs of the 1917 revolution, would revive all the latent prejudices and fears of Labour supporters. In the second place, the conference assembled under the shadow of a much publicised rumour of a reopening of the old quarrel between Mr Morrison and Mr Aneurin Bevan.

In the event neither of these factors proved of any great importance. There has been no serious opposition to the rearmament programme, simply because the logic of events makes it impossible for any democratic Socialist - except for the small body of convinced pacifists - to oppose a policy of armed resistance to Soviet aggression without crossing the watershed into the camp of the Communists. It needed only the bluff introduction of Mr Sam Watson, the president of the conference, and Mr Attlee's dispassionate exposition (which by its reception proved how much he has grown in the estimation of his party) to convince the waverers.

The second cause of disquiet, the possibility of a split between the right and left wings of the party also proved a chimera. Serious rows within the party are a luxury that can be afforded only when Labour has a sizeable majority in the House of Commons. If the delegates needed any reminder of the insecurity of the Labour party's majority it was provided by the publication in the *News Chronicle* on Wednesday of the latest findings of the Gallup Poll which suggest that the Labour Party stands exactly where it stood in February, with 46 per cent of the popular vote. In the second place, Mr Bevan does not possess the necessary following to set up a rival faction to Mr Morrison. The fervid acclamation which he received on Wednesday was a tribute to his personal powers as an orator, not as a statesman; there are very few Labour delegates who are prepared to stake the party's future on Mr Bevan's brand of radicalism or on his estimate of the necessity for an immediate election. (The same Gallup Poll shows that 83 per cent of those who intend to vote Labour wish the Government to carry on for the time being). Mr Bevan's role is to put galvanic energy into the Labour party and it is becoming clear, even to Labour delegates, that he is not the man to expand its influence. The delegates, having forced upon the executive a resolution demanding the curbing of prices and profits (which if taken seriously by the Executive in its *alter ego* as the Cabinet, would be virtually impossible to translate into democratic legislation), did not exert strong pressure for the immediate prosecution of further nationalisation measures, a capital levy or the other nostrums of the extreme left-wing.

The debate on Wednesday on the Labour Party's tentative electoral programme 'Labour and the New Society' was by far the most interesting. The document is written in the most general terms, even as a statement of Labour principles, but the debate gave the Labour movement a chance to examine its collective soul. Previous debates on policy documents at Labour party conferences have generally degenerated into sharp encounters between the delegates and the executive upon the permissible limits of immediate political policy, but this year the conference was clearly engaged in the search for new ideas. The party's difficulty is that serious social and economic thinkers have, with a few exceptions, turned against political Socialism, and Labour is left without the spring of ideas upon which it used to rely. The only conception that commands general support is the well intentioned - but patronising and bogus - idea that Socialism is a 'way of life'. This idea is supported by such generalisations that the family is the basis of organisation and that cooperation or the service of the state can satisfy the highest needs of man. The danger of the Morrison approach to the public is that Labour policy may end up as a mere 'all things to everybody', an appeal to all just men - or as Mr Morrison prefers to 'the useful people.' This is nothing more than Chamberlain conservatism stood on its head.

The chasm that yawns between political good intentions and political reality has been strikingly illustrated by the references of the leaders of the Labour party to colonial development and international action. It is evident that since Labour policy at home has entered into the dusty arena of reality, an attempt is being made to rekindle the faith of the faithful by painting an all too glowing picture of what socialist action can do abroad. Mr Bevan, the Prime Minister, and other delegates who spoke in the same vein seemed to be engaged in formulating a new version of President Truman's Point Four - a vision of Labour as the emancipator of the depressed classes of Asia. This makes little sense given the strains on Britain's capital resources, and is hardly to be distinguished from 'capitalist' American ideas; the main difference is that the Americans may have the resources to bridge the gap between ideas and reality.

The annual conference of a political party provides the opportunity to seek the answer to two questions. First, has the party the necessary vitality and unity to give it a claim to victory in the unending struggle for political power? Margate has shown clearly that for the Labour Party the answer is Yes. The years in office have shorn the Labour Party of its feeling of encirclement and inferiority and have imparted to both its leaders and its rank and file a feeling of confidence which comes dangerously near to complacency. The angry internal bickerings so evident at Margate in 1947 have for the moment subsided.

But if it be asked whether the Labour Party possesses the energy and courage to tackle the immediate problems which confront it, the answer must be in the negative. On all the questions of economic policy at home it has not moved a single inch. It offers nationalisation and more soaking of the rich as an answer to the inflationary forces that its own policies have done so much to encourage. If Labour is to stand for all the people it must find a new economics that will assist its social purposes but will leave full room for enterprise.

Books for the People.

As a relaxation from manual labour, a corrective for habits of intemperance, supplying repose to the body and a stimulus to the mind, no amusement is equal to reading. Our people are great readers, and they have now great subjects to invite their attention. The use to be made then, and actually making of their easy circumstances, is to enlarge and acquire knowledge. At present, mental development - like that railway travelling which all classes share, to the manifest polish of the manners of all - is extremely rapid; and those misapprehend society and counsel the people amiss, who would divert them from the course of improvement they have entered on to become something like pauper occupants of small allotments of land, or inhabitants of self-sustaining villages.

The Economist

October 5, 1850

NOTES OF THE WEEK

Strikes and the Law

The Government has at last acted in the gas strike. Summonses have been issued against ten employees of the North Thames Gas Board under an old Act of 1875 which makes it an offence for employees of gas or water undertakings to break their contracts in the knowledge that consumers will be deprived of their supplies. The summonses will have been heard on Thursday, after *The Economist* has gone to press, but it will be interesting, to say the least, to see whether this attempt to impose some legal restraint on irresponsible and unofficial strikers is successful.

The reaction of other trade unionists to the Government's action is a matter of even greater importance. Political considerations have far too often been allowed to outweigh the need for proper legal safeguards in trade disputes in recent years. Workers and their unions should not be allowed to continue to assume that they are beyond the law, that a strike is sacred regardless of its nature, its causes, or its consequences. If the gas workers do not accept the Government's action against the leaders of the unofficial strike, they will seriously jeopardise the public standing of their own union and of the trade union movement as a whole.

Liberals Fight On

The Liberal party, at its annual assembly, rejected with greater emphasis than had been expected the idea of a united front or an electoral alliance with the Conservatives. The resolution which the assembly passed last Saturday expressed strong opposition to any agreements that would in any way limit the number of Liberal candidates put forward. The terms of the resolution are sufficiently stringent not only to make it impossible for the Liberal leaders to contemplate any national arrangement with the Tories, but also to rule out any regional arrangements, such as the "Huddersfield formula" of last February, which gave the Liberals a straight fight in Huddersfield West in return for their withdrawal in the East. The resolution does not, however, have the force of an absolute fiat. Local Liberal associations have an unquestioned right to make any arrangements in their constituencies which they may consider advantageous, and there appear to be a number of Liberal candidates who have hopes of getting a straight fight on the basis of being the lesser evil to one of the two other parties.

The Liberals have now committed themselves to what can only be a long and arduous struggle to break out of their small bridgehead of nine constituencies and advance into new territories. Their only hope of outside aid, as discussed by Mr Philip Fothergill in an admirable presidential address, is at present a remote one, the hiving off of the Liberal element in the two main parties and their union with the Liberal party. In the meantime the Liberal party will continue to champion liberal causes - particularly that of civil liberty. It is a courageous and a correct decision, but it will depend for its political effectiveness upon the degree to which the Liberal leaders can retain the loyalty and augment the numbers of the 2,600,000 people who voted Liberal last February. To this end it will be necessary to consider with great care the nature and aims of Liberal policy and propaganda so as to embrace the whole of liberal opinion, and not only the radical wing, whose outspokenness at Scarborough may have given a false impression of the tenor of feeling and opinion among Liberals as a whole.

Aid for Asia

The fundamental problem to which the Commonwealth Conference on economic aid for southern Asia has not found a solution is that of the relationship between the givers and receivers of aid. This question of relationship, in fact, dominates the future all over non-Communist Asia. The old basis on which westerners lived in many parts of the Orient has gone, with the rise of acute national feeling and the emergence of various grades of political emancipation. But no new basis for it has yet been established. So, although the Conference was concerned solely with economic problems, it ran into considerable trouble because of this political difficulty. Neither Burma nor Indonesia were prepared to commit themselves unreservedly even to the objects of the conference, although both stood to gain if these objects could be attained. Yet in Indonesia particularly this hesitation may be readily understood. During this, the very first year of their country's hard-won independence, many Indonesians do not see how they can be expected to 'join' what appears to be a Commonwealth bloc and yet remain free.

The new relationship between west and east, when it comes into being, should almost certainly be based on that of the expert and technician to the director and partner. The expert must be the westerner for a good many years to come; indeed, a large part of the task of the Commonwealth Conference has been to make plans for giving southern Asia the benefit of western 'know-how,' as well as providing the liquid capital and resources to use it. The director, on the other hand, must now be the Asian. He must take the responsibility and make the decisions. That is implicit in the freedom for which he has been struggling so hard during the last few years. On this basis - and this alone - the plans which will emerge from the Commonwealth Conference have every prospect of making a decisive contribution to the prosperity of southern Asia during the next six years. The scale of the expected effort is indicated by the investment figure of about £1,900 million which is reported to be needed if any appreciable effect is to be obtained in raising present standards of living.

Viet Nam Fighting grows

After Korea, Indo-China has looked for some time like the next most probable scene of sharp fighting in the Far East. Two weeks ago the rebel Communist-led Viet Minh forces seized a key French frontier fort, Dong-Khe, in the Chinese border region between the garrison towns of Langson and Kao-bank, heavily infiltrated by the rebels. This dangerously successful attack preceded, no doubt intentionally, a carefully prepared French offensive launched this week against one of the rebels' chief centres, Thai-Nguyen. Forty miles north of Hanoi, this has been a key Viet Minh town since its leader, Ho Chi-minh, set up his first capital there in 1944. A strategic point where roads and canals meet, Thai-Nguyen is also situated in the middle of an important rice-growing area which it has for some time been part of a systematic French policy to deny to the enemy.

The danger of Communist success in the Red River valley of North Viet Nam has lately increased owing to the arms and training which the Viet Minh has been receiving from Communist China; in the other delta area where rebel strength is serious, that of the Mekong in South Viet Nam, the rebels are reported to be losing ground. The Communist defeat in Korea will have a sobering effect on opinion throughout South East Asia. But while this may help to gather further support for the French-backed anti-Communist regime of Bao Dai, Indo-China is likely to prove a place where the Communist powers may well try to retrieve their fortunes. If so, and even without an overt Chinese invasion, the French need urgently every ounce of help the Americans are beginning to give them. They, for their part, must maintain momentum in the transfer of real political power to Bao Dai.

Humility over Groundnuts

The Overseas Food Corporation has decided to accept the recommendations of its working party on the future size and scope of its operations at Kongwa. The most important of these is that for a three year period, beginning with the new planting season at the end of the year, the cultivation of groundnuts and sorghum should be confined to four independent farms making up a total of no more than 1,200 acres while the rest of the cleared area should be used for ranching cattle. This is a very modest programme compared to the original project of clearing and planting 450,000 acres. It is small even by comparison with the 94,000 acres which have already been cleared. The figures of costs produced by the working party which reveal that during the last year it cost £600,000 to produce £100,000 of crops (the greater part of this being due to the failure of the sunflower harvest) show how unjustified would have been any attempt to continue planting over a large area.

The corporation has at last recognised that the right way of cultivating crops at Kongwa has not yet been found. If this spirit of humility had been present from the start, if political, technical and social factors had not become inextricably confused, if in the name of science the most unscientific approach had not been adopted, the story of the groundnuts scheme might have been a different one. Now that the scheme is to be altered into a few modest experimental farms, with no pretensions to place a vast quantity of edible fats upon the world market, it remains to be considered whether it is worth keeping the scheme within the grandiose framework of the Overseas Food Corporation. The Corporation has for the moment resisted the idea that Kongwa should be placed under a separate company; but the Government itself should consider whether it would not be better to write off the capital that has been wasted, and to hand over the capital that still exists in the form of building, hospitals and machinery to the Tanganyika Government.

Wisdom or Witch-hunt?

On Monday, the Middlesex County Education Committee took a step which deserves the gravest consideration. In the face of strong opposition from the Labour representatives, the Committee decided that, in future, membership of, or close association with, the Communist or Fascist parties should debar teachers from appointments as headmasters, principals of technical colleges or members of the staffs of training colleges. The question arose from the proposed appointment to a headship of a man subsequently found to be an active Communist.

There should be no doubt about the gravity of the point at issue. This is the first time that political discrimination in the schools has been made a matter of public policy, and such an interference with the principles of civil liberty must be examined with the most searching care and honesty. To penalise any Englishman for his connection with a political party and to deny him his prospects of promotion can only be justified if to do otherwise would jeopardise the safety of the state or threaten the welfare of those in his charge. The question at issue is whether the appointment of a Communist as the headmaster of a school constitutes such a threat to the independence of his staff and the right of the children to be instructed in the truth.

It has been argued that as teachers are

not permitted to introduce political bias into their teaching any Communist teacher who misused his position could be dismissed. But allegations of bias are extremely difficult to prove and are dependent on the willingness of parents to complain to higher authority about a headmaster's actions, or opinions. Few Communist teachers at the present time would risk any overt political actions, and even if they did, the whole process of dismissal would involve a highly undesirable technique of denunciation and tale bearing.

It is difficult to resist the conclusion that it would be gratuitously asking for trouble to put at the head of a school an individual whose political beliefs involve the overthrow of liberty and democratic institutions, and whose party is prepared to pursue its ends by means which are amoral, illegal and dishonest. If, however, wisdom dictates this policy of limited discrimination it must not be allowed to lead to a witch-hunt. The most rigorous safeguards are required to prevent victimisation and abuse.

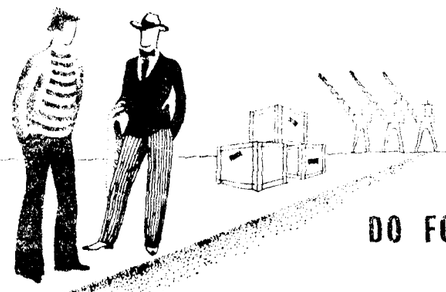
Berlin - Symbol of the West

Ever since the days of the air-lift, Berlin has remained the most dramatic city in Europe. Something about this free enclave in a territory which is, to all intents and purposes, part of the Soviet Union catches the imagination, even of civil servants. Last Sunday, Mr Harold Wilson and Lord Henderson, flying the 570 miles to Berlin in 90 minutes, in the Comet jet airliner piloted by Group Captain Cunningham, showed that they had caught the right spirit. They redeemed the rather belated British participation in a big industrial fair which Berlin has organised, as visible evidence of the fact that in the last six months its production has doubled. As part of the symbolism of the occasion, Mr Wilson and Dr. Erhard signed the agreed minute on Anglo-German trade, which is to liberalise exchanges between the two countries.

The citizens heard a message from Mr Bevin, and Mr Paul Hoffman read an assurance from President Truman that American aid would continue. American funds and energy have played a large part in rescuing the city's economy from the disastrous situation of last winter. These pledges follow the even more significant warning given to Moscow by the Foreign Ministers in New York last month, that in Berlin, as in the Federal Republic, any attack from the Soviet Zone would be regarded as an attack upon themselves.

At Sunday's ceremonies the city, without its Eastern rump, was formally granted a constitution which makes it in form, though not in law, a twelfth *Land* of the Federal Republic. President Heuss and Dr. Erhard indicated by their presence that the shameful neglect of Berlin by Western Germany is a thing of the past.

Damp Squib in the Ruhr



The east German 'National Front' chose last week-end for its first trial of strength with the police of the Ruhr, and failed badly. Communist stock is low in the industrial towns of western Germany; and whatever interest there might have been in watching demonstrations for peace by members of the 'Free German Youth', on excursion from the Soviet Zone, was damped by the rain and forestalled by energetic police action. Indeed, the Communists may now be wondering whether it was wise to make such a challenge for such a trivial result. They have succeeded merely in strengthening the self-confidence of the police in the states, in demonstrating that traffic out of the Soviet Zone can be more strictly checked than they expected, and in associating the 'Free German Youth' with memories of the storm troopers' brawling of twenty years ago.

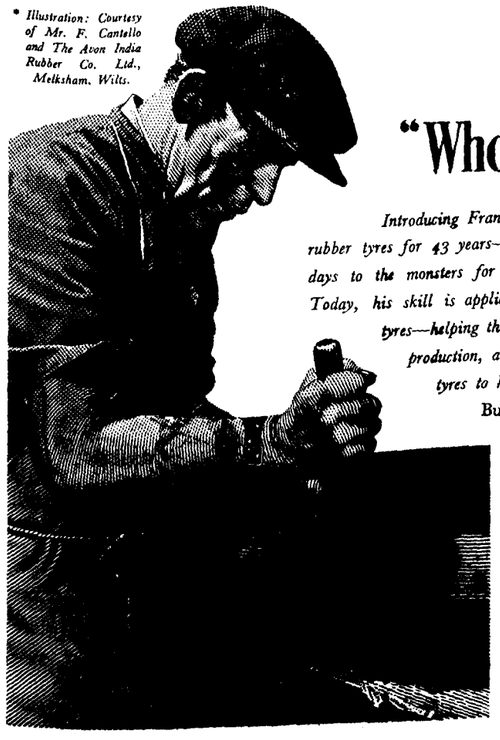
For the Federal Republic it is, indeed, important that the police should deal efficiently and the courts justly with political disorder. Should they fail, rival gangs might see their opportunity to deal with the Communists to the tune of the Horst Wessel song. It will be interesting to see what legal action is taken against the excursionists from the east. If the nuisance of their visits persists, it might be wise to sentence those against whom breaches of the peace can be proved to a short spell of detention in quarters where they could hear free speech, form their own impressions of democratic Germany and shake off some of the evil spell that has been cast on them by their Soviet patrons. There is a chance here for imaginative enterprise in which Germans and British might well work together.

Improving on Korea

There can be no excuse for failing to recognise the gravity of Moscow's aims in Germany, however far the results fall short of the goal. During the current election campaign the Soviet German leaders, who worry as little about their metaphors as their principles, constantly proclaim that their essential task it to 'liberate' Western Germany, 'the keystone of the Anglo-American war conspiracy'. It is to be accomplished some day by the resistance movement that was launched from Herr Ulbricht's rostrum at the Socialist Unity Party Congress last July. And President Pieck has openly announced his pledge that, should resistance lead to war, the German Democratic Republic would fight on the side of 'the camp of peace led by the Soviet Union'.

Further preparations for the day - which may well be several years distant in the Russian calendar - have recently been made. The support of the other satellites has been promised in treaties signed last month with

DO FOREIGNERS TALK T.I.?



By foreigners we refer to all the live and likeable people with whom we do business for Britain abroad . . . and, in explaining that, we seem to have answered the question. For TI reached a record total last year of £12,750,000 in *direct* exports alone . . . and that in spite of difficulties which did not exist the year before.
When foreigners think of TI, it may mean anything to them, from a microscopic coil of steel tubing for a highly technical purpose to a consignment of bus body components ready packed for quick assembly. When foreigners talk TI they are using what has become almost a universal language.

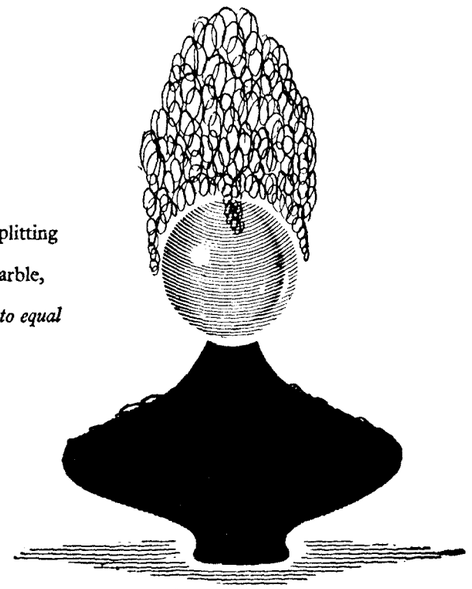
The letters TI stand for Tube Investments Ltd., of the Adelphi, London, W.C.2 (Trafalgar 5633). They also stand for the thirty producing companies of the TI Group, whose specialist skills are co-ordinated in the general field of light engineering to produce essential mechanical parts for a thousand and one things which everbody uses.

TI THE SURNAME OF A THOUSAND THINGS

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.' But . . . have you ever stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

* *Illustration: Courtesy of Mr. F. Cantello and The Avon India Rubber Co. Ltd., Melksham, Wilts.*



*Introducing Frank Cantello. He has been making rubber tyres for 43 years—from tyres for pioneer motoring days to the monsters for the wheels of modern transport. Today, his skill is applied to retreading giant agricultural tyres—helping the salvage drive, helping home food production, and helping boost exports of new tyres to higher levels.**

But does craftsmanship mean only handcraftsmanship? In the manufacture of tyres today more and more processes have been mechanised . . . but skill is as necessary as ever. In machine design . . . in setting up . . . in operation.
And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so, and they follow this rule in making a range of chemicals for the many activities of the rubber industry.

Monsanto make over 200 chemicals for use in industry: Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

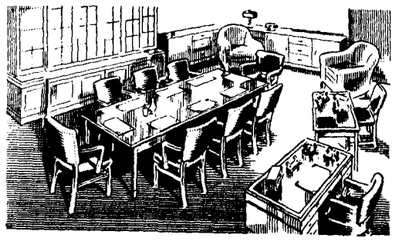
Note this head of fine hair



You read a lot of hair-raising stories nowadays. You hear a lot of hair-splitting arguments . . . So what will you say when we tell you about our Pet Marble, *which grows glass hairs so fine that it takes* 500 *of them, bundled together, to equal the thickness of one human whisker !* You don't believe that? . . . well, listen to this: THE FINEST ALL-ROUND INSULATING MATERIAL IN THE WORLD IS MADE OF FILAMENTS LIKE THESE, SPUN FROM GLASS MARBLES. It's used in buildings, dynamos, ships, railway engines, refrigerators, aeroplanes . . . It's called:—

Our only address. Telephone: Museum 7777

Clients of the Ratin Service sign a progress report after each visit by our operator. Here is proof that an occupier has taken **the most effective steps** possible both to protect his property and to conform to the requirements of the Prevention of Damage by Pests Act, 1949.

This Act makes it the responsibility of individual occupiers and managements to clear infested premises.

Employing the latest scientific methods, the Ratin Service—the largest commercial organisation of its kind—defeats the natural cunning and suspicion of rats and mice and wipes out whole colonies.

Learn about this remarkable service by writing to-day for our folder. It explains your responsibility under the Act and how the Ratin Service can clear your premises —and keep control.

Bulgaria and Rumania, which follow treaties made with Poland, Czechoslovakia and Hungary earlier in the year. Moreover, an attempt has been made to establish in advance a legalistic basis for the Soviet German campaign. In a statement on the decisions taken by the Western Foreign Ministers, which Herr Dertinger, the 'Foreign Minister' of the Democratic Republic, summoned the military representatives of the People's Democracies to hear, it was formally laid down that the presence of Western armies in Germany represents 'intervention'. And legal experts in the Soviet Union and Poland have already announced their finding that intervention in a civil war should not be supported by the United Nations Security Council. The stage is being set for an improved Korea in Germany.

Assistance Payments

As was expected, the report of the National Assistance Board, covering the calendar year 1949 (Cmd 8030), shows a further rise in the number of assistance payments. Before July 5, 1948, the board was making 543,464 payments, the great majority being supplementary pensions. At the same time, the local authorities were paying, under the poor law, rather more than 200,000 allowances; in addition they were paying nearly 40,000 blind persons' allowances and nearly 20,000 tuberculosis treatment allowances. Altogether, therefore, on the appointed day, the board was responsible for some 803,464 payments. Three weeks later, the figure had risen to 842,304. By the end of 1948 it had risen to 1,011,034, and by the end of 1949 it was 1,157,403.

The number of payments, when analysed among the different classes of assistance, shows a fairly consistent rise for each class, having increased by between 25 and 30 per cent. The payments made in supplementing unemployment benefit, however, showed a marked discrepancy, since in seventeen months they increased threefold. Nevertheless, the proportion of persons in receipt of unemployment benefit at the end of 1949 who had to have their benefit supplemented by assistance was roughly the same as that for those in receipt of sickness benefit or about 11 per cent.

The increase in the number of assistance payments is partly explained by the greater willingness of people to apply for assistance from the Assistance Board than for poor law relief from their local authorities. The chief reason is however the increase in the board scale rates, which lay down the weekly amounts considered necessary for subsistence. These scale rates were increased on July 5, 1948 and another increase was made in June of this year, the effect of which has as yet to become apparent in the payments figures. The danger is that the greater the number of people who have to apply for assistance to supplement their insurance benefits, the greater the pressure for an increase in those benefits, because they are paid without any test of needs.

Stalin's Point Four

Technical gusto and some lyrical prose have marked the entry of Soviet propaganda into the field of Point Four publicity. Indeed, the Commonwealth representatives who have been planning further aid for South-East Asia might do worse than call for a report on the press and radio material that has come out of Moscow since the first week of September. It is no disparagement of the gigantic creative projects "for transforming nature" that the Russians have in mind to say that they are very long-term indeed; what is interesting is the motive behind the present burst of publicity. It may be intended to keep alive the memory of Communist idealism at a time when the world associates the Party with sordid, unscrupulous and not entirely successful power politics. It may, too, be intended to keep Russian eyes directed at a peaceful horizon instead of the grey and fearful world around. And there is of course the regular need to claim that only socialised industry can produce technological triumphs.

The greatest attention has been given in *Pravda* to plans for Central Asia. There is to be, for instance, the 700 mile long Turkmenian Canal, which is to "increase several times" the number of live-stock in the Turkmenian Republic and provide three great hydro-electric stations. When it is completed there will exist a network of inland waterways over which "cargoes will be carried from the shores of the Arctic Ocean to the blossoming oases of Central Asia". Over a million hectares will be irrigated for growing cotton and another 500,000 planted with shelter belts and reclaimed from the sand.

As Soviet policy reveals itself over the next few weeks at Uno it will be worth remembering two things: that since the first week in September the public in the Soviet Union has had its attention concentrated on reconstruction in contrast to the destruction in Korea; and that a few lines on back pages are all that they were told of the American landings that turned the tide of war in Korea.

Commonwealth Defence

Commonwealth ideas on peacetime defence commitments are changing with quite remarkable speed. Mr Menzies has been urging Australians to accept service abroad as a normal part of the duties of their forces; Mr Erasmus has made in London tempting suggestions about the help that South Africa might give in defending the Middle East; and on Sunday Mr St. Laurent said that Canada would be willing to send its 'special army force' of 10,000 men to Europe, as part of the deterrent plans of the Atlantic Pact powers. It would be interesting to know what part was placed by Commonwealth consultation in decisions of such far-reaching importance.

Books and Publications

"The Customs Union Issue" by Jacob Viner. Carnegie Endowment for International Peace, New York. London: Stevens. 221 pages. 20s.

Forming as it does the last volume of a series of "Studies in the Administration of International Law and Organisation," this book presents the customs union question in the round, in its political and legal as well as in its economic aspects; and one may safely predict that it will rank as the standard work on its subject. Though Dr Viner has not attempted an exhaustive history of the customs union movement, he has set his matter solidly against its historical background, a precaution particularly important in dealing with the legal relationship of customs unions to pre-existing commercial and political treaty obligations. In his shrewd and elegant analysis of the economics of the customs union he moves on to a higher plane of abstraction, but always with a warning against *a priori* judgements; the effect, for good or ill, of any union depends on the particular circumstances of the tariff policy. Politically, the motives of customs union are generally related either to aggression or to fear of aggression; economically, much the same can be said of most unions proposed in the past. (It is interesting to note that the late nineteenth century saw a vigorous movement for a European customs union as a defence against menacing American competition). The book ends with an account of the Havana Charter as it affects both customs unions and other discriminatory arrangements.

Dr Viner administers some jolts to his readers. It is disconcerting, though illuminating, to follow his demonstration that customs unions between pairs of complementary economies are likely to constitute a step away from free trade - gains in this respect result only when the uniting economies are competitive - or that in the balancing of the pros and cons of customs union projects internal freedom of trade has generally been regarded as a liability rather than an asset, and the exclusion of foreign goods as the benefit thus purchased. Certain of the obstacles to customs unions (whether liberal or illiberal in intention) which have lately been debated, he treats comparatively sketchily; his chapter on "Political Aspects" deals with the relation of customs union to national independence, but not with the difficulties confronting prospective partners (as in Benelux), which have widely different political philosophies and correspondingly different tax policies. He is definite enough, however, on the related question of the supersession of tariffs, and even of quantitative import restrictions, by central planning, whether direct of through publicly sponsored cartels. Cautiously, he concludes that Western Europe as a whole could benefit economically by customs unions, but that the case for smaller unions must be made, if at all, on other than economic grounds.

* * *

"Seven Fallen Pillars" by Jon Kimche. Secker and Warburg. 326 pages. 15s.

It is always entertaining to read a book about well-known people, especially if it is brightly and amusingly written. Mr Kimche's work fulfills those requirements, especially as he claims at least a nodding acquaintance with most of the leading personalities, Arab, Jewish, and British of the Middle East. Unfortunately, the merits of the book end there. For anything more than entertainment it is spoiled by innumerable errors of facts and by half-truths and false emphasis which make it a most unreliable account of a problem and a part of the world already sufficiently obscured by propaganda.

It would be wearisome to record all the errors, but a few examples must be given. He speaks of the British censorship in Palestine at this period. So far as foreign correspondents were concerned, there was no censorship and anyone could write or cable for publication anywhere in the world just whatever he wished. There was a bumbling but by no means savage internal censorship aimed at preventing incitement to revolt. It was a Colonel Oliver Roget and not General Beynet who ordered the bombardment of Damascus. Col. Roget was senior French officer in Damascus; General Beynet was High Commissioner with his residence in Beirut. He complains, on Page 285, of "The grudging release (to Egypt) of small annual sums after long haggling..." If he would look up the figures, he would discover that these small releases have been sufficient to give Egypt, in its free account, at least £60 million more than it has been able to spend.

One is so accustomed by now to allegations that the Great Powers - nearly always Britain - are responsible for everything bad that happens anywhere in the Middle East that one is inclined to accept them without comment. Certainly Britain, America and France influence some of the Middle Eastern countries some of the time; but Mr Kimche's acceptance of Britain's alleged role in the Arab invasion of Palestine displays either ignorance, malice or an astonishing credulity which lessens the force of some of his well-merited strictures on general British policy.

It is not easy to understand Mr Kimche's object in producing this work. In his introduction he states that it is an attempt to "tell the story of the Middle East during the five fateful post-war years". But it is a very one-sided story, concerned more with misleading allegations of British iniquity than with any true appreciation of the facts.

AMERICAN SURVEY

Election Handicap

If the Republicans are to win both Houses of Congress in November, as they did in the *mid-term* elections of 1946, they need a net gain of seven seats in the Senate and forty-seven in the House of Representatives. Unless something more than the normal swing away from the party in power occurs - and the latest news from Korea makes such a swing less likely than it seemed a few weeks ago - the only Democratic Representatives in danger will be those who won by a margin of less than 5 per cent of the total vote in 1948. There are not enough in this predicament to suggest that the opposition will recover more than about 30 seats, although in the process many of the most promising young men in Congress may be defeated. To win control of the Senate will be an even harder proposition and only the most optimistic Republicans believe that it can be done.

There are thirty-six Senate seats up for election, but the number where a change of representation is possible is much smaller. There are ten Southern seats where Democratic incumbents will come back for another term whether this is a Republican year or not, and two more where there will be new faces but no change in nominal allegiance to the Democratic Party. There are six other seats where the Democrats should be safe, though in three they will have to fight hard. The Republican *machine in* Rhode Island has disintegrated into quarrelling factions, leaving the field to a popular Democratic Governor, Mr Pastore. Mr Magnuson should not have much trouble in the State of Washington and Senator Tydings has apparently triumphed over the disadvantage of having been chairman of the sub-committee investigating the charges of Senator McCarthy. Senator Elbert Thomas has strong opposition in Utah, but probably not quite strong enough, and Senator Lehman, who was running for the last two years of Senator Wagner's term when he beat Mr Dulles last year, has to try again in New York, a State where nothing is ever cut and dried. Nevertheless, he should survive and so should Representative Monroney who just managed to beat the other, and less admirable, Senator Thomas in the Oklahoma primary.

On the Republican side three of the best men in the Senate are certainties - Mr Aiken of Vermont, Mr Morse of Oregon and Mr Tobey of New Hampshire (after a desperate struggle in the primary); so are three less interesting men in the Dakotas and Kansas. There are four other Republicans, in Wisconsin, Idaho, Iowa and Indiana, who should win unless Democratic strength grows appreciably in the next four weeks. Senator Wiley is, and deserves to be, the most secure, the other three being easily expendable. Mr Dworshak, a dim figure, was beaten in Idaho in 1948 and reappointed by the Republican Governor when his Democratic opponent died some months later. Both Senators Hickenlooper and Capehart are being given harder fights than Republicans usually have in the Middle West by men who resigned from government jobs to tackle them. Mr Loveland was Under Secretary of Agriculture before he took on Senator Hickenlooper, a man with an infinite capacity for looking ridiculous. Mr Campbell, an ex-Assistant Attorney-General, would beat Mr Capehart, who has the face, figure and prejudices of the wealthy manufacturer that he is, anywhere but in Indiana, which prides itself on sending its worst men to the Senate.

There remain seven Democratic and three Republican seats where a change would not be surprising. And in some of them important men in the party are in danger. Every week Senator Taft's prospects look more shaky, even against an inadequate opponent. On the other hand, Senator Milliken, chairman of the Finance Committee when his party is in power, has a more than adequate opponent in Colorado, Representative Carroll, one of the best young Congressmen to appear since the end of the war. Mr Milliken will probably lose and so will Senator Donnell in Missouri, if the prophets are right.

The Democrats have even worse troubles. The majority leader, Senator Scott Lucas, lacks the character for a position of such responsibility. But his defeat would bring to the Senate Mr Dirksen, who made a certain reputation in the House during the Marshall Plan debates, but has lately decided that the support of the *Chicago Tribune* is worth a turn of coat. The Democratic whip, Senator Myers, would be a real loss, but Governor Duff, who looks like beating him in Pennsylvania, would do much to compensate for it by strengthening his party's internationalist wing. There are also doubts about the chances of Senator McMahon, the Chairman of the Atomic Energy Committee, as Connecticut is normally Republican. If he goes, so too will Senator Benton in the other Connecticut seat. It would be more pleasant to think that Senator McCarran will lose in Nevada but it seems that wishful thinkers may have exaggerated his opponent's chances. In Idaho, however, a Republican victory is very likely.

Finally, there is the struggle in California between two Representatives, Mrs Helen Gahagan Douglas and Mr Nixon. Mrs Douglas's heart, which sometimes acts without consulting her head, has led her in the past into some organisations which, in the present atmosphere, leave her open to attack. Her opponent, as a member of the Un-American Activities Committee, is just the man to take advantage of this weakness and, in these times, he will probably win.

American Notes

Full Speed Ahead?

With the Korean emergency no longer in the driver's seat, will the rearmament drive continue full speed ahead? To General Bradley, the greatest present danger is that the United States may let down its guard now the Korean fighting is nearly over. Mr Truman recognised the risk when he promised last week that there would be no slowing down in the effort to strengthen western defences.

Two members of the Cabinet with a known preference for "business as usual" - Mr Snyder and Mr Sawyer - went out of their way to insist that no matter how quickly peace was restored in Korea, taxes would have to be increased again next year, and that there was little hope of avoiding federal controls over business. The uncertainties which prompted a break in commodity and share prices on the better news from Korea are thus not of the Administration's making. General Bradley has its full support for his statement that it would be fatal to hesitate now or to fall short in the despatch of the troops or equipment promised for the defence of Europe, the key of North Atlantic security.

This means that conscription will have to be applied more, not less vigorously, to raise and maintain an armed force of three million men; it means a probable addition of $10 billion to the $30 billion already voted for defence this year. And the Administration is convinced that foreign economic aid must be continued and preferably expanded.

With American troops no longer under fire, the enthusiasm for this costly three-point programme is bound to be somewhat blunted, even though the Republicans do not actively oppose it. And even if Congress does not refuse to vote the sums needed, there is a danger that it will refuse to raise them by new taxation. This would add fresh fuel to the existing inflation and cause hardships and resentment which might have been avoided. The Administration is rightly making every effort to show that the victory in Korea is only a first step toward making peace secure.

Hands for the Job

Factories and farms, as well as the forces, now hang out permanent 'Help Wanted' signs. The forces alone need more than a million men from a fully employed economy if the goal of three million in uniform is to be met by next June. It is clear that the services must relax the standards which now lead to the rejection of half the men called up. If, in addition, Congress permits the conscription of veterans and the President tightens up exemptions based on dependency, the need can be met by the 19 to 25 year olds. But first the services must satisfy two Congressional committees that they are not wasting manpower, and that certain elementary notions of justice are observed. Today, a childless marriage may excuse a conscript, while a Reservist with ten children is not exempt.

Another problem certain to become acute is the competition between industry and the services for technicians. Many Reservists and National Guardsmen are highly skilled, and it is not forgotten that in the last war the factories were stripped of key workers who eventually had to be released. A realistic deferment policy is urgent if this is not to happen again. A skilled worker is already a pearl of great price, although most of the new war contracts have not been let, and pirating and hoarding of workers have been revived despite official remonstrances.

There is no scarcity, at this stage, of untrained workers and the next nine months should not present great manpower difficulties. In a war emergency, the present labour force of 64 million (including 2.5 million unemployed) could be expanded by drawing upon 5 million housewives, young people, handicapped and elderly persons. This reserve is smaller than it was in 1941, apart from the 8 million unemployed available then. One legacy of the depression, with its low birth-rate is that the increase in the working population has not kept pace with that of the whole population; and with more babies and old people to care for, women will not find it so easy to take jobs. Many of those who found they liked working, in the last war, have stayed in their jobs and will not always be able or anxious to move to more essential tasks. Finally, one of the prices of the spread of industrial pensions is that it discourages men - and women - from changing their occupations.

CBS at the Rainbow's End

Unless the Federal Communications Commission changes the mind it has had such difficulty in making up, the Columbia Broadcasting System will soon be dipping into the pot of gold at the end of the television rainbow. CBS's two rivals in colour television, who so far cannot meet the FCC's standards, had hoped for approval because of their 'compatibility': they use the 525-line picture of American monochrome television, while CBS's process has 405 lines. Owners of existing sets would need adapters to receive CBS programmes in black and white as well as converters to colour them.

The Commission decided, to most people's surprise, that the best possible colour in the future was more important than compatibility in the present. It tried to safeguard purchasers of new sets from obsolescence by asking manufacturers to concentrate on sets that would reproduce both types of picture, even if only in black and white. But for the time being the industry is far more interested in finding enough materials, labour and components to satisfy the present demand than in experimenting with new models. It does not look as if royalties on colour patents will be showing up in black and white on the profit side of CBS's accounts for some years yet.

THE WORLD OVERSEAS

Australia's Emergency (2)

(From Our Melbourne Correspondent)

In the main, Australia is following a pattern of economic development similar to that of the United States over the last 100 years. From an economy based predominantly on rural production, Australia has become one of the most highly industrialised countries in the world, measured by the proportion of total workers employed in factories. Further development can be achieved only with the assistance of a large increase in the working population coupled with a large flow of imports of capital goods and essential raw materials from overseas. The impact on the economy of a large number of new settlers, brought in under a vigorous immigration programme, initially causes certain strains and stresses; but these should ease as the increased labour force, working new equipment, becomes productive and is able to make a net contribution to the nation's wealth. An Australia which is strong industrially is also strong from the point of view of defence; and for this reason a deterioration in the international situation could cause the acceleration of certain aspects of the development programme and the re-casting of others.

The overall plans for development, which are being co-ordinated by the new Ministry of National Development, envisage a great expansion of agriculture, a stepping up of hydro-electric power capacity, the rehabilitation and modernising of the railways, the expansion of production of black coal and with it the output of steel, the development of non-ferrous metals mining and a general expansion of manufacturing capacity of essential industries. The actual carrying out of the development work will be in the hands of the States as a general rule; but in the case of the great Snowy River hydro-electric scheme, involving the construction of 16 power stations with an installed capacity of 2,960,000 k.w. at a cost of £125 million, the work is being done by a Commonwealth authority.

Strength and Strategy

The incalculably vital strategic position which Australia holds makes it of more than passing interest to Britain and the United States to see the Commonwealth an efficient and self-sufficient economic unit. By reason of its particular geographical position, a highly industrialised Australia with a population of 11 million would possess a strategic importance far greater than the actual number of people living on the Continent would indicate. The experience of the last war showed that Australia, with a relatively small population of 7½ million, was not only able to supply the Allies with large quantities of food and raw materials, but was also able to arm and equip its own forces and supply in addition other armies with much of their war material.

Australians know full well that they cannot expect to hold indefinitely a vast undeveloped land mass of 3 million square miles - the area of the Continental United States populated by a mere 8 million, while there are millions of land-hungry people to the north. They know that they can only justify their holding of so large a domain if they themselves take active steps to exploit and develop its natural resources.

Sensitive Economy

Although Australia is no longer predominantly a primary producing country, the economy is exceedingly sensitive to fluctuations in the volume of the export income. High export prices, such as have been enjoyed since the end of the war, have had the effect of setting in train a process of monetary inflation which today is threatening the stability of the economy.

The official index ('C' series) of retail prices has risen by 74.3 per cent above the average of the three pre-war years. This means that the purchasing power of the Australian pound is about 11/6 compared with 1939. At the same time, the nominal wage rates of males have risen by 92.7 per cent, resulting in an increase in the 'real' male adult wage of 14.6 per cent. The retail price index shows no sign of slackening in its upward trend of about 10 per cent per annum while money incomes have been rising much more rapidly than the supply of goods. The volume of money has increased by £A620 million, or 42 per cent, since the end of the war.

These inflationary trends are likely to be stimulated in the current year by increased prices for wool which could well swell the nation's wool cheque to £A400 million. This is why the buoyant opening of the season's wool sales, although causing jubilation among wool-growers, has led to serious misgivings about its beneficial effect on the community as a whole. The inflationary effect of the steep rise in export income, without a corresponding increase in imports, is generally realised in Australia; and for this reason Professor Sir Douglas Copland's suggestion for a 33 1/3 per cent export levy on the proceeds of wool, to insulate the economy temporarily from the inflationary effect of high prices, has found

much support. The secondary inflation that would develop from an increase in wool exports of £100 million would be considerable.

It is clear that any serious aggravation of the present state of inflation would have a very deleterious effect on the success of development schemes. As the Bank of New South Wales recently observed: 'A large volume of immigrants can be absorbed without trouble only if they are accompanied by a high rate of new investment.' Sufficient experience has not yet been gained to determine, however, if new capital can be accumulated either from imports, or by increasing production of capital goods in Australia at the expense of other manufactures, and on a scale to meet development demands without worsening inflation.

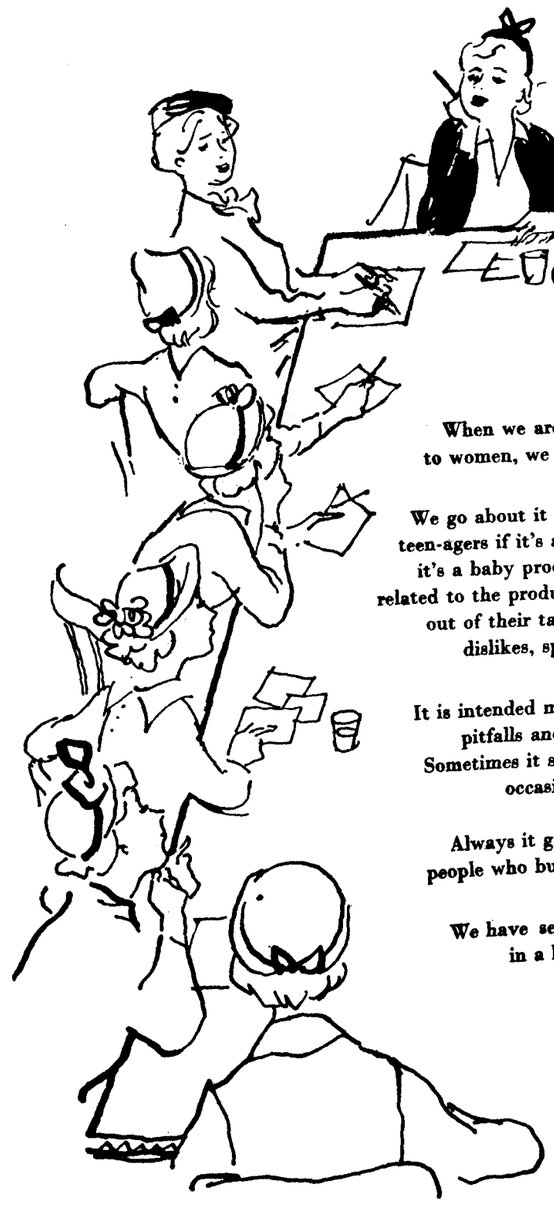
Frontier Mischief

By a Correspondent

Behind the iron curtain consistency in politics is regarded as a bourgeois virtue. So there must not be too much surprise at the fact that the Fatherland Front Government in Bulgaria is posing as champion of the rights of its Turkish minority, at the very time that its disregard for the individual liberties of Bulgarians - guaranteed by the peace treaty - is on the agenda of the United Nations General Assembly. Here is a useful piece of minor mischief to be done, which fits well into the Cominform policy of making trouble all round the Soviet periphery.

The minority in question, descendants of colonists during the long years of Ottoman rule, number about half a million out of a total Bulgarian population of just over 6 million. Almost all are peasants, living in separate communities in the eastern and south-eastern districts, maintaining their traditions, their language and their Islamic religion. In August Mr Chervenkov's government suddenly announced that 250,000 of these people wished to emigrate to Turkey. In an offensively worded Note it demanded that the Turkish Government should accept them within three months. It invoked the agreement between the two countries of 1925, which guaranteed the principle of voluntary emigration, and charged the Turks with deliberate delay in granting entry visas and with imposing political conditions on intending emigrants. To forestall the obvious retort the Bulgarian government explained that it was not ill-treatment which made the minority wish to leave but the deceitful promises of better living conditions held out by Turkish propaganda. Having sown the seeds of discontent, Turkey must now gather a bumper harvest of immigrants.

The Turkish Government was embarrassed. Opinion in the country is willing enough to welcome the immigrants but, as the Turkish reply to the Bulgarian Note pointed out, the time limit imposed is quite unpractical. The mass exodus proposed is far removed from any previous rate of emigration. The impact of such numbers on the Turkish economy would in any case be considerable; but the emigrants are being prevented from taking with them more than their personal belongings and become a charge on the state immediately on arrival - all of which is contrary to the terms of the 1925 convention. Moreover, there can be no guarantee that there may not be among the quarter of a million emigrants some whose object is to create mischief; so Turkey has reserved the right to refuse entry to those it considers undesirable. A Turkish mission is to go to Bulgaria to discuss the problem. If negotiations fail Turkey is likely to raise the matter with the United Nations.



A Winter Exodus

It is very unlikely that this sudden urge to migrate is wholly spontaneous and voluntary. In spite of lavish Bulgarian protestations about the excellent treatment of the Turkish minority, there has been evidence of confiscation of property, arrests and other actions designed to make them think it well to leave the country. The motive of Bulgarian action may be no more than revenge for the slights which the government fancies it has received at Turkish hands; for relations between the two countries have been frigid for some time and the Fatherland Front government has always resented the welcome given by Turkey to political refugees. It is also in line with Cominform policy. From 1945 to 1948 the rate of emigration of the Turkish minority, which was 11-12,000 a year before the war, dropped to a thin trickle of 500 a year. The figure then rose suddenly to 25,000 and has since increased. These dates in Bulgaria, and other Cominform countries, mark the end of a stage in Communist policy; no longer are all and sundry invited aboard the 'ship of progress'. As recent purges inside the Communist parties and increased attacks on any remaining Social Democrats have shown, the decks are being cleared for action. There is no room now for the queasy passenger. The language, religion and peasant life of the Turkish minority in Bulgaria are formidable conservative obstacles to Communism. The Chervenkov government is unlikely to have overcome them all, and Bulgaria has no deserted hinterland in which to dump a dissident minority on the Soviet model. The danger of disloyalty among a population close to its eastern frontiers may best be removed by this drastic expulsion.

The Bulgarian action may also be designed to undermine the growing economic and military strength of the western powers' most important ally in the Near East. From the Cominform point of view, the arrival of a quarter of a million destitute and dissatisfied peasants in Turkey in the depths of winter would be a useful piece of minor mischief, while the possibility of smuggling in a few hundred agents doubtless heightens the value of the proceedings.

women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it *before* we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product ; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.

Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

We have set down more about ourselves and our services in a booklet entitled "Choosing An Advertising Agency." Let us send you a copy.

ALUMINIUM

ADORNED with rubies and sapphires from the Mogôk mines of Burma this Shan woman prepares her food. These jewels and the common clay of her ornate bowl are but a few of the many minerals containing aluminium. Though first isolated in 1826, it was not until 1886 that its production became commercially practicable. Most of the world's aluminium is now produced by dissolving an ore named bauxite in molten cryolite, a mineral obtained from Greenland, and passing an electric current through the solution. In combination with other metals such as magnesium or copper, aluminium forms light alloys, some of which, though only about one third of the weight of steel, are just as strong and do not rust. The famous statue of Eros in Piccadilly Circus, one of the earliest large aluminium castings, shows no signs of corrosion after 40 years' exposure to London smoke.

One of the largest factories producing wrought aluminium and its alloys in the form of sheet, strip and extrusions is the I.C.I. works at Waunarlwydd in South Wales. These go to help in the production of all manner of finished articles from saucepans to aeroplanes, scaffolding poles to ashtrays, motor car parts to egg cups.

ICI

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

The Chartered Bank of India, Australia and China

A sensible policy for process steam - No. 20

Flash Steam on the agenda

BY SPIRAX

All steam traps discharge condensate from a higher pressure to a lower pressure. The drop in pressure causes the water immediately to reduce its temperature and it does this by releasing excess heat in the form of steam.

This 'flash steam' is precisely the same as live steam from the boilers or any other source. It has the full quota of heat, ready for use in process heating equipment operating at the lower pressures.

Putting the flash steam to work presents no difficulty. The flash steam is collected in a simple apparatus known as a Flash Vessel and from there is piped to the process heating equipment in which the steam is to be used. The residue of condensate, still hot, continues from the Flash Vessel back to the boilers.

Opportunities for flash steam recovery offer themselves wherever there are both high-pressure and low-pressure steam-heated plant under the same roof.

The flash steam system is a sensible and simple means of economy that pays a permanent dividend on a quite small outlay for labour and material.

THE BUSINESS WORLD

Canadian Dollar Freed

Last week-end the Canadian dollar was freed from its fixed rate of $Can 1.10 = $US 1 and left to find equilibrium with the United States dollar. This decision was justified by the Canadian Minister of Finance on the ground that at its previous rate, which showed a 9 per cent discount on the United States dollar, the Canadian dollar was attracting a disquieting volume of hot money that was endangering the stability of the Canadian economy. It has been officially estimated in Canada that more than $300 million had been sent across the 49th parallel during the last three months by American speculators anticipating an upward valuation of the Canadian dollar. Mr Abbott, the Minister of Finance, revealed that Canada's reserves in gold and United States dollars reached an all-time record of $1,789 million on September 30th, having increased by $534 million since June. During September alone there was an increase of no less than $285 million.

The rapidity of this increase in the reserves was a clear symptom of the undesirable inflow of short-term capital into Canada. It is true that Canada's balance of payments with the United States has recently improved considerably, but the current account is still in deficit. In the first eight months of this year Canada incurred a deficit of $110 million in visible trade with the United States compared with a deficit of $402 million in the comparable period last year. In these uncertain circumstances, the Canadian authorities decided that the most appropriate course was to allow the Canadian dollar to seek its own level, though the Minister of Finance hoped that ultimately the rate would return to parity with the United States dollar; he hoped indeed that even in the free market parity would soon be established and that fluctuations might thenceforth be limited to 1 per cent on either side of it.

Canada's decision must be read in the light of the disillusionment that followed the restoration of parity with the United States dollar in 1946. That attempt to escape from the consequences of inflation in the United States proved singularly unsuccessful - largely because the expected inflation hardly got going. Once again the menace of American inflation has raised its head but the Canadian authorities, having learned their lesson, decided to preserve their freedom of action and leave room for retreat if necessary, without having to admit defeat through yet another change in the official parity. Canada's dash for freedom in the exchange market is to be accompanied by a comparable freeing of imports from the United States in the new year. Meanwhile the Canadian dollar, after two days of free dealings, has been changing hands at $2.95½ to the £ and $Can. 1.05 to the US dollar.

Free Rates and the Fund

The decision to let the Canadian dollar float free was duly communicated to the International Monetary Fund, but at the last possible moment. The Fund has issued a communique which recognises 'the exigencies of the situation which have led Canada to the proposed plan' and takes note 'of the intention of the Canadian Government to re-establish an effective par value as soon as circumstances warrant'. Grudging approval can be read between every line of this frigid statement, and its tone can hardly cause surprise. Canada's action violently contradicts the spirit of the IMF agreement and represents one more breach in the idealistic international monetary structure for which plans were laid at Bretton Woods.

In present circumstances, however, it is a moot question whether the objectives of stability and equilibrium to which the Fund was dedicated are best served by a system of rigid official parities or by a regime of free market rates whose fluctuations are cushioned, as they were in the 'thirties, by stabilisation funds and exchange equalisation accounts. Rigid parities have often presented one-way options for speculative operations and have encouraged rather than deterred movements of fugitive and speculative capital. Given the rigidities of the present day world, where full employment, social security and encouragement for agriculture are accorded the highest priority, perhaps the only equilibrating and adjustable factor is now provided by exchange rates; if so, they will have to be given an even wider measure of elasticity than was contemplated under the Bretton Woods agreements.

Apart from the merits of Canada's action, it would however be unwise to generalise too readily from it and from the earlier precedent by France. An exchange policy fitting to these countries and to their essentially domestic currencies would not necessarily serve a currency such as sterling which is used to transact half the trade of the world. Mr. Gaitskell's visit to Washington and Ottawa next week will no doubt provide an opportunity for the discussion of these matters and their impact upon the pound.

Sterling Rumours and Rates

The freeing of the Canadian dollar rate has intensified the rumours of a possible revaluation of sterling in terms of gold and the dollar. It is significant that last Monday one of the immediate reactions of the

Stock Exchange to the Canadian decision was to mark down the prices of gold shares. Yet the Canadian action can by no stretch of imagination be regarded as offering a precedent for British policy. The freeing of the Canadian exchange, accompanied by a freeing of import licensing, is a symptom of the kind of liberal economic policy that seems least to commend itself to the authorities in Britain. Canada has led from impressive strength. Its present gold and dollar reserves, converted in terms of population, production and trade would be equivalent to a British holding of about $7¼ billion - still a long way from the figure of $2756 million at which the total reserves of the sterling area now stand.

It is true that certain rates for sterling continue to show signs of strength and confidence. Forward sterling is quoted in New York at 1¼ cents premium for three months. American importers with sterling commitments to meet are covering their exchange forward - in significant contrast to their behaviour before devaluation last year when they left their sterling positions wholly uncovered and postponed paying their debts to the last possible moment. As a result of these operations, a certain volume of short-term capital is in fact coming into London since the American banks that sell sterling forward at this attractive premium cover themselves by spot purchases and employ their funds in London as best they can. Other rates for sterling have, however, recently shown a somewhat more hesitant trend. The rate for security sterling, which was struck near the top of the prevailing range of quotations when the switching concessions were made, and thus touched $1.95, has since declined slightly to $1.90. Similarly the rate for transferable sterling which touched $2.69 in July of this year has since come down to around $2.59. This market, however, is deceptively narrow now that transferable sterling is limited to the finance of direct commercial transactions between two countries in the transferable group and can no longer be used in third country transactions. Confidence in sterling has been growing but the evidence of these free rates, all showing substantial discounts, cannot be ignored.

Rising Reserves

The ascending scale of recovery of the British gold and dollar reserves is not being maintained, though little fault is otherwise to be found with the performance put up in the third quarter of this year. In this period $334 million came into the reserve, compared with the previous quarter's increase of $438 million and $296 million in the first quarter of the year. The latest addition brings the reserve up to $2,756 million, which is more than double the low point of $1,340 million touched just before devaluation. As in the previous quarter, the latest addition to the reserve is in part the result of a genuinely earned dollar surplus in the trade of the sterling area. That surplus amounted last quarter to $187 million. The balance of the addition to the reserve was provided by ECA refunds of $147 million. This last figure compares with refunds of $240 million in the second quarter. The tapering off in the rising curve of the reserve is therefore more than accounted for by the reduction in Marshall Aid receipts.

The balance of payments figures which will be published in the near future are likely to reveal that Britain continues to operate an over-all surplus and that consequently no anxiety need be felt about the fact that a large part of the dollar earning should have been done by other sterling countries. It must not be forgotten that a great deal of the additional profits made by sale of commodities such as rubber did not accrue to the country of origin but to Britain itself, since the companies concerned are for the most part registered in Britain, and the profits earned on these commodity operations are therefore directly canalised to British accounts. It follows that the invisible earnings accruing to Britain should show a remarkable increase.

Coal Exports Flagging

Coal is not immune from the inflationary forces that have influenced the demand for other commodities in recent months; the buyer's market in Europe, so often heralded, has faded once more into the distance. The National Coal Board no longer has much cause to be worried about the willingness of overseas customers to pay high prices, but its worries about supplies are increasing. The purpose of Lord Hyndley's visit to Denmark and Sweden last week was to smooth over difficulties that may arise for the Scandinavian buyers of British coal if the board fails to export as much in 1950 as it had hoped. In these discussions prices did not play the important part that they would have done only a few months ago.

No doubt the board will do its best to carry out its export programme, but a few figures show how slender are its chances of full success. Saleable output (including opencast output) was 152 million tons in the first 37 weeks of this year, an improvement of 1,875,000 tons over the first 37 weeks of 1949. But a comparison of British inland consumption in the same periods shows an increase of 4,000,000 tons. How, then, can the board carry out the intended export programme of 22 million tons - 3,000,000 tons more than last year? In the first half of 1950 the board kept to its export programme, but distributed stocks were allowed to run down. Now, the Government having sounded the alarm, stocks are being rebuilt for the winter and exports have fallen off. Thus, at the end of June the export performance for the six months showed an increase of 1,375,000 tons over the first six months of 1949; but by mid-September the lead (measured over 37 weeks) had fallen to 390,000 tons. A spurt will be needed if the board is to equal in 1950 - let alone to exceed - the export performance of 1949. But a spurt in exports will require a spurt in production, and it is not yet possible to guess how far the production drive will succeed.

European Coal Stringency

Not only British but also European coal markets have markedly changed in the last few months. In the first half of the year, the European coal trade seemed to be approaching that "equilibrium" of supply and demand to which the Coal Committee at Geneva has so long aspired. Germany, Britain and Poland were the chief suppliers; France and Belgium added a useful quota; imports from the United States had almost disappeared. In the summer such marginal suppliers as France began to find it economic to cut their production, and Holland (a little slow, perhaps, to read the signs) felt strong enough in July to enforce import restrictions on British coal because of its high cost.

This may have been the swan song of consumer resistance for some time to come. Poland has lately tended to reduce its coal exports to western Europe, and has shown no interest in attempts to attract extra supplies with tentative offers of higher prices. Ruhr output, which was running at more than 360,000 tons a day in March, failed to maintain the improvement and last month was in the neighbourhood of 355,000 tons a day. But German industrial consumption continues to rise, and doubts have been expressed whether western Germany will be able fully to meet its export commitments for the fourth quarter.

The immediate effect is that France can once more operate its marginal mines on full-time, and Belgium can get rid of the surplus stocks that, a few months ago, were unsaleable on considerations of price and quality. There has, as yet, been no sign of any significant resumption of coal shipments from the United States, but if the present boom in the heavy industries of western Europe goes on such a possibility will not be remote. A major relaxation in the international tension might once more change the outlook for coal as for other commodities. But for the moment at least the seller is again firmly on top, and only a few faint cries in the wilderness recall the clamour against dual pricing.

Rubber Unsettled

Rubber has been more sensitive than most commodities during the three months of fighting in Korea. Before hostilities started on June 25th the spot price in London was 1s.11d. a lb. On September 25th it touched 4s.2d., and then with the dramatic success of the United Nations forces, the price fell by September 29th to 3s.7d. a lb from which it recovered slightly to 3s.8½d. last Tuesday. The reaction in prices followed the stopping of stockpiling purchases by the American authorities. The improvement in the political situation has released the United States Munitions Board from the compulsion of buying without reserve and it can now pay more attention to market conditions. Industrial consumers also are less eager to accumulate large stocks than they were two months ago. A similar reaction in prices has occurred in the tin market, though the movements have been less sharp.

Demand for natural rubber is still at a high level. Consumption in the United States in August was 63,741 tons and in September more than 60,000 tons, according to provisional estimates. The average monthly consumption in the first half of the year was almost exactly 60,000 tons. When the increased supplies of synthetic rubber come on to the market, natural rubber may find itself in some difficulty to compete at 45 cents a lb with general purpose synthetic selling at 18½ cents. But rearmament and stockpiling will still provide powerful support, and no serious setback in prices is likely while they continue.

Copper Shortage

At least there is now uniformity of a sort in the New York copper market since Kennecott Corporation last week raised its selling price from 22½ cents to 24½ cents a lb. But although all American producers are now quoting a single price for copper, buyers are still having to pay anything up to 30 cents a lb for current supplies and the present tightness in the market seems likely to continue. Indeed, a review of world copper supplies by the Economic Co-operation Administration suggests that the potential copper shortage this year may be as high as 180,000 metric tons. World production in the first seven months of the year has been at an annual rate of 2,385,000 metric tons while consumption has been running at 2,305,000 tons. Some 260,000 tons are also needed for American stockpiling and defence programmes, and it is this addition to commercial demand that threatens to produce the deficit. Stockpiling is no longer a device for absorbing surpluses; it is now a prime cause of shortage of visible supplies.

Import requirements of the United States for copper are put at 450,000 tons - 260,000 tons for stockpiling and defence and 190,000 tons for civilian purposes. As the world's total exportable surpluses amount to little over 500,000 tons, the margin between supplies and requirements is very narrow. Imports of copper into the United States have so far been running at an annual rate of 350,000 tons; unless civilian consumption is restricted (by a further rise in price or by licensing), the American Government's buying programme may have to go short.

Half Year Surplus

In the first six months of this financial year ordinary revenue was £4,700,000 higher and ordinary expenditure £83 million lower than in the first six months of 1949-50; for the full year the Budget had contemplated a fall of £26 million in revenue and an increase of £80 million in expenditure (this

latter figure being struck before allowing for additional defence outlays). It would be dangerous to read too much into these figures and into the unexpected £70 million "above-the-line" surplus which they show. The decline in ordinary expenditure, almost entirely concentrated on the supply services, is surprising but it arises from an accident of the calendar and not from any change in Government policy. The small increase in ordinary revenue has resulted from higher customs receipts (which garner the chief harvest of the increased petrol tax) and are up by £40 million. The falls in income-tax and sales of surplus stores accord closely with the estimate but receipts from profits tax and EPT have already dropped by nearly £25½ million, only £1,500,000 less than the fall anticipated for the full year.

Net 'below-the-line' expenditure in the first six months of 1950-51 has amounted to £220 million compared with £294 million in the first half of 1949-50; for the full year the budget contemplated a decline of only £37 million - largely because a special non-recurring payment of £62½ million to public utilities for war damage was swept into the returns a year ago. Perhaps the most satisfactory feature of the latest return is the stability of loans to local authorities, at just under £133 million. They were expected to be £7,000,000 higher for the full year but at the end of the first quarter they were straining alarmingly at the leash - no less than £19 million above their total for the first quarter of 1949-50. But in this item too the six months' figures are not necessarily a reliable indicator of the year's eventual out-turn.

Earnings and Wage Rates

Average earnings of men and women in British industry are higher today than ever before in spite of the relative stagnation of wage rates. The half-yearly survey of earnings published in the Ministry of Labour Gazette shows that men's average earnings at the end of April, 1950, were 145s. 9d. a week and women's 80s. 6d. Many occupations - among them agriculture, coal mining, railways, dock labour, shipping, distributive trades, catering trades and domestic service - are not included in the survey; separate figures for coal mining and dock labour are given - for coal miners 186s. 10d. plus allowances in kind worth 8s. 8d. a week and for dockers 170s. 3d. a week. The average number of hours worked was also higher than it has been since 1946. Men worked an average of 47 hours a week, women 41.9 hours a week, while all workers averaged 45.6 hours a week.

Apart from coal mining and dock labour, the highest earnings were in metal manufacture in which men averaged 166s. 3d. a week for 47.5 hours work, paper and printing (men: 164s. 0d. for 46.7 hours), and vehicles (men: 162s. 7d. for 46 hours). The lowest earnings were in national and local government service in which men (wage-earners) earned 117s. 0d. for 44.9 hours.

Comparative figures for the last three years show that the increase in earnings has been faster than the rise in the retail price index. The index of basic wages, on the other hand, has remained remarkable steady, and has been outdistanced by the retail price index. Thus many industrial workers are meeting the increased cost of living by putting in more overtime and by receiving more incentive bonuses from employers. But those whose pay packets are determined by basic wage rates are becoming increasingly vocal in their demands for increases.

Shorter Notes

The Iron and Steel Corporation was established on Monday in accordance with the Government's announced intention. Mr. A. R. McBain, a retired official of the Ministry of Supply and a part-time member of the Southern Gas Board, has been appointed a part-time member for six months to replace Mr. Maclean, who withdrew.

Preference and ordinary shareholders in Rootes Motors are offered 1,250,000 4s. ordinary shares at 21s. per share. The offer involves one quarter of the Rootes equity which has hitherto been held by the Rootes family.

The index number of industrial production as provisionally estimated by the Central Statistical Office fell from 143 in June to 134 in July. The index for manufacturing industry fell from 150 to 138.

As from October 30th the London Stock Exchange is to remain open for another half hour until 3.30 p.m.

Company Meetings

VITAMINS LIMITED

"Twilight" Health

At the annual general meeting recently, Mr H.C.H. Graves, chairman, said we knew the shareholders would expect a few words about the role of Bemax, the best known vitamin, mineral and protein food in the world. They heard many complaints all round of a feeling of frustration, of fatigue, of being "under par". They still heard, even in these days, of listless children and of infants who did not grow as rapidly as they should. The National Health Service would treat them and us when we were ill - but what about when we were not really ill - just "below par"? It was the twilight stage, the "betwixt and between" period which most dramatically benefited from the steady use of Bemax.

