As anticipated, the release of controls on the maximum price of fish has brought about a big improvement in the quality of fish landed. There is now best quality fish available to suit every purse, although, quite naturally, plaice, halibut, soles and a few other kinds will inevitably be expensive to buy as they cannot be produced in large quantities.

Whilst trading results to date this year do not compare at all favourably with the same period last year, it is hoped that there will be in the later months of the current year a gradual and sustained improvement. With its widespread interests your company is well placed in the fish industry, and your directors face the future with confidence.

The report was adopted.

COAST LINES LIMITED

RESULTS OF A DIFFICULT YEAR

The thirty-seventh annual ordinary general meeting of Coast Lines Limited was held on October 19th in London, Captain A. R. S. Nutting, O.B.E., M.C., the chairman, presiding.

The following is an extract from his circulated statement:—

The net profit, subject to taxation, of Coast Lines Limited, and its subsidiary companies, for 1949 amounted to £684,616, which is £170,000 less than the figure of the previous year. This reduction in profits, of which £75,000 arises from the increased charge for depreciation, is caused principally by the constant increases in costs and charges which the shipping industry has to bear. The profit of the group, less taxation, amounts to £210,917, of which £8,540 is attributable to outside shareholders in subsidiary companies.

Our cross-channel services continue to show on the whole satisfactory results. The coastal and continental trades have had a successful year but there has been some decline in the general cargo trades. In road transport our companies have had another satisfactory year.

The taxation charge against profits in the accounts, computed on the fiscal basis which does not recognise the imperative need to set aside moneys to replace assets at greatly enhanced prices, absorbs over one-half of the profits. It is this aspect of the fiscal policy pursued by the Chancellor of the Exchequer which will have such serious consequences for the whole of the citizens of this country.

We can face the future firm in the assurance to be derived from a soundly-based business, strengthened by the diversity of its interests.

The report was adopted.

ALLIED INDUSTRIAL SERVICES, LIMITED

RECORD OUTPUT

The 16th annual general meeting of Allied Industrial Services, Limited, was held on October 27th at Bradford. Mr W. H. Rhodes, C.B.E., the chairman, presiding.

The following is an extract from his review included with the accounts for the 12 months ended June 30, 1950:

The general output of our factories has again been in excess of any previous period. Expenditure on buildings and plant was approximately £51,000 and a sum of £25,000 was estimated for capital commitments at June 30, 1950; as a result of these outlays, we have made and are making some additions to factory and storage space and to plant. In view of the present cost of buildings and machinery, it may be noted that our main buildings were erected and equipped in the six years prior to 1939; these, together with all our other buildings, have been well maintained. The amounts allocated to general and other reserves will be found in the directors' report.

The net profit amounts to £168,265 and the sum of £200,655 is available for allocation.

Concerning the present year, output to this date (October 4, 1950) is fully maintained; on the other hand the prices of our basic raw materials have risen very considerably during the last few months and there is still a scarcity in the supply of some of the products we require. Thus, with these facts in mind, I consider it somewhat unlikely that results for the present 12 months will be at the same satisfactory level as during the year under review.

The report was adopted.

NORTH KALGURLI (1912) LIMITED

CONSIDERABLE IMPROVEMENT

The annual general meeting of North Kalgurli (1912) Limited was held in London on October 26th.

Mr C. T. Ley (the chairman), in the course of his speech, said: In September, 1949, the price of gold rose from £10 15s. to £15 9s. 10d. per ounce Australian currency. This event was, of course, of great importance to our company. During the last three months of the year the effect was considerably to improve the appearance of our profit and loss account.

The first eight accounting periods of the year yielded a surplus of £52,595 and the last five £142,667. After meeting all charges, including taxation, there remains a sum of £76,335 out of which we are recommending paying a dividend of 1s. per share, less tax, and a bonus of 3d. per share, less tax, amounting to £37,812, leaving £38,523 to be carried forward.

The mine now has a continuous length of a mile and a half. A great part of it has still to be developed but from indications obtained by drilling recently undertaken our ore reserves should before long show a great improvement.

Our general manager, Mr A. A. McLeod, writes:—"The ore reserves were estimated at January 4, 1949, as 2,153,000 long tons and again more recently at January 3, 1950, at 2,359,498 long tons; recent indications enable me to say with confidence that in the next few years this estimate will be substantially increased and a life expectation of a further 20 years is not unduly optimistic."

In spite of troubles we still believe there is a bright future in store for the industry.

The report was adopted.

BENNIS COMBUSTION LIMITED

SATISFACTORY RESULTS

The fifteenth annual general meeting of Bennis Combustion Limited was held on October 30th, at Bolton, Mr Thomas Hough (chairman and managing director), presiding.

The following is an extract from his circulated statement:

We have achieved a level of profit during the past year which has only once been exceeded during the company's history, and I feel sure you will agree that the results before you are very satisfactory.

We have been allocated four large high-pressure water tube boilers for a power station in the 1953 and 1955 programmes of the British Electricity Authority; these entail a year or so of preparatory work, credit for which will only be revealed in our figures at some future date.

The management, both technically and commercially, of Bennis Mechanizations Limited, has been considerably improved, and altogether the prospects are very promising.

Coming to your other subsidiary, viz., Saxon Engineering Company Limited, all has turned out as we expected; the company has made considerable progress during the last 12 months and is well equipped to undertake the substantial orders on its books.

The final dividend of 10 per cent. for the year was declared on September 22, 1950. Income tax and profits tax have continued at the same high level. After making a provision of £39,631 for this item we are allowed to retain the balance of £24,586 from our earnings, out of which we have to make our reserves and provisions for the future and pay our dividends.

The report was adopted.

SCHOOLBOYS know that two parts of hydrogen unite explosively with one of oxygen to form water. Hydrogen is produced commercially in vast quantities by reversing this process. Water, in the form of steam, is split up into its constituent elements by passing it over red hot coke. The carbon in the coke unites with the oxygen in the steam to form carbon monoxide and dioxide. When these are removed from the mixture, hydrogen is left. Lightest of all the elements, hydrogen occurs free in nature in volcanic gases, but exists in the atmosphere to the extent of only one part in a thousand. Combined with carbon it is present in nearly all animal and vegetable tissues. The high proportion of hydrogen in ordinary coal gas is due to its release from the organic matter from which coal is formed. Industry uses hydrogen for many purposes. Some of the vegetable oils used in the manufacture of margarine require hardening by chemical combination with hydrogen. This is done before they are incorporated in the final blend of fats of which margarine is made. Hydrogen is used in welding and in extraction of metals.

Thousands of tons are needed every month by I.C.I. for making synthetic fertilisers. It is used in the production of petrol from creosote oil and coal, for making industrial alcohols and as a constituent of urea, one of the most important raw materials in plastics manufacture. All these, as well as hydrogen itself, are produced at the Billingham works of I.C.I.

Deadlock of Policy

TEN days of debate in the new session of Parliament have shown the Labour Party to be as barren of fresh ideas for administration as was the King's speech of substantial proposals for legislation. The one important legislative proposal is a Bill to make permanent powers that the Government already possesses; the one declaration of policy is to go on doing as nearly as possible what is being done. The shortage of legislation matters little and may easily be more a blessing than a weakness; the lack of policy matters a great deal and may easily be disastrous. The thought should be lying more and more heavily on the consciences of Ministers that if they cannot themselves grapple with the problems now facing the British economy, it is their duty, calculations of party advantage apart, to go to the country as soon as there is any sign that an election would end the present stalemate.

The new Chancellor of the Exchequer made the best, indeed the only considerable, Labour statement during the whole debate on the King's speech. And he himself summed up its main points as these:

> International agreement on raw materials . . . a strict, but fair, budgetary policy . . . food subsidy and price control, including its re-imposition where necessary . . . other controls designed to keep expenditure in check . . . encouraging productivity and saving.

Apart from agreement on raw materials (on which the British Government has not, in fact, shown any great forwardness) these are the old prescriptions for delaying the day when contradictions of policy bring their inevitable consequences. They are the prescriptions of proved ineffectiveness for anything more than postponement. What adherence to them means in practice is that the Government will drift on the tide with merely a few gesturing beats of the paddle. The present tide is, it is true, more favourable than some. It will become, as Mr Gaitskell admitted, less favourable. The world-wide inflation will put increasingly sharp strains on the British economy in rearmament. The rearmament will be slower and less effective than the country's resources allow. And when eventually the economic tide turns elsewhere, Britain will remain too rigid, inflation here will continue to run strongly, and we shall be back to a shortage of foreign currencies, import cuts, and all the rest.

There is no sign that the Government will do anything but continue to stand still where it is. Mr Attlee's present intentions are plainly to stay in office through the winter—and, it may be, even longer. He has a good chance of succeeding in that. It may be doubted whether the Opposition wants immediately to stop him. His own party may, indeed, judge him severely if ill luck in the incidence of infections on Labour members destroys the plan and forces on reluctant campaigners a January election in the snow. That government should depend on marshalling the infirm to the division lobbies is not less fantastic because the public has got used to the fun. But, as long as members' infirmities allow them to rise from their beds to vote,

the remarkable technique of governing the country by single-figure majorities can no doubt be continued. It has already done much more than take the Government through a session and a bit with only two defeats—one in the early days of inexperience during March and one this week on a minor matter of procedure. It has enabled the Government to feel strong enough to insist on prompt nationalisation for iron and steel. After that, most things are possible. Ministers can hardly complain of any lack of power to do whatever they think fit—provided it can be done (as very many things can be done) without an Act of Parliament.

On such terms the Government may get along not merely for the winter but perhaps through next summer too. But it cannot, by even the narrowest of political reckonings, come through the trial unscathed. It is Ministers who suffer most from the strain of long hours of attendance at the House ; the effect, especially on men who have now borne the heavy modern responsibilities of office for more than ten years, must be still further to devitalise British government. The effects on Parliamentary procedure are not less important. Things have come to a pretty pass when the committee stage of every measure—even down to the Highways (Provision of Cattle Grids) Bill—has to be taken on the floor of the House. This slowing-down of the business of legislation absorbs the extra time that Parliament ought now to have for probing into administration and general policy. No doubt this is a welcome relief for Ministers, but it perpetuates into a period of political deadlock some of the worst evils of government by the steamroller majority of 1945.

*

There are also new evils. Near-equality in voting strengths has necessarily made the parties more rigid and uniform internally. That is particularly so with Labour. Whatever its stupidities, the ferment on the Left of the 1945 Parliament did at times usefully enforce a more thorough appraisal of such controversial policies as Mr Bevin's on Palestine. After one early splutter over Seretse Khama the ferment has in this Parliament subsided entirely. That is convenient for the Labour leaders but in the long run unhealthy for British politics ; unrealism can flourish a little less easily on the floor of the House than in the backbenchers' weekly journalistic effusions. As between the two main parties, the political contest has become as dominated by set tactics as was warfare in the pre-Napoleonic era of rigid manoeuvring of massed columns of troops. There is real danger that this formalisation of politics will reduce the popular, democratic interest at least in the present parties.

The sterility of Labour policy-making, the hardening and formalisation of political divisions, are consequences of the February stalemate. But they are its consequences as the Government has reacted to it ; they are not, in their worst features, inevitable consequences. The stalemate implies an absence of highly controversial legislation, but it need not, at a time of external danger recognised by both parties, imply an absence of policy. For ten years the country has had too much governing and the greatest need now is for less of it. Of this less legislation is purely the negative side ; it avoids putting yet further burdens on the civil service. The positive side is to do less administering on the basis of existing legislation. This would not weaken policy but would make it firmer by concentrating on the points that matter. It does not mean, for example, leaving capital investment to settle itself in economic conditions as they now are ; it means controlling the level of investment less by fussy administrative regulation and more by higher rates of interest to restrain the projects that bring only long-delayed returns. But the Government is doing less administering only in a few isolated cases: one of the most important—the dropping of the Ministry of Labour's control over engagements—was forced on it by dissent within the party. In general, government must go on as it is because Ministers can think of nothing better.

*

Labour's defence is, of course, that no change is needed: the country is getting along quite nicely on present policies. But no one ever doubted that, once the immediate dislocations of war had been overcome, the British economy of high Government spending and taxation and over-full employment could pay its way in times of world-wide inflation ; no one doubted that, with some degree of restriction on imports and at some exchange rate, sterling could be a hard currency. While the world is inflating we may, indeed, do too well. The Government's policies are essentially measures of containment. They will, no doubt, remain successful in moderating the rise of British prices. For a time they can secure for Britain a stronger competitive position—and more unfavourable terms of trade—than we need. But by its nature the containment is a delaying action. It ensures that inflationary pressures, only suppressed below the surface, will remain strong in Britain when they have worked themselves out elsewhere. It ensures, if it goes on, that at the next turn to buyers' markets the rigid British economy will again be left the fish out of water that it was in the summer of 1949.

Labour's determination is plainly to go on with nothing more than containment to inflation. It is to perpetuate all the economic and political evils of stalemate in the present form. The single, grim consolation is that any better practical alternative is still hard to see. The Tories provide little more than demagogic competition in the promise to squeeze more popular benefits, and particularly more houses, out of the welfare state. In fairness it must be said that any Opposition is bound at this stage to offer some large prospects of popular social betterment. The concentration on housing—for all the unfortunate appearance it gives of thinking of a figure first and of methods afterwards—could be on balance an advantage if it meant that the Conservatives would feel strong enough not to play to the gallery in other policies, and even to try something new. Perhaps it was too soon after Blackpool to expect any signs of that in the debate on the King's speech. It was not too soon to expect a little less general soft-soaping than the Tories were content to produce. For the time being Labour can go on governing by default of an effective opposition. But the time surely cannot be much longer. For the Labour Government is progressively pushing itself into a dilemma. Already its politics are spoiling its economics: it dare not either hold wages down or reduce government expenditure, and is, therefore, incapable of any really effective defence against inflation. And very soon its economics will start spoiling its politics, when the rising cost of living and—probably—sporadic industrial trouble begin to turn the voters against it. Perhaps it is necessary to create a complete vacuum of policy before anything fresh can come in to fill it.

The German Auction

IT has not proved difficult in the western countries—or at least in America and in Britain—to pour scorn upon the proposal that emanated from the meeting at Prague between Mr Molotov and his satellites for still another four-power conference on the future of Germany. The proposals contained nothing new, and their disingenuousness was very transparent. After years of experience with Russian tactics, western public opinion is very well aware what the consequences would be of accepting proposals that would exclude the holding of free elections throughout Germany and place the Soviet's one-third of Germany on a basis of equality with the two-thirds that enjoys the democratic freedom to vote as it pleases.

But it is unlikely that the Kremlin, for all its fantastic misinformation about the west, really expected to produce much of an effect upon public opinion in the western countries. The manifesto was launched with an eye to its effect upon the Germans, and as a weapon in the strugge for mastery in Germany. Far more clearly than the west, the Russians see—and have seen for years—that Germany is the vital battle-ground. Whichever side, east or west, can get Germany effectively enrolled in its support is in a fair way to control Europe. To this end they give a devotion as single-minded as the narrowness of their ideology and their commitments to their satellites permit.

This does not mean that their German policy is not often very stupid—or even that, on balance, it has been less stupid over the five years since the Potsdam conference than that of the western allies. For example, the "national resistance movement" proclaimed by Herr Ulbricht last July was a complete failure, partly owing to the effective action of the Government of North Rhine-Westphalia and of the British authorities in the Ruhr last September, but, more fundamentally, because it conflicted with the present temper of the German people. Communist calls for sabotage and strikes to the slogans of "Americans, go home," and "Germany for the Germans, Korea for the Koreans," met with little response from a passive, egocentric people, who cherish their work and will be less anti-American than anti-Russian so long as America aids them to maintain their factories and asks nothing in return.

But the Communists have always been masters of the tactical somersault. They have now reverted to an only slightly modified version of the policy laid down at the previous conference of Communist Foreign Ministers that was held in 1948. At that time the conciliatory line was hardly more successful than Herr Ulbricht's threats. But no one should leap to the conclusion that it will be equally unsuccessful now. For the circumstances in Germany have changed since 1948. Then the Germans were not in a bargaining position ; nothing but hard work (which is, in any case, a German instinct) was required of them in return for western aid. Now they are asked to do something which they cannot be forced to do. The lists are open and the bidding has begun.

*

It was always perfectly obvious that Germany would, some day, quite inevitably recover its national sovereignty, its equality of status among the great powers and its freedom to set its own course. In 1945, at the time of the Potsdam Conference, it was still possible—not indeed to doubt the inevitability of German political recovery, but to believe that it would be long postponed and that the victorious allies therefore had a long period of years in which to work out their reforms and remedies. But as soon as it become apparent that the victorious allies were not going to work with each other, but as hard as they could against each other, then it should have been clear that Germany's recovery of status would be as rapid as it was certain.

None of the western governments, however, has even yet been willing to base its policy upon this hard fact. Indeed, at the moment, so far from showing any signs of ability to interpret the lessons of the past, the policy of the western powers towards Germany does not even seem able to read the signs of the present. The urgent need of the moment is that the policy should be revised in the light of the need for incorporating the Federal Republic into western defence organisations. It might be objected that only last September the Ministers met to do precisely this. But they spent so much time discussing what Germany was to contribute to a future European Army that they gave virtually no consideration to the changes that are necessary in Allied

control of Western Germany during its transition from an ex-enemy to an ally. The September communiqué, a vague document, would, if taken *au pied de la lettre*, have meant an actual increase in the powers of the High Commission. Even with the most liberal interpretation, it cannot involve much further freedom of decision for the Germans. The western powers are inclined to dwell overmuch on the extent to which the Germans have been granted an internal political freedom which most of them have never known and few appreciate. It was right to accord that freedom, but not enough. In the economic life of the country, the machinery started by Potsdam still grinds on. The Ruhr Authority, which seemed likely to die a natural death in an era of surpluses, has recently revived in order to force the Ruhr to export coal which expanding German industry requires ; and Dr Adenauer has not yet received any assurance that this organisation will cease to exist as soon as the Schuman Plan comes into effect, or some other body takes over the international allocation of scarce raw materials. The High Commission still retains its right to break up the vertical trusts which dominated the German iron, steel and chemical industries, though even at this late date the problem of their ownership and reorganisation is still far from solved. At the same time the High Commission, in particular its American element, still insists on all manner of restrictions in the endeavour to dissolve any and every form of cartel and to prevent them from reforming. Even dismantlement, which is responsible for more bad feeling to less purpose than any other allied measure, has not completely stopped. It is not surprising that the demand is growing more and more insistent that Germany shall be accorded equality of rights in the economic field as an essential prerequisite for German participation in the Schuman Plan, and later in defence. If Dr Adenauer cannot secure really far-reaching concessions for his country in matters concerning the trade and industry of Germany, he may lose even the present half-hearted support he gets for his policy of collaboration in western defence.

The point is not whether the Germans deserve to have these relaxations conceded to them, or whether the result of conceding them will be to produce the sort of German economy that the western victors desired—the time when considerations of this order could decide matters has long since passed. The only important question is whether, so long as these disabilities exist—and are daily exaggerated in the German press—there is any prospect of persuading Western Germany to bear any part of the burden, in money or manpower, of Atlantic defence. It is a dangerous illusion to suppose that the Germans must under present conditions support the West because logic and justice demand it, or because they are anti-Russian and must wish to defend themselves, or because Britain, France and the United States would find it intolerable if Germany were simply to profit from the concentration of all its commercial rivals on armament production.

Neither logic nor justice will be effective in deciding the German attitude. Their anti-Russianism does not imply pro-Americanism. Their present objection to Communism is no guarantee that they will be ready to die or even pay taxes for a concept of individual liberty which they have only known as the concomitant of enemy occupation. Among the greater part of the young men the militant enthusiasm they displayed under Hitler has given way to a disillusioned pacificism under a leadership which provides them with nothing to fire their imagination. Dating world history from 1945, a large proportion of Germans find it easy to argue that the job of defence is one for their western ex-enemies, since the quarrel between East and West was none of their making, and strategic necessity demands a front on the Elbe. And since Germany has suffered so much more than the other nations from the war, the argument runs, it is unthinkable that it should bear any further financial burden. Above all, German sentiment opposes the idea of providing cannon fodder to protect a retreat of the French and other forces behind the Rhine.

How far irresponsibility can go can be illustrated by the demand raised by Dr Schumacher, the leader of the Social Democrats, by Pastor Niemoeller, and other leaders of the protestant churches, that the issue of remilitarisation shall be settled by the people in a referendum or general election—oblivious of the fact that this plays straight into the hands of the Communists. Dr Schumacher has even made the nonsensical demand that no German must aid the west until the Atlantic Treaty powers guarantee that the first battle shall be fought and won on the Vistula—in other words, until German aid is no longer necessary. If those Germans who, like Dr Adenauer, sincerely wish to see Germany committed to the west are to be successful, they will need powerful assistance.

*

Ever since 1945 there has been only one sound basis for policy towards Germany. The western powers should have made up their minds on a very short list of restrictions to be imposed, and demands to be made, upon Germany, asking themselves in respect of each item not only whether it was basically necessary to their purpose, but also whether it stood any chance of being permanently maintained—which means, in effect, freely accepted or at least tolerated by the Germans. Once this list was established, and pruned to essentials, all other disabilities imposed on Germany in the armistice period should have been progressively removed early enough for western policy to reap some benefit from their removal. There is no question whether such things as dismantlement and trade discrimination will go ; the only question is whether the circumstances of their removal will help the friends of the West in Germany or provide triumphs for the instigators of grievances against the West.

Most of the chances of pursuing this policy have now gone. There may still be some left, though there is a sybilline progression in these matters, and with every delay a larger price has to be offered for a smaller gain. But it is still perhaps just possible to persuade a sufficient majority of the Western Germans to see all the advantages, and therefore to accept the burdens, of full membership in the Atlantic Pact, and thus to complete the ties of trade, of religion and of political institutions which have during the last few years increasingly bound them to western Europe. At the risk of tedium, it must be repeated that the western powers will quite certainly, at some time in the next few years, find themselves compelled to put up the price required for this bargain by releasing the Germans from their present restrictions and disabilities. The only question is whether they will get anything in return, and the only chance is to act both largely and at once. The first step might well be a four-power conference—but with Dr Adenauer, not Mr Molotov, in the fourth seat.

The Controls—I

Emergency Powers Since 1945

THE only substantial item in the King's Speech last week was the proposal to introduce legislation to "make available" to the Government "on a permanent basis but subject to appropriate parliamentary safeguards, powers to regulate production, distribution and consumption, and to control prices." The subsequent debate on this portion of the Address, which took place on Tuesday, did not reveal in very much more detail what is in the Government's mind. It evidently does not propose anything quite so sweeping as the simple perpetuation of the existing powers, which were recently extended for a further twelve months with very little discussion. But the tone of Dr Dalton's speech made it clear that Ministers' demands for permanent powers of control are unlikely to be modest. Indeed, most Labour discussion of the subject of controls tends to assume that it is a simple issue of retaining all the present powers of control or else of having none at all. It was in this spirit that the Lord Chancellor, in the summer, chose to treat the debate on the Liberal Party's Liberty of the Subject Bill as if the occasion were an evening out with a local debating society. As a matter of political tactics, it would suit the Labour Party's book if this assumption could be made general ; they would not then have to argue the necessity or the merits of any particular power they ask for ; and with luck the Opposition could be tempted into arguing for complete *laisser faire*.

But in fact the issue is not one of simple black and white. Only the ignorant can be "for" or "against" controls in the abstract. The only sensible questions to ask are which powers are needed, for how long, and with what safeguards against their abuse. The answers can only be given in detail. It is proposed to attempt this task in a short series of articles, of which this first one is mainly concerned with the present state of emergency powers and how it arose.

When the Labour Government took office in July, 1945, the wartime Emergency Powers Acts had some eight months more to run. Parliament had obediently given to the executive the right to make what regulations for the conduct of the war it thought fit to draft, but it had insisted that these absolute powers should have one limit, that of time. The Labour Government had until February 24, 1946, in which to decide whether to accept the existing time limit or to ask for an extension. It asked for an extension but it devised a new method of approach. In effect, it divided the wartime defence regulations into two groups ; those which it claimed were still needed for their original purpose ; and those which, it claimed, were needed for new purposes, to regulate the economy in a postwar period of shortages and to assist the processes of reconstruction and reconversion. The first group were to be prolonged, for some two years only, by a further Emergency Laws Act. The second group were to be extended by a new Act, a Supplies and Services Act, and for that the Government asked a life of five years, plus the opportunity to prolong it further by yearly extensions if both Houses so agreed.

Both Acts were amended in 1947. The Emergency Laws Act of 1947 extended the life of some of the defence regulations already prolonged by the 1945 Act until December 10th this year (now extended for a further twelve months). The Supplies and Services Act of 1945 was amended by grafting on to it an entirely new reason for keeping on foot some of the defence regulations still surviving. The additional object to be served is worth setting out in full: "generally for ensuring that the whole resources of the community are available for use and are used in a manner best calculated to serve the best interests of the country." The 1947 amending Act passed both Houses ; misgivings aroused by the ominously vague and general language of the new clause were stifled by the atmosphere of crisis just before the convertibility of sterling had to be suspended and by the fact that the original Act had then only another three years to run.

*

The subject of liberty in the modern state is one which is of the greatest importance and yet one which too easily escapes on to the metaphysical plane. It is not the business of the Opposition in Parliament to discuss metaphysics but Government proposals ; for that reason alone the Supplies and Services Act as it now stands makes a convenient starting point for considering the powers of the executive. Although it has not been greatly abused —except in the mood of panic at the time of the fuel crisis in February, 1947—the Act puts in the hands of the Government a very wide range of dictatorial powers, including a power to override any Act of Parliament passed before 1947 save the two 1945 Acts under discussion.

It is alien to the whole conception of parliamentary democracy that a Government should say "These powers should stay because you never know when they may be useful." Of this Ministers showed at least a slight awareness both in last month's debate on the extension of the Act for twelve months and in this week's debate on the Address. But that they still regard any excuse as good enough for an extension of ministerial powers is shown by the eagerness with which they seized upon rearmament. The argument was, in effect: "A new emergency is arising, so we may need these powers." There was little attempt to show how the powers are related to the expected nature of the emergency. They have little relation to war. If the international situation were to worsen, making a large military and economic mobilisation necessary, the Government would have in any case to ask Parliament for a new Emergency Powers Act ; the powers remaining in force under the present legislation are quite insufficient to meet a full emergency. It follows that, if the outbreak of war in any case requires new legislation, the danger of it provides in itself no logical reason why the Government should have at present any reserve of powers over and above those it is actually using. "They may be needed" is nothing but the plea from laziness of the politician in power.

The defence regulations kept alive by the Supplies and Services Acts are many and important. Some of the structure of price control, a good deal of the control over building operations, and all the elaborate machinery governing utility clothing and furniture, food rationing and subsidies—all these depend upon defence regulations. So do the powers to control exports and imports directly ; so do all the Minister of Health's powers to

permit local authorities to requisition land and property and to keep it requisitioned; so does the Minister of Labour's power to declare a strike illegal. So do a host of minor powers; for instance, the Local Authorities (Charges for Dustbins) Order, 1949, was made under Defence Regulation 56, the Syrup and Treacle Order, 1950, under Defence Regulation 55. Some of the regulations date back to the earlier period of the war. A few—notably one empowering the Minister of Health to authorise subletting in houses where the lease prohibits it—were hastily tacked on to the wartime regulations between July, 1945, and February, 1946, before the power to make new regulations vanished. All were made five years ago at least. There is no logic about the pattern; the single connecting thread is expediency.

Has it been essential to keep these defence regulations alive in this way? Of course not. It is clearly arguable that some are still needed—that will be the subject of a subsequent article—but there has been no valid reason why they should be prolonged in this particular way. Among the original defence regulations were those that controlled the movement of money in and out of the United Kingdom, an essential wartime requirement and one for which the need, it may be admitted for the sake of argument, still exists. But these regulations are no longer imposed by the authority of the Supplies and Services Act. In 1947 the Government presented to Parliament an Exchange Control Bill intended to make its powers to control movements of money permanent. The Treasury, at least, had the courage and honesty (and, perhaps one should add, the influence) to cast its postwar requirements into the shape of a parliamentary Bill and to submit that Bill to the full scrutiny of a postwar debate. The Minister of Agriculture took the same course over most of his responsibilities. It may still be necessary for local authorities to keep their wartime powers over requisitioned houses after December, 1951. Is there any reason, in principle, why the Minister of Health should not have presented to Parliament the equivalent Houseownership Control Bill at any time over the last year or so—any reason, that is, except the wish to avoid a discussion that might have had unpleasant consequences on polling day?

There is one defence regulation in particular that the present Government would obviously be most reluctant to debate in detail; one can well believe that a proposal to make the Supplies and Services Act permanent in a general form will spring from a desire to avoid any such debate, on the principle that the more overcrowded the coach the more difficult it is to scrutinise each individual traveller. That is Defence Regulation 58, which authorises the Minister of Labour to set up wage arbitration tribunals for various industries and when this is done any dispute in that industry must be referred to the tribunal and no strike or lock-out action may be taken during the following twenty-one days. Action earlier than this is illegal and it is this regulation which enables the Minister to declare illegal the unofficial strike. What Minister of Labour today would willingly lose that weapon from his armoury? Yet what Minister of Labour in a Labour Government would willingly face a debate on a motion for its extension?

The Supplies and Services Acts present to Parliament, and to the Government, an issue of importance in an unusually acute form: how far should expediency be allowed to prevail over principle? And the first point of principle that public opinion should press upon the Government is that there must be a careful attempt to discriminate, if not between individual powers and purposes, at least between categories. There are some powers that are now being exercised for which everyone will recognise a continuing need. There are other powers now being used which are painful necessities, to be tolerated only until they can be done away with. There are still others which are kept in force only because the bureaucracy will not let them go. And there are others again which are held in reserve—some rightly, some wrongly. All these deserve different treatment. The essential principle of any permanent Act must be discrimination.

(To be continued)

Humpty Dumpski

IT is curious, when one comes to think of it, that no political party has thought it worth while to compile and keep up to date a record of the sallies and epithets it has found most useful in the past. One would have expected the research organisations of the parties to hand down from generation to generation of members an anthology of masterpieces of rudery which could still be used with effect in a House of Commons where the art of invective is in decay. And even outside the House there are things now being said and written which should be preserved for the polemics of the future—things such as the Socialist taunt that a liberal economist is someone who believes in mass unemployment, or that classic phrase "frozen penguins of the City," or the Communist denunciation of Mr Churchill as a "cannibal statesman." There exist dictionaries of quotations, without which few leading articles would be started—let alone written—but there have existed hitherto no dictionaries of abuse and invective. In view of the Marxist revolution in world attitudes, the ideological conflict of the age and the topsyturvy state of our bourgeois society, it is remarkable that such aids to dialectics should be lacking.

Some such thoughts must have passed through the minds of two Russian scholars called Liokhin and Petrov, when they began work on their great Dictionary of Foreign Words, which was published recently by the State Publishing House in Moscow. For they have produced just the kind of anthology of abuse that is needed to start a new fashion in dictionaries. They had doubtless remarked that the period of pre-Marxist lexicography, beginning with Galfridus Grammaticus just five hundred years ago, corresponds almost exactly with the period of bourgeois predominance. As that period is now passing, what is more natural than that two ambitious Soviet scholars should anticipate the universal dictatorship of the proletariat by explaining exactly what words are going to mean under it? They have doubtless read somewhere that Samuel Johnson gained the title of "Great Cham of literature" by producing a dictionary.

This is, indeed, an epoch-making work. For one thing it is funny; and it would remain so even if the dictatorship of the proletariat came to pass. For another, it is superbly dogmatic. Liokhin and Petrov's dictionary is in the best tradition of Humpty-Dumpty ("When I use a word"), for when they use a word it means just what they choose it to mean—neither more nor less. And finally, it is gloriously inaccurate. The authors clearly believe, for instance, that cricket is merely a form of hockey not played on ice; for they define it as "a game played with a ball by two teams, during which one tries to hit the ball into the opponent's goal with a bat." If this should seem a rather esoteric subject, on which Liokhin and Petrov are entitled to go wrong, let us take the definition of the Labour Party—as a body which "from 1936 to 1939 supported the internal and external policy of the Conservative Chamberlain." What endless vistas of misunderstanding are opened up by this definition; it foreshadows a period, not so far off, when it will be impossible for a Russian and a European to carry on a rational conversation. Soviet citizens contemplating foreign travel will study their Liokhin and Petrov and so fortify themselves against subversive influences. And foreigners will have to translate it into their own languages in order to discover what the Soviet citizen thinks he is trying to say.

After the deep concern that Stalin himself has shown lest linguistics in the Soviet Union be brought into disrepute, this lapse into crazy lexicography under official auspices might seem deplorable. (Indeed, someone like Mr Maisky, if he is still alive, might be able to convince the Kremlin that the State Publishing House has had its leg pulled. And Humpty Dumpski might have a great fall.) But it would have been a pity if this dictionary had not been compiled and solemnly issued as a contribution to learning. Without it many would have continued to regard as a joke, or as a mere propaganda ruse, the distortion of words, the reversal of meanings through which the Stalinist now expresses himself. Here now, in 780 pages is the evidence in black and white, of the lengths to which the process has now gone. Double talk and double think of 1984 now has its dictionary; it is only a matter of time before it has its academy and its professors.

Realising from the title and the preface the kind of book he is dealing with, the wise reader will start by looking up himself. In other words he will look up the word bourgeois. He finds that he belongs to "the most reactionary class of present-day society, the bitter enemy of the Soviet Union, the People's Democracies and the workers of the world." He may say to himself "I am not that kind of bourgeois; I am a liberal who hates no one" and then look up "liberal" in the hope of more magnanimous treatment. But Liokhin and Petrov regard a liberal as worse than a bourgeois: he "takes up a thoroughly reactionary position, openly joining the counter-revolutionary camp and allying himself to the front set up against the working class. Liberals are fierce antagonists of socialist revolution and the dictatorship of the proletariat." In the second sentence, of course, the truth is told by accident and cancels out some of the malice of the first. And this makes the bourgeois liberal wonder how the bourgeois Socialist and reactionary Conservative fare. The Labour Party is defined as a "reformist, self-styled workers' party, carrying out a bourgeois policy among the workers as agents of imperialist circles in America"; the Conservative Party as a "reactionary party of the bourgeoisie carrying out an imperialist policy of expansion, suppressing by force the workers' revolutionary movement and liquidating democratic freedoms." The only difference between them lies really in the tailpiece: "at the moment (1949) the Conservatives are openly passing over to Fascism."

So much then for British politics. In the eyes of Liokhin and Petrov they amount to nothing more than a struggle within the bourgeoisie, which goes on in a parliament which "guarantees the class rights of the ruling caste" and under a constitution which "expresses and strengthens the rule of the bourgeoisie and its dictatorship." The forces of reaction maintain their ascendancy in this country—according to Liokhin and Petrov—by such organisations as the Boy Scouts, which is a "bourgeois children's movement of a military political character in capitalist countries."

When it leaves the dismal British scene the dictionary is even more sweeping and scathing in its definitions of some familiar features of the international world. Missionaries "are usually the first spies and intelligence agents of imperialist aggressors"; a reference to Dr Livingstone, we presume. The philosophy of reactionary classes everywhere is "idealism, a reactionary, anti-scientific tendency in philosophy, bitterly opposed to true science and closely allied to religion." After this it is hardly surprising to find that "cosmopolitanism is a bourgeois ideology denying the right of nations to national existence and state sovereignty"; or that

> psycho-analysis is an anti-scientific, reactionary, subjective-idealist tendency in bourgeois psychology based on the work of the Austrian psychiatrist Freud. It ignores social conditions . . . and has been completely outdated by Soviet science.

And if Soviet science is so infinitely superior to all other science it is because, among other things, "the Nobel Prize is frequently awarded, not for the advancement of science, and to true workers for peace, but on a basis of class interests of the bourgeoisie."

★

Those British citizens who take part next week in the "Peace Congress" at Sheffield should find this work on the Kremlin's English useful for helping them to understand what some of the foreign visitors are talking about. For Liokhin and Petrov have not invented the nonsense that their dictionary contains; they have merely recorded what they believe to be current usage among the progressive intelligentsia. To judge from previous peace congresses, questions will be discouraged at Sheffield and critics silenced by the stamping of proletarian feet; but if the platform should—for tactical reasons—make any concessions to British democratic practice, someone might ask what is the correct definition of a supporter of the "peace campaign." According to Liokhin and Petrov "pacifists" are wicked people:

> Hypocritically hiding behind the slogan "pacifism," reactionaries oppose all liberation, revolutionary, civil and other just wars. Rejecting the revolutionary activities of the masses; pacifists deceive the workers and conceal the preparations for the imperialist wars of the bourgeoisie. Thereby their policy contributes to the launching of imperialist plundering and unjust wars.

If that is Moscow's definition of a pacifist, then some new term must be found for the kind of people who will assemble in Sheffield. Proceeding according to the well-known Marxist law of opposites, it is quite clear that everyone who is not a warmonger must be a peacemonger. Let Sheffield, therefore, mark the birth of the word "peacemonger" and so contribute yet another term of abuse to Liokhin and Petrov, who are, doubtless, already working on the corrections for their second edition and clearing up the confusion between ice hockey and cricket.

NOTES OF THE WEEK

The Motives of Mao

It can be argued that the motives of Mao Tse-tung in sending Chinese troops into Korea are defensive; that he wishes to warn the United Nations troops off the precious dams and reservoirs of the Yalu river and force them back from the frontier of industrial Manchuria—in fact, that he is concerned only with defending Chinese interests. It can be argued with equal cogency that he is concerned with stemming the tide of Communist defeat and intends—if allowed—to follow a policy of "repulsing and annihilating the unconsolidated American troops, and of forcing the aggressors to accept a just and peaceful solution of the Korea question." The phrase is that of Peking radio.

If the first argument is true, then he should be sufficiently reassured by what has been said in the Security Council and by American statesmen to stop a very dangerous adventure. Unless he is completely misinformed, he must know—what the Washington correspondent of *The Times* stated on November 7th—that

> it was decided on the highest level some time ago that the United States must avoid war with China at almost all costs.

If the second argument is true, then Mao may gain rather than lose by the part that Uno is now playing. The Security Council has now decided, on British initiative, to invite a representative of the Peking Government to answer the charges in General MacArthur's report. As this allows the Peking Government to take its time over making its case, and as the Russians may be expected in any case to veto a decision adverse to China—though this cannot now prevent the dispute from being subsequently referred to the Assembly—the effect of this procedure must be to postpone for a considerable time any action on the matter by the United Nations as such. This delay may be of advantage in keeping the conflict within bounds; it should nevertheless be recognised that, with American soldiers being killed in Korea by Chinese and an increase in Republican strength in Congress after an election in which attacks on the Administration's Far Eastern policies have been a principal feature, President Truman may have some difficulty in resisting agitation in America for some kind of retaliatory action against Communist China.

* * *

Limits of Cold War

The tact and caution with which some governments are treating the Chinese intervention in Korea are signs of a feeling that it is time to try such classic diplomatic techniques as the quiet remonstrance that leaves a loophole for an angry government. A situation in which British soldiers are fighting hand-to-hand with Chinese troops hardly fits into the normal definition of cold war, which has hitherto been conducted according to certain rules, which have been implied rather than laid down.

First among these rules was the assumption that no great power would directly confront another on the battlefield. Greek guerrillas might fight American-directed Greek Government troops, and British troops could fight Russian-trained North Koreans—but that was the limit. Second was the assumption that the conflict would be contained within the area in which it started and not allowed to spread, for example, to Formosa from Korea. Having started the fashion of aggression by proxy and having let it be understood that these were the rules, the Soviet Union and its allies are obviously wondering whether the American and other forces fighting under the United Nations flag understand them. There has been—and still is—on both sides of the struggle between Stalinism and the free world the assumption that neither wants or is ready to start a world war. Each, in case it might be wrong, makes formidable military and ideological preparations. Each is sufficiently ill-informed or doubtful about the intentions of the other to read into a breach of the rules of cold war more than may be intended. One side's "war of liberation" is the other side's "defence against aggression," and each treats the other's definitions as bogus. All this is clear to the diplomatist, but it is dismally obscure to the man in the street in the free world who, quite rightly, makes no such subtle distinctions between different kinds of war.

It is perhaps worth recalling in these anxious days that both the North Korean attack and the United Nations reply to it were experiments: the first in full scale aggression by proxy, the second in collective police action. Each was undertaken without a clear idea of where it would lead, and it is not difficult to understand the perplexity with which both General MacArthur and Mao Tse-tung regard a situation which has no recent precedents. The American cannot finish the job he was ordered to do without alarming the Chinese; the Chinese cannot see why the American should not interpret the rules of cold war to his own strategic advantage.

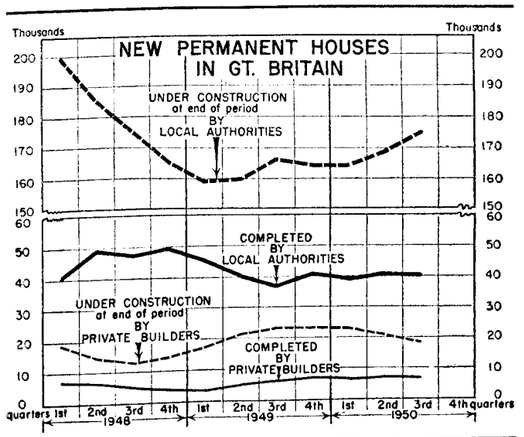
In such a situation the old-fashioned remedy would be to arrange a truce and secure a mediator. But the Stalinists have worked so hard to besmear any independent institutions or persons who might perform such a role—witness the campaign against Mr Trygve Lie and the rebuff to India over Tibet—that the main hope of stopping the threatened international crisis lies in the statesmanship of Mr Acheson and Mao Tse-tung, of whom the former is hamstrung by internal politics and the latter by his association with Moscow.

* * *

Still in the Air

It is hard to take altogether seriously the debate on whether the Conservative housing programme is practicable. The figure of 300,000 houses was conjured out of nothing better than the enthusiasm of a party conference; its acceptance by the Conservative leaders was the same kind of concession to the prejudices of the rank-and-file that is so roundly condemned whenever Mr Attlee does anything remotely "Socialist."

The case against promising to build 300,000 houses a year is not that it is impracticable but that it is irresponsible. Certainly the houses can be built—if enough other things are sacrificed. In the House of Commons on Monday Mr Marples, introducing the Conservative case, declared that houses were "the highest social priority, ranking second only to defence." He can hardly have been speaking for the realists among the Tory leaders. They must know well enough that the acuteness of the housing shortage is the creation of just those Labour policies they condemn (if somewhat half-heartedly). The British public can afford to have a higher demand for housing than it has ever had before largely because food absorbs much less of its income than it did before the war. If there were not food subsidies and if housing subsidies were concentrated on slum-clearance schemes, so that most tenants had to pay an economic rent, instead of being forced to pay for houses by taxation, then, if the shortage did not vanish overnight, at least the need for a rate of building in excess of 200,000 houses a year would.



It is true that a Conservative Government would not immediately scrap the subsidies. The official policy is supposed to be gradually to reduce them. Is it consistent with this to talk about a "long-term" building programme—for five or "better still" ten years—that would allegedly give security to the brick manufacturers? If the Conservatives are serious in this they are proving themselves as anxious to perpetuate the artificial prices and rigidities of the British economy as is any Labour planner or trade unionist.

It is impossible to judge more kindly one other of the methods by which the Conservatives on Monday proposed to build more houses: that is to recruit more labour to the industry. At this stage, with inflation mounting again and the demands of rearmament barely begun, it is folly to think of devoting more of the country's resources of manpower to the satisfaction of a subsidy-generated need. Few people will believe that a Conservative Government would in practice be so foolish. To include this among the proposals was to admit that many of the extra 100,000 houses are still as much houses in the air as when they were first thought of.

* * *

The Rate of Building

The practical test of the Conservative programme is whether it could produce more houses without calling for more labour and without the concoction of ten-year commitments to suppliers. No doubt in considerable measure it can. Mr Marples made many sensible, if old, suggestions. There is plenty of scope for increasing the efficiency of building by

the wider application of payments by results. There can be little doubt that houses would be built faster if the speculative builder were allowed more scope (though Mr Churchill's promise to maintain "the priority given to houses built by local authorities" sets a fairly sharp limit to this gain). Thirdly, there is everything to be said for allowing local authorities freedom to build houses smaller than the rather extravagant Dudley-Bevan standard and for the present to exclude some of the more elaborate fittings.

By these means the rate of house-building could be usefully increased and the proper indictment of Mr Bevan is that he will not even consider them. To abolish the bulk purchase of materials—another of the Conservative proposals—might also help to put up the numbers built, but possibly also their cost. And it would not now be unreasonable to spend dollars on as much extra timber as greater efficiency enabled the building industry to use. The question is whether these various measures add up to produce 300,000 houses a year. The most recent quarterly housing returns (Cmd. 8072, 8073), which are summarised in the chart below, show that the rate of completing houses is now fairly steady at 17,000 a month—just over 200,000 a year. At the moment a steady fall in the number of workers engaged on building new permanent houses is being about offset by a slow increase in productivity, especially where incentive bonus schemes are being introduced. Could the Conservative proposals produce such a spurt in productivity as would raise the rate of building to 25,000 a month? Plainly the Conservatives themselves do not think so: they would not otherwise have fallen back on the suggestions for recruiting more labour and for framing "long-term" programmes. On an optimistic view, improved efficiency might in a reasonable time raise the building rate to, say, 20,000 finished houses a month. To promise the electors more than that is to undertake to remove labour from some other industry. And such robbing of Peter to pay Paul is consistent neither with the rest of Conservative policy nor with the patent economic needs of the country.

* * *

Calm in the Council of Europe

In the short space of last weekend, the Committee of Ministers of the Council of Europe met and dispersed in Rome. But if their proceedings were short they were, even in the absence of Mr Bevin, sweet—and generally sensible. A most encouraging symptom was the growing evidence on all sides of a policy of live and let live, particularly on the question of revising the Statute of the Council to give it the possibility of greater federal authority.

Here the Ministers, dodging any decision on proposals offered by the Assembly, decided that the Statute as a whole should be re-examined by a group of high officials, reporting back on March 1st. To some extent this was mere temporising, but in two respects it was an important step. The first is that the Ministers should at last have reached some unanimous decision on this vexed question; the second that, in passing the buck to the experts, they agreed in principle to two of the Assembly's recommendations which open the way to limited progress by "partial agreements" between some member states only. While Mr Davies prefaced his agreement by an apologia on Britain's position

which marked little, if any, advance on the Government's previous views, he stated unambiguously that Britain did not want its own inhibitions to frustrate any progress that other countries felt they could make without Britain ; and, said Mr Davies, good luck to them. This went a long way towards reassuring M. Schuman, and it should at least provide a challenge to the other members of the Council to show whether they really can and want to federate. Perhaps the only person left with a grievance was M. Spaak, who expressed understandable impatience at the prospect of his Assembly's recommendations being scrutinised by some "expert" high officials, and not returned direct to their creators.

Storm signals went up when the Ministers came to the question of a European army, which has been transformed by France from a Churchillian challenge into the Pleven plan. Even this did not ruffle the calm, though it was unfortunate, perhaps, that Mr Davies took it upon himself to introduce the proposal to postpone discussion. In so doing, he was bound to restate the legalistic British case that it would be *ultra vires* under the existing Statute. The French themselves had left no one in any doubt that they did not want the Council of Europe to be seized of the issue, while it was still with the North Atlantic Council.

* * *

Atlantic Pact Arguments

More than a month has passed since the North Atlantic Council announced, with a fanfare of trumpets, that they had agreed to establish an integrated defence force under single command. All that remained to be done, it was understood, was for the Defence Committee to make its final report on the technical details, and then, "at the earliest possible date," the force would be well on the way to existing. But the Defence Ministers have met and nothing tangible has emerged except more delay, and the dawning realisation that the Foreign Ministers had left a great deal more to be agreed than they admitted in their communiqué. It is now clear that no final agreement can be reached at least until the middle of December, nearly three months after the original decision, when the Council meets again in Brussels.

If the Defence Ministers had been stranded on the sands of technical details, the delay would be disappointing but understandable. Modern armies do not spring from dragon's teeth, and the problem of raising and equipping the necessary manpower, let alone of resolving conflicting national aspiration in the various fields of defence, are formidable indeed. But this was not so ; with commendable promptitude the Defence Ministers arrived at a decision on the total size and national distribution of the forces ; what checked them was the political problem, handed on to them by the Council, of the status of the integrated force, and of German participation in it.

The resulting delay is alarming. Not only has there been no final decision on the distribution of short-term aid—which is intended to keep things going until the new American appropriation next year—but there is a growing need for urgency in working out the complex multilateral basis for the distribution of long-term mutual aid (some aspects of which are discussed on p. 750). This can only be done in the light of the strategic decisions of the Council. Firm decisions on the contributions to be made by member countries and their needs have to be ready in time for the presentation to Congress of the 1952 budget, in January next. Unless some solution of present difficulties is found—perhaps by an agreement to postpone the political problems which are bedevilling practical work—the Atlantic Treaty powers may well find that the right number of troops cannot be got to the right place by the date agreed. Yet that, after all, is the main purpose of the pact.

Lion's Share for France

There is still no sign of compromise between the conflicting French and American views on Germany's role in western defence ; but the American answer to French fears of German rearmament was crystallised this week by Mr Douglas, retiring American Ambassador in London. In a speech at the Pilgrims' dinner he restated American support for the Schuman plan as a means of bringing about the reconciliation between France and Germany, without which no common defence is possible. The French were also reminded that the military security of their country would be guaranteed and the international good behaviour of the Germans assured by the prospect of a "genuine international military and defence organisation subject to genuine political direction."

Quite apart from the Ambassador's speech there is abundant evidence that Washington has gone to considerable lengths to reassure France. M. Petsche has himself declared that, so far as material aid is concerned, the US government has done its "utmost" to satisfy French needs. The French have been promised the largest single share of the total military equipment to be distributed among the North Atlantic powers under the American appropriations for 1950 and 1951 ; this should amount to between $1.6 and $2.2 billion worth of arms. France has also been granted $200 million, part of which is not formally tied to purchases in the United States, and will be used to finance raw material imports and to help balance the French budget. The lion's share—some $275 million—of American appropriations for military assistance to the Far East will also go to France in the form of military supplies for Indo-China.

Simultaneously with this material aid Washington is willing to support an arrangement by which Western Germany would have no general staff and no defence ministry ; German troops would take their orders directly from the Supreme Commander of Nato. This provision, it is believed, meets the most serious of all French apprehensions—that a rearmed Germany would drag the rest of Western Europe into a crusade to regain its eastern territories.

Beyond these steps—and perhaps some vigorous advice to the Germans to get on with the Schuman plan—there seems little more that the United States can do to overcome French hostility to armed Germans.

* * *

Private Members' Time

In its second session Parliament is to enjoy one useful by-product of the political stalemate. The Government, unable to embark on a wide series of controversial measures of its own, has decided to restore to private members their rights to initiate both motions and Bills. In 1949 Bills alone were allowed, and in the last session motions alone ; now ten days are allotted to each. The House has also voted to restore the "Ten Minute Rule," under which private members' Bills may be put up to a snap decision after question time.

The effect is to restore the full prewar rights of private members. This is not less welcome because the Government has postponed it as long as it reasonably could. The next step rests with private members. It is their responsibility to make sure that the time is put to its proper use. That is to deal with the kind of small but urgent issue which should be the concern of the individual member rather than of the party machines. As was pointed out when the House discussed private members' time last month, it has in the past only too often been used for matters bearing the clear imprint of the Whips' office ; what was intended as an assertion of the rights of the individual member is liable to become only another, if indirect, assertion of the party machine.

This danger of misuse is greater for motions than for Bills. Most of the private members' Bills introduced in the 1949 session showed marks of individual authorship, and the five which reached the Statute Book were all of value. But it is now suggested that the Conservatives intend to use the procedure to introduce into the Commons a Bill, already in the Lords, which seeks to make important revisions in the Transport Act. This would surely be a mistake. There is, indeed, no reason why private members' Bills should be non-controversial. But they should be serious attempts at legislation in fields with which the political parties as such are not concerned. Road transport is certainly and properly outside that category.

* * *

Liberal Voters

Oxford and the Scotstoun division of Glasgow are as unlike as most pairs of constituencies, but the recent by-elections suggest that in both the Conservative party is now helped by the absence of a Liberal candidate. The evidence is not conclusive. It is strong.

At Oxford last week 1,875—7 per cent—more votes than in February were cast for the Conservative candidate. The number of converts must have been higher than this, since there would certainly be some Conservative voters at the general election who did not trouble to go to the poll in the lesser excitement of a by-election. It is possible that all the converts were won from Labour, whose poll fell by 3,517 (15 per cent) ; since the total poll fell by 8,943, all the 6,807 Liberal voters of February (and the 494 Communists) may have abstained last week. The strong probability, however, is that apathy kept many more than 1,642 Socialists and Conservatives from the polling booths, and therefore that a fair number of Liberals voted for one or other of the two big parties. There is little reason to suppose that either at Oxford or at Scotstoun, where in both cases the Conservatives were defending a narrowly held seat, apathy would affect one side more than the other. If Labour did not lose relatively heavily on this score, the likelihood is that it failed to attract as many of the Liberals as did the Conservative party. This conclusion is almost certain for Oxford and likely, but no more, for Scotstoun. There the Liberal vote in February had been only 2,023 and Labour lost less ground at the by-election—its vote was cut by 12 per cent, while the Conservatives also lost 4 per cent.

This conclusion does not apply to members of the Liberal party, and especially to its active workers. No doubt most of them would still prefer to abstain, and many even to vote Labour, rather than to put a Tory into Parliament. But the signs are that, of the unattached voters who supported Liberal candidates in February, more would now vote Conservative—in many and perhaps in most constituencies—than would vote Labour. It is not, after all, surprising that if opinion is moving slowly to the right (as the by-elections, for what they are worth, suggest) the Conservatives should gain from the centre as well as from the Left. The implications have to be weighed by the Liberal leaders as well as by the Conservatives.

* * *

Liberals in Parliament

Liberal voters have hardly been encouraged to faithfulness by this week's voting of their nine representatives in the House of Commons. The independence of Liberal members is one of their great assets. But no group of like-thinking people can claim to be a political party without setting some limits, however wide, to the exercise of individual conscience. There are many occasions when Liberals may properly be found in both division lobbies. There is no reason why a centre party should be united on issues between the Right and the Left ; it may reasonably claim that these are not the real issues and Liberal members may, in many cases, judge differently which of the two sides has slightly more of the truth. This is, however, rather more subtle a point than can be effectively made at most political meetings. It was, to say the least, unfortunate that on Monday the Liberals supporting the Government against the Conservative amendment on housing included the deputy leader of the parliamentary party, while its chief whip was among those who voted with the Conservatives.

The split on Monday would have mattered little if it had not been followed by Tuesday's debate on the cost of living. Here the division was on an amendment put down by the Liberals themselves ; it was not a case of choosing between the two evils of Conservatism and Socialism. If the Liberals could not act as a united party on this the voter is entitled to ask whether their Right and Left wings really have any practical policies in common. Yet the deputy leader and two other Liberal members deliberately abstained. Their reason was not, apparently, that they disagreed with the amendment but that they thought it should not be pressed to a division. It is hard to see what else they thought could happen: Parliament had last week given time enough to general debate without dividing on specific amendments. But even if there had been any point in putting down the amendment without wanting to vote on it, no party—and the Liberals least of all—can afford to advertise its differences over minor matters of tactics. The beginnings of a Liberal revival in the country have to be sought in some slight measure of cohesion in the House of Commons.

it coincide with the latest Russian efforts to display better party manners at Uno and in a conference of the Foreign Ministers about Germany—if that can be arranged—but it will also mark an important new stage in the Communist effort to split the Atlantic partnership, hamper rearmament, and return to the united front tactics of the thirties.

That Britain should be chosen for the launching of this operation is easily explained. Nowhere in Europe has the Communist Party suffered more from the Stalinist connection; nowhere have the bridges between the democratic Socialist and the Party been blown so extensively; nowhere is there so much to be gained by trying to combine a bogus, anti-American pacifism with the genuine anxiety of workers about wages policy and a rising cost of living. For such a prize the Communist strategist is ready to perform almost any tactical manœuvre.

Mr Pollitt prepared the way three weeks ago in his report to the Executive Committee of the Party. First there was the coaxing reminder to old comrades who have drifted rightwards that Arthur Henderson used to oppose the idea of attaining and preserving peace by strength. Then—as a concession to British common sense—there was the unceremonious jettisoning of the Stockholm peace resolution:

> In the new situation the peace movement cannot confine itself only to a demand to ban the atomic bomb.

Then there is the flattering suggestion that "a mass peace movement in Britain can save peace," and that its people have a common interest with colonial peoples in opposing "American imperialism." And lastly the prefabricated bridge is thrown over to the British trade union movement. If it will oppose rearmament it can avert such "consequences" of rearmament as higher profits, lower real wages and more controls. It is invited to join in a "massive united front" in which "Party and Young Communist League" members will fight in the front rank. Just in case it should be thought by veteran comrades that any real *volte-face* from Stalinism is intended, Mr Pollitt declared:

> If the organised workers producing and transporting the coal, the steel, the bombs and uniforms are wholeheartedly for peace this can be a decisive force for preventing war.

* * *

One Step Back to Madrid

At long last an illogical and unsatisfactory state of affairs has been ended in the relations of Britain and other countries with Spain. A week ago the United Nations General Assembly voted by 38 to 10, with 12 abstaining, to rescind that part of the resolution passed in 1946 which called on members to withdraw heads of missions from Madrid. Spain is also to be admitted into the agencies of Uno without becoming a full member of the Organisation. In this development Britain has played a negative and somewhat disingenuous part: along with France and the Scandinavian states it abstained from voting on the motion—which was backed by the United States. In other words, it did not honestly say what it thinks, which is that it dislikes the Franco regime, would like to see the Spanish people get something better, but has found by experience that the absence of a British ambassador has neither weakened the regime nor helped the people. If anything, the Caudillo is more firmly established than ever. If their envoy now reappears, as he doubtless will, the abstention of the British at Uno will ensure that they get no credit for it.

This policy of embarrassed silence was the outcome of a difference of view between the heads of the Foreign Office and the hearts of the Labour Party. The party men who can just abide Marshal Tito and see all the advantages of maintaining diplomatic missions behind the iron curtain cannot stomach General Franco. Without perhaps realising it, they accept in some cases Salisbury's dictum (which has not escaped Stalin's notice) that

> in past times we have not inquired what the government of a country was in deciding to protect great strategic positions which it was necessary for the interests of England and Europe should be kept from an overwhelming power.

But, for understandable reasons, they regard dictatorship of the right as more untouchable than dictatorship of the left; and they dread nothing more than the charge from the local branches of the party that the cold war is driving them into the arms of Fascism.

There is no question of any such thing. All that has happened is that a Uno decision now makes it possible for British interests and points of view to be represented in Madrid with full authority. Those who wish to criticise General Franco will go on doing so, doubtless encouraged from time to time by such crudities as his description of the Uno resolution as "victory in the last battle of the civil war."

Friends With Italy

In spite of occasional outbursts by individual Italians, the ill-feeling generated by each of the three main subjects in dispute with Britain has lately declined; these subjects were colonies, trade and the Atlantic Pact. Last year the United Nations reached a temporary solution of the problem of the former Italian colonies only after grinding debate; but this settlement proved enough to cut the ground from under immediate Italian ambitions to regain all the lost territories.

While, therefore, anxiety about Italians in the former colonies is not dead in Italy, the colonial question has become less of a national issue and Britain is no longer blamed for every development. Somaliland may be dismissed now that it is under Italian control. In Libya Rome is still much concerned about the future constitution; in Eritrea about police protection and taxation problems affecting Italians. Last month the Political Committee of the UN General Assembly passed by 53 votes to 1 (France) measures to establish a provisional Libyan government by next April, in preparation for complete independence by January 1, 1952. The new state will subsequently be put up for membership of Uno and may receive technical and financial assistance from it. As the predominant power now administering Libya and Eritrea, Britain has a special obligation to the remaining Italian communities to see that they are not victimised as an alien minority.

Italy has built up its sterling balances to a considerable level, and there is little present complaint on economic grounds. In the field of the Atlantic Pact, on the other hand, there is still plenty of room for misunderstanding. In the Chamber of Deputies recently Count Sforza, the Foreign Minister, had to give assurances that Italian forces would remain on Italian territory. If the British and Americans appeared to favour the defence of northern Europe at the expense of the south—as they easily might, by talking so much of Germany—last year's suspicions that Italy might have to be sacrificed would revive. Now that their industry is being given a genuine role in western rearmament, the Italians rightly count on similar treatment throughout the North Atlantic defence plans.

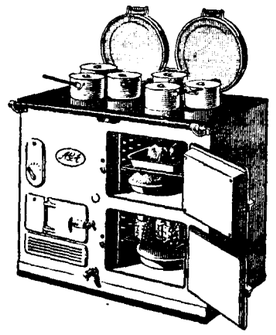
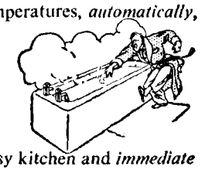
Twenty Million More for the Colonies



It is not quite two and a half years since the Select Committee on Estimates reported on the underspending of the amounts voted for the colonies each year under the Colonial Development and Welfare Acts. This week the House of Commons was asked to give a second reading to a new Colonial Development and Welfare Bill, which increases the total sum payable from the Fund in the ten years ending March 31, 1956, from £120 million to £140 million and

ONLY AGA



Regd. Trade Mark

Gives you all these NINE advantages in ONE combined cooker and water heater

1. Burns *unrationed* coke and thus serves you independently and at full efficiency every day and at all times.
2. Fuel consumption *guaranteed* not to exceed 3½ tons a year; costs less than £4 . 7 . 6 a quarter for all your cooking and bath water, or less than 1/- a day.

3. The largest true boiling and simmering plates of any cooker on the market. Two enormous ovens (one roasting : one simmering).
4. Thermostatically controlled to maintain hotplates and ovens at the required cooking temperatures, *automatically*, without knobs or switches.
5. Gives you 3 *piping hot baths* a day and lashings of washing-up water all day long.

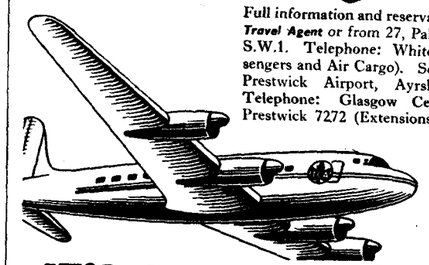
6. Stays in all night to give you a cosy kitchen and *immediate service* from first thing in the morning till last thing at night.
7. The shiny, vitreous, enamelled surfaces are cleaned in a moment with a damp cloth. *No moving parts to remove and scrub.* No flames to blacken utensils. No smoke or fumes. Nothing to burn out. Absolutely *safe*.
8. Every Aga is *guaranteed for 10 years*. In fact the Aga, with its massive chrome-steel fire-unit, lasts a lifetime.
9. Available on *Hire Purchase* over periods of up to 5 years but, by its saving of fuel, in most households it creates its own instalments.

Send to-day for free, 26-page "Saga of the Aga", fully illustrated in colour, dealing with all Aga models and including kitchen designs by a leading expert. Write to: Aga Heat Ltd., 34/6 Orchard House, Orchard Street, London, W.1. *(Proprietors: Allied Ironfounders Ltd.)*

2/6d. A DAY BUYS THE AGA AND PAYS FOR ITS FUEL

Canadians will play!

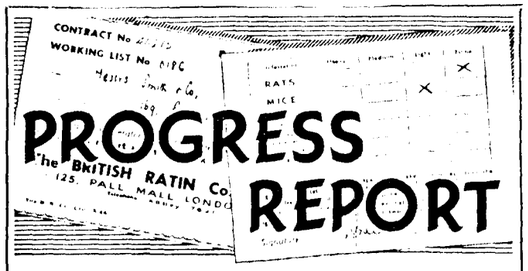
WHEN YOU SELL GOODS to Canadians the way they understand—*on the spot*—you'll find they *will* play! The U.S. business man operates that way—and uses *high-pressure* salesmanship. Remember, Canadians don't just buy goods but expect to be 'sold'. By flying T.C.A. today you, too, can operate in the heart of Canada's market tomorrow.



DOLLARS FOR THE ASKING!

Dollar-orders will be yours for the asking when you fly into Canada's market by Trans-Canada Air Lines, the most frequent service to Montreal and all of Canada. Board your Skyliner at London or Prestwick—and it takes only a day to reach major cities like Montreal and Toronto. You can do business in the U.S. market, too—note that T.C.A. now have a direct Montreal-New York service with, if you wish, stop-over in Montreal at *no extra cost*. Your Skyliner trip will be a *pleasure*. Friendly service . . . twin-cabin roominess . . . deep, reclining chairs . . . piping-hot meals . . . snacks and drinks to order . . . "on-time" arrival.

Swift Skyliner services link you with *every* important Canadian and U.S. city. Let T.C.A. take you there—and *you* will take the orders.



TRANS-CANADA *Air Lines*

Full information and reservations from your *Travel Agent* or from 27, Pall Mall, London, S.W.1. Telephone: Whitehall 0851 (Passengers and Air Cargo). *Scottish Address:* Prestwick Airport, Ayrshire, Scotland. Telephone: Glasgow Central 3428 or Prestwick 7272 (Extensions 268 and 269).

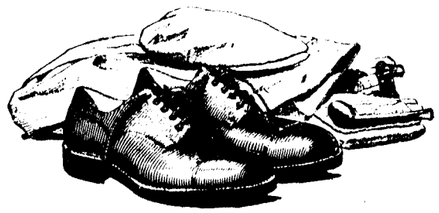
IT'S ONLY A DAY BY TCA

— AND BRITISH ALL THE WAY!

Clients of the Ratin Service sign a progress report after each visit by our operator. Here is proof that an occupier has taken **the most effective steps** possible both to protect his property and to conform to the requirements of the Prevention of Damage by Pests Act, 1949.

This Act makes it the responsibility of individual occupiers and managements to clear infested premises.

Employing the latest scientific methods, the Ratin Service—the largest commercial organisation of its kind—defeats the natural cunning and suspicion of rats and mice and wipes out whole colonies.



Learn about this remarkable service by writing to-day for our folder. It explains your responsibility under the Act and how the Ratin Service can clear your premises—and keep control.

FLY BY B·O·A·C AND Q·E·A

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH QANTAS EMPIRE AIRWAYS LIMITED

increases the amount that may be paid out in any one year from £20 million to £25 million. This is no surprise. Last year, so far from the £7,353,000 voted for development and welfare being underspent, a supplementary estimate of almost £6,000,000 was asked for. This year, the estimate, at £19,150,000, is almost up to the limit imposed by the Act of 1945. In its annual report, moreover, the Colonial Office stated that the time had almost come when finance, not the shortage of supplies, would be the limiting factor in colonial development.

The £120 million made available by the Act of 1945 was allocated as follows:—£85½ million to individual colonial governments as part of the finance for their ten-year development and welfare schemes; £11 million to reserve against unforeseen developments later in the decade; and £23½ million to projects, such as research, surveys and higher education, designed to benefit the whole colonial empire and which could best be administered from the centre. It is to replenish this central fund, which is now nearly exhausted, that the extra £20 million is needed.

Another clause of the Bill repeals the provision in the Act of 1940 limiting the benefits of the Colonial Development and Welfare Acts to colonies "not possessing responsible government." Ceylon, for instance, ceased to be eligible for development and welfare grants when it attained dominion status. Malta, on the other hand, by special dispensation, has remained eligible, although it has responsible government in internal affairs. With so many colonies on the brink of responsible government—yet still so backward economically—it is clearly necessary that financial assistance from Great Britain should not be in danger of coming to an end overnight. But the inclusion of colonies with responsible government within the scope of the Acts is not automatic. *It will depend on the decision of the Secretary of* State, with the agreement of the Chancellor of the Exchequer.

* * *

Living in Flats

The Ministry of Health has recognised the need to do something about the worst disadvantages of life in flats. A sub-committee of the Central Housing Advisory Committee has been set up "to examine social needs and problems of families living in large blocks of flats." The committee's first move has been to send to local authorities with appropriate experience a list of ten specific points on which their views are invited. These include questions on the design of flats, communal facilities, measures to prevent noise, and a delightful inquiry about measures taken by the local authority "to counteract the lack of individual gardens" which surely begs the whole question about life in flats.

Flats are a necessity in some areas, and anything is to be welcomed that may prevent a repetition of such grey cliffs set in a sea of black asphalt as have been built since 1945 at, say, Woodberry Down by the London County Council. Among town planners, who are frequently architects, there is a dangerous preference for the large and spectacular as against the intimate and homely—for a series of eight or ten-storey blocks instead of low blocks and three-storied terraced houses. In Holborn or Westminster high blocks are unavoidable, but they need not be copied outside the congested areas. The new committee will presumably comment on the social costs of dense development, particularly in its effects on young families. The terms of reference do not cover financial costs, and with its report the Ministry of Health could usefully publish information about the relative costs—and relative burdens to tax and ratepayer—of flats and houses at different densities. It is only with such information that the public can decide how to balance the advantages and disadvantages of life in flats.

Putting the Icicles Outside

As winter comes the family circle shrinks into the living room or kitchen and the shiny bedroom suite witnesses only a shivering plunge into bed. At a recent conference of the National Women's Citizens Association Mr G. Grenfell Baines, chairman of a group of architects working on two new towns, said that only about a third of most houses was at present efficiently used; the greater part of each house was empty except at night. If all the rooms in the house could be used more constantly it would be possible to reduce the size of houses without a loss of effective living space.

This is a theme worth developing. In this country houses are being built at public expense bigger than those in any other part of the world. An area of 1,050 square feet would be considered palatial in Sweden, Holland or Denmark. Yet the British houses are so frigid upstairs that domestic life in winter is crowded into the one warm room—and this in spite of improvements in insulation and heating appliances over the past ten years. In Scandinavia, with colder winters, a much smaller dwelling is more intensively used.

There is a strong case for reducing the size of many new houses to something near the prewar 800 square feet. That is probably as much as most council tenants would choose to pay for if they had less extravagant assistance from the taxpayer. If the reduction can be made without reducing, or even while increasing, the effective living space, then even the idealists can hardly complain. The practical possibility turns on the comparative costs of the present house and of a smaller house with improved methods of heating, insulation, and so on. It is for the architects and the heating experts to say whether they can keep houses warmer at a low cost. If they can, future generations may no longer have to simulate pride over the film of ice on the bedside glass of water.

* * *

Hard Facts of Benelux

Every time the three Benelux countries meet to push their economic union a stage further, they run up against one hard fact: the Belgians are *laisser-faire* minded, while the Dutch have a preference for a manipulated economy. This conflict arose once more at the conference held last month by Belgium, the Netherlands and Luxemburg to discuss trade between them in agricultural products.

One of the main obstacles to union has been the unwillingness of the Belgians to import agricultural produce from Holland as freely as the Dutch would like. Their reluctance springs from a desire to protect the home farmer and from the fact that Belgian agricultural prices are nearly 30 per cent higher than those in Holland. This differential is partly the result of greater farming efficiency in Holland and partly, too, the Belgians claim, the result of the Dutch policy of maintaining subsidies. Costs for the Dutch farmer are reduced by subsidies on feeding stuffs, and his wage bill is kept low by the system of domestic food subsidies which holds down the general cost of living.

To date the Belgians have protected home agriculture against Dutch competition by traditional *laisser-faire* methods. They have subjected Dutch imports to a heavy licence tax which has "uplifted" the selling price of these products on the Belgian market. Under the agreement reached at the conference, the Belgians have consented to fix the amount of this "uplift" jointly with their two partners, to narrow the list to which this practice will be applied, and to allow Holland to collect the tax; the amount of the "uplift" will be shared equally between the two parties. What the Belgians have not agreed to is a Dutch suggestion that this levy be used to set up an indirect system of subsidies on the model of the Dutch agricultural equalisation fund. In return for Belgian concessions the Dutch have

pledged themselves to a further reduction and gradual abolition of their own domestic subsidies.

Great hopes were expressed at the end of the conference that the final Benelux Treaty of Economic Union would be signed at the end of the year. But it is plain that months, perhaps years, will elapse before the three economies can in practice become thoroughly co-ordinated. Even if the agricultural problem were settled, which it is not, there would remain Holland's balance of payments difficulties, at present being aggravated by the uncertainties of trade with Western Germany, its biggest single market.

* * *

Savings on Proprietaries

In its efforts to place a limit to expenditure on the health service, the Ministry of Health has in recent months been asking doctors not to prescribe proprietary drugs if an equally good standard preparation exists. Two types of proprietary drugs are in question. There are those that are advertised direct to the public. A list of these has been sent by the Ministry of Health to doctors. It covers some 700 preparations ranging from the well-known "Aspro" and "Bile Beans" to the less well-known "Johnson's (Mrs) American Soothing Syrup," "Page Woodcock's Wind Pills" and the wonderfully alliterative "Kasbah Kidney Cure." The Ministry of Health states that "the inclusion of preparations in this list has no significance as regards their therapeutic value." Its request to doctors not to prescribe them for health service patients is based on the report of the Central Health Services Council's committee on prescribing, which recommended that preparations advertised direct to the public should not be prescribable through the health service because responsibility for prescribing should rest solely with the doctor.

The other proprietary drugs that the Ministry of Health has asked doctors *not to prescribe* are those that are sold exclusively to the medical profession and for which there is a standard equivalent. In defending the expenditure on the health service in the House of Commons last March, Mr Bevan made great play with the economies that would result if doctors prescribed non-proprietary preparations. It is now revealed, in the report of the management committee of the Executive Councils' Association for England, that doctors who have been complying with this request have found that chemists have often not got the non-proprietary preparation in stock—and may not even have heard of it. The result, in fact, is only a considerable waste of the doctor's and patient's time.

The best way to save on the cost of the pharmaceutical service is to cut down on the amount prescribed rather than to restrict what can be prescribed. The association's report also reveals that in the year ended March 31, 1950, some 192 million prescriptions were dispensed in England alone—that is, about five for every health service patient. Is it not time that the Government again considered imposing a shilling charge ?

* * *

Children at the Cinema

After the report of the Departmental Committee on Children and the Cinema, published some months ago, comes an important section of the evidence on which its conclusions were based: the fascinating report of the official Social Survey that investigated the cinema-going habits of a random sample of about 2,000 schoolchildren. It provides a reasonably solid and entirely objective statistical framework for generalisations about the cinema habit. It also discloses highly suggestive correlations between the nature of the child's home and school background and the frequency of visits to the cinema, and between both these and what may be called the attitude to life of the children questioned.

Of the boys under ten years old 47 per cent, and of the girls 39 per cent, go to the cinema once a week or more often: over the age of ten the proportions rise to 72 per cent and 66 per cent respectively. In this older group 35 per cent and 27 per cent go two or more times a week. Frequent visits to the cinema coincide consistently with lower economic and educational status, with lack of hobbies and other interests (including membership of clubs and the like), with a taste for the more violent type of film, and with evidence of a romantic and fantasy-tinged attitude to the child's own future. Wisely, no attempt is made to establish the direction of the chain of cause and effect. There is no reason to give a snap verdict against the cinema. The absence of alternatives, for the child from a poor home without recreational resources, is as likely to encourage excessive cinema going as is the latter to cause the emptiness that so often accompanies it.

The efforts of the Survey's investigators to find out what films children like or dislike, and why, were ingenious and well-considered. The results are, however, unmistakably the thinnest part of the report. Films are disliked because they are "dreary"—or liked (by a small minority) because they "make one feel sad." How, without knowing the individual child concerned, is one to interpret such judgments ? "At Kilve there is no weathercock"—so Wordsworth's boy tried to account for an unsatisfyingly obscure preference ; in a similar spirit, perhaps, one eleven-year-old, more inscrutable even than those questioned by the Social Survey, summed up his appreciation of "The Red Shoes" in the words "Wizard trains!"

The State of Germany

WE have the satisfaction of stating that the alarm of war . . . has for the present subsided. . . . The old system, with much increased humiliation for Prussia, and much exultation for Austria, is restored in Germany. The mediating Czar, who is almost recognised as lord paramount of Germany, and sees his power over that country much increased by the appeals made to him, is exalted into the master of Continental Europe. . . . If indeed, the Russian pretensions should grow under the patronage of Count von Brandenburg, and the Prussians be called on to resist the Czar, the present humiliation imposed on them by him will exalt their courage, give point to their patriotism, and make them, at all hazards, as in 1806, brave the fortune of war.

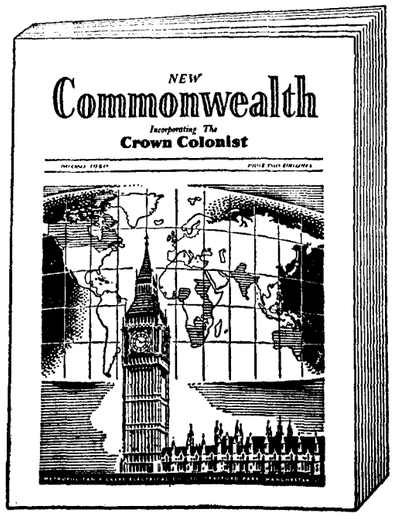
Though we rejoice in the preservation of peace, as certain ultimately to promote the freedom of Germany, we feel no satisfaction at her present pitiable condition. The result of all the late struggles — of the blood shed by the democratic rabble and the legal functionaries—of the destruction of confidence and property by the revolutions—of the severe sufferings inflicted on many families—of the pompous oratory at Frankfurt, and the subtraction of so many learned professors from the quiet order of their college lives—of the vast theoretical changes that have been advocated, promising a profusion of liberty and social welfare—the result . . . seems to be the restoration of the old military mastership. The corporal, somewhat improved indeed in manners, and the Croat, hardly improved, but converted from a fierce savage into a cunning political dandy, have resumed their rule in Germany.

The Economist

November 9, 1850

New Commonwealth

THE CROWN COLONIST was the only paper devoted wholly to the affairs of the British Colonial Empire. For twenty years it has faithfully fulfilled its function of linking the Colonies, Dominions and the Mother Country.



The characteristic trend of development in the British Family of nations is that Colonies become Sovereign Peoples. This evolutionary process has been quickened and today the Commonwealth stands on the threshold of the greatest economic and political expansion in its history.

THE CROWN COLONIST therefore has taken on itself the mantle of Commonwealth responsibility, and it now appears under the all-embracing title of NEW COMMONWEALTH. Its editorial scope has been extended to cover all the Dominions and India ; that is to say, 560 millions of people spread over a quarter of the world's surface and linked to the Crown. Colonial affairs will continue to receive the same attention as hitherto, but will be discussed in relation to the wider field of which they are an integral part.

NEW COMMONWEALTH will strive to mirror the Commonwealth to the Commonwealth, but through its expert editorial staff will address itself in particular to those who bear the major responsibility for Commonwealth administration, industry, commerce and finance.

Through its advertisement columns it will continue to serve the interests of trade between all the Commonwealth countries and manufacturers in Great Britain, and U.K. importers with sources of supply in the Dominions and Crown Colonies.

A free copy of the current issue will be sent to anyone interested in the Commonwealth markets.

Letters to the Editor

Two Chancellors

Sir,—In your issue of October 28th, in writing on "The Two Chancellors," you made this misleading statement:

> In 1948 inflation was checked in the only way then possible. . . . The higher taxes of Sir Stafford Cripps's first budget were the necessary method of securing a large budget surplus.

Actually, Sir Stafford Cripps's "higher taxes" in April, 1948, only added £11 million, for he raised £47 million more from Customs and Excise, remitted £86 million in Income Tax reliefs (rising to £103 million in a full year) and imposed the Special Contribution (which you found most objectionable) which was to yield £50 million in its first year. Thus, the big surplus of £319 million which Sir Stafford Cripps secured in 1948-49 was, in fact, due (except for £11 million) to Mr. Dalton's two budgets of 1947, both of which increased taxation.—Yours faithfully,

NICHOLAS DAVENPORT

Athenaeum Club, London, S.W.1

[THE 1948 Budget imposed higher taxes with the considerable yield of £97 million in their first year. It was to these, not to the net effect of the Budget changes, that the quoted statement referred. The reliefs in income tax could hardly have been avoided by any Chancellor as military expenditure ran down after the war. Sir Stafford Cripps's distinctive decision was that he did not allow these reliefs to eat into the prospective Budget surplus (of which the two causes were Dr Dalton's higher taxes and the 1947 inflation, increasing tax yields in 1948), but instead achieved a large surplus by higher taxes in other fields (not, as the article of October 28th pointed out again, well chosen, but in some form necessary).—EDITOR.]

The Way it Works

Sir,—Surely a serious periodical like *The Economist* can find better use for its paper allocation than to poke fun at that well-meaning body of civil service statisticians, whose constant endeavour it is to bring down the cost of living. Where would we be without them? What would my money be worth now, for example, but for the master-stroke whereby the introduction of the new interim index of retail prices was delayed until the price of my pipe tobacco had risen from 1s. 2d. to 4s. 2½d. per ounce?

If one must poke fun, moreover, let one at least have due regard for the facts. Had you taken the trouble to refer to the Ministry of Labour's handbook on the new interim index, you would have discovered that beef sausages indeed figure therein, and from your knowledge of the past you should have known that there could be no question of their being removed from the index merely because nobody eats the things any longer. "Obsolescence" in this context is no crime; if the tallow candle could still supply light in the old cost of living index more than thirty years after its use became confined for all practical purposes to ecclesiastical circles, the beef sausage is clearly destined to live long as its modern counterpart in the field of statistical curiosities.

You would have been on sounder ground, surely, in drawing a distinction between the Statistical Pork Sausage (the "Webber"), whose contribution to the new index will presumably fall in accordance with the "Meat Content" formula explained in the Ministry's handbook, and the Sausage As Eaten—whose meat content seems likely to remain at 50 per cent because the master butchers decline to do better without an increased allocation of pork.

One sees that your fantasy on the subject of "Standard Sausage Satisfaction" is based on the method adopted in the index for dealing with beer. But hard fact, had you known, is better than all your prosaic flights of fancy. "The procedure chosen" (I quote from the handbook) "in fact gives a sort of compromise movement . . . and therefore may be said to reflect the fact that a purchaser of a glass of beer is not only concerned with the alcoholic content, but also with the quantity of liquid refreshment, service, recreation, social intercourse and amenities of the public house." In measuring all these in a single figure the Ministry performs a statistical feat to which your sausage cannot hold a candle.

All the same, the official treatment of beer has its mysteries. The price (says the handbook), ascertained from a specified list of public houses, is adjusted each month "to allow for the extra duty which would have been payable if it had been of the strength which prevailed in 1938." To the layman this would seem to mean that if the excise duty on beer goes up next month and the gravity remains unchanged, the cost of living will go up (i) by the extra duty on the beer you are actually drinking, plus (ii) the extra duty on the beer you are not drinking, but would have been drinking if 1950 had been 1938; which seems odd.—Yours faithfully,

PETTIFOGGER

The United Nations

Sir,—In your issue of October 21st, you point out that in deciding whether the problem of Indo-China is to be referred to the United Nations or not, the Big Three must do a lot of calculation of uncertain and marginal votes. You imply that, if the prospect is good that a majority can be obtained for a Big Three decision, the problem should be submitted; if the prospect is that a majority cannot be gained then the Big Three must act in some other way.

This is an entirely realistic attitude on your part, but does it not reflect a complete conviction that the United Nations machinery has broken down, or has, at least, failed to function as was hoped? Are you not simply saying that the only hope of maintaining world peace today is a military alliance of the Big Three, and like-minded nations?

As far as I can see, this is the truth of the situation. Why should it not be faced? Why must we go on with this pretence that the United Nations system is working? As long as it is assumed to be working, as long as the present chorus continues of cheerful assertions that the United Nations showed, in the case of Korea, how Communist aggression could be stopped, so long shall we drift to the inevitable moment at which the Big Three find themselves unable to act for the preservation of civilisation, because the United Nations machinery will not permit this.

Mr Acheson is trying to escape from this dilemma, by an attempt to alter the functioning of the United Nations system, without first obtaining an impossible alteration in the Charter. Even if this plan be adopted, it will not solve the problem which you state—of cases in which Mr Acheson cannot depend on obtaining a majority vote in the General Assembly. Would it not be better for us to face facts and to substitute for the United Nations system a franker alliance between the Big Three and like-minded nations than now exist?

Action in this direction would not involve the disbanding of the United Nations system. It would require open acceptance of the fact which you state—that it is the power of the Big Three which guarantees the peace of the world, and that the United Nations is to be regarded, at present, and probably for a long time, as nothing more than a forum in which international affairs may be discussed, with the rather vague hope that this discussion may produce good results.—Yours faithfully,

P. C. ARMSTRONG

Montreal, Canada

Consumers Representation

Sir,—As Mr Egbert Cadbury states, the consultative committee system is new; he is still more correct in pointing out that the general public is not aware of its existence.

Many who have followed closely the postwar trend away from local democracy are emphatically of the opinion that consultative committees and councils at the local level in connection with passenger transport, gas, electricity, hospitals and health should meet in public. Their proceedings would then be reported in the local press—so far as space, now so wickedly limited, affords—and the public would soon take a most salutary interest in these organisations. Probably they would first ask how the councils, etc., are appointed! A necessary reform is a new Press Act covering all these new bodies.—Yours faithfully,

London EDGAR E. TAYLOR

Books and Publications

Very Taking Lecturer

Testament for Social Science. By Barbara Wootton. *Allen and Unwin.* 192 pages. 15s.

Though Mrs Wootton may not altogether like having her admirable book called a declaration of faith, that is essentially what it amounts to. Scientific method, to summarise her thesis, is essentially as applicable to human problems as to those more obviously physical. All that science can do in any field is to establish associations; the higher their probability the better, but such certainties as the boiling point of water are only limiting cases. In the social sciences degrees of probability are generally low; but they can be raised, and while some scientific methods (notably the rigorously controlled experiment) are excluded, others, such as observation, measurement and statistical analysis, only demand the development and application of existing techniques. Even pending these, there is no excuse for adopting towards human problems a "pre-scientific attitude," whether merely impulsive, superstitious, or self-containedly intellectual. Science need not prove effective occupation of the territories over which, on its behalf, Mrs. Wootton claims sovereignty with all the assurance of that Pope who divided the New World between Spain and Portugal. There is nothing, from the demand for soap to the nature of mystical experience, from the motives of tyranny to aesthetic emotion, from the formation of public opinion to the workings of conscience, which scientific enquiry—observation, hypothesis, empirical verification—cannot eventually explain; conclusions otherwise reached are no more than unverified hypotheses.

Like her namesake, Mr Bernard Shaw's Salvationist, Mrs Wootton "would have been a very taking lecturer on Secularism," though certainly no one would preface that judgment, as did Major Barbara's interlocutor, with the remark "It's a pity you was never trained to use your reason, Miss." She is courteous, incisive, sensible, witty, and cool; in fact, a paragon among controversialists. Yet she seems curiously blind to the dangers of her claim. Scientists may be sufficiently scientifically-minded to remember, and to give warning, that this or that conclusion is provisional; but while, in other fields, conclusions are acted on by experts who understand such warnings, the field of human relationships is one in which everyone must practise. What happens when the inexpert get hold of a scientific conclusion in that field is demonstrated by those luckless parents and children whose relationships have been conscientiously shaped, against all instinct, intuition and "pre-scientific" horse sense, by textbooks on infant psychology. Nor is actual misreading of, or undue reliance on, the "conclusions" of science the only or the gravest danger. There is an observable and radical difference in quality between those actions in the field of human relationships which are spontaneous and those which are intellectually planned and deliberately willed. A love-relationship scientifically considered by the lovers, a loyalty-relationship scientifically considered by leader and led, a joke or an impulse of generosity scientifically analysed by the laugher or the giver, cease to be what they were and become something unmistakably less valuable—less "valuable" even in Mrs Wootton's sense of conducing to physical and mental health.

Here is a dilemma indeed. If physical and mental health demands that certain experiences and certain relationships remain unanalysed and spontaneous for those involved in them, then those scientists whose vocation it is to test and analyse such experiences must themselves fall short of mental health—and must, moreover, realising this, safeguard others from this latest and deadliest fruit of the tree of knowledge. The complete conquest by science of the human field, foretold and applauded by Mrs Wootton, demands in fact a priesthood of sociological initiates, debarred by their initiation from normality, constantly perfecting their knowledge of the springs of human nature, and eventually exercising a power more inescapable than any physical tyranny; a priesthood in whose hands the rest of mankind, debarred for their own good from the arcana, would at last be no more than puppets.

The dilemma, however, is indicated in no spirit of obscurantism. The harm done by dogma and ignorance far outweighs any to be expected in the nearly foreseeable future from the advance of science over new territories; curiosity still retains the same overwhelming survival-value as when it first spurred mankind upward from among the other primates. It can only be rightly curbed in the name of principles which it has itself established; and if that happens Mrs Wootton will presumably comment from the Elysian fields, not "*Mea culpa*" but "I told you so."

Broad-Gauge Executives

Developing Men for Controllership. By T. F. Bradshaw. *Harvard.* 231 pages. $3.25.

The Growth and Development of Executives. By Myles L. Mace. *Harvard.* 200 pages. $3.25.

These volumes, published by the Harvard Business School, are competent and useful studies of the experience of big American firms in training their senior executives. They cover much the same ground. Professor Bradshaw noted that an accountant is often a major executive in his own field, may control a staff running into hundreds if not thousands, and often also passes into the field of general management (one remembers the Urwick Committee's figures showing how 70 per cent of British technicians end as managers); he set out to discover how firms develop their accounting technicians into what he describes as broad-gauge controllership executives. Finding that accountants, for no very good reason, are usually left out of executive training schemes, he had to fall back on the more general experience of turning specialists into managers, which also concerns Professor Mace.

Both studies are records of experience, rather than speculations on how training might be improved. Their weakness, so far as they have one, is that they do not go back often enough to first principles and ask, in the light of the theory and practice of education outside as well as within industry, how this or that might be done better. But as a record of what is actually going on they are interesting and stimulating. Their central theme is that in big firms the vast majority of the posts through which men graduate to general management are of necessity specialised and so offer only a limited range of experience. These firms therefore find that it pays handsomely to define requirements for each executive post, appraise the qualifications of staff

Butterworth Books for Company Secretaries

BUCKLEY ON THE COMPANIES ACTS

12th Edition, 1949. Edited by THE HON. D. B. BUCKLEY, M.B.E., M.A., Barrister-at-Law, a Bencher of Lincoln's Inn, assisted by C. BRIAN PARKER, M.A., LL.B., of the Middle Temple, Barrister-at-Law and NIGEL WARREN, B.A., of Lincoln's Inn, Barrister-at-Law. Consulting Editor CECIL W. TURNER, Barrister-at-Law, a Bencher of Lincoln's Inn. Price £5 5s., by post, 1s. 6d. extra. '. . . a mine of information for all concerned with the legal side of Company affairs.'—*The Financial Times*

BUTTERWORTH'S COMPANY PRECEDENTS

1949. Edited by RALPH SUTTON, M.A., K.C. and W. J. WILLIAMS, B.A., of Lincoln's Inn, Barrister-at-Law. Two volumes, price £6 6s. per set, postage and packing, 2s. extra. This work is a separate edition of Volumes 4 and 5 of *The Encyclopaedia of Forms and Precedents*, especially produced for company secretaries and accountants. Every form likely to be required in everyday practice will be found in these two volumes, which contain 802 Draft Forms, with over 100 Object Clauses in the section on Memoranda of Association.

Butterworth & Co. (Publishers) Ltd., Bell Yard, Temple Bar, London, W.C.2.

available for promotion, and adopt a definite training scheme to make the gaps in their qualifications good. Each firm's policy must be tailor-made ("no capsulated programmes"). The authors are properly sceptical about the rule-of-thumb methods still commonly in use. Executive training gives results in the long run, and to some extent diverts attention from day-to-day problems; therefore it needs good publicity and sustained pressure from the managing director downwards to get it across. Its most effective method is a dressed-up version of the old school of hard knocks. A man learns best by moving through a wide range of jobs in his own field, and occasionally outside it, and by coaching on the job; the coaching to be done, not by some hireling from the personnel department, but by the budding executive's own immediate superior. Coaching, as defined by Professor Mace, turns out to be neither more nor less than the process by which a good manager in any case gets the best out of his subordinates. Classroom methods have their place, and the education experts have their part to play in coaching the coaches. But no one has yet produced a substitute for experience in the art of handling men.

These books pass the supreme test of being digestible in a badly-lit train around one a.m., after a heavy day. But the murder of English will out. The broad-gauge controllership executive, it seems, is trained to dollarise the day-dreams of managing directors by being rotated for several years within his function, varied with short courses of role-playing; an intriguing activity promoted by the disciples of Kurt Lewin, but nowhere here precisely defined. Professor Bradshaw is the worse offender. Professor Mace gets off with a verdict of occasional manslaughter.

Taxes for Prosperity

Creation of Income by Taxation. By Joshua C. Hubbard. *Harvard University Press, London: Geoffrey Cumberlege.* 239 pages. $4.00. 25s.

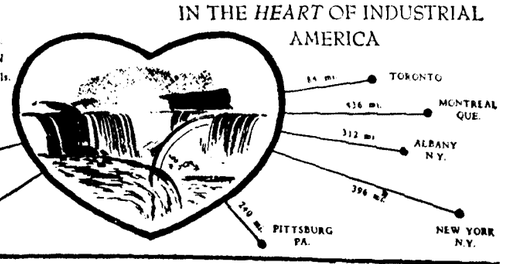
That deficit finance is the obvious budgetary weapon against deflation, and taxation the most powerful means of breaking an inflationary spiral, is a fiscal generalisation which, according to Mr Hubbard, will not stand up to close analysis. Deficit finance rightly employed has its place in full employment policy; but that place is a preliminary, almost a subsidiary, one. The really reliable lever by which to jack up consumption and investment and reduce savings to a healthy level is none other than the supposedly deflationary device of higher taxation.

This paradox Mr Hubbard justifies through a closely reasoned, austerely expounded, argument in which Keynesian terminology is combined with a critical attitude to Keynesian precepts. The basic phenomenon on which his theory is founded is the stickiness of the propensity to consume. Taxes will be, on the whole, paid out of the taxpayer's margin for saving; the richer the taxpayer, and the heavier consequently the tax, the more notable will be their effect. Let the receipts then be devoted either to increasing consumption (by redistribution action) or, in certain, recognisable circumstances to increasing investment (directly or through cheap or interest-free loans) and the net result will be income creation and higher employment. Thus the bogy of an increasingly unbalanced budget can be laid and an effective full employment policy be combined with financial rectitude.

It is impossible to deny that Mr Hubbard has brought into prominence an important and generally neglected element in the fiscal picture, or that considerable benefit may be derived from this element being properly taken into account. Unfortunately it is difficult to feel as cheerful as he does about the practical implications of this income-creating property of taxation. A once-for-all activation of the "stagnant" economy, bringing it up from an under-employment equilibrium to one of full employment, is one thing; successive tax increases imposed to deal with a chronic tendency to relapse into stagnation are quite another, resulting as they must do (quite apart from any effect on incentives) in the transfer of more and more economic power and initiative from producers and consumers to government officials. The converse, too, of the merits of taxation as a creator of income is its demerits as a weapon against inflation—an uncomfortable thought in present-day Britain, with its apparently irreducible tax burden of 40 per cent of national income. Mr Hubbard, apparently unconsciously, does much to explain the "gap" lamented by successive Economic Surveys.

Land of Promise?

Brazil, World Frontier. By Benjamin H. Hunnicutt. *Macmillan, London: D. Van Nostrand, New York.* 387 pages. 45s. $6.00 Illustrated.



Here is a book for the American student or business man, about a land of promise, written by one who has lived and done educational work there for more than forty years. The author is bilingual, having written books and articles in Portuguese as well as in English, and he has been honoured by the Brazilian Government with the rare decoration of Commander of the Order of the Southern Cross, in recognition of his efforts to promote understanding between the peoples of Brazil and the United States. The book is illustrated with photographs and attractive black and white drawings, and reinforced with statistics—and yet, it is disappointing; for at the end of it, primed with facts about the history, development and potentiality of the country, we only know the people in so far as they have adapted themselves to the North American pattern — which is superficially. Many aspects of Brazilian life are examined, but the approach is always from the standpoint of the United States, never from that of world geopolitics, so that all contrast and comparison is bilateral. Having read it, the American traveller would arrive in Brazil with a wealth of data, a predisposition towards friendliness, and a conviction of his own popularity there; but unless he had previous experience of the Latin American temperament, he would soon become perplexed and frustrated, because his guide-book was devoted to action and exclusive of reaction.

The British reader would feel slightly inhibited, for one is left with the impression that Brazil is a United States preserve, and that European association is to be deprecated. The author actually uses the phrase "cultural warfare," and primly deplores that "The prewar activities of a number of nations in actively promoting cultural relations in Brazil could only lead to one conclusion. They were seeking trade." Which enormity having been exposed, he goes on with naïve enthusiasm to describe the activities of the Rockefeller Foundation and the Office of the Co-ordinator of Inter-American Affairs in encouraging cultural unions, study tours, scholarships, exchange of professors, distribution of books, films and radio programmes, and "everyday trade and commercial interchange" whose cultural values are coyly admitted to be "somewhat elusive."

The most exciting thing about Brazil, from the author's angle, is that its frontiers are still fluid. Previous waves of exploitation (sugar, gold, rubber and coffee) have each affected the shape and size of the developed area, and new road, rail and air communications, with modern engineering and agricultural

techniques, presuppose a further spate of settlement in lands hitherto uninhabitable. Mr Hunnicut makes no secret of his belief that this development could best be carried out under the aegis of the Good Neighbour Policy—and perhaps he is right. But there are signs and portents, in the recent presidential elections, that a neighbouring republic, whose influence is not here taken into account, is just as eager to be associated in the cracking of the Brazilian nut.

A Study in Colonial Development

Puerto Rico's Economic Future. By Harvey S. Perloff. *University of Chicago Press and Cambridge University Press.* 435 pages. $4.75.

The problems of many "colonial" territories are cast in a mould which is at least as much economic as it is political or social. Puerto Rico is no exception so far as the general rule goes, but it is almost unique in so far as painstaking attention has been paid to the analysis of its economic structure, and the discussion of contemporary events in their economic setting. Dr Perloff's book is, in fact, a model of what should be attempted for every dependent territory in which a low standard of living and low productivity of labour are matched by high political and social aspirations.

The most outstanding contribution that he has made to the study of this important subject is to apply techniques of quantitative measurement to the situation he has investigated. Many of his conclusions will be disturbing to the politicians, and it is very right and proper that this should be so. Population trends are, he finds, alarming; unless the very rapid rate of population growth can be checked, higher levels of living cannot be maintained, and even the present very low standards may deteriorate still further.

Dr Perloff assumes that agriculture will not be able to provide much more employment, and most of the increase will have to be absorbed elsewhere. No fewer than 170,000 *new* "non-farming jobs" will have to be found by 1960 if excessive amounts of poverty and unemployment are to be avoided. This will mean the creation of an "employment pattern" similar to that of North Carolina, Georgia or Tennessee, as it existed in 1940. The capital investment that will be required will be of the order of $340 million, or, making the necessary allowance for the upkeep of existing plant, about $85 million a year, at 1948 prices. (Even this does not provide for the agricultural sector of the economy.)

The final conclusion is that "real and lasting gains can be made only if the people of Puerto Rico are willing to make present sacrifices for the sake of future improvements." The island's Government and the Federal Government of the United States can take much credit for the energy and the efficiency with which the problems of the island have been tackled. But what has been done so far can be regarded only as a beginning. Dr Perloff's remark that "there seems to have developed in Puerto Rico a tendency to associate the economic improvement programmes with the war-created budgetary surpluses" is a clear warning of gathering storms ahead.

A Sombre Picture

The Age of Terror. By Leslie Paul. *Faber.* 256 pages. 18s.

As in his previous books, Leslie Paul offers us the choice between a return to God from Mammon and inevitable destruction from total and incessant war. With his accustomed clarity of thought and style, he inquires into what has happened to the Europe which was founded on the precepts of Christianity and flowered into the exuberance of humanism, to bring the glowing promise of the enlightenment to the sordid modern fulfilment of police state and cold war.

He examines the history of socialism and its diverse manifestations through Fabianism to the Labour Party; through Marxist theory to the Social Democrats; and through the gradual transformation of the ideal of the dictatorship of the proletariat into Lenin's actuality of the dictatorship of the Communist Party over the working class, and Stalin's application of this to power politics.

CAMBRIDGE UNIVERSITY PRESS

Why YOU should have it!
THE NEW
CHAMBERS'S ENCYCLOPÆDIA

THE ECONOMIST says of CHAMBERS'S: "Those articles which deal with economic and related topics score very high indeed. A formidable company of top flight contributors has been assembled: Professor Hayek, for instance, writes on Economics, Professor J. R. Hicks on Value on the Theory of Wages, Professor G. D. H. Cole on Economic Planning, Economic Systems and a number of other topics, Dr. N. Kaldor on Distribution, Dr. T. Balogh on Exchange Control—to name but a few. One can hardly imagine the work better done . . . In the economic field at all events it can be said without qualification that a new standard of excellence has been set up."

THE MASTER OF BALLIOL (Sir David Keir) wrote in the *Sunday Times*. "In range, clearness of conception, weight of authority and liberality of mind, this is in every way a historic achievement."

Completely new, CHAMBERS'S is the only post-war encyclopaedia of major status in the English language—and it is British.

Eminent contributors. Thousands of illustrations. Many magnificent colour plates. 144-page Atlas in full colour. Beautifully bound volumes.

You will find that the new CHAMBERS'S ENCYCLOPÆDIA is something you have always wanted. *You will be proud that* you and your family possess this work of world standing and authority. And you will spend hours of delight just reading its pages wherever your mood takes you, although its greatest value will be found in the up-to-date information, unimpeachable in authority and scholarship, immediately available at your elbow.

The chapter on "Economic Perplexities of Western Nations" might well be extracted and issued as a text-book for sixth-formers, to send them out into the world with a grasp of what will be expected of them as wage earners, and what they can and cannot hope to receive in return.

The author believes, with Bertrand de Jouvenel, that the present economic problem of Western Europe is only a symptom of a moral condition arising from the fact that the individual no longer relies on himself, but throws the onus of providing his means of maintenance on the state, which in its turn relies on foreign aid; and that this moral sickness *cannot be cured by increasingly* generous gifts in the shape of indefinite loans, but only by a realisation that the material ends for which we all struggle and are willing to die are chimerical.

> *The rejection of the spirit* is the rejection of humanism; the rejection of God is the rejection of Man. It does not need words to prove this: one honest and steady stare at the contemporary world is proof enough. How long, in *such a stare, before we lower our eyes* in anguish?

It is, indeed, a sombre picture. But before we are overwhelmed, it might be well to remind ourselves that what Western man has been, and is, willing to die for is a way of life, in the defence of which his material well-being is reduced. Moreover, the medieval acknowledgment of a supra-temporal power did not prevent the devastating struggles of Guelph and Ghibelline, or the later horrors of the Thirty Years War; nor is ours the only age to be "bedevilled by conflicting ideologies." If our present pass is due to spiritual inadequacy to our vastly expanded material environment, the answer is not the renunciation of materialism, but its control in the interests of humanity. It is irrefutable that in his pursuit of creature *comforts* and power (which is an inherent human urge, and not a genie escaped from the Renaissance bottle) modern man has evolved a social conscience not dreamed of in times of greater awareness of spiritual values. If the present is, in Bertrand Russell's words, "An age in which authority no longer suffices to produce a socially necessary minimum of belief," it is also an age in which the common man is aware of his dilemma as never before, and in which his representatives consider his situation as a major factor in the shaping of world policy. Reforms may be adopted from expediency, but *their conception* is a matter of conscience, and this, with or without faith, is a thing of the spirit.

Academic Pamphleteer

Essays in Social Theory. By G. D. H. Cole. *Macmillan.* 251 pages. 15s.

Among Professor Cole's many gifts is that of being able to speak with many voices and address many audiences. There are few more effective pamphleteers, popularisers, translators into the vernacular from the vocabulary of the mandarins; and it is in these capacities that he is most widely known and admired—or, occasionally, deplored. Behind the superbly efficient mouthpiece, however, is a serious political thinker and teacher of political thinkers; and in this collection of essays it is the serious thinker, though armed with the same powers of lucid and delightful exposition as his pamphleteering *alter ego*, who is uppermost. The essays collected here range from Professor Cole's inaugural lecture at Oxford on "Scope and Method in Social and Political Theory," through appraisals of the ideas of Rousseau, of the *Déclaration des Droits de l'Homme*, and of Auguste Comte, to practical dissertations on the teaching of social studies, on civil service *reform, and on the basic aims* of education. The collection is characteristically rounded off with a reprint of the chapter "What I Take for Granted" from his "Intelligent Man's Guide to the Postwar World," which bears re-reading, and pondering, very well—not so much for its actual content as for the light it casts on the mind of a fairly representative Socialist intellectual.

On the whole it is the essays dealing, from one angle or another, with educational matters which are most satisfactory. Whatever has to do with the imparting and organising of knowledge, with the training of minds and characters, with the development of the qualities making for a happy and creative society, brings out all that is best in Professor Cole's attitude both to his fellow-men and to the things of the mind. While registering the opinion that it is extremely fortunate, both for Professor Cole and his countrymen, that he lacks "aptitude and taste," as he says, for political leadership, one could wish that he were in a position to impress his views more directly on the emergent educational system of Great Britain.

Shorter Notices

Both Sides of the Curtain. By Sir Maurice Peterson. *Constable.* 314 pages. 21s.

The Foreign Office bears a heavy responsibility for emasculating the memoirs of its servants. There can be no other explanation of the fact that, in regular sequence, experienced and able ambassadors are unable to offer any profound or far-ranging reflections on the principles and conduct of British foreign policy. Instead they restrict themselves to cautious reminiscence and to amateur reflections on national character and institutions, which show a limited range of sympathies and interest. Sir Maurice Peterson is less guilty of such superfluities than some; but he would doubtless have liked to give the British public a picture of his work in Moscow comparable in range and documentation to that given by the American General Bedell Smith.

There are excellent things in the Moscow chapter: for example, the sketch of Molotov, "the little buttoned-up man whose smile seldom extends to the eyes," whose "sole intellectual equipment" is "tenacious obstinacy." Sir Maurice remarks in passing that as Soviet Foreign Minister he "committed nearly every stupidity under the sun"; that is the kind of idea which one would like to see developed for several pages. There are even better things in the chapter on Spain, which the author saw in three guises: King Alfonso offering advice on unemployment to Ramsay MacDonald, a sleeping portrait of a British ambassador worthy of La Bruyère, candid remarks about both Falange and Republicans. Sir Maurice has dry wit, a very readable style, some justifiable grudges and it seems the gift of observing foreign affairs *without* significant emotion.

Variations in Working Class Family Expenditure. By J. L. Nicholson. *University of Oxford, Institute of Statistics.* 60 pages. 2s. 6d.

This paper, first published in 1949 in the Journal of the Royal Statistical Society, has now been reprinted by the Oxford Institute of Statistics where most of the work was carried out. It is a study of the effect of changes in family income and family size on the pattern of prewar household spending, made by carrying out a statistical analysis of some of the working-class family budgets collected by the Ministry of Labour in 1937-38. Of particular interest is a section attempting to measure the cost of children, which was undertaken at the request of the Royal Commission on Population. But much of this work must be regarded as only experimental, for there are many difficulties in an analysis of this nature, especially when it is confined to a fairly small sample—most of the results are based on a total sample of some 700 families. In discussing the difficulties, the investigation should be helpful in the design and analysis of future budget surveys.

World Statistical Congress. United Nations. Proceedings of the International Statistical Conference, *Volume II.* *275 pages.*

The first World Statistical Congress under the auspices of the United Nations was held in Washington during September, 1947, and was attended by representatives from fifty countries. This volume contains the addresses and papers reproduced in the original language in which they were presented, together with an abstract in the other of the two working languages (English and French) of the United Nations.

The papers include accounts of the statistical activities of agencies such as the International Labour Organisation and the Food and Agriculture Organisation and also the most important developments in the statistical work of national governments. The collection and availability of international statistics have altered quite appreciably since 1947, but this volume provides some useful background information.

Urban Mortgage Lending by Life Insurance Companies. By R. J. Saulnier. *U.S. National Bureau of Economic Research.* 180 pages. $2.50.

This is one of a group of investigations of real estate finance in the United States sponsored by the National Bureau of Economic Research. Although in the United States, as in Britain, mortgage loans are now a much smaller proportion of insurance companies' assets than they were in the nineteenth century, between 15 and 20 per cent of all mortgage debt outstanding there is still held by insurance companies; the offices concentrate in particular on the financing of specialised commercial properties such as hotels and offices and of larger residential structures. Professor Saulnier ploughs systematically and painstakingly over the whole field of his subject matter; the history, scope and varying experience of such loans, the legal framework within which the companies operate, the organisation and operating costs of the lending, all are reviewed in staccato style amid a plethora of statistics.

MONETARY POLICY for a COMPETITIVE SOCIETY

By LLOYD W. MINTS, The University of Chicago
9x6 236 pages 25/6

A definite and announced monetary policy is one of the essential rules for the satisfactory functioning of a competitive society. This point of view, often neglected, is emphasised in this book.

TECHNIQUES OF INTERNATIONAL TRADE

By MORRIS S. ROSENTHAL, Formerly Lecturer on Foreign Trade, Columbia University.
9x6 554 pages 51/-

In this volume, factual examples are combined with descriptions of general current practice. An authoritative writer, Mr. Rosenthal maintains that an understanding of the economic principles underlying international trade is essential to the success of any enterprise.

An American analysis of the European Recovery Programme

The Economics of Freedom

BY HOWARD S. ELLIS

This is the fruit of over a year's work by a group of American economists and other authorities assembled by the Council on Foreign Relations, New York, under the Chairmanship of General Dwight D. Eisenhower. Written by a former President of the American Economic Association, it sets forth the political and economic aims of the Marshall Plan, surveys the resources and needs of Western Europe, and analyses its financial institutions. It then examines the post-war economic situation of each country, and appraises the contribution of the Economic Co-operation Administration. The prospect for European co-operation is fully explored, and in conclusion Professor Ellis deals broadly with the question, 'What comes after the Marshall Plan?'

THE SOCIAL CRISIS OF OUR TIME

by

W. RÖPKE 15s. *net.*

Professor of Economics at the Graduate Institute of International Studies, Geneva.

After a critical examination of the rival systems of capitalism and socialism the author concludes that both are wrong. He proposes a reformed capitalism, free from the taint of monopoly and based on genuine competition, as the only safeguard against the totalitarian state to which the old capitalism and the new socialism are inevitably tending.

AMERICAN SURVEY

Two Ramparts to Watch

Washington, D.C.

SOME weeks ago Mr Walter Lippmann pointed out that because the Republicans were in power during the period of American territorial expansion in the Pacific they had, as a party, tended to take a special interest in that area; the Democrats, on the other hand, having been in power during both World Wars, had become involved in, and identified with, European affairs. In the election campaign which has just finished this difference between the two parties could be seen with greater clarity than ever before. For almost the first time in American politics both sides were advocating some form of intervention overseas, even if, in the case of economy-minded candidates, it was only a verbal one. Neither party was preaching complete isolation as both have preached it at times in the past.

Mr Dewey once remarked that the party out of power always appeared to be more isolationist than the Administration, a theory which, though it has no validity in other countries, has been generally true in the United States. It is so long since the Democrats were out of power that it is easy to forget that they did not, in opposition, appear as an international party, preaching an identity of interest with Western Europe. They complained that the annexation of the Philippines was "imperialism" during the campaign in 1900 and in 1932 they had an isolationist programme, and it was Mr Stimson, with his attempts to stop the Japanese in Manchuria, who was the interventionist. If, in recent times, the two parties looked different ways, this was because, in a country which occupied a continent and had frontiers on both the Atlantic and the Pacific, there were two ways to look and a case could be made for preferring either.

But, by 1950, with the Soviet Union stretched across Eurasia, though each party continued to look in its traditional direction, both saw the same danger. It was this which made it possible for Senator Vandenberg to chivvy his party into support of the "bipartisan foreign policy," that is to say, into temporary agreement for giving priority to Europe. But the arrival of the enemy on the Pacific coast of Asia scared lesser men, in Mr Vandenberg's absence, into breaking the national unity and precipitating a bitter quarrel over Far Eastern policy in a critical year.

Because each party looks in a different direction and there is so little resemblance between the strategic situations in Europe and Asia there are conflicting ideas about the best means of meeting the threat of Communist expansion. The Administration, having in its favourite continent a large and literate population, most of the industrial potential outside North America and peoples who have fought invaders from the East for as long as they can remember, believes that the cheapest and most effective policy—and the one with the best chance of avoiding open war in the pursuit of its aims—is that of encouraging, supporting and helping the countries of Western Europe. The opposition, which puts not its trust in foreigners, would prefer, if necessary, to fight Communism at once in China, and do it without allies, though not, if its campaign oratory is to be believed, in Korea where the United States enjoys the moral support of most, and the material support of some, of the rest of the non-Communist world.

"If the Europeans," the *Chicago Tribune* said the other day, "without our garrison in Germany, cannot hold off the Russians for even a few months, until our reinforcements arrive, the Europeans are worthless as allies and our ten divisions in Europe will be sacrificed for nothing." A week or two earlier Mr Herbert Hoover had raised the question whether the European nations, except for Britain, had the will to fight or even the will for preparedness. "If we do not find," he said, "real military action of powerful strength in Western Europe . . . we had better . . . consider holding the Atlantic Ocean with Britain (if they wish) as one frontier and the Pacific Ocean with an armed Japan and other islands as the other frontier"—a simplification of the problem before the United States which, for his party's "elder statesman," approaches the naïve.

There runs all through the Republican approach to the problem—the result, no doubt, of eighteen years without responsibility—a skein of mediaeval xenophobia, of the isolationism of an untrustworthy baron who, wary of friendships and alliances, would shut himself and his forces up in an impregnable castle, raise the drawbridge and pour boiling oil—or the oil of boiling invective—on any stranger who ventured near.

*

From these different views of how best to deter or defeat Communism there flow two different views of how to treat, and treat with, Communists. The President, the Secretary of State and all his Department believe that every chance of reducing tension between East and West must be taken. If Mr Acheson's policy costs votes because some of Senator McCarthy's mud has stuck, that must, as the acting Chairman of the Democratic National Committee said, be accepted as part of the liability of the party in power. The Republicans, on the other hand, believing that conflict is unavoidable or undesirable to avoid, take every chance of insulting the Russians and fought their campaign by calling anyone who was prepared to negotiate with a Russian a Communist sympathiser or a "pink," in the belief that this would please the voters.

The *Washington Daily News* (and, perhaps, others of the Scripps-Howard newspaper chain) published a photograph of the President shaking hands with Mr Vyshinsky when he went to address the General Assembly with the ominous caption: "You are likely to see this picture again," and the remark that a Republican might say about it: "But he didn't have to smile, did he?" And Mr Dewey, who, however

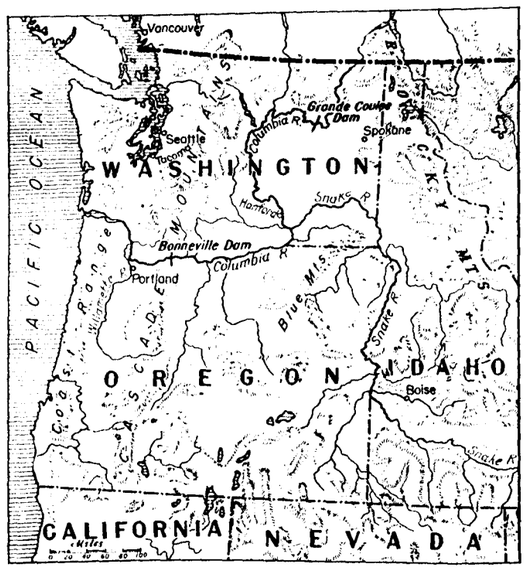
"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect: all others are the work of the editorial staff in London.

much the Hanley letter may have tarnished his shining armour, is not a fool, must obviously have thought that he was collecting votes when he said, in a prepared speech, at a dinner for United Nations delegates, that "it would be folly to ignore the harsh fact that . . . the Soviet Union has ten to fifteen million people living as slave labour under conditions which amount to torture and death." The satisfaction with which he added: "I must say I am complimented by the withdrawal of those who plot the destruction of the world," when Mr Vyshinsky and Mr Malik walked out, suggests that the success of this piece of atrocious manners had been carefully calculated.

This kind of tactic gives the Administration, which has the responsibility of trying to prevent war, a bad time during an election campaign. The State Department discovered during the Berlin blockade that quiet discussion, such as then took place between Mr Jessup and Mr Malik, could produce satisfying results. Ever since they have been on the watch for a chance to repeat that success. The conversation Mr Dulles (who, having been engaged in active diplomacy, does not share the irresponsibility of other Republicans) had two weeks ago with Mr Malik may only lead up a blind alley—and the fact that it became known and its substance was published may ensure that it does—but it might lead somewhere more substantial. Coming soon after a suggestion by Mr Malik to Mr Bernard Baruch that the visit of a private individual to Moscow might be worth while, it at least suggests that the public should welcome, rather than question, Mr Truman's smile to Mr Vyshinsky.

It would appear that one Republican politician, Mr Harold Stassen, had his doubts about the wisdom of the rest of his party and thought that a man who tried to make peace could gain more popularity than one who went about scattering personal insults. He presumably heard of the approach to Mr Baruch and jumped in to turn it to his personal advantage. But Mr Stassen, who moves in a mysterious way his blunders to perform, bungled as usual and made conditions which earned him a rebuff from *Pravda* instead of an invitation from Stalin. The result of the election hardly justifies his doubts and may well scare the Russians into a belief that no accommodation with the United States can be reached if the American people are turning to the Republican view. But having come so near to gaining control of the Senate, the Republicans may recapture some of their mood when they controlled the Eightieth Congress. Then they were a more temperate party than they were before—or have been since.

Northwest Frontier



[FROM A WEST COAST CORRESPONDENT]

In the Pacific Northwest, complacency is a sin. The rawest newcomer and the oldest inhabitant share the same pioneering spirit and both are convinced that this is a land of almost unlimited opportunity. Their enthusiasm has not been satisfied in the slightest by the mushroom growth of industry in the Northwest or by the bursting prosperity there. These modern frontiersmen feel that the possibilities for expansion have only just begun to be realised. Yet there is a notable absence of the blatant boastfulness which has characterised other boom regions, especially Texas and Southern California. The quiet determination of the people of Oregon and Washington leaves little doubt that they will succeed in subduing their "wilderness."

It is already more subdued than wildernesses usually are. The bustling cities, ringed round with new factories, do not look much like a frontier, nor do the huge aluminium plants, although they stand where only a few years ago was raw land. Nor are the forests of fir, pine and cedar very wild, for they echo with the whine of power saws and the roar of tractors.

The Second World War only partly explains why the Northwest has shot up so quickly towards industrial maturity. Its economy was deeply rooted long before 1940 in lumbering, agriculture, fishing and mining and, since the war ended, these basic industries have absorbed much of the population which flooded westward during the war years. In the mid-forties, sceptics predicted that many of these immigrants would leave the Northwest when the shipyards and other war industries were closed. But when noses were counted in Oregon and Washington this year, the census showed a million more people than in 1940, an increase of 37 per cent in the decade, and fewer of them are now idle than at any time since 1945.

The wave of prosperity which has swept across America has lifted the Northwest to new crests. Sawmills in Oregon and Washington are producing more than 17 billion board

feet of lumber this year for the 1,250,000 houses Americans are building, and plywood, pulp and paper mills are all working to capacity to keep their heads above a record-shattering demand. More food is being eaten and more money is being paid for it, which makes Oregon and Washington farmers expect a cash harvest even richer than last year's $840 million. This year, the Northwest's aluminium mills will produce nearly 300,000 tons of the light metal, almost half of the US output, confounding the "experts" who only a short while ago were predicting that these war-babies would never survive the peace. This pattern of prosperity is repeated in nearly all of the area's other factories, large and small and in the high level of retail trade in the cities and villages.

But what of the industrial goal the Northwest has set for its future? Here the pace is slower and problems are many, but, little by little, there is progress, and everywhere there is confidence that the problems will be surmounted. For example, signs are multiplying that the nation-wide building boom is nearing an end, yet, in the last few months, half a dozen big lumber mills have begun to expand. Two new plywood factories are now being built, bringing the additions

since 1945 to 25. Behind these decisions is a confidence that new markets will be found to replace the dwindling demand from house builders. Already the wood producers are planning broad advertising campaigns designed to attract new consumers to new products. Lumber and plywood have an infinite variety of uses, many of which have scarcely been exploited because military and conventional purposes during the last ten years have taken all of the supply. The plywood industry, for instance, considers it has only scratched the rural market; six million farms, it is calculated, could find new uses for plywood, if its possibilities were understood by farmers. Nearly every large lumber company has tucked away on its "rainy-day shelf" processes for making new materials from wood waste—about 35 per cent of cut timber is damaged or not used at all. Research has found ways of extracting tannin and wax from fir bark, cheaply and in huge quantities. Sawdust mixed with plastics can be pressed into a wide variety of boards, whose surfaces are glossy and harder than the hardest hardboard, and there are dozens of other possibilities.