How different many of the frustrated and listless would be on Bemax. Some recipes for good health were a little unpleasant and not easy of acceptance, but Bemax with milk or fruit juice, in soup or sprinkled on food, was so delicious and added such zest to life that it was incredible that anyone who had the opportunity should fail to give it a trial; still less that anyone could deny their children the benefit of it. If it were expensive there might be some excuse, but one packet of cigarettes less a month (yes, a month, not a week) would pay for all the Bemax one needed.

Although most thought of Bemax as a vitamin food, its content of first-class protein was as high as that of best quality beef. There was no need to be short of protein when you could buy Bemax - the normal intake of one ounce giving the protein equivalent of 3 ounces of bacon daily.

The report and accounts were adopted.

KEPONG (MALAY) RUBBER ESTATES

Increased Demand For Latex

The forty-fifth annual general meeting of this company was held on September 20th in London, Mr T. J. Cumming (the chairman) presiding.

The following is an extract from his circulated address.

It will be seen that estate expenditure for 1949 was £52,934 greater than in the previous year, and that receipts from sale of crop were up by £62,075 on an output of 14,282,000 lbs. compared with the 1948 figure of 13,072,000 lbs.

It is proposed to pay a dividend of 4 per cent., less income tax, making a total of 7 per cent. for the year, to transfer to rehabilitation account £50,000 and to provision for replanting £30,000, leaving £59,000 to be carried forward.

There has been a considerable change over from sheet manufacture to latex production and additional plant and machinery have been installed to meet the increasing demand for our latex. We have, as I informed you last year, established definite trade names for our latex and we are doing everything possible to improve the standard of our products.

The two port storage installations at Singapore and at Hull, in which we are financially interested, are being kept busy and are vitally necessary to enable us to supply the ever-increasing demand for latex in bulk.

The present high prices for rubber latex do, of course, enable us to make substantial profits, but taking the long view we believe that lower prices which would give us a good profit would be advantageous to the industry. The chairman announced that the board would give early consideration to the payment of an interim dividend.

The report was adopted.

SCRIBBANS-KEMP, LIMITED

Considerable Development

The 23rd annual general meeting of this company was held on 21st September in London, Mr. H. Oliver-King (chairman and managing director) presiding.

The following are extracts from his circulated statement:-

The year has been a particularly difficult one, in that the raw materials available for manufacture have been considerably limited, and also there has been a constant rise in expenses.

In spite of these difficulties it is satisfactory to be able to report to you that the trading profits of the group are slightly ahead of last year at £1,597,492, though, due to the expenses aforementioned, the net profit is slightly down.

During the year we have successfully established companies in South Africa, Canada and U.S.A.

Your company have acquired on satisfactory terms the whole of the share capital of the old-established biscuit manufacturing company of Wyllie Barr and Ross, Limited, of Glasgow, and I am able to report that trading since its acquisition has been satisfactory.

During the year there has been some considerable development on the retail side, chiefly with Meesons, Limited, the number of retail sweet shops having been more than doubled during the last five years.

Total reserves amount to £4,063,208, and current assets at £3,087,725 show a balance of £2,121,365 over the current liabilities and provisions.

Since the end of the financial year, there has been some slight recession of trade and evidence that the spending power of the public is somewhat restricted which may show itself in next year's accounts.

The report was adopted.

HACKBRIDGE CABLE HOLDINGS

Continued Progress

The annual general meeting of this company was held on September 21st in London, Mr. Claude I. Steen, chairman of the company, presiding.

The following is an extract from the chairman's circulated statement:-

It gives me much pleasure to be able to present satisfactory accounts and to report continued progress in your group's development.

The turnover for the year under review showed an encouraging increase in all departments. Due to factors outside our control, costs have continued to rise with a consequent narrowing of our profit margin.

The consolidated figures of the company and its subsidiaries disclose a trading profit for the twelve months of £274,437, and this figure is after providing £34,069 for depreciation. This is an increase of £14,539 over the profit for the preceding year.

Your directors are pleased to recommend a final dividend of 12½ per cent, making 20 per cent in all for the year and leaving a carry-forward to the next financial year of £3,447.

It is extremely difficult to express any reliable view as to the future. In common with manufacturers generally, our industry is passing through a period of difficult trading conditions. Turnover for the first four months of the current year has been satisfactory, although it is lower than twelve months ago. Shareholders may rest assured that the group continued to be conducted as economically as is possible, compatible with efficiency, and I have no reason to doubt that the current year's results will again show a satisfactory return on the capital invested.

The report was adopted.

INTERNATIONAL DIATOMITE COMPANY, LIMITED

Continued Progress

The fifteenth annual general meeting of International Diatomite Company Ltd., was held on October 4, 1950, at Winchester House, London, E.C.2, the Chairman, Mr. E.W.D. Tennant, O.B.E. presiding.

The Secretary (Mr. Jesse Wood) read the notice convening the meeting, and the report of the auditors was read by Mr. H.J. Binder.

The following is the chairman's statement which was circulated with the accounts for the year ended June 30, 1950:-

In my Statements circulated to Shareholders with copies of each of the last three Annual Accounts, I was able to refer to the steadily improving position of the Company, and I am pleased once again to be able to report continued progress. During the twelve months under review your operating subsidiary Company, Moler Products, Limited, has again achieved improved results. That Company's turnover exceeded that of the previous year by 12½%, with production maintained at the maximum possible level.

In my Statement last year I referred to the proposed erection of a new section of Plant. This new Plant has been completed and brought into operation so that this coming year should again show an increase in output.

Good Order Book

Orders continue to come in freely, and with a good Order Book in hand, subject to the international situation, I am able to forecast another satisfactory year. In this regard, an encouraging start has already been made.

Our Danish sub-sidiary Company, a/s Fur Moler Kompagni, has made a profit and the losses made while the Company was in enemy hands have been now wiped out. Fur Moler has, during last year, supplied all the Danish Moler which Moler Products Limited required for its own consumption. The Quarries are in good condition, and the Company is in good heart.

In last year's statement, I explained in some detail that, due to previous writing off of Capital, the actual Capital used in your Companies is much larger than the figures shown in the Balance Sheet. The profit achieved and the proposed dividend, while they may be considered to be good, are not on an unreasonably high scale when the Capital actually employed in the business is taken into account.

I feel sure that the Shareholders will join the Directors in expressing their sincere appreciation of the satisfactory results to your Managing Director, Mr. Robert Wood, and to all the officials and employees of the Company.

The report and accounts were unanimously adopted, and a final dividend of 15 per cent., making 25 per cent. for the year, was approved.

The retiring director, Mr. E.W.D. Tennant, O.B.E. was re-elected. Messrs. Binder, Hamlyn & Co. continue in office as auditors.

MYTON, LIMITED

(Building And Civil Engineering Contractors)

Good Turnover Prospects

The fifteenth ordinary general meeting of Myton, Limited was held on September 20th in London, Mr A. Ridley Martin, O.B.E. (the chairman), presiding.

The following is an extract from his statement circulated with the report and accounts for the year 1949:-

In my address last year I stated that your directors and the management had continued to subject the whole of the organisation to the closest examination. This work has continued and our overhead expenses reduced wherever possible. I advised you last year that in November, 1948, we formed a new wholly owned subsidiary company called Industrial Joinery (Kingston), Limited. In the summer of 1949, in order to indicate the wider scope of its activities, the name of this company was changed to Kingston (Architectural Craftsmen), Limited.

During the period under review it was apparent to your board that further orders on any large scale for the factory built house, for the manufacture of which Minster Works have been equipped, were unlikely to be forthcoming. We therefore decided, in view of the considerable and favourable experience gained in the production of joinery for the requirements of this house, to expand this section and enter the market for building joinery and allied products.

Success Of New Venture

This venture is meeting with some success, and you now have a factory equipped and able to produce joinery of all types in large quantities. That this business is capable of even further expansion is proved by the fact that this factory has received an order for the production of 1,000 timber houses for Australia. Furthermore your company is securing orders for school furniture and equipment and for domestic furniture. Our other subsidiary company, Kingston Concrete Products, Limited, continues to operate successfully.

Myton (Scotland), Limited, took over the whole of the operations and management of our Scottish factory as from October 1, 1949, and has developed so satisfactorily in 1950 that your directors considered the best interests of the group would be served by transferring to the company the whole of the area building department as well. This transfer has recently taken place, so that the whole of our interests in Scotland are now embodied in this Scottish subsidiary. The company is at present engaged in the production and erection of over 400 non-traditional houses in Scotland, and is also carrying out contracts for traditional houses and school buildings which will bring a considerable expansion of turnover in 1950.

Our building and civil engineering business in England, carried out by your parent company Myton Limited, has been adversely affected by the small number of contracts obtained in a highly competitive market, and following on the completion of our contracts for factory built houses so reduced the turnover as to make it difficult to maintain such an extensive building organisation. However, we have recently secured several large building contracts, including two technical colleges at Birmingham and Billingham.

The report was adopted.

Notices

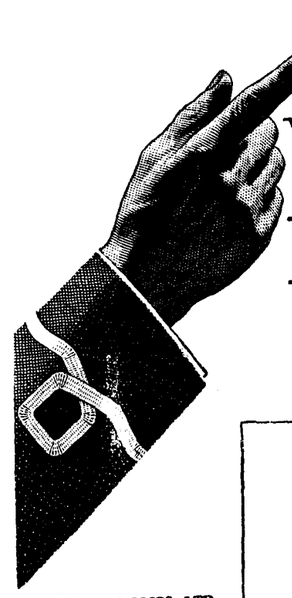
Chartered Accountants, under 40, wishing to widen their experience while engaged in lucrative employment, are invited to submit applications for a progressive appointment with a well-known industrial organisation. Only those who have held responsible positions in industry will be considered. Knowledge of standard costing, budgetary control and modern accountancy practice essential. Post involves considerable responsibility and carries correspondingly high salary. Fullest particulars, in strictest confidence, to Box 514.

ADVERTISE ! ADVERTISE ! ADVERTISE ! These words conclude a recent letter to 'The Times' from Mr. George Bernard Shaw. Although Mr. Shaw was advocating national propaganda, his sage advice applies with equal force to commerce. Sound and sustained advertising - such as is produced by Samson Clarks - is the gateway to growth and greater prosperity - Samson Clark & Co., Ltd., 57-61, Mortimer Street, London, W.1. Museum 5050.

Gold Cup Jaffajuce

Orange • Orange and Pineapple • Orange • Grapefruit • Lemon • Lime

I'd rather have a Jaffajuce



Jaffajuce Orange contains over 80% natural Orange juice (which is more than three times as much as the standard laid down by the Ministry of Food)—plus, of course, pure sugar.

GUARANTEE. Jaffajuce has been awarded the Certificate of the Royal Institute of Public Health and Hygiene. If for any reason you are not satisfied, your grocer is authorized to replace your bottle immediately.

Breakfast Orange for early morning

Smoke Wavy Navy

Pure Navy Cut of Pre-War quality

For the busy Executive

Executive's Loudspeaking Master Station

Desk Telephone

Standard introduce a new Loudspeaking Interphone incorporating modern design with the best engineering practice.

Reliable communication between all Departments at the touch of a key.

Systems available for one or two Loudspeaking Master Stations and up to 15 desk or wall pattern Sub-Stations.

FOR THE EXECUTIVE

Priority if a Sub-Station is engaged.
Conference with two or more Sub-Stations.
Freedom of movement during conversation.
Receiver as alternative to Loudspeaker operation.
Clear speech of adequate volume.

Sub-Stations incorporate red lamps to indicate a call from the Executive.

Available on rental or by purchase.

Specialists for nearly half a century in telecommunication systems for private and public use.

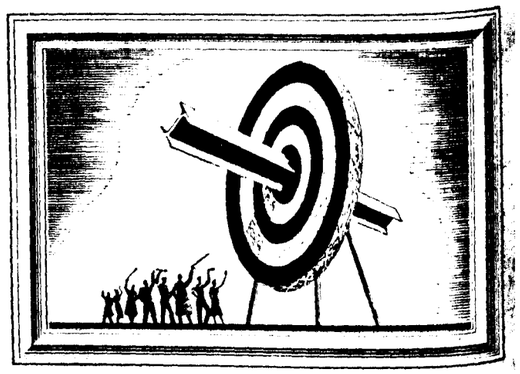
British Industry uses Mouldings

These warp beam flanges, used in textile production, are moulded in a special shock resistant grade of BAKELITE material.



—in BAKELITE Material to be sure

Textile Manufacturers know how to profit by the serviceable qualities of BAKELITE Plastics—do you? Take these strong warp beam flanges, for example; they can be dropped on a concrete floor without being damaged. Intricate shapes present no difficulty, either, with mouldings. Simple or complex, they can be turned out to fine limits quicker and cheaper. BAKELITE materials can satisfy industry's most exacting demands—for production components or finished products. Why not go into the details with the BAKELITE Technical Staff?

HOW

does the steel industry do it?

No greater demands have been made on any industry than the nation has made on the steel industry. The response has been magnificent.

1. Output has achieved an all-time record.
2. Exports of goods made from steel are now double pre-war.
3. Steel prices are among the lowest in the world.

What produced these results?

The team spirit in the industry, the stimulus of competitive enterprise, and the sense of public responsibility on the part of both workers and management.

The steel industry has been unique in combining Government supervision with the great advantages of free enterprise working in the best interests of Britain.

The Economics of Margate

The Labour Party has never been strong on economic policy, which should be the product of a dispassionate study of the facts and a clear view of the objective. For all their Plans, the objectives have tended to be contradictory and the motive power sentiment rather than reason. It is true that they have had a great deal of economic good fortune and that the present state of the British economy, to judge by any of the familiar indications, is strong. But the three pillars that manifestly sustain this state of present prosperity are American aid, the phenomenal continuance of a general seller's market in the world as a whole (caused chiefly by American prosperity) and the devaluation of sterling a year ago. The first and second are beyond the control of any British government; and the third, though Labour Ministers now point to it with pride, was forced upon a reluctant Cabinet who would have much preferred to avoid it. For the rest, Labour policy - apart from the irrelevancies of nationalisation - has been content to be negative, trying to prevent any disturbance to the state of things as they are, which most trade unionists find very satisfactory. Tribute should be paid to the political courage with which Sir Stafford Cripps, in his heyday, insisted on the necessity for a large budget surplus; but that also was hardly a positive or constructive policy; it was a holding operation.

Since midsummer, the need for a definite economic policy has become greater than ever. But the particular policy required has somewhat changed in emphasis. The dollar gap is, for the moment (though it may be only for the moment), not the paramount preoccupation; for the first time for many years sterling is a hard currency. But the internal problem needs firmer and more skilful handling than ever. The need for rearmament has obviously greatly increased the pressure and the threat of inflation, never wholly absent. A large increase in expenditure on defence has to be fitted into the national economy just at a time when the world-wide trend towards inflation is more marked than ever. Yet if the threat of inflation is greater, the defences that have just sufficed to hold against it for five years are visibly crumbling. Restraint on wage increases is breaking down; the sharp deterioration in the terms of trade is beginning to have a marked effect upon internal prices; and the psychological tide, in governmental circles hardly less than in the general public, is set strongly against the continuance of physical controls, let alone their reintroduction. The budget surplus is being nibbled away, and there seems to be little will, in Sir Stafford's absence (and perhaps in his presence too) to defend it.

In short, even such logical content as there was in the Government's economic policy seems to be disappearing, and the need is clearer than ever it was for a new turn, for the mobilisation of fresh expedients to preserve the balance of the economy. Unfortunately, the proceedings at Margate have made it quite clear that the Labour Party has no new ideas. Some of the Labour leaders see the dilemma clearly enough; but their reaction appears to be to defy it. Mr Aneurin Bevan was recently described as the Prince Rupert of the party - and certainly his notion of how to deal with an economic problem is to launch an ideological cavalry charge, which always scatters the enemy and usually loses the battle. Even the moderate Mr Morrison can evidently see only the inviting prospect of new ways of taking other people's property away. The policy of the party at this juncture appears to be to insist that everything for the organised wage-earners must be left exactly as it is today, or if altered must be improved; and that if any further resources are needed for the service of the state or for the defence of the nation, they can be squeezed out of profits or abstracted from capital. Perhaps it is a mistake to take too seriously what is said in the charged atmosphere of a party meeting. But unfortunately it is easy to see that there are plenty of real pressures pushing ministers in the same direction. Facing an election, they think they dare not either cut

expenditure or impose taxes that will hurt the 'little man'. They must try to keep wages from rising too fast, and the political price that the inexorable trade unions exact for that is another attack on profits. Members of the Labour Party would be very indignant at the suggestion that they propose to be patriotic at somebody else's expense; but that is what their various promises and declarations are leading them to.

It is political pressures that are pushing the Government to this. But in point of fact it is doubtful whether the result will be good politics. Politicians can rarely remember (and never at party conferences) that their loyal followers are not The People. Indeed, when electoral calculations are in order, his own devoted followers are the one set of people whose views the leader should least consider. The people who will decide the result of the next election are not those who always vote Labour or those who always vote Conservative, but those who might vote either way. It is true that 'the rich' have few votes; but it is also true that the more Labour poses as the champion of one class and the enemy of another, the more votes it will lose. There is only one way in which Labour can do better next time than in February, and that is by inducing several hundred thousand people who then voted Liberal or Conservative to vote Labour. Is that likely to be achieved by talk of social warfare?

But whether it is good politics or bad, the line of talk to be heard at Margate is certainly bad economics. A new impetus is being given to the inflationary spiral. The Labour leaders are unwilling to try to stop it at its source, since this would involve such horrible things as raising interest rates, curbing non-productive capital investment and cutting down expenditure on the social services. They are not even prepared to maintain the existing curbs on wage increases which, ramshackle though they are, have certainly put a brake on the trend in recent years. But they do want to prevent as many of the consequences of inflation as they can. In short, we are moving back to Daltonism and the miseries of suppressed inflation. Not by design, but by default of willingness to explore any of the alternatives, the Labour policy is likely to bring back all the worst features of a war economy, without that redeeming discipline which at least enables the community to put forth its greatest efforts.

Next Step for OEEC

For some time past there have been various hints and suggestions that the Organisation for European Economic Cooperation and its close partners in the Economic Cooperation Administration could think only in terms of economic recovery and were quite unfitted for the new problems of containment and the armed truce. This view must, however, have been very thoroughly scotched by the meeting of the Council of the OEEC which took place in Paris last week. The Council had before it a report prepared by the secretariat of the OEEC which represents the first genuine survey of the impact of present conditions of 'no war - no peace' on the economies of Europe and the first attempt to persuade member governments to face the implications frankly. Some policies, the report recognised, would need to be applied by governments acting individually. First among them would naturally be action to check inflation and one may wonder with what inner reservations Mr Gaitskell read the report's sober reminder that each government must determine by one means or other to offset the new demand created by rearmament:

> The offset may be in consumption or in the level of investment on in other items of government expenditure. It is not necessary that all of these should be cut but it is extremely unlikely that any country can master inflation without a cut in at least one of them.

Other policies, however, depend for their effectiveness on the close cooperation of the member governments. The Council, after studying the report, agreed to use the technical sub-committees of the secretariat to establish what shortages in raw materials were likely to occur both in Europe and in the international market - electricity appears to be Europe's worst deficiency - to take joint action where necessary to control prices and to establish machinery for allocation and, in the case of materials controlled by non-European governments - wool, for instance, or rubber or tin - to use the OEEC as a 'claimant agency' representing Europe's interests as a whole. The Council further recommended that all countries participating in the work of the OEEC should agree to pursue their purchases of scarce materials with 'due regard' to the need of other members of the Organisation.

It is no secret that this recommendation has chiefly the United States in view. In the last six months, massive American buying for the purposes of rearmament and stockpiling has reduced the world's dollar deficit in one year from $3.3 billion to $1.1 billion, but it is in Canada and Latin America and the sterling area that the advantage of the new flow of dollars has been felt. Continental Europe has gained almost nothing from it. Its own dollar gap has hardly fallen at all and the entry of America as a competitive buyer into so many third markets has forced prices up and made it increasingly difficult for the European countries to obtain supplies. Coordination of economic policy in Europe alone is thus insufficient. It is in the whole western area that a common policy for price control, allocation and coordinated stockpiling is urgently needed.

So much the report suggests, so much the Council admits and, in theory at least, its recommendations should cover all the governments principally concerned in the development of economic policy. By virtue of decisions taken earlier in the year, the United States and Canada have joined the OEEC as participants, and their entry into the work is reinforced by the intimate partnership established between the OEEC and the ECA headquarters in Paris. Unfortunately, the western powers have also provided themselves with another embryo instrument of economic coordination in the committees and subcommittees of the North Atlantic Council, some of which are also concerning themselves with the impact of rearmament on the different economies and are considering what joint action is necessary to combine a sustained effort of defence with the maintenance of economic stability. There are now in fact two agencies in the west, both concerned in economic coordination, and unless one or other is eliminated or a fusion brought about, the result can only be confusion, overlapping and a waste of administrative and technical staff who are already too few for the tasks being laid upon them.

The obvious solution would seem to lie in a peaceful fusion of the two bodies. The OEEC can offer its experience and its high standing, which could not be created afresh without years of patient work. It can also offer the confidence which, both as an intergovernmental organisation and as an international secretariat, it has contrived to inspire in ministerial circles in Europe. On the other hand, the North Atlantic Council has the advantage of formally and specifically covering the necessary field and of enjoying a status in the United States and a working relationship with both the State Department and the Defence Department which are probably unique. The present defect in the machinery of the North Atlantic Council is that the Deputies to the Foreign Ministers, who are the permanent heads of the organisation, have not turned out to be the persons of commanding status and virtually ministerial rank that were originally intended. But if this can be corrected, the obvious shape of fusion would seem to lie in preserving the structure of the North Atlantic Council and adding to it the delegations and the invaluable international secretariat of the OEEC.

Unhappily this apparently straightforward solution is being jeopardised at the moment by a series of obscure departmental quarrels in and between Washington, London and Paris. The belief that the two organisations are in dangerous competition with each other has been allowed to gain ground and fear and suspicion much more than logic and confidence seem to be dictating policy. This is really midsummer madness. The western world has too much on its hands in dealing with the hostility of the Russians to spare time for internecine warfare and interdepartmental strife. The sooner all parties to the disagreement can devote themselves to the building of workable institutions and abandon their trench warfare in defence of vested interests, the more speedily can the Atlantic community become a reality.

NOTES OF THE WEEK

Over the Parallel

With the North Korean government making no reply to General MacArthur's summons to cease fire, and with Mr Vyshinsky proposing a settlement which would lead straight to anarchy in a devastated land, the United Nations had to take the brave decision. Indeed, to hesitate longer was to ensure that any advance across the parallel would cost its forces even more in dead and wounded. Forty-seven members of the General Assembly have empowered General MacArthur to drive on, with terms in his pocket as generous as any aggressor has been offered in this century. No unconditional surrender, the promise of unity and independence, an honourable share in electing a single assembly for all Korea, help in reconstruction, and the promise that no power will retain any bases in the country. These terms are offered less to the leaders of the Communist regime than to the people of the North; nobody yet knows just who their alternative political leaders are.

To the British goes much of the credit for these proposals; but to the Indian delegate, believed to receive exclusive information from Peking, goes the credit for the most fulsome assurances that Chinese interests will be in no way infringed. He appears to have convinced most people at Flushing Meadow that a mysterious entity called Asian opinion would take a grave view of any determined effort by the white man - or United Nations forces - to stay and make a reality of Korean unity and independence.

General MacArthur now advances into a perplexing and dangerous future; but it is now becoming clear that such risks and uncertainties are inherent in the whole idea of collective security. Whether they can be dealt with by a Uno commission on which is represented neither the strength of the United States nor the mediating influence of India is a matter for candid reflexion.

Vienna Fiasco

It is not easy to understand what the Communists in Vienna were up to last week, when an attempt to stage a general strike in the city proved a fiasco. There was understandable discontent among Socialists and trade union leaders at the wage-price agreement which allowed various basic items to rise in price by 30 per cent while limiting the average wage increase to 13 per cent. Indeed, the first wave of strikes had fairly

general support from working people. At some moment, however, the Communists overplayed their hand, planned riots and strong-arm action to bring the city's life to a standstill, tampered with the loyalty of the police - and suddenly found the Socialists turning against them - so much so that Communist attempts to seize stations and factories were defeated by non-Communist workers without police assistance.

The basic facts about Vienna are that the Communists could isolate it from the outside world and starve it of food, power, and light, provided that the Russians prevented the police from doing their duty. Hitherto they have not openly supported such action by the Communists. But, with Allied troops present in the city, the use of violence is bound to be futile unless both Russians and Communists are prepared to stage a *putsch* on Prague lines and risk an armed clash which would quickly spread beyond the city boundaries. In case they should be thinking along those lines both the British and the American Governments have made it clear what their reaction would be. Why Moscow should persist in doing things that draw from Washington and London one declaration after another of intention to stand firm and one fresh argument after another for speeding rearmament is a mystery. If it is mere probing, it is clumsily done; if it is just local blackmail, it is paying no dividend. For each Communist failure builds up the free world's confidence in its power and determination not to pay Russgeld.

Strike Action

All the weaknesses in the existing pattern of labour relations in Britain seem to be making themselves felt at the same time. The unsatisfactory state of the law was demonstrated last week by the prosecution of ten out of 1,500 men who took part in the unofficial strike of gas maintenance engineers. The ease with which the authority of trade union leaders can be undermined was shown by 200 lorry drivers in Preston who gave the required 21 days' notice of a strike on Monday without going through their union leaders. Finally, Mr Deakin has put in a claim for higher wages for dockers, presumably in order to steal the Communists' thunder, but at the same time showing what an unpleasant situation must arise if leadership of the workers is to be auctioned off to those who can make the highest bids.

There seems to be no clear way out of the dangers which loom ahead. Some form of improved legislation for trades disputes might be helpful, but it is difficult to frame a law which will distinguish adequately between malicious strikes and strikes which are called to remedy a genuine grievance. Moreover, even if a good definition of malicious strikes could be devised, such legislation must either doubly entrench the authority of trade union leaders - which would only exacerbate the rank and file and provide more fuel for the Communists - or allow anyone to call a strike - which would leave the present position unchanged. Perhaps the only form of legislation which can be considered is one that extends the prohibition on strikes to which the army and the police are already subject to other equally essential services.

Exercise Broadside

The yearly divisional exercise, in which the summer training of the British Army of the Rhine now culminates, provides *(writes our special correspondent)* the main opportunity of judging the army's progress in strength and proficiency. It is alarming to observe that the shortage of manpower in the Rhine Army is more acute in 1950 than it was in 1949, in particular the shortage of experienced NCOs. The Government's decision to extend the period of national service and to attract a greater number of regulars has come none too soon. The obsolescence of the equipment is in some ways more serious since it may take a longer time to remedy. Apart from the admirable Centurion tank, there is not a weapon or a vehicle in the Rhine Army which does not date from the period of 1943 to 1945. The perpetual dilemma between defence research and defence production, linked to the needs of the export drive, provide an adequate explanation. But the soldier in Germany can only be thankful that events have dictated a change in policy, although it will be at least two years before the army begins to feel the benefit of new weapon production.

Exercise 'Broadside' was framed in a realistic setting which assumed that in the early stages of a future war the enemy would have the advantage of a higher degree of readiness including air superiority. The first part of the exercise accordingly consisted in the movement of 7th Armoured and 2nd Infantry Divisions to concentration areas with all the available air effort opposed to them. This entailed a difficult problem of night movement which the units - their vehicles mostly in the hands of young national service drivers - conducted with great skill.

The tactical part of the exercise was less satisfactory. In accordance with the criticisms of last year's plan, its purpose was to study the problem of holding a wide divisional front, which with the present paucity of troops in Western Europe would be the case in the early stages of a war. But, as General de Lattre de Tassigny pointed out, this aim was considerably compromised by creating a series of imaginary minefields and inundations along the river Weser which converted the 2nd Division's front from a wide into a narrow one. Even so the deployment of the division in defence left it with very little local reserve. From the comments of the CIGS, of General de Lattre and General Keightley, the Army Commander, it is clear that what the British army has to relearn is that no river line is an impregnable obstacle - in Western Germany the steep and densely wooded ridges may provide better obstacles to armour - and that the only way to stop the enemy is to defeat and kill his troops.

The Colombo Plan

Realism rather than ardour, and speed rather than scale are the marks of what has come out of the Commonwealth Conference on aid for southern Asia. By forming the new Council of Technical Cooperation and encouraging it to start work in Colombo before the end of the year, the participants - not including Burma and Indonesia which were represented by observers - have ensured that some use is quickly made of the £8 million which is to be spent before July 1, 1952. By dealing direct with governments the directors of the council will be able to keep an impetus behind the opening moves; these are likely to consist largely of paying teachers, scientists, and technicians - of which southern Asia is so short - and of endowing and equipping universities and training institutions.

The other main achievement of the talks is the report on a six-year development programme - the 'Colombo Plan' - to be published in a few weeks. This involves no immediate action by governments; it is rather a series of studies country by country joined to an analysis of the economic problems common to the area as a whole. Without such information, handily arranged, it would be scarcely possible to get down to the task of raising further money for long term schemes of increased output from the land, better transport services, new sources of power and - to a minor degree - industrialisation. It is, in fact, a prospectus for public spirited but intelligent finance ministers.

Development plans at this stage arouse enthusiasm only when they are accompanied by propaganda of the Five Year Plan - and Margate Conference - kind. The Commonwealth personalities working on this bold new conception are wisely concentrating on getting things done and finding the people to do them. Behind their efforts lies, nevertheless, the determination to help southern Asia and to prevent its rising population from undermining living standards and checking economic development.

Finding the Money

To prime the pump in southern Asia to the extent now required is beyond the resources of the Commonwealth, which - indeed - has not undertaken to tackle the whole task alone. The present effort is designed rather to set a course and a pace that can be maintained over a long distance. Without fixing any sum as the target, the conference has sifted and arranged priorities for a programme that would cost about £1900 million between now and 1957, and has set out ways in which the money might be raised by 'an effort of mutual help'. First in the order of possible contributors come the Asian countries themselves, which should raise internal loans and increase taxes wherever possible. Second come public or private loans from the west for specific projects, the World Bank, the American Export-Import Bank and Point Four. Last come loans, credits or gifts from government to government.

The full scheme is impossible without aid from outside, especially from the United States. Washington has been kept informed throughout the conference, and will find that the report has been given by Canadian delegates the kind of slant that will make it more readily assimilable. The Colombo Plan has been drawn up without specific reference to the need to fight the Communist challenge; but it will appeal to all who believe that one of the best ways to do so is to demonstrate how low economic standards can be raised without using totalitarian methods, and by ensuring that southern Asia takes its rightful place in the pattern of world trade.

Social Priorities

Conservative spokesmen have been criticised for their reluctance to commit themselves on how they would reduce expenditure on the social services to allow the reduction in taxation and the higher defence expenditure that they advocate. Nine of the new Conservative MPs have published a pamphlet ('One Nation'. Conservative Political Centre 1s) which expresses their own views on how the problem might be tackled. It is one of the clearest and best informed pamphlets on home policy which has appeared from any quarter in a long time, a fact which is not so surprising since the authors includes Mr Iain Macleod, Mr Angus Maude, and Mr Richard Fort, who are among the ablest of the new Tory back benchers. The pamphlet is also a tribute to the wisdom of the Central Office of the 'stupid party' in maintaining a large research department during its lean years in order to provide a reservoir of well informed parliamentary candidates and members.

The purpose of the pamphlet is to lay down priorities. Most of its proposals are familiar: the gradual elimination of the food subsidies accompanied by compensatory increases in social service payments; charges for some health service benefits; the postponement of some educational developments; the freeing of building from control, the overhaul of rent restriction and the concentration of local authority building on slum clearance. Housing itself is given first priority among the social services, and education second. Probably this order should be reversed. Of all the social services, it is education that could, provided the principles of educational policy were sound, pay the highest dividends.

The chief criticism of the pamphlet is that the authors do not quite make their case. The economies that they suggest in the social services are well conceived, but it would be optimistic to expect that they would more than offset the increased expenditure they would allow on higher salaries for teachers and doctors, the reopening of hospital beds

and so on. This means that on the elimination of the food subsidies must depend the chances of reducing taxation and of meeting the possibility of higher expenditure on defence. In spite of the pamphlet's persuasive reasoning, the sum does not quite add up.

Schuman Plan Progress

The six nations taking part in the Schuman Plan continue to make quiet progress in their talks. Especially in the matter of commercial policy there have been several advances during the past few weeks. All participants will be given unrestricted access to markets in the overseas territories belonging to member countries. It has been decided, too, that the High Authority shall be the negotiating agent for the six as a whole when it comes to bargaining with other producer nations over both domestic and export markets. If the Schuman countries do band together to this extent, there is a clear possibility that Britain, the outsider, may be put at a great commercial disadvantage.

Some of the questions which - at least in the view of British observers - lie at the heart of the plan are still unsolved. For instance, the division of tasks between the supra-national High Authority and the intra-governmental body, the Council of Ministers, is not yet perfectly clear. Delegates are also finding it difficult to agree on what price level or levels should prevail for coal and steel within the area.

A reasonable compromise on these issues can be reached, most of the delegates feel, provided that the shadow of German rearmament does not grow too swiftly. The French in particular are anxious that no German divisions should be armed before they have a chance to put the plan into working order. Otherwise they are afraid of creating the very danger that the plan was designed to avert - the re-emergence of a powerful Germany without the safeguard of a larger European unit into which it can be absorbed. Frenchmen think and say that the Americans, by insisting on an immediate decision to re-arm Germany, have put the cart before the horse and are thereby threatening the foundations of the plan while the builders are still at work.

Consumers' Representation

When the various Nationalisation Acts established consumer councils and consultative committees as a check on the possibly arbitrary behaviour of the statutory monopolies, it was hopefully assumed that they would be effective. How far this assumption has been justified has been expounded in a valuable little pamphlet ('Consumers' Representation in the Public Sector of Industry' by A.M. de Neuman) which sets its findings in perspective by quoting Mr Herbert Morrison's assurance that consumer's representatives are expected to be 'critically minded...ready to fight...active and vigorous'. But in fact, the crucial first year of each nationalisation project was passed without benefit of a complete consumer council organisation. There is a wide variation in the terms of the various acts: while some corporations are obliged to refer matters to their consumer bodies, others are not; so important a body as the Central Transport Consultative Committee need meet only twice a year; in coal there are no local bodies, in gas and in electricity there is no national body; there is no obligation on Electricity Consultative Councils to publish any reports at all. In all their organisations (except for the Air Transport Advisory Council) members are appointed by the Minister chiefly concerned, which makes it improbable that they will be persons likely to be thorns in the flesh of the Board which he has also appointed. If the constitutional framework is unpromising, the practical results are worse. One and all, the Councils and Committees have made it their business to defend the Corporations before the public rather than the public before the Corporations; an ominous tradition of secrecy has been established; and the public has mostly ignored its supposed champions and gone on querulously writing to its overdriven members of Parliament who are in this respect constitutionally impotent.

It is of course too early, as Mr de Neuman recognises, for final judgment; but it is not too early to emphasise the undesirable precedents which have been established. The Corporations and their parent ministers have only themselves to blame if the public looks on the consumer organisations nominally protecting his interests with the mingled indifference and distrust felt by the unenfranchised natives of some backward colony for their 'appointed' representatives selected from, responsible to, and paid by, the oppressing master race.

The Defence of Turkey

'Why worry about the Atlantic Pact?' says the leading article in a leading Turkish newspaper. Exclusion from it 'is not so grave when one considers that this country has pacts with Britain and France that bind both western nations to rush aid to us in the event of attack?' If this philosophic attitude is widespread, why did the Turkish government so ostentatiously apply afresh for membership of the Pact last month? What more did it want? Is it satisfied with the result of its application, which is a refusal to which has now been appended an invitation to 'associate with' Atlantic Pact defence plans in the Mediterranean?

The answer to these questions is that Turkey will not feel confident of adequate aid on D-day until the United States, as well as Britain and France, is pledged in treaty form to rush to its rescue. The request for inclusion in the Atlantic Pact was bound to be turned down, for the smaller north Atlantic nations still prefer to think that their frontier is in northern waters and not on the Bosphorus. But by making it with ostentation and by accepting refusal not as a rebuff but as the starting point towards an 'associated' alliance, Turkish diplomacy has done well enough. It has come as near as is possible, in the present state of American armaments and commitments, to securing an undertaking of American protection.

Its critics suggest that, when it sent its 4500 combat troops to Korea, it was attempting to buy its way towards its goal, much as Cavour, in Crimean days, bought his seat at the western council table. The implication is unfair. Though the despatch of the troops and the request to the Atlantic powers virtually coincided, they were independent gestures. Mere commonsense dictated that Turkey, physically placed just as near to the Russian frontier as is Korea, should do as she would be done by.

Professional Obstacle Race

A new circular issued by the Ministry of Education shows that an obstacle race of inhuman ingenuity is being devised for the young entrant to the professions. It gives details of the requirements, in terms of the new General Certificate of Education, of such bodies as the Law Society, the Royal Institute of British Architects and the Institution of Civil Engineers. Twenty-two out of the thirty professional bodies had laid down different educational criteria for the aspirants to their profession, only the engineering institutes having managed to work out a common formula. The reason for this is that the new General Certificate, unlike the old School Certificate, can be awarded for proficiency in one subject only instead of a balanced group of subjects. The professions, like the universities, have shown that they do not trust the schools to send their pupils out provided with a sound general education, irrespective of what may be displayed in examination results, and they have set out requirements which they severally demand for exemption from their own preliminary examinations. Since the different professions have different ideas about basic education, there is a bewildering variety of requirements: almost all the professional bodies require a minimum of four or five subjects, and all but three demand English and Mathematics, but some require Latin and some do not; some require a scientific subject and some a foreign language. To the masters who must devise a curriculum to fit these different requirements, and to the pupils who must follow it, the alleged freedom of the new General Certificate must appear to be an illusion.

Shorter Notes

The French decision to evacuate their garrison from the frontier town of Kaobang on October 3rd was serious; although Kaobang had for months largely depended on airborne supplies, so long as French troops were there they made it more difficult for the Viet Minh to bring arms across the frontier. But in withdrawing, a decision hastened by the loss of the neighbouring post of Dong-Khe, the French have suffered a first class disaster. Even if their offensive goes well elsewhere, they have lost not only part of their control of the frontier region, but, by the reported annihilation of over 3000 men, have received a dangerous blow to anti-Communist morale throughout the country. The gravity of the situation is shown by the dispatch of the veteran expert in guerrilla warfare, General Juin, from Morocco.

* * *

Much has been written about the military and political miscalculations made by the Communists and Russians in Korea. What has so far escaped notice is the failure of the political warfare that has accompanied the campaign. Seoul did not turn out a second Stalingrad; the South Koreans fight on with undiminished zeal; above all, the 'working masses' of the world have not taken the action against 'imperialist warmongering' for which two years of the 'peace campaign' had prepared them. Exasperated by this fact, Soviet propaganda is now conducting an outright atrocity campaign against the American army which seems to call for some official protest.

Doing and Showing

We cannot conclude without reminding our countrymen that their strong point has always been doing, in contradistinction from exhibiting. We are not sensible of any more striking moral characteristic between the Saxon and Celtic races than that the Saxons perform while the Celts exhibit. The former, though abundantly self-willed, self-confident, and self-conceited, are withal awkward and retiring. They are not gascons. What they do is done for themselves, or because the thing is worthy to be done, and it is not done for show. The Celts, on the contrary, always display all their virtues. Whether it be at the fair, flourishing a shilelah, dancing on the village green, erecting magnificent castles, or constituting a state, their great desire is to attract admiration. They prefer the arts which dazzle others to those which comfort the artist and his neighbours.

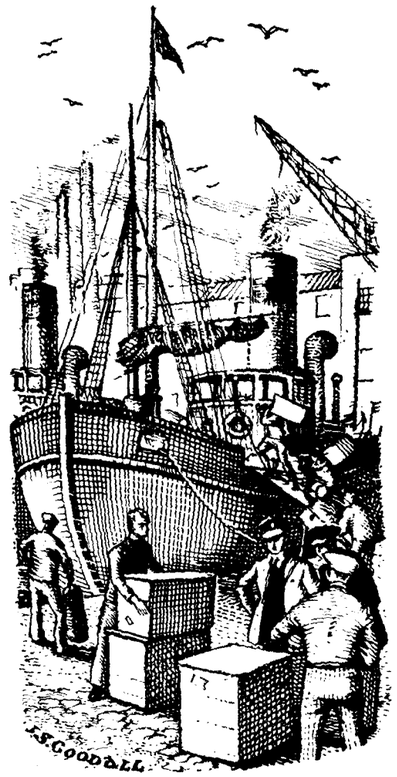
Books and Publications

'Roosevelt in Retrospect' by John Gunther. Hamish Hamilton. 441 pages. 21s.

It looks as if Franklin Roosevelt's reputation may soon enter upon that apparently inevitable period of slump which, for most great men, is delayed until a generation or so after their death. Many circumstances point to this. Unlike most war leaders, he handed down a peace hardly less critical than the war itself; consequently the magnitude of his own achievement has to compete with the gravity of his successor's task. Moreover, the achievements of that successor, so much beyond popular expectation, and displayed through a personality and political technique so different from his own, have shown up certain of Roosevelt's weaknesses and limitations. Lastly the celerity with which the full record, both of his private life and of his administrations, has been laid bare to the public gaze contrasts strikingly with the protection afforded to so many eminent public figures by the joint operation of family discretion and the Official Secrets Act. How much more is already known of Franklin Roosevelt than of his nearest British counterpart, Lloyd George. When once the paranoiac Roosevelt-phobia of the thirties and forties ceases to evoke, by a compensatory process, a corresponding degree of Roosevelt-philia, the cumulative effects of these circumstances may not be long in making themselves felt. The election of 1948was probably the last in which the Roosevelt *myth* could be a serious issue.

Perhaps Mr Gunther feels something of this. His book at any rate suggests it. It is not written in the vein of vigorous counter-polemic appropriate to a contemporary apologia, such as the admirable 'Roosevelt' of Mr Gerald Johnson; but neither is it written with the detachment that might be expected from someone who comes to his task after the publication of such revelations as those of Mr Sherwood, Mr Morgenthau and Mr Moley. Mr Gunther has drawn upon these and all the other rich vein of Rooseveltiana now available (though not, alas, always in this country). But his book is something more and less than a synthesis of these. More, because it is primarily a tribute from an unashamedly fond admirer - a tribute, moreover, primarily to Roosevelt the human being - and only secondarily to Roosevelt the President. (The structure of the book illustrates this, the first half being devoted to 'The Character', while even of 'The Life' only about 75 pages are allotted to the years 1939 to 1945). Less, because the critical analysis of all the disclosures and interpretations now available is something which Mr Gunther has not seriously attempted.



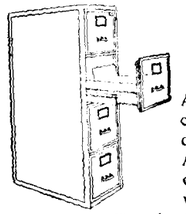
Indeed, this study is a good deal like Mr Gunther's travel books, in both its charm and its inadequacy. This is a country which he likes very much and which he describes with warmth, vivacity and an engaging loyalty to its way of life. But even the best countries have their enigmas and their problems, and on these Mr Gunther is less revealing. We tour the furnishings of Mr Roosevelt's mind in the company of a most informing and beguiling guide. There is the desk at which he sat. There is the donkey which he loved to ride. There is the battered fedora we know so well. But what is in the drawers of the desk? Why did he ride the donkey along the paths he did? What went on underneath the fedora - and behind that famous smile?

* * *

'Scottsboro Boy' by Haywood Patterson and Earl Conrad. Gollancz. 317 pages. 16s.

In the nineteen-thirties the Scottsboro case taught the world - and many Americans as well - what racial prejudice meant in the United States. It would not be true to say that the Negro boys who were sentenced to death time and again for the rape of two white prostitutes were framed. There was no need; apart from one judge who made legal history and ruined his career, all those in Alabama who were concerned in the case based their decisions on blind prejudice, not on the evidence. It was prejudice not only against Negroes but also against Communist interference. For to the Communists the Scottsboro case was, and to some extent still is, a Lenin-sent demonstration of the decadence and oppressiveness of capitalism. They made the boys their own and bombarded Alabama with protests from 'foreign' parts - from countries across the ocean and, much worse, from cities across the Mason-Dixon line. That great pleader, Clarence Darrow, was forced by the Communist tactics to abandon the boys' defence and with him went,not their hope of acquittal (there was never any hope of that), but their chance of a speedy pardon.

There is no evidence in this book that Haywood Patterson is aware that the Communists are responsible for at least part of his seventeen years in prison for a crime he never committed, or for the fact that they were ended not by release but by escape. But even he, the most aware of all the Scottsboro boys, is aware of very little except the iniquitous way in which he has been treated. He cannot be blamed for that, but as a result, the horrifying story he told Mr. Earl Conrad could be nothing more than an account of the degradation of human beings and the debasement of justice. It is not difficult to read, but it is certainly not pleasant, and it sheds little new light on the basic problem of the Scottsboro case in particular and of the South in general, the poverty and ignorance of Negro and white alike.



October

Nowadays trade across the sea often involves special problems and difficulties and businessmen confronted with these will find that the Midland Bank provides ready assistance. The Overseas Branch at 122 Old Broad Street, London, the West End Foreign Branch at 196A Piccadilly, London, and the Provincial Foreign Branches in Birmingham, Bradford, Liverpool and Manchester are especially equipped for this purpose and the services they offer are available at over 2,000 branches in England and Wales.

MIDLAND BANK LIMITED

Stand design and construction comes naturally to

OLYMPIA

It is logical that the home of so many famous exhibitions should house a department which creates and builds hundreds of stands a year. They are produced by Olympia's own designers and craftsmen—for exhibitions all over the country or on the Continent. This service is, we believe, second to none. Not least amongst its features is that wise planning makes prices decidedly competitive.

What do your retailers think of your advertising?

Today, more than ever before, people are brand conscious and your retailers look to you to create a demand for goods by advertising to the maximum number of people.

The Daily Mirror has the largest daily net sale in the world—over 4,566,000—and its inch per thousand space rate —·90 of a penny—is lower than that of any other national daily.

Daily Mirror

THE LARGEST DAILY NET SALE IN THE WORLD

"Glad you like this sherry —it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.

So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

AMERICAN SURVEY

Inflation's Shadow

Washington, D.C.

The theory that it could be left to the good sense and patriotic spirit of the trade unions and the employers to agree upon wage adjustments which would discourage inflation and serve the national interest was one of the first American casualties of the second world war. By the time President Roosevelt's Administration had gathered the political courage to devise a harness that would hold wages and prices from running away, there appeared to be nobody in the United States who had not learned the economic lesson of the times. The first part of the lesson was that, though dipsomaniacs might voluntarily give up drink and rivers would sometimes run uphill, trade unions would not renounce the opportunity of winning wage increases so long as the opportunity could be discerned to exist. The second part of the lesson was that whenever prices and profits were rising and manpower was valuable the opportunity would exist.

Ten years have passed and now here we are again in time of armed conflict, with a big rearmament programme launched, with prices airborne, with profits in a more satisfactory condition than ever before, and with an imminent manpower shortage foreshadowed by early September totals for employment. In these circumstances President Truman has just appointed Dr Alan Valentine to supervise the control of prices and wages if this becomes necessary.

Before it departed for home to attend to pressing election business, the Congress passed a Defence Production Act which gives the President powers (for which he had not asked) to invoke such controls. But the Congress handed over the baby with a certain diffidence. Lest there should be any unfortunate pre-election idea in labour circles that members of the House or Senate were compelling Mr Truman to frustrate current wage claims, the Act enjoined the President to have recourse first to voluntary action to stabilise wages and prices. If that did not work, then the President was to take sterner action.

Last May, the General Motors Corporation, the largest industrial firm in the country, signed with Mr Walter Reuther's United Automobile Workers a new five-year contract under which nearly 250,000 members got an immediate wage increase of 4 cents an hour, an undertaking that their pay would be raised by another 4 cents an hour each year for the next four years, a number of assorted pension and vacation benefits, and a formula under which wages would rise indefinitely quarter by quarter if the cost of living went up but would be cut by not more than 3 cents an hour however much the cost of living went down. It was a reasonably safe prediction, even before Korea, that other automobile makers would have to toe this line, and that unions which thought that they were in strong enough positions to improve on it would, as Mr Pickles might say, have a go.

Workers in the aluminium, rubber, hosiery, electrical equipment and farm implement industries are among those who have had, or are going to have, successful goes. The Chrysler Corporation, in a sort of Santa Claus gesture that shook industrial America, last month signed a new contract with the UAW, presenting unskilled workers with a 10 cents an hour increase and skilled workers with a 15 cents an hour increase out of the blue. And Mr Philip Murray, of the United Steel Workers Union, who last winter secured by means of a strike some handsome new pension and health insurance benefits, wrote to 1,400 steel companies announcing that he would be seeking a wage increase before December 1st, when the union can strike. Mr John L. Lewis of the United Mine Workers Union has not been heard from yet, but he will hardly resist the temptation to secure benefits higher, wider and handsomer than anyone else's.

Soon after the steel strike was over last winter, the United States Steel Corporation announced price increases averaging $4 a ton on a wide range of steel products, to yield an extra $80 million a year to the company, 'an amount equalling the estimated yearly cost of the new pensions programme'. Within the last week or so two steel firms have announced new price increases, and the magazine *Iron Age* is discussing the likelihood that Mr Murray's negotiations will force up steel prices by another $6 to $8 a ton.

'Inflation's Sinister Shadow Has Actually Materialised' said a headline in the *Washington Star* the other day, but the substance of inflation does not in fact seem to have arrived yet. Commodity prices are not as high as they were during the 1948 peak, production is well beyond that peak and there have been recent signs that the heart has gone out of the Korea-inspired buying scramble. So far the only restrictions have been relatively painless ones on instalment buying - which accounted for over $13 billion of the $21 billion of consumer credit outstanding in August. But stricter credit regulations are prophesied on mortgages which will certainly bring down with a rush the recent furiously high rate of house-building. The biggest curb on inflation so far has been the rise in income taxes this month.

And after that? It may be a long, long trail; but the logic of ten-year-old lessons lingers on. Wage ceilings and price ceilings, a formula to 'hold the line against inflation' and a War Labour Board to adjust disputes may once again be on the cards.

American Notes

DOs and Don'ts for Industry

The first industrial priorities to come out of the Defence Production Actare straightforward DO (defence order) ratings, telling industry that it must do jobs for the services, the foreign military assistance programme and, where necessary, for the Atomic Energy Commission, before it takes care of its civilian customers. These ratings, which will apply to practically all military contracts, even those already placed, can be passed on by the prime contractor to his suppliers and sub-contractors. The National Production Authority is expected to determine the proportion of steel, and presumably later of other commodities, that can be earmarked for defence purposes, and to work out a method of spreading DO ratings among firms, so that non-military consumers shall all suffer together. If this is done and if the services do not relapse into their old habit of over-ordering and of piling priority on top of priority, the civilian economy should not be dislocated very severely just yet.

But by early next year the recent flood of defence appropriations will be swamping factory benches and by then essential civilian and indirect military orders - steel for rails, for example - will need priority ratings if they are to stay in the swim. This is when non-essential civilian goods will find it difficult to keep their heads above water. So far the departments controlling essential civilian products have done little beyond mobilising the alphabet to name the new offices set up to deal with their new duties. But already an interdepartmental dispute has developed between the Departments of the Interior and of Commerce over the responsibility for non-ferrous metals; those who believe that it was a mistake to divide authority among existing Government agencies are saying that they told the President so.

Non-ferrous metals were amongst the most important of the 32 commodities to which the National Production Authority's first regulation applied. This was a "Don't", not a DO, order, and laid it down that industrial stocks of these commodities should not exceed 'the practicable minimum working inventory.' Metals are already being allocated voluntarily and the next stage will be mandatory allocations for copper, aluminium and perhaps some others, officially expected before Christmas. The automobile industry is talking of a 'de-emphasisation trend' which will dim its chromium sparkle, to save metals.

Crime Campaigns

The Republicans have new hopes of making organized crime and the public protection it buys pay political dividends in three close Senate races, the battles in New York, Illinois, and Missouri. Senator Kefauver has steadily resisted their pressure to devote his crime inquiry to an exposure of the links between the underworld and Democratic machines in big cities such as Chicago and Kansas City. But in New York revelations that a $20 million-a-year Brooklyn gambling syndicate spent $1 million of that on buying police tolerance throws a fresh light on the hurried departure of Mr O'Dwyer, the Democratic Mayor, for his Mexican retreat, and handicaps the Democratic candidates, however great their own integrity.

Mr Thomas Murphy, the successful prosecutor of Mr Alger Hiss, has new scope for the talents the New York Democrats found themselves unable to reward adequately. Appointed Police Commissioner, his new broom has already resulted in the hasty resignation of sixteen police officials, some of high rank, and the return to the beat of the entire plain-clothes division, which is charged with enforcing the laws against gambling and vice. Mr Dewey, the Republican Governor, has gladly entered a fray which promises to be as profitable, politically, as his own crusade against the rackets twenty years ago.

The New York exposure is the work of a Brooklyn grand jury, not of Senator Kefauver, but the conviction of the nation's largest bookmaker grew out of testimony before the committee. Civic reformers are taking heart and the alarm of the 'mobs' has brought the murder of two of the committee's witnesses in Chicago.

In Florida, the committee proved what it set out to: that gambling corrupts public officials and that the crime network crosses state boundaries and hence requires federal remedies. (A representative of the Capone gang in Chicago had muscled in on the local syndicate). But Florida is a one-party State and Republicans are impatient for the Committee's findings in Illinois and Missouri. It was a Republican, however, Senator Malone of Nevada, the only State that permits off-the-course gambling and the uninhibited use of gambling machines, who filibustered to death a Bill to prohibit the movement of these 'one-armed bandits' across state boundaries.

In the Name of Security

The anti-Communist Act passed over the President's veto already stands convicted of endangering America's prestige abroad in the name of security at home. Its exclusion of 'supporters of any totalitarian regime' is a nightmare to travellers and harassed officials who have already limited an Austrian pianist to a six-day stay because he joined the Hitler Youth at the age of ten. Senator McCarran, friend of General Franco, and the author of the Bill, would get his deserts if it kept out all unofficial Spanish visitors. The same reasoning, applied to South America, would make havoc of the good neighbour policy. It would exclude 90 per cent of all Germans, thus wrecking the re-education programme, and offend the Yugoslavs. The temptation to make a monkey of the Act by taking it literally must be strong, but allowances must be made for the 'intent of Congress', which may be clarified after the election.

THE WORLD OVERSEAS

Indonesia Now

Indonesia is now three quarters of the way through its first year. It has been a period of vigorous change, even if the violence of the last few years has died down. The new cabinet recently formed by the Masjumi leader, Mr Mohammad Natsir, under the new provisional unitary constitution, has had a fairly good reception. It was disappointing to many, both in Indonesia and outside, to learn that Mr Hatta, the moderate and realist who had negotiated Indonesia's final independence agreement with the Dutch at the Hague last year, was to give up the premiership. But the facts are that Mr Hatta had worked himself almost to a standstill after two years of constant strain and that the new government is headed by a man who is close both to Mr Hatta and to Mr Sutan Sjahrir, the strongest anti-Communist figure in Indonesian politics. On paper, therefore, the cabinet is nearly as 'sound' as it could reasonably be expected to be.

What now matters most in Indonesia is to know whether this or any other moderate government can impose its will on the country. On that score there is considerable doubt among independent observers in Djakarta, the capital. There are three particularly intransigent elements: outlying peoples, such as the rebellious Ambonese, who resent a unitary state run from Java; malcontents and guerrillas like those of the Dar ul Islam in Java itself; and everywhere the growing body of Communists and fellow travellers. These trouble-makers are once more becoming the most important, as before the Madiun rebellion in 1948. Lately the trade union organisation, SOBSI, whose leaders now take their instructions from the Soviet-directed WFTU (World Federation of Trade Unions), has greatly extended its influence, largely by means of intimidation. Alimin, one of the chief Moscow-trained Indonesian Communist leaders of two years ago - who was widely reported as dead - has turned up again.

The government's most important achievement so far has been to settle the serious strike of estate workers which started on August 20th. In loss of tea production this has cost Indonesia about 16 million rupiah of foreign exchange. There has also been a number of other sporadic strikes, which are due to the kind of local corruption that no government can tackle overnight, but which have certainly struck at the country's economy when it is just beginning to get on its feet again. Nevertheless, Indonesia has made considerable strides in economic recovery during the past six months. This has recently been accentuated by the high prices now ruling for many of its main products, such as rubber. One result is that more consumer goods are beginning to flow into the country and that the pernicious inflation has been checked. Moreover, the new financial regulations controlling foreign exchange are working very satisfactorily. Indonesia's new standing is most strikingly shown by the recent sharp appreciation of its currency. From a free market rate of 30 to the $ and 72 to the £ in May, the rupiah rose to 15 and 38 respectively in July, its best level since 1945.

Indonesia is trying to steer a neutral course in foreign policy, following India's example; the one exception, towards which it has a blind spot, is New Guinea. By working up an exaggeratedly emotional claim in the face of rational argument, of the indignant determination of the Dutch and of Australia's strategic interests, Djakarta is heading for trouble.

As the Dutch See It

(From Our Correspondent at the Hague)

Present Dutch feelings on Indonesia range from the professional, slightly ridiculous, optimism of Dutch cabinet ministers to the embittered feeling of the soldiers of the former Royal Netherlands Indies Army. The cabinet ministers are bound to appear optimistic since they must make a success of the 'Dutch-Indonesian Union' - a not very real superstructure, that was asked for by the Dutch mainly for internal political consumption and accepted by the Indonesians because they felt it was not a very important concession. But very real Dutch interests lie behind the facade of the Union. The Dutch Government estimates that between fl.5000-6000 million of Dutch capital has been invested in Indonesia. The chief reason for the Dutch willingness to give a 'general purpose loan' of fl.200 million to Indonesia is the knowledge that otherwise there would probably be a severe cut in Dutch imports. And the fact that Dutch trade, particularly with the dollar area, can practically never be balanced without the three-cornered trade with Indonesia, again makes it highly desirable for the Dutch to have a High Commissariat at Djakarta which is something more than a mere embassy.

Among Dutch businessmen in Indonesia there is a remarkable difference between the smaller firms, which continue to daydream about the colonial past, and the big business men, who ask Indonesian ministers to dinner and make incredibly rosy statements about the way things are going. In private they are not so optimistic, but there is undoubtedly a big opportunity for business people who are [redacted] to adapt themselves to changing condi-

THE BUSINESS WORLD

Policy and the Pound

Exchange policy now holds a prominent place among the problems that face Britain and the sterling area. Dollars and gold are still flowing into the sterling area reserves; the British balance of payments has been transformed; and there is no mistaking the hardening of sterling in recent months. These symptoms of improvement have been noted abroad and their implications in terms of future policy for sterling have already been argued with implacable logic in the United States. At the recent meeting of the International Monetary Fund in Paris, the justification for continuing restrictions on current payments by Great Britain and other sterling area members of the IMF was questioned. That issue will be discussed in a specific context next month, when the signatories of the General Agreement on Tariffs and Trade, now tariff-bargaining at Torquay, turn to debate the principles of commercial conduct and discuss the discrimination now applied against dollar imports by sterling countries.

Questions of exchange policy cannot have been far in the background of Mr Gaitskell's discussions in Washington and Ottawa this week. Britain's request that part of America's military aid should be in free dollars is, in present circumstances, tantamount to asking for further American help to raise the British gold and dollar reserves. It is certain to have aroused some American questioning about the size to which the reserves need to be built up before they would justify a restoration of full convertibility of sterling for current transactions. Future exchange policy, however, does not rest solely on sterling-dollar relations, important though these are. A fortnight ago, Canada announced its fateful decision to let the Canadian dollar find its level in a free market. Australia has decided to adhere, for political reasons, to a patently undervalued rate for the Australian pound. And within the next few days, the results of the first periodic compensation under the European Payments Union should be known; it may result in considerable gold payments and thus call into question the desirability and practicability of leaving the sterling area's monetary relations with certain members of EPU to the automatic mercies of that mechanism.

Many ingredients are thus being thrown into the cauldron of this debate, and the brew is kept bubbling by continuing rumours of changes in sterling's parity. The widely held and tenacious belief that the exchange value of sterling is to be raised against the dollar is an inexplicable example of economic hypnosis. Can it be seriously believed that the British Government, little more than a year after devaluation and in to-day's abnormal circumstances, would ask the International Monetary Fund to sanction a higher rate for sterling? Repeated ministerial pronouncements make it clear beyond doubt that the building up of the gold reserve well beyond the present level of about $2,800 million is the first priority in external financial policy. To revalue sterling now would seriously impede the further recovery of the reserve. It would also reduce the sterling price of gold and thus put further strain upon the loyalty of gold producing members of the sterling area. Even more incredible is the supposition that the IMF, sensitive as it is to American economic ideas, would sanction any such proposal. The Fund would surely be quick to assert that if sterling were so genuinely strong as to justify some upward adjustment in its gold parity, it should first test and use that strength by the resumption of convertibility for current transactions.

Or can it be that expectations of a change in the dollar-sterling rate are based, not on these improbable assumptions, but on an even absurder belief that the United States dollar is about to collapse and break the link with its gold parity? So long as it is cast in sensible terms, there is something in the raw material of this argument. The United States economy is undergoing greater stress than at any time since the war; little effective anti-inflationary medicine can be administered until the November elections are out of the way; wages have begun another round of nation-wide increases; a good deal of potentially unstable foreign capital that has found its way to the United States in the past three decades is beginning to look for a new home. But to jump from these premises to the conclusion that an exchange crisis is about to break in the United States is to lose all sense of proportion. Some two-thirds of the world's monetary gold is still held in the US Treasury reserve. The United States is still lending and giving abroad to the tune of about $5 billion a year. There are powerful brakes that can be applied to the American monetary mechanism, even without reckoning on the prodigious productive capacity of the American economy when it is really put to the test. If the dollar is becoming softer and more abundant, it should be a cause for profound satisfaction and it should evoke an appropriate response in the administration of sterling exchange control and in British commercial policy.

The conclusion suggested by this reasoning is that the sterling-dollar rate is much better left where it is, and that the relative strengthening of sterling and weakening

NEW FACTORY for Britain's oldest producer of figuring, accounting and statistical machines

Burroughs great factory at Strathleven, Scotland, now in production

Now coming into production, the world's newest plant for the manufacture of business machines is located 16 miles from Glasgow, at Strathleven, on the Vale of Leven Industrial Estate.

This plant of 150,000 square feet at Strathleven, coupled with Burroughs production at Nottingham, ensures the continued leadership of these outstanding products both at home and in the Empire.

With the opening of Strathleven, Burroughs production in Britain now includes all types of Burroughs machines. In addition, the production requirements for *the entire world* for some Burroughs models are now being met exclusively at Strathleven.

Also expanding—as production increases—is the alert Burroughs service organization. Always near at hand, facilities and specialists are locally stationed to keep your machines in peak condition... to give you the finest counsel and guidance in solving those problems of business which involve figuring, accounting and statistics.

We are grateful to our many friends in business whose increasing patronage has made this new project necessary. With ever greater facilities, we hope to serve them even better in the future.

of the dollar should be allowed to reflect itself in a measurable relaxation of sterling exchange control and of the admission of dollar goods. No sensible person would argue for an immediate jump to dollar convertibility; but the progress already made in easing the rigours of restrictions on payments to the dollar area should be accelerated.

It remains to consider the argument that Britain should emulate Canada and let the pound go free. Apart from its propriety or desirability, such a move would be reasonably safe only if free sterling were backed by a much larger gold reserve than at present. Sterling is not under pressure to repulse a massive inflow of hot money comparable with the flow into Canada in recent months. In the choice between a free rate and a fixed rate, Canada's decision sets no precedent for Britain. The Canadian dollar is a local currency. By contrast, sterling for all its limitations is still a great international currency and provides the basis of a far-flung monetary area. These wider responsibilities appear to require a firm relationship between sterling, gold and the United States dollar. It would be asking a great deal of the sterling area, and of the other countries that use sterling extensively in their international transactions, to adapt their commercial policies in pursuit of a pound that was at the same time inconvertible and freely fluctuating. A free rate may be preferable to a fixed rate first determined by thinking of a number and later discovered to be overvalued or undervalued. There may be an argument, *pace* the Fund, for a free rate that remained in practice more or less pegged, since that would avoid a succession of political acts in changing a fixed rate to suit changing economic circumstances. But there is no argument for shifting a fixed rate either up or down if nothing is done to bring a positive policy to bear on the forces that play upon the pound. All the arguments at present point, not to revaluation, but to a more liberal philosophy in sterling policy.

Business Notes

Canadian Dollar Dealings

In the first week of its new freedom the Canadian dollar disappointed many bulls by floating less than halfway towards parity with the American dollar. During this first week, speculators taking profits on hot money in the Montreal market seem to have called most of the tune; the Canadian authorities must have stood ready to even out hour-to-hour fluctuations but so far, at least, there have been no reports of large-scale intervention on their part. The New York market, after some initial aberration, seems to have followed more or less in the wake of Montreal. The Bank of England rate, announced each morning, is now based - with a little latitude in the spread - on the previous night's Montreal close. Thus at the beginning of this week the rate at Montreal was $2.96-2.97 and in London $2.95-$2.97.

Canadian security prices, which had been rising for some weeks, receded slightly at the first news but have since resumed their progress. Dealings in these securities in London have been impeded by the wide gap in longitude and, therefore, in working hours. News of opening prices on the Montreal Stock Exchange does not reach London until 4 o'clock in the afternoon - half an hour after the Bank of England has closed its exchange dealings for the day. London brokers selling stock to Canada on the basis of these opening Canadian prices cannot cover their exchange transactions until the next morning, and are thus at risk for possible changes in the Canadian dollar during a whole day's dealings in Montreal.

Hot Money in London

The inflow of short term funds into London from abroad is beginning to make itself felt in the money market. Lombard Street has been unusually flush with funds in the last few weeks - including some on offer from American banks; at the end of last week it was even reported that some short term loans had been made at 3/8 per cent compared with the usual 1/2 per cent minimum. As this foreign money has come into the central reserves, the Treasury has had to increase its borrowing on floating debt in order to find the sterling counterpart. One consequence of this was the decision to raise the total of bills on offer at yesterday's tender to the new record figure of £260 millions. Another consequence is reflected in the rise in bank deposits in September.