In recent years, too, Northwesterners have conquered another problem—depletion of the forests. More than five million acres are now set aside as "tree farms," where forests of the future are seeded and cultivated with all the care of growing vegetables. Hand in hand go timber cutting practices which forbid the harvesting and stimulate the growth of immature trees. Never will the Northwest's forests be ruthlessly slashed to extinction as were the once-great timber stands of the Atlantic and Great Lakes regions. Nor will agriculture be hampered by lack of land, at least for generations to come. In eastern Washington, a vast federal irrigation project will in 1952 begin to make fertile a half million acres of sage-covered desert.

These and the Northwest's other natural resources—its minerals and its rich fish crops—provide the foundation for even greater industrial expansion. But the lifeblood of the Northwest's present industrial colonies and the hope for its future empire is the power that comes from the huge dams on its rivers. Inexpensive electricity has been the lure for many of the region's new factories; it will be the bait to draw as many more. At present, there is just enough power to make ends meet. Until more is available, industrial growth will be stunted. But during the coming two years new hydro-electric projects and additions to present generating plants will add 880,000 kilowatts of electrical capacity to the existing 4,400,000 kilowatts. The lion's share of this expansion will be at Grand Coulee, the world's largest hydro-electric enterprise, and already engineers have surveyed sites for 257 additional hydro-electric dams on the Columbia River.

*

It is as yet too early to tell whether the defence programme will, like the last war, touch off a new boom in the Northwest and start a new migration to the region. Some industries have already been affected; aluminium factories are speeding up production to the limit of the available power supply, and will expand their capacity if electricity can be provided. The big Boeing aircraft works at Seattle, that city's largest single industry, is working at a faster pace, and expansion at the huge Hanford atomic plant in eastern Washington is being hurried. In western Idaho and eastern Washington—the Northwest's mineral belt—lead and zinc miners have felt the spur of higher prices and rising demand and so have farmers and fishermen in the area. However, the once-great shipbuilding yards, now deserted or dismantled, show no signs of revival and, with many of the military establishments built for the last war still intact, the demand for lumber for defence purposes is small.

American Notes

Close Call for Democrats

The Democrats have kept their heads above the Republican mid-term tide, though it has crept uncomfortably high. A majority of two, instead of twelve, in the Senate, and of less than forty, instead of ninety, in the House leaves technical control, and the committee chairmanships, in Democratic hands, but it also more than confirms the conservatives of both parties in their unofficial working majority. Mr Truman's consolation must be that the cynical exploitation of the Communists-in-government issue, and the Korean casualty lists, did not produce a stampede among the voters and return to the Republicans the control of both Houses they won in 1946. The reverse of the coin, however, is that the opposition will now enjoy more power without responsibility—a combination it has made the most of in the past.

Republican gains in both the Senate and House were to be expected, for not since 1934, when the New Deal was still in full flood, has the party in power been able to hold, or increase, its Congressional majorities. The real surprise and shock to the Democrats has been the swamping of most of the President's champions in the doubtful states, and the triumphant survival of all but one of the embattled Republican conservatives. Senator Lucas, the Democratic leader, lost by over 150,000 to Mr Dirksen, whose last turn of coat has once more revealed him in the Pacific-first colours of the *Chicago Tribune*. Senator Myers, the whip, gives way to a Republican of a progressive and internationalist stripe, Mr Duff. In normally Democratic Maryland, Senator Tydings, who courageously climbed out on a limb in pursuit of Senator McCarthy, has been sawn off.

The labour leagues have failed as conspicuously in bringing down their Republican quarries as in saving their friends. Senator Taft's nip and tuck race in Ohio turned into a walk-over with a majority of over 430,000; with the victories of

One of the World's Great Banks

with Headquarters in the

United States

THE CHASE NATIONAL BANK

OF THE CITY OF NEW YORK

A United States Corporation with Limited Liability

LONDON — 6 Lombard Street

51 Berkeley Square Bush House, Aldwych

Senators Millikin, Capehart, Hickenlooper and Wiley, the line-up of the Republican right shows no gaps save that caused by the elimination of Senator Donnell in Missouri. It is, instead, strengthened by the victory of Mr Nixon, a former member of the Un-American Activities Committee, over Mrs Douglas, an even more convinced Fair Dealer than the President.

The Democratic left suffered a series of other reverses; it was its moderate, independent candidates, such as Senator Lehman, Mr Monroney in Oklahoma, and Senator McMahon in Connecticut, who saved the day. Senator Benton's helicopter also carried him just over the finish line in Connecticut, but the Governor who first appointed him, the Fair Dealing Mr Bowles, has lost. Even more discrimination was shown by voters in New York. Returning a Democratic Senator over the ailing and somewhat flyblown Mr Hanley, they nevertheless sent Mr Dewey back to the Governor's mansion with a majority of over 550,000; and in New York City they repudiated both machines in favour of Mr Impellitteri, the Acting Mayor, who, instead of keeping the chair warm for the next official Democratic candidate, turned independent, at least for the campaign, and walked off with it under Tammany's nose.

The trend to the right shown by the voters will discourage Democratic Fair Dealers and reinforce the grip of mid-western conservatives upon the Republican party. Mr Truman will have to accept the conservative view on taxation and controls, and make considerable concessions in foreign policy if the blockade of the past two years on progressive domestic legislation is not to spread and paralyse the business of government. Senator Taft has already proposed a review of foreign aid programmes, and Mr Stassen has demanded his pound of flesh in the form of Mr Acheson's resignation. This is stretching the election returns, but the Republicans have it in their power to make Mr Acheson's position unbearable.

Wage Controls Around the Corner?

In an hotel room in Pittsburgh last week, officials of the US Steel Corporation listened to Mr Philip Murray, president of the United Steelworkers' Union, as he explained why his 155,000 members must have a wage increase. Every manufacturer in America kept one eye on that hotel door, wondering if "Big Steel" would give its workers another 12 or 13 cents an hour, to add to their present average hourly wage of $1.70. But unlike previous years, other manufacturers have not waited for US Steel to start another wage race. Most of them broke through the barrier months ago. In September alone, the rush of trade unions to get pay increases before wage controls were imposed resulted in wage boosts for over 1,200,000 organised workers. The average wage of production workers has climbed to $60.53 a week, the highest in history.

Nevertheless, wages are barely half a head above the cost of living: since the Korean war began the consumers' price index has moved up 3.6 points to 173.8, just below the record set in 1948. Mr Murray is as determined as any of his labour colleagues that the cost of living shall

Prices and Wages

Source: U.S. Department of Labour.

not catch up with his union members, but he has not attacked this negotiation with his old vim and vigour. The talks have dragged on for three weeks without result, and some Republican critics have taken this as evidence of a deal between the steel workers and the Administration to delay settlement of the contract until after the election. Announcement of a pay increase in the steel industry, say these critics, followed by the rise in the price of steel which corporation executives think is inevitable, might have raised a clamour for wage and price controls, an embarrassing prospect for any politician running for office.

Now that the election is over, neither US Steel nor any other manufacturer may be able to resist further wage demands. American manpower is in tight supply, and manufacturers must pay whatever is asked. Last month, unemployment fell off in 147 out of 150 cities checked by the Bureau of Labour Statistics, and total factory employment edged close to 15.6 million; there were 35,000 jobs left vacant for want of men to fill them.

With jobs going begging and with many trade union contracts calling for automatic wage increases in 1951, Mr Stuart Symington, the chairman of the National Security Resources Board, will find it hard to avoid direct wage controls. So far, the Administration has been willing to allow wages to catch up with prices. A chairman has been appointed for the Wage Stabilisation Board, but he has no staff. Mr Symington has put his faith in such indirect controls as higher taxes, restrictions on hire purchase credit, and allocations of scarce materials. "If everyone gets in

and pitches," he says, "we may have a good chance to make indirect controls work." But the Administration may not have all of organised labour pitching on its team this season. When automobile sales slumped as much as 50 per cent after the Federal Reserve Board tightened hire-purchase terms for motor cars, Mr Walter Reuther, president of the powerful automobile workers' union, denounced the measure. He sees "mass unemployment" as the result.

Bullets and Ballots in Puerto Rico

Now that the United States has in its turn reached the stage of trying to liquidate its colonial interests, it is discovering for itself that dependent peoples sometimes bite the hand that frees them. The snarling protest from the Philippines, that the graft and extravagance there only followed the example set by Americans, was still echoing in Washington when the Puerto Rican shots threatened the President's life and the Puerto Rican revolt seemed to threaten the territorial government for a day or two. But the Filipinos were mortified not because the United States was putting an imperialist finger in their pie, but because there was hesitation about publishing the Bell report which recommends that the United States should, in effect, resume responsibility for the entire economic menu of the Philippines. And, while the would-be assassins from Puerto Rico were more orthodox anti-imperialists, it is not President Truman who stands in the way of their nationalist aspirations, but their own Governor Munoz Marin, elected by an overwhelming majority of their countrymen two years ago.

He is convinced, partly perhaps by the experience of the Philippines, with a similar type of economy, that Puerto Rico cannot yet afford independence or even statehood, however desirable one or the other may be in the long run. The tax and trade privileges which the island enjoys as a territory save it from the bankruptcy which threatens the Philippines, and Governor Marin has no intention of dispensing with these until the economy of the island is established on a soundly diversified basis. His attempts to bring American manufacturers to Puerto Rico, with the help of an industrial development corporation which the Philippine government is now urged to copy, have had some success; they should have more as costs rise and labour becomes scarce on the mainland as the result of the defence programme.

This programme will open new opportunities for the many unemployed Puerto Ricans, who take advantage of cheap air transport and their American citizenship to seek jobs in the United States. The conditions they find there, as unskilled workers, of mixed race, speaking little English, have not given them much cause to admire the American way of life, and the large number of Puerto Rican voters in New York City have been the main support of Mr Marcantonio, the fellow-travelling Congressman. The President's assailants came from his district and he was the only opponent of the legislation passed by Congress last summer, which permitted Puerto Rico to put the keystone on its uniquely independent position as a self-governing territory, by writing its own constitution. Mr Marcantonio objected to this legislation, as did the small group of nationalists in Puerto Rico, and the even smaller group of Communists, on the ground that it was a sop to distract attention from genuine independence.

The first step towards lifting this keystone into place was taken last weekend, when voters registered for next summer's referendum on the constitution. The revolt, and probably also the attack on Mr Truman, seems to have been an attempt by the nationalists and Communists to discredit and disrupt the process of gradual and orderly progress towards political maturity. But the Puerto Ricans, preferring ballots to bullets, refused to be diverted: at home they registered in unexpectedly large numbers and in New York Mr Marcantonio was defeated.

Not for Export

In August the United States found itself with an import surplus of merchandise for the first time since 1937. Imports, which have been rising steadily since last year's currency devaluations, shot up to a record figure of $819 million under the impact of war demands and raw materials shortages in the United States. This is almost 50 per cent above the 1949 monthly average. Exports reached only $761 million, compared with an average monthly total of just over $1 billion in 1949. In 1947, the excess of exports over imports alone amounted to nearly that. Mr Sawyer, the Secretary of Commerce, reports that, on preliminary estimates, the export surplus has been wiped out for the three months July, August, and September. It is this return to a balance in America's international payments, stimulated though it has been by mobilisation demands that one trusts are abnormal, that has prompted demands in the United States that Britain and the sterling area should begin to dismantle the controls that have protected them from dollar competition. The National City Bank points out that, if shipments under foreign aid programmes are disregarded, the United States has incurred import surpluses since last January.

Exporters, who have watched their trade decline by a third in three years, are gloomy about the future, though the exports of military goods under the Mutual Defence Assistance Act probably will prevent an import surplus during the coming year. This newest difficulty is less a dollar shortage —some restrictions abroad are being relaxed—but a shortage of goods for export. The goods that foreign countries would like to import are increasingly hard to find, quite apart from the export controls now imposed on copper, aluminium, lead, and zinc in the interests of the defence programme, and the revival of controls to protect domestic civilian supplies of sugar and cotton. What foreign traders would like is some assurance that foreign markets will not be starved to protect home consumers.

The Administration will not be entirely unsympathetic. It still puts a high priority on international trade as a method of strengthening the West, and of binding the undeveloped countries to the anti-Communist alliance. It also appreciates that supplies of raw materials may become contingent upon the ability to turn dollars into machinery and electrical equipment—perhaps even Cadillacs. Most of the rise in imports in August came from Latin America, in the shape of coffee, tin and copper. Armed with a fresh supply of dollars, the Latin American countries are increasingly anxious to know what they will be able to buy with them. If the rearmament programme is as rapacious as is feared, a limited number of priorities for export may be needed.

* * *

Piling Up the Stockpile

The newest recruit to step into the ranks of the alphabet agencies of American defence will be the DMA, or Defence Minerals Administration. Scheduled to move into action within a few weeks, the agency will offer federal loans and guaranteed markets to producers who develop new sources of such vital minerals as aluminium, manganese, copper and zinc. A potent force for the future, the DMA will have little effect on today's metal markets, which are fluctuating wildly out of control. Copper is commanding up to 46 cents a lb. on the grey market, compared to 17.6 cents a year ago; tin has jumped to $1.52 a lb., an historic high, compared to 76 cents a lb. before the Korean outbreak.

Most of these materials, of course, are being gobbled up by private industry, whose appetite for raw materials to fill defence contracts and to manufacture mountains of civilian goods seems insatiable. However, the decisive influence which has tipped the balance from adequate supply to acute scarcity has been the government's decision to double its buying for the US stockpile of strategic materials. When the Korean war began, Americans were shocked to discover that four years of work and $1.5 billion in appropriations had given them a stockpile only 38 per cent complete by dollar value. President Truman promptly asked Congress for another $600 million to speed up the process; the Economic Co-operation Administration announced it would lay out an extra $138 million for purchase of strategic materials abroad.

The government's headlong plunge into the raw materials markets has drawn bitter comment from many manufacturers. Tyre makers claim that orderly buying last year could have secured all the rubber the government needed at 16 cents a lb., but that the sudden rush to amass a 1,500,000-ton stockpile had created such a shortage that natural rubber now costs 70 cents a lb., an increase of 350 per cent. When three big steel companies cut their production of galvanised products by 20 to 30 per cent, they blamed the lack of zinc on government stockpiling. And as nickel vanished from the market, automobile manufacturers gloomily prepared to use more paint and less chromium on new models.

Even abroad, where the spending of dollars once raised unqualified hosannas, the stepped-up stockpiling programme has met with a mixed reception. The demand of the United States for 20 to 30 per cent of the highest grade wool in the Commonwealth clip, when tight supplies had already forced prices up to record highs, has led some nations to wonder if America's concern for her stockpile has not blinded her to the needs of her allies. And some Americans have already asked their Administration to consider if a woollen blanket in the haversack of a British soldier does not contribute as much to US security as a bale of wool cloth on a US stockpile.

Shorter Notes

The Swiss Government has reluctantly agreed to the addition of the "escape clause" to its 1936 trade agreement with the United States. American watchmakers are losing no time in asking the Tariff Commission to invoke the clause on the ground that their industry is being seriously injured by imports of Swiss watches. They are undoubtedly encouraged by the fact that, for the first time, one of the similar petitions which have frequently been presented by other manufacturers has been successful: tariff concessions on women's fur felt hats and hat bodies, made to Czechoslovakia, France and the United Kingdom in 1947, are to be withdrawn at the end of this month.

*

The Tax Court has ruled that the fees paid to "five percenters," the "pedlars of influence," who help manufacturers to get government contracts, are legitimate business expenses and can be deducted for income tax purposes. The Bureau of Internal Revenue had refused to allow this, considering such payments contrary to public policy.

*

If the Civil Aeronautics Board examiner has his way, a "heliport" will be set up on the roof of the General Post Office in New York, and the centre of the city will be linked with its three airports and at least 35 other towns within a 50-mile radius. Mail, freight and eventually passengers will be carried. One of the most telling arguments for the service was its usefulness in the event of atomic attack. The only opponent was the Post Office itself, concerned not about its roof, but at the addition to its perennial deficit which will be involved if passengers do not take kindly to the new service and leave the mail subsidies to hold the helicopter.

New Order in China

(By Our Hongkong Correspondent)

AT Hongkong, now the only open threshold of China, the first impression is of variety. The downfall of a centralised regime confronts us with an old truism: that China is not so much a nation-state as a great sub-continental area, containing a great range of geographical, social, and other conditions. In an age of fervent nationalism, progressive opinion (both Chinese and foreign) has long discounted this underlying fact as far as possible, desiring to support the country's struggle for a national and independent status. It is the more striking, therefore, to find the Chinese Communists, in all practical matters, bluntly recognising this diversity as a preliminary fact. Their China is divided into half a dozen main regions, each with different regulations, different administrative devices, taxes and incentives—even issuing different postage stamps. Administratively, there has been a great decentralisation of procedures, and localisation of the immediate executive machinery. With this has come, however, an equally great centralisation of the powers of control and decision — indeed, of all authority on any plane higher than the executive one. Mao Tse-tung had repeatedly promised a "federal" solution for China; here it is, neatly coupled with the extreme of "Leninist - Stalinist Centralism."

This is, of course, not called Communism. That is held out as a future goal. Only foreigners speak of "Communist China" or "Red China"; the present regime defines itself as the "New Democracy," and each of its regions is a "People's Government." The element of people's government consists in the familiar device of allowing non-Party candidates to stand, on condition that they are personally approved by the Party and always vote with it; the element of democracy consists in allowing local administrations to debate freely the best means of locally enforcing central decisions. The "New Democracy" has, however, a broad theory of class collaboration (other classes being permitted to exist, though under the dynamic leadership of the working class), which has not yet been discarded to the extent it has in Eastern Europe.

Theoretically, only "bureaucratic" capital (that associated with the Kuomintang), and foreign imperialism are to be suppressed; "people's capital," workers, handicraftsmen, peasants, are all to be encouraged. In practice, this is a great scheme for "having it both ways": workers were first supported in inordinate demands against capitalists, but later the government could turn round, invoke its duty to support the "people's capital," and put the screws on the workers. This has happened in thousands of instances, with the general result that standards have on balance deteriorated for both parties.

Thus far this is, broadly speaking, the local application of a pattern already familiar in Eastern Europe. The primary differences are perhaps the regionalisation of administration, and a less subordinate relationship to the Soviet Union. The regional dispensation is, in the Marxist phrase, "not accidental," since it largely reflects the basic structure of the country, though it has been specially shaped by recent circumstances.

The nucleus of the new state was the wartime stronghold of Shensi Province, around Yenan. This area was wild, remote; appropriately termed the Border Region, it was self-contained (under blockade) at primitive levels. A rough and ready collectivism was there achieved, a homespun way of life close to the heart of the peasant. In the vacuum created by the Japanese surrender and the Russian Army's marauding expedition into Manchuria, this simple populism was rapidly spread, in 1945-46, over a great part of North China. Quickly, crudely, but on the whole smoothly, the Yenan pattern was imposed in wide stretches in the North, as an egalitarian (but not relentless) collectivism. It is deeply characteristic of Chinese Communism that its most spontaneous form of public demonstration is a childish rural folk-dance—the yangko, originally an ancient harvest-revel. The sense of liberation spread rapidly, and it must be stressed that this was liberation: the sudden ending of the foreign occupation and the long years of war-weariness, and the swift disappearance of corrupt puppet or Nationalist regimes.

The people of this area, which may be called the first zone of liberation, were barely conscious of any alternative to the Communists. In the first days the people found the dances and the crowd-movements very enjoyable, after the gloomy years of war. Only occasionally were they rudely interrupted by the fall of Nationalist bombs and shells; that the latter were known to be manufactured in America did more for Communist propaganda than all the efforts of the Communists themselves.

Soviet Models in Manchuria

The second zone to be distinguished is the North Eastern People's Government—the area more familiar under the name of Manchuria. In the last few days of the war, when the Japanese were already defeated, it was seized by the Russian Army. Soviet troops behaved in a manner fitting their own description of colonial imperialism; the country was plundered, the inhabitants manhandled. The Soviet

Union took railway and port concessions exceeding any previously demanded by Tsarist Russia; it removed a great part of the industrial potential of the country, then handed the remainder over to Chinese guerrillas and cadres established rather by Russian authority than by that of Yenan. The Communist pattern—its collectivisation, nationalisation and the rest, is clearer and firmer in Manchuria than in North China: but it is on Russian, not Chinese, Communist lines.

United Front in the Towns

Meanwhile, in China proper, a third zone was coming into existence. Besides the "stable base" of Yenan there had continuously existed a broad and fluctuating penumbra of guerrilla operations, representing an extraordinarily wide permeation of Communist and semi-Communist influence all over the country. Into this third zone the "overturn" was spread, in part by force of arms, in part by the methods of embittered class struggle, and largely through terrorist action by the fifth column. The upshot was sometimes a degree of compromise between full Yenan-style collectivism and the needs of the local situation, but more usually a savage imposition of Communist doctrines. The easy-dancing populism of the first zone here went by the board.

This phase shaded rapidly into the next, and into the emergence of a fourth zone. The next expansion of Communist territory brought in the major industrial and urban centres of China. The acquisition of these faced the Communist Party with entirely new problems. Its old stress on agrarian reform and its somewhat rustic populism had to be revised; a new United Front approach, with a different doctrine of class collaboration, had accordingly to be emphasised. This new task of organising a part-industrial state proved to be much beyond the immediate resources of the party cadres. From this point onwards (from the fall of Nanking and Shanghai) they have given the impression of being unable to cope with more than one task, or one sector of the home front, at a time; and it was their rural programme that was abandoned, so that all available hands could be turned to the urban and industrial problems. Thus the land-distribution and other programmes, which have been fully and uncompromisingly carried out in the North, have been effected only partially or in modified form in the third zone, and halted altogether in the fourth.

Uncertainty in the South

This carries the story to the crossing of the Yangtse River. Thereafter, the whole of South China fell swiftly into Communist hands. South China represents an entirely different region, with problems entirely different, in every social and economic field: the rice economy (instead of wheat), tenancy, transport, customs and outlook, even language—everything is on a different footing from that found in North China. The Communists appear to have been unable or unwilling to produce a solution for this area, or to apply to it the procedures confidently followed in the North; indeed, they have—broadly speaking—done very little in the South, and certainly nothing decisive.

Still a sixth zone remains to be specified: the vast and potentially rich hinterlands of West China. The turnover of power in that great area was extraordinarily slow, often lackadaisical. In many areas, liberation armies did not even arrive for many months; in some districts interregnum has become almost an accepted state of affairs, and local forces (which are commonly nothing but bandit groupings) are holding these districts in varying degrees of collusion with the new central authorities.

This rough outline is intended to emphasise the amazingly uneven development of the new order in China. This fact has not received adequate recognition abroad, but it is probably fundamental to an understanding of the position and prospects there.

(To be continued)

Persia Faces Both Ways

AT first glance the new Russo-Persian trade agreement, coming on the heels of two announcements about American aid with economic development, looks like just another parry to a thrust in the cold war. But, seen from the Persian home front, it has a different significance. The Persian political world consists of a myriad splinter factions, dozens of which must be simultaneously wooed by any premier who wants to keep in office. The agreement with Russia, and the pleasure with which it was greeted locally, is proof that no Prime Minister of Persia can afford to lean on the west alone. Since the Shah's visit to America last year, successive governments have tended to look chiefly westward.

But the Russians are so near that, even to Persians who do not like them, it seems merely prudent to get along with them. There was therefore relief when, in August, they made overtures about implementing the Russo-Persian Trade Treaty of 1940. This month's agreement is an annexe to that treaty.

The west need not feel that it has been worsted. Its prime requirement is a stable Persian Government, in order that its economic aid to Persia may have a chance to mature. The present Persian premier, General Ali Razmara, has for the moment gained a wider backing because he can point to agreements in hand with Russia as well as America; his chances of stability are therefore improved.

Expensive Russian Sugar

Whether the agreement will also increase contentment by improving the economic plight of north Persia remains to be seen when it is put into practice. Its actual terms are not yet published. The Russians are hard bargainers. The best evidence of this fact is that in the last year in which they supplied any considerable quantity of goods for the Persian market—1946-7—they headed the list of suppliers (in value) of Persian imports, chiefly because the 12,000 tons of sugar which they supplied cost Persia 600 million rials, whereas only 250 million rials was paid for 35,000 tons of sugar coming in through southern ports. The new agreement is made on a barter basis; if north Persian rice and dried fruits now resume their old route northward in fair exchange for Russian sugar and manufactures, prosperity in Persia's Caspian provinces ought to increase, and contentment with it. It may be a good augury that the Russian negotiators seemed ready to meet Persian requirements on some important points that were discussed—in particular, to trade through five Persian Government agencies instead of, as the Russians wished, through Soviet commercial travellers dealing directly with Persian rural producers. They also agreed to hand back the Persian frontier patrols they had impounded, to settle some disputed boundary lines, and to reopen negotiations about the eleven tons of Persian gold which they carried off to Moscow during the war.

A Start with Point Four

As far as foreign policy is concerned, therefore, General Razmara is now facing both ways. He is, however, more deeply involved with the west than with Russia. The two newest items of western aid at his disposal are a 25 million dollar loan from the Export Import Bank of Washington and a $500,000 American grant—the first such to be made under this year's Point Four allocation—towards village training centres in agriculture and public health. These are to be run on the pattern of those already operated—on a tiny scale compared to the size of Persia—by the American Near East Foundation. Half a million dollars will not greatly alter the scale relationship, but it is a start.

Can the Prime Minister, striking while the memory of success with both Russia and America is green, utilise the support he has temporarily gained in order to put through the main items of his home policy? His chances do not look rosy. The main aims he is pursuing are three. One is the passing of a budget; Persia has been living on monthly votes for some years. Another is advancement of the country's education in democracy by decentralising some of the responsibilities of the Government, and passing these to elected provincial and district councils. The third and most important is the financing of the Seven Year Plan for development and welfare. This, which has been on paper for years, gets little farther because Persia has no money to finance it, and because most Persian politicians are too proud to borrow this except on terms which are far too arbitrary and opinionated to attract most foreign lenders.

General Razmara has the Shah behind him in his efforts to get these three projects moving. But he is handicapped by the age-long failings of the Persian politician. Even Cabinet Ministers desert rather than admit that they are not being 100 per cent. successful; his latest cabinet re-shuffle was caused by the desertion of his Finance Minister while on an errand abroad. In the Majlis, group upon group of landlord politicians are endlessly ready to carp and criticise, but unready to advance an inch towards the changes that are their only hope of arresting Asia's march towards the overthrow of their class. Their support for General Razmara has been fluctuating because, belonging largely to Teheran—if they do not belong to the landowning class—they hate his decentralisation policy. Further, throughout his time in office, they have poured volumes of destructive criticism upon his every idea for raising funds to finance the Seven Year Plan. They prefer to turn a blind eye to the fact that he can achieve this only by foreign borrowing, or else by accepting the Supplemental Agreement on oil royalties which the Anglo-Iranian Oil Company had offered to his predecessor and is still fully ready to make. (The terms of this relatively generous agreement were set out in *The Economist* of May 6th, 1950.)

Unconstructive Parliamentarians

General Razmara has secured an Export Import Bank loan but this does not yield funds for local spending; it serves merely for purchases of equipment in America. To meet the local wage bill of the Seven Year Plan, and to start activities that will ultimately yield revenue for servicing and refunding loans, he must both borrow more and come to terms with the oil company. Yet, at present, the prating in the Majlis is such that he is doing neither. Precious time is being wasted, and the very considerable funds that the Majlis could immediately secure by accepting the Supplemental Oil Agreement are lying idle. An Assembly of sleek and unconstructive Parliamentarians is spending its time either procrastinating or reaching for the moon. Sometimes it gives the impression that it would not be capable of grasping essentials or facing realities even were the tumbril at its door. There is no doubt that a more purposeful parliament could borrow the money Persia needs both on better terms and in bigger quantities.

Is there a way out of a situation in which politicians cannot finance their own development and will not let others do it for them? The best discernible course is to pray for the emergence of a leader with sufficient aplomb and backbone either to command a steady following or else to override unconstructive opposition. To the disappointment of many of Persia's foreign wellwishers, neither the Shah nor General Razmara seem to think that it is up to them to display such qualities.

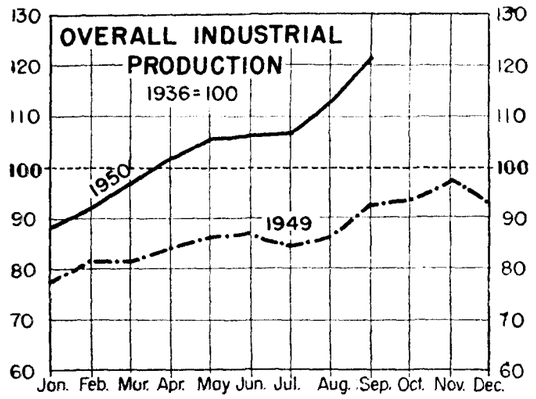
German Industry Reaches a Landmark

[FROM OUR SPECIAL CORRESPONDENT]

THE moment is approaching when the Atlantic Pact powers and Federal Germany will have seriously to consider what the Western German economy is capable of contributing to Atlantic defence. No direct request for financial or industrial aid has yet been made, but the word has gone round that the Federal Republic will be expected to contribute in one way or another ten per cent of the national income. This percentage will deliberately be kept lower than the British or American burden in order to meet the German argument that wartime destruction, dismantlement and the need to support an army of unemployable refugees and disabled soldiers have rendered the economy incapable of bearing even the present burden of occupation costs. This aspect of the complex problem will be discussed in a later article.

The question also arises: is German industry capable of expanding to meet the demands of western rearmament for its basic materials and, perhaps, equipment such as uniforms and lorries? No one at present thinks of re-establishing the dismantled German armaments industry, but it is realised that there are many ways in which the country should and could help to supply the Western forces without rebuilding Krupps.



At this moment, the situation in German industry appears to be that further increases will be limited by shortages in coal, power, chemicals and skilled labour. Further shortages in imported raw materials, particularly non-ferrous metals, loom up with the exhaustion of Germany's foreign exchange resources unless effective measures to direct the use of available funds are taken. Last winter's worries over an unemployment crisis and deflation seem more remote than the troubles of 1946.

Will the Boom Continue

A landmark has been reached in the progress of German industry, and Germans as well as the Atlantic powers are asking themselves, what next? Many firms are now working to capacity, particularly in the chemical field, and are reluctant to expand because of the uncertainty as to whether basic necessities will be available. A wider doubt also influences many—whether the boom will continue. There is a tendency in industrial circles to take the view that Stalin need only smile and American rearmament will be called off. This doubt is making some firms whose production of strategic materials has hitherto been prohibited chary of turning back their factories to their original use when the bans are raised. It also means that industrialists and traders still believe that they need and would find a stable market in Eastern Europe.

In the meantime, records continue to be achieved in output, productivity, employment and foreign trade. In September, for the first time, overall production exceeded that of 1936 by 21 per cent and reached the level of 1938. The greatest

increase was in investment goods (plus 10 per cent compared with August), and in the consumer goods industries (plus 8.8 per cent). Some individual records that are notable were: machinery (plus 9.3 per cent, largely owing to the spectacular increase in export orders); precision and optical instruments (plus 14.4 per cent); electrical goods (plus 14.7 per cent); iron, steel, sheet and metal goods (plus 11.8 per cent); and glass (plus 22.7 per cent). On the other hand, steel production has recently remained fairly constant at slightly over one million tons a month, while coal and coke production stagnated. The way in which production has soared without a break this year is illustrated by the accompanying graph.

The coal shortage is temporarily serious. Nothing but a real fright would have induced the Ministry of Economics to revert to a form of rationing. Last week the German Coal Control (DKBL)—a curiously anomalous body which exercises the powers of a government or cartel under the nominal authority of the Allied Coal Control—was empowered to ration supplies, in practice though not in name. The DKBL can do so because it controls a sales organisation which in the internal market exercises all the powers which used to be wielded by the *Rheinisch-Westfaelisches Kohlensyndikat*. This organisation was dissolved by Military Government on account of its being a cartel. *Plus ça change, plus c'est la même chose.*

The outlook for coal is not, however, so black as it appeared in September. After a strenuous tussle, the Germans in the Ruhr Authority secured an assurance in October that they could keep for the home market all output over 370,000 tons a day. The average daily output in October was 365,000 tons. There is every likelihood that this will prove a substantial concession, since the pre-Christmas period of peak production is beginning, and the miners have just received an increase in wages which introduces an output bonus. Even so, however, a stringent time lies ahead. The steel industry estimates that its present production can only be assured if coal output is at least 385,000 tons a day. To reach this figure it will be necessary to do more to stop the present drift of miners to less arduous jobs. The recent rise in wages is a step in the right direction. But it is being matched by the increases which are now taking place in almost all branches of industry.

Is There Full Employment?

The statement can already be heard in German economic circles that the country has reached the stage of full employment. This is, however, only true if qualified by the words "under present conditions." The unemployed still amount to 8 per cent of the employable population (workers and unemployed together) in spite of a constant flow of men and women into jobs. The total could doubtless be still further reduced if proper training were given to the army of youths—the product of the birth rate boom during the Hitler regime—who annually enter the market, and if more were done to provide housing in the industrial areas. Owing to this influx, the rise in the number of employed has been greater than the reduction in the total of unemployed. A satisfactory feature of the situation is that productivity has been rising and costs have been cut at the same time as employment has increased; and the process is not at an end. What can be done as a consequence has been shown by the Ford Motor Company, which recently simultaneously cut its prices and distributed a substantial bonus to its workers.

In detail, the trend in employment is shown by the following table:

in 1,000's	1948 30th June	1950 30th June	1950 30th September
Employed	13,468	13,845	14,295
Unemployed	451*	1,538	1,271

**The figure of unemployed at the time of the currency reform is misleading, since few found it worth while to register for employment or the dole while money was worthless.*

In contrast to 1949, the trend towards lower unemployment has continued into October. The first clouds on the sky appeared late in that month, when the limits of capacity were temporarily reached in some fields, shortages of raw materials began to appear, and the country's reserves of foreign exchange ran out. It is now gradually being realised that the new situation in the world is having repercussions on the German economy which call for revised policies. The first breaches have been made, on American instigation, in Dr Erhard's free market economy.

(To be continued)

Economics of the Atlantic Pact

On October 27 the North Atlantic Council Deputies decided to establish "an economic and financial working group" in Paris, based on the delegations of North Atlantic Treaty (NAT) countries to the Organisation for European Economic Co-operation (OEEC). The Deputies explained that their decision was inspired by their desire to gain access to OEEC's wealth of experience in tackling the economic problems of rearmament and the equitable distribution, in particular, of mutual aid. So far, so good; it is at last assured that the anomaly of establishing a separate body of experts, attached exclusively to the Nato organisation, sitting in Lancaster House, and duplicating (or attempting to do so) the work of OEEC, will be avoided.

The practical decision about OEEC's contribution to Nato work was confused, sometimes lost, and certainly delayed, by the psychological problem of OEEC's relationship with the younger organisation. Was OEEC, the European organisation, centred in Paris and the instrument hitherto of American pressure for European integration, to retain its individual importance and become Nato's economic instrument? Or was it, in the shadow of Nato, to be gradually absorbed and even replaced by the broader Atlantic character of the latter? Though they have decided to set up their economic working group in Paris, with OEEC delegations, the Deputies have temporarily shelved this issue, but it took valuable time to enable them to do so. They have forged a device through which they hope to use OEEC in their work without prejudice to the future relations of the two organisations. Those members of the Atlantic Pact—particularly the British—who feared that by using OEEC delegations and facilities the issue would be prejudiced, have been persuaded to swallow their fears—not indeed from a change of heart, but because the voracious demands on personnel of the Atlantic and other international organisations have at last convinced them that they cannot afford to duplicate.

CIGARS FOR CHRISTMAS—

but which cigars?..

For Christmas—if only for just this once—the *best* cigars! And so—as any man who knows today's cigars will tell you—you'll be wise to confine your choice to finest Jamaica.

And remember this: the occasional cigar smoker usually prefers a *mild* cigar. La Tropical—as full of character as any that Jamaica sends us—is notably, nevertheless, a mild cigar. *When you're buying cigars as a gift, you'll be wise to ask for La Tropical.*

In cedar boxes of 10, 25 and 50. In cartons of 5. In all the usual sizes from 2/5d. upwards; Petitas 1/6d.

Under Two Flags

This psychological background to the Deputies' decision finds a clear reflection in the ambivalent personality of the new working group. While the actors themselves will all be drawn from the delegations to OEEC, the dramatis personae will have different names, they will meet in different places and at different times, as dependents of Nato not of OEEC.

The immediate task for the group, which began meeting last week, is to produce comparable facts about the economic position of the Nato countries which are relevant to a decision on the equitable distribution of long-term mutual aid—that is, aid available after the end of the present American emergency appropriation in June, 1951. If the "fair-shares" ideal is to be realised, a complex assessment has to be made of each member's need to receive, and ability to contribute. This must include not only the size of each member's forces—already decided by the Defence Ministers—and the location in each country of production for joint requirements of equipment—now under study by Nato's Production and Supply Committee—but also the relative capacities of each country to absorb additional burdens, both in their internal budgets and their external balance of payments. It is towards filling this gap in the information available to the Deputies that the fact-finding activities of the working group in Paris will be directed; and they must cover such factors as internal financial stability, levels of investment, productivity and consumption, and trade and balance of payments prospects as affected by the rearmament and strategic production plans finally agreed by the North Atlantic Council.

OEEC's part in this exercise is beginning to emerge fairly clearly. The working group will use the information collected by OEEC in its October questionnaire for the Third Annual Report; to the extent that this will not cover the whole field (and for security reasons it is clearly impossible that it should) it will issue an additional questionnaire of its own, exclusive to Nato countries, in which the OEEC secretariat and the neutral members of the OEEC will not be involved.

Raw Materials and Controls

Secondary tasks for the working group must presumably be the more specific economic problems of rearmament such as raw material shortages and export controls, and here its relations with OEEC are ambiguous to say the least. OEEC is already launched on a study—and has committed itself to making recommendations—on the raw material situation as it affects the economies of all participating countries. While there is no question of transferring this work to the working group, the latter must be involved and may need, in the specific context of defence and security, to take the matter further than, or approach it differently from, the OEEC. No cut-and-dried decision has been, or will be, made on the division of work between the Nato working group and OEEC on this sort of problem. In theory, the duplication of personalities is intended to avoid duplication of work and, if not unanimity, at least compatibility of decisions. But in practice the Nato body in Paris would seem likely to gain predominance over OEEC where the two are covering more or less the same ground. Where they are not, as for instance in OEEC's work on internal financial stability, manpower, productivity and technical assistance, OEEC will continue unaffected. Thus, oddly enough, the consequences of establishing a formal link between OEEC and Nato on the former's home ground may well be, not to consolidate OEEC's position, but to provide a corridor down which the work of OEEC can gradually pass into the hands of Nato, without losing the knowledge and experience which the Paris body has so admirably acquired.

Communism Hard and Soft

[FROM OUR ROME CORRESPONDENT]

SENSATIONAL inferences about Togliatti's latest retreat into a nursing home have been answered by full-page dithyrambics in the leader's honour in the Communist Party organs. It took the *Unitá* twenty-four hours, however, to dismiss the impression that Togliatti was a politically finished as well as a sick man. After July 14, 1948, when Togliatti was saved by the surgeons from any fatal consequences of the attempt upon his life, very much the same speculations floated around. Then, too, the party's bulletins were scrutinised for indications that the grief was only formal, and that the necessary long period of rest would in fact be permanent. Then, too, it was said that the controls would pass into the hands of the "hards," then identified chiefly in Luigi Longo, because times were no longer propitious to the "soft" Togliatti with his Latin quotations, historical disquisitions, and studied personal resemblance to Cavour. But after a month or two Togliatti took back the reins.

Two years later Togliatti undoubtedly shows signs of fatigue and disappointment. He has presided over many frustrations and has had few openings for bestriding the stage with a convincing air of intellectual superiority. The fact that this year for the first time he led his deputies into physical *mêlée* on the floor of the Chamber has not raised his prestige. None the less, not only was the theory of an imposed diplomatic illness, parallel to one of Thorez, put out of court by the news of the new serious operation on October 31st, but there seem no grounds for believing that the party has undergone a profound upheaval. In the third week of October extensive reports were published in the Communist press of a three-day session of the Central Committee in preparation for the plenary party Congress in January. Though many of the contributions are reported enigmatically, a really big commotion should surely have betrayed itself.

Behind Picasso's Dove

It can be discerned that the atmosphere was not buoyant. The chief positive line was a call by Togliatti himself for greater confidence in the movement of the Partisans of Peace. Sereni, the party's cultural adviser, was the chief spokesman for the movement which, he said, has achieved "an autonomous political physiognomy." This means that a certain number of non-Communist notables, such as very aged pre-Fascist statesmen, can be claimed as signatories of the peace pledge—the important Bishop of Trieste has been widely publicised as a signatory despite his own indignant denials—as well as a great number of the bewildered and ignorant, and some people who are still seriously convinced that Italy's interest lies in neutrality. Through Togliatti's latest utterance there still floats the hankering after a great national front of varicoloured organisations shepherded and led by "the advanced element of the nation." These flocks would not rally behind the Garibaldi banner in 1948, but they might follow Picasso's dove in 1951. Such seems to be the main theme prepared for the impending national congress of the Communist Party.

Luigi Longo, the party's military chief, once the most quoted "hard," and second in the official hierarchy, seems to have said nothing even faintly divergent from his now invalided chief. A good deal more interesting was the intervention, as reported, of Pietro Secchia, in charge of organisation. Secchia indicated in abstract terms some deviations to which he could presumably have attributed personal identities. There were the "opportunists" who "have no faith in the masses but claim to save them without their own aid by dint of parliamentary combinations," and on the other wing there were the "sectarian extremists also

without faith in the masses who claim or believe that they can save them by sole virtue of revolutionary loquacity and simple exaltation of the conscious part (of the nation) and of the advanced element." It is perhaps an indication of Togliatti's value at least as a figurehead that either of these deviations might conceivably be expected of him. Secchia's speech was unmistakably "hard," and it included the interesting remark that it is not enough to have reliable local chiefs; they must also be men capable of compelling acceptance of the correct political line. Among the many excursions in self-criticism, the most amply reported was that of Togliatti when he lamented that activity was only displayed by party members of the rank and file when there were syndical struggles afoot and when direct instructions came from the centre. An eminent "hard," Di Onofrio, spoke similarly of the abundance of good executants in the party, with a scarcity of men capable of diagnosing a situation and acting correctly. Many speakers called upon comrades to show greater keenness and persistence in talking to men and organisations outside the pale of Communism, which one said was "far more important than talking to ourselves." Unmistakable discomfort in some quarters about the continued existence of Nenni's Socialist party as an alternative approved vehicle of Marxist policy was revealed by a defence of this anomaly by Togliatti. He vaguely justified it on grounds of "tradition, personalities, and methods."

Togliatti's Advice

Despite some little displays of "hardness"—such as a denunciation of "acquiescence in the liquidation of the Constitution" and a call for "mobilisation of forces against these reactionary messages"—the general purport of Togliatti's last utterance before his enforced rest was one of advice to keep the movement going in view of new opportunities to be offered at a later day, when the present "slow erosion" of anti-Communism, thanks to economic discontents, shall have changed the national situation. The summer months appear in fact to have been discouraging for the would-be fomenters of a new revolutionary situation. If Government information can be trusted the attendance at "Korea" meetings throughout the country has been feeble, and echoes of criticism about Korea from the rank and file pervade parts of Togliatti's own speech. If indeed the "hards" are going to profit by his absence to take the running of the party into their hands they will probably have to pay for their hardness by a sacrifice of numbers.

French Socialists Stand Firm?

[FROM OUR PARIS CORRESPONDENT]

THE press of the world has interpreted the French Government's refusal to accept German rearmament as envisaged by the United States chiefly in terms of French Socialist opposition. At the same time the recent Soviet proposal that the four occupying powers should confer on the basis of the "Prague decisions" is seen as a shaft thrust into that chink in the Atlantic armour offered by French Socialist half-heartedness in matters of defence. It is true that France cannot, in the interval before the general election of next spring, summer or autumn, be governed against the will of the 100 Socialist deputies. It is also true that French Socialist tradition from Jaurès to Léon Blum has been suffused, if not with pacifism, at least with a deep repugnance to everything military. Thus at the Riom trial—that curious fiasco in which the Vichy Government sought to inculpate the ministers of 1939 and before of having dragged France into a disastrous war—Blum, Prime Minister of the Popular Front, was accused of stinting military preparations. The uneasiness of the postwar Socialists over the Indo-China war, which they have regarded as the legacy of outmoded colonialism and of its epilogue under the provisional government of General de Gaulle, has added colour to the anti-militarist portrait. The unconvincing performance of the veteran M. Ramadier as Minister of Defence, itself associated with the unfortunate loss of General Revers's strategical report, set the seal on the legend of Socialist defeatism, which is a prominent theme of present Gaullist propaganda. What substance is there in this charge today?

Ministers in Key Positions

The Socialists, in the person of M. Moch, hold the Ministry of National Defence and its subsidiary, the War Ministry (M. Max Lejeune). Both these ministers have outstanding war records; in addition M. Moch, *le premier flic de France*, is the Communists' most successful and best hated antagonist for his virtuosity in smashing the insurrectional strike. There is no greater patriot in the National Assembly. The party's *Comité directeur*, which has absolute control over policy, including decisions to participate or not participate in the coalition government, is said to contain paler personalities. It is therefore interesting to examine the record of the party's national congress, held last week-end immediately after the Soviet diplomatic overture.

M. Guy Mollet, secretary general and schoolteacher from Arras, whose courageous actions in the resistance have not prevented a certain reputation for pacifist neutrality in the cold war, stated at the outset that "for Europe neutrality is the position of the lamb in front of the wolf." He asked the delegates fully to support the Government's proposal for the inclusion of German units in a European army. This support seems to have been generally given, although under the condition—also M. Pleven's—that Germany should first sign the treaty pooling her steel and coal with that of the other five countries negotiating the Schuman Plan. Several voices expressed disbelief in any European amalgamation without Britain (M. Ramadier, in particular, feared that "the Catholics believe in a Western European coalition . . . schismatics excepted . . . under the aegis of the Vatican"); but M. André Philip, most vigorous of federalists, who has just returned from the United States, strongly rebutted this view. The French rearmament proposal had, he said, come too late for acceptance; since, therefore, purely German units must be raised, the danger of a German quest to recover the lost Eastern territories could not in fact be avoided. The sole means of curbing Germany economically and militarily was to create a nucleus of European specialised institutions to which Germany would effectively surrender sovereignty.

Uno and Indo-China

The congress seems to suggest that the French Socialist Party is neither weaker nor stronger in regard to the Germano-Soviet problem than the M.R.P. or Radicals. The Socialists proclaim that French rearmament must not be paid for out of workers' wages; but so do the other coalition parties. The Socialist Party is certainly more disposed than they, at least on its left wing, to drop French hegemony in Indo-China by appealing to the United Nations and to make reforms in the North African protectorates. However, M. Gorse, a former colonial secretary, just returned from the United States, warned the congress that France was quite isolated in the United Nations as regards policy in dependent territories, and that an appeal to UNO over Indo-China was both technically difficult and politically inadvisable.

If these speeches are reliable evidence of Socialist intentions during the next months, it may be concluded that the party will be doctrinaire only in the matter of opposition to a reduction of the workers' purchasing power. For the rest the leader-writer of *Le Populaire* . . . no longer shrunk to one sheet through lack of funds . . . rejects outright the terms of the Soviet proposal on Germany and demands a united Atlantic front for security.

A NEW SOLUTION TO AN OLD PROBLEM

The New Shannoleaf Loose Sheet System Gives Quicker Control

Streamlined — Compact — Economical

Wherever there are activities there have to be records.

And no modern problem calls for more urgent action.

Why? Because the staff to run records is getting more and more expensive; because the time taken to find and refer to them becomes more costly; because the space occupied by records is daily becoming more precious.

The problem, therefore, is this:

Where can we find a record which is

(*a*) quickly found and referred to;
(*b*) speedy for recording purposes;
(*c*) economical in space;
(*d*) inexpensive in price.

Take your own activities . . . what method do you use? Files? "Blind cards"? Bound books?

Are your records all housed together? Easy to get at—to enter—to correlate?

Now try to imagine housing all your records *together* . . . visibly . . . And visualise every single one of those records clearly in sight, instantly available, instantly referred to and/or posted.

Would not that be a considerable convenience?—Saving much cross-reference and clerical labour? And if, furthermore, one clerk could sit at a desk with *fifteen thousand* records within arm's reach, does it not begin to suggest all sorts of economies to you . . . in relation to sales and purchase ledgers, sales records, plant and machinery records, stores and stocks records, personnel records, hire purchase records, etc., etc.?

The upshot of the foregoing is this: a completely new and "streamlined" system has been evolved to handle *all* recording problems. In its creation the outstanding essentials were covered first. That is, it houses any number of records together. It makes each visible. It permits easy removal or insertion of records. It takes up very little room.

And it costs little money and saves a great deal.

Ought you not—immediately—to know about this latest idea in record control? And may we therefore (without even a moral obligation) show you it. Then please scribble "Shannoleaf" on your letterheading and take the first step towards effecting considerable savings.

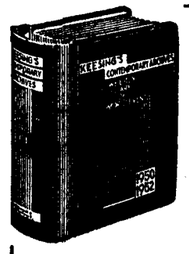
BANK-INSURANCE UNITS

THE investor in Bank-Insurance Units secures a freely marketable investment spread over 50 high-grade equities, the Trust Fund being made up as follows:



Insurance companies	35½%
Canadian $ Bank Shares ..	16%
Other Dom., Col. & O'seas banks	14½%
Home banks	22%
Discount companies	7%
Trustee securities	5%

In recent years there has been a steady upward trend in the distributions paid on Bank-Insurance Units, and the Managers consider that the distributions for the coming year will be at least maintained.

Offer price, 8th Nov. 21/11d. Yield calculated in accordance with Board of Trade requirements, £3/9/2%, subject to reduced rate of tax allowing for D.I.T. relief.

Units can be freely bought and sold at quoted net prices (and information obtained) through any Stockbroker or Bank.

NITROGEN

IN 1898, Sir William Crookes warned the world that the human race might soon starve because intensive cultivation was draining the soil of essential plant foods. Yet today, agricultural land has become more productive than ever, for the chemist has learned the necessity for returning to the soil the nitrogen and other elements taken up by the plant in its growth. Nitrogen is a colourless, inert gas that forms four-fifths of the air we breathe. Hundreds of thousands of tons of it are available over every square mile of the earth's surface, but it must first be "trapped" and then combined with other elements before plants can absorb it in the form of fertilizers.

Every day, the great synthetic ammonia factories of I.C.I. convert hundreds of tons of nitrogen from the air into a range of fertilizers that have helped to make British farming the most efficient in the world. And not fertilizers only: I.C.I. also uses nitrogen to make explosives and plastics, resins, paints and leathercloth. I.C.I.'s nylon and other synthetic textile fibres contain nitrogen. So, too, do many of the drugs which I.C.I. contributes to modern medicine.

ICI

SIMON ENGINEERING GROUP

It would be hard to name industries and public utilities more important than those for which the Simon companies build capital equipment. Simon-Carves coal cleaning and coking plants, power stations and sulphuric acid plants aid the production of coal, iron and steel, gas, electricity and heavy chemicals. Grain handling plants and granaries by Simon Handling Engineers and flour and provender mills by Henry Simon help to produce food for man and beast. In serving these industries Simon machinery and plant earn dollars, pesos, cruzieros, escudos, kronor, guilders, francs, and many other currencies.

Dollar Aid in Suspense

IT is not often that the Home Secretary assumes the responsibility for making an important pronouncement on the state of the British economy. Mr Chuter Ede's declaration in the House of Commons this week was as startling as it was presumably inadvertent: "We have now reached a stage," the Home Secretary said, "through the policy of the Government and, I admit, a bit of luck, in which Marshall Aid is no longer a requisite of our economy." From any backbencher this proposition would have passed unnoticed; but as a pronouncement from the Government front bench it must presumably be regarded as marking official recognition of a turning point in Britain's postwar economic history.

It must also be regarded as a sign that the Government has decided to bow to the inevitable. On the eve of Mr Ede's statement, Mr William L. Batt, the new head of the Economic Co-operation Administration in Britain, arrived in this country. The first important item on his agenda is the somewhat invidious one of negotiating with the British Government for the suspension of the flow of Marshall Aid to Britain. This question has been under discussion ever since the sterling area began to run an appreciable surplus in its current trade with the Western Hemisphere. The Americans have never intended that Marshall Aid should serve as a reinforcement of the British gold and dollar reserves; it was to be a means of plugging a deficit. It may be assumed that the new Chancellor of the Exchequer was left in no doubt about American intentions when he recently visited Washington. The first official statement on this important development in Marshall Aid policy was made by Mr Attlee when he disclosed in the House of Commons last week that the British and United States governments would review the question of Marshall Aid to Britain "in the light of relevant factors." This statement was subsequently confirmed and made somewhat more specific by Mr William Foster, who has followed Mr Paul Hoffman as Economic Co-operation Administrator in Washington. Mr Foster suggested that any suspension of the flow of Marshall Aid to Britain would be conditional and that "any new economic relationship between ECA and the British Government should be rather one of standby aid than of termination."

These carefully phrased statements and soft-worded reservations cannot hide the fact that in present circumstances, with Britain gaining and the United States losing gold, with sterling hardening and the dollar softening and with Britain balancing its foreign payments, Marshall Aid to Britain is to be brought to a complete—though possibly temporary—standstill. It would be courting disillusion to assume that the outcome of the discussions which are to begin in London between Mr Batt and representatives of the British Government is not already prejudged. Unless there is a considerable change in the international balance of payments Britain is likely to have received its last Marshall dollar.

Since July 1st Britain has received $175 million of its provisional total allocation of $424 million of Marshall Aid for 1950-51. Britain's total allocation for this year was to include $150 million of conditional aid, which was to offset its initial contribution of the same amount to the European Payments Union. It is true that this initial EPU debit has not yet been wholly exhausted by the surplus that the sterling area has accumulated in account with its EPU colleagues and that no firm allocation can yet have been made of the whole of this $150 million of conditional aid. As and when the EPU compensations show the cumulative position of Britain with EPU to have reached the figure of $150 million, however, the necessary allocation of conditional dollar grants can be made retrospectively and can thus be made to refer to part of the $175 million which have already been paid over. Put baldly, the continued operation of EPU and the fact that Britain may be called upon to give further aid to other member countries does not imply that Britain can count on further conditional grants from ECA.

The relation of Britain's receipts of Marshall Aid to changes in the gold and dollar reserve since the plan

came into effect is shown in the following table:—

	$ million	
	ERP Receipts	Changes in gold and dollar reserve
1948	681	+23
1949	1,132	+67
1950 (9 months)	974	+1,959

On the superficial showing of these figures the logic and justification of the American case are scarcely open to question. Marshall Aid was conceived as a rescue operation, to extricate the countries of Western Europe from the chronic deficits that they were running with the Western Hemisphere and to allow intra-European trade to continue undeterred by the lack of balance that characterised the aftermath of war. It was never intended to be a device by which the countries of Europe might look to the United States for special rewards for the rapidity and vigour with which they emerged from their temporary insolvency. It could be argued that some such element of incentive should have been drafted into the scheme. But that, for good or ill, was never part of the plan and its absence can hardly be a ground for complaint now. Once Britain had attained solvency in its over-all balance of payments and the sterling area had attained solvency in its current dollar account the *raison d'être* of Marshall Aid was achieved.

The arguments put forward by the American Administration have been reinforced by the contentions that the strain on the American economy has recently been increasing, that the United States is undertaking a larger proportionate burden in its additional rearmament expenditure than that carried by any other North Atlantic Treaty power and that there is nothing in the Marshall Plan, or in any other commitment made by the United States Administration, to justify continued aid from American taxpayers and consumers to a now solvent Britain. Right up to the outbreak of the post-Korean boom it was possible to argue that some (although never a large) part of Marshall Aid "financed itself" by filling up what would otherwise be slack in some sectors of the American economy. That argument is now utterly untenable. Every dollar that the American Government gives away now represents one less dollar's worth of purchasing power in the pockets of the American people.

What are the arguments that may be put forward on the British side for some continuation of assistance? Britain's first reaction may be to stress the abnormal and impermanent factors which have played their part in the recent improvement of the gold and dollar reserves. The shift of sentiment towards sterling has unquestionably had an appreciable impact on the timing of Britain's dollar and other foreign currency receipts. These were being delayed before devaluation; they have recently been anticipated, and the incidence of this factor on the current balance of payments must be responsible for a considerable part of the improvements in the gold and dollar reserve since September, 1949. Stockpiling and the phenomenal rise in commodity prices are other developments on the permanence of which it would be improvident to count. Stockpiling could easily be followed by a prolonged period during which current purchases by the American authorities were well below normal. Apart from such elements of artificiality in the recent improvement in the reserve, it might also be contended that the restored equilibrium in the balance of payments has been achieved at a low level, for the volume of imports into Britain is still no greater than 84 per cent of what it was in the last prewar year. It might also be argued that the gold reserve, in spite of its recent improvement, is still at an inadequate level if sterling is to play its part as an international and ultimately a fully convertible currency and that, therefore, the need for Marshall Aid has not disappeared. There is also the possibility that the impact of rearmament may endanger once again the equilibrium that has now been achieved in the British balance of international payments.

These are arguments that might be persuasively put to Mr Batt. It is by no means to be implied from their enumeration here that they are valid arguments or that the wider aspects of national dignity and economic independence justify their use. The precise weight of each argument is difficult to assess. It is almost impossible to discern what is permanent and impermanent in the factors that have contributed to the recovery of the gold and dollar reserve. The suggestion that America should go on helping Britain in order still further to raise the level of the gold and dollar reserve is one which might carry greater power of conviction in the United States if there were a clear indication that Britain would match each rise in its reserves by some relaxation in the discriminatory application of its import controls. Despite the doubling of the reserves since devaluation, there has so far been no such relaxation. British official spokesmen have lost no opportunity of uttering sympathetic generalities about the need for multilateral trade, non-discrimination, convertibility and the rest. But when asked to give more precision to these hopes, they have made it quite clear that they are still thinking of these objectives in terms of "the long run when we are all dead." Last June, it is true, rumours of some projected moves towards convertibility were in the air but the rearmament crisis is reported to have swung the debate in favour of the apostles of caution. If these rumours are correct those who counselled timidity after Korea have served the country ill.

There remains the question of the financing of mutual defence needs. This is an issue of which the merest preliminaries have yet been discussed between the North Atlantic Treaty Powers. The kernel of this problem is that of the division of the burden between the United States and Great Britain. It may well be that the suspension of Marshall Aid will be dovetailed into this new form of military aid. No reply has yet been received to the British memorandum, sent to the United States last July, which set out the intended scale of Britain's rearmament effort and stressed that it could only be reached on the assumption of substantial American aid. It may, however, be assumed that when Mr Gaitskell was in Washington he was given part of the answer to the British memorandum, namely a firm refusal by the United States to contemplate military aid to Britain in the guise of "free" dollars—that is to say of dollars available for expenditure in any part of the world and intended to make good any loss of British exports arising from industrial conversion to defence. This refusal to grant free dollars confirms the other indications that civilian aid to Britain under the European Recovery Programme will be brought to a temporary halt. The discussions with Mr Batt would, therefore, appear to have a predetermined conclusion and it is possible to regret that this fact should not have been recognised earlier in British quarters. British representatives could surely have spared themselves the unenviable role of pleading for a continuation of aid at a time when Britain, with the help of the sterling area, is managing reasonably well without assistance of this kind.

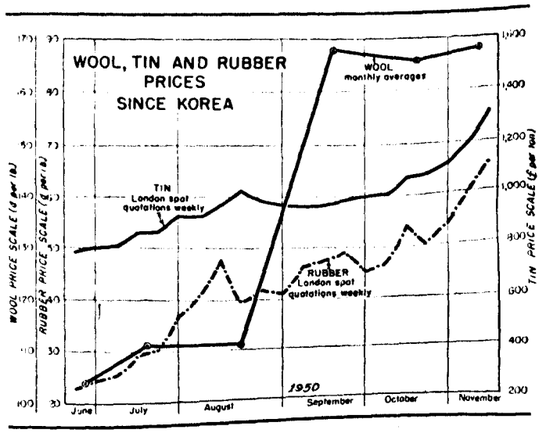
The implications of this development are important and wide. In the first place it should kill stone dead recent suggestions that the pound sterling should be revalued. It should also serve as a healthy reminder of the strength of America's economic position. Marshall Aid is one of the valves that can and will be turned off, if necessary, to ease the pressure on the United States' economy. After this reminder there should be less irresponsible talk of a breakdown in the American economy. Whether the suspension of Marshall Aid to Britain will have a serious impact on the British economy must depend on the course of British and sterling area exports. In existing circumstances the suspension will mean no more than that the recovery in the gold and dollar reserve will be reduced to the pace of the sterling area's trading surplus with the dollar world. Beyond that the prospect becomes shrouded in uncertainties about stockpiling by the United States, about the behaviour of commodity prices, and about the extent to which American exports will be impeded by America's rearmament drive. On all these issues it is impossible to formulate even approximate estimates. The new situation need not be overdramatised since the ratio of Marshall Aid to merchandise imports into Britain has been running this year at 12 per cent. The suspension of Marshall Aid should not call for new measures of import control in Britain; dollar import control is still screwed up tight as it was before the substantial improvement in reserves began. The danger that suspension may postpone still further any advance towards freer trade is real enough, but this does not mean that such postponement would be justified. Britain's duty to itself and to the free world is to keep its dollar accounts in good order, but the fearful (though they may have good reason for their fears) may still take heart from the fact that if sterling deteriorates again to a point at which an appreciable dollar deficit returns, Mr Foster's promise will no doubt hold good and "standby aid" will again be forthcoming.

Policy for Commodities

THIS week's news from Korea depressed the security markets, but it has led to a new scramble for rubber and tin. Prices are fantastic—tin touched £1,280 a ton and rubber 70d. a pound—and there are scarcely any supplies. This scramble for raw materials has been going on for nearly five months. In this brief space of time prospective surpluses have become a lost illusion; the whole of the free world is battling with problems of dire shortage. These changes have been so bewildering in speed and scale that common effort and thought about them have not been able to keep pace. The Organisation for European Economic Co-operation and the North Atlantic Treaty Organisation are engaged on a survey of key commodities and hope to draft workable schemes for their international allocation and a common policy for stockpiling key materials. But while these difficult deliberations proceed, commodity prices continue their dramatic rise. These discussions, nevertheless, do represent an advance on purely national or "producer or consumer" attitudes towards commodity problems. Only a month ago, the international wool study group endorsed proposals from the Commonwealth countries for a scheme of reserve prices for wool designed to prevent wool prices from falling below a given point. At this moment a special conference in Geneva is discussing a draft control scheme for tin designed to regulate its price by imposing export quotas, restriction of output, and building a buffer stock. Next month the international sugar council is to meet in London to consider an international agreement for sugar which again presupposes (though perhaps with greater relevance in this case) a surplus of supplies.

These recent and prospective discussions show how sadly the world has been caught unawares by the booming prices and desperate shortages of many critically important commodities. The phenomenal price increases have alarmed producers as much as consumers; they have let loose forces of inflation beyond the powers of fiscal discipline in producing countries. The accompanying record of the course of prices for tin, rubber and wool during the past five months needs little elaboration. It shows what has happened to three strategic materials bought and sold in free markets unhampered by any lack of foreign exchange. But it is important to remember that the increased demand that has been responsible for these record prices has not been for supplies to use now but for supplies to put into stocks. Consumption of the staple raw materials both in the United States and in the United Kingdom has increased but little in the past few months, but stocks have risen dramatically. In the first half of the year, some reduction was made in stocks because prices in the second half of the year were expected to fall. Korea violently altered that expectation and fears (heightened early this week) that the conflict might extend to South-east Asia, coupled with the possibility of delays in shipment and expanded rearmament and stockpiling programmes, have made stock building attractive and difficult. Industry in Europe and in the United States has found itself in competition with the American Munitions Board, now engaged in a frantic attempt to bring its strategic stockpile up to a more "reasonable" level—and what is "reasonable" is affected by every change in political tension.

An indication of the pressure exerted on commodity markets is given in Table I. This shows the annual rate of world production of eight commodities based on the first six months of this year and the annual rate of world commercial consumption. In the majority of items production exceeded consumption, though usually the balance was more than absorbed by American stockpile purchases. Column (6) gives estimates of American military requirements for all of these commodities except cotton; if these are to be met within a reasonable period the current level of commercial consumption will have to be reduced appreciably.



Prospects of increasing the production of these commodities are not bright. The trend of output since the war is shown in Table II. Copper output in Rhodesia could be expanded if sufficient fuel were assured, but there is a persistent shortage. Production in Chile, the United States and Canada might expand with the

incentive of high prices, but the limiting factor will be refining capacity until the extensions to the Rhodesian refineries are completed. There is even less hope of increasing zinc production. The need for a larger output of lead is not so urgent though the sharp rise in world output since 1946 suggests that some further expansion might be difficult. Tin production is already very high and is still rising. This year's output should reach 170,000 tons and the present fantastic level of prices may encourage some further rise. Natural rubber production is also expanding quite sharply and should reach 1,750,000 tons this year ; Malaya has only limited possibilities for further expansion but production in Indonesia shows a quickening tempo and next year world output could reach 1,825,000 tons. But this is outpaced by synthetic rubber, the output of which has been running at an annual rate of 460,000 tons, with an actual estimate for the full year of 560,000 tons ; by March next year, the United States expects to produce synthetic rubber at an annual rate of 950,000 tons. Production stepped up to such a rate will not be easy to curtail. Wool supplies this season will be smaller than in 1949-50, for although the clip is larger, the stocks of the Joint Organisation are almost exhausted. Users will have to wait while wool grows on the sheep's back—a slow process that cannot be expected to increase total supplies by more than 5 per cent a year ; 3 per cent may be more realistic. World cotton crops this year were relatively small, chiefly because the acreage restrictions imposed by the United States became effective at an awkward moment. They have now been taken off so that output in 1951-52 should expand sharply ; but twelve months is a long time to wait.

★

The problem confronting the commodity markets is twofold. The immediate job is to make the best use of current supplies in the defence programmes of the Western Powers. The other problem—scarcely less urgent—is to offer security to primary producers to encourage them to expand their production with all speed and purpose. But as the present inflated demand for commodities is largely to increase stocks, it follows that the mechanism of the commodity markets might be upset when conditions become more normal. Once the political outlook showed convincing signs of becoming easier, manufacturers and governments would have to look carefully at the cost of carrying stocks, and a fall in prices would be certain and sharp. Expanded rearmament programmes (apart from defensive stockpiling) will give support of their own to key commodities for two or three years and there may well be an unsatisfied demand for consumer goods because raw materials are diverted to military purposes. Any satisfactory scheme of encouraging production now must include some means of curtailing it later without reducing the producing areas to a state of insolvency and political unrest.

The price mechanism is one method of distributing materials between civilian and military uses. But in present conditions it can make the process of rearming and stockpiling a very costly one because military demand has the longest purse. If allocation by prices were to be effective, countries would have to take steps to curb

their domestic inflations and to allow high prices for raw materials to be fully reflected in prices of finished products. There are few of them, not excepting the United States, that are prepared to accept the political and economic strains implicit in such a decision. The price mechanism works tolerably as a method of allocating supplies when conditions are such that buyers have to assess the financial cost of their actions. Today, political uncertainty, fear of rationing and high taxation remove such considerations from traders' minds and encourage them to carry large stocks irrespective of price.

The alternative to the price mechanism is some system of international allocation. During the last war, the Combined Raw Materials Board was highly successful in keeping both British and American factories supplied with enough raw materials at reasonable prices. But it is well to pause and see exactly what international allocation implies. First, it presupposes a system of fixed

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

Supply—and Demand

From April through to January the shearers, wool pressers and classers are busy, for the Australian wool clip is a major factor in world supplies. Production in Australia is on a grand scale. Equally great are the requirements of the Australian consumer—and in this magnitude of supply and demand lie opportunities for British business houses . . . A wise preliminary to any Australian venture is consultation with the Commonwealth Bank. For the Commonwealth Bank *knows* Australia. Its activities touch upon every aspect of Australian life and industry and its branch system covers Australia, and New Guinea. It has, therefore, unrivalled sources of information, and this information it gladly places at the disposal of business houses in Britain.

COMMONWEALTH BANK OF AUSTRALIA

or controlled prices, which would mean the closing of the commodity markets ; such a decision would be politically unwelcome to governments of producing countries. Secondly, allocation of materials would have to be carried out inside each consuming country ; producers would never agree to fixed prices if the supplies allotted to a particular country were then distributed to those manufacturers who were prepared to bid the most. Thirdly, an allocation system would have to cover all production and not merely that part which was exported ; no producing country would submit its output to allocation at a fixed price if a consuming country which produced part of its domestic requirements could remain outside it. Fourthly, allocations of one commodity would have to be related to allocations of others. These are merely the technical requisites of an allocation scheme. There are abundant political and administrative difficulties besides. The Combined Raw Materials Board was successful because only three important consuming countries were involved as allies. Today, twenty countries would be concerned and each would demand adequate representation and require assurances that its own interests were protected. Negotiations to devise such a scheme and make it work, in circumstances short of war, would require superhuman patience.

A comprehensive allocation scheme even for the major strategic materials may be out of the question at present on all these grounds, but there would still be room for co-ordinated methods of procurement, at least within the Atlantic Union, to meet the more urgent requirements for rearmament and stockpiling. But nothing has yet been done to overcome the immediate problem of shortage without provoking a future problem of surpluses. A system of reserve prices as proposed by the Commonwealth wool producers is likely to suffer the common defect of such schemes of putting the minimum price too high and thus encouraging too much output. The tin scheme is specifically designed to combat non-existent surpluses and its only immediate help might be to give some security to producers about the future. Neither of these schemes has been devised with any system of allocation in mind, nor does either guarantee minimum supplies for consuming countries in the event of a shortage. In these respects, the wheat agreement seems to provide a more suitable pattern for adaptation to suit the needs of individual commodities. Its system of minimum and maximum price limits and of guaranteed supplies to be sold or purchased at the top or bottom price respectively, may provide the conditions needed to ensure sales of given size to producing countries at a minimum price and supplies of given size to consuming countries at a maximum price. If such an agreement existed for tin, the United States would be guaranteed an agreed supply at the predetermined maximum price and could then decide whether to use it for military or civilian purposes.

To introduce any scheme for any commodity now that inflation has already become rampant would be most difficult, for prices have got out of hand. If tin can jump and fall £100 in a day, who can be expected to fix reasonable maximum and minimum prices to satisfy both sides for perhaps five years ? Yet, if the scramble for commodities is to be brought to order by means of allocation schemes or co-ordinated defence purchases, action will have to be firm and swift—indeed, it is already too late to secure many of the advantages that such a scheme might be expected to confer. If, however, the price mechanism is to be the sole arbiter, consumers who could make good use of materials here and now might suffer interruptions of supplies and defence output might be jeopardised at a critical time. It would then be no satisfaction at all to point to large stockpiles passively filling the warehouses that ought instead to be filling the defence pipelines.

Business Notes

China and Chancellor

There has been plenty to give the security market food for thought this week. Active Chinese intervention in Korea came as a distinct shock ; it requires news as serious as this to depress gilt-edged stocks by as much as a point, and the new 3 per cent Funding Loan, dutifully subscribed by cash applicants who received 89 per cent of their applications in amounts of more than £1,000,000, opened at a quarter of a point discount with little business. Had the conviction grown that Chinese intervention might become the prelude to a long and costly campaign of containment in Korea and throughout the Far East, this disturbance to the gilt-edged market would not have stopped where it did. Perhaps the revised calculation that Chinese intervention represented no more than a tactical move in the protection of China's frontier interests, rather than a new strategic threat, puts a cheerful gloss upon future possibilities ; but at any rate by the middle of the week the gilt-edged market was staging a quiet recovery and Funding scrip showed a small premium. By that time, too, it was showing some readiness to share

Wall Street's welcome to the drift to the right revealed by the American election results.

The two events have at least one economic meeting point. If the Chinese are set on a major adventure, commodity prices would be pushed even higher (as they were earlier this week), even though the heightened political risks depress tin and rubber shares—which happened, too. In the United States, firm executive action will now become extremely difficult, and there may be less chance of securing a stable financial policy or effective economic controls at home and the desirable degree of economic co-operation abroad. Directly or at a remove, these factors will make it no easier to control the rising tide of inflation throughout the world. The instinct that has brought new support for commodities, for rubber, oil and copper shares, and selective buying of industrials seems sound enough—so long as these conditions last. It may be illogical that gilt-edged should advance at the same time, but that phenomenon merely continues the minor puzzle of the markets only too familiar in recent months. It argues a readiness on the part of the authorities to tolerate conditions of monetary ease that seem hardly appropriate for an economy already fully occupied and under the necessity of shouldering additional burdens for defence.

For this reason, the market's reception of the Chancellor's economic review in Parliament last week has been distinctly qualified. If there were any doubts that the new Chancellor was an apt disciple of his former master, this speech certainly removed them. It presented serious warnings about the dangers of internal inflation, of rising prices and potential shortages of raw materials that might call for the reimposition of controls, and against immoderate claims for higher incomes beyond the "due share of any increase in the national output" (is this not already dedicated to the needs of defence?). But the Chancellor's prescription offered no new conclusions about economic policy beyond the hope of international agreement on the allocation of raw materials, and was content to reassert the need for a strict budgetary policy (continuing "all possible economies in public expenditure"), maintenance of food subsidies, and strict price control.

The situation changes, but the formula remains constant. Ebullience about the rise in the gold and dollar reserves is waning, for foreign funds are no longer flowing to this country and dollar aid is in question. Meanwhile the forces of internal inflation, despite the Chancellor's protestations about prices and policy, are flowing strongly. Whatever else may happen in the security markets during the next six months, there will be no deficiency of profits; if the official statisticians reckoned that price increases in 1948 added £400 million to industry's reported (not true) profits, this year's rises will hardly do less. In these circumstances, it becomes a little unreal to urge upon industry "an even more intense concentration than before on the achievement of better results at lower costs." The compelling pressures do not exist; they are hardly likely to come about in the absence of a monetary policy that would regard as odd a relative gain in profits marching together with sustained strength in fixed-interest securities.

* * *

Beating the Gun

Direct effects of rearmament upon industry in general are already, and perhaps inevitably, being exaggerated. In light engineering, for example, certain firms have received about a year's normal orders in the past three months from civilian customers anxious to place orders while they are still being accepted; some others, who are not as busy as they make out, appear to be talking about pressure of work in an attempt to hurry the sub-contracts which may be forthcoming from heavy engineering firms with defence orders. But as yet few sub-contracts have materialised, except for firms manufacturing specialised items such as petrol tanks for aircraft. The industries directly concerned show no hurry to pass out work.

To date, it seems that large defence contracts consist mainly of orders for aircraft, reconditioning of light naval craft, the heavy and light armament and radar that these require, vehicles and service clothing. Most of the firms involved in aircraft and shipbuilding and the Royal Ordnance factories concerned, had recently been less than fully employed; electronics equipment makers, on the other hand, were busy when the programme was announced, but even in this sector the work has so far fallen mainly upon firms already devoting a large proportion of output to defence. Certain sections of heavy engineering receiving direct orders, however, are already fully employed. These include the machine tool industry. Here there is little chance of expanding output; it can only be transferred from home and perhaps export orders, for many of which delivery dates are already very long. The Ministry of Supply has a considerable strategic reserve of machine tools left from the last war (as distinct from the surplus stocks which it has almost finished selling) and the industry's first substantial orders were for reconditioning these. Other large orders appear still to be delayed pending information about the types, volumes and delivery dates of tools that America can supply. The gap in the range of machine tools that Britain produces and those it uses has been greatly narrowed since the war; British firms can now make all but a very few highly-specialised items, though in terms of volume and time—and financial aid—it may pay British users to buy American. Demand has tightened throughout the world since rearmament began, and British prices are still competitive. Apart from its defence preoccupations, the industry should be able to hold its export markets—even including the heavy machine tool market that Germany used to command before the war and is now trying to regain.

* * *

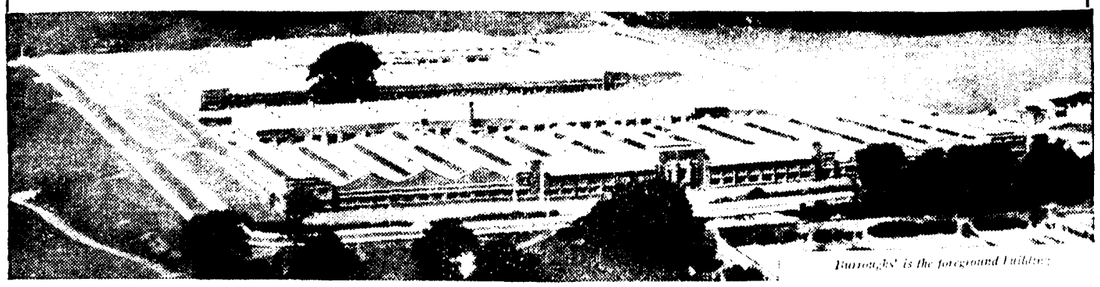
Men and Materials

The machine tool makers, like other heavy engineering firms, are short of skilled labour; they have been for years. But their problem has a somewhat distant connection with the figure of "250,000 extra workers for rearmament" which is being used freely in general discussion. This problem of finding skilled workers cannot be avoided in any defence programme that falls with such direct impact on sections of the engineering industry. But the general labour problem is much less formidable than is commonly assumed. A large proportion of the 250,000 workers who, according to a Ministry of Supply calculation, will eventually be required to fulfil the programme, can be expected to change from civil to defence production inside their present firms; others will be drawn into rearmament by the natural stimulus of higher wages. Housing may impose a brake upon the mobility of labour between industrial centres (Coventry is already full to bursting); but large-scale movement of labour is not in question yet. Such long-range problems will, no doubt, engage the attention of the new committee Mr Gaitskell announced last week.

The "pressure of rearmament" already being reported in industry is inextricably connected with the strengthening of western defence. It is provoking an accumulation of stocks of materials by manufacturers for civilian or for defence production—a movement natural enough in a period of growing material shortages and rapidly rising prices. An example is provided by the mild panic of steel orders since the onset of rearmament. Paper orders have risen by 50 per cent; yet the facts of steel supplies remain unchanged. Sheet steel is short, as it has been and will be until capacity at Margam and Shotton comes into production; in other forms of steel, there is no reason to believe that rearmament will affect demand seriously before the end of the year. Last month's new production record—a yearly rate of 17,040,000 tons—hardly suggests an industry unable to meet its commitments. Customers who are hoarding steel against defence orders they hope to get seem to be guarding against a shortage which is unlikely to materialise save in a hot war.

A machine to cut non-productive time

It takes a hundred-and-one jobs of handling all along the production-distribution line. It's a hoist, a truck, a loco and a "conveyor belt". It is mobile, powerful, dexterous, versatile. It is a whole handling system in one.



It will carry and tow like a loco, at 12 m.p.h. indoors and out. It will hoist like a hydraulic lift, as much as 6000 pounds at a time, through 12 ft. in 20 seconds. It will turn almost on its own axis, pick up and lift down like a mechanical arm. It will climb a ramp with a two-ton load. It will lift or tow, or stack and stow, tons in a few minutes, like a whole gang of stevedores.

Its name is the Coventry Climax fork lift truck—expert store-keeper, space-saver, gang-of-all-work. And there are models, Diesel or petrol, of the size and capacity to fit your problem and your lay-out.

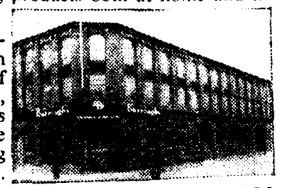
NEW FACTORY for Britain's oldest producer of figuring, accounting and statistical machines



Burroughs' is the foreground building

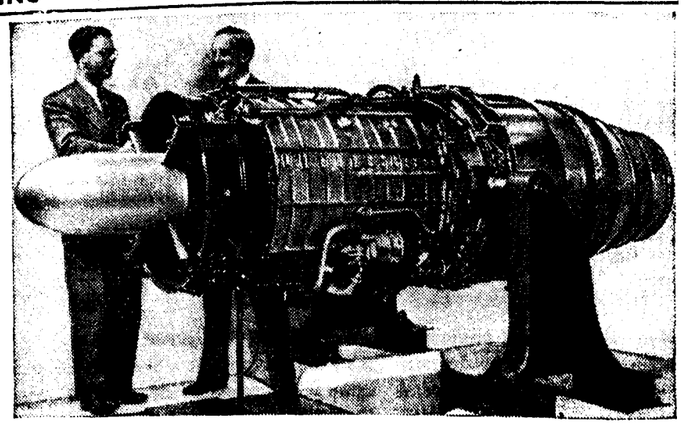
Burroughs great factory at Strathleven, Scotland, now in production

NOW coming into production, the world's newest plant for the manufacture of business machines is located 16 miles from Glasgow, at Strathleven, on the Vale of Leven Industrial Estate.

This plant of 150,000 square feet at Strathleven, coupled with Burroughs production at Nottingham, ensures the continued leadership of these outstanding products both at home and in the Empire.

With the opening of Strathleven, Burroughs production in Britain now includes all types of Burroughs machines. In addition, the production requirements for *the entire world* for some Burroughs models are now being met exclusively at Strathleven.

Also expanding—as production increases—is the alert Burroughs service organization. Always near at hand, facilities and specialists are locally stationed to keep your machines in peak condition . . . to give you the finest counsel and guidance in solving those problems of business which involve figuring, accounting and statistics.



We are grateful to our many friends in business whose increasing patronage has made this new project necessary. With ever greater facilities, we hope to serve them even better in the future.

Exporting the Coal Shortage

A cut in coal exports has not built up winter stocks to any of the successively-reduced safety limits which the Ministry of Fuel and Power this autumn deemed "absolutely essential." At the end of October industry started the winter not with stocks of 16.5 million, 16.2 million, or 15.75 million tons; it had 15.4 million tons, a million and a quarter tons less than a year ago. The diversion of coal from exports has not been sufficient to make good the effect of rising consumption upon lagging output; for the third week in succession, output has dropped below that of the corresponding weeks of 1949. The industry is still losing workers: four hundred men, all from the coalface, left in the last week of October, bringing the net wastage since the end of last year to 22,100, of whom 9,700 were face workers.

Britain has thus largely succeeded in exporting its coal shortage. Two months ago, the Coal Committee of the Economic Commission for Europe, reporting that Europe was virtually self-sufficient in coal, decided to discontinue its allocation system from the beginning of October. Almost before that decision took effect, a dramatic change had occurred in European coal supplies. Largely, but not wholly, because of the cuts in British coal exports, Europe is facing a serious shortage. Two other factors have contributed. Poland has recently been exporting more coal to Eastern Europe, at the expense of the West; and Western Germany, in attempting further to increase its lion's share of the European market, appears to have been overselling. Its current export contracts are now in arrear and a Coal Commissioner has been appointed to "direct," if not to ration, domestic German supplies. Reductions of 250,000 tons each in current British contracts for supplying Sweden and Denmark have begun to take effect. Holland, which suspended coal imports from Britain in protest against the Coal Board's dual-pricing, is meeting much difficulty in making up its import requirements from Germany. Italy, unable to collect arrears on British contracts, is one of the countries that is considering whether to spend ECA dollars upon American coal, which Europe has managed without for the last year. France is the only European customer to which British exports have been largely maintained.

In Britain, the level of stocks is probably less threatening than it appears. Industrial consumers have been buying fairly heavily since the summer and probably have appreciable stocks in hand; domestic users, according to the Coal Board's estimate, have something like 300,000 tons more than usual stored in their coal-cellars. Financially, the Coal Board is already suffering; coal exports are not likely to exceed 17½ million tons this year, compared with 19-22 million tons forecast or assumed in the "Economic Survey," and each ton diverted from export to home use brings in about £1 less. But the most serious aspect of the situation is the Coal Board's failure to fulfil hard export contracts in a market which must eventually become competitive again.

Russia Rescues Mr Webb

The new contract for 800,000 tons of Russian grain has certainly relieved Mr Maurice Webb, the Minister of Food, of some of his anxieties, for Britain's supplies of feed grain were beginning to look precarious. Imports this year had been good; in the nine months up to September, Britain received 880,000 tons of maize, 700,000 tons of barley and 85,000 tons of oats—a total import of 1,665,000 tons against 970,000 tons in the same period of 1949. But the prospects of maintaining this rate of purchases during the current season seemed by no means bright. Supplies of Argentine maize were not plentiful, even supposing that Argentina would sell to Britain without first reaching agreement on the price of Argentine meat. Last season's crop was a poor one. Australia could be counted on for about 100,000 tons of barley and a smaller quantity of oats, and Jugoslavia might be willing to sell 100,000 tons of maize.

Since fighting started in Korea, importing countries have been building up stocks and supplies are tight. Without Russian supplies this year, British imports of coarse grains would have been reduced by more than half: Russia supplied 875,000 tons out of the total of 1,665,000 tons in the first nine months. The total Russian contract last year was for 1,000,000 tons of grain comprising 400,000 tons of maize, 500,000 tons of barley and 100,000 tons of oats. This year's contract covers 300,000 tons of maize, 425,000 tons of barley and 75,000 tons of oats.

In August, the Minister of Food was waiting anxiously for an offer from the Soviet Union, but none came. Later, when Russia agreed to attend the Geneva grain conference, it seemed that Russia would only trade at the conference table and force importing countries to bid against each other. Happily for Mr Webb, that did not happen and a contract has now been signed. The official announcement makes no mention of price; that has become traditional in the Russian deals, but the price is almost certain to be higher than last year's.

* * *

Politics and Grain

The new contract, however, raises two interesting issues. Coarse grains cannot be considered a strategic material and therefore Britain is quite free to trade with Russia in them. But it means that Britain will provide Russia with sterling that can be used to buy tin, rubber and wool. Again, although the American Government might take a more broadminded view of the deal, the American farmer, who has been keeping his grain in the hope of a further rise in price, will probably regard the contract without favour. This attitude is not likely to assist the financial discussions between America and Britain.

The second issue concerns Russia's position at the European grain conference. This conference was convened by

the Economic Commission for Europe and is to open in Geneva next week. It is expected that Russia will be the only supplying country to attend; the other delegates will be from the importing countries of Western Europe. The Russian wheat harvest is known to have been none too good and any export surplus that Russia can find will probably go to its satellite countries. It is presumed, therefore, that the conference will be mainly concerned with coarse grains, and Britain at least hopes to conclude a long-term contract with Russia, a more comfortable situation than waiting each year for an offer to come from Moscow. Whether the rest of Western Europe would join Britain in such a venture remains to be seen. But if these other countries are hoping to buy from Russia this year, they are likely to be disappointed. Russia is thought to have 1,000,000 tons of coarse grains available for export, and Britain has now bought 800,000 tons of it.

* * *

Britain's Role at Torquay

The fifth session of the contracting parties of the General Agreement on Tariffs and Trade is now in full swing at Torquay. These discussions are going on concurrently with the tariff negotiations in which fair, though by no means sensational, progress can be reported. On the tariff front one of the main obstacles to progress has been the unwillingness of the French to modify the highly protectionist character of their recently reconstituted tariff schedules. Another difficulty is the complaint raised by the Dutch, and shared by many other countries, about the high level of purchase taxes in Britain and the exemption of domestically produced utility goods. This, it is argued, is protection under a very thin guise. The logic of this argument cannot easily be refuted.

The meeting of the GATT signatories faces a full agenda which is likely to keep the discussions going until well into December. One of the most important items concerns the policy of contracting parties that find it necessary to maintain import restrictions because their balance of payments is unsatisfactory. The specific application of this issue largely concerns the sterling area and it arises in particular from the administrative decision last year to effect a 25 per cent cut in dollar imports. The changes in the sterling area's dollar balance of payments since the devaluations of September, 1949, have been duly noted by countries adversely affected by the cut and their voices are being raised at Torquay, as elsewhere, in urging that this discriminatory application of import controls should now be abandoned. Two other items that were expected to appear on the agenda at Torquay—the question of the granting of most-favoured nation treatment to Japan and that of the creation of the new system of preferences that the Schuman Plan would entail—are not apparently down for immediate discussion. The effect of the preliminary jockeying for position at the conference may be that Britain now, as in the original negotiations for the European Payments Union almost exactly a year ago, will find itself persistently—and perhaps rather unfairly—in the dock. That, however, is one of the inevitable consequences of its status as a major trading nation. If the British Government is sincere in its subscription to the principles of GATT, it should now be exerting every effort to devise means whereby it can take the sting out of these widely propagated complaints.

* * *

EPU's Prescription for Germany

Another periodic compensation under the European Payments Union is being completed at Basle covering payments for October. It was first intended that compensations for the remainder of this year should cover two months, but the rate at which Germany has been gobbling up its credit facilities made it desirable that the clearings should be held monthly in order to keep track of the rapidly developing situation. The cumulative deficit of Germany with EPU is now reported to have substantially exceeded the credit portion of Germany's quota; this portion amounted to $192 million of the quota of $320 million. The point has therefore been reached at which Germany has to pay 100 per cent in gold or dollars for any further deficits incurred with its EPU colleagues—and it has very few dollars (probably only about $20 million) left. The German position has been investigated by a special mission consisting of Mr Per Jacobsson of the Bank for International Settlements and Mr A. Cairncross of the Organisation for European Economic Cooperation. Their recommendations have already been considered by the management committee of EPU but they still need the approval of the OEEC Council which is to meet in Paris next week. There are reports that they will include the grant to Germany of an exceptional short-term loan of $120 million under article 13 of the EPU Agreement; this loan, however, may carry a high rate of interest and be repayable by the end of next year.

It is estimated in any case that $120 million would cover only about 60 per cent of Germany's probable deficit with EPU in the next six months—unless Germany puts its house in order or unless countries with which Germany should normally expect to run a trade surplus agree to ease their import policies. Mr Jacobsson and Mr Cairncross are reported to have recommended a series of drastic reforms in German economic policy; these are said to include heavy increases in direct taxation and in the turnover tax, new measures to restrict speculative purchases of imports, and greater control over investment and over commercial bank credit. The Bonn Government has apparently agreed to take some at least of these steps. The recent sharp rise in the Bank Rate was intended as an instance of its good intentions, but the psychological effect of this has been somewhat marred by its subsequent decision to replace the Bank Deutscher Laender, the present central bank and traditionally austere watchdog against Government generated inflation, by a Bundesbank which would be obliged by its constitution to be much more amenable to Government influence and control.

* * *

New Rubber Duty in Malaya

The Malayan export duty on rubber is to be revised as from January 1st. The present duty is a straightforward 5 per cent *ad valorem* tax. The revised version is much more complicated. Its effect is to produce a sliding scale so that the duty becomes proportionately higher as the price of rubber rises. The duty is to be fixed quarter by quarter and based on the average price in the quarter ended three months before the duty is changed. Thus for the first quarter of 1951 the tax will be 20¼ cents (5¼d.) a lb., a figure based on the average price in the third quarter of 1950 which was 126.7 cents a lb. This means that the new duty will be double the present one at current market prices.

The effect of the new tax is shown in the accompanying table. When rubber is 60 cents a lb. the tax is equivalent to 5 per cent; at 300 cents a lb. the tax rises to 39 per cent. It is certainly an anti-inflationary measure, and one which will bring in considerable revenue for the Malayan Government if high rubber prices continue. The present export tax provided the Government with $M102 million when the price of rubber was 140 Malay cents (3s. 4d.) a lb.; at the same price, the new tax will reap $M364 million. This latter figure is almost equal to total estimated Government revenue from all sources for the current year.

MALAYA RUBBER EXPORT DUTY

Price of Rubber per lb.		Existing Duty	New Duty
Malay cents=	pence	cents per lb.	cents per lb.
60	16¾	3	3
80	22¼	4	7
100	28	5	12
120	33½	6	18
140	40	7	25
160	45	8	33
180	50¼	9	42
200	56	10	52
250	72	12½	81¼
300	84	15	117

It is difficult to estimate what effect the new tax is likely to have on the rubber market. Prices have continued to rise this week, despite the announcement. Indeed on Thursday the London market closed at 5s. 10½d. a lb, the highest since 1911. Although relief will be given to forward contracts already in force, uncertainty about the size of tax will probably discourage forward sales. The tax would seem to work well enough on a rising market, but if prices were to fall sharply the export tax being based on prices ruling three to six months earlier would have a much more serious incidence especially on smallholders.

* * *

What Price Tin?

The price of tin this week has lost all reason. Ten days ago it passed the thousand pound a ton mark and soared upwards, closing on Tuesday at £1,282½ a ton. On the same day, however, "after hours" transactions brought lower prices which were reflected in the official closing price of £1,262½ a ton on Wednesday. Rumours that the US Reconstruction Finance Corporation might again offer tin from its stocks and that the stockpile authorities were unwilling to buy at present high prices caused the market to slump badly on Thursday and the closing price was £110½ lower at £1,152 a ton.

American stockpile purchases are covered by contracts with the Netherlands and Belgium, but the contracts are believed to contain an escape clause allowing the United States to refuse to buy if the price exceeds $1.03 a lb (£824 a ton). This escape clause has not yet been invoked. Earlier this year the Ministry of Supply refused to sign a contract with the United States, for America wanted to fix the price a few cents below the ruling market price. Thus the impact of virtually the whole of American commercial demand and a part of the European demand has fallen on sterling area supplies, and buying earlier this week had been heavy, especially in the East. The Ministry of Supply has announced that it would release no further tin from its stocks after this week, on the ground that British consumers should be able to cover their genuine needs from supplies in the country.

Meanwhile the tin conference in Geneva is continuing, with all the energies of a Don Quixote, to combat a prospective surplus. Very little information has emerged about its deliberations, but it is known that the American delegation last week submitted counter-proposals to the draft agreement. The latter calls for export quotas and buffer stocks. The American proposals followed closely the outline of the official draft, but proposed that the initial buffer stock should be in the region of 30,000 tons, which is much larger than that originally suggested. The United States' main concern is to see that tin production is not restricted until all defence requirements have been covered.

* * *

Concord in Sugar

The stage is now set for the meeting of the international sugar council in December to consider an international commodity agreement. The council should have discussed this subject some months ago, but it was postponed pending a settlement between Britain and the West Indies on the long-term contract starting in 1952. At the beginning of this year Britain offered a seven-year contract to buy 640,000 tons of sugar a year from the West Indies, at agreed prices, and a further 75,000 tons a year on special terms based on world prices.

This offer was at first not accepted. More recently, however, New Zealand has guaranteed to buy 75,000 tons of sugar a year and this extra import has been allotted proportionately to Commonwealth exporters. The West Indies and British Guiana were thus offered a guaranteed market for a further 30,000 tons a year with a corresponding reduction in the supplementary purchases. Their total guaranteed market will now be 670,000 tons a year at agreed prices, with an additional 45,000 tons at world prices. The West Indies have accepted this new offer and the Commonwealth negotiations have been completed.

This Commonwealth sugar contract will be incorporated into any commodity scheme that the international sugar council might decide to adopt. Part of Britain's annual requirements has quite deliberately been left out of the Commonwealth contract so that it could be allocated to such outside exporters as Cuba and San Domingo.

At the moment sugar supplies are acutely short. In March, Cuba was worried about the disposal of its surplus, and Britain, hoping for lower prices, refused to buy. The invasion of Korea brought with it a wave of panic buying by the American public and exporters' stocks of sugar dwindled rapidly. Other countries joined in the rush and spot supplies of raw sugar are now virtually unobtainable. The new crop, however, will be available at the turn of the year and supplies are expected to be adequate to meet even the demand for hoarding. Production in 1950/51 is estimated by Messrs. C. Czarnikow Ltd. to increase by 2,500,000 tons to 34 million tons; it will be the largest crop on record. Even so, no "burdensome surpluses" should appear within the next twelve months, but if the

Sterling Arrangements and E.P.U.

The process of tidying up sterling arrangements with countries in the European Payments Union has been going on since July and is nearing completion. Arrangements for the gradual utilisation within EPU of Italian and French sterling balances, and for gradual repayment of Danish and Norwegian debts to Britain, have been in force for some time; it is only in the last three weeks, however, that arrangements with the two latter countries have been finally written into new monetary agreements. Discussions have also reached an advanced stage on the utilisation within EPU of Sweden's sterling balance of £25 million and on the repayment of the Dutch debt of about £10 million to Britain. An agreement with Sweden may be announced within the next few days; it is likely to show that the tangled problem of how far Sweden's balance did, and how far it did not, carry a revaluation guarantee in September, 1949, has been surmounted by mutual goodwill. Other discussions are now in progress in Berne on the utilisation within EPU of Switzerland's small sterling balance (it may, indeed, now be a debit). It is understood that here, too, the problems set by the revaluation guarantee have been finally settled. The tardy entry of Switzerland into EPU (which dates from November 1st) has led to a removal of British discrimination against tourism in Switzerland (represented by the ceiling of between £5,000,000 and £6,000,000 on British tourist expenditure) and to the automatic extension of British trade liberalisation measures to that country. From Berne the Treasury mission is likely to move on to Lisbon, where the whole of Portugal's £80 million sterling balance is still only held back from entering the EPU clearings by informal agreement—and by the fact that the Portuguese are keeping their current external payments in healthy order. For the rest, formal arrangements on sterling payments were concluded some time ago with Western Germany, which was neither a substantial net creditor nor net debtor of the sterling area at the outset of EPU, and similar arrangements are likely to be struck soon with Belgium, whose account with the sterling area by June 30th last was probably already slightly "in the red."

One of the most surprising features of this series of talks is that Denmark alone has so far joined the transferable account system as a result of them; Norway, Sweden, Holland and Italy already belong to the system and Britain has announced that any other member of EPU is at liberty to join it at any time. The continued abstention of such countries as France, Belgium, Switzerland and Western Germany from the transferable account club, however, is more a matter of form than of substance. It should be remembered that each of these countries has a pattern of bilateral agreements with the outside world not very dissimilar from that which the far-flung British missions in Europe are now methodically tidying up. Each of these countries has apparently to plough through a similar series of painstaking conferences with each other until their formal accession to the sterling transferable account system can be announced.

* * *

Inquest on Hot Money

The inflow of foreign funds to London has now died down to a mere trickle—if indeed it has not come to a dead stop. It is quite impossible to make any estimate of the net inflow in October although reports from the Continent, which are of varying authenticity, all suggest that it was large. German traders, for instance, are reported to have bought more than £30 million forward sterling. Belgium's forward sterling contracts are said to have exceeded £50 million. Estimates of American and Swiss purchases of forward sterling are even bigger and may be even more unreliable.

Very little of this inflow of funds has been due to speculation pure and simple. The bulk of it represents forward covering by prospective overseas importers from the sterling area. There has been no converse evidence that sterling area importers have been delaying payments for purchases from abroad; since the bulk of sterling area imports is invoiced in sterling there would be little point in their doing so. Some British exporters, however, who have hitherto been in the habit of invoicing in sterling all goods sent to their foreign sales subsidiaries, have now changed to invoicing in dollars—on the argument that if any capital loss is to be suffered through revaluation, they would rather, for tax purposes, take it here than abroad. Other firms in the same position continue invoicing in sterling but have obtained approval from the authorities to convert inward transfers at the current rate of exchange. Other features of the period of revaluation rumours have been some forward sales of sterling by overseas sellers to Britain (which have reduced the immediate inflow of foreign funds to this country) and a decline in the number of foreign bills in the London market. American importers in the past two years had again come to use the bill on London to finance some of their imports from the sterling area, at times because they wanted to be short of sterling, but primarily because credit is cheaper here than in New York; they are now much more reluctant to owe sterling than heretofore. Yet another feature has been the sharp appreciation of security sterling which is now quoted $2.12 against $1.75 just after the switching regulations were relaxed. The premium on dollar securities had last week fallen to 7½ per cent against more than 15 per cent earlier this year, though in the last two days it has again risen to 10½ per cent.

* * *

Austin's Bumper Profits

A threefold increase in the group profits of Austin Motor for the twelve months ended July 31, 1950, has exceeded the most optimistic estimates. Preliminary figures reveal an expansion from £1,521,360 to £4,509,771, to which a further £473,198 exchange profit on devaluation is added. But if the results are fully up to expectation, the dividend, although higher, has disappointed some optimists. Shareholders' participation in this high prosperity bears every sign of moderation and restraint. They receive by way of ordinary dividend £340,316 against £256,355, equivalent to 52½ per cent on the old capital against a payment last year of 40 per cent. The issued capital was raised by a 50 per cent share bonus last year, and the actual dividend declared is 35 per cent.

The higher profit attracts almost £2,500,000 in United Kingdom taxes against £837,200 last year, but even so the group retains over £1,500,000, excluding the exchange profit and £360,000 surplus taxation provisions no longer needed. The year has been so good that any disappointment about the dividend has been tempered. The 5s. ordinary shares had been very firm in recent months, having risen from 19s. in March to nearly 30s. before the results were announced. A certain amount of profit taking, though it happened to coincide with weaker markets, affected the price but little, and at 29s. xd the shares now yield six per cent.

Last year the Austin group made 157,628 vehicles, one-quarter more than in 1948-49. If a 25 per cent increase in output can raise profits threefold, it is clear that the motor industry could achieve even greater economies if it were in a position to utilise its plant to the limit of capacity. Demands on steel output for defence needs, coupled with the defence demands on the vehicle industry itself, may stand in the way of greater benefits from higher output next year.

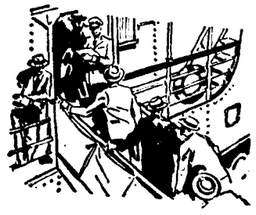
HOW MUCH DO YOU KNOW?

Can cold air heat metal?

YES, when steel is made in a Bessemer converter. A blast of cold air is forced through molten iron and raises the temperature by as much as four hundred degrees Fahrenheit. This burns out the impurities and changes the iron into steel. So high is the temperature produced in the converter that it would melt a garden roller like a lump of sugar.



HOW hard can a hammer hit?

Steam hammers used for forging steel can strike a blow of 100 tons but the workers operating them can make them tap a watch glass without breaking it.

A Fence around the Earth

The amount of barbed wire for fencing made in Britain in 1949 would go 1¼ times round the earth. A great deal of it goes to New Zealand. It helps to pay for the wool we need for clothes.

Do young steel men travel far?

Many young steel men and students are sent abroad each year by the industry under a regular exchange scheme. They go to France, Belgium, Luxemburg, Holland, Germany and Sweden, and also as far as Australia. This scheme is just part of the industry's training programme to extend general as well as technical knowledge. Progress in British Steel depends on the skill, enterprise and knowledge of all who help to make it.

A sensible policy for process steam — No. 22

A place for the Automatic Pump

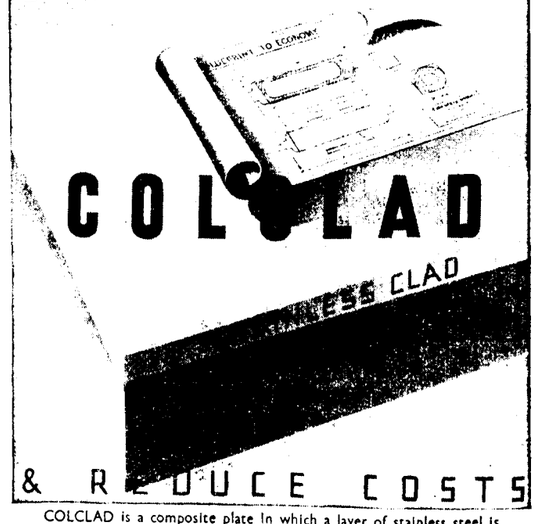
BY SPIRAX

It may seem almost out of place in the atmosphere of "THE ECONOMIST", and in this series of short notes (which must necessarily take a rather broad sweep of their subject), to talk about a simple pump.

But if we leave out the pump we leave out the answer to a problem which is found at many factories.

It is often the case that the heat in low-pressure condensate is sacrificed because the expected cost of getting the hot water back to the boilers seems to outweigh the economy to be gained.

On the basis of operating cost of standard types of pumping apparatus it might well be so in particular cases.



That is why we must mention the existence of a simple pump which is designed to meet such a situation. Because it is so very simple the pump is inexpensive to buy; because it automatically starts when there is pumping to be done and stops when there isn't, and because it needs nothing more than a very small amount of steam or compressed air for its operation, the pump is cheap to run.

The pump is useful for many jobs; but if for nothing else it deserves a place in these notes because it removes the main excuse for sacrificing the heat in low-pressure condensate.

DESIGN WITH

& REDUCE COSTS

COLCLAD is a composite plate in which a layer of stainless steel is bonded to a weldable carbon or low alloy steel. Special methods of manufacture ensure a uniform thickness of cladding. If protection is required on one side only COLCLAD offers equivalent corrosion resistance of solid stainless steel at considerable reduction in price. Easier fabrication and availability of plates in sizes larger than can be obtained in solid stainless steel, reduces production costs.

To assist YOU in adapting COLCLAD to YOUR products our technical staff is at YOUR service.

COLVILLES LTD., 195 WEST GEORGE STREET GLASGOW, C.2

Molasses Price Rise

The price of molasses to be shipped next year has been fixed by the Cuban Government at 20 cents a gallon, compared with less than 4 cents a gallon for the previous crop. All British industrial alcohol and a large proportion of American is produced by fermenting molasses, and a sharp rise in price of this essential industrial material is now inevitable. An acute shortage of alcohol has developed in the United States, for it is essential for the production of styrene, one of the materials used to make synthetic rubber. Cuba is the only big exporter of molasses and can supply no more until March, after the next cane crop is crushed. American distillers are therefore competing for the limited stocks of molasses held by dealers in the United States. Supplies of ethyl alcohol to the plastics industry have been cut to meet the demands of the rubber plants, and some high cost alcohol has even been imported from Europe.

Industrial consumption of alcohol has also been rising in Britain, but stocks of molasses are large enough to remove any danger that the distilleries might run short of raw materials before next season's deliveries. The Cuban Government, instead of asking for tenders, has allocated the 1951 crop among the chief consumers. Out of an estimated total of 290 million gallons, 120 million gallons is to be kept for Cuban use, 50 million gallons is to be sold to Britain, and the balance will go to the United States. The British allocation meets only half the estimated requirement. Last year Britain bought 60 million gallons and drew heavily on stocks which will be exhausted by next March. Small supplies of molasses might be obtained elsewhere, but distilleries may be driven to use expensive beet molasses. The alternatives of grain and potatoes might also be considered if supplies become desperately scarce.

The output of alcohol from distilleries will soon be supplemented by the output from new petroleum-based plant. By the second quarter of next year, the Grangemouth chemical plant of the British Petroleum Chemicals Company, which is jointly owned by Distillers and Anglo-Iranian, should be in full production. This plant is expected to supply a quarter of the country's alcohol requirements. Consumption last year was about 28 million bulk gallons.

* * *

An Aluminium Shortage?

The Ministry of Supply, the sole importer of virgin aluminium, may have difficulty next year in buying enough metal to keep British fabricating plants working normally. Consumption of virgin aluminium last year was about 178,600 tons. It had been running at a lower figure during the first half of 1950, but several fabricating plants are now reported to be working below capacity for lack of raw materials. One of these is the Northern Aluminium Company's new rolling plant in Wales, which has a sheet producing capacity of 50,000 tons a year. This plant, which is one of the largest of its kind in the world, could quickly be put into full operation, but there is no prospect of finding adequate supplies to feed it. If the company were to run this and other rolling plants to capacity, it could handle 6,000 tons of sheet products a month, 50 per cent more than its present rate of output.

The bulk of British supplies of virgin aluminium come from Canada, where the Ministry of Supply has long-term contracts with the producers. Last year, 159,672 tons were imported from Canada and 5,710 tons from other countries, mainly France and Norway. Domestic production averages 30,000 tons a year. Canadian imports this year will be about 124,000 tons. When the Ministry of Supply negotiated for these in April, it considered British stocks too high and planned to reduce imports while they ran down. The position has altered considerably since then. Recently, American government agencies and American firms have been buying up all available supplies of aluminium in Canada and on the Continent at prices far above those paid by the Ministry. They are also contracting with European producers for future supplies. The Ministry is, therefore, having trouble in finding producers able to accept orders for the early part of next year. To a limited extent supplies are supplemented by the use of secondary aluminium, mostly for castings. Production of secondary ingots during the first half of 1950 was 42,314 tons.

To conserve supplies, exports of virgin and secondary aluminium from this country have been stopped, but as they were largely token exports their retention will make little difference. Exports of fabricated aluminium are still permitted so long as their value is not less than £180 per ton. As American buyers are also anxious to buy fabricated aluminium, exports from this country to the United States rose from an average of 200 tons a month early in the year to 770 tons in July and reached nearly 780 tons in September.

* * *

Pottery Export Difficulties

Alterations in New Zealand's import regulations are worrying some sections of the British pottery industry. After next March, the more expensive china and earthenware may be imported freely, but individual applications will have to be made for licences to import cheaper pottery, mostly white or slightly decorated. If New Zealand producers can show that they could make comparable articles at a cost not more than a third above British prices, the licences will probably not be granted. About 30 firms are exporting the type of goods likely to be affected; they expect that their sales to New Zealand may be halved, and have no easy hopes of finding alternative markets. This pottery is decorated by trainees who are not sufficiently advanced to do more elaborate work. There is an established market for such pottery in Commonwealth countries, but it is the most obvious class of exports to be displaced by local production, as may soon be the case in New Zealand.

Exports for the pottery industry as a whole are still rising. In the first nine months of this year they were valued at £10,410,501 compared with £9,221,730 in the same period last year. Not all sections of the industry find it easy to sell abroad. The highest quality china sells without effort in any country, and the volume of sales is limited only by a shortage of decorators. Pottery below this quality is meeting increasingly strong competition, either from local producers or from other exporting countries. The installation of tunnel ovens, which must be kept in continuous production, has greatly expanded the capacity of the industry but its selling problems are increasing.

There is a case for considering some measure of relief for those producers who are meeting difficulty in exporting their particular goods by allowing them to sell lower-grade decorated pottery on the home market. But producers of high quality china oppose any such scheme, on the ground that their exclusion from the home market should not be to the gain of other manufacturers. The Board of Trade has responded by tightening its control on the sale of export rejects on the home market. Retailers as well as wholesalers now have to keep records of the firm who

British Insurance

Next week's issues of *The Economist* and of the *Records and Statistics* Supplement will include the Annual survey of the British Insurance Industry. This Survey, delayed by the printing dispute, provides a comprehensive study of all aspects of the business of the British offices and will include many new and improved features.

supplied them with the decorated goods, and a committee in the industry scrutinises applications to send such pottery to the home market with a rather greater knowledge of them than the Board of Trade could possess. By this combination of book-keeping, equalised misery and self policing in industry, the needs of the export market are sustained. What would that original of the five towns, the "Card," have made of it all?

* * *

Britain and Rhodesian Tobacco

Southern Rhodesia's programme for increasing its tobacco output is proceeding much more rapidly than British manufacturers thought possible. This year's crop yielded 104.2 million lb., the largest on record and 22 million lb. more than in 1948-49. Next season, Southern Rhodesia hopes to harvest 120 million lb. and in 1952 140 million lb., a crop not originally thought possible until 1954. British manufacturers have estimated that they could use only between 75 and 80 million lb. a year and they have accordingly signed a six-year contract with the Southern Rhodesian Tobacco Board, stipulating the quantities they will buy each year. In 1951 their purchases will amount to 75 million lb., against 67 million lb. this year, and they will rise by 5 million lb. each year until 1954, when they will remain at 85 million lb., falling to 80 million lb. in the following two years. In no one year may total British purchases exceed two-thirds of the crop. On the other hand, if consumption of flue-cured tobacco in Britain should fall by 20 per cent compared with 1948, British purchases may be reduced by 15 per cent. So far British consumption has declined by only 3 per cent.

The quality of the Rhodesian crop has improved in recent years and this year's leaf was considered the best since 1947. This improvement was also reflected in higher prices. The average price for this season's crop was 37.67d. a lb., yielding a total income for growers of £16.5 million. The average price in 1949 was 31.87d. a lb. and in 1948 32.56d.

Britain is by far Rhodesia's largest customer for tobacco, taking approximately two-thirds of the crop. Australia is second and this year took nearly 7 per cent of the total. Other important markets are South Africa, Egypt and Denmark. But until Rhodesia finds other outlets any expansion in its production is likely to be limited by the size of British purchases, and these have now been fixed for a period under the new agreement.

Supplies of Cortisone

The Ministry of Health is importing limited quantities of the new drug cortisone from the United States for research, and larger quantities may be imported soon for clinical trials. This is welcome news, for apart from a small supply brought in as a gift, no cortisone had previously been used in British hospitals. The Ministry has also placed an order for 200 grammes of adrenocorticotropic hormone (ACTH). Research indicates that these two chemicals might prove important in treating several rheumatic conditions, asthma, and certain eye diseases; cortisone may also reduce the dangers of serious burns. Medical evidence is not yet conclusive, but if these drugs fulfil present expectations they are likely to prove the most important commercial development in the pharmaceutical industry since penicillin. They will increase by two the small number of drugs that can be kept in continuous large-scale production because they are needed in quantity for the treatment of comparatively common conditions.

Both of these new drugs are being produced from natural materials. ACTH is extracted from pig pituitaries and cortisone is obtained by an elaborate 32-stage process using ox bile as its starting material. No alternative raw materials have yet been found. In this country the Ministry of Food has now arranged for the collection of pig pituitaries from the large bacon factories, and most of these are going to Organon Ltd., who hold patents for the extraction process and who have just started production of ACTH on a commercial scale. The cortisone synthesis is not covered by patents, but the process is so difficult and requires so large a plant that in fact the Merck Company of America alone in the world produces cortisone. By raising the extraction rate from less than 1 per cent to 80 per cent and by importing ox bile to supplement domestic supplies, this company expects to be able to meet demand from any part of the world by next year. The increased rate of extraction and the recovery of some of the most expensive reagents used in the process have brought the price down from $250 a gramme to $35 a gramme; the price forecast for next year is $5 a gramme.

No British firm has yet put forward plans for cortisone production by the method used by the Merck company; research in this country has been directed, so far without success, towards making cortisone by a process of total synthesis. The efficiency and output of the method of partial synthesis has improved so rapidly that the commercial problems of a process of total synthesis, should one be discovered, would be very great; but success would mean enhanced business and prestige for the British pharmaceutical industry.

"Tanks" Deal and Dollars

The American syndicate which took an option on 600,000 Tanganyika Concessions ordinary shares last April (when the Treasury sold its holding of 1,667,961 Tanks shares to an Anglo-Belgian group) has now exercised it. This transaction is of particular interest, for it is the first important purchase since the war by an American investor of quoted sterling securities paid for in sterling at the official rate and not at the depressed security sterling rate. Should the American interests concerned decide to dispose of their shares at some later date, they will have the right to transfer the sterling proceeds into dollars at the official rate, but only up to the limit of the amount originally paid in sterling. But if the sale should yield a sterling profit above the purchase price, that portion will be transferable only at the security sterling rate and not at the official rate. Thus, the capital gain can only be withdrawn at a discount, although the original risk was undertaken at par. This may be taken as evidence of the bargaining strength of the British authorities, but the principle raises at least some doubt about the encouragement of dollar investment to the sterling area.

Reports on Productivity

Among recent reports from the many British teams that have lately visited the United States in search of the secret of higher industrial productivity are studies of electric motor control gear, grey iron founding and packaging in American distribution. The teams examining electric motor gear and grey iron founding (that is the jobbing foundries specialising on short runs) found that in each industry the average output was higher in America than in Britain; the grey ironfounders put it twice as high. The two reports give similar reasons for the difference; other teams from other industries have already made it abundantly clear that American industry, though in general no more than the equal of British industry in technical advancement, is superior in organisation within the factory. These reports emphasise the skill with which production is planned.

American manufacturers in both industries have to some extent standardised what are usually regarded as non-

RHOKANA CORPORATION LIMITED

The TWENTY-EIGHTH ANNUAL ORDINARY GENERAL MEETING OF THE MEMBERS of RHOKANA CORPORATION LIMITED will be HELD at the CHARTERED INSURANCE INSTITUTE, 20, Aldermanbury, in the City of London, on the 28th day of NOVEMBER, 1950, at 12 noon.

Extracts from the REPORT OF THE DIRECTORS FOR THE YEAR ENDED 30th JUNE, 1950.

Proceeds from the sale of metals during the year were £10,597,893, an increase of £1,108,240.

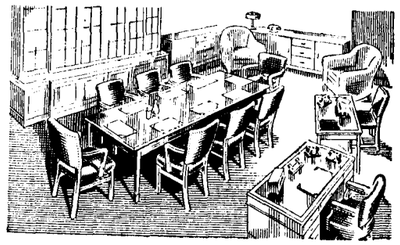
Production Costs including Development Redemption, Depreciation and Realisation and Outside Refining Charges have increased by £692,428 to £5,723,225; against this the stock of metals at cost has increased during the year by £488,336, whereas the previous year's increase amounted to £284,788. Therefore the net increase in Operating Costs applicable to the year's sales amounted to £488,880, and so the profit from the year's operations has increased by £619,360 to £5,363,004. Added to this figure is an amount of £339,616 which arises mainly from the settlement of the costs claims on the Ministry of Supply relating to the war period as referred to in last year's report and also from the settlement of a claim in respect of the sale of cobalt which has been outstanding since 1939.

The profit carried to Profit and Loss Account amounts to £5,702,620, an increase of £958,976.

Dividends received include a maiden dividend from Nchanga Consolidated Copper Mines Limited of £469,000 and dividends from Mufulira Copper Mines Limited amounting to £552,500. A comparison of the dividends with those received last year is given later in the full Report in the paragraph headed "Mufulira Copper Mines Limited."

The net profit carried to the Appropriation Account is £6,687,165 as compared with £5,425,175 last year, an increase of £1,261,990, and the Directors propose that the profit should be dealt with as follows:—

	£	£
The balance on the Profit and Loss Account for the year ended 30th June, 1950, is		6,687,165
Taxation on these profits, after crediting £23,084 in respect of adjustment on earlier years' assessments, amounts to...		3,590,223
Leaving a net available profit for the year of		3,096,942
The balance brought forward from last year was		560,270
Making a total of		3,657,212
Against this the Directors have made appropriations as follows:—		
Preference Share Redemption Fund	7,500	
General Reserve	1,400,000	
	1,407,500	
Dividends on Preference Shares paid on 31st December, 1949, and 30th June, 1950, after deduction of Income Tax amounted to	43,461	
Interim Dividend of 30% on the Ordinary and "A" Stock paid on 26th May, 1950, in respect of the year ended 30th June, 1950, after deduction of Income Tax amounted to	412,500	
Final Dividend of 90% on the Ordinary and "A" Stock in respect of the year ended 30th June, 1950, is now recommended by the Directors and after deduction of Income Tax will amount to...	1,237,502	
		3,100,963
Leaving a balance to be carried forward of		£556,249



COPPER PRODUCTION

Details are given below of production during the years ended 30th June, 1949, and 30th June, 1950:—

	1948/49 Long Tons	1949/50 Long Tons
Electrolytic Copper	62,720	64,864
Blister Copper	12,262	15,676
Total	74,982	80,540

The year was an exceptional one for production in all departments. Record tonnages were hoisted from the Mine and milled in the Concentrator. The output of molten copper from the Smelter and of electrolytic copper from the Refinery was also a record. In view of the impending completion of the Electrolytic Refinery belonging to Rhodesia Copper Refineries Limited which is referred to elsewhere in the full report almost the entire output of the Corporation during the year ending 30th June, 1951, will be in the form of electrolytic copper.

Inspiration

To draw inspiration from one's surroundings one must be able to see the wood despite the trees. Catesby Office Furnishings provide the answer for the business executive who seeks the unobtrusive efficiency of the perfect office designed by experts to serve his needs. For a complete new office or a single item we invite your enquiries to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

CATESBYS LIMITED

64/67 TOTTENHAM COURT ROAD
LONDON, W.1

Our only address. Telephone: Museum 7777

ASK THE MAN WHO KNOWS

Business men and bankers who have visited Australia or New Zealand will tell you that the best medium for facilitating trade with those countries is the Bank of New South Wales — largest commercial bank there.

You are invited to use our specialist services through your own bank.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA

LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

standard products. Grey ironfounders have in part met their particular difficulties by specialising in a limited range of castings. Their market is large enough for this, while the British market does not provide the same opportunities. The electric motor manufacturers have been helped by the general acceptance of the squirrel cage motor. Electricity regulations in Britain prevent its universal application here and British manufacturers therefore produce motors in a variety unknown in America. Some of these are sound export lines and should not, the team conclude, be dropped.

Another aspect of American production planning is described by a specialist team sent to report solely on the function of packaging in American distribution. American manufacturers did not, the team found, consider the cost of the package without considering also the cost of filling it; a more costly package might be chosen because it could be handled the more rapidly and therefore the more cheaply. In British factories this is an unusual approach. Many American techniques cannot be recommended to British manufacturers because of the strict allocation of the major packaging materials in Britain. But when allowance has been made in each of these three subjects for the limits of the British manufacturer's market, the challenge to management remains.

Shorter Notes

Negotiations to raise further capital for Petrochemicals Ltd. have been concluded. The Finance Corporation for Industry has agreed to provide up to £2,350,000 in 5 per cent prior lien loan stock, 1953.

★

The Ministry of Food is in difficulties about chartering ships for the Black Sea to carry Russian coarse grains. The first offer of 40s. a ton brought no response from shippers and even 45s. a ton has proved unattractive. Shipowners are thinking rather in terms of 55s. a ton.