In the five weeks to September 20th clearing bank deposits rose sharply by £78 million to just over £5,856 million. The whole of this rise was due to an increase of £88 million in Government borrowing on floating debt from the banking system; bank cash holdings ran down by £12 million (thus depriving the Government of an equivalent volume of central bank finance) but bank advances and investments were little changed. The Government's new calls on the banks are partly explained by switching operations by the departments out of floating debt to put up their share of the £30 million call on the electricity loan on September 15th; the money raised by this call was largely used to repay bank advances. For the rest, the Exchequer seems to have run a very small deficit during the period and there was also a drain of about £10 million in net withdrawals from National Savings. It is clear, however, that internal transactions alone do not account for this upsurge in deposits.

British Jet Engines in America

Final details are now being worked out for a long-term contract between Armstrong-Siddeley Motors and the American Curtiss-Wright Aircraft Corporation. The agreement

will make it possible for Curtiss to build the present range of Armstrong-Siddeley aero engines under licence and provides for exchange of information on future developments. For some time the exchange is likely to be one way only. The American firm is soon to give up the airframe construction side of its business, which has been without orders since the end of the war. Its engine division, on the other hand, has been fully occupied building the Cyclone piston engines used in the more successful American civil aircraft such as the Dakota, the Constellation, the Skymaster and the D.C.6. During this period the company has done little or no work on gas turbine engines, being one of several American firms that rejected gas turbines for civil use in favour of the 'compound piston' engines which seek to improve the performance of a piston engine by using its exhaust gases to drive a turbine.

Without an agreement of the type now intended, Curtiss would have found it difficult now to catch up with gas turbine developments. A British firm was the obvious choice. But Rolls-Royce already have licensing agreements with Pratt and Whitney which cover most of their engines; these agreements date back to the Merlin piston engine. Armstrong-Siddeley have a smaller number of engines than Rolls but have successfully developed the Mamba and Python turbo-prop engines and the turbo-jet Sapphire, one of the most powerful of jet engines. The Curtiss contract will not interfere with Armstrong-Siddeley's licensing agreement with Westinghouse, which covers combustion chambers only.

A New Wool Scheme?

American proposals for international allocation of raw wool seem to have been changed. The latest proposal is for what the Americans call a 'set aside' scheme. No details have been published but reports from Australia give some idea of its outline. Certain quantities of certain types of wool are to be short circuited from the auction sales, and sold direct to the United States. This wool will not pass through the market, but the price to be paid will be based (so it is reported) on the average level of market prices for the grades of wool 'set aside' during each month.

In return for this arrangement, it appears that the United States has agreed to ensure that all wool 'set aside' will be used only for military purposes. Such a scheme could only operate through some such organisation as the Joint Organisation, which appraises all wool offered for sale in the three southern dominions; its acceptance must presumably imply that the United States is willing to accept the continuance of the Joint Organisation either in its present form or perhaps in a new dress as a Commonwealth wool scheme on the lines now under discussion by the international wool study group. Judgment cannot be passed on the 'set aside' scheme until all the facts are known; on present knowledge, however, it has several marks of a dubious transaction between Britain, the United States and Commonwealth suppliers.

Freedom for Softwood

The partial resumption private trade in softwood can be interpreted as an admission on the Government's part that bulk purchase has failed to deliver the timber. Softwood is critically scarce; stocks at the end of June were the lowest ever recorded - 164,800 standards compared with a figure of 199,000 standards a year earlier, itself the barest minimum. This reduction in stocks has occurred despite a 15 per cent reduction in consumption during the first half of 1950.

For the cause of the present shortage, one can blame the buying policy of the Timber Control last winter. This organisation refrained from buying in the vain hope that world prices would be forced down. When this miscalculation became obvious, little or no timber could be bought at any price. In the first eight months of this year imports of softwood have amounted to 441,670 standards, a reduction of no less than 21 per cent compared with the same period of 1949. There is usually a seasonal increase in imports towards the end of the year, but total imports for 1950 will be much lower than in 1949 and perhaps lower than in 1948 when only a million standards was received. Last Autumn, Russia offered another 153,000 standards for sale; a similar offer this year would be welcome but there is no sign of one.

Private imports are permitted only from members of the European Payments Union and Finland; and in the past these countries have provided about half of Britain's annual imports. This partial resumption of private trade is likely to result in a sharp rise in timber prices for Britain, if only because these will now have to match world levels.

South Africa's New Import Control

A statement recently issued from Pretoria lifts a corner of the veil from the new system of import control that South Africa is to introduce in the near future. Hitherto South Africa's foreign currency earnings have been divided into two pools. One pool has been made up of South Africa's earnings from gold production and from exports to and capital borrowed from hard currency countries. Gold and hard currencies coming into this pool have probably been worth between £150 to £180 million a year and payments have been made from it for 'essential' imports (i.e. imports on the 'universal' list). To the extent that these 'essential' imports have been supplied by countries that accept sterling in payment, the gold or hard currency concerned has come to London to swell the sterling area's central reserve. The second pool has consisted of South Africa's soft currency earnings and the capital inflow to the Union from soft currency countries. All 'inessential' imports have been satisfied by payments from this pool; thus America and other hard currency countries have not competed for the provision of 'inessential' South African imports.

It appears that this measure of discrimination against hard currency exporters is now to cease. Under the new system, all South Africa's current exchange earnings (both hard and soft), plus any inflow of hard currency capital, plus an additional sum in sterling equal in value to this hard currency inflow, will be put into one pool. A very rough guess suggests that between £250 and £300 million might come into this pool annually, of which about £120 million might be in sterling. Payments from the pool will be made for the vast majority of South Africa's imports - those, that is, which are covered by new 'general' licences valid throughout the world. The only exports from soft currency producers that will still enjoy differential treatment in the South African market will apparently be a limited list of 'inessentials', determined by the inflow of soft currency capital into the Union.

Less Gold for Britain?

When this new system comes into effect, American and other hard currency producers will be able to compete for the provision of a much wider range of goods to the South African market and it must be expected that they will draw heavily on the gold and hard currency in the 'general' imports pool. The gold portion of the pool that will accrue to the Bank of England, as a result of the purchases of soft currency goods by holders of general import licences, will not however be allowed to fall below £50 million annually. If American exporters earn so much hard currency from the pool that insufficient remains to cover the sale of £50 million of gold to the Bank of England, the 'essential' list will be shortened again, although it is unlikely that American competition will be so keen that a curtailment of the list will become necessary. Hard currency countries will clearly be able to battle for South Africa's gold on a much broader front than hitherto.

Under the old arrangements, it is believed that Britain got £9,000,000 worth of gold from South Africa in the first quarter of this year, £20 million in the second quarter and just under £20 million in the quarter recently concluded. If these figures are correct, and if Britain fails to secure much more than the £50 million annual minimum henceforth (as unfortunately seems rather probable), the sterling area must expect rather smaller gold receipts from South Africa in coming months.

What Price Danish Butter?

The Minister of Food, making a further attempt to restrain the rising cost of imports, has turned down Denmark's request for an increase in the price for butter under contract in 1950-51. The contract, signed just before devaluation, runs for five years; prices are reviewed each year and may be varied by not more than 7½ per cent up or down. In return for a long-term contract, Denmark agreed to reduce its export price from 321s.6d. a cwt to 271s.6d.; when, a fortnight later, sterling was devalued, the cost of feedingstuffs imported by Denmark rose sharply.

The Danish case for a higher price this year was statistically impressive. Import prices of feedingstuffs have risen by 35 per cent in the past year and fertilisers by 11 per cent. The Danish Government puts the rise in farmers' costs at almost 9 per cent during the period. Denmark has therefore suffered a sharp deterioration in its terms of trade since devaluation. From August 1949 to August 1950 the Danish price index for imports rose from 285 to 340 (1935 = 100) while the index of export prices fell from 308 to 290. Exports of butter to Britain alone represent about 18 per cent of Denmark's total exports.

The British case seems to have been rested on the proposition that at some time a halt must be called to the steady rise in food prices. New Zealand and Australia had already been refused a higher price for butter, and therefore no increase could be made for Danish butter.

Denmark has stated it will continue to ship 75 per cent of its butter exports to Britain. But the question is whether Britain's rigid attitude on prices will reduce the production of butter in Denmark. If, as the Danish Government claims, butter production is unprofitable at present prices, Danish farmers will attempt to switch to other products and to other markets. Such opportunities are limited. Bacon has to be sold to Britain at 'unremunerative' prices; eggs are abundant at the peak season; outlets for cheese and milk powder are becoming rapidly saturated; Germany, Denmark's other main market, wants to protect and develop its own agriculture. The British Government may know that it holds the trump cards; but it may one day have cause to regret that it played them for such a deliberate squeeze. It would never dare do the same to British farmers.

Britain's Overseas Investments

The Bank of England has taken up the trail that was blazed by Lord Kindersley between 1929 and 1939 in estimating the overseas investments of the United Kingdom. The figures have been brought up to date and supplemented by the information that has become available to the authorities through the operation of exchange control. They still cover only the nominal capital value of the overseas investments of British residents through the medium of securities quoted on, unofficially dealt in or otherwise known to the London Stock Exchange. Thus while Lord Kindersley's estimate of overseas investments at

the end of 1938 was £3,324 million, the Bank's estimate for the same year is £3,546 million the difference being largely accounted for by dollar securities that came to light as a result of registration with the Bank under Exchange Control regulations but which Lord Kindersley had no means of discovering.

The securities listed fall into three main classes - loans of central and local governments, shares and debentures of British registered companies operating mainly abroad,

Value of British Investment Overseas

(£ million: end year)		1938	1948
Government and Municipal Loan		1,521	797
UK Companies:	Share Capital	817	596
	Loan Capital	367	119
Overseas Companies:	Share Capital	473	304
	Loan Capital	368	144
In Commonwealth Countries		1,998	1,111
In Foreign Countries		1,455	749
Not Classifiable by area		93	99
		3,546	1,960

and those of companies registered abroad. Between 1938 and 1948 the nominal values of these securities fell by £1586 million to £1960 million; details are shown in the accompanying table. The interest and dividends received on these investments, which totalled £155.4 million in 1938, fell to £102.4 million for 1944, but had recovered to £116.4 million in 1948.

Prospects for Steel Supplies

Excellent steel production figures for September offer a good occasion to review the prospects for steel supplies in Britain and to measure the effects of the rearmament programme upon them. Weekly average production of steel ingots and castings in September was 305,900 tons, equivalent to an annual rate of output of 15.9 million tons a year. The forecast in this year's 'Economic Survey' was 15.75 million to 16 million tons for the year, and to reach the higher of these figures the industry would have to add 400,000 tons to its 1949 performance. In fact, the aggregate output for the first nine months of the year has been 12.1 million tons - about 530,000 tons more than was produced in the comparable period of 1949. The holidays are now over, and it seems fair to guess that production by the end of September was well above the rate of 16 million tons a year; the chances of exceeding the forecast seem to be good.

An article in the August *Statistical Bulletin* of the British Iron and Steel Federation, took an optimistic view of production prospects for the year, but added a note of caution about total supplies. Imports have been cut and now seem likely to be 400,000 tons lower this year than last. Exports have risen, and are estimated at perhaps 400,000 tons more in the year than they were in 1949. Some 600,000 tons were added to stocks in the hands of producers, merchants, and consumers last year, and since these stocks can very well be run down if need be, there seems no reason to anticipate any shortage. But it is unlikely that the expansion of direct exports can be permitted to go much further at present.

In the federation's view, rearmament will not affect domestic steel supplies this year in any serious way. It points out that steel-using industries would have difficulty in finding any more labour with which to increase their consumption of steel. The normal gradual improvement of productivity might lead to such an increase - but not simultaneously with any marked switch of production from pacific to warlike production. Such a switch 'would inevitably mean a temporary drop in productivity and therefore in steel requirements.'

Shorter Notes

The Minister of Supply has made an Order specifying February 15th as the general date of transfer under the Iron and Steel Act, 1949. On that date the securities of the 92 companies now specified in the schedule to the Act will vest in the Iron and Steel Corporation, which is at present engaged in recruiting staff and looking for offices.

The American Civil Aeronautics Board has at last agreed to accept in America the certificates of airworthiness issued by the British Air Registration Board to British-built civil aircraft. There are now no technical barriers to the import of British aircraft into the United States.

A revision of the hosiery utility scheme has been carried out by the Board of Trade, and a new schedule of specifications covering certain kinds of knitted goods other than silk and nylon stockings has been embodied in a new Order which comes into operation on October 20th. The purpose of the changes is to 'afford greater scope for manufacturers in the selection of materials and method of construction'.

Company Meetings

BEKOH CONSOLIDATED RUBBER ESTATES

Satisfactory Trading Results

The 30th annual general meeting of this company was held on September 29th in London, Mr. E. G. Estall, the chairman, in the course of his speech said: The net profit for the year is £36,010, against £11,766 last year. This represents approximately 3d. per lb. on crop harvested.

The crop was 2,801,447 lb. say 299,000 lb. lower than the previous year. Irrespective of the lower crop, there was no increase in the cost of production. The all-in cost, including replanting and upkeep of immature areas was just under 9d per lb. The result of the year's working, I am sure, is considered very satisfactory, and I have little doubt that when the dividend of 10% has been declared it will be received with acclamation.

Your directors considered it prudent to sell forward part of the crop and thus ensure that estate expenditure was covered for the current year. Since the issue of the report sales for 1951 have been made as follows:- 5 tons monthly January/December 1951 at 2/6d per lb. c.i.f: 5 tons monthly January/March 1951 at 3/3d per lb. c.i.f: 5 tons monthly April/December 1951 at 2/8d per lb. c.i.f.

The crop for the year which ends 31st March next is estimated at 2,870,000 lb. Of that crop just under 1,000,000 lb. have been sold or valued at lower than today's price, showing a profit of very nearly double that earned for the year under review. Your Directors feel that an interim dividend should be paid, and it was decided that this should be 10% payable on October 23rd.

Sir Sydney B. Palmer, who had visited the Company's Estates, confirmed their good condition.

The report was adopted.

A. C. COSSOR, LIMITED

Year of Marked Improvement

The Twelfth annual general meeting of this company was held on September 26th in London, the Rt. Hon. Lord Burghley, K.C.M.G. (Chairman) presiding.

The following is an extract from his circulated address:

The company has made a net trading profit of £114,659. Taxation absorbs £26,115 leaving a balance of £88,544. This compared with a net loss last year of £207,814. The corresponding figures for the group as a whole are a profit this year of £99,370 against a loss of £213,969.

The bank overdraft has been reduced from £679,343 to £373,490, while the group's total overdrafts have fallen from £849,849 to £383,133. The net current assets of the group at £1,305,688 show an increase of £135,851.

The company's turnover for the year (in all branches) was approximately double that for the preceding year, while its overhead expenses remained practically the same. This alone will perhaps give you some idea of the vigorous efforts made by your management to put your company upon a sound and healthy basis.

You may now, I think, perhaps begin to feel that the patience with which you have supported your board through some very trying times is coming within sight of some reward. I told you in my address a year ago that I thought the corner had been turned. The results before you justify this statement. This year, up to the present time, the indications are that we are doing better than a year ago.

To build up your company into an unassailable position remains our policy. At the same time the shareholders are fully entitled to expect a reasonable return. It is therefore our aim to resume the payment of dividends as soon as possible.

The report was adopted.

HENDERSON'S TRANSVAAL ESTATES

Strong Financial Position

The 38th annual general meeting of this Company was held on September 27 in London.

Sir Joseph Ball, K.B.E. (chairman and managing director), who presided, in the course of his speech said:- The consolidated balance sheet again discloses a very strong financial position. Both the market value of our quoted investments and the estimated value of the unquoted securities which we hold are substantially in excess of the book value.

The gross revenue received by the Parent Company is almost the same as the previous year at £90,260, but the net profit for the year, after allowing for taxation, is up by £10,333 at £50,342. There has been added to the General Reserve a further sum of £11,500. We recommend the payment of a dividend of 15 per cent., which is at the same rate as for the three preceding years.

The dividends distributed by Henderson's Transvaal Estates since 1932 amount to no less than 208 per cent. on the issued capital of the company, and since that date the General Reserve has been increased from nil to £341,500.

We hold, through our subsidiary, Mineral Holdings, Ltd., the mineral rights in the farm Vryheid No. 799, which adjoins the property of the Messina (Transvaal) Development Co., Ltd. The results of a geophysical survey were sufficiently encouraging to warrant further investigation, and a programme of boreholes is in progress.

The report and accounts of Tweefontein United Collieries, the subsidiary through which your company holds its very large interest in the South African Coal Trade, show that the company is well maintaining its position among the leading Transvaal Colliery Companies.

The report was adopted.

GOLD MINES OF KALGOORLIE

Record Output

The annual general meeting of this company was held on September 29 at Melbourne.

Sir Walter Massy-Greene, presiding, said:- The mill treated an average of 12,555 tons per four-weekly period, which exceeds the previous highest output of 12,400 tons attained in the previous year. (The figures quoted are in sterling unless stated otherwise.)

The tonnage treated was 163,213 tons, of which 163,182 tons came from the company's leases and returned 41,337 ounces of fine gold, equivalent to a yeild of 5.07 dwts per ton. The gold realisations averaged 55.3/- per ton of ore treated, an increase of 12.2/- compared with the year before. This is in part due to the increase of .07 dwts per ton in the grade of ore treated, but is mainly due to the increase in the price of gold, which from 19th September, 1949, was £12/8/- stg. or £A.15/9/10 per fine ounce against the old price of £8/12/3 stg or £A.10/15/3.

Operating costs increased by 4.11/- to 37.82/- per ton. The profit before appropriation amounted to £139,862, which is £73,919 more than the previous year's profit. The interim dividend of 1/- per unit paid on 13th April, 1950 took £61,475 and the proposed final dividend of 1/3 per unit will absorb £76,844.

The total development of 8,049 feet is 547 feet less than carried out in the previous year. The percentage of payable development footage on lode was 46.6%, an increase of 3% on last year's results, and the average grade of the ore exposed was 9.1 dwts over 56 inches. The pleasing feature is the good average grade disclosed, even though it is below last year's exceptional figure.

The report was adopted.

WESTERN MINING CORPORATION

The annual general meeting of this Company was held on September 29 at Melbourne. (The figures quoted are in Australian currency).

Sir Walter Massy-Greene, the chairman, in the course of his speech, said:-

The profit for the year was £154,204. Revenue was derived mainly from the following sources:- first, dividends from Central Norseman Gold Corporation N.L., £82,031, and from Gold Mines of Kalgoorlie, Limited, £23,082, and, secondly, profit from the sale of shares, properties, etc., £58,751.

Progress of Associated Companies

At Gold Mines of Kalgoorlie the main feature has been the good grade of ore developed recently. Progress is being made in installing the additional equipment required to increase output.

At Central Norseman additions to the mill and power house are approaching completion and output has reached a rate of 150,000-160,000 tons per annum.

At New Coolgardie developments have been very satisfactory.

At Central Victoria Dredging the Jim Crow Dredge has been brought into production.

The main features in the affairs of the companies in which W.M.C. has a substantial interest are the expansion of activities, increased expenditure on buildings and equipment, and the difficulties of obtaining speedy deliveries of plant and materials. Extra finance has, in consequence, become necessary and this has been provided by Western Mining Corporation.

The Future of Gold

Since our last annual general meeting the further devaluation of sterling and of the Australian pound has fundamentally altered the prospects of Goldmining in this country.

I do not think we have yet seen the full effect of war finance on the price of gold. America is still hanging on to the dollar price of gold of $35 per fine ounce. I believe there is nothing surer than that sooner or later the anomalous position of the dollar price of gold will be corrected.

I look forward to a still greater revival in the gold mining industry, and, as the relative rates of exchange are adjusted between the United States and the whole of the sterling area, a satisfactorily payable price for gold for a long time to come.

Until there is a free market for gold and paper money is freely convertible into gold, inflation must and will continue. The report was adopted.

AMALGAMATED TOBACCO CORPORATION

Lord Llewellin's Statement

The fourth ordinary general meeting of the Amalgamated Tobacco Corporation Ltd. was held on September 21 in London, the Rt. Hon. Lord Llewellin, P.C., C.B.E., M.C., T.D. (chairman), presiding.

The following is an extract from his statement:-

Our gross trading profit of £259,221 for the 10 months' period was running at about £25,000 per annum higher than last year. The same improvement is not apparent in our net profit after providing for taxation, because our provision for tax in this 10 months' period is almost as high at £104,262 as it was last year at £106,195 on a full year's profit.. This unusually high figure is due to adjustments arising from the change in our accounting date and the placing of our income tax on a more current basis.

As a result of this very heavy tax charge - a non-recurring event - net profit after providing for taxation is £68,819 for 10 month,, against £97,741 for the previous full year. The directors feel justified in recommending dividends for the 10 months at the same rate per annum as last year.

Walkers Tobacco Company, Ltd., our newly-acquired subsidiary, shows a profit for the twelve months to March 31, 1950, of £19,918 plus £3,000 provisions of previous years no longer required, £22,918. Taxation requires £12,500, £9,000 pre-acquisition profits are transferred to reserve and £2,070 carried forward.

The steady rise in leaf tobacco prices, whilst the price the manufacturer receives for his products remains unchanged, is a matter of concern. These conditions have been accentuated by the devaluation of sterling, but they have persisted now for some years and have very largely offset the benefits we would otherwise have obtained by developing our business in the way we have.

In conclusion, however, I am happy to say that the demand for our products and the reports we receive on them indicate the good saleability of our products under whatever conditions of competition we may have to encounter in the future and, meantime, our results to date in the current year are fully equal to those of the corresponding period last year.

The report was adopted.

WATNEY COMBE REID AND CO.

High Standard of Quality

The ordinary general meeting of this company was held on September 22nd, in London. Major A.C.Bonsor (the chairman), presiding.

The following is an extract from the chairman's circulated statement.

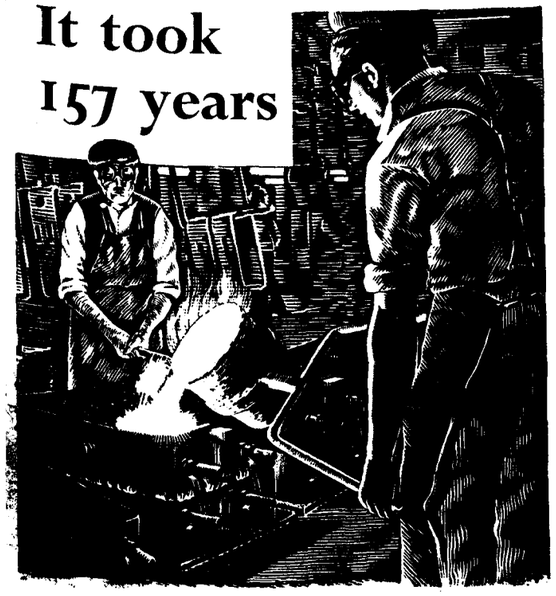
In April this year the Chancellor rearranged the existing heavy rates of beer duty. This did not check the continuing decline in sales, a decline particularly bad in the southern half of England.

Every possible precaution is taken to ensure that the products which we offer to the public are in all respects of the very highest standard of quality. We have, during the year, introduced a new and stronger bottled beer-Red Barrel Ale-which is meeting with a most satisfactory reception, while our container beers, which, by their special preparation and sale in stainless steel containers, possess unique attractions for clubs, hotels and ships, are gaining an ever-growing popularity. I am also pleased to be able to state that our export trade is making slow but none the less appreciable progress.

Effect of Taxation

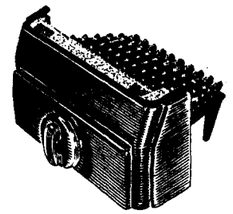
But while these facts are all to the good, it would be most imprudent to close our eyes to the probability of a continuance of the present state of affairs, and, moreover, the possibility of still further deterioration.

I still consider that there is little likelihood of any sustained improvement until the taxation on beer is really materially reduced so as to bring the price once again within the diminished spending power of the public.



During the year, thanks to an easing of the position with regard to licences, we have been able to make substantial progress in overtaking accumulated arrears of repairs and decorations to our houses, but much still remains to be done.

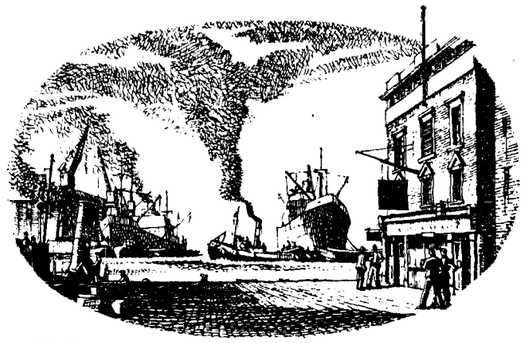
The rate of progress in providing licensed houses on new housing estates and the replanning of licences in war-damaged areas is still deplorably slow and that is certainly not the fault of the brewers. The replacement of worn-out buildings is still not allowed, other than in the most exceptional circumstances.



The profit on trading at £1,452,329, shows a decrease of £130,041. After providing for taxation, the net profit for the year is £70,138 smaller at £873,197.

The report and accounts were unanimously adopted and a final dividend of 10 per cent., making 15 per cent. for the year, and a bonus dividend of 2 per cent. on the deferred ordinary stock were approved.

It took 157 years



Producing modern, labour-saving domestic firegrates that economise in fuel and keep fires burning continuously, night and day, is but one of Newton Chambers' many interests. These appliances are rapidly produced in large numbers with a skill and quality of workmanship acquired over seven generations in ironfounding. Newton Chambers started ironfounding in 1793 and the high standard of quality in everything they produce has been maintained from that day to this.

IRONFOUNDERS · ENGINEERS · CHEMICAL MANUFACTURERS

"Next to mine own shippe I do most love that old Shippe in Exon, a tavern.... A mariner fresh come from Plimouth told me that the Power of Spain is already afloat." Thus wrote Drake (according to local tradition) when the Armada was fitting out. In every port there are taverns which have heard tidings brought from distant seas and plans for great ventures—taverns which have been preserved by the brewer working in a unique form of partnership with mine host.

Beer is stronger now and costs no more

COTTON: The association between Egypt and cotton dates from the earliest days of that ancient country and woven cotton has clothed its inhabitants ever since the time of the Pharaohs.

In spite of this long association, it was not until 1820 that Egypt set out to produce cotton in the quantities required by European manufacturers, and the year 1821 saw the first shipment of Egyptian cotton to England. The shipment was only 100 bales—but from this small beginning the export of cotton has become the mainstay of the Egyptian economy.

Full and up-to-date information from our branches in Egypt on market conditions and industrial trends in the country is readily obtainable on request. Please write to our Intelligence Department at the address given below.

Because it has a mind of its own . . .

No one has ever accused the Guardian of not knowing its own mind. Does that suggest the party line—the mind made up in advance of the problem? Not to those who know us best! This is a newspaper with a tradition of editorial freedom. The free mind is an open mind.

You will find much to agree with in the Guardian. And to disagree with? Certainly. You too have a mind of your own, politics of your own—possibly prejudices. But opinion well-reasoned and well-informed makes good reading—and useful reading

When the news in your daily paper is fuel for controversy, it is always worth while to find out what the Guardian thinks. And easy, too. Comment in this paper is forthright—and seldom undecided. Leader-writing with the gloves off? Hardly that. But never leader-writing with handcuffs on!

Read the MANCHESTER GUARDIAN *too*

EMERGENCY EDITION

The Economist

Established 1843

October 21, 1950

One Shilling

It is impossible to foresee how much longer the dispute in the printing trade will continue. We are most actively exploring every possibility of improving the quality and increasing the size of these emergency editions. Meanwhile, it is perhaps advisable to explain why we continue to charge a shilling for what is only a shadow of what The Economist *should be. For one thing, these emergency editions actually cost more to produce than a normal edition. For another, the immense amount of labour that would be involved in altering the price and then altering it back again would put a burden on our accounting and publishing departments that they could not carry at a time when very long hours are being worked coping with the physical problems of simply getting the paper out. We ask for the patient indulgence of our readers.*

Houses in the Air

In recent years the annual conference of the Conservative party has not been regarded as an event of much importance either by political observers or by Conservative politicians themselves. The amorphous nature of the party organisation, the fact that policy is handed down from the leader of the party and is not - even in theory - handed up from the party delegates, and the enormous size of the gathering, four times as large this year as the Labour party conference, have combined to make it into an assembly more noted for enthusiasm than for clear thinking. It has been a rally rather than a conference, the signal for a demonstration of enthusiasm rather than a serious discussion of the aims and content of Conservative policy. For the party managers the advantage of this system is clear enough, it provides an opportunity to kindle immense enthusiasm, and to send the delegates back to their constituencies with fire in their hearts and a pleasant cloud in their heads. This makes it an assembly which is more easily swayed by demagogic oratory than by a cool discussion of the implications of political policy. The more thorny questions are edged out by those on which it is possible to produce the greatest enthusiasm.

The advantages and disadvantages of this system were clearly illustrated at last week's conference at Blackpool. The hardy annuals of Imperial Preference and free enterprise performed their function of stimulating unity and enthusiasm. On the other hand neither the Schuman Plan nor Western European Union - two issues on which the Conservatives in parliament have most strenuously joined issue with the Government - were even mentioned. It was only the skilful advocacy of a young delegate, Mr J. Gower, that prevented the conference from being seized with such mass hysteria about Communism as to saddle the party with a promise to conduct a legal witch hunt against the Communists. World opinion, which pays more attention to party conferences than to political pamphlets and programmes, has been only narrowly prevented from conceiving a very false opinion of what a Conservative government in office might seek to achieve.

Much the most interesting development at Blackpool was the release of a sudden wave of pent-up protest which swept aside a carefully non-committal resolution on housing policy, and forced the party executive to commit itself to build 300,000 houses a year - half as much again as the present Government's rate of building. The resolution was moved as the result of a purely demagogic agitation among the delegates of a kind to which an unorganised gathering such as a Conservative conference is particularly susceptible. It was quite plain that it was received with the greatest reluctance by the more thoughtful leaders of the Conservative party. On a cool calculation it is difficult to see how it is possible to build an extra 100,000 houses a year and still retain the rest of the investment programme without seriously adding fuel to the flames of inflation. The

grave men of the Conservative party have already shown how embarrassing this new demand is to them.

But considered in terms of electoral advantage, this demand may prove most useful. The trend of Conservative thought during its five years in opposition has been towards a specific policy which it could oppose to the specifics of Socialism. It has been borne in upon Conservatives that the days have gone when it was possible for Tories to pose as the party of sound government and sound men, and to expect to regain power whenever the electorate was tired of a more definite or a more expensive programme. Many Conservatives have come to the conclusion that a better educated nation expects to choose between two equally coherent and specific political programmes.

Here is an opportunity for the Conservatives. The temper of their conference showed how deeply the shortage of houses has bitten into the consciousness of the ordinary person. The rank and file of the Conservatives want 300,000 houses built a year. What better opportunity could there be for the Conservatives to take the wind out of their opponents' sails? It is true that to build so many extra houses would involve considerable cuts in the rest of the investment programme. It could only be done without creating further inflation by curtailing other forms of building, whether offices, schools, power houses or factories. But if the nation feels that domestic dwellings are more important - and there is no authority which can say that they are less important - than the provision of electricity, education or employment, then the Conservatives have, if they are prepared to explain the disadvantages as well as the advantages of the programme, a positive policy to put before the nation. Mr Aneurin Bevan made great play at the Labour party conference last year with the phrase, 'the language of priorities is the religion of Socialism'. But, in fact, the religion of Labour in office is of priority for every kind of capital and social expenditure. If the Conservatives are really prepared to use the weapon of priorities, they will have forged a formidable weapon with which to fight their opponents upon their own ground.

During the last five years, the voices of the moderates within the party have come to exercise more and more influence. There have been many Conservatives who have regarded the attempts of Mr R.A. Butler to concentrate the party's fire not upon the principle but on the inefficient practices of the welfare state, as rank heresy. But in the absence of a coherent alternative, Mr Butler's ideas have prevailed and the result of the February election greatly strengthened his hand, first, by showing that a policy of moderate Toryism can win votes, and second, by bringing into the House of Commons a number of new members of his own way of thinking. The pamphlet on social policy 'One Nation' recently published by a group of new members clearly shows that intelligent Conservative thought is now concentrated upon the means by which the priorities within the welfare state can be better arranged in order to produce more efficient results and make the cost less onerous.

Unless the present government has an unexpected run of luck in the forthcoming by-elections, or unless it can summon up new reserves of energy and pertinacity, it is probable that there will be another general election in the spring. The Conservatives have therefore only a few months in which to prepare a new election programme. It will be a tragedy if it is merely a reproduction of the programme for the last election, that is a collection of promises of future benefits with little indication of the corresponding rearrangements and sacrifices which must be made. From the temper of the three recent political conferences, it is clear that the main preoccupation of the ordinary citizen is with the danger of war and with the steady growth of the cost of living. If the Conservatives are wise, they will not underrate the intelligence or courage of the ordinary citizen nor his capacity to learn that in a dangerous and insecure age it is not possible to pursue every desirable form of social activity at once.

Third Front in Asia

Frenchmen and their allies can no longer pretend - as they have been frequently tempted to - that the war in Indo-China is a matter of colonial and not of international policy. If there lingered any reasonable doubts on that score they must have been scattered by the grave events of the last fortnight. For, at the very moment when a deeply worried Europe was beginning to sit back and appraise the recent triumphs and future risks of the Korean campaign, there came the news of a French offensive nipped in the bud, of a garrison of seasoned troops almost wiped out and another suffering heavy losses, and of new and urgent requests from Paris for American aid. The blow came, too, at a time when the French were congratulating themselves on the capture of Thai Nguyen - for a long time the Viet Minh capital - and reports suggested that Ho Chi-minh could not mount another major offensive. Now it seems that his partisans have been reinforced, reformed and supplied with high class weapons from camps and dumps in Communist China; and the French face not a further sequence of guerrilla operations but set battles with a force of some 50,000 men in which decisive gains might be made by either side.

The response from France has been resolute. General Juin, its outstanding soldier, is on the way to Indo-China to report on the situation. Public opinion, so long divided by bitter argument and searchings of conscience over the rights and wrongs of *la sale guerre*, has been brought by disaster hard up against the fact that Ho Chi-minh and his partisans are cast for a major role in the plot of the cold war. He is no longer just the leader of nationalist resistance against what Mr Nehru would call effete colonialism, a personality attractive to the European left and even - not so long ago - to the Americans. His role now is a military one: to maintain a third front in the cold war by pinning down in a crucial area of Asia men and material needed for the defence of western Europe. How successful he has already been is seldom grasped outside France. Here on China's southern frontier, 8000 miles from home, are engaged 150,000 troops, the cadres of NCOs and technicians around which the new French army in Europe of 20 divisions should be forming. The budget for the campaign of 1951 is almost half of the cost of home defence - that is to say, of France's contribution to the Atlantic Pact.

Even at this high cost the French effort has always fallen short of complete success and pacification; now even the limited gains of the past are in danger. Fresh American aid in arms and supplies is expected and reinforcements are on their way from North Africa; but it may be that the Chinese can now keep up along the newly built frontier roads a flow of aid to Ho Chi-minh's army, which will keep the odds heavy against the French. In short, it is impossible to see any end to war in Indo-China unless more strength can be marshalled there against the Communists than France can afford to send. The alternative is either a partial or a complete French withdrawal, solutions not only unthinkable but impracticable in the present situation. In such a plight France has every right to turn to its allies for help.

Sentiment and solidarity apart, what exactly are the stakes in this corner of Asia? What is there in Indo-China that can justify this steady drain on French strength and American aid? There is first the strategic situation: if they could control Indo-China, Communist armies would be on the march towards the main sources of the west's rubber and tin and Asia's rice. Through the adjoining states lies the way not only to India and Malaya but to enlisting the Chinese minorities throughout south-east Asia on the side of the Communists. If there is anywhere in that region a line where containment is vital it is in Indo-China; and no power has a stronger interest in holding it than this country. Second, there is the infant state of Viet Nam, on the way to almost complete independence in the French Union, aspiring to be one of the successful new regimes of Asia. Is this too to be overrun in the name of liberation and civil war? If it is, then the repercussions will be felt wherever the white man is coming to terms with the new Asia. The case for helping the French could not be clearer.

On more than one occasion Mr Acheson and Mr Bevin have said as much, but with an air more of condolence than conviction. There has seemed to be in Washington and London a lukewarmness towards the appeals from Paris which probably is due to misgivings about the Bao Dai regime - which they have recognised - and the French handling of it. Moreover, American policy in Asia has been going through a period of uncertainty that has hampered any concerted action with British policy, which persists in believing that the Chinese Government can be wooed and won away from solidarity with Moscow. With the American elections approaching, and with President Truman and General MacArthur apparently now in rough agreement, the time may be close when some order can be introduced into the present confusion of western policy towards Asia. If so, it is time for the French to make up their minds just what they expect of a collective approach to their problem in Indo-China.

One thing is certain; if there is to be collective action by the Big Three, there will have to be a joint policy. That is a fact that the French have so far been loth to face, largely because of their fear that what happens in Indo-China will set precedents for North Africa and other spheres of interest oversea. But the first need is to stop the present military threat, and to make it clear - as France alone cannot - to Ho Chi-minh and his Chinese backers that there must be no repetition of Korea. With guerrilla operations turning into full-scale warfare, this may be the moment for the French - or one of their allies - to bring the threat to peace in Indo-China before the General Assembly of the United Nations. Such an appeal means far more now, after Korea, than it has meant in the past. It would be a warning that the Communists could not disregard. It offers the prospect of a fair and full presentation of the case for Viet Nam and for French policy, the declared object of which is to give the country virtual independence. It would focus the world's attention on the dilemma that has been created there. For, so long as the partisans of Ho Chi-minh threaten the security of Vietnam, so long must it be protected by foreign power in some form or another; and so long as that power comes from France, and from France alone, so long will the government of Bao-Dai be regarded with distrust in all Asian capitals.

The pros and cons of referring a problem to the United Nations depend on calculations of certain and marginal votes, and on a knowledge of procedure and powers, that are beyond the layman's competence. If careful consideration of such a course shows that the risks outweigh the advantages, that there is nothing practical that the General Assembly could do, then it is for the Big Three to find other means by which collective power can be brought to bear in this vital area. One of the lessons of Korea is that military action against an aggressor needs the support of clearly conceived and firm political action. It is that above all which has been lacking in Indo-China, which is strategically far more important to the West than Korea.

NOTES OF THE WEEK

Aggression and the Veto

The current debate in the United Nations Assembly is making it clear that Mr Acheson earned the sympathy of large parts of an exasperated world when he produced his 'United Action for Peace' plan. Its purpose is to by-pass the veto when the veto is used to prevent action to stop an aggressor. At the time of writing it is being redrafted to meet amendments from all over the world, few of which, however, seem to amend its substance. It is also the subject of a wordy difference between the lawyers of east and west as to whether it does or does not amend the Charter by the back door. Mr Vyshinsky, arguing ably but on the defensive, is fighting to defeat it by proposals to use old apparatus afresh; but he has so far shown no indication of readiness to use this in a new way.

Amidst a welter of legal technicalities two main facts about the Peace Plan should be kept in mind. The first is that it is not a substitute for the veto. This, as originally conceived by several great powers besides the Soviet Union, was designed to give any one of the Big Five state members the right to say that it was not automatically prepared to act in fulfilment of the Security Council's compulsory powers. It is wilful misconception of this sensible purpose that has transformed it from a contracting-out system into a system for preventing any action whatsoever.

The second fact is that the 'United Action' plan does not and cannot transfer the Security Council's powers of compulsion to a two-thirds majority of the Assembly. The Assembly can only recommend, and must rely on a powerful consensus of national opinions to execute its recommendations. Presumably, if these are widely viewed as un-enforceable (as they were in the case of its recommendation to internationalise Jerusalem), they will simply be left in abeyance. A vote for the Acheson plan, with its dependence (whenever the Security Council has reached an impasse) upon a two-thirds majority which may consist entirely of small states, therefore exposes the Assembly to the risk of an indignity - to that of voting impotently for some worthy plan that cannot be executed. But in the impasse to which the Russians have reduced the Security Council, it offers the optimum chance of widespread cooperation to stop an aggressor. Its best point is that it provides a loophole for the exercise of common sense.

Tito Faces Famine

Marshall Tito's problems have been increasing for some time. The attempt to carry out the gradiose plan of industrialisation with insufficient manpower and inadequate machinery was bound to run into difficulties; and Cominform hostility has forced him to divert much of his scanty wealth to rearming. Largely owing to his unwillingness to accept the foreign advice and inspection which are the normal conditions of loans from abroad, he has obtained less than $80 million in foreign loans. Yet, according to Jugoslav estimates, $300 million is required for economic and defence needs alone. Now the drought, which has reduced the harvest to about half of last year's, may come near to being the straw that breaks the camel's back.

The Jugoslav government is doing what it can. It has banned the export of maize and cut the compulsory purchase of maize from the peasants; it has also decreed the abolition of the special privileges for Government and party officials which have created so much resentment among ordinary people. But only the import of about $50 million worth of grain will suffice to avert a famine. And this cannot be bought without a dollar loan or grant-in-aid. Tentative talks on the matter have been going on for some weeks in Washington. Now Marshall Tito, who has shown an understandable reluctance to compromise himself with his own Communist supporters by too open dependence on the west, has at last decided to apply to the United States for aid openly and in writing. He must realise that his greatest asset has been and still is the loyal support of most of the Jugoslav people. It has survived tremendous material hardship but might well give way under the strain of actual starvation. From a failure to give prompt and adequate help to Tito only the Cominform will benefit.

Problems of the Thaw

'Restraint' in wage claims is over. It has now been more than rejected by a narrow majority of the Trades Union Congress; its stoutest practiser has abandoned it. Mr. Deakin's great Transport and General Workers Union decided last week to take up officially the demands for higher pay that have been agitating two of its main constituent groups, the dockers and the bus workers. Though the details are not yet settled, the promise is of 'substantial' claims. Mr Deakin is one of the few union leaders who has tried to apply in his own union's policy what he accepted in discussions with Ministers. When the T and GWU turns to claim higher wages no union will be far behind. The long-heralded thaw for wages is coming.

The thaw may still be gradual. What has ended is union restraint in making claims. That was never the most effective part of the wages policy. The main practical expression of restraint was the unions' acceptance of the long delays, and small results, which the processes of negotiation and arbitration have secured since 1948. The engineering unions last week rejected the employers' offer (after previous refusals) of as much as 11s a week for skilled workers. The barriers to wage advances are still unlikely to be swept away so completely that an immediate large inflation of British wage costs must follow. But, with some barriers still standing, the thaw is likely to create dangerous oddities in the wages structure. The coal industry's National Reference Tribunal decided last week that the Coal Board could afford to pay out £3,500,000 a year more in wages, but it left the miners' union and the Board to work out how this should be done. In its financial effect this new departure in wage awards is very like the usual compromise of arbitration - less than a third of what the union asked and 50 per cent more than the employer offered. But in dodging the difficult part of the award - the decision on which miners should get what - the Tribunal has created a disturbing precedent. The £3,500,000 seems to have been chosen as the estimated surplus the Coal Board may earn after paying off its remaining losses from 1947 Will a nationalised industry that reduces costs ever be allowed to use the resulting surplus either to cut its prices or to plough back savings for investment?

Trouble at the BBC

Recent events must have convinced the BBC that it never rains but it pours. Of the 'Party Manners' controversy, which Mr Clement Davies has announced his determination to keep alive, one can say two things. Firstly, Lord Simon's apologia for his ban - viz: that BBC impartiality should not extend to any matter bringing democracy itself into disrepute - would have carried more weight had the ban been imposed in the first instance instead of following, however coincidentally, on the assault upon the play of the organ of Lord Simon's party. Any suspicion of censorship on political grounds does infinitely more harm than a little mockery. Secondly, the Postmaster General's refusal to hold an enquiry, on the grounds of the undesirability of Parliamentary interference with day-to-day programme-building, entirely misses the point, which is to establish whether or not there was any interference by a political party in the day-to-day administration of the BBC.

The resignation of Mr Norman Collins raises afresh the uneasy question of the relationship between sound and visual broadcasting. Had both techniques been invented simultaneously that question would hardly have arisen, since there would surely have been but one service from the start, using sound and sight in the proportions required by the subject matter. Division of authority according to matter transmitted - drama, music, spoken word- has a sounder logical foundation than division according to the technique employed - visual or aural - which inevitably gives the technique mastery over the content of the programmes, as if printers should decide what was printed. The more experimental nature of television does indeed call for a chief of exceptional calibre with considerable scope for initiative; but this is a very different matter from elevating television to virtual independence and parity of status with the parent Corporation, - which must, in any case, heavily subsidise it.

ECA speaks out

America's generous and vital grants of dollar aid since the war give it every right to pass judgment on other countries if they do not make satisfactory use of that aid. In both Athens and Rome, however, there has lately been a good deal of dismay at American criticism directed at domestic policy. While the Greeks have suffered the most - their total ECA aid has been reduced from $267 million last year to $207 million in 1950-51 - in Italy some reported remarks of Mr Leo Dayton, head of the ECA Italy mission, recently caused a political explosion.

The ECA mission in Greece was more careful, in that it placed the blame squarely on all the major political parties, and only after very lengthy discussions in private. It condemned the Greeks for their inadequate investment programme. This, it felt, was partly due to political instability, as a result of which the Greek government had not carried out several measures repeatedly recommended by ECA. These include reorganising the civil service, increasing and enforcing direct taxation, controlling investment to avoid luxury and unproductive projects, and promoting foreign exchange earnings.

In the 'Dayton affair', as it has become known in Italy, the ECA mission condemned the deflationary policy pursued by Signor Pella, Christian Democrat Minister of the Treasury, as excessive. Mr Dayton has since partly withdrawn his statement by a letter to Signor De Gasperi, the Prime Minister. But it is known that his view was substantially shared not only by Republican and Socialist ministers in the Italian cabinet, but by Mr Foster the new head of ECA in Washington, if not by the American government as well. In Greece American criticism was certainly justified. In Italy there is more to be said for caution after a 5000 per cent inflation in a decade. But, however awkward politically, American views deserve treatment as disinterested advice. There can be few small Italian business men who do not hope that it will be taken.

The Attlee of the Amazon

The final results of the Brazilian elections are not yet fully tabulated, but the Presidency is already being conceded to Dr Vargas, with over 50 per cent of the votes so far counted. His closest rival, Brigadier Gomez, has to date received less than 30 per

cent, and the balance is held by Dr Machado, the candidate of the outgoing government.

Until he was ousted by the Army in 1945, Vargas had held the Presidency of Brazil for fifteen unbroken years, in the last eight of which he had dispensed with democratic elections. It is difficult to translate his current victory into conventional European terms. The bulk of his supporters are well to the left of centre, yet he does not speak for either the Brazilian Socialist or Communist parties. The roots of Vargas's success probably lay in the insipidity of the outgoing Dutra regime, the discontent among all classes with the rising cost of living and his promises to extend social benefits to the backward rural population. His own colourful personality and vigorously conducted campaign were also potent factors.

In a recent statement to the press, Vargas indicated that his new government would follow Socialist models of Britain and Sweden; it would be a government, in his own words, of 'evolution, not revolution'. In practice this is likely to mean greater expenditure on the social services, increased government investment, possibly some attack on the fantastic profits of the coffee producers, and - if he is to keep to his models - eventual devaluation. Vargas has no doubt benefitted at the elections from at least the passive support of some sections of the business community. They are likely to be the first to regret the consequences of 'evolution'.

Throughout the elections all the candidates consistently ignored the subject of foreign policy. Since the outcome has been clear, however, Dr Vargas has affirmed his enthusiastic support of the 'Good Neighbour' policy pursued by President Truman and expressed a desire for closer ties with the Latin American countries. These generalisations do not throw much light on the future of Brazil's commercial relations with the outside world, particularly Britain.

Exercise Emperor

The nine-day air exercise 'Emperor' which finished last Sunday was not designed primarily to test the present air defences of Great Britain, but to study new methods of defence and attack. It will be some months before the final analysis of the results is available, but it has been agreed, by those who took part, that the exercise has shown that current developments in the technique of both defence and attack have been shown to be on the right lines. Since the exercise was spread over a number of days, the weight and persistence of the attack could by no means be described as a rehearsal or simulation of an actual high level bombing offensive, but the way in which the fighters were able to locate and make contact with their targets - which necessitates the ability to reach a height of 40,000 feet within a few minutes of receiving the warning of approaching bombers - was encouraging. The speed of fighter operations has, however, created fresh problems of control, since aircraft moves from sector to sector in a matter of minutes. The problem is to create control sectors sufficiently large to ensure unified control without overburdening the operations staffs.

On the hoary Anglo-American argument over the relative virtues of day or night bombing, there is still no sign of compromise. Each party to the argument has developed its own technique to a point where it seems possible only to agree to differ. Exercise 'Emperor' has however illustrated how important inter-allied cooperation on the ground has become, since the defences of Britain are now virtually dependent on the cross channel and Western European radar network. Encouraging as the results of the exercise have been, they should create no illusion about the enormous expansion in guns and aircraft which is necessary to ensure even the barest margin of safety from air attack.

Planning for Planners

The Report of the Committee on the Qualifications of Planners (Cmd. 8059; HMSO 2s6d) raises wider questions than its title implies. To discuss constructively the qualifications of planners one must consider the nature of planning itself; and while a narrow interpretation of that term - e.g. the architects' focus on aesthetically satisfactory physical design - makes the assessment of necessary qualifications comparatively straightforward, the Committee has wisely rejected it. Planning the use of land is only one aspect of planning in general. Yet no other aspect so directly, intimately and permanently affects the daily lives of ordinary people. Planning decisions are civic decisions; the expert can indicate possibilities and impossibilities, he can synthesise, reconcile, implement and administer, but as servant, not as master.

The powers of the planning authorities have only too obviously outrun both what the report calls 'the limits of the plannable' and the supply of persons qualified to use them. The 'limits of the plannable' will presumably be discovered by trial and error; the supply of qualified persons will begin to emerge in due course from the present post-graduate courses in Town and Country Planning. But will the qualifications be the right ones? It is for a complex of functions, not a single profession, that students must be fitted; there must be those qualified to gather and interpret facts - economists, statisticians, sociologists; there must be technicians - architects, surveyors, engineers; there must be administrators and lawyers; and at the head of each local team an absolutely first rate organiser, possessing that 'wisdom of good minds' which should go with a University honours degree and in addition enough special training in the physical technique of town planning to enable him to coordinate his experts. This is a large order, and the schools and universities will have their work cut out to fill it. Yet it is the minimum necessary of town planning to become more than on the one hand the accumulation of Utopian blueprints and on the other the exercise, by arrogant and half-baked 'experts', of a vocation for pushing round and slapping down the ordinary citizen.

Votes for Yes-Men

The elections held last Sunday in eastern Germany appear to have been the most crooked that countries beyond the iron curtain have yet seen. The pressure put upon voters was carried to almost farcical lengths; they were warned again and again that those who failed to record their votes would be regarded as enemies of peace, prosperity and German unity. To make assurance doubly sure no official means of casting a negative vote were provided, and it was difficult either to abstain or to spoil a voting paper. It is, therefore, hardly surprising that the Communists can announce triumphantly a 90 per cent poll in favour of the official lists of candidates. Since these lists were thoroughly sifted beforehand, the east German government can count on a set of completely subservient yes-men throughout the state, *Land,* county and municipal governments.

It is, in fact, these purges which, in Communist eyes, differentiate these elections from the 'obsolete form of democracy' practised in the West and turn them from a 'bloodless phantom' of democracy into the 'living reality'.

Where the Communist republic will go from here is not yet clear. Nothing has been said of any immediate reward from the Russians - such as a peace treaty or membership of the Cominform - for this demonstration of solidarity with the Soviet Union. Perhaps the east Germans must first achieve a little more success in their efforts to draw the west Germans into their camp. At any rate it looks as if a new campaign will be run side by side with the shock tactics advocated by the National Front a few months ago. According to Grotewohl, the east Germans will work hard to fulfil and overfulfil their five-year plan; their economic successes will reverberate more and more strongly in the west until finally they will cause a 'political landslide', in which the west Germans will be bustled into sharing the 'prosperity' of the east.

Russian Grain on Offer?

Mr Myrdal's endeavours to expand east-west trade through the Economic Commission for Europe at Geneva have at last been partially rewarded with the news that the Soviet Union has accepted his invitation to a grain conference on November 14th. This means that both sides (with the Soviet representative apparently the sole spokesman for the one) will sit down at the same table to discuss the proposal for a multilateral exchange of eastern cereals for western goods. Sceptics can but wonder at Soviet motives.

There are three arguable possibilities; difficulty in disposing of their grain; shortage of west European currencies; a tactical move to embarrass the west. Local reports tend to eliminate the first. The Jugoslav drought has apparently spread east and north affecting the green fodder and maize crops of Hungary, Rumania, and the Ukraine. Judging from past experience and present omens, any Soviet surplus that is not needed to make good this shortfall will more probably be negotiated bilaterally and privately with the British then multilateraly and publicly through ECE. This suggests that if the Russians deal at all, it will be in wheat. At best they can have only a modest wheat surplus; the Ukraine harvest is reported as over a million tons larger than last year but some will be needed to make up bad harvests elsewhere.

Nor does it look as if the Russians need to supplement their existing sources of foreign exchange. They have been buying sterling area raw materials at a steady but not voracious rate, while their sterling receipts have been high. The British have taken their maximum option under this year's timber contract and would almost certainly be prepared to renew the coarse grain contract at not much below last year's volume and above last year's price.

If the Russians have little scope for real negotiation, they will have plenty for some effective wire-crossing. They have made their gesture at a time when the west is under renewed pressure to curtail its trade with the east. If they come to the table determined to extract concessions, they may force the west - even though it needs non-dollar cereals - to appear sulky and obstructive, or to reveal the internal stresses which this issue is inevitably creating.

Soft and Hard Water

Extremely soft water is not pleasant to drink, and water is only agreeable when it is to some extent hard. Nowhere is water found pure in a state of nature, except rain water; and if men and animals had been destined to drink rain water, their mouths would have been buckets to catch it as it falls.. It is giving ourselves needless trouble to make all water soft and pure, like distilled water; and the companies which followed Dr Clarke's plan would be more likely to delight washerwomen than water-drinkers. But the ingredients in the water which make it hard and palatable, also prevent it from corroding lead, and conveying a stream of poison into every house. Pure soft water.. flowing through leaden pipes, poisoned the family of the late King of the French at Claremont.

AMERICAN SURVEY

Campaign in Connecticut

(From a Correspondent in Connecticut)

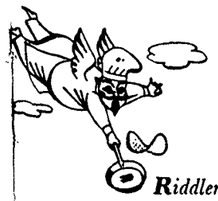
The familiar electoral rhythm is given variety from time to time by political accidents or colourful personalities, or, as in Connecticut this year, by both. It is axiomatic that the Presidential year is the most significant, but 1950 in Connecticut shows signs of being anything but an off-year. Of the thirty-six Senate races which will determine control of the upper house, two will be run in this State. For Republicans, eager to upset the Democratic apple-cart, and for Democrats determined to hold their slight Senate majority or increase it, the Connecticut campaign is of intense importance.

Moreover, the Governorship is also at stake; Mr Chester Bowles, Mr Roosevelt's energetic price administrator, is seeking re-election. And the two Democrats defending their Senate seats are national figures as well: Senator Benton, Governor Bowles's former advertising partner and once in charge of information activities at the State Department; and Senator McMahon, the chairman of the Joint Congressional Committee on Atomic Energy, who has fought a long battle to preserve civilian control over the atom.

To this is added campaign colour of a type rare in New England. The west has its film stars and its singing cowboys who run for public office, but this is the first time the northeast has seen a Senator campaign by helicopter and distribute comic books, anda candidate for the Governorship whose handsome blonde wife solicits votes by dancing the tarantella. Such differences in technique are possible because Connecticut, though influenced by the nearness of cosmopolitan New York, has a population that is about half of foreign origin or foreign parentage (Italian, Polish, Hungarian); there is another cleavage between the rural north and the industrial valleys and coast towns of the south. The native Americans are counted as indomitably conservative, but this legend is belied by the large independent vote.

Before the New Deal, Connecticut ranked as a Republican State, and the Republicans have not given up their hope of winning it back from the Democrats who, in recent years, have overlaid the hard core of Republican officials still running state affairs from minor posts. Mr Roosevelt carried it in all his campaigns. Mr Truman lost it in 1948, but Mr Bowles scraped into the Governorship by 2,250 votes out of some 900,000. The thinness of that majority feeds Republican hopes this time.

These are pinned to their candidate for Governor, a man who struggles hard for popularity with foreign-born factory workers. Mr John Davis Lodge, brother of the Senator from Massachusetts and grandson of Senator Henry Cabot Lodge, and thus impeccable as to Boston ancestry, is also a personable young man with a theatrical flair, a fine broadcasting voice and a good voting record on foreign affairs during his two terms in Congress. A lawyer by profession, he speaks reasonably good Italian, a political asset in Connecticut which he reinforced by marrying an actress of Italian extraction.



The Democratic Governor whose seat Mr Lodge seeks is still a devoted and determined New Dealer. Elected by a narrow margin in 1948, he started at once to reform the State's archaic government, a plan that has been accepted only in part and has made him enemies as well as friends. It was Mr Bowles's unconventional ways which brought about this year's double Senatorial fight. In 1949, when the Democratic majority in the Senate was even lower than it is now, he persuaded the Republican Senator from Connecticut to accept an important state judgeship. This left him free to appoint a Democrat until the next regular election - a manoeuvre more popular in Washington than in Connecticut, where both parties regarded it as heresy. His choice was Mr William Benton, former Assistant Secretary of State, trustee of the University of Chicago, delegate to Unesco, chairman of the board of the 'Encyclopaedia Britannica', and his former partner - but an independent, not a registered Democrat.

It is this which gives voters in Connecticut the extraordinary chance to return not one, but two Senators. The other Democratic incumbent is Senator Brien McMahon, a more traditional political figure. They are opposed by old-line Republicans who are expected to 'balance the ticket' by pleasing the conservatives, but who have excited little interest among independents whose favour may be decisive. There is always the chance, however, that Mr Lodge might set a Republican tide flowing.

This danger has prompted Senator Benton to apply all his knowledge of publicity and communications to his own campaign. His weakness, he feels, is that he is not well known in Connecticut, and to remedy this he has made recordings for radio stations, motion picture films for street showings, meetings, and television, and a series of cartoons for the 'comic' sections of newspapers. He also descends from the skies for personal appearances in the helicopter which covers more ground than an automobile and can land on a smaller space than an aeroplane.

The outcome is, at the moment, anyone's guess. Voting in an off-year is traditionally light and hence favours the Republicans, but 1950 in Connecticut lacks only a Presidential race to make it the most exciting political year in the State's history.

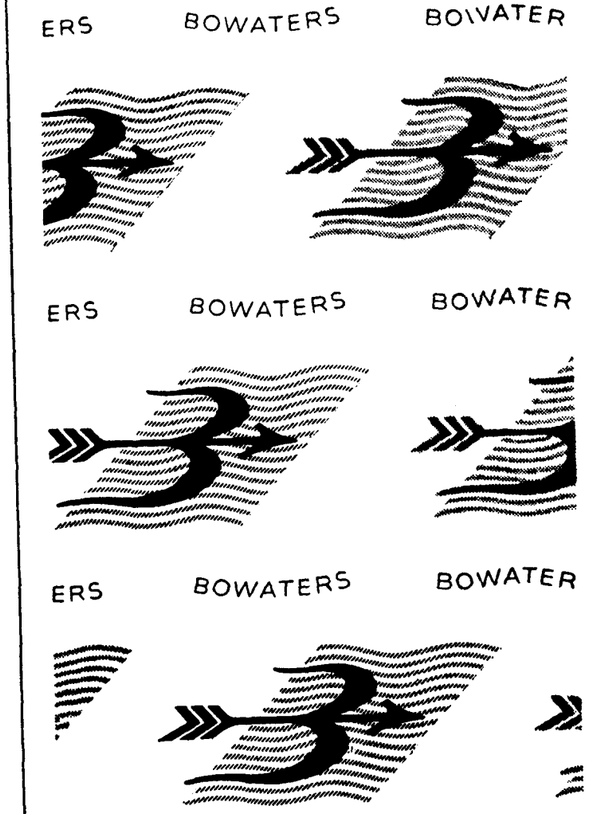
Agasaga

Riddlemeree! The Aga "CB"
Is a miracle cooker and boiler,
So if you've a wife
And you value your life,
Better buy her an Aga and spoil her.

grills and it toasts,
boils, fries and roasts
like Grandma (but
better to look at!)
It bottles and bakes
Bread, pastry and cakes,
and it's terribly comfy
to cook at.

If you riddle and stoke
With unrationed coke
Only twice in the day, as you oughtter,
Your baths will be hot
(Your temper will not)
And you've lashings of washing-up water!



For one shilling bright
It slaves day and night
Without ever a sulk in a lifetime.
With Aga (the treasure!)
You've leisure for pleasure—
For it saves you both
money and wifetime.

The President Goes to MacArthur

It is easy to explain President Truman's visit to the far-eastern Mahomet in terms of domestic politics, as the disgruntled Republicans are doing. The trip scotches their charge that the Administration never consults General MacArthur, the practical expert on the Pacific; it gives the Democrats at least a branch of the laurels of the Korean victory; and it reminds the voters of Mr Truman's chief political asset, the generosity and lack of ceremony which made him go more than halfway to meet one of his subordinates. The Democrats certainly have reason to be thankful that the ending of the initial phase of the Korean outbreak made it necessary, just three weeks before the election, for the US Commander-in-Chief to meet the UN Commander-in-Chief.

But the necessity arose from the obligations of international statesmanship, not of domestic politics. With the immediate emergency over, the United States could no longer postpone making up its mind on a long-term policy for the Far East. Such a policy will, it is presumed, be outlined by the President in the speech he is making at San Francisco while *The Economist* is in the press. Mr Truman went to Wake Island not to consult General MacArthur on the basic principles of this policy, but to make sure he understood them. That in the past he has not has been apparent from the divergences of opinion between Washington and Tokyo on the question of Formosa.

The joint communique issued at the end of the surprisingly brief talk did not mention Formosa and the fact that complete unanimity of view is said to have prevailed makes it doubtful whether both sides had an opportunity of presenting their view on this question. This is only one of the important omissions in a communique which keeps strictly to such matters as Korea and Japan, on which General MacArthur has a right to give advice. If Mr Truman has made him understand that the responsibility for the foreign policy of the United States is the President's in fact as well as in theory, then the fresh start in the Pacific will at least have got off on the right foot.

Topsy-Turvy Cotton

The agricultural situation has been turned upside down in the last few months and nothing is more topsy-turvy than cotton. This most troublesome of all surplus crops is in short supply and shipments abroad of this most traditional of all agricultural exports are being restricted. To Congressmen representing cotton States, this means that the Department of Agriculture has betrayed the farmers to the textile industry, which is concerned because its cotton now costs 40 cents a pound, 10 cents more than in June. The Korean war, unfavourable weather and boll weevils are all partly responsible for this price rise, but Congress itself bears as much if not more of the responsibility for the potential scarcity of cotton. Last year it reimposed controls on the amounts of cotton that might be planted and marketed, in order to reduce the expense of price supports.

The latest estimate is for a crop of 9,870,000 bales this year and a carry-over of 6,500,000 bales, both less than the planners planned - and they did not plan for the new defence programme. This total is just about enough for domestic needs as estimated, or overestimated, by the textile industry, and exports are therefore to be limited for the present to an annual rate of 3 million bales, half last year's rate. Farmers are being told to aim once more in 1951 at the 16 million bales which seemed so excessive a year ago. But they may not take kindly to the idea of reversing themselves again, now that they have at last begun to learn the lesson of diversified agriculture, especially if a manpower shortage makes it hard to find the labour needed in the cotton field.

Deflating Housing

The housing boom that credit built is to be deflated by giving the credit tap another, sharper, turn. The needs of the defence programme for men and materials, and the fear that they will drive up prices further, have brought the Administration round to the position of critics who have declared for years that easy credit for housing is the fountain-head of inflation. Regulation X, issued last week by the Federal Reserve Board, marks the spot; it requires private, as well as government, lenders to stiffen their terms, something that could not be done before the passage of the Defence Production Act.

The government agencies, whose guarantees finance about half the new housing, were ordered last July to be less liberal; now, even higher down-payments, rising to 50 per cent, and repayment, in most cases, in 20 rather than 25 years, must be demanded by all lenders. The only exception is private credit extended on existing houses. Interest rates are not affected, and veterans retain their advantage over other home-seekers, but even they must put substantial amounts down in cash for all but the cheapest houses.

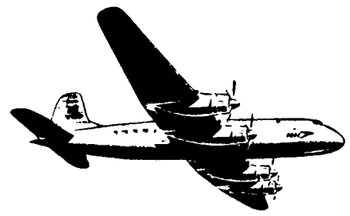
The aim is to reduce the production of new houses in 1951 from the present rate of 1.3 million a year to 800,000 or 850,000 and to release some of the 2.6 million men in the trade, as well as some of the copper, steel, and aluminium the snow-balling boom has consumed.

The building industry is convinced that the curbs will prove severer than intended, and that ruin threatens for itself, if not for the whole economy. But the housing boom might, in any case, have reached its peak. And if armament orders fail to take up the slack, or building sags too far, the Administration, which has always regarded housing as the essential driving-force behind an expanding economy, can reverse gears once again.

THE BUSINESS WORLD

Markets for Motors

The difficulty that the average British citizen meets in trying to buy himself a car has not blunted his interest in the Motor Show; for these ten days the motor industry enjoys as much public attention as ever falls to any industry. The moment is appropriate to take stock of the industry's performance in the postwar period - the more so because other considerations may well make the autumn of 1950 the end of one phase in its existence and the opening of another. The easing of extreme dollar shortage as the single dominant factor in national economic affairs may well permit the industry to form its trading policy on more normal commercial considerations. Many schemes of reorganisation or expansion, held up for so long, are now under way and may soon take effect, giving the manufacturers for the first time in twelve years some freedom of manoeuvre within their own workshops. At the same time, the demands that rearmament is bound to make on materials and components must, before long, set a limit to the expansion of the industry's volume of civil production, which may, indeed, be able to go little further than it has gone already.



On no industry has the export drive imposed more severe demands, but these demands have for the most part been met, and more than met. To require an industry traditionally based on a protected home market to send three-quarters of its most important group of products abroad imposes a severe strain; yet this has been done with comparative ease, and as conditions now appear it may very well continue for much longer than even the authors of the policy can have envisaged. In 1947, out of a total production of less than 287,000 passenger cars, the industry exported 143,000. In the first eight months of 1950 passenger car production was 337,000, and 270,000 were exported. There seems to be no reason to suppose that saturation has been reached in export markets; the exporters' problem is rather to spread a limited volume of product to the best advantage among markets that cannot be fully satisfied.