★

The Capital Issues Committee has given permission for the British Aluminium Company to raise nearly £3,500,000 of new capital. Two million new ordinary shares are to be offered to ordinary stockholders on the basis of two new shares for every £3 of existing stock held; the issue price of 34s. per share (of which 20s. will be payable on application) compared with a market price of 42s. 3d. for existing £1 stock units at the time of the announcement of the issue.

★

One million ordinary shares of 5s. each of Manfield and Sons, the well-known boot and shoe makers and retailers, are to be offered for sale to the public next Tuesday at 20s. per share. These shares, which represent some 40 per cent of the total share capital of the company, are being marketed in order to meet death duty payments.

★

The cocoa market reopened in London on November 1st, and trade has been quiet. The Ministry of Food is still selling supplies from its stocks at 220s. a cwt, a price substantially below the "world" price of 272s. a cwt. So long as manufacturers can get all they want from the Ministry at the lower price, there is little purpose paying the higher market price.

★

The British cheese ration is to be supplemented by supplies from the United States. The Ministry of Food has purchased a sizeable quantity of surplus American cheddar at 14 cents (1s.) a lb. The cheese is said to be "very ripe" and may challenge the British palate. But the Ministry will have the satisfaction of being able to sell it at the controlled price without the need for any subsidy from the Treasury. The Dutch Government has objected to what it regards as an act of dumping by the United States. Dutch cheese—of milder character—is selling in London at nearer 6s. a lb.

SECURITY PRICES AND YIELDS

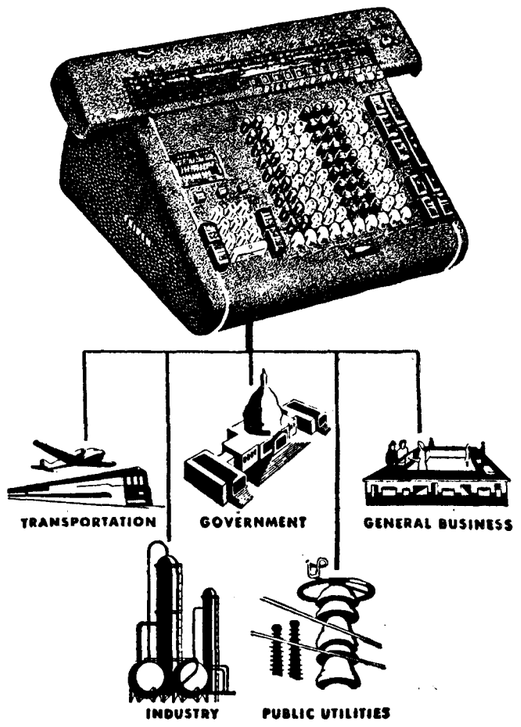
It took 157 years



Behind the design and construction by Newton Chambers of ladles to hold 100 tons and more of molten steel lies a skill which has accumulated over 157 years. Experience has been passed down generation by generation within the stable Thorncliffe community, which accounts in large measure for the unremitting quality found in everything Newton Chambers produce.

DEMAND FOR PRODUCTS CONTINUES TO GROW

RECORD SALES FIGURES

EXPORTS MAINTAINED IN FACE OF SEVERE COMPETITION

SIR GREVILLE S. MAGINNESS ON NEED FOR GOVERNMENT ECONOMY

The forty-third annual general meeting of Roneo Limited was held on October 31, 1950, at the Holborn Restaurant, London, W.C.1.

Sir Greville S. Maginness, chairman of the company, who presided, said:—Once again we meet to render an account of our stewardship and to place before stockholders the results of our operations for the past year. The accounts have been in your hands for the requisite statutory period and I assume, therefore, that you will agree to take them as read. (Agreed.)

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The net profit after providing £352,793 for taxation and £112,382 for depreciation and amounts written-off was £182,405, out of which it is proposed to transfer to Plant Replacement Reserve the sum of £80,000—bringing the total reserve under this heading to £200,000—and to general reserve £30,000, raising this figure in the balance-sheet to £250,000.

Dividends on the 6 per cent. and 10 per cent. preference stocks, less tax, amounting to £11,781 for the year ended June 30, 1950, and an interim dividend of 5 per cent., less tax, on the ordinary stock amounting to £11,303 have been paid. It is now recommended that a final dividend of 10 per cent., less tax, be paid on the ordinary stock, which will absorb £22,607, making a total dividend on the ordinary stock of 15 per cent., less tax.

After payment of these dividends the amount to be carried forward to next year will be £213,487, compared with £186,773 brought in from the previous year.

DIVIDEND POLICY

Your board have given very careful consideration to the question of the rate of dividend recommended for the year.

The trading results coupled with the strong financial position of your business might well have justified the payment of something more on the ordinary stock than 15 per cent., less tax, for the year, but the company has aligned itself with others in pursuing a policy of restraint whilst the wage-freeze continued.

If conditions should change your board will review the position in the light of all the circumstances ruling at the time the matter is under consideration.

LIQUID ASSETS

The net liquid assets as at June 30th last amounted to £1,385,302, compared with £1,174,751 on the same date last year—an increase of £210,551.

RESERVES

Excluding taxation the company's reserves and balance carried forward on profit and loss account amount to £673,487, or slightly more than the total issued capital. The inherent strength of the company requires no emphasis.

TRADING

I am pleased to report that the demand for the products of the company continues to grow. In fact, our sales both in value and in volume during the year under review reached a record in the history of the company to date. This is just as well, as costs have risen and continue to rise. The slight improvement in net profit is due to larger turnover, greater efficiency in our manufacturing operations, and improved sales methods.

STEEL OFFICE EQUIPMENT

More people are becoming conscious of the advantage of installing modern and efficient equipment, although there is still a very big field to be covered in this direction. It is one of our jobs to develop new lines which will appeal to the progressive user who is convinced that both works and office equipment must be really up to date and the best available if modern standards of comfort and efficiency are to be attained. Following the introduction of the high quality unit style desks and tables known as "U" series, we have added to this range cupboards, wardrobes, book-cases, telephone tables, etc., all of which are constructed on the unit principle and built upon the same artistic lines. Unfortunately, however, our sales of these and other lines of steel equipment continue to be limited by the scarcity of steel sheets, which still persists.

MACHINES AND SUPPLIES

This section of our business continues to develop satisfactorily. Since we last met we have added to our range of duplicating machines a policy model which has the same basic principles as the Roneo "500" and it has already met with a most encouraging reception owing to its outstanding advantages. We have also introduced to the business world our electronic stencil system, which has created widespread interest. By enabling stencils to be prepared at a reasonable charge and without the additional expense of positives and negatives, both the scope and the potential use of our duplicators are considerably increased. Another exclusive Roneo achievement is the supply of teleroll stencils for use on the teleprinter.

The review of the machine side of our business would not be complete without reference to the new improved insurance machine introduced last year by Roneo-Neopost Limited—one of our subsidiary companies. This machine eliminates completely any loss in the handling of sums of money and negotiable stamps, and ensures a much speedier operation of stamping cards thereby releasing labour for other duties. In short, the use of this machine provides security, convenience and saving of time.

All these new lines are the result of intensive and unceasing efforts in development work, the cost of which is considerable but which is, of course, inevitable if the company is to maintain and improve its position in the manufacture and sale of its wide range of office equipment.

EXPORTS

I drew attention in my speech last year to the growth of competition in export markets. Events have certainly justified my note of warning. Even with the advantage of devaluation of the pound we were only just able to maintain the same level of exports compared with the previous twelve months. It must, however, be borne in mind that in addition to the growth of local manufacture in many countries we have to meet prohibitions, restrictions, or quotas in no less than 25 of our established foreign markets, but as we had continuously increased our export business to a substantial extent each year since 1946 it is, in all the circumstances, no small achievement to have maintained our position last year. I would, however, again point out that competition is likely to become more severe, especially from countries whose wage standards and living conditions are much lower than those which exist in this country. On the other hand, there is a due appreciation on the part of foreign buyers of the very high standards of design, quality and finish of Roneo products, and provided that our costs of manufacture are not unduly raised—due to circumstances beyond our control—these assets should be of considerable help to us once the trade barriers to which I have referred have been removed.

NATIONAL SITUATION

In presenting this report I may perhaps be permitted to express my view about the general situation in the country for it is upon its welfare that not only our own industry, but every industry, and, indeed, every citizen depends.

The fundamental fact in the national situation is that, through our having had to realise our overseas investments to help to pay for the war before the U.S.A. entered it, our net income from these investments, which used to pay for some 20 per cent. of our imports, is now hardly sufficient to pay for 3 per cent.

It is, therefore, only by our producing more goods and services at competitive prices and by finding markets for them overseas that we can fill the gap and so enable us to pay for the food and raw materials which are vital to our existence as a nation.

When we met last November the new feature in our industrial situation was the devaluation of the £ sterling which had taken place in September of that year and which had increased the necessity for our expanding our exports and finding markets for them in hard currency countries. At that time I expressed the view that there was an urgent need for a substantial reduction in the heavy burden of taxation if the people of this country were to be given the necessary incentive to secure the increased production for the expansion of our export trade.

On the present occasion the outstanding new feature in the national situation is that the Government, with the full approval of all thinking sections of the community, has decided on an armaments programme which over the next three years will bring our Defence expenditure up to an average of £1,100 million a year, representing an average annual increase of some £300 million. Whatever help the U.S.A. may provide towards meeting that £300 million a year, it is only prudent to assume that the larger portion of it will have to be met from our own resources, and in view of the present high rate of taxation, the financing of that additional expenditure presents a national problem of the first magnitude. Here the fundamental fact is that taxation, which before the last war used to absorb 25 per cent. of our entire national income, now amounts to some £4,000 million a year and absorbs 40 per cent. of our entire national income.

An examination of the two major items from which that £4,000 million come shows that some £1,500 million (37½ per cent.) come from income tax and surtax, and that £1,000 million (25 per cent.) from the duties on drink and tobacco—some £600 million come from tobacco and £400 million from drink. There is clearly a point when any increase in these duties will defeat its own

object and, indeed, one is tempted to wonder what would happen to our National Budget if everyone decided to stop smoking and drinking!

As far as income tax and surtax are concerned there are many who think that it is possible to meet increased Defence expenditure by raising the tax of those who pay on the higher income brackets. It is not, I think, generally recognised that the number of those who have a gross income of £2,000 a year or over is only some 1 per cent. of the income tax paying public and that the rate of tax they already pay is so high that if the Exchequer were to take all that is left to them after they have paid their tax and left them with no income at all—an unthinkable proposition—all that the Exchequer would get would be some £450 million. We have long since passed the days when it was possible to accumulate large fortunes in this country and it is easy to foresee a time coming when there will be no large estates from which the Exchequer can secure death duties and upon which it at present so largely depends for some £200 million of its total revenue. The facts are that since the war we have been carrying on with a rate of taxation almost as high as during the war. It has left us with no margin for eventualities, and, in my view, the only way of meeting the additional Defence expenditure without serious detriment to the economic life of the country is for the Government to reduce public expenditure on items other than Defence. I know how unpopular that process is, but the fact remains that our present position arises from our having compressed into a few years since the war far-reaching reforms, each of which it might be possible to justify on its own but which all taken together have placed on the country a heavier burden than it can bear.

In addition to the Exchequer expenditure of £4,000 million there is also the Local Authorities' expenditure of some £300 million and the present position is that subsidies and social services in all their various forms absorb some £1,800 million, which represents more than 40 per cent. of our total national and local expenditure.

The result has been that with subsidies and social service benefits on the one hand and heavy taxation on the other to pay for them, there has been brought about a distorted sense of the value of money and it is little wonder if our wage problems have become more than ever complicated.

If I am asked where Government expenditure should be reduced I can only say, as I did last year, that that expenditure is the result of national policy laid down by Parliament and that it is Parliament which is charged with that responsibility. Our duty as industrialists is to do everything possible within our power to produce and sell our goods at competitive prices in the world's markets, and equally in my view it is the duty of our political leaders to create the conditions in which the natural energy and resourcefulness of our people can have the freest and fullest scope.

We must also remember that Marshall Aid, which is due to end in 1952, provides us today in dollars with some £300 million a year and it seems clear to me that little progress will be made in bringing this country to a position when it can again stand on its own feet until the Government has authoritatively confronted the nation with the facts which will demonstrate to everyone the necessity for sacrifices and until they have also set on foot a serious review of all items of public expenditure.

In conclusion, I should like once more to pay tribute to all those members of the Roneo Organisation who—by their loyal and devoted services to the company—have made their contribution to the successful results of the past year.

The report and accounts were unanimously adopted.

FRAS. HINDE AND SONS, LIMITED

(Silk and Textile Manufacturers, Dyers and Finishers)

EXPORT DEMAND INCREASING

CAPT. W. M. H. POLLEN'S STATEMENT

The twenty-sixth annual general meeting of Fras. Hinde and Sons, Limited, was held on November 8th at St. Mary's Silk Mills, Norwich, the chairman of the company, Capt. W. M. Hungerford Pollen, M.C., J.P., presiding.

The following is the statement by the chairman which was issued with the report and accounts for the year to June 30, 1950:

During the past year, our turnover has increased by 15 per cent.; though part of this increase is due to the greater number of looms now working, much of it must be credited to greater efficiency. The demand from our export customers, especially for pure silk, continues to increase, and some sections of our home trade call for greater production, which more than balances the the decrease in others. Orders on our books will keep us in full production for many months ahead, and the increase in plant already referred to has been fully justified.

Such results could not be obtained without the good will and co-operation of all those who work for the company, whether in offices, on the floor of the weaving sheds, or in the repair shops; and it would be wrong, in allotting credit, to make any difference between them. I think it can be said truthfully that all those employed by the company have its interests at heart, and are happy to be associated with one of the oldest names in Norwich.

LARGER TRADING PROFIT

The trading profit has exceeded that of last year owing to our increased production and sales. Provisions for income tax and profits tax amount to £46,000 after allowing for an overprovision in previous years, and we have transferred to our reserve for future taxation £19,500, being the net benefits of initial allowances since their inception; these allowances we regard merely as a deferment of taxation. Bearing in mind the restrictions on dividend payments, which we have accepted, we recommend the payment of 25 per cent. on the ordinary shares as previously. During the past few years we have been able to place various amounts to reserve which have established the company in its present strong financial position. We consider it prudent to continue this policy by transferring £30,000 to general reserve from the current year's trading surplus. We fully realise that a larger distribution could be made to the shareholders, and hope that a time may soon come when some form of increased distribution will be possible.

In the balance sheet you will have noticed the increased value of our fixed assets. This represents the extensions at our Mile Cross factory and the new plant and machinery installed at St. Mary's. When we reach a settlement with the War Damage Commissioners, which we hope will not be delayed too long, we shall know how much of the costs of reconstruction will have to be borne by the company in excess of the amount received from the Commissioners. Since the end of the year we have had a settlement of our claim in respect of the plant and machinery destroyed in 1942. The increased value of our stock is due to the necessity of clothing the larger number of looms recently installed.

ALLOCATION OF INCOME

As a matter of general interest, the following figures based on the year's trading are given: Of each 20s. received by the company on account of sales, manufacturing expenses take 14s. selling expenses 11d., administration 1s. 1d., making a total of 16s. From the remaining 4s. taxation takes 1s. 11d., depreciation 7d., net dividends 6d., leaving 1s. to put to reserve.

With regard to the future, it is foolish to prophesy. The outlook changes from day to day as the shadow of war becomes darker or lighter. The disturbance in the Far East has already caused a sharp rise in the price of raw silk. The nature of the goods on our order books shows some important changes, and many more are expected. Thanks to the policy of spreading our risks, it is probable that we shall continue production at our maximum rate, and we are fortunate in being able to take a very important part in the rearmament programme.

During the year Mr J. M. H. Pollen was appointed to the board, and we shall be asking you for your confirmation of this appointment at the annual general meeting.

The report and accounts were unanimously adopted and the proposed dividend was approved.

The retiring directors, Capt. W. M. Hungerford Pollen and Mr J. M. H. Pollen, were re-elected and the remuneration of the auditors, Messrs. Price Waterhouse and Co., was fixed.

The proceedings terminated with a cordial vote of thanks to the chairman, directors and staff.

At an extra-ordinary general meeting following the annual general meeting a special resolution was passed adopting new articles of association in substitution for the company's existing articles.

ANGLO-DUTCH PLANTATIONS OF JAVA, LIMITED

RUBBER POSITION SATISFACTORY

The 40th annual meeting of this Company was held on October 31st in London.

Mr G. C. Denham, C.I.E., C.B.E. (deputy chairman), presided in the absence in Java of Mr W. H. Daukes, the chairman.

The following is an extract from the chairman's circulated statement:—

The estates gross profit amounted to F.7,892,824. The chief contributors to this total were tea—with a profit of F.3,500,000; and rubber—with rather more than F.2,500,000. Tapioca, with a profit of over F.1,250,000, gave also substantial help, but, on the other hand, sisal showed a loss of F.882,000, so that the profit from Sukamandi as a whole was only a small one.

The total tea crop, 4,842,499 lb., was produced at a cost of 1s. 11d. per pound and sold at 3s. per pound. The crop was a disappointing one; there is no doubt that the severe cutting back after such prolonged neglect caused a greater shock to the bushes than had been anticipated, and in consequence a longer time was required for them to recover their productivity. For 1950 the estimated crop is 6,500,000 lb.

The total rubber crop amounted to 18,466,168 lb.; the "all-in" cost price was 9d. and the net selling price 11d. per pound. The output for 1950 is estimated at 21,000,000 lb. and in June last the crop amounted to 2,116,000 lb., the first time in the history of the company that the two-millionth mark has been reached in a single month. It can safely be said that the rubber position is a satisfactory one.

The report was adopted.

THE STANDARD MOTOR COMPANY, LIMITED

RECORD RESULTS

MR. C. J. BAND'S SPEECH

The forty-seventh annual general meeting of the Standard Motor Company, Limited, was held on October 31st at Coventry, Mr C. J. Band (chairman of the company) presiding.

The chairman, in the course of his speech, said: The turnover, trading profit and net profit have exceeded anything achieved before in the history of the company and I think you will agree that, when the many difficulties facing all manufacturers are taken into consideration, the results achieved reflect the greatest credit upon all concerned in the management of the company's affairs.

The balance from trading account has increased by more than a quarter million pounds. The depreciation and amortisation charges together amount to nearly 1½ million pounds. In passing, I may say that the tooling charges incurred to date for the Vanguard car have now mainly been written off against profits.

Taxation, after making the necessary adjustment on the taxation equalisation (initial allowances) reserve, about which I have spoken at previous meetings, shows a charge of £780,000, representing no less than 57½ per cent. of the company's profit before taxation. This figure of taxation is more than three times the net sum proposed to be distributed to stockholders. I might also mention that no less a sum than £519,000 was paid by the company to the revenue during the year under review, in respect of income tax which we are required to deduct from our employees' wages and salaries. Taxation of this nature, whether direct or otherwise, ultimately represents a part of the cost of national production, and is reflected in the prices which must be charged to overseas markets, irrespective of the products.

The directors see no reason why stockholders should be prevented from sharing in the company's increased expansion and prosperity. Stockholders have provided almost 4 million pounds of extra capital since the war, without which the company's expansion could not have taken place. They are entitled to a fair return upon the money they have invested, and the recommendation of the directors is that the dividend be increased from 25 per cent. to 30 per cent., representing about 5½ per cent. on the value of the net assets as shown in the balance-sheet now before you. I should like to remind stockholders that a 35 per cent. dividend was paid by the company in 1946.

I am aware that certain stockholders hoped that the dividend recommended would be somewhat higher, and I gather that there may have been some wishful thinking on the Stock Exchange. In arriving at their decision, the directors had many matters to consider and perhaps the predominating factor was that so long as they have the confidence of the overwhelming majority of stockholders, they consider it is their duty to safeguard the future of the company and to go on building up its resources so that its future is assured.

I have purposely not spoken of the future prospects of the company. I am going to ask Sir John Black to second my proposition. He is much more competent to speak about these matters than I am, and I feel sure that he will have something to say not only about the progress during the last year, but his plans for the future. Sir John's initiative and foresight have been proved and are still unbounded. With his energy and drive I am convinced that still greater achievements will be made by the company.

SIR JOHN BLACK'S SPEECH

REVIEW OF PRODUCTION

Sir John Black (Deputy Chairman and Managing Director) in the course of his speech, said: I wish to review our production over the past year, and also give you an indication of our plans for the future. Since we last met, over 1½ million pounds have been spent on additional capital equipment, bringing our total postwar expenditure on capital assets to well over 8 million pounds. This policy of capital expenditure has been amply justified. Through it, we have been able to counter the ever-increasing cost of materials and wages. By increasing our car production we have, during the year, once again created a record overall turnover in spite of the setback we experienced in the early part of the year on tractor production. Output of tractors then dropped to as low as 85 a day, but it is now back to 270 and we are not stopping at that figure, for we plan to be at 300 a day by the end of November. This position, you will agree, is very satisfactory, and is due to the wider appreciation of the qualities of the tractor and of the whole Ferguson system, and also to the very extensive education of farmers and distributors, undertaken by Harry Ferguson, Limited, all over the world.

OVERSEAS COMPANIES

In the directors' report, reference is made to the recently formed subsidiary, or associated companies. These have been established in Australia, India, South Africa, Canada and New Zealand. I particularly wish to give you some details about Australia, India and South Africa.

The new companies are being operated jointly with our distributors in those countries, and we have a considerable financial interest in them. They have been formed to meet local conditions, and to increase our sales in their markets. With our ever-increasing volume, it is now often more economical to ship cars unassembled in order to take advantage of preferential tariffs, and also the considerable saving in freight and other charges. There seems no doubt that these conditions will lead progressively to the local manufacture of more and more components. These three companies are, therefore, operating plants for the assembly of the Standard "Vanguard" and "Triumph" cars, to which has been added the Triumph "Mayflower." and they will be in a position to assemble the Ferguson tractor when local conditions require it. The Indian company, which is situated near Madras, is actually assembling tractors now, in addition to cars. Last year 7,867 vehicles were assembled in Australia—mainly by our distributors. Arrangements have now been made for our new company at Melbourne to centralise a large proportion of this assembly work, and for it to co-ordinate the whole Australian market. In South Africa our company has already assembled nearly 1,000 cars since it started to operate early in 1950 at East London. In Canada our turnover last year was four times that of the previous year, and here the company is ready to assemble if that course becomes desirable. New Zealand presents a different problem, because of the heavy restrictions on the importation of cars, but we are ready to take immediate advantage of any relaxations.

Car assembly plants have also been established in Eire, Belgium, Switzerland, Sweden and Denmark, and they are being operated by our distributors in those countries. To give you some indication of the magnitude of our shipments to overseas car assembly plants, this month's figures are 1,734 sets of chassis parts and body panels, representing a rate of 10 motor-cars per hour, or 34 per cent. of our total car output. Our five biggest markets at the present time are Australia, Canada, Sweden, Belgium and Brazil, in that order.

EXPORT ORDERS

At this very moment the company is achieving a daily output of 574 units of both cars and tractors, and by the New Year this figure will be in excess of 600. During the month of October we have established a record production and turnover in the history of the company. We have a positively embarrassing number of orders for deliveries from all over the world for the new Triumph "Mayflower," and production is increasing week by week. The company's other well-established models—the Standard "Vanguard" and the Triumph "Renown"—continue to give a good account of themselves in all overseas countries as well as at home. Just over 80 per cent. of our total production of cars is being exported. With the tens of thousands of orders for the home market, it is to be hoped that the present Government will allow a greater proportion of cars to be released for this market, for I am sure that you will agree there are far too many dangerous old cars on the roads of Britain today, and it is high time that the country which produces the cars should get a fair share.

INCREASING TRACTOR PRODUCTION

As I said before, tractor output is now approaching 300 a day. This output comprises three types of tractor—run on petrol, on vaporising oil, and on lamp burning oil. In addition to these types, a new Ferguson tractor with a Diesel engine is being developed.

Harry Ferguson, Limited, continue with their development of constantly improving tractors and implements, and it is satisfying to us, as I am sure it must be to them, that there are 157,000 Ferguson tractors somewhere in the world, all of these produced from this factory.

FUTURE PLANS

Now with regard to the future, provided no unforeseen circumstances arise, particularly an actual disturbance of world peace, and provided there is no cut in sheet steel for the manufacture of cars and tractors, we have planned a manufacturing programme of no less than 144,000 units for this year, which compares very favourably with our production of nearly 100,000 last year. We know we are capable of accomplishing this under ordinary circumstances and our present rate of production, if maintained, will give us this planned programme.

We, in this company, are fortunate in having the full co-operation of the trade union officials, who, I am glad to say, still retain an active influence on their members who are employed in our factories. I say we are fortunate because this does not appear to be the case in so many of the nationalised industries, where a minority bunch of extremists continually try to upset the economy of the whole country by acting in a manner contrary to the purposes for which trade unions were created.

There is no doubt that our country must now embark upon a considerable rearmament programme which will tax the country's resources of materials and manpower, and it may be necessary for certain production to be curtailed, but it is my belief that tractor output will have not only to be maintained, but actually increased, if the necessary food is to be produced to alleviate poverty and hunger—the breeding ground of discontent and trouble.

The report was adopted.

TRONOH MINES LIMITED

MR J. H. RICH ON TIN CONTROL

The forty-eighth annual general meeting of Tronoh Mines Limited was held on November 7th in London, Mr J. H. Rich, the chairman, presiding.

The following is an extract from the chairman's review which had been circulated to shareholders:—

Although there were no outrages committed by the bandits on the property during the year, yet the district was not free from their activities. Since the end of the year six coolies and one forest guard have been killed on or near our areas.

Labour.—Our own experience seems to show that where Malayan workers are fairly and considerately treated and no third party intervenes relations between employees and employers will be harmonious and mutually satisfactory. In such circumstances the Government's policy of forcing trade unionism on the country would hardly seem a wise move.

Tin Control.—The Tin Study Group in March, by a majority vote, resolved to request the Secretary-General of the United Nations to convene, in accordance with the provisions of the Havana Charter, a United Nations Conference to which all members of the United Nations would be invited to discuss a draft agreement for the control of tin. It is incomprehensible how anyone having the interests of Malaya at heart can support any commodity agreement which, inaugurated under the auspices of the Havana Charter, would in effect mean the handing over the control of one of the two most important basic industries of Malaya, and in fact of the Commonwealth, to an unknown international authority. The present seems to be hardly an opportune time to even consider any international arrangement with the object of restricting or cutting down the production of tin.

LABOUR AND CAPITAL

One reason put forward to justify an output restriction agreement is the political argument that without such an agreement a burdensome surplus of tin would be produced and that that would bring about unemployment. The 1938 annual report of the Chief Inspector of Mines, F.M.S., said: "Many mines were closed down as the result of the low quota releases, and although mines retained their men as far as possible, some 30,000 coolies were discharged from the mines during the year." Who can deny that, if a new restriction agreement were now introduced, many thousands of Malayan workers would not again, in due course, be forced out of employment?

It is an open secret that one of the means by which the Secretary of State has suggested that Malayan revenue might be increased was by doubling the existing 20 per cent. rate of income tax upon company profits. The Secretary of State for Economic Affairs has declared that one of the greatest needs was for new capital investment. There are two main requisites to the investment of capital. One is confidence in the future of the country in which investment is made; the other is the necessary profit incentive.

As regards what I called the second requisite to the investment of capital—the profit expectation incentive—the realisation of this incentive must depend largely on the future incidence of taxation. We do not decry social services, but it is obvious that if they are to be of a kind that can be permanently maintained, the financing of them must not involve rates of taxation so crushing that investors will have no motive for investing in the country the new capital on which its economy must ultimately depend.

The report was adopted

PETER BROTHERHOOD LIMITED

INCREASED SALES

The forty-third ordinary general meeting of Peter Brotherhood Limited was held on November 7th in London.

Mr A. M. Neal, J.P., A.C.G.I., A.M.I.C.E., the chairman, presiding, in the course of his speech, said:—

The total of current liabilities amounts to £342,778, against a total of current assets on the other side of £1,091,849, a surplus of current assets over current liabilities of £749,071, which, I think you will agree, gentlemen, reveals a very satisfactory position.

The value of our sales for the year was approximately 5 per cent. greater than last year's figure, and if you will refer to the profit and loss account you will observe that the net trading profit for the year before providing for taxation amounts to £246,040, against £227,527 in 1949.

This, I think, is a matter on which the shareholders may quite properly congratulate themselves, especially in view of the expected deterioration in the sellers' market to which reference was made at our meeting last year.

Of this trading profit of £246,040, provision for taxation absorbs £133,500—a further reminder of the constant drain on the cash resources of industry—leaving us with a net profit, after taxation, of £112,540. Provisions made last year but found to be not required amount to the net figure of £7,895, bringing the available surplus for the year to £120,435.

The question of a final dividend has been before the board, who have felt it their duty on this further occasion to remain in line with the wish of the Government that dividends should not be increased at this time. The members of the board have in mind, however, that if, during the current year, the conditions, including that concerned with the freezing of wages, under which the wish of the Government has in the past been complied with, should cease to have effect, they will be freed from the obligation entered into some three years ago and will feel entitled to recommend a dividend more in consonance with the trading results achieved from year to year.

Accordingly, we recommend the payment of a final dividend of 12 per cent., less tax, on the ordinary shares, making with the 8 per cent., less tax, already paid, a total dividend of 20 per cent., less tax, for the year.

REPLACEMENT OF FIXED ASSETS

After the payment of this final dividend and allowing for the preference and interim dividends already paid, a balance of £96,194 remains to be dealt with. Bearing in mind the increase of the general reserve to £127,000 last year, we recommend that the whole of this balance of £96,194 be allocated to reserve for replacement of fixed assets, increasing that most necessary reserve to the figure of £171,194.

The balances referred to above under general reserve and under reserve for replacement of fixed assets, and to the credit of profit and loss account totalling £465,171, are in daily use in the business as extra capital without which it would have been difficult to finance our enlarged and varied output.

As to the future, I am pleased to report that business is being well maintained and that we have an excellent order book, which at our present rate of output will provide work for at least two years; we see no reason, therefore, why, in the absence of unforeseen circumstances, we should not look forward to a continuance of prosperity for some time.

The report was adopted.

ANGLO-CEYLON AND GENERAL ESTATES COMPANY, LIMITED

A BONUS ISSUE

The sixty-fourth annual ordinary general meeting of this company was held on October 26th in London, Mr Francis W. Douse, chairman and managing director, presiding.

The following is an extract from his circulated statement:—

The results of the company's operations for the past year have been satisfactory. In Ceylon in May of last year Nilloomally Estate was sold and contributed only one month's production to the season's record crop. Despite that sale a crop of 5,388,683 lb. of tea was obtained. This is the largest crop ever harvested from the company's properties.

Production and maintenance costs continue to rise, but were offset by the larger crop obtained. A substantial portion of our production for the calendar year 1949 was delivered under contract to the Ministry of Food, while the remainder of the season's teas was sold on the Colombo market and under contract to destinations outside the United Kingdom. The average price of all sales was 2s. 8.88d., as compared with 2s. 4.98d. for the previous year, an increase of 3.9d. per lb.

Politically the past year has been one of quiet progress for Ceylon. Last year I referred to the inequity of the double taxation to which sterling companies operating in Ceylon were subject. I am very glad to be able to record now that relief has been granted; first, by an amendment to the Finance Bill, which granted relief from Ceylon taxation up to 75 per cent. of the United Kingdom tax, and more recently by an agreement between the Governments of Ceylon and the United Kingdom providing for full reciprocal relief.

RECORD SUGAR CROP

Another record crop was reaped in Mauritius during the year, some 416,000 tons of sugar being produced as against 395,000 tons for the previous year. The net price realised was approximately £25 per ton. Costs have again risen but were offset by the increased crop.

The trading profit of the company and its subsidiaries amounted to £747,774 for the year, including £10,525 surplus realised on the crop for the previous year. This compares with a trading profit of £560,933 for 1949. After providing for all expenses, depreciation, and taxation, there is a net surplus of £316,737, as against £227,277 last year.

The directors have pleasure in recommending that a final dividend of 20 per cent. be paid, making 30 per cent. for the year.

The book cost of our interests both in Ceylon and Mauritius is obviously far below the present value due to the conservative policy adopted for many years, coupled with the general increase in values brought about by present-day conditions. It follows, therefore, that the issued capital of the company bears little relation to the actual value of the undertaking.

Accordingly the directors recommend that £50,000 of the share premium account should be capitalised and applied in paying up in full 200,000 new ordinary shares of 5s. each to be issued to the ordinary stockholders on the basis of one new ordinary share for each £3 of ordinary stock now held.

For the current year the prospects are favourable. Again a further record crop in Mauritius is predicted.

The report was adopted and at a subsequent extraordinary general meeting the bonus issue, as recommended, was approved.

WILLIAM DOXFORD AND SONS, LIMITED

SATISFACTORY POSITION

The fifty-eighth annual general meeting of William Doxford and Sons, Limited, was held on October 27th in London.

Dr E. P. Andreae, the chairman, in the course of his speech, said: After charging to profit and loss account £35,759 in respect of exceptional research expenditure, and providing for taxation based on the profits for the year, the net profit, before transferring £42,000 to income tax equalisation account, amounts to £276,433, as compared with £237,163 for the previous year.

We are recommending the capitalisation of another £50,000 from undivided profits for your consideration at this meeting. If approved by you, it will mean that the issued capital of the company will be £850,000, divided into 250,000 Cumulative participating preference shares of £1 each and 600,000 ordinary shares of £1 each—still a modest figure in relation to the capital actually employed in the business.

SHIPYARD MODERNISATION

Two years ago I told you that we had in hand an extensive programme for the further equipment and improvement of our shipyard, primarily designed to enable us to make use of the latest methods of "pre-assembly" and the welding of hull structures. It has been a very lengthy and costly undertaking, but I am happy to say that during last year excellent progress was made with the new installations.

We have enjoyed conditions of full employment during the year under review, and completed and delivered to their owners eight cargo ships and one oil tanker, all fitted, of course, with Doxford engines. In addition, we built in our own engine shops six sets of Doxford engines, and installed them at our Palmers Hill fitting-out quay in hulls built by other shipbuilders.

The Doxford Engine has maintained its popularity with shipowners all over the world, as instanced by the fact that at present engines totalling over one million horse-power in capacity are under construction or on order.

One important line on which our research engineers are working is concerned with the use of heavier oils in the place of so-called "Diesel Oil." There seems to be no inherent difficulty. Two vessels with Doxford engines have already had more than 18 months' successful experience with heavy fuel in service, and a number of new vessels are having the necessary equipment installed.

THE OUTLOOK

When I spoke to you last year I said that few enquiries for new ships were circulating, and that the indications were that when orders then on the books were completed, it would be difficult for the industry to keep its yards fully employed. Fortunately, however, the situation soon changed, chiefly owing to a large demand for tankers, and the outlook is now much brighter.

Our company participated fully in the flow of new business, with the result that we now have orders covering seven large tankers, several of which will be the largest we have ever built, in addition to two tankers already launched but not yet completed.

Our present commitments enable us to forecast full employment for nearly three years ahead, and with our up-to-date shipyard and engine works, and our strong financial background, we ought, even in less busy times, to be in a position to obtain our full share of any orders that may be available.

The report was adopted and the proposed bonus issue approved.

FERRANTI LIMITED

RECORD ORDER BOOK

SIR VINCENT DE FERRANTI'S REVIEW

The forty-fifth annual general meeting of Ferranti Limited was held in London on October 26th, Sir Vincent Z. de Ferranti, M.C., M.I.E.E., chairman and managing director, presiding.

The following is an extract from his circulated statement:—

The accounts show further progress in the expansion of the company's activities and the extension of our manufacturing facilities to keep pace with the increase and development of the output of electricity.

The consolidated profit for the year, together with dividends on investments, amounts to £550,995, as compared with £321,004 for the year ended June 30, 1949. After provision for tax the net profit is £248,100, against £133,027.

The output of the company, which is employing over 7,000 people, has increased by 20 per cent., brought about by a large increase in the output of transformers and Government work. There has been a slight decrease in the total orders received during the year, but we are left with a record order book of over £10 million, which will necessitate a further extension of our manufacturing facilities; 32 per cent. of our output has been exported.

TRANSFORMERS

The erection of transformers has been moved to the new factory, which is equipped with a lifting capacity of 240 tons, and part of the Hollinwood works has been converted to a greatly enlarged tank shop. These changes have made possible the increase in output of 40 per cent. We had in course of construction at June 30th, eighteen 230 kilovolt transformers of sizes up to 64 M.V.A. and installed weights of 250 tons for export, and since that date have received orders for an additional thirteen.

At home we have recently secured a large bulk order from the British Electricity Authority for grid transformers which is commensurate with our greatly enhanced production facilities. This order covers transformers up to the end of 1953 and is in addition to a large volume of business placed with us by the electricity Boards, which, together with the export business, maintains our input at the high level of the last few years.

METERS AND INSTRUMENTS

Our meter department has successfully launched a new single-phase meter which has met with very wide approval. This meter has been designed to cope with both home and export trade.

The instrument department has a design team of considerable strength working in conjunction with Manchester University on the development of an electronic digital computer. The future applications of this machine in science and accounting are very numerous.

Electronics.—As the result of the increase of the television business, orders for the manufacture of 12-inch cathode ray tubes have necessitated considerable plant expansion, which will be kept in full production during the next twelve months.

In Canada, to keep pace with the steadily increasing demand for electric power, the utilities have, this year, brought into operation a number of large hydro-electric generation stations, adding several hundred thousand kilowatts to available capacity. To utilise this additional power, transformers are needed for transmission and distribution, and I am glad to say our Canadian subsidiary is obtaining an increasing share of this important business.

The report was adopted.

COVENT GARDEN PROPERTIES COMPANY, LIMITED

ORDINARY DIVIDEND PAYMENT RESUMED

The twenty-sixth annual general meeting of this Company was held on November 2nd in London, Mr Louis Nicholas, J.P., F.C.A. (the chairman), presiding.

The following is an extract from his circulated statement:—

The profits of your company and its two subsidiaries—English Property Corporation, Limited, and Sanctuary Buildings, Limited—for the year ended June 30, 1950, have not only been maintained but show a slight increase.

The total of such profits, including income from investments before providing for amortisation of leasehold properties, and before deducting debenture and mortgage interest, taxation, etc., amounted to the sum of £415,108 as compared with £409,695 for the previous year. The rents and tolls from the Covent Garden markets show an increase of some £10,000, but this increase has been barely sufficient to cover the increased cost of salaries, wages, rates, repairs and other expenses. The net income received by the company from properties owned by it, surrounding the markets, and its other properties, has been well maintained.

The Company has continued to reinstate war damaged properties and to effect the repairs deferred owing to war conditions. Some £20,000, including £3,000 incurred by one of its subsidiary companies in respect of repairs overtaken during the year, has been charged against the provision for deferred repairs, and in addition the amounts charged for repairs against this year's income have been more than maintained.

THE SUBSIDIARIES

The dividends received from the company's two subsidiaries are the same as those received in previous years, although the net revenue of these companies is in each case slightly in excess of that of last year. The sum that has had to be provided for taxation is some £7,000 in excess of that charged last year, thus reducing the profit for the year of your company, notwithstanding its increased income to £106,801 as compared with £109,176 for last year. Your directors have pleasure in recommending a dividend on the ordinary shares at the rate of 4 per cent., less income tax.

The capital reserves of the companies have been increased by some £32,665, this being the surplus over cost arising on the realisation of certain fixed assets while the general reserve has been increased by £20,000. It will be noticed that the provision for deferred repairs has been reduced by some £20,000.

Freehold and leasehold properties show an increase of some £71,036 (reflecting the purchase of one long leasehold and various freehold properties during the year under review after making adjustment consequent upon the sale of two of its properties.

Certain of the Stock Exchange investments held by the company have been realised during the year at a slight excess over cost, which surplus has been used to write down the value of the remaining investments. The lease to the Government of the Royal Opera House has now been completed.

In view of the present international situation it would not be wise to attempt to give any forecast, but I am pleased to say that up to the present the profits of the company are satisfactory and, in the absence of restriction of imports and any other unforeseen contingency, I see no reason why the profits for the current year should not be maintained.

The report was adopted.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LIMITED

EMINENTLY SATISFACTORY RESULTS

CONTRIBUTION TO THE WELL-BEING OF TRINIDAD

MR KENNETH MOORE'S REVIEW

The annual ordinary general meeting of Trinidad Petroleum Development Company, Limited, was held on October 31st at River Plate House, Finsbury Circus, London, E.C.

Mr Kenneth A. E. Moore, F.C.A., the chairman, who presided, said:—

Gentlemen,—If figures were all that mattered there would be little for me to say today, because the accounts, which speak for themselves are eminently satisfactory and reflect the most successful year in the history of the company. Not only has production been well maintained but devaluation as foreshadowed in my speech to you last year, has had the effect of increasing substantially the effective price received for our oil.

Before I leave the accounts, however, I should perhaps mention that they are, of course, drawn up in the conventional form in accordance with the Companies Act, 1948. In that form it is not altogether easy to grasp certain of the essential aspects of our affairs and it may be of interest to you if I summarise the results in a more intelligible form.

THE YEAR'S RESULTS

Before charging payments to Government, the surplus remaining on the year's working after deducting from our gross revenue from oil sales the cost of salaries, wages, materials, and depreciation and administration, was approximately £919,000. Our partners in this enterprise are primarily the Governments of Trinidad and of the United Kingdom. The share for the past year, of the Trinidad Government, which it takes in the form of oil rents, royalties, duties, and income tax, was about £520,000 and of the United Kingdom for taxation £100,000—£620,000—leaving as the company's share available for dividends and reserves £299,000. Of this £299,000 if our recommendations are approved, there will be distributed by way of dividends £187,000 leaving to be ploughed in to help to finance future development £112,000.

The Governments of Trinidad and the United Kingdom are, of course, sleeping partners. They provide none of the capital and take none of the risks but they take an imposing percentage of our revenue. On the other hand, it is only fair to acknowledge that the role of Government is an expensive one these days and covers a multitude of services beyond the primary duties of defence and the maintenance of law and order. In this connection, as you are no doubt aware, elections have recently been held in Trinidad for the first time on the basis of universal adult suffrage and a new and liberalised constitution. It will be the wish and hope of everyone, I am sure, that this experiment will be a success and that, for the sake of Trinidad and all who live and work there, stable and orderly Government will continue to maintain the underlying conditions and the confidence essential to progress.

PROGRESS OF THE UNDERTAKING

It is interesting to look back over the years and to recall that the company was formed early in 1918—some 32 years ago—and that for the first half of its life, its search for oil in commercial quantities was, in the main, a costly failure and disappointment. It was not until 1935 that the company really turned the corner and began earning regular profits, and you will remember that, in 1937, it was reconstituted, hived-off from the British Controlled Oilfields, and additional capital was raised by public issue of ordinary shares.

It will also be within your recollection that, since 1937, the company has never looked back. During the war production was successfully raised to about 10,000 barrels a day by concentration in accordance with official requirements on proved areas. Since the war production has been maintained at a more rational level and exploratory drilling has, once again, been able to proceed in an orderly manner.

The early experience of T.P.D. was by no means unusual in the very difficult geological conditions found in Trinidad. It is a matter of history that 157 companies have been formed from time to time to search for oil in Trinidad; 84 of these have actually operated; 12 remain active, but only five of these pay dividends, the remainder having gone into liquidation or been absorbed by others.

SUCCESS OF PRIVATE ENTERPRISE

I have thought it desirable to mention these matters because it will, I hope, give perspective to shareholders, and to a wider audience whose perception is at risk of being blurred by insistent propaganda against private enterprise and profits. Private enterprise in Trinidad, as exemplified by the oil companies, has done, and is continuing to do, a magnificent job and, instead of criticism of profits, there should be congratulation that some, at least, of the pioneers have been successful, after years of struggle, and have managed to establish their undertakings on a profitable basis.

In connection with the mention of pioneers, it is our sad duty to place on record today the passing of Mr R. R. Tweed early this year. He and Mr Dalley, who died in 1944, joined the company in 1927 when its fortunes were at a low ebb, and it was very largely due to their faith and tenacity of purpose as managing directors that the whole undertaking was not abandoned in the early 1930s. Both, I am glad to say, lived to see their faith justified and their work for the company crowned with success. We honour their memory.

CONTRIBUTION TO THE WELFARE OF TRINIDAD

From the figures I have given earlier in this speech you will have noted that the amount accruing to the two Governments is more than double the amount of profit available for dividends and reserves. It is, of course, not only the exchequers that benefit but also the general community in Trinidad, to whom a large measure of useful employment is afforded directly and indirectly by the company's activities. Indeed, as is becoming more generally realised, it is only on the sure foundation of the successful commercial development of natural resources that the standard and amenities of life in colonial territories can be raised.

Apart from our contribution in the shape of royalties, taxation, etc., we are, as a company, playing our part in improving life in Trinidad. For example, we provide free medical attention to all employees and their immediate families; we have a fully equipped medical centre with modern X-ray apparatus and dispensary; in housing we have built and are now extending a model village—Dollet Village—with a community centre for the use of residents and their children; in recreation the company has provided a sporting club with cricket and football grounds, etc.; in education we have recently decided to grant university scholarships, either to a university in the United Kingdom or to the Jamaica University, to local students who have shown aptitude in a branch of science, and to keep two such scholarships continuously in existence.

A boarding scholarship will also be granted to the San Fernando Technical School when that school has been built. In addition, we are establishing a trade school on the company's land at Palo Seco for training apprentices as skilled artisans. It is intended to carry a total of 50 apprentices on the pay-roll.

In one way or another, therefore, we are making an important contribution to the well-being of Trinidad and to all who live there, and we are providing opportunities for local young men of promise to equip themselves for posts of responsibility.

OPERATIONAL MATTERS

To return to operational matters, it is becoming increasingly clear that the long-term prosperity of the oil industry in Trinidad will depend, in no small measure, on the results of our own and other companies' efforts to find new reserves of oil at great depths.

Our drilling programme during the past year included five exploratory or semi-exploratory wells. Three of these turned out to be normal commercial producers, but our first well in the Moruga district encountered structural difficulties, exceptional even for Trinidad, when a depth of about 1¼ miles was approached, and it was not possible to proceed with it. Further tests are in progress in the hope that we may get some oil from higher levels.

The fifth exploratory well, Coora 188, which is planned to go down over 2½ miles, produced extremely interesting symptoms at rather more than half that depth but, as drilling is proceeding in the hope of reaching the designed depth, it may be some months before we know the exact significance of the conditions encountered higher up.

You will, I am sure, appreciate the enormous difficulties of drilling to great depths. It is really quite remarkable that they can be surmounted more often than not by the ingenuity of mechanical equipment and technique and by human skill, but as you will have inferred from my earlier remarks, one must not expect early and easy success in deep exploratory drilling. It is a long and expensive job but, having put our hand to it, we shall not lightly be deterred from pursuing it.

ADDITIONAL ACQUISITION

With regard to our reserves, you will have seen from the report that we have acquired oil rights over an additional 11,799 acres during the past year, making a total of 67,579 acres on the mainland. As we have so far explored by the drill only about one-third of this total area, it is clear that the scope for exploratory drilling in the years to come remains very considerable. The rate at which it can be pursued must inevitably be influenced by a variety of factors, including

the cost and availability of equipment, the level of crude oil prices and general economic and political circumstances.

In the meantime, our "proved" reserves at more easily attainable depths remain very substantial and, if oil prices remain at about the present level and costs do not get out of hand, we need not be unduly fearful of the future.

I say this with the more confidence because we have a very capable managerial team in Trinidad under our general manager, Mr Bennett, and in London we have the benefit of the long experience of our managing director, Commander Lavington, who, for many years, and through some of the difficult as well as the successful years, was in charge of our affairs in Trinidad.

We also have available to us the wealth of experience in geological matters of Mr Halse, who, I am glad to say, on his return to this country, is continuing in an advisory capacity. He and Mr C. C. Wilson, our resident geologist in Trinidad, have between them made an immense contribution to geological knowledge of conditions in Trinidad generally, which has been of very great benefit not only to this company but to others. To them, and to all who work on our affairs in whatever capacity, either in Trinidad or London, we extend our thanks, in which I am sure you will wish to join.

The report and accounts were adopted.

FISHER AND LUDLOW LIMITED

GREAT INCREASE IN PRODUCTION

MR ARTHUR KEATS' REVIEW

The thirtieth Annual General Meeting of Fisher and Ludlow Limited was held on November 3, 1950, at the Queen's Hotel, Birmingham, Mr Arthur Keats, O.B.E. (chairman of the company), presiding.

The following is his statement which was circulated with the report and accounts for the year ended March 31, 1950:—

Production, of which over 70 per cent. was for export, greatly exceeded any previous achievements and this has contributed materially to the considerable increase in the group net profit, which has risen from £172,617 for the previous year to £427,853 after providing no less than £535,455 for taxation and £221,789 for depreciation. Of this, £22,265 is attributable to shareholders outside the group and £1,192 to pre-acquisition profits on shares acquired in a subsidiary company during the year, leaving £404,396 attributable to our interests.

The company, as already intimated in my statement of last year, purchased during the year the majority shareholding in Bendix Home Appliances Limited, and for the first time the trading results of this company are included in the consolidated accounts, thereby affecting comparisons between the figures for the two years. Since the end of the financial year your board has acquired the remainder of the ordinary share capital of this company, which was previously held by American interests. The profits of the Bendix Company have been well up to expectations and have made a valuable contribution to the improved results now before you. The sales of its automatic washing machines, undoubtedly the foremost of its kind, are at present only limited by the amount of raw materials, principally steel, made available to us. A large proportion of this output is being exported to all parts of the world and provided prices can be maintained at a reasonable level the outlook for this company looks distinctly promising.

ADDITIONAL EQUIPMENT

The demands upon our productive capacity are still increasing and although £263,297 was spent on acquiring new plant during the year the company is committed to a further £250,000 to provide additional equipment and to ensure that our plant is maintained and modernised to the fullest degree. Some indication of our progress in this direction can be gathered from the fact that over the last four years we have expended £1,206,747 on new machinery and equipment.

The most recent extensions to our facilities and now in production include a further area of 200,000 sq. ft. principally equipped with the latest type of plant for the painting and trimming of automobile bodies and also giving additional capacity for general purposes.

STRONG FINANCIAL POSITION

In these days of expansion of trading and constantly rising prices when many companies are finding difficulty in obtaining working capital your company is in a strong financial position to meet all demands likely to be made upon its resources in the foreseeable future. The liquid position has, in fact, improved during the year with current assets at £4,895,531 and current liabilities £1,716,015.

We are continuing to employ all possible mechanical aid to production and material handling, and whilst the complete palletisation of our factory for the mechanical handling of raw materials, component parts and finished goods is not yet in its final state, sufficient progress has been made to enable the immense advantages of this system over previous methods to be appreciated and the economies effected have convinced us that our decision to install was correct.

PENSION SCHEME

You will be aware from the brochure enclosed with your copy of the accounts that we are celebrating our centenary year and to mark this event your board, after much thought and consideration, decided that it would be most appropriate to institute a comprehensive contributory pension and life assurance scheme. For this purpose £162,872 has been appropriated to provide for past service pensions in recognition of the long and valued service of so many of our employees. I am sure you will be pleased to learn of this decision to provide a measure of security to all our employees when reaching retiring age.

ASSESSMENT OF FUTURE PROFITS

Whilst fully appreciative of the excellent results before you I feel that I must add a note of caution in any assessment of future profits. It should be borne in mind that the motor industry with which we are so closely associated has been exceedingly busy during the past year, despite difficult steel supplies. We have not been faced this year with any major changes of models involving, as this does, expensive retooling, alterations to layouts, initial development and interruption in the rhythm of production, but such can be expected to occur periodically in our class of business. In addition to this within recent months, in common with other manufacturers, we have been confronted with considerable increases in the costs of many of our raw materials. In many instances, in face of world competition, it has not been possible to recover these increases in our selling prices and contracts are tending to become less profitable.

CENTENARY BONUS

Bearing in mind the Government request for restraint the directors are recommending the maintenance of the dividend of 20 per cent., less tax, on the ordinary stock, but in addition, in view of the celebration of the centenary year of the company, feel justified in recommending a special bonus of 5 per cent., less tax, to mark the occasion.

The order books of the parent and subsidiary companies remain full and during the current financial year production has been fully maintained. It seems, therefore, that should there be no great deterioration in the international situation, we can look to the future with confidence.

In conclusion, I feel sure you would wish to be associated with the board in tendering thanks to the executive staff, and all personnel, to whose efforts the eminently satisfactory results are so largely due.

The report was adopted.

GESTETNER, LIMITED

(Manufacturers of Duplicators, Accessories and Supplies)

RECORD TRADING PROFIT
MR S. GESTETNER'S SPEECH

The annual general meeting of Gestetner, Limited, was held on November 2nd at Aldwych House, Aldwych, London, W.C., Mr S. Gestetner (chairman and managing director) presiding.

The following is an extract from his speech.

Profits on trading of Gestetner, Limited, and of Gestetner, Limited, and subsidiaries were the highest in history. Manufacturing and selling expenses both showed increases, which were in part offset by increased turnover and economies in manufacture resulting therefrom and from improved methods.

From almost every one of our overseas subsidiaries and concessionaires come reports of a steadily increasing demand for Gestetner machines and equipment; the existing demand is higher than it has been at any other time in the history of your company.

UNITED STATES

A few days ago I returned from a visit to the United States of America. I am pleased to be able to report that the progress of our young subsidiary there is indeed satisfactory and gratifying. Progress in the organisation of distributing and servicing arrangements is ahead of the time-table originally set. Sales somewhat exceed anticipations. Everywhere I found that our products were meeting with a favourable reception in that highly developed market. General trading conditions in the United States are at record level and there is no doubt that they are a favourable factor in our operations. Substantial orders should result from our being on the Bureau of Federal Supply list and will still further swell the amount of business we expect from that market.

FINANCIAL POSITION

The ratio of current assets to current liabilities still continues to show a healthy picture.

Shareholdings in subsidiary companies have increased by £127,000, which is substantially attributable to the new American subsidiary. This will in turn increase the amount of stocks and debtors to be financed from our own resources.

Your directors have taken all steps to keep abreast with modern methods of production and have continued the policy of installing the latest and most efficient equipment; this was the more essential in view of the substantial and increasing demand for your company's products in the world's markets.

This policy, which embraces both factory extensions and re-equipment, will extend over

a number of years and has during the year covered by these accounts cost £187,000. Commitments for these purposes at August 31, 1950, were £212,000.

The consent of the Capital Issues Committee of H.M. Treasury has recently been obtained to an issue of preferens capital. Members will be informed of the details as soon as the arrangements have been completed.

THE FUTURE

In 1951 we celebrate our seventieth anniversary. We look forward to this anniversary year with complete confidence in our ability to establish even greater turnover records during the current trading year. The excellence of our products and the efficiency of the world's sales forces together make an excellent augury for the future of the company.

Your company's financial year started on September 1st and sales for the months of September and October exceed those of the same months last year by a considerable margin.

Our thanks are due to the employees of Gestetner, Limited, for their loyalty and keenness, and I am sure you will join with me and the directors in expressing appreciation of their work. They are a happy band and I know that you approve of the expenditure of just on £40,000 for staff endowment assurance and provident funds which was incurred for their benefit during the last financial year.

The report was adopted.

TANGANYIKA CONCESSIONS

TRANSFER TO SOUTHERN RHODESIA

The annual general meeting of Tanganyika Concessions Limited was held on November 2nd in London

Mr Maurice Hely-Hutchinson, M.C. (the chairman), in the course of his speech, said:—In 1946 your board reached the conclusion that a reorganisation of the capital was desirable to simplify the capital structure. At the same time, the board directed its attention to the possibilities of expanding the business of the company and spreading its risks.

In 1948 it became apparent that emigration was necessary in order to bring the seat of management and control nearer to the properties in which the company has substantial investments and also, so far as possible, to relieve the company of the crushing burden of taxation.

With the approval of the Courts granted on Monday last, October 30th, to the proposal for reorganisation of capital, and the alterations of the Articles necessary for emigration, it seems that we are in a fair way to regard the first two steps as accomplished. At the same time, we are in the fortunate position of finding associated with the company the very interests in America and Africa whose co-operation we had sought and shall value, while at the same time our Belgian associates have increased their interest in the company, and we are also able to look forward to the co-operation of new interests in London.

From now on the work of the company lies in Africa, to which the principal seat of management and control is being transferred. We hope that this will take place on or about November 17th.

The report was adopted.

NOTICES

UNIVERSITY OF LONDON

The Stamp Memorial Lecture, entitled "Treasury Control," will be given by Sir Edward Bridges at the University of London, Senate House (entrance from Russell Square or Malet Street, W.C.1), on Tuesday, November 21st, at 5.30 p.m. The chair will be taken by the Rt. Hon. The Viscount Simon. Admission free, without ticket.

JAMES HENDERSON, Academic Registrar.

THE CIVIL SERVICE COMMISSIONERS invite applications from men and women for the following permanent appointments: (a) one Agricultural Economist in the Ministry of Agriculture and Fisheries, and (b) six Assistant Agricultural Economists, three in the Ministry of Agriculture and Fisheries and three in the Department of Agriculture for Scotland. For post (a) candidates must have attained the age of 28 on June 1, 1950; for posts (b) candidates must be at least 23 and under 30 on June 1, 1950, with extension for regular service in H.M. Forces. Inclusive salary scale for post (a) is £750–25–£1,000 (men) and £650–25–£850 (women); inclusive salary scale for posts (b) is £375 (age 23)–25–£750 (men) and £375 (age 23)–30–£650 (women), with higher starting pay for candidates over 23 on appointment. These scales apply to London posts and are subject to deductions ranging from about £10 to £15 for posts (b) in Edinburgh. Superannuation arrangements will be made under the Federated Superannuation System for Universities.

All candidates must have a University Degree with First- or Second-Class Honours in Agriculture or Economics, or in a related subject (e.g., Geography, Mathematics, Statistics); or, in cases where Honours are not awarded, must satisfy the Commissioners that their Degree is of Second-Class Honours standard. Those qualified in subjects other than agriculture must have specialised in agricultural applications of their subjects, and those who have qualified in agriculture must have specialised in the economic aspect of the subject. Candidates should preferably have undertaken some original research work in agricultural economics. For some of the posts it is desirable, but not essential, that candidates should have some experience of field work in farm accounting investigations.

Full particulars and application forms from Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 3326; completed application forms must reach him by November 24, 1950.

MANAGEMENT AND INDUSTRIAL CONSULTING.—Production-Engineering, Ltd., invite applications from qualified Engineers and Chartered Accountants, preferably with University Degrees and with a real interest in the problems facing management today. There are exceptional openings for first-class men with initiative requiring permanent posts in this type of work. Engineers should have served an apprenticeship and should also have had good practical experience and an executive position in industry. Accountants should have experience of modern developments in financial control and its application in industrial management. After training, there is a four-figure starting salary as well as Life Assurance and Superannuation Schemes. Applicants should be between 27 and 35.—Write, giving age and full details of education, qualifications and experience, to Production-Engineering, Ltd., 28, Bruton Street, London, W.1.

A LARGE FIRM of Chemical Manufacturers require the services of a young man, aged 21-25, as trainee in the Sales Department in London. Applicants should have had a good general education, preferably with scientific background, and should also have completed military service. Previous commercial experience would be an advantage, but is not essential. The post is permanent and progressive, and salary will be commensurate with age and experience.—Apply, giving details of age, education and experience, to Box 534.

PRIVATE SECRETARY.—Young lady, Canadian, University graduate, good typing and shorthand speeds, seven years' experience, wishes permanent position, preferably involving travel, where capability and industry are suitably rewarded. Best references.—Box 505.

DESIGN for Study: "Economic Planning and the Co-operative Movement," by A Bonner. Copies available from the Publications Department, Co-operative Union, Ltd., Holyoake House, Hanover Street, Manchester, 4. Price 1s. per copy (1s. 1d. post free). 12s. 6d. per dozen copies, carriage paid.

ECONOMISTS, June, 1949, to June, 1950, indexed.—Offers, Box 502.

DR JAMES A. BOWIE MEMORIAL FUND

A Fund has now been opened for the purpose of commemorating the work of the late Dr. James A. Bowie M.A., D. Litt., First Principal of the School of Economics, Dundee.

Dr Bowie, during nearly 20 years' work in the City, gave much of his time and thought to young men and women who came under his charge, but in many ways contributed greatly to a variety of organisations not only in Dundee but throughout the country. Those interested are invited to add their names to the list of Subscribers.

Subscriptions should be addressed to the Hon. Treasurer, Mr James R. Nicoll, Clydesdale and North of Scotland Bank Ltd., High Street, Dundee.—On behalf of the Committee,

Sir Garnet Wilson, Chairman; William Patterson, Hon. Secy.

YOUNG GERMAN MERCHANT, 21 years, interpreter (Engl.), who wants to get commercial experience abroad, seeks position in British trade or industry. Sales and administrative experience. Employers, willing to apply at the Ministry of Labour for a permit for my stay in Britain are asked to write to Box 507.

NO matter what product you have to offer, you will achieve a profitable enlargement of your market, through effective advertising. Why not discuss the matter with Samson Clark and Co., Ltd., 57/61, Mortimer Street?—Museum 5050.

FOR SALE.—Sets "Economist," 1947-1950.—Offers, Box 495.

EXTERNAL Student, just failed B.Com. Gp. E., wishes borrow successful student's notes. Copyright will be observed.—Box 510.

THE EASTERN BANK LTD., LONDON, has a few vacancies for young men of good education who are interested in an Exchange Banking career, in which opportunities arise from time to time for suitably qualified men to transfer to the Eastern Executive Staff.

Preference will be given to those who have passed any of the Institute of Bankers' Examinations, or who have had practical Banking experience.

For particulars of service, apply to:
The Secretary,
The Eastern Bank Ltd.,
2 and 3 Crosby Square, London, E.C.3.

JOAN,

We are planning a Christmas holiday in Jersey, Britain's carefree continental resort within the sterling area, where the Christmas season is kept up gaily. Why not make up a party?

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 4, 1950, total ordinary revenue was £88,440,000, against ordinary expenditure of £57,128,000 and issues to sinking funds £620,000. Thus, including sinking fund allocations of £10,701,000 the surplus accrued since April 1st is £89,629,000 compared with £905,000 for the corresponding period a year ago.

But the methods of campaigning pursued by the Republicans this year—actively pursued only by a minority but silently acquiesced in and turned to account by virtually the whole party—have cast upon every Republican gain in this year's election a light that, in European eyes, is inevitably sinister. For months the Republicans have been conducting against the Secretary of State, Mr Dean Acheson, a campaign that, from this distance, has seemed to be as scurrilous as it has been irresponsible. Mr Acheson is regarded in the outside world not merely as a good Secretary of State, but as one of the best that the United States has had in modern times—and this not because he has shown any undue partiality to his country's allies, but because, together with his predecessor and former chief, General Marshall, he has given to American policy a consistency of purpose and an intellectual foundation which have brought new hope to the free world. It may be that distance makes it impossible to see his defects of bearing when under Congressional inquiry; but distance also makes it impossible to see why such superficial niceties should weigh for anything in the balance against the world stature of a real statesman. Do not the Republicans see, in hurling their charges of incompetence and misfeasance, on grounds that carry utterly no conviction abroad, that they are undermining the very foundations of that confidence in the consistency and trustworthiness of American policy on which rests the hope of defeating Communism without war? That such a campaign, not merely of dragging foreign policy into party politics but of spattering it with mud, should be tolerated by the leaders of a great party, must seem to many of America's most affectionate friends to be bad enough. But that it should be rewarded by the electors is found by many of them to be downright alarming.

*

The spectacle has certainly not been an edifying one. And yet the alarm can easily be overdone. The American constitutional system is so devised that it puts a positive premium upon irresponsibility and wildness of language. A man can spend a whole lifetime in politics without ever having to carry the responsibility for any policy of the government. Yet, for all that, as the record of the last few years abundantly shows, the system does work. For all the clamour and the nonsense, the right things are done, possibly not much later and certainly no less generously than they would be done under other systems.

There is no good reason to believe that the result will be any different this time. The extent to which the American people recorded their votes against the foreign policy of the Truman Administration has been vastly exaggerated. There were some surprising Republican victories, but some unexpected Democratic victories too. Nor need it be assumed that every Republican gain is a step back to isolationism. Senator Taft has said that "we can't be isolationist under present circumstances" and several of the newly elected or re-elected Republican Senators, such as Mr Duff of Pennsylvania and Mr Morse of Oregon, are convinced internationalists.

It may be that, as a result of last week's election, there will be some shifts in emphasis in American foreign policy. Economic aid to other countries may be scrutinised more carefully and the Far East may compete rather more strongly for attention with Europe. Some of these shifts in emphasis may seem, on this side of the Atlantic, to be unfortunate. But they do not seem likely to go, very [illegible] the monume[illegible] built up [illegible] judgm[illegible] measures [illegible] far less c[illegible] are the[illegible] they are far mo[illegible] moving under the pressur[illegible] winds that blow upon them [illegible] elected always have the most powe[illegible] and immediate effect upon Congressional opinions. [illegible] nowadays one means Russian actions. Hitherto the Kremlin has been infinitely the most effective assistant that the policy of closer collaboration among the free nations could desire; the timing of Russian strokes to this end has been miraculously good. If the Russian course were now to be altered, any previous judgment about American policy would have to be revised.

*

The other gale that blows daily in full force upon American politicians and policy-makers is that of public opinion. In America, public opinion is a prime mover on its own account; it is the effective means of resolving conflicts between the executive and legislative branches of the government—and of doing so, not simply at election time but every day. It is in this that the significance of Mr Gordon Gray's report lies. His recommendations (of which a summary is printed on page 815) are most unlikely to be accepted as they stand by Congress; they are not even a considered policy of the Administration. But it is important that a political leader, assigned to the study of the problem, should find himself drawn to such well-rounded and liberal opinions. And it is very important that the Administration should think it wise to launch such a report upon public opinion in the obvious hope that it will serve as a text for the formulation of views on policy.

It is difficult to pick any quarrel with Mr Gray's analysis or conclusions. Indeed, if American opinion in general were to follow the lead he has given, the rest of the free world would get all that it has a right to hope for from American economic policy. The countries of Western Europe would have continued dollar aid to help them rearm, aid not tied to military equipment, and perhaps not even to purchases in the United States, but general aid to help them carry the overall burden of increased military production. They would also have an assurance that the United States, through its commercial and domestic policies, would make it easier for them to earn dollars.

This is not, of course, the first time that an authoritative American voice has expounded the need for a liberal economic policy towards the rest of the world; on the contrary, that has been the steady theme of academic thought in the United States for a decade or more. But there are several specific reasons for paying particular attention to this document. The first is precisely that it is not academic; this is the report of an active politician who knows what it is to deal with Congress, drawn up in consultation with government departments who know the limits of the possible. The second is that Mr Gray carries the familiar argument into unfamiliar regions. He is not afraid to attack the discriminatory shipping policy of the United States or—more daring—even the sacred cow of agricultural policy itself. He sees the point that if the United States, in the name of "stockpiling," lays its hands on most of the scarce materials needed for the defence programme at the expense of its partners, western defence as a whole must suffer. Thirdly, the report shows a very real and sympathetic understanding of the difficulties of other countries, particularly of Britain's. It is rather a novelty in any American writings, official or private, to find the sterling area treated favourably or the acknowledgement made that the countries of Western Europe have ideas of value about the methods of assisting underdeveloped countries. Mr Gray realises, as few other Americans have done, that there must be an order of priority in the demands that are made on other countries, and specifically on Great Britain. Britain can be asked to do without free dollars, or to increase its dollar purchases, or to restore the convertibility of sterling, but it cannot reasonably be asked to do all at once.

In short, the nearer that American policy, under the pressure of public opinion, approximates to the views of the Gray report, the better for all of us. The obvious next question is whether there is anything that can done on this side of the Atlantic to bring about such a consummation. And to that the answer is equally clear. What may now be offered, more fully than ever before, is a living partnership, with all the essential points that British representatives in Washington have struggled for years to put, at last recognised and accepted. But partnership implies contributions from both sides, and there is no doubt whatever about the contribution that would be acceptable from our side. It is to be willing to take some risks, in the economic field as in the strategic, to make the free world work. The impression has grown up that to ask this of present-day Britain is to ask a great deal, but there is no reason why it should be so, even when it is asked of members of the Labour party, whose socialism has never hitherto been meant to exclude freedom. But even if the price were heavy, would it be too large for the immense boon that is offered in return?

Empire into Union?

THE Sultan of Morocco last week left Paris amidst a wealth of gun salutes and handshakes, but with nothing settled about the future relationship of the Moroccan protectorate to metropolitan France or to the French Union. Only a month previously the three Indo-Chinese states of Viet Nam, Cambodia and Laos had disbanded from a four-month conference at Pau during which they had reached little agreement either with their French partner, or, indeed, among themselves, as to mutual economic relations. The two events combined are a serious setback for the French Union, though the nature of the setback is largely escaping the notice of Frenchmen. It is passing unnoticed—except among a very few—partly because of preoccupation with what has become a war with Mao Tse-tung in Indo-China, but partly also because the average Frenchman gives little thought to France overseas. The home country—*la métropole*—absorbs all his attention. When he uses the word empire he means the regime that ended with Waterloo or with Sedan.

To understand the gravity of the setback it is necessary to know the shape of the Union into which the Fourth French Republic has been working to convert the former French Empire—an untried shape which it has written, possibly prematurely, into Chapter VIII of its Constitution. By the terms of this Chapter, upwards of 69 million non-Europeans, living mainly in Indo-China (25 million), West and Central Africa (over 24 million) and North Africa (over 18 million) now "rank as citizens equally with French nationals." They have thus acquired rights which are to almost all of them brand new. The territories in which they exercise these rights fall into four classes: first, metropolitan France, and the assimilated overseas departments which are run as if they were part of France; secondly, the overseas territories, which are the former colonies; thirdly, the associated territories, which are former mandates; and lastly, the important group of the "associated states," which comprises the dependencies having international status and governments of their own—Viet Nam, Laos, Cambodia, Tunisia, Morocco. To enable all these to enjoy their new rights, the 1946 Constitution provided them with a hierarchy of three representative bodies. At the apex of the pyramid it set up a Higher Council (*Haut Conseil*) which was to consist of representatives of the home government sitting at a round table with representatives of the associated states. This body has functions of liaison, not of decision. Beneath or alongside it was created an Assembly of the French Union, consisting half of representatives of metropolitan France and half of elected representatives of the overseas departments, territories and associated territories. This plays an advisory role, advising the French Parliament on both legislation and administration in the overseas territories. The third rank of the hierarchy consist of a series of elected local assemblies—one in each of the overseas territories.

The second and third bodies are functioning. The first—the Higher Council—has never been set up because the dependencies that were to join it do not all of them see eye to eye with Paris on the form that their link with France is to take. Three out of the five have joined the Union as it stands. In 1949 the three rulers of Viet Nam, Cambodia and Laos, feeling the breeze from the north, decided that French support was necessary for keeping order and holding on to office, and signed the relevant treaties. But Tunisia and Morocco have not followed suit. Though attached to France, and aware that they need a link with a friendly great Power, neither feels tempted by the form of relationship at present conceived by Frenchmen. Moroccan feelings on the subject are described in a note on page 796.

Three Indo-Chinese states plus metropolitan France do not make an all-union Higher Council. The whole neatly knit structure is therefore threatened from the top; a body and legs lack an important headpiece. For, given the rate at which news and thought travel nowadays, what an associated state thinks today an overseas territory may well think tomorrow. If Morocco is unattracted by the idea of unity, Madagascar may become so. The French dilemma, to which point is lent by the abortive Pau Conference and the yet more abortive visit of the Sultan to

Paris, is as follows: must the structure of the Union be changed or can Frenchmen, in order to maintain it, take a more elastic view of their relationship with the developed and developing peoples of Asia and Africa?

That the latter process would be a painful one is clear from the history of the last few years. The Union, which is an admirable conception, sprang from feelings evoked during the war. Prewar France had managed its empire on a basis of assimilating its members to Frenchmen yet at the same time running them, in a paternal way, on a purely centralised basis—straight from Paris, and not worrying too much about the growing number of quasi-Frenchmen who were beginning to chafe at getting too little responsibility. In 1940-44 the assimilationist side of the policy paid a handsome dividend. Despite the fact that France was divided, the educated élites of its Asian and African dependencies felt bound to it. Except for the mandated territories of Syria and the Lebanon, which were in any case on tiptoe for independence, no overseas dependency attempted to sever its link with the home country. A coloured governor-general—M. Eboué in French Equatorial Africa—was one of the first Frenchmen to declare for General de Gaulle. At the end of the war the French were ready to recognise this loyalty.

They first started to give overseas France its due at a conference of governors and officials convened at Brazzaville in 1944. These produced a draft that was coloured by their long-standing habit of centralisation and by their knowledge that large parts of their handiwork would fall to pieces if they loosened their grip too quickly. It laid down that secession was unthinkable. A second draft, produced by the broader-minded but less experienced First Constituent Assembly of 1946, bore the stamp of the French home politics of its period and laid down that the Union would be "freely entered into" and that its peoples could cut the link with France at will. The final text as adopted by the Second Constituent Assembly was the result of a series of compromises, and has endowed the proverbially logical French nation with some fine legal anomalies. But the chief point about it, for purposes of the present argument, is that it dropped the phrase about "free agreement" to co-ordinate, and proclaimed that "France, faithful to her age-long mission, will lead the peoples in her charge towards freedom to administer their own affairs." In a word, France remains the leader, and has set no time-limit to this state of affairs.

The extent to which the more advanced of the overseas peoples concerned are failing to fall in with this plan is by no means all due to its design. It is being applied at an awkward moment; all over the world, the peoples now courteously called "underdeveloped" are in a difficult mood. Some of the greatest weaknesses of the plan arise from faults in applying the machinery. For reasons that have been described, the Higher Council is a dead letter. Because some of the wheels of the Union have not been installed and others are not working properly, the men in charge overseas have tended to fall back—some of them not—unthankfully—upon old methods in order to keep the administration going from day to day. The Assembly of the Union, when it meets at Versailles, is an impressive sight with its wealth of races meeting on an equal footing, but it too is having its growing pains. For lack of concrete responsibilities such as the framing of legislation, it is apt to become a mere collection of debaters from areas whose problems are often enough unrelated. A second drawback is that too many of its home members are chosen for their services to party, too few for their knowledge of overseas France. Thirdly, membership of the national legislative bodies as well as of this central advisory body is, at present, apt to overtax overseas resources in educated manpower. Lastly, the virtue of the experiment in Union is gravely weakened by instability in postwar home politics. Minister after minister—and there are no less than four in every cabinet with direct responsibility for running one part or another of the Union—seems uncertain what to do for the best. The result is that each concession to the rising tide of overseas nationalism is given under outside pressure, and usually too late to earn metropolitan France the gratitude it deserves.

★

It would be wholly unfair to write off the new system as a total failure. It presents the dependencies—and the French—with some immense advantages. In all colonies and trust territories, elected local assemblies now handle local matters; some governors freely consult these. Simultaneously with its inception, old and autocratic practices such as the exaction of forced labour and the application of a special penal code to indigenous peoples have been abolished. The Assembly of the French Union, when it gathers at Versailles, affords an excellent meeting ground for civilisations and ideas.

But just as a meeting of Frenchmen and Indo-Chinese does not make a *Haut Conseil*, so a school for debaters does not make an Assembly of the Union. To come to fruition, both bodies need an infusion of new thought springing from the minds of Frenchmen. Otherwise the Assembly will, in rising degree, develop the lack of enthusiasm for unity which is already apparent in the story of the *Haut Conseil*. A revision of the pattern laid down in the 1946 constitution is not essential. It is the thought behind it that has grown out of joint with the times.

Why are Frenchmen so nervous of forming a looser federation? Is it because they are ridden by a postwar neurosis—the fear that someone will secede and by seceding expose the fact that France is weaker than it used to be? Or is it because those who grasp the mood of Africans and Asians are too few in number to overthrow the powerful vested interests that are tugging in the other direction—notably the overseas administrator (who weeps to think of his handiwork crumbling at the hands of backward peoples) and the overseas French settler (who is forever pulling strings in Paris because he fears dominance by an indigenous majority)? Or it is because Frenchmen are congenitally incapable of thinking except in a pattern centred exclusively upon Paris? It seems to an outside eye that France's century-old policy of assimilation would, given a little more elasticity, cause most of the peoples with whom it is linked to pay to it, in the 1950s, the same tribute of esteem that they paid by not seceding during the lean forties. At present, only in Tunisia—the most adult of the associated territories—are there signs that Frenchmen are capable of responding to local gestures and going half way to meet up-to-date aspirations. Elsewhere, they are pushing at a door that Asians and Africans are slowly but inexorably closing against all Europeans with a prewar mentality. In such conditions, surely an experiment in federalism would be worth a try.

The Controls—II

What Must be Kept?

THE first article in this series ended with the argument that any attempt to provide a permanent legal basis for what are generically known as "the controls" must be based on a careful discrimination between the bad and the good, between the necessary and the unnecessary, among the Government's present powers. These are a legacy inherited by the present Government from its predecessors, and the inheritance had the characteristics of such windfalls. Some were found to be, at any rate in the opinion of Labour ministers, effective practical implements against which there was little political feeling. In such cases, the defence regulations have already given place to improved models having the same purposes. Of this, the Exchange Control Act and the Borrowing (Control and Guarantees) Act are important examples.

Many of the powers that have been retained in force by the Supplies and Services Acts and the Emergency Laws Acts are of different character. Some are clearly stored away in the junk room, saved from jettisoning by the thought that "they may come in useful one day." Others are saved from rather a different motive. They correspond to the kind of article that the cautious housewife keeps under lock and key and of which she is apt to say, in confidence, "They don't make that kind of thing nowadays." That is certainly true of the defence regulations that confer the power to requisition houses and that give a minister power to declare a strike to be officially an illegal one. In these cases the Government is keeping for peacetime purposes powers that would never have been given to it outside wartime conditions and would probably never be extended today if they were asked for separately and specifically. It is powers of this kind that have to be looked at most suspiciously.

There is one general feature of the Supplies and Services Acts which should certainly not be repeated in the permanent legislation replacing them. When Parliament has given the executive a permanent right to amplify a statute by decree, it has customarily been only for the specific purposes of that statute. It had never before given the executive a general right to use a heterogeneous collection of emergency decrees for such purposes as the Government might afterwards find them suitable. It is beside the point to argue that no British Government at present conceivable would misuse this general power to change legislation by decree. It is not sufficient for a parliamentary democracy to act like a democracy; it must also look like a democracy, and with that anything like the Supplies and Services Acts is, in normal conditions, incompatible.

★

Any legislation permanently conferring upon the executive the right to issue orders having the force of law should therefore be restricted to the delegation of defined powers; the rights given to the Government to make orders and regulations under it should relate solely to purposes defined in the Act, and should not be left to be covered by the wider constructions that a future Government may choose to put on such vague phrases as "generally for ensuring that the whole resources of the community are available for use and are used in a manner best calculated to serve the best interests of the country." The Bill now being drafted will, no doubt, give the Government power to ration consumer goods. But it should define the type of ration scheme which the Government is thereby entitled by order to apply to any suitable commodity. It should not give the Government the right to introduce such form of rationing as it may at any time choose.

One other general point is of fundamental importance. If powers of this sort are to be permanent, then they should be made quite specific. If, over and above these specific and permanent powers, there is any need for wider, more general and vaguer powers, then they should be granted only for a year at a time. In other words, there cannot be unlimited powers, and every power delegated must have a close limit either of definition or of duration. The precedents for annual renewal are firmly established. Even during the last war the Government's emergency powers, from which the present Supplies and Services legislation was derived, were renewed annually. But the most important precedent of all is the Army Act. The annual nature of the Army Act is now so old and so unnoticed that it is easy to forget the concern for individual liberty that led to its establishment. Parliament was then struggling to assert its own and the individual's rights against the executive. It was determined to erect enough barriers to prevent the tide of executive power from rising again. In fact, the tide has now risen, and, indeed, it is Parliament itself that has contributed most to the advancing claims of the executive. The old principles have become important again. In the early days of the modern state it was felt that liberty was made more secure if the King could not keep his standing army together for more than a year at a time without the express consent of Parliament. Today, equally, liberty will be more secure if the executive must each year obtain Parliament's approval for any general reserve powers of control that are given to it. It is true that nowadays the executive is dependent on the popular will and that its abuses of power can be punished at the polls. But because the executive enjoys popular approval—in the sense of being preferred to the alternative—it does not in the least follow that it is never subject to the temptation to assume arbitrary power. On the contrary, it is only the grossest abuses of power that can be made issues at a general election; over the whole wide range of a modern government's activity the only safeguard is constant publicity and discussion. To confer unlimited powers without imposing on the executive the obligation to submit its powers for frequent confirmation is to take a bigger risk with liberty than need or should be taken.

There are only two possible arguments for taking the risk and neither is convincing. It may be said that there is not enough Parliamentary time to debate a renewal Bill thoroughly each year. It is true that the purpose of

general powers is precisely to save parliamentary time; it is this that, in abnormal conditions, makes them essential. But to this saving of time, when it is most important, there should be an offset when time is less precious. After all, what is here being suggested is not that every delegated power should be annually reviewed, but only that general residuum of powers that the government is not prepared to define in purpose and method. This surely, in ordinary circumstances, is not an unreasonable demand to make upon the time of Parliament. If Ministers are working it too hard for that, then they are not to be trusted with any sweeping delegation at all.

It is impossible to give more weight to the other argument against annual review which Dr Dalton used in the Commons last week. It was simply that annual review left the Government's powers of control at the mercy of the House of Lords. The one certain thing about the present or any future second chamber in British politics is that it will never stand against the Government unless it has clear evidence that public opinion is with it. In any case, why should the argument be confined to controls? Is it really the position of the Labour Government that it will not permit discussion in the Commons because it is afraid of discussion in the Lords?

It is on such general principles as these that both Government and Opposition must work if the perpetuation of controls is to take a satisfactory form. It will then be necessary to go through the existing emergency powers of government and decide, on the merits of each individual case, what powers should be kept in what forms and what should be dropped altogether. Public opinion should strongly resist any attempt at blanket perpetuation of powers that are not fully disclosed and individually justified. But the obverse is equally true: where the case can be made, the powers should be granted.

*

There are, first, some defence regulations that have done no more than make minor administrative changes in prewar laws or practices. Time has shown many of these changes to be convenient and non-controversial. Some were made permanent in 1945 and others in 1947. There are still others that can now safely be put into the same category. Thus the Aliens Restrictions (Amendment) Act of 1919 laid it down that every competent officer on a British merchant ship should be a British subject. This requirement was relaxed in 1940, in the first place to cover the case of Denmark, by Defence Regulation 47c. This relaxation has so far been maintained only under the emergency legislation, but unless one believes in a national closed shop there is plainly every reason why it should now be put on a permanent basis. There are a few other regulations of the same kind. The right course would be to sort them out from the controls and put them all into a separate permanent statute or possibly a separate part of the contemplated Bill.

There are other regulations of which it is equally clear that they should be suspended entirely. The Government has already said that it will not take permanent powers to direct labour. It is equally unlikely to ask Parliament to allow it to go on declaring strikes illegal. It is hard to imagine many situations in which this power can be used for such prosecutions as were brought against the London gas strikers; the main effect of the regulations, creating a criminal offence where the offenders will very rarely be prosecuted, is therefore to bring the whole law into contempt. The merits of such prosecutions in any circumstances at all are highly doubtful. The regulation has been kept chiefly because it gives the Minister of Labour twenty-one days during which he can fend off awkward questions in Parliament, while he conducts flurried negotiations with resentful trade union leaders and militant unofficial strike leaders. This may be convenient for the Ministry, but that is not an end sufficient to justify the means.

The difficult questions concern the powers of economic control. Dr Dalton, in his vague outline of the Government's intentions, dealt only with the easier cases. Any Government would at present retain in some form powers to control prices, to ration consumer goods, to allocate raw materials, and to limit imports. That the use made of such powers should generally be very slight indeed is the best indication of a sound economic policy. But if that is true in most circumstances it is certainly not true always. As reserve powers to deal with particular situations these controls have to be taken as permanent additions to the armoury of the state. What is important is to ensure that Parliament has an adequate opportunity of studying, and if need be debating, the orders through which such powers are exercised in specific cases. The case would be met if, within defined limits, there were a permanent power to make orders, but if the orders themselves had a definite limit in time, after which they would have to come up for review.

The more debatable economic controls are those by which the Government interferes not with the distribution of goods, but directly with the industrial policies of private firms. Of these, the most important cases are the utility schemes, which still depend on defence regulations and which Dr Dalton did not mention. By their nature such powers give more discrimination to the executive than do, for example, rationing schemes; their principles cannot be closely defined, and therefore they cannot be left to be applied to individual cases simply by order in the way that rationing reasonably can be. Things like utility schemes should therefore not be included in any general legislation for economic controls. If it wants to keep them, the Government should be made to introduce a separate Utility Clothing Bill, a Utility Furniture Bill, and the like.

A similar argument applies to the Government's present power, under a defence regulation, to limit the number of houses built for private ownership. That this number should be restricted to a fixed proportion of the number of houses built by local authorities is not a generally agreed method of dealing with a shortage. It is a particular political policy. As such, the power of licensing private building should be embodied in a separate Housing Act.

It is impossible in articles such as these to do more than suggest the different ways in which the various types of emergency powers should be dealt with. A more detailed examination will be necessary when the Government comes to put forward its own proposals. In the meantime, there are important principles to be established not only about the powers the Government should have but also about the ways in which these powers should be exercised. This will be the subject of a final article.

(To be concluded)

NOTES OF THE WEEK

The Sheffield Affair

It would be a misstatement of fact to say that public opinion is profoundly disquieted by the handling of the Sheffield "peace" congress. To judge by all the signs, public opinion is fairly solidly behind the Home Secretary. But whether public opinion is right to be so complacent is another matter—and to have the most serious doubts about that is not in the least to sympathise with the medley of saboteurs, stooges, and doubleplusgood duckspeakers (to quote the invaluable George Orwell) who found themselves inconvenienced and frustrated thereby. Considering the treatment meted out to would-be visitors to Communist countries, Communist protests reach new depths of hypocrisy.

The only people with a right to protest are non-Communist British subjects. And it is disturbing how few of them feel moved to protest. It is not, indeed, a matter of black and white. There are presumably individuals who should not, on grounds of national safety in what is essentially a war situation, be allowed into the country at all, conference or no conference. Presumably, too, Mr Ede's security officers are at least better placed to identify such individuals than are the general public. (It can also be argued that the Kremlin should not be given the propaganda value of such a conference in such a place at such a time—but that is an argument for refusing to allow any delegates in, not for accepting some and turning others away).

These arguments have validity. It is when they result in so many of the delegates being refused admission that doubts begin. Mr Chuter Ede says he personally examined each case. But in doing so, was the right bias in his mind? Did he remember, as he looked at each dossier, that every exclusion, however necessary, is an evil, a piece of illiberality, a denial of the great tradition to which he himself lately paid parliamentary tribute? Did he draw the distinction between the holding of opinions, which ought to be free for all in this country, and the intention to commit hostile acts, which is a proper ground for penalising the native and excluding the alien? Did he stop to ask himself what is likely to happen to democracy as a way of life if it once admits to being frightened of the expression, in public meeting, of any opinions whatever?

The numbers make it very difficult to give those questions the answer they ought to have. To Victor Hugo, in the last century, it was inconceivable that the day should come

> *Quand même l'Angleterre et même l'Amérique*
> *Diront à l'exilé 'Va-t-en, nous avons peur.'*

It looks very much as if Mr Ede, in playing safe for the moment, was willing to run unjustified risks with the eternal.

* * *

Dollar Imports

The suspension of Marshall aid to Britain makes it more important than ever that both the British Government and its critics should clear their minds on trading policy. How far can Britain now go in relaxing import and exchange restrictions? And, since few people seriously suppose that everything can be done at once, which changes in policy should be made first?

The Chancellor of the Exchequer has now admitted that some changes are inevitable or desirable. The present restrictions on dollar imports into the sterling area were designed to reduce them in July, 1949, by 25 per cent. Since a memorandum by the International Monetary Fund, critical of the restrictions, leaked out at Torquay, Mr Gaitskell has explained that all the Commonwealth countries decided as long ago as September that the 25 per cent formula was out of date. But even then were they doing more than recognise that devaluation had made it out of date twelve months before? The sterling area's dollar imports have been cut not by a quarter but by a third, and they were cut more by the 40 per cent increase in their cost after devaluation than by administrative regulation. Mr Gaitskell insisted roundly on the sovereign right of governments to restrict other countries' trade as they choose—in the light, of course, of their international obligations; the British Government would act on its own assessment of the dollar position and not on the views of the International Monetary Fund.

This high-handed attitude seems unnecessary at a time when the sterling area is earning a dollar surplus. Would many more dollar imports in fact now be bought if the quantitative restrictions on them were considerably relaxed? The Government's concern to go on building up the sterling area's dollar reserve even without Marshall aid is entirely right, but there seems some danger of forgetting the purpose for which it is right; that is, eventually to enable the pound to stand again in a world of multilateral trade and convertible currencies. It now requires a considerable extra increase in the dollar reserve to justify a large continued departure from the rules of good trading conduct that we want other countries to practise.

* * *

One Law for the Government . . .

It will be interesting to see what is the fate of the Festival of Britain (Sunday Opening) Bill, which Mr Morrison presented last week. The Bill proposes not only that the exhibition areas and the "Festival Pleasure Gardens" should be open on Sundays from 12.30 p.m.—to which the Christian Churches' Advisory Committee for the Festival agrees—but also that the "amusement area" (to the Government, "fun fair" to the general) should be open as well. Stage plays, variety shows, circus turns, boxing, wrestling and public dancing on Sundays are prohibited by the Bill, but the other attractions of the amusement area will be allowed.

Anyone who remembers the controversy over the proposed opening of theatres on Sunday during the war will expect much the same fight over the present proposal for the Festival's merry-go-rounds. Then, as now, the proposal was left to a free vote of the House, and it was defeated by a majority of eight. It remains to be seen, when the new Bill reaches the committee stage and the free vote on this particular clause is taken, whether the disappearance of the Conservative majority in the meantime will affect the issue.

It is possible to support this proposal for Sunday opening and yet be indignant at the circumstances surrounding it. If the Government, which according to Mr Morrison has no collective view on the opening of the amusement area, really wanted to do something constructive, it ought to have tackled the whole question of Sunday observance by repealing, or at least modernising, the contradictory and often hypocritical laws governing it. Many of the more stringent provisions owe less to the Puritans of the seventeenth century than to the panic that followed the Gordon riots of the eighteenth, and it is time the laws were considered afresh. As it is, the Government is giving the impression that it wants to repeal an archaic law only in so far as is necessary for its own particular interests. Together with the grant of dollars for the purchase of fun fair equipment, the Bill is one more example of the Government's habit of considering itself above the law.

Stalemate in Korea

The Chinese are now bent on getting the greatest possible diplomatic advantage out of their intervention in Korea. In refusing to accept the Security Council's invitation to discuss General MacArthur's dispatch dealing with the movement of Peking's troops across the Manchurian frontier into Korea, Mr Chou En-lai, the Chinese Prime Minister, has made a provocative counter proposal. He claims that, since the two questions of Formosa and Korea are closely related by virtue of American aggression in each case, they should be discussed together on the basis of China's accusations. A delegation, headed by Mr Wu Hsiu-chuan, was due to leave Peking by air for Lake Success on Tuesday, travelling by way of Europe; it was appointed to take up the Security Council's earlier invitation to come and talk about Formosa. Mr Chou En-lai, however, is barking up the wrong tree if he thinks that, having spent so much blood and treasure in fighting aggression in Korea, Washington is now going to be put on the spot itself.

There have been two other important developments during the week in Korea, where, as with the Berlin blockade last year, world peace depends on neither side letting events run away with premeditated policy. First, the Chinese have stuck to their story that their troops on Korean territory are no more than volunteers, organised, moreover, not by the Government but by the Chinese Communist Party; this leaves the Government room for manoeuvre without too much loss of face. Secondly, the United Nations forces, which last week were withdrawing before the reinforced North Koreans in order to consolidate their over-extended lines of communication, have now begun probing forward again. In doing so they have so far met with only a patchy opposition, though they know well that considerable and growing enemy strength now lies between them and their final objective, the Manchurian border.

General MacArthur is faced with a peculiarly exasperating and disappointing dilemma. On the one hand, enemy aircraft, as well as army reinforcements, are using inviolable Manchurian bases where they cannot be attacked by superior air power, one of the American's strongest weapons; the UN troops face a bitter and disheartening winter campaign when victory once seemed near; and guerilla activity behind the lines is growing. On the other hand, the campaign cannot be wound up until the Manchurian border is reached, while to do this runs the constant risk that the Chinese may not only increase their reinforcement of the enemy very substantially, but that the flames of war may spread. The General Assembly decided on the unification of all Korea and the incident will not be closed until this has been accomplished. But it is worth recalling that the original purpose of UN intervention was to stop the North Korean aggression against the South and to prove to Russia that aggression does not pay. This has already been achieved, and it would be a pity to jeopardise the major aim for the sake of the minor. In that case the United Nations could do worse than to consolidate temporarily on a front line across the narrow neck of the peninsula from Anju to Hamhung. This would also have the military advantage of turning the North Korean mountains into a buffer region where air power could continue to be used against enemy preparations for attack.

Mr Bevin on the Soviet Offer

In the House of Commons on Monday Mr Bevin, the Foreign Secretary, stated that, in consultation with Washington and Paris, London is considering its reply to the Soviet Note of November 3rd, proposing another meeting of the Council of Foreign Ministers on Germany. The Soviet Note had also drawn attention to the communique issued by the foreign ministers of the Cominform countries at Prague on October 21st, in which they glibly proposed a joint declaration against German remilitarisation, the hastening of a German peace treaty and the formation of a constituent council for uniting Germany—as if none of these issues had ever been bedevilled at all by the Russians' own tactics. Mr Bevin rightly put himself on record alongside other western statesmen—including President Truman, recently at San Francisco—with the view that if the Russians want to get round a table to bring peace to the world they must first offer some proof at least of good will. In addition, he reaffirmed the British attitude that a discussion of this kind must also cover subjects other than Germany.

As the Foreign Secretary pointed out, at the last meeting of the Council of Foreign Ministers—which was held in Paris eighteen months ago—a considerable measure of agreement was reached on the essential points for an Austrian peace treaty. But since that time Moscow has repeatedly and consistently dragged in new and extraneous issues which have made it impossible to complete the treaty. If the Russians mean business on Germany, or indeed on any other fundamental topic, they have no one but themselves to blame if more is asked of them than mere words. In Austria the means to give proof of a change of attitude lies permanently available.

Challenged by Mr Harold Davies, a Labour member, with the old plea for the wisdom of making yet one more attempt to reach agreement with Russia, if necessary over the heads of the Americans and French, Mr Bevin made a tart reply which found approval throughout the House. He could not, he said, bring himself to discard his friends in such a risky proceeding; the organisation of the western powers had reached a point at which it would be disastrous for the world as well as Britain if he threw them over in such a way. It is certainly true enough that even now, after all that has happened in the last three years, a doubt must sometimes creep into the mind whether everything possible has been done to try to get along with Russia—or (a slightly different point) whether some good might not come of trying again. It is true that some day (we must all hope) the Russians will be ready for a genuine settlement. When that time comes, their first approach will doubtless be as truculent as ever, and it would be a tragedy if it were turned down on that account alone. It is therefore a matter of judgment whether or not the time has yet come. Lord Salisbury, in the Lords on Wednesday, seemed to hint that he thought it might have—and he deserves to be listened to with respect. But most people's judgment is in the contrary sense—M. Schuman's and Dr Adenauer's as well as Mr Bevin's and Mr Acheson's. And to treat as genuine an offer that is really only a tactical diversion would be to play into the Kremlin's hands. The overwhelming balance of the argument is still on the side of making no concessions—even if it looks like rigidity.

* * *

Morocco and Paris

The nature of the tightrope that is perennially walked by the Sultan of Morocco was never more obvious than during his recent visit to Paris. On the one hand, he must keep in with the French mentors without whose support he could not be sure of maintaining public order; on the other, he must curry favour with the local Istiqlal (independence) movement of Arabs and Berbers who are by no means all of them his personal supporters. Upon arrival in France he lodged a memorandum and made a speech. While the speech struck, at points, a note of discontent, the memorandum was all readiness to negotiate. There followed, therefore, harmonious talks on such problems as the transfer to him of power to appoint local authorities; the suppression of the present censorship; the formation of trade unions under Moroccan control; an increase in the powers of the Moroccan element in each ministry. On the eve of the Sultan's departure, however, he lodged a second document, and one much more to the Istiqlal's palate. In this he asked for revision

of the treaty of 1912, which is the basis of French Morocco's present status. The French think the 1912 treaty sufficiently elastic to meet all current needs. The meeting therefore adjourned without result. Conversations will be continued in Rabat.

The Moroccan argument against the French technique of protection would be simple if all Moroccans wanted the same thing. It would be the cry—long familiar in the Middle East and Asia—for speedier education in self-government as a preparation for complete independence. But the issue is complicated by increasing evidence that the Sultan's idea of progress towards this goal is different from that of the French or of the Istiqlal. Both the latter want the transfer of power from Paris to entail the creation of a democracy of classic type with a figurehead monarch. The Sultan's idea is that any power transferred shall pass into the hands of a benevolent palace autocracy.

The French therefore have good excuse for not moving too fast. But Frenchmen have no excuse—and the Sultan and Istiqlal are here both highly critical of their practices—for publicly planning as if Morocco were eternally their property. Great umbrage has recently been taken by the Istiqlal at some proprietary plans for armament industries on Moroccan territory. The Moroccans therefore have their excuses and grievances also. The triangle is one in which each of three partners is in a position to put the screw on the other two. A country in this situation tends to jog along without major change until some world cataclysm affords the chance for a crisis. But it jogs unhappily.

Two Views on the Planning Act

It is now generally accepted that the financial provisions of the Town and Country Planning Act (1947) will not work satisfactorily. The compensation provisions are regarded as unfair by landowners and are not even satisfactory to the Government, which must shortly add to inflationary pressure by making a lump payment of £300 million. The development charge is a definite and depressive tax on most forms of private development. It is assessed, moreover, by a new and apparently arbitrary method of valuation against which there is no appeal.

The real choice is now between the repeal of the relevant parts of the Act and their drastic amendment. Both courses have been urged in recent proposals. The Federation of British Industries supports the suggestion, made earlier this year by the Royal Institution of Chartered Surveyors, for paying compensation not out of a global sum but by way of "deferred payment certificates," issued for each individual piece of land which had development value when the Act came into force. The certificate could be encashed only when development was authorised (when it would be set off against development charge), or when planning permission was definitely refused. In this way compensation would be fairer, and the immediate (and perhaps the eventual) cost to the Exchequer reduced. The Federation also urges that the rate of development charge should be something less than 100 per cent.

The case for complete repeal has been made in recent memoranda by the Chartered Auctioneers' and Estate Agents' Institute and (more contentiously) by the Association of British Chambers of Commerce. The institute argues that planning needs could be met by giving local authorities wider powers of control without liability to compensation, and by increasing Exchequer aid. On these conditions, the whole compensation and development charge scheme could be swept away.

There is force in both sets of arguments. The basic defect of the Town and Country Planning Act is that it sacrifices all other considerations to that of making public planning powers effective. In pursuit of this aim it has instituted a thoroughly bad form of taxation which would never be tolerated on its own merits. As a planning Act it is mainly good, as a taxing Act it is wholly bad. To amend or to repeal its offending sections in the ways suggested would probably reduce somewhat its effectiveness as a planning measure; but this would be at least a lesser evil than the stranglehold on development which the Act now threatens to impose.

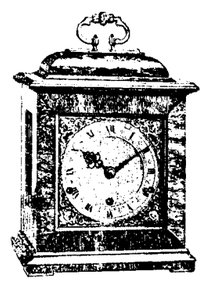
Rents in Scotland



For the first time for eleven years, the Scottish Department of Health has published a white paper giving the rents of houses owned by local authorities in 1949. The corresponding figures for England and Wales have not yet been published. The Scottish figures show that average rents rose from £18 17s. 7d. in 1938 to £22 8s. 7d. in 1949, an increase of barely 20 per cent; the rent of houses built since 1945 averaged £28 6s. 3d.—an increase of about 50 per cent over the prewar figure. For this the tenants of the new houses get a bigger and better house than they would have done twelve years ago.

The white paper is not concerned with the costs of house-building nor with the difference between economic rents and actual rents. There is therefore no indication of the rate deficits incurred in keeping rents at these levels. Some comparisons can, however, be drawn from a paper read by the City Chamberlain of Dundee to the annual conference of the Scottish Institute of Housing earlier this year. Mr A. L. Imrie then said that, according to figures supplied to the Secretary of State by local authorities, the average cost of a four-roomed house in 1948 was £1,730. The annual outgoings on such a house to cover interest, repairs and administration were about £80 a year. On this basis, with

Long service awards promote staff goodwill

We at 112 have helped many World famous organisations in the realisation of Staff Goodwill and the years of consultation with executives in different industries enable us to offer valuable assistance in deciding "What is the right gift" for a Long Service Award. We shall be happy to place our services at your disposal if you are interested.

An English-made chiming Clock in Walnut Case. Reproduction of Thomas Tompion circa 1700.

at annual Exchequer cost of £70 a year and a rent payment by the tenant of £28, the resident is left with a net gain of £42 a year. This is almost four times the size of rate subsidy which was anticipated when the Exchequer subsidies were calculated in 1956.

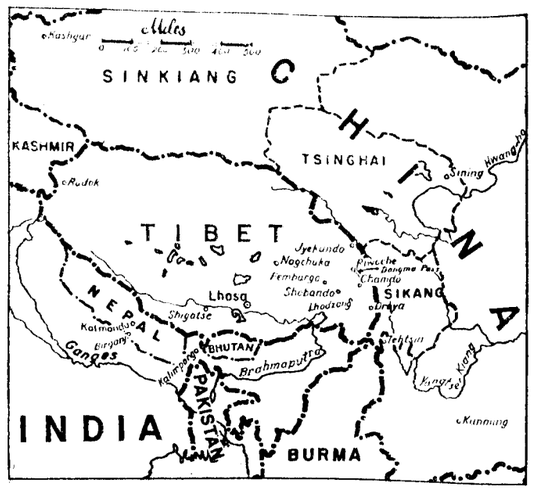
The argument must not be pressed too far, for 15 per cent of the dwellings built in Scotland since 1945 have 3 apartments or less, compared with 71 per cent in 1938. But a system whereby the distribution of cost between local authority, Exchequer and tenant is so crippling like the present one of 29 to 23 to 28 plainly needs revision.

* * * *

Staffing the Hospitals

The Minister of Health's circular to hospital authorities on the number of senior registrars and registrars that they ought to employ has come as a shock to those concerned. But it was not altogether unexpected, for a survey of the medical staffs of Scottish hospitals, published some months ago, had shown that there were far too many registrars in relation to the likely number of vacancies for consultants. The registrar grade is, as the Minister's circular says, accepted as a training grade for consultants, and it is consequently "not justifiable . . . to multiply training posts regardless of the probable needs for the recruitment of trained men."

Drastic reductions are therefore laid down. In England and Wales the number of senior registrars should not exceed 600, and the number of registrars 1,100, whereas at present there are about 1,400 in each grade. But however logical this reduction is, when viewed against the 150 vacancies a year open to the senior registrars at the end of their third year in that grade, there is another side to the question which the Ministry of Health hardly seems to have considered. In practice, a great many, if not most, of the 2,800 registrars, particularly the senior registrars, are not being trained for their specialties so much as practising them—and thereby shouldering a large part of their hospital's responsibilities. If their numbers are to be drastically reduced, who is going to do their work? Who, in particular, is going to teach the medical students—which is one of the registrars' tasks in the teaching hospitals? The Ministry's suggestion that suitably experienced general practitioners could be appointed on a part-time basis is no answer because, for the most part, it is full-time service that is needed if the work of the hospitals is not to be reduced.



There could hardly be a better example of unplanning in the health service. The present inflation of registrars is, after all, largely the result of the Ministry's encouragement to demobilised doctors to undergo training for a specialty because of the expected needs of the health service, and they were given Government grants to do so. The hospitals had been surveyed, and the number of consultant staff wanted should therefore have been known. Now, without even waiting for the results of its own general review of hospital establishments, the Ministry is in effect telling the registrars whom it encouraged to specialise that they ought to have chosen general practice instead, while at the same time it is telling the hospital authorities that the registrars' place can be filled by general practitioners.

Trouble in Nepal

Since the British Raj in India came to an end three years ago, both India and Pakistan have gone far in the administrative absorption of the numerous princely states formerly subject to British "paramountcy." Two states, however, Nepal and Bhutan, were in a special position. Secluded in the valleys and foothills of the Himalayas, these kingdoms were reckoned outside the paramountcy system, and their relations with India had not hitherto provided for any supervision of their internal affairs. Bhutan has now acceded to the Indian Union, but Nepal remains an independent state. It has a social and political order which is decidedly archaic and "feudal" as compared with present-day India; this resembles the Japan of a century ago in that the titular monarch is virtually without power, while an autocratic government is carried on by a hereditary prime minister. In such a situation there is a tendency for the king to ally himself with a party of reform against the vested interests represented by the "Shogun," and it appears that this has happened in Nepal.

The sympathy shown by the king and members of the royal family for the forces of discontent organised by the Nepal National Congress caused the prime minister to take action against them. The king sought safety in the Indian Legation and has now arrived in Delhi, while his grandson, a child, has been proclaimed king in his place. The sequel has been civil war in Nepal. There is no proof that such an outbreak of disorder south of the Himalayas at a moment

when a Communist army is advancing into Tibet to the north, is more than coincidence. But a dangerously significant pointer is that the phraseology of the Nepalese Congress programme reads not unlike that which the Communists themselves habitually use. Nepal, moreover, has sometimes been referred to by the Soviet radio as a British and American base. The infiltration now going on from India would provide ready scope for Calcutta agents to take a hand.

The Indian Government has not officially taken up any definite attitude towards the conflict in Nepal, but the sympathies of some members of the Indian Congress Party are certainly with the Nepal National Congress and its demands for constitutional government. Apart from the ideological disapproval for the old-fashioned princely regimes of India in a movement based on democratic republican principles, there is an obvious Indian interest in the stability of Nepal, particularly at a time when Chinese Communist troops may be expected at any time to establish themselves on the Tibetan frontiers of both Nepal and India. At first sight this interest might appear to imply a policy of propping up the existing regime in Nepal. But this regime is so narrowly based that Delhi may take the view that a more popular form of government would make Nepal in the long run more resistant to Communist infiltration, even at the cost of temporary disorder. Delhi may have to beware, however, of supporting a movement which might ultimately play into Communist hands.

Tibet—the Legal Aspect

Tibet has now made a direct appeal to the United Nations against the Chinese invasion of its territory. The appeal was cabled from Kalimpong, just over the Indian frontier, to Mr Trygve Lie, the Secretary-General, and it is understood that it will have the support of India for inclusion on the agenda either of the Security Council or of the Assembly. The legal position, however, is still somewhat obscure. No nation has hitherto recognised Tibet as a sovereign state, and China claims that its military operations there are a purely domestic affair. On the other hand, Tibet has in fact enjoyed complete independence from China for 38 years, that is to say, since the Chinese garrisons were driven out by a Tibetan revolt in 1912. Normally in international law so long a period of effective independent existence as a national state carries with it *de jure* recognition. In this case, however, the question of Tibet's international status was left wrapped in a cloud of ambiguity owing to the policy of the British Government—which was inherited by India with the transfer of power in 1947.

Desiring to maintain the actual independence of Tibet as a buffer state between India and China, without giving offence to the Chinese Republic, which claimed all the territories of the former Manchu empire, Britain invented the formula of Tibetan autonomy combined with Chinese "suzerainty"—not sovereignty—over the country. Since no countries except China, India and Nepal had common frontiers with Tibet, no other powers were concerned with the matter. The formula worked well enough as long as China was too weak or apathetic to enforce its claims on Tibet by military means. But now that China has both the strength and the will to do so, the formula is useless as a diplomatic instrument. "Suzerainty" is a concept outmoded in modern international law, which nowadays requires that a state either has or has not sovereign rights over a given territory. The Chinese Communists themselves repudiate the concession of "suzerainty," rightly classifying it as a feudal conception; they declare that Tibet is simply a part of China, and that it is for China to decide what degree of local autonomy it may be permitted to have.

If the United Nations regards Tibet simply as a part of China, it must decide that it has no jurisdiction over Chinese "police action" there. If on the other hand, it follows the precedent of its action over Indonesia, it will assert jurisdiction. The Security Council refused to accept the Dutch contention that their conflict with the Indonesian Republic was merely a domestic affair of the Netherlands, in spite of the fact that none of the nations represented on the Security Council had then recognised the Republic as an independent state, or had formally repudiated Dutch sovereignty in the Netherlands East Indies. It was held that the Indonesian Republic existed *de facto* and that the war in Java was a disturbance of international peace. If two years of effective independence were enough to gain recognition for Soekarno's Indonesia, surely thirty-eight years of freedom should obtain it for Tibet.

* * *

Italy and Germany

The forthcoming visit to Rome of Herr Adenauer, the West German Chancellor, marks a new step in Europe since the war. It will not only be the first formal trip abroad by the head of the German Government, but the choice of Italy for the occasion suggests the re-emergence in postwar European politics of an old alignment. Memories of the Berlin-Rome Axis inevitably spring to mind at the mention of German and Italian association; it is after all only five and a half years since the Axis was broken. The new ties between these two countries, however, are based on a very different philosophy of life; both Rome and Bonn are trying to get through a gruelling period of political, economic and psychological convalescence by resort to the salutary forces of Catholicism and democracy. Like other political associates, Christian Democrats may now gain confidence in themselves by shaking hands across the shrinking frontiers of Europe. And it is good that the Germans and Italians should be doing so in their present moods; it is certainly far better that men like Herr Adenauer and Signor De Gasperi, the Italian Prime Minister, should give the lead than that it should be left to former Nazis and Fascists—whose link has never been entirely broken.

This rapprochement has, in fact, made considerable progress during the summer and autumn. The West German Minister for Economic Affairs and the Bavarian Prime Minister both visited Rome last month, while Signor Gonella, Italy's influential Minister of Education, recently attended the German Christian Democrat congress at Goslar. The two countries, moreover, have a considerable range of common interests and problems, including the Schuman Plan. Their economic links, indeed, are increasingly valuable to them, as is shown by a new £100 million trade pact just signed in Rome. Italy has lately regained some of its former importance as a market for German machinery, chemicals and an annual 3½ million tons of coal, while a significant part of the flow of Italian agricultural exports is shifting to Germany instead of Britain; one sign of the times in Milan, for instance, is the increasing number of jobs advertised for which German speakers are required.

There has been a natural tendency since the war to think and speak of a Western Europe in which France, Britain, Benelux and the Scandinavian countries set the pace. But Italy and the Federal German Republic between them contain all but 100 million people. It would be blind as well as futile to expect Europe's centre of political gravity to remain exactly where it is, once these two countries have completely regained their rightful status among the nations. In spite of the Atlantic Pact, Italy's rearmament is still limited by the peace treaty. Apart from anything else, Rome and Bonn have it in common that they share the front line of Western Europe without even normal forces of their own.

* * *

The Future of GATT

The current discussions at Torquay (a full account is given on page 832 have again brought to the fore the anomalous position of GATT, the General Agreement on Tariffs and Trade. This organisation was established at Geneva in 1947, its purpose being to provide a temporary framework for negotiations and discussions until such a time as the Charter of the permanent body—the International Trade Organisation (ITO)—was ratified by the major trading nations. So far the world's largest trader, the United States, has failed to ratify the ITO; there is little prospect that the American Congress will do so and with this defection it is unlikely that the ITO will ever be launched.

How far GATT can carry out the tasks intended for the ITO depends primarily on two things: first, the readiness of Congress to renew the Reciprocal Trade Agreements Act which enables the American Administration to negotiate further reductions in the American tariff and second, to what extent the other member countries find it expedient to co-operate in lowering world tariff barriers. At the moment it is the second of these two limitations which is occupying the attention of the Torquay delegates.

Although each conference of GATT sees the arrival of more participants, some of the founder members are showing little inclination to further the object of the work. The restrictionist behaviour of France, if persisted in, threatens not only to block additional gains but even to put in motion a series of retaliatory measures which will wipe out some of the hard-won advances of the past three years. In an attempt to shake French recalcitrance, it has been suggested

that at least within the Marshall Plan area, no more automatic benefits should accrue to France by virtue of the most-favoured-nation clause; wherever a new market is opened to French goods, France should be compelled to provide its partners with a suitable *quid pro quo*.

If GATT succeeds, it will be a lonely but encouraging tribute to the possibilities of voluntary association. GATT is not a United Nations body, it has no richly endowed and numerous secretariat and it has no more chance than ITO of becoming a ratified institution. Those nations who farther its good work take part as sovereign bodies motivated by enlightened self-interest.

* * *

The Technologists' Riddle

The game of "when is a technologist not a technician . . ." has been played with varying results by nine committees since 1945—four of them governmental. A tenth—the National Advisory Council on Education for Industry and Commerce—has now produced yet another answer by proposing* the establishment of a Royal College of Technologists. If technological education does not improve it will not be for lack of suggestions. The college would be neither a teaching nor an examining body, but would have power to inspect the staffing and teaching arrangements at technical colleges, to control the syllabuses, and to approve the conditions for examinations. If a course at a particular college was satisfactory to the Royal College in all these respects successful students could win awards. These would be of two standards—comparable, it is hoped, to ordinary and post-graduate degrees at the universities.

There is much to be said for a new Royal College and its awards. The present arrangements for National Certificates and the external degrees of London University are far from satisfactory. In some branches of technology no degree is available. But the report is obscure about the differences in content and purpose between degree courses in technological subjects at universities and advanced courses in the technical colleges. If some technical colleges really can recruit staff capable of teaching fundamental science and of doing research, and if they can also obtain suitable equipment and accommodation, then they will come very near to being technical universities. But if, as is more likely, they fall short of this goal, the Royal College's awards would not in fact have the value of university degrees. This is not an argument against trying. The technical colleges are at present so far from the universities that any carrot that can be hung before this very reluctant donkey is welcome. What must not be expected is that the donkey will turn into a thoroughbred, or indeed that the technician will be made a technologist by tying a new pedigree round his neck.

* * *

Industrial Design and the Festival

The fifth Annual Report of the Council of Industrial Design continues its predecessors' story of unsensational but lively, ingenious and at the same time solid work. Broadly, that work follows three lines: the improvement of design by the direct encouragement of designers and by advice to manufacturers, retailers, publishers, and so on; the education of the public in the appreciation of good design, by exhibitions, publications, and co-operation with schools and universities; and the raising of British industrial prestige abroad by publicity for the achievements of contemporary industrial (or handicraft) designers.

This year all three lines have to a great extent merged in the work which the Council, and particularly its Industrial Division, are doing for the Festival of Britain, which accounts for a considerable increase in its staff and its budget. There could hardly be a more important contribution. While it is true enough that good design is much more than skin deep, that it concerns function as well as appearance and indeed before appearance, it is nevertheless generally at first impact that the difference between good and bad design is most apparent. For visitors to the Festival the first impact, the shop-window impression, will in general be the only one; a badly or indifferently designed exhibit, whatever its sterling qualities of material and workmanship, will get little credit for them. The reputation of British design, for a long time regrettably but understandably low, is on the upgrade—a development for which the Council deserves a good share of the credit. It could easily suffer a setback were there a preponderance, at the South Bank Exhibition, of the kind of uninspired, bogus or actively hideous products which the normal consumer still finds it so difficult to avoid. No such preponderance, fortunately, is probable; and it is a relief to hear that the Council has appointed a committee to examine the design of Festival souvenirs offered for sale in the South Bank exhibition. In no field is there more room for improvement; and a souvenir remains when the impression of a display has faded. As usual, the Council's report has eight pages of pleasant illustrations and itself demonstrates that good design, like charity, begins at home.

* The Future Development of Technological Education. HMSO, 1s.

Mayhew's London

In general the public mind is too well aware of the amount of individual wretchedness that must prevail among a dense, artificial, and highly-vitalised population like that of England, not to receive with ready belief the assertion and the description of this wretchedness. Where there is great inequality of wealth, there will be startling contrasts of comfort and condition; where masses are crowded together in the lanes and courts of great cities, there must be much squalid misery, which for the most part lives and dies unseen, but occasionally forces itself upon public notice in a manner not to be forgotten or put by. . . But when the *Morning Chronicle* put forth its graphic delineations of the 30,000 needlewomen, and 23,000 journeymen tailors of the metropolis, such a vast proportion of whom were said to be starving on 2½d. a day, and enduring the strangest varieties and the deepest extremities of human wretchedness—the tailors imprisoned by the sweaters, working for nothing, and starved on a scanty allowance of tea and bread and butter—the needlewomen, driven by hundreds to eke out the earnings of the needle with the wages of prostitution—the public stood utterly aghast, unwilling to believe, yet unable to disprove, statements promulgated by a journal of high repute, and attributed to a gentleman whose zeal, diligence, and capacity it was impossible to question. By degrees, however, a few facts peeped out, and a few considerations presented themselves to men's minds which gave reason to hope that much of this misery may have been exaggerated. If we have hitherto entertained a doubt as to the value of the reports which, it appears, were contributed by Mr. Mayhew to the *Morning Chronicle* . . . we now cannot hesitate entirely to refuse . . . to accept any large or startling body of facts on the testimony of so wild a speaker and so illogical a thinker.

The Economist

November 16, 1850

More Czech Goods for Russia

A new five-year Czech-Soviet trade agreement was signed in Moscow on November 3rd in what the official communiqué called "an atmosphere of mutual friendship and understanding." It provides for a striking increase in the volume of Czechoslovakia's trade with the Soviet Union, which, together with trade with the "people's democracies" already accounts for 53 per cent of its imports and 55 per cent of its exports. The general effect of the agreement will be to accelerate the already rapid development of Czech heavy industry at the expense of the traditionally important consumer industries and to harness them still more firmly to the fulfilment of Soviet demands. It is clear that the strain on the Czech economy—already suffering from a too rapid and drastic orientation towards the east—will be great.

The production goals for the second half of this year (the first year of the five-year plan) were considerably stepped up in the summer, and they are not all being reached. Heavy engineering, in particular, has, as President Gottwald euphemistically put it, "failed to uncover hidden reserves." Coal production fell in September and October and absenteeism in the mines has risen in spite of special bonuses and the urgent exhortations of the Czech leaders. Throughout industry there are signs that the drive to secure greater productivity is meeting with little response from workers who have had their production "norms" raised too many times already. The Government has, indeed, felt it necessary to promise that after one last revision, norms will remain stable until the end of 1951. Party members are now busy overcoming what *Rude Pravo* calls the workers' "initial mistrust" of this final revision. Czech leaders have never attempted to disguise their anxiety over the acute manpower shortage which they are trying to overcome largely by an intensive campaign to recruit women into industry. Mr. Erban, Minister of Social Welfare, referring to the fulfilment of the five-year plan, admitted recently "that without the assistance of our women we would remain stuck half-way."

On his return from Moscow last week, Dr Gregor, the Minister of Foreign Trade, is reported to have claimed that the greatly increased Soviet orders would guarantee full employment in large sectors of the economy and would necessitate an expansion of production. These are curious grounds on which to recommend the new agreement to a country which is already suffering from an acute labour shortage and which is having a hard struggle to achieve the production targets already set. It seems doubtful whether the Soviet plan to secure a higher output from Czech heavy industry by pumping in greatly increased quantities of iron ore, copper and other raw materials will be very successful so long as industrial conditions in Czechoslovakia continue as at present.

* * *

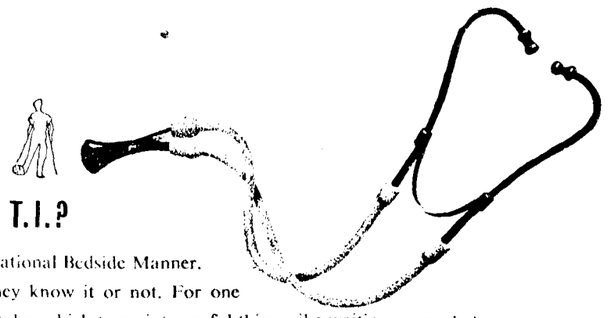
Thorez goes to Moscow

The weird flight to Moscow in a special Soviet plane of Maurice Thorez, leader of the French Communists for the last twenty years, is a reminder of the way in which Mr Dimitrov, the former Bulgarian Premier, was whisked off the scene in 1949. M. Thorez has been seriously ill for some weeks reportedly suffering from a partial paralysis of the right side of his body. So far as is known, he has received first-class medical attention in France and could certainly have expected to go on obtaining the best available treatment to promote his recovery—which, the world has been happy to learn, had already begun before he left France. The aircraft in which M. Thorez, lying on a stretcher, took off from Orly airport near Paris last Saturday was Mr Vyshinsky's personal plane, for which special landing permission had been requested and obtained from the Quai d'Orsay. M. Thorez headed east for a clinic and a rest cure in the Soviet Union—accompanied by his wife, unexpectedly by M. Lecoeur, his possible successor as Secretary-General of the Party, and by a Russian neurologist.