It is true that a closer examination of the export performance reveals some flaws in the picture - on the assumption, at least, that the task which was set the motor industry was altogether the right task. The industry still sells preponderantly to the British Commonwealth, with a group of European countries following at some distance behind. It is true that most of its members had some doubt about their ability to sell to the United States, and it can perhaps be argued that to require them to do so was a miscalculation. In the event there have been expensive, if sporadic, selling campaigns in the United States, and they have produced only small results; in the first eight months of this year the United States took less than 10,000 British cars, and this with the American economy in a condition of boom. What proportion even of these sales would be held in an American recession, when they would really be needed? Apart from two or three types of sports car, it is unlikely that any British car can claim to have established itself in the market.

This is not to say that the motor industry cannot be a direct earner of dollars. Car exports to Canada in the first half of this year amounted to 39,000, compared with 12,000 in the first half of 1949; and the rate of export to Canada has increased further in July and August. Canada is now the largest market after Australia; but Australia, which took some 70,000 passenger cars and chassis in the first half of the year, has become the dominant export customer, and the present wave of inflation in Australia seems likely to raise the question whether the British motor industry is physically able fully to meet its demands.

Now that the balance of foreign payments has moved, if only temporarily, in favour of the sterling area it may not be necessary to regard this as an unhealthy state of things. When the overseas members of the Commonwealth were running a dollar deficit it was necessary to question a state of affairs in which British manufacturing output was being preempted to an overwhelming extent by the soft-currency markets. But when those countries are prospering in world trade and are good dollar earners, it is reasonable and in no way disastrous that their expanding purchasing power should be met with British manufactures. The problem becomes different; and as it confronts the motor manufacturers at the moment, it is to organise their production and sales economically for the best result. Any answer to this question likely to emerge at the moment can be expected to exclude costly marketing efforts and elaborate sales promotion in the United States for relatively small results.

But it would be unfortunate if the present world-wide boom were to induce the motor industry to rest on its oars and become indifferent to the possibility of competition with the greater American industry. Competition is perhaps best not conducted on the American industry's own doorstep. It is still no less essential to the industry's future health that its cars should be bought from choice, not from necessity, by people

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

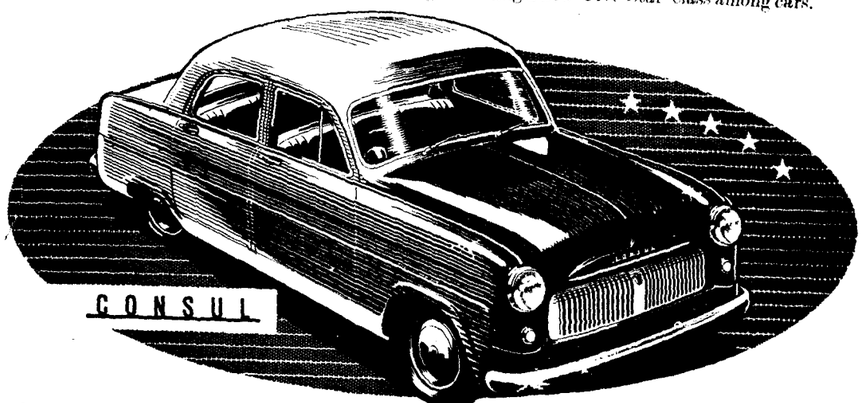
REMEMBER GENEROUSLY SAT · NOV 11

"Who are Britain's Craftsmen?"

*Introducing Herbert Martin. Many years ago he learned the craft of fitting a frame with teazle heads for finishing fine woollens. This age-old process was one of the factors that made British cloth pre-eminent throughout the world . . . and that is today helping raise woollen exports to new records. **

But does craftsmanship mean only handcraftsmanship? Consider, for instance, the manufacture of the cloth from the spun wool. The care and skill necessary in weaving, dyeing and finishing to established standards of quality . . . and to modern demands of output. Craftsmanship gives the answer though it may be difficult to single out one man or one part of the process. For must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and they follow this rule in making chemicals for a long list of British industries. In the spinning, weaving, dyeing and finishing of fine textiles Monsanto chemicals play a vital and increasing part.

* *Illustration: Courtesy of Mr. H. Martin and Messrs. Hunt & Winterbotham Ltd. Cam, Glos.*



Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

FORD again makes History

WITH 'FIVE-STAR' MOTORING!

From Ford of Dagenham, sponsors of so many developments which have been to the benefit of the motoring public at large, now comes the newest and most significant development of all. With the introduction of their two great new cars, the 'Zephyr-Six' and the 'Consul' Ford have brought together all the most desirable features of modern motoring—creating a new 'Five-Star' class among cars.

Here is the definition of a 'Five-Star' Car:—"A 'Five-Star' Car is a *combination* of all those features of design, performance and service which afford the maximum pleasure and satisfaction to its users at the most economical cost."

Here are some of the features which Ford designers and engineers have incorporated in the 'Five-Star' Cars—'Consul' and 'Zephyr-Six':—

★ O.H.V. ENGINES (1,508 c.c. 4 cyl. in the Consul, 2,262 c.c. in the Zephyr-Six)
★ ALL-STEEL WELDED INTEGRAL BODY CONSTRUCTION
★ HYDRAULIC BRAKES
★ CENTRE-SLUNG SEATING
★ INDEPENDENT FRONT-WHEEL SUSPENSION with built-in double-acting hydraulic shock absorbers

See these fine cars at Earls Court Oct. 18-28, Stand No. 164

Ford MOTORING IS 'FIVE-STAR' MOTORING
THE BEST AT LOWEST COST

FORD MOTOR COMPANY LIMITED · DAGENHAM

who would not change their choice if they suddenly found themselves free to buy an American car instead. This ought to be the spur to technical improvement, to changes in design, and to the pursuit of economy and efficiency in production. It is not a condition that has approached fulfilment yet.

Changes in car design and improvements in factory methods have alike been slow in the five postwar years. The constant pressure of demand has inhibited manufacturers from allowing their output to fall off while production lines were retooled. Shortages of steel sheet have caused plant to be only partially employed, and at the same time the difficulty of new building and re-equipment has obstructed expansion and change. It may in some ways be disheartening for the manufacturers to find that, when these obstacles are on the point of being overcome, a rearmament programme should threaten to set unexpected limits on the supplies of steel sheet and components which they had expected to flow so freely in 1951. But the industry has still to make itself fully competitive in markets that may soon be less strongly fenced with currency restrictions. Their answer must be to grasp the opportunity for technical change that has been too long delayed.

Business Notes

New Issues and the Funds

There seems to be no shaking the strength of the gilt-edged market. One would hardly suppose that rearmament and inflation existed, or that a single economist had ever breathed the recipe of higher interest rates in the last month or two. Spilling over from its immediate port of arrival, foreign money has spread its influence beyond the money market into the 'shorts' and thence to the 'longs'. It is pleasant to see old market influences at work after an absence of many years, but it may be questioned whether the influx of funds from overseas could work such an effect on long-dated gilt-edged without assistance by other factors. There has been no lack of institutional support during the past month, and more recently the opportunist camp-followers of the big battalions seem to have joined in. A month has seen rises of up to a point in the 'shorts' and of up to two points in War Loan and the 'longs'. It is hardly to be conceived that the latter are regarded as a specially attractive haven by the overseas investor; their improvement must be largely domestic in origin. And while overseas money makes its mark upon the 'shorts', the premiums on dollar stocks remain, narrower than they were but substantial still. Evidently one school of thought is prepared to take Mr Gaitskell at his word.

Coupled with the strength of the funds, the new issue market remains in an active state. Perhaps it is the threat of further rises in commodity prices that has provoked some of the recent demand for cash. The fact is that high class industrial issues and a handful of dominion and colonial stocks have together absorbed £46 million of new money since the end of August, and calls amounting to £27 million are outstanding. To extract £75 million or so of new money from the market in such a short time must have left the institutions fairly fully invested, for they have not been idle in other directions. The latest in this impressive series of issues is the offer of £20 million of 4 per cent unsecured loan stock to preference and ordinary shareholders of Imperial Tobacco. A large issue by 'Imps' has been on the tapis for a long time - ever since the company was forced into a disproportionate expansion of its short-term debt. Some £20 million of these obligations has been given a static form as redeemable Notes, while a year ago the group had £27 million outstanding in bank loans and acceptance credits.

Direct comparison with recent issues of similar standing is not easy. The highly successful Unilever issue was of different type and carries 3¼ per cent. But since that stock was issued at 98½ and is now at 1½ premium, it is not likely that much of the 'Imps' stock, with a 4 per cent rate and issued at 99 will go begging. Its calls are well spaced, and its maximum life is in fact five years shorter than the Unilever stock (1960-70 compared with 1955-75). Twenty million pounds is a large sum to seek even from stockholders as numerous and as influential as those of Imperial Tobacco; but it would be very surprising if many of them passed such an attractive offer by.

Free Market in Canadian Dollars

Since Monday this week the London foreign exchange market has been dealing freely in Canadian dollars. During the first fortnight of floating rates in Montreal and New York, the London market had dealt in Canadian dollars at rates fixed daily by the Bank of England on the basis of the previous night's close in Canada. In fixing these rates London had not always anticipated with great accuracy what Montreal and New York would be deciding a few hours later, and some losses were incurred. It was therefore decided to allow dealings in Canadian dollars through authorised banks, acting as principals. The new market has been organised around three firms of foreign exchange brokers, the sole survivors of the galaxy of talent that flourished before September 1939, when the control took over. The authorised banks are called upon to notify their positions monthly to the Bank of England and a careful check will no doubt be kept in this way on any undesirably large positions that they may carry. The authorities hope that the authorised banks will maintain fairly even books and that they will cover in Canada positions that emerge from London dealings. The authorised banks will also have recourse to the Bank of England for evening up their books.

The early stages of this return to a free market in Canadian dollars have revealed a welcome survival of the old expertise. A narrow range of rates has been quoted, the normal turn between buying and selling being

one half-cent; the spread of $2.95 - $2.97, which the Bank of England had maintained throughout the preceding week, was narrowed to a quotation of $2.95½ - $2.96 by the end of the first free dealings. By this decision to restore a free market in Canadian dollars the London market is retaining business which it undoubtedly would have lost to Montreal and New York if it had persisted in limping along behind the rates set in these other centres. Its resumption is another illustration of the manner in which freedom can be reconciled with controls.

Australia Shirks the Issue

The Australian Government has decided to prod the menace of inflation on a number of widely scattered fronts instead of launching a large scale offensive. Mr Fadden's budget last week included proposals for the prepayment by wool growers of £103 million of income tax, (a sum representing one-fifth of their current income), for increased sales taxes on luxury goods and for higher postal charges. His budget speech also foreshadowed the re-imposition of controls over capital issues and scarce basic materials, a 20 per cent cut in the public works programme, a tighter credit policy by the Commonwealth and the commercial banks, and some sort of excess profits tax (the details of which have yet to be worked out). Each of these weapons is apparently to be used as far as political susceptibilities allow. Unfortunately, in present conditions, and with the possibility of an election, they cannot be pushed very far. The Budget provides, for instance, for a surplus of only £400,000 over total expenditure (including some capital items) of £738.3 million. The receipts expected from the new taxes will be offset by higher defence expenditure and by concessions to those directly threatened by rising inflation, such as pensioners and consumers of wool products.

Meanwhile the opposition of the Country Party has apparently put the revaluation of the Australian pound out of court, at least for the time being, and opposition by Australian industry (particularly the high cost sector of it) will presumably prevent any action being taken to implement the common sense suggestion of Mr Colin Clark. that 'at least three hundred thousand employees in the manufacturing industries must be guided into useful work'. The chances of so guiding them might have been higher but for the recent ruling of the Arbitration Court that the basic wage for all workers should be raised by £1 a week.

Scramble for Rubber

On Monday rubber reached its highest price in the London market since 1912; it was selling at 4s.8½d. a lb, a rise of 7½d. in a week and a halfpenny above the peak reached in 1925. This astonishing performance has been due to the shortage of spot supplies. In the first six months of 1950, the American stockpiling authorities bought 80,000 tons of rubber for delivery in the second half of the year. Since June they have been attempting to buy more rubber for current delivery.

Other countries are also scrambling for rubber. China bought only 250 tons from Malaya and 4,900 tons from Hongkong from January to June; its purchases in the following three months were 9,334 tons from Malaya and over 12,000 tons from Hongkong. Russia bought 28,000 tons from Malaya in the third quarter of this year against 35,800 tons in the first half of the year. Japan, too, has been buying more heavily since June, taking 18,500 tons from Malaya in the third quarter against 916 tons in the previous six months. Italy has been very active in the rubber market, but part of its purchases was apparently for transhipment to the United States. Even Argentina has more than doubled its purchases in the third quarter of the year compared with the first half of the year.

Individually, these purchases may not seem very large - not, at least, in comparison with those of the United States. But since American buying has been aggressive the increased demand by these smaller countries has produced the biggest squeeze the rubber market has ever known.

Is the Wool Scheme Wise?

The international study group's discussions on wool have ended without provoking much excitement. American suggestions for a scheme to allocate wool among consumers were not tabled. Nor was the study group officially apprised of an impending wool shortage. It estimates that the world's wool consumption this year will exactly equal the supplies coming forward, and if next year supplies fall by 10 per cent it is thought that consumption will fall correspondingly owing to high prices. The Commonwealth wool scheme was endorsed by the full study group without amendment. Since the Joint Organisation is to be wound up this season some replacement was needed; the new scheme is virtually the Joint Organisation scheme reenacted, and it will be run by the same staff. The three wool-growing dominions want to finance the scheme (it may need about £70 million of finance) in part at any rate by imposing a levy on their producers.

The prospect that wool prices will need no support for a long time seems to have encouraged the consuming countries to accept a scheme that is consciously designed in the producers' interest. But to give the scheme official endorsement when it is to be operated by four countries only (Australia, New Zealand, South Africa and Britain) seems open to question. The provisions of the international trade charter on the conduct of commodity schemes were acknowledged by a resolution providing that 'when buying operations are expected to assume substantial proportions, there should be a further opportunity for full international consultation'. But when the four countries operating the scheme are financially heavily committed (as they will be if buying in operations ever assume substantial proportions) will they be prepared to modify their course because of representations by consumers?

The Joint Organisation's reserve prices (which will be the basis for reserve prices under the new scheme) are less than half present market prices; hence the latter can fall a long way before the organisation has to buy in any wool. Yet, it is claimed, the new scheme will prevent wide price fluctuations. Experience alone will demonstrate the merits of the study group's action. But it has created what may be a dangerous precedent by interpreting Chapter VI of the trade charter so as to establish a producers' agreement that lacks full international representation.

America Restricts Cotton Exports

The United States has decided to conserve its cotton stocks by restricting exports this season to 3,000,000 bales; shipments on this scale would represent little more than half of the previous season's exports and these were not large. The American crop is put at only 9.9 million bales against 16.1 million bales in 1949-50; this fall is mainly explained by the acreage restrictions imposed by the United States Government twelve months ago. Carryover stocks in August amounted to 7 million bales, equivalent to 9½ months' supply. If American consumption this season is no larger than last (8.7 million bales), the export surplus would only be 1,200,000 bales, so that to export 3,000,000 bales would reduce the stocks carried over next August to 5,200,000 bales. In normal circumstances this would be a more than adequate stock. As circumstances are far from normal, the limitation on American exports might seem justified, though consuming countries, and in particular Britain, may regret that a miscalculated attempt to keep American cotton prices high by restricting output should twelve months later react so severely on them.

Lancashire has become used to 'making-do' with small supplies of American cotton. Last season, when there was raw cotton to spare, dollars were scarce. In the first eight months of this year imports of raw cotton from the United States amounted to only 204 million lb against 319 million lb in the same period of 1949. Stocks of American growths in this country cannot be large, but fortunately the Cotton Board is able to claim that they will suffice to keep Lancashire fully at work. Substitutes for American cotton are not easy to find. Since the war, Brazil has become one of Britain's main sources of American growths (1 1/16 to 1 1/16 inch staple) and smaller quantities have been bought from Nigeria, the Belgian Congo and Russia. Ashmouni, the shorter staple Egyptian cotton, has also been used as a substitute.

There is no threat of an acute shortage of cotton. The spinners' concern is how best to use cotton slightly longer than American middling; in this task Lancashire may well show something of its old superiority. In any case American cotton is very dear; only ten days ago, the Raw Cotton Commission raised its selling price for middling 15/16 inch to 41.65d a lb. - the highest price yet recorded. Twelve months ago such cotton was selling at 29.15 d a lb.

Boom Days for Oil

No vestiges remain, unless as purely psychological manifestations, of last year's depression in the American oil trade. Average production of crude oil and condensate in the United States in September is estimated at 5.8 million barrels a day. This is nearly 19 per cent more than the average in September, 1949; and in the week ended September 16th production averaged 5,938,000 barrels, the highest daily average ever recorded. The recovery of demand preceded the recovery of production, and in the first half of this year absorbed the big stocks that had piled up. Internal demand in the United States averaged 6,300,000 barrels in September, and this was an increase of 12 per cent over the level of September, 1949.

These figures lend further point to the account of the continuing change in Europe's sources of oil given by Mr Vernon Smith last week in a paper to the Institute of Petroleum. The Middle East, which furnished only a quarter of the crude oil and products supplies to Europe in 1938, is supplying more than 65 per cent this year and is expected to supply nearly four-fifths in 1953. This is not necessarily trade lost to the American companies, which are expanding their Middle Eastern production in order to be able to meet the rising consumption of Europe and other markets in the eastern hemisphere. One great American project, the trans-Arabian pipeline, was ready for operation on October 1st and is now carrying oil to Sidon from the Saudi Arabian fields on the Persian Gulf. Its full capacity of 15 million tons a year will be reached next year.

As Mr Vernon Smith recalled, it was an American principle, contained in the Economic Co-operation Act, that laid it down that ECA should procure oil for Europe as far as possible from sources outside the United States. Now that the recession is over and forgotten, the expansion of supplies is, once again, demonstrably more important than the protection of markets. Perhaps the reserved attitude of ECA to British oil development can now be reconsidered. The prohibition on ECA financing of British refinery projects on the Continent seems to have become out of date, but in principle at least it is still in force.

Trade Trends

In August, for the first time in thirteen years, the value of imports into the United States exceeded the value of American exports. A single month's figures may not be a very safe foundation for discussion, but

in the light of recent pressure on the dollar, the August trade results are something more than a statistical curiosity. American imports during the month reached a record of $819.4 million, while exports were only $760.7 million. The value of imports was 50 per cent above the monthly average for 1949 and 29 per cent above the average for the first six months of this year. The increase arose mainly from larger imports of coffee and sugar, but heavier shipments of rubber, vegetable oils and metals were also cleared.

Britain's trade balance also continues to move in the right direction. In September the excess of imports (c.i.f.) over exports and re-exports (f.o.b.) was £13.5 million, the lowest figure since July, 1946. The cumulative surplus of imports for the first nine months of the year amounts to £284.7 million against £328.5 million in the same period of 1949. Exports in September fell by £18 million to £171.4 million, some £3 million below the average for the first eight months of 1950. September trade figures are normally higher than those for August, but this year the effect of the holidays seems to have been delayed. Exports to the United States and Canada both declined slightly last month but were still above the average so far this year. For the nine months to September, total British exports to North America were worth $US558 million, compared with $384 million in the first three quarters of 1949. Imports into Britain last month fell by £21 million to £194 million while re-exports rose to the exceptionally high figure of £9 million.

The Freight Markets

One effect of the demand for shipping for the Korean war was to make charterers more receptive to shipowners' ideas about freight rates and more fearful of being left without tonnage to move their commodities. In a season of the year that is usually dull, therefore, freight rates in most markets have received a boost, and this in spite of the falling-off in British coal exports. The Chamber of Shipping index of tramp freight rates, which is based on fixtures in sterling only, rose from 74.3 (1948 = 100) in June to 78.8 in July and 86.6 in August. In 1949 the trend of freights during these months was almost exactly the reverse; the index then fell from 86.7 in June to 73.3 in July and 70.6 in August.

The advance in freight rates has not affected all markets equally. Ships were urgently required for the North Pacific trades. This had the effect of relieving the chronic congestion of tonnage in Indian waters, so that higher rates were obtainable than for a long time past for the movement of Pacific lumber and Indian exports. But trans-Atlantic routes have been dull and only recently have Mediterranean ore freights advanced by 3s. in the £. Prospects of employment from the Plate have been so thin that as much as 52s. 6d. has been paid for the few coal cargoes outward, compared with 27s. 6d. when Plate grain cargoes were freely available at schedule rates.

Rising Profits

Any doubt that a profits inflation is again in full swing can be set aside by the September quarter analysis. Some 586 companies whose reports were issued in that period showed a rise in gross trading profits from £271.8 million to £290.0 million, while their total income including extraneous items rose from £299.1 million to £324.0 million.

It is well to be clear what this means. It will lead - indeed, is already leading - to the usual attacks from the usual quarters on profits. But this is not an issue that can be determined by the simple exercises of Margate morals and economics. Profits are high because output is high, prices are rising and a world-wide inflation is afoot. The question remains whether the broadest national interest could afford to see profits any lower, and if so by how much. The latest figures show that a tiny proportion only of the increase in profits has gone to increase personal incomes - ordinary shareholders receive £30.4 million whereas a year ago they received £29.1 million. This hardly suggests that voluntary dividend limitation has virtually broken down. Indeed the main uses to which the increase in industrial profits has been put are to swell depreciation (£54.1 million against £41.1 million) income tax and profits tax (together £123.7 million against £117.9 million) and reserves. In short, what the Chancellor leaves is being put to effective use towards maintaining industry's existing capital resources. It is indeed doubtful given the continued rise in prices whether all sectors of industry are in fact succeeding completely in doing so.

Printing difficulties prevent the publication of our detailed analysis of profits for the past quarter. This will appear as soon as possible.

STATISTICAL SUMMARY

Company Meetings

BRITISH SUGAR CORPORATION LIMITED

Progress In Mechanisation

The fourteenth annual ordinary general meeting of the British Sugar Corporation, Limited, was held on September 25th in London, Sir Alan Saunders, O.B.E. (the chairman), presiding.

The chairman, in the course of his speech, said: The 1949 beet crop in weight was above average for the country as a whole and was an all-time record in Scotland, Yorkshire and North Lincolnshire. The total yield was 3,962,000 tons of beet, but the average sugar content was the lowest on record, due primarily to the autumn rains and mild weather which followed the prolonged summer drought. In many cases also virus yellows disease was a contributory cause.

Considerable progress was made in the mechanisation of the beet harvest, and over 1,600 machines were in operation. About 11 per cent. of the crop was harvested by machine, compared with about 3½ per cent. in the previous season. This achievement has been made possible by the co-operation of manufacturers which has been stimulated by the annual demonstration of mechanical harvesters, organised jointly by the Corporation and the Ministry of Agriculture.

Two hundred and sixty five thousand tons of dried sugar beet pulp - a valuable feed for livestock - were manufactured and sold to farmers.

In addition a very large quantity of leaves and crowns - about 3 million tons - was made available to growers for stockfeed, and 190,000 tons of molasses were produced.

Reconstruction

During the year capital expenditure amounted to £1,125,369. This sum is larger than in any year since the corporation's formation and represents the beginning of a large-scale plan for reconstruction and improvements in our factories. For several years the existing plant has been heavily overloaded and the need for replacement of obsolete plant, increased sugar gains and greater factory capacity became very urgent. Moreover, there was much that could be done to mechanise many of our processes, reduce casual labour, and improve the welfare and general amenities.

Large-scale plans for this reconstruction work have been prepared and are proceeding satisfactorily. In order to assist the executive in the planning and execution of the work of reconstruction, a central production coordinating committee was set up and working parties were appointed at each factory, under the chairmanship of the factory general manager.

This programme of re-equipment and modernisation is likely to involve an expenditure, mostly within the next four years, of between £9 million and £10 million. A substantial part of the money required can be found out of the corporation's own accumulating resources, but it is proposed to raise part of it by an issue of debenture stock. As has already been announced in the press this issue will be by way of a placing on the market and will be without a Government guarantee but with appropriate assurances from the Government departments concerned to ensure regular payment of the interest and sinking fund of the new stock, which will take the form of £3,500,000 of 3½ per cent. redeemable debenture stock.

We are faced with a record beet crop this year, and it will take all our ingenuity and goodwill to deal with it with our present equipment. I am confident, however, that we shall do our very best to cope with the many problems which we shall meet.

The report was adopted.

ASSOCIATED LONDON PROPERTIES LIMITED

Pre-War Dividend Resumed

The 23rd annual general meeting of Associated London Properties Limited was held on October 5 in London. Brigadier-General Wallace Wright, V.C., C.B., C.M.G., D.S.O., D.L., the chairman, said:

The accounts show improved results. All our properties are fully let and seem likely to remain so.

Consolidated revenue increased by £14,536 during the year and there is a net improvement of £8,720 despite rising costs. Of the year's profit after taxation, Preference dividends take £43,175, leaving a margin of £31,800 odd. In considering the proposed Ordinary dividend we had regard to the prospects for the year to June, 1951, and the conversion rights of the Preference stockholders. We decided that we could and should revert to the pre-war 6%. This will leave a retained profit of £18,591.

The consolidated balance-sheet shows an improvement in shareholders' funds of some £48,000. The figure of £78,189 for various surpluses placed to capital reserve includes a surplus on the sale of St. Ermin's, on a factory property purchased and sold during the year and on realisation of some Stock Exchange securities. Referring to our temporary investment in Stock Exchange securities, stockholders might like to know that yesterday's market value showed a small surplus compared with cost. We have no intention of holding such investments when opportunity occurs for reinvestment in property.

I repeat that the Board's policy is to make sure of a profitable investment of the company's money, and I think we may be confident of ultimate success.

The report and accounts were adopted.

BRITISH HOMOPHONE COMPANY

Sir Herbert Morgan's Speech

The annual general meeting of The British Homophone Company, Ltd., was held on September 29 in London.

Sir Herbert E. Morgan, K.B.E., (the chairman) said that the net profit for the year before providing for taxation, showed a modest improvement, being £15,122 as against £13,850. The final result of the individual trading of the parent company, Homophone, was a net profit of £6,222, compared with £6,010, the net profit for 1949.

Last year he had told shareholders that the profits of the Homophone section of the business showed a certain consistency from year to year, and results had justified him in making that statement. At the same time he had said that for the then current year they did not think the previous year's rate of profit could be maintained, particularly in the Ebonestos Company, and unfortunately that had proved to be the case. The Ebonestos Company were moulders of plastic materials - in fact Plastic Engineers. They obtained their orders from large companies principally engaged in the electrical and wireless trades. While their trade with those companies had fallen off, they had not lost those customers.

The immediate outlook appeared to be somewhat brighter, particularly as trade had recently improved in the electrical and radio industries. In addition, the General Post Office, with whom they had had a long and friendly association, were again placing orders for the articles with which they supplied them.

He must pay a tribute to their staff for its loyalty and the strenuous efforts it made under the direction of their managing director, Mr. Jack Lesser.

The report was adopted.

Finally, India was the only important abstainer. The majority attained - 50 votes to 5 with 3 abstentions - offers a heartening margin over the statutory two-thirds, which is at present 40 votes.

But to jump to the assumption that the new scheme will work marvels whenever the Security Council reaches deadlock is to go much too far. The scheme has all the familiar limitations. It does not alter the fact that the responsibility of deciding to withstand a major aggression still lies, and will always lie, with the great powers. The scheme will work only if a majority of them concur. Nor can it work miracles even then. It is likely to serve less often as a preventative than as a cure. To meet many misgivings, its sponsors agreed to an amendment whereby a recommendation to use force can be made only *after* the breach of the peace or the aggression has started. It can invent *no magic* for generating the preventive force of public opinion behind the Iron Curtain - - for instance, the opinion of the millions of war-weary Russian signatories of the Stockholm Peace Appeal. Lastly it does not obviate - nothing can - the sheer physical difficulty of massing effective numbers of troops and heavy equipment at the right spot and at a moment's notice. In addition, the new plan presents some drawbacks that are peculiar to itself. Recent experiences at Lake Success suggest that the Assembly is by no means an ideal body for handling all the kinds of problem that are apt to threaten peace. It is too unwieldy for jobs of conciliation. It has been known to vote in moods of irresponsibility, swayed by motives that bear no *relation to practical possibilities*. In addition, it is a prey to block voting, and the largest block is capable, singlehanded, of depriving it of all possibility of a two-thirds majority. The new plan will succeed only if it is reserved for straightforward cases of aggression. It will fail if it is overstrained by attempts to apply it to most problems on which a majority of great powers are not prepared to act together or, indeed, on which no one may see the way to a workable course of any kind.

Yet against these drawbacks must be offset the risk of a great disaster. Who is in mortal danger of impotence in face of all aggressors save those of whom Russia disapproves. The hopelessness of the slough into which the Security Council has sunk has been masked by its success over Korea. People forget that this was entirely due to the fact - apparently fortuitous - that the Russians were absent when the North Koreans attacked the South. Either new machinery must be devised, or else the most important section of the United Nations' fabric collapses. The new proposals certainly possess some intrinsic advantages. They immensely speed procedure: within twenty-four hours of a crisis they would make it possible to know whether or no a majority of great powers was set upon preventive action.

The most trenchant argument against them comes from the advocates of regional pacts as the best method of stopping aggression. Clearly these, within their own locality, work more quickly and surely than any other system. But they would provide a worldwide network only if the globe were girdled with a chain of them, each centred on a great power. But the world today is not so shaped. Only one regional group, that of the Atlantic Pact is capable of countering a major aggressor. The nations have no alternative to handling aggression on a unitary basis, or else doing so inadequately. The good news from the current Assembly is that over three quarters of the world now recognises this fact. The Communists have themselves to thank for this further stiffening of the ranks against their 'wars of liberation.'

Two Chancellors

In times of inflation a Labour Chancellor of the Exchequer may frame and execute a right financial policy, but only if he can stand more blame than praise from his own party. In time, as the country grows more heartily sick of persistent inflation and Labour's established sentiments evaporate, this may change; or a transformation of the British economic problem may make the ideas of the thirties again up to date. But for the present inflation will be resolutely avoided only when the Labour party is so badly frightened - by loss of foreign confidence and a run on the pound - that it has temporarily no will of its own. A strong man, a Sir Stafford Cripps in 1947, can then take things into his own hands. But the strongest Labour Chancellor is unlikely, as the last two years have shown, to maintain the impetus of an unpopular policy once its first fruits have been obtained and immediate disaster avoided.

Implicitly the Prime Minister has recognised these unpleasant facts by choosing as Sir Stafford's successor the man most likely to fight against them. Mr Attlee has also shown himself to be, personally, on the side of the angels and financial probity. It required courage to appoint the best Chancellor available by raising Sir Stafford's assistant above many senior members of the party hierarchy. For the present, Mr Gaitskell, with an able new assistant in Mr John Edwards, is likely to do as well at the Treasury as Sir Stafford has been doing for the past two years. He may do better.

But this is the comparison with a Chancellor in decline. It is no measure of adequacy to deal with the problems that now face the British economy. If Sir Stafford Cripps had retired at the end of 1948 he would have been one of the great Chancellors. His essential achievement was to appreciate earlier than other Ministers the force of the economic limitations on Labour policy. He went to the Chancellorship without any particular disposition to use financial measures rather than physical controls as the instruments of a sterner economics. But in the office he listened to good advice, absorbed it with all the great lawyer's skill, and applied it with scant regard to the politician's normally timid estimate of what the public will stand. He was the man, in Professor Robertson's phrase, 'capable almost single-handed of putting heavy engines into reverse'.

The Budget of April 1948 made tremendous first steps towards harmonising internal policy with the needs of export trade. It cancelled the Daltonian divorce. The tragedy is that what the upright Sir Stafford achieved instead was merely an uneasy liaison, not a re-marriage. The first steps were never followed up. Early in 1949 internal policy was allowed again to get out of harmony with external need. Reluctantly the adjustment had to be made by devaluation. That combined with the American boom temporarily to modify the impact of the external situation. But, as Mr Gaitskell takes over, the internal policy that has now set so hard is becoming again painfully out of adjustment.

The things that made Sir Stafford fail to take the second steps are likely to inhibit Mr Gaitskell more completely. In 1948 inflation was checked in the only way then possible. The habits of war-time extravagance in Government spending could not be undone in a day. The higher taxes of Sir Stafford's first Budget were the necessary method of securing a large Budget surplus. But during 1948 it became plain that, if taxes were raised again, they would be paid much more by saving less than by cutting personal consumption; on balance, they would probably add at least as much to inflation as they subtracted from it. A large Budget surplus was as necessary in 1949 as in 1948; but if flexibility and incentives to efficiency were to be restored to the British economy, it would have to be achieved by cutting Government expenditure rather than by piling on taxation.

In his aversion from cuts the Chancellor was as unbending as in his resolute use of taxation. The insistence that Government expenditure could not be reduced was maintained without systematic enquiry and in words of which many had to be eaten six months later. Such obstinacy was possible only because it was buttressed by the greatest of all the fallacies of Labour's post-war economics: that full employment, even if the threat of unemployment arises in the export trades, can be permanently maintained simply by turning on the Keynesian taps of internal spending. Government expenditure was increased in 1949 by keeping taxes unchanged and allowing the Budget surplus to fall. The plea was that the inflationary danger was lessening and a slump lay ahead. There was never any evidence of this in the home market. The serious turn to a buyers' market was in exports. The smaller Budget surplus implied that the loss of exports should be accepted, and the demand for labour switched to the home market, rather than that workers should fall into temporary unemployment. For a country with Britain's difficulties in paying for necessary imports this policy is at best a short-term expedient, and if persisted in for long it must be disastrous. In 1949 inflation revived, exports were reduced, in spite of the demand provided by larger releases from the sterling balances, and devaluation became inescapable.

The things that killed the Cripps policies are the new Chancellor's weaknesses also. Mr Gaitskell is conciliatory in manner; he is a trained economist who can be relied on at least to listen to advice. But he is not less a doctrinaire, he holds no less strongly to the belief that present over-full employment must be preserved at all costs, that the inflexible British economy of high Government expenditure and savage taxation can somehow be cajoled and driven into maintaining a sufficient external income even in competitive conditions abroad.

To this must unfortunately be added a further liability. With so short a political experience behind him, as a younger man with his career still to make, it will be more difficult for Mr Gaitskell than for Sir Stafford to disregard the sentiments of his party. However hard he presses his views, they are bound to carry less weight with his fellow Ministers than did those of the Chancellor who, grudging as was the acknowledgment he received for it, everyone knew to have saved his party in 1947-8. Even if Mr Gaitskell is more right-minded than his predecessor he is bound to be a less effective Cabinet Minister. It would, one must trust, be going too far to fear that Treasury control will suffer another Daltonian eclipse. But it is almost certain to slip farther into the background.

This would have been dangerous enough before the Korean war. Now there is little doubt that, without prompt Government action, inflation in Britain will gather considerable force this winter. This is not the stage of preparing for an approaching danger. The inflation has begun: the question is how far it will go. No policy acceptable to any Government could now prevent widespread increases in British prices, costs and profits. Those are the consequences of past policies.

Mr Gaitskell's immediate task is to confine the inflation of costs to what is truly inevitable. All the signs are that it is now in fact being fed by a growing expansion of credit. If the Government is content to wait we may easily find ourselves early next year back in a financial situation very close to that of 1946. It would not be a galloping inflation any more than Mr Dalton's was; but trotting or cantering could be quite enough to turn the sterling area again from dollar surplus to heavy deficit. The inflation can be kept to walking pace in the short run, and before long stopped altogether, only by large economies in the government's civilian spending. Whether or not their preparation is his first concern will be the test of Mr Gaitskell's ability to make his mark as a British Chancellor in spite of all the party pulls against him.

Plain Men and the Pact

In Western Europe's partnership with the United States the stage has now been reached where the common man must get ready to understand yet another set of initials. Having got used to Uno, and very nearly inured to OEEC, he must now prepare to cope with NATO. That this stands for the North Atlantic Treaty Organisation, and that this is an immensely important body with a function and identity of its own is self-evident only to a few officials and staff officers in Nato capitals. To the common man in this country Nato has no personality at all; and on the Continent a hundred will cheer the struggling but powerless Council of Europe for every one who will say a word for the mighty Council of the Atlantic Pact.

This may be because so much of its work has been kept secret - quite unnecessarily secret in many cases; and because there is a persistent and highly intelligent propaganda campaign against the Americans both in this country and on the Continent. But that so little gratitude, interest, enthusiasm are felt for this body - offering not only security against war but the most fascinating possibilities of new relationship between the free democracies on both sides of the Atlantic - is due quite simply to this fact: that there is still nothing of importance - save communiques and committees - to which people can point and say: 'without Nato this could never have been achieved'.

During the present and coming week there is to be a series of decisive committee meetings which should yield, among other things: the plan for an 'integrated international force'; the plan for equipping and paying for it; the plan for sharing the contributions of manpower, materials, production and money over the next three years; the decision 'in principle' whether the Germans are to make any contribution; and lastly, the calculation of aid that is to be asked of the United States for its impoverished and - let it be said - so far timid and reluctant partners in rearmament.

Clearly those are all very important decisions; progress over the next three years can hardly be made without them. But the ordinary man asks whether they are being taken by methods and by persons capable of yielding the quick results which the military weakness of Europe demands. As the day-to-day news will show, they involve meetings of twelve Defence Ministers and twelve Chiefs of Staff in Washington; long sessions in London by twelve Deputies of the Foreign Ministers; detailed calculations of manpower, weapons and equipment by the three-power Standing Group in Washington; a further study by the Deputies of economic possibilities, short-term and long-term; and then, at the end, a hardfought battle to decide how much American aid shall be given

Compare this procedure and these plans with what ordinary people expect of the Atlantic Pact. First, at any rate on the Continent, they want to see in or near Germany air and ground forces sufficient not only to deter the Russians from reckless action but to give a strength to western diplomacy that does not rest entirely on superiority in atomic weapons under the sole control of the President of the United States. Until this is done - or there are clear signs of an intention to do it - rearmament in Europe will be a half-hearted business. The second thing that ordinary people look for is that each member of Nato should take on those defence tasks for which it is most clearly fitted, that each nation should do one or two things well and not half a dozen things fairly well or badly. If there is to be integration, its result must be greater power and efficiency for the whole than the parts can achieve separately. The third thing that is looked for is a method of rearming, training and equipping forces that will be cheaper than the methods of previous rearmament programmes.

It is true that this combination of demands is not altogether reasonable: integration is bound to be a lengthy and experimental process; the sharing of burdens presents political difficulties; the economies of standardised weapons and rationalised production come at first only slowly. But in his first demand the ordinary man is surely right. If Nato were arranging now for greater strength in Germany; if the Supreme Commander and his chief of staff had been chosen; if the headquarters had troops to command, and if the soldiers had practised cooperation as eagerly as the sailors and the airmen - then it could be confidently felt that Nato was not just another piece of planning for planning's sake but an efficient defence executive in the making.

In short, the layman refuses to be daunted, as the staff officer and the official are daunted, by the tug-of-war between long-term and short-term policies that has gone on since 1945. He asks for action and visible results now from a body whose first purpose is to keep the peace and protect western Europe from invasion.

If this can be done only by streamlining the immense committee structure, by appointing to Nato national representatives who can report direct to Prime Ministers, and by concentrating executive powers into a few hands, then - for the short-term task - let those things be done. The danger at the moment is that the working of Nato should become an end in itself, and that ordinary people should come to the conclusion that rearmament is not, after all, urgent.

NOTES OF THE WEEK

Molotov Cocktail

These are days of bewildering activity in the public diplomacy of the power blocs. Mr Vyshinsky at Lake Success has been showing inklings of reasonableness on one or two matters, and it was - by Uno standards - a quite statesmanlike debate that led last week-end to agreement by the Political Committee that the Big Five should try and settle some of their differences by consultation. So much initiative has fallen into western hands through the Korean fiasco, the further progress towards west Germany's independence, and the passing of the Acheson security plan, that Moscow may well feel it is time to try the effect of the smile on the face of the tiger.

Yet the tiger goes on snarling and padding around in the dark. The declaration that came from Prague last Saturday was, it is true, a clever rather than a fierce document; and there is nothing in it that has not been foreshadowed in Moscow's German policy during the last two years. But it is hard to believe that either Mr Molotov, or the Foreign Ministers of the Cominform governments and Eastern Germany, think its terms acceptable to the Americans, British and French. Dr Adenauer, indeed, smartly got in first and asked just the right questions. If occupation forces are to be withdrawn after a peace treaty has been settled with a united Germany, how far away will the Red Army move? And how are free elections to be possible with eastern Germany's present superiority in armed men and after the 99 per cent result recorded by the Communists on October 15?

If Mr Molotov wanted to do more than reassure his satellite colleagues about his German policy or complicate the debate about the west German contribution to the new Atlantic Pact forces, there are several more convincing moves he could have made. He could have replied to the western proposals for free elections throughout Germany, and to their inquiries about the large para-military forces in eastern Germany. Instead Mr Molotov has merely reiterated the familiar chief points of the Soviet propaganda line: the appeal to the German people's desire for unity and peace, the insistence on a return to the legal basis of Potsdam, and the hint that Soviet troops might retire behind the Elbe. It is a formula for deadlock.

Paris Versus Bonn

Whatever may be the effect on the Kremlin of Dr. Adenauer's reply to Molotov, it will not soothe the Quai d'Orsay. In the past few weeks French officials have gained the impression that Germany's leaders are once again preparing to settle issues by means of ultimatum and blackmail.

Until mid-summer, there was every sign that Western Germany would take part in the Schuman Plan as a step towards the integration of Western Europe, political and economic. For two reasons the German delegation had, at this stage, been instructed by its government to cooperate fully. The politicians in Bonn saw the plan as a way in which Germany could share as an equal partner in Western councils. At the same time the Ruhr industrialists hoped it would help them to meet what seemed to be a rapidly approaching buyer's market for both coal and steel.

The Korean war created entirely new conditions. On the one hand all signs of a buyer's market disappeared; on the other hand Washington, followed by London, became obsessed with the urgent need for an army in western Europe, ready to check a Soviet attack. Thus, when the Big Three Foreign Ministers met in New York last month it was chiefly to discuss an unrehearsed demand from Mr. Acheson that an immediate decision be taken in principle to arm German divisions.

Almost overnight the French found that they were dealing with a new Germany. In Paris the representatives of the German industrialists began to discover flaws in the Schuman Plan. Meanwhile in Bonn Dr. Adenauer chose as his new Minister of the interior Dr. Robert Lehr, a former member of the German steel cartel who had only recently made a forthright attack on the Schuman Plan. Both Dr. Lehr and fellow industrialists have made it clear that the German steel cartel is determined to throw off all allied controls, to regain all its former powers and to negotiate with its neighbours on its own terms.

At the moment the deadlock between Paris and Washington persists. The French stand by their earlier - and perfectly reasonable - view that the formation of an integrated international force must precede the arming of any German troops. Developing this view further, the French Government has now put forward two new proposals; that the continental force - not the British and Americans - be placed under a European Defence Minister and that the Schuman Plan be expanded to provide for complete coordination of the western European arms industry.

Emergency Powers

It is hard to understand why the Commons on Monday allowed the Government to get away so easily with the renewal for another year of the Supplies and Services Act and other emergency laws. Everyone knows that the Government would have wanted to keep many of the wartime defence regulations alive even if there were no rearmament programme. To rest

their plea almost entirely on the needs of rearmament, as Ministers did, would have got scant respect if the Conservatives were not still by temperament the party of authority. The Liberal protest was inevitably ineffective.

No one supposes that all the reserve powers given to the executive since 1938 can now be swept away. What is entirely objectionable is that a great mass of these powers should be renewed, after one short debate, on the vague plea that the Government may at some time need some of them in a hurry. Mr Morrison admitted that 'at the appropriate time' there should be permanent legislation to define the sphere in which the Government may make regulations. He did not explain what may be supposed to make 1951 or 1952 more appropriate than 1949 or 1950. The last thing that is wanted is, in any case, a general consolidating act. That would inevitably confirm the executive in wide powers without adequate debate. If a Socialist Government feels that it must always have in the background the right, say, to direct labour without fresh legislation, then that specific power ought to be delegated by a particular act of Parliament. If Ministers had to frame a series of such acts they would quickly find that they could get along with far fewer powers than they will think essential as long as Parliament makes their retention easy.

Labour Answers Blackpool

That Mr Bevan should respond to the Conservative demand for 300,000 houses a year with a virtuoso display of righteous indignation is so normal as hardly to be worth comment. Rather more interesting is the response of that apostle of conciliation and sweet reasonableness, Mr Herbert Morrison. He makes no overt accusations of hypocrisy and finds no speculative builders under his bed; but the pains which he took, in his party political broadcast of October 21st, to brush aside the Blackpool resolution as an impracticable dream, to be contrasted with solid Labour achievement, indicate an uneasy suspicion that the raising of the Conservative bid may be effective with the voters. The spectacle of Labour denouncing as Utopian a Conservative programme of social betterment has its humorous side, the more so as - unless the Conservatives are willing to offer the electorate a realistic programme of capital cuts to match their projected housing expansion - the denunciation is perfectly justified.

The disturbing element in Mr Morrison's speech is the resurgence of Utopianism in world affairs, the attempt to appropriate the leading idea of President Truman's Fourth Point as a Labour specific and thus to recapture a tactically useful preeminence in conspicuous idealism in a field where voters have little chance to check performance against promise. The Labour attitude to European unity can serve as a warning of what may happen to the idea of international co-operation for the advancement of backward areas if once that idea is envisaged as a trump to be laid on the Tories' domestic ace.

The Printing Dispute

The Court of Inquiry into the dispute in the London printing trade has now published its conclusions. They have been worth waiting for, since they reveal a clear understanding of the problems of the industry. On the substance of the dispute the Court finds, on balance, in favour of the employers. It is true that the report recommends an increase in the minimum wage from £7.3.6d. per week to £7.15s., but this recommendation is subject to two conditions: first, that it shall be

> linked with conditions which will ensure a long period of stability in the industry, an increase in its manpower, and the adoption of working arrangements which will facilitate greater output;

and secondly that it shall in fact be no more than an increase in the minimum, without any increase to those who were, before the dispute, receiving more than the minimum. On the question of manpower in the industry - the other main bone of contention - the Court finds that the union has been unduly restrictive and recommends it to admit adult entrants. On the methods by which the dispute has been conducted, as distinct from its substance, the Court uses very strong language towards the union: it has adopted an 'intransigent attitude' and has been 'determined to exploit its key position without regard to the interests of other sections of the industry.'

We appreciate that many of our readers, particularly those overseas, must be very perplexed by this dispute. To set out all its intricacies would require a great deal of space. Put very briefly, however, the substance of the matter is that in the absence of negotiating machinery for the printing industry as a whole, each section in turn feels itself aggrieved. As the report of the Court of Inquiry puts it,

> The present practice of 'leap-frogging' demands from individual unions has kept the industry in a constant state of unrest for over three years, and it is vital that it should be brought to an end.

The way to do this is to set up a Joint Industrial Council empowered to make wages agreements for the whole industry. The other main issue at stake has been that of fair play and honest dealing in the conduct of a dispute. As one of the victims of the dispute, we feel that it would be far better that it should continue than that it should be settled in any way that compromises the main issues at stake.

Korean Reconstruction

As the United Nations forces complete their occupation of North Korea, it must have become clear even to the Communist world that this Soviet puppet has been left to its fate, at least for the time being. The North Korean authorities fled from their capital, Pyongyang, at the end of last week. In spite of sabre-rattling in Peking, the Chinese have - sensibly enough from their own point of view - made no move. Tass, the Soviet news agency, has gone so far as to alter its version of the text of a last-ditch appeal to his people by Kim Il Sung, the North Korean Premier, from the statement that 'we are receiving the absolute support of the Soviet Union and the Chinese people' to 'the sympathy of all progressive mankind'.

The people of North Korea certainly do have the sympathy of the whole world. For now that the fighting is at its last stage, the political and economic problems of pacification are becoming acute. Already, for instance, Mr Syngman Rhee, the South Korean Premier, is at loggerheads with the new United Nations Commission, which is to establish a single Korean state. He disputes its wise decisions that the authority of his government must be confined to the South, and its own view that fresh elections also should be held there at the same time as in the North. The task of fusing this government into a new administration for united Korea is indeed prickly, since Mr Syngman Rhee has done little to earn the support of progressive opinion in the non-Communist world.

The Americans propose setting up a United Nations Korean Reconstruction Agency, led by an Agent General and responsible to the UN General Assembly. As the major share of relief work will undoubtedly fall on them, their plan for this agency should be accepted. There is no reason, however, why the Russians should not contribute; to their astonishment they were voted on to the seven-member UN committee drafting measures for relief. It would also be of real value to future relationships in the Orient if the Chinese could be asked to associate themselves in some way with the Reconstruction Agency.

France and Indo-China

The unhappy French government finds itself in an almost impossible position over the war in Indo-China, from which the growing casualty lists are increasing the sense of despair, frustration and irritation throughout France. With a general election in prospect next spring no party - except the Communists - cares to commit itself to any clear statement or to admit that the war may have been in vain. That is one of the main reasons why General Juin has been sent to make a report. His report, which should be available next week, will be used as a gospel and may prove to be one way out of an internal political impasse. From M. Pleven, the Prime Minister, downwards there is increasing tendency to say the best course may be to withdraw, politically and militarily, if only terms can be established which would give Bao Dai a chance to carry on alone, safe and free.

On the other hand, a kind of paralysis is setting in, particularly among certain French colonial officials. Some want to hang on at any cost, in the belief that a world war is coming anyway and if it starts with them in possession they might be restored afterwards. Both tendencies make an appeal to the United Nations difficult, until the military situation in Indo-China itself gets quite out of hand. If anything is to be done, however, such an appeal should be made now as soon as possible, before it is too late.

India's Voice in Asia

When the new United Nations Commission for Korea was formed three weeks ago, many hoped that India would accept a seat on it. Indeed, its participation was thought so important that, on its refusal, the size of the projected Commission was reduced from eight to seven members; as now composed the body will lack some of the authority it would have had if India had been in it. These disappointing hesitations in Delhi have two main causes. There is, first, a determination to avoid full commitments either to the western or to the Communist camp; and there is also a feeling that Delhi has special knowledge of China's intentions, conveyed in the despatches of the ambassador in Peking, Mr K.M. Panikkar, whose relations with the Chinese are at present closer than those of the envoy of any other major power, except the Soviet Union.

Regarded as the voice of free Asia, India's views have lately come to be regarded with something approaching awe both in Washington and London. But in view of India's rejection of a course which other free Asian states - Pakistan, Siam and the Philippines - have accepted at Uno, it might be wiser to regard more critically India's ability to reflect Asian opinion. Indeed, is there even a coherent Asian opinion to be reflected? To judge by the many voices raised at the recent conference of the Institute for Pacific Relations at Lucknow, there is not. Indeed, as Mr Nehru, the Indian Prime Minister, himself said last week: 'To talk of Asia as a political unit is misleading.' It is true that there is growing up in Asia a universal desire for political freedom and economic improvement, with all the repercussions on traditional relationships that this involves. But it is no more accurate to speak of a general opinion in Asia on intricate international questions than it would be in Europe.

The Chinese, moreover, may be trusted to make shrewd use of their access to Mr Panikkar's ear. They know that the gist of his reports, when it reaches London, may at least cause the western powers to waver in a firm attitude to the problems of Korea.

Debts for Dollars

The White Paper on the balance of payments in the first half of the year - which is examined in detail on a later page - helps to make plain the economic tasks to which British policy must now be directed. Since devaluation the United Kingdom has been incurring extra short-term debts to the rest of the sterling area almost as fast as the gold

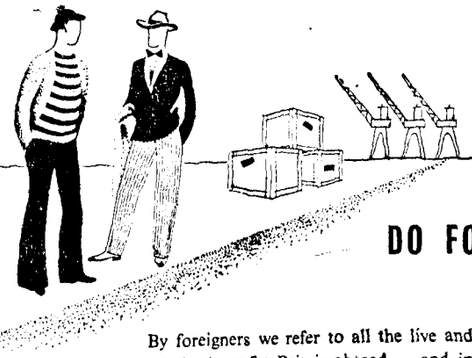
and dollar reserve of the whole area has been rising. During the first six months of 1950 the claims on London held by sterling countries rose by £200 million while £262 million was added to the reserve. In large part this exchange of debts for dollars was, of course, inevitable. Britain could not expand its exports to the sterling countries as quickly as they could, after devaluation, cut their imports from North America. In fact the expansion of British exports has been far too little to offset the worsening of the terms of trade as the prices paid for British imports have risen. Britain's surplus with the rest of the sterling area was reduced from £135 million in the first half of 1949 to £80 million this year.

Quickly to increase exports to the sterling area is now as important as earning more dollars in direct trade with North America. Britain's own dollar deficit is being - and must be - financed, and the gold reserve increased, from the dollar surplus earned by the sterling area's primary producers. In the twelve months since devaluation Britain has been lucky to do this so largely at the expense of claims on future production. The process cannot go on indefinitely. The claims will be cashed sooner or later - and, with inflation mounting in Australia, probably sooner. The sterling area's dollar surplus has been achieved chiefly by cutting imports from North America. Britain's monetary partners will be content to go on passing their dollars to London only if they can buy what they want here as easily as in the United States. To make the British payments position secure, therefore, the country has in future to increase the dollar reserve not at the expense of fresh sterling debts but by current payment in the form of a bigger export surplus to the sterling area. It will be necessary to squeeze many more exports - not merely, or even mainly, a thin stream of dollar exports - from an economy on which the domestic demands are being allowed to grow still heavier.

Fair Prices for the Colonies

The Colonial Development Corporation shines by contrast with the Overseas Food Corporation, and its better reputation was apparent in last week's debate, which completely lacked the political sparring of debates on the East African groundnut scheme. Members on both sides of the House showed themselves in sympathy with the corporation's aims and anxious to be constructive in their criticisms of its methods.

It may be that the House was a bit too friendly. One or two members suggested that the time had come for the corporation to take stock, to refuse to undertake any new projects and to examine its organisation to see whether its administrative overheads could be reduced. Another question was the extent to which the corporation was going to retain the active management of its many and varied projects. Ought not its main function, or one of its main functions, to be the launching of pilot agricultural schemes rather than the actual running of poultry farms? The place of the public corporation in colonial development has still not been satisfactorily determined, and care must be taken lest in a few years' time the Colonial Development Corporation finds itself out of its depth.



There is, above all, one issue that has not yet been settled. In its last report hints are given that the corporation expects to have some say in the fixing of prices for the products of its enterprise. It appears worried lest, having undertaken some £30 million of capital development at a time of high prices, it should find that the price of colonial produce has fallen by the time its schemes bear fruit. It is right to feel some uneasiness on this score, which must make it doubly cautious in approving a project. But it is wrong if it thinks that the Ministry of Food, or whatever Department is involved, should automatically guarantee a remunerative price irrespective of what happens to world prices. Yet this was the attitude of almost every member who spoke in the debate, and the Government spokesmen did not reject it. Only one member said that the fair price must be a reasonable price and that 'this poor old country cannot be a milch cow for all these schemes'. Great Britain has a duty to help to raise colonial standards of living. But the help should be through investment and taxes, when it can be measured, not through the consumer.

Thunder in Egypt

King Farouk, fresh from his gay holiday in Europe, has returned home to alarms and excursions. The opposition leaders have served on him a memorandum complaining of the Palace entourage, stating that the public breast is 'boiling with anger', and warning him of imminent revolution. The Wafd countered by staging street demonstrations of welcome. Anyone who counted the heads in these could have estimated their cost to a piastre.

The King is vastly unpopular. He is disliked not for his trivial taste in pastimes, but for his taste in friends - often foreigners - and for his waywardness. Though highly intelligent, he is a volatile person with a hand that seems the wrong shape for keeping a steady grip on a tiller. Nevertheless, the Egyptian crown itself is a strong institution, hence the assiduity with which successive governments - whatever they may say while they are in opposition - cultivate 'the palace' when in power. This is what Wafd has done since the elections. Its position is that it enjoys popular support because its sick leader, Nahas Pasha, is a public hero, and it has palace support because other prominent Wafdists are hand in glove with certain palace officials. Therefore the opposition must attack both. Its manifestation is largely a party manoeuvre, and if revolution were to happen opposition leaders would be among the victims.

At present, however, it is difficult to see where the revolutionary leader is to come from. Perhaps he is lying low or being

DO FOREIGNERS TALK T.I.?

By foreigners we refer to all the live and likeable people with whom we do business for Britain abroad . . . and, in explaining that, we seem to have answered the question. For TI reached a record total last year of £12,750,000 in *direct* exports alone . . . and that in spite of difficulties which did not exist the year before.

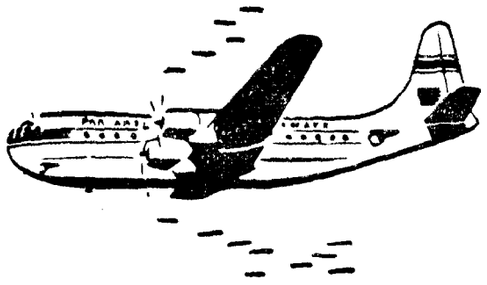
When foreigners think of TI, it may mean anything to them, from a microscopic coil of steel tubing for a highly technical purpose to a consignment of bus body components ready packed for quick assembly. When foreigners talk TI they are using what has become almost a universal language.

The letters TI stand for Tube Investments Ltd., of the Adelphi, London, W.C.2 (Trafalgar 5633). They also stand for the thirty producing companies of the TI Group, whose specialist skills are co-ordinated in the general field of light engineering to produce essential mechanical parts for a thousand and one things which everbody uses.

THE SURNAME OF A THOUSAND THINGS

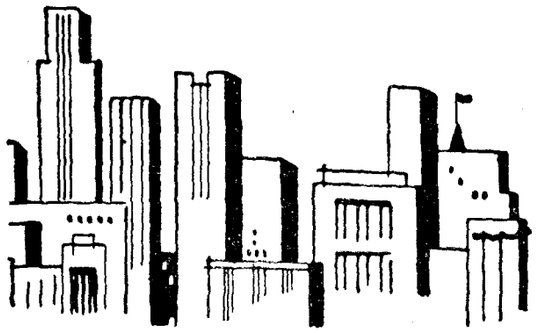
Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

"Who are Britain's Craftsmen?"



*Introducing Herbert Martin. Many years ago he learned the craft of fitting a frame with teazle heads for finishing fine woollens. This age-old process was one of the factors that made British cloth pre-eminent throughout the world . . . and that is today helping raise woollen exports to new records. **

But does craftsmanship mean only handcraftsmanship? Consider, for instance, the manufacture of the cloth from the spun wool. The care and skill necessary in weaving, dyeing and finishing to established standards of quality . . . and to modern demands of, output. Craftsmanship gives the answer though it may be difficult to single out one man or one part of the process. For must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and they follow this rule in making chemicals for a long list of British industries. In the spinning, weaving, dyeing and finishing of fine textiles Monsanto chemicals play a vital and increasing part.



* *Illustration: Courtesy of Mr. H. Martin and Messrs. Hunt & Winterbotham Ltd. Cam, Glos.*

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

trained in Moscow. If so, the moment for launching him is more likely to be one when there is confusion and tension in the world than one like the present, when a Soviet puppet has just been worsted.

Can Germans Plan?

The Managerial Board of the European Payments Union have now made the first quarterly compensations under the scheme. With perhaps an excess of reticence, the Board declined to publish the positions of its members, but it is clear that a major feature was the rake's progress of Western Germany. In three months the Germans have acquired a deficit of something over $150 million, at least half their total credit for two years of $320 million. Some of the reasons for the deficit are temporary - such as the anticipatory buying of raw materials inspired by the Korean war - but others are more permanent, and it is clear that the Germans cannot afford to continue borrowing in the conditions which apply to their present position under the scheme.

Only three immediate possibilities are open to the West German financial authorities. The first is dollar aid, on which the Germans themselves have clearly been gambling, but with little encouragement; the second is tighter import and other physical controls, and the third, tighter money. There are already signs of a stricter import licensing policy, but it is doubtful whether the German licensing system is adequate to the task, and even more doubtful whether the Germans would be prepared to supplement it with the necessary internal controls, such as rationing; but it looks as though it will be the first expedient to be tried. It would mean a reversal of Germany's movement towards liberalisation, and the creation of new, or rather the return of old, problems for other participating countries, especially the agricultural producers. Holland and Denmark have relied on Germany as a market and the Dutch in particular have relied on a trade surplus with Germany made possible under liberalisation, to help offset their deficits elsewhere. Tighter money - reduction of demand by financial control - may well prove to be the only effective expedient, but its consequences for Western Germany, with an already tight financial policy and a continual threat of unemployment, would be serious in the extreme.

Vengeance or Reform?

The purpose of the Criminal Justice Act of 1948 is, in brief, to reform the offender if there is the slightest sign of this being successful and to keep out of society for a long period the hardened persistent offender who appears irreclaimable. The Act recognises what penal reformers have long been urging: that a prison sentence, to be effective, must be accompanied by hard work, not hard labour, by the teaching of self-discipline rather than the imposition of petty discipline. Corrective training, in fact, takes time, and for the young lag the short sentence in, if not brutal, at least brutalising conditions does more harm than good both to him and to society.

Many judges, however, would have none of this, and Lord Oaksey appears to be among them. Addressing the Magistrates' Association last week-end, he advocated in effect savage punishment for savage crimes as being the greatest deterrent, although both the evidence and expert opinion, including that of the Metropolitan Police Commissioner, uphold the view that the prospect of a long deprivation of liberty is much more effective. There is no evidence at all for Lord Oaksey's contention that a prison sentence is virtually no deterrent if prison diets are improved and the brutalising conditions removed. Is he, moreover, really trying to suggest that honest normal boys and girls commit crimes in order to escape from the back street and live in the luxury of an approved school? It is fortunate that penal reform does not have to wait for the approval of His Majesty's judges, for if it did, there would be far more crime and criminals at large today.

Visitors to the Exhibition

The persons who visit the Exhibition will, with few exceptions, be the select of all classes in the civilised world. The most intelligent artisans and mechanics - the most skilful manufacturers and machinists - the most advanced of artists - the most learned and intelligent of the aristocracies and princes, from all quarters, will be our visitors in 1851, and the naturally chosen representatives of all the world. They will come for the enlightened purpose of gaining and imparting instruction and improvement; they will be, as the rule, orderly, well-conducted men, given to run about ...and not given to low debauchery...How the increase of people is to be supplied with provisions and water, is for us a more important matter than how they will be accommodated with lodgings. But we believe that both may be safely left to private enterprise and private interest.. If...such an influx of people should be supposed to make it necessary for the Government to interfere with the supply of either food or water, we should regard the moral results of the Exhibition as more likely to be disastrous than beneficial.

The Economist

October 26, 1850.

Letters to the Editor

Consumers' Representation

Sir, - As chairman of one of the committees which you criticise so severely in your emergency edition of October 14th, I must join issue with you in your very sweeping statement that these councils and committees set up in the nationalised industries to protect the consumers' interests have made it their business to defend the Corporations before the public rather than the public before the Corporations. You go on to say that as members of these bodies are appointed by the Minister responsible it is improbable that he will select persons likely to be thorns in the flesh of the Board which he appointed.

On behalf of my colleagues I resent the implication that we are yesmen or there to whitewash the imperfections of the British Transport Commission. I am sure if you had taken the trouble to check the membership of the committee such shortcomings could not be substantiated. I am also certain that this is far from the mind of the Minister responsible.

In examining the work of Consultative Committees it is important to keep one or two factors in mind. We are not there to act as a postbox between dissatisfied users and the various Executives. We are anxious that those who have any complaint should first make contact with the Executives concerned or their representatives. It is only if they fail to reach agreement or obtain a satisfactory answer that we feel we should be called in; I can assure you that those cases which have been referred to us have received the closest examination, and, if we considered necessary, the strongest representation has been made either to the Commission or, failing satisfaction there, to the Minister direct, so far with satisfactory results.

Secondly, our functions should be constructive and not destructive, in an endeavour to assist the Commission to build up an efficient, integrated transport system. My committee has already had differences of opinion with the Commission. If as a result we can get any shortcomings rectified without unnecessary fuss or publicity, then I feel that we are satisfactorily carrying out the work which it is intended we should perform.

The Consultative Committee system is new in industrial life. The general public is still not aware of its existence. If the machinery does not function it is largely the fault of users of transport in not taking advantage of the facilities afforded to them. Surely it is only when the machinery has had a fair trial that it is possible to judge whether it - and those of us who are not only giving our time but also paying for the privilege out of our own pockets - can be likened to the appointed representatives mentioned in your last sentence. The whole reason why we sit on these Committees is that we believe they can serve as a check on any arbitrary behaviour of a statutory monopoly. - Yours faithfully,

EGBERT CADBURY

Chairman,
Central Transport
Consultative Committee
London

Pension Reform

Sir, - During a recent holiday in England I had the opportunity of meeting some retired people whose pensions had not been adjusted to the depreciation of currency and to the consequent rise in the cost of living. Having resided in a country where currency depreciation has caused greater havoc than in England, I venture to submit for consideration a remedy which has been put into practice in France with a view to improving the sorry condition of pensioners. It is based on the simple principle that, in each profession, the active members must support the retired members. An equitable pension scheme ought to fulfil two conditions, first, to ensure the same pension to two men who have carried out the same duties for the same length of time, irrespective of the year when they retired and, secondly, that pensions are continually adjusted to the cost of living as reflected in the present scale of wages.

Under this system funds need not be accumulated. The question of depreciation does not therefore arise. The premiums now collected from the active members are distributed now to the retired members of the profession. It is more or less the system of state pensions, linked with an automatic increase of pensions in proportion to the increase of wages of the active members.

One must not imagine, however, that the system of 'distribution' is a panacea. It needs careful handling in order to maintain the right proportion between the active and the retired members of each profession. But this difficulty is not insuperable and can be overcome by wise administration. - Yours faithfully,

V.S. GARIBIAN

Paris

Books and Publications

'While Memory Serves' by Lt. General Sir Francis Tuker. Cassell. 667 pages. 25s.

General Tuker's new book is a contribution to history by an experienced, observant, and sensitive soldier. It is not the story of the last two years of British rule in India, but a record of military aid to the civil power in North-East India, amid the communal horrors and political uncertainties of 1946-47. The comparative peace of three quarters of the sub-continent, historically relevant, is barely mentioned. The chronological arrangement and an occasional lack of selectivity impair the sequence and perspective of the narrative. The theme which pulls it together is a testament of the true, impartial temper of the undivided Indian Army, and of the British soldier in India, proved in a furnace worse than any battle.