No proper announcement has been made of the reason for this carefully prepared demonstration of the long arm of Soviet power. Presumably we are left to draw the conclusion that the West either cannot or will not provide a prominent Communist with proper medical care, while the Soviet Union, on the other hand, is not only better equipped than the West, but will see that its faithful followers have the benefit of these advantages wherever they may be. Yet, this, of course, is by no means the whole story. M. Thorez has had to go to Russia because the Kremlin does not like to leave him on the loose in France. Two possible explanations have been advanced. Either the French Communist Party expects to act in the near future in such a way that it will be driven underground, and so could not cope with a sick leader; or—more likely—the Kremlin fears that, in his weakened state, M. Thorez may lend his valuable support to the recalcitrant "Titoist" and dangerously nationalist section of the party.

The Kremlin's fears are a reflection of the decline which has lately taken place in the prestige of Communism in France. The party is now reported to number only 700,000 members compared with over a million soon after the war, and to be seriously divided into pro and anti-Soviet factions. Indeed, there are fortunately now grounds for hoping that, if French recovery continues, the Kremlin may possibly be justified in fearing a decline in the Communists' voting strength of five million—and 180 seats—at the elections next year.

Shorter Notes



The House of Commons debated on November 8th an adjournment motion concerned with the employment of Communist teachers in schools. The kernel of the argument turned on the question of evidence—evidence that Communist teachers abuse their trust. Mr Hardman in replying to the debate was less than fair to those who are concerned with this issue in its wider implications. He claimed that the Ministry of Education had no evidence of abuse, and that in the absence of evidence his Ministry remained unmoved. It may well be that the Ministry of Education should take no action itself. That does not debar a Minister from expressing some understanding of the problems of local authorities responsible for appointing teachers, and more particularly headmasters, who are known to be Communists.

*

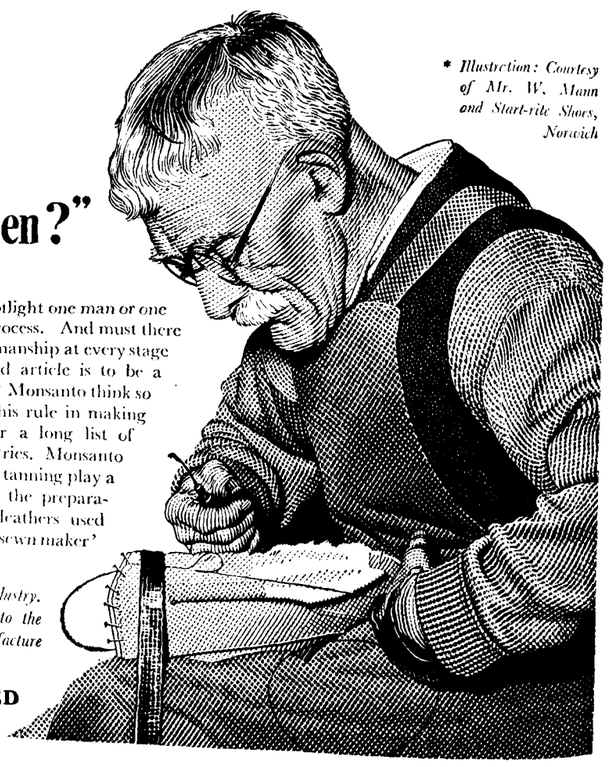
It is regretted that the note on "Liberal Voters" in *The Economist* of November 11th was based on an inaccurate report in a daily newspaper of the voting at Oxford. The Conservative poll at the by-election was in fact bigger than at the general election by 75 votes, not by 1,875. This greatly weakens the conclusion that the Conservatives this month gained considerable support from the Liberal voters of February.

*

An article in *The Economist* last week on Persia's new trade agreement with Russia mentioned that the Persians had succeeded in arranging that trading should take place through five government agencies. It now transpires that, though the Russians were ready to agree verbally to the establishment of these agencies, they insisted that no mention thereof should appear in the text of the agreement. Some Persians are beginning to feel that so loose an arrangement bodes trouble for the future.

DO DOCTORS TALK T.I.?

This has nothing to do with a National Bedside Manner.



All doctors talk TI, whether they know it or not. For one thing, TI specialise in precision tube, which turns into useful things like waiting room chairs, hypodermic needles, operating tables, thermometer cases, delicate instruments, or intricate medical research apparatus. For another, TI supply oxygen and other gas cylinders, those versatile aluminium alloys, and special lighting and heating equipment. You probably race out for the doctor on a TI cycle, and your doctor hurries to your home in a car which is a moving catalogue of TI ingredients. Tell him when you catch your next cold. . . .

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2. (Trafalgar 5633). They also stand for the thirty producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses.

THE SURNAME OF A THOUSAND THINGS

Whenever Export figures are quoted there comes the accustomed reference to 'export British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

* *Illustration: Courtesy of Mr. W. Mann and Start-rite Shoes, Norwich*

Introducing Billy Mann. Fifty-three years a 'hand sewn maker'. He produces a special type of light fashion shoe for ladies. One of the reasons why Footwear ranks high as a special item in the Export List. *

But . . . does craftsmanship mean only handcraftsmanship? The production of the fine grade leather used by the 'hand sewn maker' is also the work of craftsmen . . . although one may be unable to spotlight one man or one part of the process. And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and follow this rule in making chemicals for a long list of British industries. Monsanto chemicals for tanning play a vital part in the preparation of fine leathers used by the 'hand sewn maker'

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture

Letters to the Editor

Transport in Trouble

Sir,—I read with interest the article on "Transport in Trouble" in your issue of September 23rd. With a great deal of it I entirely agree. However, I should like to answer the questions you raised about "Whether any advantage has been gained, or is likely to be gained, from a separate Docks and Canals Executive, performing functions that the former railway companies managed to perform with reasonable success and probably greater economy in the ordinary course of their duties."

Perhaps it would be as well to state what exactly the duties of the Executive are. They are mainly three: to take over and administer all railway-owned trade harbours; to take over the principal waterways and canals in Great Britain; and to keep under review, under Section 66 of the Act, dock and harbour authorities throughout Great Britain and to prepare alternative schemes for their administration where these are deemed necessary after consultation with all concerned.

In considering these three aspects it has generally been recognised for some time to be in the public interest to sever railway-owned trade harbours from the railways; and on investigation we have proved that this has been fully justified and generally has been welcomed at the ports concerned. At last these ports have been put on their own feet and the actual costs of running them ascertained, facilities have been thrown open to road and water-borne traffic, and perhaps finally, development has no longer been hampered by the exigencies of railway finance.

Among other docks taken over are the six ports in South Wales; the Humber Docks, including Grimsby and Immingham; Fleetwood and Barrow; the Hartlepools and Middlesbrough; Grangemouth and, lastly, Southampton. In every case the changeover has been smooth, without friction, and in nearly all of them a new spirit has been generated of enthusiasm and progress. Already the financial results have shown the advantages of the change.

With regard to canals and river navigations, only a minority of these was railway-controlled — often, however, at strategic points. But investigation has revealed shocking neglect for many years of the railway-owned waterways. They had neither financial resources nor any incentive to keep them in first-class going order. Since we have taken them in hand a very active dredging programme is already yielding results, and on long lengths boats are now able to carry 25 per cent more loading and at the same time to cut down the journey times. The whole system is organised on a national basis; through-running and through-borne traffic has been arranged between all points, and already traffic is flowing as a consequence. In fact, in many sections there is a shortage of boats and crews to carry the traffic offering. All this has been accomplished in less than three years, without establishing expensive supervisory staffs. In fact economies in staffs have been made and the old staffs have been rearranged to give more efficient results. Some of the principal canal carrying companies decided to give up business following the cessation of government control. It is only due to the Docks and Inland Waterways Executive having purchased the craft and terminals of these companies that the services for water-borne traffic have been maintained.

Perhaps one of the biggest duties of the Executive is to review trade harbours which are not under the control of the Commission. Already most of the large ports in the country have been visited, local inquiries held, and all persons interested invited to give evidence. Reorganisation schemes are being considered where these are thought necessary, and a scheme is now being discussed for the Tees and consultations are proceeding for the Clyde.

I may say that the financial results are improving every month and there is some prospect that in a very short period the Executive may show results on the right side. I think it would be hardly reasonable to refer these duties to the Railway Executive, who are overburdened with their own problems and are hardly constituted to deal with the greater number of problems which this Executive has to face.—Yours faithfully,

GEORGE CADBURY

Birmingham.

[It is regretted that the publication of this letter was delayed by the printing dispute.—EDITOR.]

Cures for India's Poverty

Sir,—Your correspondent, in his review of the development scheme for India considered at the recent Commonwealth Conference, stressed the lag of agricultural output in relation to the growth of population. This is a legitimate and fundamental point, but his implication that India's substantial imports of raw cotton, overwhelming dependence upon imported jute, and net imports of food grains are novel factors, attributable to wartime and postwar changes, may be seriously misleading. India is now dependent upon "imports" of jute, and needs to "import" more cotton than before the war, chiefly because Partition gave a large part of the areas of production to Pakistan, whilst the factories are in India. For many years undivided India imported substantial and increasing quantities of raw cotton, but this was not because her domestic output was deficient in quantity (on the contrary, she had a large net export) but because she did not produce the longer stapled and better qualities required for the manufacture of finer cloths. Similarly, it was the separation of Burma, in 1937, that changed India from a net exporter to a net importer of foodstuffs, and Partition accounts for part of the increased need to import food. It remains true that for India and Pakistan, taken together, agricultural output has failed to expand in proportion to population growth.—Yours faithfully,

VERA ANSTEY

Esher, Surrey

Tax Exodus

Sir,—In your issue of November 4th you referred to the exodus of companies from the taxation net of the United Kingdom. May I suggest that there is one important aspect of this still continuing operation which is of serious consequence to this country's balance of payments?

I am referring to the volume of invisible exports accruing from the activities of companies controlled in this country but operating abroad. I cannot put forward any estimate of the total of salaries and wages, directors' fees, and rent which are at present disbursed in this country or of the commissions paid to insurance and shipbrokers—to mention only two of the types of agent habitually employed. I would, however, venture a guess that the total when ascertained would substantially exceed our much-vaunted income from tourists which has given rise to so much discussion and effort. All we need to do so far as the foreign-trading companies are concerned is the more or less negative act of not persisting in taxation of profits at such a rate as to drive them away.

So far as mining companies are concerned, there are two additional considerations: (a) United Kingdom control gives rise to orders for machinery and stores that might otherwise go abroad; and (b) London's former place as the centre of mining development and finance was especially productive of invisible income and must be regained.

In Canada companies of the type I have mentioned are treated as honoured guests and charged no normal income tax at all. Their contribution is limited to a tax of 15 per cent deducted from dividends paid to non-residents. The Brazilian Traction Light & Power Co. can be quoted as an instance of the operation of this system.

It is too late for half-measures; the nineteenth century attractions of this country as a controlling centre are on the wane. Action to put taxation in this country on a similar basis to that ruling in Canada must be taken now; there is no time to lose. All British companies operating in Africa will soon be gone and as soon as petty nationalism and disorder begin to abate in the East and in South America a new exodus will start. Action should be taken by the authorities now with a view to legislative provisions in the next Finance Act. By reason of the unilateral relief granted in the Finance Act, 1950, the amount of revenue to be lost would not be as great as might be supposed.—Yours faithfully,

K. M. PARRY

Books and Publications

The Common Man

A History of the English People. By R. J. Mitchell and M. D. R. Leys. *Longmans.* 612 pages. 21s. 6d.

A Social and Economic History of Britain, 1760-1950. By Pauline Gregg. *Harrap.* 484 pages. 18s.

The Story of English Architecture. By Hugh Braun. *Faber.* 200 pages. 12s. 6d.

The time is not long past when, after you had mastered your dates and the names of the Prime Ministers, you were allowed a glimpse of J. R. Green or the Quennells to provide a bit of background. Now that social history has become the fashion the process is often reversed. The appearance of such a handsome and scholarly book as "A History of the English People" raises the question of what social history is. G. M. Trevelyan defined it as "the history of a people with the politics left out." Miss Mitchell and Miss Leys go much farther by throwing overboard law, literature, war, commerce and a good deal of religion as well. The results are surprising. We are told what happened to the libraries of the abbeys, but not the distribution of their lands; railways are included, but not canals; smugglers, but not seamen; the theatre, but not dramatic literature.

One must sympathise with this rigorous method of selection in view of the impossible task which the authors set themselves: nothing less than a picture of English life from the Stone Age to the reign of Victoria. They may have fulfilled Dr Johnson's prayer—"I wish to see one branch well done, that is the history of manners, of common life"—but they have not written a history of the English people. They have given us an intriguing collection of facts about everyday things and ordinary people, garnished with unhackneyed quotations and buttressed with references to modern and often recondite authorities. With the aid of an admirable subject index you can discover when the Elizabethan dined, how the Norman shaved (with pumice stone), when shop signs were abolished and revolving bookcases came in. But in history it is the extraordinary people who matter, and they do not make much of an appearance in this book.

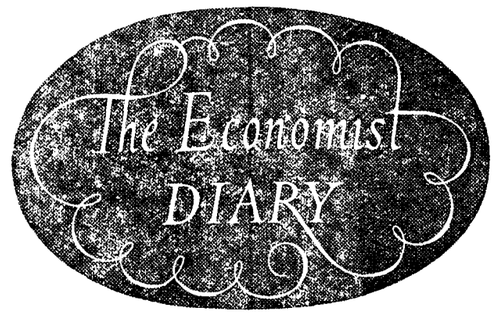
Nor do they in Dr Gregg's "Social and Economic History." If we are given the names of leading trade unionists we are entitled to those of the captains of industry as well. The author wisely makes no attempt to divorce social from economic history, but her interpretation of social is too narrowly political. The consequence is that the book is largely a history of the working-class movement. Mere space is devoted to the Tolpuddle Martyrs than to the expansion of the merchant navy. Chartists and Co-operators are here in full force, while the middle classes are neglected even in their prosperity. It is unwise to suggest, as does the blurb, that this is a sequel to Clapham's "Concise Economic History"—it has neither the authority nor the breadth of view which characterise that survey of the earlier centuries. Only a brilliant or original writer can bring to life the oft-told tale of the Industrial Revolution. On the other hand, for the evolution of the welfare state and the events of the last hundred years, this book should prove useful to university students and the like. The tables and charts are handy and the illustrations (as is the case with the other books under review) excellent.

Mr Braun also writes his introduction to the history of English architecture from the social point of view. He is concerned with practical problems rather than aesthetic results. From Stonehenge to prefab he describes the kind of building required by the conditions of the age, the materials available and the way in which they were used. His style is elementary ("in 1615 there was a surveyor-general named Inigo Jones who was a very clever architect. . . ."), but much practical information is imparted. Anyone who is still uncertain about the difference between the triforium and the clerestory, or between Flemish and English bond, will be pointed out such features in a pleasantly conducted tour through the buildings of the past.

Milner's Achievement

Lord Milner et l'Evolution de l'Imperialisme Britannique. By Vladimir Halpérin. *Paris, Presses Universitaire de France, 1950.* 257 pages. 500 Francs.

Within the British Commonwealth Lord Milner's reputation has come to be regarded as the vested interest of that dwindling band of distinguished men who in their youth were members of his kindergarten, and like all vested interests is looked upon not without suspicion by the world outside. For this reason alone a reassessment of Milner's work by a distinguished French scholar is welcome and appropriate. Yet Dr Halpérin has undertaken no easy task, for such a reassessment requires not only intimate knowledge of the facts of Milner's career but also a critical approach which Dr Halpérin's admiration for Milner virtually precludes him from adopting.



To the author of this book, and indeed to many others, Milner was unquestionably a great man. He thought "like a Richelieu" writes Dr Halpérin, and what higher tribute than that can a Frenchman pay? Yet Dr Halpérin's verdict is not likely to carry conviction with all his readers. He succeeds in recording fully and faithfully Milner's many achievements; but he fails to give to his judgments upon them their necessary air of impartiality. He has consulted carefully and frequently quoted the opinions of Milner's friends and admirers, but he has too lightly discounted his critics whether English or Afrikaner. At times he seems to accept the tributes of contemporaries as the verdict of history. It is interesting to know that "*le grand historien*, J. A. R. Marriot," in a personal letter to Milner in 1901, compared his services to the Empire with those of Hastings and Wellesley, but too often Dr Halpérin seems disposed to attach to such contemporary opinions a weight which they do not possess. For this reason his book, which is instructive and very readable, though marred by a number of minor inaccuracies, is suggestive rather than conclusive. Milner's stature as an administrator, as the greatest civilian soldier of the Empire, is clearly brought out; the extent of his achievement in Egypt and in South Africa is well described; but his impact upon the evolution of British imperialism is left uncertain. Here it may well be that Dr Halpérin has attempted too ambitious a task. The Rowse method, if one may so describe it, demands that the personality should dominate his subject—"Augustus and the Roman Empire," "Louis XIV and the Greatness of France." But not a few could dispute with Milner the claim to have played the decisive part in the evolution of British imperialism in the twentieth century and only a comparative survey of their claims could help to fix his place among them. This Dr Halpérin does not attempt to do. But one thing is certain. The loosely knit multiracial Commonwealth of today is not the Commonwealth Lord Milner would have liked to see.

A Century of Catholicism

The English Catholics, 1850-1950 Edited by the Rt. Rev. G. A. Beck. *Burns and Oates.* 640 pages. 35s.

The rock of Peter has stood remarkably fast in these last hundred years. Since 1850 the population of England and Wales has been multiplied by two and a half, but the number of Roman Catholics by seven. It stands today at somewhere near 10 per cent of the total. This record is all the more striking by comparison with the decline of other denominations. In 1851 one churchgoer in thirty was a Catholic. Today the proportion is more like one in three.

Catholic influence on national life in these years, as Bishop Beck admits in his summing up, has been less than these figures might suggest. The sheer speed of expansion forced bishops and clergy to concentrate on the bare essentials of preaching and teaching, struggling all the time to keep the supply of churches and schools from dropping too far behind the swelling demand. The problem was to provide for Irish immigrants already Catholic, and for their descendants, concentrated until very recently in comparatively few centres;

THE BUSY MAN OF AFFAIRS requires a diary that is expressly designed to meet his needs. These needs have been carefully studied by The Economist Intelligence Unit, in association with the co-publishers Charles Letts & Co. Ltd., and the unique features of The Economist Diary are the product of this study. A diary and a complete reference book are combined in one volume (10in. × 8in.) which will lie open flat on the desk.

The day-to-day part of the diary is laid out so that appointments are arranged in chronological order and so that ample space is available for notes. Each double-page opening shows the day-spaces for a week, a complete calendar for the year, and calendars for the corresponding months in the previous and succeeding years.

The reference section consists of 72 pages of information specially selected to be of practical value; quick, easy reference is achieved by means of thumb indexes down the outside margins of each page. The principal contents are:

Airline services and distances
Banking and exchange rates
Basic statistics on 47 principal countries of the world
British press
Education
Election results, 1950
Hotels, clubs, etc.
Income tax and Surtax
National debt and national savings
National finances and social services
Production: fuel and food
Production of manufactured goods
Statistics of world production: foodstuffs, textiles, fuel, minerals
U.K. balance of payments
U.K. external trade
Useful statistical sources
Wages and prices
Weights, measures: conversion factors
World population
World trade

The diary is bound throughout in red leather, with the title blocked in gold.

PRICES
UNITED KINGDOM *(including postage and Purchase Tax)* 37/6.

G&G

all the less time, then, in spite of some remarkable early missions, for general propaganda among the English. For seventy years the Irish MPs at Westminster were a source of Catholic strength; but in most of social life the close tie between Catholicism and Irish culture and politics created a bar. In an increasingly middle-class world the Catholics started with practically no middle class. And whereas in 1850, when religion was a power in the land, the Catholic religion was an object of scorn and aversion—a state of affairs which itself imposed caution on Catholics—the much greater influence of Catholicism among the religious today is more than offset by the decline of the religious lobby (if one may so call it) as a whole.

The authors of this volume do not, however, suggest that the Church's strategy or sense of priorities was wrong. The steady flow of recruits for the clergy and convents is itself remarkable enough in a materialistic age. Clerical salaries in the nineteenth century are recorded as £25 to £50 a year. In real terms, they are often lower now.

But one cannot read these articles without feeling that there is indeed a new climate in them. The material difficulties of Catholics are still great. In the matter particularly of schools, Catholic parents in England and Wales (though not in Scotland) have to find some £60 million for capital expenditure alone. But the Church's own administrative machine has now been largely built; the old national cleavages have gone; and a Catholic middle class exists, though still relatively small. There is a new note of self-confidence and a new, less hand-to-mouth, policy seems to be on the way.

One Man's Meat

Social Insurance in Britain. By Charles E. Clarke, FIA. Published for the Institute and Faculty of Actuaries, by the *Cambridge University Press.* 136 pages. 13s. 6d.

This book is intended for students preparing for actuarial examinations. It describes, without comment, both the actuarial basis and the detailed provisions of Britain's social insurance schemes. The actuarial basis of the scheme rests on a number of "commutation functions" (drawn from information supplied by demographers) and certain data about future employment and interest rate levels (drawn from wild guesses supplied by economists). One of the "basic commutation functions" for example, can apparently be derived from the formula

$$\underset{65}{m}K^{mat}_{x} = \sum_{x}^{64} {}^{m}H^{mat}_{x}$$

The average future level of unemployment can be put at 8½ per cent—Lord Beveridge said so.

It is not Mr Clarke's purpose to differentiate between the accuracy of these two pieces of actuarial data. Nor is it his function to examine either the economic significance of the national insurance reserve fund—in which the dictates of orthodoxy have been satisfied by the public sector's acquisition of £1,000 million worth of claims against itself—or the social significance of a welfare scheme financed by an indirect tax on employment and a poll tax on almost the *entire population.* Mr Clarke's sole purpose is to provide hard facts for actuarial examinees—and he provides these in an admirably short, sharp, staccato style, completely devoid of padding. For all such students the book is to be thoroughly recommended—with deep sympathy.

The Natural History of Economics

The Foundation of Economics. By Walter Euchen. *Hodge.* 351 pages. 21s.

More perhaps than any other branch of human knowledge, economics has been and remains a battlefield of opposing methodologies; the deductive system-builders, the historicists with their insistence on time, place and social circumstance, the political arithmeticians who respect only the measurable, confronting one another with profound mutual distrust, propitious neither for the advancement of knowledge nor for the reputation of the science which they serve. Professor Euchen's aim, in this original, penetrating (and difficult) work, is to effect a reconciliation or synthesis—not, indeed, on that highest philosophical plane where the nature of knowledge is unavailingly debated, but at a practical level suited to the commonsense co-operation of different faculties and types of expertise—between what he calls the "individual-historical" and the "general-theoretical" approaches to the economic problem.

His method is to isolate from the various historically observed economic systems, not the "stages" and "styles" favoured by the German historical school, but a certain limited number of economic characteristics or forms which each system has, in varying proportions, historically exhibited. "Just as a huge variety of words . . . can be formed out of two dozen letters, similarly an almost unlimited variety of actual economic systems can be made up out of a limited number of basic pure forms," says Professor Euchen; and the bulk of his work may accordingly be figuratively regarded as an essay in alphabet-making. Exchange economy and directed economy, for instance, are not mutually exclusive; each household is a directed economy, whatever its relation to the whole system. The directed economy may be either totally centralised, or centrally directed with free exchange of consumers' goods; a market may be purely competitive, monopolistic or oligopolistic on the buyers' or sellers' side or on both; access to a market of any type may be "open" or "closed," with minor variants. Professor Euchen enumerates twenty-five types of market, all historically identifiable, each of which may be found functioning under various equally identifiable types of monetary systems; and presents the resulting "morphological scheme" as a means of "distilling scientific experience from the contradictory *pointilliste* experience of everyday life." He shows himself, however, well aware that it is one thing to know one's alphabet and quite another to be able to read off, at high speed, the complicated texts flashed on the screen of contemporary events. At the lowest reckoning his book should save much economic argument at cross purposes; at the highest, it may prove a signpost on the road to a truly scientific, as against a merely logical, or merely descriptive, economic discipline.

Reference and Text Books

The Stock Exchange Official Year Book 1950. Volume I. *Thomas Skinner. 2 Volumes £6.*

This is the 76th year for which the Stock Exchange Official Year Book has been published. The division of the contents between the two volumes, introduced last year, remains the same. Special information is given concerning companies in industries which have been nationalised and particulars of the proposed nationalisation of certain sections of the steel industry.

First Census of Manufactures, India 1946. Volumes I and II. Ministry of Industry and Supply, Government of India. *Government of India Press, New Delhi.*

These two volumes form the first report of the census of manufacturing industries in India which is taken annually. Statistics are given by industries and provinces and the census covers 29 industries of the 63 groups into which factory production in India has been classified. Although the report refers to 1946 it does not include any part of Pakistan or the States so that reports for subsequent years will be comparable.

Annual Review of United Nations Affairs, 1949. Edited by Clyde Eagleton. *New York University Press.* 322 pages. $5.

This book is an account of the proceedings of the Institute for the Annual Review of United Nations Affairs which forms part of the Graduate Programme of Studies in United Nations and World Affairs. The papers delivered to the Institute and the discussions which followed are printed and deal with the main sections of the United Nations organisation. The book is expected to form a critical companion volume to the United Nations Yearbook.

Wills and Executors. By E. S. Tomlin and Richard Clegg. *Crosby Lockwood and Son.* 137 pages. 7s. 6d.

This is a useful and practical guide to the making of a (simple) will and to the formalities of probate and executorship. It is intended for the man, or woman, left responsible for the administration of a small estate; with its aid, he, or she, should be able to complete the responsibility without recourse to professional aid.

The International Who's Who: 1950 *Europa Publications.* 1031 pages. 80s.

The 14th edition of the International Who's Who is complete up to May, 1950, and gives short biographies of those who are important in world affairs. For the United Kingdom it takes account of the changes in appointments which followed the general election in February.

Voters Play for Safety

Washington, D.C.

UNBIASED election forecasts had predicted that the Democrats would lose some seats in both the Senate and the House of Representatives, but would not be deprived this year (as they were in the last mid-term election in 1946) of majorities which gave them technical control of both chambers. Yet when this prediction was fulfilled, there was vast astonishment and immense excitement from Cape Cod to California. Wailing and lamentation arose from the Democratic compound, while on the other side of the fence Republicans could be seen braiding their hair and dancing in the streets.

The exulting voice of Mr Gabrielson, the chairman of the Republican National Committee, was heard crying:

> The American people have registered an emphatic protest against the policies of the Truman Administration. They are opposed to Socialism at home and to appeasement of Communism whether at home or abroad.

Mr Nixon, who won a Senate seat in California mainly by being the man who metamorphosed the Hiss case from a red herring—Mr Truman's incautious phrase—into a national scandal said: "I consider (the vote) a mandate from the people to make changes in the State Department." Mr Harold Stassen echoed: "I would assume . . . that Secretary Acheson would resign." In Ohio, Senator Taft, whom the battalions of organised labour had undertaken to bury but who was now sitting on top of the largest majority in the nation, observed, not too mysteriously, that "the results of this election are favourable to a Republican candidate for President" in 1952. In Pennsylvania Governor Duff, a liberal Republican, beat Senator Myers, the Democratic Whip; but he rather let the side down by saying:

> I'll be a newcomer to the Senate so I don't think I should make any statements at this time.

It was the exuberant Senator Wiley of Wisconsin who came nearest to blowing the gaff. Discussing his and Senator Taft's victories he said that his Wisconsin colleague, Senator McCarthy, was to be given a large share of the credit for awakening Americans to the Communist danger at home and abroad. He then seemed to sense that he had said rather a lot, and quickly declined to concede that Mr McCarthy's unproven charges that the Communists had infiltrated the State Department were the decisive factor behind the Republican gains.

There are those, however, who privately, off the record, not for quotation or attribution, are ready to admit that it could be that Mr McCarthy really did the trick. An honest Republican cannot make this admission with any great pride. For the truth, which is not concealed from honest Republicans, is that Senator McCarthy put up an appalling exhibition of demagogy. An honest American in either party, thinking back upon this election, will not lament because somebody won a seat or somebody lost one. What will disturb him will be that the mid-century United States, in the pride of its free education and college-trained millions and its ample and elaborate press and radio, has clearly demonstrated that voters can swallow and candidates can exploit a piece of shameless political sophistry.

For, although it can no doubt be convincingly argued that local issues and personalities influenced each result, the evidence that Republican candidates of almost all degrees of standing and stature, almost everywhere, cashed in on the prevailing state of uneasiness appears to be irrefutable. They were aware that people had been alarmed, that they had been persuaded to feel that something was wrong somewhere in the Government. In that sort of climate there was a ready-made audience for statements to the effect that the Democratic Administration had brought on the war in Korea by appeasing the Communists and "blundering" in the Far East, and that Mr Acheson was not to be trusted any longer with the conduct of the nation's foreign affairs.

A mild version of this line during the campaign, from an eminent Republican, was that the Roosevelt-Truman foreign policies, "influenced by Communists in the government," were "largely" responsible for "the present military strength of Russia." A cruder version, uttered by a less eminent Republican, was:

> Your boys wouldn't be dying in Korea today if a man named Alger Hiss hadn't been at Yalta and a man named Owen Lattimore hadn't been the big adviser to the State Department.

*

Many a voter, consciously or not, must have decided to play for safety. As sub-editors say: "When in doubt, leave out." Certainly it was the Communists-in-the-government line that defeated two of the Democratic Party's favourite candidates—Mrs Helen Gahagan Douglas in California and Senator Tydings in Maryland. The record of Mrs Douglas as an intelligent, fair-minded, liberal member of the House was simply obliterated by the record of her opponent, Mr Nixon, as the relentless exposer of Mr Alger Hiss. Senator Tydings was beaten by the politically unknown Mr John Marshall Butler because—or at least partly because—he had been the chairman of the subcommittee which dismissed Senator McCarthy's charges as groundless.

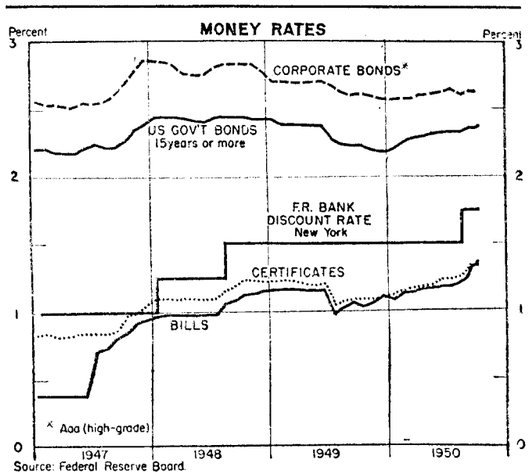
These are two bitter defeats for the Democrats, but the fall in Illinois of Senator Lucas, the Democratic leader in the Senate, is more bitter still. He was unseated by Mr Everett Dirksen, a man of great vigour who lately, to the plaudits of the *Chicago Tribune*, returned to the isolationism he had once renounced and assured the electors that to vote funds for Marshall aid was to pour money down a rathole. The departure of Senator Thomas in Utah and of Senator Myers in Pennsylvania fills the Democratic cup fuller; and still there are to be faced the triumphs of the Republican headliners, the "mossbacks" whose defeats would have been worth a guinea a box.

Senator Taft says he won in Ohio because the voters would not be dictated to by the "labour bosses"; and this is a credible explanation of his huge majority. The unions and their political henchmen overreached themselves: they distributed too much election literature and shouted too loudly, and their comic books ridiculing Mr Taft were too highly-coloured. Moreover their candidate, Mr Joe Ferguson, was rather too homespun for that part of the electorate which clung to the old-fashioned notion that a legislator should exhibit a grasp of contemporary affairs. The trade unions and their political henchmen took a drubbing, in Ohio and elsewhere. Out of nineteen candidates approved by "labour and liberal groups," thirteen went to the wall.

The new Congress will contain some new members of whom no liberal need be ashamed. There will be Mr Mike Monroney from Oklahoma on the Democratic side of the Senate, and Mr Duff from Pennsylvania seems unlikely to disgrace the Republican side. But there will also be a covey of case-hardened conservatives ranging from the Republicans, Mr Francis Case of South Dakota, Mr Dirksen, Mr Nixon and Mr Frank Carlson of Kansas, to the Democratic Mr Willis Smith of North Carolina, who defeated his liberal rival for the party nomination, Senator Frank Graham, with the use of such aphorisms as "If you want your wife or daughter eating at the same table with Negroes, vote for Graham." It is beyond dispute that Mr Truman's supporters in the Democratic party have lost prestige and influence as a result of the humbling of some of their outstanding personalities and the exaltation of conservatives whom they hoped to bring down. They will have to take what comfort they can from the knowledge that they have retained technical control of both Houses of Congress—provided that a recount in Connecticut, where the Democrat, Senator Benton, had a majority of only 925, does not reduce the Democratic representation in the Senate from 49 against 47 to an even 48 against 48.

The conservative coalition between Republicans and Southern Democrats will in future be strong enough to frustrate any Fair Deal legislation that it does not like. But since it has been doing precisely that ever since the Fair Deal appeared, the situation presents little novelty. Nor are the prevalent predictions that spending on foreign aid will be cut or killed as ironclad as they must look from Europe. The fact is that, for some years now, the inclination of Congress to authorise and appropriate funds for aid to the rest of the free world has depended more upon the behaviour of the Russians than upon the votes of the American electorate. The principal witnesses to this truth are the members of the Republican-dominated Eightieth Congress who launched the European Recovery Plan.

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.



FRB's War of Independence

[FROM A SPECIAL CORRESPONDENT]

THE principal duty of the Federal Reserve System, according to all the literature on the subject, is "to regulate the supply, availability and cost of money" for the greater good of the nation. To be accurate, however, this statement must be amended by the observation that not since Pearl Harbour has this central bank organisation been in a position to do its duty, except by accident.

By statute, a commercial bank that is a member of the Reserve System must maintain with the Federal Reserve Bank in its district a non-interest bearing reserve amounting to a specified percentage of its deposits—from 14 to 22 per cent at present, depending on the size of city in which the commercial bank is situated. If a bank expands its lending, it thereby creates new deposits and must therefore increase its reserves with the central bank by one-sixth or one-seventh of its new deposits.

In prewar days, when practice could accord with theory, the Federal Reserve had the initiative, by buying or selling government securities in the open market, to create or extinguish reserves, and therefore credit and money. By buying securities from the market and paying for them with its own credit, it added to the reserves of its member banks. By selling securities from its own portfolio, it reduced bank reserves and damped down commercial credit. These operations were usually accompanied by appropriate changes in the discount rates of Reserve Banks. But for the past ten years the Federal Reserve System, in spite of continued

Source: Federal Reserve Board.

pleas for flexibility in rates, has been obliged to support the obligations of the Treasury at the low yields the Treasury has set. The Federal Reserve has thus been deprived of its most useful tool for controlling credit and money. Commercial banks came to have huge quantities of "governments" during the war and can sell them without loss to acquire cash and new reserves, as long as the Reserve System stands ready to buy them at a pegged price.

During the war it was obviously necessary for the Reserve System to guarantee that the Treasury would obtain the money needed for war finance. After the war, however, and because of postwar inflationary pressures, the Governors of the Federal Reserve System began a mounting agitation for release from their straitjacket. Finally, on August 18th last, impelled by the acutely inflationary consequences of the Korean conflict, the Governors issued a declaration of re-independence. Bluntly they announced that they would use all measures at their command to prevent a further expansion of commercial bank credit, even if this meant a fall in government bond prices and a consequent rise in the cost of the Treasury's borrowing.

Had the Treasury agreed to the Governors' proposal for higher interest rates—or at least more flexible rates—the matter could have ended there. Instead, the Treasury showed its disagreement in the most forceful possible manner. On the same day as the Federal Reserve Board's declaration, the Treasury announced an offer to refund some $13 billion of maturing certificates and bonds with a new 13-month issue at 1¼ per cent, the current yield for those instruments.

The FRB dodged the immediate challenge. It absorbed the bulk of the new obligations at the Treasury's offering price. But at the same time it sold to the market, at prices slightly lower than the ones it had previously supported, about the same amount of government securities of other kinds from its own portfolio. By that exchange, the Reserve Bank in effect refunded the holders of the maturing instruments with Treasury obligations yielding them a slightly higher interest rate. The result was to push up the going rate on all short-term governments by about ¼ of 1 per cent. Since then, commercial bank lending rates have risen to an equivalent degree.

The battle now stands undecided. The next engagement will come on December 1st or thereabouts, when Mr Snyder, the Secretary of the Treasury, must announce the refunding of some $8 billion of maturing securities. If his offer is at the new, higher, market rates, the FRB will have won. If it is at the former rates, it will be a sign that the dispute is so serious that only Congressional action can settle it.

★

The FRB has already appealed to Congress on behalf of its lost power. Late in 1949 it took its complaint to a special subcommittee of the Joint Congressional Committee on the Economic Report. That group agreed unanimously that the FRB was, indeed, "powerless to restrict credit in general" as long as it was obliged to support the Treasury's low interest policy and to act as passive or ultimate buyer of price-pegged government obligations. The subcommittee recommended that Congress instruct the Reserve Board and the Treasury to base their policies for money, credit and debt management primarily on national economic considerations, rather than on the narrow aim of maintaining low carrying charges on the national debt. It further proposed that Congress declare its will to be

> that the primary power and responsibility for regulating the supply, availability and cost of credit shall be vested in the Federal Reserve System.

Mr Snyder naturally opposed the recommendation, doubtless seeing in it the camel's nose that would bring down the protective tent of his calm, assured and comfortable marketing apparatus. The Treasury argued to the subcommittee, as it now argues, that the only effect of the minor increases in the interest rate proposed by the FRB would be to raise by a large amount the cost of carrying the federal debt. The Treasury maintains that fluctuations of a fraction of 1 per cent in yields would not curb bank credit in the present boom situation: no bank that sees the prospect of a good loan at 4 or 4½ per cent would hesitate merely because the security it would have to sell, to get the cash and required reserves, was yielding interest of 1½ per cent instead of 1¼.

The President's Council of Economic Advisers, usually poles apart from the Treasury in economic outlook, backs it to the hilt in this case. It adds the argument that, if the FRB persisted and drove interest rates on governments up to the point where a banker would be faced with a real choice when making a new loan and selling a bond to do it, the federal debt-carrying charges would be intolerable. More important, the expansion of industrial capacity, which the CEA sees as the real solution of the present inflation, would be halted if credit became so costly. What are needed, the CEA asserts, are not general, but selective, curbs on credit extension.

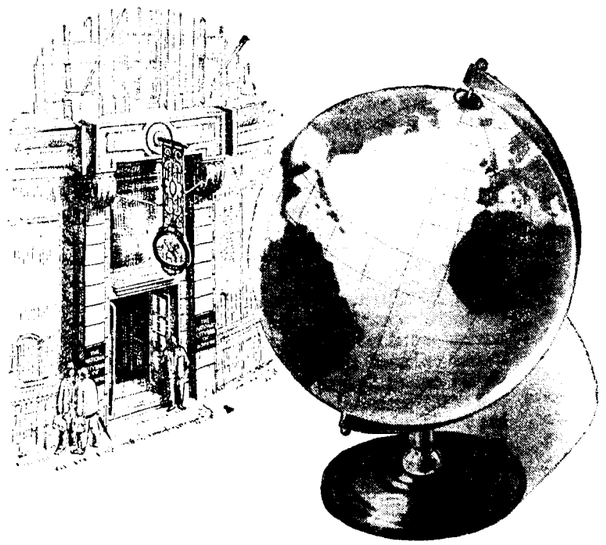
Supported and sustained by the findings of the Congressional subcommittee, the Federal Reserve gives every sign of persisting in its new policy. It makes light of the notion that a panic could develop as a result in the federal securities market; in its opinion, the greater danger to future sales of government issues lies in a public realisation that their values diminish day by day with continuing inflation. The FRB argues also that a good part of any increase that might result in the cost of servicing the federal debt would be recovered in income taxes.

It is still too early to measure the efficacy of what has been done so far by the statistics on commercial lending. But Reserve Bank officials insist that, for the future, the rise in money rates cannot fail to be an effective dampener. They consider it economic idiocy to assert, in disregard of all history, that the cost of money is not a profound factor in governing the extension of credit. The slight change of rates, and the injection of a small uncertainty into the market, will not stop all lending, nor are they intended to. But they will curtail the granting of marginal loans, and that is what is desired.

Should the Federal Reserve System lose in this dispute, its future as a semi-public, independent agency will be thrown into question. The prophecy is heard that, within five years, it would become a subordinate adjunct of the Treasury. If the Federal Reserve wins, however, it will once more be able to do the duty for which it was originally designed.

American Notes

Brakes for Industry



As Secretary of Commerce, Mr Charles Sawyer has been well advertised by the Administration as the businessman's friend. Last week, many American businessmen were pained to hear their friend say that voluntary controls on industry "just won't work" and that the government has decided to rely on compulsory controls to get the job done. And businessmen have no reason to believe that the job will be done quickly: one week earlier, Mr George Marshall, the Secretary of Defence, spoke of a four-year programme of military production to re-arm the United States and its allies.

Mr Sawyer and his National Production Authority have already started to apply the brake of government control to civilian production. Two months ago, the NPA issued a mild decree forbidding industry to stock 32 critical war materials beyond the "reasonable" demands of current production. A fortnight later, it set up a priority system which gives the government power to issue "Defence Orders" to factories to fill war contracts ahead of civilian goods. Last month, NPA tightened the brake a bit when it banned new construction of such entertainment facilities as bowling alleys and theatres; at the same time it told the steel industry to set aside enough steel in the first quarter of 1951 for 30,000 new railway goods trucks. It has also directed manufacturers of tyres to reduce their output by 16 per cent, and has ordered a 35 per cent cut in the use of aluminium for civilian products, beginning on January 1st.

With NPA still pressing only lightly on the brake, most producers of civilian goods are running as free as ever. They may be nearing the bend in the road: the Chairman of the National Security Resources Board, Mr Stuart Symington, is a firm supporter of "tough" controls and he has bitterly attacked manufacturers who have allegedly made big profits by restricting production and boosting prices. However, NPA can make few drastic changes in the working habits of American industry until it receives more information from the military services. So far the Department of Defence has issued no detailed plan of the exact numbers of planes, tanks and guns it will need.

For its part, the Treasury Department is proceeding on the safe assumption that the plan will be terribly expensive when it does appear. This week, President Truman sent a letter to the House Ways and Means Committee, urging early enactment of an excess profits tax. Mr Snyder, Secre-

Wide horizons

THE FINANCIAL PROBLEMS of businessmen with world-wide interests are best solved by a bank that thinks and operates globally.

Those who deal with the London headquarters of The National City Bank of New York enjoy the advantage of being served by a staff not only equipped to handle business in this country, but trained and experienced in the field of international banking.

Moreover, the London offices can call upon the skill and support of over fifty branches circling the globe, in addition to many hundreds of banking correspondents in every commercially important city of the world.

With its headquarters in New York, plus 850 banking correspondents throughout the United States, the Bank is very favourably placed to advise on the development of the vital two-way trade between this country and the dollar world.

Today, no less than 4,500 of The National City Bank's 11,000 employees are stationed overseas. Every 3 seconds, they serve a client—handling his financial problems with the understanding and proficiency born of over a hundred years of banking experience.

WHITE LEAD LADY

PAINTED *some two thousand years ago, this mummy portrait of an Egyptian Lady may be seen today at the National gallery . . . its condition almost as perfect as when the artist finished it. Among the pigments used in it was a familiar one . . . White Lead. It is a forceful tribute to the lasting qualities of White Lead that even twenty centuries of wear should leave it almost unaffected.*

By permission of the Trustees of the National Gallery, London

White Lead as a pigment gives—(1) Elasticity; the paint follows the natural movement of the surface it covers without cracking or flaking. (2) Great resistance to moisture. (3) Protection from the destructive acids of the atmosphere. (4) Long life; both on the job and in the tin.

ASSOCIATED LEAD PRODUCTS

ASSOCIATED LEAD MANUFACTURERS LIMITED

tary of the Treasury, followed this with a personal appeal for an excess profits tax of 75 per cent, to raise $4 billion a year. Although it was popular as a vote-catcher during the election campaign, the excess profits tax has strong Republican enemies in both the House and the Senate, while Administration leaders have differing ideas on how deeply it should cut into corporate income. Under these conditions, the chances are slim that an excess profits tax will appear on the statute books before the new Congress meets in January.

* * *

"Trying to Trouble You"

The steady succession of labour disputes on America's telephone lines suggests that the 600,000 employees of the Bell Telephone System are not as happy in their work as the company's advertisements imply. However, it is not they who for the past week have been trying not to connect telephone subscribers and have been happy to trouble them, but 17,000 striking employees of the Western Electric Company, another subsidiary of the American Telephone and Telegraph Company, which deals, amongst other things, with the maintenance and installation of telephones. As long as repairs are not needed, the strikers are dispensable, but telephone operators, who belong to other branches of the same union, the United Communications Workers, are reluctant to cross the picket lines round telephone exchanges. Except in Michigan, which has a full scale telephone strike of its own, local services have only been affected in a few places, notably New Jersey, where exchanges are operated by hand. But trunk service has been intermittent, in spite of the efforts of the supervisers and other non-union employees who have manned the long-distance switchboards.

The strikers, far too few to keep permanent pickets everywhere, have been switching them from one exchange to another, thus causing the maximum inconvenience to subscribers, who never know if they will get an answer when they pick up the receiver. The Bell System has now brought charges of "lock-out" down upon its head by refusing to allow its operators to work unless they will promise to brave picket lines if necessary. It is also appealing to local courts for injunctions against picketing. So far there is no sign of the strike being effective enough to force the President to use his emergency powers, as he has done before in nation-wide telephone strikes; he has already intervened in telephone negotiations once this year. Such intervention might not be unwelcome to the union, since it is alleged to weight the bargaining scales on labour's side.

Neither side seems particularly anxious to reach a settlement at the moment. The argument is over the duration of the contract—one year or two—and the size of the hourly wage increase—11¼ or 15 cents. Neither is very large beer as post-Korean wage rises go; but the Western Electric Company, with a practical monopoly in its field, can afford to be more intransigent than corporations with competitors waiting to pick up any workmen they let drop.

* * *

High Costs of Campaigning

When Mr Harold Stassen answered President Truman's political broadcast that wound up the campaign, the Republican National Committee pleaded poverty for its inability to buy time for him on more than one network, though the Democrats had assembled audiences on four to hear their star performer. Only a few weeks before, Mr Dewey had spoken affectingly of his party's lack of wealthy "angels." Preliminary figures show, in fact, that the Democratic National Committee is likely to have spent about $2,000,000, nearly twice the Republican total. Lack of return on past investments has certainly made contributors more reluctant to bring out their cheque-books when the Republican campaign manager calls. Some play safe by supporting both sides. But it is too soon to conclude that the party of big business has fallen on hard times. Many contributors, particularly when the Presidency is not at stake, like their candidate to know who his benefactors are, and these state and local funds may well outrun the national totals, especially when the year produces such exciting races as Senator Taft's successful bid for survival in Ohio.

The truth is that no one can give more than an informed guess about the part money has played in the campaign, or who paid the piper, though it is widely believed that the total this year has set a record for a mid-term contest. This is hardly surprising. The conventional costs of being elected have soared, with the cost of living, while costly television appearances have become almost a necessity and the comic book and helicopter travel have made their first, but probably not their last, appearances.

The reformers must take much of the blame for sending campaign contributions under the counter. In 1940, on a wave of moral indignation at the corrupting power of money, it was ordained that no individual campaign contribution should exceed $5,000, and that no committee operating in two or more states should spend more than $3,000,000. This has led to an immense proliferation of state and local committees subject only to state laws; the limit on the size of contributions is even more easily evaded. The ban on political contributions by labour organisations, which was to parallel that on corporate spending, has been got round by creating independent bodies. The Federal Corrupt Practices Act was so riddled with loopholes, even when it was passed in 1925, that it hardly requires evasion. A candidate for the Senate may spend only $25,000, but he cannot be held responsible for the generosity and enthusiasm of his friends; and even his own costs need not take account of postage, travelling expenses and telephone bills. Thus, though Senator Lucas spent $55,000 in Illinois, he contends that over $40,000 was exempt. Many candidates file accounts of their receipts, but there is no penalty for a failure to do so.

Not since 1944, when labour emerged as a political ally of Mr Roosevelt and stirred the House to investigate, has there been a thorough examination of campaign costs. Exactly how much the oil interests and Mr Louis Johnson's friends invested in Democratic success in 1948 has never been verified. If the Republicans are as poor as they profess to be, they could serve both their own and the national interest by supporting Senator Gillette's subcommittee in letting in some light behind the political scenes.

* * *

The Services Look at the Sky

From the labyrinthine depths of the Pentagon Building in Washington last week came the whisper of a rumour that the US Navy is making a fresh bid for the 65,000-ton aircraft carrier which was scuttled during the skirmish with the Air Force. Whether it dredges up its super-carrier or not, the Navy has noticeably recovered the *élan* which was dashed so badly last year. Naval aircraft have done well in Korea, and Marine Corps fighter pilots have made a spectacular display of their special military mission, the hedge-hopping support of an invading amphibious force.

On the other hand, Korea has been a big disappointment to the Air Force enthusiasts who thought the air arm could deliver a knockout blow anywhere, at any time. The outbreak of war found the Air Force primed for swift retaliation to an intercontinental attack, but just a little at a loss how to cut the supply lines of a highly mobile enemy moving quickly over a primitive countryside. And since most of its smaller aircraft were jet-powered interceptors, the Air Force was under-supplied with the type of tactical bomber best suited to support of ground troops. To fill the gaps in its tactical bomb-power, the Air Force was forced to order B-29 Superfortresses to fly low-level bombing missions. Air generals found that some of their pilots were disastrously unfamiliar with ground support techniques: some United Nations units

dodged more Air Force bombs than North Korean shells. Representative Vinson, Chairman of the House Armed Services Committee, has promised a full-dress investigation early next year of the alleged inadequacies of tactical air support.

The Air Force generals have a good defence. Their original estimate of sufficient air power called for 70 groups in 1948, and it was the President who whittled it down to 48 groups. The Air Force had little choice but to salvage its best weapon against intercontinental attack—the B-36 bomber—and to toss tactical bombing overboard.

Congress is now repairing in haste the damage done at leisure. The armed services have handed the Secretary of Defence a proposed $50 billion spending programme, more than this year's entire national budget, to begin next July. Under plans already made, the Air Force hopes to have 69 groups and 688,000 men by next June, and will eventually expand to 100 groups.

Some critics fear that increased appropriations may blind the services to the urgent need for a reduction in their lavish use of manpower. They point out that the Army uses 42,000 men in the rear areas to keep in the line a rifle division of 18,000, about twice the Russian ratio. Only by a careful reshuffling of all branches of each service can the United States hope to match the "bodies in the line" which Russia can muster. Presumably with the idea of accomplishing much the same thing on the home front, Mr Marshall, the Secretary of Defence, last week recommended a woman for what would normally be a man's job. The new Assistant Secretary of Defence, Mrs Anna Rosenberg, will have the task of spreading America's thin supply of skilled craftsmen over the swelling bulk of the defence industries.

* * *

Fine Weather for Farmers

To the Administration, rejected by the voters of all the mid-west agricultural states except Missouri, the farmers' ingratitude must seem sharper than a serpent's tooth. But in fact the farmers' thanks are due not to the Administration, but to the Korean war, for the sudden blaze of prosperity which has apparently driven them back under the Republican sunshade which they abandoned in 1948 when the rural sky was not so bright. The agricultural air has been cleared, for the moment, by the Korean storm. It has not yet brought about any noticeable change in the barometer of farm exports, but the barometers of farm prices and incomes are now rising faster than they were falling in the spring. And the Commodity Credit Corporation's threatening cloud of surpluses has become a rainbow of strategic reserves, which are melting away as rainbows do.

The defence programme will not only mean higher earnings for more people, but also a shortage of durable goods on which to spend them. The consequent demand for food means that the post-Korean rise in farm prices, now checked by seasonal influences, will almost certainly be resumed before the winter is over. That could bump the farmers' heads against food price ceilings, but Congress went out of its way to prop them up well above present levels when it authorised price controls. The Department of Agriculture, like other government agencies, sees expanded output as the answer to inflationary price rises and has resumed its wartime habit of urging farmers to grow all they can. Unless the weather lets it down, its exhortations will probably bring record crops next year. For even this year, when there were restrictions on planting and marketing, total agricultural output was only a little below the records of the two previous years.

The Department's problem child, the potato, did better than ever and government employees are celebrating its last season of price support by working overtime to destroy the unsaleable potatoes as fast as they come out of the ground. In the past some of them, and low-grade maize as well, have been made into alcohol, now badly needed as a raw material for synthetic rubber. But this year the government is buying alcohol from France, made out of the sugar beets which the French government itself acquired under its own price support programme. French oil importers have been required to mix this alcohol with petrol and Congress is already preparing to look into the Administration's apparent neglect of American farmers for the sake of French motorists.

Shorter Notes

Dr Gallup is eating "pheasant" instead of the "crow" he had to swallow two years ago; his poll forecast that the Democrats would have a two per cent margin over the Republicans in the House of Representatives, an estimate that is borne out by the election results.

*

A private financing scheme this week enabled Mr Henry Kaiser to hand a cheque for $91,476,989.92 to the Reconstruction Finance Corporation. He thus paid off, twenty years early, the government loans which in 1942 enabled him to go into the steel business and give the west coast its much desired steel plant, an enterprise that at that time seemed too risky to attract private backing. Under the new scheme this plant, at Fontana, California, is to be expanded to an annual capacity of 1,380,000 tons and a tin plate mill is also to be built.

*

The United States government has returned the superliner *United States* to the United States Lines. Unless plans are changed again, the ship will, when completed, carry tourists instead of troops, and will be the American champion in the competition for the blue ribbon of the Atlantic instead of the military transport which it was in danger of becoming after the Korean war broke out.

Private Kim and Corporal Lee

(From a Correspondent lately in Korea)

WHEN we first met those stolid battalions of Private Kims and Corporal Lees, in those early days of confusion and dismay when every line and aspect of the country seemed full of unknown and potentially hostile factors, he—the South Korean ally—was the biggest mystery of all. He was clearly for us, on principle ; over his improvised barracks and public buildings the signs stared in varying degrees of stumbling enthusiasm: "Well come United Nations!" and "Huray Huray for Democracy!" It was very soon equally clear that the signs, having been put up wholly by the local bankers and chamber of commerce associations, in no way reflected the emotions of Private Kim and his countless relatives, who appeared to accept them in the same spirit as they did the coca-cola boards and the wild irruption of two-ton trucks. From the very first it was quite evident that there were two utterly unassimilable armies at work on the defence and later liberation of South Korea. Such liaison as there was to be found was strictly at the administrative level ; further down, there was nothing. The language problem presented a barrier that no one seemed disposed to tackle ; there appears to be no acceptable form of pidgin-Korean, and even the old occupation Tokyo-hands with a grasp of Japanese found, in Taegu or Waegwan, that they might as well have been in Albania. No one complained, much. Orders were orders ; they filtered through. For the rest, there seemed little that the GI would wish to discuss with the Korean. From the start the enemy Korean was, inevitably, the Gook. Later, because of the virtual impossibility of distinguishing a North Korean from a South Korean—leading to some disturbing cases of misunderstanding and some dangerous infiltrations among the refugees—all Koreans became Gooks, a term it is impossible to apply affectionately. It was exasperating that, by and large, the most positive emotion felt by the majority of the United Nations troops was that of contempt for the people they were there to defend, but there it was ; the Koreans are not a likeable people, nor was the general civilian attitude, at the best, much more than a vaguely resentful acceptance of the tide of assistance. As for the South Korean ally, he waged his war in his own way, and it was seldom the GI way. It was not until mid-September, for example, that any attempt was made by the UN command to mix S. Korean and American units in the field, and then only tentatively.

Heroisms and Excesses

The Korean's character seemed full of Oriental paradox. Sometimes he would, quite literally and in a matter-of-fact way, lay down his life for you. Sometimes he—or his brother or father, or even his grandmother, dressed in the drab anonymous white of the country—would produce a grenade from a refugee's bundle and blow off your leg. As a soldier, he was variously capable of dramatic moments of military endurance and resource, and of mad bursts of headlong flight. But whatever he did or refrained from doing was a corporate United Nations matter ; he fought (at least theoretically) under the olive-branch flag.

It was never possible to obtain a firm and official figure of the number of South Korean troops in the field. During the entire summer "box" period their divisions were holding the whole right flank from Kyongsan to Pusan. They were at most times heavily outnumbered. The big call-up of July-August was undertaken to put 150,000 men under arms—or at least within reach of arms—in what must surely have been the most intensive short-term conscription drive ever seen outside a Communist country. The intake was vast, the training almost unbelievably rapid and cursory. The entire period of military drill and instruction took five days. The man was drafted at the age of eighteen. On the Sunday he might be at work in the paddies or the shop ; by the following Sunday he was in the line.

Quick-Witted Recruits

I made a study of this assembly-line process, the five-day manufacture of troops from peasants which could surely have succeeded nowhere but in the East. There was the taking of the oath—a curious matter which for some reason nobody took the trouble to publicise, though it seemed to have some bearing on the political implications of the campaign. Even at that time, when the crossing of the 38th parallel was still very much in the realm of theory and debate, the South Korean recruits were swearing, among other things, to "restore the unity of their country within its frontiers." From the moment the conscripts entered the barrack-yard work began ; each man was assigned a specific place in the team of a particular weapon—a mortar here, a Browning automatic rifle there—and instructed with the utmost intensity for eleven hours a day in the basic principles of its operation, without any pretence at time-wasting theory. Overseeing the process were two American master-sergeants from KMAG (Korean Military Advisory Group). Around them a group of Korean NCOs drove in the lessons with venomous whacks and thuds from a short stick on anyone foolish enough to appear slow-witted. Few were. The recruits were astonishingly quick at picking up the fundamental motions.

I observed the course through the person of a young student-conscript, Kim Chung-ki. Like so many Koreans with any pretensions to intellectual standards, he held himself aloof from the whole issue of the war as an ethical, or moral question ; he resented and feared it ; he expressed himself as strongly against the arrival of the Communists, but having to oppose them physically he disliked as a horrible interruption of his private life. He hoped, *faute de mieux,* to become an interpreter. In his second day he became a squad-leader ; from that point no other recruit in his sleeping-room might begin to eat the meal until he had begun. As a private soldier he would be paid at the rate of 1,000 *won* a month—about four shillings, with the *won* at 5,000 to the pound, in its wholly theoretical value. As a staff-sergeant he would get 2,000 ; a tech-sergeant 7,700, a master-sergeant 8,500 ; in the fantastically unlikely event of becoming a general he would be paid 25,000 Korean *won* a month. In the enlisted-man class, this was calculated at a bit under subsistence, as with most armies ; the price of rice was 3,000 *won* a *mah,* which is a little less than half of what a man eats in a month.

At the end of the five days he was loaded into a lorry and sent north-west, towards the South Korean Capitol Division. He did not, in fact, have a rifle, but he would in the line be stationed near to a comrade who had, whose weapon he might inherit. Later on, there would be guns. He made,

one has no doubt, an excellent infantryman, capable of considerable heights of personal bravery and certainly—as I frequently saw for myself—of quite remarkable physical phlegm and fortitude after physical injury. He had—it seemed equally obvious—the most sketchy and inadequate doctrinal understanding of what he was fighting about. Nor was that by any means confined to the South Korean ally. It seemed the more disturbing, however, in that the result affected him more closely ; moreover, he belonged to a nation whose educational standards are not low. One of the most striking aspects of Korea was the fact that almost without exception every building of any pretensions whatever to solidity or permanence was a school, or a college—a curious sidelight on Japanese colonial methods. At the outset of the campaign, however, every building of any quality at all was commandeered for this or that military purpose, and the pupils dismissed indefinitely ; the first result of the two-way war for enlightenment was the complete stoppage of all education throughout the country. Among the twelve thousand harrassments which will bedevil the United Nations Commission in the months to come, that factor has probably not been overlooked.

The Gray Report

MR GORDON GRAY, in his report to the President, has condensed into ninety-nine pages* an analysis of the future of American economic policy which contains everything that external observers of that policy could reasonably hope for. More important perhaps even than his recommendations are the major premises from which they are deduced. Unless, he says, the recipients of American aid are at one with American purposes in giving aid, the aid itself will bear a bitter fruit, if it bears any at all. In the past, Americans have been sometimes heavy-handed ; morale in many recipient countries is seriously low, and it does not follow from the fact that aid has been accepted that its purposes will be furthered. There must, therefore, be some recasting of the American approach to economic aid, and its new principles should be a greater recognition of identity of interest and a return to a partner relationship with the rest of the free world. Thus Mr Gray's advice to the Administration and to Congress is to take the long view and the broad view of economic programmes or they will not fulfil the objective of American foreign policy, which is to save the free world ; to see through the "Buy American" fallacy ; not to tie every dollar, and not to expect an immediate or tangible economic return from all assistance given. The time, he says, has come to base aid on an "overall assessment" of the global economic position and to abandon the project-by-project, country-by-country, calculations which have been the basis of Marshall aid.

Mr Gray's recommendations fall under three main heads—western defence, development, and commercial policy ; and in his argument he treats them as closely related, in logic and in practice. By the end of 1950, it was clear that the problems of recovery were nearly over and that there would be no further need for dollar subventions to Western Europe or Japan after 1952. The problems that remained related mainly to ensuring adequate export markets and they could and should have been solved, not by dollar grants, but, on the European side, by increased competitiveness, and, on the American, by increasing imports and outflow of free capital. Then came Korea, and intensified rearmament ; marketing problems disappeared overnight and the supply of dollars got longer, as a result of increased activity in the United States and of rising import prices. But rearmament brings new problems for the countries of Western Europe ; their demand for dollars becomes greater, and will do so increasingly, and the burden of increased military production imposes a new strain on their economies generally.

Some of this increased strain can be absorbed by existing resources, by cuts in current consumption and investment, by "aggressive measures" to eliminate all under-employment of resources, and by increased productivity through reduced protection. Some of the increased strain—but not all of it if rearmament is to be adequate, and the economic and political health of the countries concerned is not to be prejudiced. United States aid will be needed, in addition to military equipment, to bridge the gap for at least the next three or four years. Its object should be to help finance partly their increased foreign exchange requirements, and partly the burden of increased military production. It is not explicitly stated that this aid should be "free" but by implication it is fairly clear that at least part of it should be so. Nor is it clear whether existing aid to Western Europe, other than through the European Payments Union, should be discontinued, but Mr Gray implies it might well be revised, and possibly replaced altogether, by aid on the new basis.

Increasing Resources

Against the background of the western defence effort, development of the under-developed areas acquires a new urgency. Here, Mr Gray strips the wool from the eyes of those—and there are many of them—who still believe that private investment, with a smattering of government-financed technical assistance, will do the trick. Private investment, he agrees, is the most desirable means of development, and the original Point Four proposals for investment treaties, and guarantees to private investors, should be enacted forthwith. But in the early stages, before the development of basic services, its function can only be strictly limited even if investment conditions in under-developed countries were not so inherently unattractive, and, Mr Gray insists, what private investors do not do, public funds must. The International Bank and the Export-Import Bank should between them achieve a net outflow to under-developed countries of $600 to $800 million a year, as compared with total authorisations of $462 million and net disbursements of $144 million in 1950. He agrees that the inadequacy of their past activities was due to lack, not of funds, but of opportunities, but believes that it was also because of restrictions on the type of financing which these institutions were prepared to undertake. In future, this must be broadened to include lending not merely for the dollar needs of the borrowers, but for their internal costs as well, and there should be a "general policy of permitting" untied dollar loans. Grants may also be necessary, as an initial incentive, or where the particular project cannot finance the servicing of a loan, and total annual expenditure on grants and technical assistance should be increased from $150 to $500 million per annum.

Into the same context, Mr Gray places his views on United States commercial policy. The freeing of world trade from discriminatory restrictions remains "an important object of United States economic policy." If this was true before rearmament, it is doubly true now. Short of a total mobilisation of resources only possible in time of war, part of the long-term remedy for world shortages must be to increase both the volume of existing resources, and the efficiency of their use, through increased competitiveness and reduced discrimination. Further, under the threat of serious inflation, the United States itself cannot afford to continue restrictive practices—it is something of a shock to find Mr Gray applying to the United States the familiar British cry of "competing claims on our limited resources."

Mr Gray recognises at the outset that the extent to which other countries can afford to move in this direction is largely a function of the United States own trade practices. So he makes perhaps the most revolutionary statement in his whole report—"This Nation has nothing to fear and much to gain from liberal trade import policies." The first thing, therefore

* "Report to the President on Foreign Economic Policies." US Government Printing Office, Washington, D.C. 40 cents.

is for the United States to provide its own economy. Congress should ratify the charter of the International Trade Organisation; it should extend for a four-year term the President's powers to reduce tariffs under the Reciprocal Trade Agreements Act; it should review its agricultural support policy and the cargo preference system for American shipping; it should pass the Customs Simplification Act of 1950, and it should repeal the Act of 1933 which obliges government purchasing agencies to discriminate in favour of domestic suppliers. Simultaneously, the United States should encourage its foreign partners to move towards convertibility; it should continue dollar aid through the European Payments Union as the first step in this movement, and it should consider now, for application when the time is ripe, the possibility of easing the last stages of their journey by the provision of stabilisation credit.

In return, Mr Gray asks only this of European beneficiaries—that they face up to the impact of "vigorous competition," and that they fully employ all their resources. Without this, Western Europe's economic potential will be seriously and unnecessarily limited, and America will not be able to afford the additional burden. He does not attempt to demand an immediate return to convertibility and, indeed, his assessment of Britain's financial position as affected by rearmament is extremely sympathetic. But he asks for some forward move, and in particular, for the removal of all barriers to free trade which are not necessary to safeguard essential foreign exchange reserves. There is evidence, in these passages of the report, of compromise drafting—doubtless to meet the wishes of the State Department and of the Treasury. Thus in one place, the restoration of enough convertibility of currencies to permit the settlement of deficits "with any currency area including the dollar area" is described as the minimum that the United States should require; in other places it is recognised that to restore the full convertibility of currencies, and particularly of sterling, will take a long time. Perhaps the most significant part of the report is its willingness, in the interim, not only to tolerate the discrimination against the dollar that is inherent in the sterling area and the European Payments Union, but to welcome them for the partial multilateralism they permit.

German Industry Reaches a Landmark

The Reorganisation of The Ruhr

[BY OUR SPECIAL CORRESPONDENT]

THE reorganisation of the heavy industrial combines of the Ruhr under Law 27—the tripartite successor to the Anglo-American Military Government Law 75—has become of increasing urgency in recent weeks. Both Germans and French have now made demands in regard to the Law a condition of the Schuman plan; and the plan is in turn a French condition for allowing a German force to take its place in a European army.

The complex history of Law 27 dates back to 1945 when the Ruhr lay prostrate, and the British assumed trusteeship of the heavy industrial combines, in order that the operating companies might get on with production, and the old owners be removed from power. By "Operation Severance," 25 steel companies were cut out of six big combines—the Vereinigte Stahlwerke, Krupps, Mannesmann, Kloeckner, Hoesch and the Gutehoffnungshuette, and worked under British supervision. The separated coal mining companies operated under the very efficient control of the British. It might be said that this interim period saw the end of the power of the former "Ruhr barons" with family interests in the concerns, and a new era of power for the company managers.

With the idea of ending the uncertainties of this emergency period, the British, now joined by the Americans, promulgated Law 75 just three years ago. From the start this measure suffered from the fact that it mixed punitive political aims with economic proposals, and so made German opposition inevitable. It set out to break up excessive concentrations of power in German heavy industry and to prevent the return of the old owners, on the grounds that the past organisation and personalities had fostered war. At the same time, it laid down that the industry was to be regrouped on the most efficient lines, and that the German Government was to have the last word on ownership. Finally, the Allies were to retain the right to reject the German plan for reorganisation, and to formulate one of their own. The German plan was to be drafted by two bodies working under the Allies, the steel trustees administration and the German coalmining control (DKBL). They could keep the Federal and *Laender* Governments informed, but no more.

The steel trustees and the DKBL have worked separately and at different speeds. The DKBL reached agreement with the miners' union on the need to separate coal from steel, and presented a draft plan to the Allied control authorities some weeks ago, which called for the setting up of some 23 different coal companies. The steel trustees have faced a much more complicated task. They are, however, far advanced, and, given their head they could probably regroup the industry in a few months.

Should Steel Companies Own Coal?

A long time ago it was plain that the trustees would be glad if the Bonn Government would intervene and relieve them of some of the responsibility of their vital task. But the first intimations last year that the Government wanted to have a share in the decision met with refusal from the Allied side, on the ground that unpopular measures would have to be taken and it would be better if the Government did not bear the responsibility for them.

A further claim of old standing is that the shareholders in the liquidated combines shall be given the right to exchange into holdings of the newly-established companies. The Germans attach great importance to this point. It is, however, not clear how the exchange could be effected, since the new concerns are to be formed out of parts of others in a general reshuffle; but it is also not clear how the capital is otherwise to be found.

Finally, the steel trustees have met with extreme difficulty in deciding the crucial question: shall the new steel companies own coalmines, and if so, to what extent? Pressure has been great from some trusts to reform the Ruhr on much the same basis as before. For the steel interests, the power to control coal is obviously a great advantage. The French, however, see that their own steel companies in the Schuman pool will be placed at a disadvantage if the Ruhr steelworks can continue, as before, to manipulate coal prices to their own benefit, and have assured supplies when others may go short.

The whole question has reached a new climax. German indignation at the "interference" of the occupying powers came to the surface when the announcement was made in September on the authority of the Allied steel control that most of the big holding companies were placed in liquidation. This announcement came three days after the Foreign Ministers' communiqué proclaiming a new era in freedom for Germany. It was of no avail to point out that the step was laid down in Law 27, that it did not mean liquidation in the sense in which the term is understood in German law, and that the companies would continue to operate. Dr Adenauer lodged a protest, and let it be known that unless the Allies handed over to the Germans there would be little

BP PLAYS A BIG PART

IN BRITISH PROGRESS

The rapid development of Anglo-Iranian Oil Company's home refineries HELPED TO END PETROL RATIONING in Britain.

The steel column of this crude-oil distillation unit recently installed at Llandarcy, the BP refinery in South Wales, is over 150 feet high. Constructing and erecting this new unit made a full-time job for 1,500 people in 1949.

The vast resources of
ANGLO-IRANIAN OIL COMPANY, LTD.
are behind the BP trade-mark—your guarantee of Better Performance when Better Petrol can be made again.

'Recordon' is more than a dictating unit. This remarkable machine enables you to record the most personal and secret correspondence without any fear of unauthorised transcription. The paper discs can be posted in an ordinary envelope and played back on a 'Recordon' using the matched Codit scrolls. This is only one of the many ways in which the 'Recordon' method has superseded other forms of dictating units.

£49 10s.

Microphones and receivers extra according to the types required.

Incentive

THE SHAREHOLDERS of John Laing and Son Limited are working members of the firm. You will find them driving cranes or mechanical shovels, laying bricks or leading a gang, costing contracts in detail, managing or directing—active in some way as part of the team at home or overseas.

Not every member is a shareholder. It is a privilege reserved for long service, loyalty, ability to lead and to set an example.

So at key points, from head office to the remotest site, are men to whom the firm belongs. That is the finest incentive in the world, and the surest guarantee of good work for those who entrust their construction to John Laing and Son Limited.

hope for the Schuman Plan. The Bonn Government claimed the right to take responsibility for the future of the Ruhr. It was rumoured that the Government's experts had prepared a draft scheme of their own, which called for the reconstitution of the link between steel and coal.

Since then the Government, the trustees and the DKBL have combined to agree on a draft for presentation to the High Commission; but the Commission has not consented to hand over the decision to the Germans. Their agreed draft is not yet public. Reports say that it is a compromise on the Government's first plan, in that it proposes no fewer than 20 steel concerns and 23 coal companies. The extent to which steel shall own coal is, however, still not agreed, though the Bonn Ministry of Economics has suggested that 20 per cent of Ruhr coal should be in the hands of steel companies, instead of 55 per cent as before.

Formidable opposition can be expected from the German trade union leadership to any plan which places the coal industry at the mercy of steel, and allows the old owners to regain their holdings. The union leadership is preparing to battle for the removal of the former Ruhr industrialists, and for a form of socialisation which would place 50 per cent of power in the hands of representatives of the trade union headquarters. They are not concerned with the break-up of trusts, as such, nor with nationalisation on the British model, but with this matter of power for the union. One of the main reasons why the German steel industrialists and their associated politicians so strongly object to Allied policy hitherto is that they are wrongly convinced that it has favoured the unions' aim.

In spite of the long drawn out period of uncertainty, the steel companies have invested astonishingly large sums from their own resources and have expanded production by 41.3 per cent in the past twelve months. As an instance of their financial strength, the Huettenwerk Rheinhausen may be cited. This company, "deconcentrated" from the Krupps concern, invested no fewer than DM 25 million (over £2 million) in repairs and reconstruction between June, 1948, and September, 1950. The process of writing down these investments, in order to start afresh the process of building up hidden reserves, will doubtless be resumed by this and similar companies. But even the maintenance of present production, it is claimed, requires the investment of DM 1,000 million a year.

How Much More Steel?

The boom that followed Korea has been astonishing. The volume of orders in September this year was nearly four times as great as the average for 1949, and was more than double production. The United States entered the market with a rush, and over 1,200 tons of steel a week have been going from the Ruhr across the Atlantic.

The question of expanding capacity is likely to become acute. At present capacity is about 14½ million tons of crude steel a year, and production is running at about 13 million tons. The iron and steel industry as a whole is only working at 90 per cent of the 1936 level, compared with an overall industrial level which is 21 per cent above 1936. There is, therefore, room for further expansion of output; but the Ruhr is deeply concerned with the fact that its industry is twenty years or more behind its competitors in modernisation, and in particular, lacks a continuous strip mill for the mass production of sheets. The post-Korean boom, it is hoped, will strengthen the German claim that they should re-equip the Thyssen works to produce a million tons of steel and instal a strip mill for processing this output. The Reichswerke (former Hermann Goering works) would, under German plans, be re-equipped to produce 500,000 tons of steel. So far, however, the western powers have not given their permission for any expansion of capacity. All that has been conceded is that production for export to the West will not be counted in the ceiling of 11.1 million tons of crude steel per annum.

New Order in China—II

[BY OUR HONGKONG CORRESPONDENT]

THE Manchurian region, beyond the Great Wall, is organisationally separate from the rest of China; forming a closer appendage of the Soviet Union proper, it seems doomed once again to participate in a "bloc development," this time tied not to Japan but to Russia. Manchuria is partly under direct Russian occupation, and wholly under Russian supervision. The executive functions are there greatly decentralised and departmentalised, but control and decisions are highly centralised. The emphasis is on "industry," as it was under the Japanese. Soviet advisers are found in most offices of government, and Soviet technicians or experts in the main state enterprises. The private sector comprises a host of small workshops; these are restricted to finishing processes, and are under steady pressure either to amalgamate into controlled co-operatives or to merge with government undertakings.

Stakhanovism is applied in an extreme form, and there is "socialist competition"—units or districts challenging each other in duels for increased production. There are consultative committees, in which workers are invited to further production and rationalisation, and are privileged to put forward their own views as to how their own labour may be intensified. This drive in the factories has done quite well, owing initially to the artisan enthusiasm of the workers and later to the adroit direction of the flow of consumer goods to give them preference over other classes. Coal mining claims 90 per cent of the output reached during the Japanese occupation, though it is admitted that only 50 per cent of the equipment—removed by the Red Army in 1945—has been restored. Electric power generation has returned to about two-thirds of the Japanese peak, non-ferrous metals to about a quarter, textiles to a similar fraction; it is claimed that the chemical industry is fully rehabilitated, but admitted that paper pulp production is insignificant compared to "Manchoukuo" levels, while the manufacture of machinery is also extremely low, since the Russians largely removed such items as machine tools. The railways are working well, under Russian staffs.

Defects Of Stakhanovism

The Sino-Soviet Pact of 1950 deals mainly with the rehabilitation of Manchuria, and the industrial loans under that Pact chiefly provide for the restoration of the equipment looted by Russia (though the sums mentioned appear inadequate even for that purpose, if the figures of the Pauley Mission are accurate). Further industrial revival in Manchuria is therefore probable. The defects of Stakhanovism are, however, already apparent; it drives everyone to an unscrupulous struggle for output at all costs, with a general disregard for quality and for the depreciation of plant.

Agrarian reform has been completed in Manchuria, on exactly the same basis as in the Soviet Union. The total cultivated area is, however, still short of the figure maintained under the Japanese. Though the redistribution of land removed the big landlords, it generally left the former tenants with land but without tools or capital to cultivate it. *Kolkhoz* arrangements are proceeding slowly to overcome these difficulties, but the general level is more primitive than ever.

Accounts of the social framework in Manchuria thus indicate a basis similar to that found in Russia itself. The North China region appears rather as a half-way house to this stage of Communism. Peking is an administrative and intellectual centre; there has been only vague talk of its industrialisation. It is quite a stage-post for indoctrination; in which it appears that the attention was first concentrated on the higher levels. The maximum use was made of the disgust felt by all intelligent and educated people against the Kuomintang, and the practical "bankruptcy" of the west

was stressed, and contrasted with the honest realism of the people. Intensive courses, and the astonishingly effective use of infinite repetition, soon make the appropriate jargon a habit; and even the best minds are quickly silenced or neutralised. The student movement has always been a mainstay of Chinese Communism, and undergraduate enthusiasm (with, at last, the prospect of rapid promotion for this class) is fully utilised.

Private Enterprise Controlled

Of the industrial aspect, Tientsin is the best example in this region. As in Manchuria, the major undertakings have been nationalised; there are now 69 government owned factories in Tientsin with over 40,000 workers (40 per cent of the factory population), all having electric power and full mechanical equipment, against more than 10,000 private workshops, which have an average of only six workers each, and only 30 per cent of which have any power-driven machinery. The state sector, as in Manchuria, employs Stakhanovite methods and presses hard to absorb the private sector. In North China, there are larger entrepreneur and merchant classes than in Manchuria, and the preliminary struggle has been to get these under full control. The liberation (end of 1948) was followed by a very severe slump; trade and industry were practically at a standstill during most of 1949. After the liberation of Shanghai, however (May, 1949), trade and transport revived. During this revival, the state sector was "consolidated" on the lines indicated above. Thereafter, a more direct squeeze was put on the private sector. Merchants, manufacturers and others were invited to make "voluntary" subscriptions to Victory Bonds; collectors would call, who specified the sum the concern was expected to contribute, and displayed an exact knowledge of its bank balances (sometimes even of its accounts held abroad!).

This technique, plus penal taxation, halted the inflation; but it brought the collapse of the boom, and thousands of bankruptcies. It was accompanied by a selective use of "encouragement loans," to put private concerns into a state of dependence on government credit. The administrative system is similarly used as a "class weapon"; disfavoured activities have to go through an incredible complexity of bureaucratic procedure, but the latter is magically short-circuited for any transactions of which higher authority approves. Tariff and exchange controls were also effectively used. This policy may now, it appears, have achieved its objectives, for recently the pressure has been eased in all these respects; and life in North China is not altogether gloomy, from the "petty-bourgeois" point of view.

In Shanghai, in the zone of the East China People's Government, heavy fines, damages for past or present misdeeds, constant wage-increases, and inordinate taxation were imposed on employers after the liberation. By such measures of class war, the capitalist class was brought to its knees; broadly speaking, this procedure has been used in this zone, rather than the discriminatory development of state-ownership.

Russian Mystery Men

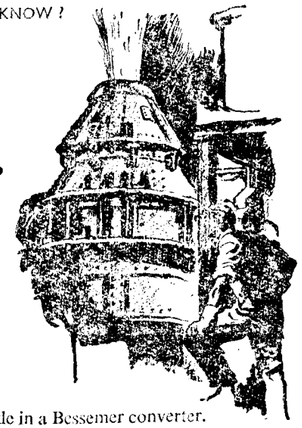
In the matter of indoctrination also, there appears to be an interesting difference in the East China Region. With the double aim of "debunking" the technical superiority of the Occident (with which Shanghai especially was familiar) and of enticing the best technical and organisational talent of the area to go north, great stress has been laid on the qualitative superiority of Russian technique. More generally, the effort is made to foster to the utmost that longing for industrialisation which looms so large in the Asian mind today.

Various reports have been given of the presence of Russians in Shanghai and elsewhere; these accounts have generally a sensational tinge. Evidence suggests that these Russians are to some extent "built up" for Chinese popular consumption, as Mystery Men. They work in fact for the large Soviet state trading organisations, for the Sino-Soviet airlines project, etc.; but it is also suggested that they are to work, in "back-room" fashion, some miracle for China, and are generally to exemplify Russian technical superiority. Anti-Russian feeling in China is strong in some respects; these aspects are studiously avoided in education and propaganda, and replaced by this stress on Russia's technical promise for China.

Only in a partial and modified form have all these motives and procedures of the great "overturn" as yet reached the vast areas and hinterlands of south, central and western China. There, the land reforms have largely been halted, and industrialisation is not immediately to the fore; the Communists hold all the key points, and have reformed procedures in every respect. Famines rage, banditry is rife. Political and economic life is largely in abeyance; the general criteria are those of carrying on, on the present interim basis, till a new stage is reached—which eventually appears to depend on external, rather than internal, events. Canton and other southern cities are experiencing stagnation and lethargy. State control is cumbersome, and defensive rather than (as in the north) aggressive in its policy. Yet, despite all this, and despite the widespread breakdown of that extensive and complicated network of personal and local contacts on which the economic life of these vast regions depends, there continues a fair volume of trade; and the age-old industriousness of the inhabitants may still be described as antlike in its persistency.

Butter and Guns for Denmark

[FROM A CORRESPONDENT]



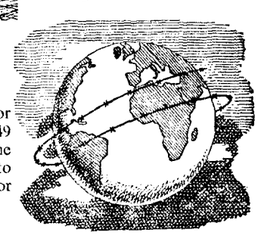
THE first act of the new Danish Cabinet, which took office on October 28th under an Agrarian Prime Minister, Mr Eriksen, was to abolish butter rationing. One of its next acts was to introduce in a modified form the measures which all parties except Communists had agreed as long ago as August were necessary to finance Danish rearmament. It was on the incidence of these new taxes and loans that the extraordinary general election was fought in September. When the Rigsdag reassembled the Social Democrats, who had gained two extra seats, reintroduced unchanged their proposals for raising the extra money necessary for defence; and the acceptance of these measures by the opposition had created the impression that the recent deterioration of Denmark's economic position was bringing the parties together in the face of difficulties. It was therefore a surprise when, a week later, Mr Hedtoft's government was defeated—although only by 69 votes against 68—when it resisted a proposal for the immediate abolition of butter rationing.

Having prudently abolished butter rationing in face of the public feeling on the matter the new Government, which consists of seven Agrarians (*Venstre*) and six Conservatives, has now to face realities—and to try to make the Danish people do the same. The new Finance Minister, in a broadcast on November 1st, made an excellent start. Although there are mitigating factors, the blunt truth is that Denmark has for some time been living beyond its means. In the first nine months of this year imports, on a total trade of 7,525 million kroner, exceeded exports by just over Kr. 1,072 million. During October the net foreign exchange position of the Central Bank deteriorated by nearly Kr. 2,000,000 a day. This is a disappointingly unhealthy situation in view of Marshall Aid and help from other international agencies.

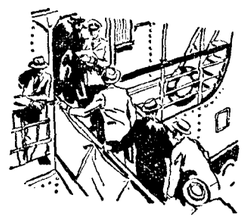
Deflationary measures are therefore being taken. On November 2nd the bank rate was increased from 4½ to 5 per

HOW MUCH DO YOU KNOW?

Can cold air heat metal?



YES, when steel is made in a Bessemer converter. A blast of cold air is forced through molten iron and raises the temperature by as much as four hundred degrees Fahrenheit. This burns out the impurities and changes the iron into steel. So high is the temperature produced in the converter that it would melt a garden roller like a lump of sugar.



HOW hard can a hammer hit?

Steam hammers used for forging steel can strike a blow of 100 tons but the workers operating them can make them tap a watch glass without breaking it.

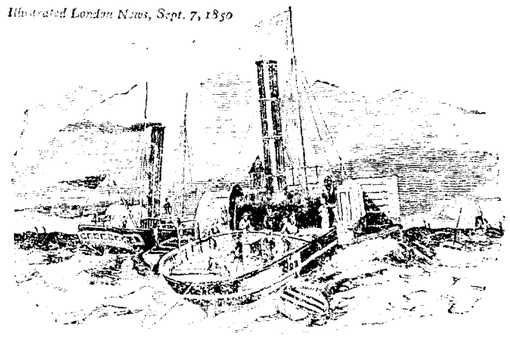
A Fence around the Earth

The amount of barbed wire for fencing made in Britain in 1949 would go 1½ times round the earth. A great deal of it goes to New Zealand. It helps to pay for the wool we need for clothes.

Do young steel men travel far?

In Skill and Enterprise

STEEL



is serving you well

Many young steel men and students are sent abroad each year by the industry under a regular exchange scheme. They go to France, Belgium, Luxemburg, Holland, Germany and Sweden, and also as far as Australia. This scheme is just part of the industry's training programme to extend general as well as technical knowledge. Progress in British Steel depends on the skill, enterprise and knowledge of all who help to make it.

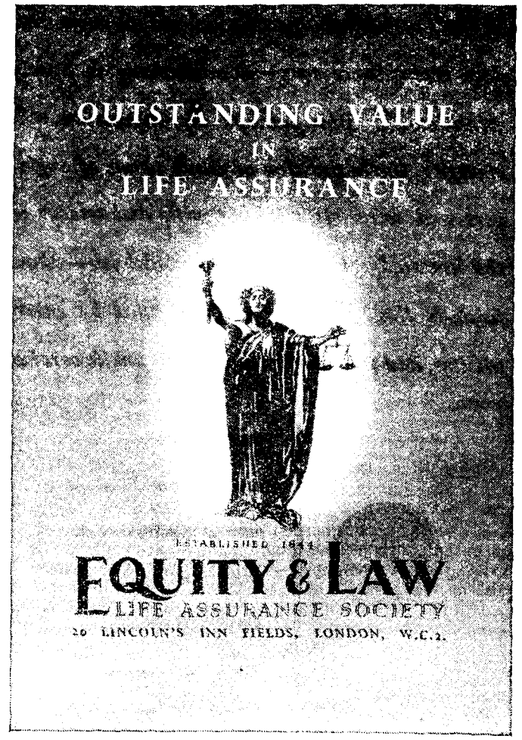
Illustrated London News, Sept. 7, 1850

The first small thread



Just a hundred years ago the good ship "GOLIATH" laid the first submarine telegraph cable across the Dover Strait. How many would have realised then that this endeavour was the first small thread in a web that was to cover the whole world with a complicated system of Telecommunications?

To-day the 155,000 miles of ocean cables, owned and maintained by Cable & Wireless Ltd., are constantly humming with news flashes, business deals and communications of State. The Company operate overseas telegraph stations in the Crown Colonies and many foreign countries. Their cables link United Kingdom postal telegraph offices with the Commonwealth cable network.

SIMON ENGINEERING GROUP

Aspects of enterprise

No. 1.

This series of announcements deals in a random way with some aspects of the Simon Engineering Group's activities, organisation and management. Any resemblance to good advertising is purely coincidental. But perhaps an impression will emerge: the impression of many teams of engineers and scientists working with enthusiasm in the knowledge that they do a useful job—whose faith is that private enterprise must be enterprising, and that its justification is public service.

A sensible policy for process steam No. 23

Heat transfer summing up

BY SPIRAX

The earning capacity of a process steam plant is decided finally by what happens at the actual point of steam usage. *The deciding factor is the rate at which the heat is able to get from the steam to the stuff being processed.*

In this series of Notes we have described, though briefly, steps which will achieve a higher rate of output and reduced level of costs. This is a summary:

(i) *Meter the steam supply to each department so as to check excessive consumption and to keep proper track of departmental costs;*

(ii) *On the steam supply pipe to each process heating unit fit a small steam separator, so that the steam goes in as dry as ever possible;*

(iii) *So control the discharge of air and condensate from the steam spaces that as much heat as possible is transferred from the steam at a maximum rate of transmission;*

(iv) *Make all practicable use of any "waste" heat from the steam.*

The methods are well tried and by no means expensive. And they are highly effective.

Correspondence to: **Spirax Manufacturing Co. Ltd.** (Economist Enquiries), Cheltenham, Glos.

NOTES ALREADY APPEARED: *Jan. 14*, "A sensible policy for process steam"; *Jan. 28*, "Who controls your steam plant?"; *Feb. 11*, "Do you get full value from your steam?"; *Feb. 25*, "What steam costing will tell you"; *March 11*, "Meter your steam and prevent steam wastage"; *March 25*, "Why have a boiler house?"; *April 8*, "Steam of proper steam wisdom"; *April 22*, "Forces beyond our control"; *May 6*, "Four rules to cut the costs"; *May 20*, "Removal times a process economy"; *June 3*, "Removing the air film handicap"; *June 17*, "Increasing the air film handicap on process output"; *July 1*, "Individual steam separation"; *July 15*, "Water film assisted steam traps cleaned"; *July 29*, "Better steam trapping, better output economy"; *Aug. 12*, "The steam circulation system"; *Aug. 26*, "Steam pressure under control"; *Sept. 16*, "Thermostatic control simplified"; *Sept. 23*, "Intelligent use of 'waste' heat from steam"; *Oct. 7*, "Flash steam on the agenda"; *Oct. 28*, "Better condensate return systems"; *Nov. 11*, "A place for the automatic pump."

STILL TO APPEAR: *Dec. 2*, "The seven best-known plant process steam"; *Dec. 16*, "Two instructional courses for steam executives"; *Dec. 30*, "Professional advice on process steam problems"

HALT! WHO GOES THERE?

Unless it is stopped, corrosive water eats insidiously into the iron and steel pipes of many industrial water systems. This corrosion is a trouble-maker which brings dislocation of work and high maintenance costs in its train. But Calgon (Albright & Wilson's Sodium Metaphosphate) introduced into the system by what is known as Threshold Treatment will halt corrosion and banish the troubles that arise from it. A few parts of Calgon in a million parts of water effect a cure — a cure which our technical department will be pleased to discuss with you.

cent. Last week came a whole series of new financial measures. They have a twofold purpose. Firstly they will meet the cost of the new defence measures which Denmark intends to adopt as its contribution to the strengthening of the Atlantic Treaty Organisation. (The pressure of events and of the military committee of Nato comes opportunely at a time when important changes are being made in the structure of the Danish armed forces.) Secondly, the bills will help to right the adverse balance of payments and counteract inflation. Altogether, in direct and indirect taxes as well as loans, they are estimated to bring in Kr. 885 million. There is a proposed defence tax to yield Kr. 200 million in the next two years, a purchase tax to bring in Kr. 300 million, a defence loan of Kr. 150 million, compulsory savings on all incomes over Kr. 8,000 (about £400) a year which should yield Kr. 170 million, a bachelor tax to yield Kr. 35 million and a tax, estimated to produce Kr. 30 million, on all profits resulting from devaluation. The effect of these measures is to increase Danish defence expenditure to a sum equivalent to about 4 per cent of the national income. On the deflationary side they are accompanied by proposals to cut government expenditure by about Kr. 100 million.

The proposed incidence of these taxes rather than their existence has aroused strong political reactions. Yet they represent a considerable part of the money the Government intends to raise in the 1951-52 fiscal year, when total revenue is put at Kr. 2,163 million and expenditure at Kr. 2,151 million, of which Kr. 364 million will be for defence, apart from the new tax. That they come as such a shock and amount now to so much is a measure rather of what was not done earlier and more gradually than of the actual severity of Denmark's military or economic position.

The Lucknow Conference

[FROM OUR CALCUTTA CORRESPONDENT]

THE Institute of Pacific Relations Conference at Lucknow in October on "Nationalism in South-East Asia" seems in retrospect to have been as rambling and fascinating as the city of York. The general sense of the meeting was that nationalism has grown very strong, is natural for countries recently freed, and is the only spiritual force able to resist Communism. Nationalism alone, however, is not enough, and there must be, simultaneously with the cold war, a material economic improvement.

As to nationalism, each country, however small and weak, was entitled to decide its own future, and to retain its own customs and language. But each country should look to the United Nations for protection, respect the alien minorities in its territory, and perform its obligations as a member of United Nations. This brought us with a sigh of relief to the old cliché "unity and diversity"—separate members of the United Nations each with its own nationalism but speaking English as its second language. The Indian delegates continually stressed that nationalism is right and proper. They added that Communists in the early stages of the struggle for freedom made allies of the nationalists; but then, when independence was attained, Russia made the Communists toe the strict party line and submit to party discipline, and denied the nationalist leaders. The local Nehrus and Patels would then be dubbed the willing tools of Dutch, French or American imperialists.

As to economic recovery, the poverty of Asia was stressed. It was pointed out that rice, milk, and potatoes cost the Indian working classes more than bread, milk, and potatoes cost the working classes in Britain. Asian governments are all inexperienced and have not the personnel to take over and manage nationalised industries. Capital cannot be raised locally when tax-evasion has become a fine art. Foreign capital is necessary and America must supply it. The Americans agreed, but were profoundly hurt when their motives were suspected. The Burmese and Vietnamese plumbed the depths of absurdity when they discussed what conditions they would impose before they condescended to accept a gift. The Indian chairman talked about responsibility and asked if the Burmese were working harder. The Burmese delegate replied that, now Burma was free, they felt free to do anything or nothing.

Genial to the British

The British had the warmest receptions and were treated with courtesy and geniality. Malaya was referred to as an example of "colonialism," but its economic recovery, its law and order (apart from the bandits), its long-term plans, and its introduction of elected governments made the phrase a conventional one that deceived no one. Pandit Kunzru thought that if Hongkong were handed over to the United Nations it would make relations with China happier, but his seemed to be a lone voice.

"Foreigners" had to fill up residency forms, but the British were told with a smile that they were, of course, exempt from this. The Americans were deeply hurt that they were so suspect. One man said: "Whatever the US does seems wrong. We're damned if we do, and we're damned if we don't." Nehru says the United States lacks subtlety in dealing with the East. The East is quite prepared to tread the American path, but at its own pace, with its own methods, and certainly not to rush along tied to jet-propelled chariot wheels. Psychologically the East prefers a thoughtful, static life, and dislikes the dynamism of the Americans.

During the conference Pakistani and Indian fires smouldered very close to the surface. Their differences seem as alarming as those between Ulster and Eire. Kashmir was also dangerous ground. But, apart from this, Indian and Pakistan delegates were excellent. They had facts and figures. They knew the extreme difficulty of their task, and they knew what was practical politics and what were priorities. In the Indian sub-continent trains run to time, road traffic is disciplined, and goods are fairly plentiful. The Indians do not give themselves enough credit for what they have achieved and are apt to magnify their failures—the division of India, the lack of co-ordination in planning, high prices, over-generous compensations to zemindars, and the pressure of big industrialists.

Delegates of Varying Ability

Many of the other delegates were of poor metal. Their optimism was callow. They believed that all their Communists are good boys who will never be naughty and violent. Vietnam issued an almost daily rhapsody on democracy. The Filipinos were unable to be clear about anything and had no programme, except to rely on American help for an indefinite period; but they were the only ones to admit widespread corruption. The Burmese showed complete irresponsibility. They asked Mr Melby of the American mission not to visit Burma. War dilapidations there have so far been scarcely touched.

The Japanese sat solidly quiet. They are doing their best at economic rehabilitation and looked formidable. Australia is particularly suspicious about their conversion to democracy and called attention to the re-emergence of big business in Japan. The Indonesians were likewise unpractical. Agoos Salim, one of their elder statesmen, seriously argued privately for over an hour that the Lucknow Residency, the Museum and the Imambara, should be pulled down and the bricks and stones used to build workmen's houses in the public parks and gardens. The Malayan observer, Ungku Aziz, had all the charm of his race, plus the prestige of a post in Economics at the University of Malaya. His knowledge and good sense and wonderful command of good English made an excellent impression.

THE BUSINESS WORLD

Plan for Coal

THE National Coal Board's long-awaited "long-term" plan will disappoint those who expect from a nationalised industry spectacular developments unattainable by private capital. During the next fifteen years the board proposes to invest about £520 million in coal-mining proper and £115 million on its ancillary activities such as coke-ovens. One man is employed in coal-mining for every twelve people engaged in manufacturing industry; the proposed investment of £40 million a year in coal is less than one-tenth of what the official statisticians estimate is being currently invested in manufacturing. This proportion does not prove that the board has chosen the right scale of investment, but it does suggest that the extreme temptations to do too much have been avoided.

The general principles of the plan are those sketched some eighteen months ago in the board's report for 1948. Through a zonal pricing system the consumer is to be charged the full cost—for production and transport—of the particular grade of coal he chooses. The board matches the expected demand at these prices against the marginal cost of output in each coalfield, in order to decide how to divide total production most economically among the coalfields. The appropriate level of investment in each coalfield is then implied in the level of output.

The board is to be congratulated on adopting an economically rational framework for the business decisions of a nationalised monopoly. This is pioneering, and some weaknesses and confusions can be regarded charitably. The first question is whether the framework itself is enough. The aim of the plan is to make each coalfield self-supporting, or nearly so. But a coalfield is an administrative rather than an economic unit; given the board's methods of pricing, coal will be produced at the lowest cost to the nation not if each coalfield but if each colliery pays its way, and losses should be tolerated temporarily only when they can clearly be attributed to short-term causes. The board's account of this aspect of the plan is far from clear. It says that collieries will make profits and losses "if only because the situation will be always changing"—and is silent about other possible reasons. It argues that each colliery will try to equate its costs to the zonal prices because its future will "usually" depend on the success it has in this effort. There is no attempt at definition of the unusual cases. No doubt the board realises that the balancing of profits and losses under the plan depends on the way in which the schedules of marginal cost for each coalfield were built up. And on this first, detailed stage the planners at headquarters are in little better position to pass judgment than is the outsider. Here is the weakness of nationalisation by whole industries. But the moral is, of course, for the politicians; the board need not be blamed for taking itself as it is.

The second, and immediately more important, question is whether the present plan reflects a wise application of economic principles as the board conceives them. The plan-making depends chiefly on broad judgments. The first is of future demand. The board's outlook is, as the first table shows, expansionist.

PROJECTED COAL OUTPUT
(million tons)

	1938	1949	1961-5
Inland	180·7	195·7	205-215
Export and bunkers	46·3	18·9	25-35
TOTAL	227·0	214·6	230-250

The export figure is an assessment based, inevitably, on little concrete argument. Inland demand is put at 205-215 million tons by a simple projection to 1961-5 of the postwar trend. The prewar trend of consumption would have given an estimate of only 190 million tons. The cautionary range of 10 million tons may, therefore, prove too small. The board shows how for seventy years the "real" price of coal—its price in relation to the prices of other commodities—has been steadily rising. During the last few years coal has become relatively cheap, as usually happens during a boom. It might be unwise, therefore, to base estimates of future demand predominantly on recent experience. Perhaps the coal board is not really doing this. It seems to think that the plan will make a sharp change in the fundamentals of coal economics: that the increase in productivity the plan expects to secure will dramatically arrest the upward trend in the real price of coal. The grounds for this attitude are rather obscure. The board estimates that if costs were unchanged the plan would reduce the price of coal by seven shillings a ton. But it expects miners' earnings to rise as productivity rises, and it does not say directly how the benefit is assumed to be shared between the miner and the consumer. Since, however, the increase in earnings per man-shift is elsewhere put at 9 per cent, it can be roughly calculated that wage-costs are expected to rise by two shillings a ton. The consumer (or, if demand is strong, the coal board's reserves) may benefit to the extent of five shillings a ton. It is, however, another question whether this will amount to a reduction in the "real" price of coal. It is quite possible for mining costs to be fairly stable over the next fifteen years while the prices of many commodities are reduced. The improvement which the plan is supposed to achieve for coal is not so sharp that other industries—including, say, oil—may not do better. This is only one of many circumstances in which the internal, as well as the export, demand for British coal may be less buoyant than the board assumes. In this field one guess is almost as good as the next, but the coal plan might have attracted more confidence if the notional figure for future production had been put at, say, 220 or 230 rather than 240 million tons.

A more cautious view of the future would have been encouraged if the board were getting its capital less

cheaply. It estimates that some £350 million of investment would be needed merely to maintain present production, and this it expects to get from depreciation allowances. The remaining £170 million, required to raise output from 203 to 240 million tons, is approximately what will be borrowed from the Treasury at (the plan assumes) 3½ per cent. If the interest charge were, say, 7 per cent, the marginal cost of the extra 37 million tons of coal would be directly increased by some three shillings a ton. On the use of the money the plan follows the lines mapped out long ago in the Reid report. There is little scope for new pits—a total of 22 is suggested. In general coal must come from areas already being worked, and the policies are to concentrate mining through a smaller number of shafts, and to reconstruct the pits below the surface for horizon mining and for locomotive haulage and power loading. Tentatively 67 major and 192 minor reconstructions are mentioned. Some 250 of the present 950 collieries will be little changed, about 90 will, by underground reorganisation, be absorbed into neighbouring pits, and some 350—mostly small—will be closed.

The productive effect of these changes is put at 18 per cent more coal got by 80,000 fewer workers. Output per man year will rise, that is to say, by 34 per cent in fifteen years. For an old extractive industry this would be a large but not a startling achievement. The board claims that the result is conservatively calculated. If it is a miscalculation, it can—in theory at least—be put right by adjusting the plan, and doubtless there will be other adjustments too. But the board should begin with reasonably accurate ideas about the best distribution of its investment among the coalfields, for it is on this point that genuine "flexibility" will in practice be hardest to achieve. Whether a million pounds should be spent on reconstructing a pit in South Wales or a pit in Yorkshire depends on three main considerations: on the comparative physical productivity of investment in the two places; on the relative prices of the different types and qualities of coal obtained; and on the relative transport costs of

getting these coals to the places where they can be sold. The board describes these three considerations but gives no factual information whatever about the second and third and only inadequate information about the first. What there is, is summarised in columns 1—3 of the second table.

Net changes of output in each coalfield are not in themselves measures of the effectiveness of investment, but they enable some conclusions to be drawn. In coalfields where the labour-force is to be reduced, a net change in output understates the physical productivity of new investment; where the labour force is to increase, only part of the extra output is to be attributed to investment. Some allowance for this variation in manpower may be made by multiplying the change in the number of workers in each coalfield by the present output per man employed there. Increases in output attributable to new investment can then be obtained by subtracting the effects of manpower changes from the net changes in output. The results are shown in column 5 of the table below. They are crude estimates subject to many reservations, but the only estimates that the published information affords as a means of comparison for the effects of new investment on the different coalfields:—

THE COAL PLAN IN SUMMARY

Coalfields (Grouped according to estimated productivity)	Capital Expenditure 1950-65 (£ Mn.)	Change in output, 1950-65 (Mn. tons a year)	Change in labour force, 1950-65 (Thousands)	Estimated change in output due to change in labour force (Mn. tons a year)	Estimated productivity of investment (2) minus (4) (Mn. tons a year)	Investment cost of additional output (1) divided by (5) (£ per ton)
	(1)	(2)	(3)	(4)	(5)	(6)

(*A further £33·4 million for contingencies is not allotted to the coalfields.)

On the chart the value of investment in each coalfield is plotted against its estimated effect in increasing output. The straight line represents the average outcome over the country as a whole—an increase of 1 ton in annual output for every £8.3 of investment (without allowing for contingencies). The points above this line on the chart represent the coalfields where investment is more productive than the national average, while the others fall below the line; these are the two groups separated in the table above. For the five coalfields where large investments are most productive the range of investment costs per ton is narrow—from £6.3 to £6.8; the average for all the nine "better-than-average" coalfield is £6.7 a ton. Many of the coalfields in the "below average" group compare very badly indeed with this result. Even if Bristol and Somerset and the Forest of Dean are disregarded—for the amounts involved are too small for the figures to mean much—some coalfields in this second group show investment costs per ton of almost three times those in Northumberland and East Durham.

It is difficult for the outsider to check the Coal Board's judgment that such discrepancies are justified. The heavy investment proposed in some old coalfields is explained on the grounds that the geographical shift in coal production has hitherto been steady and slow. But

the boards self-portrait of submission to the compulsions of historical forces is misleading. In the past seventy-five years the expanding group of coalfields—notably Yorkshire and the East Midlands—has increased its share of total coal production at an average rate of 3 per cent a decade. The Coal Board proposes sharply to slow down this development ; the expanding group will gain only another 1 per cent in the next fifteen years. For Scotland and South Wales, which had been declining, the trend is reversed, and each will increase its share of the national total by 1 per cent.

This is a surprising decision when the competitive advantage of paying lower wages, which used to help to maintain the less productive coalfields, has been greatly reduced by flat-rate increases. The answer seems to be that the premium obtainable for special coals is now greater than in the past. All that the outsider can say is that the board does not provide enough evidence to establish this case. Investment in the anthracite area of South Wales at £10.4 per ton may not be unreasonable ; the case for spending £70 million on the steam and bituminous area at £9.6 per ton is less clear. Certainly nothing is said in the plan to explain the expenditure of £10 million each on the Warwickshire and Cannock Chase coalfields. Kent's geographical advantage is plain enough, but the investment cost still seems remarkably high. Similarly, the extra output of North Staffordshire's gas and coking coals seems to be very dearly bought. One of the oddest cases of all is Lancashire ; the argument is not that Yorkshire coal is dearer after transport costs have been added, but that the carrying capacity of the railways over the Pennines is limited. Has the Pennistone electrification made no difference?

It may well be that in all these cases the Coal Board has weighed physical productivity against quality of coal and transport costs with entire reasonableness. But it has not chosen to explain itself in sufficient detail for anyone to know. And unfortunately there is some reason for not giving it the benefit of the doubt. The board explains that in two coalfields—Cumberland and West Durham—"weight has been given to the social consequences that would result from a sharp reduction in mining employment." It has no business to give any such weight. The plan is at present a set of proposals for discussion with the miners and later for approval by the Minister of Fuel. It is not the board's responsibility itself to weaken the criteria of economic efficiency from the start. If there has been this sort of woolliness over some decisions, can the rest be above suspicion ?

Aircraft for Defence

IT is expected that the value of orders for military aircraft to be built in the current financial year will be a little over £100 million. The Air Estimates last spring allotted £55 million for new aircraft ; part of the first £100 million of supplementary defence expenditure represented additional orders for aircraft ; and later figures given by the Minister of Defence suggest that a further £50 million will be spent on aircraft (though perhaps not all this year). Expenditure on such a scale as this does not imply an impressive number of aircraft, and some members of the industry are disturbed at the small size of the orders so far placed. These complaints appear to be shared by the Services themselves. Details of orders cannot be disclosed for security reasons, but an indication of the possible number of aircraft so far involved is given by the fact that a fully equipped fighter in quantity production now costs between £35,000 and £50,000, while the cost of newer and larger aircraft is considerably higher. But these figures should not be interpretated too closely. Contracts now being negotiated are for orders which will be paid for in future years and they are conceived on a more generous scale. Nevertheless, the distribution of orders in the industry raises problems quite apart from the size of the expenditure incurred.

Orders have been and are still concentrated on the two jet fighters developed during the war, the de Havilland Vampire with the company's own engine and the Gloster Meteor with two Rolls-Royce engines ; these have been in production since the war as standard equipment for the RAF and for other European air forces. Consequently the factories of these firms have been busier than the rest of the industry. This year large-scale orders were also placed for de Havilland's newer Venom and the English Electric Canberra, powered by Rolls-Royce engines. The balance of orders now in production are for two naval fighters, the Vickers Supermarine Attacker and Hawker's Sea Hawk, for certain trainers built by Vickers, Handley Page, Boulton Paul and de Havilland, and for an anti-submarine aircraft built by Westland Aircraft with an Armstrong Siddeley turbo-prop engine. None of these orders is very large.

The valuable orders are therefore still going to a handful of firms while the remainder have few or no production orders. This is an inevitable consequence of the service demand for standardised equipment in quantity. But the Ministry of Supply has a dual responsibility—to maintain the rate of technical development and to keep in existence the reserve of technical skill and factory space of each individual firm. This must be done because designing ability is not necessarily the prerogative of the few leading firms. The decision taken at the end of the war to concentrate on developing gas turbine aircraft was undoubtedly the right one, but it aggravated the Ministry's problem. It meant that until new aircraft had been developed there could be no production orders. Work has been financed by means of development contracts placed by the Ministry, but these do not cover all costs, and as a result the financial resources of many firms have been severely strained.

The Germans showed during the war that weight of numbers in the air is of little value without technical superiority. Therefore, while the Services think in terms of standard equipment, the Ministry and the industry think in terms of replacements for aircraft and engines in production. The Meteor fighter has virtually reached the peak of its development. Variations of the original Meteor, such as the ground attacker and night fighter recently demonstrated, are still being evolved, but engine developments have outstripped the endurance of the basic airframe. Much the same has happened to de Havilland's Vampire ; the Venom which replaces it is, in spite of a superficial similarity, a radically different aircraft with a much more powerful engine. The gap between the range and performance of the Venom and the standard Meteor is narrowing, and the Venom has

THE
THREE BANKS GROUP

Total resources over £300,000,000

A complete, modern banking group with connections all over the world and with a specialised knowledge of conditions affecting trade and finance both at home and abroad from an experience gained during two centuries of banking. It is a banking group, moreover, giving individual attention to the particular requirements of its customers.

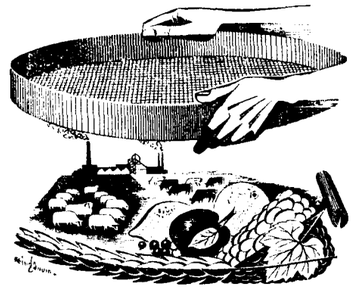
SHAREHOLDERS
THE ENGLISH AND SCOTTISH BANKS

I.C.F.C. in the Midlands

An office of the Corporation is now open in Birmingham to deal with enquiries and proposals.



I.C.F.C. since its establishment in 1945 has made available over £20 million in amounts from £5,000 upwards to some 330 small and medium-sized businesses, mostly private companies, by way of long-term loans and share capital. It offers economy, despatch and flexibility in method.

The purpose of the new office is to bring I.C.F.C.'s facilities closer to Industry in the Midlands.

Full particulars of the facilities offered may be obtained from

The General Manager, The Birmingham Manager,
7, Draper's Gardens, 214, Hagley Road,
London, E.C.2. Edgbaston, Birmingham.

Not all the gold is in Kalgoorlie

The many opportunities open to business men in Australia and New Zealand are far richer than the famous "Golden Mile" of Kalgoorlie, Western Australia gold mining centre.

The Bank of Australasia offers up-to-date information on prevailing market conditions to business men interested in trade in Australia or New Zealand. Write for our booklet "The Answers To Your Questions" which may be obtained from the Bank on request. It contains not only information concerning the commercial world but also more personal details about life in these two Dominions.

THE BANK OF AUSTRALASIA
(Incorporated by Royal Charter 1835)
MANAGER: G. C. COWAN

TIME-MASTER

has a place on the council

YOU'LL FIND a Dictaphone Time-Master in the most exalted places.

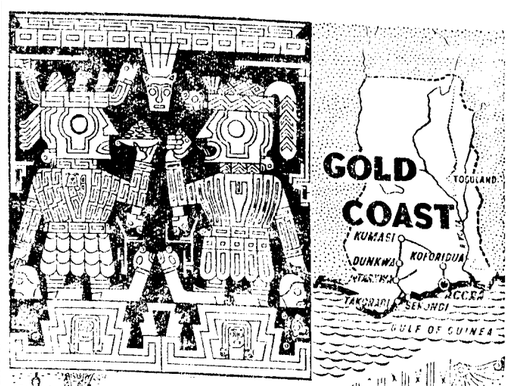
At councils, meetings, committees, international conventions and at meetings of governing bodies, there's often a Time-Master at work; making a permanent record of every vital point and decision, clearly and accurately on small plastic Memobelts.

The perfect office dictating machine

Time-Master was designed for you in your own office. It is the perfect office dictating machine — small, simple and highly dependable. Time-Master records on plastic Memobelts — each one taking 15 minutes of perfect, crisp recording.

Only Time-Master offers all this!

1. Streamlined machine, only 4¼ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform back-spacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, fileable, expendable Memobelts. 6. Nation-wide service through our own branches giving you Dictaphone dependability.



Write for TIME-MASTER literature to Dictaphone Co. Ltd. (Dept. O), 107 Kingsway, London, W.C.2.

COCOA: Many years before the Spaniards conquered Mexico, the native Aztecs were familiar with the cacao tree. They drank the cocoa and used the seeds as money. Cocoa was introduced to Europe in the 16th century and soon became a fashionable and popular drink. Indeed, by the end of the 19th century the supply of beans from the New World could not keep pace with the demand. The introduction of cocoa to the Gold Coast only dates from 1889 but today the territory is the largest producer of cocoa beans in the world.

Full and up-to-date information from our branches in the Gold Coast on market conditions and industrial trends in the colony is readily obtainable on request. Please write to our Intelligence Department at the address given below.

the advantage over the older fighter of providing opportunities for further development.

The Venom might be considered as a replacement for the Meteor as well as for the Vampire ; if it is, the question of capacity will arise. The de Havilland factories could handle orders larger than those that have already been and are likely to be placed with the company. In spite of this, the Ministry of Supply would probably make arrangements for the construction of a fair proportion of the aircraft by other manufacturers, if only to keep them employed. Alternatively, the Ministry may look to other firms for a direct replacement for the Meteor. Two possible choices are the Supermarine 535 of Vickers and the Hawker 1081 of the Hawker Siddeley Group, each with a Rolls-Royce engine. Both stem from a sequence of high-speed prototypes, so a proportion of their development work has been done. From a designer's point of view, the Supermarine 535 is ready for production, but later developments in the Hawker factories may mean that the 1081 will become an interim design like its predecessor.

Inevitably, there is a danger that constructionally sound aircraft ordered now will not have a performance that will meet Service requirements as the latter may be conceived when the aircraft come to be delivered in quantity. But there is always a distance between requirements and design and between design and output ; and the question that the Services always have to answer is whether any alternative design is likely to be ready for production by the same date. Work has been going on, for example, on the " flying wing " or tailless aircraft, which in theory offers the greatest opportunities for speed. In practice the structures built have not successfully withstood the enormous stresses of high-speed flight. A delta wing design, like the Avro 707 or the Boulton Paul BP 111, suggests a possible compromise between the tailless machine proper and the present tendency to superimpose swept-back wing and fin surfaces on conventional outlines. Difficulties met in developing these prototypes beyond their early stages mean, however, that for some time their main interest will be as research projects.

These structural problems are important and difficult. They will have to be solved before the full advantage can be extracted from the change from piston engines to gas turbines, a change that British engine manufacturers made with an ease that set a new pace for technical progress in the industry. Rolls-Royce and de Havilland have the greatest experience, having had the wartime contracts for jet engines. Since de Havilland has built engines only for its own aircraft, the industry generally has been dependent on Rolls-Royce for its military engines, and it would be natural enough if this firm found it difficult to expand its output much further. The proportion of the new orders which involve aircraft with Rolls-Royce engines suggests that manufacture may be sub-contracted to other firms. The two other manufacturers that have made the greatest advances in gas turbine developments, Armstrong Siddeley and the Bristol Aeroplane Company, are developing engines too powerful for the present generation of fighter aircraft.

The line of development that designers are now following, and in which they have been encouraged by the National Gas Turbine Establishment of the Ministry of Supply, might create serious production problems. Of two possible designs of air compressor for gas turbines, the earlier engines had centrifugal compressors, consisting of a single disc with vanes. The later and more powerful engines, such as the Rolls-Royce Avon in the Canberra and all the Armstrong Siddeley and Bristol Aeroplane Company designs, have axial compressors which can be made up of as many as fourteen stages, each with roughly 100 blades ; the only company not using the axial compressor at all is de Havilland. Like the turbine blades, these compressor blades have to be made to fine dimensions. Designers are attempting to evolve a machine that will stamp out compressor blades at high speed, but so far no quick and simple way has been found of producing them. Some people, therefore, are asking whether it might become impossible in war to produce the engines in large quantities, because of the physical difficulty of supplying the numbers of blades required for the axial compressors. The engineering refinements used by some designers to increase the output of power raise similar problems, since the engine becomes, in effect, hand-made and unsuitable for mass production.

A new and unassessed feature in engine development is the rocket motor. The Fairey Aviation Company has devoted much work to this field, working closely with the Ministry of Supply in Britain and Australia. It has by now accumulated probably more experience than has any other manufacturer. The security screen makes it difficult to judge how near this work brings the firm to a rocket-driven aircraft, and the same can be said of similar development work going on in the Hawker Siddeley group. Some rocket developments are designed only to give supplementary power to a jet engine during combat. Others are for guided missiles, as distinct from rocket aircraft.

Orders can be placed for new engines only when the aircraft which they are intended to fly are also ready for production. For some of the newest engines, this raises questions of policy on which clear decisions appear not to have been taken. Of the balance of the defence orders, none are for large aircraft. Among the firms who now specialise in such aircraft are Bristol, Handley Page, Vickers, A. V. Roe and Short Brothers and Harland. Some of these firms have been working since the end of the war on development contracts for jet bombers, for which certain new engines are intended. They are also the most likely manufacturers of military transports. No official statement has been made about the future of bomber production, beyond the fact that some are being developed. But the industry suspects that it has been decided to leave the construction of all large military aircraft to the United States. Because the industry is undergoing a technical revolution, designers find this prospect disturbing, particularly as there is no evidence that the United States manufacturers themselves are finding the transition to gas turbines easy. If the firms developing bombers receive no production orders, they may face fairly heavy losses. The developments contracts do not cover all costs, and firms cannot stay in business indefinitely on the strength of development work alone. They would also have to consider a change in their production policy, for the civil aircraft market alone could never keep them in business. One sign is the production of trainers by Handley Page and helicopters by Bristol. Reassurance on this point is needed: " large " aircraft may only mean, in this context, machines of the dimensions of the Brabazon or the ten-engined American B.36 bomber.

The Ministry of Supply is now trying to find out

what proportion of current orders can be given to the many firms that have comparatively little production work in hand. The Canberra bomber will be built by A. V. Roe, by Shorts and possibly by another sub-contractor, as well as by its designers, English Electric. Similar arrangements are also being made for Rolls-Royce engines. This was a common wartime practice; but apart from some regular peacetime contracting work—for example by Folland Aircraft—it has been much less frequent since. Sub-contracting is not likely to be popular under present conditions, for no firm will relish losing part of an order to a competitor while its own factory space is not fully occupied. The arrangement by which Armstrong Whitworth developed the Gloster Aircraft Meteor night fighter worked easily because both Armstrong Whitworth and Gloster are members of the Hawker Siddeley Group. The problem of excess capacity, moreover, promises to become more acute as firms establish factories in the Commonwealth; but the alternative—to license designs to foreign firms—would also mean less employment here.

Tax Collectors' Kaleidoscope

IT may be that the British people are the most heavily taxed in the world. They may console themselves that they are the most richly informed about what they pay. The report of the Inland Revenue Commissioners for the year ended March, 1949, recently published, is a mine of information only partially revealed by the trial borings of the National Income White Papers and the annual Economic Surveys into the Inland Revenue's files. The facts and tables in the report throw much new light on problems to which the attention of Government statisticians is not customarily directed. They also paint a graphic picture of the social revolution of our time—a revolution which would not have succeeded without the ubiquitous and expert activities of the Inland Revenue. This broader picture and some of the specific problems can be sketched in outline by a lightning analysis of the report and by brief extracts from its statistical riches.

In 1948-1949 the Inland Revenue celebrated its centenary year by collecting £2,055 million in taxes—about a fifth of the whole national income. It had begun more modestly with receipts of £30 million in 1848-49, £78 million in 1898-99 and even in 1938-39 no more than £521 million. Over the hundred years, the standard rate of income tax, the Inland Revenue's main weapon, rose (if that is the word) from 7d. in the £ in 1848-49, to 8d. in 1898-99; in 1938-39 it was 5s. 6d. and today it is 9s. More striking than these comparisons of monetary symbols of differing significance is the potent political fact that only 3,800,000 people paid income tax in 1938-39; by 1948-49 the number of income tax payers had risen to 14.8 million and 6,000,000 more, with incomes above the exemption limit but below the allowances limit, were just beyond the reach of the income tax collector's grasp.

The redistribution of incomes between taxpayers in the last ten years is the key fact of the social revolution. The ordinary taxpayer, grumbling at his own burdens, can still spare a gasp when he is told that while 6,560 people received more than £6,000 a year after tax in 1938-39, only eighty-six were so fortunate in 1948-49; it would be interesting to know how far this reduction of large incomes to one for every eighty before the war has been accompanied by an increase in the proportion of remuneration received in the form of tax free allowances. But although some of those who earned or inherited large sums before 1939 may still be maintaining the substance of their fortunes, no ex-newspaper boys can nowadays work their way up to the millionaire class. Most of those—the bulk of them professional and business men—who received between £2,000 and £5,000 a year before tax earned more than half their incomes; but nearly 86 per cent of annual incomes between £12,000 and £20,000 was from investments (though the proportion of unearned to earned income fell again at higher income levels).