The author's political and social judgments, notably on the future of Hindu Orthodoxy and Communism in India, have yet to stand the test of time; and, in other respects, certain passages are premature. Wounds have not yet healed, and, even in the interest of truth, salt is not a good ointment. This book, *pace* the publishers, will not encourage Hindu and Muslim to mend their quarrel.

* * *

'The Secret Army' by General T. Bor-Komorowski. Gollancz. 407 pages. 21s.

No matter how high the price of freedom, the Poles have always been prepared to pay it. In the terrible years of German occupation it rose to an extortioner's ransom. The sacrifice in youth and blood made for that pitiless ransom is General Bor-Komorowski's story - the story of how the Poles built up the clandestine 'Home Army', the largest underground force ever created by a suppressed people for their liberation. At the time of the Warsaw rising in August, 1944 its numbers had reached 380,000 of which women formed one-seventh of the strength in the capital.

That such a huge force was raised explains the extraordinary achievements of the Polish resistance army. The author points out that, although five consecutive commanders for the Silesian sector were arrested in two years, there was never the slightest difficulty in finding a successor. And if the ways in which that secret army was operated, or made to operate, still remain somewhat obscure, it is because the narrator has for the most part, and rightly, allowed human incident to tell his story.

With its nerve-breaking turns of fortune and misfortune, its incredible feats of ingenuity, daring and selfless steadfastness in the face of torture and cruel personal ordeal this story makes bleak and terrible reading today. On the political issues General Bor-Komorowski comments with a soldier's restraint; he is writing, after all, primarily for the British public, but he admits at one point that he had 'no illusions where Soviet' Russia was concerned'. He is convinced of Soviet responsibility for the Katyn massacres.

As to the events leading up to the ill-fated Warsaw rising and their political complexities, he writes about them as a man in a dilemma - as well he might be. At last he had his vast army - supplied and straining at the leash; it was the weapon of deliverance against Germany - but what of the Russians? The Red Army guns could already be heard in Warsaw, yet not a single official Soviet liaison officer had appeared and there was a split in the London Polish Government over policy. Sosnkowski wanted to base the Home Army's fighting action on the Soviet Union's resumption of diplomatic relations with his London Government; Mikolajczyk 'seemed to believe in the possibilities of a compromise'. But it was obviously left very much to the General on the spot to decide. Once Mr. Churchill had persuaded Mr Mikolajczyk to go to Moscow, there was a chance that the rising of the Home Army could weight the scales of diplomacy. As the Poles rose, squandering their home-made ammunition with frenzied valour, the Red Army artillery over the Vistula became as silent as the grave. All the Kremlin could see was that the Polish white eagle flying over the telephone building bore a crown. In a few weeks Warsaw was a dynamited ruin and 100,000 of its defenders lay under the debris.

'Social Case Works in Great Britain' Edited by Cherry Morris. Faber, 223 pages. 12s 6d.

Although much has been written in America this book is the first of its kind to be published in England. The first two chapters are devoted to analysing the principles of social work which has as its object not groups or classes of people but the individual or the family in need. Then follow six chapters showing the professional social worker doing his or her job in a specific setting. The account of how this work began, in the efforts of a few enlightened people to combat ignorance, indifference and prejudice, is admirable; the case-histories quoted are interesting; and what the worker sets out to achieve, and, largely, how she achieves it, is clear.

In a brief concluding chapter there is an outline of how modern psychological theories have affected not only the attitudes of many workers by making them aware of the need to understand both themselves and their 'clients', but also the selection and training of students.

AMERICAN SURVEY

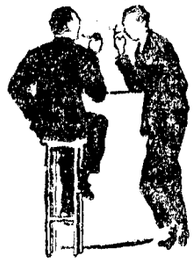
Premature Inflation

Washington, D.C.

The inflationary effect of the rearmament programme in the United States can now be seen; the cause, the programme itself, as is so often the case, will follow later. Up to the present there has been no additional expenditure on defence and on October 17th the weekly Treasury statement showed an accumulated deficit for the fiscal year up to date of only $124 million compared with $2,344 million at the same time last year. But inflation has not waited for any factual justification and its immediate impact on the rearmament programme itself was dramatically illustrated on October 4th by Mr John McCone, the Under-Secretary of the Air Force, who told a sub-committee of the House Armed Services Committee that the rise in prices between April and September had cost the equivalent of 750 jet fighters. A supplementary appropriation of between $315 and $360 million or more would be needed to pay for the additional cost of materials for the 4,428 aircraft to be constructed by 1952; and there would, no doubt, be wage increases to consider later as well.

The steps taken to meet the inflation have so far been cautious - even excessively cautious. When the Korean war broke out the Administration relied - and pretended that it could go on relying - on exhortations and the operation of the public conscience. It was not until September 18th that Regulation W, which set a statutory limitation on hire purchase credit, was put into force. But, as was predicted at once, it proved to be by no means strong enough to have much effect at a time of increasing employment and rising wages. If it had any effect at all it was probably to act as a warning to those who, seeing a long period of prosperity and shortages ahead, wanted new motor-cars and refrigerators, that they had better arrange their credit terms quickly before sterner regulations made buying more difficult.

On October 16th Regulation W was amended and motor-cars must now be paid for in 15 months instead of 21 and household appliances and furniture in 15 instead of 18 months. Down-payments of 25 per cent instead of 15 per cent for appliances and 15 per cent instead of 10 per cent for furniture are also required. The new Regulation W will probably have a significant effect, but even in its present form it may do no more than reduce the level of demand to, or nearly to, the level of supply. It will certainly not cut it to the point where critical materials flow naturally away from consumer goods into armaments.

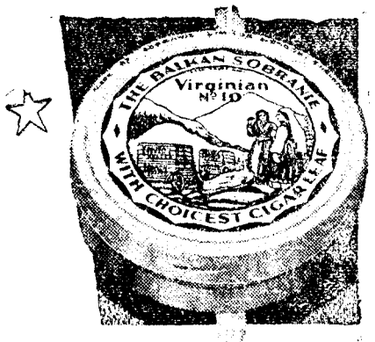


Much more effective will be Regulation X, issued on October 10th, under which mortgages on new houses - though so far only on one or two family units - are controlled. The housing boom had, under the competitive generosity of credit terms, reached the point where 1,200,000 houses are at present being built. Regulation X is designed, and is expected, to reduce this number by a third during the next year. As a by-product, it will probably also have a greater effect on the sale of household appliances than Regulation W because 400,000 of the refrigerators, washing-machines and other trimmings which the speculative builder must now offer will not be needed.

Regulation X is, too, only a beginning. Restrictions on credit for commercial buildings are being drafted and on October 18th Mr William Harrison, the Administrator of the new National Production Authority, had a rather stormy meeting with representatives of the building industry to whom he was trying to explain the necessity for stopping, more directly than by credit regulations, the construction of dance halls, racecourses and amusement parks. Mr Harrison is also getting under way in other directions. Civilian use of copper and aluminium will be controlled, as rubber already has been, and before long the same types of priority controls are expected to be put on steel and, later, on other materials.

But up to the present the emphasis has been on the redirection of supplies required by the rearmament programme rather than on the direct control of inflation. The supplementary tax bill, the mortgage restrictions and the credit controls added together do not go very far towards closing the prospective inflationary gap. The kind of measures which are needed to do that are those which must, of political necessity, wait until after the election. When Congress comes back at the end of November it will be faced with a task which, superficially, will be much harder than it would have been had it been possible to undertake it earlier. But it is probably not, in spite of appearances, too late for resolute action. It has been estimated that actual cash expenditures during the fiscal year ending June 30, 1951, will be only just under $5 billion more than in the previous year. Cause is, therefore, following effect at a respectable distance.

By the second quarter of 1951, however, a larger labour force, longer working hours and wage increases will have produced a demand for goods and services which cannot be



'AMERICAN SURVEY' is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

From the Customer's View-Point

ONE of the fundamental principles of Hoover policy is to consider every project from the customer's viewpoint. This applies to markets at home and abroad and relates not only to Hoover Cleaners, but also to Hoover Washing Machines, E.H.P. Motors and all other Hoover Products.

CONSEQUENTLY the closest liaison is maintained between the Hoover engineers and technicians and the Company's sales and service departments. What is more, Hoover employ trained specialists whose job it is to keep in constant touch with the public — to discover just how Hoover products are used, what new requirements may have arisen, what suggestions there may be for improvement, and so on.

THERE can be little doubt that it is to this policy of looking at every problem from the customer's viewpoint that Hoover Limited owes a very large measure of its rapid and constant progress.

controlled except by a much more drastic reduction in the availability of credit and by new taxes designed to produce a budgetary surplus. If these two things can be done in the last weeks of the present Congress or early in the new one, the inflation which has already taken place - and some was inevitable over the next twelve months - may be enough to soak up the balance of the surplus demand. In which case, the period of inflation without armaments will be followed by one of armaments without inflation.

American Notes

Peace and Progress

President Truman, in his address on the fifth anniversary of the United Nations, repeated in general international terms what he had said in specific American terms at San Francisco a week earlier, and added a special plea to the United Nations to continue to work for effective disarmament. Korea has, in his opinion, shown that the United Nations Charter works and has given a new impetus to peace and progress, the only constructive answers to the Communist challenge. The Korean campaign is already 'the symbol of the resistance of a united humanity against aggression' and Mr Truman is determined that Korean reconstruction shall become a symbol of international co-operation for improving the conditions under which people live.

Congress is to be asked to finance relief and reconstruction in Korea and this problem was one of the chief subjects discussed at the President's famous meeting with General MacArthur on Wake Island. This meeting turns out to have been a much more clear-cut proceeding than could at first be discerned through the fog of rumour that reporters built up on hints from 'official spokesmen.' The President finally dissipated the fog at his press conference last week with a shaft of furious lightning directed especially at the speculation on what had been decided about Formosa. There was nothing to decide, said Mr Truman, for the decisions had been made (by him alone) five weeks earlier. For the present, it appears, the US fleet will go on neutralising Formosa; for the future the United Nations will decide its status.

Communist Dead-line

The day has come and gone on which Communists, Communist-action and Communist-front organisations were supposed to register under the Subversive Activities Control Act, and no one has signed up voluntarily. Now the Department of Justice must go and get those who it thinks are Communists and bring them before the new subversive activities control board. It will take millions of dollars and many years to get through all the legal processes required if the 55,000 alleged Communists in America are to be forced to register.

Long before that, the whole procedure may have been shown to be unnecessary. The Administration has always contended that the Smith Act, under which the eleven Communist leaders were convicted for conspiring to overthrow the government, is all that is needed; the Supreme Court has now agreed to review these convictions and is expected to rule on the constitutionality of that Act.

Congress will be more ready to amend the Subversive Activities Control Act after the election in consequence of the Department of Justice's decision that Spanish Falangists are inadmissible to the United States, under the section which forbids entry to persons with Communist or totalitarian connections. Senator McCarran, the author of the Act, will take the plight of his special pets more seriously than he has that of the many Italian musicians who have been herded on to Ellis Island, even though he claims that this is merely part of an Administration attempt to discredit the Act. In order that the Island should not become an overcrowded concentration camp worthy of any Communist or totalitarian country, the State Department suspended all outstanding visas for reconsideration, with the result that US Consulates abroad have been made demonstration centres for the shortcomings of American democracy.

Politicians in Glass Houses

Democratic politicians in New York have stumbled upon a rare opportunity to be self-righteous at Governor Dewey's expense and they are making the most of it. Politicians who live in glass houses evidently are an exception to the rule, particularly when their party is under fire for tolerating a gambling syndicate in Brooklyn.

It now appears that, when Mr Dewey patriotically decided not to retire from public life after all, the rejoicing in the Republican party was less than unanimous. In a letter to one of his backers Mr Hanley, who had been promised that he should be the candidate for the Governorship, reveals that he stepped aside only when he was given, in addition to the nomination to the Senatorship, an offer to discharge his private debts, a promise of a secure state job if he failed to dislodge Senator Lehman, and an assurance that his salary as Senator would be augmented by a state pension. None of Mr Hanley's explanations is convincing, and the existence of some such deal is hard to ignore.

Mr Lynch, Governor Dewey's Democratic opponent, is taking a high line and demanding grand jury and Senate inquiries into an alleged violation of that part of the penal code which prohibits the bartering of public office. But promises of appointment, after all, are the coin in which all parties deal; Mr Impellitteri, the independent candidate in the New York mayoralty triangle, volunteers that he was offered a $28,000-a-year job if he would oblige the Democrats by standing down. What is really disillusioning is not that Mr Hanley was persuaded to give up his ambitions to become Governor, but that a man of 74, with failing eyesight, was encouraged

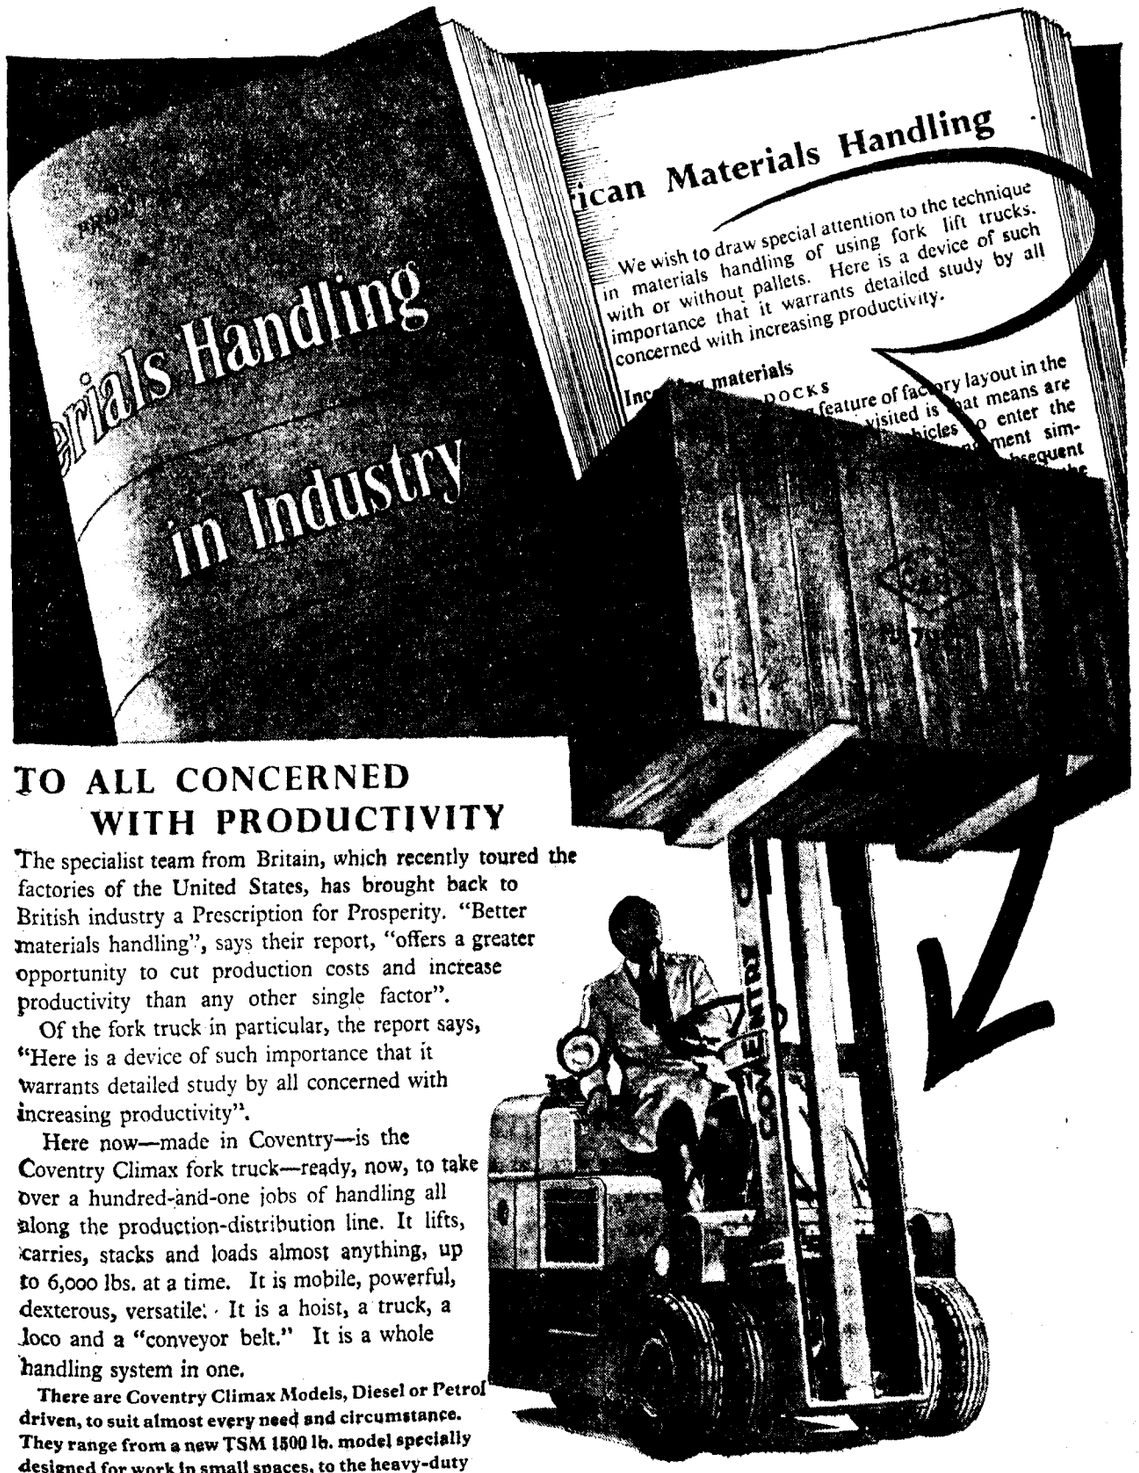
to aspire to a Senate seat for which he is clearly not qualified.

The Hanley letter reached the Democrats because of the indignation - perhaps not altogether disinterested - of its recipient. There is a story that it was speeded on its way by a Republican supporter of Senator Taft and consequent critic of Governor Dewey. When Mr Dewey re-entered the political ring, there was much speculation that perhaps he had not given up hope of the Presidency, after all. Last week he announced firmly that 'under any conceivable circumstances' he would not be a candidate a third time. But he threw down a challenge of another kind to Senator Taft and the conservative and isolationist wing of his party when, on a television programme, he rang up the curtain on a new Eisenhower-for-President boom. If Governor Dewey cannot be king, he can aspire to king-making, and General Eisenhower's amiable disclaimer sounded less final than it has in the past.

Calling Up the Ships

Of the six new express liners that were to give foreign shipping lines a run for their money, four have been called up as troop transports: the superliner *United States*, and the *Presidents Jackson, Hayes,* and *Adams*. The *United States*, originally scheduled to be completed in 1952, will be able to carry at least 12,000 troops; if it had been ready this summer, it could have landed a division in Korea within two weeks of leaving New York. The other three smaller vessels have troop capacities of about 2,500. The government is contributing more than half to the cost of each, through construction subsidies and special defence features which enable them to be transformed from luxury liners into military auxiliaries with little waste of time or effort.

The industry is disappointed at the indefinite postponement of its bid for the blue ribbon. But it is delighted that defence needs have so soon justified the liner programme, and shipbuilders naturally hope that new legislation expanding subsidies and a large building programme will sail through the next Congress before favouring Korean winds. More money for more liners is not likely until an investigation shows whether the Maritime Commission (now reorganised inside the Commerce Department) was grossly extravagant in its distribution of subsidies. But the new Maritime Administration is already pressing for $250 million for cargo boats, on the ground that the Victory ships in the reserve fleet are too slow to be safe or economical. Design work has already been given out for a 20-knot ship, with twice the speed and two and a half times the carrying capacity of the Liberty ships.



The Bureau of the Budget has so far failed to give its approval, presumably in accordance with the Administration's view that one promising way of easing the dollar shortage is to give foreign shipping a larger, rather than smaller, share of the trade. A big shipbuilding programme not only would mean an expensive duplication of effort, but would further reduce foreign earnings. This view is hotly contested by the industry, and six subsidised lines and the Maritime Committee of the Congress of Industrial Organisations, who have sometimes worked together successfully in the past, have officially joined hands to 'educate' the public in the need for more subsidies and smaller taxes, and the danger of relying upon foreign fleets in an emergency

Doctors in Arms

Three military hospitals are being reopened to deal with casualties from Korea and young men are no longer judged unfit for conscription because they have fewer than sixteen teeth. The Army has thus a rapidly growing need for doctors, dentists and, more unexpectedly, veterinarians, none of whom are showing any enthusiasm for joining the forces. Their reluctance is in part explained by the services' reputation for failing to make the best use of the medical skill at their command and by the great shortage of civilian doctors, which might be catastrophic in the event of air-raids.

But it is surprising that there has not been a greater readiness to volunteer amongst the young doctors and dentists who received their training at government expense during the war or were deferred while they completed their training at their own expense and who, in the end, only saw active service for a few months, if at all. The recent special legislation, for conscripting medical men up to the age of 51, was directed largely against this particular group and the Army expects to be able to get about 5,000 doctors and 3,000 dentists in this way, enough for its immediate needs. The prospect of conscription does not seem to have stimulated volunteering, as both Congress and the Army hoped it would, in spite of the $100 a month bonus and the immediate commission given to those who come willingly.

It would be easy, but hardly fair, to explain the doctors' apparent neglect of their duty to fight for their country by their preoccupation with their fight against their government. The American Medical Association seems to regard 'socialised medicine' at home as a greater danger to the nation's freedom than the Communist threat abroad, but not all its members go so far. Many of them objected to the compulsory levy of $25 a head, out of which comes the $1,100,000 the association spent in the last few weeks on a concentrated advertising campaign against the Administration's compulsory health insurance plan. As a result few Americans will go to the polls next month without having heard of the government's attempt to guarantee medical care for every citizen. Democratic candidates hope, but not very confidently, that the campaign may defeat itself by winning votes for the government making that attempt.

TO ALL CONCERNED WITH PRODUCTIVITY

The specialist team from Britain, which recently toured the factories of the United States, has brought back to British industry a Prescription for Prosperity. "Better materials handling", says their report, "offers a greater opportunity to cut production costs and increase productivity than any other single factor".

Of the fork truck in particular, the report says, "Here is a device of such importance that it warrants detailed study by all concerned with increasing productivity".

Here now—made in Coventry—is the Coventry Climax fork truck—ready, now, to take over a hundred-and-one jobs of handling all along the production-distribution line. It lifts, carries, stacks and loads almost anything, up to 6,000 lbs. at a time. It is mobile, powerful, dexterous, versatile. It is a hoist, a truck, a loco and a "conveyor belt." It is a whole handling system in one.

There are Coventry Climax Models, Diesel or Petrol driven, to suit almost every need and circumstance. They range from a new TSM 1500 lb. model specially designed for work in small spaces, to the heavy-duty FTF series lifting 4000, 5000 or 6000 lb. in a single load

We've solved some problems in our time!

In 1945 an oil company came to us with a problem. In measuring oil and gas pressures, they told us, recording instruments were lowered into the wells. The change in temperature during descent was resulting in false pressure readings. Could we supply a battery that would preheat the recording mechanism to a temperature of 160°F, and maintain it at that heat till it reached the well bottom? There was just one little difficulty—how to get a battery of 6 volts and one ampere hour capacity *inside a diameter of 1¼ inches* and a length not exceeding 3 feet.

¶ We designed and produced that battery—a contrivance of three cylindrical cells wired end to end within a framework of steel rods. It fitted exactly into its allotted place amongst the delicate recording instruments housed inside the 4 inch diameter steel cylinder. And it did the job.

¶ Hundreds of thousands of Chloride, Exide and Exide-Ironclad batteries giving good service today in every branch of industry, transport and communications owe their origin to just such a demand: 'Here is a job—make us a battery for it'. We have been solving that sort of problem for over 50 years.

¶ Our battery research and development organisation is the largest and best equipped in this country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

THE WORLD OVERSEAS

Cures for India's Poverty

(By a Correspondent)

Of the development schemes considered at the recent Commonwealth Conference by far the largest is that for India. This involves an expenditure of about £1,380 million, of which £600 million is sought from outside sources. Much of this will be spent on agriculture. Three Indians in every four make their living from agriculture, yet agriculture is the least productive of all India's occupations. Yields are at present no higher than when Buddha preached, and total output is little greater than half a century ago. But, though agriculture remains stationary, the population goes up by 1 per cent every year; and so the rural standard of living goes inexorably down, however this may have been concealed over the last few years by the improvement in the countryside's terms of trade with the towns. Today there is only one cultivated acre for each of the 250 million people who live off the land; and that acre produces only a third as much rice as in Japan, or a third as much cotton as in the US, or a third as much wheat as in England.

The inevitable consequences are an upset balance of payments and a subhuman poverty for millions. India has more acres under cereals than any other country in the world, and more under cotton than any country except America; but in 1949 it had to import 3½ million tons of foodgrains and £75 million worth of cotton. Even then 130 million people had to be content with 1,500 calories a day each, the diet of the least favoured classes in Germany in the days when German hunger shook the conscience of Britain and America; and India had available only half as much cloth per citizen as the Gold Coast. Before the war India was the world's greatest exporter of groundnuts; today there are not enough for India's own needs. Calcutta was built on jute; but India last year imported two-thirds of its requirements. A hundred years ago there was land enough for all; today one family in three is landless. Moreover, other outlets are rare, since the poverty-stricken countryside provides only a poor and limited market for industry.

Starvation of the Soil

In India, therefore, an increase in agricultural production is truly a panacea. If the land could be made as productive as in Japan or England, there would be no more risk of revolution, no more difficulties with the balance of payments, no more grinding poverty. If India's annual 60 million tons of food could become 74, if its 3,000,000 bales of cotton and of jute could each become five rationing, budgetary limitations upon development, and susceptibility to economic pressure by Pakistan, would all be swept away in a great economic renaissance.

It can be done. The remedies are well enough known. The two most important are more fertilisers and more water. The soil is starved, because for centuries it has been growing nitrogen-exhausting cereals without replenishment. Religion makes night-soil taboo. Cow-dung is burnt for want of firewood; refuse and urine are wasted. The land is rarely fallow and never laid down to grass. The only nitrogen-fixing crops grown are pulses and groundnuts. The lack of water is more serious still. Only two-fifths of India's cultivated area has an assured water-supply; for the rest a poor monsoon, or simply a badly-distributed monsoon, means famine. Every year the monsoon fails somewhere; this year it is Madras, last year it was Gujerat; in 1943, as everyone remembers, it was Bengal. The protection which irrigation affords has been given to 49 million acres, more than anywhere else in the world, but still it is only a quarter of the area which needs it.

How to Increase Output

More irrigation, however, takes time and money. Fertilisers pay for themselves at the very next harvest. The first need is to turn every available ounce of refuse and cow-dung in the countryside into compost, and every ounce of night soil in the cities into sludge. Direct application of rural night-soil to the land is dangerous to health, but city sludge is germ-free. This alone could increase output by 30 per cent. One could get perhaps another 20 per cent by a series of minor measures - from improved seed, by ploughing along contours and growing more crops like Sann hemp to use, for example, as green manure.

Immediate help on a large scale must come, however, mainly from a greatly extended use of artificial fertilisers. India at present uses a featherweight of 250,000 tons, one-sixteenth as much as Japan for 15 times as many acres. The Government is aware of the need and is building a plant at Sindri which will produce 500,000 tons of fertilisers a year in five years' time. But one Sindri is not enough; half a dozen are required. Meanwhile the filling of the gap should be left to the private enterprise which sold 100,000 tons to the peasant at the bottom of the slump. The present Government monopoly has to give a subsidy at the height of the boom in order to sell hardly more, although each cwt. of sulphate of ammonia gives 3½ cwt of paddy - at today's prices a return for the peasant of 170 per cent on his outlay.

Unemployed in Belgium

(From a Special Correspondent)

Belgium is still, with Germany and Italy, one of the few European countries where the problem of unemployment causes concern, although the general economic situation has remained satisfactory. It first became important in Belgium at the end of 1948 and the post-war peak was reached in January, 1950, with a total of 309,000 registered unemployed, about 15 per cent of the insured population. But during recent months, apart from seasonal influences, the first beneficial effects of the financial measures taken at the end of 1949 and of the improving economic conditions have been felt. After the abnormal period of holidays and social troubles which characterised the months of July and August the number of unemployed has now fallen to roughly 160,000 at the beginning of October, 1950, against 250,000 in October, 1949. The number of completely unemployed fell from roughly 165,000 to 108,000 during the period.

At the end of 1949 the Government took three main measures to check the growing numbers of workless people. First the 1950 extraordinary budget, which includes financing of public works, subsidies to private construction and most of the unemployment allowances, provides for an increase from 15.8 milliards of francs in 1949 to 17.5 in 1950. Then the rate of discount was lowered from 3.5 per cent to 3.25 per cent in October, 1949, and a reform of the banking organisation was prepared in order to facilitate credit to the private sector. Finally the payment of indemnities for war damage was accelerated. In fact, the progress of public works and private building with public assistance has been evident for some months, and between April and June, 1950, unemployment in the building industry decreased by 8,000 to 21,000.

Misleading Statistics

As a result of the Benelux agreements, the exceptional expansion of textile exports to the Netherlands during the first quarter of 1950 reduced unemployment in the textile and clothing industries in the month of March from 39,000 in 1949 to 28,000 in 1950. But this temporary improvement, which was felt especially among women and in Flanders, where 70 per cent of the total unemployment is concentrated, has already disappeared with the return to more normal conditions of activity. The metal industry which still had 39,000 unemployed in April, is already beginning to benefit from rearmament. Nevertheless there still remains a considerable number of registered unemployed, accounting, till July, for approximately 10 per cent of the total insured population. The question arises whether these unemployment statistics give a true picture of business activity and employment.

The latest half-yearly census of unemployed in May indicates that 35,000 of the 177,000 totally unemployed are partially disabled or unemployable. In any case, out of a total of 134,000 men more or less employable 45,000 are over 50 years of age and 52,000 are unskilled workers. The OEEC Report on Internal Financial Stability suggests that in April, 1950, of the 221,000 unemployed, 50-75,000 were in transit to new jobs, 50-60,000 were unemployed for structural reasons and a further 50-60,000 for cyclical reasons. This suggests that the figures of registered unemployment in Belgium must be interpreted carefully, especially if comparisons are made with other countries where definitions are different.

Results of Rationalisation

The conditions under which unemployment allowances can be obtained in Belgium seem definitely to be less rigorous than those stipulated in the United Kingdom. For example, with the exception of some restrictions on female workers, almost every occasional worker can be registered as unemployed, because the payment beforehand of a certain number of weekly contributions is not required in Belgium, as it is elsewhere. Also the unemployed worker benefits, except for the first day of unemployment, for as long as he is unable to find a suitable job. Whereas in the United Kingdom limits are set to the period over which he may benefit. Other factors which may partially account for the increase of some thousands of unemployed as compared with 1949 is the reduction of approximately 25,000 in the number of frontier workers or seasonal workers whose work in France or the Netherlands depends largely on conditions in those countries - and the presence of 4,000 foreign workers among the registered unemployed in Belgium.

There are, therefore, several reasons for believing that the figure of registered unemployment gives a misleading idea of the general economic situation in Belgium. This impression is reinforced by the fact that, in many industries where there are still large numbers of unemployed, employers report difficulties in finding the necessary skilled manpower. Likewise, it is remarkable that in many industrial sectors there has recently been pressure to obtain higher wages, even before there was any rise in the cost of living. These various manifestations are usually associated with periods of full employment rather than of under-employment.

High Labour Costs

None the less, there are undoubtedly a large number of workers who have lost their employment since 1948. This cannot be explained, as in Germany or Italy, by a rapidly growing population or by the destruction of productive capacity. It cannot even be explained satisfactorily by a marked recession of business activity. It seems, therefore, that the most important factor in explaining the rise of unemployment from 37,000 in September, 1946, to 160,000 in October, 1950, must be the improved rationalisation of pro-

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

A sensible policy for process steam - No.21

Better condensate return systems

BY SPIRAX

Nature almost always operates in a cycle. In the steam plant the cycle is (i) the generation of heat in the form of steam, (ii) the utilisation of the readily-available bulk of that heat, (iii) the utilisation of the remaining heat by returning the condensed steam to the boilers, where it began.

As the water of condensation holds some 20 to 30 per cent. of the heat provided by the fuel at the boilers, the condensate return system is an essential item in the economical working of the plant.

There are few places now where that simple fact is not recognised: but there are many where the methods of utilising hot condensate are not as effective nor as profitable as they could be.

Plainly the aim should be to put the heat to work before it has a chance to slip away unused. Yet it is not uncommon to find quite long lengths of condensate piping without heat-insulation, and boiler feed tanks without either insulation or a top cover. It is not uncommon for condensate return systems to waste heat or cause waterlogging trouble due to faulty designing.

Particularly regrettable are those instances where considerable quantities of low pressure condensate are sacrificed because of some expected difficulty or the supposed high cost of recovery; whereas there is available a quite simple pumping apparatus for that very purpose.

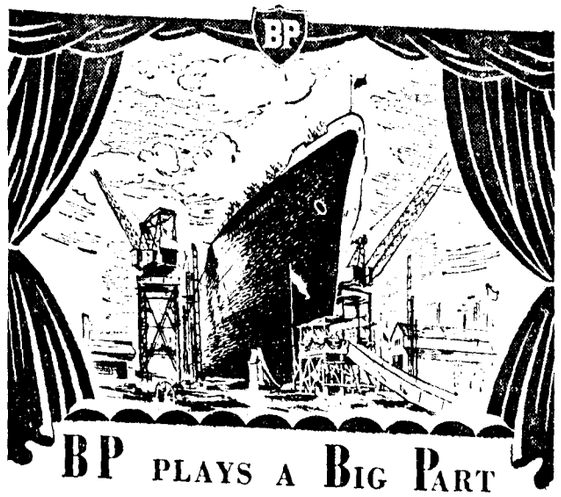
Behind the Scenes

MEN AND MACHINES are the substance of the Laing organisation. By constant care for both, the firm's welfare and plant maintenance systems keep work at its highest pitch.

Welfare means daily provision for over ten thousand men. Trained welfare officers—there is one resident on every remote site—are responsible for food and film shows, religious services and cups of tea..



The maintenance system, radiating from central depots at home and overseas with specialised staff and equipment, provides everything—from the smallest spare part to complete and regular overhaul—to keep millions of pounds' worth of machines and vehicles efficient.

These are two large businesses within one business. They function behind the scenes: but evidence of their constant work is seen in a long succession of jobs completed smoothly and on time.

are behind the BP trade-mark—your guarantee of Better Performance when Better Petrol can be made again.

duction and the ensuing greater output per man-hour. The high level of labour costs in Belgium (now approximately at the index figure of 460 as compared with 100 prewar) in relation to falling wholesale prices (for which the corresponding figure is 367 in May, 1950) has imposed a drastic contraction in costs of production and especially economy in the use of labour. This necessity has been greatly increased since the middle of 1949 by the rapid fall in export prices, which dropped roughly from the index 410 in the second quarter of 1949 to about 350 in the first quarter of 1950.

Every industry and firm is experiencing, in concrete terms, the effects of this economy of manpower, which results from a redistribution of labour as compared with 1946, the modernisation of equipment, and the elimination of the less efficient workers or marginal units of production. This improvement of productivity is, of course, partly due to the end of the sellers' market for labour, and is therefore more precarious than that attributable to modernised equipment. Another reason for the present unemployment is the fact that more than 30 per cent of the unemployed still need training at a time when qualified workers are in demand in many trades.

Fear of Over-Investment

It is difficult to agree, as has been suggested in some foreign circles, that unemployment is due to the policy of monetary deflation which it has been necessary to follow for years in order to make exports possible and to preserve the international value of the franc. But the fact remains that, in relation to other countries, Belgium has been slower to start public works and re-equip public services; the remaining 'Bailey bridge' on the high road from Brussels to Antwerp is often seen as a symbol of this reluctance and delay. Private industrialists have been more anxious than they have been in other countries to avoid any form of over-investment, especially as industrial re-equipment had to be financed from private funds and had not been assisted to any large extent by public financing or ECA grants.

In spite of the efforts already made to promote new industries there still remains, for an economy which is under pressure to improve the productivity of labour, the problem of creating fresh possibilities of employment. They may be found in new lines of production, or in the development of personal services, or by promoting greater mobility, or by envisaging a reduction in working hours and a change in the school-leaving age.

On September 5th the National Council of Employers and Employees *(Conseil général paritaire)* passed a resolution, for transmission to the International Labour Office, to discuss the question of a reduction of working time. It seems, however, that this proposal for an international shortening of working hours, which could have eased the Belgian situation some months ago, is inopportune now. For the new rearmament effort, the prolongation of military service and the better prospects for Belgian heavy industry are likely to stimulate appreciably the present improvement in employment.

Austria Wins a Round

(From our Special Correspondent)

Evidence about what lay behind the recent troubles in and around Vienna is now clearer, and the Austrian Government may now boast that it is not every European cabinet that can claim to have frustrated an attempt to disrupt the life of the country and bring down the regime. The Chancellor, Dr Figl, and his Socialist Minister of the Interior, Herr Helmer, showed justifiable pride in the conduct of the people, and in particular of the Vienna police, when they presented the Federal Assembly at a special session on October 12th with an account of what happened. The western occupation powers can also congratulate themselves on having resisted any provocation to become embroiled in the affair. Only the Soviet commandants intervened to prevent the Austrian police from doing their duty in a number of incidents which Herr Helmer fearlessly denounced.

Cudgels of Steel

The Russians must now bear the odium of interference and - even worse - they must share with the Communists the stigma of failure. The hollow pretence of the Communist peace campaign and their championship of the working people's grievances have seldom been better exposed than by Herr Helmer, when he brandished a bundle of steel cudgels with which Communist 'factory guards' in the Soviet Zone had broken up a meeting of Socialist trade unionists. This incident occurred only last week, after the general strike had been called off, and has been hastily repudiated by the Communist Party. In every way the Communist leaders, of whom only five sit in the Austrian Parliament, are endeavouring to deny that they had aimed at a *Putsch* or that they attacked their fellow workers. At the Allied Commission meeting on October 13th the Soviet representative, confronted with irrefutable evidence, had to make a weak and obviously false statement to the effect that the Soviet authorities were entitled to do what they liked in their zone.

For Moscow Austria has proved a miniature Korea. In the pride of victory it would be well for the Government, the National Bank, the industrialists, the peasants, and, in particular, the army of traders who batten on the Austrian economy, to remember that they owe their survival in the first place to the workers and to the Socialist trade union leaders. More of the British principle of 'fair shares for all' in an era of rising prices would help to ensure that another and better prepared attempt on the regime, if it comes, will meet with equal failure.

THE BUSINESS WORLD

The Balance of Payments

In the first six months of this year the United Kingdom's current transactions showed a surplus of £52 million, compared with a deficit of £34 million in the preceding half-year and a surplus of £16 million in the first six months of 1949. Current and capital transactions combined to produce a rise in official British holdings of gold and dollars of £262 million and in official holdings of other foreign currencies of £18 million, while Britain's sterling liabilities to overseas countries increased by only £131 million. By any criterion of the statisticians's fancy this is a notable performance.

These encouraging figures summarise the elaborately detailed information in the latest Balance of Payments White Paper (Cmd 8065). This document now appears in a much improved form. To give one example, its assessment of the current account surplus is now much more accurate because, at long last, it puts investment expenditure by oil companies and other British enterprises overseas where it belongs - in the capital account. Its thirteen closely packed tables give a clear picture of how sterling has been shunted round the separate monetary areas of the world in the last five years; they supply the answers to many postwar monetary riddles - and pose as many new ones. The analyst of current trends, however, is most likely to look to the White Paper for enlightenment about the remarkable strengthening of sterling since devaluation. Here the most relevant comparison is between the sterling payments account in the first half of 1949 and that in the first half of 1950. The exceptional ebb-and-flow in the second half of 1949, almost exactly divided by devaluation, is better left aside.

Any direct comparison between the experience of sterling in the first half of this year and the first half of last year reveals three points of major interest. First there has been an improvement in the United Kingdom's net receipts from invisible transactions from £59 million to £160 million between the two periods. This striking improvement in invisible earnings more than accounts for the improvement in the balance of payments as a whole, for the deficit on visible trade has greatly increased, from £43 million in the first six months of 1949 to £108 million in the first half of this year. Secondly, only a modest rise has been recorded in the sterling value of United Kingdom exports compared with the figures before devaluation. Thirdly, and most important, a remarkable turn-round is evident in the accounts of overseas sterling countries not only with the dollar area but also with the United Kingdom itself.

On the first of these points - the remarkable improvement in the invisibles - the information in the White Paper is not as complete as one might wish. Some £27 million of the total improvement of £101 million in net invisibles between the two half years arises from increased net shipping earnings and overseas dividend remittances. But the lion's share of the increase (£62 million) is contributed by the item labelled 'Other credits (net)'; this presumably reflects in large measure increased earnings of British oil and insurance companies operating abroad but it is to be noted the list of transactions covered by this omnibus heading takes up nine lines in the notes. The item has some of the appearance of a statistical rag-bag into which any untidy trimmings left over after tailoring the statistics of the current account can be gathered. But on any view this item clearly demonstrates that British commercial, financial and industrial enterprise abroad has served the nation well: it has incidentally transformed a net dollar payment of £31 million on invisibles in the first half of 1949 to a dollar receipt of £19 million in the first half of 1950.

The second important point that emerges from the White Paper can be more clearly described. The United Kingdom's deficit on visible trade deteriorated from £43 million in the first half of 1949 to £108 million in the first half of 1950; this was because imports over this period rose from £958 million to £1,150 million while exports rose from £915 million to only £1,042 million. The rise of £192 million in imports was not beyond expectations. An increase in imports of raw materials from the overseas sterling area accounts for £70 million of it, while raw material imports from the OEEC countries rose by £16 million and from other non-dollar areas by £17 million. Increases in all imports from these three areas amounted to £73 million, £55 million and £68 million respectively. Only from the dollar area did the sterling value of imports decrease, by £4 million to £202 million; these imports represented 17½ per cent of total imports in the first half of this year, compared with 21½ per cent in the first half of 1949. Owing to devaluation, they represented a much smaller dollar expenditure than twelve months ago.

The comparatively small rise in the sterling value of exports between the two half years must, however, be regarded in the

circumstances as disappointing. No doubt the country's export potential has improved since June and rather better results may appear for the current half year. The £127 million increase was almost wholly explained by an increase of £36 million in the sterling value of exports to the dollar area and of £81 million to OEEC countries. The value of exports to all other areas showed remarkably little change compared with the first half of 1949. These figures do not in themselves throw doubt on the improved competitive position of sterling exports since devaluation; but it has not been so potent as to evoke a large demand from, say, South American markets to replace their former imports of dollar goods. Nor does it appear that the rest of the sterling area is receiving in anything like adequate volume British exports to make good their voluntary cuts of dollar imports.

This leads directly to the third point. The White Paper throws some new light on the vast improvement in the external payments of the overseas sterling area since devaluation. In the first six months of 1949 the overseas sterling area ran a deficit with the dollar area of £64 million, it had to pay £35 million sterling to transferable account countries and it incurred a deficit of no less than £135 million with the United Kingdom; its overall deficit must therefore have been of the order of £234 million before allowing for sales to the United Kingdom of newly mined gold. In the first six months of 1950 the overseas sterling area showed a dollar surplus of £65 million, it gained £95 million sterling from transferable account countries and its deficit with the United Kingdom was cut to £80 million. These figures indicate an overall surplus for the overseas sterling area of about £80 million - a turn-round of no less than £314 million compared with a year earlier. These figures strongly suggest that the crisis last year was not solely concerned with dollars. It was also a sterling area crisis, reinforced by improvident releases from the sterling balances. These releases heightened the problem of dollar payments, but their effect on the sterling area itself was masked by hot money movements and British capital investment in Australia and other parts of the sterling area. If there is one over-riding moral contained in the White Paper, it is implicit in these figures. British responsibilities towards the rest of the sterling area have assumed an immediate importance which is no less inescapable than British liabilities in terms of dollars.

A varied *potpourri* of other information rewards closer examination of the White Paper. Even in the first half of 1949, for instance, the Colonial Empire earned a dollar surplus of £22 million and also sold £3 million of newly mined gold to the central pool; in the first half of 1950 its net contribution of gold and dollars rose to £60 million. Another point arises from the somewhat improved official figures on the distribution of the sterling balances shown in the second table. This shows that sterling balances held by OEEC countries amounted to £378 million at the end of June. At first sight this total seems odd, for it has been officially stated in Parliament that only £200 million sterling held by OEEC countries could, after due negotiation, be swept into the European Payments Clearing. Some official elucidation of this discrepancy (which may be explained by sterling holdings not in central bank hands) would be valuable. Who are these Europeans who hold £178 million of sterling that cannot be brought into the EPU accounting? There are a number of further technical points on which the White Paper might be more forthcoming but the official statisticians deserve congratulation for having revealed so dextrously the complicated anatomy of the sterling economy. All the figures now revealed support the conclusion, now rapidly emerging from other evidence, that the fundamental assumptions on which British trade policy has been based for three years call for re-examination.

Business Notes

First EPU Compensation

The first compensation in the European Payments Union, covering intra-European payments over the July-September quarter, has been completed by the Bank for International Settlements. The management committee of the European Payments Union has yielded to pressure by some of the members and is drawing a veil of obscurity over the results. It is more than probable that this pressure has come from Germany and France, who are at the two extremes in this first compensation. Germany is reputed to have run a net deficit that more than accounts for its gold-free credit line with EPU and has been called upon to make a substantial gold payment. France, for her part, has built up a net credit which entitles her to a gold payment by EPU.

Germany's resistance to publication can be readily understood since the figures suggest that Germany is still in a state of economic disequilibrium which makes its position as a partner in EPU equivocal. French reservations can also be understood, though hardly forgiven. The French stand for a considerable measure of protectionism in the tariff negotiations at Torquay might be undermined through publication of the unexpectedly large credit which France has managed to build up with her European partners during the past three months.

The British Government has rightly decided to go ahead with the publication of its own figures, though it will not divulge the state of its bilateral balances. With the EPU countries as a whole, the Sterling Area built up a surplus of 96 million units (equal to US dollars) during the September quarter. This net surplus was met to the extent of £5,847,000 out of pre-June 30 balances held by the countries indebted to the sterling area. This left the equivalent of $79¾ million as a credit balance to be entered on EPU books in favour of the sterling area. This balance will go to reduce the initial debit of $150 million with which the sterling area was charged when EPU was put into operation. If the trend revealed in sterling area–EPU relations over the past three months is maintained, the United Kingdom should be able to extract some gold from EPU before its first year of operation has run its course, although even when the initial debit has been exhausted, the sterling area will have to extend 20 per cent of its quota of $1,060 million as a credit to EPU before it begins to receive gold.

Exchange Account Borrows Again

The borrowing powers of the Exchange Equalisation Account have been increased by a further £300 million, the second such move in less than five months. The total borrowing power of the EEA has now reached £1,175 million - good evidence of the continued inflow of gold and dollars into the British reserve. The current value of that reserve should not be confused with its book value to the EEA since nearly half the gold held in the account was acquired at prices lower than that which has obtained since devaluation in September 1949. The previous increase in borrowing powers was announced on July 5th and it is known that between July 1st and September 30th the Exchange Equalisation Account had to take up an additional £119 million in gold and dollars.

Unless the Account, through some abstruse internal accounting mechanism, had obtained an advance of sterling before the £300 million increase in its official borrowing powers was made on July 5th, it follows that upwards of £180 million must have remained in hand at the beginning of October. If the further increase in borrowing powers is intended for immediate use, it would follow that the inflow of gold and dollars since the beginning of this month must have been considerably greater than the rate maintained in the previous quarter.

This is a matter of conjecture, but it is borne out to some extent by the recent increase in the issue of Treasury bills at the weekly tenders. The bills to be taken up last week amounted to a record figure of £260 million, £30 million greater than in the corresponding week of last year and £20 million greater than the current maturities. The bills to be taken up this week amount to £250 million, some £20 million above the corresponding week of last year. It seems highly probable that the authorities are having to resort to this new net borrowing in order to secure sterling with which to buy inflowing foreign exchange.

Transport Debated

Last week's debate on the 1949 report of the Transport Commission provided yet another occasion for the kind of ministerial apologia that has become common form in the reviews of nationalised industries in Parliament. On this occasion, however, Mr. Barnes was at least prepared to step out of his part to argue two matters of principle, though only 'as an individual Minister'. He argued against any repudiation of interest on the compensation stock; but his rejection of this dishonest nostrum would have come with greater force if he had not begun his speech by claiming that if the Commission's accounts had been cast in the same form as that of company accounts they would have shown a 'profit' of £31 million. The case for a subsidy, whether as a direct grant or relief for the upkeep of strategic lines, was rejected, not on any demerits of its own (Mr Barnes thought that the case for a subsidy could be argued 'on stronger grounds') but because this was the wrong time to add to the taxpayer's burden.

These conclusions are certainly welcome

So was his justification of the working of the Transport Tribunal. But he had no observations to offer about the organisation of the Commission and its working relations with the Executives. On this, Mr Callaghan (brought in to reply after an attack on the Minister by a Labour member, Mr Poole, who insisted that there was not traffic enough for more than 650,000 road vehicles compared with the 801,000 in operation) produced evidence to controvert comments made in *The Economist* of September 23rd. Mr John Elliott, the Chief Regional Officer of the London Midland region, speaking elsewhere on the same evening as the debate, denied that, in his experience, 'regional initiative is strangled, enterprise frowned on, frustration nurtured.' These views are entitled to respect, as are those of other strong critics of our article. But unhappily the statement that all is well in one or two of the Railway regions does not dispose of the general arguments in the article about the relations between the various strata of the transport system.

Commentary on Exports

Britain's exports declined in September by £18 million to £171.4 million, an unusual occurrence since exports normally begin to recover in September from the low level of August. This year, the August figures were the highest ever recorded; thus it seems that the September total reflected the delayed effect of the holiday period. Exports of all major groups (except chemicals, which reached a record of £10.2 million) declined during the month. Increases were recorded by some of the smaller categories, including linen, oils and fats, leather, sugar and biscuits, but apart from these the decline was general.

Shipments of vehicles fell by £7.6 million to £27 million. The United States took a larger quantity of motor cars than in August while Canada took fewer. But during the first nine months of the year Canada has remained the second largest market for the British motor industry and in one or two months it took more cars than Australia, Britain's largest market. Exports of machinery declined by £4 million to £23 million; shipments to the Soviet Union amounted to only £500,000 compared with approximately £1 million a month in the previous eight months. Cotton and wool textiles both declined, though not sharply, and in each group shipments to the United States increased while those to Canada fell. But Canada is still by far the largest market for the wool textile industry; it took 12 per cent of the industry's total exports in the first nine months of the year. Exports of woollen and worsted tissues during the third quarter were the largest since the war.

Apparel, though a less important export, offers an interesting illustration of possible repercussions to the British export drive. Exports of apparel this year have been increasing steadily and Canada and the United States have become the second and third largest markets respectively, following closely on Australia. Last week the United States announced to the tariff conference in Torquay that it would resort to the escape clause of the General Agreement on Tariffs and Trade and raise its import duty on hats.

Film Trade Defends Itself

Among the recommendations of the Plant committee on film distribution and exhibition it was a quite innocent-looking suggestion that aroused the sharpest controversy - the proposal to set up a body independent of trade interests to regulate certain matters in the trade and act as arbiter in some disputes. This is the last thing the trade wants, and the report (HMSO, 4d.) of the trade members of the Films Council, which undertook the duty of working out 'specific practical proposals', makes the fact clear once more. The proposed body would deal, among other matters, with disputes between members of the trade arising out of the new and freer film booking procedure that the Plant committee desired to see introduced. But the trade's representatives do not fully share the Plant committee's faith in freedom. Indeed, they point out that the industry is not one in which a standard formula or a recognisable grade of efficiency will necessarily lead to success - and success, once attained, cannot be automatically repeated. Therefore, they argue, free competition will not necessarily produce the results expected of it, and 'the usual arguments about promoting efficiency have only a very limited application in the film industry.'

The trade committee does not agree with the more important of the Plant recommendations designed to secure a freer booking procedure. It concedes that trade practice has become somewhat too standardised; it accepts the suggestions of pre-release provincial runs, extended runs in certain provincial centres, and an increase in the number of copies put into circulation. But it does not want competitive bidding for films; it does not want to see cinemas in monopoly situations made to change hands; and it does not want to end the practice of barring. Above all, however, it does not want any independent tribunal arbitrating on questions of this kind, and if any arbitration is to be done it wants the Films Council (with its heavy trade representation) to do it.

Some of this is the mere natural dislike of interference. But it seems not unfair to detect two ideas underlying the tenacity with which the quite sensible suggestions made in the Plant report are being opposed. One, that appears in the trade members' report from time to time, is the state of mind that relies on enforcement of the quota to put things right. The other is a desire (no doubt sincere) to encourage good films - but without discouraging bad ones. A trade entrenched behind such ideas as these is in no condition to reform itself.

Allocation for Raw Materials?

Pressure for some system of international allocation of raw materials is now coming from other sources than the United States. The Council of the Organisation for European Economic Co-operation has decided to survey world supplies of raw materials and to devise allocation schemes for scarce commodities. The same topic has also been discussed by the North Atlantic Treaty Organisation.

The anxiety of the United States about raw materials is evident. In the first six months of this year, commercial consumption of all commodities has reached a high level and consumption of copper, zinc and natural rubber touched new postwar peaks. Commercial stocks have fallen sharply in the period - copper from 104,000 tons to 45,000 tons, zinc from 84,000 tons to 24,000 tons, and natural rubber from 107,000 tons to 100,000 tons. Stocks of lead declined only slightly from 63,000 tons to 61,500 tons, while tin provided an exception with a rise in stocks from 36,000 tons to 43,000 tons. This running down of inventories, it will be noted, occurred in the six months before the fighting in Korea.

Consumption of raw materials in other countries has also increased but less markedly. World consumption of copper, zinc, natural rubber, wool and rayon has reached the highest levels since the war. Although production is expanding, it is not keeping pace with these record rates of consumption. During the first half of 1950, world outputs of copper, zinc, lead, tin, natural rubber, crude oil, wool, cotton and rayon reached the highest annual rate since the end of the war. The actual increases compared with 1949 ranged from 0.5 per cent for cotton to 10 per cent for natural rubber.

The Gap in Supplies

At present, the biggest question for the commodity markets is the measure of additional demand to meet the expanded stockpiling and rearmament programmes. Of this only the most tenuous estimates can be made. The accompanying table shows world production, consumption and commercial stocks for five representative commodities covering the period from January to June. Production of copper, tin and natural rubber exceeded consumption, but since in each case commercial stocks also declined, the inference must be that stockpiling has absorbed the current surplus and part of the world's free stocks. The figures suggest that such stockpiling purchases accounted for 92,000 tons of copper, 36,000 tons of tin, and 45,000 tons of natural rubber. Consumption of synthetic rubber exceeded production, but the excess was almost exactly matched by the fall in world stocks. Wool consumption equalled half the combined current clip and offerings from the Joint Organisation's stocks.

Some estimates of American military requirements have been made by the Economic Co-operation Administration and other bodies; these are given in the last line of the table. They represent a significant addition to normal American consumption, and indeed to world consumption. Two points emerge from a comparison of these figures with world production, consumption and stocks. First, these additional American requirements (and the United States is not the only country now rearming and stockpiling) cannot be met from existing world stocks. Secondly, if world consumption is maintained at the same level as in the first half of 1950, world output will not expand sufficiently to meet these new demands.

To what extent can production expand still further? Natural rubber production in 1950 is expected to reach 1,750,000 tons and to rise by 75,000 tons next year. Synthetic production this year should total 560,000 tons and is scheduled to reach 950,000 tons a year by next March. Copper output might rise by a further 5 per cent, but only if there is no labour trouble and if Northern Rhodesia gets enough fuel - which is seriously in doubt. Tin production might be maintained, but wool supplies will be small owing to the depletion of the Joint Organisation's stocks.

Canadian Bank Rate Raised

The Bank of Canada increased its bank rate from 1½ per cent to 2 per cent on October 17th, thus adding one more significant adherent to the number of countries which have recently called into play the orthodox mechanism of credit control in order to counter inflation. A statement by the board of directors of the bank explaining the increase recalls the previous reduction of the rate in 1944. The bank then expressed the view that it saw no prospect of economic developments in the post-war period that would call for a policy of higher interest rates. In face of this venture into prophecy, the board of directors now admit that 'the earlier view no longer holds good under today's conditions when Canada faces the prospect of substantially increased defence expenditure, adding to

women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it *before* we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product ; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.

Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

We have set down more about ourselves and our services in a booklet entitled "Choosing An Advertising Agency." Let us send you a copy.

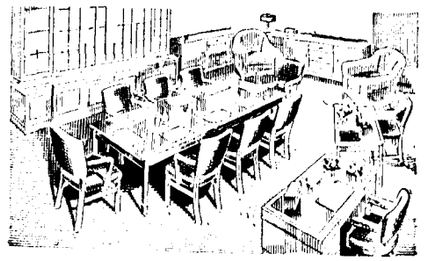
PLATINUM



WHEN the Spaniards conquered South America, they found the Indians making white gold. This was an alloy produced by mixing gold with grains of a grey untarnishable metal, now known as platinum, a name given to it by the Spaniards from its resemblance to silver (plata). Platinum is gaining ground as a favourite metal for jewellery because, like gold, it retains its lustre and does not rust or corrode. This resistance to atmospheric and chemical attack, combined with its high melting point and ability to promote chemical reactions, have made it a metal extremely valuable to modern industry. Alone or alloyed with other metals, platinum provides electrical contacts and scientific apparatus. Finally, it is so stable that it is chosen for making the standard weights and measures kept by the Board of Trade in London.

Platinum is especially important to the chemical industry, not only in laboratory apparatus, but as a "catalyst"—that is, a substance which assists a chemical process without itself being altered. I.C.I. uses platinum in the manufacture of sulphuric acid, one of the most important chemical raw materials in the world, and in converting ammonia into the nitric acid which is used to manufacture fertilizers, explosives and many other substances.

Which would you choose in the event of illness?

PRIVATE TREATMENT OR GENERAL WARD!

The National Health Service ensures that everyone receives medical and, if necessary, hospital treatment in the event of illness or operation.

To many people, however, the necessary formalities, the waiting and, finally, treatment in a general ward, are disconcerting both in anticipation and in practice.

To such, the B.U.P.A. offers an inexpensive alternative. For a moderate annual subscription, graded to suit individual means and requirements, members can make their own arrangements for speedy and private treatment in nursing home or hospital paybed and the whole or major portion of the expenditure is refunded by B.U.P.A.

In view of the fact that serious illness or the need for operation so often strikes without warning, it is no more than obvious wisdom to safeguard yourself and your family without delay. A brochure giving full particulars will gladly be sent on request.

BRITISH UNITED PROVIDENT ASSOCIATION

President: The Viscount Nuffield, G.B.E., F.R.S.

(23/761) BARTHOLOMEW CLOSE, LONDON, E.C.1.

Branches throughout England and in Scotland and N. Ireland

the pressure on the country's resources at a time of virtually full employment'.

Canada's bank rate decision is, perhaps, little more than a gesture; interest rates in the Dominion are not under such direct influence of bank rate as they are in the United Kingdom. But, taken together with the policy of letting the dollar go free and of removing as from the end of this year import prohibitions and quota restrictions, it does suggest an acceleration of the trend towards a policy of monetary freedom and orthodoxy.

The Canadian dollar has recently been settling down at around $2.95¼ to the £ in London and 94 7/8 cents to the US dollar. Some early advices from Canada after the decision was taken to let the rate go free suggested that the Canadian authorities hoped to see the Canadian dollar re-established in due course at parity with the US dollar. The public statement made by the Minister of Finance at the time does not confirm these suggestions. The full text shows that the Canadian authorities had decided not to establish any new fixed parity for the Canadian dollar for the time but to allow rates of exchange to be determined by conditions of supply and demand. Mr Abbott hoped, however, that 'after a short transitional period' reasonably stable conditions would develop and that Canada would ultimately conform to the provision of the International Monetary Fund agreement which requires member countries not to allow their exchange rates to fluctuate more than 1 per cent on either side or parity.

The Tin Conference

The special tin conference convened by the United Nations Organisation to discuss the draft agreement on buffer stocks with regulated buying and selling prices opened in Geneva on Wednesday. The United States, which had opposed the idea of calling such a conference at the last meeting of the tin study group, in the end decided to attend. During the past six months, considerable changes have taken place in both American and British views about the advisability of an international agreement. Informal talks between the two countries last summer smoothed out most of the technical difficulties, but Korea has since altered the whole conspectus of commodity dealings.

If the recent wool conference serves as a guide, international allocation of tin is unlikely to be discussed in any detail at Geneva. The United States, however, would like to see agreement on a maximum price even if it meant agreeing to a minimum price as well, though its main concern is to ensure that production will be allowed to expand.

Britain still wants to have the draft agreement adopted but is less anxious to have it put into force straight away. It argues that the high price of tin is due entirely to panic buying; published statistics certainly show no marked rise in tin consumption since the Korean invasion. The fixing of a maximum price at the present time would neither lessen demand nor expand output. But as soon as political conditions become more normal, the price of tin might well be expected to fall to a more reasonable figure. On Monday the London price of tin reached an all-time record of £909 a ton.

World Price for Wheat?

This week the international wheat council presented its first annual report at a general meeting in Geneva. The report discussed the familiar point that purchases of American wheat in 1949-50 were smaller than the sales guaranteed under the international wheat agreement. The undertaking on the part of importers to buy their quotas operates only when the price is at the agreed minimum for each year. The United States, the principal exporter, pursued a policy designed to keep the price at the maximum, and hence it was not entitled to ask purchasers to honour their guarantees.

The new exporting season has brought a significant development from Canada. Last month the Canadian Wheat Board decided to reduce the price of wheat sold outside the agreement to $Can. 1.98 a bushel. This is the maximum price that producers are entitled to charge for the fixed quantities of agreement wheat. Non-agreement wheat had previously commanded a premium of as much as 30 cents a bushel. Australia is still selling wheat outside the agreement at a premium of 15 per cent but the quantities are small and Australia is the only major wheat exporter prepared to accept sterling. The Canadian move, therefore, has not led to a uniform price of wheat for all sales by member countries to all purchasers, though it may perhaps be a step towards that end.

* * *

The oversubscription of the Northern Ireland loan establishes a new basis in the gilt-edged market. Applications totalling nearly £19 million were received for the £4 million of 3¼ per cent stock 1969-71 on offer to the public at 98. The redemption yield is approximately 3 3/8 per cent.

Company Meetings

WILLSONS (LONDON AND PROVINCES), LTD.
(Manufacturers and Distributors of Women's Outerwear)

25th Year of Foundation of Business

Turnover Creates All-Time Record

The eighteenth annual general meeting of Willsons (London and Provinces), Ltd., was held on October 18 in London.

Colonel the Right Hon. Lord Barnby, C.M.G., C.B.E., M.V.O. (chairman), who presided, in the course of his speech said:

Turnover for the year under review has been a record, which indicates the fundamental vigour in the direction of the business. Part of the increase was influenced by the termination of rationing and the opening of new branches and the conversion of former non-profitable branches to a different character of merchandise, giving a greater volume of trade. Simultaneously the weather in the summer of 1949 favoured sales of women's dresses.

Profits and Appropriations

The net profit of the group for the year is £254,131 before deducting directors' fees and management emoluments, depreciation and amortisation. After allowing for all charges including Taxation there is a balance of £101,417, and in compliance with the Government's wish, we are maintaining the dividend on the Ordinary and 'A' Ordinary shares at 30 per cent., which amounts to £17,325 net., and as this only absorbs a fraction of the amount earned under normal conditions a higher rate would have been recommended. It is interesting to note that if the net amount distributed in dividend to Equity shareholders were calculated on the capital employed, and not on that issued, it would only represent a dividend of 3½ per cent.

Great effort has been involved to attain these results, because it has been necessary to cover both the compulsory reduction of 2½ per cent in the profit margins on utility garments and rising costs in overheads, including wages, &c., and the increased demand for garments at lower retail prices.

In pursuance of the Company's aim to maintain an attractive appearance of its premises, considerable sums were, as customary, spent on repairs and renewals. The figure at which shop fixtures and fittings stands in our books, less depreciation, of course, reflects a valuation far below what any correct computation would set on these at their today's replacement costs.

You will observe that the freehold and leasehold properties which stood in the accounts twelve months previously at £228,710 have, since the last accounts were published, been valued professionally as of March 31 last. The resulting surplus on valuation, amounting to £483,914, has been carried to capital reserve account.

Strength of Company's Reserves

I would like to draw your attention to the following items in the consolidated balance-sheet:-

(a) Reserve for future taxation stands at £82,750. This is considered adequate to cover taxation for all profits to March 31, 1950.

(b) The aggregate reserves set aside out of this year's profits amounts to £76,626.

(c) Total reserves now amount to £963,594, or over nine times the ordinary share capital.

(d) Total assets now stand at the record figure of £1,671,816, reflecting the continuing expansion policy of your Company.

Stocks, you will notice, show an increased amount in value. This reflects what was considered prudent forward buying to take advantage before the expected price increases. This involved the advance 'taking in' of substantial volume which contributed to the increased total.

The abolition of rationing has brought about a progressive return to the former conventional 'seasonal' trading. This brings with it more rapid fashion changes which in turn involve larger markdown costs. This brings repercussions in varied directions, including timings in purchase of merchandise stocks.

Where the Money Goes

I have in previous years informed you how every 20s. spent by the public in our branches has been utilised and would emphasise that the amount distributed in dividends this year represents again only 2d. in the £ of turnover.

When the Wages Council brought in this year a standard minimum rate of remuneration for employees in the retail trade for the class of goods handled by this Company, it was found that the earnings of 1,544 out of our 1,600 employees were more than the new recognised scale.

Development of the Company

In regard to future development the policy of going steadily forward will continue and branches be opened whenever an opportunity promising profit appears. During the year five new branches were so opened. The Company will not engage itself in any race in order to claim a record number of branches in its class of trade.

Trading Conditions

The distributive trades are all operating under the impact of progressively rising costs both in raw material and in most making charges. With, however, the likelihood of full employment being assured for some time to come the demand for our products will continue to be assured so long as prices do not rise above the purchasing power of the public.

Sales to date in comparison to last year are slightly down, in common with most other retail distributors. The demand for autumn and winter, however, looks encouraging, and while it is most difficult to forecast these days, I have every hope that our turnover will approximate to that for the year under review.

We again wish to record our thanks to the workers in the factories, to the makers of materials, and to those manufacturers of garments with whom we do business, and to each of them we express our appreciation of their help and co-operation during the year in presenting to the consumer-public merchandise which must have possessed attractive qualities. We hope that the same co-operation will continue in the future.

Twenty-Fifth Anniversary

In expressing our best thanks to our founder and managing director, Mr. Maurice Mauray, I would point out that the year 1950 marks the twenty-fifth anniversary of the foundation of the business by him. It is a wonderful achievement that in so short a period such great and sound progress has been attained and Mr. Mauray must feel rightly proud of all that has been accomplished in those 25 years, in spite of the difficulties through which the Country has passed during that period.

We also wish to express our thanks to Mr. James Cohen, the director in charge of merchandise; to the buyers for the efforts of the administrative officials; and to all the members of the staff employed at headquarters and in the branches throughout Great Britain and Northern Ireland for their loyal services during the trading year.

The report was adopted.

ODEON THEATRES & SUBSIDIARY COMPANIES

A Year of Progress

Mr. J. Arthur Rank's Statement

The annual general meetings of Odeon Theatres Limited and its Subsidiary Companies were held on Sept. 28 in London, Mr. J. Arthur Rank, D.L., J.P., (the chairman), presiding.

The following are extracts from his circulated statement:

In my statement on the accounts for the year ended June 25, 1949, I had a disappointing, indeed a disastrous, account to give of that year's results due to the losses sustained on our large-scale production programme of British films.

The year now under review, ended June 24, 1950, has been an extremely difficult one, since it covered the transitional period between the heavy production losses of 1948-49 and what I hope will prove a more stable and more satisfactory future. It was impossible to make a sudden contraction in the large film production programme and organisation without sustaining losses, but unless drastic steps had been taken the financial position of the group, already strained, could not have withstood the burden of the loss which would inevitably have occurred from a continuation of large-scale production under the conditions then existing.

Policy Of The Group

The policy of the group during the year under review has been influenced by the following aims: (1) To reduce film production commitments; (2) to reduce the unfunded indebtedness of the group; (3) To effect economies in overhead expenses and ensure maximum effioiency.

The year's results unfortunately show a net loss which will be as disappointing to shareholders as they are to me. Such loss is very considerably reduced when compared with the loss of the previous year, and, in view of the factors to which I have referred, it may be regarded as not unsatisfactory. A great deal has been done during the year, and the group's financial position has been considerably improved, so that we can face the future with far more confidence than when I reported to you last year.

Bank Loans And Overdrafts

It is satisfactory to record that a reduction of £3,336,545 has been made in bank loans and overdrafts, from £16,286,581, at June 25, 1949, to £12,950,036 at June 24, 1950. Of the total bank indebtedness £2,863,000 is lent to Odeon Theatres Limited, £2,100,000 to Overseas Cinematograph Theatres Limited, £1,468,000 locally to overseas exhibiting companies, and £5,350,000 is now directly employed in film production and distribution, and the balance is advanced to various theatre-owning and manufacturing companies in the group. In the aggregate mortgages, Debentures, loans and overdrafts have been reduced by £4,064,665 during the year.

Consolidated trading profits, less losses, show an increase of £1,706,070 as compared with last year. Last year the trading profits were arrived at after including a non-recurring credit of £1,296,466, arising from the alteration in the basis of valuation of films; in consequence, the improvement in the year's trading profits is greater to this extent. This improvement is due to a reduction in the amounts required to be provided for losses on film production. These losses were, however, very substantial in this transitional year and amounted to approximately £1,750,000 in the case of the Odeon and G.C.F. group and £575,000 in the case of Gaumont-British Picture Corporation Limited, including its wholly-owned subsidiary, Gainsborough.

Having regard to the policy which has been adopted for future film production, I do not anticipate that losses of this magnitude should recur although losses on a much reduced scale are probable.

Gaumont-British Picture Corporation

The trading profit of this company at £1,794,720 shows a reduction when compared with £1,890,175 in the previous year, but the previous year's figures included a non-recurring credit of £332,038 resulting from the change in the basis of valuation of films. The provision for production losses on Gainsborough films, charged against trading profits, amounted to approximately £500,000 (apart from contributions to Studio overheads shown separately, £77,804), due to circumstances to which I have previously referred. At June 24, 1950, there were three Gainsborough films completed, but not released. In addition, the Corporation, through a subsidiary, had financed the production of a number of uncompleted or unreleased educational or sponsored short films. Theatre profits showed an increase as compared with the previous year.

British and Dominions Film Corporation Limited

Total reserves now exceed £1,100,000. Loan capital has been reduced by £69,228. The bank loan of £997,252 has been repaid.

National Provincial Bank, Ltd.

When dealing with the financial position of the companies within the group, I cannot allow this review to be concluded without referring to the help and encouragement we received from our bankers.

The support which we received, both at that time and in the months that followed, was magnificent. Our bankers gave us every assistance possible and this has done more than anything else to assist us to recover the position and enable us to present these accounts which show that we have made material progress towards putting the financial affairs of our business in order.

This would not have been possible but for the farsightedness of our bankers and the support they gave us.

Film Production

I informed you last year that it was your Board's decision to continue during the year under review with a reduced production programme. This policy has been carried out and has enabled us to reduce our commitments and thus control terminal losses, whereas if we had ceased production entirely, our losses would have been infinitely greater.

I am sorry to say that, although a report by the Working Party on Film Production Costs and the Report of the Committee of Inquiry on Distribution and Exhibition of Cinematograph Films have been published during the year, and although there have been five debates about the industry in the House of Commons, the basic problem facing the production side of the industry has not been solved - that is, that the annual investment which is made in producing the negatives is greater than the return which can be reasonably anticipated from the markets available to British films.

I said at the annual general meeting last year that the National Film Finance Corporation had done immeasurable good in providing finance for production which could not be found from usual financial sources. They have continued to play an important part in the last twelve months in helping to keep production going.

Assisting Independent Producers

It is in the national interest, as in the interest of our business, that there should be a strong and healthy British film production industry; but we must curtail our production activities until it is possible to expect that a series of films, if made with reasonable competence, will recoup at least their cost.

Your directors have considered very carefully the policy which they should adopt for the year now before us, and have decided that, in view of the difficulties existing in the industry, the problem must necessarily be dealt with on a short-term basis. We are proposing, therefore, to assist both with finance and creative and technical assistance, independent producers to produce a limited number of films which otherwise might not be able to obtain the necessary finance. The financial assistance will be provided by means of distribution guarantees. The producer who operates under this plan will be able to take full advantage of the fine equipment and facilities which we have to offer in our studios, and obtain the benefit of our world distribution organisation.

Entertainment Tax

The industry during the year has had to spend a great deal of time in wrestling with the unreasonable burden which it has to bear. In the 554 theatres controlled by this group the public paid £26.615.205 by way of admission prices, and of this total no less than £10,278,391 was drained off at once as Entertainment Tax. Nearly 7s 9d in every pound taken at the box-office has gone straight to the Inland Revenue.

If the basis of tax applicable to live shows and some other forms of entertainment had been applied to our business, the tax which would have been paid would have been reduced by no less than £8,158,888 to £2,119,503. It must also be remembered that in addition, tax in similar proportions will have been suffered on takings from films produced by us exhibited in theatres outside the group. These figures bring out the astonishing burden from which our industry, which provides entertainment for such a large proportion of the country's wage earners, is suffering.

If only a small portion of this difference in the two rates of tax had been made available to our industry, its economic problems would have been solved, and it would have been able to embark with confidence on a balanced British production programme.

I am glad to say that during the last few weeks the Government has admitted in principle that the industry needs help, but I am sorry to say that the help which has been offered will not solve the problem, though, of course, it should be welcome.

The negotiations with the Government brought the whole industry together, and that in itself will, I am sure, over a period bring benefits to the industry.

This scheme - a voluntary one - could not have been brought into being except with the agreement of the American production industry. I would like to thank them for the way in which they came forward and agreed to participate in the scheme, which showed their far-sighted approach to the problems which exist.

Children's Cinema Clubs

The Departmental Committee on Children and the Cinema issued their report on May 5, 1950. This report passed many complimentary remarks about the way in which our clubs had been run and the efforts of many of the managers of the theatres in connection with them.

We intend actively to continue the operation of these clubs as we believe it is a contribution which we should make to national and community life.

Distribution

Overseas - The policy which we instituted some years ago of developing a world overseas distribution organisation continues materially to help our overall operation.

We firmly believe that to secure the best results from distribution it is necessary to have a world distribution organisation operated wholly by ourselves, or in partnership with nationals of the countries in which we operate.

I am happy to say that independent producers have made increasing use of our organisation during the year and that we are distributing 30 independent productions.

We are prepared to extend the facilities which we have to offer to any British producer upon the same terms as those which apply to films financed by ourselves.

Western Hemisphere - We have today good relations with the leaders of the American industry, but in spite of this the distribution of British films in the U.S.A. in particular remains a difficult operation. We have made progress during the year by placing our films in theatres which specialise in such product, which policy we believe is the soundest way of exploiting the American market. We know that this policy is a slow method of distribution, but nevertheless it is one which produces net results in the form of cash remittable to this country.

Organisation

It has been an essential part of our policy during the year to examine the whole of the group organisation and to effect economies wherever possible. Very substantial economies have already been made but are not fully reflected in the results for the year under review.

I am proud to say that we have to-day fine personnel who form the executive of this group.

Their loyalty and the loyalty of all our employees who work under them has been most gratifying and encouraging to myself, the managing director, and my colleagues during this difficult period.

My colleagues and I would like to thank them all for their efforts and loyalty during the year.

It is the wish of the Board of directors of the four principal companies that I should place on record their appreciation of the outstanding services of Mr. John Davis during the past year. In face of great difficulties he has carried through extensive reorganisations to meet the changed circumstances resulting from the reduction in the film production programme: the financial position of the group has been strengthened, commitments reduced, economies effected wherever possible and a high degree of efficiency maintained.

I am hopeful that, in the absence of circumstances over which we have no control, the progress which has been made in strengthening the financial position of the group and consolidating its trading activities will be continued during the current year.

The reports and accounts were adopted at each meeting.

NEEPSEND STEEL & TOOL

Mr S. C. Goodwin's Review

Mr. S. C. Goodwin, J.P., (Chairman) presided at the 30th annual general meeting of the Neepsend Steel & Tool Corporation, Limited, held at Sheffield on October 17. His statement disclosed that the results showed an improvement over those of the previous year. Reserves and Surplus of the parent company were £224,341 compared with £495,511 the previous year, mainly accounted for by capitalisation of reserves in connection with the Bonus issue. Current Assets totalled £1,002,906 against Current Liabilities and Provisions £564,807 giving an excess of Current Assets of over £400,000.

The Consolidated Reserves and Surplus amounted to £1,264,718 compared with £1,398,565 a reduction due to capitalisation of Reserves. Current Assets of the whole group amounted to £1,802,019 against Current Liabilities and Provisions of £399,989 showing an assets excess of £1,402,030. It would be seen that the Neepsend Group was in a very sound position financially. The Consolidated Profit and Loss Account showed trading profits before taxation had amounted to £539,554 against £528,649 in the previous year. After providing for transfers to Reserves and for the proposed Dividends and Bonus the carry forward was £649,737 against £528,397 brought forward.

During the last few years several additional businesses had been acquired which had previously distributed dividends now credited to the Neepsend Steel & Tool Corporation. The directors felt that the members of the company were entitled to a slightly larger return especially as the companies had been acquired from built-up reserves. The Dividend and Bonus declared on the Ordinary Stock represented approximately 5 per cent tax free on the capital employed in the Group.

The report was adopted.

POWELL DUFFRYN LIMITED

The annual accounts to the 31st March 1950 were presented at the annual general meeting held on the 25th October.

The Company has maintained its dividend at 8%. After the 31st March it received £3½ million of Treasury Stock in payment on account of Compensation and this stock has since been sold.

The following is an extract of the Statement of the Chairman - Mr. Edmund L. Hann:-

The main Group Companies have had a difficult but, on the whole, successful year.

Nothing could be more disappointing than the continued failure of the Coal Mining Industry of this country to produce sufficient coal to supply export markets which have been ours for up to one hundred years.

It was expected that, after nearly four years of national ownership we should have been allowed - indeed encouraged - to go out into the World and sell British coals freely, but such is not the case, and, slowly but surely the Coal Export Trade of this country is dying. The Company's substantial overseas depots have been compelled to deal in foreign coal to satisfy its customers although they would prefer British coal if only it were available.

Having regard to the limited quantity of coal available for export, our exporting houses, Cory Brothers & Co., Ltd., Gueret, Llewellyn & Merrett Ltd., and Maris Export and Trading Co,, Ltd., have held their own in overseas markets.

In the inland and coastwise distribution of coal, Stephenson Clarke Ltd. has maintained its position. It has replaced its shipping lost during the war having 21 vessels totalling 45,690 tons compared with 19 ships totalling 36,040 tons in 1939. The facilities of Stephenson Clarke have been increased by the acquisition of the old-established business of E. Foster & Co.

Cory Brothers & Co., Ltd., has continued to widen its interests particularly in general exports. Valuable orders for agricultural equipment have been received from Canada and elsewhere.

Since the 31st March Powell Duffryn has invested £500,000 in the Wankie Colliery Co., Ltd., and has been appointed managers of the Colliery for a minimum period of ten years. The Wankie Colliery in Southern Rhodesia offers magnificent opportunities for development; the coal is of very good quality and is in full demand.

On 24th March last, we signed Heads of Agreement with the Socony-Vacuum Oil Co. Inc. of America, providing for the erection of a new refinery at Coryton. The refinery will be owned by the Vacuum Oil Co., a British company, to be jointly owned by Socony-Vacuum and the Powell Duffryn Group.

This project will cost not less than £3,500,000 over the next few years and it is expected that the plant will operate early in 1953.

Cambrian Wagon Works Ltd. have been fully employed during the year with satisfactory financial results.

Powell Duffryn Technical Services continues actively at home and abroad. It has been engaged overseas on important work as Consultants for Governments and private clients in the Dominions and Colonies and in Europe on various aspects of coal development, processing and utilisation.

The Company has been commissioned by the Government of Southern Rhodesia to act as Consultants in connection with an oil-from-coal plant. It has also carried out for the Government of Greece an investigation into the Lignite deposits of Western Macedonia under the auspices of the Marshall Aid Administration.

On the fuel utilisation side, in accordance with our decision to expand this aspect of our work, we have in addition to our branches at Birmingham, Glasgow, Newcastle-upon-Tyne and Sheffield, now opened a Branch Office in Cardiff to serve South Wales and the West of England.

The major part of the equipment of Powell Duffryn Carbon Products Ltd. has been installed. We are now placing on the market various products for the Engineering and Chemical Industries, some of which are of novel design and meet a demand from industry which could not be satisfied by the conventional forms of carbon.

The Chairman announced that he was relinquishing his office as Chairman at the conclusion of the meeting and at the unanimous request of the Directors, Sir Herbert Merrett had agreed to accept the Chairmanship.

The Report and Accounts were adopted.

Sir Herbert Merrett was elected Chairman of the Company at a Board Meeting following the Annual General Meeting.

METAL TRADERS LIMITED

Thirty Years' Progress

Mr. Frank L. Baer on Tin Prices

The thirtieth annual general meeting of Metal Traders, Limited, will be held on November 9 at the registered office of the company, 7 Gracechurch Street, London, E.C.

The following is the statement by Mr. Frank L. Baer, chairman and joint managing director, circulated with the report and accounts for the year to March 31, 1950:-

The accounts and balance-sheet, which have been in your hands for the prescribed period, embody important changes which were referred to by me last year. Permission to capitalise part of the company's reserves was obtained and the formalities necessary to give effect to this have now been completed.

Balance-Sheet Changes

To summarise the effect of these changes in our balance-sheet. Share premium account has disappeared, and the issued capital now stands at the pre-war figure of £415,760. Reserve fund is £100,816, which together with the amount carried forward in profit and loss account - namely, £134,582 13s 4d - makes a total of £235,398 13s 4d, employed in the business.

Metal Traders Incorporated have capitalised a further sum of $100,000 from their accumulated, undistributed, profits resulting in your company's holding in the American subsidiary being $600,000 which is valued in our balance-sheet at £125,000.

Assets and liabilities in U.S. dollars are again included in the combined balance-sheet and combined profit and loss account at $4.03, compared with the present official rate of exchange of $2.80 to the £1 sterling. The directors are of the opinion that this is the best way to treat the changes resulting from devaluation of sterling, more especially as the Chancellor of the Exchequer stated on September 18, 1949: 'It was essential to fix that new rate at

a level that we could hold; we can always let the rate go up if events prove that we have gone down a bit too low.'

Subsidiary Companies

Metal Traders Inc.-The management are to be congratulated on the results achieved during the year ended 1949, and I am glad to be able to report that business so far this year has been equally satisfactory.

Brookside Metal Company, Ltd., have more than maintained their previous activities, which, owing to export restrictions on all kinds of scrap, are still practically confined to this country.

L.P.C. Chemicals & Dyes, Ltd. - I regret to report that this company continues to struggle against the many currency and import restrictions existing in foreign countries, but I am not unduly depressed because the management is able and alert and will come into its own again as soon as the situation eases.

Resumption of Tin Dealings

Metal Traders, Ltd.-As you know, trading in copper, lead, zinc and tin has not been possible for many years, and therefore the most important event in the affairs of your company has been the reopening of the London Metal Exchange for dealings in tin.

From an historical point of view, I believe that it is worth while recording some details of this event. During the many conferences with the Ministry which preceeded the freeing of the tin market, the Committee of the London Metal Exchange again and again stressed the importance of making available to the world in general and the market in particular as large a quantity of tin as possible by meeting the demand both for cash at a reasonable price and three months at a proportionate contango (that is, a premium over the price for cash), so as to make the carrying of the metal financially attractive.'

The Ministry, well aware of the fact that it had a monopoly, being the only owner of tin for spot delivery, did not accept this recommendation, but announced previous to the opening of the market that: 'It is the intention of the Ministry to see that any release of its stocks takes place in an orderly manner with due regard to the need for reasonable price stability for tin.'

Price Fluctuations

The result has been as best shown in the following table of prices of cash and three months between November 15 and December 7:-

Nov., 1949	Cash		Three Months	
	£ s.	£ s.	£ s.	£ s.
15th	725 0	726 0	660 0	669 0
16th	707 10	712 10	650 0	655 0
17th	690 0	695 0	617 0	620 0
18th	675 0	680 0	592 10	600 0
21st	662 10	665 0	582 10	585 0
22nd	642 10	645 0	585 0	590 0
23rd	640 0	645 0	595 0	599 0
24th	640 0	645 0	595 0	600 0
25th	637 10	640 0	599 0	600 0
26th	-	-	-	-
28th	635 0	636 0	585 0	587 10
29th	622 0	625 0	579 0	580 0
30th	617 10	620 0	578 10	580 0
Dec., 1949				
1st	616 0	617 0	578 0	578 10
2nd	607 10	610 0	575 10	576 0
3rd	-	-	-	-
5th	602 10	605 0	569 0	570 0
6th	601 0	605 0	564 0	565 0
7th	604 0	605 0	564 0	565 0

There is no evidence of reasonable stability in these price movements over such a short period and whoever, therefore, was responsible for the pronouncement must have indulged obstinately in much wishful thinking in the face of expert advice.

Original Investment Returned

This is the thirtieth anniversary of the company, which gives me an opportunity of thanking my colleagues and every member of the staff for their loyal service at all times.

At the conclusion of a period of thirty years, it is perhaps not out of place to put on record that our original shareholders have received by way of bonus and return of capital more than their investment, together with a very fair yield on the money invested. This is an achievement of which the management is justly proud.

HAROLD WESLEY, LTD.

Increased Sales

The 4th annual ordinary general meeting of Harold Wesley, Ltd., was held on October 26 in London, Mr. Percey Day-Winter (Chairman and managing director) presiding.

The following is an extract from his circulated statement:-

The lifting of controls on paper during the year led to increased supplies and a return to more competitive trading. However, greater production enabled your company to reduce costs and increase turnover at reduced selling prices. The total volume of sales was higher than last year and sales in export markets were maintained in spite of the difficult conditions which prevailed. This resulted in a small increase in trading profit.

Despite the increase in the profits tax the net profit was greater than that of the previous year and your directors therefore recommend a final dividend of 15 per cent., making a full dividend of 24 per cent. for the year, as against 22½ per cent. last year. The extension to the Burton-on-Trent factory has been completed and operations commenced in April this year. During the year we also received permission to rebuild a war-damaged building at Harlesden, which was also completed.

With regard to the prospects of the year to June 30, 1951, your company's factories are in full production and subject to the availability of adequate supplies, progress will be maintained.

Your company's subsidiary, Wesley and Clark Engineering, Company Ltd., while still having a well filled order book has experienced rising costs of production, resulting in a lower profit than that of the previous year. New developments have been undertaken to improve their products and reduce production costs, which should increase profits.

The report was adopted.

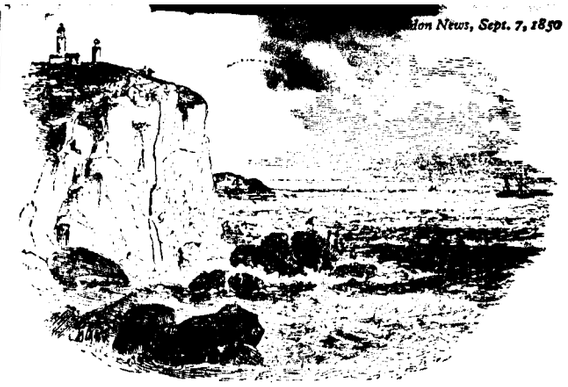
NOTICES

MAN, young for 42, married, three children, desires entirely new work. Capital available. Would begin at nominal salary if good prospects later. Cambridge M.A. (History Hons.): five years master, major Public School; Chairman U.D.C.; reached four-figure income at 32. Anything, anywhere, but would like Eire. - Write Box 498.

SENIOR EXECUTIVE (34) seeks administrative, advisory, or research post in industry, commerce, publishing, or social work. First-Class Hons. B.Com. (Lond.); Published economic and sociological writings; present £1,350 p.a. but salary secondary to prospects. - Box 497.

EX-MEMBER OF PARLIAMENT and joint founder of flourishing Public Company now resident in British West Indies for long period, possibly permanent residence, offers services at top level to reputable business interests only for on the spot personal negotiations and/or representation, etc. - Enquiries in strictest confidence to Box 500.

Output in the first nine months of 1950 was 12,177,000 tons of steel - 530,000 tons more than in the best previous similar period.



In high production and low prices

STEEL

is serving you well

BRITISH IRON AND STEEL FEDERATION

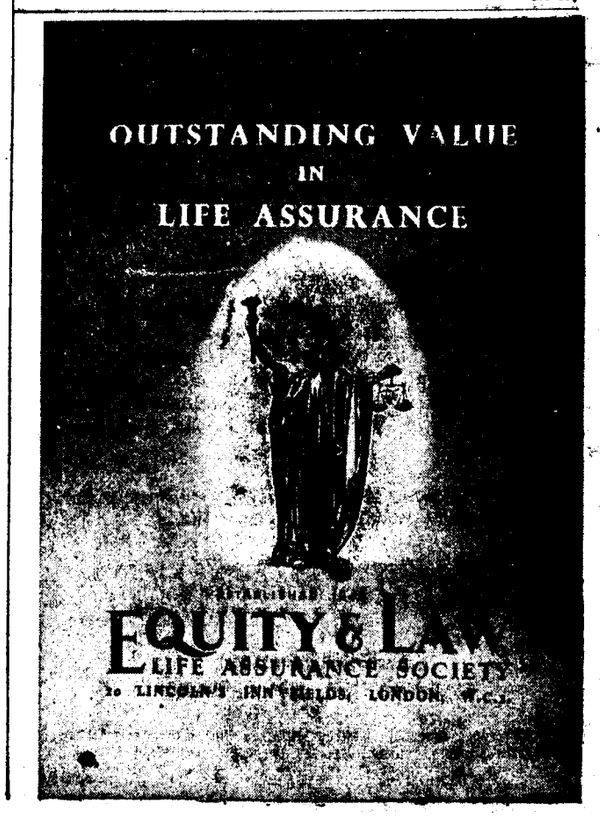
It worked!



Only a single slender wire crossing the Channel in August 850. Only a handful of men hauling it up the cliff-face at Cap Gris Nez. Only a faint sound as the first message comes through. Yet what an achievement! England and France were linked at last. It was the beginning of a telegraphic system which would girdle the globe.

To-day the 155,000 miles of ocean cables owned and maintained by Cable & Wireless Ltd. are constantly humming with news flashes, business deals and communications of State. The Company operate overseas telegraph stations in the Crown Colonies and many foreign countries. Their cables link United Kingdom postal telegraph offices with the Commonwealth cable network.

TIME-MASTER
has a place on the council

YOU'LL FIND a Dictaphone Time-Master in the most exalted places.

At councils, meetings, committees, international conventions and at meetings of governing bodies, there's often a Time-Master at work; making a permanent record of every vital point and decision, clearly and accurately on small plastic Memobelts.

The perfect office dictating machine

Time-Master was designed for you in your own office. It is the perfect office dictating machine — small, simple and highly dependable. Time-Master records on plastic Memobelts — each one taking 15 minutes of perfect, crisp recording.

Only Time-Master offers all this:

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, fileable, expendable Memobelts. 6. Nation-wide service through our own branches giving you Dictaphone dependability.

Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

When the Ice Breaks

A NEW attitude to wages cannot be put off much longer. It is thirty-three months since the Government steeled itself formally to declare the need for stability in personal incomes. The policy of restraint still survives the persistent prophecies of its breakdown. It has become more, not less, effective since devaluation. In the first nine months of 1949, 4,714,000 workers got increases in wage rates adding altogether £814,100 to industry's weekly wage bill. So far this year increases for 3,235,000 workers have added £590,700. When restraint began, the index of weekly wage rates had risen by five points in nine months. From March, 1948, to September, 1950, it has risen by only another five points. The increase in the twelve months since devaluation is by a single point —by one per cent.

It is not a bad storm that follows every calm. There is still no evidence that Britain has to fear a sudden, large inflation of wage costs. Most prophecies of a breakdown in the wages policy have rested on a misunderstanding of the way it has worked. Trade union abstention from demands for more pay has never, in fact, been a main part of the policy, and the flood of claims now being made in itself makes very little difference. Many unions have made considerable claims all along. The restraint is in the way they have been handled. Employers and arbitration tribunals have been encouraged by the Government's attitude either to refuse the claims or to grant much less than the usual 50 per cent or so of what the unions asked. The unions' restraint—and it is real enough—has been to accept with fairly good grace the slowness of the negotiations on their claims and the smallness of the results.

This policy has worked well. Its weakness is that of all government by postponement. It requires an increasing effort to produce a constant result. For some time the administrative apparatus of delay for wage claims can make the number of advances granted very small. But, as more and more claims accumulate in the pipelines of bargaining and arbitration, the number coming out as, at any rate, small advances must increase again even though each individual claim is subject to as much delay as ever.

The economy has lately been enjoying the maximum benefits from delay. To keep the rise of wages to as little as one per cent again in the next twelve months would require more, not the same, effort of restraint. In fact the effort is certain to be smaller. There is, however, no reason to think that the fresh wage demands will be so forceful as quickly to break down all the habits of postponement established by employers and arbitration tribunals—or even the practical caution of the union officials themselves. The new claims are important not so much for the wage advances which will be granted in 1951 as for their significance in the change of union temper. The long-standing claims of the engineers and others will now be pressed more

insistently. Prolonged delays and small awards will be tolerated much less readily.

There are perfectly good reasons for this change. It is an unreasonable perfectionism to expect more of trade union policy than that it should be based on recent experience (as distinct from the experience of the thirties). And, whatever dangers the close future may hold, there is no doubt that in the past twelve months British export trade could have stood somewhat higher costs and prices with little damage. It could not have stood them in 1948, when the wage policy began, but while British wages and prices have been kept fairly steady the pound has been sharply devalued and the world has turned back to boom conditions. There is now, temporarily, some lag that Britain can afford to make up.

The new economic psychology allows no alternative. Profits (though not, in the main, dividends) have for some time now been rising ; the rearmament programme has already lengthened most industrial order books. Many employers are willing or anxious to bid for more labour. Both they and arbitrators must become less resistant to wage claims as the feelings grow both that the country is again prosperous and that the cost of living has had a long time to rise since wages were last settled. What is really significant in the wages situation is not that the unions have formally dropped restraint but that the engineering employers have at length offered their workers appreciable rises (though not, as yet, enough to satisfy the unions).

★

There is no point in trying to stick to what was in its nature a temporary expedient. The proper basis for government policy is now to assume that over the next twelve months most wages will rise. The task is to see that this rise does as little harm as possible. This is partly a question of quantity. The British payments position is not so strong, and certainly will not be so strong if the pace of the American boom slackens at all, that we can afford a runaway inflation of costs. At this stage it would be reasonable to take, say, 5 per cent as the sort of wage advance that can—as an average, not as a uniform enactment—be afforded during 1951. More than this would be dangerous, and there is no reason why it should be more. If they are given a chance the administrative delays to wage claims will still combine with the usual caution and moderation of the British temperament to keep the pace of wage advances moderate. What would destroy the chance is encouragement to inflation from the side of Government policy. If the flow of incomes is allowed to expand sharply selling will be so easy as to make it profitable for even the least efficient firms in the least important industries to pay higher wages. In that case the wage increases will be cumulatively large and will do nothing but harm. Since devaluation the Government has in effect relied on the stickiness of wages in face of rising prices to act as the agent of disinflation. With rising wages the Government must play the active part itself. Economy in Government expenditure becomes more than ever essential.

Psychologically this is one of the easier adjustments of policy that the wages thaw demands. More difficult will be the proper handling of prices. While wages were being kept steady there was logic, as well as political compulsion, behind the Government's efforts to cushion the consumer against rising prices. The political pressure remains but the economic logic has gone. It is important to distinguish two ways in which rising wages can hamper exports. Directly, by raising costs, they make British goods dearer. But also indirectly, by swelling the pressure of demand in the home market, they draw manufacturers' efforts away from selling abroad. The export trade can stand a moderate increase in costs ; it certainly cannot stand, on top of the inevitable switch of some engineering products from export to rearmament, a further diversion of supplies into civilian consumption at home.

If a cut in export supplies is to be avoided, the extra purchasing power of the home market must be absorbed —at least in part—by prompt increases of prices accompanying the wage advances. For some goods this will happen whatever the Government wishes or does. But those will be generally the less essential things. The danger is that other prices will lag far behind wages—partly through the remaining price controls on essentials and more widely by the influence of Government exhortation and threats against "profiteers." The effects can only be dangerously to hamper the export effort and to harden the British economy in producing less than people want of just those things—such as textiles of medium quality at present covered by the utility programme—that are most essential to a satisfactory standard of living. All this is, of course, in no way an argument that inflation is a good thing ; it is that if we must have inflation nothing but harm can come from trying to confine it to one section of the economy.

From this another necessity follows. The price increases that higher wages make necessary will bear hardly on the receivers of fixed incomes who have already lost more than enough in the past ten years. It is an urgent task of social policy at least to offset this further burden ; that could best be done by tax reliefs on small incomes, though some increase in pensions will probably also be necessary—to the further complication of the Budget problem.

A return to free enterprise in wage bargaining has one other implication, most difficult of all for the Labour party to accept. It can be made to yield advantages only if the Government lets the rest of the economy respond freely ; this is true not only for prices but also for dividends. The sharpest danger of all is that the Government will be frightened by a reviving wage inflation into imposing statutory limitations on dividends. That—apart altogether from its monstrous inequity—would destroy all possibility of an increase in personal savings. By making undistributed profits still more exclusively the one form of saving it would finally stifle the supply of risk capital for new ventures and solidify investment into established firms and industries. Such an extra barrier to progressiveness and efficiency in the British economy must be avoided at all costs.

The return to wage advances will be, above all, a test of the Government's ability to help the economy to regain a little flexibility. Freedom for wages can be sound policy in full employment only if there is also freedom for prices and profits, if it is allowed to encourage investment in the industries where its returns will be greatest and to attract workers to the jobs where they are most needed. A breath of air all round will do good. It is the function of the Government's financial policy to see that a little freedom does not degenerate into a universal scramble of steeply rising wages and prices.

Collective Defence

GENERAL MARSHALL has done well to remind the western world that the forces at its disposal are "definitely not enough to resist attack without serious and critical initial losses." The success of the collective resistance to aggression in Korea has probably bought a few months' respite, but the urgency of the need to build up the collective defences of the free nations is as great as ever. Looking back, one cannot fail to be impressed by the magnitude of what has been achieved—perhaps not in actually assembling troops and munitions on the defence line, but in clearing away some of the very awkward and important political issues that might have inhibited all effective action. At the moment, however, the further progress of western unity is obstructed by estion of how Western Germany is to be treated. othing surprising in this, since Germany lies entre of most of the international problems e world. It is now quite clear to everyone five years ago to anyone with a sense of ermany will inevitably, and rapidly, reeignty and equality among the nations. rmany to be counted as a member of the ce or not ? To most people in America and answer is obvious. There is no such thing in international politics, and if Western Gerot on one side it will find itself on the other. r, the contribution that the Germans could make y needed. It is to everybody's interest that the e line of Western Europe should be set on the ; the western powers have given a guarantee that it be so ; and it is ridiculous to suppose that Germany n be defended without the Germans. To the Anglo-Saxon mind, this logic is decisive. The Americans, in fact, have made it a condition of their own further involvement that Western Germany shall be recruited into the joint effort.

But the logic goes too fast for the French. They still hanker after the doctrine that the Federal Republic of Western Germany can be made permanently content with the status of a second-class ally of the west, called upon to assist, but without a seat in the councils of the alliance and without any right to dangerous weapons. Until very recently it appeared that no French Government would dare to propose to the Assembly that arms should, even in principle, be allowed to the Germans. M. Pleven and his colleagues have, in the event, gone much further than might have been expected of them. They are prepared to swallow the principle: albeit with much foreboding they agree that there shall be Germans in armed military formations ; and that this is an act of great political courage will not be questioned by anybody who has tasted the mood of French public opinion. The acceptance of the principle, however, is coupled with a number of conditions. There is not to be a German army, but only German contingents within a European army, and none of these contingents is to be larger than a battalion. Moreover, when the French say "a European army" they make it clear that they mean it literally: there is to be a real pooling of European defences under a European Minister of Defence. Pooled defence means pooled defence industry ; and it is, therefore, made a further condition that Western Germany shall accept the Schuman Plan before any further steps are taken.

★

The great risk at the moment seems to be that these French views should be treated with too much impatience. Such, at least, appears from the reports from Washington to be the American reaction to them. That would be a great mistake. For not only do the French proposals represent a very real effort of accommodation to the American and British points of view, they also enshrine some points of real substance and value.

To say this is not to say that the French conditions are all reasonable, or even practicable. On the contrary, there are some patent absurdities among them. To limit the national contingents in an international army to battalion level is to forget the nature of modern warfare. It should not be overlooked that any limitation that is imposed on the Germans will in the end have to be accepted by the other nations, and the best technical opinion is that the smallest practical unit is the division. It is also quite clear that it would be madness to hold up the formation and equipment of defence forces—of any defence forces that are available—while the very difficult and complex problems of organising an international army, of appointing a European Defence Minister and of setting up a political organ to provide him with authority and finance, were argued out. It may be desirable to have a European army ; but it is much more urgent to have an army in Europe, and for the next two or three years the one is not compatible with the other.

Nevertheless, even when these reservations have been

made, there still remains in the French proposals a great deal of the root of the matter. Virtually everybody accepts the doctrine that German rearmament can be permitted only within the framework of a defence scheme organised for Western Europe as a whole; but the French are right when they imply that the phrase is becoming, on Anglo-Saxon lips, a cliché with very little meaning, and insist that it be given some reality.

One of the great tragedies of postwar Europe is that the powerful urge towards unity, which undoubtedly exists in the public opinion of every country, not excluding Britain, should have been diverted into the attempt to secure economic integration. This is to tackle the most difficult job first. The nations do not agree about economic policy; what is more, they do not in their hearts believe that economic policy must be international or nothing—on the contrary, many of them pin their faith to the powerful instruments of purely national economic planning. This being so, to tackle economic integration first is to put the cart before the horse.

This argument will be familiar to readers of *The Economist*. But the converse is also true: that to construct organs of unity in the political field, and above all in that of defence, is both possible and desirable. Except perhaps in the United States, there is no longer any possibility of belief in the sufficiency of national defence. The expert and the layman are at one in accepting, both as an ultimate principle and as an immediate practical necessity, the utmost possible unity in defence matters between like-minded nations. Proposals to this end are not in defiance of the facts, they are pushing against a door which is already ajar.

The French have, therefore, done well to restate the challenge to the nations to organise their defence in the most collective way they can contrive, knowing—as they must do—that collective defence forces require the creation of some collective political organ to give them their instructions and to establish their responsibilities. None of this, after all, is very new. What is needed is little more than the re-creation of what existed during the war, when there were supreme commanders in the field, combined chiefs of staff to determine the strategy, combined boards to oversee supply and even, in the periodic conferences of the President and the Prime Minister, a supreme political instance.

The citing of the precedents, however, recalls one essential point that it is as well to make quite clear. The French proposal is for a European army and a European Defence Ministry. But, whatever may be true of economic matters, Great Britain cannot, in matters of strategy, be regarded as a European country. Indeed, strategically, there are infinitely more resemblances between the positions of Britain and America than between either one of the two and that of France or Germany. Britain, like America, thinks itself (with some justification) safe from actual invasion. Britain, like America, thinks in terms of the sea and the air (that is, of an independent air force) fully as much as of the land. Britain, like America, has world-wide responsibilities. And if Britain is not quite so complete an arsenal as America, it is far more so than any of the continental countries. If, then, the British Government is invited to participate in a [illegible] for purely European defence unity (and it is by [illegible] clear that this is at present proposed), the [illegible] be an offer to go just as far as the Unit[illegible] no further.

This difficulty, if it be one, could, of c[illegible] pletely removed if the proposal for unit[illegible] ferred from the European to the world-wi[illegible] is, indeed, the British interest in the matter. [illegible] speculation has cast Mr Shinwell for the r[illegible] nent of the French proposals for closer co-ord[illegible] is to be hoped that this is a misapprehension. [illegible] role for Britain is that of pressing for the utmost [illegible] pooling of all defence matters throughout the [illegible] alliance of the free nations, not in any part of it. [illegible] British Government should promise to go as far as [illegible] United States will go—and to make this promise not [illegible] a clever debating way of saying no, but in the real hope that America will be willing to go a very long way. Indeed, the hope can be a belief: American policy has moved so amazingly far in these five years that willingness to join in an international defence force seems only a small step further. Every British effort should be directed to ensuring that the step is taken, no matter what surrender of purely national authority may be involved.

Controlling the Giants

LAST week's debate in the House of Commons on the nationalised industries made little progress with their unsolved problems. "Nobody will pretend," the chairman of the Fabian Society wrote last year, "that the problems of successful, democratic control of industries under public ownership have yet been solved, or are even within sight of solution." Professor Cole's judgment is shared, one may be sure, by all the sober leaders of the Labour Party; but it was hardly evident in the speeches made for the Government last week by Mr Morrison and Mr Noel-Baker.

Parliament was concerned with what the jargon calls the "public accountability" of the nationalised industries. How can the new giants, monopolies free from most of the compulsions of the market, be made to do what the country wants—or what it might be supposed to want if it thought about it?

In the statutes, the responsibilities of the public corporations, the National Coal Board and the rest, are defined by little more than vague injunctions to pursue "the public interest." To find methods of effective public control it is important at least to distinguish two broad aspects of the responsibilities. There is, first, efficiency: the corporation should provide its products or services at the minimum practicable cost. But besides this technical requirement there is also the economic requirement: in fixing the scale of its operations, how much and exactly what things it will produce in what proportions, the size of its investment programme, and so on, the corporation must assess on some reasonable principles the various wants of the community, and satisfy them as fully as possible.

The two things, efficiency and economic policy, are closely related in practice. But they require entirely different kinds of checking in the public interest. If the policies are taken for granted, efficiency in the narrower sense is, in theory at least, a matter of objective measurement; it is a question of detecting and eliminating costs that are unnecessary to the policies. In practice probably nothing short of competition between public corporations can do this fully; certainly little can be done without more effective decentralisation, enabling similar units to be compared, than exists at present in coal or transport. But at any rate what is being aimed at is a quantitative judgment. The assessment of policy, on the other hand, is in large part necessarily qualitative; it is a broad judgment of right or wrong. The purpose of public control is here not to impose objective tests on the corporations but—necessarily vaguely—to ensure that the policy-makers work on sound principles with adequate knowledge.

Once this distinction is recognised, the inadequacy of the Government's one proposal for reform is patent. Mr Morrison suggested that each of the nationalised industries should be subjected every seven years to an inquiry of the kind made periodically into the affairs of the BBC. This may be a useful way of taking stock on the broad issues of policy and organisation. But plainly the eminent men who serve on such inquiries cannot have the expert knowledge or the time to make judgments on efficiency; they can easily be bamboozled by the technicians. The measurement of efficiency is a lower-grade job, for industrial consultants and cost accountants and economists rather than for retired heads of colleges, civil servants and trade union officials. And to be effective the investigation must be regular. The great danger in Mr Morrison's proposal is that for six years out of seven the promise of formal inquiry would be used to fob off awkward questions—including those which the committee would be incompetent to deal with in the seventh year.

*

Yet Mr Morrison would have none of any of the suggestions for making some check on the efficiency of the public corporations. What is required, for the corporations collectively, is a watch-dog such as is provided for Government departments by the Committee of Public Accounts. In essentials the task would be the same: to track down unnecessary costs as the Public Accounts committee tracks down avoidable waste in administration. The speed and the methods of inquiry would have to be different. There would be difficulties and weaknesses, but in time a useful system of efficiency auditing could be developed. It need not inhibit the managements of the corporations. What makes Government departments cautious is not the Committee of Public Accounts, where the civil servant appears himself, but the parliamentary question, through which the Minister has continually to answer for the deeds of his officials. If Mr Morrison is right in arguing that the corporations' managers would be made nervous by a committee looking over their shoulders occasionally, then they are too tender to show initiative and courage in any conditions.

An efficiency audit in itself involves no progress towards public control over the policies of the nationalised industries. The public corporation, free from day-to-day questioning in Parliament, was a prewar invention to meet limited needs. Everyone was anxious to keep the Government and Parliament out of broadcasting, and, therefore, willing to delegate almost complete authority to the BBC. The affairs of the Central Electricity Board and the Forestry Commission were too technical and too remote from the ordinary consumer to demand political decisions. And the London Passenger Transport Board, for all its size as a business undertaking, was still a local concern raising no national issues for Parliament. The point about the original public corporations was, in short, that almost no public control was wanted. The Government and public opinion were no more interested in their affairs—provided they made no grotesque mistakes—than is the ordinary shareholder in a private firm, provided it pays the customary dividend. The boards of the corporations could, therefore, work much as do the boards of ordinary companies.

In the new nationalised industries, and especially coal and transport, the case is different. They employ too many workers, and as suppliers are too closely in contact with the whole country, to be kept out of politics. In practice Ministers and their departments play a large part in running the nationalised industries. The Ministries of Fuel and Power and of Transport still duplicate the organisations of the main corporations. The division of power depends on personalities and circumstances. The Minister of Fuel has so far tended to be the managing director of the Coal Board, but electricity has got out of his control, while the Minister of Transport is rather the chief public relations officer to the British Transport Commission.

The effect in either case is that policy is settled by some confused process within what is virtually a single organisation. The Minister cannot fulfil his intended function of watch-dog for the public; either he is the corporation or he is its apologist. There is no one else close enough to the corporation, yet independent of it, to see that its policies are not parochial or short-sighted, that it does not pursue the interests of its employees at the expense of the consumer.

What such a watch requires is not simply a more critical attitude of Ministers to their own creations. Independence will remain impossible while the departments are closely concerned in detailed decisions of corporation policy. Whitehall's dealings with each nationalised industry should be restricted to a handful of civil servants competent to observe the broad directions of policy and provide continuously an informed outsider's point of view representing, in some fashion, the national interest. Both Parliamentary debates and periodic inquiries such as Mr Morrison suggested might then play a useful additional part. But the first necessity is simply to take detailed responsibility from the Government and put it squarely on the shoulders of the giants. What they make of it can then be seen.

Normal working in the London printing trade was resumed on Wednesday morning and it has therefore been possible to produce this issue of *The Economist* by less extraordinary means than in recent weeks.

Emergency issues were produced in each of the weeks when normal printing was impossible. Every direct postal subscriber should have received a copy each week, and as many copies as possible were supplied to the trade. Subscribers who did not receive copies for which they had paid in advance would be doing us a service if they would notify us (in the case of direct subscribers) or the agent to whom the subscription was paid.

Publication of the *Records and Statistics* Supplement will be resumed next week.

NOTES OF THE WEEK

The New Session

There is one unifying purpose behind the Government's programme for the new session of Parliament: it is simply to leave Mr Attlee's hands free to fight an election whenever he sees the best opportunity. The minor proposals for legislation are all things that can be dropped in a moment almost without anyone noticing. They are not merely non-controversial, as is inevitable; they lack that mild spirit of useful reforming which might be expected from a Labour Government however narrow its Parliamentary majority. In the one important matter to be tackled—leasehold reform—the object will be temporarily to patch up the law (no doubt at the expense of fresh anomalies), not to make a radical change. It is sad to see Labour so devoid of any positive ideas that are not ruled out because they are too Socialist for an evenly divided country.

The one further measure of nationalisation which the Conservatives would not oppose in principle—for water supplies—is left out of the programme because the Labour party still cannot agree within itself on the form a new organisation should take. The proposal to nationalise the British Sugar Corporation must be the outcome of a pretty desperate search for some alternative way of keeping the Socialist flag flying without doing any harm. This measure will not affect the main part of the sugar industry, refining cane sugar. The British Sugar Corporation, refining beet sugar, was set up by a Conservative Government; it has always been dependent on subsidy and the Treasury is already its controlling shareholder. Nationalisation in this case will disturb nothing. The Government's Bill will be attacked as a ridiculous gesture on behalf of a bad principle, as a complete waste of Parliament's time, not because it matters.

The battle, if there is one, will be on the Government's attempt to make permanent the powers of economic control at present exercised under the temporary extensions of wartime emergency legislation. The turgid phraseology of this proposal—"powers to regulate production, distribution and consumption"—is obviously intended to make the Labour party feel that the old, simple faith in prosperity through the state has not entirely gone. But it does not follow that the Government is in fact prepared, as many political commentators have assumed, to challenge the Opposition to pitched battle on this issue. No one proposes to strip the executive of all the powers it has gained since 1939. When it comes to the point the Government may still choose legislation limited enough in scope to avoid sharp controversy. And the point may in any case be put off for some time yet. The minor legislation can be made to keep Parliament uselessly occupied until April and the Budget; if the Government does decide to challenge the Opposition—and the Lords—with a sweeping Controls Bill, it need not do so until the late summer. Accidents of sickness among Labour MPs apart, an election before next autumn has been made no more probable than it was before Parliament reassembled.

* * *

Fourth Act in Korea

Official appreciations of what may happen in Korea have been wrong in the past and may well err again; for intelligence must be hard to come by in the present confused state of the campaign in the north and with air reconnaissance having to stop short at the Manchurian border. It is, therefore, difficult to judge how serious is the intervention of Chinese troops and what may be the purpose of the heavy counter-attacks into which American and South Korean columns have been running. This may be the Communists' Ardennes come-back, or it may be only the first stage in operations which will frustrate General MacArthur's declared purpose of getting the battle-worn troops home for Christmas. It would be wise to assume that United Nations troops in some numbers will be needed on the spot well into next year, perhaps even that Korea will become another Greece.

A more alarmist view of China's intentions has to be taken if some of the recent statements of Peking Radio are to read as something more than propaganda. Listeners are told that the "flame of aggressive war" has now reached China's door, but that they are not to be afraid, for the atomic bomb is nothing but "a paper tiger"—to use Mao Tse-tung's phrase. Indeed, says the Peking commentator, if the Americans used their whole stockpile of atomic bombs only six per cent of Chinese cities could be destroyed. He adds the assurance that "in a general war" the Americans would suffer from far-flung fronts, supply lines of a length "unprecedented in history," and the resistance of the European workers.

The criminal and malicious rubbish about the west's aggressive intentions put out by Communist propaganda has lately reached a point where it is a danger to peace. It is time that the western governments asked men of intellectual standing to prepare a study of what is being said and to present it to Uno for publication.

* * *

Tibet Invaded

Chinese Communist troops have entered Tibet "to free three million Tibetans from imperialist aggression," which no more exists there than it did in South Korea. Before these forces crossed the frontier some 500 miles from Lhasa, the capital, the Chinese Second Field Army issued a political directive instructing its soldiers to complete the "unification of the whole of China" and—a somewhat tall order—to learn the Tibetan language. This invasion began just as Tibetan delegates, led by the Finance Minister, Tsepon Shakabpa, were on the point of leaving for Peking, having spent several months in Delhi trying vainly to negotiate with Communist China about their country's position. Tibet's status in international law is vague; while it is normally shown on western maps as part of China, the Government of India recognised its autonomy over thirty years ago, and the Tibetans ejected Chiang Kai-shek's representatives last year. But there can be no doubt that, as extreme and independently-minded Buddhists, they do not want Communism.

Although opposed by negligible military forces, the Chinese have to cross a vast and rugged territory which no invader has hitherto conquered for long. The reason why they have undertaken this winter campaign on the roof of the world is, no doubt, that success would help to offset a loss of face in Korea and to reinforce the myth of the Communist juggernaut in southern and south-east Asia. As its political directive suggests, Peking is also determined to assert itself in all territory traditionally regarded as Chinese, whatever the effect may be on world opinion.

For Delhi the invasion has been a shock. Mr Nehru, the Indian Prime Minister, has lately been courting the Chinese Government to an extent which has made him blind to their manifest failings and avowed intentions. Now he has expressed "surprise and regret," and has already come down more firmly than previously against the Communist bloc at Uno—on the question of re-electing Mr Trygve Lie. Tibet has appealed to India for diplomatic help, but there is little that Delhi can do except possibly to air the question before the United Nations. Nor is the invasion a direct threat to India, except in so far as it brings Communist

government to its very borders. With the Chinese sending troops into North Korea, equipping and training Viet Minh forces in Indo-China and now campaigning in Tibet, Mr Bevin—as well as Mr Nehru—might feel it appropriate to think again about policy towards Peking. The rewards of appeasement are slow in coming.

* * *

Farewell to Kongwa

The second report* of the Overseas Food Corporation will cause no stir. A year ago, the reservations to the auditors' report on its first accounts marked the culmination of a campaign which, though at times frankly political, was in the main designed simply to obtain the truth about the East African groundnut scheme. Today the excitement has died down. The protagonists, Mr Strachey and Sir Leslie Plummer, have gone; a working party has recommended that Kongwa should, in effect, be closed down; and all that remains is to see what can be salvaged.

The corporation's report also covers its Queensland scheme. It is only fair to point out that this scheme, for producing sorghum and raising pigs and cattle, shows some signs of being a success. But it is by the £30 million capital spent on the groundnut scheme that the corporation will be judged, and there is nothing in this second report to encourage hopes that it can be redeemed. Kongwa is to become a cattle ranching project; clearing at Urambo is to cease this month—at the end of March only 16,000 acres had been cleared there, compared with the 90,000 acres aimed at a year ago. As for the Southern Province, the fair and smiling land about which Mr Strachey once declaimed lyrically in the House of Commons, the report is extremely cautious. Land is now being cleared there "on a highly selective basis"; the plots cleared are, therefore, small and disconnected, which "is producing new problems." Moreover, the new railway built for the corporation in the Southern Province, which Mr Strachey described as one of the scheme's assets to be offset against the capital expenditure, came to grief in the rains of March this year.

Throughout the report facts are given about the scheme's by-products in colonial development and welfare which shine by contrast with its dreary failure to produce groundnuts. But unless these by-products—the transport facilities, the hospitals and medical service, the new village communities and so on—can be maintained they, too, will have to be written off. Tanganyika's other resources may be expanded enough for the Government to take these assets over from the corporation. But so far the corporation has been as unsuccessful in adding to the territory's wealth as it has in relieving the alleged world shortage of fats.

* * *

Reprieve for Teachers

There will be general approval for the recommendations of the Burnham Committee that teachers' salaries should be increased by £75 a year for men and by £60 to £68 a year for women, that the allowance for a university degree should be doubled, and that other improvements in the allowances for posts of special responsibility should be granted. It is generally agreed that teachers have been underpaid and that the service should be able to attract better men and women to it. This should not, however, blind the public to the cost of the proposals. Some 70 to 77 per cent of the cost per pupil in schools is attributable to the salaries of teachers and on a rough estimate something between £16 and £17 million a year will be spent in increasing the salaries of the 226,000 teachers in England and Wales. This is a large sum at a time when education authorities are being pressed to reduce expenditure.

* His Majesty's Stationery Office. 3s. 6d.

While the all-round increase may be justified, the most important and controversial parts of the recommendations are those concerned with special allowances. This is a key issue. One of the schools' principal difficulties has been to attract and keep in the service teachers of outstanding ability and with qualifications which command a high salary elsewhere. They have, for example, since the war found it almost impossible to recruit good science graduates, and in a number of small grammar schools science departments have had to be closed. Hitherto the maximum allowance for posts of special responsibility has been £150 a year. This ceiling is now abolished and local education authorities will be able to draw on a "pool" of their own creation (assessed at 4s. per pupil a year) to pay whatever allowance they think a teacher merits.

The difficulty of this ingenious and far-seeing proposal is that it rests upon individual authorities to decide whether to make their bonuses for merit many and small or large and few. It would be possible for an authority to give the handful of their really able sixth form teachers allowances suitable, or more nearly suitable, to their qualifications. Unfortunately, it is too often a matter of party politics whether they will or no. But, given the strength of feeling behind the pressure of the National Union of Teachers to equalise salaries in grammar and non-grammar schools, the Burnham Committee is to be congratulated on finding at least a partial solution to the problem of maintaining grammar school standards.

* * *

Local Government Hunger

The award to teachers will no doubt be regarded as strengthening other claims for higher salaries. The National Association of Local Government Officers announced on Tuesday that it was about to press a claim for a 20 per cent increase in pay for all its 150,000 workers. Since 1939, the pay of local government officers has fallen well behind the rising cost of living and the wages of manual workers. Whether local government officers have fared worse than civil servants or other comparable workers the association has not attempted to show in detail. It has been content to state that the average earnings of its members have increased by only 63 per cent since 1939 (52 per cent in London).

Compared with other salaried workers, this is not conspicuously bad. It was calculated in *The Economist* of January 21, 1950, that salaries had gone up by 67 per cent—but this figure relates not to the average salary but to the total of all salaries, and since their number has almost certainly grown, the rise in the average salary must be much less than 67 per cent between 1938 and 1948. It must also be remembered that, in times of full employment, Nalgo's complaint about the shortage of school leavers is common to all employers, and that the competition for technical staff—for architects, surveyors, planners, dentists and doctors—is everywhere acute and the turnover of staff rapid. The association does, however, claim that local government is suffering a steady loss of technical and clerical staff to better paid work elsewhere. In the case of experienced professional staff there is outside corroboratory evidence of this. And it cannot but be detrimental to these important public services that the best men should leave. Yet it would be easier to give whole-hearted support to Nalgo's case if it were not so apparent that the appetite of local government for men is insatiable in spite of a decrease in its functions. The national interest requires that local government should employ fewer people more efficiently.

* * *

Scapegoat at Bonn

Dr Adenauer's dismissal of his military adviser, Count Schwerin, is a symptom of the confused state of mind that

prevails in Germany concerning all matters of defence. For many weeks past Bonn has been the centre of rumours, unofficial statements followed by official denials, and constant tussles between the Chancellor and the Premiers of the *Laender* for control over the western *Bereitschaften*, as the armed mobile police are now known. Dr Adenauer's opponents quickly spread the news that Count Schwerin, who commanded the 116th Panzer division during the war, had sent a request to former officers of the division and others receiving aid from an ex-servicemen's welfare organisation, to apply for posts in a special guard that Dr Adenauer proposed to set up for defence of the Government in Bonn. This guard was also to play the role of a *Fuehrerreserve* and provide a cadre of officers for the *Bereitschaften*, or a future German contingent in a European army. This proposal offended the heads of the *Laender*. They intend to keep even this guard of 400 men decentralised under their control, and are so opposed to reconstituting anything in the nature of Hitler's Wehrmacht that they propose to take only men of 22 and under into the new police force.

The latest and worst leakage from Count Schwerin's office was to the effect that the Government was preparing a conscription law. A categorical official denial has not removed the public's uneasy and irritated feeling that matters vitally concerning them are being arranged in secret by the Chancellor, his military adviser and Allied generals. The sacrifice of Count Schwerin will hardly improve the situation. On the contrary, it is likely to make matters worse.

Count Schwerin, who was associated with the July 20th plot, was not acceptable to the *Bruederschaft*, the organisation of generals which is busying itself independently with questions of a revived Wehrmacht. Dr Adenauer, who is determined to keep policy in his own hands, and refuses to be linked with any aspirants to a revived High Command, does not intend to appoint another military man in the place of the indiscreet but otherwise innocuous Count. Dr Blank, who looks after arrangements for Allied reinforcements in Germany, will take over his office. The episode should show the Chancellor the importance of taking the German public more into the confidence of the Government.

* * *

Germans Prefer Freedom

Dr Erhard, the Federal Minister of Economics in Western Germany, will do all in his power to preserve his country from a return to the system of quotas and controls which failed so lamentably in the early postwar years. Faced with the exhaustion of Germany's initial credit in the EPU (which is discussed on page 705), and American pressure to impose controls equal to those which the United States has adopted as part of the defence programme, Germany's apostle of free market economy is determined that the state shall directly interfere as little as possible. Voluntary steps by industrial organisations and fiscal measures will, it is hoped, proved sufficient to deal with shortages.

The steps taken recently to master Germany's foreign exchange crisis—notably the raising of the bank rate—represent an alternative to abandoning liberalised trade. The American authorities, who are sometimes curiously hasty, had proposed that outstanding licences for foreign exchange should be cancelled for review, regardless of the fact that such action would have involved breaches of contract with Germany's customers. Dr Erhard may well be proved right, as he has been on past occasions when the Occupation Powers tried to induce him to adopt controls which work more or less satisfactorily only in more stable societies. The plain fact is that Germans are easily panic-stricken. If they saw around them symptoms reminiscent of the days before currency reform they would interpret them as omens of returning inflation ; and to Germans inflation means worthless money.

Blame for the EPU Crisis

The Bonn Government is not unjustified when it maintains that the EPU crisis has been exaggerated and will right itself in a few months, with some further credit and the action taken already by the *Bank Deutscher Laender*. Even now, it is said, the position has been stabilised, and half of the $400 million of debts due to German exporters has been recovered. Exporters had been giving much too lenient credit terms in order to capture markets. There is also little doubt that German traders have been gambling on a revaluation of sterling and, in any case, on a devaluation of the mark. Payments have been made in advance of due date, and outstanding debts have been left uncollected. Exporters, it is suspected, have also been falsifying invoices with the object of depositing nest eggs abroad. It is evident, too, that the German consumer is not benefiting from the record imports revealed by the statistics. Some goods are being hoarded once again, and others are being channelled to third countries.

The central bank, by imposing stiffer terms for foreign exchange and credit, hopes to squeeze out of business the innumerable men of straw who apply for import allocations. It is doubtful, however, whether the new regulations will not hit the bona fide firms more than the upstarts, whose cash is usually plentiful.

Though Dr Erhard has been badly served by his trading community, he has some justified complaints to make against Germany's partners in EPU. The Federal Republic should have been granted an initial credit of over 500 million units, instead of only 320 million, in view of the very great increase in its trade since 1949. Exports in the first half of 1950 were 47 per cent higher than in the previous six months, and about 75 per cent of the total now goes to OEEC countries. Production also continues to rise and is now 21 per cent higher than in 1936. Furthermore, Britain was very late in liberalising its trade with Germany, and France has not done so yet. Almost the whole of Germany's deficit in EPU is with these two countries.

It might be said that the large purchases of raw materials which Germany made after Korea constituted a wise hedge, since it was almost certain that the goods would soon be worth more than the money that bought them. But the incontrovertible fact remains that Germany, whether it was hedging or gambling, it was done with other people's money.

* * *

The Encroaching Corporations

The action of the Road Haulage Executive in withdrawing the permits of several thousand road hauliers to operate outside the twenty-five mile radius, and that of British European Airways in squeezing out the air charter firms from the Channel Islands trade, raise afresh the awkward question of the proper delimitation of monopoly powers.

For two types of opinion no question really arises. When the dogmatic old-style Socialist sees a most desirable thinning out of the "miasma of private enterprise" hampering the national industries, the dogmatic individualist sees a gratuitous attack on freedom and, moreover, a confession of inability to compete in a fair field against the superior efficiency of private business. The real issue is less simple. It was not, after all, doctrinaire socialism which drove the "pirate" buses off the London streets, nor a Socialist creed which dictated, over the course of more than a century, the grant of monopoly rights to public utilities. It is indeed arguable, in the rarefied theoretical atmosphere of pure economics, that the only justification for monopoly is the kind of massive physical indivisibility represented by a municipal waterworks ; in practice, no one would bring back the "pirate" bus. The balance of social loss or gain—loss from the lessening of flexibility and initiative, gain from co-

ordination and the more rational distribution of overheads—when a scatter of competitive enterprises is absorbed into, or replaced by, a single organisation whether private or public, is a matter to be decided not *a priori* but on the facts of each case.

More unsatisfactory than any particular encroachment of public monopoly on private business in the same field is the absence of any impartial body to decide whether the facts do or do not justify it. The corporations are judges in their own cause. Their executives must be almost superhuman if they can wholly avoid being biased by mere administrative convenience, irritation at invidious and perhaps unjustified comparisons, and the itch of empire building—considerations which, to put it mildly, are out of place in deciding the proper composition of a mixed economy.

* * *

G.B.S.

Mr Bernard Shaw is—one can hardly bring oneself to write was—about the last person to appreciate the smoothly laudatory phrases of a conventional obituary paragraph. A great man, a man diversely and magnificently gifted and diversely and infuriatingly deficient, a major and unmistakably salutary influence on the thought, opinion and perceptiveness of three generations ; a "swallower of formulas," a crank, a crusader, and a supreme master of English prose, of polemic and of stagecraft ; an impish devil's advocate constantly compelling readers and auditors to re-examine the bases of their beliefs or complacencies ; he was the sort of unique, splendid and slightly absurd eccentric, for whom, in a society shaped as he endeavoured to shape it, there would be very little room.

He lived to see many of his heresies and paradoxes become commonplaces and platitudes, and it is perhaps to his unwillingness to relinquish the congenial role of arch heretic and gleeful iconoclast that one must attribute the less attractive intellectual antics of his last decades—the flirtings with successive totalitarianisms, the uncharacteristic reverence for brute force, as well as the engaging minor sillinesses with which he enlivened the correspondence columns of the press. Yet if he was an intellectual exhibitionist, deliberately wrong-headed, perverse, intemperate in denunciation or in praise, he was never ungenerous ; he was never dull, he never bore malice, and he never struck an underhand blow. No one could have found his ideas and ideals more incomprehensibly abhorrent or fought him on platform or paper with more conviction and zeal than did G. K. Chesterton. Yet Chesterton—than whom few were better haters where hatred was called for—always felt the warmest affection for him and saluted him, at the last, as a chivalrous adversary. Time will burnish Shaw's reputation ; if prophecy may be hazarded, he will be remembered neither as an exasperating Eulenspiegel nor as an advance sample of the Superman, but, as he delineated himself in the "Adventures" of his Black Girl, as the redheaded Irishman "digging, productively and with inexhaustible zest, in the garden of Voltaire."

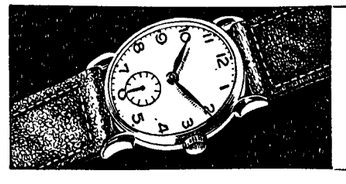
* * *

Tainting the Secretary-General

One unfortunate outcome of the quarrel over extending Mr Trygve Lie's term as Secretary-General has been to taint an office that should be above politics with the nasty flavour of the cold war. The fault is not Mr Lie's. It lay, in the first place, squarely on the Russians. Subsequently the Americans, by a tactless speech of their representative, also placed themselves in the class of voter who uses the veto to baulk any nominee but his own. Mr Lie becomes, to his embarrassment, the west's man and is reviled by *Pravda*—quite unjustly—as the "Salesman-General of Wall Street."

The appointment of the Secretary-General lies with the Assembly, on the Security Council's nomination. The Charter fixes no term for it, but Mr Lie, on appointment in 1946, was placed in office for five years and his term expires next February. When the Security Council considered the succession, Jugoslavia proposed that Mr Lie should carry on, and was supported by eight further votes. The Russians vetoed the proposal, and their distaste for Mr Lie is said by Mr Malik to be due to his "quarrel with Stalin" over the details of the 20 point peace proposal which he took to Moscow in the spring. But the real reason for it—officially denied, but at one point implied and blurted out by Mr Vyshinsky—is his use on June 25th of his powers under Article 99 of the Charter to address the Security Council on its "plain duty" to stop the Korean aggression.

The Russians therefore proposed a rival candidate, a Pole, who got no votes except theirs. There followed some days of confusion during which other names were submitted. In view of the overwhelming vote earlier given for Mr Lie, to accept one of these nominations would amount to penalising a man who had merely done his duty. Thinking to stop the muddle, Mr Warren Austin of the United States, in the heat of a maddening debate, rapped out his mistaken threat to "thwart the Soviet veto by every means in his power"—to meet veto with veto. The Russians replied that they would not recognise the validity of Mr Lie's re-election ; so by ten votes to one the Council divested its agenda of the deadlock and passed the deadlock to the Assembly, which has now prolonged his appointment for three years.



The risk of non-recognition by the Russians is worth taking, for to bow to their objections would have grave implications. It would discourage any international official from doing his duty in an independent spirit.

Long service awards promote staff goodwill

We at 112 have helped many World famous organisations in the realisation of Staff Goodwill and the years of consultation with executives in different industries enable us to offer valuable assistance in deciding "What is the right gift" for a Long Service Award. We shall be happy to place our services at your disposal if you are interested.

Liberalisation Marks Time

It is now over a year since the Marshall Plan countries, acting through the Organisation for European Economic Co-operation, embarked on a process of trade "liberalisation"—by which they meant something a good deal less than free trade. The intention was to withdraw in progressive steps quantitative import restrictions on that part of intra-European trade in the hands of private enterprise. It was argued that, as exports and imports moved into balance, quota controls would no longer be needed for the purpose of safeguarding each country's foreign exchange reserves. By the autumn of this year 60 per cent of trade on private account had been "liberalised."