These are the rarefied heights of personal suffering. On a lower plane, 19,200,000 of the 20,800,000 people assessed for tax in 1948-49 earned between £150 and £1,000 a year and had in their spending and keeping about 87 per cent of net personal incomes after tax. These figures show that there were comparatively few families in Britain in 1948-49 who were living below what the dour statisticians of prewar years used to call "human needs standards." Although more than a million individual workers still earned less than £150 a year, and although nearly 1½ per cent of all the interest disbursed on Government securities went to people with incomes below the exemption limit, it is probable that most members in these low income groups were either juveniles or adults with other means of support. Apart from the 10,500,000 married women and 11,500,000 children swept into the income tax statistics in 1948-49, about 3,500,000 adults seem to have been dependent on income tax payers other than their consorts. But the shoe of poverty must still have pinched tightly in more than a quarter of a million British homes. Of the 10,400,000 married couples who were assessed for income tax in 1948-49, some 2,800,000 earned less than £250 a year and 373,000 of these had three or more children or other dependants to support.

So much for the purely social panorama that emerges from the Inland Revenue report. The report also includes, for the first time, statistics of profits by trade groups in the three trading years immediately before the war and in 1948-49. These tables supplement the picture of earnings in these industries already sketched by the National Income White Papers and by *The Economist's* own assessments of trading profits; much more information on the financial statistics of trade groups is apparently to be included in future issues of the report (when, of course, figures will be available for a run of postwar years). Perhaps the most interesting fact in this section of the report is that individuals and private firms accounted in 1948-49 for much the same proportion (almost exactly one-third) of gross trading profits as they did before the war. Personal enterprise continued to flourish in a wide variety of callings from which one might have supposed that it had long since been banished—and this despite the present toll of death duties.

On death duties, the report throws open a most interesting field for research. Of roughly 500,000 adults who died in 1938-39, about 18,000 left estates with a net capital value exceeding £5,000 and the average value of these estates was rather over £22,000. In the year 1948-49, the total of adult deaths seems to have been about 50,000 greater, the number leaving more than £5,000 was about 12,000 greater and the average value of these estates was about £23,500. These figures suggest that in the immediate postwar years there has been a tendency for more of the comparatively rich to die comparatively richer. In view of the rise in capital values, this is not really surprising; most of those who left over £50,000 in 1948-49 must have earned the greater part of their savings before 1939 or else had inherited large sums in past years. The figures do not refute the contention that few new fortunes of over £50,000 in net capital value are being built up now.

The implications of high death duties for the future of the security markets deserve close scrutiny. The Inland Revenue report shows that nearly 70 per cent of the net capital value of small estates (those between £2,000 and £5,000) was held in houses, Government securities and cash—in that order; this result accords very closely with the distribution of such assets in the same capital range in 1938-39. Both before and since the war there seems, in fact, to have been a remarkable tendency for those leaving more than £2,000 at death to hold about 20 per cent of their savings in Government securities. The distribution of holdings of industrial stocks and shares between different income groups, however, is much more uneven. Both in 1938-39 and 1948-49 only about 10 per cent of estates between £2,000 and £5,000 was held in industrial securities but in both years such securities figured much more prominently in the bigger estates; by coincidence, they represented 49½ per cent of the net capital value of estates over £50,000 in both years. In 1948-49 more than half of all industrial securities assessed for death duties was held in estates with a net capital value of £50,000 and more.

Although no figures of the distribution of large fortunes according to the ages of their holders are available, it must be presumed that the main body of privately-held industrial securities will run the gauntlet of assessment for death duties within the next twenty to thirty years. If the statistics for 1948-49 are representative—and, since they accord closely with the recorded prewar pattern, it is reasonable to suppose that they are—more than half of these industrial securities are likely to be in the hands of estates that will be liable to duty at a rate of over 25 per cent. The impetus that this is likely to give to sales of industrial securities on the market is obvious—and it is not very clear who will be there to take these securities up. The impetus towards sales of gilt-edged to meet death duties may be less marked. Private holdings of gilt-edged are spread more evenly across estates that attract a lower rate of duty; in 1948-49 only 29 per cent of all Government securities assessed for death duties were contained in estates of over £50,000 in net capital value. Moreover, the total value of Government securities assessed for death duties last year represented a much smaller proportion of total gilt-edged issues outstanding than did the equivalent proportion of industrial securities; it is a fair guess that well over half of all gilt-edged holdings, against perhaps a quarter of industrial security holdings, is tucked away in institutional portfolios that do not come within the compass of death duties.

The strain that the present high level of death duties is likely to put on the future provision of risk capital for industry is but one example of the way that an economy based on high taxation is beginning to burst out at its seams. It may be that another sign of wear can be found in the statistics of uncollected taxes outstanding. For income tax collected under the PAYE scheme, of course, annual estimates of tax chargeable and tax collected tally almost exactly. At the time that the report was drawn up, however, there was about £370 million of tax under other schedules still outstanding. It was estimated that by the time appeals on assessments had been heard, only about £170 million of this £370 million would be collected. It is difficult to avoid the impression that assessments to income tax, and certainly assessments to death duties, depend more than they should on the skill—or luck—with which bargains are struck between taxpayers and inspectors. When direct taxation takes as much as 20 per cent of the national income, it cannot be at all times precisely fair in its incidence; thanks to the low proportion of the British population that is self-employed and to the efficiency of the British tax-gathering machine, this defect is at least less prevalent in this country than elsewhere. But despite the efforts of Somerset House, and despite the fact that Inland Revenue services now cost more than £23,500,000 compared with less than £10 million before the war, one menacing conclusion remains; it is only in the physical, and not in the economic sense, that mounting tax collection can be associated with genuinely increasing returns.

INCOMES AND TAXATION

Note:—The following tables are based on tables appearing in the Inland Revenue report.

TABLE I—CLASSIFICATION OF NET PERSONAL INCOMES
(After Payment of Income Tax and Surtax)

Range of Income After Tax	No. of Incomes in Each Range		Average Tax Paid		Average Income After Tax	
	1938-39	1948-49	1938-39	1948-49	1938-39	1948-49
£			£	£	£	£
135— 150*	2,508,000	1,113,000	0·2	0·1	138	144
150— 250	4,630,000	8,500,000	0·9	5·0	188	201
250— 500	1,940,000	9,152,000	13	21	333	340
500—1,000	507,000	1,551,000	95	164	670	677
1,000—2,000	142,200	349,000	324	633	1,368	1,378
2,000—4,000	54,640	79,650	1,072	2,992	2,731	2,618
4,000—6,000	11,600	5,264	3,138	18,361	4,836	4,360
Over 6,000	6,560	86	13,399	138,953	9,482	7,558
All Incomes assessed to tax	9,800,000	20,750,000	31	51	272	325

* For 1938-39, figures relate to the range £125—150.

TABLE II
CUMULATIVE DISTRIBUTION OF TOTAL TAXATION ON INCOME

Range of Income Before Tax	Percentage of Total Incomes Before Tax		Percentage of Total Tax Collected	
	1938-39	1948-49	1938-39	1948-49
£				
135— 150	11·52	1·78	0·2	...
150— 250	40·64	21·72	1·4	2·7
250— 500	61·89	61·73	7·9	17·1
500— 1,000	74·04	78·31	20·8	35·9
1,000— 2,000	82·36	88·00	35·3	55·1

Business Notes

Inquest on Trade Restriction

The meeting of contracting parties of the General Agreement on Tariffs and Trade at Torquay has been very considerably enlivened, if not dominated, by the discussion of discriminatory import restrictions, applied by a number of countries, including Britain, last year. These restrictions were put into effect immediately before the devaluations of September, 1949. Article 12 of GATT allows contracting parties to intensify restrictions on dollar imports in order to "forestall the imminent threat of, or to stop, a serious decline in monetary reserves," but it also calls upon all countries to relax these restrictions "as such conditions improve." Under the rules of GATT the sterling area's dollar import cuts last year were referred to the International Monetary Fund for consideration; in all problems concerning monetary reserves, balances of payments and exchange arrangements the IMF is the authority whose findings in all matters of fact the contracting parties must accept. After some delay, the IMF has issued a report on the action of Great Britain, Australia, New Zealand, Ceylon, India, Pakistan and Southern Rhodesia (and also of Chile, which introduced discriminatory import restrictions at much the same time.) This report is a secret document but it has been thought convenient and politic by certain delegates and representatives at Torquay to ventilate it publicly and authentic summaries of it have appeared. The report states that the measures of dollar economy adopted by Britain and the other countries named were justified at the time of their imposition but it adds that the present level of reserves and the current rate of gold and dollar earnings of Britain, Australia, New Zealand and Ceylon, make feasible a progressive relaxation of their restrictions. It admits that caution is needed in the degree of relaxation because any serious decline from Britain's present level of reserves would be undesirable. The report goes on to excuse India, Pakistan, Southern Rhodesia and Chile from any obligation to relax their restrictions, in view of the current level of their reserves and earnings.

A great deal of unnecessary recrimination has been caused by the unauthorised publication of this report. Some of the criticisms of it seem to have been prompted much more by anger at the leakage than by considered judgment of its contents. The attitude of the British delegation at Torquay has been to condemn the IMF intervention out of hand and to stress three points in particular: that the report should not have concerned itself with the post-devaluation questions, since the IMF was only consulted about what had happened before devaluation; that the facts about the adequacy of reserves produced by the IMF are gravely suspect since they make no allowance for Britain's current liabilities; and thirdly, that the report should have limited itself to a question of facts and should not have ventured into opinions. It is something that an open clash on this issue at the meeting of the contracting parties has been avoided by remitting the question to a working party.

The report raises a number of fundamental issues for the discussion of which the Torquay meeting does not offer the best forum. One of these is the differential treatment of members of the sterling area; some sterling countries are encouraged to relax their dollar import restrictions and others are told that they need not make such concessions. This is tantamount to a denial of the principle of pooled reserves on which the operation of the sterling area mechanism hinges. It is this aspect of the debate, lending itself as it does to being interpreted as an attempt to dismember the sterling area machine, that has caused special offence and suspicion in British quarters. The problem is one that will require very careful handling. Members of the sterling area are autonomous signatories of international agreements, including that of the International Monetary Fund and their relations to such institutions may have to be interpreted afresh. This, however, is an issue which far outstrips the scope of the Torquay negotiations. It should be debated on a larger stage in the months to come.

* * *

The Chancellor's Apologia

The prospect that it will be so debated has not been advanced by the Chancellor of the Exchequer this week. His statement amounted to a virtual dismissal of the report as "material which the Fund prepared for the use of its representative," who had been invited to take part in the discussions but who, Mr Gaitskell implied, had no *locus standi* in the matter. The Chancellor added that these discussions

> do not require either any determination by the Fund or any conclusion by the contracting parties on the justification for the restrictions under review. Decision on such matters must be taken by governments in the light of their international obligations.

This statement does not stand up at all well to the dialectic of the General Agreement on Tariffs and Trade. Under Article 12 of the Agreement, Britain and seven other countries were invited last year to consult with the contracting parties about the recent changes in their import programmes. Under Article 15 of the Agreement, the contracting parties, when notified of the intensified restrictions on dollar imports by certain countries, including Britain, were bound to "consult fully with the IMF" about the matter. The Article goes on to declare that

> in such consultations the contracting parties shall accept all findings of statistical and other facts presented by the Fund relating to foreign exchange, monetary reserves and balances of payments and shall accept the determination of the Fund as to whether action by the contracting parties in exchange matters is in accordance with the Articles of Agreement of the IMF.

The meaning of the general agreement is as clear as the contorted language of such documents can make it. The Chancellor might be asked again to explain under what article of the agreement he justifies the suggestion implied in his statement, that the consultations with the contracting parties about the 1949 import restrictions are a matter that does not concern the International Monetary Fund. It is quite true, as the Chancellor pointed out, that the restrictions imposed in 1949 are now dead anyway; the rise in prices alone has made it impossible for Empire countries to bind themselves to restrict their dollar imports to 75 per cent of their 1948 value. But Britain's signature of the general agreement would certainly seem to carry with it an obligation to do more than shrug off with doubtful legalistic arguments this comment by the IMF on a policy of which the spirit, on Mr Gaitskell's own admission, still prevails.

* * *

Tariff Bargaining Goes Slow

Very little progress has so far been made in the tariff negotiations which have been going on at Torquay since late September. A great deal of time has been spent in discussing the surprising number of "withdrawals" that the French delegation tabled at the beginning of the conference. These are withdrawals of earlier concessions made by France in the Geneva negotiations of 1947 and now liable to be reconsidered under Article 28 of the general agreement. The French list has taken all other delegations by surprise and has emphasised once again both the highly protectionist character of the French administration and the striking contrast between French eloquence on the subject of European integration and trade liberalisation and the deeds by which these causes are served. The French withdrawals have affected not merely the direct negotiations to which France is a party, but also negotiations between other countries where the French secondary interest is of some substance. The discussions between the United States and the Benelux countries, for example, have run up against the difficulty that several concessions that the countries in question are prepared to yield to the United States against adequate consideration cannot be made because the concessions would have to be extended to France, against which the Benelux countries now badly need bargaining counters. The French policy may be caused by the appearance of Germany at the negotiating table and to the desire to take up a strong bargaining position vis-a-vis that newcomer.

The first appearance of Germany is probably the most important single event in the Torquay tariff negotiations. Most of the other countries represented at the talks have already exchanged considerable tariff concessions in previous negotiations, but the discussions with Germany offer a virgin field for mutual concessions. The new German tariff has agreeably surprised some of the delegations in Torquay. It seems to lie about half-way between the low Danish and Benelux tariffs and the medium-to-high British tariffs; an exception is the comparatively high German duties on agricultural products, which have been criticised particularly by the Danes and the Dutch. The British duties that meet with most criticism are those on chemical and iron and steel products. It is, however, on preferences that the British team will really go to battle when the most important of the negotiations, those between the United States and the United Kingdom, begin. There is every sign that these preferences are to be defended with a vigour and emotional fervour which Empire Free Traders, at least, will applaud.

It is, however, on intra-European tariff bargaining that the main limelight may be cast at Torquay. The United States may still prove to be the main giver, as indeed it should be, but the scope for further American concessions was considerably narrowed by the outcome of the Geneva and Annecy conferences. The importance of the negotiations in which European countries are concerned lies in their link with the OEE's proposals for freer European trade. If the results of Torquay do not produce a reasonable harmony in European tariffs, the low tariff countries in Western Europe will not take the additional steps towards liberalisation of intra-European trade that are due for the end of this year. In view of the attitude so far taken by the French and Italian delegations at Torquay, it seems dangerous to assume that this harmony of European tariff rates will be achieved.

Departmental Brer Rabbit?

Some mystification has been caused in the City by the poor response to last week's conversion offer to holders of 1949-51 War Bonds. Only £88 million of these bonds were converted into the new 1966-68 Funding Loan although it was widely, and probably correctly, assumed that the authorities held nearly £150 million of the £209 million of the outstanding bonds. The conclusion seems inescapable that the authorities decided to leave at least part of their holdings unconverted. There is no reason to search for any deep intentions behind this decision. The authorities had to choose between converting the Bank of England's holdings of what has in effect become a three-month bill into the new medium-dated stock, or leaving those holdings unchanged until February and then converting them into internal floating debt. Since official portfolios are already bulging with the new Funding Loan after the issue a fortnight ago, the second course may well have been the more logical. From the Government's point of view there is all the difference between an obligation to pay cash to a private holder of unconverted War Bonds and an obligation to pay cash to the Bank of England; the latter is obliged to pass the chips back in new short-term lending to the Government.

There is, therefore, no reason to suppose that the authorities' decision to leave their holding unconverted has, by itself, made the calling of 1951-53 War Bonds at their earliest date either more or less likely. It is, however, widely believed in the market that an early call of these bonds has long been part of the authorities' strategic plan; the earliest date for an intimation of any such intention would be December 1st next. In view of the present excess of the authorities' cash needs over its cash receipts (largely reflecting the continuing need to find the sterling counterpart of the balance of payments surplus), it must surely be hoped that no steps will be taken that will necessitate large official outlays at this time. Such outlays could only be financed by yet another expansion of Government borrowing on floating debt from the banks. This borrowing has already run up by nearly £400 million in the last six months—an increase, to say the least, that has been somewhat unpropitious.

* * *

Opposition to the Malayan Rubber Tax

Rubber growers and traders alike have lost no time in protesting against the new Malayan export duty. The tax, which was discussed on page 768 in *The Economist* last week, is in the form of a sliding scale and increases by an additional 5 per cent for every 20 cent rise in the price of rubber. Opposition to the duty is based on two points, the size of the tax and the way it works. The need to curb inflation in Malaya is generally accepted, and since income tax is an uncertain method of absorbing excessive purchasing power, revenue has to be collected in the form of import and export duties. Rubber growers are naturally indignant that their product should be singled out to provide the Malayan Government with a large prospective budget surplus. But they object more violently to the fact that the new tax has been imposed in such a way as to prevent any public debate in the Malayan Legislative Council.

The case against the scale of the tax, as distinct from its incidence, is less strong. If the average cost of producing rubber is taken at about 40-45 Malay cents (11¼d.-12½d.) a lb., then the tax would never be so high as to prevent a reasonable return to the producer, if it were collected when sales were made. The complaint arises from the way the tax is calculated and from its delayed impact. It is fixed for each quarter and based on prices ruling three to six months earlier. Thus the tax in the second quarter of 1951 will be based on prices ruling in three months October to December, 1950. As the memorandum issued this week by the joint committee of Rubber Growers' and Rubber Traders' Associations has pointed out, it is quite possible that the export duty for next April, May and June will be 52 cents (14½d.) a lb., based on to-day's price of 200 cents (56d.) a lb. But if the price of rubber in those months should fall to 100 cents (28d.) a lb., not only would the Malayan Government then receive a larger return than the growers would then be receiving, but also the growers' net return would barely cover their costs of production.

If a form of delayed taxation has to be used for technical reasons, then the rate of tax should not be so high. Otherwise hardship is almost certain to be inflicted on rubber growers, particularly on smallholders. The new tax would operate well enough if rubber prices were to remain fairly stable. But that is the one assumption that cannot be made about next year. The sharp expansion in American synthetic production and the probable slowing down in stockpile purchases both presage lower rubber prices in 1951.

The new tax is also likely to have serious social effects. It will be more keenly felt by the smallholder than by the estates, for the estates can budget more easily from one period to another and can carry over reserves to cushion the delayed impact of the tax. It will encourage smuggling, for rubber smuggled out of Malaya and re-exported from Siam

would evade the new export duty. Further, since the change in duty from one quarter to another could easily be large—because price fluctuations are large—there is likely to be a rush to export rubber when the tax is low and to delay shipment when the tax is high. These objections are far from trivial, and the Malayan Government might be well advised to think again on this matter.

* * *

Utility Patchwork

Fresh life has been put into the utility schemes for cotton and rayon by the committees of inquiry appointed last May. It is true that the interim recommendations—announced by Mr Harold Wilson on Tuesday—are little more than the minimum recognition of existing fact and that without this the utility schemes would have broken down. But a common recognition by the industry and the Board of Trade is no small achievement after the ill-feeling that Mr Wilson's attacks on the cotton industry caused earlier this year.

To cover increases in raw cotton prices up to the end of October the converters' ceiling prices for utility cotton cloths are to be raised by 6 per cent (instead of the previously agreed 5 per cent.) above those in force in July. In future such adjustments of prices to costs are to be regularised by means of an automatic sliding-scale. Thus the Board of Trade has recognised that its past attempts to squeeze profit margins whenever costs rose were incompatible with a large utility programme. It is a recognition, in other words, that the Board's policies themselves caused the reduction in utility output after devaluation for which Mr Wilson so roundly condemned the industry. Lancashire has gained its main point and can now make utility cloths without having to wonder how belated will be the Board of Trade's next arbitrary decision on prices.

The other immediate decision is to broaden the range of utility output. The proposed new specifications for cotton and filament rayon cloths have still to be discussed with the making-up trade. The general purpose is to allow more variety in cloth constructions and to bring more "fashion" fabrics, such as those for women's dresses, within the utility range. So far as it goes this is the right policy. Beyond that, judgment must be reserved until the publication of details shows how far it does go. It is hard, however, to see that such broadening as seemed to be implied in Mr Wilson's statement can bring within the utility range more than, say, a third of the existing non-utility production. That will far from solve the problems of manufacturers trying to match output for export and the home trade. The lesser amount of non-utility production will in future feel the discrimination of a high rate of purchase tax still more sharply than before. The new arrangements will not serve for very long. The committees, under the chairmanship of Mr Hervey Rhodes, have done their first job well enough; what remains is to decide whether the utility scheme in cotton and rayon can be given a satisfactory permanent form or whether it should be dropped altogether.

* * *

Sensitive Tin

The tin market has proved particularly sensitive to rumours during the past fortnight and the London price has risen and fallen by more than £100 a day on more than one occasion. On November 7th a new peak of £1,282½ a ton was reached, and tin actually changed hands on that day at £1,300 a ton. By the end of last week, however, the price was £310 a ton lower, having fallen by £160 and £130 on successive days. Rumour then said that the United States would cease stockpiling at these high prices. But last Monday it rose by £130 a ton, only to fall steadily though modestly to £1,022½ a ton by Thursday. Backwardation on three months' delivery was £27 a ton a fortnight ago and at one point it actually disappeared. During the past eight days, however, it has tended to widen and on Thursday it was over £65 a ton.

These sharp movements in tin prices show to what extent the market is at present influenced by speculative operations. Undoubtedly some buying has taken place in the hope of a further rise, and the sharp falls towards the end of last week can only be explained by the sudden liquidation of speculative purchases. But the amount of metal that has actually changed hands is surprisingly small. World production of tin is still expanding and now promises to exceed the estimate of 172,000 tons for the full year. Consumption has expanded, but only slightly, and might total 145,000 tons this year. The surplus output has gone into stocks, chiefly into the American stockpile.

Current political developments certainly do not suggest that the United States can slacken its stockpiling demand for tin or for any other commodity. Its purchases will therefore continue to set the tempo of the market and the scope for speculative dealings will be increased. In these circumstances sharp price swings must be expected, though a more stable price level would be better for the tin market. The only hope of this seems to lie in the institution of a co-ordinated plan of purchases for defence needs among the allied powers. At the moment America is acting single-handed and this week it has limited stocks of materials containing tin held by manufacturers to "60 days' supply or a practicable working inventory." Even the tin conference in Geneva is proving a disappointment. The difference of views between Britain and the United States on the draft agreement to regulate the tin market is so great that the hope of a compromise is fading.

* * *

Rubber Market Movements

Rubber has also been unsteady during the past ten days, but price movements have been much more restricted than for tin. A week ago rubber almost touched 6s. a lb., only to fall by 5d. on the following day. This week the London price at first hovered around 5s. 6d. a lb., but by Thursday it had fallen to 5s. 2½d. As in the case of tin, backwardation has tended to widen. There is perhaps more reason for rubber to be weak; indeed, the market is still surprisingly strong in view of the rate at which the production of both natural and synthetic rubber is expanding.

In the first nine months of this year, world production of natural rubber totalled 1,335,000 tons and consumption 1,212,500 tons, which includes imports into Russia of 53,250 tons. Commercial stocks increased during the period by

London Tin and Rubber Prices

	Tin (£ per ton)		Rubber (d. per lb.)	
	Spot	3 Months'	Spot	3 Months'
Nov. 6	1,177½	1,150	63	58½
" 7	1,282½	1,252½	63	59½
" 8	1,262½	1,240	68	64½
" 9	1,100	1,065	71	67½
" 10	972½	952½	66	62
" 13	1,107½	1,047½	67	63½
" 14	1,070	1,037½	66½	60½
" 15	1,055	1,007½	63	56
" 16	1,022½	957½	62½	55½

35,000 tons and most of this increase has taken place in the third quarter of the year. These figures would suggest that up to September official stockpiling purchases were less than 100,000 tons. But the United States has curtailed its civilian consumption of natural rubber to release supplies for the stockpile and this move has undoubtedly eased the pressure on the rubber market. Synthetic production for

the first three quarters of the year totalled 375,000 tons against a consumption of 407,500 tons while stocks have declined by 42,500 tons. The output figure does not yet reflect the re-opening of standby plants, and a sharp increase must be expected in the fourth quarter.

Stockpile purchases will no doubt continue next year, but they will not be superimposed on an inflated American consumption for civilian purposes. If the American rubber industry does not voluntarily consume more synthetic rubber, when output has been expanded to over 900,000 tons a year, the United States Government will probably enforce a higher statutory minimum consumption. In any case world production of natural rubber is still expanding, and though Malayan output may not increase much next year, Indonesian production is rising quite rapidly and may even regain its prewar level.

* * *

£200 million Surplus?

Within twelve months Britain's embarrassing trade deficit has been converted into an embarrassing surplus. The preliminary trade figures for October show new records for exports and the lowest import surplus for over four years; they also suggest that the surplus of receipts over foreign payments is running at a much higher level than the £52 million surplus recorded in the first half of the year. The President of the Board of Trade must have relished the disclosure of such figures when he opened the new export showroom of the Jewellery and Silverware Industry last Wednesday, even though by doing so he had kept them from the rest of the world for a few days.

Exports in October are put at £202.2 million—the first time in history that they have exceeded £200 million. The total was £30 million higher than in September. But the export figure for that month was reduced by the delayed effects of the summer holidays, so that the real expansion in exports last month was perhaps not quite so impressive as the figures suggest. It is nevertheless a fine achievement. Exports to North America totalled £70.3 million, also a record. Shipments to both the United States and Canada increased sharply and continued their steady upward trend since the beginning of the year.

Imports were provisionally valued at £223.0 million, some £11.4 million more than the combined value of export and re-exports. If the value of imports is adjusted to the same f.o.b. basis as exports and re-exports, October would appear to show a surplus on visible trade of £7 million compared with a surplus of £2 million for September and a deficit of £12 million in the third quarter. From these figures it is possible to make some tentative guesses at Britain's overseas payments surplus. If the surplus on "invisible" account in the first half of the year has been maintained (there are reasons for supposing that it has increased) the overall surplus for the third quarter would be about £70 million, and for October alone perhaps £35 million. The surplus for the first half of the year was £52 million. Thus up to October, the overall surplus has been of the order of £155 million—an annual rate of £185 million—or, say, £200 million to allow for a possible increase in the invisible surplus.

If September and October are taken together, the result is even more startling. The visible surplus for these two months was about £9 million and the invisible surplus (taking the same rate as the first half of the year) £53 million, making an overall surplus of say £60 million or an annual rate of £350 million which again would be raised towards £400 million by the possible increase in the surplus of "invisibles." Thus the overall surplus for this year may be of the order of £200 million, but the current rate of imports and exports might yield an annual surplus of £400 million if it were to be maintained. Such figures give some indication of the inflationary pressure generated by the export drive.

* * *

Hitch in Airworthiness Agreement

A surprise move by the civil aviation authorities in Washington seems to have taken the meaning out of the recent Anglo-American agreement on airworthiness. The agreement said quite simply that the American civil aeronautics board would accept British airworthiness certificates as the equivalent of its own. This removed a technical barrier which could have been used to prevent the sale of British-built aircraft in the United States. Since the American industry has not yet begun to develop gas turbine civil aircraft, the concession was as important to American aviation operators as to the British aircraft industry. Unless they can buy medium- and long-range British aircraft—in the first instance the Vickers Viscount and the de Havilland Comet—American airlines face the prospect of using piston engined aircraft while their competitors operate faster, more comfortable and probably more economic gas turbines.

Now the Washington authorities say that the agreement does not apply to gas turbine aircraft. This is at variance with the interpretation of the original agreement, for the only British-built piston engined aircraft which could have a market in America are small feeder-line machines such as the de Havilland Dove and the amphibious Short Sealand. It is true that the American authorities have reached no decisions about domestic airworthiness standards for gas turbine aircraft, but in international discussions they, like the rest of the world, have accepted without much question the proposals of the British authorities. Moreover, the Americans still stand by an agreement to recognise British certificates of airworthiness issued for gas turbine engines as distinct from aircraft fitted with those engines.

This makes mockery of the excuse that gas turbine standards have not been decided and suggests that the American aircraft industry may hope to make up for lost ground by using British gas turbine engines in American airframes. But the Americans know that if they were to apply special airworthiness requirements to keep British aircraft out of the United States, the British could as easily use them to keep American aircraft out of Europe and the Commonwealth. The majority of countries now follow British rather than American airworthiness standards. This consideration undoubtedly influenced the American authorities' attitude during the original negotiations. The reason why any reservation should suddenly be raised now is not clear to the British authorities, and they appear to be fairly confident that they can persuade the Americans to stand by the original interpretation.

* * *

Anglo-Argentine Negotiations

Three senior members of the staff of the Argentine Central Bank are coming to London for financial discussions with the Bank of England. The immediate object of their journey, which is to press Argentina's claim for a bigger sterling payment in respect of its old exchange guarantee, may not seem to bode well for Anglo-Argentine relations. When the terms of the financial agreement of June, 1949, were published, it will be remembered, the details of the exchange guarantee were for some reason kept secret. It is widely believed, however, that the guarantee applied to all sterling held in Argentina's current account at the end of the first year of the agreement (that is on July 1, 1950) plus or minus Argentina's net forward position at that time. Argentina's sterling balance on July 1st is believed to have been rather under £15 million and its outstanding debt to Britain (including the overdue financial remittances) to have

been rather under £20 million. It is on this unpromising wicket that the Argentine delegation is coming here to bat for its "rights."

It would be a pity if this sterile argument about the exchange guarantee (in which Argentina appears to be wholly in the wrong) and the more serious disagreement about meat prices (in which Britain is making little headway) were to continue to stand as barriers in the way of more normal trade between the two countries. If these two problems could be surmounted now the prospect of settling other outstanding differences, including those about financial remittances and the volume of "inessential" Argentine imports from the sterling area, would be much brighter than in recent years. The technicians in the Argentine Government have always been willing to accord more liberal terms to foreign investors and traders—especially now that their campaign for attracting foreign investment to Argentina is in full swing. Hitherto any moves in this direction have been thwarted by Argentina's desperate foreign exchange shortage and by the President's unwillingness to "truckle to foreign exploiters." At the moment, however, thanks to the completion of the Export-Import Bank Loan, the improvement in Argentina's terms of trade, and the evident first fruits of their retreat from the industrialisation programme, the technicians' star is in the ascendant. It is even possible that the recent increase in Argentina's customs duties might be a paradoxical preliminary to allowing more imports to come in. Sir John Balfour, the British Ambassador, now on his way back from leave, may find a more cheerful atmosphere awaiting him in Buenos Aires.

Higher Prices and Larger Sales

The inevitable rise in wholesale prices is continuing. Signs are now appearing that the public is ready to anticipate the prospective rise in retail prices and retail sales in September received an abnormal boost. The main impact of the larger retail demand has fallen on clothing, and on men's wear in particular. The fear of a clothing shortage and the rise in prices of clothing fibres in September undoubtedly spurred the public to replenish and extend their wardrobes. Sales of other goods, particularly furniture and hardware, also increased during the month, but the rise was no more than normal.

Total retail sales in September rose by 7 per cent in value, whereas clothing sales alone increased by 30 per cent.

Source: Board of Trade.

Usually the winter rush for clothing does not begin until later in the year. This year it was not only earlier but also on a much larger scale. Sales of men's and boys' wear increased by 36 per cent on September, 1949, women's and children's wear by 29 per cent and footwear by 17 per cent. Stocks of apparel at the end of September were about the same as in the previous month. Preliminary reports for October, however, indicate that the rush to buy clothing has abated. Furniture sales showed a rise of 19 per cent on the year and hardware of 9 per cent. All shops—departmental stores, co-operative societies and independent traders—experienced this unusually large increase in apparel sales, but only the large retailers showed any substantial rise in their turnover of other goods.

The Board of Trade's wholesale prices index records another jump of nearly 3 per cent in October. It now stands at 278.9 (1930 100) and is 9 per cent higher than in June and 20 per cent higher than immediately prior to devaluation. Raw materials experienced the largest rise during the month; they were 6½ per cent dearer than in September. Only two commodities included in this category fell in price—Japanese raw silk and imported hides. Most clothing fibres rose sharply. American cotton was 5 per cent dearer, Egyptian cotton 30 per cent, rayon 12 per cent and wool only 2 per cent dearer; the main rise in wool prices had taken place in September. Non-ferrous metals, including aluminium, rose by 5 per cent and rubber by 11 per cent.

* * *

Failure in Softwood

The resumption of private imports of softwood from most European countries has taken much of the sting out of the report* of the Select Committee on Estimates dealing with the Timber Control. The committee started its investigations in April and concluded them in June; its report was published this week. It made no direct recommendation that private trading in timber should be restored. But it emphasised that the present need was to obtain as much timber as possible from those countries where no currency difficulties existed without trying to pursue a bargaining strategy mainly directed at securing the lowest price.

The timber trade maintained in its evidence to the committee that the Timber Control's preoccupation with attempting to secure low prices had led to late and unsatisfactory buying. They instanced the now familiar case of the negotiations with Swedish shippers this year. The committee added that British imports of softwood in 1949 totalled only 1,200,685 standards compared with the estimates of the Keith Price Committee that on an extreme "austerity" standard Britain would need 1,516,000 standards in 1949 and 1,539,000 standards in 1950. Yet imports this year are likely to be much lower than in 1949, although the Food and Agriculture Organisation has estimated that world supplies of softwood are larger than before the war.

The trade's second criticism of government timber buying was that too little attention had been paid to the size and specifications wanted by British consumers. The Timber Control might secure lower prices than other importing countries, but timber on arriving in this country had to be sawn and converted into the required sizes. The trade maintained that these extra conversion costs offset any saving made on the purchase price. Now that a major part of the softwood trade has been returned to private importers, it is hoped that shipping to specification will be resumed.

The committee also criticised the method of "bulk lifting"—the indiscriminate loading of timber ships with little regard to the suitability of the specifications for the district to which the ship was going or to the uniformity of the specifications in the cargo. The Timber Control used this method so as to ship the maximum quantity of timber as quickly and as cheaply as possible. But the committee thought that it ultimately led to greater waste and expense. Indeed, it recommended that the system of bulk-lifting should be "re-examined with a view to effecting a more rational and economical distribution of timber."

Among other recommendations the committee suggested that the allocation system (which is to be continued under private importation) should be altered to conform more closely to the present pattern of consumption and that the validity of consumer licences should be increased from three to six months. The report is a fair judgment on the operations of the Timber Control, and it goes far to justify complaints that have been made by the timber trade and timber users during the past three years.

ICI and Terylene

Plant for the manufacture of the new synthetic fibre "terylene" (polymeric ethylene terephthalate) is to be built by Imperial Chemical Industries at Wilton. This is the company's first independent venture into large-scale synthetic yarn production. Nylon yarn was developed as a joint project with Courtaulds; it appears that this venture has provided sufficient experience to enable Imperial Chemical Industries to handle "terylene" as an independent project. The new plant should be finished in four or five years' time, and will have an annual capacity of 11 million lb of continuous filament and staple yarn. Its main raw materials, ethylene glycol and terephthalic acid, will be obtained from ethylene and para-xylene produced in the Wilton petroleum cracking plant.

Too little is known about the yarn to define its applications clearly at this stage. It has a rough resemblance to nylon; as a clothing fibre it is said to have a warmer feel, and can be used alone or in a mixed cloth. As an industrial fibre it has the property of resistance to most acids (nylon resists most alkalis). Because of its chemical inertness, it has been difficult but not impossible to evolve dyeing techniques.

The fibre was discovered in 1940 by the British Calico Printers' Association, which had not the facilities to develop it. The Chemical Research Laboratory of the Department of Scientific and Industrial Research helped to carry the work a stage further, after which world rights outside the United States were given to ICI who brought "terylene" to its present stage and will make it on a royalty payment basis. American rights have been sold to du Pont who are developing it as "Fibre V."

The production process and the plant needed for it are simple compared with those for nylon, which suggests that "terylene" will be cheaper. The interest shown in it by du Pont, who are already producing the wool-like synthetic "Orlon," and by ICI, who possess but are not using British rights for "Orlon," suggests that "terylene" is expected to compete with this fibre too. Its price, however, would have to be appreciably lower than nylon in order to compete with rayon. ICI's other synthetic fibre, "Ardil," is to be produced on so much smaller a scale that it cannot affect these plans. Production is due to start next year and will not exceed 100,000 lb a year.

* * *

Re-opening the Tea Market

Detailed plans for the resumption of tea auctions in London next April have still to be worked out. But the Ministry of Food has taken certain decisions which give an idea of how the market is likely to operate when it re-opens on April 2nd. A flat rate subsidy has been fixed at 1s. a lb on all teas bought for consumption in Britain. The present controlled retail prices of tea (which average 3s. 4d. a lb) are expected to be maintained for at least one year and, provided that these prices remain unchanged, the new rate of subsidy will be maintained for the same period. British buyers will also be given certain concessions to buy in the Colombo and Calcutta markets.

A fixed subsidy will undoubtedly help the London market to operate more smoothly than would have been possible under a fluctuating subsidy. The new rate will be 1½d. a lb more than the existing one (10½d. a lb) and this increase will allow for some rise in purchase prices. But Mincing Lane will have little chance of returning to its full prewar scale. The existence of controlled prices and a rigid rationing scheme means that in their domestic trade brokers will be operating as buying agents for the Ministry and will be working to fixed buying limits. Unless they are willing to incur a loss or unless they can offset a loss on one grade of tea by a profit on another, their maximum bids at the auctions must be prescribed by the controlled retail price and the shilling a pound subsidy.

This method of buying ought to be more successful in getting reasonable supplies at world prices than the Ministry's contract system. It is, indeed, possible that the pace of British buying might once more set the level of world prices. In the last two or three years, the small consuming countries have determined the temper of the Colombo and Calcutta markets, since the Ministry of Food made—or attempted to make—contracts direct with growers. But it would be wrong to imagine that full freedom has been restored to Mincing Lane or that private trading has been given a real chance to show its mettle.

Loch Sloy Quarrel

The Loch Sloy hydro-electric station, which was opened last month by the Queen, was designed to meet peak demand for electric power in South-West Scotland. Last weekend, the power shortage was relieved by the diverting spectacle of a dispute between the North of Scotland Hydro-Electric Board and the British Electric Authority, the result of which was that the BEA suffered a power cut from Loch Sloy. Although the issue was confused by arguments about price it seems to have been mainly concerned with the efficient operation of the new power station for meeting peak demand. For some time the station has been supplying power to the BEA; it is under contract to do so from the beginning of next year, but for the interim period, a temporary financial arrangement based upon kilowatts and units consumed, had been reached on what the board considered "generous terms." The station's water supplies are still limited, as its catchment area has not yet been fully extended, and in order to build up reserves against its regular supply commitment in January, it offered no more than 300,000 kilowatt-hours a week from the two turbines, each with an output capacity of 30,000 kilowatts.

On October 30th, one of Glasgow's "Black Mondays," the region suffered considerable power cuts during peak hours. During these hours the BEA was taking electricity from Loch Sloy at the rate of only 12,500 kW, or one-fifth of the station's capacity. The board then suggested that instead of thus stretching 300,000 kilowatt hours over five hours a day and five days a week, the BEA should take it at the rate of 30,000 kW for two hours a day on five days a week, or 60,000 kW for one hour a day if peak demand required and backed this suggestion by pointing out the economies that would result. When the BEA held to its original requirement, the board stopped supplies from Loch Sloy for a week. Last weekend, under protest and after the dispute had attracted publicity, the BEA agreed to take power at the rate the board suggested. This week, Loch Sloy supplied almost its full weekly commitment on Monday alone (nearly five hours at 60,000 kW), and probably averted power cuts in South-West Scotland.

A supply of this size is very small compared with the gap of some 800 megawatts between maximum supply and peak winter demand. Loch Sloy's supplies to South-West Scotland may at the BEA's discretion be offset by diversions to England. But if three-quarters of a kilowatt is used by each consumer during peak hours, the hydro-electric station's supplies from one or two turbo-alternators at full

capacity may save cutting off 40,000 or 80,000 domestic consumers. It is the BEA's responsibility to distribute the power it buys from the board; but it seems to have preferred that Loch Sloy should run far below capacity throughout the week even though that meant the minimum of assistance at peak hours.

Sweden's Sterling Balances

A new monetary agreement between Sweden and the United Kingdom, signed in London at the end of last week, is chiefly significant and welcome for the abandonment by Sweden of the exchange guarantee on the sterling held in the Swedish No. 2 account. This account was established in December, 1949, and credited with the £27 million which Sweden had accumulated prior to the devaluation of sterling. The account was in no way blocked and the balance in it is being gradually reduced. Sweden's readiness to relinquish the exchange guarantee on the balance in this account is a token of the restored confidence in sterling. It may prove an encouragement to other countries enjoying similar guarantees to do likewise.

United Steel Swansong

The report of United Steel Companies for the year ended June 30, 1950, is presumably the last before nationalisation. Shareholders have to decide for themselves whether bitterness at this prospect will be tempered or inflamed by the group's achievement last year of record steel output and profits. Trading profits have expanded from £3,712,752 to £5,107,852; after deducting £1,175,484 (against £1,017,975) for depreciation and £2,678,000 (against £1,958,123) for taxation the parent company's net profit is some £500,000 higher at £1,328,945. Production of steel ingots rose from 2,042,000 tons to 2,128,000 tons but pig iron and coke outputs were slightly lower than in the previous year —a fall attributed to "the quality of raw materials available."

The group's productive assets stand in the consolidated balance sheet at £23,293,000. To replace these assets, Sir Walter Benton Jones pointed out at this week's meeting, would have cost £25 million even in 1913; today, he estimated, it would cost not less than £76 million. Assuming that they have a useful life of 25 years, therefore, these productive units—however owned and operated—must provide £3 million every year to cover their own replacement. Since taxation reduces trading surpluses by half, this means that the group, under a nationalised corporation as much as under private enterprise, can afford to make profits no smaller than today's if it is to continue efficient operation.

In fact, replacement and extensions have cost United Steel nearly £22.5 million in the last decade, and more than £4,000,000 in the year under review; this rate of spending is expected to continue for the next five years. Since the compensation was fixed on the basis of Stock Exchange prices two years ago, the group's net worth has increased by £3,415,000, while current market prices have reflected dividends limited by the Steel Act. This method of valuation is grotesquely unfair as a basis of compensation for an industry which has been spending such vast sums on development as has iron and steel.

Shorter Note

Higher earnings of International Nickel in the third quarter of this year reflect the recent increase in the price of the metal. Net earnings expressed in US dollars were $13,534,752 or the equivalent, after deducting all charges, taxes and preferred dividends, of 90 cents per common stock unit. The equivalent figures in the same quarter of last year were $5,093,708 or 31 cents per share.

SECURITY PRICES AND YIELDS

A fuller list containing 346 securities appears weekly in the *Records and Statistics* Supplement.

INSURANCE SURVEY

THIS year's survey of British insurance is in two parts. The four articles that follow discuss a number of topics of importance both to insurers and to the insuring public. In addition to this section, we have revived most of the special analyses of British insurance results that were a feature of pre-war surveys; these appear in this week's issue of the *Records and Statistics* Supplement. It is regretted that the Survey appears so late; for this, the recent stoppage in the London printing trade is largely to blame.

Is Insurance Too Costly?

IT is a common fallacy, understandable perhaps but wrong nevertheless, to regard the payment of insurance premiums, other than life premiums, as an exaction. An intangible service such as insurance only proves its full worth when disaster occurs and claims are paid, and the hazards against which people commonly insure their homes and their property occur rarely enough to encourage the feeling in the minds of some insured that their premiums are unduly costly for the small return that they think they get. That this should be so may argue a defect in the insurance industry's relations with its public. It may also be due in part to lack of factual information about the experience of British insurance companies in underwriting British risks.

The business of the British companies and Lloyds underwriters is carried on all over the world and about 70 per cent of the whole (excluding life assurance) is transacted outside the United Kingdom. The returns that they are required to make to the Board of Trade do not call for the separation of home and foreign business except in the life department. Such public sources of information as the annual directors' reports and chairmen's speeches give only a broad outline of the course of business in these general branches.

One of the branches that most closely affects (and can most easily irritate) the public is motor car insurance. In 1938 the comprehensive insurance of the average family 12 h.p. (1,650 c.c.) car, garaged in the London postal area, cost about £15, assuming that its use was broadly restricted to domestic, pleasure and business purposes. The premium for a similar insurance of the same size of car today, allowing for its greatly increased value, would be about £19, an increase of 27 per cent. The current premium rates have been in force since the restoration of the basic petrol ration in June, 1948, when the rates previously charged were increased by 25 per cent, and a discount of 40 per cent was allowed to motorists eligible only for the basic petrol ration, and able, therefore, to obtain a half-duty excise licence. When petrol rationing was abolished last May, this discount was withdrawn from the earlier of the next renewal dates of the licence or policy. The private motorist who had been paying, say, a £15 premium before the war, and £11 5s. whilst he held a half-duty licence, has thus been faced with a two-thirds increase in his premium to £19.

Motor insurance in this country would seem to have been yielding a reasonable profit to the insurance companies during the period when petrol was stringently rationed for private motoring. The mileage of many cars was then restricted to a fraction of what was normal before the war; traffic density, particularly in the large centres of population, was correspondingly reduced and with it the number of accidents. In 1949 the number of people killed on the roads increased by 5½ per cent, while the number seriously injured rose by no less than 31 per cent although petrol rationing was in force; the number of accidents has inevitably increased with its abolition. There can be little doubt that the amount paid out in claims by motor insurers will be substantially greater in 1950 than in any year since the war. Apart from the fact that the modern car is a good deal more expensive to repair because of its integral design, the cost of all repairs and of third-party claims reflects the decrease in the purchasing power of money since 1939. Claims costs are two to three times greater than in 1939, whilst premiums are up by only some 25 per cent. In all the circumstances it seems unlikely that underwriting losses can be avoided notwithstanding the considerable increase in premium income resulting from the cancellation of the half-duty rebate. A further increase in premium rates for private cars is likely, though it will probably be delayed until it has become abundantly clear that it is justified. But the offices will be lucky if they gain any credit for such forbearance.

The resistance of the average member of the public to paying higher insurance premiums is responsible for another difficulty for insurers. This is the persistence of under-insurance during periods of rising prices. Under-insurance is a particular problem in the fire department owing to the great increase in prices since 1939. Insurances are supposed to be for the full value of the property insured. Fire policies do not, however, as a general rule, contain an "average clause"; that is to say, the insurer is unable to protect himself against under-insurance by calling upon the claimant to bear a rateable proportion of the loss, according to the extent of any under-insurance. It follows that fire claims are in present conditions generally paid in full out of premiums which, in the aggregate, are considerably lower than they would have been if the current value of the risks had been fully insured. Considerable efforts have been made by exhortation on renewal notices to persuade policyholders to increase the amount of their insurances in conformity with the lower value of money, but it is all too common to find that no change—or at best an inadequate increase —has been made since 1939 in the insurance of, say, a private house then worth and insured for £1,000 which would now cost up to £3,000 to reinstate. This fact

was observed by excellent underwriting results in the fire department last year, but these were due much more to the exceptionally favourable claims experience in the United States of America and to satisfactory results in other parts of the world than to the results of home business. In fact, fire wastage in the United Kingdom was the highest ever recorded, the estimated cost being some £22,500,000. The paradox is that if the practice of under-insurance were to be eliminated, it would be possible to reduce premium rates to the benefit of those who now insure their property for its full current value. The problem arises in its most acute form in the insurance of private houses and their contents; merchandise and commercial and business premises are more usually fully covered.

In marine insurance, premium costs are at present tending to fall. The combined marine surcharges which were applied during the war to all cargo insurances, were abolished last year and cargo insurance rates have since fallen quite substantially under the pressure of competition. Indeed, there is considerable doubt as to whether they are now adequate. While the surcharge system was of real value in stabilising the marine insurance market during the war and immediately after, its arbitrary incidence had the unfortunate effect of penalising the best risks. The decision to remove it and to restore the traditional flexibility of the market was recognised as a step in the right direction and has justified itself in practice. Aviation insurance, with its periodical heavy claims arising from catastrophes, is running at a loss to the insurers and an increase in present rates is expected.

A public increasingly conscious of the rising cost of living is not likely to welcome increases in the cost of the insurance services that it requires. Yet it can hardly expect to cover its risks on the basis of the historical costs of the property insured and to be recouped in the event of casualty on the basis of current replacement cost. Perhaps the offices could do more than they have done to make the facts of their experience in fire and accident business more easily understood by the man in the street; it is probable that his lack of sympathy is not perverse but arises rather from want of the right information presented to him in the right way.

What a Life Premium Buys

THE public demand for ordinary life assurance continues to expand. Last year the net new sums assured exceeded the 1948 figure by 4 per cent and so set up a new high record. The contribution of ordinary life assurance to the nation's savings is best measured by the annual increase in the funds. The President of the Faculty of Actuaries in his recent inaugural address showed that the combined ordinary and industrial life funds of British offices increased by £113.2 million in 1947, by £123.0 million in 1948 and by £122.5 million last year.

In recent years the public has shown an increasing preference for endowment assurances over whole life contracts and for non-profit policies over those which participate in profits. Table I shows that between 1937 and 1948 aggregate sums assured by endowment assurances in force jumped from £1,220,800,000 to £1,940,100,000 or by 59 per cent; but whole-life assurances increased modestly from £603,200,000 to £650,500,000, or by less than 8 per cent. The decline in the popularity of with-profits contracts is even more marked; whole life assurances with-profits actually fell during this period by 7 per cent, but non-profit contracts of this class increased by 36 per cent. For endowment assurances, with-profit policies increased by 49 per cent, but non-participating endowment assurances increased by no less than 105 per cent, though the comparison in this case is with a much smaller total. Whether or not the recent public instinct in favour of non-profit policies is right must remain to be seen. Past experience of participating assurances shows that they have been the more profitable in the long run. But to many people the advantage of quite substantial additional life cover secured at the outset under the non-profit type of policy may more than outweigh the possibility that, in the long run, the return from such a policy will be less than could be secured by paying the same premium over a similar period on a participating contract.

TABLE I

ORDINARY LIFE ASSURANCES IN FORCE

Latest Valuation Returns of Companies Established in Great Britain

Year	Whole Life Assurances		Endowment Assurances	
	With Profits	Without Profits	With Profits	Without Profits
	£mn.	£mn.	£mn.	£mn.
1937	395·7	297·5	1,007·9	212·9
1946	355·5	272·0	1,317·6	376·9
1947	360·1	275·9	1,395·4	405·3
1948	367·7	282·8	1,503·5	456·8

The sum assured which can be secured today by a 25-year term non-profit endowment assurance varies for the offices included in Table II from £720 to £656 (some 9 per cent less), while for a whole life policy the sums assured (apart from special terms offered by certain offices to total abstainers) range from £1,435 to £1,247 (13 per cent less). Since the security offered by any of the British insurance offices is not in question, it would seem logical to expect that offices quoting the lowest rates of premium for non-profit policies would secure the bulk of the new business. Many offices offering terms materially less favourable than those of some of their competitors are, however, able to underwrite a satisfactory volume of non-participating business year after year. This may have some connection with the fact that the average proposer has no ready access to the comparative figures of several offices or does not take the trouble to ask for them.

In trying to assess the relative merits of with-profit contracts, the only firm basis of comparison is the actual amount paid, including bonuses under the similar policies terminating by death or maturity. On this basis a few offices included in the table (which covers most, but not all, of the British companies undertaking life assurance) stand out from the others, and the majority of these are mutual life offices. Of the six offices showing the best results for with-profit 25-year term endow-

The Mark that ensured PROTECTION

In the early days, the Sun Fire Office used to provide each policy-holder with a special plaque or 'mark' bearing the number of his policy. This was affixed to the insured premises and in the event of fire, the Company's fire-fighters were authorised to extinguish the blaze only after the premises had been identified as being 'Sun Insured.'

Eventually, this practice was discontinued as Public Fire Brigades developed, but for more than two centuries the 'Sun' emblem has been recognised as the symbol of Service and Security to be sought wherever insurance is arranged.

ment assurances maturing this year (which were, therefore, effected in 1925) only one, the National Mutual Life was also amongst the six leading offices in a similar computation relating to 1925, giving the results of policies then maturing and issued at the beginning of the century. The amounts payable at maturity in 1950 under with-profit endowment assurances vary between £994 and £827 (a spread of nearly 17 per cent), whilst the results of whole life policies effected in 1910 and becoming claims in 1950, show the even greater difference of 29 per cent between the range of £2,146 and £1,521.

Such results of the past are not necessarily a reliable guide to the future. The table also shows the participating sum assured currently offered by each office together with the present rates of interim bonus (these latter differ in many instances from the rates declared at the last valuation, being frequently somewhat lower). Provided that the rates of interim bonuses shown are maintained throughout the duration of the contracts—which is, of course, a pure assumption—those offices which showed the best results in the past would once again be among the leaders, although there are some, whose past records are not quite so good, who would take their place with them. The sums assured by new participating policies vary quite considerably from office to office and, as would be expected, broadly in inverse ratio to the rate of bonus.

The table does not comprehend all offices nor does it cover all the differing classes of business they conduct. It does not show, that is, which life insurance office offers the "best terms" today. It does, however, demonstrate that substantial differences exist between mutual offices, proprietary companies and the ordinary branches of the industrial-cum-ordinary offices and also between individual offices within these groups. It is difficult for the average proposer to obtain disinterested advice on the relative attractiveness of the contracts offered by the various offices. It is asking much of the ordinary part-time agent, who usually represents at the most a handful of companies, to be of real help in this way. The better firms of insurance brokers alone offer reasonably disinterested and knowledgeable service; some of these handle a large and increasing volume of new life assurance business, and their services should be of real importance to the insurance industry and to the public.

Notes:—(*a*) Policies currently being issued normally provide unrestricted cover, except that cover against war risk and aviation is commonly restricted for men below about age 30. Policies marked * give only restricted cover should death occur through war or aviation. The prospectuses of the respective offices should be consulted for details of the extent of the restrictions. (*b*) A simple bonus is one calculated with reference to the sum assured only: a compound bonus is calculated upon the sum assured and existing reversionary bonuses. Except where otherwise shown bonuses in the table are applicable to both whole life and endowment assurances. (1) Minimum rate. Bonuses are on a sliding scale. (2) Rate applicable to endowment assurances; a higher rate of bonus is paid on whole life assurances. (3) For the policies shown the present rate of interim bonus on endowment assurances is 30/- per cent bonus is 40/- per cent of the sum assured plus 18/- per cent of existing reversionary bonuses. (4) The present rate of interim bonus on endowment assurances is 30/- per cent compound. Whole life assurance do not receive any bonus until the premiums accumulated at 4 per cent compound interest amount to the sum assured. For this reason the profits sum assured is considerably higher than that of other offices.

Uberrima Fides

(By a Correspondent)

WHEN a man asks an insurance company to issue him a policy he must disclose the facts material to the risk; and by the Marine Insurance Act every fact is material that would influence a prudent underwriter in deciding whether to accept or refuse, and in fixing his rate of premium. If the man fails in this duty of disclosure the policy that he gets is void and worthless. That principle of English law has in its time raised many prickly points and few of them are more troublesome than those which spring from a man's past record and character. Must a proposer who has broken the law, or been in the hands of the police, or spent a period in one of HM prisons, confide these distressing facts to an underwriter when he asks for a policy? Or can he tell himself that what is past is past; what has been expiated is expiated; what was done twenty years ago lies buried under two decades of respectability?

More than once in the last thirty years, underwriters defending an action have pleaded that past wrongdoing is material, and have tried to avoid a policy because some discreditable incident was not disclosed; but usually they have had little success and sometimes judges have criticised the defence rather sharply. When a motorist was shown to have broken the law by persistently driving without a licence, and underwriters' counsel argued strongly that she ought to have disclosed her wickedness, Mr Justice McCardie dismissed the argument almost with contempt. It is not necessary, he said, "for a person to reveal to the insurance company every irregularity in his past life." And indeed if the exposure of every blot on a long life's copy-book were the pre-condition of insurance, what man among us would not run his own risk? In another case, two Frenchmen first insured a worthless film for an extravagant sum, then lost it and sued underwriters for a total loss. The underwriters found out that one of the men had previously been convicted of theft and pleaded that the conviction was a material fact which had not been disclosed. But the judge would have none of it. He said (though this was not reported) that many a man had redeemed his criminal record by a subsequent career of honesty, and he would not agree that a sentence of imprisonment must be disclosed by a man who is doing legitimate business after his release. The point was not pressed by counsel; his Lordship's judgment made no reference to it; and on that part of their defence underwriters lost by an innings and several hundred runs.

*

It is twenty years since that case was fought, and until July of this year there have been few if any reports of defences based on undisclosed convictions. But last July the defence was raised again. The action was brought by a diamond merchant for the loss of his stock by theft. He was a man of 40 who had been a criminal in his earlier life. He was convicted when he was 17 years old. For the next seven years he was in and out of trouble and at the age of 24 he was found guilty for the last time—charged on this occasion with receiving a cushion cover. Then he pulled himself together and for sixteen years his record is clean. For nine of those sixteen years he has been a member of the London Diamond Bourse, where he is said to be respected by his associates. In 1948, without disclosing his past, he took out a jewellers' block policy to protect his stock. Shortly afterwards he was robbed of goods worth nearly £20,000 and underwriters in court did not challenge the loss nor did they suggest fraud. But they did deny liability under the policy on the ground that a criminal record, even if it ended fourteen years ago, was a fact that would influence a prudent underwriter and should be disclosed. The plea was supported by the evidence of other underwriters, and the jury found against the plaintiff. So the ex-prisoner lost his case and a defence very like the one that Mr Justice Roche would not listen to in 1930 prevailed in 1950.

Whether it is right that a man should be dogged through life by the crimes—or rather the convictions—of his youth is a social question that every man must decide for himself; but if the expert witnesses and the jury in this case were correct, then, as the law stands, an extraordinary situation results—that no one who has been gaoled for dishonesty can ever go into a business that calls (as most businesses do) for insurance against fire or theft. That is a disturbing thought. But, penology apart, the case raises the whole question of *uberrima fides* and the duty of disclosure. The doctrine or the principle has been plugged so persistently that it has come to rank almost as high as the Ten Commandments or the law of gravity; but one must not forget that it originated, not with the Almighty, but with the late Lord Mansfield. And it is just as well to step back a pace or two to look at it afresh and realise what an extraordinary piece of law it is—how exacting, how perplexing, and how absolute.

*

To every insurance contract there are two parties and in every direct insurance one party is a professional and the other a layman. The professional spends his life underwriting and knows what things influence his judgment, for insurance is his subject. The layman has his own subject, but it is not insurance. He may know all about jewellery or the sugar market or the second Peloponnesian war, but what goes on in the mind of an underwriter is as much a blank to him as the sorting of diamonds or the chemistry of beet or the disaster at Syracuse would be to the accident manager of an insurance office. Nevertheless the duty is put on him of knowing everything that may sway the judgment of a professional underwriter and if he fails in that duty he can be told, after his goods are stolen, his factory burnt or his furniture in ashes, that the policy on which he has been relying is void. At times indeed the principle has been interpreted so sternly as to make insurance business practically impossible. It has, for example, been held in the Court of Appeal that brokers when they place a non-marine risk must disclose to every insurer the fact that other insurers have been offered the risk and have refused it. That judgment

does not commend itself to modern opinion, and it is lucky that the insurance market never prays it in aid. If it were to invoke the judgment in litigation, the market would almost certainly find within a year or two that it had successfully cut its own throat. In another case a man of foreign birth, living in England under an adopted name, voided his policy because he had not told underwriters of his origin, and the judge was satisfied on underwriters' evidence that the information would have affected their minds if it had been given them. So a layman was presumed to know, and penalised for not knowing, the inner subtleties of an underwriter's business technique.

But there is another line of approach to the question of what facts are material, a line which has been taken in the past but seems now to be closing up. Forty-two years ago Lord Justice Moulton trying a case on a life policy decided that the important point was whether "a reasonable man" would have recognised a given fact as material—a very different yardstick and a much more equitable one, because it gets away from the mind of an underwriter (which has always been a difficult thing to comprehend from the outside) and focuses on the mind of the ordinary man. Once the evidence of a reasonable layman is admitted to check and override the evidence of a professional, the responsibility of the assured can be kept within reasonable bounds, for the test is no longer "would a prudent underwriter be influenced" but "would an honest man of average good judgment expect an underwriter to be influenced." At present, the permissible evidence comes from one side of the counter only; the law would be much fairer if the evidence could come from both.

Insurers as Investors

THE present year has so far been much more favourable for insurance offices' investment operations than 1949. Last year, when the Actuaries' Investment Index recorded falls of 11.8 per cent in 2½ per cent Consols, 9.3 per cent in debentures, 19.1 per cent in preference shares and 13.9 per cent in ordinary stocks, the insurance companies could hardly have avoided considerable depreciation. This year they have fared better. In the nine months to September, 2½ per cent Consols improved by 2.1 per cent, debentures by 1 per cent, preference shares by 4.1 per cent and ordinary shares by 8.0 per cent. Thus they have so far this year recorded some modest capital gains without having to give away much in terms of current yield. Moreover, they have recently participated with eagerness in the spate of new industrial issues of debentures and unsecured loans. Imperial Chemical Industries, Distillers, Unilever, Imperial Tobacco—the list is long, the figures run into the tens of millions, and for most of them insurance money has been abundantly provided. The Prudential is an enormous institution, but it certainly succeeded in conveying a striking impression of its great resources when it subscribed for £7,500,000 out of the £20 million of 4 per cent unsecured loan stock of I.C.I., and followed this up within a few days by taking £3,000,000 of the £6,000,000 unsecured loan stock placed by Distillers at 3$\frac{13}{16}$ per cent.

*

Some of these debenture issues took the form of public offers and some, like the I.C.I. and Distillers issues, were private placings. There has been considerable controversy about the merits of private placings, but there is no doubt of their attractions to such institutions as the insurance offices. Their interest in marketability or in the legal hypothecation of assets as security is today less insistent than the need to avoid stamp duty, to obtain a satisfactory yield, to avoid book depreciation and to obtain repayment after a fixed term. These conditions have not been satisfied in their entirety in the last year or two, and it would be fair to conclude that 1949 was a year of particular difficulty for those who had responsibility for administering insurance investment portfolios. The Stock Exchange investments of the forty offices included in the table amounted at the end of last year to £1,926.1 million out of total assets of £2,546.1 million. The gilt-edged investments of the insurance companies are widely spread from shorts to longs, so that the actual depreciation will have been much less than that of 2½ per cent Consols, perhaps not more than one-half. On this assumption, and using the Actuaries' Index as a measure for the other main classes of securities, the life offices and the life funds of the composite companies with an average distribution of assets probably suffered a depreciation of about 10 per cent of their Stock Exchange securities; expressed as a proportion of all assets (including mortgages, loans, property and cash) the depreciation may have been of the order of 7 per cent. This depreciation is, of course, relative to market values at the end of 1948 and not to original cost. It has been met out of investment reserves, either hidden or published, and the majority of offices still showed book values below market values at the end of last year. Where this was not so, the depreciation was covered by free reserves. Moreover, there was an important offsetting factor for many offices. The non-life assets of the composite offices held in North America considerably exceed the corresponding liabilities; thus these companies received a substantial windfall from devaluation

(*a*) 38 offices.

to put against the depreciation of their sterling investments. Their dollar investments have not, as a general rule, been written up, and the consequent addition to hidden reserves in terms of sterling must be substantial.

*

In spite of the further increase in British Government guaranteed securities resulting from the nationalisation of the gas industry, which became effective in May, 1949, a start has been made in reducing the swollen importance of gilt-edged in insurance portfolios. The percentage of total assets invested in British Government and Government guaranteed securities fell from 39.9 per cent of total assets at the end of 1948 to 38.4 per cent last year, although such holdings increased absolutely from £939.7 million to £978.5 million. Holdings of overseas government and municipal securities expanded from 9.5 per cent to 10.0 per cent of the total, whilst ordinary shares were up from 9.9 per cent to 10.3 per cent. It can be deduced from certain of the life office chairmen's speeches that some part of the increase in ordinary shareholdings was due to investments in United States common stocks. The increase in cash and debentures was largely due to writing up overseas current assets following devaluation.

Any study of Table I must bear in mind that insurance companies (with one exception) do not enter their Stock Exchange securities in the balance sheet at current market prices. Last year brought a material rise in the rate of interest, the gross yield on 2½ per cent Consols on December 31, 1949, being 8s. 5d. per cent greater than at the end of 1948. An appreciable rise in the rate of interest has only a small effect on the average yield on insurance funds in a given year as its benefits apply only to the increment in the funds. Some rise in the average interest return might have been expected last year, but in the event there was a small fall of 5d. per cent. This fall occurred mainly because some offices brought proportionately larger income tax charges into account last year; these charges caused corresponding falls in net yields and had a considerable effect on the average net yield, which is not weighted. There was also, no doubt, a general shortening during the year of the average maturity date of gilt-edged securities and towards its end some offices were preferring to hold cash as a precaution against depreciation, even though this entailed a temporary loss of current income.

(a) Excluding industrial life funds.

'IT IS FOR US, THE LIVING, RATHER . . '

MANY who accept a measure of dependence on their fellows in their lifetime will not contemplate it in death. In the past, this attitude found expression in the old burial societies and in the still earlier provision of the guilds. In the last century the need of the new industrial classes for provision against burial expenses gave rise to industrial assurance. Small weekly payments were made to avoid the indignity of a parish burial.

Although the system was thus confined to the contingency of dying, the service which is still described by the name of Industrial Assurance has been developed to meet far wider social needs and goes far beyond the industrial classes. Moreover, today it is more concerned with providing benefits for the living.

Under modern endowment schemes, a man may hope to reap the fruits of his saving secure in the knowledge that these benefits, as far as his dependants are concerned, do not depend on his survival. From the moment the first premium payment is made, his life is insured. By means of endowment policies, the service of industrial life assurance is being increasingly used to the benefit of the policyholder during his lifetime and most of the new policies issued by the Industrial Life Offices are now of this type.

Thus, an honoured phrase used in another context by Abraham Lincoln also describes the development by free enterprise of this great service. Although founded on the need for burial assurance, we may truly say of that service today 'It is for us, the living . . .'

Issued by the Industrial Life Offices CP1

Very attractive terms for

EXECUTIVE PENSION SCHEMES

A special method of providing adequate retirement benefits for Executive Directors and Key Personnel.

EXAMPLE:

Age 45 next birthday.
Premium of £500* p.a. secures a pension at age 65 of £973 p.a. Alternatively a tax free cash payment of £2,688 plus a pension of £730 p.a.
The pension is payable monthly in advance for life. If death occurs within 5 years, payments are guaranteed for the remainder of that period.
On death before 65 the sum assured is payable of £10,755.

*Usually borne by employer and allowed as a trading expense for tax purposes.

COMPANY MEETINGS

THE UNITED STEEL COMPANIES, LIMITED

PRODUCTION STILL HIGHER
THE TRAGEDY OF NATIONALISATION
SIR WALTER BENTON JONES'S SPEECH

The annual general meeting of the United Steel Companies, Limited, was held on November 15th at Caxton Hall, Westminster, S.W., Sir Walter Benton Jones, Bt., the chairman, presiding.

The chairman said: Gentlemen,—This meeting may be the last annual meeting of the stockholders of this company. But as nothing is certain in this world, I propose first to comment on our company's affairs during the last twelve months as if the Iron and Steel Act had not been passed and to conclude by explaining the effect of the Act.

The report and accounts were circulated with the notice convening this meeting, and if we may take them as read I beg to move:

"That the report of the directors produced together with the annexed statement of the company's accounts at June 30, 1950, duly audited, be received, approved and adopted."

THE REPORT AND ACCOUNTS

In the report for 1948-49 the directors added a statement of the year's operations which showed among other things the high level of production achieved and the progress of development schemes.

In the current report the directors are able to say that production has reached a still higher level. This higher level is again the result of improvements and extensions to plant, adequate and regular supplies of raw materials and co-operation between management and employees. At this meeting it is no formality but our sincere appreciation which prompts us to convey to employees of all grades our thanks for the work they have done and the goodwill with which all co-operate.

The 1948-49 report and my remarks at the last annual meeting cover the whole ground of our modernisation and development schemes, and it is only necessary for me to say now that since then, having regard to present conditions, reasonable progress has been made. The most important of the schemes outstanding is the enlargement and elaboration of the ore preparation plant and the duplication of the coal carbonising plant at Appleby-Frodingham.

In the directors' current report it is recorded that in the last ten years the amount of capital expenditure which covers extensions, as well as improvements and replacements, has been nearly £22½ million and that in the year under review the amount spent has been £4,153,000. It will continue at this rate for the next five years. This may seem a large sum, but expenditure on extensions, improvements and replacements is inevitable in industry and whether it is called capital or revenue the mounting level of prices pushes this expenditure up to corresponding levels. On this subject I have something to say later.

The accounts are clear. I need not go over them in detail or repeat what has been said in the directors' report. You will notice that in the consolidated balance sheet the bank overdraft after deducting cash at bankers and in hand stands at about £1,400,000. This is the reflection of the excess of capital expenditure over surplus revenue. In order to meet this and requirements over the next five years it is necessary to introduce new money. Negotiations for this purpose were well advanced before the announcement that the Government proposed to put the Iron and Steel Act into operation at an early date. Now we must continue to use the accommodation placed at our disposal by our bankers.

ANALYSIS OF EXPENDITURE

In each of the last three years an account has been presented to you of the company's gross income from sales and investments and an analysis of expenditure. This account and analysis for 1949/50 is as follows:—

	Total Amount £	Equivalent Proportion Per cent
Gross income from sales and investments	56,118,187	100·00
Amounts expended on:—		
Raw materials, fuel and services	34,216,679	60·97
Wages, salaries and state insurance	12,934,261	23·05
Holidays with pay	363,855	·65
Pensions for staff and workmen	165,000	·30
Rents, rates, insurances and general trade expenses	972,603	1·73
Delivery charges	2,257,087	4·02
Taxation	2,678,000	4·77
Dividends to stockholders (6 p)	574,686	1·02
Retained in the business for depreciation of plant and machinery and other purposes	1,956,016	3·49
	56,118,187	100·00

GLAMOUR OF NEW WORKS

A short time ago I read in some publication referring to a new steel works that one of Britain's boldest and greatest industrial developments is nearing completion. But it must not be forgotten that there are already in existence great iron and steel works built up in many cases from small beginnings by courageous proprietors which can truly be described as great British industrial developments.

I shall not be belittling enterprises of other companies if I mention our own. There are four large steel works which together produced last year 2,128,000 tons of steel ingots; they are Appleby-Frodingham Steel Company in North Lincolnshire, Steel, Peech and Tozer and Samuel Fox and Company, near Sheffield, and the Workington Iron and Steel Works in Cumberland. A fifth works, the United Coke and Chemicals Company, at Orgreave, near Sheffield, supplies coke to Appleby-Frodingham and gas to Samuel Fox and Steel, Peech and Tozer, and produces also large quantities of oils and chemicals. All have fascinating histories, all have been built up from small beginnings to large works by enterprising proprietors, all have marched with the times, all are impressive and all are known all over the world. I refer to them in this way for two reasons, first because the proprietors of the company should realise that their properties are not overshadowed by newer works which are more frequently referred to in the press, and secondly because the employees of the company are often jealous of the publicity given to works which they regard as little or perhaps no better than their own.

I shall not take up your time by referring in detail to more than one. I do so in this case because of the size of the works, because it is self-supporting, and is one of the few iron and steel works in this country which is based on and uses only home ore.

LARGEST STEEL WORKS IN COMMONWEALTH

The Appleby-Frodingham works in North Lincolnshire claims to be the largest steel works in the British Commonwealth. It mines its own iron ore. It makes a large proportion of its requirements of coke, and its coke works are in process of duplication. It makes its own iron.

It uses the gas made at the ironworks for blowing its blast furnaces, for generating electricity, for heating furnaces and in its steel melting furnaces. It converts its iron into steel. It rolls steel into a number of products. It fabricates steel for constructional purposes.

PROGRESS SINCE 1866

It was founded by the Cliff family in 1866 to make iron from the Frodingham ironstone bed which contained little more than 20 per cent. of iron, and it still uses this ore with ore from its South Lincolnshire mines. In 1888 the Cliff family, after consultation with Thomas Gilchrist, began to make steel in open hearth furnaces, then in their infancy. In 1901 they installed the first tilting steel furnaces in the world.

The output of iron at Frodingham in the year 1866 was 11,000 tons, it has grown to 800,000 tons per annum. The capacity of the steel works built in 1888 was 20,000 tons per annum, last year it made 874,000 tons. The area covered by the works is 1,175 acres.

The maintenance shops alone cover 5½ acres and employ 752 men, their size gives an idea of the amount of machinery and plant in operation in the works. The works have been kept abreast of the times, their products and their technique are known all over the world.

At these works nearly 800,000 tons of iron per annum is made from home ores which have an exceptionally low iron content. The smelting of these ores needs much more coke than is required for the smelting of the higher grade imported ores which are available for iron making at works on the coast. When two new blast furnaces were built at the South Ironworks a few years ago a plant for the pre-treatment of ore was included. This pre-treatment of the ore has proved to be so beneficial that a scheme for its enlargement and elaboration has been undertaken and will be in full operation at the end of March next year. It is expected that as a result of this extension of the ore pre-treatment, or ore beneficiation plant, the output of iron will be increased and a substantial economy in coke consumption will be effected.

TRADING SURPLUS

In the public mind the word profits applied to trading or manufacturing companies is often misunderstood. It is regarded as so much cash which has accumulated in the till waiting to be distributed to shareholders. It is important to remove this misunderstanding because it leads to the assumption that while everything else which is affected by the fluctuation of the purchasing power of the pound should fluctuate correspondingly, profits in terms of the pound should remain static. In fact so-called profits are what industry lives on, its cost of living goes up when prices rise just as inevitably as the cost of living of the man in the street.

If you will refer to our consolidated profit and loss account you will see it begins with what is described as balance of trading profit £5,107,852. This would be more correctly described as trading surplus because many charges including provisions of no less than £2,678,000 for taxation and of £1,175,484 for depreciation have to be met out of it before arriving at a balance available for appropriation to reserves or dividends. Thus reduced, the balance becomes £1,328,945. Again, £750,000 of this

balance (plus £250,000 from another source) is appropriated to General Reserve. The amount distributed to stockholders is £574,686.

DEPRECIATION AND TAXATION

This illustration demonstrates that if the provisions for depreciation and for taxation and the appropriation to General Reserve are no more than is needed, the trading surplus of our company recorded in the accounts of approximately £5,000,000 is also no more than is needed to meet what I have called its cost of living.

The provisions for depreciation and taxation follow a formula and are matters of arithmetic. They are no more than is needed. It is true that the appropriation to general reserve is arbitrary, but the provision for depreciation and the appropriation to general reserve, together approximately £2,000,000, represent provisions for the future in which replacement of plant is constantly and regularly required and in which unforeseen contingencies may arise and periods of less active trading may be encountered. Of these the continued fall in the value of the pound, in other words, the continued rise in prices, makes the future replacement of plant a difficult problem, as has been frequently pointed out by chairmen of companies and by the technical and financial press.

REPLACEMENTS

Replacements can only be made in exchange for pounds and since pounds are no longer related to gold, replacements whenever they are made will have to be paid for in paper pounds at the date of replacement. No one can foresee how much paper pounds will buy in the future, or, in other words, how much future replacements will cost. But the increase in the cost of replacement can be illustrated by looking at the replacement cost of our company's producing assets in today's paper pounds compared with the past, based on the Board of Trade index of General Wholesale Prices. These assets at June 30, 1950, after applying the depreciation provisions, stand in the consolidated balance sheet at £23,293,000.

It is estimated that the cost of replacing these assets as they exist today would have been no more than £25,000,000 in the gold pounds of 1913, and no more than £26,000,000 18 years later in 1931, the year in which the Gold Standard was abandoned. But in the paper pounds of today, 19 years later than 1931, the cost of replacement would be no less than £76,000,000, an increase of £50,000,000.

If it is assumed that the useful life of these assets is 25 years, their replacement will require 3,000,000 of today's paper pounds every year, and these pounds can only come out of trading surpluses after providing for taxes, which today takes one half of them. We know that in practice some assets may not need replacing in 25 years, but the illustration indicates first, that our trading surplus is not more than we need, and secondly, that trading surpluses in general cannot be regarded in isolation but must keep in step with prices.

Nationalisation will make no difference to these problems, the same trading surplus will be needed and the same cost of replacement will have to be incurred.

NATIONALISATION

The Iron and Steel Bill introduced on October 29, 1948, became an Act of Parliament on November 24, 1949, eight days after our last annual meeting. The Act is commonly regarded as an act to nationalise a whole industry, viz. the iron and steel industry. In fact it is an act to provide for the establishment of an Iron and Steel Corporation of Great Britain and for the transfer to that corporation of the securities, not of all but of certain selected companies—specified in the third schedule to the Act—who are engaged in the production of iron and steel and in activities leading up to and following their actual production. The number selected is 96, and the basis of selection is production in excess of minimum outputs of iron ore, pig-iron or steel.

The specified companies will not be dissolved by the Act as in the case of transport, electricity and gas; they are to remain in being. The effect of the Act was to take the securities, i.e. the share and loan capital, from the present holders on a date to be fixed and to transfer them to one holder, viz. the Iron and Steel Corporation of Great Britain, which the Minister of Supply would set up. The Minister has duly appointed members of the Corporation.

VESTING DATE

The date of transfer or vesting was left to the Minister of Supply. It was to be not later than twelve months after January 1, 1951. It was hoped that the Minister would defer fixing the vesting date as long as possible, but on October 9th he announced that the date would be February 15, 1951.

The transfer of the securities of the specified companies is compulsory. In cases where the securities are quoted on the Stock Exchange, as they are in our case, the compensation has been fixed by the Act and without reference to the owners of the securities.

The compensation is fixed by calculating the average prices of the securities on the Stock Exchange on certain dates. For the purpose of determining the amount of compensation so to be calculated, each company had to appoint an individual to act as stockholders' representative, and these representatives had to be appointed not later than two months before the date of transfer.

The United Steel Company is a specified company and unless legislation is passed which would make the Act of no effect, or the date of transfer is postponed, the securities held by our stockholders, namely, £5,097,000 preference and £10,194,000 ordinary stock, which are the only securities constituting the company's capital, will automatically pass to the corporation on February 15th.

At a meeting of stockholders held in Sheffield on October 23rd they appointed Mr C. R. Urquhart, partner in the firm of the company's auditors, Messrs Peat, Marwick, Mitchell and Company to be their stockholders' representative. He will take care that the amount of compensation is correctly calculated.

COMPENSATION

It is expected that the compensation for preference stock will be 22s. 10d. and ordinary stock will be 30s. 4d. Compensation will be paid not in cash but in a new form of stock to be known as British Iron and Steel Stock, the conditions of which, speaking generally, will make it of par value at the date of issue.

In addition to the compensation payable in iron and steel stock, pro rata dividends would be payable in respect of the period between the end of our company's last financial year, viz. June 30, 1950 and the transfer date, viz. February 15, 1951. The normal dates for paying dividends are, for the preference stock 2½ per cent. on February 1st and 2½ per cent. on August 1st, and for the ordinary stock 2½ per cent. interim dividend towards the end of March and 5½ per cent. final dividend in the middle of November.

DIVIDENDS

The amount of dividend which will have accrued in respect of the preference stock between the last payment on August 1st and February 15, 1951 will be 2.4411 per cent. compared with 2½ per cent. normally due on February 1st. The Act provides that dividends payable shall be paid as soon as possible after the date of transfer. It might be more convenient to preference stockholders to receive a single payment soon after February 15th than to receive the normal payment of 2½ per cent. on February 1st and a relatively small amount at some later date.

In the case of the Ordinary stock a dividend would be due in respect of the period between July 1, 1950, and February 15, 1951, which calculated at 8 per cent. per annum would amount to 5.0192 per cent. There are no means of ascertaining when this would be paid, but there would be nothing to prevent an interim dividend being paid in March as usual, in which case the balance might be paid at the same time or later.

ALL ASSETS TAKEN OVER

Letters received from stockholders from time to time indicate that they do not understand clearly the effect of the Act. They appear to think that some of the assets of the company might be retained for their benefit without reducing the amount of compensation they will receive for their securities.

The securities of our company are of two classes only, viz., Preference and Ordinary stock. The effect of the Act is to take away from every holder of Preference and Ordinary stock on February 15, 1951, the whole of his stock in return for compensation, and to transfer it to the newly formed Iron and Steel Corporation. By this transaction the Corporation in effect will acquire every single asset of the company and every single liability. Nothing whatever will be excluded.

It is true that some specified companies have segregated, or hived off, as it has been called, part of their assets which it has been agreed by the Minister of Supply might be retained for the benefit of stockholders. But in such cases a valuation of the assets segregated is made, and this is deducted from the amount of compensation to be paid. For example, suppose that some of the assets of our company had been segregated by agreement with the Minister of Supply, and suppose that the value of such segregated assets had been agreed with the Minister of Supply in round figures at £500,000 or 1/20th of the Ordinary stock, then the compensation per £1 of the Ordinary stock would be reduced by 1s., i.e., from, say, 30s. 4d. to 29s. 4d.

Further, some kind of body would have to be set up to which the segregated assets could be transferred. Such a body might be a new company, the shares of which would be issued to the stockholders, or it might be trustees, who would find a purchaser and distribute the proceeds to the stockholders.

NO SEGREGATION

The possibilities of segregation have been considered by your directors, but it does not appear that any of the assets are suitable for segregation or that any segregation would profit the shareholders.

We have also been asked if the compensation received and receivable for coal mines can be distributed to the stockholders. The answer to this question is that the compensation received or to be received in respect of coalmines assets is for the purpose of the Iron and Steel Act no different from any other assets, and there is no provision to provide for this special treatment, but even if it were admissible to hand over to the stockholders the compensation received or receivable for the coal mines, then the compensation so received would still be deducted from the compensation payable for the company's securities.

THE FUTURE

As to the future, the Minister of Supply when speaking in the House of Commons during the debate on the Third Reading of the Iron and Steel Bill said, "the making of iron and steel in its many forms will not, under this Bill, be the responsibility of any Government department. It will be the responsibility of the managements of the existing companies which will retain their identities, their goodwill and such loyalties as they have been able to build up. The Corporation's function will be that of a holding company responsible in their broad policy to Parliament through, of course, the Minister of Supply. They will be charged with the general duty of ensuring that the development of the industry and the price, quality and type of their products conform to the overall economic needs of the nation."

Again, at a press conference in South Wales on September 30, 1950, the Minister, as reported, emphasised that the transition from private ownership to nationalisation should have no effect on the manner in which the steel industry would carry on. The individual companies would still exist as units with all their traditions and loyalties which have been built up. The Steel Corporation would merely be the holding company of the shares.

OPPOSITION'S INTENTION

The Opposition have said that if they are returned to power they will return the selected companies to free enterprise.

But whatever the future may be, unless in the meantime the Act is repealed or the date of transfer postponed, that part of the iron and steel industry represented by the specified companies, of which we are one and all their other activities will be what is called nationalised on February 15, 1951.

Much has been said and written about the method of valuing the shares of the specified companies. Great objection has been taken to the valuation by reference to the price on the stock exchange on some selected date. Whatever may be said for this method, it can hardly be a fair way of valuing iron and steel companies which it is common knowledge have been spending very large sums on developments in recent years which at the time transfer prices were fixed by inclusion in the Iron and Steel Bill on October 29, 1948, had not and in many cases still have not become productive.

In the case of our company since July 1, 1948 the net worth of our assets as they are recorded in our consolidated balance sheet including the provision for deferred taxation has increased by £3,415,000.

It is no answer to say that the current market price of the stock reflects this increase in net worth. Market values of stocks and shares follow very closely the rate of the latest dividends, dividends generally have been voluntarily restricted by special request of the Chancellor of the Exchequer since March, 1948, and in the case of the specified steel companies dividends payable after October 29, 1948, were limited by the Act itself.

ATTITUDE OF DIRECTORS

In conclusion the directors of specified companies and their trade association, the British Iron and Steel Federation, have been criticised for unwillingness to co-operate once the Act was passed. But it should be remembered that the directors of the specified companies and their trade association (which has other members) are the elected representatives of the owners of the securities which are to be compulsorily acquired but which have not yet been acquired. They could hardly lend themselves to the acquisition, on the contrary it is their duty to oppose it until the last moment. The irony, the tragedy of the whole matter is that nobody really wants iron and steel to be nationalised.

The report and accounts were adopted.

ROAN ANTELOPE COPPER MINES, LIMITED

The following is an abridgment of the statement by the chairman (Mr R. L. Prain, O.B.E.), dated October 9, 1950, circulated to members.

MR A. CHESTER BEATTY

Last June, his colleagues no longer felt justified in continuing to ask Mr A. Chester Beatty to remain on the board as chairman against his expressed wish to retire, and accordingly, on June 6th, Mr Beatty resigned after 23 years as first chairman of the board.

Mr Chester Beatty was the founder of this company, and indeed is generally acknowledged to be the main architect of what is now the great copper industry of Northern Rhodesia.

My colleagues did me the honour of inviting me to succeed Mr Beatty as chairman.

MINE POSITION

After a successful and confident start at Roan Antelope, underground difficulties were encountered. The years 1931 to 1938 were years when the low costs of production and the successful extraction of the ore gave no indication of the trouble which was to develop later on account of the mine workings being subjected to unduly heavy pressure. This situation became evident in the year 1939, and resulted in the necessity of introducing more costly mining methods. The questions of safety, mining recovery and mining costs all had to be considered and correlated to the best advantage under difficult circumstances. In the development period, during which the mine was being turned over to new methods, costs were bound to be high and production low, and it is only now that the results of this work are beginning to be seen. It is calculated that maximum production will be about 72,000 tons of copper per annum.

The development of the Roan Extension area proceeded satisfactorily.

The bringing into production of this area has taken 4½ years, and has cost about £1,000,000, all of which has been found out of taxed profits.

DEVALUATION

In December, 1949, agreement was reached with the Ministry of Supply whereby the price basis for Northern Rhodesian copper delivered to the Ministry would be approximately the same as the price of copper f.a.s. New York. The importance of this decision to the Northern Rhodesian companies is obvious, as it results in a higher copper price in terms of sterling, which is essential to meet the inevitable increase in the costs of production and capital goods following on devaluation. The increase in price and the increase in costs should first be evident in the current year.

RESULTS FOR THE YEAR

The blister copper production for the year was 63,557 long tons (56,162 the previous year).

Stocks were increased by 1,500 tons to about 18,000 tons, which completes the stock-building programme. The remaining production was sold at an average of £127 4s. 7d. per long ton of blister copper f.o.b. Beira (£120 7s. 9d. the previous year).

The profit for the year before replacements and taxation amounted to £3,334,000, an increase of approximately £670,000, of which about half is due to the increase in the price received for our copper, and the rest to the increase in production. In order to make adequate provision for the very heavy expenditure in the years through which we are now passing, the appropriation to replacements and obsolescence reserve has been increased from £700,000 to £900,000; the reserve now stands at £1,588,284. In line with previous policy, £100,000, being the approximate amount of the increase in the value of copper stocks, has been transferred to general reserve.

The board has recommended a final dividend of 9d. per unit of stock or share which, together with the interim of 6d., will make a total distribution for the year of 1s. 3d. (1s. 1½d. the previous year).

Taxes payable for the year amount to about £1,616,000, against which there is a credit in respect of over-provision for previous years amounting to £52,000; the carry-forward is increased to £193,936.

COPPER MARKET

Our copper has been sold almost entirely to the Ministry of Supply. I have referred already to the agreement reached with the Ministry with regard to the effect of devaluation on the copper price. This price will thus continue to be based on the United States export quotation which during the year touched a low point of 16 cents per pound of electrolytic copper f.a.s. New York and a high point of 22.50 cents. At present this price is standing at 24.50 cents. It will not, I believe, be considered an excessive increase in price, considering the movements which have occurred in other commodities and the extremely strong statistical position which still obtains for copper.

LABOUR POSITION

There were two short strikes which together caused an interruption of three days. The matters in dispute were ultimately settled with the European trade union, either by discussion or through conciliation.

There were no disputes with the staff association or the African trade union which were not settled by discussion or conciliation, while in the case of the European union the only dispute on which agreement was not reached was that relating to the question of a 40-hour week. The union had requested the copper companies to recognise the principle of a 40-hour week, and the matter had been referred to conciliation, at which no agreement was reached. A Board of Enquiry was appointed into this dispute, and into the question of compulsory arbitration; its findings have not yet been published.

FUEL

There were no interruptions during the year on account of shortage of fuel. Deliveries of coal were not up to the company's requirements, but the effect of the shortage in deliveries was mitigated by the continued intensive wood-burning efforts of the copper companies.

Since the end of the financial year there has been further deterioration in the fuel position, and the outlook is still far from clear. It does appear, however, as if the problem may again develop, as it has done in the past, into one of carrying capacity of the railways rather than of colliery output.

WESTERN CONCESSION

Just over £9,000 was spent on an area to the west of the Copperbelt which is being prospected by Mufulira Copper Mines on behalf of itself and certain other Northern Rhodesian companies, and in which work this company has a participation of 30 per cent.

GOODE DURRANT AND MURRAY

(Wholesale Merchants, Importers and Warehousemen)

A SATISFACTORY RESULT

MR GEORGE P. SCHOOLAR ON BUSINESS TRENDS

The fifty-second annual general meeting of Goode Durrant and Murray, Limited, was held on November 9th at 197, Great Portland Street, London, W., Mr George P. Schoolar, the chairman, presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended July 20, 1950:—

In presenting to the shareholders the balance sheet for the year ended July 20, 1950, the directors are pleased to again be in a position to report a satisfactory result for the period under review. The continued upward movement of markets caused uncertainty as to the capacity of the public to keep pace with rising prices; the opinion being frequently expressed that limits had been reached, and that buying resistance would interfere with sales.

There has indeed been considerable price resistance, and people have either substituted with articles of lower quality, or gone without, by making the old garment last out another season; but increasing population and rising wages, coupled with steady employment, has kept sales at a level which consumed available supplies, with little sign of slackening demand. Profit margins, under the system of price control applied in Australia, are inadequate, and not in keeping with the risks entailed, and margins do not allow for the provision of reasonable reserves to cover ordinary market risks.

Labour conditions show some signs of improvement in factories and workrooms. In addition to seniors with some experience, juniors and beginners have become available in larger but still limited numbers. The juniors are very welcome, as indicative of a revival of interest by young people in this type of occupation.

TRADE PROSPECTS

New Zealand trade is increasing and prospects are encouraging. South African trade made a good recovery following on a dull period due to import restrictions and unbalanced buying by some importers.

There has been a rush to secure goods, in anticipation of shortages and still higher prices. Purchases are in excess of current requirements and an easing in demand can be expected, while stocks are being reduced to normal. This buying excitement has been general and not confined to South Africa or Australia and New Zealand.

The West Indies have recently bought from this country the bulk of the goods that were formerly obtained from the United States and, in consequence, our shipments have assumed much greater proportions. Owing to currency regulations our trade with South America has been restricted. There are indications of easier conditions in this market.

Business in other parts of the world, including India, Pakistan, Middle East and Far East, has been adversely affected by unsettled conditions, but there are some signs of improvement. With all these factors intervening, it is gratifying to us to be in a position to recommend the same dividend and bonus as paid last year, after putting further sums aside for contingencies and superannuation. Reserves for future taxation on current profits have been provided at existing rates.

BALANCE SHEET FIGURES

I would like to draw your attention to the fact that the figures in our balance sheet on this occasion are entirely in sterling. Previously mixed Australian and United Kingdom currencies were given, with provision for exchange on the excess of current assets over liabilities in Australia. This exchange provision has now been applied to the separate totals of assets and liabilities, and, in order to give an accurate comparison, the previous year's figures have been similarly treated. The total excess of current assets over liabilities is now £980,742. To the best of our knowledge, ample provision has been made for doubtful debts. Stocks have been subjected to careful inspection by the management, and conservatively valued, and, provided there is no major disturbance to business, should be realisable at a profit.

Since July 20th, world events have affected markets to an unusual degree. We are again facing market advances, but of a more revolutionary nature, and problems have to be expected which make it difficult to forecast future trading results. We are endeavouring to maintain and to improve sales without increasing stocks unduly; but sales can only be effected by providing goods in sufficient quantities to give the turnover required. The quality of management and staff will be tested when facing up to the position.

LIMITING RISKS

Retailers can be expected to adopt a conservative policy, and endeavour to limit risks by buying from hand to mouth. We can see the wholesaler being called upon to carry the stocks, and assume a greater proportion of risk in their disposal until such time as markets settle on to a steadier basis.

Harvest prospects in both South and West Australia are satisfactory. Wool, the main primary product, has taken a spectacular rise and the clip will be responsible for a much larger amount, owing to very keen demand and high prices. Excessive prices give a temporary benefit to the seller, but do not serve the real interests of the industry, and, in the case of wool, forces manufacturers to search for substitutes and mixtures. A genuine shortage obtains with high prices unavoidable; and demand for military purposes has aggravated an already serious position.

A shortage of labour for primary and secondary industry is still hampering operations in pastoral, farming and mining pursuits, as well as heavy industry in Australia. Building shortage is acute, and importation of prefabricated houses is being resorted to. These structures may satisfy an urgent demand; but in countries where homes of a substantial nature are a feature, it is a great pity that resort to substitutes should be necessary.

I should like to place on record the board's appreciation of the loyal support of our staff in Australia and also in London, which the board consider has contributed to an important extent in the export trade of the United Kingdom.

The report and accounts were adopted.

SOUTH AFRICAN DISTILLERIES AND WINES LIMITED

INCREASED PROFITS

The sixteenth annual ordinary meeting of South African Distilleries and Wines Limited was held on November 10th in London, Mr H. R. Mosenthal (the chairman) presiding.

The following is an extract from the statement by the chairman for the year ended February 28, 1950:

The consolidated trading profits amount, before providing for United Kingdom taxation but after providing for all South African taxation, to £541,304, as compared with £516,389 last year, an increase of £24,915.

The total estimated liability to South African taxation on the profits earned during the year is £183,704, as compared with £182,931 last year. The total provision for United Kingdom taxation is £130,503, compared with £122,287 last year.

RESULTS OF YEAR'S OPERATIONS

Dividends declared by the subsidiary companies amounted to £298,726, as compared with £275,937 in the preceding year. Net profit available for distribution amounts to £180,505. The directors propose to distribute a final dividend on the Ordinary stock of 19 per cent., less income-tax, making, with the interim dividend of 6 per cent. already paid, a total of 25 per cent. for the year.

Last year our subsidiary companies suffered a further reduction in their quota of rebate brandy, which had necessitated the further rationing of their sales, but I was able to inform you that they were able to minimise this very serious handicap to a certain degree by careful anticipation. This problem has been resolved and the policy is being continued of increasing maturing wine and brandy stocks. The prospects of the operating companies are as good as ever.

Some shareholders may feel that we should not have increased our dividend, but I fail to appreciate why, it the decreased buying power of the pound or, in other words, the cost of living, justifies wage increases, those such as widows, men in retirement and generally all people dependent on dividends to maintain not only their standard of living but their actual living, should not also receive the extra dividends where profits justify increased distribution. I emphasise the word "justify." Adequate reserves must be provided, as in fact they have been.

I do not like bringing politics into the annual statement, but may I be permitted to say that the economic recovery of this country would be speeded up by the limitation of Government expenditure and waste rather than the dividend limitation, which is to some extent a class measure; it would seem that the old and very sound motto, "United we stand, divided we fall," has been converted into "Unions must stand, dividends must fall."

QUESTION OF TRANSFER OF CONTROL

The board has for some time had the question of the transfer of directorial control to the Union of South Africa under consideration. The decision is not an easy one. Many factors come into the matter which have to be taken into account, and there might be alterations in taxation both in the United Kingdom and in the Union of South Africa which may have disadvantageous effects if control were removed from this country. The report of the Tucker Committee is expected to be issued shortly, and this may indicate very clearly whether the removal of control is desirable or otherwise, and in these circumstances the board has come to the conclusion that it is in the best interests of the stockholders to defer coming to a final decision.

The report was adopted.

DALGETY AND COMPANY

ANOTHER SATISFACTORY YEAR

The sixty-sixth annual general meeting of Dalgety and Company, Limited, will be held in London on December 7th.

The following is an extract from the statement of Mr D. Abel Smith, the chairman, circulated with the report and accounts for the year to June 30, 1950:—

I am pleased to be able to report another satisfactory year's trading. The company's business during the year has been well maintained and in many directions increased. Shareholders will be interested to learn that the number of offices in Australia, New Zealand and East Africa has increased since 1945 by no less than 74.

HIGH LEVEL OF PRICES

Prices for all primary products have remained at high levels and have contributed very materially to the satisfactory results for the year. Although the outlook for the current year is very promising, we do not lose sight of the fact that the present high prices may not last, and we have thought it prudent again to make substantial appropriations to our reserves as an insurance against less favourable times in the future.

I referred last year to inflationary tendencies in the Australian economy which show no signs of abating. One of the main effects on our business has been a substantial increase in expenses, a large proportion of which has been the salaries and wages of our staff. Fortunately during the past year increased earnings have more than absorbed the increased expenses. That these earnings have proved so buoyant is in the main due to the high prices which have ruled for wool and which are themselves reflected in the price of sheep.

It is contrary to the company's policy to deal on its own account in wool or stock. Wool, as you know, is sold at public auction by us and our competitors, and our aim is to persuade the pastoralist to entrust his clip to us for sale. It is from the commissions on these transactions that our earnings arise, and by working only on a commission basis we can justly claim that the interests of our clients and ourselves are one.

TRADING IN NEW ZEALAND

In New Zealand, too, the year's trading has been highly satisfactory, and each of our main branches has been able to show profits which are an improvement on the previous year. In view of the keen competition which exists in all the numerous small centres in New Zealand where the company's business is conducted, and taking into account the fact that many clients formerly financed by us are now independent and therefore free to deal with whom they wish, the results reflect great credit on the management and staff. As in Australia, however, our satisfaction must be tempered by the knowledge that the good results are in part to be attributed to the high level of wool and stock prices, and we cannot but be disturbed by the heavy rise in expenses.

I turn lastly to East Africa where the result of the year's working has been a disappointment. Most of our smaller branches did well, but the profit for East Africa as a whole is the lowest for some years, which is the more disconcerting in that prices of primary products, and particularly sisal and coffee, have been higher than ever.

Although the results for the past year have been below expectations, we retain our faith in the successful development of the East African territories.

We are recommending a final dividend of 6½ per cent. on the Ordinary shares, which represents 10 per cent. for the year, and we also recommend the payment of a bonus of 2 per cent. on the Ordinary shares, making a total distribution of 12 per cent.

STREAM-LINE FILTERS LIMITED

RECORD VOLUME OF ORDERS

MR C. S. GARLAND'S REVIEW

The annual general meeting of Stream-Line Filters Limited, was held on November 13th in London, Mr C. S. Garland, the chairman, presiding.

The chairman referred to the serious loss the company had sustained in the death of his son, Mr J. C. Garland, A.C.G.I., B.Sc., A.M.I.Chem.E., in the accident to the Dakota machine at Mill Hill on October 17th. He was technical director of the company and had, since his return from the R.A.F., completely reorganised two of the company's factories. He was on his way to a conference regarding the lubrication of a new rolling mill which was one side of the company's work in his charge. He was a very capable engineer, well versed in all phases of the company's operations and will be difficult to replace.

Continuing, he said: The volume of orders and the output from the works steadily increases—both being a record since the establishment of the business in 1923. Apart from the rearmament programme, for which it is providing essential equipment for some 14 countries, over 60 per cent. of its output is exported and a substantial part of the balance is for such important services as power stations, steel, aluminium and brass rolling mills, large-scale mining operations and shipbuilding.

The company's strength in the export markets is based on its policy of quoting fixed prices, keeping faithfully to delivery dates and selling a large volume of a high-grade product at a modest margin of profit. Stream-Line Filters are manufactured in London, Detroit, Paris, Barcelona and Stockholm and are sold through some 60 enthusiastic and energetic agencies overseas. They enjoy throughout the world a reputation for good quality and sound engineering design.

TAXATION BURDEN

The heaviest charges from the net income of £42,272 are for taxation £17,704 and depreciation £8,725, both of which arise from the same cause—high taxation. This is one of the main reasons for high prices, and these high prices in turn demand the setting aside of ever-increasing sums to provide for the higher cost of replacement of plant and tools. The company's order book ensures the full operation of all the factories for the next twelve months at prices which show a satisfactory margin over cost.

It will be noted from the consolidated accounts that the tax liability of the subsidiaries has not yet been finally determined, but the directors and their advisers believe that they have made provision for this and for deferred repairs in the sum of £165,245, of which £72,245 has already been paid on account. The cash resources of the subsidiaries are fully extended in providing out of the small part of their profits remaining after paying taxes at the present penal rates for the increased sums needed for stocks and book debts resulting from a larger volume of business and higher prices of all supplies and for the maintenance of their works and plant.

While they continue to earn reasonable profits they could make a substantial contribution to the divisible profits of the group only by the provision of fresh capital from outside sources and, in pursuance of their conservative financial policy, this is a course which your board would wish to avoid.

The report was adopted.

Mr F. H. Rogers was re-elected a director and the audit fee of Messrs Lever Honeyman was agreed.

ALLEN HARVEY AND ROSS, LIMITED

INCREASED PROFIT

The seventh annual general meeting of Allen Harvey and Ross, Limited, was held on November 14th in London.

The following is an extract from circulated statement of Mr G. M. B. Portman (chairman and managing director):—

The net profit for the year ended September 30, 1950, amounted to £87,999, against £64,357, an increase of over £23,000 above the previous year. After the same dividend appropriations as last year, £69,898 remains to be carried forward, equivalent to twice this year's appropriation for dividends.

The discounting of bills on London has lately shown a new significance—indeed, some return towards former practices. The market has increasing cause to see to it that their purchases bear authentic hallmarks upon them showing that the goods secured under acceptance credits will indeed be self-liquidating commodities. Such bills can readily be turned over by the discount houses, at the small margin of profit now generally agreed upon by all concerned as the consideration due for the discount firm's endorsement liability.

At this moment sterling is showing remarkable strength, resulting in a notable flow of foreign money into the market. It would be unwise at this stage to treat this movement as more than temporary, for we must look cautiously ahead at the consequences which may befall our economy during 1951, during which year international war debts to Canada and U.S.A. start to fall due, and deposits in sterling recently made by foreigners mature.

The report and accounts were adopted.

LEETHAMS (TWILFIT), LIMITED

RECORD TURNOVER

The twenty-second annual general meeting of Leethams (Twilfit), Limited, was held on November 16th at Portsmouth, Mr C. H. Reynolds, J.P., chairman and managing director, presiding.

The following is an extract from his circulated statement:—

We are pleased to report another year of progress by the company. Our turnover has been the highest in the history of the business, but whilst the trading profit is greater than that of a year ago, it has been influenced by the heavier working expenses which were expected and also by the persistent rise in the cost of materials, especially those containing cotton and rubber. We view with concern the tendency for costs to increase, the full effect of which has not yet been felt, and we can only hope the price-level of materials will not rise above that which the public both at home and abroad can pay.

We have continued to exert the utmost efforts to develop our overseas markets. We know that our prices are right and our products are acceptable; but there are many obstacles before our overseas friends can secure permission to purchase and import. Twilfit House came into production during the year, and afforded considerable relief to our other factories which were working under difficult conditions. It will also be noted we are contemplating extending another factory which we are convinced will be of benefit to future trading.

Stocks have risen by £78,194. This is attributable in part to enhanced costs of materials and in part to our decision to carry greater quantities of garments manufactured and in course of manufacture, with a view to permitting equitable distribution to our customers.

The report was adopted.

CITY OF SAN PAULO IMPROVEMENTS

RECORD SALES

MR R. G. MILLS'S STATEMENT

The thirty-eighth ordinary general meeting of the City of San Paulo Improvements and Freehold Land Company, Limited, was held on November 16th in London, Mr R. G. Mills, the chairman, presiding.

The following is an extract from his circulated statement:—

Under Brazilian law the company is not permitted to remit profits in excess of 8 per cent. of its registered capital employed in that country. In respect of the profits of the year ended February 28, 1949, the permissible remittances were £134,450, of which £120,000 has been received. In respect of the profits of the year to February 28, 1950, the company has made application to the Brazilian authorities for remittances of about £150,000 to meet its liabilities for British taxation, interest and redemption of the Five and a-Half per Cent. Redeemable Income stock, and dividends on the Preference and Ordinary stock.

The profit for the year in San Paulo amounts to £195,628, as compared with £215,233. The decrease of £19,605 is attributable chiefly to certain non-recurring expenses and to the fact that in the previous year a considerable block of land was sold, for outright payment, the profit thereon being taken into that year's accounts. After bringing into account revenue and charges in London, the profits for the year are reduced to £180,641. For the first time the company has become liable to British taxation, the amount being £20,300 for profits tax. The board feel justified in recommending the payment of the same final dividend for the year as was paid last year—namely, 2½d. per Ordinary stock unit.

LAND SALES AND PRICES

During the year under review the total sales made on the company's usual terms amounted to Cr.$75,000,000 approximately, which is by far the highest amount yet recorded. The present stock of land, developed and undeveloped, is 474 acres, and stands in the balance sheet at the amount to which it was written down on March 1, 1940, or at cost where purchased subsequently.

Prices of land are being maintained and there appears to be no slackening off in the demand, provided credit facilities are continued. The tendency of most people in Brazil to invest savings in property is very pronounced.

For commercial and other valid reasons, the board has felt for some time past that there would be distinct advantages in registering a subsidiary company in Brazil. It was decided to register on July 6, 1950, a company in Sao Paulo entitled Companhia City Paulista de Terrenos e Melhoramentos, having a capital of 20,000 contos, being the equivalent of £250,000 when calculated at the rate of 3d. to the cruzeiro.

This is a wholly owned subsidiary, but direction of the company is in the hands of its directors, all of whom are resident in Brazil. An agreement has been drawn up by virtue of which the new company will act as our agents in Brazil, and it is the intention of the directors of the new company to invest its capital in land purchases as and when the opportunity occurs. As the result of having taken this step we have further identified ourselves with the country in which we operate.

The report was adopted.

CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

BENEFITS OF NEW DIAMOND CONTRACTS

The twenty-sixth annual general meeting of Consolidated African Selection Trust, Limited, will be held on December 12th in London.

The following is an extract from the circulated statement of the chairman, Mr A. Chester Beatty:—

The combined profit for the year ended June 30, 1950, by this company and its wholly owned subsidiary, Sierra Leone Selection Trust, Limited, was £2,366,255, a decrease of £223,385, compared with the previous year. The directors recommend a final dividend of 3s., making a total for the year of 4s. per unit of stock.

ILLICIT ACTIVITIES

A factor which has a prejudicial effect on our operations in the Gold Coast is the very serious growth of diamond thefts and illicit mining activities over the last two years. There is no doubt that important quantities of diamond have been stolen from our mines and from our plants at various stages of our operations. All possible steps are being taken, with the close co-operation of the Gold Coast authorities, to reduce the loss through these causes, but the protection of our concessions from illicit mining in the thick African bush presents great difficulties, which are increased by the extremely loose regulations under which Africans are at the present time able to work and deal in diamonds. Representations have been made to the Gold Coast Government regarding this state of affairs, which urgently calls for appropriate preventive measures if serious repercussions in the economy of the colony are to be avoided.

The current contracts with the Diamond Corporation for the sale of our production were due to expire on December 31, 1950. As a consequence of the devaluation of sterling, however, their revision became necessary, and it was decided to take the opportunity which thus arose to review the whole situation from a long-term point of view. As a result, new contracts covering all diamond material produced by your companies and operatives from January 1, 1950, for a period of six years, were entered into with the Diamond Corporation and with Industrial Distributors, Limited, on terms which your directors consider satisfactory. The new arrangements will result in a substantial increase in the earnings for our industrial production, which will, however, not be reflected in our accounts until the current financial year is completed.

CURRENT YEAR'S SALES

At the end of last year, indications were that world sales of diamond for the current calendar year would be at a lower level than for 1949. In the event, however, due perhaps in part to the developments in Korea, the value of sales of cuttables and industrials reached nearly £35,000,000 by the end of September, and there is little doubt that the sales for the year will reach a new record. While the higher prices introduced as a consequence of the devaluation of sterling mean that the caratage sold has not increased proportionally to the rise in value, the long continuance of this high rate of demand has resulted in the disposal of our accumulated stocks, and present indications for the current financial year are that there will be no difficulty in finding a market for the whole of our production. The outlook for your companies continues, therefore, to be satisfactory.

EASTWOODS LIMITED

NATIONALISATION THREAT

The thirtieth ordinary general meeting of Eastwoods Limited was held on November 16th in London.

Mr G. W. A. Miller, F.C.I.S. (chairman and managing director), in the course of his speech, said: The threat of even more State control of cement and other industries had to be repeated at a time when coal, transport and practically all the nationalised undertakings are showing losses which can only be corrected at the expense of the public, that is charged to private enterprise, and there is undue haste to cover the losses before disclosure of the calamitous cost of the policy becomes inevitable.

In view of the further proposals announced at the opening of Parliament, we must now assume that out of the veiled and guarded juggle with words, out of the obvious ambiguity and double entendre one issue emerges clearly. That issue is private enterprise, personal effort and the national interest versus State control, the fostering of hatred between class and class and the reduction of the way of living, the savings and the income of those who can and will to the sub-standard level of others who cannot or will not. We will fight nationalisation at Eastwoods on the basis that a tremendous contribution to the national welfare is being made by the Cement Industry financed entirely by the savings of the people, including thousands of our own employees and stockholders.

Town planning and licensing delays are obstructive to progress, and effort has been made to short-circuit these troubles by the purchase of closed yards for re-equipment and re-opening as soon as possible.

SUCCESS OF FREE ENTERPRISE

Free enterprise need not be ashamed or afraid of its successes. On the contrary, it is from the wider spread of our many and varied activities that the larger volume of net revenue flows with which to finance social services, Government expenditure in general and the losses of nationalised industry in particular.

We can now speak with some experience about Town and Country Planning, with particular reference to the operation of the 1947 Act. In the effort to float any new project years of delay are common between the date of the original scheme and the time when the production stage is actually reached. Something must be done very urgently to streamline procedure and sweep away the ever-growing mass of new regulations and added restrictions. Unquestionably some of the provisions, besides being a bar to the very development which the Act contemplates, are *ultra vires* the Act itself—notably any consent on a fresh application accompanied by additional restrictions on land worked out in the past, not immediately contiguous and not forming part of the present application.

One of the absurd anomalies we have to meet every day, and I have no answer to give our employees, is that our bricks are being delivered in millions to build houses for agriculture, mining and police on top priorities in the centre of areas in which we cannot get allocations for the brick-making employees themselves.

In reviewing the progress during the past year of outstanding successes when the results of programmes initiated during the war are becoming apparent, we are at last able to measure the value of projecting nearly one million pounds of new capital expenditure in the past five years upon an organisation such as Eastwoods.

The report was adopted.

INDUSTRIAL FINANCE AND INVESTMENT CORPORATION

INVESTMENT INCOME WELL MAINTAINED

MR J. N. BUCHANAN'S STATEMENT

The twenty-fifth annual general meeting of the Industrial Finance and Investment Corporation, Limited, will be held on Friday, December 8, 1950, at Winchester House, Old Broad Street, London, E.C.

The following is the statement by the chairman, Mr J. N. Buchanan, D.S.O., M.C., which has been circulated with the report and accounts for the year ended June 30, 1950:—

The publication of our accounts has this year been somewhat delayed, mainly because we wished to obtain the agreement of the Inland Revenue to a change in the basis of valuing our investments.

Previously, for purposes of taxation, we used to deal with the investments as a whole, valuing them each year either at their total cost or at their total market value, whichever was the lower. In this way the depreciation on holdings valued at less than their cost was first set against the appreciation on holdings valued at more than their cost. Only if there was a net depreciation on the investments as a whole was a deduction made from our taxable profits. Following the decision in a recent taxation case, we have now arranged to value each individual holding at the lower cost or market value. This enables us to deduct from our taxable profits the unrealised depreciation on any investment and not merely the net depreciation of the investments as a whole.

INVESTMENT FLUCTUATION RESERVE

To effect a corresponding change in our accounts, we have drawn on the investment fluctuation reserve to write the investments down by £185,046. This is the amount of the depreciation on individual holdings which at July 1, 1949, had been set off against the appreciation on other holdings and which hitherto could not be deducted from our taxable profits. The investment fluctuation reserve has been restored to its former figure of £200,000 by a transfer from the appropriation account. Although there is thus a considerable reduction in the carry-forward, the margin between the market value and the book value of the investments is greatly increased. There is also substantial relief from taxation of which full advantage could not be taken in these accounts, but which will be available against future profits.

In my statement last year I pointed out that the charge for taxation in the accounts bore little relation to the profits shown. As a result of the changes set out above, a similar position has arisen this year. The profit tax represents a distribution charge and the income tax is tax deducted from dividends received for which the relief from taxation mentioned above was not available owing to the fiscal year in which these dividends were paid. In future, however, once this relief has been fully utilised, the tax then payable will bear a close relationship to the results shown in the accounts.

The board considered carefully whether or not it was desirable to make this change. Apart from any saving in taxation, we considered the new method of stating our investments to be altogether more conservative, as we deal with losses as they arise, but do not take credit for profits until they are actually realised.

THE CURRENT YEAR

Conditions during the past year have not been easy. The year began when devaluation was threatening and ended a few days after the invasion of South Korea. In view of the uncertainties brought about by these events, it is satisfactory to be able to record the results shown by these accounts.

With regard to our old continental loans—which have, of course, long since been written off—nothing tangible has so far been achieved despite continuous negotiations, but there are indications that modest recoveries may be possible in the not too distant future.

The current year has begun in a rather better atmosphere, but the economy of many industries is likely to be put to a severe test by the continuing spiral of rising costs. This may well lead to increasing demands on the capital market, but viewed as a long-term factor is a less encouraging sign. Selectivity in investments, therefore, assumes ever-increasing importance. Income from our investments has so far been well maintained.

Finally, it is my duty and pleasure to express our sincere thanks to all our staff for their loyal service for the past year.

SOBRANIE LIMITED

VALUE OF PRODUCTS

The twelfth annual general meeting of Sobranie Limited was held on November 10th in London, Mr Isaiah Redstone (chairman and managing director) presiding.

The following is an extract from his circulated speech:

The consolidated profit for the year of the company and its subsidiary is over £134,000. This result must be regarded not only as a tribute to the company's trading, but as a very remarkable acknowledgment by the public of the value of its products.

The profits earned by the company this year may prompt the thought that the shareholders should participate to an increased extent. I regret very much that your directors are unable to recommend any increase. I am sure that it is better that, for the present, we should continue this policy of placing into the company's reserves and ploughing back to its use as much profit as can be spared.

Our subsidiary company has had a thoroughly satisfactory year and has more than confirmed our original confidence in this investment.

We are continuing the policy of increasing and improving the company's machinery, and during the past year we have made important additions.

The sales policy of the company remains unaltered, namely, to stimulate public taste for the best cigarettes, and to exploit every possible market available. We have not neglected our export trade and with freer markets our products would enjoy a very great demand throughout the world.

We should always remember that there is probably no trade more susceptible to economic fluctuations beyond its control and every word of confidence one utters must be qualified by the cautionary reflection.

The report was adopted.

NOTICES

UNIVERSITY OF NATAL
DURBAN, SOUTH AFRICA

Applications are invited for the post of Lecturer in Accounting.

Salary scale—(Men) £550 x £25—£725. In addition, a cost-of-living allowance, at present amounting to £208 for a married person and £83 4s. for a single person, is payable. The initial salary will be determined by qualifications and experience.

Further particulars and information as to the method of application may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is December 31, 1950.

VACANCY EXISTS in the Board of Trade for a Research Officer to serve at Reading or other provincial centre. London salary range, £900-£1,220 a year (men); £800-£1,050 (women), starting pay according to age, experience and qualifications, with small reduction for a provincial post. Appointment is in a temporary capacity, but there is superannuation provision under F.S.S.U. Candidates must have a University Degree in Economics, Statistics or kindred subject with at least Second-Class Honours or equivalent, and a general background of knowledge and research experience in distribution of population, trade and industry, communications and services, natural resources, etc.—Applications, giving age, particulars of experience and qualifications and posts held, including dates, should be addressed to the London Appointments Officer, 1-6, Tavistock Square, London, W.C.1, quoting JN 515, within 14 days of the appearance of this advertisement.

FINANCIAL COMPTROLLER required by leading manufacturer of toilet preparations in the London area. The successful applicant will preferably, but not necessarily, have professional Accounting qualifications, but must have had considerable experience in budgeting sales, costs and profits. He will be required to advise the Managing Director on all aspects of the Company's finances, overheads, distribution costs, etc. The position is an important one in a large and expanding Company, and the right man should find a seat on the Board in due course.—Write, giving full details of experience, education, age, to Box No. 529.

ECONOMISTS, January, 1948, to December, 1949, with indexes (January to June, 1948, bound).—Offers, Box 526.

MARTINS (DYERS & CLEANERS), LTD., of Apperley Bridge, near Bradford, invite applications for the position of Personnel Officer. Commencing salary offered from £450-£600, according to qualifications and ability. Applicants must possess Diploma in Social Studies or equivalent or higher qualifications, and must have had two years' post-graduate experience of work in this field or similar.—Write, stating age, and full details of education, qualifications and experience, to Personnel Manager.

THE TRADES UNION CONGRESS invites applications for the post of Assistant in its Research and Economic Department. Sound knowledge of economics and related subjects essential.—Further particulars of the appointment may be obtained before December 9, 1950, from Sir Vincent Tewson, C.B.E., M.C., Trades Union Congress, Transport House, Smith Square, London, S.W.1.

CHARTERED ACCOUNTANT and Management Consultant (public school and Oxford) seeks change. Specialist subjects: Standard costing, financial and budgetary control, mechanisation and administrative methods. Intensely interested in Personnel Management, at its finest, and in the Higher Management movement.—Box 524.

GENERAL MANAGER required to take charge of the hire purchase collection department of a large multiple shop Company with branches throughout the U.K. Comprehensive knowledge of hire purchase business generally and ability to choose and control staff essential. Commencing salary, £1,500 p.a.—Box 522.

MANCHESTER MERCHANT CONVERTORS handling piece goods and yarns require General Manager with seat on the Board. Remuneration to be discussed, but should not be under £3,000 per annum. Replies will be handled by the Chairman only and dealt with in strictest confidence.—Reply, Box 528.

SCOTTISH TEXTILE FIRM, selling to retail, require Manager to administer and integrate several speciality departments. Applicant should have thorough knowledge of modern merchandising. He will be required to stimulate the design and production of a wide range of quality goods, but not to sell.

The position provides interesting work, opportunity, and satisfactory remuneration. Present staff are aware of this advertisement and all applications will be treated confidentially.—Box 525.

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 11, 1950, total ordinary revenue was £59,303,000, against ordinary expenditure of £52,056,000, and issues to sinking funds £470,000. Thus, including sinking fund allocations of £11,171,000 the surplus accrued since April 1st is £96,406,000 compared with £19,852,000 for the corresponding period a year ago.

HIS MAJESTY'S COLONIAL SERVICE

Vacancies will shortly exist in both Trinidad and British Guiana for an Economic Adviser. Duties will be to advise the respective Governments on economic policy, with special emphasis on commercial, industrial and developmental aspects, and to undertake administrative and committee work as may be required. The functions of both posts will involve close collaboration with the Financial Secretary, and in the case of the British Guiana post will include those of Development Commissioner, who will be responsible for the planning of development schemes and the overall supervision of their execution.

Candidates should possess, in addition to academic qualifications, such as a First- or Second-Class Honours Degree, preferably in Economics, commercial and industrial experience in responsible administrative positions.

For the Trinidad post the salary is £1,875 per annum for appointment on agreement for three years, or £1,700 per annum for a permanent and pensionable appointment on two years' probation. The salary of the British Guiana post is £1,600 per annum for a permanent and pensionable appointment on two years' probation. Pensionable terms could not be offered to candidates over the age of 45.

Intending applicants should submit brief particulars of age, qualifications and experience, to the Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, S.W.1.

BRADFORD EDUCATION COMMITTEE
TECHNICAL COLLEGE, BRADFORD

Applications are invited for appointment as Senior Assistant in the College, to give general assistance to the Principal. He should, preferably, have high qualifications in Economics.

The salary, including allowances, may range from £700 to £905 per annum, according to the Burnham Scale.

Further particulars of the appointment and forms of application may be obtained from the Director of Education, Town Hall, Bradford, and completed forms should be returned to the Principal of the College as soon as possible.—A. SPALDING, Director of Education.

CROWN AGENTS FOR THE COLONIES

Marketing Officer required by the Government of Nigeria for the Department of Marketing and Exports, for one tour of 18 to 24 months with prospect of permanency. Salary according to qualifications and experience in scale £711 rising to £1,290 a year including allowances. Outfit allowance £60. Free passages for officer and wife and allowance towards cost of children's passages. Liberal leave on full salary. Candidates, under 45, should have had a good general education preferably with a University degree in Commerce or Economics. Experience of the produce trade, a knowledge of general conditions in West Africa or familiarity with Government procedure an advantage. Apply at once by letter, stating age, full names in block letters, and full particulars of qualifications and experience, and mentioning this paper, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M/N/25588(3C) on both letter and envelope. The Crown Agents cannot undertake to acknowledge all applications and will communicate only with applicants selected for further consideration.