When the OEEC ministers met in Paris last week it was found that the next stage—to 75 per cent—was the toughest so far attempted. Because of the present weakness and fears of various member countries, the ministers ended their discussions with a recommendation instead of a decision. Participants were "urged" but not "obliged" to aim at an additional 15 per cent by February 1, 1951.

Perhaps the greatest obstacle to lifting more restrictions was the trade deficit of Western Germany. Unless this is speedily righted by other means, the German authorities may be compelled to reimpose some of the quota restrictions already abandoned; further liberalisation would be out of the question. Among the most vocal critics of the 75 per cent target was the group made up of Holland, Denmark and Turkey. They argued that because such a large proportion of their trade was carried on with Western Germany they would have to mark time until Bonn clarified its trade policy. This group was given an extra three months' grace beyond the February deadline before committing itself.

A second dissentient voice was that of France. The French delegation complained that their country was particularly dependent on raw materials and that, so long as there was no satisfactory international scheme of allocating them, France would reserve its position on further liberalisation. The logic of this argument is difficult to grasp; the cynical but perhaps reasonable interpretation is that France is determined to hold fast to all bargaining counters until concessions on the question of raw materials are made. This issue has in recent months become an obsession with the Quai d'Orsay. Finally, there were protests from low tariff countries which maintain that the high-tariff policy of such countries as France is making nonsense of the trade liberalisation programme. Low-tariff nations were granted the right to ignore the latest OEEC recommendation if the ITO Conference at Torquay fails to reduce international tariffs.

All in all, it looks as if the prospects for further liberalisation of European trade are pretty dim.

Plain Speaking to Spendthrifts

The Filipinos have had their clamorous wish fulfilled with the publication last weekend of the Bell Report on the Philippine economy. The report is by far the most searching and forthright approach yet made by the United States to the problem of how aid to under-developed countries can be made to do the job for which it is intended. This is the first time that American aid has at the outset been so unambiguously tied to strict American supervision. It has doubtless come as the culmination of a series of disillusioning experiences, first in China, then in Greece, southern Korea and the Philippines themselves.

Since the end of the war the Filipinos have received in various forms some $2 billion from the American Government but have nevertheless managed to bring themselves to a state of near bankruptcy and social demoralisation. Last year, in response to Philippine pleas for still more aid, Washington insisted on the dispatch of an all-American fact-finding mission. Reluctantly President Quirino gave way. The mission, headed by Mr Bell, former under secretary of the US Treasury, was sent to Manila in July and completed its labours within two months.

Sheer incompetence and lack of initiative, the Bell report suggests, are more important reasons for the plight of the country than graft and corruption. The failure of the Philippine Government has been its inability or unwillingness to tackle the basic economic problem—"inefficient production and very low incomes." As a result there is an alarming and steadily widening gap between production and needs, wages and prices, and between Government expenditure and taxes. The report says trenchantly that:

> Because of the deteriorating economic situation there is a widespread feeling of disillusion. Most agricultural and industrial workers have no faith that their economic position can or will be improved. Business men fear a collapse of the peso.

This is the kind of situation, the report warns Manila, on which the Communist-led Hukbalahap movement will thrive.

The mission recommends that the United States provide $250 million over a five-year period, but only on condition that this assistance is continually "supervised and controlled" by an American technical mission and that the Philippines carry out a number of far-reaching reforms. These include redistribution of land, a more equitable and efficient tax structure, diversification of the economy, reform of the Civil Service, organisation of free trade unions, and a stiff import tax on non-essential goods.

This experiment in plain speaking will be watched with deep interest wherever the future economic relations of the western lender and the Asian borrower are being thought about. Its launching has not been auspicious. Washington's first reaction was a decision to withhold publication—presumably for fear of offending a proud and newly independent people—and it relented only when rumours of the radical nature of the document penetrated to the Philippines. There it caused a hubbub and provoked from one of President Quirino's underlings the statement that, in matters of corruption, Filipinos are "pikers" as compared to their American mentors.

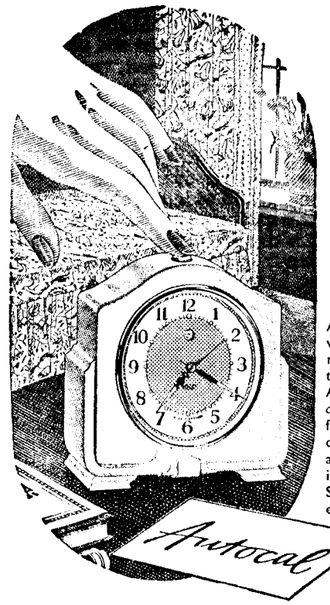
Israel Rounds a Corner

There is a direct connection between the sudden solution, last Sunday, of the cabinet crisis in Israel and the simultaneous meeting, in Washington, of a national planning conference of American Jewish organisations "for Israel and Jewish rehabilitation." For some days before this met, the wires to Tel Aviv were humming with its advice, the gist of which was: "We American Jews cannot launch our campaign to raise $1,000 million until you produce stable political conditions at your end."

Israel had been without a cabinet for three weeks. Its old government, of which Mr Ben Gurion's Labour party (Mapam) was the chief component, had for the last two years been able to execute its policy of planned economy thanks to the support of groups to its right. Of these the least dependable was the United Religious Front, which contains one group—the Mizrachi—that does not confine its platform to religious issues. Mizrachi also expounds economic doctrines; it stands for the little man and more freedom for his enterprises. Last month the worsening balance of payments drove the government to impose yet further restrictions, and it has always been bad at explaining these to the electorate. Its late minister of rationing, Dr Joseph, out-Stracheyed Strachey in his capacity to enrage the housewife. There followed much murmuring at Mr Ben Gurion's arbitrary ways. When he took a decision to adjust the

Doubloons or Dollars



"It was a long, difficult business, for the coins were of all countries and sizes—doubloons and louis-d'ors, and guineas, and pieces of eight".

'TREASURE ISLAND' *by Robert Louis Stevenson*

The old Buccaneer's chest presented quite a problem to so honest a woman as Jim Hawkins' mother. How could she extract the exact amount owing to her from among this jumble of coins from foreign countries? This problem of exchanging many different foreign currencies into sterling often confronts the modern business man.

Foreign exchange is no mystery to the highly trained staff of the Midland Bank, whose friendly assistance is always at your disposal.

incidence of responsibility as between ministers by creating a new ministry—that of trade and industry—Mizrachi, taking advantage of the general discontent, claimed the portfolio. He refused them this, and losing their support, was obliged to resign. Deadlock followed. A general election seemed inevitable until the wires from Washington grew busy.

Their influence magically produced a compromise in which what is virtually the old coalition resumes office. Part of the United Religious Front, proclaiming that certain religious demands have been met, has agreed to serve; some, but not all, Mizrachi supporters have split from the front on the issue. Mr Ben Gurion's cabinet is therefore much as he originally wanted it. The new minister of trade and commerce, Mr Jaacov Geri (better known to the business world under his former name of Jack Gering) is a non-party man who is likely to be a staunch supporter of Mr Ben Gurion personally. The prime minister's position and repute are strengthened by all that has occurred. He has chiefly to thank Washington for the advantage gained.

Church and Communists in Poland

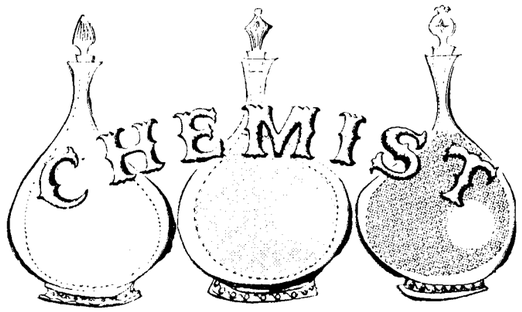
The bitter struggle between church and state in Poland is flaring up once again. Few, indeed, can have hoped that the concordat signed last April between representatives of the Government and the Polish bishops, which was never accepted by the Vatican, would do more than gloss over temporarily the deep and irreconcilable differences which divide the Communist Government and the Roman Catholic Church in Poland. The Government's latest, widely publicised, outburst is directed particularly against the failure of the Episcopate to set up a permanent church organisation in the western territories in place of the present provisional arrangements. The Polish Government, which has recently obtained a formal renunciation of these lands from the Government of eastern Germany, is naturally anxious that nothing shall impede their complete integration with the rest of Poland; and it has announced its refusal to tolerate any longer their unsettled ecclesiastical administration. The Polish bishops, for their part, have always maintained—as in loyalty to the Vatican they were bound to do—that the matter was outside their competence and must be settled by the Vatican. The Government says that they can no longer thus "shelter behind the pretext of formal considerations."

The Polish Government may hope that its fulminations against the bishops' attitude to the organisation of the church in the western territories may divert attention from the far more fundamental issues at stake in its struggle with the church. After a meeting of bishops early in September, the Primate Archbishop, Stefan Wyszynski, and Cardinal Sapieha addressed a "statement of grievances" to President Bierut. It reveals such a state of affairs that it is hardly surprising that it has been hushed up by the government-controlled press and radio. Large numbers of priests are under surveillance, have been imprisoned without trial or have been sentenced to penal servitude; more than 500 priests have been dismissed from teaching posts because they refused to sign the Stockholm "peace appeal"; the training of new priests is jeopardised by the closing down of seminaries, and the religious teaching of Polish children is gravely threatened by the handing over of more than a thousand schools to the "Children's Friends Association," which excludes all religious teaching from the schools under its control.

* * *

The Way it Works

The price of pork sausages is going up from 1s. 6d. to 1s. 10½d. per lb. The young and innocent might therefore suppose that the offal constituent of the cost of living index would be increased by 25 per cent. But the proportion of pork meat in the standard or Government sausage is being raised from 50 per cent to 65 per cent at the same time as the price is increased. Those with a sound arithmetical background would therefore seem justified in taking the more cautious view that the offal constituent of the cost of living will be going down rather than up. The sausage as such is obviously an unsatisfactory unit; it must be presumed to be bought for its "standard pork content," and in terms of this unit the cost of sausages will now fall by 4 per cent. The cost of living is therefore clearly on its way down.



Only the expert is likely to spot the real answer, though fundamentally it is very simple and obviously conforms to common sense. Everyone knows that the sausage we are getting now is a Bad Sausage: but we have the authority of the Minister of Food himself for the statement that the sausage with 65 per cent of pork in it is a Prewar Sausage. Anyone who gives a little thought to the matter, even though he may not be the true Connoisseur du Saucisson of whom the gentleman from Whitehall is the perfect embodiment, will readily agree that the Good Sausage is at least twice as good as a Bad Sausage. The measurement must clearly be in terms of "Standard Sausage Satisfaction"; who, therefore, can doubt that by correct methods of computation the price of sausages will now fall from 1s. 6d. per unit to 11¼d.—a reduction of 37½ per cent in the offal constituent of the cost of living index?

There is a slight difficulty still to be overcome. By any of the above standards, beef sausages are going to increase in price by 6½ per cent. But everyone knows that no true Englishman will touch a beef sausage when good pork sausages are available. If by some oversight the now obsolescent beef sausage still figures in the cost of living index, one may safely presume that the gentleman from Whitehall will follow the dictates of common sense and have it deleted. Or better, he will have it replaced by its money equivalent in pork sausages. Since the cost of these is now going down, it will then give an additional fillip to the downward movement in the cost of living. No wonder Mr Webb is quoted as saying that he is "fascinated by the problem of the sausage."

The Alarm of War

Public writers, we think, do not pay sufficient attention to the prevalent habits and sentiments, to what we may call the framework of the mind of Europe, in contradistinction to the ornament and frippery of words. . . . Princes and their armies form numerically but a small portion of the whole people, and it is a great mistake to put them for the whole. Nor is it a less mistake to conclude, because war has been, that it will ever be, the pastime of nations. When clubs were the only weapons, and each individual handled a club, every man was a warrior. . . . As an ever-increasing portion of society ceased to be clubmen, as the part devoted to the art of war became less, so the character of nations changed and is still changing; and though they formerly carried on war for pleasure, they no longer do so, nor will they do so hereafter. In Germany a few noisy students and journalists, fresh from the Universities, clamour about war; in France a few military men by profession and their abettors and followers talk big; but in either country these compose only the smallest part of the nation, while the bulk of our community look with pity or contempt on the exciters of strife.

Letters to the Editor

German Vicars of Bray

Sir,—In your columns of September 23rd, under the heading "German Vicars of Bray," you described the attitude of the Evangelical Church in terms which can only be misleading. It is certainly true that the Communists claim "increasing support from Protestant pastors"; it is part of their campaign against the official church to do so. You imply that you believe their claims. Reliable reports from the Russian zone, however, indicate that the majority of clergy are firmly united behind Bishop Dibelius, and that attempts to draw them into the National Front have failed. The Communist "puppet" National Front pastors are a mere handful, none of them a man of any significance, and attempts to gather pastors in political assemblies have not succeeded in winning the support of more than 5 per cent of the clergy.

The resolution on rearmament, to which you refer, was issued at Essen, not Duesseldorf. The full text of the statement contained approval of a police force for the purpose of maintaining internal law and order. At the same meeting Dr Heinemann said that, while he was not in favour of the military rearmament of Germany at present, he knew that it was his duty to work for a strong police force. Such a police force (not one "to match the Volkspolizei") is, as far as I know, all that has been mentioned in recent discussions by either Dr Adenauer or by the Allies. The immediate point at issue in the conflict between Dr Adenauer and Dr Heinemann was, according to the official statement issued at the time by the Ministry of the Interior, the fact that Dr Adenauer had omitted to consult him, the responsible Minister, before submitting his memorandum on security to New York. Recent events, including Dr Heinemann's resignation, indicate that the issue was a deeper one, and that there was a real difference of opinion about German military contribution to the defence of Europe.

What you say of the attitude of the Church to Communist propaganda might have been true a year or two ago. There can be hardly any Protestants today who hesitate to condemn both the doctrine and the methods of Communism. Where opinions of the Evangelical Church do differ is on the method of meeting the Communist threat. Some are strongly in favour of Germany's taking a share in the defence of Europe; others feel that Communism should be met on the spiritual level, and would regard the social reconstruction of Germany as the primary task. All are deeply concerned to find the Christian answer to a question which is a particularly difficult one for Germany, and they are not likely to be helped by the frequent misrepresentations of their attitude in the press.—Yours faithfully,

Cologne M. C. BAILEY

Houses in the Air

Sir,—You state that the Conservative target of 300,000 houses can be achieved only "by curtailing other forms of building, whether offices, schools, power houses or factories."

Surely it is implicit in the programme that first curtailment should take place in non-essentials. There are many, but the "Festival Buildings" are estimated to take enough labour and material for 3,000 houses and are a fair instance of Labour policy.

Perhaps you could give more prominence to this aspect of the Conservative programme.—Yours faithfully,

JOSEPH T. HORN

40 *Berkeley Square, W.1*

Books and Publications

A Fight to a Finish

The Coming Defeat of Communism. By James Burnham. *Jonathan Cape.* 286 pages. 12s. 6d.

Mr Burnham's book opens with thunderbolts, forked lightning and anathemas. We are living in an extreme situation, under the threat of catastrophe. This sense of catastrophe

> thrusts between the broken or distorted forms of Picasso and the antiharmonics of Schoenberg. It is bodied in the novels of Joyce and Faulkner and Gide and Mann, and shows quite openly in Malraux Silone and Koestler. It gives relevance to the neo-Lutheran theologies and the existentialist philosophies.

The political form of the crisis is the threat of world conquest by Communism. In face of this threat the foreign policies of the United States and the democratic front are disastrously inept. The Third World War has already begun, and here they are slowly inching forward from appeasement to containment—as if anyone ever won a war by containment!—while at home they still worry anxiously about civil rights for Communists. Time is running out; what is needed is a new policy and the seizure of the initiative, the realisation that the war with Communism is already on and the preparation of immediate plans for the destruction of the power of the Kremlin and its satellites.

Mr Burnham's books are best-sellers, and with a title like this the opening chapters had to grip. But Mr Burnham, when he quietens down, has some telling points to make and an interesting case to develop. It is a fact that all over the world the western powers and the Communist bloc are in a state of acute conflict, a permanent condition of near-war, which in a number of places—Greece and Korea, for instance—has already led to considerable campaigns. It is also true, as Mr Burnham points out, that the western powers are reluctant to admit the implications of this state of affairs. They prefer to regard the cold war as a temporary and abnormal phenomenon. If only we are firm with the Russians—but avoid provoking them—they will come to their senses in time; the expansionist phase of Communism will pass; and the world will be able to settle down again. The awkward question Mr Burnham raises, however, is an uncomfortable one to answer. What do we expect to alter the present situation for the better? What are we betting on? A change of heart on the part of the Communists? The collapse of the Communist bloc from internal tensions, a succession crisis following the death of Stalin, or the spread of Titoism? Are these well-grounded expectations? Or are they, as Mr Burnham suggests, excuses at which we clutch rather than pull our heads out of the sand and admit that the struggle with Communism is a fight to a finish?

These are serious questions, not to be brushed aside by easy and superior remarks about the hysteria of ex-Communists and the sterility of anti-Communism. Mr Burnham's answer at least is clear. The aggressive ambitions of the Communist leaders will not be defeated unless we take active steps to defeat them. In the long run, either we destroy their power or they destroy ours. A balance of power, the uneasy truce or stalemate, which is the object of our present policy, is not a sufficient objective; it can only perpetuate the cold war, not end it. Mr Burnham, however, does not belong to the "Drop the Bomb Now" school; he is not an advocate of a preventive war. The Russians, he thinks, are no more anxious for an old-fashioned shooting war than are the western powers. The risks are too great, and in any case unnecessary. Subversion, fifth-column tactics, the methods of "agit.-prop.," the threat of war and the exploitation of the weaknesses, inhibitions, and divisions of the open societies of the west offer an alternative, at much smaller cost and much smaller risk. So far the western powers have been concerned to defeat these Communist methods of attack. They have not seriously considered using similar methods against the Communists themselves. But, Mr Burnham argues, there is here a method of weakening and defeating the Communist threat which might provide an alternative to the unattractive choice of the cold stalemate or another major war.

This is an interesting proposal, and there is a good case on paper for arguing that the totalitarian Communist regime is more vulnerable to such methods than the freer and more loosely organised societies of the western powers. But how is it to be put into effect? Mr Burnham has a first-class chapter on propaganda; beyond that he loses himself in vague and unsatisfactory suggestions. The proposal to build up a spearhead from the exiles and emigrants now living in the United States ignores some bitter lessons from the last war, and how much is really to be expected from all out support for a trio as unpromising as de Gaulle, Chiang Kai-shek and Franco?

In short, Mr Burnham is at his best in analysing the contradictions and hesitations implicit in existing policy, but not nearly so convincing when it comes to suggesting alternatives. Is the answer that the present cautious and deliberately unaggressive policy, while weak in logic, is in the long run more effective than Mr Burnham admits; or is Mr Burnham, while unsuccessful as yet in formulating a satisfactory alternative, right in believing that an alternative policy can be found, short of war, along the lines he suggests? It is at least a sufficiently interesting question to make his book, for all its irritating characteristics, well worth reading.

Research into Business Cycles

Statistical Indicators of Cyclical Revivals and Recessions. By Geoffrey H. Moore. *National Bureau of Economic Research, Inc., New York.* Occasional Paper 31. 95 pages. $1.50.

This report sets out some of the latest findings in the National Bureau's research on business cycles. Before the last war the Bureau made a special study of business revivals and selected a number of economic series which were considered most likely to give an indication of the approaching end of a business contraction. The new research has aimed at revising the list of these indicators and has extended the analysis to recessions. The present report is a preliminary one. Here is no simple statistical device to put an end to crystal-gazing, but an interesting contribution to the knowledge about the patterns of business cycles.

A great deal of labour has gone into this piece of research. Eight hundred and one series of indicators for the United States have been analysed; some of them going back as far as the 1850s, most begin much later. But, as the author points out at the outset, the interpretation of statistical indicators is full of difficulties and their use is limited. He dispels any optimistic hopes about easy reliable forecasts from the methods described in this paper by concluding that ". . . there is some ground for confidence that objective use of these methods will at least reduce the usual lag in recognising revivals or recessions *that have already begun.*" The Bureau has assessed this lag from past experiences at as much as six to eight months in some instances.

The technique used in this study has been to apply consistency tests to select those series whose timing in successive business cycles has been relatively systematic. The series have been related to standard reference dates believed to represent the turning points of aggregate economic activity. Out of the 801 series it was considered possible to identify 75 series that generally led at the reference turning points, 29 series that roughly coincided and 30 series that lagged behind. While no one series can be relied on to behave consistently at each business cycle, it is suggested that by combining some which tend to react before business in general it may be possible to obtain a useful trend indicator. This was tried by taking a small number of suitable series, applying a smoothing process of moving averages and combining in such a way as to give a figure of the number of months the average of the series had been going up or down—the "average duration of run." For this particular group of series, a rather critical duration of run either way appeared to be about three months. This trial gave promise of some success, but suffers from the severe disadvantage that a moving average does not give an up-to-date picture; some allowance for this may be possible, but difficulties such as this are left for further study. These are interesting ideas, but it is apparent that much of the work is still in the experimental stage and some of it may well fall down on more rigorous statistical examination.

Seats of Government

Parliament House. By Maurice Hastings. *The Architectural Press.* 200 pages. 12s. 6d.

Whitehall Through the Centuries. By G. S. Dugdale. *Phœnix House.* 192 pages. 18s.

"Oh, good God, the House of Lords is on fire!" exclaimed Mrs Mullencamp, the doorkeeper's wife, at six o'clock on October 16, 1834. The Dutch laundress who scorched her linen on the afternoon of January 4, 1698, must have said much the same thing when the Palace of Whitehall caught fire. Of the two palaces which were the seats of government for so long only Westminster Hall remains of the one, and Wolsey's wine cellar and the Banqueting House of the other.

Dr Hastings's is the more timely of these two admirable and complementary "place-histories." He concentrates on the history of the Chamber rather than the Palace of Westminster—the Chapel of St Stephen occupied from 1547 to 1834 and modified by Wren, the Barry-Pugin reconstruction first used in 1852, and Sir Giles Scott's new adaptation, so necessarily traditional in style. The story shows clearly the enormous influence of the architecture on the evolution of the two party system: what might have happened if the Commons had continued to sit in the octagonal Chapter House instead of the choir stalls of the Chapel? The fact that they habitually occupied borrowed quarters is still reflected in the conspiratorial air of much of their procedure. Indeed, nothing is so typical of the English character than the way a thoroughly unsuitable meeting place was frequently modified without ever being fundamentally transformed. Even the dimensions of the floor of the new Chamber (68 ft. by 45 ft.) are almost those of the old Chapel (60 ft. by 28 ft.).

Similar constitutional results occur in the history of the buildings Henry VIII called Whitehall, meaning, according to Mr Dugdale, Festival Hall. After the burning of the palace the monarch is excluded from the executive seat of government. For three centuries the centre of gravity has shifted from the riverside site of the palace to the park side of the street, the Admiralty being the first government office to occupy a separate building there, followed by the Horse Guards and the nineteenth century monstrosities further south. Perhaps the new buildings behind the War Office will redress the balance. Beneath the miles of corridor haunted by the executive lie tiltyards, cockpits, bowling alleys and tennis courts, just as below the legislature lie chapel and cloister, painted chambers and privy gardens.

Shorter Notices

National Income Statistics of Various Countries, 1938-1948. *U.N. Publications. H.M. Stationery Office.* 249 pages. Cloth 25s. Paper 17s. 6d.

THIS volume is the second in the series on national income statistics and includes information received up to February, 1950. Thirty-two countries are covered—rather fewer than in the 1938-47 edition, since those countries for which there is no new data have been excluded. As well as having the later figures, this new edition contains a much fuller analysis of the various factors entering into the national income and expenditure of a country and also shows the social accounts of those countries where this technique is used. Another useful addition is a series of national income estimates (in total only) over a longer period of time than before and going back into the last century for some countries. As in the previous edition, the statistics are accompanied by explanatory notes.

The Incorporated Statistician. Vol. I. No. I. July 1950. *The Association of Incorporated Statisticians.* 32 pages. 5s.

THIS new journal introduces a series which will describe in later issues the organisation of statistical departments in various concerns. It hopes to make available this sort of information on the practical aspects of applied statistics by obtaining suitable papers from members of the association. Also in this issue, Dr Dudding describes in general terms the introduction of quality control technique to industrial problems, while a more theoretical flavour is provided by Mr A. J. H. Morrell in a study of age-standardised rates of sickness

AMERICAN SURVEY

Eve of the Poll

Washington, D.C.

THE mid-term elections on November 7th are now close enough for a sensitive voter to feel the hot breath of pursuing politicians. The memory of other elections is dimmed by distance, so that the Gallup Poll can, and does, do business at the old stand; it predicts, for instance, that the Republicans will pick up some seats in the House of Representatives, but not enough to give them control of that chamber.

The usual charges of "dirty work" have been forthcoming for some time at a rate that must be highly gratifying to those citizens who hate most of all a dull election. "Dirty work" is a wide phrase, taking in practices which can be defined as downright illegitimate, borderline, or wholly legitimate, according to where you are sitting. The Senate Elections Subcommittee is investigating situations in four states, involving respectively an alleged "sordid deal" to secure a candidate's nomination for one contest and his elimination from another, an alleged violation of laws forbidding intimidation of voters, the alleged expenditure by a candidate of fourteen times as much as he is permitted to spend, and an alleged intervention in a contest by government officials. This is only part of the ground, ranging from the muddy to the dusty, that has been covered by accusers of one sort and another.

In general the tendency has been to treat it all as just a part of the normal service for voters. There have not been many who challenged the right of leading campaigners on the Republican opposition side to invite the electorate to vote for them on the ground that the Secretary of State and his department are "Communist lovers" intent on "appeasing Russia" or on manipulating a "great sell-out" in China. Nor have there been many who wondered, aloud, whether, in these precarious times, the knowledge that there are votes at stake is sufficient justification for a series of speeches and statements which might hamper and discredit officials on whose work in the field of foreign affairs the nation's safety must largely depend.

*

It is the classic pattern of a mid-term election in the United States that the party which triumphed two years earlier, when its principal candidate was elected President, should lose seats in the Senate and House on being bereft of the enthusiasm and energy generated when the top job was fought over. Frequently the loss of seats has been great enough to swing the Congressional majority from the party whose nominee was sitting in the White House and running the Administration to the party without an executive official to its name. When that happened, two years of tension and intermittent stalemate could usually be safely predicted until the next presidential election.

In the present circumstances, however, and not altogether for the first time, it is clear that the retention by President Truman and his party of a technical Democratic majority in the Senate and House will not automatically remove the threat of two years of tension and stalemate. On the other hand the mere gaining of some seats by the Republicans and the consequent reduction in the Democratic majority need not make it harder in the next session of Congress than it was in the last for Mr Truman to secure the legislation he wants.

What does matter greatly is which candidates win and lose, and why they lose and win. For it has long been a mistake—and it has never been a greater mistake than it is now—to think of either the Democrats or the Republicans as a single, disciplined party. President Truman, and President Roosevelt before him, and other Democratic Presidents before them, have been bedevilled and frustrated by Democrats-in-name who never hesitate to form a victorious coalition with the Republican opposition in order to get something they want or to defeat something they do not want. This is a sort of licensed disloyalty. It is not confined to the Democrats from the southern states, though many of them are its foremost practitioners and—since they are able to vote against the party leadership with impunity—its foremost beneficiaries. A good idea of the wide latitude the President must allow his supporters in Congress in cases where they feel that there is more to be gained by following the line of their mail from back home than the line of their leader in Washington, is furnished by the record of Senator Scott Lucas, now fighting for his political life in Illinois. He is himself the Democratic leader in the Senate, and the President is very anxious to see him returned; but in the last two sessions he opposed two of the major pieces of Fair Deal legislation which the President sought (but did not get) from Congress—the health insurance and the Brannan farm plans.

The tone and temper of the next Congress will be affected most by what happens in the "key states." If candidates who have always, or usually, gone along with the President are returned there, the election will be a Democratic triumph, for the implication for the next Congress will be that the way to get elected now is to follow the President's lead. The key that might easily unlock much of the legislation Mr Truman wants will be the result in Ohio. If Senator Taft, the prow of the Republican ship, should be knocked off by the votes mobilised behind Mr Joseph T. Ferguson by the labour organisations, it can be guaranteed that the coming Congress will pay respectful attention to whatever demands the President and the labour organisations may make upon it.

If the Democrats can also return Senator Lehman in New York, Senator Tydings in Maryland, Senators McMahon and Benton in Connecticut, Senator Myers in Pennsylvania, Senator Lucas in Illinois, and Mrs Helen Gahagan Douglas in California, they will be sitting pretty. Still prettier would they be sitting if some of the key Republicans who are running either for Congress or for Governorships—for instance Mr Dewey in New York, Senator Millikin in Colorado and Senator Donnell in Missouri—should have failed to be elected. For the inference that the country wanted Mr Truman and all his works would then be irresistible.

Whether the Democrats can defeat Mr Taft and return a fair proportion of the more faithful followers of Mr Truman is what matters most to them, for a result of that sort would more than outweigh a reduction in the totals of their majorities in Senate or House. They are up against the inevitable hazards to the party in power of mid-term elections. But they have with them the stimulus of victory in Korea and of a continued prosperity which rising prices and the fear of inflation have not so far seriously damaged. So the Democrats reason, fervently and hopefully, or so some of them reason.

The political cinema in America is never showing just one film at a time: there is always a stupendous double-feature programme. A few weeks ago, when Senator Taft seemed sure to win, it was the single-minded Democratic objective to beat him. But lately, when his chances are reported to have narrowed to fifty-fifty, when victory looks as though it is within grasp, a number of Democratic brows have begun to knit in doubt.

Suppose Senator Taft is beaten. Then the whole Republican party will be thrown into a ferment. Moderates may rise and take control. The party may be reborn—and that might be very dangerous to the Democrats in 1952. Now, suppose Mr Taft wins. The conservatives will be confirmed in their almost undisputed mastery of the Republican party. Mr Taft himself might well be nominated Republican candidate for the Presidency in 1952. Would it not be easier to beat him than to beat a bright new liberal reformer? Might it be better for the Democrats in the long run that the Democrats should be defeated in Ohio now?

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

American Notes

More Work for Lame Ducks

President Truman is thinking of summoning the Eighty-first Congress to return to Washington for its post-election, "lame duck" session about November 15th, nearly two weeks earlier than Congress itself thought necessary when it adjourned in September. Then it was expected that the lame ducks' main task, before they were superseded by the newly-elected Eighty-second Congress on January 3rd, would be to hatch out an excess profits tax to put in the Treasury's Christmas stocking. That task has been given greater urgency by the further appropriations for defence purposes, amounting perhaps to $15 billion, and for Korean rehabilitation, which will probably be needed before the end of the year. These will have to be voted, and the Administration is also anxious to get a new lease of life for the Rent Control Act before it becomes moribund in January, now that credit controls are curtailing building and increasing the pressure on existing houses. There are other measures, notably statehood for Alaska and Hawaii, that have almost completed the course in the present Congress, but will have to go back to the beginning if they do not get over the final hurdles before the new Congress meets.

Lame ducks will hardly be in good enough condition to cope with amending the complicated anti-Communist Act, but even if that is left in its present unsatisfactory state until January, the programme is heavy enough to justify Mr Truman's anxiety to get Congress back to work as quickly as possible after the election. The amount of work it actually accomplishes will depend upon the result of that election, upon whether the voters have reaffirmed their faith in the Democratic party. They will not be discouraged from doing so should the President, by summoning Congress, remind them of his party's programme and his own qualities as a national leader. Such a summons, although warranted by purely governmental considerations, might also make up in political dividends for the "whistle-stop" tour on behalf of Democratic candidates which Mr Truman had planned before the Korean crisis, and which has now been reduced to a single speech in Missouri this weekend. The Republicans remember that a somewhat similar recall of Congress was the forerunner of Mr Truman's triumph in 1948, and they are furiously apprehensive at the suggestion that history may be given a chance of resembling itself.

* * *

Expansion Unlimited?

Those who believe that the government should use both the carrot and the stick to persuade private enterprise to expand are convinced that present shortages prove their point. Civilians may have temporarily to forgo new cars, houses, and dance-halls to save steel, and television sets and saucepans to save aluminium, but these deprivations, it is argued, should be accepted only as a stimulus to the expansion which will enable the economy to support both a large peacetime military establishment and an unrestricted standard of living.

Under the Defence Production Act, industry can be tempted to build new plant by offers of rapid depreciation for tax purposes and by government guarantees of loans or purchases; it can also be prodded by the threat of loans to competitors or direct government construction. Mr Symington, the chairman of the National Security Resources Board, is a strong advocate of expansion and likely to use both weapons, if necessary.

The hottest argument, both inside and outside the Administration, is over the adequacy of the steel industry's promise to add 9.4 million tons of capacity by 1952 to the existing 100 million. This is double the pre-Korean rate of building and is to be privately financed, but the Assistant Secretary of the Interior, Mr Davidson, views it as one more example of the industry's "timidity." He has called a capacity of 125 million tons by 1953 essential if there is to be enough steel for the new freight car programme, for the services, for civil aircraft, and for expansion in aluminium and steel itself, without cramping civilian needs.

The Secretary of Commerce has tartly replied that steel capacity cannot be turned on like water from a tap, and has pointed out that 110 million tons of capacity is twice the maximum military consumption in the last war. He evidently sympathises with the industry's contention that manganese and iron ore shortages limit the use that could be made of new plant. It was, however, a trifle tactless for Mr Fairless, of the US Steel Corporation, to complain that steel was literally "cheaper than dirt" and to suggest that the shortage would vanish fast enough if only the price were raised.

Steel's future is dim, however, compared with the dazzling prospects painted for aluminium by the government planners. Mr Symington is thinking in terms of a 1 billion lb. addition, in the next year or two, to the present production of 1.4 billion lb. a year and of double that in the long run. Aluminium was short even before the Korean outbreak; the shortage will become more acute with the expansion of the air force and the military insistence on lightness, not only for airborne equipment but also in the foot-soldier's gear. Even helmets are to be made of aluminium. The difficulty is that every pound of aluminium requires 10 kilowatt hours of electricity and that supplies of cheap power are virtually exhausted.

The aluminium producers believe the government must not only contribute a major share of the capital costs of any

expansion, but must also subsidise power costs in some way. Neither the aluminium nor the steel industry is anxious to be saddled, at the end of the emergency, with uneconomic facilities. The strongest ally they have inside the Administration camp is the fear that excessive expansion of the defence industries, at the expense of consumer goods, might leave the economy seriously unbalanced when the international climate cools down.

* * *

Lobbying in a Goldfish Bowl

By federal law, a lobbyist is a person who spends money to influence legislation before Congress. Such a definition covers a broad territory, and lobbying has developed into a broad-gauged business. The Special House Committee on Lobbying Activities, tabulating a "voluntary" questionnaire sent to 175 major corporations, reveals that 152 of them spent $32 million in three and a half years on lobbying activities. Massive as this sum is, it must be just a splinter of the total, for 23 corporations chose not to answer the committee's questionnaire, among them the giant US Steel Corporation. And the committee's entire mailing list includes only a tiny fraction of the 500,000 corporate enterprises in the United States.

Served up just before the November elections, the report has made savoury political fare. Already three Democratic Senators have demanded a "full investigation" of all lobbying. A really full investigation would include at least a glance at the activities of such sacred cows as trade unions, farmers and veterans, all of whom maintain expensive lobbying offices in Washington. But, so far, the election-minded Senators have confined themselves to a request for "full information" from those corporations which failed to answer the committee's questionnaire.

So far, the Lobbying Activities Committee has not charged the corporations with having anything to hide. Instead, it has proposed a three-part programme to strengthen the political system before corruption takes root. First of all, says the committee, the processes of government should be simplified, for cancerous lobbies thrive when government "becomes too complex for ordinary citizens to understand." Also, the committee believes that political party discipline should be tightened to the point where members can successfully resist undue pressure from special interests. But Representative Frank Buchanan, chairman of the committee, thinks that the best preventative against acute lobby poisoning is a large dose of publicity. While he does not regard lobbying as an evil in itself, Mr Buchanan believes that "influencing legislation is an activity that should be carried on in a goldfish bowl."

* * *

Television's War

The Federal Communications Commission has finally awarded its apple of discord, authority to transmit television in colour, to the Columbia Broadcasting System. From all accounts, the commission certainly chose what is, at present, the fairest of the three methods of colour transmission. But it is not so certain that CBS will hold its supremacy once the first flush of youth has faded, or that the public will be attracted by the whirling discs and small screen which so far are an unavoidable adjunct of CBS's beautiful colouring. The public, however, will have to wait, and then to pay, before forming an opinion on the FCC's choice. Existing television sets must be "adapted" even to receive CBS programmes in black and white, and then "converted" to receive them in colour; neither adapters nor converters are yet on the market.

They never will be if the Radio Corporation of America has its way; one of the leading producers of wireless equipment, it also sponsors a rival method of colour television and is contesting the legality of the FCC's decision. RCA has powerful allies amongst manufacturers and distributors of television sets, who are aghast at the effect on their sales of this new uncertainty, coming on top of credit curbs and excise taxes. There are, nevertheless, a growing number of deserters to CBS in this latest phase of its Trojan war with RCA, for the obvious way of luring the public back into the television shops is to offer adapters and converters.

A major disaster, however, looms over both sides alike: a drastic curtailment in output of all kinds of television equipment seems inevitable as the result of coming restrictions on civilian use of nickel, copper, aluminium and cobalt. And this threatens just as the FCC is preparing to open the frontier that has been closed to new television stations for two years. Hearings are at last being held on the allocation of wavelengths in the ultra-high-frequency band, where there is supposed to be room for two thousand more stations. With only 107 stations in existence at present, eight million television sets have been bought; even though this ratio is unlikely to be maintained, the possibilities for empire building are immense. No one is more anxious to exploit them than the salesmen of television time, for the increased audience should make it possible for the networks to raise their advertising charges and to show a profit for the first time on their expensive television operations.

Segregation Sent Down

This autumn over a thousand Negro students are to be found in the formerly all-white classrooms of southern colleges and universities. It has taken fourteen years of Supreme Court decisions to force the door open this much, fourteen years of mounting insistence that segregation is constitutional only if the facilities offered Negroes are the equal, in every respect, of those provided for white students. But the Sweatt and McLaurin decisions in June appear to have convinced most southern educators that this test is to be applied rigorously, and that they must bow to the inevitable.

The Court itself has not yet ruled on the constitutionality of the regional educational compact, under which fourteen southern states pool their facilities for advanced study. But its refusal to review the decision of a lower court has left the University of Maryland with no alternative but to admit a Negro girl to its school of nursing. The State had offered, instead, to send her to a Negro college in Tennessee. Many Negroes suspect the regional scheme to be merely a device to perpetuate segregation, although this is denied and a majority of the 584 participating students this year are white.

The University of Virginia and that of Tennessee reluctantly admitted Negro students for the first time this autumn, while Kentucky has taken the lead by accepting a constitutional amendment permitting the enrolment of Negroes in white institutions when the courses they seek are not available at the Negro college. At the other extreme, Governor Talmadge of Georgia has promised that the colour bar will be upheld to the end.

The strategy of the Negro campaign has been to start at the top. Few southern states provide any graduate or professional training for Negroes, and the cost of providing it at a standard high enough to satisfy the Supreme Court is in most cases prohibitive. The hope is that once the pattern of segregation, which is just beginning to crack, has been broken at the graduate level, it will be hard to maintain in the elementary and secondary schools. Here, however, it is more firmly established. What is most encouraging is that, in the universities, white students have so far accepted the revolution without fuss, indeed in many cases with approval, and without any of the racial clashes prophesied by their elders.

THE WORLD OVERSEAS

Rearming Canada

(By Our Ottawa Correspondent)

CANADA'S immediate contribution to western rearmament was authorised by the special session of Parliament which met in September, and the first effects of that session were contained in an announcement last week that Canada would arm and equip one Dutch Army division. The first Bill which then received the Royal Assent was an amendment of the National Defence Act, extending the power of the Governor-in-Council to call the armed forces to active service and to send them abroad. The Government already had this power in the case of an emergency, defined as "war, invasion, riot or insurrection, real or apprehended." The new Act also allows it to do so "in consequence of any action undertaken by Canada under the United Nations Charter, the North Atlantic Treaty or any other similar instrument for collective defence that may be entered into by Canada." In either case Parliament must be summoned, if not in session, within ten days of the order to the forces. The first action taken by the Government under the new powers was to issue an order authorising the Canadian Army Special Force to the support of United Nations operations in Korea.

Commitments Explained

Opposition members spent a good deal of time questioning Mr Pearson, the Minister for External Affairs, about the precise nature of Canada's commitments. He explained that in the Korean case it had been possible for the United Nations to conduct so-called police operations only because the Russians were absent from the Security Council, and the Canadian Government wanted to work out a way by which similar action could be taken in the future, if necessary, by the Assembly. Part of the plan, as the Canadian Government sees it, would be for all loyal members of the United Nations to follow the Canadian example by earmarking a special contingent of their armed forces for United Nations operations. It is recognised that an Assembly resolution calling for forces to be so earmarked would not be binding on the members, but it would enable those who wish to see collective security work to stand up and commit themselves.

The United Nations role is seen here as organising resistance to any future "aggression by proxy." The much more definite obligations of the North Atlantic Treaty would come into play in the case of an open attack by Russia on any one of the signatories. Mr Pearson and his colleague, Mr Claxton, the Minister of National Defence, were quite definite that Canada has an absolute obligation under this Treaty to regard an attack on any other signatory as though it were an attack on itself; but that it was not bound as yet to any definite plan for the deployment of Canadian forces.

Opposition members, whose concern all along was that Canada might not be doing enough, asked if there should not be a Canadian division stationed in Europe. Mr Claxton showed little enthusiasm for the idea. He pointed out the great difficulties of supply and maintenance of such a relatively small force at such a great distance, and suggested that the production and building up of a fighting Air Force might have a higher priority. Mr Pearson confirmed that North Atlantic Treaty plans did not call for Canadian troops to be stationed on the other side of the Atlantic, but carefully stated that this situation might change at any time.

The second Act passed by the Canadian Parliament was the Defence Appropriations Act. It increases both the immediate appropriations and the commitment authority of the Canadian forces. It also gives the Governor-in-Council power to "transfer defence equipment or supplies, and provide services or facilities for defence purposes, to any of the parties to the North Atlantic Treaty, upon such terms and conditions, if any, as the Governor-in-Council may specify." For this purpose Parliament voted $100 million could be spent before March 31, 1951, but the intention was to get production rolling as quickly as possible, and to spend the money as soon as possible. The Government could not tell Parliament what it would be used for. Part of it goes to cover the cost of training Air Force and Army personnel from the European signatories of the Atlantic Pact as well as from the United Kingdom. But the major part is for arms and equipment to be sent to the European countries. The Canadian aim must always be to concentrate its own defence industry on a few lines, so that it can get the benefits of large-scale production by supplying its allies as well as its own forces. But necessity dictates production in certain lines whether other countries are interested in them or not: such are fighter aircraft, anti-aircraft predictors, radar equipment, light motor vehicles and the new 3-inch 50-calibre naval guns. The choice whether to buy or to produce thousands of other items should logically depend—though these things are not always determined by logic—on Allied agreement about where production can most economically be concentrated. The old bugbear of the difference between British and American designs also poses constant problems. Industrial common sense would lead Canada to concentrate on American designs and industrial standards, but industrial common sense is often controverted by the traditions and habits of the armed forces themselves, and by the practical difficulty of switching from established types to new ones.

One Billion Dollars a Year

The vote for European arms aid aroused no criticism. The Opposition concentrated all its fire on what it called the slow rate of expansion of the Canadian forces. During the present fiscal year the forces expect to spend an additional $144 million in addition to the $425 million voted in the spring. The commitment authority, allowing them to place contracts for delivery in future years, is, however, increased five times to a total of more than $500 million. The Finance Minister, Mr Abbott, told the House that next year's expenditures on defence would be about $1,000 million. Forty-three per cent of the current vote is being spent on the Air Force, 35 per cent on the Army and 21 per cent on the Navy. Once again the Minister of Defence stood firm against demands that larger permanent forces should be stationed in Canada as defence against a possible invasion.

The other new Parliamentary Acts were concerned with the economic front. The rearmament drive is imposed on an economy which is already running at a very high rate. Canadian exports are expected to be higher this year than ever before, and the planned capital investment programme is 8 per cent higher than it was last year. The requirements of the Canadian armed forces alone are expected to

amount next year to 6 or 7 per cent of the gross national product, now estimated at $17,000 million. The addition of arms aid for Europe and of arms purchases here by the United States Government will raise this, but probably not above 10 per cent of the gross national product. In the next year or eighteen months the main pressure will be on the construction industry and on the conversion of industrial capacity to military needs. The Government is trying to ease the strain on the supply of basic materials like steel and concrete by reducing its own programme of public works and by urging industry to postpone inessential capital development.

As the defence programme develops it appears inevitable that it will impinge on the production of consumer goods. For that reason Mr C. D. Howe, the Minister of Trade and Commerce, has been given powers to control the production, distribution and sale of essential materials and services. The powers are wide, but it is not intended to use them more than is absolutely necessary. For example, the most acute shortage in the near future will be in steel, and Mr Howe is confident that he will secure the co-operation of the Canadian steel industry without any compulsory orders. Provision for the regulation of prices is necessary to ensure that Government allocation of raw materials is not frustrated by unreasonable price demands, but here again it is not expected that the powers will have to be used. No general price or wage control is contemplated.

The main measures already announced to combat inflation here are a strict "pay-as-you-go" fiscal policy, restrictions on consumer credit, and the discouragement of unnecessary capital investment. While no one is prepared to predict that the upward trend of prices will be checked, it is felt that the present defence programme should not add unduly to the pressure on prices of consumer goods in the near future. Its impact will be felt gradually, and for some time to come it should be limited to the field of durable goods. The light tax increases announced in the special budget were less than many Canadians expected, and the general feeling is that they are getting off more easily than they might have. Next spring's budget will bring heavier burdens.

Vietminh Front Against the French

THE nationalist movement in Indo-China in the immediate postwar period differed radically from the corresponding movements in India, Burma, Indonesia and the Philippines, in that its supreme direction was Communist. There were three significant reasons for this peculiarity. The first was the absence—as a result of French administrative policy—of any strong legal or semi-legal political organisation of moderate, constitutionalist tendencies comparable to the Indian Congress Party and of any constitutional organ through which such tendencies could have developed before 1945. The second reason was the relation of the French "Vichy" regime in Indo-China to Japan during most of the war. Whereas in Burma, Indonesia, and even to some extent in the Philippines, extreme nationalism was sponsored by the Japanese as part of their political warfare against Britain, the Netherlands and the United States respectively, Indo-China was regarded as a Japanese protectorate in which the French administration was to be upheld. Thus revolutionary nationalism could not look for support from Japan and had to seek it elsewhere; when, a few months before the end of the war the Japanese, in fear of a defection of the local French to Gaullism, took over control in Indo-China, it was too late for them to capture Vietnamese nationalism for their own purposes and they only made use of puppets with no popular following.

Meanwhile, a resistance movement which was at once anti-French and anti-Japanese had been organised from bases over the frontier in China, and herein lay a third reason for its predominantly Communist character. For it developed in close contact with, and under the influence of, Chinese Communists. The Kuomintang, with its narrowly Chinese nationalism, could never establish satisfactory working relations with the Vietnamese nationalists, whereas Communism appeared to the latter to provide a basis for Chinese-Vietnamese solidarity without Chinese domination. The Chungking Government during the war was very antipathetic to the Communist tendencies of the Vietnamese exiles in China, but their organisation was too valuable an ally against the Japanese to be suppressed; and in the late summer of 1945 it stood ready to take over power from the Japanese in Vietnam under the leadership of the Communist Ho Chi-minh.

Camouflage for Communism

Because of these factors in the situation, it is not enough to regard the Vietminh as a nationalist movement whose leader happened to have had past Communist associations; it was rather because of the Communist predominance in it that Ho Chi-minh emerged as the leader. The Communist character of the leadership was, however, carefully camouflaged for various reasons. During the war the bases for underground action in Vietnam against the Japanese and the French were located in the Chinese provinces of Yunnan and Kwangsi, in areas not under Chinese Communist control; and it was expedient to avoid too much open Communist activity in order not to provoke the Kuomintang authorities. This need for caution remained even after the surrender of Japan, for Chinese Government troops occupied northern Indo-China and were in a position to assist or thwart any Vietnamese regime set up in Hanoi. The Indo-China Communist party, therefore, in 1941 created for itself a cover organisation known as the Vietminh Front, and then in 1945 formally dissolved itself, the Communist cadres continuing as the leadership of the Vietminh Front. Subsequently, this camouflage was found to be of tactical advantage not only in dealing with the Kuomintang; it also facilitated propaganda in Europe and America, claiming that the Ho Chi-minh regime was not in fact Communist.

Energy and Fanaticism

The Vietminh Front, with its affiliated labour, women's and youth organisations, is the driving force of the Vietminh regime and keeps control of the armed forces. It works, however, in coalition with four other parties, which are represented in the government, the whole being known as the National Union, and called by foreigners simply the Vietminh. The non-Communist parties have little influence, since they have not been able to acquire any mass political following or military backing; and the Vietminh Front dominates the central committee of the National Union, which issues instructions to the cabinet of departmental ministers. The prominence of non-Communist leaders on the latter body—which continues, probably not so much for purposes of camouflage as to utilise the administrative talent relatively abundant in the smaller groupings of the intelligentsia—does not therefore reflect the real relations of power in the movement.

The Vietminh system undoubtedly provides a very strong, unified organisation, which has had five years to consolidate itself in those parts of Vietnam which it rules and is comparable to Communist North Korea in its administrative energy and in the fanatical spirit which it has been able to generate. The Bao Dai regime started late, after nationalist sentiment had been captured by Ho Chi-minh, and it has been from the beginning too dependent on French military support to rival Ho successfully for nationalist leadership.

JAEGER

"Wear wool," explained Dr. Jaeger in 1881, "and your health will improve, for these reasons. One, wool retains heat but excludes cold. Two, wool keeps you dry by absorbing damp. Three, wool is the most comfortable, natural and hygienic clothing." These were the theories on which the House of Jaeger was founded.

Today, Jaeger leads the world in wool fashions. They never compromise on quality. They use only the purest wool, made from the finest animal fibres. Their designers are the best in Britain. So that Jaeger has come to be—both within the trade and to the public—"the fashion name for wool". And it is a great tribute to their leadership that the House of Jaeger has been chosen to occupy one of the nine special shops in the Festival Pleasure Gardens . . . to present their merchandise to the many who will visit us from overseas in 1951.

The Fashion Name for Wool

"Glad you like this sherry —it's South African

It's extremely good. I got some South African wine the other day . . . .

I know. A good wine, but not of this quality.

Precisely, but why the difference?

Well, this is a truly representative South African wine. You see, though the Cape has been for centuries one of the world's finest wine countries, it couldn't compete in Britain with European countries until Empire wines got a duty preference twenty years ago. That bucked up the South African industry.

But why haven't we tasted such wines before?

Because really fine wines are achieved by selectivity, experiment and slow maturing. South Africa has done as much in twenty years with some wines as the Continent has in generations.

Only certain wines, then?

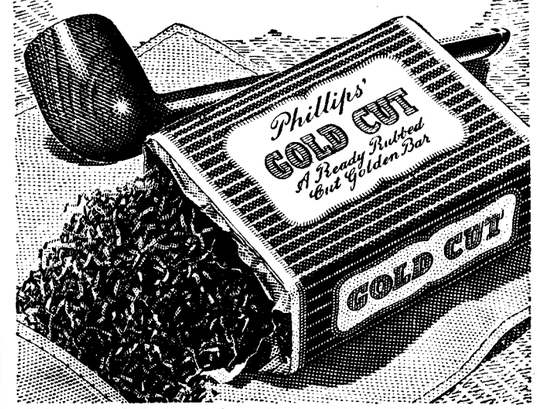
So far. All are good, but not all are fine. The improvement is naturally progressive.

Were South African wines well-known here before the preference twenty years ago?

Now you're delving into history. They used to be very popular. But in 1860 Mr. Gladstone removed the Colonial Preference and sent the South African wine industry into the wilderness.

Is that likely to happen again?

I hope not. Imperial Preference has encouraged the South African wine growers to tremendous efforts. The British Government is not likely to lead such an important Empire Industry up the garden again. It wouldn't make sense.



So we can look forward to several kinds of really fine wines from South Africa?

You certainly can, and very soon, too."

Calmer Days in Italy

[FROM OUR ROME CORRESPONDENT]

How Italy stands economically at the end of this year's hot weather, citizens have had an opportunity to infer from semi-public controversies between hard and soft money men inside the Christian Democrat party; from brushes between the Finance Minister, Signor Pella, and the Social Democrat leader, Signor Saragat, followed by cordial hand-shakes across Signor De Gasperi's desk; from aspersions upon the government's energy by the new ECA chief, Mr Leon Dayton, which also evaporated beneath the warmth of Signor De Gasperi's handshakes, but only to be redirected against the industrialists of Italy in general (who have not taken them lying down,); and finally from the spectacle of a national agreement between employers and trade unions on dismissals, exactly contemporaneous with a highly painful essay on the "redimensioning" of the Ligurian heavy industries which have been the subject of bitter trade union outcries for years on end ("redimensioning" is the ministerial euphemism for cutting down the redundant staffs of state owned or aided enterprises).

What the spectator can discern in this rapid alternation of antagonisms and appeasements is, firstly, the prevalence in some of the sectors of government and cabinet of an expansionist or Keynesian mood, emboldened by the robust counsels of the ECA spokesmen; secondly a persistent fastidiousness about suspected inflationary odours on the part of Signor Pella, visible guardian of the Einaudi tradition; thirdly a slowly growing disposition to believe that the government's investment programmes do not wholly die on the paper on which they are born but have at least a tenuous after-life in factory and field (a few hundred peasants on the Sila plateau have really been assigned land, and agricultural machinery has really, it seems, been produced for them in Turin), so that this is not the moment to break up the government front on the issue of stimulatory expenditure. The unemployment spectre is as big and grim as ever, but the post-Korean rise in prices has already dispelled much of the recent gloom in textiles, and there is a prospect, sinister in its wider implications but grateful at the moment, that heavy industry, including that of Liguria, may find relief in home and international armament orders. All things considered, the winds on the path of the De Gasperi administration—even those from the Communist point of the compass—seem less boisterous than in the recent dog days.

Cures for India's Poverty—II

[BY A CORRESPONDENT]

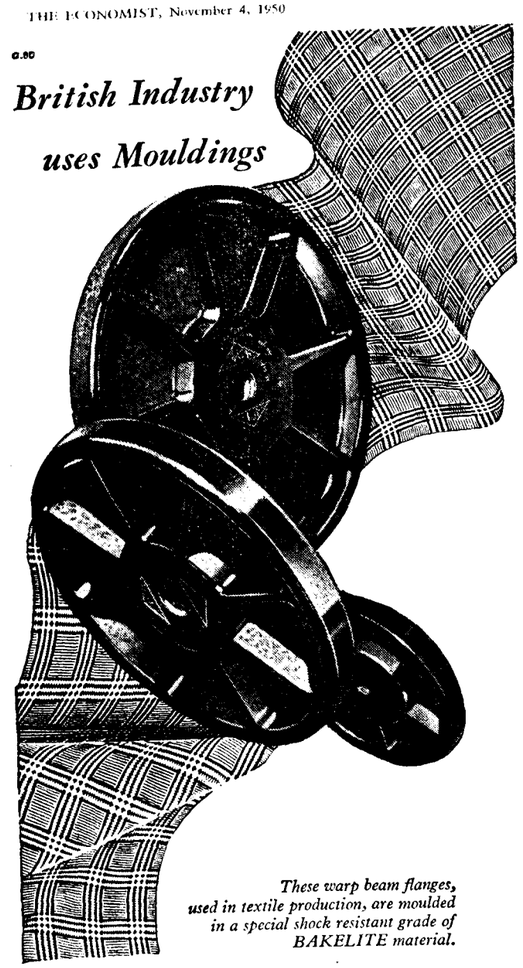
MORE fertilisers promise the quickest results in improving Indian agricultural output; but only irrigation can protect the farmer against the vagaries of the monsoon. Something can be done by quite small schemes, by lending Government money to the peasant for him to sink his own well, or by the digging of tube-wells. Bihar, for example, has a £1,000,000 plan to irrigate nearly 200,000 acres with 375 tube-wells. The main extension of irrigation must, however, come from the multi-purpose schemes which are proposed. Altogether they will add 25 million acres to India's irrigated areas, and at least 8,000,000 tons to its agricultural output. But the Government must resist the temptation to start more schemes than can be supplied with technicians, steel, machinery and dollars. At first the Government ignored this tiresome limitation; but now it is concentrating on three schemes, the Damodar, the Mahanadi and the Bhakra, which between them should add some 3,000,000 tons to India's food supply in five years' time.

Another great Government effort which started badly but is now going better is the reclamation of waste land. West Bengal, for instance, has reclaimed 100,000 acres since 1947. In Central India 6,000,000 acres are being freed from Kans, a weed with a 14-inch root and a locust-like gift for expansion; and in almost every state legislation has been passed to enable the Government to work land which the owner insists on leaving waste.

There are many other measures which could increase production, but on which so far very little is being done. Holdings are so fragmented that the farmer's five acres may be spread over half a dozen plots; consolidation would save time, land and labour, and permit fencing. Pests and disease cause a loss of 4,000,000 tons of rice alone a year. Now pesticides, fungicides and immune varieties of seed, such as rust-free wheat, could reduce this loss enormously. Then there are the tens of millions of worthless cattle. The Indian cow produces only one-twentieth as much milk as her Danish sister, and the plough bullocks of Eastern India are so weak that there are never enough of them, though there are more to the square mile than anywhere else in the world. Artificial insemination and castration of scrub bulls could do more for the cow than all its traditional sanctity.

Old Prejudices and New Methods

Any change in the way of dealing with cattle, however, comes up against the peasant's deepest beliefs. There can be no modernisation of India's cultivation without a change in the attitude of its cultivators. Only more schools and better health can give the peasant that activity of mind and body which will enable him to take a chance on a new idea—hence the priority given by every Government in India to rural dispensaries and primary schools with an agricultural bias. The Government recognises, too, that no improvements or investment of capital in the land can be expected from a cultivator who has neither security nor incentive. In the old days the tenant would not even manure the land; to do so ensured eviction, to make way for another who would pay a higher rent for the extra fertility. Nor did he ever dream of spending money on fertilisers, fencing, or a well, when the money had to be borrowed at 25 per cent, and the landlord took half the extra crop. Inevitably, the land grew poorer with every crop. Now, everywhere, this is being changed. The Zemindar is being abolished. Rents have been reduced to a maximum of one-third, sometimes one-quarter of the crop, leases have to be for at least ten years, and the tenant can buy his land compulsorily at a price fixed by arbitration.



Money-Lenders' Extortions

In the old days, moreover, what the landlord did not take, the moneylender did. And the debts were rarely for productive purposes. The peasant knew that wells and stud bulls do not pay 25 per cent in a bad year. But when it came to paying for a child's marriage or a parent's funeral, not even the nightmare of foreclosure could protect him from the social pressure which drove him to borrow. This, too, is being cured. Conciliation, inflation and the rule of *damdupat* have nearly wiped out old debts. The restriction by law both of the peasant's credit and the moneylender's extortions is limiting the power to incur new ones. More and more credit in the countryside is being provided by the Co-operative Society and by Government, who lend only to increase production.

The task, and the ways of doing it, are known. The governments are doing their best. But their resources of revenue, men and equipment are small. There could be no more helpful application of President Truman's Fourth Point or the Colombo plan than to find the money for those many schemes in India—from high dams to agricultural colleges—which already exist on paper, but which still need money to turn them into better crops and a happier, more stable peasantry. There is no need for gifts; low interest loans would do. Then, at last, production might overtake the babies with whom it has been running a losing race.

British Industry uses Mouldings

These warp beam flanges, used in textile production, are moulded in a special shock resistant grade of BAKELITE material.

—in BAKELITE Material to be sure

Textile Manufacturers know how to profit by the serviceable qualities of BAKELITE Plastics—do you? Take these strong warp beam flanges, for example; they can be dropped on a concrete floor without being damaged. Intricate shapes present no difficulty, either, with mouldings. Simple or complex, they can be turned out to fine limits quicker and cheaper. BAKELITE materials can satisfy industry's most exacting demands—for production components or finished products. Why not go into the details with the BAKELITE Technical Staff?

GOING UP TO TAKE IT DOWN

SCALE IN INDUSTRIAL WATER SYSTEMS can cause any amount of trouble. Choked pipes must be dismantled, seized valves freed, and water heaters cleaned—there is never any lack of work for the maintenance staff. Many of these troubles can be avoided before they start simply by treating the water with Calgon (which is Albright & Wilson's sodium metaphosphate). A few parts of Calgon in a million of water will prevent scale or stop corrosion. The advice of Albright & Wilson's Technical Service Department is available for the asking.

THE BUSINESS WORLD

The Problem of Prices

FASHIONS in economic concern change from month to month. Britain no longer broods on the problem of the dollar. Instead there is another preoccupation shared by most consumers and industrialists and by all politicians—the rise in prices. The two things are closely connected. High commodity prices have notably helped this year to bridge the dollar gap: in this particular, they have largely relieved the sterling area's back of its heaviest burden. But they have added a lot of weight elsewhere—rampant inflation in Australia and certain colonies, and heavier responsibilities on the United Kingdom to satisfy the sterling area's needs. Although modern governments prefer to see prices rise rather than fall, they become nervous when consumers begin to protest at having to pay more. Unfortunately when politics get mingled with prices, the results are not always enlightening. In his broadcast a fortnight ago, Mr Herbert Morrison did not deny that the cost of living had risen (although the official index of retail prices has been scarcely affected). He merely declared that under an anti-Labour government conditions would have been "much worse." This would, indeed, be a damning result, for of all the Government's economic attitudes, its policies about prices have been least convincing. It has succeeded in keeping stable an index which accurately reflects neither the cost of living nor the level of retail prices. The fault does not lie in the index, for that performs well the limited job for which it was designed—to measure relative changes in the cost of a given prewar pattern of consumption. But the ordinary man needs a long draught of the stronger beer that puts the index down a month ago to believe that the index and retail prices generally have been behaving in the same way.

Three factors have been at work during the past twelve months in producing a sharp rise in prices: the devaluation of sterling; the record level of economic activity in the United States up to June; and the more alarming boom caused by Korea. Devaluation immediately raised sterling prices of raw materials and foodstuffs (grain and sugar) bought from dollar countries. It also raised the sterling prices of raw materials sold to the United States by sterling area countries. It left largely unchanged the prices of those goods (mainly foodstuffs) produced in the sterling area but sold almost entirely to Britain. The impact of the first phase of the American boom made itself felt very soon after devaluation. Business activity in the United States recovered in the second half of 1949 and the dollar prices of most commodities began to rise from November onwards—a rise which in turn gave a further boost to the sterling prices of internationally traded commodities. At the very moment when it seemed that this advance of prices might be reaching its peak, war broke out in Korea. Commercial stocks in the United States at the end of June were low and manufacturers rushed to build them up. Stockpile purchases were immediately expanded and new rearmament programmes introduced. The scramble for materials with governments outrunning industry produced the third phase of the rise in prices—and the sharpest.

Throughout the twelve months, the Government has been concerned to limit the rise in the interim index of retail prices—to convince itself, if no one else, that rising prices were only a spectre. After the pound was devalued, the Ministry of Food showed the strongest opposition to any suggestion by foreign suppliers that prices should be raised. At the annual price reviews during the summer, the British negotiators have offered no advance on the previous season's prices, to the dismay of suppliers bound by contracts. A wholly different policy, however, has been pursued for raw materials, many of which are purchased privately. Since adequate supplies had to be secured to maintain full employment, there has been no escape from paying world prices. Such official purchasers as the Ministry of Supply and the Raw Cotton Commission have showed no unwillingness to compete with the rest of the world for raw materials, without regard to the fact that raw materials have risen far more sharply than food. To limit the rise in the index of retail prices, manufacturers have been exhorted—if not, indeed, more heavily pressed—to keep their own selling prices unchanged. It is an offence against modern morals, it seems, to base the prices of manufactured products on the replacement costs of the materials that have to be used to make them.

This reversal of what was once considered sound practice—to make the full charge for high cost raw materials during period of rising prices—has had a remarkable effect on Britain's terms of trade. Since devaluation, the terms of trade have moved sharply against this country. That was one of the consequences—indeed one of the objects—of devaluation. A deterioration in the terms of trade means that a larger quantity of physical exports must be sold abroad, compared with fourteen months ago, to buy the same volume of imports. Between August, 1949, and May, 1950, prices of imports rose by 19 per cent whereas export prices rose by only 5 per cent. This discrepancy between the trend of import and export prices is even more spectacular when the prices of imported raw materials are compared with prices of exported metal manufactures. Imported raw materials rose by 25½ per cent during this period while the export price of metal manufactures rose by a mere 2½ per cent. The deterioration in the terms of trade has not lessened since May. By September import prices had risen by 4 per cent and export prices by less than 2 per cent, while imported raw materials rose by a full 10 per cent. These figures do not prove that British exports are being sold too cheaply, but they are not at odds with the impression that the general level of British export prices could rise perceptibly without cancelling out Britain's competitive advantage in many hard and soft currency markets. An undervalued pound and unduly cheap exports are two aspects of the same phenomenon.

The trend of wholesale prices shows more clearly the combined effect on the British economy of devaluation, the American boom and the scramble for commodities since Korea. Between August, 1949, and May, 1950, the Board of Trade index of wholesale prices rose by 11 per cent; from May to September the index rose by a further 7 per cent. Basic materials alone rose by 25 per cent in the first period and by a further 31½ per cent between May and September, a total jump of 64½ per cent in thirteen months. Intermediate products have risen by 20 per cent since devaluation and manufactures by 7 per cent. This last figure may be compared with the average rise in export prices of all manufactures of 5¼ per cent.

These index numbers do, at least, suggest that prices have been rising. It has, therefore, to be explained how it comes about that the interim index of retail prices in September was no higher than in May and only 2½ per cent higher than in August, 1949. The food items of the index rose by 7¼ per cent between August of last year and May of this year, but by September they were actually calculated to be 2 per cent lower. Since the index uses prices as at the sixteenth of each month the recent rise in butter and eggs will not affect it until October. The decline in retail food prices in July and August was ascribed to cheaper vegetables and fruit. The clothing items in the index have shown even less change. In May the prices of clothing included in the index stood at the same level as in August, 1949, and by September they had risen by only 1¾ per cent.