47 ALBEMARLE STREET

"A suite of exceptionally light offices" was how the Estate Agents described them and we found them so to be. Our friends are welcome at this new address, where we are able to give even better service to our growing clientele. Our telephone numbers remain the same. Regent 0501/2.
ROBERT BRADDON & PARTNERS, LTD.,
Advertising and Public Relations,
47, Albemarle Street, London, W.1.

AN interesting administrative appointment connected with PERSONNEL is about to be made by a firm with wide industrial interests. A degree and experience of industry are desirable, but a record of progressive responsibility is essential. The appointment is pensionable and carries a four figure commencing salary. Applications, giving fullest details of qualifications and experience, will be considered from candidates aged 40 to 45 years and should be sent in confidence to Box 511.

LEADING NATIONAL BUILDING CONTRACTORS have vacancy in their London office for articled pupil to be trained during four years in main aspects of building administration, including costing, buying and surveying. Applicants should have had good general education (public school preferred), and should be between 16½ and 18½ years of age, and just left school. Training ranks for deferment of National Service. Salary (increasing annually) will be paid, staff canteen. Young man who has just completed National Service and who has the other requirements would be considered. Write, Box L.N.B., c/o Dixons, 1-9, Hills Place, Oxford Street, W.1.

MONSANTO CHEMICALS LIMITED require Sales Trainees in the age group 21/26, of good general education. Some commercial experience an advantage and knowledge of Export practice desirable.—Apply, by letter only, giving full details of age, education, and experience to Chief Personnel Officer, Monsanto Chemicals Limited, 8, Waterloo Place, London, S.W.1.

URWICK, ORR & PARTNERS seek additional staff for the Accountancy and Administrative Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:—
1. Professional qualification in Accountancy.
2. Some years' responsible executive experience in senior industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.
Successful candidates will be trained as Management Consultants at the Company's own Training Centre.—Applications should be addressed in writing to the Company's Offices, at 7, Park Lane, London, W.1, quoting Reference: C/1047.

MAN (53), comprehensive commercial experience, Econ., Stats., Costing background, specialised exhibitions, Europ. Langs., incl. Scand. excl. Slav., at pres. in interesting executive posn., wishes to change to appt., preference Market Industrial Research, where knowledge fully employed, Gr. Brit. or Canada.—Box 517.

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar ($1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable December 15, 1950, to shareholders of record at the close of business November 15, 1950.

Toronto, By Order of the Board,
November 8, 1950. J. R. BRADFIELD, Secretary.

AN IMPORTANT GROUP of companies require a Commercial Manager, who must be an experienced business man between 35 and 45, accustomed to administration and marketing. The post involves the supervision of activities of a number of factories in one of the Dominions and responsibility for their exploitation from the commercial point of view. The factory managers are production experts in their particular trades and specialist knowledge of factory management, and manufacturing processes is not essential, although general experience in this field is necessary. After initial employment in the United Kingdom the man appointed would be required to spend three years in one of the Dominions, and renewal of contract would depend on satisfactory service.—Write in confidence, giving age, particulars of education and experience, to Box 523.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments if desired.

Prospectus from the Director of Studies, Department P17, WOLSEY HALL, OXFORD

AVELING-BARFORD, LIMITED

At a Meeting of the Board of Directors held on Tuesday, November 7th, the following Resolutions were passed:

(1) That Dividends be paid on January 1, 1951, on the £250,000 5½ per cent Cumulative Preference Stock at the rate of 5½ per cent per annum for the six months from July 1, 1950, to December 31, 1950, and that the 5½ per cent Cumulative Preference Stock Transfer Books of the Company be closed from December 9 to December 23, 1950, both days inclusive.

(2) That Dividends be paid on January 1, 1951, on the £500,000 5 per cent Second Cumulative Preference Stock at the rate of 5 per cent per annum for the period from July 1, 1950, to December 31, 1950 and that the 5 per cent Second Cumulative Preference Stock Transfer Books of the Company be closed from December 9 to December 23, 1950, both days inclusive.

By Order of the Board,
H. C. RYAN, Secretary.

Grantham, November 7, 1950.

THE BOND STREET STAMP AUCTIONS

The H. R. Harmer Saleroom is the Mecca of all serious Philatelists. The auctioneers of the "Hind" and "Roosevelt" Collections invite you to contact them if you have fine stamps or Collections for disposal. If you wish to buy, write for Catalogue subscription blank. Airmail editions of Catalogues are available six to seven weeks in advance of Sales. To all serious Philatelists, the H. R. Harmer Service is indispensable.

H. R. HARMER, LTD., 39-42, New Bond Street, London, W.1.
Tel. No.: MAY. 0218. Cables: "Philatamsel London."

NATIONAL COAL BOARD

Applications are invited for the post of Assistant Marketing Officer in the Market Intelligence and Planning Section of the Marketing Department at Headquarters. The post carries a salary (male) of £690 x £25 to £750, plus location allowance of £42 at the minimum and £54 at the maximum of the scale, and (female) of £480 x £20 to £600, plus location allowance of £34 at the minimum and £42 at the maximum of the scale.

Essential qualifications are a wide statistical experience and a general knowledge of the coal industry. Training in economics would be an advantage.

Apply in writing, giving full particulars (in chronological order), of age, education, qualifications and experience (with dates) to National Coal Board, Establishments (Personnel), Hobart House, Grosvenor Place, London, S.W.1, marking envelope TT/268. Original testimonials should NOT be forwarded. Closing date, November 23, 1950.

MANAGEMENT AND INDUSTRIAL CONSULTING.—Production Engineering, Ltd., invite applications from qualified Engineers and Chartered Accountants, preferably with University Degrees and with a real interest in the problems facing management today. There are exceptional openings for first-class men with initiative requiring permanent posts in this type of work. Engineers should have served an apprenticeship and should also have had good practical experience and an executive position in industry. Accountants should have experience of modern developments in financial control and its application in industrial management. After training, there is a four-figure starting salary as well as Life Assurance and Superannuation Schemes. Applicants should be between 27 and 35.—Write, giving age and full details of education, qualifications and experience, to Production-Engineering, Ltd., 28, Bruton Street, London, W.1.

Questions for Stalin

THERE appear to be quite a number of people in the free world who are now taking fright at the cost of keeping it free—the cost not only in money and work but also in patience, political courage and self-denial. Both in the British and French parliaments there are men who refuse to acknowledge the challenge of Stalinism, and whose resolution falters as they see just what is involved in that once cherished idea, "steady and collective resistance to aggression." It is natural that there should be such people, especially on the still convalescent and tormented Continent; just as it is natural that there should be only few of them in vigorous and confident America. Indeed, it is desirable that they should be listened to and argued with in a situation where military planning can easily stifle political imagination. Persistent, well-informed criticism should be directed at the policy and diplomatic methods concerted by Mr Acheson, Mr Bevin, M. Schuman and their colleagues, if it is intended to be a stimulus not only to efficiency and vigour, but also to wisdom and fresh thinking. And at the moment it is wisdom above all that the conduct of diplomacy demands.

But these critics have a clear and overriding duty not to mislead the public. It is only too easy to kindle hopes that are doomed to disappointment, and to confuse people by offering argument and prophecy as if they were authoritative information. (Mr Henry Wallace in the United States appears to have learnt and acknowledged this lesson.) It is easy, too, to be misled by the skill and persistence with which Soviet propaganda at regular intervals lures the appeaser from cover. Doubtless, behind present talk of discussions with the Russians "at the highest level," of an effort to reach a "general and lasting settlement," of stopping the cold war and the "drift to world war," there lie mixed motives and divergent ways of thinking. Lord Salisbury's speech in the House of Lords last week was a wise and humble appeal for statesmanship which, in saner days, would have found an echo in Moscow. On the other hand much of what has been said in the "Peace Congress" at Warsaw has been foolish and arrogant. And between those two extremes are groups that believe now, as they have believed periodically in the past, that another Yalta is not only desirable but possible, and that the Americans are as much to blame for present tensions as the Russians.

It is worth considering closely—so far as the scanty information available allows—what precise grounds there are for believing that Moscow would not only welcome talks but would wish them to lead to a *détente*, that is to say to conciliatory action. It is also worth considering what precisely a "general settlement" in present circumstances could or should be. The layman who challenges the advice of the State Department and Foreign Office on these two questions is under an obligation to produce his evidence and his proposals.

On the first point superficial evidence appears to support the optimists. The world-wide "peace campaign" is at its height; its

scope has been widened to include a demand for general disarmament, condemnation of all aggression and an end to the cold war. The attempt to organise opinion against the atomic bomb only has been dropped, because it was too obviously to the advantage of the Russians and to the disadvantage of the Americans. But the purpose and methods of the "peace campaign" are so patently subversive, so obviously part of a tactical development in Communist political strategy, designed to obstruct western rearmament, that they give no clue at all to the mood in which Stalin would, say, receive a visit from Mr Bevin and Mr Acheson. The tone of the partisans of peace is bitter and abusive; Picasso's dove of peace is, in fact, the trumpeter pigeon.

Then there are the recent gestures and hints by Mr Vyshinsky at the United Nations which have raised some hopes. In public he has been no less rude, little less obstructive than usual; but there have been conversations behind the scenes, and hints of co-operation in committees discussing Korea and the Acheson plan for checking aggression. He has put forward a five-point peace plan—which would be promising if all five points had not been discussed *ad nauseam* for more than three years—while furiously denouncing the Secretary-General's twenty-year peace plan, which Stalin is known to have seen. (The variety of talks on peace now going on at Uno is described on page 890.) There has been the Note to London, Paris and Washington proposing fresh talks on Germany. There has also been a revival of Stalin's phrase about the possibility of "peaceful competition" between the Communist and non-Communist world.

Let it be said straightaway that the difficulty of distinguishing the genuine from the bogus gestures arises from three facts: first, they are made by the same men who have wrecked conference after conference since 1945; second, they were first made at a time when the Korean campaign had gone wrong for the Communists and when the Atlantic powers' defence plans were going right; third, the vital words that dominate discussion of these issues no longer mean the same to both sides. Professor Bernal put the matter in a nutshell when he told his fellow partisans at Warsaw this week that "what we (the partisans) call peace they (the capitalists) call cold war." That is precisely the trouble: what Stalin calls "peaceful competition" might well turn out to be what we call the cold war. Likewise, it is clear that Stalinists everywhere persist in regarding as "aggression" what the United Nations began in Korea on June 27th, and as "war of liberation" what the North Koreans began on June 25th. Is it surprising, when one considers the men who make these gestures, their past record, and the meaning of the words they use, that Mr Bevin should ask for fresh evidence of goodwill? Is it not his duty to make sure that a meeting, say, of the four Foreign Ministers will lead to something more than an interruption in the process of building up a strong Atlantic community?

If the factual evidence of a Russian desire for reconciliation is scanty and suspect, what is to be said of the attempts to argue round the evidence? It may be said that the Russians are disturbed by talk of rearming Western Germany and are frightened by the Atlantic Pact. Doubtless they are; the risk that they would be was foreseen and deliberately taken. But if the Russians had taken action six months ago to limit or abolish the *Bereitschaften* in Eastern Germany, the influence of London—and probably that of Bonn, too—would have been thrown in with the French against the American proposals for a German contribution to an integrated force. Likewise, fair and workable proposals for a settlement of the German problem put forward before the rigged Eastern German elections of last October, would have commanded immediate attention. It may be that Mr Molotov and Mr Vyshinsky were too slow or too badly informed, to see their opportunities. It may be that they are now desperately trying to redeem past mistakes. If so, their proposals for a new conference on Germany show little improvement either in wisdom or in information, and look like nothing more than a tactical move to confuse opinion in France and Germany, and to revive at the heart of the Atlantic Pact the dormant influence of those who advocate European neutrality between America and the Soviet Union.

It may be argued that the Russians are mortified and frightened by the Communist failure in Korea. It is true that aggression by proxy has failed but it is still far from certain who wins or loses there in the long run. The United States has been stripped of its land forces, Europe has been scared—after a short spell of elation—by the scale of the contest; and much of what has been gained in Korea may yet be lost in Indo-China, an area of far greater strategic importance to the west. Is it suggested that Stalin may be prepared in Asia to negotiate from weakness, when Peking is openly saying that the Americans must be driven out of Asia? It is more likely that his gestures towards Europe are due to confidence that he holds a good hand in Asia.

*

It may, finally, be argued that Stalin sees the time approaching when any extension of the cold war—especially in Europe—will run too great risks, and that he wishes to consolidate the position so far gained. This is a more plausible interpretation. For the containment cordon, slender though it is, is now tightly drawn. Any further aggressive adventure, whether in Europe or Asia, is liable to bring the United Nations into action. But if any diplomatic action is to be based on this interpretation, its advocates must be quite sure what they want from "talks at the highest level."

There is a persistent belief that a "general and lasting settlement" would be possible. Recent history suggests that such a settlement would be loose and unstable, defining rough spheres of influence in the way that the Yalta conference did—and nobody in the West wants another Yalta. If it were, then, to be something more detailed and specific, the question arises what the frontiers of the two spheres are to be. In whose sphere, for instance, is Indo-China or Greece or Germany? At once we are back to where we started. It is, moreover, certain that such an agreement would demand from the western powers sacrifices of interest and a review of obligations. What precisely would those be? In Asia, for example, would they include the withdrawal from Indo-China of the French, of the British from Hongkong, of the United Nations from Korea and of the Americans from Japan? Would Eastern Europe—presumably minus Greece and Jugoslavia—be formally consigned for good to the Soviet sphere?

If no concessions of this kind are to be considered, what inducement would be offered to Moscow to call off a cold war which has brought such rich dividends

Would it be, for instance, an undertaking to stop Western rearmament and leave the Russians with their present superiority in the air and on land? Or would it be a pledge that the Americans should leave Europe lock, stock and barrel? it is not suggested that the advocates of talks have such concessions in mind; but it is suggested that any attempt at a "general and lasting settlement" must raise such questions, and it is important to know what answers would be given.

It may be protested that talks would not go beyond an exchange of views, a sounding of moods, and an attempt to replace distrust with confidence. But let us consider what are the minimum terms in which the free world could feel confidence. What worries it most is the Russian—or rather the Stalinist—state of mind. What specific, enforceable guarantees of a change of mind can Moscow give in exchange for the specific, geographical concessions on which the West might negotiate? There would have to be an end to the Politburo's avowed leadership of subversive action in the free world, and to the virulent propaganda by radio and newspaper that poisons the air between the peoples. There would have to be free movement of persons and ideas between the two worlds, and reasonable courtesy and co-operation from Soviet officials and officers. In other words, Stalin's "peaceful competition" must not mean simply a continuation of the cold war "by other means." If the aim of Soviet policy is to make its world safe for Stalinism, the free world's purpose is to make itself safe from Stalinism.

Is there likely to be, on present evidence, any compromise between these two demands? The answer is surely No. So long as the fomenting of strikes, the encouragement of sabotage, the preaching of subversion, the appeals to peoples over the heads of their Governments go on; so long as the invasions of Korea, Tibet and Indo-China are regarded as incidents in the "liberating mission" of the Stalinist system, so long is any real understanding and settlement unlikely. If it is against the nature of the Stalinist to be persuaded of this, if the dynamic of the Soviet system depends on this missionary spirit being kept alive, then only two possibilities remain. One is that its expansion is contained and contested in every part of the world where free peoples are threatened, until Stalinism gives convincing evidence of having abandoned aggression; that has been for two years the policy of the United States and the British Commonwealth. The other is that changes in the Soviet system eventually lead to a change in its attitude to the outside world. The first possibility is within the power of the free world to attain if it tries hard enough. The second might one day be attainable by peaceful means, but is primarily the concern of the Russian people.

The clear implication for present policy of either of these possibilities is to stand firm and wait. It will be said that this is a policy of rigidity, a counsel of despair. On the contrary, it is those who persist in thinking—as Mr Chamberlain persisted in thinking when dealing with Hitler—that the twentieth century generalissimo is open to persuasion by nineteenth century methods who are rigid; and it is those who want to abandon or modify a policy of resistance just when it is taking shape and effect who are guilty of despair. They are, surely, confuted by their own logic. If they are convinced that the Soviet Union does not intend war, then there is no point in urging the danger of war as a reason for premature appeasement. If, on the other hand, they believe that the Soviet Union will go to war rather than accept a fair and just ordering of the world's affairs, then they should be advocating the speediest and most resolute rearmament as the one way to prevent the recurrence of what has happened in Korea.

Life Without Dollars

BRITAIN is coming at the end of 1950 to the position that had to be reached by 1952. For a time, at least, the dollar accounts of the sterling area must be balanced without American grants-in-aid under the Marshall Plan. The speed with which that position has been reached inevitably means that both Britain and the United States have come to it mentally unprepared. Of this there is illustration enough in the reports of the sober New York press—officially denied in London—that Mr Bevan and some other Ministers want now to snap their fingers at the Americans and reduce the rearmament programme. However misleading the incautious remarks that prompted such reports, they show the dangers of confusion in policy, and of misunderstanding between friends, in the new situation. As little as a year ago Britain's capacity to live without Marshall aid seemed a goal too remote for any practical man to look beyond it. Now that the goal has been reached, it is necessary—however temporary the circumstances—to face what have become the immediate problems of British and American policy.

Since 1947 the British and American Governments have agreed on two policies demanded by the dollar shortage. There had to be Marshall aid to Britain, and the sterling area had by import and exchange restrictions to limit its dollar spending. On other issues—devaluation, deflation in Britain, the convertibility of the pound, tariff liberalisation and the meaning of full employment in the United States—the disagreements have often been considerable. But these two policies were common ground. This agreement was based, however, on a tacit assumption: that the two policies would also wither away together. In the mind of Congress, indeed, it was rather that they would die together. Of late neither the British Government nor the American Administration has regarded 1952 so dramatically. It has not been supposed either that all forms of American aid would then stop or that the world could in 1952 return to a pure multilateralism with convertible currencies and non-discriminatory trading; it has been supposed that the retreats from extraordinary dollar aid and from trade and exchange restrictions would go on together. Now, however, sterling has returned to strength more quickly than had been expected, and there will have to be a corresponding speed-up in the adjustment of policies. The strength of sterling makes possible a large withdrawal of aid to Britain—for which everybody in this country ought to be very thankful. The same circumstance makes it possible to reconsider the assumptions on which British importing policy is based. It may be true—it very probably is true—that there will be, in the third quarter of the twentieth century, a chronic tendency

towards a shortage of dollars. But clearly there is not going to be a shortage of the same severity all the time; and British restrictions should be reconsidered accordingly.

If this reconsideration does not arise naturally in Britain it will certainly be enforced by American opinion; of that there has already been a foretaste in the International Monetary Fund's comments on special restrictions on dollar imports imposed by the countries of the sterling area. It would be pleasant to see the British Government for once in these matters not moving so slowly that it seems to be making reluctant concessions even where it is in fact doing what it is in its own good time quite happy to do.

*

To inquire whether it is time to take some of the protective wraps off the sterling area economy is in no way to imply that the present strength of sterling is anything but temporary. Three main causes have contributed to the relative softening of the dollar over the past twelve months. First, there was the sharp reduction in the world's purchases of American exports when devaluation raised their price to many buyers by 40 per cent. Second came the American boom, stimulating imports into the United States and encouraging American producers not to bother to hold their export markets by cutting prices. And, finally, the intensified commodity boom following the Korean war must by now considerably have increased the dollar earnings of the primary producing countries. This highly favourable conjunction is unlikely to keep sterling strong for years or perhaps even for many months. But it does not follow that British policy should go on as if sterling were weak all the time. The past two years have demonstrated forcibly enough how much part in determining the value of currencies is still played, in spite of all the restrictions on international capital movements, by confidence. The best way to ensure that sterling will become again a currency that no one wants to hold is for the British Government to base its policies on an evident belief that this will be so. On these grounds alone there is case enough for allowing at least a little more freedom in the international use of sterling.

But the case is far stronger than that. Whatever Britain may choose to do, the present balance of trade is highly unstable. Many countries cannot go on financing their current deficits in sterling. Either they must sell more to Britain or they must import less from Britain. In the past four months the sterling area has been running with its partners in the European Payments Union a surplus of exports over imports at the rate of £300 million a year. If this goes on, gold will soon begin, under the terms of the payments union, to pour from the Continent to Britain. The European countries cannot tolerate that for long. They are, temporarily, in the same position in relation to Britain as Britain is so accustomed to find itself in relation to the United States. The moral is the same in the new case as in the old. Either trade can be brought nearer to balance at a low level by the European countries cutting their imports from Britain while British imports from Europe are constant. Or trade can be balanced at a high level by Britain buying more and so enabling other countries to earn their imports from the sterling area.

Britain has always found it easy enough to see which of these alternatives is to the advantage of the country with a surplus in its balance of payments when that country is the United States. If the Government looks any distance ahead it can have even less doubt in the British case. It is as true as ever that Britain's ability to earn enough imports and to maintain full employment depends chiefly on the prosperity of world trade as a whole. It would be the extremity of short-sightedness to ignore Britain's interest in an expanding world economy because devaluation and the rearmament boom have temporarily enabled this country to pay its way in a world of trade restrictions. There would be few stronger reasons for pessimism about the future strength of the British economy than a retreat from such liberalisation of trade as has this year at last been achieved in Western Europe.

The argument also bears upon the needs of the domestic economy. Inflation is once again the pressing danger and a favourable balance of payments is just as inflationary a factor as an excessive programme of public works. In principle, any steps that are taken to reduce the surplus on the balance of payments help to close the gap between the superabundant flow of incomes trying to spend themselves within the British economy and the inadequate flow of goods. If imports into Britain increase, there are more goods for British incomes to be spent on. If British exports decline, then either there is unemployment in the export trades, which means smaller incomes, or else—and in present circumstances much more probably—there are more goods for the home market. What is right internationally is thus right at home.

*

The argument for relaxing some of the present restrictions on imports into Britain divides itself, as such arguments so frequently do, into two parts according as the imports come from the dollar or the non-dollar areas. In the case of the non-dollar countries—or more specifically of the European countries—most private trade is already free from import licensing, and if there is to be an increase in British imports, it must be by an increase in the bulk purchasing of the Government itself, especially the Ministry of Food. There is a good case for this: there is butter and bacon to be bought in the Netherlands and Denmark if prices remunerative to the producers are offered; the British consumer would cheerfully pay those prices; and there could hardly be a better way of absorbing the pressure of inflation. But it is an interesting illumination of the narrow corner into which the British economy has planned itself to point out the practical obstacle to such action. To buy Dutch or Danish produce at higher prices would involve either raising the cost of living, which would encourage wage demands, or else increasing the cost of food subsidies, which would unbalance the budget. It may perhaps be possible to defend these policies—or at least to sympathise with the political plight of those who pursue them. But nobody should be under any delusion that the continued throttling of British imports strengthens the pound sterling for more than a short period. Before long, the effect will be to cut down British exports to Europe because the Europeans cannot afford to buy them. That is to say, the reward for continuing the policy of austerity in imports after the justification for it has passed will be, as soon as trade becomes competitive again and sterling is in fact, it will not to strengthen but to weaken the British balance of payments.

The case of dollar imports is different in form but similar in principle. Here also the choice between more imports and more reserves is, after a certain point, no choice at all—but for rather different reasons. Here also an attempt to pile up the gold reserve by keeping the screws tightened against imports would in the end result in securing neither the imports nor the balances—not, as in Europe, because the Europeans could not help themselves, but because we cannot help ourselves. The cutting down of Marshall aid itself illustrates the principle: if we had bought the newsprint and the timber that we needed when we could have got them, the reserves would not have increased so rapidly and the cut in Marshall aid would not be so severe. If the gold reserve continues to rise next year, the United States Government can quite reasonably not merely stop giving aid but can also put a positive demand on Britain: the first instalment of interest and capital on the postwar loan will be due.

The argument cannot, of course, be pushed so far as to justify lavish purchasing of luxuries. But it certainly goes far enough to justify such relaxation in the extraordinary restrictions on dollar imports as the Americans are asking for. If there were any chance that continued austerity could increase the dollar reserve in 1951 by another $1,300 million, there would be a case (though not necessarily a conclusive case) for trying it. But it is difficult to see that in the likely circumstances of 1951 marginal additions to the dollar stockpile can be of anything like the same value as commodities in hand to an economy that is (in so far as the official figures are credible) supporting a volume of industrial production 40 per cent higher than the average of 1935-38 at a volume of imports 10 per cent lower.

being done in the name of nothing more than administrative convenience.

This series of articles has covered a number of topics [illegible] attempted to make a number of points. There [illegible] trade. That would [illegible] matters which are important enough [illegible] porary strength of sterling, [illegible] and which should running a certain amount of risk. The [illegible] time comes to three legs. The first is that not all the improvement the position of sterling is evanescent; the severe devaluation has made dollar goods permanently very expensive for the sterling area. The second is that, even if the sterling area's demand for dollar goods were as large as ever, the supplies are not. It is now physically impossible to collect large immediate shipments from the United States. A relaxation of controls would not be an invitation to a flood of imports but an opportunity for British traders to do some hard looking for such useful things as can still be picked up (and how much better off we should now be if they had been allowed to do so last spring).

The final argument is that, if optimism proved to be misplaced, the relaxations could be reversed. The reversing mechanism in these matters is well established. The possibility that it might have to be used is no reason for refusing to go forward, in low or middle gear if not in top, while the road is as innocent of danger as it is at the moment. It should not be forgotten that there is an element of good faith involved. On no subject has the British Government more frequently avowed its good intentions than in this or more earnestly explained that the apparent contrary direction of its policy was a reluctant concession to *force majeure*. Now the chance has come to show that there was some meaning in those words—or else to reinforce the growing belief in the outside world that Britain under its present rulers is not isolationist from force of circumstances so much as from conviction.

The Controls—III

The Rights of the Subject

THE two earlier articles in this series have dealt with the content of Government powers. It was argued that many of the powers still held under emergency legislation should now be dropped altogether; and the rest should be sorted into various categories, for which different types of new legislation are appropriate. This final article is concerned with the administration of the powers that are kept.

Probably no one would claim to be satisfied with the methods of administration used during the past eleven years. From the constitutional point of view almost the gravest objection to many of the defence regulations is that they could not be consistently enforced. Their breach—particularly in such matters as petrol rationing and the maximum price of restaurant meals—was too widely tolerated by public opinion for more than a small proportion of offenders to be found and punished. This has not prevented the rationing schemes, particularly, from being effective enough to the administrator's eye. The black markets never reached such proportions that they could not be allowed for and tolerated without destroying the value of rationing. They caused no more trouble than the planners' own miscalculations of the future supplies available, the size of stocks, and the strength of demand. But if a regulation fairly often broken is tolerable administratively it is intolerable constitutionally. To say that a regulation cannot be enforced with a reasonable approach to universality is to say that its impact on individuals is arbitrary: many offenders go scot-free while a minority of no more unworthy citizens is severely punished. In no society is the crust of civilisation, the habit of good social behaviour, so strong that anything which brings the law into contempt can be accepted lightly. In the emergency of war such considerations must, of course, be sacrificed. They cannot be sacrificed in framing permanent legislation. The Government is entitled to take upon itself in peacetime only such powers as it can generally enforce. The test is not whether the enforcement is sufficient for practical administration, but whether it is sufficient to avoid any impression of arbitrariness as between individuals. If an offender caught and punished is regarded by ordinary, generally law-abiding citizens of his acquaintance as having had bad luck, then the law is wrong however well

towards a shortage of dollars. But clearly there is not going to be a shortage of the same severity all the time; and British restrictions should be reconsidered accordingly.

If this reconsideration does not result against existing legislation it will certainly transgression. There Britain it will certainly transgression. There In the first place, it creates a whole of that there possible crimes of which the common citizen may be completely ignorant. Secondly, it empowers hosts of minor officials to pry into his affairs and his premises. And, lastly, in some way it seems to deprive him of what he believes to be his natural right to have his quarrels with the powers that be, decided if not by the courts themselves (in which he still places a good deal of confidence), at least by some tribunal that can be relied upon to be impartial between him and the executive government.

However much the first complaint may be justified, it cannot be ascribed mainly to legislation by decree. It is an inevitable feature of the welfare state. When the state hands out many benefits it must also create many restrictions. It must prevent and punish those who attempt to take more than they are entitled to. It must even penalise those who refuse the generous offerings, as, for example, the parent who believes that his child will be better off away from a state school than inside it. Those are the thorns on the stem, and if we are all agreed to go on grasping the welfare state, there is little to be done about them.

*

The other two complaints are much more substantial. If there must be new crimes, at least the individual is entitled to his old protections. First, on the right of entry into premises, one point should be made clear from the start. There are two reasons why an official should wish to enter private premises. The first is to obtain some relatively impersonal information which he lacks and which it is generally accepted he should have. The second—to enter premises at will in search of suspected offences—is quite another matter. It is remarkable how wrong the popular saying on the importance of names is. How different an enforcement officer sounds from a policeman—and how different he in fact is. For centuries the courts have struggled to lay down and enforce a code of behaviour for policemen. To enter premises the policeman needs an individual search warrant, and the law has laid it down that he must convince an independent magistrate on the *prima facie* merits of his suspicions before he can be given the warrant. On the criminal charge itself, the Judges' Rules are specific and detailed. A policeman may not question a man once he has decided to charge him. He cannot make use of any statement the suspect may make unless he has cautioned him first. These rules were devised by lawyers and Parliament, not because they had overmuch sympathy with criminals but because they cared for civil liberty and they had seen how easily it disappears in the hands of a state police.

But call the policeman an enforcement officer, give him no specific training in his responsibilities, keep him out of uniform, make him a civil servant without local control, free him from the supervision of a Chief Constable and a Watch Committee—and, then, for some reason, he may be entrusted with infinitely more power. He need not apply for a separate search warrant for each investigation; he is given a permanent warrant by his

Britain he He is under no compulsion to caution any of the interviews; on the contrary, he may demand that the suspect produce the incriminating evidence. If he is an official of the Ministry of Food, for example, he was even able until six months ago to command his victim to commit his crime by ordering an illegal meal. The policeman is trained to think of himself as impartial, to remember that he must never take sides. The enforcement officers, and the organisation behind them, are the agents of the prosecutor and think as such. They are departmental servants and that fact colours all their activities.

Some remedies for this situation are proposed by Lord Samuel's Liberty of the Subject Bill, but they do not go to the heart of the trouble. What is needed is a declaration that every official concerned with the enforcement of the law shall be subject to the same rules and customs that govern the activities of the police, from the need to apply to a magistrate for a search warrant to the need to caution a suspect before questioning him. That would not be a less valuable safeguard to civil liberty because it could be easily secured by a single clause in a Bill.

The third reason why the citizen feels that government regulations are oppressive is that they are administered through a host of new tribunals, in which the procedure is informal, in which he is denied the protection of an advocate, and from which there is no appeal. The Lord Chief Justice in the case of *Rex v. Brighton Rent Tribunal* summed up a lawyer's mistrust of such a tribunal:

> No court of law ever proceeds to hear a case without having some evidence before it. No court of law can proceed to give judgments affecting people's rights of property unless those people not only are before it but have an opportunity of cross-examining the other side. It is quite obvious here that Parliament has said that the ordinary procedure to which lawyers are accustomed shall not apply to these cases. . . . That these proceedings have not been conducted in a way which would be tolerated in an ordinary court of law is in no doubt.

Yet the court was unable to interfere.

There is no easy solution for this situation. Lawyers are inclined to insist that all such matters should be settled in the courts, according to the rule of law. But there are two arguments against such a course. The first lies in the very great burden that would then be thrown upon the courts and the delay that would be caused, since the volume of matters coming before administrative tribunals must be many times that of formal litigation. This difficulty could perhaps, in theory, be got over by a great increase in the number of courts of law; but that would hardly remove the obstacle of cost. Nor would it get over the second, and major, objection that, in the nature of many of the cases that come up for administrative decision, what is called for is the exercise of an informed discretion rather than the application of anything as rigid as a law. This would make it very difficult for a court of law to act as the tribunal of first instance, and still more difficult for it to act as a court of appeal, as it is a settled principle of law that a higher court should be loath to interfere with a lower court over the exercise of its discretion.

Yet there is real need for safeguards for the individual. Whether or not ministers and civil servants realise it, there is no confidence in the public that they can be trusted to be impartial where their departments' interests are concerned. In the case of much of the town planning legislation, for example, (and though the example does not come under the Supplies and Services Act, it will serve to illustrate the principle) the citizen who is aggrieved by a decision of the local planning authority can appeal only to the Minister of Town and Country Planning—which, in his eyes, is no appeal at all, since it is from one set of officials with a bias in favour of "planning requirements" to another set of officials with exactly the same bias. And these decisions may very gravely affect the individual's life and livelihood. How can the necessary safeguards be provided, and the desirable public confidence in the fairness of the procedure be built up, without taking away the advantages of speed, low cost and flexibility?

There can be no complete answer. But two suggestions can be made, one of which could be written into the statutes, the other of which is a matter of administration. The first is that whenever a Minister of the Crown is given power to decide any matter affecting the rights of individuals, provision should be made for the facts first to be referred to a non-expert and impartial panel of reference appointed by somebody other than the Minister concerned. This would be, in a way, the application to the structure of administrative tribunals of the principle that, in courts of law, gave rise to the jury—that unless the skilled experts can prove their case to the satisfaction of the layman's commonsense, the case is not good enough. These panels might be advisory only, but if so there should be an obligation on the Minister to reveal the fact that he was not following their advice. The citizen would at least then have the satisfaction of knowing that his case had gone before a panel of his peers; he would not be left feeling that he had been overridden by an autocratic bureaucracy. It is worth adding that no Bill drafted in the departments can be expected to contain provisions to this effect; it is a matter on which Parliament—one House or the other—will have to insist for itself.

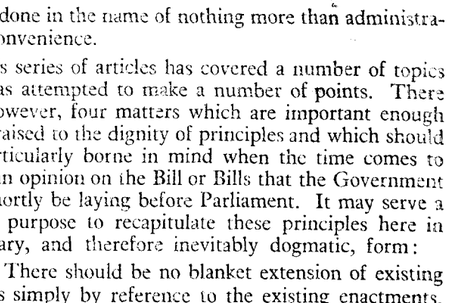
The other possible safeguard is to set out deliberately to create a tradition of impartiality among those in the official hierarchy who have to pronounce judgments. The judges began as servants of the Crown in a most literal sense. In course of time they came to be the officers for executing the independent authority that the state itself must be deemed to possess. They freed themselves from subservience to people, even from subservience to any theory save the belief that it was their duty to hold an even balance of justice. They found that freedom only by building a tradition for their whole profession strong enough to resist all the pressures that its members would inevitably have to meet. The Crown remains their paymaster, as it is that of the civil service, but the difference is there for all to see.

Traditions are not created overnight, but a great deal can be done to foster their emergence. It should be possible to make the Lord Chancellor's Department responsible for the selection, training and supervision of all men in Government service who serve as members of tribunals in the widest sense. Similarly, the Public Prosecutor's Department should be made responsible for the selection, training and supervision of all men who are concerned with departmental prosecutions. That, more than anything else, would free those men from the unconscious feeling that they are servants of a particular department. The danger to liberty in Britain is not that the judiciary is getting less independent; it is that the judiciary is being overgrown by a crop that is neither judicial in mind nor independent in temper. And this is

being done in the name of nothing more than administrative convenience.

This series of articles has covered a number of topics and has attempted to make a number of points. There are, however, four matters which are important enough to be raised to the dignity of principles and which should be particularly borne in mind when the time comes to form an opinion on the Bill or Bills that the Government will shortly be laying before Parliament. It may serve a useful purpose to recapitulate these principles here in summary, and therefore inevitably dogmatic, form:

1. There should be no blanket extension of existing powers simply by reference to the existing enactments. If Parliament is to grant permanent powers to the executive, it must know exactly what it is asked to do.



2. There should be no unlimited grants of powers. If powers are to be granted to the executive without limit of time, then they must be quite specific as to object and method. If it is decided to have in reserve general powers to attain vaguer objects, then the orders made under these powers should be limited in the time they can last before they come up for parliamentary discussion and renewal.

3. Wherever orders made under such a grant of powers provide for penalties being exacted for offences, the same safeguards of the citizen's rights should be applied as prevail within the criminal law.

4. Wherever a Minister of the Crown is empowered to reach decisions affecting the rights or property of individuals, provision should be made for the facts of each case to be reviewed, even if only in an advisory capacity, by some non-expert and impartial body.

Fire and Water..

Harrison's Fourth Marine Timekeeper (1759)

Two significant developments occurred during the reign of Queen Anne. When John Harrison was perfecting his historic chronometer (enabling the mariner to avoid the peril of the sea), the Sun Fire Office was formed to provide insurance against fire. Today, navigators still find their way safely across oceans with the help of timekeepers evolved from Harrison's model—and the Sun Insurance Office continues to serve the community by providing insurance against fire and many other risks.

Ring Up the Curtain

"IF your governor don't prove a alibi," said Mr Weller, "he'll be what the Italians call regularly flummoxed." As it happens, flummoxed is just the word to describe reactions in governing quarters to a suggestion that has recently travelled back and forth between Italy and this country. It was such an informal, bright idea that it could not be regarded in Whitehall as a proposal, which is something that arrives—like a *démarche*—through the proper channels. Let it, therefore, be called a suggestion—the suggestion that some 10,000 Italians should come to be trained for work in our undermanned pits. Italy, as everyone knows, has too many men and too little coal, whereas Britain has plenty of coal but is losing miners. Its exports are falling and that means Italy may have to buy more dearly farther away. Therefore the suggestion runs, let Italy provide the miners to dig the coal it wants.

One can hardly imagine anything more simple and helpful than this suggestion for mutual aid. It breathes the pure spirit of Strasbourg; it has Latin logic and spontaneity; it echoes that great liberal ideal of services, goods and people moving freely from one country to another towards which all in Western Europe are supposed to be working. One would have expected it to receive rapturous welcome, if not from the hard-faced realists of Smith Square at least from the more emotional Conservative leaders of the European Movement. Instead there has been silence. Inquiry has merely elicited the semi-official comment that an average wage of 141s. 4d. for a 47 hour week must be attractive to surplus personnel of an unplanned economy in the throes of a deflationary spiral. One gathers that Continental schemes to share such benefits need the closest scrutiny. Clearly, then, our Italian friends should be given some explanation of how an offer so obviously advantageous to Britain at this particular moment can meet such a reception.

These are—let them not forget—new and exceptional times. The days of unbridled *laisser faire, laisser venir* are over. Immigration—if it is desirable at all—must be planned with a proper balance of economic, ethnographical, ecological, sociological and political factors. Quixotism in such matters means chaos, as two examples will show. First, to bring 10,000 workers into Britain in 1951 is to thrust upon its employment policy an unpredictable factor of no less than .045 per cent (taking the gainfully employed population as 22 million). Second, owing to the Italian emigrant's habit of sending home the greater part of his earnings, a quite new balance of payments problem with Italy would be created; unofficial estimates put the likely remittances as high as £150,000 a month. Other problems, too, are raised which could be adequately assessed only by an inter-departmental committee. To ignore them would be to let the jungle creep in under Britain's paper curtain.

Lest Italians should think that mountains are being made out of molehills, let them consider for a moment what would happen if the suggestion were officially taken up with a view to producing—let us say—the Isaacs Plan. The decision having been made that no existing committee could handle the matter, a departmental committee would be originated in the Ministry of Labour. Italians may think this is a problem of getting out coal, which should fall first to the Ministry of Fuel and Power; but the British see it as a problem of getting in manpower—or keeping it out. Therefore, it is Labour's pigeon, as we say. The question then arises: which departments must be brought on to the committee and which merely brought into the picture? First, as foreigners are involved, comes the Foreign Office. It will wish to send two experts, one on economics and another on Italy. Second, as foreign immigrants (movement of) is under discussion, the Home Office must be brought in. It, too, would expect to send two representatives, one for immigration pure and simple, another for security. There must be no question of letting Pontecorvos loose in the pits. Then there must be two seats for the Ministry of Fuel and Power: one for an expert on exports, one for a consultant on industrial relations. For it cannot be taken for granted either that Britain wants to export coal, or that British miners like Italians. On the question whether to export or not the Board of Trade must also have its say about the overall long-term prospects; and the Treasury must be there to see that nobody unsettles either the Budget or the balance of payments. And to make quite sure that a system of remitting earnings to Italy could be safely worked, it would be necessary to call in the Bank of England. To watch the overall picture there would be present a member of the Central Economic Planning Staff.

So far we have the nucleus of a body that should, at any rate, take care of British interests. It is far from complete; for example, the Ministry of Transport is not included at this stage, because it is uncertain whether the miners would come in Italian or British ships. They might—like seamen nowadays—prefer to fly, in which case Transport would have to give place to Civil Aviation.

At this point it is clearly the duty of the Foreign Office to represent that the committee is well qualified to discuss coal, but ill qualified to plan for Italians. There should, at least, be some examination of the kind of services they would need. For instance: considerations of safety, discipline and morale demand that most of them should know sufficient English to be able to obey orders, follow regulations, and understand what their fellow workers think of them. Special intensive courses in English would be needed. (Their content would, of course, vary according to whether the Italians went to Fife, South Wales, or Yorkshire.) This brings in the Ministry of Education, to examine not only the teaching personnel needed but also the possibility that Unesco might help. Health, too, will want to send someone to discuss what hostels, camps—perhaps even houses—might be required for the new intake. If anything like a bold, imaginative pioneer scheme should be contemplated—a little Italy, say in Clackmannan—then Dr. Dalton, as a good European, would be interested and Town—or Country—Planning would be brought in. It might be as well to have somebody from the Ministry of Food to give consideration to the desirability of providing cereals and vinous beverages.

Here then, quickly assembled, is a committee of between 15 and 20 experts, ready to draw up the Isaacs Plan. At this stage the Minister of Labour has probably found out what is the feeling at the top level about the whole business. He has then to decide whether his committee is likely to work on the plan as a team or whether the vote may split. He might well find Foreign Office, Fuel and Power, Education and Works for, with Health, Home Office, Town and Country Planning and Treasury against. At least, this might well be the line-up on the merits of the question. But there is a complicating factor to bear in mind, of which Mr Isaacs might not be aware, so seldom is he involved in paradiplomatic matters (foreign); that is the practice of inter-departmental shuffling by which one department gives way to another over one problem in order later to get its way on another and quite different one. Treasury, for example, might vote with Foreign Office on the Isaacs Plan in order to get Foreign Office support over the Schuman Plan. Or Works, which will do anything for a standard of timber, might swap sides in the hope of later pressing the Foreign Office to squeeze Tito.

Our Italian friends will now surely understand what trouble we have to take not to make mistakes; and how even a spontaneous and friendly gesture, backed by the most logical argument, can fail if it is made in the wrong direction. If the Italian miners are to get in they must go through channels: that is to say, the last quarter they must turn to is the British miner and his unions. But their lack of success so far should not make them think the matter is ended. It has, indeed, only begun. For the suggestion has not yet become a proposal, let alone a plan. A little spirited writing here and some well-timed grumbling there by Italians will ensure that the question comes up in the Council of Europe. It then becomes a "factor" in Anglo-Italian relations. When British diplomatists in Rome have decided just how big the factor is, the chances are that a despatch will be sent to London setting out how Italian public opinion feels that the rejection of the miners' offer reveals a protectionist, non-European attitude that comes surprisingly from the natural leaders of Europe. If that paper is read by Mr Bevin—who is sensitive to such charges—and if he decides to make a Strasbourgian gesture, it will take more than an inter-departmental committee to flummox him. The Italian miners should, therefore, go on working away quietly through channels. One or two very hot sessions in Strasbourg—and one or two very cold spells in London—may one day make Mr Bevin call for the Isaacs Plan and ring up the paper curtain to let them in.

NOTES OF THE WEEK

Back to 1947

The Government's decision again to import coal into Britain—as was done in 1947 after the fuel crisis—is no doubt sensible given the mess into which the coal industry has got. If the winter is mild the present stocks and likely production may just be enough to keep industry going without quite stopping all coal exports; if the winter is hard they may well not. The small imports (about 1,500,000 tons seems to be intended) will provide some margin for safety. If they are not needed this winter, they will help to make stocks next autumn a little less disastrously low than is on present tendencies inevitable.

The sharp necessity of spending dollars on coal imports has brought the Government to consider new methods of increasing production from British mines. The announcement of these measures, which the Minister of Fuel on Monday promised "in due course," will no doubt be accompanied by an explanation of why they were not undertaken when the winter shortage of coal was merely foreseeable. But even more disturbing than the lack of foresight is the Government's patent inability to understand what the coal shortage means. Oddly enough, it was the Labour party's daily newspaper that unconsciously summed up the situation most neatly: "Booming Britain outpaces pits." For the faithful followers that may have been in some way comforting, but one might expect it to prompt the leaders to ask themselves the obvious question. What is the good, and what are before long the consequences, of a boom which so strips the essential industries of workers that the country is short of the things it most needs? The consequences were demonstrated forcibly enough in February, 1947. Reviving inflation is taking us back to the Daltonian "empty economy," to an economy so far from being planned that stocks of materials and components are chronically too low for industrial efficiency, and spasmodically too low to keep industry running even at the pace of concealed unemployment, with men kicking their heels in the factories for lack of materials to work on. Coal has again proved to be the weakest link. It provides warning not, indeed, of quite immediate catastrophe but of the way we are quickly going. The Government will not arrest the flood by piling on expedients, by plugging the dyke with a little dollar coal here and an appeal for longer hours there. The coal shortage will be relieved when the Government learns to look for the point at which full employment becomes inflation.

In the meantime it is, of course, foreign customers for British coal who must go short before the "boom" at home is allowed to suffer any check. The Government cannot be altogether unaware that over-full employment at this price of sacrificing exports is precarious. But is there anything—efficiency at home, co-operation in Europe, even the defence arrangements of the Atlantic Pact—that much of Labour opinion would not choose to sacrifice in order to keep the British economy as it is for a few months longer?

From Peking to Lake Success

The Russians have often thwarted the United Nations, but it has been left to the Chinese to spin such a cocoon of doubt and confusion round the whole enterprise, that many people, even at Lake Success, now find it hard to know just where they stand on what has been called the "vast complex of Chinese problems." The forthcoming arrival of Mr Wu Hsiu-chuan's mission from Peking to discuss Formosa is therefore awaited with intense interest on all sides. This is the greater because it will clash with the period, beginning in a few days' time, when Dr Tsiang, the Chinese Nationalist representative, will be taking his turn as president of the Security Council. How, furthermore, will the Russians treat this mission? Will they squire its members round New York like lost souls from Outer Mongolia, frigidly trying to keep them from any intimate contact with the facts of life in Flushing Meadow—as some of the British now suspect they want to do? Or will they flourish these real live Chinese Communists in the faces of the Americans, and try to treat them as if they were already members of the Uno club?

On the answers to some of these questions depends the peace of the Far East and so, perhaps, of the world. In dealing with Communist China, Uno first tried to let the sleeping dog lie. But Peking's threat to Formosa, its eleventh hour aggression in Korea, its disastrously successful support of the Viet Minh, its invasion of Tibet and its bombastically abusive radio propaganda have prevented the leading western powers in Uno from pursuing any independent policy of

pacification in eastern and southern Asia. As a result there is now great scope—as well as need—for a deal behind the scenes between, say, Washington, as representative of the western powers, and Peking. The Sino-American war which has threatened to break out from Korea—however "cold" and unofficial—is one that neither side wants, though the Chinese are certainly prepared to fight it if necessary. Fortunately, the fact that both sides have so far acted with restraint suggests that they may yet be able to compromise. If so, the Americans would do well to consider the possible advantages of accepting Communist China into Uno in return for even a partial settlement on the present basis in Korea. For this a tremendous further effort is required to reassure the Chinese about the limits and peacefulness of American intentions. The Chinese having come to Uno to talk about Formosa, their agreement might now well be sought for a western mission to visit Peking to talk about Korea and, subsequently, other problems. The British would be in a fairly good position to play a prominent part in such a mission.

* * *

Egypt and the Treaty

Year by year the King of Egypt, in his November speech from the throne, warns the British Government that the presence of its troops on Egyptian soil is an affront and must stop. This year he has done so with greatly increased acerbity: "The 1936 treaty has lost its validity and . . . my government deems it inevitable that it should be abrogated." Mr Bevin has civilly replied that the 1936 treaty is a 20-year agreement reached by common consent at a moment of grave threat (by Mussolini) to Egypt's security, and that such a document cannot be abrogated unilaterally. Later he added, under severe pressure from the House of Commons, that delivery of Centurion tanks to Egypt will be suspended pending talks with its Foreign Minister, who is due in London next week. Some Egyptians seem pleased that neither party to the argument has closed the door to negotiation.

In Egyptian eyes times have changed since 1936. They remember that the British offered to go in 1946, subject only to negotiation of dates and stages; the British ought therefore by now to be gone. In British eyes times have changed yet again since 1946. In present world circumstances the security of Egypt's Canal and wealth and, indeed, oligarchic upper class is not what it was four years ago. Times have changed so much that it is hard to understand why king and pashas should at present be wanting to jettison an arrangement which, however distasteful, affords them some shelter from chill winds from distant Moscow and from neighbouring Israel.

Much of the explanation of their seeming shortsightedness lies in Egypt's internal politics. The King is unpopular, and must constantly seek backing from other forces within Egypt. Until the elections of last January, he sought it among the anti-Wafd parties then governing the country. When the Wafd came to power he turned to the army and a chief of staff—Haidar Pasha—who had direct access to him. Now this friend has become the scapegoat of an inquiry into a widespread financial scandal connected with the supply of arms and comforts during the Palestinian war; to quiet unrest among younger elements in the army he has resigned. Already, however, King Farouk had added to himself a new and unexpected buttress—the Wafd. The first sign of this was the royal decree of June last, which packed the Senate with Wafdist senators.

Even a combination of king and Wafd, however, does not earn for throne and party the public favour that attaches to the personality of the sick Wafd leader, Nahas Pasha. Nahas is taking less and less part in politics. His prominence is waning before the rising star of the party's secretary, Serag-el-Din. Not yet 50, able, wealthy, humorous, debonair, ambitious for control of power and purse strings, Serag-el-Din is at present Minister of the Interior and, since last week, also Minister of Finance. His prospects are great and the speech from the throne doubtless helped to earn public plaudits for him as well as for the king.

But this light on Egyptian internal affairs does not clarify the dilemma which faces two governments, neither of which wishes to slam the door on the other. On the one side are the Egyptians, anxious to see the Middle East defended but insisting—in ignorance of modern defence requirements—that this be organised from no fixed address. On the other are the British hoping, Micawber-like, that something will turn up to alter relations before the present defence arrangements expire in 1956.

* * *

Farm Price Foolishness

The Minister of Agriculture has slid further down the dangerous slope of inflating farm prices. Following the recent award of the Agricultural Wages Board (which establishes a minimum wage of £5 for England and Wales), the National Farmers' Union asked for a special price review to enable farmers to recoup their increased costs of production. The union is entitled by the Agriculture Act to insist on a special review and the Minister, under the terms of an agreement he made with the union in 1946, is bound to concede an increase in prices. This, however, would not necessarily be the end of the matter. At the annual farm price review, due to take place in a few months' time, the Minister is supposed to review prices in the light of national economic requirements as well as from the standpoint of farmers' costs and profits. He might take away then, on grounds of national policy, what should be conceded to the farmers now as an automatic right.

That this is an unfortunate and invidious arrangement is obvious—to anyone but the Minister, who seems hardly able to realise that there might conceivably be a conflict between the interests of farmers and the interests of the nation. Two complicating factors have stayed his hand. It is now late in the year to adjust the national finances so as to meet the farmers' claim. Further, the Scottish Agricultural Wages Board have taken the independent course of rejecting the workers' claims for higher pay. It is hardly logical or fair that a farm worker should be paid less north than south of the Border; but, given this situation, it would be still sillier for the Exchequer to give Scottish farmers a windfall through a general increase in prices (which are fixed for the whole United Kingdom). To get out of this dilemma the Minister needs time to think; and the NFU has graciously given it to him on condition that its claims are met at the annual price review. The special review will therefore not take place.

It is regrettable that Mr Williams has, in effect, committed himself to finding another £11 million a year for agriculture. If food subsidies remain pegged, the consequence is likely to be a further rise in the cost of living—which helps to explain the Minister's preference for delay. He can still reduce the price of certain farm products (and should certainly do so) in the interest of national economy. But it will seem to the farmer a trifle Gilbertian to cut his prices for one set of reasons when an increase has been promised for another. Once again, Mr Williams has made the right course harder for himself—and his successors.

* * *

Temporary Protection for Leaseholders

Its temporary nature is the most reassuring feature of the Government Bill to give protection to leaseholders. It is a Bill designed to redress moral grievances and it will be fortunate if it does not create as many injustices as it relieves.

It applies to two classes of tenant, the tenant of a shop and the tenant of a house originally let on a lease of more than twenty-one years. No one can have much complaint over the protection given to the shopkeeper. The Bill on this point corresponds very closely to the law already in force in Scotland. If the tenancy of a shop comes to an end within the two years that follow the start of the Act, the shopkeeper may apply to the county court for an extension of his tenancy on a yearly basis. If the court is satisfied that he has been a responsible tenant it may extend his tenancy for a year. Equally, the landlord may defeat the claim by showing that he can offer alternative accommodation, or that the premises are to be demolished or reconstructed, or that greater hardship would be caused by granting the extension than by refusing it. These provisions are very much in accord with the recommendations of the last departmental committee that considered the problem.

The protection to be given to the tenant of residential property is, again, limited to two years, but it raises quite other problems. The effect of the Act will be to extend by up to two years every long lease where the leaseholder, or a member of his family, is in occupation of the property comprised in the lease. No provision is made for any adjustment of the rent and no compensation is offered to the freeholder for this compulsory extension of the original term. In fact, the main reasons for the presentation of a Bill in this form seem to be that there are a number of long leases of small houses in South Wales expiring next year, that the Government is reluctant to face all the complications of a thorough reform of the law of landlord and tenant at the present time, and that it thinks it proper to avoid unpopularity with the leaseholders of these properties by offering them a free two-year extension of their terms. The Bill is a complicated draft; it is difficult to avoid the conclusion that, as with the Rent Restriction Acts, one of the principal beneficiaries under it will be the legal profession.

* * *

Schuman Plan's Final Stage

All the reports from Paris this week indicate that the Schuman plan, after a period of hesitation, has started to swing forward again. The new momentum is undoubtedly real and is due to a variety of causes. President Truman's re-statement last week of American sympathy and interest in the scheme undoubtedly gave it a push; and at the same time the Continental experts managed to reach a compromise on one of the biggest technical obstacles—the high-cost Belgian coal mines.

The proposal that now seems acceptable to all parties is a compromise between the original French and German views. The French wanted an equalisation fund, to which low-cost producers would contribute on a scale large enough to bring Belgian coal prices into line with the lower price fixed for the single market. For the Germans this would have been an expensive proposition, since the cost price of Belgian coal was some 50 per cent higher than that of German. They therefore suggested that Belgium be left out of the single coal market.

Meanwhile the Germans have had to raise their own coal price, thus reducing the differential, and have accepted a suggestion for subsidising only a small proportion of Belgian coal. In practice, Belgium will gradually close down the least economic mines, and in return the High Authority will guarantee to deliver to the Belgians at the single market price a quantity of coke equivalent to the loss of domestic production—probably about 5,000,000 tons annually. The cost of the required subsidy will be shared equally between the Belgian Government and the low-cost producers, Germany and the Netherlands. Realists have already pointed out that this solution can only be a long-term one, arrived at to satisfy the negotiators, for in the present acute coal shortage no mines, however uneconomic, are likely to be closed down.

Two further points remain to be settled before the treaty is ready for initialling. One is a rigorous anti-cartel provision, which the French are urging over German and Dutch protests; the Germans favour a milder law such as they have already drawn up at home. Another and entirely separate issue which the French are urging in the face of determined German resistance is that the treaty should forbid vertical trusts—that is, the practice, especially widespread in the Ruhr, whereby steel companies own their sources of raw materials.

This particular French objective is no more than the introduction into the Schuman plan structure of the provisions of Law 27 whereby the Allied occupation authorities aimed to break up the German vertical trusts. So far the occupation authorities have not succeeded in fully implementing Law 27, and the French are undoubtedly preparing for a time when all Allied control and regulation of German industry will be formally abandoned. Indeed, the Germans are insisting that the essence of sovereignty lies in the absence of controls imposed by the occupying powers, and that Germany can take part in the plan only as a sovereign power.

As the plan moves toward completion, there is growing interest in the British attitude toward the experiment. Dr Dalton made it clear this week at Strasbourg that, once the plan is approved by the six governments and the High Authority exists, the British Government will consider how it can associate itself with them. This conciliatory statement is a welcome surprise.

* * *

Successes for Dr Schumacher

The vote in the elections held last Sunday in two of the smaller states of Western Germany—Hesse and Wuerttemberg-Baden—was an unmistakable indication of the present frame of mind in Germany. The total vote was low, reflecting the political inertia of the people; it was in favour of the Social-Democrats, reflecting their opposition to rearmament.

The Social-Democrats in Hesse are now twice the strength of any other party in the state. They have an absolute majority in the new *Landtag* instead of being, as heretofore, merely partners in a coalition government. In Wuerttemberg-Baden Dr Schumacher's followers also gained largely at the expense of the Christian-Democrats. The Communists lost all their seats in both states. The advocates of a German national army had no luck either. A voice in the wilderness was that of the chairman of the organisation of ex-generals known as the *Bruederschaft*, who declared in an election address that "it is time the command in rearmament should be given to the fighting men, instead of to Ministers who have never smelt powder."

Dr Schumacher greeted his victory with two mis-statements. He claimed that the results were due to the fact that the Social-Democrat party was the only one with a clear policy on rearmament, and that they represented a vote against the Adenauer Government's economic policy. It would be more accurate to say that the Germans voted against Dr Adenauer's party as the only one with a clear policy in favour of a German contribution to a European army, and for Dr Schumacher's eloquent but confused opposition. The vote was not one for Socialism, but will certainly be exploited for Socialist policy. Dr Schumacher has, indeed, been making himself the spokesman of German sentiment on defence in order to gain power for his party.

It is hard to know how far Dr Schumacher's rejection of a German military force goes, or whether he would change his policy if a Socialist party were in power in Bonn. Some optimistic analyses of the recent *Bundestag* debate on the subject concluded that he and Dr Adenauer agreed in principle. But

the Social-Democrat leader himself declared subsequently that his views differed from those of the Chancellor as black from white. The debate seemed to end in a stiffening of the fronts between the Socialists and Christian-Democrats. It would be too much to hope that Dr Schumacher's latest victories will lead to the formation of a "grand coalition" at Bonn, or to a bipartisan policy on defence. It appears more likely that the Social-Democrat leader will be encouraged to persist in his demand that the question be submitted to the people in a general election.

In the present confused state of the rearmament issue, the results of a general election would probably be highly damaging to the western cause. It is hard to understand how Dr Schumacher can be so lacking in responsibility as to demand such action for the sake of party politics. Germans at present do not know what is to be asked of them, or under what conditions. They are reacting to resentment against the idea of being used as cannon fodder to save nations which, as they feel, have robbed them of homes and property, and for years have abused them for militarism.

In some typically pungent catch-phrases, Dr Schumacher has declared that Germany has suffered much more in the last war than other countries, so should be spared in the next; that Germans must not contribute to western defence until the Western Powers can undertake to win the first battle on the Vistula; and that not a German soldier will defend foreign national states on German soil. This is the voice of the average German.

Apart from his unthinking resentment, the young man of military age in Germany dislikes at least as much as his British or American counterpart the prospect of fresh regimentation and death in battle. The Germans are an impressionable people, and this attitude could change very quickly. But for the time being, they are still under the influence of the upheavals and personal catastrophies of recent years. They would like best to contract out of the international quarrel. *Ohne mich*—or, as Mr Sam Goldwyn would say, "include me out"—is the watchword of the day.

* * *

Prising Open the Closed Shop

The Durham County Council's threat to dismiss any employees, of whatever status, who refuse to produce evidence of membership of an "appropriate" trade union or professional body, is a precise and equally repugnant counterpart to the notorious "Document" or "yellow-dog contract" of an earlier day, whereby a pledge to abstain from union membership was exacted from newly enrolled workers. The council has got itself into an awkward situation. The National Union of Teachers and the medical organisations have advised their members not to comply and have backed the resistance of non-members—no doubt from motives variously compounded of genuine liberalism and of a lively apprehension of internal troubles from an influx of rebellious conscripts. The council is thus left without allies to face the difficulty confronting any would-be dictatorial employer in a time of full employment—the difficulty that if one dismisses recalcitrant workers, whatever they are being recalcitrant about, it is remarkably hard to replace them. Doctors, nurses and teachers are scarce; essential services must be maintained. Government pressure and the facts between them indicate a retreat.

The Durham affair may do good if it shows up the closed shop for the illiberal anomaly that it is. Even apart from the special case of the conscientious objector, it puts the individual worker at the mercy of a trade union executive whose arbitrary decisions are not subject even to that economic check which restrains an employer. Capriciously sacked by one firm, a man can seek another berth; deprived of his trade union card he is, under the closed shop, permanently deprived of his livelihood. This may be acceptable to those who, with minds firmly rooted in the nineteenth century, equate the trade unionist with the under-dog—an animal which can by definition do no wrong. If this mythology is put aside, it is hard to see any reason why the closed shop and the "yellow-dog contract" should not be equally illegal. Complete enforcement would admittedly be difficult. It would be something, however, to lay down that exclusion from a job on account of either membership or non-membership of a union was illegal victimisation entitling to legal redress. A government with the courage to undertake such a reform might reap unexpected dividends of popular approval.

* * *

New Principles of Arbitration?

The National Arbitration Tribunal last week referred the engineering unions' claim for an increase in wages back to the disputing parties. This decision, or the lack of decision, seems best interpreted as another attempt to develop more satisfactory principles of arbitration. There are ample grounds for believing that the tribunal used to do little more than split the difference between offer and claim. In the past two years, with a policy of wage restraint in force, something less than half the difference—usually about one-third—has often been awarded; conceivably, if it were ever the Government's policy to encourage wage demands, something more than half the difference would be awarded.

No one could pretend that this amounted to a reasoned principle of arbitration, though in the absence of any intelligible wages policy it was probably as good a method of getting the claims settled as any. The methods adopted in the case of the engineering unions, and in that of the miners three weeks ago, are both departures from the normal types of awards. The miners were awarded a lump sum to be distributed among the workers concerned more or less as their union saw fit. The tribunal deliberately refrained from offering anything more than advice about who should be paid what, presumably having decided that the miners were more likely to be satisfied by a division of the spoils by their own leaders than by an arbitrary decision. In the case of the engineers, the tribunal confined itself to "recommending" a new basis for negotiations between employers and workers. It reserved the right to enforce an award if no subsequent agreement was reached, but for the second time the attempt was to get the matter settled out of court instead of imposing a verdict.

In normal civil litigation there is a great deal to be said for settling disputes out of court, but wage disputes have long ceased to resemble normal litigation. They involve far more people than the two parties immediately concerned, and a wages decision in one section of industry may have repercussions throughout the whole economy of the country. The former methods of arbitration may have been unsatisfactory; it may indeed be impossible to lay down clear-cut principles for arbitration under present conditions; but is it right that the National Arbitration Tribunal should reduce even its present inadequate influence on wage disputes?

Freedom of Choice for Indo-China

The problem of Indo-China has lately been discussed in Paris from three points of view, all of them fresh. First there has been the arrival of American material in Viet Nam itself; the military equipment already delivered and the promise of a great deal more to come have transformed the French supply outlook. Second, the French Council of Ministers last week accepted the recommendations discussed in the Committee of National Defence for giving M. Letourneau, the Minister for Associated States, sole responsibility for government policy in Indo-China—a considerable and statesmanlike concession by M. Moch, the Minister of National Defence, which should lead to a more vigorous direction of the campaign in Viet Nam. Third, an entirely new urgency has been given in Paris to the question of a French "declaration of intent" about the proposed future of Viet Nam, Cambodia and Laos.

This last point is very important, and it is to be hoped that Paris will soon make a statement about it. It is important because the struggle in Indo-China is, and must remain, political as well as military. Even now it is not too late to win over to Bao Dai a good deal more support from the Vietnamese than he has at present—which may be around 40 per cent of the country. It could come not only from people who have hitherto sat on the fence, but from among the supporters of the Viet Minh (the League for the Independence of Viet Nam). Many of them who are not Communists now fear the growing Communist stranglehold on the whole movement, deliberately increased during the last two months by the Lien Viet, or out-and-out policy of a Communist-controlled national front. But Bao Dai can make no further headway if the result of an anti-Communist victory would be to reimpose French rule, however carefully concealed that may be.

The present growth of nationalist feeling has gone too far in Indo-China and the danger of Communist success has now become too great—though these are two entirely separate things—for the French to have any real alternative to declaring for a policy of complete Indo-Chinese freedom of choice. At last this appears to be increasingly understood in Paris. What matters as much, therefore, as a "declaration of intent" to recognise the national aspirations of Viet Nam, Laos and Cambodia, is that the French should live up to the spirit as well as the letter of any intentions about granting independence that they may state. If the heavy Viet Minh pressure round Hanoi has achieved this, American arms may have come in the nick of time. If not, arms alone cannot save Indo-China.

* * *

War Office and General Winter

It is disgraceful that British troops should have been committed to fight in the Korean winter without proper clothing, and the statement made in the House of Commons last week by the Minister of Defence, Mr Shinwell, did not relieve anxiety in the country. He assured the House that front-line troops had already received the winter equipment they needed. From a more detailed statement on Tuesday by Mr Strachey, the Secretary of State for War, it is now learned, as reports from Korea had already indicated, that there has continued to be great difficulty and delay in delivering winter clothing to advance units of the 27th Commonwealth Brigade, although the material has now just arrived in base depots. As a result, the troops have been forced to exist for three weeks among the icy mountains of North Korea with inadequate and makeshift garments, in temperatures going down to zero fahrenheit.

The 27th Brigade is composed of two battalions from the United Kingdom and one from Australia. It has been fighting in Korea for the past two and a half months, the British units having been drawn from Hongkong—unlike the 29th Brigade which recently reached South Korea direct from this country, completely and properly equipped for all eventualities. There is therefore some excuse for an initial muddle about supplies for the 27th Brigade; its dispatch was an emergency measure. But it surely required no more than normal foresight in the War Office to remember that winter follows autumn, and that in the fullness of time severe weather would be met in Korea. The decision to dispatch adequate clothing should have been made as soon as movement orders to Korea had been signed.

The excuses are that the Brigade would have been withdrawn from the fighting by now, if the Chinese had not intervened, and that the Americans had promised to help with heavy winter clothing pending the arrival of British supplies. The Americans have indeed come to the rescue—but they have had their own problems too. And there can be no valid reason for failing to provide against the possibility of a change in the tactical situation.

Mr Strachey said that on August 25th London was informed that the Americans might want British help in providing winter clothing, and that additional clothing arrived in Korea on November 3rd. He has neither explained this delay of over nine weeks nor given any assurance that inquiry into its causes will identify the culprits.

Fourpence More on the Cards

The announcement made last week-end that the national insurance contributions paid by employees and employers would each be increased by 2d. a week in October, 1951, was merely a reminder that the present contributions are only temporary. It was laid down in the National Insurance Act that five years after the new rate of old age pensions came into force—which was in October, 1946—the contributions would be increased by 4d. The purpose of the increase is to relieve the Exchequer of some part of its future liability in respect of old age pensions.

Nevertheless, the increase is likely to intensify the pressure, already being felt, for an increase in the rate of national insurance benefits. Those benefits were roughly on a subsistence level when they were fixed by the National Insurance

Putting your money to work

CHAMPION OF THE SMALL INVESTOR

Act in 1946. To maintain them on that level the Government promised that the cost of living would be kept stable—a promise which it has not been able to keep. But it cannot raise benefits to the new subsistence level without setting up a chain of consequences that it wants to avoid. First, old age pensioners, on whose behalf the strongest pressure is exercised, cannot have their basic pensions increased without similar increases being made in unemployment and sickness benefit, for it is a cardinal principle of the social insurance scheme that the main risks it provides for should be covered by a flat rate of benefit. Another equally important principle is that the scheme should have an actuarial basis. Higher benefits would mean higher contributions, and Mr Griffiths, when Minister of National Insurance, said that an increase of 4s. a week in the standard rate of benefit would increase the total contribution for a man by 1s. 4d. a week. Since he has also said that the present contribution is already as high as it can be if the principle of a flat rate of contributions and benefits (instead of a rate varying with earnings) is to be preserved, higher benefits appear to be ruled out.

Nothing, in fact, is likely to happen until the first quinquennial review of the whole scheme takes place in three years' time. It may then be possible to increase benefits without increasing contributions if the Government actuary is allowed to assume that unemployment will be at a lower level than 8½ per cent. For the time being, the Government can offset the effects on the social security scheme of the actual and prospective rise in the cost of living only through national assistance—that is, at the sole cost of the taxpayer.

Jobs for Graduates

The Assistant Secretary of Oxford University Appointments Committee has recently returned from a busman's holiday among American universities. The difference in the approach of American and British industrialists towards the employment of university graduates is painfully obvious from his report. The American business man is normally prepared to tout his firm's attractions round the universities, and is provided with a suite of rooms in the university buildings to do so. Too often his British counterpart remains suspicious and hesitant and has to be beguiled by the university appointments officers into trying out some of these strange creatures in his works.

There is no doubt that British industry and commerce could with advantage move nearer to the American practice. The Americans have realised that with the cream of the schools going into the universities they will only get skimmed milk direct from the schools. They have also realised that the collection of potential workers at the universities is, if nothing else, a supply that the recruiting officer from the firm can tap more conveniently than the young people scattered among many schools. Most important of all, they have recognised the advantage that university education often gives for managerial positions. University appointment ("college placement") departments in the United States are consequently much bigger and more important than the modest, not to say hole-in-the-corner, organisations in some British universities

There is no need to imitate the lavish American schemes for placement. Their significance is not in their size, but in the light they throw on the climate of opinion in America about the value of university recruits. British industry needs a continuing supply of technologists who can turn the fundamental discoveries of the universities into profitable commercial channels. But it needs also young graduates whose broader education may fit them to make better managers and directors. So far, it is chiefly the largest firms that have fully grasped these possibilities. There are smaller firms that can and need to employ the greater share of university graduates.

Truman Aid for Tito

The US Administration's decision to help Jugoslavia will come up for close inspection when Senator Taft embarks on his "re-examination" of American foreign policy. Already, and without specific Congressional sanction, President Truman has put in motion an emergency programme to relieve the food shortage caused by the severe droughts. Altogether some $30 million worth of aid is being mobilised; flour will be shipped from Italy and Germany and paid for by ECA; the remainder of an Export-Import Bank loan to Jugoslavia has been released for foodstuffs; and still further supplies of food are to be purchased with funds from American military appropriations for Europe.

These sums, substantial as they sound, fall short of what Marshal Tito needs, even when allowance is made for the recent sterling credits granted by Britain. The American Administration is convinced that nothing less than a further $85 million is required and, in a preliminary effort to extract these funds from Congress, President Truman has sent a message to Congressional leaders which sets out more forcibly than ever before the importance which Washington attaches to the part that can be played by a Titoist Jugoslavia in the cold war. The policy of aid is based, the President said,

> On conclusions that (1) Tito's defection from Kremlin control represents the first setback to Soviet imperialism, and as such is an important political symbol; and (2) Tito controls the largest fighting force in Europe except the Soviet Union and that these forces constitute an important element in the defence of Western Europe against Soviet aggression.

The first challenge to this policy came from Formosa, where Senator Knowland called a press conference to protest that aid should not go to Tito while that other stalwart fighter-for-freedom, Chiang Kai-shek, remains a victim "of the State Department's policy of appeasement in the Far East." Yet another group of critical Republicans can be expected to press General Franco's claims for aid as a bulwark against the USSR. Indeed, the President's striking reversal of his policy toward loans to Spain may well have been an attempt to forestall these claimants. Almost simultaneously with his call for aid to Jugoslavia, Washington announced that the $62.5 million loan to Spain, voted earlier this year by Congress and strongly criticised by the President, would get under way immediately.

In spite of these storm signals it is probable that a number of Republicans can, in the end, be induced to come to the aid of the Marshal. They are, after all, anti-Russian above all else and not entirely impervious to the argument that Jugoslavia is of great strategic importance. But the immediate threat to the programme lies in the possibility that the opposition will hold back until there is greater evidence of a direct threat to Jugoslavia, meanwhile bargaining their support against any concessions they can wring from the Administration over Far East policy. By that time help may be too late.

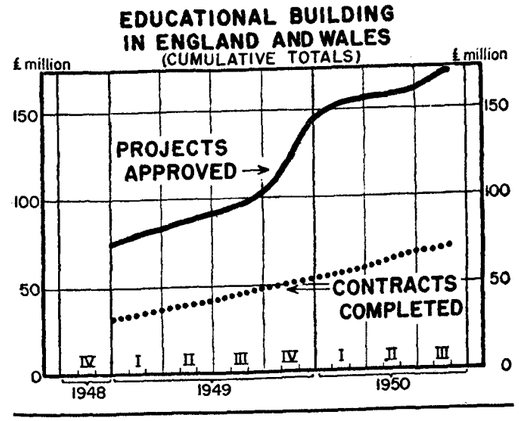
Russian Grain for Europe

The grain conference in Geneva organised by the Economic Commission for Europe, which ended on Tuesday after a week's work, was further evidence—if this were needed—that in relatively unimportant matters the Russians are taking a co-operative line in Europe. There was a full house from Eastern Europe; the Soviet delegation was headed by M. Borisov, Deputy Minister for Foreign Trade, whose interest is in the practical not the polemical and the atmosphere was consistently businesslike and friendly.



A certain amount of limited business was in fact done. The east Europeans made a total offer of no more than half a million tons of coarse grains beyond their existing commitments, against a demand for over a million tons of bread grains and nearly 3 million of feeding-stuffs. It is not clear whether this modesty was politically dictated, but there is every reason to suppose that quantities available are exceptionally low this year. On the other side, none of the prospective purchasers wanted to discuss, in public forum, what goods they were prepared to offer in exchange. Within these limits the only thing that could be done—and was done—was to reach agreement on quantities, both between competing buyers and between buyers and sellers. The French, the Dutch and the Scandinavians emerged victorious, and will now withdraw to their separate capitals—or to Moscow—to negotiate bilaterally the outstanding questions of price and counter-deliveries, which may, of course, always prove intractable. The British went to Geneva with 800,000 tons already in the bag, so their reticence may count for once as an unmixed virtue. But there was some tendency among the Continentals to construe their motives as the usual desire to stand aloof from a European venture.

If the object of the conference, which was always a little obscure, was to meet Western Europe's need for non-dollar grains and to relieve Eastern Europe of a grain surplus, it clearly was not successful. The western countries will still have to find the bulk of their grain requirements from outside Europe, and it seems highly unlikely that the eastern countries have much spare grain around. But if its object was to prove that, whatever the international tension on vital issues, there is no reason why co-operation on smaller issues should not be possible, it can be said to have succeeded admirably. The mountain may have given birth to rather a small mouse, but it may, in a number of small ways, prove quite a useful mouse.

Squeeze on School Building

The Conservative proposal to build 300,000 houses a year has so far led to very little serious discussion of the cuts in other building programmes that might make room for more houses without increasing the labour force in the

building industry. A few obvious but small cases—shops in Lambeth, offices in Westminster, and so on—do not add up to a convincing programme of cuts. There has been some tentative mention of cuts in school building, but little concrete evidence about what they might or might not be supposed to achieve. Since, however, this is obviously one of the larger possibilities, it may be worth while to examine the present relative sizes of the school and housing programmes.

Between 1945 and August, 1950, some £68 million of school building was completed in England and Wales, and about £12 million in Scotland. To have done without new schools so far since the war would not have produced many extra houses. That, however, is partly because school building started very slowly. The amount of school building under construction has risen from £26 million to £81 million during the past two years. As with the early stages of the housing programme, the rate of finishing schools has not kept pace and only £21 million worth of building was completed in England and Wales in 1949. This year the figure is likely to be something over £25 million, with another £5,000,000 or so in Scotland.

Houses are being built at the rate of 200,000 a year and the annual investment in them is not far short of £300 million. The school building programme is still small by comparison. It is confined to three purposes: to providing the extra places (some 1,100,000 between 1947 and 1953) demanded by the higher birth-rate of the forties; to schools for new housing estates; and to a modest £3,000,000 for technical education. To squeeze school building would soon involve a serious loss in educational standards. To obliterate it entirely would produce only perhaps another 25,000 to 30,000 houses a year. There is already great anxiety lest the extra school places will not be produced in time, while no resources can yet be spared to replace the many schools which have been condemned for years. A slogan of "houses before schools" would have no great popular appeal and would not in practice produce many more houses.

The Need for Peace

Peace is now the prevalent habit of society, as war was when men had no fixed homes, and fought for a hunting-ground as a means of subsistence. It is a necessity for all the industrious wealth-creating classes, for the merchant and the manufacturer, for the grower of food and of the raw materials on which art is exercised, for all the professional men who depend on them, and all these now constitute a vast majority of almost every society. They may be sneeringly described as dealers in public funds, or peace-at-any-price men; but they are not only the vast majority, they are the increasing portion of society, for whose security and advantage Government exists, and in the end their interests must be consulted, and they will give law to the whole. Governments must study their interests, and must obey them. To pique the honour of the Prussian army or the Austrian soldiers, and urge Governments into war, is not merely, therefore, to rouse the angry passions of Austrians and Prussians; it is to set the military part of society against their own peace-requiring countrymen, and generate civil contention, together with foreign war. We say not that the military profession is in hostility to the feelings, habits, and wants of the present age, for it is still required to some extent in every society, both to insure security abroad and guard against convulsions at home; but it is gradually decreasing in relative importance and will become hostile to the other classes and to the habits of civilised life, to its own injury, if feelings of honour and a passion for glory and strife be nourished at the expense of national peace.

Letters to the Editor

German Deflation

Sir,—The recent report on the foreign exchange difficulties of Western Germany prepared for the Management Committee of EPU, which has fortunately found its way into the French press, merits the closest attention in this country. The Western German Federation has in the last two months lost some $350 million in the European clearing and has exhausted not merely its original quota of credit granted by EPU but the whole of its foreign exchange reserves. The report advocates the grant of new credits on condition that a general domestic credit restriction is forthwith initiated by the German Government, a large increase in taxation is introduced so as to produce a budget surplus, investment plans are cut, and the independent authority of the Central Bank is reinforced. Unemployment in Germany is still above the 1,250,000 level. The proposed measures would undoubtedly increase it towards the 2,000,000 level reached last winter.

This policy can hardly fail to have the most disastrous political consequences by leading to extremism at a moment when the Americans are pressing for the rearmament of that country. Nor is the case for a general deflation supported by a careful analysis of the facts. Only a small fraction of the losses of foreign exchange was due to the worsening of the current balance of payments. The bulk was accounted for by a wild bull speculation in sterling and commodities which was made possible by the dismantling of the direct controls and the liberalisation of trade by Germany. The measures proposed would not deal with this overwhelming problem. No doubt a better distribution of income is needed. But the tax reform advocated by Mr Cairncross and Mr Jacobsson has merely a deflationary aim, and would fail to do this. Only a restoration of import and investment controls to give priority to necessities and enable the rebuilding of a balanced German economic system would meet the crisis. This was expressly permitted to "extreme" debtors by the EPU agreement. The acceptance of the Cairncross-Jacobsson report would set a dangerous precedent for Britain should a turn in the world economic position lead to renewed tension in our (dollar) balance of payments.—Yours faithfully,

Balliol College, Oxford T. BALOGH

Still in the Air

Sir,—In *The Economist* of November 11th it was said that "the (Conservative) figure of 300,000 houses was conjured out of nothing better than the enthusiasm of a party conference." In fact, *before the motion on housing was put* to the conference, Commander Galbraith, M.P., who is on the Parliamentary housing committee, said in his speech from the platform that "We must set ourselves a target, for otherwise the industry cannot plan and cannot calculate the amount of additional materials required; and it is my submission that the target should never be set any lower than 300,000 houses a year."

This can hardly be said to be the hysterical outpourings of a Conservative conference. It must at least be admitted that the party leaders were aware of this figure and that the possibility of attaining it had been at least investigated by the Parliamentary housing committee.

You said that the proposal was not impossible but simply irresponsible. To begin with, a lot could be done to raise the housing figure from the money, materials and labour which are already allocated to that purpose. Surely you cannot consider that it is a sensible state of affairs when production as a whole has gone up by 30 per cent and housing production has fallen by 26 per cent? Are we to accept this as irrevocable? And is it irresponsible to suggest that building production could be raised to a prewar figure? The number of houses which could be built from this factor alone is 50,000 more a year—half what is necessary to achieve the Conservative target of 100,000 extra houses.

As for sacrifices: it may be that some things will have to be sacrificed. We could make a start, for instance, by sacrificing such projects as that of spending £200,000 in Lambeth to build new offices and shops—and I am sure that this small example could be repeated all over the country. Of course we want new offices and shops. But do we want them at the expense of the people's homes?

As for the argument that the need for housing is a "subsidy-generated need," I do not think I have ever heard a more cynical and inhuman pronouncement. What of the thousands of young families, decent, clean and self-respecting, who are now being forced to live and rear their families in slum conditions in houses unfit for human habitation? What of those condemned to live indefinitely with in-laws, who have no hope under present conditions of being rehoused before they are middle-aged—if then? In Lambeth the population increased by 2,800 last year and there were 1,291 marriages. Is this a "subsidy-generated need"?

If subsidies were taken off food the first casualties would be football pools, cinemas, beer and tobacco—not houses. And if there was any real deflation the price of housebuilding would also fall. A quarter of a million houses have been knocked down by the enemy during the war; three-quarters of a million houses have become obsolete through old age and lack of repairs; the population has gone up three and a half million since 1939. The figure of 200,000 houses a year does not overtake the rate of obsolescence, so how can it be argued that if subsidies were removed the need for more than 200,000 houses a year would not exist? Are we to have no *new* houses—no *more* houses than the total number which exists today?

If this is all the criticism which you offer against the Tory programme of 300,000 houses, then I do not think we need worry overmuch.—Yours faithfully,

House of Commons J. G. SMYTH

The Encroaching Corporations

Sir,—In *The Economist* of November 4th, you referred—under the heading "The Encroaching Corporations"—to the supposed fact that British European Airways is "squeezing out the air charter firms from the Channel Islands trade" and that "more unsatisfactory than any particular encroachment of public monopoly on private business in the same field is the absence of any impartial body to decide whether the facts do or do not justify it. The Corporations are judges in their own cause."

May I be allowed to explain the true position? We in BEA have in fact recommended to the Air Transport Advisory Council the granting of permits for the operation of 10 routes from England and Wales to the Channel Islands by private companies next year—the same number as has been operated by private companies this year.

Secondly, far from being judges in our own cause we merely make recommendations to the Air Transport Advisory Council—an independent body sitting under Lord Terrington. This council decides whether applications shall be granted, modified or refused. It is, in fact, a licensing authority. In the past it has certainly not accepted the recommendation of BEA in all cases.

In forming our recommendations we are guided not only by our own commercial prospects but also by the Minister's directive that:—

> It is Government policy, in accordance with the Air Corporations Act, 1949, that the scheduled internal and external air services of the United Kingdom should normally be undertaken by the British Airways Corporations.

Far from wishing to squeeze out the air charter firms, we have recently proposed to them co-operative arrangements for full interline agreements whereby BEA's routes and those of the private operators may be fully integrated to the benefit of both the operators and the travelling public—an approach which has been welcomed by many of the companies concerned.

I fear that some of the private operators may have hoped that we would give up some of our profitable routes to them and that such a view may have led to some misrepresentation of the facts that I have endeavoured to set out above. Much as we should like to help them all, we cannot do so at the expense of increasing our deficit.—Yours faithfully,

PETER G. MASEFIELD

The Origins of Soviet Russia

The Bolshevik Revolution, 1917-1923. Vol. I. By E. H. Carr. *Macmillan.* 430 pages. 25s.

A hundred years ago the greatest French historians, almost without exception, were occupied with the French revolution and its consequences. Even as early as the 1820s, Thiers was leading the impressive procession of the revolution's historians; he was followed by Lamartine and Michelet, who in their turn were succeeded by Albert Sorel, Aulard, Jaurès and many others. It is a reflection on the state of historical research in Soviet Russia that, thirty-three years later, not one real history of the Bolshevik revolution and regime has been produced there. (The two great histories by Trotsky and Miliukov were written in exile, and dealt only with the events of 1917.) It may be argued that the French began to assess their revolution only from the vantage point of the post-Napoleonic and post-Restoration era, and that the Russians at present lack not only freedom for research but also historical perspective. But this does not alter the fact that the need for a full scale history, or histories, of the Soviet regime is felt very acutely. Nor can it be doubted that the Russian revolution, like its French predecessor, will fascinate many generations of historians. In years to come it will probably be a matter of pride for British scholarship that the first ambitious and comprehensive history of the Soviet regime has been attempted by a British scholar.

This is the first volume of a series of books planned by Mr E. H. Carr. "The Bolshevik Revolution: 1917-1923" is to cover, in three volumes, the period from the October revolution up to Lenin's withdrawal from the political scene. The second part of the study "The Struggle for Power: 1923-1928," will deal with the formation of the Stalinist regime. The scope of this work, if, as is hoped, it is completed according to plan, will be fully comparable to the scope of some of the classical histories of the French revolution.

This first volume is divided into three parts. Part I (The Man and the Instrument) is devoted to an analysis of the origin and the development of the Bolshevik party before 1917. Part II (The Constitutional Structure) describes in detail the early constitutional ideas and practices of the Bolsheviks and the merger of their party with the Soviet state. In Part III (Dispersal and Reunion) Mr Carr discusses the revolutionary disintegration of the old Russian empire and the reassembly of its constituent parts in a new highly centralised state, the Soviet Union proclaimed in the Constitution of 1923.

The author follows these processes, crucial for the understanding of the Soviet state, on the basis of impressive and exhaustive research into original documents. The wealth of his documentation will surprise many readers, but it is a fact that the material relating to the first decade of the Russian revolution is richer than that available to many other historians. The main difficulties of research into Russian history—difficulties created by secrecy or falsification—begin later.

Any work of the kind which Mr Carr has undertaken can be written from different political viewpoints and from different methodological angles. Mr Carr himself sums up his standpoint as follows:

> Politically, the programme [of the Bolsheviks] involved an attempt to bridge the gap between autocracy and socialist democracy without the long experience and training in citizenship which bourgeois democracy, with all its faults, had afforded in the west. Economically, it meant the creation of a socialist economy in a country which had never possessed the resources in capital equipment and trained workers proper to a developed capitalist order. These grave handicaps the victorious October revolution had still to overcome. Its history is the record of its successes and failures in this enterprise.

This, of course, is a viewpoint which invites controversy from both those who want to hear only about Bolshevik successes and those who want to be told about nothing but the failures. But any history of so controversial a period is itself bound to be controversial up to a point. What can be said in favour of Mr Carr's approach is that it is free from the extremes of apologetics and denunciation, and that the massive framework of fact he has built up is unassailable, regardless of possible differences of interpretation. It is the author's distinction that, at a time when most writing on Russia is coloured by political passions, he has throughout maintained the historian's critical detachment.

In its method, this is primarily a history of policies and institutions. Mr Carr traces, with very great diligence and penetration, the evolution of the major ideas of Bolshevism, the formation and consolidation of the central institutions of the Soviet state and their relations with each other. His analysis of the structure of the institutions is in many respects genuine pioneering work. This is not, however, a history of the social forces of modern Russia or of the Soviet way of life. These are, of course, reflected in the policies and the institutions, but they remain dimly in the background. No single history can adequately include all these aspects. The concentration on institutions and policies has this to commend it: it allows Mr Carr to trace definite processes with the maximum of precision, and it saves him from the temptation to try at any point an imaginative reconstruction of the elusive "spirit of the epoch," of the psychological climaxes and anticlimaxes, of the tensions, dramas and moral conflicts in which the Russian revolution has been so rich. Mr Carr writes in a deliberately austere but lucid style. His stylistic austerity is in keeping with his general method and testifies to the writer's self-discipline. But Mr Carr's story is so important and inherently dramatic that to the serious student it is never dull.

Foreign Policy in a Democracy

Congress and Foreign Policy. By Robert A. Dahl. Published for the Institute of International Studies of Yale University by *Harcourt, Brace and Company, 1950.* $4.00.

It is no disrespect to Professor Dahl to say that, in some ways, the most significant thing about his book is its title. Much has been published in the last hundred and seventy years about "The Senate and Foreign Relations" and many general books on the Senate have included a chapter entitled "Treaties." But it is only since the end of the war that American foreign policy has needed money—money for foreign aid programmes, economic and military, money for information services and for the expansion of the armed forces. And money can only be obtained through Appropriations Bills, which originate in the House of Representatives, a body carefully excluded by the Constitution from meddling in foreign policy, and concurred in by the Senate, whose only previous constitutional contact with the outside world was over the confirmation of the appointment of ambassadors and the approval—by a two-thirds majority—of treaties. But now, Professor Dahl says,

> the whole Congress is as deeply involved in foreign policy as it is in domestic policy; for, measured by the demand placed on Congressional power, there is far less basis today for distinguishing foreign from domestic policy than there was a centry ago.

His book is an analysis of the problems presented by this change (another book in the same series discusses the consequent problem of "The American People and Foreign Policy"), an analysis in which the evils produced by Congressional ability to interfere in what Congressmen little understand are fully and confidently stated. If he shows more uneasiness among the possible remedies it is hardly surprising.

He recognises three methods of conducting a foreign policy in modern times. The first is that of open dictatorship; the second that of a "democratic" regime (the quotation marks are his) with extensive executive discretion—on the lines of the Weimar Republic; the third "is a democratic regime under which executive policy rests upon the confidence of the legislative branch," with, in the United States, "a high degree of collaboration between executive and Congress in the formulation

and conduct of policy." It is his theme that the second alternative becomes uncomfortably close to the first in so far as it is successful and that only the third is really available to the United States.

The trouble with this view is that confidence between the President and Congress is precisely what the framers of the Constitution tried, only too successfully, to avoid; and that the American Congressman seems to be becoming more, rather than less, of a delegate, who refers home for instructions when each new problem comes up, than a representative, who votes according to his best knowledge, confident that those who elected him will trust his judgment. And, as the author admits, "the decision of means to be employed in foreign policy is a terrifying demand to place on the citizen" without a degree of knowledge which the ordinary citizen has neither time nor inclination to acquire, and without public discussion which at times "might jeopardise a proposed policy."

Professor Dahl has, in fact, expounded the problem in detail without solving it. And his attempted solution, which amounts to more education for the citizen and a greater patriotism and sense of responsibility on the part of his representatives, is put forward somewhat wistfully. Since his book was finished there have been two occasions—the vote in the House of Representatives to exclude Britain from the Marshall Plan as long as Ireland remained partitioned and that for Senator McCarran's $100 million loan to Spain—which make it look more wistful still. These were not cases when Congressmen have acted out of ignorance of the damage they were trying to do. They were cases when Congress understood perfectly well and did not care. Their country's foreign policy did not matter if they could strengthen their personal positions in their home States. As long as this happens, it is impossible to blame Presidents, as Professor Dahl does by implication, for trying to become "Constitutional Dictators" where foreign policy is concerned.

A Political History of Canada

Canada. By G. S. Graham. *Hutchinson's University Library.* 177 pages. 7s. 6d.

"This short book," says the author in his introduction, "is not so much a history of Canada as an interpretation of Canadian history; it is an attempt to approach Canadian history from outside rather than from within North America." It is generally fruitless to quarrel with an author's conception of his work, whatever criticisms may be levelled at the finished product; but one may regret in this instance that so much skill in presentation, working on such resources of scholarship, should have been used to produce an "interpretation" so overwhelmingly political and strategic, so little calculated to enable the non-Canadian readers to relate the totality of Canada's past to the living reality of her present and the promise and problems of her future. At the same time the "approach from outside," the relation at every stage of events in, or directly concerning, Canada to the moves proceeding on the major chessboard of European or world politics, gives a sense of perspective and proportion provided by no other writer.

Professor Graham does not, of course, entirely neglect the story of fur and fish, wheat and lumber, and has indeed some shrewd, and some entertaining, things to say about Canadian economic development; while the internal tension between French-speaking and English-speaking, Catholic and Protestant, Canadians is inevitably one of his major themes. Yet when he comes in his final chapter to discuss "The Future of a Medium Power" the picture seems strangely thin. Postwar Canada is "placed" deftly and sympathetically on the international stage, but there is hardly a hint of the revolutionary acceleration imposed by the second world war on its industrial development; nor, any economist is bound to feel, does Professor Graham assign enough weight to the difficulties, possibly of long duration, arising from Canada's position at the frontier of the hard-currency and soft-currency areas with a foot in both camps. Nor, indeed, does he convey anything of the curious atmosphere of mutual fear and distrust, mitigated by good sense and by an equally fervent allegiance to varying ideals of the same motherland, which characterises Canadian inter-racial relations. No doubt, however, these complaints leave Professor Graham's withers unwrung. His main theme is power politics, and that theme he handles with an effortless authority which maintains the standard of the excellent series of which "Canada" forms part.

The Geography of South-east Asia

South-east Asia. By E. H. G. Dobby. *University of London Press.* 415 pages. 18s.

The author is Professor of Geography at the University of Malaya, Singapore. His book covers Malaya, Burma, Indonesia, Siam, Indo-China and the Philippines. It is not, as he points out, "a dictionary, a gazetteer or an encyclopaedia." It is in fact a very readable geographical text-book, which should stimulate the politician and business man, the administrator and sociologist to learn more about the physical and human surroundings they work in.

Professor Dobby has divided his book into three parts. The first deals with the natural features of the area—geological formation, climate, vegetation, soil and drainage problems. However important to a comprehensive geographical survey such as this, it is perhaps the least exciting section of the book—although Professor Dobby has certainly done well to present so many facts in such a readily assimilable form. They benefit particularly from a liberal supply of really imaginative and useful diagrams and maps; indeed there are no less than 118 of these charts in the book as a whole and a great deal could be learnt from them without ever looking at the text at all.

The second part consists of studies of each individual country in turn, spread over fifteen chapters of which five are devoted to the vast territories of what is now Indonesia. These include human studies which range well outside the term geography in its narrower and older sense. Professor Dobby deals capably with such subjects as cultivation of crops for export, industrialisation, population origins and trends, and the cycle of Malayan paddy farming.

The third section of the book is the most interesting. It links historical development with present problems. The population of South-east Asia, for instance, has grown from about 10 million in 1800 to some 145 million today—an expansion equal to that of the United States but with only a tiny fraction of the capital development. There could be few better ways of understanding the current aims and difficulties of the Colombo Plan than to read Professor Dobby. For those who want to delve further—or who are not satisfied with him—he has provided an extensive bibliography.

A Diplomatic Anthology

Principles and Problems of International Politics. Selected Readings Edited by Hans J. Morgenthau and Kenneth W. Thompson. *New York: Alfred Knopf.* 476 pages. $5.00.

The idea of this stout volume is excellent—to show to Americans from the international relations of the past what is apparently recurrent in the present, to go back to principles of foreign policy and to the wisdom of great statesmen of the past—most of them British. The extracts are divided into six groups, with a concluding seventh section consisting entirely of a notable speech made in the House of Commons by Mr Churchill last March. There is first the "Science of International Politics," which includes some most salutary thoughts on the art of guessing by H. A. L. Fisher; then "What Foreign Policy Is All About," which ranges from Alexander Hamilton to Salisbury; then "National Power," in which Lenin rubs shoulders with the author of the Tanaka memorandum of 1927; then "International Order and Peace" with David Hume talking good sense about the balance of power and Mr Hugh Gibson telling home truths about diplomacy. The celebrated paper of Sir Eyre Crowe on British foreign policy comes in with the Truman Doctrine, the Harvard address by Mr Marshall and a good piece of Kennanism. Finally a section on "Present Problems of Foreign Policy" concentrates on the east-west conflict, with Fox and Burke supporting Sir Charles Webster and—it is gratifying to see—enjoying the company of a leading article from *The Economist*.

This anthology will have its uses in British as well as American universities for the study of principles and motives in international relations. But—may one say with great respect—is it not too

Alistair Cooke

A Generation on Trial

THE TRIALS OF

ALGER HISS

"No man could handle this fascinating and important story with greater balance and discrimination than Mr. Alistair Cooke. He was present throughout both trials . . . He is one of the most gifted of living descriptive writers . . . While avoiding dramatisation or sensationalism, his account is vibrant with life . . . I congratulate him."

FAÇADES AND FACES
By **Osbert Lancaster**

This is the first Lancaster album and with inimitable wit in text and illustration it gives Mr. Lancaster's observations on the façades we know abroad and the faces familiar to us at home. 8s. 6d. net.

TIME'S CHARIOT
By **Sir John Pollock, Bart.**

The world of international affairs as known to a press correspondent, over a remarkable family background. *Recommended by the Book Society.* Illustrated. 18s. net.

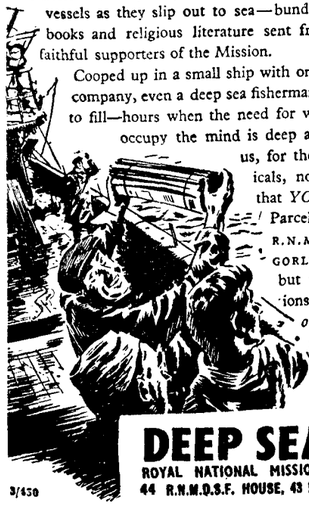
LORD HERVEY AND HIS FRIENDS
Edited by the **Earl of Ilchester, G.B.E.**

Lord Hervey, one of the shrewdest, and raciest of the 18th century chroniclers, is here shown as a diverting letter writer. Most of these letters were written to the Fox brothers. Illustrated. 21s. net.

BEFORE THE CURTAIN
By **Thomas Preston**

A personal story of immense variety and colour, of diplomacy and of music, of the old and new Russias as a diplomat and musician knew them, with many pungent reflections on current diplomatic affairs. Illustrated. 18s. net.

JOHN MURRAY



"Magazines! — from the Mission"

Down by the harbour in the chill hour before dawn, you may often see that beloved figure wearing the uniform of the Deep Sea Mission. One by one, he tosses his precious bundles aboard the fishing vessels as they slip out to sea—bundles of illustrated magazines, books and religious literature sent from all over the country by faithful supporters of the Mission.

Cooped up in a small ship with only the rest of the crew for company, even a deep sea fisherman has many grim, empty hours to fill—hours when the need for wholesome reading matter to occupy the mind is deep and grave. Do, please, send us, for the fishermen, all used periodicals, novels, detective stories, etc., that *YOU* can spare.

Parcels should be addressed to R.N.M.D.S.F. STORES, QUAYSIDE, GORLESTON, GREAT YARMOUTH; but will you please send donations, inquiries or anything else *other than parcels of magazines, comforts, etc.,* to the Secretary J. W. DONALD—

COST OF LIVING

The most pressing domestic problem of the moment, directly affecting us all, is the cost of living. This is the subject of a new Gallup Poll Feature to be published in the News Chronicle.

A special reporter of the News Chronicle who accompanied one of the investigators engaged on this survey will amplify the final results and embody them in a series of articles beginning on November 28.

When scientifically analysed, the answers to carefully designed questions on spending habits (e.g. how much is spent on food, entertainment, education, etc.) and on people's expectations and intentions, make a fascinating and instructive study and show in detail how different income groups are affected by the cost of living.

This new survey, like all Gallup Polls taken in Great Britain, has been carried out by the British Institute of Public Opinion, and is to appear exclusively in the

schematic, almost Teutonic, in its approach to diplomacy? How much more useful it would be for contemporary America, and for the growing numbers who study international relations, to study the technique and methods of diplomacy in situations which have their contemporary parallels. Here the extract method would be practicable and useful to the student. Indeed, it would be a valuable companion to such a fine book as Professor Seton-Watson's "Britain in Europe, 1789-1914."

Autobiography and Tract

Confident Morning. By Sir Harold Butler. *Faber and Faber.* 192 pages. 12s. 6d.

From its title and its publisher's blurb this book should be an autobiography. That is what its author seems to have meant it to be—a record of his working life from Oxford until the end of the 1914-18 war and his entry into international civil service at the International Labour Office. But he does not stick to his intentions. For about half the book he describes his life during the years when most people thought they were working to make the world better and better. For the other half, he uses his moves from post to post as pegs on which to hang a tract on the pitfalls of nationalisation. Much as fish and chocolate, separately delicious, are spoiled, if eaten together, so the two topics do not combine into a good book.

Because it cannot let itself go on narrative, it gives far too few snapshots of past scenes and masters. Yet the talent for evoking these is there. It comes out well in a chapter on the first international conference on air navigation in 1910, and better still in a description of the way in which the declaration of the 1914 war reached "all departments"—in a circular from the Foreign Office on which the formula was printed with a gap into which a clerkly hand could fill the name of the right enemy. Sadly, it fails to live up to this standard in a description of the part of the Paris peace conference that gave birth to the ILO.

The other half of the book—the tract for the times—contains one good and succinct comparison between the struggle of trade unions against the corporative states of the inter-war years and the struggle in which these same unions are beginning to find themselves involved within nationalised economies. But too much of the rest is nebulous or else trite. It will delight many readers over sixty; it says so many of the things that they have said all along. "With the multiplication of officials the citadels of power become more inaccessible." "Is the crushing weight of the all-powerful state now to be substituted for the rule of the feudal landlord?" "When comes such another as Mr Churchill?" The book, however, is not just a treatise on Now and Then with all the balance in favour of the Then. It sees clearly enough that the Edwardian morning was only confident for those with £500 a year. But it is content to exclaim that the extent of current political and social upheaval is too vast for human measurement. If a man of Sir Harold's experience has no more than this to say to the younger generation, he would have done better to stick to autobiography.

Textbooks by the Ton

International Relations. By Robert Strausz-Hupe and Stefan T. Possony. *McGraw-Hill Publishing Company, Limited.* 947 pages. 51s. $6.00.

Elements of American Government. By John H. Ferguson and Dean E. McHenry. *McGraw-Hill Publishing Company, Limited.* 803 pages. 36s. 6d. $4.25.

The Monetary and Banking System. By George Walter Woodworth. *McGraw-Hill Publishing Company, Limited.* 588 pages. 42s. 6d. $5.00.

Manpower Economics and Labour Problems. By Dale Yoder. *McGraw-Hill Publishing Company, Limited.* 661 pages. 42s. 6d. $5.00.

Mass production of university graduates obviously also involves mass production of university textbooks. American universities, with two and a half million students, have doubled their output in the last ten years and publishers of textbooks are working overtime to keep up with this growth in the college market and to cash in on it. The things the student learns about have been growing and changing too, so that reprints are not enough; it is a question of new editions and, more often than not, of entirely new books.

The four books reviewed here are only a selection of those coming off the McGraw-Hill Publishing Company's assembly line. They are all by working professors and are evidently what American university teachers and students expect, although questions and exercises at the end of each chapter are something the British student leaves behind with his schooldays. With the exception of "International Relations," which is of far more general interest and of greater originality than the others, these are little more than up to date factual studies, doing little to encourage the reader's critical faculty, but setting out clearly and ably everything he needs to know about the subject covered.

Shorter Notices

Conditions of Freedom. By John Macmurray. *Faber and Faber.*

THIS little book contains three lectures on a subject on which it is particularly difficult either to find something new to say or to avoid being sententious. Professor Macmurray's lectures, admirable alike in content and in tone, should be pressed into the hands of all and sundry. While raising old problems, they do so from fresh angles; while always profound, they are also always clear and often inspiring. No one need fear that he will not be able to follow Professor Macmurray's arguments, though most readers will acknowledge that without Professor Macmurray they could hardly have got so far. In his first lecture, for instance, Professor Macmurray points out that freedom, being the ability to do as we please, may be increased either by our acquiring power to do more things (the technological road) or by our limiting the number of things which we want to do (the moral road, once the main road but now unfashionable). This is so simple that one is tempted to call it obvious, until one realises how badly it needs saying at the present time. No attempt can be made here even to outline Professor Macmurray's main theses, but lest anyone should think that the argument is conducted on a remote or abstract plane, it should be added that at the end Professor Macmurray has some pertinent things to say about why our recent unprecedented efforts to create a world order have not only failed but have made things worse.

Statistical Register of Western Australia, 1946-47. *The Government Statistician, Perth.* No price stated.

THE Government Statistician has compiled from the official records tables covering vital statistics, public finance, trade, industry and transport, social statistics, local government and prices. The tables follow the pattern of previous years.

AMERICAN SURVEY

The Future of Foreign Aid

Washington, D.C.

THE cautious replies of the Republican victors to questions about their future attitude to the Administration's foreign aid programmes is but one more proof of Lord Keynes's observation that "the power to become habituated to his surroundings is a marked characteristic of mankind." There is still no certainty that attempts will not be made to mutilate those programmes when it comes to voting in the Eighty-second Congress. But everything said so far suggests that the Republicans have become habituated, if not completely resigned, to living in a world in which the foreign policy of the United States is an expensive affair. Even five years ago a conservative of Senator Taft's stamp would have had much more to say about Mr Gordon Gray's "Report to the President on Foreign Economic Policies"—providing, of course, that any President had the temerity to publish it—than merely to observe that it went further than he would have gone.

Naturally the White House hoped that Mr Gray's report would appear just after a vote of confidence had been given to the Administration. Instead, its impact has been weakened by a fear that nothing much will come of it. But regardless of the timing, this is a study which was, if anything, overdue. And even the opposition ought to welcome its form, however little they like its content. They have often complained that it was never possible to add up the foreign aid bill because American overseas commitments were presented to Congress piecemeal and nobody would ever give them a comprehensive survey. Now they have got one. They know what an experienced group, with the advice of every even remotely interested agency of the Government, believes to be the broad lines along which foreign economic policy should develop. The report is written only in general terms and seldom gives estimates of cost, but it provides a score-card of twenty-two recommendations against which Congress can fill in the figures as this policy statement is converted into an operating programme.

While the campaign was in full swing a man from Mars might have been forgiven for summarising the Republican policy as "Let the Russians have the Ruhr Basin; give us the rice paddies of China." The changes in existing policy now being advocated by the Republicans are more modest in scope. But their main quarrel with Mr Gray will be, as it has been with Mr Acheson, about the priority which the Administration gives Europe over Asia. (The word "China" does not appear in the Gray Report until Table 7 of the Appendix.) There will be a few among them, no doubt, whose addiction to Generalissimo Chiang Kai-shek is great enough to prompt an attempt to sabotage the defence of the West on his behalf. But in general Mr James Reston is probably right in saying, in the *New York Times*, that "Republicans in Congress don't hate Mr Acheson more than they love their own country, even if some of them made a very close thing of it during the campaign."

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect all others are the work of the editorial staff in London.

★

These recommendations which involve direct aid to foreign countries, whether economic or military, will probably suffer less than those which would mean changes in domestic legislation. Mr Gray's gallant assault on the agricultural and shipping policies of the United States goes further than any member of the Administration has ever dared to go officially, and there is no doubt that it will be repulsed. So will his flank attacks on present tariff practices, though nothing but good can come, in the long run, from letting the politicians, and the businessmen who support them, know what the economists think of some of their sacred cows. Indeed, that vague area called "Wall Street," from which Mr Truman draws so many of his ablest officials and to which he directs so much of his abuse, has, since November 7th, been crowing quietly over the prospects of a successful counter-sortie against some of the measures taken, since Mr Hoover's defeat in 1932, to liberalise trade.

The Trade Agreements Act must come up for renewal in the spring, and those who think that it is un-American to buy foreign goods are already "speculating about the difficulty of getting it renewed," licking their lips over the possibility that it might not be renewed at all and hoping that, at least, the "peril point" provision, which the Republican Eightieth Congress managed to include, will be revived. They forget, however, that, if there is a subject on which the Democratic ranks close (the southerners having for once an identity of interest with the northern wing of the party), it is reciprocal trade agreements. Only Senator McCarran and six Democratic Representatives voted against the extension in 1949. And most of the Atlantic Republicans can be counted on to support it, even if some of them have previously tried to limit its usefulness. It is also likely that the Customs Simplification Act has enough support in both parties to pass in the next Congress.

Mr Gray's recommendation that the United States should become a member of the International Trade Organisation was probably no more than a necessary bow in the direction of the group which handles economic affairs in the State Department and whose Bible, Senator McCarthy notwithstanding, is the Charter of the ITO, not the Communist Manifesto. There is not the slightest chance of the Senate ratifying the Charter and, apart from the little band of State Department faithful, there will be none to mourn it. Once it is out of the way the United States will doubtless stop chiding other countries for breaking the rules of a club to which it has itself refused to belong.

When it comes to loans and grants, "the long, hard look" will be fashionable, and, to quote Mr Reston again, "every Senator to the west of Pittsburgh and the right of Senator Wayne Morse will be all for investigating French foreign policy back to the days of the first Napoleon." In this atmosphere the kind of help which Jugoslavia needs so desperately might be a forlorn hope if the Jugoslavs had not been more astute than the Spaniards in spending their entertainment account. The Administration's sudden decision to grant the loan to General Franco which Congress authorised in the summer will provide a handy parallel and precedent.

The underdeveloped areas, especially those in South and South-east Asia which are uncomfortably close to the borders of Communist China, may do better than was expected before the need became so urgent to expand their production of strategic raw materials and keep the Chinese out of them. The "Point Four" approach to these areas, which seemed to infuriate many Republican opponents of "do-goodism," has been forgotten and "the security and well-being of all free nations" will be the yardstick against which their needs will be measured in future. On this practical basis, and in this part of the world, the Republican doctrine of "less for Europe, more for Asia" can be fitted into the Administration's plans.

The Administration will not accept the "less for Europe" part of the doctrine, however, except to the extent that it believes the Marshall plan has done its job of promoting economic recovery. Mr Gray concluded that, "except for possible emergency situations," the readjustment from the distorted balance of payments position is nearly complete. But the chief struggle in the next Congress will come over his proposal to continue supplying aid, apart from military equipment, for another three or four years to meet the short-run burden of the military production of the Western European countries "in so far as it exceeds the sacrifice which it is within their ability to make." There is likely to be sharp debate over the point where this ability ends, and it will not only be among Republicans in Congress that a flattering, if uncomfortable, confidence in European capacity for self-sacrifice will be noticed.

Western Europe, partly because it has already received so much under the recovery programme and partly because it is suspected of being more cunning and devious than less developed areas, will be required to demonstrate unceasingly the efforts it is making to help itself. But, though Senator Taft has promised "a greater caution about money," there are other members of his party who, in the present world situation, would favour as great a caution about cutting it off.

American Notes

Drafting Dollars

The Democrats in the House of Representatives are doing their best to force the Senate to a decision on an excess profits tax before the end of the lame-duck session. The Ways and Means Committee rushed through its hearings in a few days and hopes to write the necessary Bill in little more than a week. It might then reach the Senate by December 6th or 7th.

The hurry is inspired more by the wish to make a political point, before the present Congress gives place to the new, than by any serious expectation that the Bill will in fact be made law before the end of the year. The chairman of the Senate Finance Committee, Senator George, seems determined to stick to a cautious attitude: he insists that, while a tax to capture abnormal profits made from defence production is wanted, it would require lengthy hearings and executive sessions to write a satisfactory Bill. The Senate as a whole is very likely to agree with him. Though trade union pressure for EPT is strong, the election results suggested that it was not quite so popular a cry as some Democrats had supposed. Since the election the opposition from business groups has become open and even vociferous. No one opposes in principle a defence tax on corporation profits. "If you draft men, you draft dollars" fairly expresses the common view. The disagreement is on how the drafting should be done and how severe it should be.

The Bill produced by the House Committee seems likely to follow President Truman's recommendations pretty closely. It would impose, that is to say, an excess profits tax with bite. Corporations would be allowed to reckon as "normal" only three-quarters of their average earnings in the three best of the postwar years 1946-49. A tax at the rate of 75 per cent would fall on all net profits above this standard. The yield of such an EPT is estimated at $4 billion and, since it would be retrospective to July 1st, corporations would have $2 billion to pay out of their current profits.

The criticism of the EPT proposals would sound familiar in Britain. It is argued that EPT encourages waste and extravagance and makes corporations lax in granting wage and salary increases, over-manning factories, and so on: in such ways it feeds inflation and defeats its own purpose. Secondly, EPT is inevitably unfair as between firms that have been doing well in the postwar years and those that have been doing badly; in the form proposed, it would be no more a genuine "war" tax on defence profits than a tax on the automobile and housing boom of 1949-50. And, most serious objection of all, EPT is bound to penalise new and growing firms; no practicable alternatives to the "base period" formula for assessment can make adequate allowance for their special case. Such a check to economic progress may be tolerable in war, but it is quite intolerable, the argument goes, if the nation has to settle down to a decade of rearmament in a time of half-peace.

The critics' alternatives to EPT vary in form, but most commonly boil down to some kind of special increase in the rates of ordinary income-tax and surtax on corporation profits. The case has been made sufficiently well for the Senate probably to feel that it can put off legislation until January without fearing that charges of toadying to big business will stick. The Secretary of the Treasury, Mr

Snyder, has himself estimated 1950 profits at $37 billion. As the accompanying chart shows, this is $3 billion above the 1948 peak, but much of the increase was generated by the boom before Korea. There would be no enormity in letting the 1950 profits go and spending more Congressional time on devising a better tax than EPT for 1951.

To the Victors . . .

The lame-duck session of Congress, which opens on November 27th and winds up in time for Christmas, was so badly crippled by the election results that little is expected of it; as Senator Taft said when asked what it might accomplish, "it can adjourn." The real interest is in the organisation of the new Congress in January, which will reflect the balance of power inside the two parties. Thanks to Senator Benton's hairsbreadth victory in Connecticut, which the Republicans have at last conceded, the Democrats will enjoy —if that is the word—a majority of two. But the distribution of the spoils is likely to prove unusually slow work.

There are few contenders for the posts of majority leader and whip left vacant by the defeat of Senator Lucas and Senator Myers. Since the first days of the New Deal, the majority leader's function has become that of White House spokesman to the Senate, rather than the Senate's to the President It was awkward enough for Senator Lucas at times. But to sponsor the President's programme when the real power so clearly lies with a coalition of conservative Democrats and Republicans is a prospect to daunt any candidate, particularly if Mr Truman is determined, as he says, to continue to wave the Fair Deal flag before the conservatives. The last word, among Democratic Senators, lies with the Southerners, but few of them would undertake to speak for the President, since it would earn them black marks at home. Mr Truman's advocacy of Negro rights caused a Southern rebellion two years ago and it is still simmering. The most likely choice is a middle-of-the-road Democrat, such as Senator McFarland, of Arizona, who has voted with the Southerners on the race issue.

Unlike the Labour, Agriculture, and Services Committees, the Foreign Relations Committee did not lose its chairman in the election, but it has lost three of its Democratic members and will have to be recast. In 1949 the Democrats shortsightedly celebrated their victory by reducing the Republican representation from six to five, and increasing their own from seven to eight. In view of Republican gains this year, it will hardly be possible to deny them this coveted extra place any longer, but the candidate put forward by the Republican leadership is Senator Knowland, one of the earliest and most persistent critics of the Administration's Far Eastern policy, who is even now in Formosa for a refresher course. Had the Democrats been less grasping two years ago, they might have had Senator Morse, to whom the place belongs by right of seniority, and who is a firm supporter of bi-partisanship and a close follower of Senator Vandenberg.

The solitary ray of light in this picture is the announced intention of Senator Vandenberg, if his health continues to improve, to take his old place on the Foreign Relations Committee. Already he has taken up the cudgels for Senator Morse. But the determination of his colleagues that the critics of Mr Acheson's Pacific policy should have a spokesman on the committee may be hard to overcome.

Men in Uniform

The Korean fighting has shown, to the Army's satisfaction, that it is not the anachronism the devotees of strategic bombing imagined, but as much cannot be said of the methods which had to be taken, in that emergency, to fill the ranks. One of General Marshall's first tasks was to safeguard the morale of reservists by assuring them of fairer treatment in future. The need for experienced men meant that many were sent overseas, with scant warning, although they had jobs and dependent families which would have exempted younger conscripts who had never done any military service. Employers even began to refuse to hire members of the reserves who might be snatched away at any moment.

Korea has thrown a hard light, not only on the injustices of the system, but on its inefficiencies. Service reserve rolls were shown to be inadequate and out of date. The dual reserve system, which organises some men in reserve components of the forces and others in the states' National Guards, is being re-examined in a more critical spirit. Two years ago the Gray Report suggested that consolidation would save money and improve the quality of training, but the National Guard was outraged at the prospect of absorption into a federal organisation, and the report was pigeonholed. There is also an evident need for reclassification of the reserves into two groups: men immediately available in a limited emergency, and those who should be ordered up only in a full crisis.

*

A well-trained reserve is of the utmost importance in a country which refuses to contemplate a large standing army, and one of the consequences of Korea has been to revive interest in Universal Military Training. Mr Truman, who has unsuccessfully urged such a scheme on Congress eight times, argues that compulsory training for all would reduce the "disgraceful" rejection rate of the services, which, though drastically modified under the stress of war, still stood at 35 per cent in September.

In the past, the effective objections to UMT have been that it would militarise and corrupt the youth of the country, and interrupt its education. Now, military considerations alone seem to rule out UMT, in its proposed form, for the duration of the crisis. The trainees would not become part of the services; they could not be sent overseas. In August General Bradley pointed out that the Army could not spare

80,000 instructors to turn out half-trained men with no obligation to undertake regular service. What is beginning to be realised now is that the men, as well as the instructors, for UMT cannot be spared. If the services are to have 3,000,000 men, more or less, in uniform, yearly replacements alone will take 750,000 a year, and more will be required during the period of expansion from the present level of about 2,000,000. There are only just over a million 19-year-olds each year, reflecting the low birthrate of the thirties. With deferments and rejections, the margin will be narrow.

Senator Johnson, who is in charge of the Senate hearings on UMT and conscription, and Mr Vinson, of the House Services Committee, would like to turn UMT into a feeder for the forces, civil defence, and the factories by requiring training of some kind for all and by sending military trainees into the forces for two years' regular service. This ambitious plan for turning UMT into UMS—universal military service —is more likely to be achieved by enlarging the conscription net than by a new and controversial start. There is no doubt, as there has sometimes been in the past, that the Selective Service Act will be extended when it expires in June, but the new emphasis will lie on service, rather than selectivity. General Hershey, the administrator, believes that the Army, which alone needs conscripts at present, must lower its physical and mental standards even further. The present generous scale of deferments for reasons of dependency will also have to be restricted if the Army is to have the men it needs in the 19-26 age group—and the forces strongly oppose the suggestion that the upper age limit should be raised. The President can close some of the loopholes: for example, he can rule that a dependent uncle or aunt is no cause for exemption. But only Congress can authorise the conscription of veterans, which is now forbidden even in the case of single men under 26, and lengthen the period of service from the present 21 months to the 24 or 30 months the forces favour.

Aluminium Called Up

Cries of distress, not only from the producers and fabricators of aluminium, but from the electrical workers, have greeted the order that use of the metal for civilian production in 1951 must not exceed 65 per cent of each company's average production in the first six months of 1950. This is the first of a series of call-up notices for metals, and the most stringent order yet issued by the National Production Authority. The makers of saucepans, ashtrays, buses, window-frames and fishing rods argue that the limitation is even severer than it appears, because consumption has been rising steadily throughout the year. Inventories, also, are to be held strictly to 60 days' supply. But worse may lie ahead: the NPA is considering a complete ban on the use of aluminium in non-essential products, and by next summer all consumption of aluminium, copper, and steel may be controlled.

The excuse of the NPA is that the defence spending already authorised will take 30 per cent of the available aluminium next year and perhaps more, if further appropriations are voted by Congress. In fact, it is likely that most of the aluminium saved, at least in the first six months of 1951, is destined, not for aircraft and guided missiles, but for the neglected stockpile. Military orders are not expected to reach their full flow until the middle of the year, and by that time it is hoped that 200 million pounds of aluminium will have found its way into the reserve. In the second six months, 100 million pounds is scheduled for the stockpile, with 300 million pounds a year for the following four years bringing the grand total to 1.5 billion pounds. This is equal to about one year's production of aluminium in the United States at present capacity working, and some businessmen fear such a rate of hoarding will pinch the arms programme as well as the housewife.

*

Not all the stockpile will be at the expense of the nation's saucepans and cigarette foil. The Aluminium Company of America—the industry's giant and consequently the target of the trust-busters—has at last been asked to put to use idle facilities which in six months' time should be producing about 158 million pounds a year for the government. The rest of the idle capacity has already been taken up by smaller producers. Expansion of the domestic industry—largely at government expense—was the alternative favoured by the aluminium industry when the government was debating whether it should accept an offer from the Aluminium Company of Canada of 440 million pounds for the stockpile over the next three years. The offer was allowed to lapse last month, after long consideration, on the ground that too little would be delivered in the first year and that, if waiting there must be it would be preferable to wait for the expansion of the home industry. Meanwhile the industry may wish it had not protested quite so vigorously against the Canadian purchase for, although the fabricators are the immediate victims of the cut in consumption, the producers will find the supply of ingots to the stockpile less profitable than the production of prefabricated shapes for furniture and insulation.

In the Governor's Mansion

After see-sawing for a week, the Michigan governorship has been decided, for the moment at least, in favour of the incumbent Democrat, Mr Mennen Williams. The Republican candidate, in Florida celebrating the victory he was told he had won, is expected to demand a recount. He would

MEMBER FEDERAL DEPOSIT INSURANCE CORPORATION

certainly be justified in doing so, for the check of the election returns found confusion and irregularity in practically every one. Mr Williams owes his present majority of 1,152 votes to the discovery that, in one polling district, ballots which had been counted in favour of the Republican candidate had actually been cast in favour of coloured margarine.

Even if Governor Williams eventually loses, he has done much better than might have been expected in what has turned out to be a Republican year. This is a tribute to his constructive record and to the positive campaign he fought. Governor Lausche's victory in Ohio, in spite of the Republican triumph in the senatorial contest there, can be explained in the same way; in addition he very wisely dissociated himself from the inadequate candidate and violent attack with which his party tried to defeat Senator Taft. The Democrats also managed to hold the Massachusetts and Rhode Island governorships, and came near to winning in Pennsylvania, where their candidate was a young man with a reputation for exposing Republican corruption in Philadelphia.

Elsewhere the Democrats can find no more cause for self-congratulation in the gubernatorial results than in the Congressional—rather less, in fact, since control of the governor's mansion carries with it the long-term advantage of controlling state patronage. Not even the magic of the Roosevelt name—Mr James Roosevelt had little else to conjure with—could defeat Governor Warren in California. There was no hope of defeating either Mr Dewey in New York or the Democratic candidates in the seven southern states where governors were being elected this year. But in Nevada and Arizona (where their candidate was a woman), the Democrats lost governorships while winning senatorial fights. Both of these states are normally Democratic strongholds, as are New Mexico and Maryland. In the last two, the Democratic defeat is blamed on local civil wars in the party organisations. Governor Bowles, too, might have won in Connecticut if he had not had a Socialist opponent as well as a Republican.

As things now stand, the Republicans won 6 of the 33 state governorships which came up this year and lost none, so that they now hold 25 in all to the Democrats' 23, instead of 19 to 29. The pendulum swung farther than in the senatorial contests, but the moral is the same: where the Democrats had a united party, a good candidate and a clear record, they usually did well; where they lost, it was often their own fault.

Shorter Notes

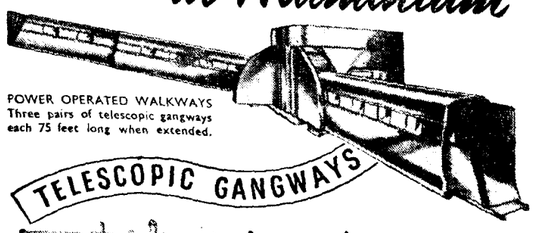
The cotton farmer cannot lose and the government cannot win. This year's short crop has enabled all the surplus cotton in the government's store to be sold at a profit, amounting to about $50 million. All of this must be returned to the cotton farmers, even though, if there had been a loss, all taxpayers would have had to foot the bill.

*

The Reconstruction Finance Corporation, losing "Fannie Mae" (the Federal National Mortgage Association) to the Housing Finance Agency, has lost one of its chief sources of revenue. In order to get back on a self-sustaining basis, it is raising its interest rate on business loans from 4 to 5 per cent and is making a charge for processing all loan applications. Administrative expenses are also to be reduced, by about a third, to $11 million a year.

*

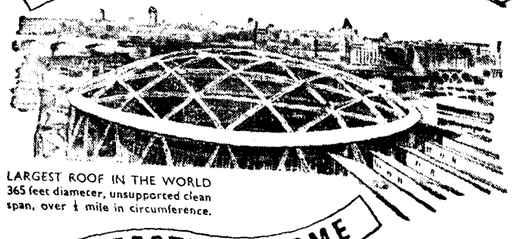
The Commodity Credit Corporation, which bought 600,000 tons of sugar from Cuba last August to convince hoarding Americans that there was no shortage of sugar, was so successful that it has been left with half the emergency purchase on its plate. It is now trying to sell it for export, but not much interest is being shown in the trade.



ANNOUNCEMENT BY ALMIN LIMITED

TWO OUTSTANDING STRUCTURES in Aluminium

by S·M·D OF SLOUGH



This year has seen the erection of the two most outstanding structures ever attempted in aluminium alloy. We are pleased that our construction company STRUCTURAL & MECHANICAL DEVELOPMENT ENGINEERS LTD. of SLOUGH has played a leading part in the construction of each project; for the Ocean Terminal — the entire construction of the Telescopic Gangways; for the Dome of Discovery—the manufacture of the Main Arch Ribs which support the Roof, the Canopy and the Apron.

THE ASSOCIATED LIGHT METAL INDUSTRIES GROUP

POWER OPERATED WALKWAYS
Three pairs of telescopic gangways each 75 feet long when extended.

TELESCOPIC GANGWAYS

LARGEST ROOF IN THE WORLD
365 feet diameter, unsupported clean span, over ¼ mile in circumference.

THE FESTIVAL DOME

Head Office:
ALMIN LIMITED · FARNHAM ROYAL · BUCKS
Telephone: Farnham Common 594

THE WORLD OVERSEAS

Shaking Down in the UN Army

(From a Correspondent lately in Korea)

TO the United Nations soldier who happened to be British, grinding his way up a country that apparently begins in the tropics and ends in the Arctic, the climate was not the only aspect of Korea full of upsetting contrasts. From that August day when the *Ceylon* and *Unicorn* put him ashore at Pusan—with a Negro ragtime band competing exuberantly with the Argylls' pipes—his relations with his American opposite number presented many situations that were not in the book. They caused little friction, but many misunderstandings. The last months of fighting have brought the Tommy and Doughboy closer; nothing, however, will eradicate a few firm impressions, of which the least harmful is the conviction that the opposite number lives in the one case on tea, in the other on coca-cola.

The men of the 27th Brigade who were Britain's first, and it must be agreed belated, contribution to Korea were for the most part too young to have served with Americans in the previous war, and there were few Americans with European experience among the base troops at the time. Both sides watched with professional criticism the two quite incompatible conceptions of discipline. The cultivated American slouch and the casual acceptance of orders seemed bizarre to the British. The crisp regimental way the British "square-bashed" round the docks (showing off, as was natural and proper) and maintained drill-order even in that American free-for-all, the "chow line" was a constant wonder to the Americans. These were superficial differences, possibly symptomatic of something more basic. For all that, on the CO of the Middlesex Regiment the initial welcome to the war produced a shattering effect in the first five minutes. He was approached by a correspondent at the foot of the gangway. "Hi, Colonel," said the correspondent, "What's your strength, would you say? Which sector you heading for? And when do you figure on reaching the line?" The scandalised officer, shaken beyond articulation, could only make threatening gestures and gaze wildly around for MPs. "Why, Colonel," said the correspondent, baffled, "I don't get it. If you don't want to talk, I guess I'll have to go ask the General." Which he did, and, of course, received every satisfaction. It was many weeks before the British adjusted themselves with a violent effort to a casual system of security that seemed—as they would proclaim in amaze—fantastically lax.

Yanks and Limeys

It was inevitable that to the British every American soldier was a Yank, even if he chanced to come from Georgia; likewise Limey was a generic epithet even for the soldier wearing the bonnet of the Argylls. It implied no sort of comment. That was reserved for later, when the widely diverse methods of campaigning became apparent. For a long time it had been recognised that the Americans and the North Koreans were fighting two wholly different wars on the same piece of land. The American Army, with its vast technological and industrial resources, has probably always been the most road-bound fighting force in the world; many of the early disasters were due to that simple fact: the American soldier, anchored immovably to his jeep or his weapons-carrier, was helpless against the uninhibited North Koreans, who swarmed invisibly among the hills around. One of the first actions of the British troops on arrival in Korea was to look around at the steep slopes and shoulders of the mountains, decide that it was no worse than the New Territories of Hongkong in which they had been training, and resolve that the only way to fight North Koreans was to get in among the hills after them. They paraded, in their first assembly-camp near Kyongsan, with experimental variations of battle equipment. Passing Americans stared in compassionate amazement at the clanking load of picks and arms and entrenching-tools and assorted ironmongery borne by one small soldier. In their army, they explained, all the oddments went in the truck.

Mutual Respect

On one such occasion an American master-sergeant arrived to demonstrate the new 3.5 rocket-launcher, the "better bazooka," that has proved itself possibly the best anti-tank weapon in existence. Among the many virtues claimed for it by the sergeant was not only its lightness, but its destructibility. "For when you have to run out on the fight," he said, "you can smash it to bits by jumping on it." "When you have to do what?" asked the British CO politely. "When you have to quit. When you get cut off." The British officer went through the motions of a man who has not heard aright, and finally explained that he was not developing his plans on the initial assumption of quitting, and that he had always been taught that if you were cut off it meant equally that you had cut off the cutters-off, and so on. Two fundamentally conflicting attitudes were exposed and, in that interlude, not resolved. It was not until later that a basis of mutual respect was reached for two widely differing approaches to the soldier's trade.

From the start the brigade subsisted almost wholly on the American economy. The transport—very soon to be known, as part of the process of linguistic infiltration, as "transportation"—was mainly American; the bren-carrier turned out to be conspicuously a failure on Korean roads. The British soldier had to accustom himself immediately to American food, which is to say "Chow." The first impression of the American C-Ration was, inevitably, of extravagant opulence and luxury, with its Christmas-stocking variety of compressed essences and canned fruit and cigarettes and toilet-paper and plastic gadgets. Very soon it was felt that its very *luxe* was cloying; the smart tins of veal-and-spaghetti were abominable eaten cold, and many soldiers were heard to appeal for the return of the less exciting, but more solid, "Compo" packs. The only British supplement was tea, and that was late arriving. A squad of Clydeside Jocks crouching in a Korean orchard, trying to do a traditional brew-up with little bags of coffee-essence, dried milk and concentrated sugar, was one of the more heartrending spectacles of the war.

In view of the deplorable confusion that appears to have arisen in the matter of winter clothing-issue to the British troops, it is remarkable to recall the open-handed, almost profligate lavishness of the American quartermastering. The American uniforms were good, and the supply apparently inexhaustible. A man had only to apply at the stores or replacement-depôt for any article of clothing and it was readily available in what seemed to be limitless quantity.

In the early days, when our representation was infinitesimal —two battalions alone—it was hard for the British soldier to escape the feeling that he was lost in the crowd, and his presence unnoticed by the world. For many of the first weeks the British brigade did, in fact, work completely without publicity. This was not due, as was felt, to a deliberate American policy of playing-down ; it was at least largely caused by the British command's excessive resistance to publicity, to a half-hearted and inadequate PRO system that was the most bleakly minimum concession—and, of course, to the fact that the British saw practically no significant action for a long time. Yet there were Commandos at the Inchon-Kimpo operation, and their presence was about the only aspect of that boisterous invasion that was kept prodigiously secret, for what reason no one ever knew.

The British, now reinforced, and with a core of Korean veterans, have taken their correct place as an important cog in the UN machine. What difficulties and incompatibilities there were have probably been largely ironed-out by the spiritually welding experience of shared battle. The problem of solidifying the structure of a United Nations Army has not been solved, but at least it has been attacked. It is now left to the late starters—the Turks, the Siamese, the Greeks—to recognise the difficulties and curiosities of being a minority group in the all-American way.

Uno Plans for Peace

ALTHOUGH the UN General Assembly at the beginning of this month passed Mr Acheson's "United Action for Peace" resolution, it is as busy as ever with ways and means of preserving peace. This is hardly surprising, since Uno is at the moment confronted with a genuine case of aggression—in the western sense of the word—by the Chinese Communists in Korea and by a mythical aggression committed, according to the Chinese Communists, by the Americans in Formosa. If El Salvador has its way, aggression in Tibet will be added to the list. The discussion of Korea and Formosa is greatly complicated by the problem of Chinese representation at Uno ; and it has been delayed by the leisurely journey to Lake Success of a delegation from the Peking Government.

At the moment the General Assembly is able to leave both Korea and Formosa in the hands of the Security Council. It has not yet been asked to consider Korea, and its Political Committee has relegated Formosa to the bottom of its agenda, in order to run no risk of prejudicing by a rash or hasty word the extremely difficult negotiations about to begin in the Security Council. The Assembly has, therefore, been able to relieve its feelings on the general subject of aggression by passing a bewildering number of resolutions, all designed to help in preserving peace and unmasking aggressors.

Attempts to Define Aggression

The anti-Soviet majority in the Assembly has probably been spurred on by the persistence with which the Russians have put up their peace plan and by the feeling that if it is knocked down—as it has been—something must be put up in its place. The Soviet peace plan contains the familiar proposals of a one-third reduction of armaments, the prohibition of atomic weapons without—in the western view—any adequate safeguards and controls, and the condemnation of war propaganda. The Assembly's countermove to this last point is a resolution which condemns propaganda against peace and includes in its condemnation "measures tending to isolate peoples from any contact with the outside world." In a "Peace through Deeds" resolution passed on November 17th, the Assembly called on member states to demonstrate by their deeds their will to achieve peace, and proposed a gradual reduction of armaments through a system of United Nations supervision and control.

The Assembly has also been anxious to place on the record some cut and dried definitions which will enable it more easily to counter the maddening Communist evasion and double-talk which confuses all discussion of breaches of the peace. The "Peace through Deeds" resolution, for instance, carefully includes in its definition of aggression the fomenting of civil strife in the interests of a foreign power. This typically Communist form of attack by proxy was not included in the five-point definition of aggression, based on the Soviet proposals to the League of Nations in 1933, for which the Soviet Union has been unsuccessfully seeking support in the present Assembly.

Another resolution accepted by the Assembly on the "Duties of States in the event of the outbreak of hostilities" is designed to provide yet another means of fixing the guilt for any aggression. In the words of the Jugoslav Foreign Minister, who originally proposed it, it "enriches the existing arsenal of struggle against aggression with a new weapon." His particular motive in proposing it must have been the fear of an invasion of Jugoslavia by Soviet satellites which would be proclaimed to all the world as a Jugoslav attack on the satellites The original Jugoslav plan was felt to place too much reliance on the good faith of the aggressor ; and in its final form the resolution laid down, among other things, that warring states must, within twenty-four hours of the outbreak of hostilities, announce their willingness, if the enemy will do the same, to order a cease-fire and withdraw any invading troops. They will also invite the Peace Observation Commission (set up as part of the Acheson plan) to examine the situation on the spot. In this way it is hoped speedily to unmask the aggressor, protect the victim and invoke the UN machinery for the peaceful settlement of disputes.

Yet one more design for peace has been before the Assembly—Mr Trygve Lie's 20-year, 10-point peace plan for which he sought support in the capitals of the four great powers during his "peace mission" last spring. The proposals in this plan include periodic high-level meetings of the Security Council, a new attempt to set up an international armed force, a new effort to control armaments and atomic energy, universal membership of Uno and technical assistance to under-developed areas. Mr Vyshinsky made a bitter personal attack on Mr Lie and asserted that his peace plan had first been approved in Washington, London and Paris "by that whole company of plotters against peace". He announced that the Soviet Union was willing to join in high level meetings of the Security Council provided Communist China was given a seat. But the Assembly decisively rejected a Soviet resolution which set forth the conditions for Soviet co-operation in the Lie plan. Instead it approved a resolution put forward by nine of the smaller states, which called on the various organs of the United Nations to carry out a study of Mr Lie's memorandum.

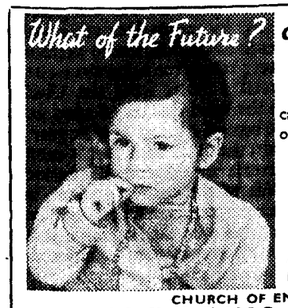
Tito's Liberalism

[BY A CORRESPONDENT RECENTLY IN JUGOSLAVIA]

"SOCIALISM before democracy" was the guiding principle of Tito's revolution in Jugoslavia at the end of the war. This principle was strictly followed as long as Jugoslavia was on good terms with the Soviet Union. But since the break with the Cominform, and particularly in the past twelve months, Jugoslav leaders seem to have modified their ideas about revolutionary change ; and today the principle is "socialism with democracy," or rather, in Tito's own words, "socialist democracy." This new aim has resulted in many changes which are claimed to be of a liberalising nature.

The first indication of a change of policy was when it became apparent early this year that Jugoslavs were being allowed much greater freedom of speech than they had enjoyed since the war. Criticism of the regime, or consorting with foreigners from the west was no longer a reason for putting people in gaol. Rankovic's secret police had clearly received a new directive. The Jugoslavs, great talkers and confirmed critics of authority, have taken full advantage of this new freedom. Yet freedom of speech is still not unrestricted ; Jugoslavia's best known satirist Copic, who used the new freedom to write witty and biting articles on the regime's policy in general, has recently been severely reprimanded in a public speech by Tito and in two articles in the official newspaper *Borba*. It seems that criticism is free only up to a point. It is also certain that this freedom is not extended to supporters of the Cominform.

The most extensive change in economic and political life, which has been developing throughout this year, was launched in February and March by a series of laws providing for the decentralisation of the greater part of government control. As a result the central government in Belgrade now retains direct control only of the Ministry of the Interior (security and police), foreign affairs, economic planning, and defence. Almost everything else, including education, heavy and light industry, agriculture, food, internal trade, and even a great part of foreign trade is being handed over to the governments of the six federal republics which make up Jugoslavia. In these matters the central government's power is reduced to direction through co-ordinating committees. The process of devolution is still going on as ministries and committees are set up in the provincial capitals to deal with the new responsibilities.



Learning From Mistakes

Decentralisation has coincided with an economic crisis resulting from the difficulties of the past two years, the strain of the extensive Five-Year Plan, and this year's disastrous harvest. Measures dealing with the economic emergency are designed to fit the new ideas. A law of October 9th handed over the responsibility of price-fixing for consumer goods to the local authorities. Its aim is to bring down prices within the reach of the lower paid workers. A new measure announced in September abolished the system—originally copied from the Soviet Union—of special privileges to purchase food and consumer goods from the "diplomatic shops" which had been enjoyed by all high-ranking state employees. It has also been announced that certain enterprises belonging to small artisans (including some hotels) which had been nationalised are to be given back to private enterprise. The reason for this latter move seems to be to promote efficiency, and there is no indication that private enterprise is to be re-established in bigger concerns. But it is obvious that in the highest Jugoslav communist circles there has been a reaction against excessive and too rapid socialisation, and against many aspects of state organisation which were copied directly from the Soviet Union. "Our party," said Tito to parliament on June 26th last, "had too many illusions, and was too uncritical in taking and replanting here everything that was being done in the USSR, even those things that were not in harmony with our specific conditions or in the spirit of Marxism-Leninism." It is also claimed that decentralisation and the measures that have followed it will make government more democratic ; it will break up the unwieldy over-centralised bureaucratic control of Belgrade, and more of the ordinary people, either through local committees or administrative posts, will be brought to take part in responsible decisions of government. In the speech quoted above, Tito claimed that decentralisation "is not only democratic, but has inherent in it the seeds of withering away not only of centralism, but of the state in general as a machine of force."

Workers' Control of Industry

Another essential part of this process is the handing over of the control of industry to the workers. A law passed in June stated that factories, mines, transport, commercial, agricultural, forestry, communal and other enterprises should be run by elected workers' councils—the councils to be elected by secret, direct and equal ballot of all workers of the enterprise. The new system prescribed by the law is highly complicated, but it allows lists for the whole council to be put forward by "the trade union branch or a defined number of workers," depending on the size of the enterprise. The voter then exercises his choice between these lists. The councils are elected for one year, and only one-third of their members may be put up for re-election ; they sit every six weeks and deal with planning, finance, general conditions and the appointment of a management board. It is this latter smaller, separate body on which sit both a chairman and a manager as well as technical representatives which is responsible for the day-to-day running of the enterprise. Workers' councils had to be elected all over the country by last September. They are only just beginning to work and it has yet to be established that the system can be both democratic and efficient in practice.

Another change of equal importance, which is more in line with the interpretation of democracy as it is understood in the West, is the projected reform of the criminal code. For some months past, a committee under the chairmanship of Moshe Pijade has been engaged in recodyfing the laws. The present criminal code is based on that of the Soviet Union. It allows great powers to the political executive (which is above the law) and to the public prosecutor, who is in a privileged position compared with the defenders of the accused. It also allows powers of arbitrary arrest and punishment outside the competence of the courts for certain "administrative" and political offences. It is this which makes the Minister of the Interior with his secret police such a sinister and powerful figure in the communist states that have adopted the Soviet system of justice. It is claimed that the reformed Jugoslav code will liberalise both law and justice ; that the executive will be subordinated to the law,

the power of the public prosecuter diminished, and administration of justice taken out of the hands of ignorant or prejudiced amateurs (as may be the case in Peoples' Courts) and the powers of arbitrary arrest and punishment withdrawn. Laws embodying these proposals are to be laid before parliament next spring, and in the meantime the proposals are being debated all over Jugoslavia. But, as in the case of freedom of speech, there appears to be a line beyond which Jugoslav leaders are not prepared to liberalise the laws. They have been careful to tell the public that Jugoslavia is still a revolutionary state and measures will be taken to prevent any subversive activity designed to overthrow the state. Much will depend on how this is interpreted.

Can these changes be made effective, and what is their real purpose? Both questions are difficult to answer. The changes have been launched at a time of serious crisis, and they may be designed to distract attention from that crisis. They will certainly be affected by internal economic conditions in the next twelve months. If Jugoslavia receives sufficient credit, food and consumer goods to maintain or improve the present standard of living, it is possible that Jugoslav vitality will make some success of the new system. If present economic conditions—stark beyond anything in our western experience—are allowed to deteriorate, it is most unlikely that the government will be able to make a success of liberalisation.

Relations with the Church

It has been alleged that the Jugoslav government has launched these measures as a sop to Anglo-American opinion, because they must have economic aid. This has been roundly repudiated by Jugoslav leaders themselves, who point out that few of the measures have much in common with western democracy. They claim that the changes should be taken for what they are intended—measures against the evils of bureaucracy of the type that has developed in the Soviet Union, and as an interpretation of orthodox communism applied to present conditions in Jugoslavia. There are few signs so far that the new ideas can be applied to the basic problem of the relationship between church and state in Jugoslavia. It is probable that the regime would welcome some kind of *modus vivendi* with the Catholic Church which remains implacably hostile to Communism, in spite of the "socialist democracy" which is the present aim and policy of Tito's government.

The question of the release of Archbishop Stepinac has been raised on several occasions lately by American visitors to Jugoslavia. The official Jugoslav point of view appears to be that he could be released—as other prisoners condemned on similar convictions have already been released—but that he cannot be allowed to become Archbishop of Zagreb which would be the automatic result of his unconditional release. Yet even if some kind of compromise on this question is eventually reached—which seems possible—this is a special issue and it is unlikely that any of the churches in Jugoslavia—Catholic, Protestant, Orthodox or Moslem—will be allowed any increase in independence.

Warnings from ECE

THE Economic Commission for Europe (ECE) published on Sunday its economic bulletin for the second quarter of 1950. In a world where it has become the fashion to blame rearmament and the raw materials boom for frustrating an otherwise smooth recovery in Europe after devaluation, it is refreshing to hear someone saying that all was not quite right even before the Korean war broke out. This is what the ECE has said in a gentle but well-documented way.

Since the devaluations in September, 1949, European gold and dollar balances have risen by $1.35 billion, and, furthermore, have risen more steeply in the second than the first quarter of this year. But this, the ECE points out, cannot be taken at its attractive face value.

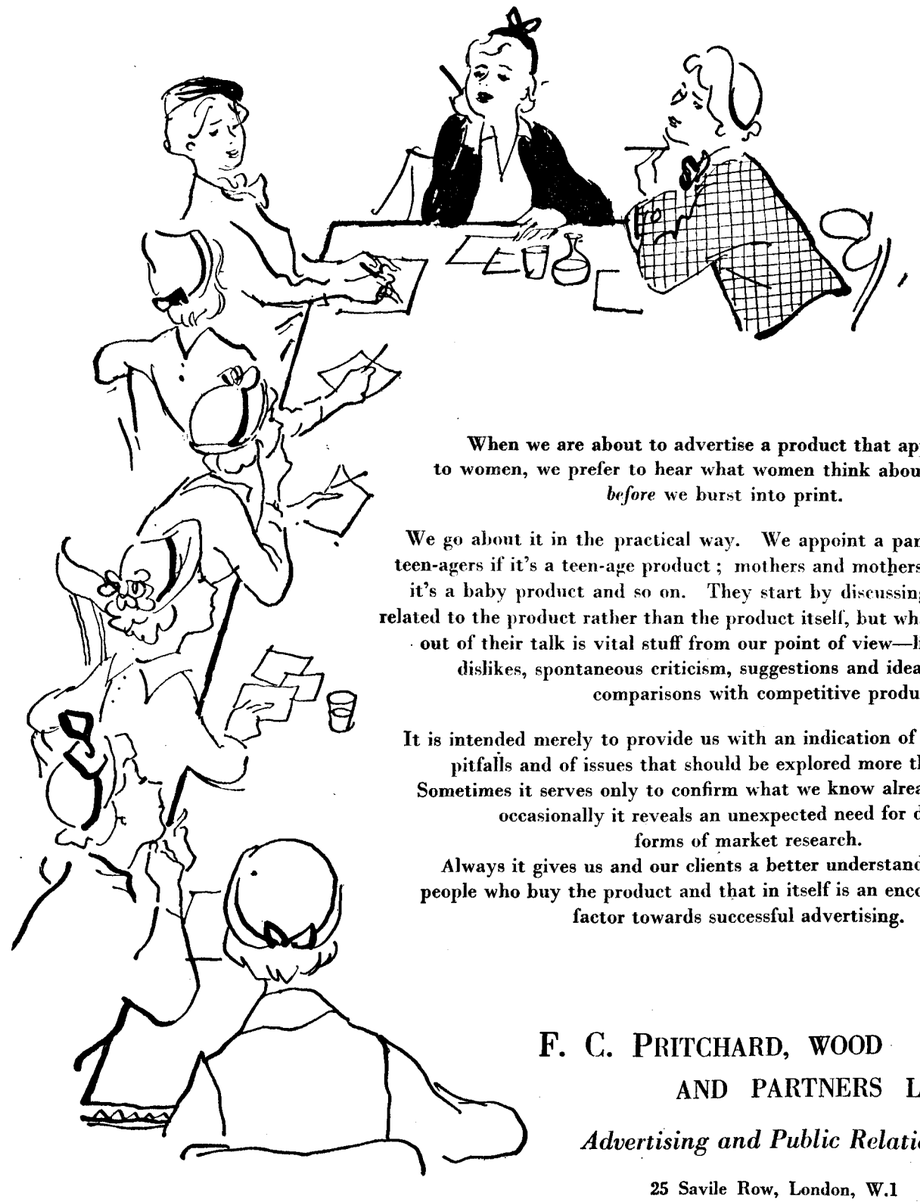
In the first place, about three-quarters of the increase has been in assets held by the United Kingdom, and include a substantial net contribution of gold and dollars by the outer sterling area during the first half of the year. Second, though total exports from western European countries have increased by about 10 per cent since the end of 1949, the rate of increase has flattened off considerably. For ten major west European countries total exports in the last quarter of

VOLUME OF EXPORTS OF TEN EUROPEAN COUNTRIES AND THE UNITED STATES BY AREA OF DESTINATION
Index Numbers: October 1948 to March 1949 = 100

Area of Origin	Ten European Countries (a)				United States			
	1949		1950		1949		1950	
Area of Destination	April-Sept.	4th Qtr.	1st Qtr.	2nd Qtr.	April-Sept.	4th Qtr.	1st Qtr.	2nd Qtr.
Europe	106	126	133	139	102	91	81	81
United States	72	120	116	122	...	...	...	...
Other countries of the Western Hemisphere	84	114	110	111	97	91	85	101
Rest of World	103	107	107	110	106	94	80	78
TOTAL EXPORTS	101	115	121	125	100	89	81	86

Sources: The figures have been taken from national statistics. *Note*.—It has been assumed that changes in the export prices of each of the countries included in the table were identical for each of the areas of destination. (a) Belgium-Luxemburg, Denmark, France, western zones of Germany, Italy, the Netherlands, Norway, Sweden, Switzerland and United Kingdom.

1949 were 14 per cent higher than the rate for the first three quarters; but in the first quarter of 1950 they increased only a further 6 per cent, and in the second quarter by 4 per cent. This trend is even more marked in exports to the United States and other Western Hemisphere countries. After an increase of nearly two-thirds in the last quarter of 1949 over the first three quarters, they actually dropped in the first quarter of 1950 by 4 per cent, though they rose again slightly in the second quarter by 6 per cent to the United States and 1 per cent to the rest of the Western Hemisphere.



Simultaneously, Europe's terms of trade with the rest of the world have deteriorated since devaluation by about 10-15 per cent. British import prices had risen by nearly 20 per cent by the middle of 1950, and, while export prices generally have risen slightly, they still remain well below the price before devaluation. The ECE thus concludes that the increased cost of imports in relation to the value of exports has roughly offset the relative increase in the volume of exports as compared with the volume of imports.

All of which casts a somewhat depressing shadow over the encouraging increase in Europe's gold and dollar balances. The ECE attributes the steepening rise in the second quarter not at all to a faster improvement in current trade, but partly to an unexplained increase in the net balance in services, and partly to some modest rise in American Government aid over the first quarter. On the general improvement since devaluation, its conclusions are equally reserved. Over a third appears to be due, not to increased exports but to reduced imports; taking the same ten western European countries, their total imports from the United States and Canada, which in the third quarter of 1949 were $1.3 billion, were cut in the second quarter of this year to $750 million. But beyond this, the ECE finds that it cannot fully account for the actual increase in gold and dollar balances by developments on either side of the current account, and it is convinced that a further important element has been the stemming of capital flight, and even the homing instincts of flight capital from Europe by strengthened confidence in European currencies.

But if the ECE has reservations about the past, it has worse for the future. It finds that the deterioration in Europe's terms of trade up to the middle of 1950 has been almost entirely the result of devaluation, and is scarcely a

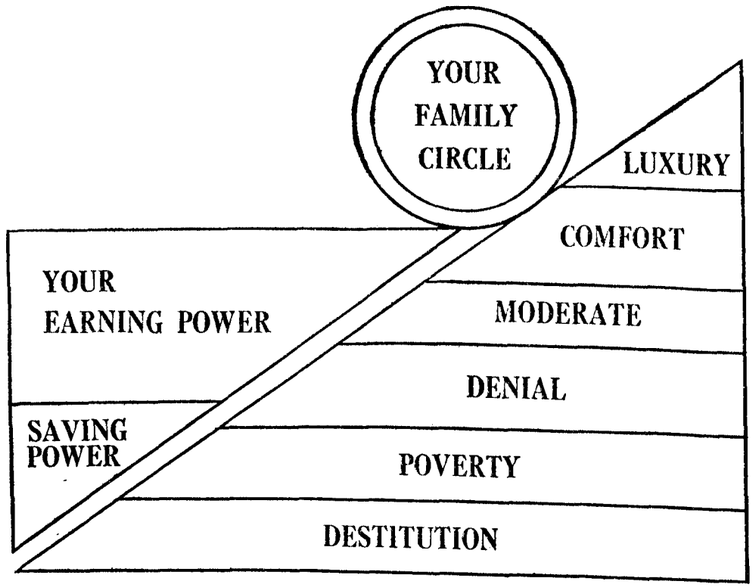
women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it *before* we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.



Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

Here are the various scales upon which families live, starting at the bottom with absolute destitution, running up to the peak of luxury. Some place along that line every family in the world can be found.

Two things hold up the family circle. One is income from savings, property, investments: but for most of us income from this source is small. The big thing that keeps the family circle high is income from our own earning power.

Some day death or old age destroys income from earning power, and the family circle falls down the scale from luxuries and comforts to a point where it is caught and held by the income from savings and investments.

Isn't that a true picture of every man's situation?

WHAT MINIMUM INCOME WILL BE NEEDED WHEN YOUR "EARNING POWER" STOPS?

taste of what has and is to come as a result of the boom in raw materials. The increasing cost of Europe's raw material imports has been discussed at length elsewhere. While on the export prospects, ECE confirms the general fear that not only will the value of Europe's exports not rise to anything like the same extent, but their volume will be reduced by the demands of rearmament and the shortages of raw materials.

In a general survey of industrial production, Eastern Europe—according to its own figures—acquits itself best. In the second quarter of this year the value of industrial output as a whole was 10 per cent above the corresponding quarter last year. But in all the Eastern European countries, including the Soviet Union, output was claimed to be well over 20 per cent higher, the single exception being Jugoslavia, "which has met with special difficulties," particularly in finding the money to pay for its raw material imports. An interesting reflection on the trend in "socialist" economies is the marked shift of production towards heavy industries even, as in Russia, at the expense of falling short of production targets for consumption goods.

Into the Laager

[FROM OUR JOHANNESBURG CORRESPONDENT]

"A MILLION new enemies" was the Johannesburg *Star's* terse comment on the Malan-Havenga agreement to take the civilised, urbanised coloured people off the voters' roll. What are the forces driving the Nationalists, and now their Afrikaner Party allies also, into taking the grave risk of a "united front" of Indians, coloureds and natives—9,000,000 people—against the 2,500,000 whites in South Africa? The easy answer is party political advantage. The United Party in 1948 polled almost 90,000 more votes than the Nationalists. The Government is still a minority one and needs all the seats it can get. With the coloureds off the common roll, the Nationalists might win eight seats in the Cape—a net gain of four, even if the proposed four European representatives of the coloured community in the House of Assembly voted with the Opposition. The same motive was at work in granting South-West Africa six seats in the Union Assembly, which the Nationalists felt sure of winning, and did.

But the real truth lies deeper. The Cape natives were taken off the common roll in 1936. Dr Malan's followers said then that this was only a "first instalment" and that the next logical step was to do the same to the coloureds. Mr Havenga stands to gain nothing politically from virtually disfranchising the coloureds. He hesitated for two and a half years before taking the plunge. By doing so he has incurred much odium and his motive must have been strong.

It is. He believes with the Nationalists that to preserve "white supremacy" there must be an entirely new pattern. He discounts the risk of a non-European united front, because he thinks that is coming anyway. The whites are retiring into their *laager;* the age of compromise is nearly ended. White southern Africa is at last face to face with the basic problem of disparity of numbers. Even in Southern Rhodesia, it is proposed to raise the qualifications for the vote: a different method to achieve the same end, which is to keep non-Europeans out of politics.

In the Union, the position is complicated by the Nationalists' desire for a quick accession of political strength, a reflection of their determination to stay in power over their white opponents as well as over the non-Europeans. To disfranchise the coloureds will mean tampering with the constitution. But the constitution has already been criticised by Dr Malan as something foisted on South Africa by Britain. Another part of the constitution prevents a still further loading of the rural against the urban vote. The Minister of the Interior, Dr Donges, nevertheless told the Cape Nationalist congress at Kimberley that the Government was "considering" giving the *platteland* more political power.

Some Cape delegates to the national convention in 1908 hoped that after union the Cape non-European franchise would be extended to the other provinces. When the South Africa Bill was debated in the House of Commons, the Colonial Under-Secretary, Colonel Seely, confidently repeated this hope, declaring it inconceivable that the contrary would happen and the Cape non-Europeans be disfranchised. The Union constitution prohibited a change in the non-European franchise save by a two-thirds majority in Parliament, with both Houses sitting together. General Hertzog at least scrupulously observed the two-thirds majority, working years to secure it before taking the Cape natives off the common roll, in 1936. Dr Malan and Mr Havenga, however, now propose to ignore that provision in their treatment of the coloureds.

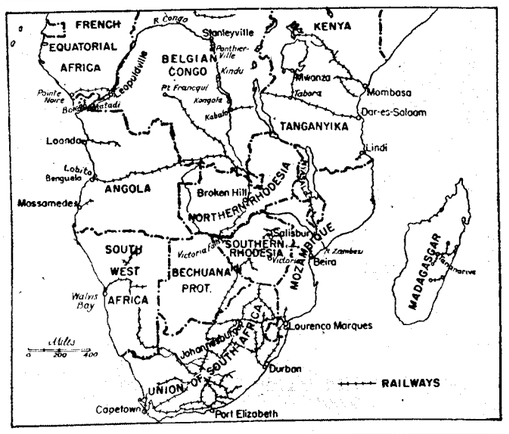
Their excuse is that as the coloureds will be put on a communal roll and not stricken off altogether, the constitution is not being violated. But a Supreme Court ruling (Ndlwana *v.* Hofmeyr) laid down that even if people taken off the common roll were given other political rights in compensation, such an action still required a two-thirds majority in Parliament. The judgment was delivered by Judge-President van Zyl, with the concurrence of two other judges, one of whom was Mr Justice Centlivres, the present Chief Justice of the Union.

Mr. Havenga's Broken Pledges

Dr Malan, and still more Mr Havenga, are also breaking former personal pledges. Before General Hertzog took the Cape natives off the roll, he assured the coloureds that they would not be next. Dr Malan joined in that assurance. When Dr Malan changed his mind, General Hertzog accused him of "disloyalty and faithlessness." Because of the Nationalists' *volte face,* General Hertzog issued a new assurance to the coloureds, on behalf of the Fusion Government. Dr Malan was not a member of that Government, and so was, of course, not bound by the new assurance; but Mr Havenga was, and he actually helped to draft the document. Now Mr Havenga has joined Dr Malan in repudiating all past promises.

The Nationalists think General Hertzog was chicken-hearted. They believe that a higher principle than past promises of constitutionally "entrenched clauses" demands that there must be no halfway house. That higher principle is "white supremacy."

General Hertzog regarded the coloureds as belonging with the Europeans. The coloureds, unlike the natives, have no language or culture they can call their own. The Europeans helped beget them, and they have taken everything they have, little as that is, from the European side. But they are still coloured, and that is enough for the Nationalists. There is, as in the old republics, to be no equality, not even a vestige, between white and non-white in Church or State. At the same time, the *platteland* is to be entrenched as the chief seat of political power among the whites themselves, as was also the case in Kruger's day.



This drive back into the past is a deliberate and conscious retreat from present realities: the rapid movement of population away from the rural to the urban areas, the emergence of an industrial proletariat, the awakening of the non-Europeans to political and other grievances. But the greatest reality of all is the disparity of numbers between black and white, and in regard to it the other white communities in southern Africa are sharing in the retreat to some degree. If ordinary political democracy is inapplicable even in the long run to a multi-racial society, then the Nationalists, in taking away the ordinary vote from all non-Europeans, are being

perfectly logical. They may even have something to put in its place. But so far they have shown no evidence of that, and the vacuum may be filled with revolution.

Transport South of the Sahara

THE African Transport Conference which has just ended after some three weeks of deliberation in Johannesburg has not achieved any spectacular success. But this was hardly to be expected of it; at least another useful exchange of views has taken place. The conference was the successor to the Lisbon conference of May last year and the less formal meeting in Paris in February, sponsored by the Organisation for European Economic Co-operation (OEEC). Representatives were present from Britain, France, Portugal, Belgium, South Africa, Southern and Northern Rhodesia, the British East African High Commission, the British High Commission in Southern Africa, Nyasaland, Angola, Moçambique, French Equatorial Africa, Madagascar and the Belgian Congo. Observers were also invited from the United States—the American ambassador in South Africa—from the International Bank and from OEEC.

Two of the outstanding subjects on the agenda were the proposal to establish a permanent organisation to co-ordinate the development of transport between the many different territories in Africa, and the familiar problem of

increasing the carrying capacity of rail outlets from Southern Rhodesia. The establishment of a permanent organisation was opposed by the Portuguese, who hesitated to accept a body which looked like making its headquarters at Johannesburg. Rather than put the Union of South Africa in what they regarded as too influential a position, they proposed that the permanent organisation should meet in each of the member countries in turn. In the end final consideration of the project was deferred; but it will probably reappear at the next conference, by which time governments will have had time to mull over it more fully.

Some of the specific problems, presented by the extent to which the rapidly growing economy of Southern Rhodesia is bursting its seams, were discussed in detail. They include improvements to the port of Beira and the Beira railway, following the recent agreement between Britain, Portugal and Southern Rhodesia, whereby the Portuguese government took over from the British company which built the line and operated it until last year. They also include the possibility of building a new Rhodesian rail link either with the Portuguese port of Lourenço Marques, or with the west coast, or through Beit Bridge to make a second connection with the South African system.

Little hard news has come out of the conference on these questions. But reports from Johannesburg suggest that there was a collision of interest between Southern Rhodesia and the Union of South Africa on the Beit Bridge project. The construction of only a hundred miles of track to make this link would probably be at least as economically rewarding as any of the immediate alternatives. From the point of view of the Union it would certainly mean increased revenues for the South African Railways and render operation profitable in the northern Transvaal; it would also relieve congestion on the long single track through Bechuanaland, which is at present Southern Rhodesia's only rail link with the south. The government in Salisbury, however, is not only very chary of putting more of its essential communications in the hands of the Union, but also dislikes the idea of increasing the economic importance of the long haul to Durban or the Cape. South Africa, it may be noted, is genuinely suspected of imperialism by some of its neighbours.

Other leading topics discussed were the communications of the Belgian Congo and of Northern Rhodesia, the extension of Tanganyika Railways to the new groundnut port of Twala, and the role of air and road transport in the development of Africa as a whole. The Belgians have a ten-year development plan for the Congo, covering road, rail and river transport. But, like the Rhodesians, they are also deeply concerned about external communications. The first priority, in the Belgian view, is to bring Beira 500 miles nearer Broken Hill by constructing a direct line cutting out the Victoria Falls loop; wagons could still make the round trip to pick up coal from the Wankie field on the way back. The Belgians are also interested in an outlet to Dar-es-Salaam; they already have a special Belgian section in the port with deep-water facilities. The proposed rail link with Dar-es-Salaam would be stategically important in forming part of a west to east line across Africa, in conjunction with the Benguela Railway. Expansion of traffic on the Benguela line, incidentally, is also a problem; the bottleneck consists of the port facilities at Lobito. As Dr Malan, the South African Prime Minister, pointed out at the opening of the Johannesburg Transport Conference, no one territory can risk a policy of isolation. Africa south of the Sahara is a single geographic and economic unit; it is in the interest of all that these present difficulties should be overcome.

Inflationary Pressures in Canada

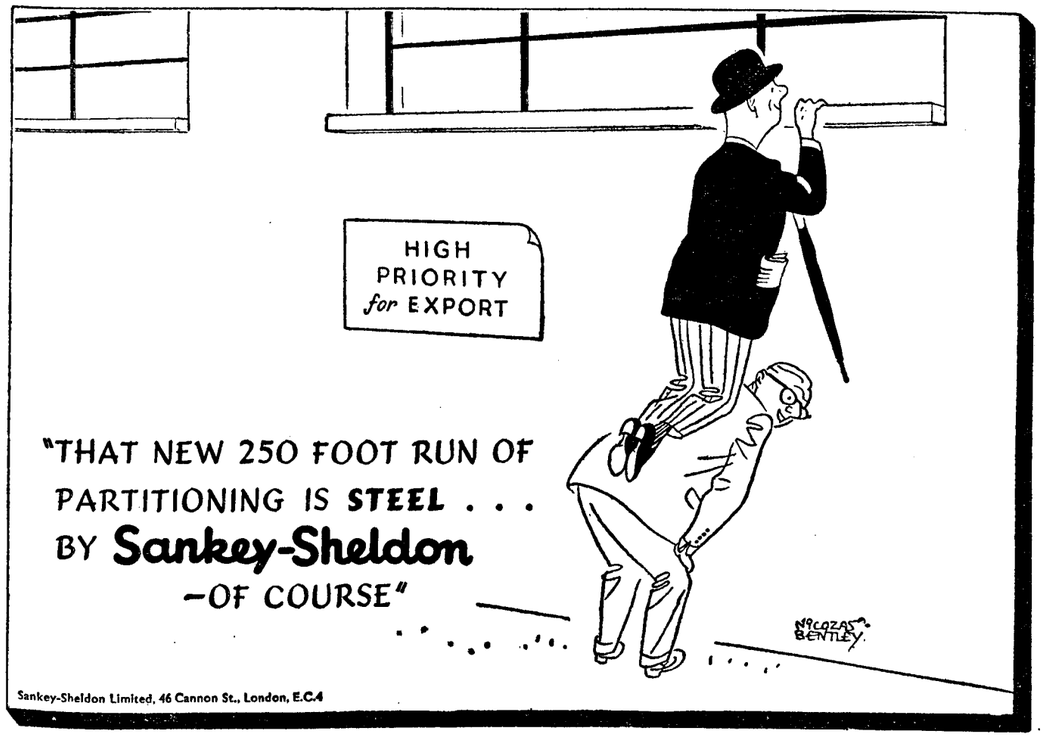
[FROM OUR OTTAWA CORRESPONDENT]

IF Britain is now brooding about the rise in prices rather than the shortage of dollars, Canada is certainly in the same mood. Official reserves of gold and US dollars reached $1,800 million at the end of September, which means they quadrupled in the short space of three years. In 1946 and 1947 when reserves were falling fast as a result of huge trading deficits with the United States and severely curtailed dollar-earning from overseas trade, the Government did not feel bound to take conservation measures until they had fallen to $480 million. Then in late November, 1947, drastic import restrictions were imposed and an official attempt was launched to increase Canadian exports to the United States. The rise, which started at once, was fairly steady until the middle of this year. Then it shot up by $65 million in July, $184 million in August, and $285 million in September.

At the end of September the Canadian dollar was freed. It rose almost immediately until the price of a US dollar was about 105½, and it has stayed steady at about that level. The next official statement of the Canadian reserves will not be

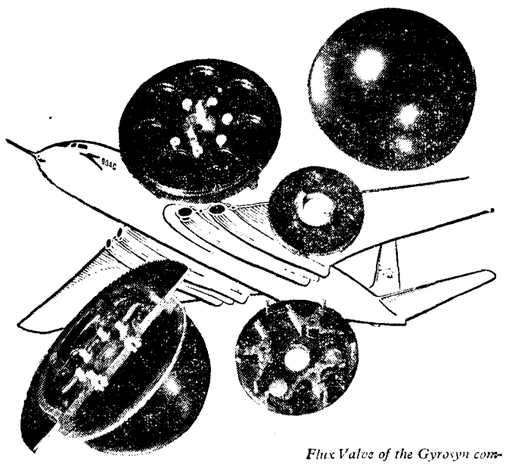
made until the end of the year. But it is already clear that the American money which poured into Canada during the summer is in no hurry to get out again. However "hot" it may have been when it came in, it seems to have cooled off since the freeing of the dollar. One can only speculate what the movement would have been if the dollar had been raised to a new fixed value; but obviously the temptation for the speculator to take his profit at once would have been much greater. The drop in reserves would probably have been much sharper than it is understood to have been so far. No financial authorities here are banking on the confidence in Canada being maintained at the same high level indefinitely. New York clearly has had a wave of extremely "bullish" sentiment about this country. There seems no reason why it should change; but Canadian authorities remark that when the New York sentiment does change at all it is liable to change violently. "In New York," said one financier here, "they're all bulls or all bears."

The movement of capital was primarily responsible for Canada's dollar revaluation, and it may be held to be at least partly unreliable because of the large psychological element involved. But the solid facts of commodity trade support the trend. Domestic exports to the United States in September reached a new high level, bringing the total for the first nine months of this year to $1,444 million compared with $1,035 million for the same nine months of 1949. But imports from the United States are only about $50 million higher than last year. The American rearmament drive seems to promise a continued high level of demand, and the Government is obviously now basing its policies on the assumption that the exchange position is relatively secure.



This is most clearly shown in the realm of defence purchases. In appropriating $300 million for defence aid to Europe, the Government is not only accepting that amount of unrequited exports; it is preparing to spend a considerable part of that sum in the United States, since only there can it obtain replacements for equipment shipped to Europe, as well as many other things needed for its own forces.

But rising prices are a matter of increasing concern. The public has watched the cost of living index rise throughout the year to a peak on October 2nd of 170.7. There is some ground for thinking that it may level off through the winter months as a result of a seasonal decline in some food prices, particularly meat. On the other hand it is clear that recent rises in wholesale wool and cotton prices will be reflected in clothing prices by the New Year.



In the field of wholesale prices, particularly industrial raw materials, Canada is tied to the world level; and even less than other countries can it escape the effect of the American price level. On this question Government experts are resigned and only partly hopeful. If American prices rise further Canadian prices will rise too; and Canada can do nothing about it without a detailed and stringent system of price controls which is held to be entirely impossible except in time of war. Indeed the years 1939-41 proved that it is not easy even then.

Canada, then, is in for the same degree of inflation as the United States, and, in the Government's opinion, will have to be very watchful to make sure that inflation does not go further here than there. The safeguards which the Government is trying to apply are the traditional ones. Consumer credit has been restricted; interest rates, with official encouragement, are gradually firming; Government influence over the distribution of scarce materials (it is hoped that "influence" will be enough, but control will be used if necessary) will be used to discourage all non-essential capital investment; and the national budget will be strictly balanced.

From now on rearmament will be making an increasing impact on the economy; and no one can foretell that these measures will be enough to restrain the inflationary pressures. But at least it is hoped to keep them within limits.

THE BUSINESS WORLD

Road Haulage—I

Trucks and the Act

FEW subjects have evoked so much heat without light in recent months as the road haulage industry. Exaggerated claims for the advantages of nationalisation have been matched by a campaign for "handing the industry back to private enterprise." Assertion has supplanted evidence. Attacks have been made up and down the country against the system of permits for private hauliers often couched in such a way that the ordinary person would never suppose that the system—whatever may be said for or against it—stems from the Transport Act of 1947. A private member's Bill, the second reading of which was carried against the Government in the House of Lords last Tuesday, seeks to extend the range of operations of private hauliers as restricted by the Act by such an extent as to threaten to deprive the nationalised section of the industry of the traffic that is—or should be—most profitable for it to carry. There is on the one hand a blithe disregard of the public expense of forcing a nationalised undertaking to operate under uneconomic conditions; on the other hand, there has been great haste to get nationalised road transport working for the assistance of nationalised transport as a whole. Political pressures combined with the high speed with which the acquisition of long-distance road haulage has been carried out have created conditions of immense difficulty for those who are trying to bring about some semblance of order in road transport.

The most important fact about the road haulage industry—so familiar that it is necessary to repeat it—is that, unlike all the other industries that have so far been nationalised, it is made up of a very large number of small independent units. Before the Transport Act of 1947 there were approximately 20,000 small hauliers. Large firms, such as the Hays Wharf Cartage Company, Pickfords and Carter Patersons, were the exception rather than the rule. Very few hauliers operated more than two or three lorries, and the system of licensing introduced by the Road and Rail Traffic Act of 1933 ensured a strict control over the free expansion of the industry. There was no established basis such as that provided by the four main line railway companies on which to build the structure of a nationalised industry. Nationalisation of road haulage meant in effect the merger of several thousand small undertakings with all the attendant difficulties of legal settlement, with little or no standardisation either of plant or service, and without the support of an organisation in being with experience of running road haulage on so large a scale. A Napoleon of transport might have attempted such a task—there were always obvious financial and operational advantages to be expected from a merger of this sort—but he would at least have given himself several years in which to complete it.

Instead, the expansion of the Road Haulage Executive has been as dramatic as any supporter of nationalisation could have wished. The total commitment for the undertakings already acquired or to be acquired is approximately £65 million, quite apart from the road haulage companies which were previously owned by the railway companies. The corresponding increase in the size of British Road Services (the trade name of the nationalised section of the industry) is shown below:—

	End 1948	End 1949
Undertakings acquired ...	248	1,880
Staff	23,195	67,289
Motor vehicles	8,208	34,894
Trailers	1,717	4,045
Horse-drawn vehicles ..	1,867	2,753
Horses	979	1,410

During the present year, approximately 400 more undertakings have been served with notices of acquisition, making a total of 2,300 undertakings and a fleet of nearly 40,000 vehicles. In addition, a proportion of the holders of the 5,300 "original permits" which are to be revoked by February next and about which there has been so much clamour will probably exercise their right under the Act to require the Transport Commission to take over part or all of their businesses, but until these options are exercised it will not be known how many more undertakings will come into the Commission's hands. The wonder is not that mistakes and delays have occurred in the service which the public have come to expect from the road haulage industry, but that they have had a reasonable service at all. Indeed, given the fact that the speed at which they have had to work was not of their own choosing, the Road Haulage Executive have put up a very creditable performance.

The rate at which these road haulage undertakings were acquired was determined partly by the Transport Act and partly by the Minister of Transport; the type and number of undertakings to be acquired were determined partly by a complicated formula in the Act and partly by the choice granted by the Act to private hauliers themselves. The Transport Commission, working through its agent, the Road Haulage Executive, had very little discretion in the matter. The road haulage section of the Act required that all road haulage undertakings of whose business more than half was concerned with long-distance traffic should be taken over. "Long-distance" was defined as a radius of more than 25 miles, as the crow flies, from the operating base, or a distance of more than 40 miles within that radius. "C" licence holders (that is, traders operating lorries exclusively for their own use) and hauliers engaged in certain specialised traffic (meat, explosives, livestock, furniture removals, bulk liquids, felled timber and abnormal indivisible loads) were specifically excluded. The Minister of Transport ordered notices of acquisition to be served on all undertakings which qualified for acquisition under this section of the Act before February 1, 1950, the "appointed day," leaving the details of compensation and in many cases

the actual date of the transfer to the Commission to be determined later. In addition, any haulier whose business qualified for acquisition under this section of the Act but who nevertheless did not receive a notice of acquisition could require the Commission to take over the whole of his business and to pay compensation for it. Since February 1, 1950, no haulier has been allowed to engage in long-distance traffic unless he obtained permission in the form of an "original permit" (for which special conditions were laid down to be discussed later) from the Road Haulage Executive.

This section of the Act had two important effects which may or may not have been intended by its framers. First, to place the dividing line between "short-distance" and "long-distance" at only 25 miles from the operator's base meant that the Commission was to acquire a monopoly over a profitable part of the industry which to lay minds is hardly "long-distance." This is the traffic between big neighbouring industrial centres—Liverpool and Manchester, Manchester and Stockport, Manchester and Birmingham, Birmingham and Coventry, Luton and London, Glasgow and Edinburgh, Durham and Newcastle, and many more. The distances between these centres are more than 25 miles but most are less than 60 miles; they are, in fact, distances which are ideally suited to the economical running of a road haulage business and over which the railways cannot hope to compete on equal terms—hence Lord Teynham's attempt to reopen this sector of the road haulage industry for private hauliers and the Government's determination to keep it for the Commission. It must indeed be said that without such traffic nationalised road haulage would find it extremely difficult to run at a profit. Furthermore, if the integration of road and rail services is to mean anything it is precisely in this sector that road transport should be able to relieve the railways of uneconomical short distance working and serve as a feeder to the longer trunk routes over which road transport is neither as economic nor as quick as rail transport.

The second important effect of this section of the Act is that the Commission had had to acquire undertakings concerned with much more than long-distance road haulage. Few road haulage undertakings confined themselves entirely to long-distance or short-distance traffic; nearly all engaged in both types of traffic. Thus the acquisition of an undertaking which engaged predominantly in long-distance traffic—that is, an undertaking which could be compulsorily acquired and which was not allowed to retain any part of its activities connected with road haulage—involved also the acquisition of vehicles, stores and equipment which were only suitable for short-distance work. The result has been that although it was presumably the intention of the Act that long-distance haulage only should be nationalised, the Road Haulage Executive has had to engage in short-distance traffic rather than write off a large proportion of the stock and premises it had acquired and for which compensation had been paid. Moreover, once it was committed to taking part in short-distance traffic, it was its public duty, imposed by the general policy laid down in the Act, to make a profit—which meant, among other things, doing its utmost in all the ways open to it to secure terms on which to compete with private hauliers. Licensing restrictions and the control of permits have undoubtedly given the Road Haulage Executive an advantage over private hauliers and this fact lends some support to Lord Teynham's second plea that the nationalised sector of the industry should be subject to the same conditions as apply to the private hauliers. But this argument involves complicated questions about services and charges, the grant of permits, and the organisation of British Road Services, which must be left for a second article.

(To be concluded)

Copper Belt Boom

THE accounts of the Rhodesian copper companies for 1949-50 reflect little of the great prosperity that has recently come to the industry. By the standards of many earlier years, these reports are impressive. Output was higher; profits per ton of copper have risen; and dividends have been raised, though there are still disappointed shareholders. The latter are no doubt making the most of the view that the results are no more than a curtain raiser to much higher profits and dividends this year. There is a good deal in their case. Early in 1949, the Ministry of Supply's selling price for electrolytic copper was £140 a ton. The price was successively lowered until by July 12, 1949, it had fallen to £104 a ton. Since that day prices have not looked back. Devaluation brought an automatic increase to £140, and by the end of March the price had risen to £153 a ton. But the really spectacular jump to £202 a ton has occurred since the end of the companies' financial years, and it is this that carries the implication of unprecedented profits.

The chairman of Roan Antelope has pointed out that the accounts for last year showed no great response either to the benefits or to the disadvantages of devaluation; this observation applies to Rhodesian copper companies generally. In practice they sell their copper output forward, and at any one time they may carry sufficient stocks to meet a considerable part of their commitments. The profits of Roan Antelope and Rhokana for their financial years to June 30th reflected the benefits of devaluation at least at the end of their accounting period and are thus rather more impressive than those of Nchanga, whose financial year closes on March 30th. The Mufulira year also closes on June 30th, but in this case the profit and loss account was less affected by the post devaluation rise in prices. This was partly because Mufulira sold less copper than in the previous year, and put the whole of its increase in output and more into stock to build up adequate copper reserves to supply the electrolytic refinery when it comes into operation. Yet despite the damping action effects of forward sales on realised prices, average prices realised per ton showed a useful improvement compared with 1948-49. Thus Roan Antelope sold 62,059 long tons of copper (against 54,662 long tons in 1948-49) and realised an average price of £127 4s. 7d. per long ton of blister copper f.o.b. Beira, an increase of £6 16s. 10d. per ton; costs only rose by 6s. 3d. from £72 14s. 11d. to £73 1s. 2d. a ton. Stocks were raised from 16,500 tons to 18,000 tons, "which completes the present stock-building programme."

Mufulira's copper sales declined from 71,166 tons to 69,550 tons, and realised an average price of £126 7s. per ton, or £4 18s. 3d. more than in the previous year. Production costs rose from £54 12s. 2d. per ton to £54 19s. 6d. Stocks were built up by 7,498 tons to 18,525 tons.

Rhokana and Nchanga, the two companies in the Anglo-American Corporation group, do not provide average revenue and cost figures, and it is possible to estimate these only very broadly. Nchanga in 1948-49 sold 30,053 long tons of copper for £3,513,478, an average per ton of £116 18s. 2d.; in the latest year sales rose slightly to 32,062 tons, but the average revenue was in fact somewhat lower at £113 16s. 9d. per ton. If this is at first sight surprising, the explanation may well be that Nchanga's trading year ends in March and that higher prices after devaluation were not sufficient to counterbalance the effect of many earlier months during which copper prices were below the 1948-49 level. Production costs in this case, however, seem to have fallen, from £53 12s. 10d. to £48 17s. per ton. Again, this is quite conceivable; of all the four mines, Nchanga is the youngest, and some regard it as potentially the cheapest producer on the copper belt. It may well be that the great strides in production that Nchanga has made in recent years are now beginning to bear fruit. During the year, Nchanga raised its stocks of blister copper from 6,690 tons to 13,449 tons, and its stocks of copper concentrates from 7,529 tons to 10,098 tons.

The experience of Rhokana conforms more closely to the results shown by Roan Antelope and Mufulira, though the estimates are very rough. Rhokana does not publish sales figures; it gives information only about production, which rose from 74,982 tons in 1948-49 (62,720 tons electrolytic and 12,262 tons blister) to 80,540 tons in the latest year (64,864 tons electrolytic and 15,676 blister). Since Rhokana put little of its output to stock, the absence of sales figures might not be thought to matter. In fact, the premium on electrolytic copper and the intrusion of cobalt sales makes it difficult to strike an average selling price per ton that would be useful in comparing Rhokana's figures with those of other mines. Subject to these qualifications, average revenue would appear to have risen from about £126 10s. to £131 12s. 6d. a ton. This roughly tallies with the experience of Roan Antelope and Mufulira. But whereas average costs for these two companies have risen less than average revenue, it appears that Rhokana's average costs have outpaced the rise in average revenue, for such figures as are available suggest an increase in costs from £63 to £70 12. 6d. per ton of mixed output.

So much for the operating results of the past year. The outcome has been a general rise in profits, and this has attracted a substantially higher tax bill. United Kingdom taxes, as shown in the table, have carried the full relief allowable against Rhodesian tax under the existing double taxation agreement. The net impost of United Kingdom tax shows roughly how much the companies could have expected to save in taxation on the basis of last year's profits if they were to transfer their seat of control and management to Rhodesia.

So far, only the companies in the Anglo-American Corporation group have sought and obtained approval from the Treasury to move to Rhodesia. The scale of tax "savings" has undoubtedly led others, including the Selection Trust group, to consider such a transfer, though conceivably with the reservation in mind that such transfers may not represent pure gain. It is thought that for Rhokana and Nchanga the move will become effective before the end of the calendar year, and that at least six months of the current year's profits might then enjoy freedom from British taxation. These tax "gains" will not be automatically transferred to the British shareholder: dividend policy may stand in the way and the British tax collector will certainly do so. Nor are they to be measured by detailed study of the results of the past financial year. Since that closed, trading has been based on an altogether different price level.

The quarterly figures of Mufulira and Roan Antelope show how startling the transformation has been; in the September quarter alone Mufulira's profit (subject only to taxation) was £2,021,000, equal to one half of the profit earned in the whole of 1949-50. In the June quarter of the full trading year Mufulira's profit was £1,635,000 from sales of 22,537 tons; the latest quarter's profit resulted from the sale of 20,863 tons. Costs are rising, but in no particularly alarming fashion. The quarterly figures of Roan Antelope are quite as impressive. In the September quarter profits amounted to £1,601,000, two-thirds of the profit of £2,434,533 recorded for the whole of 1949-50. The projection of a single quarter's profits to an annual rate is fraught with uncertainties—some £236,000 of Roan's September profits arise from a special sale—but nothing short of a major reduction in output of the kind that might, for instance, be caused by a full-scale coal shortage or a complete reversal in the present trend of prices can prevent copper profits this year from completely dwarfing those of last year, and they were by no means negligible.

Looking ahead, the inquirer must first ask how copper prices in the United States will behave. Sterling prices for copper move in step with American prices. A year ago the copper producers agreed with the Ministry of Supply that in future the price to be paid for copper sold to the Ministry would correspond as nearly as possible with the price f.a.s. New York. At present the American export price is 24½ cents per pound, which corresponds with the current sterling quotation of £202 a ton. Last year the American price moved between 16 cents and 22½ cents per pound, but much copper is currently being sold in the "grey" market at prices well above 24½ cents. Many producers have booked orders for future delivery at substantial premiums. Copper scrap is being bought at prices that can only be justified if recovered metal can be sold at 28 cents or more. The strength of the copper market in the United States owes much to private and official stock purchases. Monthly deliveries from fabricators are running at present at 137,000 shorts tons—barely below the peak wartime level. Industrial consumption would appear to be around 120,000 short tons a month, leaving only a modest margin. The reductions imposed on civilian consumption will reduce demand by several thousand tons a month, but official stockpiling purchases seem to be heading towards 30,000 tons a month and military demands may require between 10,000 tons and 15,000 tons a month. Thus, apart from any curb upon civilian requirements, consumption plus official stockpiling will be running at the rate of fully 160,000 short tons a month compared with current supplies of 130,000 short tons. The latter consist of 80,000 tons from home production of new metal, 10,000 tons from scrap, and about 40,000 tons from net imports. This lack of balance between supply and demand suggests that for a year at any rate copper prices are likely to be firm.

If so, the outlook for the sterling copper industry would seem fair enough. But there is a second, and important, question: will the copper belt be able to take full advantage of this prospect of continuing high prices? In the short run, the answer depends on coal supplies. These are inadequate and the shortage has already cut the output of blister copper in some mines by as much as 10 per cent. Coal supplies to the copper belt have been barely maintained in the current year, and the industry may be forced to use even more wood fuel than it had to find, at considerable expense, last year. Inadequate coal supplies may, indeed, affect the running in of the electrolytic refineries, the construction of which is proceeding most satisfactorily. The building of Mufulira's electrolytic refinery was started at the end of last year, and production of cathodes is expected to commence in April, 1952. The plant's initial capacity will be 36,000 long tons of electrolytic copper a year. Extensions to the capacity of Rhodesia Copper Refineries are almost complete, though the commissioning of the fourth section which could have taken place in September this year had to be delayed as a result of the coal shortage, and the remaining extensions may also have to stand idle until more coal becomes available. This construction programme has been carried out during years of high prices, and its economic results will depend very largely on the chances of writing off much of the capital cost while the high price of copper holds. It would be unfortunate for these important projects if lack of fuel prevented the companies from reaping the full benefits of the present copper boom. As for additional supplies of blister copper, the most substantial additions to output may come from Nchanga. By the end of the current year potential output could be at the full rate of 64,000 tons a year against about 45,000 tons now. Roan's output—given fuel supplies—could be raised by a further 10,000 tons to 72,000 tons.

*

Given this background, copper shares have rightly been firm for several months past. The boost to share quotations from successive increases in the price of copper was further encouraged during the summer by the prospects of the tax exodus. Rhokana has this year advanced from 11⅞ to 18½ and Nchanga from 2⅞ to 5½. Roan Antelope shares at 19s. 1½d. compare with 11s. 3d. earlier this year. Rhodesian Selection Trust, whose shareholders benefit at one remove from the copper boom through the holding in Mufulira, have risen from 24s. to 34s. 7½d. At these prices, the return on Rhokana is £6 9s. per cent, on Nchanga £3 10s. per cent, on Roan Antelope £6 10s. per cent and on RST £7 1s. per cent. Some of the buying that has produced these rises in share prices would not have taken place in the absence of the relaxations earlier this year on switching by non-residents. This has no doubt enhanced the already considerable American interest in the Rhodesian copper companies.

After a price movement on the recent scale, it is hardly surprising that American and British interest in copper shares has slackened somewhat in recent weeks. There is an obvious presumption that dividends in the current year will be further raised. After years of relatively meagre returns, higher dividends would be well justified. But it is necessary to remember that present prices of copper shares go a fair way towards discounting such prospects.

Business Notes

Importing Coal

How much coal will the National Coal Board need to import to satisfy home consumption, to meet its reduced foreign commitments, and to bring distributed stocks to the safety level? In announcing the decision to import coal, the Minister of Fuel and Power was purposely vague, putting it as "part of one week's output" (i.e., less than 4,000,000 tons) in order not to inform the market. But the market can easily follow the simple arithmetic of the figures he had already given. Deep-mined production will not be more than 205 million tons this (calendar) year, and opencast supplies are expected to be 750,000 tons lower than the 13 million tons aimed at; thus this year's prospective supply from home production may be 217¼ million tons. Home consumption will need 202 million tons, 6,000,000 tons more than last year; exports and bunkers in the Minister's last estimate were put at 18 million tons (though even at the time this appeared optimistic). Thus total demand could be put at 220 million tons for the year. And the gap would be nearly 3,000,000 tons, apart from the extra 750,000 tons that would be needed to bring stocks up to the "planned" figure of 16½ million tons. Bunker supplies are to be reduced: these have been running at roughly 75,000 tons a week, plus possibly the same amount for foreign bunkering. In the six remaining weeks of this year, to halve these supplies would save less than 500,000 tons. To fulfil an export commitment of 18 million tons, therefore, would call for imports of about 3,000,000 tons; both figures, however, may turn out to be perhaps half a million tons lower.

Most of the imports of coal will have to be obtained from the United States, where coal delivered to Atlantic ports has recently been quoted at just under £4 per long ton. Shipping charges would add £2 to £2 10s. per ton so that the Coal Board, after diverting coal from foreign to home use (and losing approximately £1 per ton thereby) is faced with the further prospect of buying American coal for £6 per ton or more and shipping it to European customers at its own current price of about £4 a ton. Coal supplies are to be had in the United States, but provision of ships may prove difficult; to transport a million tons of coal would require about 100 ships. Britain's contribution to the European coal economy has already been drastically curtailed by part cancellation of certain contracts and by running into arrears on others; and in their negotiations for 1951 the Board is unwilling to carry forward arrears from this year. Cuts in British supplies, through inability to produce the coal, are proving as effective in bringing about a coal crisis in Western Europe as the partly political diversion of Polish coal from the west to markets behind the Iron Curtain.

* * *

Full Employment to Blame?

Full employment, according to Mr Noel-Baker, is doubly the culprit in Britain's coal crisis: it is responsible for the rise in inland consumption, and at the same time it is affecting production by drawing labour away from the mines. The most recent figures for consumption, for the 45 weeks to November 11th, show that increased consumption is fairly generally distributed among most classes of consumers; only railways, iron and steel, water and the collieries themselves were using less than a year ago. The largest increase was for electric power stations, which have taken about 8 per cent more coal; engineering and metal and other industries used just under 5 per cent more.

Last week's production from the mines showed a slight increase compared with the previous week, but output was still well below that of the corresponding week last year; opencast production was also much lower, and the week's total was 86,000 tons below last year. During the week recruiting equalled labour wastage, and the labour force remained intact at 686,500; since the beginning of the year the industry has lost 22,400 workers, of whom 10,000 have left the coalface. Output per manshift remained stable and absenteeism was slightly lower. Thus the production deficit this year is largely a matter of manpower. Lord Hyndley was no doubt right when he expressed a preference this week for importing miners instead of coal; but the absence of any positive statement after the Minister's meeting with the industry this week offers no confidence that the Board will be able to bring in more foreign workers.

Dunlop's Rights Issue

A major issue of ordinary capital made as of right to ordinary stockholders is something of a rarity in these days. The Dunlop board has eschewed new-fangled devices such as an issue of unsecured loan stock or a private placing with the institutions and is raising its new capital in a way that was traditional long before the idea of a profits tax entered a Chancellor's head. The response has certainly justified the decision; unless something goes violently wrong with the market between now and December 12th the offer will be an overwhelming success.

Technically, the issue consists of 13,412,837 new 6s. 8d. ordinary shares offered at 13s. 8d. to existing ordinary stockholders in the proportion of eight new shares (that is £2 13s. 4d. nominal, expressed as stock) for each £5 nominal of stock held. For a total expenditure of £21 13s. 4d. (taking Dunlop £1 units at 65s. 6d. on the eve of the offer) a stockholder could thus obtain £7 13s. 4d. nominal stock at an average price of £2 16s. 7d., leaving the rights to be worth a shade under 9s. per unit. The issue will provide nearly £9 million of new money, or nearer £8,750,000 after underwriting and other expenses have been met; this sum, the board believes, should cover the capital programmes in sight in this country and for the manufacturing subsidiaries abroad. Such an operation would have been impossible under the absurd discipline formerly imposed by the Bonus Issues Tax; but it is still worth marking the fact that consent has been given by the Capital Issues Committee to the terms, in view of the perceptible bonus element in the price. Nor, on the prospects held out by the directors for the current year's profits and dividend, is this element illusory, for stockholders have been given reason to expect that profits for 1950 will leave room for substantial transfers to reserves and for the maintenance of the present dividend rate of 15 per cent (despite the heavier incidence of profits tax). In effect this will imply that a stockholder will receive 23s. of gross dividend on a total investment of £21 13s. 4d.—a yield of £5 6s. 3d. per cent compared with £4 11s. 9d. per cent on the eve of the issue.

This prospect has not excited the market in Dunlop ordinary shares, which have shown only a modest movement of a few pence at 57s. ex rights. On a broader point, the issue is to be welcomed because it reverses the recent tendency to choose fixed-interest or prior charge securities as a means of raising new finance and thus to dilute the importance of equity finance for industrial concerns. If this tendency has not assumed major dimensions, it is because companies have been expanding their effective equity out of reserved profits. Thus for the 586 companies whose balance sheets appeared in the last quarter (details are given in this week's issue of *Records and Statistics*) total capital and reserves rose from £1,203 million to £1,321 million; but of the increase in their issued capital from £698 million to £747 million, as much as £25 million was represented by debenture capital.

Dividends and Profits

The recent tendency towards an increase in dividend distributions has not escaped the Chancellor's notice. In a written reply this week, he has stated that "it is too early yet to say whether the tendency will persist to an extent which will make it desirable to consider other methods of checking it." Perhaps a careful student of nuances in official statements might detect some faint evidence of a changing attitude in this reply compared with Mr Gaitskell's observations in the debate on the Address three weeks ago. On that occasion he joined in one comment his views on wages and dividend restraint, and his observations need to be recalled:

> It is inevitable and natural that the increase in the cost of living resulting from the high import prices following the longish period of stability should lead to increased pressure for wage and dividend increases. It is common knowledge that a number of claims for wage increases are now being made, and it would be too much to expect that the remarkable stability of wages over the last twelve months can be continued indefinitely. Equally, I may say, we must recognise that there is a disinclination in some quarters to accept the indefinite control of dividend limitation.

The Chancellor then proceeded to argue that if "the increases" took place on anything more than a moderate scale they would have the effect of pushing up prices still further. This practice of regarding two quite separate economic quantities as being of the same essential substance, so that each is assumed to call for the same attitude of mind, has never seemed to have much to commend it, though it has its uses for political purposes. But there are other fallacies than this. Does a pound of profits distributed as a dividend necessarily exert a greater inflationary potential than a pound of profits retained and invested in new plant or set scrambling after raw materials by a company? The dividend may attract tax at 19s. 6d. if it goes to a shareholder in the highest tax bracket. Or it may be saved and reinvested in support of public or private capital expenditure, which again will be to the positive assistance of the disinflationary policy that the Government professes. Or its residue (after payment of income tax and surtax) may be spent by the shareholder who receives it. No one can measure the balance of these possibilities, but it is at least justifiable to assert that the impact of increased inflationary pressure from higher dividends, even if these had exerted a full effect, would be very small indeed. Figures published by companies reporting last quarter show that the net value of the increase in dividends of the 586 companies concerned was £1.3 million in the latest year, from £29.1 million to £30.4 million. The increase for 2,752 companies whose reports have appeared in the past twelve months is just over £2 million, from £131.3 million to £133.4 million. The trend is perceptible, and no doubt will become more evident in future. But to argue that it is generating a rabid wave of inflation would be absurd. Inflation cannot owe very much to expenditures of two parts in ten thousand of the national income.

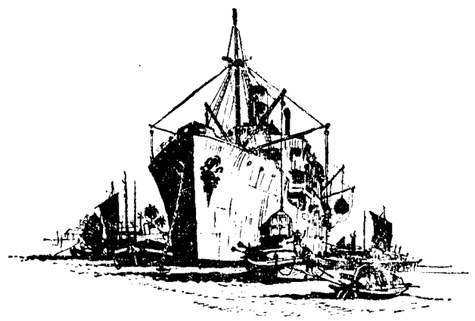
"Metaphysical" Housing Subsidy

The Public Works Loans Bill, which was given a second reading by the House of Commons this week, represented little more than the customary annual renewal of the system of local loans that has been in force since 1945. The Bill leaves the ceiling for advances by the Public Works Loans Board at £500 milion, but raises its ceiling for advances plus commitments from £680 million to £850 million; this increase is to allow local authorities to plan further ahead and to take cognizance of the rather higher proportion of school building and other longer term projects now included in local authority programmes. Mr. Jay revealed that total advances by the PWLB in the first 10½ months of this year amounted to £240 million. Of this, housing accounted for £172 million, education for £16 million, and transport, water and other items for £32.5 million.

Two useful points emerged from the debate. The first was a query by a Labour backbencher whether the Public Works Loans Commission, for whose administrative expenses a sum of £46,000 was provided in the last annual estimates, is serving a function commensurate with expenditure upon it. He alleged that all that the Board did in the financial year, 1949-50, was to knock one application of less than £2,000 out of a total of £292 million advanced. All proposals that come before it have already run the gauntlet of at least one Government department and the Board does not usually regard it as its function to tell Mr Bevan to think again. The second point that was raised was, of course, the perennial one of whether it is advisable to subsidise the housing programme by pegging the rate for long-term PWLB advances at 3 per cent—still ½ per cent lower than the relevant rate for gilt-edged. Mr Jay's answer on this point was by no means explicit. He maintained, first, that after consultation with Government departments, local authorities had given up their old habit of borrowing from the PWLB at 3 per cent merely in order to re-invest in gilt-edged at 3½ per cent; the level of borrowing was now down to the level of cash requirements. Mr Jay went on to maintain that the rate of interest would be a very bad regulator of local authority investment programmes and asserted that the Government's policy was to keep rates charged for loans to local authorities "as low as we reasonably can"; it was, however, impossible to predict what would happen "in varying circumstances." Mr Jay then put forward the rather surprising thesis that it would be "metaphysical" to apply the term "subsidy" to the provision by the Government of any service below market cost, so long as the budget was in overall surplus. Perhaps the taxpayer who provides the surplus would be able to distinguish more readily than the Financial Secretary between metaphysics and plain English.

We've solved some problems in our time!

In 1942, peak period of Hitler's submarine campaign, came a request for batteries to operate wireless transmitters in the ships' boats of the Merchant Navy. Batteries that could be relied upon to give immediate service when needed, even if they had been standing by unused for as long as two years.



¶That was a problem. No such battery existed. Normally a filled battery progressively loses its power when idle and needs periodic recharging; an unfilled battery needs a lengthy first charge before it can be used.

¶Our answer was to produce the Exide self-priming battery. Its plates were *dry* charged, and sealed in a compartment separated by a thin diaphragm from another compartment containing acid. When the diaphragm was pierced with a punch attached to the battery, the acid ran on to the plates, and within a few minutes the battery was working at full strength—even after 2 years or more of inactivity.

¶Thousands of these batteries were supplied; and many a seaman owed his life to them.

¶We have been solving battery problems for over 50 years. Wherever batteries are used today you will find Chloride, Exide and Exide-Ironclad batteries giving good service in jobs for which they were specifically designed at a user's request. Our battery research and development organisation, the largest and best equipped in this country is now, as ever, at industry's service—ready at any time to tackle another problem.

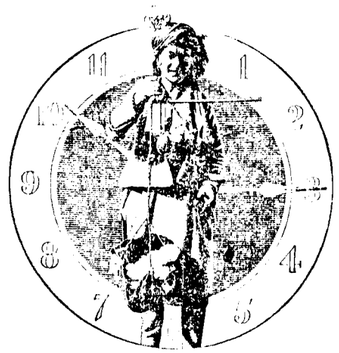
Where can your goods go?

The world is wide—but economic conditions, currency restrictions and the like exercise a limiting effect . . . It is part of the service of the Westminster Bank to provide the accurate and up-to-date information on trade conditions which must form the background to any discussions of new markets and new business ventures. This facility is included in the wider service which the Bank offers to all importers and exporters and which is described in a booklet called *The Foreign Business Service of the Westminster Bank*. Your nearest branch will be glad to give you a copy.

WESTMINSTER BANK LIMITED



TWO CENTURIES OF ENTERPRISE

Nearly two centuries ago, when Glyn, Mills & Co. was founded in 1753, commercial and industrial enterprise depended on a handful of pioneers—the 'gentlemen adventurers' of the history books. With the highly individualised businesses of the past, so with the large combines and national corporations of to-day, Glyn, Mills maintains its tradition of a private Banking House offering the most advanced and comprehensive banking facilities.

Directors and Trustees

"Boards of Directors are self-appointing and self-remunerating bodies; this is undesirable; independent trustees should be appointed to engage them and fix their salaries." This, succinctly stated, was the proposition put by Mr G. S. A. Wheatcroft (himself partner in a London firm of solicitors) to one of the best-attended specialist discussions at the Harrogate conference of the British Institute of Management last weekend. Few shareholders, said Mr Wheatcroft, attend company meetings except in cases of financial difficulty or dispute; those who do attend either confirm appointments to the board made by the directors between meetings, or accept directors' nominees. Now that many directors are full-time managers of their companies, he added, their individual remuneration tends not to be questioned; a director whose own contract is soon due for renewal is unlikely to criticise that of a colleague. Without suggesting that new appointments are necessarily bad or that remuneration is inevitably excessive, Mr Wheatcroft felt that "justice should not only be done but also seem to be done"; and his way to seem to do it is to appoint trustees (who would be paid a fixed remuneration themselves but would otherwise be bound to remain entirely independent of the company) to fill vacancies on boards of directors and approve directors' contracts of service.

And who would appoint the trustees? Mr Wheatcroft answered that the directors might nominate one, the shareholders two, and the employees another two; or that the trustees should be the holders of certain public offices. "It may sound heretical," he added, "but there is no real reason why a vacant directorship should not be advertised (say in *The Economist*)." Such a heresy, it need hardly be said in these columns, has its attractions, like the whole proposition; but it is doubtful whether either would tangibly improve present practice. In many firms, the remuneration of "functional" directors is already handled by a sub-committee of the chairman and the "outside" directors. The trustee system, elegant in theory, would prove extremely cumbersome in practice: to man an entirely new hierarchy for every company in Britain from the country's not unlimited reservoir of administrative talent would probably involve "taking in each other's washing." And the ideological advantages its author suggests it would offer seem insubstantial; propagandists who manage to build up a wholly distorted picture of the way in which the joint stock system works would find no difficulty in fitting trustees into their misconceptions, and the general public would not notice the change.

Finance and Banking

EPU Debated

During the past week the House of Commons has been giving its attention to what Mr Oliver Lyttelton called that "repulsive subject," the European Payments Union. The occasion was the second reading debate and committee stage on the Money Bill which provides the necessary accounting machinery to enable the United Kingdom to play its part in the operations of EPU. The mechanics of this participation are dull and make unrewarding study. They involve the use of the Exchange Equalisation Account to provide the resources needed for the credits that Britain is extending to EPU. The only change of substance which emerged from the committee stage of the Bill was the acceptance by the Government of an Opposition amendment limiting Britain's commitment to EPU to 60 per cent of the United Kingdom's quota, that is, to £227 million; this limitation is to apply indefinitely unless a larger amount is authorised by Parliament.

The second reading debate provided an opportunity, admirably used by the new Economic Secretary to the Treasury, to make a wider retrospect of the working of EPU to date and of the ancillary arrangements made by the United Kingdom in dealing with pre-July 1st debts owing to and from other members of the Union. The most striking item of information provided by Mr John Edwards was that the United Kingdom had accumulated a surplus of no less than £80 million with the EPU countries in the month of October alone. This figure reflects not only the United Kingdom's own balance with Europe, but also that of the whole sterling area and the net figure arising out of transfer of sterling between European and other "third countries." The net credit of £80 million was financed as to £4¾ million by the use of sterling resources by other members, leaving a final figure of about £75 million to be settled through EPU. Adding this figure to the net surplus of £28½ million accumulated in the previous quarter, the United Kingdom has now reached a position at which it has discharged the whole of the initial debit of $150 million with which it was charged at the beginning of EPU, and in addition stands as creditor for about £50 million in the books of EPU. Converted into EPU units, the cumulative position of the United Kingdom for the four months is 320 million units (each equal to a US $1), of which 30 million has been met by the use of pre-July 1st sterling resources of other members, 150 million units by the initial debit, leaving 140 million units as a credit to the United Kingdom in the books of EPU. This credit position will have to grow to 212 million units before gold begins to flow to the United Kingdom. The position at the end of October for all the participants in EPU is given in the following table:—

REPORTED CUMULATIVE POSITION OF EPU COUNTRIES AT END OF OCTOBER
(Millions of Units of Account after four months' Clearings)

	Surplus(+) or Deficit(−) set against Initial Debit or Credit	Cumulative Position at end October	Cumulative Position at which Gold Payments or Receipts become Operative	Total Quota
Austria	− 10·7	Nil	14	70
Belgium Luxemburg	Nil	Nil	72	360
Denmark	Nil	− 28·6	39	195
France	Nil	+161·7	104	520
Germany	Nil	−289·5	64	320
Greece	− 53·3	Nil	9	45
Iceland	− 1·6	Nil	3	15
Italy	Nil	− 17·1	41	205
Netherlands	− 30·0	− 42·7	66	330
Norway	− 25·3	Nil	40	200
Portugal	Nil	+ 22·3	14	70
Sweden	+ 13·8	Nil	52	260
Turkey	Nil	+ 10·6	10	50
Sterling area (excl. Iceland)	+150·0	+140·6	212	1,060
				3,950

The astonishingly large credit accumulated by the sterling area in October is in part the reflection of a genuine surplus in the balance of payments, but it also reflects anticipatory purchases of sterling by European importers encouraged to make such operations by expectations of a revaluation in the sterling rate. Even allowing for this fact, however, it is evident that the sterling area's balance of payments with Europe is now running at a considerable and perhaps an undue surplus.

* * *

Europe's Sterling Balances

Mr John Edwards, in the course of the debate on the EPU bill, brought up to date the published data on sterling balances held by other members of the Union. The total of these balances amounts to some £200 million, representing the sterling held by central banks and monetary authorities, but excluding balances held by or with commercial banks. The French balances now amount to some £28 million. They will be used for meeting instalments of French governmental debts to the United Kingdom which fall due in 1950 and 1951. Italy's balances of nearly £60 million are to be repaid by £20 million over two years in accordance with a plan which, however, will only be put into operation if the

Italians so wish. Portuguese balances amount to rather more than £80 million, and discussions are now in progress regarding their disposal. The only other substantial holder of sterling is Sweden, whose balances amount to about £22 million. No decision has been made as to its disposition, the position being held for review next year. Mr Edwards reminded the House that all these balances could be used by the members concerned to meet their deficits with the EPU and he referred to the undertaking of the Economic Co-operation Administration that it would indemnify the United Kingdom against any loss of gold that might be incurred through EPU as the result of such use of these resources. Given the extent to which the United Kingdom has been building up surpluses in Europe it is improbable that this guarantee will have to be implemented.

On the other side of the account the amounts owing to Britain by other members of the Union include debts of £24¼ million by Denmark, £8 million from the Netherlands and £2½ million from Norway. Satisfactory arrangements have been made for dealing with the repayment of these amounts. One of the more interesting items of information given by the Economic Secretary to the Treasury related to the reversal in the United Kingdom's payments relations with Switzerland. On June 30th last an appreciable sterling balance was held on Swiss account in London. By the end of October this had been converted into a debt of £4¼ million owing by Switzerland. This is the most striking illustration of the way in which sterling has recently hardened in those parts of Europe where previously it was most soft.

* * *

French Budget Crisis ?

By well-established postwar tradition, December and January are the months in which the shadow of the budget brings French Government crises to a head. This year promises to be no exception. According to present estimates, the French Treasury will have to meet a deficit of not much less than 550,000 million francs (over £550 million), next year. This estimate is apparently largely independent of an expected increase in defence expenditure (which, it is hoped, will be largely financed by American aid). The deficit will be caused by the two usual thorns in the Treasury's side—the growing salary bill for the Civil Service and losses on the railways and other nationalised enterprises. The proposals that have passed the Ministerial Council, the first and easiest hurdle the budget has to surmount, aim at raising £194 million of new taxes (mostly by higher company taxes and death duties) and at securing the other £326 million by loans.

There are three points that should be emphasised at this stage before the issues involved become lost in the cloud of political battle. The first is that France does not necessarily need to run a genuine budget surplus in order to bring intended savings and investment into the present state of tolerable (though inflexible) equilibrium. Although some industrial enterprises may be drawing upon accumulated savings for new investment, this net dis-saving in one sector of the private economy is probably more than offset by private savings that are still disappearing into peasants' stockings and other unproductive repositories. The second point is that although a small French budget deficit might be economically justifiable this year (and a still smaller one justifiable next year), such a deficit is not easy to square with the French constitution. There is a rigid limit on Government borrowing from the Bank of France. In recent years, the strains that would have been imposed by this limit have been lessened by the expedient device of ploughing Marshall Aid counterpart funds into the budget as governmental receipts. This device will again be resorted to in the year ahead, but it will not erase the whole deficit. M. Petsche, the Finance Minister, hopes to cover the deficit by raising new loans from the public ; in view of the weak state of the French capital market it is improbable that he will be able to raise such loans at home, and he may, therefore, be expected to press forward with his proposal for the floating of a common defence loan in the capital markets of all the countries joined in the North Atlantic Pact. The third point is that any attempt to close the budget gap by increased taxation has to steer clear of two perennial French fiscal rocks: first, in a country with so high a proportion of self-employed, income tax is widely avoided ; secondly, and in consequence, indirect taxes have been pushed in recent years beyond the point of economic returns. The crisis is likely to be more than usually serious this year, for if inflation is to be avoided the budget gap must be whittled down or France's hard-won price stability will go by the board.

* * *

Permanent Settlement with Egypt ?

A financial delegation from Egypt is due to arrive in London this week-end to negotiate a " permanent settlement " of the problem of Egypt's sterling balances; it will be joined at the beginning of next week by the Egyptian Foreign Minister now on his way back from Washington. Since negotiations with Egypt for a temporary settlement (for the year 1950 only) dragged on for nine weary months until September, there is a certain dread in London of what the word " permanent " implies. This dread may, however, underestimate the beneficial effects of the removal of the negotiations to London from the more highly charged atmosphere of Cairo.

Egypt's sterling balances have been falling rather sharply this year. At the end of 1949 Egypt held £64 million in its free account and £253 million in its blocked account; about £30 million of these blocked balances, however, appear to have had release rights still attached to them. At the end of August, 1950, Egypt's holding in its free account had fallen to £42 million and that in its blocked account to £238½ million ; the interim agreement finally reached last September allowed Egypt to draw up to £18 million from its blocked account in 1950—or such less amount as might be needed to maintain its unblocked balances at £45 million. The September agreement did not extend to Egypt the right to buy any dollars from the sterling area central pool, as the 1949 agreement had done (to the extent of £5,000,000). In the last year, however, the Egyptians have devised a new scheme for securing imports from hard currency countries. The latest bulletin of the National Bank reveals that turnover in the Egyptian " export accounts " system reached £5,000,000 in the first half of 1950. The greater part of this turnover, according to the bank, represented imports of hard currency goods brought into Egypt through soft currency markets—and paid for by credits to export accounts; the funds in these export accounts, which were being traded in Tangier at a discount of only 6 per cent in August, can be used in payment for Egyptian exports. The " export account " system is not intrinsically important but the fact that Egypt still finds it worth while to buy dollars at a discount in this way lends colour to reports that sterling convertibility, and not sterling releases, may be the first demand on its delegates' agenda.

German Debt Moves

The Bonn Government has recently been informed of the proposals made by the allies for modifying the Occupation Statute. The implementation of these proposals is conditional upon an assurance from the Federal Government that it acknowledges its obligations regarding the external debts of the former Reich, and also those incurred through the aid which the Republic has received during the past four years from the Western allies. These debts include the German bonds held by British holders and the standstill debts owing to British banks. The total external bonded debt amounts to £90 million, while standstill debts are still outstanding to the amount of above £46 million. In the recent financial negotiations with Germany, considerable pressure has been exerted by British negotiators for a reasonable settlement of these two items. After the first world war Germany recognised and paid in full the principal on its bonded and banking debts, but was forgiven arrears of interest. Similar treatment would be well up to the most hopeful expectations of Germany's creditors on this occasion. A considerable change, however, will be needed in Germany's balance of payments if the service on these pre-war external debts is to be resumed and the capital debt honoured.

* * *

Part Payment by Brazil

The Chancellor of the Exchequer announced in the House of Commons this week that the Brazilian authorities were about to devote £10 million of their sterling resources towards the liquidation of commercial debts owing to firms in the United Kingdom and that Brazil hoped to settle the remainder of these arrears early next year. This is a welcome announcement but it raises two questions. How have the Brazilians put their hands on £10 million of current sterling? And what is the bigger fish the Brazilians hope to hook with this large bait? Brazil certainly appears to have nothing like £10 million of current sterling though it may have nearly three times that figure in the remnants of the blocked account of £50 million which was immobilised following the financial agreement of 1947. By that agreement £10 million was to be released from this blocked account in the four-year period to April, 1951. In addition to this release Brazil has utilised over £17 million of blocked sterling to repatriate its sterling bonds. These expenditures after the operation of the exchange guarantee would leave almost £30 million in the blocked account to be used for further repatriation of Brazilian bonds and for any other purposes sanctioned by the British Government.

The £10 million needed for payment of overdue commercial debts has been mobilised partly out of Brazil's current account, by a special release of £1,000,000 from the blocked account, and as to the balance of about £6,000,000 by dollar swap operations arranged with banking houses in London, involving spot sales by Brazil of dollars against sterling matched by a six months' repurchase of those dollars. In order to provide sterling to repurchase the dollars six months hence, Brazil will take measures to add to its sterling resources, including the diversion to sterling markets of goods now exported against dollars. The operation suggests that Brazil is at the moment more flush with dollars than sterling, which is not surprising given the recent orientation of its foreign trade. Dollar income from exports of coffee at the present exceptional price for the commodity is running at a high level even allowing for the small size of the latest crop. The main obstacle to an expansion of Brazilian exports to sterling countries is not that the goods are " inessential "—for they include cotton, coffee, cocoa, timber and hides—but that at the present artificial rate of exchange for the cruzeiro they are inordinately expensive. The best measure that Brazil could take to restore order in its balance of payments would be to adjust its rate of exchange closer to the economic parity.

* * *

£1,000 Million in Trustee Savings

The Trustee Savings Bank movement has this week been celebrating the attainment of £1,000 million of deposits. During the past three years, while other forms of small savings first flagged and then fell, the Trustee Savings Banks have been going from strength to strength. Their remarkable performance has been due to a variety of factors. In the first place they are particularly strong in Ulster and Scotland, both areas where present prosperity shows an especial advance above prewar levels. Secondly, Trustee Savings Banks are essentially the " home town " bank of the small saver ; their disadvantage against Post Office Savings Banks has been that money cannot so easily be withdrawn in areas other than those in which it was originally deposited. It is not surprising that the large floating population in the war years tended to save instead through the Post Office Savings Bank, so that the Trustee movement then fell relatively, though not absolutely, in importance.

Thirdly, and most important, the Trustee Savings Banks offer many more subsidiary banking facilities than the Post Office Savings Bank can provide. Many accounts in Trustee Savings Banks are held by friendly and charitable societies and by trade unions. Some Trustee Savings Banks accept securities and valuables for safe custody and others will handle payments of rates on behalf of local municipal authorities. In addition, withdrawals can usually be effected on demand without the short notice that is required by the Post Office for sums in excess of £3 ; and the special investment departments of the banks (in which many depositors who have exceeded the £2,000 ceiling on deposits hold their savings) maintain close touch with their own localities through mortgage loans to local authorities. It is in fact on the " local " touch that the strength of the movement is largely based. Each bank is under the direction of local —and unpaid—trustees and managers. These trustees have considerable personal discretion in the banking (as distinct from the central investment) activities of the local banks and it is largely on their initiative that a countrywide scheme is now successfully in operation whereby banks in established areas put out funds on loan to banks in areas where the association's activities are not so fully developed.

Industry and Commodities

Shortages Already?

Material shortages due directly or indirectly to rearmament are already affecting some sectors of industry, and certain firms are also meeting direct competition for labour from defence production. For sufficient reasons that it is now fashionable to condemn, any industrialist who can lay hands on supplies is building his own stockpile. Such buying can have made only a small contribution to the international shortage of base metals, but it is beginning to produce a shortage of most forms of steel, apart from sheet and strip which have long been short. Metal supplies are being guaranteed to the Royal Ordnance factories—and presumably to other factories handling defence orders—and these, in preparing for capacity production, are beginning to attract workers from light engineering firms in areas such as Leeds and Nottingham.

Despite the Government's insistence upon priority for dollar exports, material shortages are making it impossible for certain firms to fulfil orders gained at Toronto this year ; and two firms in Yorkshire are reported to have decided to close factories for lack of materials. The present spate of restocking leaves the small firms with limited liquid capital less able to compete with bigger manufacturers building up inflated stocks, and some are beginning to look back wistfully to the days of controls. To starve smaller firms of materials and labour to assist rearmament would be an intelligible policy, if hardly a reasonable policy at this stage. But industry in general is receiving no indications that the Ministry of Supply is pursuing this policy, or indeed any other. As Sir Robert Sinclair, President of the Federation of British Industries, emphasised last week, industry as a whole feels the need for the fullest information about the

broad implications of defence production that is already being provided for some sectors. Present difficulties are enough without any accentuation caused by lack of timely guidance.

Questions from Knockshinnoch

On August 29th, when a shot fired in No. 5 Heading of Knockshinnoch Castle Colliery blew through the top of the coal seam into clay, nobody at the coalface, or in the colliery office, knew that the heading, which was being driven upwards at a sharper angle than planned, was only 45 feet below ground level. A survey was taken and the depth ascertained ; but the survey did not show that in the 38 feet of cover above the rock there was an unusually thick layer of soft, dangerous peat moss. Operations were therefore resumed, with extra safety pillars ; water leakage through the shothole did not appear to those in charge to indicate any danger. On September 7th, after an exceptionally heavy rainstorm, the heading roof fell and 50,000 to 80,000 tons of moss and liquid matter poured into the mine workings, burying 13 men and entombing 116 others until they were rescued through an adjoining mine two days later.

The full story of the Knockshinnoch disaster, as outlined in the evidence of witnesses at the inquiry which concluded last week, contained reminders of the everyday heroism that the miner can always be counted upon to produce at appallingly short notice. It also raised important questions about colliery planning and control. It would be most improper to anticipate in any particular the report which the Chief Inspector of Mines, Sir Andrew Bryan, will produce, but it may be useful to refer to some of the points that it is his duty to elucidate and weigh.

It appeared from the evidence that planning of this working—completed without taking into account the Geological Survey map's markings of surface moss in the area—assumed that the heading would stop 100 feet below the surface. According to the colliery manager's account, this plan was altered by "higher-ups" who decided to work the coal to its limit and take the heading through to the surface as an airway. Questions concerning liaison and responsibility in such matters seem inevitable. Apart from the special circumstances of the Knockshinnoch disaster, however, the Chief Inspector has to consider its bearing upon mining practice and regulations. If the presence of moss in surface strata is suspected, the law requires that the nature of the cover must be established (usually by boreholes), when workings approach within 60 feet (or ten times the thickness of the seam) of the surface. If moss is not suspected, there are no such working limits ; and evidence tendered at the Knockshinnoch inquiry alleged that there were no surface clues that would have led even a trained geologist to deduce its presence from walking over the grassy surface. The Ayrshire inspector of mines, asked what steps should be taken to prevent any future disaster of this sort, suggested that surface testing should be carried out above all workings within 150 feet of the surface. The specific depth required is a question for experts, but it is hard for an outside observer to quarrel with the principle suggested. Knockshinnoch is only the third disaster arising from working under moss since the beginning of the century ; but subsidence—fortunately less dangerous in most cases—is no new phenomenon in mining districts.

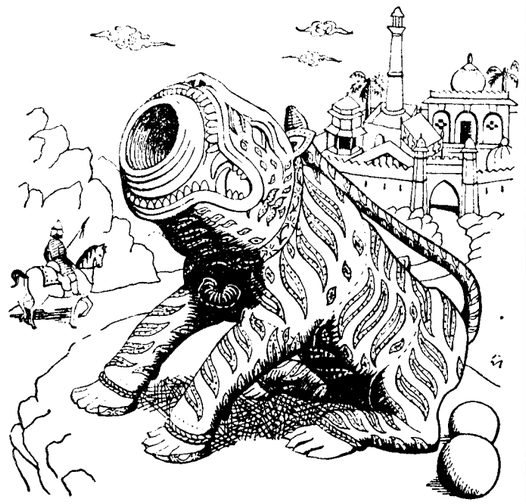
* * *

Scarcity of Sulphur

The sulphur shortage may well be the most pervasive—and perhaps even the most serious—raw material shortage at present confronting industry. Output of sulphur largely determines the supply of sulphuric acid, and any shortage of sulphuric acid would be quickly felt in industry. The United States is the largest producer ; it accounts for 90 per cent of world output and for almost the whole of world exports. According to official statistics, output has expanded from 2,600,000 tons in 1940 to nearly 7,000,000 tons this year, though trade circles suggest that present output may in fact be running nearer 5,000,000 tons. Existing deposits of sulphur are being rapidly exhausted, and despite the search for new deposits none has been found. Last year American sulphur producers suggested that exports should be curtailed but the warning went unheeded.

Meanwhile, the new rearmament programmes have further boosted the demand for sulphur and the American Government, again under pressure from the producers, is considering the curtailment of exports next year. This reduction, if it is ordered, is unlikely to be less than 35 per cent, and a cut of this size would mean total exports of less than 800,000 tons; Britain alone has purchased 460,000 tons from the United States this year. One American producer of sulphur has already cut supplies to domestic users by 20 per cent, and American stocks at the mines are believed to be little more than 2,000,000 tons—say half the quantity held at the outbreak of war.

Next year Britain will have difficulty in securing more sulphur for acid production than roughly 250,000 tons due under existing contracts with American suppliers. The acid producers are using 380,000 tons this year, and the 120,000 tons of "regular" sulphur used for purposes other than acid production may be cut even more severely. Nearly 60 per cent of the sulphuric acid output in this country is produced by burning sulphur ; a 35 per cent reduction in sulphur supplies would cut the present output of acid from about 1,800,000 tons a year to roughly 1,450,000 tons. This vital reagent, which has its use in almost every industry, has been informally rationed for several months and some users' orders have been cut by as much as 50 per cent. This step was taken to remedy a localised shortage of capacity on Merseyside, where certain plant is being rebuilt and converted to use alternative raw materials. The Government's reaction to the sulphur shortage itself has been to close certain of its own acid plants and to suggest economies in the use of acid for fertilisers (which ordinarily take nearly half of acid output) by importing superphosphate. A general conversion of the sulphur-burning plants to use pyrites has been the Government's long-term policy for the industry since the war ; but production from pyrites is costlier than production from sulphur, requires twice the capital investment and takes up twice the ground area, which is often a limiting factor. Moreover, conversion may put a plant out of production for the best part of eighteen months.



Britain's present degree of dependence upon sulphur dates from the war, when new capacity was set up to handle sulphur from Allied sources and to reduce the dependence upon pyrites from Spain. Certain large firms like Courtaulds, which produce sulphuric acid for their own industrial purposes, are switching back to production from pyrites in accordance with the change in Government policy. But firms producing for sale have in general been unable to invest large sums for conversion to this less efficient process. These are the suppliers whose lower output will affect the wider range of industrial customers, and even if conversion to production from pyrites is actively started immediately, the sulphuric acid shortage and its repercussions upon industry are not likely to be overcome in less than two years.

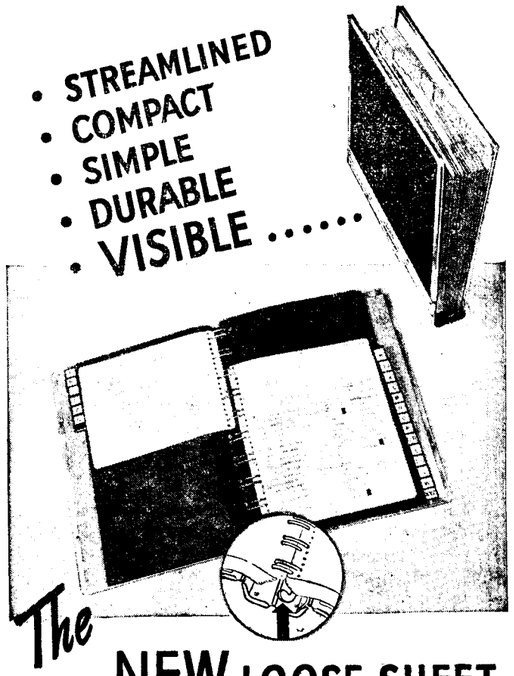
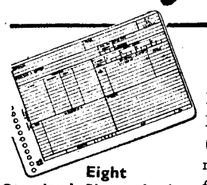
Buoyant Exports

Exports last month achieved a new record of £202 million. This total reflects in part the seasonal recovery after holidays, but the steady rise in the value of exports since the last quarter of 1949 shows that the impetus of the export drive has been well maintained. This rise is reflected in the



COPPER



NEXT to iron, copper is the most useful metal in the world today. Millions of miles of copper wire and cable carry the electricity that drives motors and transmits messages from one end of the earth to the other. It is made into fireboxes for railway engines and, alloyed with zinc or nickel, into condenser tubes for steam generators in power houses and ships. Alloyed with zinc, copper forms brass, which has a thousand uses from curtain rails to cartridge cases. Alloyed with tin, copper becomes bronze, the alloy that makes springs, statues and heavy duty bearings. Copper was the first metal used by primitive man as he emerged from the Stone Age. When the Romans came to Britain, copper was already being widely used in the form of bronze. Mining and smelting were being carried out in Cumberland, Anglesey and North Wales. Today most of the world's copper ore is mined in Africa and the Americas.

I.C.I., which is the largest producer of wrought non-ferrous metals in the British Empire, manufactures vast quantities of copper and copper alloys in forms varying from printing rollers to coins.

ICI

NEW LOOSE SHEET SYSTEM *for* STOCKS

Eight Standard Shannoleaf Loose Sheet Records

Standard printed forms are available for practically all purposes (though specially-printed-to-your specification forms are quickly supplied). Standard forms mean lower price and quicker delivery. Among these are : PURCHASE RECORDS—STORES & STOCK CONTROL—SALES & PURCHASE LEDGERS—HIRE PURCHASE LEDGERS—SALES RECORDS—CASE & CONTAINER RECORDS—PLANT & MACHINERY RECORDS — PERSONNEL RECORDS.

Here is a new system of visible records. It is perfect for the control of stocks (among many other purposes). Each record has an overlapping visible edge—for quick sighting, posting and reference. One clerk can handle 500 to 15,000 records. The binder is streamlined and is only 2¼" thick—the slimmest system ever made. Removal and replacement of any record is done by a simple flick of the trigger—no keys, no cumbersome mechanism. Each record is firmly held in position and cannot be mislaid. Each has a perfectly flat writing surface. Just write "Shannoleaf" on your letterheading and send it for further details of this new and latest method of control.

FOR YOUR INVESTMENT PORTFOLIO

THE investments offered by the Co-operative Permanent Building Society are of immediate interest to private investors and their financial advisers.

Individual investors may invest up to £5,000 maximum which earns 2½% per annum with income tax paid by the Society.

Capital never fluctuates in value, and is solidly secured by first mortgages on private houses throughout the country. The Society's Funds are in excess of £60,000,000.

Detailed literature and a copy of the latest balance sheet will gladly be sent on request to the Co-operative Permanent Building Society, New Oxford House, London, W.C.1. Telephone: Holborn 2302, or City Office: 163 Moorgate, E.C.2. Telephone: Monarch 3556/7

ESTABLISHED 1884

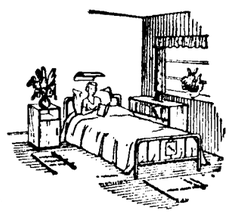
ASK THE MAN WHO KNOWS

Business men and bankers who have visited Australia or New Zealand will tell you that the best medium for facilitating trade with those countries is the Bank of New South Wales — largest commercial bank there.

You are invited to use our specialist services through your own bank.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817 HEAD OFFICE, SYDNEY, AUSTRALIA



LONDON OFFICES: 29 Threadneedle Street, E.C.2, and 47 Berkeley Square, W.1

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

Which would you choose in the event of illness?

PRIVATE TREATMENT OR GENERAL WARD!

The National Health Service ensures that everyone receives medical and, if necessary, hospital treatment in the event of illness or operation.

To many people, however, the necessary formalities, the waiting and, finally, treatment in a general ward, are disconcerting both in anticipation and in practice.

To such, the B.U.P.A. offers an inexpensive alternative. For a moderate annual subscription, graded to suit individual means and requirements, members can make their own arrangements for speedy and private treatment in nursing home or hospital paybed and the whole or major portion of the expenditure is refunded by B.U.P.A.

In view of the fact that serious illness or the need for operation so often strikes without warning, it is no more than obvious wisdom to safeguard yourself and your family without delay. A brochure giving full particulars will gladly be sent on request.

BRITISH UNITED PROVIDENT ASSOCIATION

President: The Viscount Nuffield, G.B.E., F.R.S.

Ref. 23/77

61, BARTHOLOMEW CLOSE, LONDON, E.C.1.

Branches throughout England, and in Scotland and N. Ireland

following table which recalculates the value of British exports on the basis of a standard month of 26 working days:—

BRITISH EXPORTS (£mn)
Recalculated on 26-day month.

	1949	1950
Jan.-March average	153½	174
April-June average	152	178½
July-September average ...	141	181
October	156	202

The daily rate of exports in October was 12 per cent higher than in the third quarter of the year and 15 per cent higher than in the first half of the year. The volume of exports for October has been provisionally estimated at 177 per cent of the 1947 average compared with 161 per cent in the third quarter and 155 per cent in the first half of this year.

The most encouraging feature of the export drive in recent months has been the expansion in overseas sales of textiles. Exports of wool manufactures totalled £14.4 million, a little over 30 per cent higher than the monthly average for the first nine months of 1950 and 66 per cent higher than the average for 1949. Canada has remained the chief market followed closely by Australia and the United States. Cotton exports totalled £15 million, representing a rise of 13 per cent on the monthly rate achieved in earlier months of this year but still 6 per cent smaller than last year; Australia, British West Africa and South Africa are the three largest markets. Exports of other textiles and apparel have also increased, particularly to dollar countries. The United States has in fact become Britain's largest market for apparel and is followed closely by Canada.

Vehicles and machinery, the two main export groups, are still showing ability to expand. Vehicles alone totalled £36.7 million. The number of new cars and chassis exported last month was 36,791 or 15,000 more than the monthly average for 1949; Australia and Canada continue to be the two principal markets and take between them nearly half of the total export. Machinery exports at £27 million were 16 per cent higher than last year's average; machine tools and textile machinery were the only classes of which exports last month were lower than in the third quarter of this year. Among the smaller export groups, the outstanding achievement was in iron and steel. In October 302,000 tons were exported valued at £14.7 million. This was the largest quantity shipped abroad since 1930. Canada became the second and the United States the fifth largest market during the month.

* * *

Scramble or Control?

The continued scramble for commodities which has now spread from the staple products to the minor minerals and metals might well cause serious disruption to the rearmament programmes of Western Europe. The Organisation for European Economic Co-operation has been reviewing world commodity supplies for the past month and its report will be presented to the Council of Ministers on December 1st. This study covers all the major commodities including those which the United States imports on a large scale. The ministers when they meet are expected to take action on the recommendations of the report and private discussions between member countries have already taken place.

This week Mr Petsche, the French Finance Minister, has visited London to elucidate Britain's attitude to the possible introduction of allocation schemes. So far the Government has been content to support proposals for investigating shortages, but has been careful not to commit itself to any specific policy. It shrinks from the idea of a joint commodity policy and prefers to negotiate about each commodity separately at different conference tables. This has certain conveniences. It is possible to present one view on, say, wool and an entirely different one on, say, tin. Two months ago Britain in conjunction with the main Commonwealth wool exporters offered the United States preferential treatment for the purchase of wool for military purposes. Last week at the tin conference in Geneva, Britain refused to accept the principle that defence purchases should be treated differently from ordinary market purchases.

Few countries want to see the international commodity markets closed. But there is at present a clear argument for easing the prevailing strains on the price mechanism by some measures of domestic regulation and international allocation of key materials. Such measures, however, are only likely to be effective if co-ordinated action is taken by all members of Western Europe and by the United States, and if they cover domestic supplies and also exports to other countries outside the area of agreement. The Government will clearly have to make up its mind within the next few days whether it prefers to see the scramble for commodities continue or whether it is willing to lead Europe towards some concerted policy. British industry itself has none too large stocks at its diposal. Mr Gaitskell has recently admitted that stocks of raw materials (excluding petroleum) in Britain fell by £30 million in the first half of the year and even if stocks have since been built up, much higher prices have had to be paid for them. It may well be that physical stocks of raw materials are now much lower than they were a year ago.

* * *

Tin Talks Break Down

The tin conference has failed. Four weeks of hard bargaining in Geneva on the draft agreement (which was intended to stabilise the tin market by regulating exports and production and by a buffer stock) has merely shown more clearly the opposed views of producing and consuming countries on how a commodity control scheme should work in the postwar world. Malaya championed the producers' cause—with the support of Britain. The United States championed the consumers' cause. Disagreement persisted on the three main issues that the conference was intended to reconcile: the operation of the agreement, the size of buffer stocks and the range of prices to be aimed at.

In the eyes of tin producers, export quotas and restriction of output were the mainstay of the agreement, and the buffer stock was intended to be no more than a useful mechanism to achieve final adjustment between supply and demand. The United States held quite the contrary view. The American delegation argued that the buffer stock should be a governor relating supply to demand, and that export quotas should provide the necessary reserve of control to prevent the buffer stock from becoming unwieldy. Thus, the American delegation considered that the buffer stock should be large—30,000 tons—and that only when this stock had accumulated should output be curtailed. Malaya and other producing countries first thought of a buffer stock of about 10,000 tons and finally went up to 25,000 tons, but they would go no higher.

Disagreement on the proposed price ranges was even sharper. The United States proposed a minimum price of 70 cents a lb and a maximum of 80 cents, compared with the current market price of 145 cents a lb. But it must be remembered that the scheme, if it had been accepted, was intended to operate for five years, and the present market price probably bears no relation to the price that might obtain in 1956. Producers thought in terms of 110 cents a lb minimum price and 125 cents maximum, although the Belgian Congo delegation at one point conceded 90 cents a lb as their lowest offer for the minimum price.

But the hardest bargaining of all was about stockpile requirements. The United States is worried about its small reserve of strategic materials, despite an annual expenditure of nearly half a billion dollars in the past four years. It contended that stockpile purchases should be made from

the buffer stock at current market prices, with the corollary that output could not be restricted until defence requirements had been met. Britain and the producing countries refused to accept the principle that defence requirements should receive any preferential treatment over civilian requirements. Britain's attitude is surprising, for it comes very soon after the United States had been offered pre-emptive buying rights for wool used for military purposes.

* * *

Reconsideration for the Rubber Tax

With the cautious air of a man who has just backed into a hot stove, the Malayan Government is now prepared to re-examine the new export tax on rubber, which it announced a fortnight ago. The rubber trade has registered strong disapproval of the new tax, which could jump as much as 700 per cent in one year, and which operates in such a way that it might easily exceed the total cost of production in any one quarter. The Singapore Chamber of Commerce, the United Planting Association of Malaya, the Rubber Growers' and Rubber Trade Associations of London and other rubber groups have bitterly protested against the levying of a tax with such a delayed impact on a commodity which comprises 60 per cent of all Malayan exports. As this issue was going to press, a hitch was reported in the negotiations on the modification of the tax. But it is unlikely that the tax will be imposed in its present form.

The new tax might well be the final straw for Malaya's overloaded transport and warehousing facilities. Exports of Malayan-grown rubber are running at about the same rate as last year, but total exports of all types of rubber in October hit a record level of 120,000 tons. Much of the increased volume comes from re-exports from Indonesia, where growers

RUBBER PRODUCTION AND EXPORTS, 1950

	Malaya		Indonesia	
	Production	Net Exports	Production	Net Exports
January	61,967	58,092	32,188	22,185
February	50,194	51,941	34,779	24,932
March	49,751	62,225	47,845	49,670
April	48,172	56,948	55,309	60,039
May	55,721	46,088	57,841	62,086
June	56,659	32,031	66,445	65,551
July	67,665	62,135	63,584	71,985
August	64,694	61,325	66,972	67,212
September	60,872	55,678	64,340	65,251

who had been hoarding their rubber until the government stabilised the currency have been selling their accumulated stocks on the market. If this flood of rubber is further swollen by a rush on the part of Malayan growers to export their stocks before the new tax goes into effect on January 1st, there may be neither ships nor warehouses to handle it all.

So far, ocean-going liners which normally carry rubber from Malaya to Liverpool have been able to take the extra tonnage. But much of the increased exports from Malaya has been carried in coastal vessels to China, which has sharply increased its purchases of rubber since the outbreak of the Korean war. Shipments from Malaya to China last April totalled only 250 tons; by October they had jumped to 12,000 tons a month. But, as shipping space is limited, London agents of the rubber-carrying lines are advising importers to make reservations for cargo space now.

Meanwhile, Indonesian production, aided by high world prices, continues to expand. The rate of increase in both production and exports is shown in the accompanying table. Next year Indonesia will be a serious competitor to Malaya and its producers will not be burdened with a high export duty of the kind proposed for Malaya.

Aviation Insurance Losses

Four aircraft disasters in quick succession—two of them in the London area—at the very beginning of the winter are a sharp reminder of the continuing hazards of flying in poor weather. Some 160 passengers and crew were killed in these four catastrophes and the loss to the aviation insurance market has been substantial. The Dakota which crashed a month ago at Mill Hill was insured for £15,000; the Viking wrecked in dense fog at London Airport a few days later for £35,000; and the Skymaster lost this month in the French Alps for $175,000. The Air India Constellation which was wrecked on Mont Blanc was insured in the first instance in India, but the London market was interested in the surplus over the original high value cover. An even more costly loss was that of the Tudor V aircraft which crashed at Llandow last March with a very heavy loss of life. This machine was valued for insurance at £80,000.

These accidents will cost aviation underwriters much more than the insured value of the aircraft alone. Aviation cover normally includes third party liability (including damage to property on the ground) legal liability to passengers and the insurance of freight. The importance of the freight risk is illustrated by the disappearance of diamonds worth £75,000 from the wreck of a Skymaster which crashed in the Middle East last spring. When aircraft are flying between two countries the liability for injury to passengers is limited by the Warsaw Convention of 1932 to a maximum of rather less than £3,000. Personal accident policies are also commonly effected for substantial sums. The full extent of these additional liabilities will not be known for some time, but it will undoubtedly be large. The present-day capacity of the market is, however, adequate to absorb a succession of losses such as those which have recently occurred.

The British aviation insurance market now comprises two specialist companies, owned by a number of the largest British insurance companies, a number of underwriting syndicates at Lloyd's and a few of the insurance companies which maintain specialist aviation departments. Other insurance companies and Lloyd's underwriters cover part of each risk, which must as a matter of prudence be reduced to quite small sums for any one insurer.

Some modern aircraft are very valuable. The Boeing Stratocruiser has the largest insured value—$1,700,000, or over £600,000 at the present rate of exchange. American airlines usually require cover of, say, $2,000,000 for third party risks on this type of aircraft, and the same amount in respect of passenger liability; this makes the rather startling sum at risk on one Stratocruiser of £2,000,000, not including freight insurance and personal accident cover.

American aviation business forms a large proportion of the whole, as with other classes of insurance. Since the war there has been severe competition between British and American aviation insurers and also within the British market. As a result, rates were forced down to an unremunerative level, and aviation insurance has been run at a loss in the last two or three years. There should now be some hope of improvement, for rates, after being firm for some months, are now hardening.

* * *

Shell's Programme Under Way

The new distillation unit at the Shell Petroleum Company's Shell Haven refinery on the Thames came into operation last week. It is producing now at an annual rate of 1,450,000 tons a year; its full capacity is approximately 2,000,000 tons a year. The original refinery, which is still working, has a capacity of 800,000 tons a year. This section of the plant has been fed with crude oil from Venezuela, producing mostly lubricants and bitumen products, but it can now operate on feed stock from the new distillation unit. For the production of lubricants, however, it will still be necessary to import a limited tonnage from Venezuela.

The new unit took two years to build, and has come into operation six weeks ahead of schedule. The original plans for the extension were modified early this year and some units were postponed, reducing the capital cost to $34 million (in sterling and dollars), and the assistance provided by the Economic Co-operation Administration in its construction was reduced by three-quarters to $2,500,000.

The first of the 28,000-ton tankers in service, the *Velutina*, can get as near to this refinery as Thames Haven, and it recently brought the first cargo of Middle East crude. Three more tankers of the same size are on order; until the Manchester Ship Canal Company's new oil dock is completed in 1952 the second big Shell refinery at Stanlow can be reached only by 12,000-ton tankers. When the new dock, which will be linked to the refinery by a seven mile pipeline, comes into operation it will be able to handle all four big tankers simultaneously. Stanlow began working a year ago, and is now producing at an annual rate of more than a million tons; when it is completed in 1952 its annual capacity will be 3,000,000 tons.

Shorter Notes

Both the Commercial Bank of Scotland and the National Bank of Scotland show a small increase in deposits and net profits in the year to end-October. The Commercial Bank's deposits have risen by about 4 per cent to £118 million and its net profits by about 5 per cent to £415,621. The National Bank's deposits have risen by about 1½ per cent to £96.3 million and its profits by 2½ per cent to £300,812. There, is, however, no common factor in the changes in the assets held by the two banks. The Commercial Bank shows a small decline in its holdings of investments and commercial bills and a small increase in its advances and floating debt holdings. The National Bank shows still smaller changes in each of these assets—but in each case in the opposite direction.

*

A Portuguese arbitration tribunal has awarded the Companbia do Porto da Beira—whose share capital is owned as to 80 per cent by the Port of Beira Development Company—the equivalent of £817,000 as compensation for the expropriated properties.

*

Negotiations are in progress to merge Lautaro Nitrate with Anglo-Chilean Nitrate. The two companies have for many years been closely associated.

COMPANY MEETINGS

BANK OF LONDON AND SOUTH AMERICA LIMITED

INCREASED BUSINESS

The annual general meeting of the Bank of London and South America Limited will be held in London on December 19th.