The Government has thus been successful in keeping the retail price index stable, but this advantage has involved certain costs for the community. A stable index has acted as a useful piece of machinery for limiting the cost of food subsidies to £410 million a year. To abandon the policy of limiting the subsidies at a time when an expanded rearmament programme has to be financed would be folly. But stabilised subsidies, a stable cost of living, and rising world prices are incompatible with a stable level of consumption. The Government has no alternative to paying higher prices for its food purchases, if it wants to maintain supplies. If it pays more, retail prices must go up, or the bill for subsidies must be increased. There are signs that this predicament is realised; if the British public wants to be spared a higher cost of living it must suffer instead a lower level of consumption.

There is some disposition to blame Korea for all that has happened to prices. That is a partial view. The effects of devaluation and of the American inflation were evident enough nine months ago. An enterprising system of bulk purchase prepared to take risks might have been expected to buy heavily to obtain adequate supplies of food and raw materials in anticipation of rising prices. It has always been a favourite argument of the supporters of bulk purchase that long-term contracts had particular advantages on a rising market. Long before the Korean war, prices were rising fast and it might have been supposed that bulk purchase would have been exploited to the full. But the official buyers seem to have lacked the courage of their convictions. They seem to have been apprehensive about the rise in prices that had occurred since devaluation, and insufficiently alert to the prospects of further world inflation.

PRICES SINCE DEVALUATION
(1947 = 100)

	Import Prices		Export Prices		Wholesale Prices		Retail Prices	
	Total	Raw Mats.	Total	Metal Mfrs.	Total	Basic Mats.	Total	Food
1949:—								
August	111	118	113	114	120	123	111	116
September	110	118	113	114	120	127	112	117
October	118	125	113	114	124	129	112	119
November	120	125	114	115	125	132	112	119
December	122	130	115	115	126	135	113	120
1950:—								
January	124	134	116	116	128	140	113	120
February	125	138	116	117	128	140	113	121
March	128	143	118	117	128	141	113	121
April	131	148	118	117	130	146	114	122
May	132	148	119	117	133	154	114	125
June	132	148	119	117	134	158	114	123
July	134	154	121	119	135	169	114	122
August	135	157	121	119	138	185	113	121
September	137	163	121	119	142	202	114	122

In food, as in softwood, the Government has been reluctant to face realities in the world markets. Its obsession with the declared need to keep the retail price index stable has led it to hold off the markets in expectation of a fall in prices, instead of stepping in to take advantage of the prospective rise. So it is that the British consumer pays about the same for rather less imported food, and the British industrialist a good deal more for about the same amount of imported raw materials. The British economy has suffered enough from the distortion of relative prices in the last five years to pray to be spared the new major distortion that now seems to be in progress.

Business Notes

The New Funding Loan

To expect any Chancellor to miss the opportunities afforded by the recent strength in the gilt-edged market would be unreasonable. The Treasury has this week given notice of repayment of the remaining £209 million of 2½ per cent National War Bonds, 1949-51 on February 1st next year, six months before the final date. The great bulk of this issue (£505 million out of £714 million) had been converted into 2½ per cent Funding, 1956-61 last June. On this occasion, existing holders are offered conversion into 3 per cent Funding 1966-68, a new stock with a more inviting life to institutional investors than the 1956-61 issue. Of the residue of the National War Bonds, a major part must be in official hands, and the success of the conversion offer is therefore largely assured.

But this automatic aspect of the operation is of secondary importance compared with the simultaneous offer of £250 million of the new stock for cash at par. The inflow of foreign money has caused widening ripples in the gilt-edged market, and these have imparted particular buoyancy to the three per cent twenty-year stocks. Considerable selling of "shorts" has absorbed the influx of foreign funds, but this has necessarily left the sellers under-invested. The new Funding Stock will be to their convenience, though some would regard the terms as half a point on the dear side. On the eve of the offer, 3 per cent Savings Bonds 1960-70 stood at 99⅜, including 10s. accrued interest, and offered a redemption yield of £3 1s. 7d. to final date; and although there may be attractions in the narrow spread of redemption dates for the new stock that might bring it into the field of 2½ per cent Savings Bonds, 1964-67 (on Tuesday evening these offered a gross

return to final redemption of £2 16s. 6d.), it lacks the latter's attraction of a tax free redemption profit.

The net result of both conversion and cash operations could put the Exchequer in funds to the tune of £200 million—but only if the public is enthusiastic for the cash offer and does not leave any great amount of it to be subscribed for by the departments. Thus, although the operation has the appearance of attempting a permanent mopping up of the major part of the recent influx of foreign funds, this may not necessarily be its immediate result for it is highly probable that the departments will again be playing the part of the "public stag" in the hope of reselling profitably to the public later on. Even if it were, there would be good reason for hesitation before the operation could be regarded as an orthodox neutralising action to exorcise the inflationary stimulus of a glut of foreign money, the permanent home of which might not necessarily be London at all times and under all conditions. The authorities could have done all the necessary neutralising by prompter steps to sell more short-term debt, had they been so minded. As things are, the influx has made its mark not there, but in an expansion of long-term debt, leaving so much the less room for manœuvre if the tide should reverse itself. The terms of the issue suggest that the authorities are staking heavily and provocatively on the continuance of the gilt-edged boom.

* * *

Questions on Monetary Policy

In this connection, the record rise of £150 million in net bank deposits last month provides food for thought. The whole of the increase was accounted for by an expansion of direct or indirect bank lending to the Government; bank advances, rather surprisingly, showed a small decline. Part of the increase in deposits was due to seasonal factors, for in every October since the war the Government has been a net borrower from the banks. In the period covered by the clearing banks' statement the Exchequer's above-the-line deficit was almost £80 million, and net below-the-line expenditure, plus the small deficit on national savings, probably added another £20 million of cash needs. Since the inflow of hot money and Britain's continuing surplus on current account almost certainly obliged the authorities to buy more than £50 million of foreign exchange in October, the £150 million rise in deposits—given the absence of a disinflationary monetary policy—is readily explained.

The question that now comes into issue, is whether the Government can afford to eschew a disinflationary monetary policy much longer. Since the rise in bank deposits in October fell some way short of the apparent increase in the Exchequer's cash needs, the market may be right in its surmise that the Government broker has been a small net seller of long-term securities in recent weeks. But such sales have apparently been directed solely to trimming official portfolios of particular security holdings that had grown untidily large. No deliberate effort has been evident to make sufficient open market sales to suppress either the temporary or the permanent factors that have recently been driving bank deposits higher. The result is that the volume of credit has risen by nearly £420 million (or about 7½ per cent) in the last seven months—a rate of expansion surpassed only at the very peak of the Daltonian credit orgy. It is hardly surprising that markets are good and that an issue as intrinsically attractive as the Imperial Tobacco unsecured stock should be subscribed a dozen times over and establish itself immediately at 3 points premium.

But at one remove behind these issues is the demand for real resources, and to industry's needs must be added those of a heavy government investment programme and of rearmament too. The new Chancellor might recall what happened under similar though more serious conditions in 1946 and 1947.

Tax Exodus

The City has rightly shown much concern about the growing movement of mining companies operating abroad to transfer their seat of control and management from this country to their place of operation. Last week brought the news that Rhokana, Nchanga, Rhodesia Copper Refineries, Rhodesian Anglo-American and Rhodesia Broken Hill are moving their domicile to Northern Rhodesia. The motive for the move is all too clear and lamentable; it is to save the companies the whole of the effective weight of British taxation. That this should entail the transfer of a group of companies with issued capitals of over £20 million is a poor advertisement for London as a financial centre.

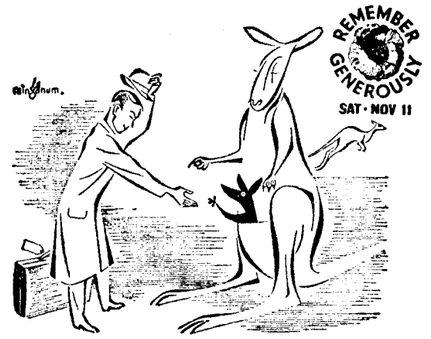
Yet the prospective savings are so great that they cannot be ignored. Income tax in Northern Rhodesia is charged at 7s. 6d. in the £. Out of every £100,000 of taxable profits, Rhodesian tax absorbs £37,500 and the whole of this can be offset against United Kingdom taxes. These absorb £30,000 for profits tax (if profits are fully distributed) and £31,500 for income tax, making a total liability of £61,500 of which £37,500 is in effect met in Rhodesia and the balance of £24,000 paid in British tax. This £24,000 out of every £100,000 of profits will in future be saved by the change of domicile, so far as the companies are concerned.

For shareholders resident in the United Kingdom, the prospective saving will be smaller. The gross dividends they receive in future will still attract total tax at their "appropriate rate"; moreover, the institutional investor is worse off, since he becomes liable for profits tax on the dividends he receives. The balance of advantage to each type of shareholder depends on the prospective increase in dividends to be paid out of tax savings. In the case of Rhodesian Anglo-American, preference shareholders may elect to be paid off at 22s. and the Rhodesia Copper Refineries' preference dividend is to be raised from 4½ to 5 per cent.

* * *

Advantages Real and Apparent

Such companies will in future show a great reduction in tax charges, as Messina has lately done. But it must be remembered that this is not all pure gain for shareholders. For other reasons it is not certain that a large number of other mining concerns will be ready to follow suit. The saving in the case of Rhokana and its associates happens to be particularly great because its close associate, Anglo-American Corporation, is itself a South African company, and many Anglo-American shareholders are South African residents. They have thus been receiving a return on their Rhodesian interests on the worst possible tax terms; other groups may not have so big an incentive to move.



All such changes in domicile have to be real; the Inland Revenue is stringent in its view of what constitutes the seat of control of a company, and the legal precedent of the De Beers case of 1906 still stands. The particular point is that the board of directors must work and live abroad; its members cannot live here and purport to do their work overseas. To change the domicile of a company, therefore, involves awkward decisions for directors. They must either break with the company or go out to live with it. Moreover, all moves of this kind require the sanction of the Treasury, for under the Exchange Control Act of 1947 a United Kingdom company may not cease to be controlled by persons resident in the United Kingdom except with the permission of the Treasury. No doubt such permission would not lightly be withheld in present circumstances, but it can hardly be regarded as an automatic right. For the longer term, there may well be questions of capital supplies and commercial relations to take into account. For these reasons, it is perhaps not likely that the exodus through the tax net will become a rush.

'What is their commercial standing?'

THE WESTMINSTER BANK can, in many cases, give you an immediate reply; or, if the required information is not already available in the extensive and up-to-date records of the Foreign Branch, it can very quickly be obtained. The provision of reliable confidential information as to the reputation of your prospective overseas customers is part of a comprehensive service which the Westminster Bank provides for those who trade abroad. This service is described in a booklet which can be obtained without charge at any branch. Ask for *The Foreign Business Service of the Westminster Bank.*

FAMOUS FOR ALL CLASSES OF INSURANCE

Bradford Gains its Point

After months of deadlock, the Board of Trade has now accepted proposals from the wool industry for a non-statutory joint advisory committee for the industry in place of the statutory development council on which it had hitherto been insistent. The outstanding point in the dispute between the Board of Trade and the employers has been the need for a body clothed with statutory powers. A development council imposed on the industry might have had disastrous consequences, for the wool industry takes some proper pride in its own organisation and it was clear that without the goodwill of the employers' organisations the council would be ineffective. The explanation for this concession by the Board of Trade to agree to a voluntary committee is that the unions are supporting the employers' new proposals. If this decision had been taken last summer, it would have been a minor concession to the employers' views, amply justified by the need for their co-operation. Coming after months of opposition (in the best Bradford manner) the change of view has the quite unnecessary appearance of a *volte face*.

The joint advisory committee that is now to be set up will provide for joint consultation for the industry as a whole, and will advise the Government and the industry on general problems. It will exercise certain specific functions about training, research and information, but these will mainly co-ordinate the work of the special organisations already at work in these fields. The employers and the unions will each appoint six members to the committee and the Board of Trade will appoint three, including the chairman. Except for its important difference of status, there will be no material distinction between the authority and functions of this Committee and those that the abandoned Development Council might have been called upon to exercise.

* * *

Germany and EPU

Although last week's decision by the management committee of the European Payments Union not to publish the results of the first compensation still stands, the salient facts revealed by this first exercise are receiving adequate ventilation—probably more than if the wiser course of official publication had been followed. The French net credit emerging from the compensation of July-September deficits and surpluses amounted to $190 million. Since the French quota with EPU amounts to $520 million, twenty per cent of that quota, or $104 million of the surplus of $190 million, was given by France as a flat credit to EPU. Half of the balance of $86 million was provided, according to the provisions of the EPU agreement, in a further credit and the other half as a gold payment from EPU. Thus France ended the first three months of EPU, holding $147 million as a credit balance with the Union and having received $43 million of gold.

The German net deficit with EPU was $175 million. Since the German quota amounts to $320 million, the settlement of the deficit was financed as to $143 million by a German overdraft on its EPU credit facilities and as to the balance of $32 million by a payment of gold or dollars into EPU. The German deficit incurred over the first three months of EPU was large enough to encroach into the third 20 per cent slice of Germany's quota. Reports from Paris and Bonn suggest that the building up of the German deficit in its intra-European trade has continued since the end of September, that the third slice is almost completely exhausted, and that Germany could—if it wished—appeal to article 62 of the EPU memorandum of agreement:

> If . . . a member finds itself running into deficit with EPU at a rate and in circumstances which it deems serious in view of the state of its reserves, it may suspend on a temporary basis measures taken by it for the liberalisation of trade.

Last week the Ministerial Council of OEEC agreed that as from February 1st next, member countries should raise the proportion of their intra-European trade freed from import controls from 60 to 75 per cent. This, however, is a typical "agreement in principle." The exceptions and reservations already threatened will reduce the gains to negligible proportions. Germany may be altogether excused by the clause of the EPU agreement quoted above. Holland has already announced that if Germany cuts its imports from Holland that country must be excused from further trade liberalisation. France, despite the massive credit already built up in its balance with EPU, has announced that it must reserve its position on trade liberalisation pending a satisfactory agreement on international commodity allocation and price fixing schemes. Belgium has a reserved list of products on which price maintenance arrangements must be made. So the exceptions go on, until they call into question the residual value of what was decided in Paris.

* * *

Currency Purge in Poland

The Polish Government announced last week-end a drastic purge of the currency allied to an exchange revaluation of the zloty. The move follows significantly the rouble revaluation of last year but it outdoes in severity the consequential measures that were taken in Russia to deflate the currency and to reduce prices. The revaluation of the exchange will put the rate of the zloty back to its former parity with the rouble—that is, it amounts to a revaluation of 30 per cent. Polish currency is to be purged to the extent of 99 per cent of the existing circulation. Old bank notes are now being exchanged for new at the rate of 100 to 1. Bank deposits will be converted at the rate of 100 old zloty for three new up to 100,000 old zloty. Larger deposits will be converted at 100 to 1. There is no question of blocking any part of the old notes or deposits; they are being completely wiped out.

This differential monetary purge is intended to hit the hoarders of notes, notably the peasants, and perhaps to provide an added spur in the threat towards collectivisation. All wages are being reduced in the ratio of 100 to 3 and presumably prices will follow, though not necessarily in the same proportion. This violent deflation of the Polish currency and the reduction of wages and prices, allied to the much smaller revaluation of the exchange with the rouble, suggest that the terms of Polish trade with Russia will undergo further deterioration. The new currency move must therefore be regarded as yet another instalment in the economic exploitation of the satellite countries by the Soviet Union.

* * *

Stockpiling and Commodities

The American stockpiling programme has destroyed all reason in the commodity markets. In London this week tin reached the fantastic price of £1,005; twelve months ago the controlled price was £750 a ton and that was considered much too high. Rubber is now over 5s. a lb—the highest price since 1912—against 1s. 1d. a lb last year, while wool (64's) at 202d. a lb is double last year's level of 103d. a lb. The size of America's commodity requirements for defence purposes (discussed on page 666 of last week's issue) involves a cut in civilian consumption either by physical controls or by the rise in prices itself. Discussions in London between Britain, the United States and other interested countries are groping towards a common policy on raw material supplies and defence needs. These talks cover a wide range of commodities from wool, rubber and tin to sulphur and manganese.

It would be unwise to expect a general plan to emerge from these talks. The United States has been offered the right to preempt certain grades of wool. No such right has been offered in rubber. Consequently, the United States is curtailing civilian consumption of rubber to build up its stockpile. If it is intended that the United States is to be the only country of the Atlantic Union to maintain strategic reserves of materials, such action may be wise. But is it not more desirable that stockpiling should be a joint responsibility of all the North Atlantic Treaty Powers? Only by some such combined responsibility can purchases be co-ordinated and outrageous prices be avoided. Some form of international allocation and some strengthening of controls over civilian consumption would no doubt be needed. But there would be important gains in stability for commodity markets and the scramble for supplies between governments and private consumers would present a much less serious threat to the success of the Atlantic Union's aims.

* * *

Will Yorkshire Go Short?

The Board of Trade made known last week the outline scheme whereby the United States will be able to preempt supplies of wool for American defence needs. The official announcement adds little to the outline of the scheme given on page 615 of *The Economist* of October 14th. It is intended that wool will continue to be sold by auction, but the types of wool required by the American Government would be set aside after appraisal and sold direct to the United States. Present knowledge of the scheme does not include any suggestion that the United States would buy such "preempted" wool at any reduction in price. According to Australian reports, the price would be based on the average of prices obtained for similar grades at the auctions during each particular month.

The total quantity of wool thus to be set aside from Commonwealth supplies for American needs is put at 100 million lb (clean). This represents slightly more than one-sixth of the current rate of American civilian consumption of wool. The burden of the scheme lies not so much in the quantities required as in the qualities. The types of wool that the United States wants for uniform cloth are the finer merino grades—the very types that Bradford needs for making up for export. Hence, it is quite wrong to regard a purchase of 100 million lb. of wool from the three Commonwealth exporters as representing only 10 per cent of their available supplies. The proper comparison is with the much smaller total supplies of high grade wools, of which American needs would represent as high a proportion as 30 per cent.

The scheme will thus involve great difficulties for Yorkshire, which will be faced with a shortage of high quality wools and high prices. Lower grade wools can be used as substitutes to a limited extent. But if Yorkshire is to benefit from its hard work of the past few years in developing trade with the Canadian and American markets, it must continue to export high quality goods. Is it wise and reasonable that Yorkshire should be asked to jeopardise its dollar exports in order that the United States can clothe its servicemen in the finest merino?

* * *

America to Use Less Rubber

The United States is to impose a drastic reduction of consumption of rubber in November and December in an attempt to ease the pressure of American demand on the market. The present rate of rubber consumption (natural and synthetic) is to be cut by 16 per cent. Natural rubber alone is to be cut by 25 per cent in November and by 37 per cent in December. No specific cut has been prescribed for synthetic consumption, since manufacturers use different proportions of synthetic and natural rubber in different products. The overriding consideration is that their total consumption in the last two months of the year must be reduced by 16 per cent.

This is America's second attempt to restrict rubber consumption within three months. The first order, which came into force on September 1st, was ineffective because many manufacturers were exempted from its provisions on the ground that they needed more rubber than the order permitted them to use. The new directive makes no provision for such exemptions. On the other hand, it applies only to rubber used for civilian purposes and the use of rubber for military purposes will not be restricted. American consumption of natural rubber has recently been running at 60,000 tons a month. Hence in November it should be reduced to 45,000 tons and in December to 38,000 tons.

* * *

British Tank Production

Tank production in this country has been rising during the summer but will not reach the rate planned under the rearmament programme until the latter half of 1951. The only tank in quantity production, the 50-ton Centurion, is being built at the Royal Ordnance Factory at Leeds and by Vickers-Armstrongs, Ltd. Most of the extra production will come from the ROF plant which has been working well below capacity. It is designed and equipped solely for tank production, and it is claimed that its specially designed layout has reduced costs by half, compared with those of other producers. It is possible to build tanks in any general engineering shop, and tank factories, both here and in America, are fed with finished components and sub-assemblies and merely carry out the final assembly. At Leeds the castings, engines, electrical equipment and gear boxes are supplied by contractors. The machining of castings and components, welding, assembling and testing are done on assembly lines within the factory. With special handling equipment and some special tools, it has been possible to apply some of the principles of flow production to a vehicle of this size. The entire production process takes 27,000 man-hours per tank.

The ROF plant will soon be working to "normal" capacity, that is, single shift working with overtime; some time next year it should be working double shift. Its rate of output has, however, had to be geared to the capacity of contractors to supply components. Manufacturers of electrical equipment are fully booked with export orders and are finding it hard to increase present deliveries to the tank factories. To increase the supply of castings would also involve difficulty. The turret casting, to take one example, weighs 8½ tons and can be supplied by about half a dozen firms in the country. It would take about nine months for these firms to make the necessary arrangements to increase their capacity.

Cheap Cottons from Japan

Lancashire has not lost sight during the past two years of the competitive potential of the Japanese textile industry. This awkward matter will be prominent in the discussions at Torquay, where it is proposed, on the initiative of the United States, to accord most favoured nation treatment to Japanese trade. Lancashire has had some difficulty in persuading the American textile industry of its anxieties about the recurrence of Japanese commercial methods which caused such heavy losses before the war. Perhaps the American industry may be on the point of learning something of Lancashire's bitter prewar experience. American trade statistics, covering the three months between March and May of this year, show that the United States imported 185,400 dozen shirts from Japan at an average value of $1.19 (8s. 6d.) a dozen. The average values month by

month ranged from a low point of 86 cents (6s. 2d.) a dozen in April to a peak of $1.53 (10s. 11d.) a dozen in May.

The American Bureau of the Census thought it well to examine these import entries and checked them with consular invoices or with importers. The low import prices were proved to be correct. In fact, the analysis revealed that values of individual importations ranged from 47 cents (3s. 4d.) to $1.89 (13s. 6d.) a dozen; British f.o.b. export prices for shirts during the same three months averaged £7 13s. 4d. a dozen.

This difference between the landed cost of Japanese shirts in the United States and the British export price is so fantastic that it cannot be explained solely by differences in quality and hardly by greater efficiency in the Japanese industry. Japanese commercial conventions are clearly as potent in the destruction of normal trade as they were before 1939. Lancashire has for some time been considering how to protect itself against competition of the old sort, once the output of the Japanese cotton industry approaches its prewar scale. At present Japan has only 3,739,000 cotton spindles in operation (all ring type) compared with 11,502,000 in 1939. It is already making striking use of them.

* * *

Rise in Silver

After isolating itself for a surprisingly long time from the inflationary trend of commodity prices, silver has now joined in. The quotation in London has risen from 63½d. to 70d. per fine ounce. This was an automatic adjustment to two successive rises in the New York price that have lifted silver in that market from 72¼ cents to 80 cents per fine ounce. Domestic demand for silver in New York has been rising steadily in the last few weeks and daily turnover has increased from an average of about 70,000 ounces to 400,000 ounces. Yet the price succeeded for a long time in resisting this increased demand. This was because a considerable amount of silver had been overhanging the market, including some millions of ounces of demonetised Cuban silver and an unspecified but considerable amount of Spanish silver. In addition, current Mexican production has been accumulating, though for some time past the Mexicans have withheld their silver from the market anticipating the advent of a higher price.

As soon as the quotation in New York broke away from the long-maintained level of 72¼ cents, the London quotation for official silver had to come into line. The Bank of England bases its selling price for essential silver on the New York parity and the adjustment in the sterling price followed automatically. In addition to this official price for silver, there is a free market rate for domestic and exportable silver. In both cases, however, the free market quotation is very near the Bank of England price, the premium being no more than ¼d. to ½d. per ounce. Free domestic silver is in the main bought by "non-essential users," such as the jewellery trade. The market suggests that the requirements of this particular trade are more than met from scrap jewellery silver.

* * *

Power and Productivity

A study of productivity in the electric power industry of the United States seemed likely on the face of it to be one of the less rewarding of the investigations undertaken by the Anglo-American Productivity Council. The history, scale, and organisation of the British and American electricity industries are diverse but their technical resource ought not to be more widely different than is justified by their dissimilar background. When the team reports in such considerable detail on the condition and practice of the American utility undertakings, therefore, it has to be asked how far their findings can be made to fit the British facts. The American power load is bigger, and very markedly concentrated on industry. The American worker has the service of six units per man hour, compared with two for the British worker; his wife uses power at home for refrigeration and for part of her cooking, but not for space heating. There is, in consequence, a much greater equalisation of seasonal and daily loads, particularly since the industrial demand is commonly spread over two and three shift working.

These differences have important technical consequences: year-round maintenance work; the acceptance of "hot line" working which aids continuity of service and leads to economy in capital expenditure; cheaper transmission systems erected faster than in this country and often in common ownership between power and telephone undertakings; high standards of transformer design; and smaller turbo-alternators for a given capacity. Important differences are also to be found in commercial practice; domestic tariffs and metering are designed to encourage demand and to keep costs low.

Some of these advantages might not be so easy to realise if the annual load factor of most American power undertakings were not 60 per cent, but nearer the 40 per cent in Britain. The high load factor clearly provides the economic justification for the larger generating sets, working at higher pressures and temperatures, in which the Americans excel. The team reports as "the general opinion of Americans whom we met" that full economic recovery in Britain depended on sufficient generating capacity to meet "present and future" needs, and that the industry should have "priority over any other requirement" for the resources that would be needed. To raise British industry to the same standard of electrification as American industry in the next decade would mean installing 650,000 kW of capacity each year over and above what is required to catch up with the present growth of load. This is far in excess of what has been installed in recent years, and in any case the industry is already burdened with a programme of 7½ million kW up to 1953.

Such a further addition to capacity might be acceptable in an ideal world if other calls on resources were not allowed to press so hard. But it has little relevance to a condition in which the British Electricity Authority's generating programme has got out of hand and cannot be overtaken until the middle 'fifties. No doubt the wasteful and time-consuming processes of planning new stations, the implicit assumption that these must be built like cathedrals, and the reluctance to experiment in this country with the "semi-outdoor" type of plant account in large measure for delayed construction and increased capital cost. But they are not the only ones. The slowness of delivery and high cost of boilers and machinery come in for severe comment. Speed of delivery by American manufacturers, the team found, was largely due to competition between them; "there is now in Britain an almost complete lack of competition between plant manufacturers."

* * *

Rayon Supplies and Prices

The recent increase of 12½ per cent in British rayon yarn prices is the first for three years. No further increase is expected unless competition forces pulp prices much higher; this is not out of the question, for the only sources of spruce pulp are Sweden and Canada and supplies are limited, while the high prices of natural fibres are encouraging European rayon producers to increase their output. Some European producers, including Italy, have idle capacity. Although pulp stocks in this country are at present satisfactory, rayon producers are not blind to the risk that towards the end of next year rayon output may be affected by a shortage of raw materials.

British rayon output for the first nine months of the year totalled 273 million lb of continuous filament and rayon staple. Monthly output of filament is now about 17 million lb, while staple output exceeds 15 million lb. No marked expansion of supplies is likely. New capacity is in full operation and there is no reserve. This high rate of operation has partly offset rising costs and price increases have been less steep than might otherwise have been the case. Expansion of nylon production has also reached the limit—British Nylon Spinners' plant is working close to its rated capacity of 10 million lb a year.

Producers may have difficulty in meeting the rising demand for artificial fibres from their usual customers and also from weavers who are increasingly turning to artificial fibres for mixed fabrics. Since the bulk of nylon output goes to stocking manufacturers, the yardage supplies can be increased by replacing 30 denier by 15 denier yarn; the recent freedom given to supply thinner stockings to the home market will allow such an increase. Rayon producers are getting inquiries for rayon staple from Yorkshire wool weavers who have only recently been allowed to use rayon in utility wool cloths. Cotton weavers will also use as much rayon yarn as they can get.

More and Bigger Tankers

Lloyd's Register statistics of ships under construction throughout the world at the end of September reveal an increase of 289,224 tons during the quarter, bringing the total to 4,839,145 tons gross. The increase arises mainly from the inclusion of German figures for the first time since the war (172,744 tons) and from an advance of 109,043 tons in Great Britain, where 2,046,234 tons are now building. Nearly 41 per cent of the world total, and 54 per cent of the British total, consists of oil tankers. Tanker building in Britain has, in fact, increased by five vessels and 121,553 tons during the quarter, although the total number of all ships is lower by three. Since September, 1949, there has been a marked increase in the number and size of tankers under construction. Whereas the total tonnage building has dropped by less than 50,000 tons in the twelve months, the number of vessels has fallen from 392 to 323. Of this last figure,

BRITISH CELANESE LIMITED

The Report and Accounts for the year ended 1st July, 1950, contain the Directors' recommendation for the payment on 31st January, 1951, of the following dividends to Stockholders registered at the close of business on 28th December, 1950:—

A Participation dividend of 1.7344% actual, less tax, on 7½% Participating Second Cumulative Preference Stock in respect of the year ended 30th April, 1950, and

A dividend of 10% actual, less tax, on Ordinary Stock in respect of the year ended 1st July, 1950.

The following details are extracted from the Report of the Directors and audited Accounts for the year ended 1st July, 1950, which will be posted to Stockholders on or about 7th November, 1950.

DEPRECIATION.

(*a*) In addition to the normal annual charge, £350,000 has been allocated to Accumulated Depreciation in arriving at the profits for the year; this additional allocation provides in full for the undepreciated balances of certain Plant items which are now redundant or obsolete.

(*b*) During the year under review sundry claims for Taxation relief, including those for Exceptional Depreciation resulting from the last world war, have been settled. On this account the Board have released Taxation provisions amounting to £500,000 which are shown in the Profit and Loss Account as an adjustment to previous years, and this amount has been allocated to Accumulated Depreciation in respect of the assets to which the Exceptional Depreciation claims related.

DIVIDENDS.

The Dividend recommended on the Ordinary Stock is very low in relation to the amount available for distribution and the Directors consider that the increased dividend is well within a policy of moderation and restraint.

LONDON, W.1. 20*th October*, 1950.

orders for export bringing the total to 127 ships of 825,745 tons, the highest recorded.

The value of Lloyd's Register statistics is enhanced by two new tables; one gives details of the registration of tankers, while the second gives a more detailed analysis of British shipbuilding, distinguishing between ships fitting out afloat and those on the stocks or for which material is being worked. In addition it shows that plans have been approved or material ordered for 127 ships of 831,642 tons, thus bringing the total under construction and preparing in British yards to 2,877,876 tons. It is understood that the industry has firm orders on its books for another 434,000 tons gross, so that its earlier cares about slacker times are not so pressing. Only 438,000 tons were ordered last year, but over 1,000,000 tons have already been booked this year. Orders for tankers continue to predominate; some 73 per cent of the tonnage to be begun consists of tankers.

* * *

British Potash Supplies

Large deposits of potassium chloride recently found by Imperial Chemical Industries in the North Riding of Yorkshire promise to provide the first commercial source of potash in Britain. Potash is one of the three essential fertiliser materials; the other two are nitrogen and phosphate. Preliminary borings suggest that the deposits are sufficient to last for about 140 years, assuming an annual consumption of about 500,000 tons. The fertiliser industry is at present wholly dependent on imported supplies, which are bought by the Board of Trade. Last year rather more than 420,000 tons of potassium compounds were imported at a cost of £6,800,000. The bulk of the British supplies come from France and Germany in almost equal proportions and prices have shown a tendency to fall. At least 90 per cent is used for fertiliser production, but small quantities are needed for explosive fuses, crystal glass and pharmaceutical products.

A year or two will elapse before ICI can start to draw supplies of potassium chloride from the new deposits. These are about 4,000 feet deep and the method of extraction will probably be similar to the solution technique now being used in the Cheshire salt mines. This method avoids both the difficulties of mining at this depth and the danger of subsidence, but a final decision is not likely to be taken before boring tests are completed in about twelve months time. ICI have been working since 1947 on the site, which is only 35 miles from the company's big chemical plant at Billingham.

More Wheat for Export

This year's wheat harvest in Canada has been good. The crop was at first expected to yield 540 million bushels against 367 million bushels in 1949. The estimate has since been reduced to 465 million bushels owing to frosts in Manitoba and Saskatchewan. But even this reduced estimate would leave room for an export surplus of 425 million bushels—100 million bushels more than last year—compared with the

WORLD EXPORT SURPLUSES OF WHEAT
(Million Bushels)

Exporters	1949-50	1950-51
U.S.A.	742·0	718·0
Canada	525·0	425·0
Argentina	120·8	124·0
Australia	194·5	188·8
France	68·0	54·4
Pakistan	14·8	24·0
Russia, Danubian and minor countries	16·0	16·0
TOTAL	1,432·1	1,550·2

Source: George Broomhall's *Corn Trade News*

guaranteed sale under the international agreement of 215 million bushels. Export surpluses this year in the United States, Australia and France are expected to be slightly

smaller than in 1949 but export supplies in the current season, estimated by the *Corn Trade News* at 1,550 million bushels, show a prospective increase of 70 million bushels.

Political uncertainty will undoubtedly encourage importers and conceivably some exporters to increase their stocks and private hoarding may also occur. An additional supply of 70 million bushels to the world market is not likely to lead to any lowering of the export price from the maximum of $1.80 (US) or $1.98 (Canadian) fixed under the international agreement.

Shorter Notes

The Chancellor of the Exchequer revealed in Parliament last week that rather less than £1,300 million of the £3,471 million of sterling balances outstanding on June 30th last were held in blocked accounts; the "Economic Survey" put the value of blocked sterling at the end of 1949 at rather over £1,350 million. Since the beginning of the year Pakistan has secured the right to withdraw about £34 million from its blocked account and Israel has secured an equivalent right for about £10 million. It would thus appear that some release rights granted to India and Egypt in 1949 have not been exercised.

*

The recent increase in the Canadian bank rate has been quickly followed by more selective methods of credit control, applying to consumer credit. Under the new regulations, a buyer of motor vehicles must pay at least one-third of the cash price on delivery. Other goods bought by instalments will require a minimum down payment of 20 per cent. In all cases payment for goods obtained on the instalment system will have to be completed over a maximum period of eighteen months.

*

The Bristol Aeroplane Company is the second British aero engine manufacturer to negotiate a licensing agreement with the American Curtiss Wright Corporation. A similar agreement with Armstrong Siddeley was announced a short time ago. These agreements should save the American company many years of development work. Unlike its rival, Pratt and Whitney, Curtiss has no experience of gas turbine engines.

COMPANY MEETINGS

ELY BREWERY COMPANY, LIMITED

TRADE FULLY MAINTAINED

OVER £2,700,000 PAID IN BEER DUTY AND TAXATION IN 3¼ YEARS

REORGANISATION NEARING COMPLETION

MR L. NIDDITCH ON THE OUTLOOK

The fifty-fourth annual general meeting of The Ely Brewery Company, Limited, was held on October 12th, at the New Inn Hotel, Pontypridd, Mr L. Nidditch, F.F.S.(Eng.), F.V.I. (chairman and managing director), presiding.

The following is an extract from his circulated statement:

I have pleasure in presenting the accounts of your company for the fifteen months' period ended on June 30, 1950. I need not dwell upon the change in the accounting dates, as this has, I think, been clearly explained in my circular of March 31, 1950, which was sent to all stockholders.

BOARD OF DIRECTORS

Before explaining the accounts and giving the customary summary of the state of the company, it is with regret that I have to advise you of the fact that after forty years of close connection with your company as solicitor, director and one-time chairman, Colonel Sir Gerald T. Bruce, K.C.B., C.M.G., D.S.O., your vice-chairman, no longer feels able, owing to advancing years, to offer himself for re-election to the board of directors.

It must be deeply satisfying to him to retire in the knowledge that the company is now once again prosperous and settled in calm waters, and that happiness has at last been brought into the homes of all its employees, who in common with the rest of the population of South Wales, suffered so much during the bad prewar period as a result of errors of judgment and neglect on the part of Whitehall.

I personally feel bound to express my sincere gratitude to Sir Gerald for his friendly co-operation and advice in connection with occurrences of past years, and I feel sure that shareholders will join with me and the rest of the board of directors in appreciation of his wise counsel at all times and sober solid judgment. We wish Sir Gerald all happiness and contentment in his retirement.

The company is now managed by a team of men of vigour, experience and vision. The average age of your directors is under fifty and that of your first ten executives (including supervisors) is under forty. The complacent attitude usually associated with aged management, however experienced, but reluctant to change old ideas, is now a thing of the past at Ely, and the task of laying the human foundations for future management is one which is constantly in the forefront of our planning as we are continually on the alert for those signs of talent and temperament which single out the promising executives of the future.

As a result of the confidence and responsibility placed upon me by your board, when they appointed me chairman and financial director, I have found it necessary to restrict my other activities considerably in the last two years, so that I could devote my attention completely to the task of ensuring the success of your company and of preserving the capital of all shareholders, including, of course, my own not inconsiderable stake. Therefore, if shareholders will bear with me, I propose to give a full summary of the last 3¼ years, since I was appointed chairman, not, I may say, without some pride of achievement, which pride I delight to share with my colleagues on the board, and with all employees, whatever their work and status. Future annual reports will need no elaboration, and will be confined to the minimum explanation of the accounts figures.

PROFIT AND LOSS ACCOUNT

Our trade for the comparable fifteen months has been fully maintained, in fact, slightly exceeded—no mean achievement in these difficult days.

Our bottling trade has increased by 30 per cent., but, owing to restricted spending power in the last year, we found from observation that individual drinking was down by about 20 per cent., drinkers accustomed to four or five pints, were satisfied with three or less, and in many cases missed a night out, and avoided spending more on "treating." Nevertheless, our sales have kept up, because we have increased our patronage by 10 per cent. to 20 per cent. and thus also consolidated our goodwill.

In the year ended March 31, 1947, a peak year for all breweries, your company's profits were £175,410. Changes in the political and economic state of the country entirely unforeseen three years ago, together with new statutory impositions, have now burdened your company with an additional annual expenditure of almost £100,000 compared with the year ended March 31, 1948. In addition to this, with profits tax raised and pensions, but for the strong and realistic handling of the reorganisation since 1947 and the loyal service rendered by all employees, your company might well have suffered a 15 per cent. decrease in barrelage sales. Such a decrease and meagre liquid position would certainly have put the company in the hands of the debenture holders once again, wiped out all chance of ordinary dividends and resulted in a heavy reduction of shareholders' capital.

The balance of the trading account for the fifteen months at £314,002 is £5,142 higher than that for the previous twelve months. To interpret this increase in its true perspective, we must, however, bear in mind certain pertinent facts. The profits have borne £69,500 extra burdens composed as follows:—

EFFECT OF CATERING WAGES ACT

As a result of the Catering Wages Act, 1948, wages for our managed houses rose by a further £17,000. The previous year's figures were only partially affected by this Act.

Increases in wages and salaries of brewery employees (including office and increased supervisory staff) and cars for senior outdoor executives required a further £8,500.

After the enforced weakening during previous years by quotas and Government regulations, we deemed it wise and politic to raise the gravity of our beers and give more strength and appeal to the palate in order to overcome growing consumer resistance. With the special 3/- imposition, additional beer duty on this account amounted to £31,000. Owing to the stronger beer produced, our expenditure on malt was higher and the increased price of coal needs no comment from me. We have also been involved in much higher charges for cleaning materials which together with sundry small items, amounted to £9,000.

Reductions in the previous Budgets caused us a loss of nearly £4,000 in duty on allowances, and on stock-in-hand.

Thousands of casks and new cases have had to be purchased, and many thousands of those in daily use have had to be repaired.

In spite of all these impositions and substantial increases in costs (not passed on in the selling price), we have managed to achieve our present profit level, because, by means of improved control we have been able to save sums amounting to many tens of thousands of pounds. During the past three and a quarter years we have paid in Beer Duty and taxation over £2,750,000. With the duty on our turnover of wines and spirits, the figure exceeds £3,000,000.

We have, it is true, been somewhat overtaken by general events beyond our control and by an official policy not very favourable to the trade as a whole. Good intentions and good wishes alone do not bear fruit, but our figures are a measure of the high administrative control of your board which together with the loyalty and efficiency of your company's employees, has ended the despondency of the last two decades, during which no dividends were available for shareholders.

ALLOCATION TO ADVERTISING RESERVE

In view of the fact that during the first year of the present Board's control in 1947 the profits improved very substantially, it was considered policy and essential to advertise with a view to putting the company "on the map" and the contemplated national sales of the company's special beer "Brewer's Own." As a result £7,000 was put to Advertising reserve and increased last year by a further £15,000. Your board have decided to utilise £12,000 from this reserve which, generally, gives a fairer picture of the company's position on its trading account.

We have tackled our revenue from unlicensed tenancies where convenient, which has now risen to £4,872 yearly income and should reach £6,000 next year.

We have charged to revenue account all items legally allowable on the basis of past years. If your board had been less conservative and had chosen for self-satisfaction to place certain items to capital to enhance profits indicating improved success still more, we should have been short of cash by many tens of thousands of pounds because of the additional taxation involved. In fact, the revenue account has borne £110,000 in the last three years for various items, half of which will never recur and the other half not for another eight or ten years. While reorganisation and profits have been favourable, the assets, and consequently the company, have derived benefits of an enduring nature, and secure the equity capital, now at 9/11 per 5/- stock unit, as shown on page 8, by simplified analysis.

I cannot leave the profit and loss account without referring to the cash and debenture position, when I was appointed chairman in February, 1947. In addition to debenture debts outstanding at £970,000 in 1946, we had then the following pressing liabilities to face, not provided for when the debenture scheme conversion was rearranged (against my advice and in spite of my strong protests: that it should be half a million pounds of debenture and first preference each and so keep the £135,000 cash, parted with too lightly).

£160,000 for excess profits tax.

£160,000 for Income and Profits Tax.

£60,000 for repairs and very essential replacements to brewery plant, much of which was at danger levels.

£80,000 for repairing casks and cases and replacements.

£95,000 for decayed building repairs, roofs, guttering, floors and cills, all at danger points.

£20,000 for floor coverings.

£25,000 for cellar installations and furniture.

£5,000 for replacement of vehicles (mostly over ten years in age).

£100,000 for general repairs and painting.

Towards all these urgent needs there was only £136,000 cash and £182,650 tax reserve certificates.

As you know from my observations in the last two years I made a favourable case to the revenue to reduce the Excess Profits tax debt to £100,000. We issued £69,000 of new 5 per cent. preference and financed all other outgoings from profits and the Cardiff Malting Company cash flotation, and of course not overlooking substantial cutting down of waste and administrative economies.

I am pleased to tell you that we have consolidated and greatly improved the value of our two largest hotels—The Grand Hotel, Port Talbot, and the New Inn Hotel, Pontypridd—raising the value by about £60-£70,000 to the present book value based on the 1946 valuation.

RECENT ACQUISITIONS

We were fortunate last year in being able to acquire the freehold of the Grand Hotel at 47 years unexpired lease, at the sum of £8,000, and in the case of the New Inn Hotel we successfully negotiated the surrender of the existing lease with 34 years unexpired term and procured a new lease for 99 years at an increased ground rent of £140 per annum. In both cases after much attention to neglected conditions and effecting the necessary repairs in line with modern ideas, the net profits have risen tenfold as compared to 1946-47, although the Catering Wages Act has raised their wage roll by over £3,000 per annum.

I refer you to my observations at the top of page nine in my review of June, 1947, wherein I mentioned that the valuation in 1946 of fixed assets excluded fifteen short leaseholds with less than seven years to run. We have renewed the leases of seven of these and bought the freeholds of a further five and are negotiating at the present with another of these fifteen. In the case of two houses we allowed the negotiations to lapse owing to poor trade and not being justified on the price and terms demanded. We managed to acquire the freeholds of two other houses in place, which were not previously selling Ely beers. In the case of these fifteen houses alone I estimate that the assets have an improved capital value of almost £40,000.

We have in three years purchased 50 freeholds, renewed many short leases to 99 years and in all reduced the debenture debt by £226,050. The latter now standing at £623,950 is about half a million pounds better secured than when issued, and through my personal pressure and initiative since 1945 has been reduced from a million pounds, for which I cannot—being human—do other than claim due credit.

TRIBUTE TO EMPLOYEES

Our profit figures under prevailing conditions reflect no mean effort by all our employees in whose well-being your board continues to take a deep and active interest. It has become a guiding principle in the administration of the company that sympathy, understanding and good human relationships are vital to efficient co-operation between management and labour. We have reason to be well satisfied with the response we have received from our employees, and the loyalty given to Mr Colin W. Jones, your general manager, and myself: for this we are both proud and thankful. Sweated labour conditions, which were one of the stains of the past record of this company, and on all lips in South Wales, is now a thing of the past.

The wages level of all employees, the bare minimum and in fact insufficient numbers employed until 1946, especially on the administration, supervision and cleaning sides, has meant that this company has probably suffered the greatest increase in wage roll compared to barrelage trade with any other established brewery in the country. However, in this direction your board are satisfied, since a well paid staff must have its advantages towards prosperity in the end.

BOARD'S PROGRESSIVE PROGRAMME

We have overhauled roofs, passages, staircases, windows, kitchens and the like, thus incidentally enhancing the value of our properties. It was not possible to attend to all our houses at once but in fact we have done in three years what was then thought would be at least a seven-year job. A progressive programme is in hand whereby every house, wherever situated, will eventually have still better amenities. Our maintenance staff is now organised and is always on the alert to effect, in a matter of *hours*, any urgent repairs and remedy any break-down in any of our houses, to avoid inconveniencing our patrons—and so maintain patronage. All facia boards and sign boards have been repainted and brought up to date.

In the brewery itself and the stores around it, we have repaired much worn and derelict plant and roofs and made extensions for better storage space. We are in course of installing conveyor belt systems and have already installed a modern automatic cask-washing machine to ensure the highest standard of cleanliness. A new bottling plant and automatic labelling machine are now functioning We have relined all our vats, mostly with copper and overhauled our electrical plant. The refrigerating room has been modernised and latest type of filters have been installed. As a result of my visit to the United States of America and invitation to visit a brewery there, we believe we are the first in the country to instal such a special system of heavy are lighting enabling a special watch on *every* bottle of beer whether dark or light, before it reaches the end of the conveyor for crating, thus preventing the despatch of bottles with cracked necks or containing foreign matter. This has saved costs by avoiding the return of possibly affected bottles and of course inconvenience as well as book entries. The public, too, are safeguarded.

In all we have spent large sums so that our houses and the brewery are almost unrecognisable when compared with their condition three years ago. This has resulted in valuable improvement of our assets, and possibilities of increased trading.

I am also pleased to report that we acquired for cash on the open market, during the last fifteen months further debenture stock, which has been cancelled and is not re-issuable and that the amount now outstanding is £623,950. Since June we have acquired and cancelled a further £7,000 debenture stock.

BONUS ISSUE

Owing to the necessity to preserve liquidity pending the final settlement of the company's excess profits tax liability and in view of the substantial sums spent on acquiring freeholds of existing leaseholds, new brewery plant, casks and cases, and repairs and furnishings, extensions and improvements, and taxation, a distribution in shares in lieu of cash is more advisable. The bonus may be considered as small, or modest, but it is considered by your directors that it is more equitable that those shareholders who have invested in the equity or "risk money" should get the reward, in case unforeseen circumstances of the individual compel a sale to procure cash; this is preferable to future shareholders getting all the benefits of bonus issues through undeclared retained profits. Such a small bonus, too, does not affect the dividend distribution, and helps to maintain capital values. We are increasing the general reserve by a further £40,000, making in all with the dividend equalisation reserve and profit and loss balance £313,549. With other balances our total reserves are £543,000.

As trade has been fully maintained and last year's barrelage slightly increased, it is contemplated, subject to no unforeseen circumstances arising, to pay during next April an interim dividend of 3¼ per cent. for the financial year ending June 30, 1951; subsequently a reasonable final dividend for the year will be considered subject to the trading and final profit results of the year.

GENERAL

Although we have no licensed houses at present in North Wales, our prosperity in the south is linked with that of the whole of Wales. It is, therefore, interesting to note that although Wales has long depended primarily upon France for its pitwood, this picture may well change in the next ten years. Under State ownership or control, Welsh forests now cover 90,000 acres. Much of this has already come into production; in the current year, the target, I understand, is about 100,000 tons of pitwood per month, and this target is due to be raised. Last year a million cubic feet of timber was produced in North Wales, of which about two-thirds was sent to the mines in the form of pit props and general timber.

STAFF

I cannot close my review without a final word of thanks to all members of the staff. It is pleasant to be able to report to the shareholders that the morale and *esprit de corps* at Ely are excellent, and the board acknowledges gratefully and I take special personal pleasure in mentioning once again the splendid work of Mr Digby T. Leyshon our head brewer and Mr O. D. Harrison the under-brewer.

Finally I acknowledge gratefully the ready assistance given to me by my colleagues on the board.

The report and accounts were unanimously adopted, and at a subsequent extraordinary general meeting the proposed bonus issue was approved. The proceedings terminated with a cordial vote of thanks to the Chairman, directors and staff.

FINNEYS SEEDS

The fourth annual general meeting of Finneys Seeds, Limited, was held on October 30th, at 18, St. Swithins Lane, London, E.C.4, Mr Ernest Cornwall, the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—

The first year of the third century of our business records a period of successful trading, which I think you will agree is very satisfactory. The combined sales of the operating companies established a record, and this is all the more gratifying, inasmuch as the prices of some of our leading commodities were less than in the previous year, and we have had to face increased and fierce competition. Our trade in agricultural seeds shows a decided increase, and the business in market garden and retail garden seeds has been quite good, and well up to the average.

Two or three months ago it looked as though harvests this year would be bountiful and probably a record, but whilst many crops may have received benefit from the over-abundant rain, this will not be much consolation to those who have suffered severe loss from damaged crops. Agriculture is still our leading industry and the country's first line of defence, and it is the duty of all concerned with this basic industry to strive to their utmost to increase production.

It is always imprudent to prophesy for the future, but our sales since our new year started on July 1st show, up to the present, a very substantial increase over the same period last year, and we are well placed with stocks of seed for the coming season, so that we see no reason why our business should not continue to prosper.

Our managing directors and their associates have rendered fine service to the company, and we owe them and our personnel a deep debt of gratitude for their unremitting work and devotion.

The report was adopted.

THE AUROCHS INVESTMENT COMPANY

SIR HAROLD MOORE ON SUBSTANTIAL INCREASE IN PROFITS AND DIVIDEND PROSPECTS

ACQUISITION OF IMPORTANT MANUFACTURING COMPANY IN ENGLAND

MR J. H. WORMELL'S VIEWS ON SOUTH AFRICAN MINING INTERESTS

The twenty-fifth annual general meeting of the Aurochs Investment Company, Limited, was held on October 25th in London, Sir Harold Moore (chairman of the company) presiding.

The chairman said:—Ladies and gentlemen, the balance sheet and accounts of the company, together with the directors' report, having now been in your hands for some three weeks, I assume you will desire that they should be taken as read. (Agreed).

You will have seen from the directors' report, I am sure with great regret, that Mr Charles Hughes, a director of your company, died on July 21st last. Mr Hughes was a delightful colleague who rendered loyal and valuable service to the company and we greatly miss his genial personality and always wise counsel.

The vacancy on the board has been filled by the appointment of Mr J. H. Wormell as a director, and we have also co-opted to the board Mr William Douglas Gibbs. In due course you will be asked to consider the re-election of these two gentlemen as directors.

THE YEAR'S RESULT

You will see from the profit and loss account that the profit before taxation amounts to £118,795, a substantial increase on the previous year. Nothing has been earned during the year in respect of underwriting commissions, and the whole sum of £118,795 is derived from surplus on investments realised, dividends received from quoted investments, and a substantial dividend of 10 per cent. received from our associated company in Johannesburg. The company's affairs are, as you know, managed by the Whitehead Industrial Trust, Limited, and I think the result of their efforts during the year speaks for itself.

Turning to the balance sheet, you will observe that in addition to the investment of £250,000 in our associated company, the current assets at cost amount to £527,180, giving a total of £777,180. Our effective capital in ordinary shares is £560,000. After making very full provision for taxation, including taxation on the current year's profits, there remains a surplus on the appropriation account and on capital reserve of no less than £104,283, equal to nearly 20 per cent. on the ordinary capital.

SATISFACTORY TAXATION SETTLEMENT

The increased provision of £34,929 for income tax became necessary because the Inland Revenue authorities put forward a claim that a new business was commenced when the present board took over control of the company. This claim has been contested, and I have just learned from our accountants that a settlement has been effected with the Revenue authorities as a result of which some £50,000 of the tax reserve of £119,000 will not be required. Our revenue surplus is therefore increased by a sum of £50,000, which becomes an addition to the amount available for distribution to the shareholders.

We are obligated by the Companies Act to disclose that our quoted investments at Stock Exchange prices on the 31st May last were valued at a figure very largely in excess of their cost. Our most substantial holding is in the shares of Capital Gold and Exploration Company, Limited, with widespread mining interests in the Union of South Africa and the native territories. All these South African undertakings are now managed by Mr I. H. Wormell, who, before poining up with us in South Africa, had a distinguished and successful financial career in England.

You have received from the managers of the company a very carefully prepared chart in which your interests in the various South African companies are fully explained. I had intended to tell you somewhat more in detail about these companies, but as we are fortunate in having Mr Wormell with us today, I am proposing to ask him presently to second the first of the resolutions and to tell you in his own words something of the future prospects and present development of the companies under his control.

I have already mentioned that Mr Wormell has recently been appointed a director of your company. He is also on the board of the Aurochs Investment Company (S.A.) Limited, of which latter company he is now chairman and managing director. You can have every confidence that in his capable and experienced hands your interests in South Africa will be well protected and successfully managed.

THE BOARD'S POLICY

Now just a word or two about policy. When some two years ago a lack of opportunity developed in this country, our attention was directed to South Africa in which it was felt there were great potential possibilities. The Whitehead Industrial Trust, Limited, established themselves in Johannesburg and under their aegis and with the full approval of our shareholders, the Aurochs Investment Company (S.A.) was formed, in which our own company has a 50 per cent. interest. The Aurochs Investment Company (S.A.) Limited is managed by the Whitehead Industrial Trust (S.A.) Limited, and in its first year has made substantial profits and paid a maiden dividend of 10 per cent. Our share of this dividend, after deduction of the non-resident shareholders' tax, amounted to £23,125, which sum appears in our profit and loss account.

A large interest in Capital Gold and Exploration Company, Limited, has since been acquired by your own company and our associated company in South Africa, and through the Capital Gold and Exploration Company we are now interested in many companies actively concerned in exploiting and developing valuable mining properties in the Union of South Africa and the native territories. One of these—the Union Platinum Company—has just declared a maiden dividend of 10 per cent., and others will come into the dividend list in due course. We are hopeful that all these interests will in time produce a substantial and continuing revenue.

PENDING OFFER TO SHAREHOLDERS

In the meantime, we are not neglecting any opportunities which may arise for the profitable employment of our resources in this country.

In that connection, I think I may be permitted to tell you that we have just concluded negotiations for the purchase of a very excellent business involving a sum of £400,000. We are not contemplating any further issue of ordinary shares to finance this deal; the whole amount will be arranged out of our existing resources. As soon as the legal formalities are completed, which we anticipate will be in the near future, the business will be taken over by a new company having a capital of £400,000 in 8,000,000 ordinary shares of 1/- each. We then propose to offer to our own shareholders one such ordinary share of 1/- in the new company for each ordinary share held in the Aurochs Company at cost price, which will be approximately 1s. 1d. per share.

The issue will be underwritten by the Whitehead Industrial Trust, Limited, who I gather will be very glad to take any shares which our own shareholders do not desire to acquire. I may tell you that the accounts of the company have been investigated on our behalf by an eminent and independent firm of accountants, and they certify that the profits of the acquired business for the year to April 30, 1950, before taxation, were £125,779, which, as you will see, is in excess of 30 per cent. of the purchase price of £400,000. They further certify that the turnover for the first five months of the current year, that is to say, since April 30th last, shows an increase of 60 per cent. on the average turnover figure of the preceding year, and they inform us that the directors of the company have estimated that the profits for the year now current will largely exceed those of the previous completed year, and in the opinion of these directors they will amount to not less than £100,000 for the first six months.

Your directors are hopeful that the results for the current year will be entirely satisfactory, and that before we come to our next annual meeting we shall have reached a stage at which we can consider recommending the distribution of a substantial dividend.

The chairman concluded by moving the adoption of the report and accounts.

MR J. H. WORMELL'S REMARKS

Mr J. H. Wormell, in seconding the resolution, said:—Ladies and gentlemen, I am grateful to our chairman for having given me the opportunity to explain to you, and give to you some information on your mining interests in South Africa. I have just returned from there and, as you know, I am chairman of several of the companies in which you have interests and I am also a director of your company.

A chart showing your various interests has been circulated to you, and, if you will now follow me, I will try to indicate and explain to you the extent of the interests you have in South Africa through your 50 per cent. holding in Aurochs Investment Company (S.A.)

Limited, and your holding in Capital Gold and Exploration Company, Limited.

The chart you have received has been considerably enlarged and is behind the chairman's; you will see from this that you have a varied investment in all types of base metals being exploited in South Africa. Yesterday on the Johannesburg Stock Exchange base metal shares were on active market.

CAPITAL GOLD AND EXPLORATION COMPANY

Through Capital Gold and Exploration Company, Limited, you have an interest in the activities of Anglo-Rand Mining and Finance Corporation, Limited, who in turn have an interest in the Union Platinum Mining Company, Limited, which company has recently taken up an interest in a group called Rustenburg Platinum Mines, Limited, and this combine now virtually controls the whole of the platinum mining industry in the Union. Union Platinum Mining Company, Limited, have just declared a maiden dividend of 10 per cent.

Anglo-Rand Mining and Finance Corporation, Limited, have an interest in Northern Transvaal (Messina) Copper Exploration, Limited, whose property is adjacent to the well-known Messina Copper mine. The results so far received from the property are extremely satisfactory.

Anglo-Rand also have an interest in the Beatrice Gold Mining Company, Limited, who, with its associates, the names of which you can see from the chart are known throughout the world, have a high reputation for the development which they have been carrying out. These interests will give your company a number of important development and subscription rights throughout the Union.

Through the Leader Mining and Investment Company, Limited—the names of its associates you will find again are well known in the mining world—you have further important interests and subscription rights.

On the other side of the chart, you will see your company's and Aurochs Investment Company (S.A.) Limited's interest through the Capital Gold and Exploration Company, Limited. This latter company owns a 20 per cent. interest in the prospecting company from whom Nickel Corporation of Africa have acquired a 70 per cent. interest in consideration of its undertaking to do the development of the large territory at Mount Ayliff, Pondoland, which approximates some 87 square miles.

PROMISING NICKEL, COPPER AND COBALT DEPOSITS

Development work is now in progress in this area and from the assay results of boreholes made by eminent geologists, there appear to be extremely promising deposits of nickel, copper and cobalt. I would like to mention here that the increased prices of these base metals should be very helpful to our company. Copper which during the war was £57 a ton is now £202 per ton; nickel during the last three months has increased in price from £321 to £386 per ton; and cobalt, which is becoming greater in demand, is now £1,120 per ton; so you see that in these mines we have very valuable deposits.

The company by its investment in Capital Gold and Exploration Company have an interest in the President Lead and Zinc Mines, Limited, situate in the Mashardadorp district, and also in Consolidated Copper and Lead Mines, Limited, and should shortly be benefiting from these two properties. The former is in course of development; the latter has commenced production of both copper and lead, and from the findings in this area further development results also appear to be promising.

I am chairman and managing director of Nickel Corporation of Africa, Limited, Afrikander Proprietary Mines, Limited, Capital Gold and Exploration Company, Limited, Aurochs Investment Company (S.A.) Limited, President Lead and Zinc Mines, Limited, and Consolidated Copper and Lead Mines, Limited, and I am satisfied from the development that has taken place on all the properties over which these companies exercise control, that we should be reasonably optimistic that success will attend our efforts.

Prior to my leaving South Africa, I personally inspected the principal properties, and my inspection has given me complete confidence that the view I am putting forward is correct and that you have in Capital Gold a very promising investment.

NICKEL CORPORATION OF AFRICA

As an example of the progress we have made to date, the Nickel Corporation of Africa, Limited, have been granted a licence to dispose of the mineralised ore from the Insizwa mine and, having been fortunate enough to secure the plant and machinery for working this property, we can now look forward to reasonably good prospects.

In passing, I would like to mention that this plant and machinery has been purchased on most advantageous terms, and part of it is now in operation.

I am pleased with my appointment to the board of your company as this will give me an opportunity of looking after your interests in the companies with which I am associated in South Africa and in which our company is interested. We have some splendid personnel working on the mines, mechanical, electrical and constructional engineers and mine managers.

In conclusion, I would like to assure you that the interests which your company holds in South Africa will be watched and most carefully safeguarded.

The resolution was carried unanimously.

The retiring directors (Mr J. H. Wormell and Mr W. D. Gibbs) were re-elected, and the proceedings terminated with a cordial vote of thanks to the chairman and directors.

EBONITE CONTAINER COMPANY, LIMITED

SATISFACTORY YEAR

The twenty-sixth annual meeting of Ebonite Container Company, Limited, was held on October 25th in London, Mr W. E. Smith (chairman and managing director) presiding.

The following are extracts from his circulated statement:—

The parent and subsidiary company have experienced a satisfactory year's trading. The financial year ended March 31, 1950, was not seriously disturbed by any major crisis and although still numerous Government controls eased considerably, thereby giving manufacturers some scope to expand as desired. The supply position with regard to raw materials, plant, etc., improved. Not all factors were, of course, in our favour. Wages, the price of raw materials, coal, and other items continued to rise. On the whole, however, your companies not only maintained their position but improved the same.

The profit of the parent company amounts to £40,836. The amount carried forward from last year was £41,076 and after making the various provisions and allowing for the payment of a final dividend of 12½ per cent., less tax, making a total of 17½ per cent. for the year, the amount carried forward is £54,562.

Although both companies have spent considerable sums on new plant, etc., during the year, the liquid position remains sound. Our factories are working to capacity and our order books are in a very satisfactory condition.

The report was adopted and at a subsequent extraordinary meeting, a resolution for the payment of a scrip bonus of one new ordinary share for every two held was passed.

CALCUTTA TRAMWAYS COMPANY, LIMITED

GROWTH OF REVENUE

At the general meeting held on October 20th, the deputy chairman, Mr D. E. Weeks, F.C.A., who presided owing to the recent death of Sir Geoffrey Clarke, said that although receipts continued to increase expenditure was rising more rapidly. The balance on revenue account after setting aside £80,000 for future renewals and replacements amounted to £237,881 compared with £368,736 in 1948, when an additional £25,000 was provided for deferred repairs.

There was a net balance of £49,037 for distribution, the final dividend on the ordinary shares making 6 per cent. free of tax for the year. The net current assets had increased from £572,051 in December, 1948, to £736,390 in December, 1949.

The Corporation of Calcutta had the recurrent right to purchase their undertaking every seventh year on the basis of the average annual earnings during the previous seven years, the serious shortcomings of which agreement were that any capital expenditure would be unremunerative for the whole or part of that period and would thus not be represented in the computation of the purchase price, so that such capital expenditure would be a free gift to the corporation, that extensions and improvements therefore have to be postponed, that raising new money would be impossible.

NEGOTIATIONS WITH GOVERNMENT

As there was a possibility of the Government forming a transport board the company had suggested a new and more reasonable agreement direct with the Government which had been well received. He hoped when visiting Calcutta shortly to discuss the draft scheme with ministers. It would provide for (1) an extension of the company's tenure; (2) fixing a price acceptable to all parties on expiration; (3) fixing a reasonable return to the shareholders during tenure.

They had commenced production of a new type of modern streamlined train which was more suitable for parts of Calcutta with dense population and traffic. There were twenty-eight of these trains, to be increased by the end of this year to forty. Thirty new articulated streamline cars would not be in operation until next year. They would then have only twenty-three cars in Calcutta built before 1926. They were very proud of their cars which would bear favourable comparison with any in the world. They were still awaiting sanction for the purchase of additional land at Esplanade for the proposed re-alignment.

At their last meeting it was stated that the increase of first class fares had led to a big swing over of passengers to second class, owing to the Government refusing to approve any increase except in the first class, so that although total traffic receipts increased there was a decrease in the number of first class passengers of 35 millions, while second class passengers increased by 26 millions. Several schemes were under consideration for getting some of these back to first class.

The general picture for the first seven months of the current year was very similar to last year's. There was considerable unrest and rioting in the early months, but owing to the loyalty and hard work of the staff, often at considerable risk, the damage and loss suffered by the company was confined to a minimum. The shareholders owed the deputy agent and executive staff a great debt for the way they had looked after the undertaking and for the initiative and enterprise in overcoming trouble.

The report was adopted.

TRAWLERS GRIMSBY LIMITED

MR J. CARL ROSS ON THE POSITION

The annual general meeting of Trawlers Grimsby Limited was held, on October 25th, in London, Mr J. Carl Ross, the chairman, presiding.

The following is an extract from his circulated statement:—

It is no longer news that every company engaged in the fish industry in all its various aspects has recently been experiencing extremely difficult conditions, the climax being reached in May and June after the close of our financial year. It is, however, pleasing to report there has been some improvement since that time.

The most serious phase started in November and December last, when prolific fishing resulted in catches being brought to market much in excess of requirements. Exceptionally fine weather conditions for the time of the year were experienced and continued into January, February and March, with the result that fish which had been frozen and put in store by arrangement and in conjunction with the Ministry of Food during the summer months, to be drawn upon when bad weather conditions normally restrict supplies, were not required.

The stocks held by your group of companies have been heavily written down and they have also involved us in substantial storage charges. The position generally has also been aggravated by excessive Ministry of Food imports of frozen fish and unrestricted direct imports of foreign-caught fish into our ports and inland markets. The position in regard to these stocks has improved considerably during recent weeks.

These conditions are reflected in our consolidated profit and loss account for the year ended March 31, 1950. The trading profits of the group amount to £217,854, as against £355,578 for the previous year. This includes exceptional trading profits amounting to some £10,000. Provision for taxation is £29,449, against £112,696 last year.

DIVIDEND DECISION

Of the net profit, amounting to £26,411, the sum of £187 represents profits attributable to outside shareholders of subsidiary companies. With the amount of £35,436 brought forward from last year there is available £61,159; of this sum, the fixed dividend on the preference stock for the six months to March 31, 1950, takes £3,080, and the interim dividend of 10 per cent., less tax, £10,266. It is proposed to transfer £10,000 to general reserve and to carry the balance remaining, £37,813, to next year.

It is hoped that imports of fish will be regulated by the Fish Industry Board recently set up by the Government, but meanwhile distant water fishing vessel owners in the ports of Grimsby and Hull have inaugurated a development scheme designed to improve the quality of fish landed. This scheme came into operation on September 1, 1950.