The following is an extract from the circulated statement of the chairman, Mr. Francis M. G. Glyn: The balance sheet totals at September 30th last amounted to £191,818,647, compared with £165,852,025 a year earlier. Here I would again remind you of the incidence of any variations in the rates of exchange at which foreign currency items are expressed in sterling. The substantial depreciation that has taken place in Argentine and Paraguayan pesos has had the effect of reducing the sterling equivalents of all outstanding items in those currencies, whilst the appreciation in Uruguayan pesos and Brazilian cruzeiros has operated in the opposite direction, with the result that a fair comparison of the individual items in terms of sterling cannot easily be made. However, the increase in the total liabilities and assets does in fact reflect the increased business entrusted to us.

Current, deposit and other accounts, etc., at £105,100,753 show an increase of nearly £19 million, partly due to the variations in exchange rates but more particularly to a real increase. Cash in hand, at bankers and at call at £44,783,562 is up on last year's figure by nearly £5 million and would have been higher still but for the incidence of exchange rates. Bills receivable less rebate stood at £37,244,987 on September 30th last, compared with £32,134,497 in 1949.

PROFIT AND LOSS ACCOUNT

To the balance of £180,658 brought forward from 1949 has been added the year's net profit of £310,459. The provision for unilateral relief for double taxation under Section 36 of the Finance Act, 1950, is a welcome acknowledgment by H.M. Government of the hardships from taxation to which companies like ourselves who are operating in foreign countries have been subject in the past. At this stage, however, it has not been possible to calculate even approximately the extent of this relief, so that the above profit figure does not take such benefit into account.

A proportion of the year's profits is still awaiting remittance. This is due of course to shortages of foreign exchange on the part of various countries, or to legal restrictions. Particularly in Argentina, where we are still awaiting the remittance of profits, a new restriction has recently been imposed by Circular No. 1312 issued by the Argentine Central Bank on August 28th last, which stated that applications could be registered for the remittance of profits, etc., due after that date up to 5 per cent. per annum of the registered capital, in four equal quarterly quotas. The final arrangements, however, are still incomplete, and it is not yet clear what the exact effect of this regulation will be.

The interim dividend paid last June, together with the final dividend now recommended, absorbs the sum of £133,320, which, with a transfer of £180,000 to contingency reserve, leaves a balance of £177,797 to be carried forward.

By circular dated November 10th members were informed of a change in the date of the bank's financial year-end from September 30th to December 31st of each year, and as an additional annual general meeting covering the accounts for the three months to December 31st next will be held in March or April, 1951, the usual report will be given in March or April and will cover the 15 months ending December 31st next.

MUFULIRA COPPER MINES LIMITED

The following is an abridgment of the statement of the chairman, Mr. R. L. Prain, O.B.E., dated October 24, 1950, circulated to the members:

MR. A. CHESTER BEATTY

Last June the directors no longer felt justified in continuing to ask Mr. A. Chester Beatty to remain on the Board as chairman against his expressed wish to retire, and accordingly on June 7th Mr. Beatty resigned after 20 years as chairman of the Board.

Mr. Chester Beatty was the founder of this company, and indeed is generally acknowledged to be the main architect of what is now the great copper industry of Northern Rhodesia.

My colleagues did me the honour of inviting me to succeed Mr. Beatty as chairman

DEVALUATION

In December, 1949, agreement was reached with the Ministry of Supply whereby the price basis for Northern Rhodesian copper delivered to the Ministry would be approximately the same as the price of copper f.a.s. New York.

Neither the benefits nor the disadvantages of devaluation are reflected to any great extent in the accounts under review, owing to our policy on the one hand of selling copper forward and on the other of carrying stores and supplies to cover us for many months ahead. Both the increase in price, however, and the increase in costs should become evident in the current year.

MINE RESULTS FOR THE YEAR

The tonnage of ore mined and hoisted, namely, 3,134,493 short tons, was a record, while, in terms of copper, the production for the year was 77,048 long tons, an increase of 6,082 over the previous year.

Stocks during the year increased by 7,498 tons, that is to say, by slightly more than the increase in production, so that the net result was that sales for the year were 1,616 tons less than in the previous year. The tonnage sold, however, realised an average price of £126 7s. 0d. per long ton of blister copper f.o.b. Beira, which is an increase of £4 18s. 3d. per ton on the price realised in the previous year.

The increase in the stocks brought the stock figure up to 18,525 tons. The increase represents part of the build-up of stocks required for the electrolytic refinery.

Costs of production for the year were substantially unchanged.

Construction of the electrolytic refinery was started in April. Progress on design, delivery of equipment and construction are keeping to schedule, and it is expected that the refinery will be in a position to produce cathodes during the first half of 1952.

FINANCIAL RESULTS

The profit for the year before replacements and taxation amounted to £4,877,000. Of this profit, however, £345,000 was represented by an increase in the value of the stocks, and the directors have decided to treat it in accordance with our usual practice by transferring an approximately equal amount to the general reserve.

The other main appropriation from profits is the transfer to the provision for replacements. In view of the heavy programmes in hand and the increasing cost thereof, the Board have decided this year to transfer the sum of £700,000, which compares with last year's appropriation of £500,000.

The Board recommend a final dividend of 5s. per share which, together with the interim dividend of 3s. 6d. per share paid in May, will make a total distribution for the year of 8s. 6d. per share, which is the same as for the previous year.

On this basis the taxes payable for the year amount to £2,571,000. The cost of the two dividends is a net figure of £1,143,000 and the carry-forward is decreased by £22,000 to a figure of £183,016.

COPPER MARKET

Our copper has been sold almost entirely to the Ministry of Supply. I have referred already to the agreement reached with the Ministry with regard to the effect of devaluation on the copper price. This price will thus continue to be based on the United States export quotation, which during the year touched a low point of 16 cents per pound of electrolytic copper, f.a.s. New York and a high point of 22.50 cents. At present this price is standing at 24.50 cents. It will not, I believe, be considered an excessive increase in price, considering the movements which have occurred in other commodities and the extremely strong statistical position which still obtains for copper.

At June 30th last there ended the period during which the Customs duty on copper imported into the United States had been suspended by Congressional action. In view of the present position of copper and of the fact that the United States is still an importer of very large quantities of foreign metal, it had been expected that the duty would be again suspended for a further period by fresh Congressional action. It is a surprise to most observers, both in and out of the United States, that this has not in fact occurred. The duty has thus been effective from July 1st up to the present time. Whether it will remain in force and if so for how long is difficult to predict, but it is the opinion of trade circles that some further suspension of the duty will undoubtedly have to be agreed upon by Congress before very long. In the meantime, since most buyers in the United States are prepared to absorb the duty, either because they are short of supplies or because they are confident that the duty will in due course be again suspended retroactively, the American quotation has not in fact reflected the reimposition of the duty. Should it at any time do so, the Rhodesian producers have indicated to the Ministry of Supply their willingness to discuss the position so that the United Kingdom price shall not be artificially increased by the amount of the American duty.

FUEL

There were no interruptions during the year on account of shortage of fuel. Deliveries of coal were not up to the company's requirements, but the effect of the shortage in deliveries was mitigated by the continued intensive wood-burning efforts of the Copper Mining Companies.

Since the end of the financial year there has been further deterioration in the fuel position, and the outlook is still far from clear. It does appear, however, as if the problem may again develop, as it has done in the past, into one of carrying capacity of the railways rather than of colliery output.

WESTERN CONCESSION

Just over £9,000 was spent on an area to the west of the Copperbelt which is being prospected by Mufulira Copper Mines on behalf of itself and certain other Northern Rhodesian companies, and in which work this company has a participation of 30 per cent.

BLYVOORUITZICHT GOLD MINING

STEADILY INCREASED SCALE OF OPERATIONS

PROFIT EXCEEDS £6,000,000

MR W. M. FRAMES'S REVIEW

Mr W. M. Frames, chairman, presided at the annual general meeting of Blyvooruitzicht Gold Mining Company, Limited, held in Johannesburg on November 21st.

Moving the adoption of the report and accounts, he said that the scale of operations had increased steadily, but a shortage of European miners, particularly during the early part of the financial year and a deterioration from April onwards in the native labour strength had retarded the rate of expansion.

RESULT OF YEAR'S WORKING

Profit amounted to £6,221,518. Amounts set aside in respect of silicosis outstanding liabilities had totalled £50,737, provision for taxation had amounted to £2,397,921, provision for lease consideration had accounted for £603,412 and dividends had absorbed £3,000,000. The balance of working capital on hand had been £2,777,586.

It was estimated that capital expenditure during the current financial year would amount to approximately £1,100,000, and would be incurred principally on increasing the hoisting capacity, additional pumping equipment and compressor at No. 2 shaft, winders and power supply for incline shafts, extensions to the reduction plant, a recreation hall and housing for European and native employees.

DEVELOPMENT FIGURES

Development accomplished during the year totalled 35,741 ft., an increase of 3,101 ft, compared with the previous year. The total advance in country rock had been 16,678 ft.

Of 19,063 feet of reef development, 14,105 feet were sampled on the carbon leader and 13,740 feet or 97.4 per cent. had been classed as payable, averaging 45.4 dwts per ton over a channel width of eleven inches equal to 499 inch-dwts. The few disclosures of unpayable ore had been isolated and of limited extent.

Most of the reef development had been in the western portion of the mine. To the west of No. 2 shaft disclosures averaged the comparatively low value of 247 inch-dwt. Payable ore developed had amounted to 920,900 tons valued at 9.8 dwt. per ton, which had represented an increase of 206,700 in tonnage and a decrease of 0.7 dwt. in value compared with the previous year's figures.

AVAILABLE RESERVE

The available reserve re-estimated at June 30, 1950, had been 5,960,000 tons of an average value of 13.1 dwt. over a stoping width of 46.2 inches. That was a decrease of 176,000 tons on last year's figure, while the value had been lower by 0.6 dwt. as a result of the inclusion of several blocks of lower grade ore in the vicinity of the No. 2 shaft. There had been in addition 1,101,000 tons of ore of an average value of 12.2 dwt. contained in the shaft and safety pillars not at present available for stoping. That represented an increase of 194,000 tons and a decrease of 0.5 dwt. in the average value compared with last year's figures.

It had been possible during the year to mine more in conformity with the value of ore reserves, with a consequent slight drop in yield. Stoping operations were being extended to the west into areas where development had disclosed lower values and some further decline in yield could therefore be expected.

SHAFT SINKING, ETC.

Preliminary work in connection with Nos. A.1, A.2 and A.3 incline shafts had been continued during the year. Temporary sinking hoists were being installed and sinking operations below the sixth level had recently been commenced in A.1 incline shaft.

The quantity of water pumped to the surface during the year had increased from last year's average of 1,820,000 gallons a day to 1,945,000 a day. The pumping capacity of the mine had been increased by an additional pumping unit at No. 1 shaft and since the close of the year by the first unit to be installed at No. 2 shaft.

There had been a further improvement in mine ventilation due to additional holdings to airways to the No. 3 shaft, where a third fan had been installed on the surface.

BUILDINGS AND EQUIPMENT

The erection of buildings and equipment had proceeded satisfactorily. At the end of the financial year 736 European dwelling houses had been completed, while 65 were in course of erection. Accommodation at the staff mess had been increased from 26 to 48 rooms. Work had been commenced on the laying out of parks and playgrounds for children, and the construction of a new recreation hall would start shortly. Extensions to change houses at Nos. 1 and 2 shafts to accommodate the full complement of underground employees were being undertaken. An assembly hall to accommodate 1,200 natives had been built at the No. 1 compound and work on the No. 2 compound to house 3,000 persons was well advanced. Extensions to the hospital for natives from 120 to 250 beds had been completed.

REDUCTION PLANT

Extensions of the reduction plant from a capacity of 80,000 tons to 120,000 tons per month had been completed after the close of the financial year, and there had been a gradual increase in the tonnage milled. It would not be possible to improve the tonnage treated very materially until the 10-ton winder was in commission at No. 2 shaft. It was hoped that it would be in operation early in 1951, but the rate at which output could thereafter be expanded would depend primarily on the extent to which the underground labour force could be increased beyond the present inadequate strength and in the extent to which the Electricity Supply Commission could meet increases in the mine's power requirements.

EXACTING TAXATION

He had dealt last year with the effects of devaluation of the South African currency as from September 19 and had explained that as no unpayable blocks of ore had been disclosed in the mine, neither tonnage nor grade of ore reserve would be affected by the higher price of gold. He had also pointed out that the increase in revenue of 75s. 9d. an ounce would be offset to some extent by the various improvements in wages and benefits granted as from September 19 to European and native employees and by the higher costs of certain materials and equipment purchased from overseas. Shareholders had been warned that a considerable portion of the increased working profit would be absorbed by greater lease and taxation payments.

The actual increase in working profit during the financial year had been £3,382,175, but although taxation rates had remained the same as those in force since 1948 provision for taxation and lease consideration had increased by no less than £2,114,470, due to the exacting effect of the sliding scales of formula taxation and lease payments.

The State's share of profits would have been higher but for the substantial capital redemption allowance, which would decrease appreciably when the capital expenditure programme was completed.

CURRENT YEAR'S WORKING

During the first four months of the current financial year, tonnage milled had been 341,000, yield per ton milled 14.674 dwts, revenue per ton milled 182s. 9d., working costs per ton milled 45s. 6d., working profit had amounted to £2,340,184, to which had to be added £57,844 in respect of additional revenue from sales of gold at enhanced prices and sundry revenue of £11,707, giving a total profit of £2,409,735. Development footage had been 13,091 and 6,355 ft. had been sampled on the carbon leader, of which 6,180 ft. or 97.2 per cent., had been classed as payable, averaging 48.8 dwts. over a channel width of 12 ins. The average value of the last 100 ft. sampled in each of the three most westerly drives had been 210 inch-dwts.

Since the close of the financial year the directors had decided to abolish the use of distinctive numbers in respect of issued shares of the company, all of which were fully paid. Shareholders had been notified of that action, which had been permitted under the provisions of the Companies Amendment Act, 1950.

The report and accounts were adopted.

PRICES TAILORS, LIMITED

RECORD TURNOVER

The twenty-second annual general meeting of this Company, was held on November 21st, in London, Sir Henry Price (chairman and joint managing director) presiding.

The following is an extract from his circulated speech: The great proportion of our sales during the year have been in the utility ranges and because of this the average price and profit per garment are lower than last year. Total turnover has, however, been a record for the company and it is due to this factor that there is a trading profit for the year of £906,599.

The net profit of the group amounts to £358,304. After deducting the dividends payable to Preference and Preferred Ordinary Shares, etc., there remains a sum of £345,221 of which 40 per cent. has been appropriated as Ordinary dividend and 60 per cent. has been retained in the group.

For some time my colleagues and I have been giving much serious consideration to our trading name—The Fifty Shilling Tailors. The cost of wool and cotton has increased enormously and wages and most overheads are about twice as high as in 1939 so that it would be merely wishful thinking to expect that such a price as 50s. for a suit of clothes can ever return. We have decided that as we open new branches and renew the shop fronts of old ones we shall do so under the trade name of F.S.T.—Fifty Shilling Tailors.

Stocks are predominantly made up of utility solid worsted suitings and our full requirements are assured for some considerable time.

Trading to date in the current year shows a satisfactory increase on the corresponding period last year.

The report was adopted.

CONSOLIDATED MAIN REEF MINES AND ESTATE LIMITED

SOUND POSITION
FACTORS AFFECTING RESULTS
MR P. H. ANDERSON'S SURVEY

Mr P. H. Anderson, chairman, presided at the Annual General Meeting of Consolidated Main Reef Mines and Estate Limited held in Johannesburg on November 21st. Moving the adoption of the report and accounts, the chairman said factual information contained in the directors' report and reports of the consulting engineer and manager had been rearranged and expanded, and explanatory comments had been added so as to cover the position as fully as possible up to the date of issue. He would, however, like to give shareholders additional up-to-date information and make a few observations of a more general nature on the position and prospects of the company.

DECLINE IN LABOUR SUPPLY

Since the close of the year under review, the directors' report for the first quarter of the current financial year and results of operations during October, 1950, had been published.

The results for those four months could be summarised as follows: Tons milled 781,000, yield per ton milled 2.686 ; revenue per ton milled 33s. 5d., working costs per ton milled, 27s. 7d., working profit £228,135 and total development footage 19,144.

Compared with the results for the financial year under review, the average monthly rate of milling had decreased by about 4,600 tons, the yield was lower by 0.069 dwt. per ton and the average monthly rate of development 434 feet less, due largely to the effects of the serious seasonal decline in the non-European labour supply and to a breakdown of the rock hoist at No. 3 shaft during the early part of October. The average number of non-Europeans in the service of the Company had decreased from a peak of 11,713 in April, 1950, to 10,261 in October, or 12.4 per cent. during the last six months.

DRUM SHAFT BREAKDOWN

On October 9th, the drum shaft of No. 3 shaft rock hoist fractured. Consequences had been serious, as that was the principal hoisting shaft for the higher grade ore mined from the Main Reef and Main Reef Leader in the deeper levels of the eastern portion of the mine. As much of that ore as possible had been diverted to other shafts, but it had been necessary to curtail breaking operations in that area and concentrate on work elsewhere.

While it had been possible to maintain milling at a very satisfactory level by drawing on surface reef dumps and stepping up production from the lower grade Bird and Kimberley reefs, the grade of ore milled had, however, been seriously affected. A replacement shaft took about three weeks to machine down to the correct size, but he was glad to report that the hoist was back in commission on November 15th.

ORE RESERVE INCREASED

Apart from those setbacks, the immediate position at the mine was inherently sound. The serious depletion of ore reserves during the past ten years had been halted as a result of development in September, 1949, when 1,530,000 tons had been added to the available ore reserve. During the last financial year, the available reserve had been increased by 287,000 tons—the first normal increase since June, 1939.

It had to be borne in mind, however, that development operations were being confined to the more promising areas of the Mine as broad limits of payable zones on the principal reefs had been more or less established. Work was now largely confined to closer development in order to consolidate and open up those zones. Three exploratory winzes had been sunk to test the Main Reef Leader and the Main Reef towards the southern boundary. Exposures in depth had been generally poor.

The report and accounts were adopted.

KEYSTONE KNITTING MILLS (1928) LIMITED

A SATISFACTORY YEAR

The twenty-second annual general meeting of this company was held on November 21st, at Elstree, Herts.

Mr H. N. Lewis (chairman and managing director) presided, and in the course of his speech said:—

"The satisfactory trading result is most gratifying to all concerned in the management and operation of your company. As will be seen from the consolidated profit and loss account, the trading profit has increased by £54,409, after eliminating the profits earned by the subsidiary company prior to its acquisition ; and, adding the debt previously written off and the stock reserve credited, the total gross profit is £213,772.

SALES CONTINUE TO EXPAND

I have the pleasure of informing you that the year's sales show an increase on the previous year of 36 per cent. The provision for taxation is no less than £46,297. Such high taxation makes it impossible to retain in reserve the necessary amounts for increasing the company's working capital and for future expansion.

A dividend of 5 per cent. has already been paid on the cumulative preferred ordinary shares, and at today's meeting you will be asked to consider the payment of a further 5 per cent. on these shares, making a total of 10 per cent. for the year, and that 20 per cent. be paid to the deferred shareholders. After having made these provisions, the total undivided profits have increased by £13,831, giving a total of £65,206. I am confident that all will agree that these figures are extremely satisfactory.

The total balance sheet value of the company's assets is £536,548. To replace these at current prices would cost a much larger amount.

I would draw your attention to the item "Goodwill, Patents, Designs and Trade Marks" shown as "nil," and mention that considerable sums have been expended in maintaining the Registered Trade Mark "Keystone" throughout the world ; this is a very valuable asset.

KEYSTONE—WORLD-WIDE REPUTATION FOR HOSIERY AND LINGERIE

During the year we have succeeded in considerably extending this company's exports and making our excellent reputation world-wide. As far as future prospects are concerned, I can inform you that in the first four months of this year a further considerable increase in sales has taken place, as compared with the same period in the preceding year, and therefore an improvement in profits is confidently expected.

The report was unanimously adopted.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

LARGER PROFIT

The annual general meeting of shareholders of this company was held on November 21st in Johannesburg.

Mr K. Richardson, who presided, in the course of his speech, said:—

"The company experienced a satisfactory year ended June 30, 1950, making a total profit of £1,381,684 which, notwithstanding the provision of an amount of £125,000 for the estimated loss arising from the loan to Palmiet Chrome Mines, Limited, is £175,135 greater than the corresponding figure for the previous financial year.

After charging £591,843 for taxation, the balance of the profit available for dividend and other appropriations amounted to £789,841. A sum of £300,000 was transferred to general reserve, which now amounts to £5,000,000, while, in addition, an amount of £100,000 was transferred to investment reserve, which stands at £1,707,214, that is, approximately the same figure as last year.

THE DIVIDEND

Dividend No. 58 of 3s. 6d. per share, less United Kingdom income tax at the standard rate of 9s. in the £, absorbed £380,188, and after the transfers to investment and general reserves, there remained a balance of undistributed profits amounting to £351,929, reflecting an increase of £9,653.

The aggregate book value of investments at June 30, 1950, shows a reduction as compared with the corresponding figure for last year, but that the aggregate value of all assets remains at almost the same figure as at June 30, 1949.

Since the publication of the report and accounts, your directors, having regard to our commitments in the Orange Free State and elsewhere, have raised a sum of £2,000,000 by the private placing of an issue of 4½ per cent. unsecured loan stock, 1958/62, redeemable at 101. The terms of the issue provide for partial repayment of the stock by the application of a non-cumulative sinking fund of 2 per cent., commencing at June 30, 1953.

GOLD MINING INDUSTRY

The year under review has been a most important one for the gold mining industry and consequently for the country as a whole. With the devaluation of sterling and the South African pound, the industry has been given relief from the stifling effect of the continuous rise in the cost of production, and although the higher sterling price for gold has not solved all its problems, it has provided a welcome respite.

As a result of the greater number of Europeans and natives employed, it was possible to crush a larger tonnage of ore, so that the gold recovered for the first half of 1950 was slightly in excess of that produced during the same period of 1949, despite the fact that the yield per ton was reduced by approximately a quarter of a pennyweight.

A reduction in the value per ton crushed was to be expected and is in accordance with the general practice of the gold mining companies, which is to mine ore in accordance with the value of the ore reserves in a mine, a practice that long experience has proved to be sound. The increase in revenue per ton which has accrued since devaluation has reduced the pay limit of the various gold mines and has brought into account thousands of ounces of gold which would otherwise be lost to the detriment of all who are concerned with the industry.

The report was adopted.

HOSCOTE RUBBER ESTATES

The eighteenth annual general meeting of Hoscote Rubber Estates Limited will be held in London on December 13th.

The following is an extract from the circulated address of the chairman, Mr H. B. Egmont Hake, C.B.E.:—

The profit for the year, £66,688, shows a welcome increase over that for the previous year, £31,392. Once again taxation takes a large share, £34,571, representing 52 per cent. of the profit, as against £13,512, equal to 43 per cent. The directors have written off the book value of areas destroyed during the war, £1,919, and increased the reserve for replacement of planted areas by £15,000. They recommend a dividend of 15 per cent., leaving £17,024 to be carried forward.

EXPORT DUTY

Approximately one-sixth of the estimated crop for the currant year has been sold forward at an average of 2s. 1d. per lb. That average price will be raised by the higher prices so far ruling since July. It will, however, be drastically reduced by the predatory rates of export duty recently announced as to come into force next January. This savage scale rises to nearly 8 times the existing duty; and, so far, it is the rubber industry alone which has been singled out from the whole Malayan community to overflow the coffers of the Malayan Government, whose income without it has been increased beyond their wildest expectation from existing sources of taxation by the prosperity which Malaya is temporarily enjoying. The Rubber Growers' Association and the Rubber Trade Association have issued a joint indictment of the new rates and the foolish and dangerous mechanism of their application, and have shown the very serious effects which they will have not only on the much needed reserves of growers, but also over the whole political and economic field. Local producers also in Malaya have voiced the same indignation and alarm.

For a company like Hoscote I will only add that it is the first duty of the board to maintain the company's assets and their earning power. Just as the manufacturer has to replace his obsolete equipment if he is to remain competitive, so the grower has to replace his trees. A normal rate of replanting or new planting would be at least 2½ per cent. of the planted acreage annually, but to make up leeway lost during the Japanese occupation Hoscote is aiming at a 4 per cent. replacement of its trees. The fortuitous prices we are now temporarily enjoying concern this company mainly as a means, and the only means, by which we can achieve our aim. After the heavy rehabilitation expenses, for which we have not yet received any compensation by way of war damage, and while satisfying the proper claims of stockholders for an appropriate return on their investment, it is only out of such a windfall as this, which has come our way for the first time in a quarter of a century, that we can build up the necessary reserves to meet the cost of replanting on an adequate scale. It is therefore very unwise on the part of the Malayan Government, as well as grossly unfair, to take such a vicious slice out of this rare bounty for producers and so retard their progress towards competitive strength, which is the best safeguard of Malaya's long-term interests. I also view with alarm the inflationary effects which may result from Government spending of all this money on non-productive work, whereas producers would use these reserves gradually and in an orderly manner over many years.

HORLICKS LIMITED

SUCCESSFUL RESULTS

The annual general meeting of Horlicks Limited was held on November 22nd, at Slough, Lieut-Col. J. N. Horlick, O.B.E., M.C. (chairman of the company), presiding.

The following is an extract from the circulated statement by the chairman:—

It gives me much pleasure to present to you formally the accompanying report and accounts in respect of a year which, having regard to conditions generally, can on the whole be regarded as one of considerable achievement. Substantial evidence of this is provided by the Consolidated Profit and Loss Account from which it will be noted that group profits, before taking into account miscellaneous income and charges, amounted to £598,342, which compares with £472,070 for the previous year, an increase for the group of £126,272.

EXPANSION OF HOME MARKET

The greater availability of milk, our principal raw material, has enabled us to continue with considerable success the process of expanding the home market. Most of the parent company's export markets, despite licensing and exchange problems, have also been well maintained. Successful results have likewise been achieved by some of our subsidiaries, although trading conditions in the U.S.A. and Australia have presented many problems.

After taxation at home and overseas, which on this occasion includes the establishment of an equalisation reserve to provide an even spread of the initial allowance for depreciation now operative, the remaining group total is £174,661.

Transfers to other reserve accounts of £108,423 and provision for net dividends of the same amounts as for the previous year leave a balance to be carried forward of £102,721, after bringing into account the amount brought forward from the previous year.

We have recently increased our product range by the addition of an air freshener named "Air-wick." Whilst this is outside our normal field, it is of such high repute and quality that we regard it as a prestige line. Indeed, it is so remarkably efficient we are confident that in making this new product available to the British housewife we are offering her yet another contribution to more comfortable and agreeable living conditions.

Air-wick is in regular use in well over 11 million American homes for the purpose of killing unpleasant odours, particularly those of the kitchen. Air-wick does not mask these odours with another and stronger smell—it actually kills them and renders the air of the room country-fresh.

IMPORTANCE OF ADVERTISED BRANDED GOODS

In my speech a year ago I referred to the significance of the contribution made by Branded Goods both to the amenities of what we call the British way of living and to our country's trade in overseas markets. Although until very recently the shortage of raw materials essential to the manufacture of our product restricted the supplies available for sale, I am proud to say we have been able to retain the high standard of the quality of Horlicks which has characterised it throughout the 67 years of its production. Numerous examples continue to reach us of how greatly a brand name such as "Horlicks" is esteemed throughout the world.

It is quite impossible for me to forecast the future with any accuracy beyond stating that trading results of the first six months of this current year are no worse than 12 months ago.

The report was adopted.

JOHN I. THORNYCROFT

ANOTHER SATISFACTORY YEAR

The forty-ninth annual general meeting of John I. Thornycroft & Company, Limited, was held on November 22nd, in London.

Sir John E. Thornycroft, K.B.E. (Governing Director and Chairman) said that he was pleased to be able to report the conclusion of another satisfactory year's work. During the last 12 years their capital investment in fixed plant at Southampton had been greatly increased in order to be able to deal with any type of ship damage or maintenance repairs which might be necessary for vessels using the Port of Southampton. That meant the "Queen Elizabeth," or the world's largest oil tankers down to a 500-ton diesel coaster, or any type of war vessel from an aircraft carrier to an M.T.B. They had those facilities at Southampton.

Their subsidiary, Transport Equipment (Thornycroft) Limited, had now completed its first year as a manufacturing, selling and servicing organisation in the United Kingdom. During the year the company had produced a new class of heavy overseas tractor, known as "Mighty Antar," embodying a petrol or diesel 250 h.p. V8 engine, capable of dealing with train loads across the desert of up to 100 tons. Prolonged tests had been carried out at home and in Iraq and production deliveries were now being made to the Middle East.

Nippy Star, Sturdy Star and Trident classes had been progressively improved during the year by minor modifications, the company's objective being to produce vehicles that could transport goods at the lowest cost per ton mile hour, without pandering to the spurious attraction to purchasers of low first-cost and consequential short life.

The report was adopted.

TRINIDAD LEASEHOLDS

MR. SIMON J. VOS' REVIEW

The annual general meeting of Trinidad Leaseholds Limited will be held in London on December 14, 1950.

The following is extracted from the chairman's circulated statement.

Consolidated net profit for the year after all charges, including provision for depreciation, taxation and contingencies was £765,399, as against £621,161 last year. The figure for 1949-50 embodies an exceptional dividend of £96,581 (net) from our interest in North Venezuelan Petroleum Company Limited. Contingency provisions were rather less (£169,475, as against £196,411) and depreciation has increased (£809,889, as compared with £771,681).

Income and profits taxes again bore heavily on earnings, and a liability, immediate or future, of £1,931,024 is estimated to arise on the profits for the year to June 30th last, mainly payable in Trinidad. For the year before that a provision of £1,537,963 was required.

The Regent Oil Company continues to make very satisfactory progress. Stockholders will have seen for themselves the impressive and steady development of the company's trade in Regent products throughout the U.K. I would take this opportunity of expressing the company's appreciation of the growing support rendered by the dealer trade in making these products available to the motorist.

The necessity for Government control does not yet make it possible to offer to the public Regent brands of petrol, which the Regent Oil Company is desirous of offering to the British motorist. However, good progress continues to be made in the development of the sales of all products, both in the commercial and agricultural markets.

FAIREY AVIATION COMPANY, LIMITED

SATISFACTORY POSITION

The twenty-second annual general meeting of Fairey Aviation Company, Limited, was held on November 22nd in London, Sir Richard Fairey, M.B.E., Hon.F.R.Ae.S., chairman and managing director, presiding.

The following is an extract from his statement for the year to March 31, 1950: The available profits, less losses, of the group, after provision for taxation, adding net profits of prior years now credited, and writing off expenditure on research and development, amount to £282,805. After deduction of profits, less losses, retained by subsidiary companies, there remains a net profit of £243,264 against £212,424 last year.

Your Board has given much thought to the question of the dividend payable, which has, for the past three and a half years, remained constant at the rate of 2s. per share per annum. They are very conscious of the necessity of restraint in the payment of dividends requested by the Chancellor of the Exchequer, and in deference to his wishes this has been exercised over the past few years, but in view of the present position of the company and existing conditions in the country, they now feel that it need not be so rigidly interpreted as to debar a small increase that is more than justified on general grounds. Your directors therefore recommend that the dividend be increased to 2s. 6d. per share, less income tax. The balance sheet reveals a highly satisfactory position.

The chairman, addressing the meeting, said *inter alia*: Early in the year under review we were engaged in the search for non-aircraft work to compensate for possible shrinkage in our normal programme, due to the cut in defence expenditure, and with some success. With the announcement of the rearmament programme the outlook changed again and we have every reason to expect our share of the resulting orders. Those non-aircraft contracts, together with our considerable foreign trade and certain economies that we have been able to effect, have all made their contribution to the increased profit for the year.

"FIREFLY" DEVELOPMENTS

Our main production work continues to be for the Air Arm of the Royal Navy and other Navies, and owing to the increasing menace of the submarine, anti-submarine measures are now accorded the highest priority. Our "Firefly" Naval Aircraft continues to be developed to keep pace with these changes and in its latest models will be adapted to carry new apparatus for detection and attack on under-water craft. In the Korean war the "Firefly" was one of the first British types to go into action and we understand that its performance has given considerable satisfaction.

Last year I made my first reference to a new product now known as the Fairey 17. This improved anti-submarine aircraft is undergoing final trials and the prototypes have done extensive flying. Another prototype designed for experiment in new and revolutionary possibilities has been completed and shortly will undergo trials, and our engineering department is engaged upon yet another and even more advanced type of aircraft for which we have obtained a contract from the Ministry of Supply.

With our main factories seemingly assured of ample work for as long as the rearmament programme continues, and with our overseas subsidiaries and associated concerns prospering, our present prospects would appear to be good, while new prototypes on the drawing board and in the air represent the preparations that are being made for a more distant future.

The report was adopted.

DEBENHAMS LIMITED

SUCCESSFUL RESULTS—INCREASED PROFITS

The annual general meeting of Debenhams Limited will be held on December 14th at the Wigmore Hall, Wigmore Street, London, W.1.

The following are extracts from the statement by the chairman, Mr G. M. Wright, A.C.A., circulated with the report and accounts for the year ended July 31, 1950.

The directors' report shows a balance on profit and loss account of the parent company of £1,598,147, an increase of £186,029.

The directors recommend that £50,000 be placed to reserve and a final dividend of 11d. per share be paid on the ordinary shares, making 1s. 3d. per share for the year. The resultant carry-forward is £401,713, an increase of £17,994.

BURDEN OF TAXATION

The above recommendations of the directors and the dividends paid are the same as for last year; you will appreciate accordingly that almost the whole of the increase in profit of £186,029 has been absorbed in higher charges for taxation. It has been necessary to increase the provision for profits tax by £70,000, as compared with last year, due principally to the raising of the rate of tax on distributed profits from 25 per cent. to 30 per cent., and the amounts set aside for income tax which include the estimated liability arising on the year's profits, are higher by £114,000. The result is that the total burden of taxation which the parent company is called upon to bear is no less than £900,000. The withdrawal by the Government of such a high proportion of the company's profits has a damaging effect on our financial strength and constitutes a very real handicap to trade in these times of increasing costs, both of improvement and replacement of capital assets and of replenishment of stocks. I would indeed be happy to be able to foresee any reduction in the present excessive level of taxation, but as you are well aware, there are no signs today to justify such hopes.

The period under review was in many ways a difficult one for retail distributing businesses. In addition to the general economic uncertainties which prevailed throughout the whole of the year and the numerous regulations and controls to which we continue to be subjected, our profits were adversely affected by the cut in utility margins imposed by the Board of Trade in September, 1949. The General Election in February last also had a disturbing effect on business for some weeks previous to that event. On the other hand, in the earlier part of the period sales of apparel benefited by the long-overdue abolition of clothes rationing and a further temporary stimulus was imparted by the devaluation of the £ in September, 1949. This encouraged purchases of clothing in anticipation of its ultimate effect on retail prices—an anticipation which events have shown to have been well founded.

Taking all things into consideration, I think we may reasonably claim that the result of the year's trading is by no means unsatisfactory.

CURRENT YEAR

In the circumstances prevailing today it is almost impossible to forecast with any certainty the results of the current year, and I do not propose to endeavour to do so. I can only tell you that our sales for the year to October 31st are in excess of those of the corresponding period, which was a "peak" year. This is encouraging as far as it goes, because it is only by maintaining the volume of turnover that we can hope in the face of increasing expenses and restricted profit margins to produce a reasonable net profit.

THE CEMENTATION COMPANY LIMITED

The thirtieth annual general meeting of The Cementation Company Limited was held on November 21st in London, Mr H. Clayton, the chairman, presiding.

The following is an extract from his circulated statement:—

The outstanding event of the year in the expansion of our business is the formation of The Cementation Company (Canada) Limited. The necessary negotiations leading to permission for the financial arrangements took some time to complete and it was not until August that we were able to undertake our first contract. I anticipate that this company will soon have an increasing and profitable business.

We have broadened the scope of Quickset Water Sealers Limited by purchasing the assets of Palorit Limited, which manufactured materials and owned processes of a different type but in the same field as Granitese for the permanent decoration of walls in buildings, such as schools, factories, hospitals, flats and the like.

We carry out contracts all over the world, but particular mention should be made of Turkey, where we have just been given a further important extension of work by the Turkish Government; and West Africa, where we generally have at least one sinking in progress.

Our South African subsidiary has had an active year, both in exploratory diamond drilling and in cementation, its two specialised occupations. Their services as cementation experts have been in greater demand than ever. A substantial organisation has been built up for the Orange Free State mines and their association with the Northern Rhodesian copper producers has been strengthened.

W. & J. LAWLEY LIMITED

SATISFACTORY PRODUCTION AND ORDERS

The eleventh annual general meeting of W. & J. Lawley Limited was held on November 22nd in Birmingham.

Mr J. W. Gaunt, snr., the chairman, presided, and, in the course of his speech, said: I have pleasure to submit the company's accounts for the year ended July 31, 1950, from which you will see that the trading profit of the year amounted to £57,153, and the net profit, after providing for all other outgoings, including £24,500 for taxation, amounted to £19,295, as compared with £27,983 in the year to July 31, 1949, and £20,813 in the year ending July 31, 1948.

The company's production shows a satisfactory increase over the previous year, but arising from the devaluation of the £ and other causes the cost of metals has steadily risen during the year, and it is difficult until the position has been more clarified to raise prices to recover these increased costs. The other main factor that has occasioned the reduction in the year's profit has been the increase in the wages charge.

Your directors are continuing their policy of keeping the company's plant, buildings, and equipment in first-class order, and although this occasions a heavy annual charge for repairs and maintenance, we are sure the shareholders in the company will endorse our long-term policy in this respect.

The volume of orders on hand continues to be extremely satisfactory, and I have no reason to fear any change in this direction as long as there is continued emphasis on the importance of the housing programme. Although trading conditions are not easy, I feel every confidence in the continuing prosperity of your company.

The report was adopted.

J. GLIKSTEN AND SON, LIMITED

(Timber Merchants, Producers and Distributors of Hardwoods, Plywood and Softwoods, etc.)

INCREASED NET PROFIT

YEAR OF CONSIDERABLE DEVELOPMENT

MR ALBERT A. GLIKSTEN'S ADDRESS

The forty-fifth annual general meeting of J. Gliksten and Son, Limited, was held on November 22nd, at the Holborn Restaurant, London, W.C., Mr Albert A. Gliksten, chairman and managing director, presiding.

The Secretary (Mr R. Law, A.C.A.) read the notice convening the meeting and the report of the auditors.

The following is the chairman's address, which had been circulated to the shareholders, for the year ended June 30, 1950:—

Group Profits: The trading results of the past year will, I feel sure, give pleasure to all the stockholders. The revenue from trading of the group amounts to £676,935, as compared with £512,532 a year ago. Adding income from investments, etc., of £9,264 and debiting directors' fees, interest and depreciation of £160,494, a figure of net profit before taxation results of £525,705, as against £396,265. The provision for taxation this year is £253,730, as compared with £233,198 for the previous year.

We have this year made a transfer to taxation equalisation reserve in respect of initial allowances granted on capital expenditure during the year. The effect of these initial allowances is to reduce the amount of tax payable during the year of acquisition but to increase correspondingly the amount of tax payable in later years. It has, therefore, been deemed prudent to create a reserve which may be utilised to reduce the tax liability over a period of years coinciding with the life of the assets acquired.

A NOTABLE ACHIEVEMENT

This year your Board are recommending a modest increase of 5 per cent. in the Ordinary dividend. Your directors in recommending this increase in dividend are satisfied that it represents no more than is fair and reasonable in the circumstances, particularly as group capital expenditure incurred in previous years is now yielding a return. The dividend recommended conforms with undertakings given to the Chancellor of the Exchequer by industry to adopt a policy of restraint and moderation in the distribution of profits. I would further point out that the book value of the equity has increased since the date when we first paid an Ordinary dividend of 25 per cent. from £872,225 to £1,256,457, approximately 45 per cent., within a period of three years, a truly notable achievement resulting from the conservation of profits within the group.

Depreciation of our fixed assets is taken on a liberal basis which we believe to be adequate to cover all contingencies. The net profits of the group are again a record figure due, I believe, to our settled policy of building up adequate reserves to cope with expansion, and further to an intensive policy of seeking additional sources of raw materials for conversion and distribution through our widespread and efficient sales organisation.

CONSOLIDATED BALANCE SHEET

The undistributed surplus and reserves including reserves for future taxation amount to £856,457, an increase during the year of £190,721. Current assets exceed current liabilities to the extent of £828,079. It will be observed that the loan capital, bank overdrafts and loan accounts amount to £1,120,130 as compared with £984,975 last year. I regard this relatively small increase as highly satisfactory in view of the marked expansion in trading reflected in larger stocks and debtors, also paying due regard to investment in fixed assets during the year. It will be observed that we are transferring to a special reserve fund an amount equal to the Two and a Half per cent. Unsecured Loan stock redeemed during the year. Your Board have made a close study of the group's future financial requirements, and we are working under a planned policy which, subject to unforeseen circumstances, should enable us to extinguish our loan indebtedness within a relatively short space of time, without recourse to additional capital in more permanent form.

Capital expenditure during the year amounted to £212,893, chiefly in connection with an additional battery of kilns of most modern design at our Stratford wharf and a new sawmill in the final stages of erection at Dwinasi in the Gold Coast Colony. The revenue which these two major assets will produce for the group has not been enjoyed during the year under review, but both items should yield benefits during this year and increasingly thereafter, not only to our group but to our valued customers who will receive timber in a condition suited to their requirements.

While our fixed assets are shown in the consolidated balance sheet at £779,966 these are in actual fact worth considerably more than this figure at present-day values. In addition, therefore, to the surplus and reserves actually shown in the balance sheet there is a very substantial further reserve represented by the excess of current values of the fixed assets over book values.

COMPLETE FREEDOM OF ACTION

General Survey—The year under review has been one of considerable development so far as the timber and allied trades are concerned. Further measures of decontrol have taken place in the hardwood trade and now, with the exception of control of purchasing from hard currency areas and consumer licensing of certain hardwoods from these areas, there is complete freedom of action both for importer and consumer. For the first time since they were acquired, your parent company has been able to purchase its requirements directly from its producing subsidiaries in British Honduras and West Africa. Prewar connections have been re-established with shippers who supplied our requirements before the war, and we are confident that this measure is a step in the right direction.

In addition, certain steps have been taken by the Board of Trade to decontrol plywood supplies with resultant increased freedom of operation of a plywood manufacturing enterprise in England in which the group is financially interested. Certain categories are now free of consumer licensing and importers have been given the right to purchase direct from several producing countries. Announcement has also been made of a partial resumption of the private buying of softwoods, which is welcomed by your Board.

ASSISTANCE FROM COLONIES

I would like at this juncture to refer to the great assistance that the timber trade in this country has received from producers of Colonial hardwoods. Every effort has been made to produce not only this country's requirements but also those of world markets, and this has required intensive planning and very considerable capital expenditure in order to place the necessary machinery and equipment in the locations where they are needed—that is in the parts of those Colonies where growing hardwoods are abundant. In my opinion sufficient credit has not been given to the Colonies for their very material assistance in closing the sterling area dollar gap. A considerable proportion of the dollars earned by the sterling area has been earned from sales of Colonial products, of which timber has formed a not unimportant part.

During the past year directors and executive officers of the group have visited among other places the Continent of Europe, Middle East, Africa, West Indies, Central America, United States of America and Canada, in furtherance of the group's business in these areas.

SALES DEVELOPMENT

In view of the continued expansion of your group's production of raw materials, your Board is pursuing an active policy of sales development throughout the world in order to widen the markets available for the group's products and to ensure an expansion of turnover. The raising of the standard of living of millions of people throughout the world will create an increasing demand for timber supplies.

Your Board will continue to encourage throughout its producing subsidiaries the policy of conservation of forest resources to continue extraction on a sustained yield basis from the forest areas under its control. Care is being taken to ensure natural regeneration under the most favourable conditions. I have already referred to the capital expenditure incurred in increasing our kilning capacity. As a result, not only should a satisfactory return be earned on our kiln processing, but at the same time the kiln-drying of lumber should greatly reduce the amount of capital required to be carried in stocks. Trading progress during the current financial year continues to be satisfactory.

Once again I am happy to record the keen satisfaction of the Board with the loyal and enthusiastic co-operation that has been accorded by the executive and all personnel within the group. Relationships between the Board, the management and staff continue to be excellent.

The report and accounts were unanimously adopted, and the proposed final dividend of 22½ per cent., making 30 per cent., less tax, for the year was approved.

The retiring director, Mr E. Terence Scott, was re-elected, and the remuneration of the auditor, Messrs Pannell Crewdson and Hardy, having been fixed, the proceedings terminated.

LEETHEMS (TWILFIT) LIMITED

We regret that the title of this Company was misspelt in the report of the Annual General Meeting in our issue of November 18th.

Statistical Summary

EXCHEQUER RETURNS

For the week ended November 18, 1950, total ordinary revenue was £53,830,000, against ordinary expenditure of £46,790,000, and issues to ordinary funds of £7,040,000, leaving unfunded deficit of £11,141,000. The surplus of £3,256,387 for the week ended November 18 was accounted for by a reduction of £14,397,000 in the net ordinary balances of the Exchequer.

NOTICES

MAKERERE COLLEGE
THE UNIVERSITY COLLEGE OF EAST AFRICA

Applications are invited for Lectureships or Assistant Lectureships in the Department of Social Studies from persons suitably qualified in the fields of economics, sociology and public administration.

Salaries as follows: Lecturers on the scale £695 x £25—£770 x £30—£830 per annum; Assistant Lecturers on the scale £620 x £25—£690 per annum. Starting point of entry determined by qualifications and experience. F.S.S.U. Child allowance, £50 per annum per child (maximum £150). Partly furnished quarters at not more than 10 per cent of salary. Free passages (including families) on appointment, termination and leave (three months every two years).

Applications (six copies), giving full particulars of qualifications and experience and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1, Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date, December 16, 1950.

UNIVERSITY OF SYDNEY, NEW SOUTH WALES, AUSTRALIA
SENIOR LECTURESHIP OR LECTURESHIP IN ECONOMICS

Applications are invited for an appointment to the teaching staff of the Faculty of Economics. The status and commencing salary will be fixed according to qualifications and experience.

HIS MAJESTY'S COLONIAL SERVICE
NIGERIA

Women Nutrition Officer required to investigate and advise upon nutrition problems. Post is permanent and pensionable. Salary scale, including pensionable expatriation allowance, £660-£1,300. Free passages on appointment and leave. Generous home leave with full pay. Income tax at local rates much lower than in United Kingdom.

Candidates should preferably be University graduates and must hold a Diploma in Dietetics.

Further particulars and application forms obtainable on written request to Director of Recruitment (Colonial Service), Sanctuary Buildings, Great Smith Street, London, S.W.1, quoting reference 27024/1.

NORWICH EDUCATION COMMITTEE
THE NORWICH CITY COLLEGE AND ART SCHOOL, ST. GEORGE STREET, NORWICH

Principal: FRANK LEIERS, B.Sc., D.Phil.(Oxon).

Wanted as soon as possible, and at latest by May 1, 1951, a Senior Assistant for teaching Advanced Commercial and Management subjects in the Department of Commerce and Languages. Teaching and business experience essential. Burnham Scale.

Application forms, which may be obtained from the Director of Education, City Hall, Norwich, on receipt of a stamped addressed envelope, should be returned to the Principal as soon as possible.

BRITISH ENGINEERING COMPANY with works in India must find first-class top executive, for position of General Manager of their Subsidiary. The appointment offers the widest scope for development of both sales and local manufacture, and demands the services of a man with an extensive engineering background and experience of works control and sales organisation, together with financial ability, as it will in due course develop into that of Managing Director. The successful applicant will be around 40 years of age, having had a sound education and possessing, if possible, a university degree. Consideration can only be given to those who conform to these requirements and can qualify for the high salary and other advantages which the position has to offer. It is hoped to make an appointment this year, and that the man will proceed to India after an intensive course of training in this country, so that he may assume control by the end of 1951.—Box No. Q3628, Bensons, Kingsway Hall, Kingsway, W.C.2.

MANAGEMENT AND INDUSTRIAL CONSULTING.—Production-Engineering, Ltd., invite applications from qualified Engineers and Chartered Accountants, preferably with University Degrees and with a real interest in the problems facing management today. There are exceptional openings for first-class men with initiative, requiring permanent posts in this type of work. Engineers should have served an apprenticeship and should also have had good practical experience and an executive position in industry. Accountants should have experience of modern developments in financial control and its application in industrial management. After training, there is a four-figure starting salary as well as Life Assurance and Superannuation Schemes. Applicants should be between 27 and 35.—Write, giving age and full details of education, qualifications and experience, to Production-Engineering, Ltd., 28, Bruton Street, London, W.1.

THE CIVIL SERVICE COMMISSIONERS invite applications for appointments as Senior Scientific Officer and Scientific Officer to be filled by competitive interview during 1950. Interviews began in January and will continue throughout the year. Successful candidates may be appointed immediately. The posts are in various Government Departments and cover a wide range of Scientific research and development in most of the major fields of fundamental and applied science. Candidates must have obtained a University Degree in a scientific subject (including engineering) or in Mathematics with First- or Second-Class Honours, or an equivalent qualification, or possess high professional attainments. Candidates for Senior Scientific Officer posts must in addition have had at least three years' post-graduate or other approved experience.

Age Limits: For Senior Scientific Officers, at least 26 and under 31 on August 1, 1950; for Scientific Officers, at least 21 and under 28 (or under 31 for established civil servants of the Experimental Officer class) on August 1, 1950. Salary Scales for men in London Senior Scientific Officers, £700 x 25—£900; Scientific Officers, £400 x 25—£650. Rates for women are somewhat lower.

Further particulars from the Secretary, Civil Service Commission, Scientific Branch, Trinidad House, Old Burlington Street, London, W.1, quoting No. 2887.

APPLICATIONS are invited for the position of Secretary to a large Manufacturing Company whose main factory and offices are in South London. Applicants should have knowledge of secretarial duties and of accountancy and budgetary control and must have organising ability. A suitable salary will be offered to the right man and there is a contributory pension scheme.

Applications should be sent to Box E.370 at 191, Gresham House, E.C.2, and should contain full information. Envelopes should be marked in the top left-hand corner "Secretary."

FINANCIAL COMPTROLLER.—Applications, which will be treated in the strictest confidence, are invited from Chartered or Incorporated Accountants, aged 37 to 45 years, for this important position with a Public Company having a number of Subsidiary Companies and Branches overseas. In addition to considerable experience of group organisation, accounts, budgeting, costing and taxation, a flair for commerce and a capacity for a ready appreciation of financial matters connected with overseas business are required. A commencing salary of approximately £2,000 per annum is envisaged. —Reply to Box 531.

AN exceptional opportunity occurs in old-established, well-known and large manufacturing organisation for well-qualified Electrical Engineer as Assistant General Manager. The position is an important one and will suit a progressive man of personality, drive and successful record in similar position, and carries appropriate remuneration. Pension scheme.—Write, in confidence, fullest details to Box 537.

TRADE UNION HEAD OFFICE, London, require Research Worker —initiative, knowledge of general office work an advantage. Salary £546 p.a. Permanency to suitable applicant. Superannuation Scheme. State age, education, experience, etc.—Box 532.

Without Blinkers

IN his speech in Washington on Wednesday the Prime Minister rose to the height of the great theme of Britain's partnership with the United States in the present peril. "We stand by our duty and our friends," he said, and a critical, hard-bitten, anxious audience of pressmen applauded him. Those words had to be said, and they will bring courage to worried allies and friends in Europe, who feel that Mr Attlee represents them as well as Britain. They had to be said, because the call of simple duty and the resolve to defend the rule of law between nations—the motives which sent the pick of American and British infantry to Korea—were in danger of being forgotten. The anti-Americans in Europe had turned on General MacArthur, and the anti-Europeans in America had turned on Mr Acheson, confusing rational consideration of the future with passionate recriminations about the past. Now, just as General MacArthur is struggling to form a new line of defence from a situation in which his forces were split down the centre, enveloped from the flank and harassed by guerrillas in the rear—so Mr Attlee has set about reforming in Washington the Atlantic front which it is the main purpose of Communist strategy to pierce and divide.

Both situations, the military and the diplomatic, are still fluid; there is little that can be said about the present state of either that would be helpful or relevant. But there are wider issues on which it is imperative that public opinion on both sides of the Atlantic should clear its mind. The shock of these last few days has been painful in the extreme. The spectacle of the heavily armed and mechanised forces of two world powers, with undisputed command of air and sea, retreating before a mass of lightly equipped foot soldiers is one that neither Asia nor Europe will forget. The press of personalities seeking access to General Wu's ante-room in the hope of negotiation is another spectacle from which Asia will draw its own conclusions, whatever the outcome. There is no purpose to be served by trying to blink the fact that the alliance of the free nations has suffered a grave defeat.

In such circumstances, the first temptation is to indulge in recriminations about the past. To do so is rarely helpful; and at present it could be highly damaging, since the recriminations would inevitably take on a national tinge. It might be as well for both Americans and Europeans to remember that for every grievance one side of the ocean might voice against the other, there is a contrary grievance waiting to be put into the balance. If Europeans question the skill with which the Korean campaign has been conducted, Americans can ask why they were not given more support in it. If voices from London point out that Europe is the vital battleground, Americans can ask why, in that case, Europe has not done more about it.

The solidarity of the alliance is the hope of the world, and there should be a real effort in all countries to be as silent as possible about the past and to think about the future. There is a very important

question to be decided. It goes without saying that the authority of the United Nations, so badly damaged by what has happened in Korea, must be restored. It is self-evident that the policy of building up strength enough to contain Russian imperialism must be continued and intensified. Appeasement, in a situation like this, is the one clearly disastrous policy and should not be considered for a moment. But what does that imply in Korea and its immediate neighbourhood? Does it mean that every effort must be made to reverse the tide in Korea itself, or if the front there has to be abandoned, to restore it as soon as possible? Or does it mean writing off the Far East and concentrating on Europe?

These are not posed as questions to which the answers are self-evident. Indeed, the answers are not easy. In attempting them, however, two guides can be suggested as helpful. The first is to remember that what happens in any one area of the world is only part of a whole, and that it is the whole that counts. If there have to be retreats somewhere, let them be in the places that are less vital; it would be folly to stand in the less important, at the cost of running away in the more vital, just because the less important case has come along first in time. The second guide in a perplexing situation is to ask what the Kremlin wants the free nations to do, and then, so far as possible, to do the opposite. There is no doubt at all what the Kremlin wants in the present situation. As Mr Hanson Baldwin has said, about twenty of the best American, British and French divisions are now tied down in the Far East, without a single Russian soldier being engaged. Nothing could please Stalin more than that the western powers should still further reduce their defences against the Red Army.

This is not a plea for the abandonment of the Far East. It is quite true that the United Nations is now in a strategic position in Asia that is very familiar from British history, one of being badly outnumbered in fighting on land on the continental mass, but of keeping control of the freer elements of the sea and the air. The right strategy is not to abandon the continent altogether, but to exercise a strict economy of resources in continental adventures, to defend on the continent only the most vital areas and those where the air and the sea are at a maximum advantage. In drawing up a strategic plan to this effect, it is clear that no reliance can safely be placed on hopes of being able to induce the Chinese Communists to be moderate. Their ambitions and aggressive purposes are clearly and emphatically stated daily in the Communist press of the world. There is no excuse for ignoring these statements after the way in which they have been confirmed by events. The policy of recognising Mao in order to woo him, it is now clear, was doomed to failure from the start. That he will now turn on Indo-China is all too probable—if only because it would admirably suit Stalin's book.

There is clear need for a world-wide strategic plan, in which resources must be estimated and priorities decided as realistically and cold-bloodedly as if world war were already engaged. This is a task which can obviously be conducted only behind closed doors. Public opinion can nevertheless assist it in three ways. First, it can leave those who bear the responsibility free to reach their decisions on objective facts, without having to suffer purely political pressure. Secondly, it can bend its efforts to building up the elements of military strength as rapidly as possible. And thirdly, it can remember that this is a war of nerves, in which those who keep cool heads have an enormous advantage.

Markets or Allocations

THE Minister of Defence talked tactlessly last week-end about General MacArthur and United Nations policy in Korea; but on home affairs he said soberly that it was time the public heard from some Minister. Shortages of raw materials for industry are becoming acute. With the demand and supply at present in prospect "it might not be possible," as Mr Shinwell put it, "to fulfil our commitments for the defences in the west, and we might find ourselves in a situation where unemployment might emerge."

It is open to doubt whether the Government has become aware of these dangers soon enough to have a good chance of averting them. This week has been occupied with a preliminary stage of British planning: the problem of shortages has been under discussion at Washington between Mr Attlee and President Truman. The outcome is not yet apparent. But what can and should be done, in advance of the detailed formulation of Government policy, is to consider the facts and the general principles on which action ought to be based. It is important, first, to realise that the co-ordination of policy among members of the North Atlantic Treaty Organisation, essential as that is to the most economic use of the free world's resources of raw materials, is not a magic wand that can sweep away shortages. What has made some materials desperately scarce is, it is true, the American Munitions Board's frantic efforts to do since June 25th the strategic stockpiling that the world markets—and the sterling area particularly—would have welcomed on a bigger scale eighteen months ago. But it is nonsense to conclude that Britain would be all right if the foreigner would behave himself. The limiting shortage for British industry may well be not of any imported material, but of home-produced coal. Factories may be saved from closing down through lack of, say, copper because they will be closed next February for lack of coal and electric power. No scheme of international "fair shares," no agreement for ensuring that Britain can buy more sulphur, cotton and zinc, will allow the British economy to go on in any degree of inflation it chooses.

It is plain, moreover, that a comprehensive scheme for the international allocation of key materials is at present out of the question. The wartime system rested on the effective monopoly of scarce shipping under the control of only two allies, the United States and Britain. It had to deal with the economically simple choices of a life-and-death military struggle. For all its intensity, the threat to the [illegible] countries is not yet direct enough to be an effective catalyst [illegible] of a score of sovereign [illegible] commodities predomin[illegible] others predominantly as a [illegible]

To recognise that [illegible]

should not be attempted now is not, however, to say that there must be an uninhibited scramble for the materials of rearmament. Such a scramble cannot possibly be expected to share out supplies in the way that will strengthen western defences at the best possible speed. The buying-power of the United States is too strong. Aggressively used, it can go on drawing into American stockpiles supplies essential to the current production of its allies. To carry this to the point of, say, slowing down the British defence programme would be ridiculous. Moderation in American stockpiling is the necessary starting point for any combined raw materials policy. Some of the further steps were sensibly prepared at Paris last week-end by the council of the Organisation for European Economic Co-operation. They can probably best be carried further through the North Atlantic Treaty Organisation. By consultation, national buying and stocking policies can be co-ordinated well enough to avoid an acute scramble without the cumbrous formalities of allocation schemes.

★

This will ease the British problem, not remove it. Nothing can now save British industry from acute difficulties over supplies of coking coal, sulphur, zinc, cotton and other fibres, nickel, copper and various other non-ferrous metals, cement, timber, and perhaps many steel products. Rearmament has not yet appreciably increased the consumption of raw materials. It has drastically altered expectations. Materials have become scarce because firms have tried to build up stocks in the belief that they would become scarcer and dearer; the new expectations have automatically created the conditions that justify them. The scramble for stocks has already gone far enough for some factories to be unable to order materials they will require very soon while others have, on paper at least, covered themselves for some time ahead. The position can only get worse while remedies are delayed.

The broad choice of remedies lies, of course, between letting the price mechanism sort things out through free markets and imposing direct Government controls. The Minister of Supply announced on Thursday that allocation schemes for various metals were being considered. To see the choice as a simple matter of dogma is no service to any political or economic principle. In the present situation the price mechanism has two important defects. With commodities whose production cannot be quickly increased the price that would equate supply and demand in the short run may be far higher than the price needed to stimulate the possible expansion of output in the longer run. Consumption of the raw material will not be choked off by rising prices until they affect the prices of the finished products, and with demand generally strong, it might take a very large rise in raw material prices to produce any appreciable effect on the volume of consumption. But this would create further difficulties. The fiscal powers of the primary producing countries are often incapable of coping with the forces of inflation set off by the tripling and quadrupling of their export prices. And, in the consuming countries, no government—certainly not the American Administration—will willingly accept the political and economic strains that spectacular price increases inevitably set up.

These defects of the free market are not overwhelming. They could and ought to be accepted, as a price worth paying, if the result would be to distribute scarce supplies according to the needs of the most essential consuming industries. That is, however, an unlikely result. In the present situation few firms have any reason to reckon closely the financial cost of buying whatever materials they can. Political uncertainties, prospects of rationing, and so on, far outweigh the calculations of possible losses on stocks if prices should fall next year. With markets easy and taxation at its present height the real importance of such losses to the firm's balance sheet is in any case small. In these conditions, even steep price increases are an imperfect way of sorting out the consumers with the greatest needs—especially as the purchasing power behind those needs is already distorted by price controls on "essentials." Every firm has an incentive to lay in all the stocks it can, and the firms in the least essential industries—which can expect gradually to be "concentrated" if the shortages increase—have the strongest incentive of all.

To recognise that the price mechanism will work very imperfectly is, however, very far from saying that Government controls will work better. There is, it is true, one thing that controls can do successfully. So long as supplies are not far below the needs of industry in full employment, a universal system of quotas can spread out supplies so that no firm has to close down or even to dismiss any redundant workers. To allocate to each firm just a little less than it needs is to ensure that it is worth each firm's while, in a sellers' market, to hang on to its labour force even though on several days a week the factory has too few materials to work at full capacity. An allocation system can, in other words, conceal the unemployment resulting from slightly

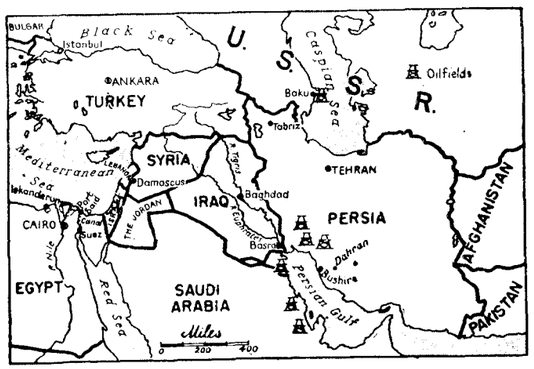
inadequate supplies of raw materials. Politically, its attractions are obviously strong. But they have nothing to do with economic efficiency, with ensuring the best use of the nation's resources in an emergency. They are not a way of avoiding the irrationalities of free markets. They are devices for letting productivity—and so the total national income—go hang, and for avoiding the redeployment of labour to the most essential industries that a full defence effort would involve.

This is the misuse of controls. By different methods of allocation the Government might ensure that the nationally most important firms got a more adequate share of some scarce materials than they would secure in a free market. That can be achieved not by any quota system based on past consumption but by deliberately discriminatory controls giving some firms all they ask and others none at all. And there is little ground for confidence that the controllers could in fact distinguish accurately between the essential and the non-essential demands of scores of thousands of firms. It should not be necessary so soon to rehearse all the arguments that were clearly drawn from wartime experience (and were so lately accepted by Labour Ministers). The main point is that a detailed allocation system can work fairly well only when the Government is itself the agent for most of the essential demands—when each department can offer the controllers a careful estimate of the raw material demands implied in the production programmes it sponsors. There is not at present, and there will not be unless rearmament assumes a scale far beyond anything yet contemplated, such a concentration of demand. And without it the controllers are likely to make mistakes, allowing some firms to build up stocks or to produce non-essentials while others go short of materials, at least as serious as the frictions involved in leaving things to the price mechanism.

*

No clear cut conclusion can realistically be drawn from these arguments. It is possible only to lay down general principles applicable in various ways to shortages of particular materials. As long as we are engaged in a cold war possibly requiring a defence effort sustained as far ahead as can be foreseen, all the objections to controls—their restraint on economic flexibility and progressiveness—apply with almost their peacetime force. The bias should therefore still be strongly towards letting the price mechanism work. And that means creating the conditions in which it can work as well as possible. Of those conditions three are most important: first, the scales must not be weighted against the producers of essential goods by compelling or persuading them to keep down their prices while those of non-essentials are inevitably allowed to go free; second, private stockpiling should be discouraged by raising the ridiculously low costs involved in present interest rates; and, thirdly, there is in this as in everything else the fundamental need to keep general inflationary forces at bay.

Perhaps the one clear proposition to be insisted on is that comprehensive physical controls cannot in the present situation be used as an effective substitute for these measures of financial discipline—which are just as necessary to reinforce specific controls as they are to enable the price mechanism to work. On the other hand, there are at least two sets of circumstances in which the additional use of physical controls may well do more good than harm. This is true when a particular and essential raw material is so scarce that the free market can equate supply and demand not by a considerable rise in price, but only by a very sharp rise quite out of line with the general movement of prices. The first practical test of Government measures will be to ask whether controls are being confined to these worst cases rather than spread widely, with all the usual cost of bureaucratic clumsiness and industrial rigidity, in an effort to distort the whole price structure. But controls may also be necessary if it is clear that, although prices have risen only moderately, some essential producers are desperately short of a material of which others are accumulating stocks. In this second case, especially, the presumption is still against a comprehensive allocation system: specific limitations—say, on the size of stocks in relation to monthly consumption—will often be quite as effective at smaller administrative cost and with less serious economic ill-effects. The real judgments can be made only on specific cases as they arise. The general principle is clearly that controls will be doing most good if they are few in number and limited in scope.



Middle Eastern Vacuum

THE Egyptian Foreign Minister, Mohamed Salah ed Din Bey, is in London for conversations. When his visit was originally arranged, the talks were to cover the rate of release of Egypt's £300 million sterling balance that is still frozen in London; discussions on this subject are proceeding. Subsequently, another topic superimposed itself—the defence of Egypt. This not very new subject was hurled into the arena by King Farouk's statement, in his speech from the throne in November, that the Anglo-Egyptian Treaty of 1936 was one-sided and intolerable, and must be abrogated. Mr Bevin, under pressure from both sides in the House of Commons, countered with the statement that until the implications of this speech were thrashed out, Great Britain must suspend a delivery of Centurion tanks to Egypt. Still more recently, a further and still larger issue has loomed up—the threat of general war in Asia.

The east-west struggle is being waged in Germany, in the Balkans, and in Asia, but the Middle East has hitherto enjoyed virtual immunity from the impact of the cold war. Since the Russian attempt at expansion into North Persia in 1946, the area between the Mediterranean and the Indian Ocean has been almost completely free from the din that rages elsewhere. Even its local war, in Palestine, never took on the familiar colours of east versus west. Why? Is this escape due to the peculiar nature of the Middle East, or is it simply a freak of fortune? The evidence points to the latter conclusion.

For the Middle East, though so arid and so largely unpopulated, is not all one great empty quarter. It constitutes a tender spot for both Russia and the western powers, and offers a promising field for east-west warfare. For the west, it is the principal source of Europe's oil supply and, therefore, a prime object of defence. For Russia, it abuts on the only part of the Soviet periphery that causes the Kremlin anxiety about security; it immediately adjoins the chief area of Russia's oil supply—the Caucasian wells that lie west of Baku. Moreover, it is the shortest route by which Russia could erupt into the Indian Ocean. What makes the relative quiet more curious is that the whole Middle East should be an easy target for the Russian propagandist because of the social inequalities of its way of life. Though the peasants, who form the great bulk of its population, are still lethargic and unresponsive, its small but lively proletariat is awake to the disparity between rich pasha and poor labourer, and ripe for tales of life in a classless society.

But these are points which most Egyptians do not see. Several years of immunity from immediate sight and sound of the clash have lulled them into false security. They hold a belief very similar to that once held by Belgium—that they can evade the accident of their geographic importance. They believe that, provided they can keep foreign troops off their territory, they can remain neutral in the world struggle. This belief increases their native tendency to look backwards rather than ahead. They are preoccupied with old grudges rather than with the impending menace of Communism. The thoughts in the forefront of their minds are of British participation in the 1948 arms embargo that deprived them of the armaments they needed for the Palestine war; of a British flag flying on the Cairo citadel for no less than four years after World War II was over, and of British tanks forcing a change of their government in the dangerous days of 1942. They forget that, when in danger from Mussolini, they signed the British alliance only too willingly. Now, though the threat is greater, they believe that, even if attacked, they can hold their own until help from the United Nations comes along. They have deduced too little from the Korean experience about how long it takes to muster help from overseas, and far too little from their experiences in the Palestine war about their own army's capacities. They reckon that weapons (which they then lacked), are the sole requirement for efficiency. It never occurs to them that, to fight well, an army needs not only confidence in its military and civil leaders, but also a conviction among its rank and file that their families' way of life is something worth fighting for.

In a word, the Egyptian mind has lived remote from the rough and tumble of current world affairs, and Egyptian thinking on defence requirements is correspondingly out of focus. Egyptians have therefore tended to strike a conventional attitude against "British imperialism" and to think that they can leave matters at that. It is only fair to add that the British too have for years struck a correspondingly conventional attitude to Egyptian grumbling—one of waiting until the dust settles in the belief that the turmoil of Egyptian politics will sooner or later throw up somebody with whom a bargain can be struck. But neither attitude is in tune with the times. This is not a simple matter between Britain and Egypt; it is only part of the wider issue of the defence of the Middle East. In that wider context there are a number of specific questions that urgently require answers. The first of these is whether the basic planning of the defence of this vital area should any longer be left to Great Britain alone. There are, it is true, certain American commitments to Turkey, the essential "roof" of the whole area. But the only outside power with any forces actually on the spot is Great Britain. Is this safe? Should it not be made plain that when Great Britain makes demands upon Egypt for military bases, it does so only as agent for the world alliance? Moreover, this does not, for once, mean simply that the United States should take over a British burden; there are six Dominions of the Commonwealth who have a vital interest in keeping the Soviets out of the Indian Ocean. Could not they play a part in the defence of the Middle East in peace, as they undoubtedly would have to in war?

Secondly, if a joint plan for the defence of the Middle East is badly needed, does a base on the Suez Canal play an absolutely indispensable role in it? It is true that the Canal, in itself, is no longer the most vital point in the area; throughout most of the last war it could not be used as the route from Europe to the East; and the Persian Gulf has taken on a double new importance, both as the source of oil and also, potentially, as the Russians' sally-port. It certainly seems to follow from this that there should be allied strong points elsewhere than in the Canal Zone, one perhaps in or within easy reach of the Gulf itself, one perhaps at Iskanderum (Alexandretta). But this does not by any means add up to saying that a base in the Canal Zone itself is not necessary. With its ample water and labour supply and its easy accessibility by water from two directions, it may still be the best site for the main base, well back from the scene of immediate action. Indeed, the onus can properly be placed on the Egyptians to say where the base should be if not at Suez.

Some of them, no doubt, will continue to say that no base is necessary, or that it is not their concern. There are signs in the more thoughtful leading articles that have been appearing this week in the Cairo newspapers that the news from Korea has awakened some minds to the desirability of facing the facts of life among the nations. (The less intelligent papers, of course, are still ready to argue that Korea is just another British trick invented to provide an excuse for staying at Suez). But the time has surely come for making it plain to the Egyptian ruling classes (and to those of the other Middle Eastern states) that the shadow of Communism falls certainly no less darkly on them than on the rest of the free world and that if they wish to be saved from it by the western powers they have obligations to meet in return. If this is said by the British Government alone it will not be believed in Cairo. It is one more illustration, at the London end as well as at the Cairo end, of the utter inadequacy of purely national actions and decisions. The issue is really one between the free nations of the grand alliance as a whole and the Middle East as a whole. It will have to be faced as such.

Is Full Employment Secure?—I.

Squaring the Cycle

WHATEVER else rearmament may do, it at least makes certain that full and overfull employment will last for a good time longer. Whether or not, in the absence of the Communist aggression on south Korea, the long-predicted transition to universal buyers' markets and recession would have occurred in 1951, it is now quite clear that any such expectations have to be indefinitely postponed. Perhaps the very absence of urgency in the subject makes this a good time for inquiring into the present state of the full employment argument. Whatever else may beset the democracies, public opinion has been led to believe that it has one great consolation: thanks to Keynes and his disciples, the problem of general depression, of poverty in the midst of plenty, has been thoroughly mastered and need never plague the world again. Such beliefs have a certain therapeutic value; the man who does not believe his foot can slip is safer on a high place than the man obsessed with the idea of falling. Overconfidence, however, has its dangers too, and the time is ripe for an objective appraisal of the present state of the full-employment argument. That argument is of necessity unsatisfyingly theoretical, for the simple reason that the occasion for putting "full employment policy" into practice has not yet arisen—which is in itself an important fact to remember. But since the public confidence rests on the belief that the economists have found the philosopher's stone, it is highly relevant to inquire how confident are the economists themselves. The result may appear at first rather dishearteningly negative; but in further articles in this series it is hoped to establish that even if faith in a painless panacea is ill-founded, that is no reason for any return to economic fatalism.

The techniques by which it is now expected to assert mastery over the "blind economic forces" of depression are clear enough in principle. Investment can be encouraged by low interest rates and stepped up by direct Government action, and every man directly employed by this expansion in the capital industries will, by his spending, give further employment to a limited but calculable extent; this, in the professional jargon, is the Multiplier Effect. Spending power can be transferred by taxation from the rich (who, with a larger margin above necessities, are likelier to save) to the poor (who, with a lesser margin, are likelier to spend); this is action through the Propensity to Consume. Further purchasing power can be released when necessary by reduction in taxes or social insurance contributions, involving a budget deficit; this is direct monetary action. The detailed specifications for combining these forms of anti-depression activity are presumed to be laid up somewhere in the Treasury, ready to be applied at the first sign of faltering employment, and capable, given goodwill and vigour, of ensuring the blessings of a permanent boom. True, it is increasingly realised that no Keynesian prescription can fend off unemployment arising directly or indirectly from failure to hold export markets; but this conceded limitation is not fundamental. It simply means that other countries, and specifically the United States, should be persuaded to apply the same magic formulae. If all the major countries stabilise themselves, there can be no depression.

★

Is this view justified by the facts? To study the work done, since the publication of the "General Theory of Employment, Interest and Money," in the field of trade cycle theory, is to be led to a less encouraging conclusion. The basic, and frequently forgotten, assumption of Keynes's doctrine—or, to be fair to Maynard Keynes, the doctrine of the Keynesians—is that industrial fluctuations are, so to speak, a disease of the body economic, an abnormality that skilled doctoring can entirely remove. The assumption, to make it quite explicit, is that economic progress could be perfectly steady from year to year and from decade to decade if it were not forced into instability by man-made—and therefore man-manageable—defects in the monetary system and in the flow of incomes and expenditures.

That there are such institutional disturbances is all too apparent, but in recent discussion economic analysts—many of them disciples of Keynes and all of them grateful exploiters of the powerful tools he forged—have been insisting that institutional defects are not the only initiating causes of economic disturbance, but that there are also "real" causes of fluctuation to be found in the physical relations between different elements of the economy, between physical productive capacity, stocks, and output both of capital goods and consumer goods. Regardless of the price tags placed on these things, the relationships between them inevitably change from time to time—indeed, it is necessary that they should change if there is to be any economic progress and growth. Inventions do not come in a steady flow—or, what is more strictly relevant, the demands for new capital arising from inventions are not even from year to year. A certain level of real investment may seem appropriate to a given level of real income at one time. But investment takes time to mature, and when the new factories are finished and at work, that fact alone dictates a shift in real resources; and since estimates are fallible, total capacity at that time may be too big or too small for the new level of real income.

Thus, too, past spurts in economic expansion generate, at intervals depending on the life of the equipment concerned, successive waves of capital replacement, with corresponding troughs between. And, finally, particular pieces of investment, fruits of particular inventions or particular acts of policy, can call urgently but briefly for subsidiary investment in the means of producing associated goods. Decision to build a railway network, for instance, may imply decision to build extra blast furnaces to make steel to make rails; when the network is made, the "induced" investment outlives, as "surplus capacity," the stimulus which brought it into being.

These elements of disharmony exist whether the economy is planned or unplanned, free or totalitarian. Essentially they owe nothing to the fact that deals are done, and accounts kept, in money terms. The monetary element on which Keynes concentrated his analysis can enormously and disastrously amplify the consequent fluctuations, but their origin, so far from being purely monetary, lies in the very fact of economic progress. Except in a society stagnant in techniques, tastes and population, there will always be disturbance, a pulse or beat in economic affairs, and every downbeat or contraction will display, unless remedial action is taken, some symptoms of slump—idle machinery, unsaleable stocks, and unemployed workers.

(To be continued)

Is the Dollar Shortage Over?

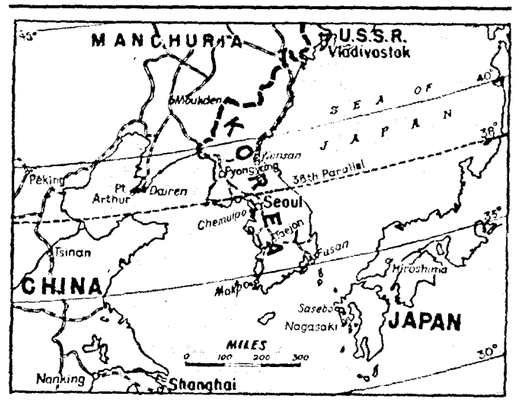
Four special articles, comprising THE ECONOMIST'S annual survey of trends in International Banking, appear on pages 1031 to 1047 of this issue, and an associated 16-page selection of International Banking Statistics is published in this week's issue of the RECORDS AND STATISTICS Supplement.

The first article asks the question "Is the Dollar Shortage Over?", while the others discuss EPU Teething Troubles, Interest Rates in Europe, and America's Uneasy Money.

NOTES OF THE WEEK

Appeal from Free Asia

One of the most remarkable and satisfactory developments in the United Nations tussle with Peking has been the joint initiative taken by eleven Asian and Arab states. On Tuesday, they appealed to Communist China and North Korea to "declare that it is not their intention that any forces under their control should cross . . . the 38th parallel." This, they believed, would give time to consider ways of settling the crisis. The list of states which took this initiative is a significant one: India, Pakistan, Burma, the Philippines, Persia, Iraq, Syria, Saudi Arabia, the Yemen, the Lebanon and Egypt.



Two factors in particular have aggravated the Korean crisis, and will go on doing so, whatever immediate settlement may be reached with the Americans. First, the clash is not just between two powerful states; it is also widely regarded in Asia as a racial issue, Asia versus the west—and that is the most explosive sentiment the world has to face today. Second, abysmal misunderstanding of the Americans' real motives and intentions has played a big part. The Chinese Communist leaders lack any normal contact with anyone outside the Cominform clique and, what is even worse, their people are kept almost entirely ignorant of the realities of the outside world. This means that in formulating their foreign policy they must rely to a truly alarming extent on the Soviet propaganda and misinformation.

The significance of the move now made by the eleven states is that it cuts right across these two barriers to understanding. The sober, moderating voice of India, long ignored in Peking, has now been reinforced. Although the Chinese appear to have the bit between their teeth, even Mao Tse-tung and Chou En-lai may pause and reflect whether the struggle with the west is quite so simple as they have chosen to paint it. They may well now accuse the eleven of being "lackeys of the imperialists." But it has been a feature of Communist action that the Russian leaders have at least always shown themselves very conscious of the force of public opinion—even if their reaction to it is obtuse and indirect. Statesmen of free Asia could do no greater service to their own people and the rest of mankind than to continue and strengthen their association, and to follow up this initiative. It is in striking contrast to the way in which the UN General Assembly has accepted, by overwhelming vote, the proposal that it should discuss what may amount to military sanctions against China.

* * *

Withdrawal in Korea

The position of the United Nations forces in Korea is becoming increasingly precarious, although military disaster has so far been averted by the speed and skill with which the main body of the Eighth Army has been extricated from an impossible defensive position on the Chong river and withdrawn intact through the communications bottleneck of Pyongyang to a position north of Seoul. There is now no question of holding a line across the width of the Korean peninsula; indeed, faced with an enemy so superior in numbers it would be quite impossible to hold a line even on a strong natural feature. The course of the campaign would seem to be dictated by the estimate of the Army commander, General Walker, as to whether he possesses sufficient strength in morale and material to mount a determined counter-attack with the object of halting the Chinese army in its tracks. If, as seems probable, he does not feel strong enough to pass to the offensive, the only military alternative—apart from any political compromise which may be achieved through diplomatic channels—would be

to organise an evacuation by sea from some west coast port. In the north-east the attempt of the 10th Corps in the area of the Chosin reservoir to fight its way down to the coast, through the opposition of both Chinese and Korean guerrillas, is one of the finest exhibitions of naked courage in the face of appalling odds since Bir Hakim or Bastogne.

The military lessons which are now being learnt from the past two weeks in Korea must have a profound effect upon the strategic thinkers and planners of the western nations. The most important is unquestionably that of manpower *versus* firepower. The armies of all the western nations are basically organised to meet and defeat the armies of other western nations, the perennial shortage of manpower in an industrial nation being balanced by increasing the fire power of each man. But against an Oriental horde, particularly under winter conditions, the mechanical aids to killing and denying ground which account for such a high proportion of defence budgets possess nothing like the same value. It will be surprising if the lessons of Korea do not lead the military planners of the west to demand a far greater emphasis on ordinary infantry, the arm which, in a mechanised society, has least glamour but which is in the last analysis the only one capable of gaining and denying ground.

Closing the Ranks in Europe

Whatever the outcome in Korea, it is to be fervently hoped that advantage will be taken of the heat of the crisis to fuse the states of Western Europe together. It is deplorable but true that there is nothing like war, or the real threat of it, to make men forget their theories, their inhibitions and their differences. Already more has been accomplished, during the past ten days, in making Western Europe think and feel as one, than in the whole of the previous ten months. It was very remarkable that Mr Attlee should fly to Washington with such wholehearted support from the French. M. Schuman, the Foreign Minister, said of the long talks that he and M. Pleven, the French Prime Minister, held in London last Saturday: "We reached complete agreement on essentials. My travelling to Washington would therefore be superfluous." Likewise, Signor Saragat, the Italian Socialist leader, justifiably pointed out on Sunday that the British Prime Minister goes to Washington as "the representative of all democratic Europe." Few voices in Benelux, Scandinavia, or even Western Germany would dissent.

The British have frittered away an immense amount of goodwill on the Continent since 1945. By hanging back at Strasbourg, rejecting the Schuman Plan and, to some extent, siding with the Americans over German rearmament, they have appeared to show themselves unwilling to treat Europe's problems as their own. People on the Continent are hardly to be blamed if they react by condemning the British attitude with the vigour of despair. Now, with the Chinese attack in Korea acting as a catalyst, the position has suddenly changed. To Europe Britain looks—ironically enough—like the one rock around which a sense of unity and purpose can be built, whatever the British themselves may say or do. To the British Europe looks suddenly very close; the danger that American concentration on the Far East may leave Europe to be overrun by the Russians is their danger, too.

One immediate result of the shock which has caused these mental readjustments is that full agreement on German rearmament may be nearer. Mr Shinwell, the Defence Minister, probably underestimated the determined logic of the French when he prophesied last Sunday "a compromise in the next few days." But there has already been an important shift; the French Council of Ministers has accepted the immediate formation of German units up to a strength of 6,000 men for a "transitional period pending the conclusion of negotiations for the creation of a European army." The French have also waived their stipulation that the signing of the Schuman Plan must come first.

* * *

Korea at Westminster

The debate on foreign affairs last Wednesday and Thursday showed beyond any doubt that the House of Commons has not lost its old capacity to rise to the level of great events. It showed also that the sense of unity on both sides of the House extends not only to thought and feeling, but also to action. Members witnessed a spectacle not seen in many years, the development and execution of new policy as the debate progressed. Mr Bevin's calm but unenterprising speech laid the first foundation upon which Mr Eden, Mr Churchill, and Mr Butler successively built until Mr Attlee's announcement of his decision to fly to Washington appeared to emerge more as the result of a joint decision from inter-party conference than as the personal action of the head of the Government.

During the succeeding days, with the centre of interest removed from Downing Street to Blair House, this sense of unity has been subjected to several tests. In the first place, Mr Attlee's decision to go to Washington had no sooner been taken than a feeling of resentment sprang up on the Conservative benches, echoed by a more general sense of regret in both London and Washington, that either Mr Churchill or Mr Eden had not been asked to accompany him. When the question was raised in the House on Tuesday, Mr Churchill refused to allow it to be made an issue. It must nonetheless be reckoned unfortunate that Mr Attlee could not or did not take with him the only Englishman who could convince the American public that in seeking a policy which will avert a general war with China Britain's motives are not those of fear and appeasement, nor a desire to draw back from its alliance with the United States.

In the second place, Mr Shinwell, to whom five years in office have not granted the gift of tact, at the week-end made some singularly unhelpful remarks about General MacArthur which the Opposition could have turned to political account if it had chosen. Mr Eden's deliberate forbearance allowed the matter to be glossed over. The third point of potential discord—the use of the atom bomb—died down within a few hours of last Thursday's debate and of President Truman's explanation that the power to order its use did not lie in General MacArthur's hand.

On China and Korea there is a more genuine identity of view between Conservatives and Labour than has often been the case in the past. The past ten days have revealed on the Labour side a small knot of members who, though not active or consistent fellow-travellers with Russian policy, have a sympathy with the aims of Communist China which overrides their dislike of China's present action. There is also a handful of sabre rattlers on the Conservative benches. But the vast majority of members seem to have a sense of identity which was clearly marked in the support given to Mr Churchill and Mr Eden during the debate. Whether this unity is only skin deep should become clear when Mr Attlee returns from Washington. On the Conservative side there is a considerable scepticism about the ability of Mr Bevin and Mr Shinwell to meet the new situation. On the Labour side there is a strong sense of frustration, a feeling that history has betrayed Socialism, that they are approaching a situation with which they are not equipped to deal, that they are losing ground in the country, and that they might not even have the necessary support to be the dominant partner in a coalition. Whether this sense of encirclement will permit the Labour party to respond to the present political forbearance and responsibility of the Conservative front bench remains to be seen.

* * *

The By-Elections

The autumn series of seven by-elections was completed last week. None has changed the party composition of the House of Commons: four seats were held by the Conservatives and three were held by Labour. But in every one of the seven constituencies except West Belfast—which cannot be taken as representative of the national trends in opinion—the Conservative vote improved relatively to the Labour vote. Only at Leicester North-east—the earliest of the by-elections—was the Conservative poll as much as 1,000 smaller than at the general election; at Oxford it increased. Labour, on the other hand, lost as many as 10,000 votes in Sir Stafford Cripps's former Bristol constituency, 6,500 at Leicester North-east, 5,000 each at Handsworth and Abertillery, 3,500 at Oxford and 2,000 at Scotstoun.

These results must encourage the Conservatives however cautiously they are interpreted. But caution is necessary. Close observers seem to be agreed that at a general election Labour attracts more support than does the Conservative party from people whose interest in politics is too small to take them to the polls in the less exciting conditions of a by-election. But the weight that can at present be given to this tendency is more doubtful than usual. The common claim of Labour agents at the general election was that the

Conservatives had done well because they had brought out every available voter. The total Conservative vote at the six by-elections in Britain was only 5,290—5 per cent—smaller than in the same constituencies last February, while the Labour vote was cut by 31,860 (21 per cent). It is hard to believe, after the high poll of February, that apathy has struck the Conservative and Labour parties in the ratio of one to six. The evidence is plainly of a shift of opinion.

At the one by-election contested by the Liberals (Bristol South-east) their poll was reduced from 4,463 in February to 2,752. The probability is that in the other constituencies the Conservatives gained something from the absence of a Liberal candidate; they almost certainly won converts also from Labour. After all reasonable allowance for the absent Labour supporters, these two shifts of opinion are probably together big enough at least to reverse the present balance of power if they were repeated over the whole country at a general election. There is, however, evidence from past experience that the floating voters tend to turn more solidly against the Government at a by-election than they do at a subsequent general election. It would be rash to conclude from this autumn's voting that an early election would now return the Conservatives with a complete working majority; but certainly Transport House has reason to be worried.

* * *

Mr Bevan and the Registrars

"Grossly misrepresented" was how Mr Bevan, in a written parliamentary answer last week, described the recent circular to hospital authorities on their establishments of registrars. It would be equally fair to say that his answer "grossly misrepresented" the facts. The medical profession has forthrightly denounced the circular, yet Mr Bevan said that it "was issued after full consultation with the profession's representatives." What happened was that consultation did take place with the joint committee representing the consultants; but the committee did not agree to the circular going out in the form it did and informed the Ministry that it reserved the right to criticise the circular when it appeared. "Full consultation" to the Ministry of Health is evidently what other official circles sometimes call "unilateral bargaining."

Mr Bevan also said that his decision was not prompted by economy. That is a pity. It would have immensely strengthened his case if he had admitted that he had allowed expenditure on the health service to get completely out of hand in its first two years and that in consequence very desirable developments, such as the expansion of the consultant service, will have to be postponed indefinitely. Most of those surplus registrars who are suitably qualified could be found consultant posts if the establishment for the consultant service were raised to the figure which early this year the Ministry itself laid down as the ideal. Of course it is economy that has prompted the circular. What the medical profession feels, with some justice, is that the axe should not fall solely on the present generation of registrars, many of whom are fully trained senior men. It is sheer hypocrisy to pretend that they can be absorbed into other branches of the health service without hardship.

Mr Bevan's insistence that it is not economy which is behind the reduction in registrars may indeed have an effect quite opposite to what is intended. Mr Messer, chairman of the North-west Metropolitan Regional Board and, incidentally, chairman of the Central Health Services Council, has said that if the hospital services of his region are not to be reduced, the registrars will have to be replaced by the appointment of more consultants, senior hospital medical officers, junior hospital medical officers or general practitioners with the right qualifications and the time. The first two categories, who alone can really do the work, will cost far more than the registrars they will replace.

Use of the Bomb

When President Truman declared at his press conference last week that use of the atomic bomb was "always under consideration" he was saying neither more nor less than it was his duty to say. American strategy is quite properly based on the scientific weapons that its great industrial resources can provide; the long-range bomber is as much the obvious weapon for Americans as the blockade by sea once was for the British. The assumption that American statesmen and officers can take any other view is wishful thinking, especially dishonest if it is made by allies whose foreign and domestic policies take the protection of American power for granted.

It may be argued that the areas and methods chosen so far by the Communists for military operations have shown the limitations of the atomic bomb, the need for ground troops, and for well-chosen and defended positions. All that is true enough. But the bomb is intended as a deterrent against the worst happening—against a direct attack by the Russians themselves on some vital sector of the free world. And there should be no doubt in anybody's mind that, if the worst did happen, the bomb would be used.

The immense energy and zeal of the "peace campaign" over the last two years have perhaps concealed from Moscow the fact that the great majority of people regard the measureless suffering and beastliness of protracted war as more evil than the use of the bomb. If aggressors can be held in leash by the threat of overwhelming retaliation, the majority of opinion in free Europe—which has no aggressive intentions whatsoever—will support the threat. But if the threat is to have its effect, public opinion must mobilise itself behind it; and to do that demands courageous leadership from those in public life whose characters and ability are held in respect. It would not be the first time that those who sought to maintain peace were called warmongers.

* * *

Dr Adenauer Under Fire

Dr Adenauer and the Christian-Democrat party are facing critical times, with no sign of support from the Allied High Commission or the western Foreign Ministers. The Chancellor has been publicly accused by the conservative Free Democrat party—partners in his coalition government—with carrying out a *Uebererfüllungspolitik* towards the occupation powers. He is branded as worse than Dr Stresemann, who earned opprobium merely for his policy of fulfilling—not overfulfilling—German obligations towards the Versailles powers.

The main weight of the attack has in the last few days shifted from the Chancellor's policy on the German contribution to western defence to the question of the Reich's debts. As a *quid pro quo* for the slightly greater freedom granted by the revised occupation statute, Germany is asked to assume liability for the prewar debts of the Reich, and to make raw materials available for western defence. Dr Adenauer is accused of being ready to sign a blank cheque on behalf of the Federal Republic, leaving it to the creditors to fill in the figure. It is—as might have been supposed—of little avail for the High Commission to indicate verbally that they only require a formal acknowledgment that the Federal Republic is the legal successor of the Reich. It is not enough to let it be known that the division of Germany and the Federal Republic's capacity to pay will be taken into account, and that the commercial debts, which the Germans themselves are anxious to settle, will have priority over government debts. The fact remains that Germany is being committed to a financial burden of unknown extent, and it will be a disastrous day for the Chancellor if it has to be presented to parliament for ratification.

The prospect of having the Social-Democrat Dr Schumacher, or Herr Blücher, the Free Democrat party chairman,

as Chancellor comes unpleasantly closer if Dr Adenauer is forced to commit Germany, alone of all OEEC countries, to export raw materials required for its home industry, at the will of an outside authority. Before long this government will also be presented, with concrete demands for increased occupation costs, or some other form of financial contribution to defence. The German refusal is already prepared, on the grounds that some three-quarters of the Federal budget is taken up by occupation costs and relief for the four million pensioners of two world wars.

Apart from the Chancellor's person, his party is showing signs of strain. It has lost not only to the Social-Democrats (who themselves suffered a rebuff from the politically realistic Berliners last Sunday), but to the smaller right-wing or separatist parties in Bavaria ; and in the last few days, it has appeared that the Protestants may secede. In this situation, Herr Arnold, the premier of North Rhine-Westphalia, has severely criticised his party for following a reactionary social policy and called upon it to return to the principles of social Christianity upon which it was founded. As party chairman and Federal Chancellor, Dr Adenauer is attacked on all hands. Mr Bevin, prevented by Korean business from visiting Germany, should watch this situation carefully.

* * *

How Not to Build a Town

The report of nine development corporations for the year ended March 31, 1950 (HMSO, 5s. 6d.) provides fresh evidence that the Government does not understand how to build a town. The main function of seven of the new towns is to relieve the congestion of London. Some of the new towns (especially those on virgin sites such as Harlow) also provide the town planner with a glorious opportunity to show his worth at community building. It was known that there would be a high initial cost in providing new services. Development corporations were set up, some with a staff of over 100, expert consultants were engaged, and everything made ready for rapid development. Now—over four years after the passing of the New Towns Act—the programme is still hanging fire.

Housing in the new towns has been cut. Hemel Hempstead's allocation for 1950 is 250 houses, Stevenage's is 450 (for a 15 months period), other of the corporations have fared worse. There is no progress to report (save at Crawley) in steering industry to the new towns. In addition Sir Ernest Gowers, in the plainest of words, speaks out on behalf of Harlow against the " tangled thicket of controls " under which development corporations labour. Each official control can be individually justified ; but taken together " they create machinery which is in some respects cumbrous almost past belief and which produces in profusion officials doing, one after another, work that one official could well have been trusted to do by himself." Sir Ernest's particular complaint is of the jealous tutelage exercised by the Ministry of Town and Country Planning, which has since—to judge from a breezy foreword by the new Minister, Dr Dalton—been much modified.

Dr Dalton has speeded up the official machinery, but he has not remedied the main blunder. If the new towns are wanted quickly (as they are), it is absurd—especially in view of their high overheads—to submit them to capital cuts of the same order as those of established local authorities. The whole planning machinery is pointless if it cannot establish effective priorities—if, for instance, it lets development in the new towns proceed more slowly than LCC building in the green belt. Moreover, Whitehall must control its passion for perfection and uniformity, which makes it try to determine the fate of each new town to the last head of population. In fact, the new towns have diverse problems and prospects which cannot be closely foreseen. The sooner the development corporations are cut free and allowed to find their own feet the better. Otherwise, those which could succeed will be strangled at birth and others less successful will be supported in a sybaritic uselessness.

* * *

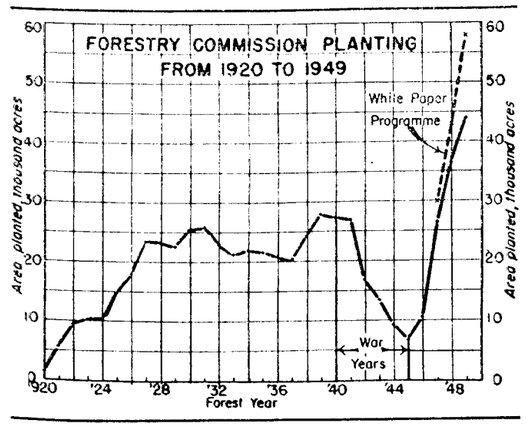
Retrenchment on Publicity

The third annual report of the Central Office of Information (Cmd. 8081) for the year 1949-50 is less comprehensive than its predecessors—because so much has been said in other official reports during the year about the work of the information services. The process of slimming applies also to the size and expenditure of the Central Office itself ; the staff has been reduced by a seventh during the past eighteen months, and the estimated expenditure during the current year is just over £3,000,000—25 per cent less than the expenditure of two years ago.

Much of the criticism of the COI from some sections of the Conservative Party and press has been captious and ill-informed. But there is no doubt that in the first three years after the war the COI was trying to perform more functions than it could discharge with efficiency and that in the process of retrenchment it is coming closer to its proper function of being the central publicity manager for the Government departments. The section of its work which commands the widest respect is that on documentary films: the Government, in Britain at least, is still the most effective patron of the documentary method, the more so now since the only other attempt at documentary filming on any scale, Mr J. Arthur Rank's *This Modern Age*, has had to close down. Indeed, during this period the COI has won an " Oscar " from Hollywood with a film on Nigeria, and first prize at the Venice Festival with a film on the unlikely subject of *The Liver Fluke*.

Underlying the report there are still traces of a confusion of thought about what the Government can and cannot hope to achieve by standard publicity methods. For instance, the report points with justifiable pride to the success of the campaign for diphtheria immunisation—a subject for which orthodox publicity is clearly appropriate—while stating elsewhere in the report that " Press and poster advertising are the inevitable media for service recruitment " even though these methods manifestly failed to stem the downward trend of recruiting before the recent increases in pay were announced. However, if the COI can be fairly accused of using stereotyped methods of persuasion, it is also clear that there is still a healthy resistance among the British people to doing or believing anything merely because the Government asks them to.

* * *



Forestry Problems

The report of the Forestry Commission for the year ended September 30, 1949 (HMSO, 4s.) strikes a cautious note. The planting programme of the Commission itself (as the accompanying diagram illustrates) has fallen behind the ambitious targets set by the Government. This is not really surprising; as it is, the Commission has been given a very generous share in the nation's capital investment programme. Government grants to the Commission have amounted to £18.5 million for the first three postwar years, and tighter financial control may be foreshadowed in the new ruling that unexpended balances must be surrendered to the Exchequer.

However, Government aid to the Commission must increase, not diminish, if it is to fulfil its vast planting programme—intended to increase the present 600,000 acres of public forest to an eventual 3,000,000 acres. The Commission's first problem is how to acquire the necessary land for continuous expansion. Only 100,000 acres (less than one fifth of what was intended) have been purchased in three years. This " disappointingly slow rate of progress " is attributed

in part to the increased profitability of hill farming. The hill farmers, who are now to get more subsidies from the Government, are reluctant to part with their land to the Commission, which is spending increased sums of public money in the effort to buy them out. This extravaganza is a poor testimony to the co-ordinating abilities of the Minister of Agriculture, who is responsible for both forestry and farming.

This is not the whole problem. The most disturbing feature of the report is the slow progress of private forestry. About one million acres of private woodlands are at present in an unsatisfactory condition. Much of this land, however, is potentially more productive than the poor uplands that the

Commission is busy afforesting. Despite the great preponderance of private woodlands, only 33,000 acres have been privately planted in three years compared with 107,000 acres planted by the Commission. This balance is far from satisfactory. At the present time, there is no economic justification for vast state schemes of afforestation on bare land, when there is more suitable and accessible land waiting to be replanted. Private owners have now been given a last chance, by way of an improved scheme of Government aid, to put their woodlands in order. If they fail to do so, the Commission should turn more of its energies in their direction.

* * *

Screening East-West Trade

Nothing has so far been decided that is likely to interrupt the small but useful stream of trade between Eastern Europe and the West. American, British and French officials have been searching, over the last few weeks, for ways of " screening " the east-bound flow without shutting it off altogether. Last week they came to their conclusions. There is to be a new list of " absolutely forbidden " exports, uniform for all three countries and somewhat longer than the existing lists ; and there is to be a new, and also uniform, list of " may be forbidden " commodities, which will mean additions to those which are already subject to export control. The controls will be used to restrict exports in this field if, at any time, they are required for western defence, or because they endanger western security by their contribution to the east European war potential.

It is estimated that the additions to the " absolutely forbiddens " will involve no more than a cut of £3,500,000 in the current annual rate of trade between the United Kingdom and Eastern Europe. The commodities affected will, with the exception of small quantities of non-ferrous metals, be entirely machinery. It is much more difficult to name a figure for the effect of bringing the new commodities under quantitative restrictions, but it is not expected to be large. Again, it is entirely machinery that is affected, of which electrical generators and locomotives are the most important items. A clue to the quantities involved is to be found in the fact that total trade in these two items between the United Kingdom and Eastern Europe is expected to run at about £1,500,000 this year.

Thus, so far as can be seen, the effect of the recent decisions on current levels of east-west trade is likely to be quite small. But this is bound to be the case only so long as the question of restricting sales of sterling area raw materials continues to be scotched. The officials, on American insistence, came to this problem during their recent talks, but hastily shied off again with the comment that it could only be decided in a broader political context. Raw materials are the only things the Russians are really concerned about, and any attempt to restrict access to them would provoke retaliation. They have inserted a clause in their coarse grain contract with Britain, reserving their right to stop shipments if they cannot get the things they want from the sterling area ; and both they and the Poles have given formal notice that they will exercise this right if provoked.

* * *

Neighbours of the Cominform

Nowhere are events in the Far East being more closely and anxiously watched than on the highly important anti-Cominform front in the Balkans. It is clear that Marshal Tito, whilst always preserving what he considers to be the sea-green incorruptibility of his Communist dogma, is inclining ever further westward. In the Security Council, for example, the Jugoslav delegate has voted with the majority in opposing Chinese aggression in Korea, instead of taking refuge in the half-way house of abstention. And the Americans have been granted greater facilities than was expected to supervise the use to which their food supplies are put inside Jugoslavia.

Marshal Tito has also brought about a reconciliation with Greece. The rail link between Belgrade and Salonika has at last been reopened ; the first party—admittedly only a small one—of Greek children who were carried off to Jugoslavia during one of the cruellest and most unforgivable stages of the civil war, have been returned to Greece ; and the Marshal has taken pains to remove Greek fears of his intentions towards Greek Macedonia. These gestures have resulted in an agreement to resume full diplomatic relations in the near future. Marshal Tito has thereby not only gained for himself the great advantage of a friendly instead of a hostile neighbour along his southern border ; he has also given further proof to the western allies of his desire to be accommodating —for a Greek-Jugoslav settlement has long been an object of their diplomacy.

The first Cominform reactions have been frequent and categorical assertions that the first object of the " Belgrade-Athens axis," instigated by its American masters, is a joint attack on Albania. This might—Communist technique being what it is—foreshadow a Cominform attack on Jugoslavia, or Greece. It may, on the other hand, be only the enraged reaction of the Cominform to a *rapprochement* which it has always done its best to prevent. In either case the value of Marshal Tito's thirty-odd divisions to the western camp remains undiminished. An American writer has pointed out that Congress, if it grants Marshal Tito the additional $50

The Economists' Bookshop Ltd.

caters for specialists and students in

Economics and the Political and Social Sciences

11-12 Clement's Inn Passage, Aldwych, W.C.2.

million considered necessary to keep his regime stable, will be keeping these thirty excellent divisions alert and ready at a cost which is less than one-third of what is needed to equip and maintain one American division for a year. The comment is none the less cogent for being double-edged.

* * *

Emergency Teachers

One of the really successful experiments of the reconstruction period has been the emergency scheme for training teachers. The response was so good that it caught the organisers unprepared and for years Members of Parliament were deluged with complaints from applicants who had been accepted as suitable for training but for whom places in the new colleges could not be found. Men and women were taken from other walks of life and from the Forces and given a year's intensive training instead of the normal two-year course. Without this emergency measure the schools would have been even shorter of staffs than they are now. And the success has not been only in numbers. These older recruits, with experience of other careers, have proved invigorating and stimulating to the schools themselves.

The official account of the scheme (HMSO, 4s.) shows that before the war the teachers' training colleges turned out about 7,000 teachers each year. For the emergency scheme some 95,000 candidates were interviewed and 23,800 men and 11,900 women were accepted. Fifty-five training colleges were opened and the total cost of the whole scheme to the Exchequer was £20 million. The long wait for places in the colleges caused many candidates to withdraw from the scheme and by March, 1950, 19,500 men and 9,500 women had completed their training. Of the 70,000 additional teachers which it was estimated would be required in the immediate postwar years, the emergency training colleges will therefore have contributed about 30,000.

As so many more of the recruits were men than women the relief to hard-pressed infant schools has been small. Most of the men chose to take up training suitable for the 9-15 age group and few of the candidates were qualified to work in grammar schools. Over 10,000 of the men and 5,000 of the women came from commercial and clerical jobs; 5,000 men came from industry, 2,400 men and 2,500 women from central and local government service. Those with technical qualifications are proving specially useful in the workshops of the secondary modern schools.

With so great a success achieved it is sad that this scheme is ending. The schools badly need the breath of fresh air from the outside world. From school to training college and back to school is no way to give teachers a balanced view of life. Somehow a side-entrance to the profession ought to be kept open.

* * *

Civil Service Recruitment

The report of the Civil Service Commissioners for the period 1941-49 (HMSO, 2s. 6d.) covers both the wartime expansion and the postwar reconstruction and consolidation of civil service manpower. The war economy and the planned economy are alike in calling for a large, complex, individually and collectively able, administrative and executive body. They require not only first-rate brains at the very top, but also a wide dissemination, among intermediate grades, of intellectual and human qualities considerably less essential to the subordinates of the older dispensation.

The new status of the Civil Service calls for new criteria of selection for Civil Servants, at once more flexible and more exacting, mitigating the predominance—without sacrificing the quality—of the traditional mandarin type, testing character as well as specific intellectual or technical qualifications, sorting round pegs into round holes and providing as much opportunity as possible for internal reshuffles and readjustments. The Commissioners' report hardly suggests that these new criteria have yet been very well established. There has been a remarkable and salutary loosening up. For the reconstruction period, access to the Civil Service was necessarily widened to include different age groups and different qualifications ; the interview has grown in importance ; there are more opportunities for regrading within the service itself ; while the famous CISSBE "country house" technique of selection may have proved unduly expensive, the methods practised at Stoke d'Abernon are being developed and refined to greater usefulness.

So far, so good ; but the maintenance, let alone the raising, of standards is another matter. Like everyone else, the Commissioners must buy manpower in a sellers' market. Instead of taking, as before the war, only the cream of a crop of eager and well-qualified young applicants, they have been driven on occasion to lower the qualifying marks in order to fill vacancies. In perspective, they are competing, skilfully but under a certain handicap, for a larger share of a painfully limited stock of ability—ability on which business, the universities, nationalised industry, the legal, teaching, medical and other professions, and local government all have urgent claims to stake out. Whether there is in fact enough of such ability available, actually and potentially, to meet the minimum requirements of the planned welfare state is the wider question that lies behind the Commissioners' report—and to which no easily optimistic answer can be given.

A Woman's Place

It will be news to most Englishmen that there has for some years existed in America a convention or association for the assertion, extension and enforcement of the rights of womanhood, as those rights are understood by the members of that association. . . . The American ladies claim for their sex equal eligibility to all professions and occupations, to medicine, the law, the church, and even to official business. Have they ever considered the incongruities which would result were they to share with men all these various departments ? . . . Have these ladies ever asked themselves whether female nerves and female strength would be adequate to endure the severe application which the law, medicine, and the public service require from their votaries ? Do they not know the intense labour demanded from the students of any of the learned professions—labour which often breaks down the constitution of the strongest men ? How would they endure the horrors of the dissecting-room, the intricacies of the statute-book, the wearing toil of the official bureau ? And what would become of their brothers, their parents, their children, while they were studying or practising these absorbing and exhausting professions ? Where would be the gentle amenities of home—the cheerfulness of the fireside circle—the well-regulated household—the orderly and happy family ? Would the men have to perform their duties ? . . . No! women have their sphere—a sacred—and indispensable—a noble one—a sphere in which they are unrivalled and cannot be replaced. It is not by leaving their own lines of eminence and elbowing men out of theirs that they can hope either to amend their position or elevate their nature. They are first-rate mothers, wives, daughters, formers of their children's minds, soothers and counteractors of their husband's asperities, comforters for the wretched, Samaritans for the wounded and the sick. And would they forfeit and exchange all this, to become incompetent surgeons—third-rate physicians—shallow lawyers—wordy, inconsiderate, and excitable senators—hasty, impulsive, and discredited ministers of state ? Those who would thus "leave their sphere and rush into the skies" can have no adequate consciousness where their true strength and excellence resides.

AGA

Regd. Trade Mark

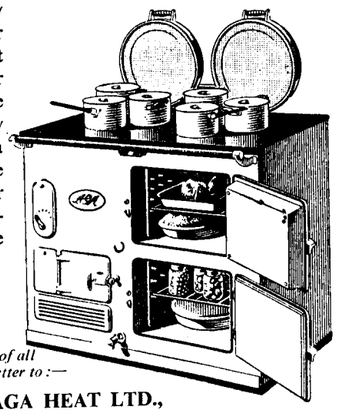
SAVES

IN THE DAYS BEFORE BANKS, country folk often buried their money under the hearthstone, and then lit over it the log fire which was never allowed to go out. Thrifty couples in these days keep up this old rural custom by putting their savings into an Aga cooker, which also stays in night and day. Here are some of the ways in which the Aga gives solid and appreciable savings :

On Cash:

So economical is the Aga in fuel consumption that savings in fuel bills eventually cover its initial cost. Look at it this way : the Aga Model CB has a *guaranteed* maximum fuel consumption of 3½ tons a year. With coke at £5 a ton this means your quarter's fuel bill is less than £4.7.6 — i.e., for less than a shilling a day you have constant hot water and a perfect cooking service. Compare this figure with your current fuel budget. The *difference* will give you your monthly *saving*. And the answer will set you thinking seriously.

On Work:

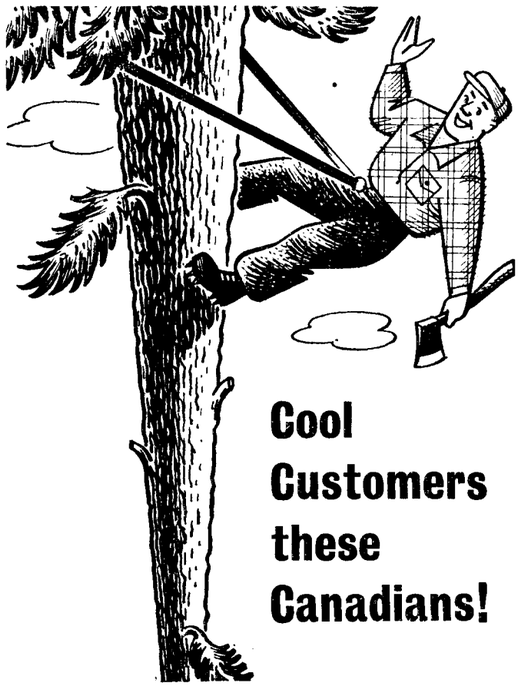


How much work the Aga saves! No fire lighting, no blackleading, no constant stoking or refuelling, no greasy fumes, no soot or smoke. The Aga is as good as a servant in the kitchen.

On Capital:

Since 1929 tens of thousands of far-sighted couples have installed the Aga as an investment. They have got their money back long since and their fuel savings are now tax free income.

On Income:



The Aga CB is the only cooker and water heater which can be bought on Hire Purchase over a period of as long as five years (and is the only cooker and water heater on the market which is guaranteed for ten years). For as little as £2 a month (say 10/- a week or 1/6 a day) you can enjoy the most efficient cooker and an absolutely certain, trouble-free supply of hot water.

Send today for full details of all Aga models, address your letter to :—

Cool Customers these Canadians!

YES, you will find the Canadian rather a cool customer. He certainly wants British goods — is ready to buy twice as much as he now does. But first you've got to warm him up—with the high-pressure salesmanship he expects! American business men succeed by doing just this. So how about *you* flying to Canada and selling hard *on the spot?*

DOLLARS RIGHT AND LEFT

What could be easier—with Trans-Canada Air Lines to whisk you, with "on time" arrival, luxuriously across the Atlantic in *less than a day?* Tomorrow you can be in Montreal collaring valuable dollars right and left. T.C.A. operate the *most frequent* service to Montreal and all Canada. Ideal, too, for the rich American market—there's a Skyliner service direct from Montreal on to New York with, if you wish, stop-over in Montreal at *no extra cost*. All this is yours on this special business man's service.

Swift Skyliner services link you with every important Canadian and U.S. city. Let T.C.A. take you there and *you'll* be taking the orders.

Fly T.C.A. during the new "LOW FARE" seasons

Letters to the Editor

Farm Price Foolishness

Sir,—The note in *The Economist* of November 25th conjures up a piquant picture of the Minister of Agriculture sliding down a rising slope of inflating farm prices. Unfortunately there is more wrong with this note than misused metaphors.

You say that the Minister "has, in effect, committed himself to finding another £11 million a year for agriculture." He has done nothing of the kind. The sum he has undertaken to make good to the industry is some two-fifths of that figure. It represents the extra cost incurred as a result of the wage increase, not over a full year, but in respect of livestock products between November and next March, and in respect of the 1951 crop of cereals, sugar beet and potatoes for which prices to the farmer were fixed at the price review last February.

To use a figure of £11 million is itself misleading in the context of the price review. It represents the extra cost to the industry of the wage increase for a full year in England and Wales over the whole range of farm produce, whereas some 25 per cent of this increased expenditure relates to the substantial group of horticultural and other non-review commodities for which neither prices are guaranteed nor markets assured.

Moreover, your note ignores the all-important distinction between prices fixed last February for current production and prices which will in due course be fixed at subsequent February reviews for production to which the farmer is not yet committed. In the case of the latter the farmer retains some freedom of action: if he does not like the price he can still do something about it, but in the former case he has no remedy if costs rise against him.

The essence of the agreement arrived at in 1946 is that sudden and substantial changes in production costs *between* annual reviews, at which prices are fixed after consideration of all relevant factors, including "national economic requirements," shall not be allowed to prejudice the contract entered into between the Government and the industry the previous February on which farmers' production plans are based—a recognised principle in commercial practice.

The Minister did in fact take the necessary time to think, in circumstances which raised issues of national importance, and the industry, by undertaking to shoulder the extra cost without recoupment for four-and-a-half months, made a contribution in keeping with its responsibility.—Yours faithfully,

TRISTRAM BERESFORD

Chilmark, Salisbury

[The Minister has promised farmers full recoupment of extra wage costs arising up to next March. In theory (as our note pointed out) he has done no more, and thereafter farmers may be left to find the £11 million a year out of their own resources. But does past experience suggest this as being at all likely?

If (as Mr Beresford claims) the automatic adjustment of prices to costs is sanctified by commercial practice, there will be an end of economic progress. Are farmers always to rest on claims that costs are "beyond their control"? The traditional (and healthier) theory is that higher wages serve as an inducement to better labour utilisation and higher efficiency.—EDITOR.]

German Rearmament

Sir,—The foreign policy debate in the Bonn *Bundestag* on November 8th has delivered a further proof that German public opinion on the problem of rearmament can no longer be ignored.

But what is German public opinion? From the speeches during this debate in the *Bundestag* one would conclude that all political leaders agree on one condition for their co-operation in the creation of a German armed force: full sovereignty and equality (*Gleichberechtigung*)—that is to say, no Allied control over German foreign policy and an army under a German general staff.

While probably all Germans would agree with the first part of that condition it would be utterly wrong to believe that the politicians express real public opinion on the second part. A very interesting private poll by the non-political Frankfurt *Abendpost* showed the following result:

	per cent
Against any form of re-militarisation	68.25
For re-militarisation on principle	3.36
For German units within a European army	17.37
For an independent German *Wehrmacht* (and against a European army)	8.26
No opinion	2.76
	100.00

In a public forum of its readers on the same subject only one of the thirty-seven contributors insisted on a German officer corps and general staff.

At a meeting of about four hundred young people in Frankfurt (which I attended), the biggest applause did not go to their political leader, but to a speaker in the discussion who said that all young men of his age had made a vow never to take up a gun again; they had had enough of fighting, and were particularly fed up with the arrogance of their officers and the inhuman treatment meted out by most of them. Now the world situation had changed, and, of course, he and his friends would not stand idle when real danger was ahead; but why should it not be possible, he asked, to serve under British or American officers? He would not mind that, but he would never put on a *German* uniform again. This last sentence brought the house down.

The German claim for equality might be met by asking German staff officers to assist in the European general staff. Under certain precautions they could do little harm and might do a lot of good.—Yours faithfully,

WALTER FLIESS

Frankfurt/M.

German Deflation

Sir,—Mr Balogh in your issue of November 25th draws attention to the difficulties arising from Germany's exhaustion of her quota with the European Payments Union. He ascribes it to "wild speculation in sterling and commodities, made possible by the dismantling of direct controls." "Only a small fraction of the losses of foreign exchange was due to the worsening of the current balance of payments." These statements are not borne out by facts.

Germany's original quota in EPU of 320 million units, against 520 million for France, was evidently too low—as is proved by EPU's proposal to grant her a temporary credit of $120 million and release $60 million she owes; yet even with a higher quota, a hitch might have occurred. For Germany is a deficit economy with very slight reserves. On November 15th, the Bank der Deutschen Länder held only $236 million after having lost $90 million since September 30, 1950 (within a similar period last year, Great Britain lost $311 million, though protected by direct and indirect controls of all sorts). For 1949, Germany's trade deficit was $1,100 million; it was almost covered by $956 million of United States assistance. During the first half of the current year, this deficit was running down at what would amount to $650 million a year.

The rapid price changes following the Korean war made imports swell in the four months, July to October, 1950, to almost twice those of the same period in 1949. Exports went on growing rapidly, but importers bought ahead, because they did not want to pay higher prices later on, as reasonable business men and responsible governments have done elsewhere. Talks about sterling revaluation reinforced these trends; they induced some exporters to retain exchange longer than they otherwise would have done.

Germany had liberated her imports according to EPU rules. Some members, Great Britain among them, were slower to liberate their imports from Germany. Others sold to Germany under liberalised terms goods which originated outside the union (amounting to perhaps $25 million). There was, moreover, a time lag between payments for imports, which had to be made almost immediately, and for exports, which were coming in more slowly. Mr Balogh's picture of an economy of gamblers and wasters, who have run amok under the impetus of a new *laissez-faire, laissez-aller* policy, does not correspond to facts. Quite possibly, the same situation would have arisen if the German Government had gone in for bulk buying; planning governments frightened of being caught "short" are inclined to over-buy.

The German crisis is purely an import crisis, and not, like Britain's crisis last year, an export crisis; exports have risen from $81 million in October, 1949, to over $200 million in October, 1950. Of course mistakes have been made, import licences have been granted too freely, some excessive investments have been sponsored, and some luxury goods may have crept in. Are these mistakes bigger than those in which completely controlled economies indulge, and which have to be hidden by devaluation?

Mr Balogh's suggestion that Germany should return to a fully controlled economy, and reverse her liberalisation of imports, will hardly find favour with EPU. For cutting imports means cutting somebody else's exports, a method by which Great Britain managed to transfer some of her troubles to other nations. Germany would certainly not get a credit of $180 million if she used the escape clause.

Mr Balogh is horrified that the experts approve credit restrictions (already adopted by the Central Bank), and press for balanced budgets and investment cuts. He fears that unemployment will rise to last year's high level of 2,000,000—at that time controls were still in force. During liberalisation, it has rapidly decreased; even now in the winter and when credit restrictions have already been at work, it has hardly risen. It could not be kept low without the grant of $180 million, for without imported foods and raw materials people cannot work.

The experts' plan can be expected to be temporarily successful. A permanent solution depends on the tackling of Germany's central economic problems, which depend on international policies. Mr Balogh's main anxiety is, however, not that the expert's deflation scheme may fail, but that it will succeed. In that case, he fears, "it would set a dangerous precedent for Britain, should a turn in the world's economic position lead to renewed tension in our (dollar) balance of payments." It really would be too bad if Britons were to be shown that progress can be made by liberalising policies and shedding controls.—Yours faithfully,

M. J. BONN

London, N.W.3

The Encroaching Corporations

Sir,—In his reply to your note on British European Airways Mr Masefield, BEA's chief executive, puts forward two arguments and makes one observation. I am even more concerned with the way in which the corporation is presenting its case than with its merits.

Mr Masefield maintains that because BEA agrees to the granting of the same number of permits for the operation of routes by private companies as were granted last year, it is not squeezing charter firms from the air. In itself his argument does not prove anything, and in the light of his closing remarks it seems ominously likely that good routes have been exchanged for bad. How can one form an opinion without such details of the routes as the port of departure, the frequency of services, passenger and freight capacity, etc.? Has Mr Masefield given all the relevant facts?

The second argument is positively misleading. Perturbed by your accusation that BEA is judge in its own cause, he says, "We merely make recommendations to the Air Transport Advisory Council—an independent body. . . . This council decides whether applications shall be granted, modified or refused. It is, in fact, a licensing authority. In the past it has certainly not accepted the recommendations of BEA in all cases." But in Dr A. M. de Neuman's little classic on "Consumers' Representation in the Public Sector of Industry," ATAC is classified as a form of consumers' council, and these bodies certainly have no licensing power. It would be enlightening to know whether on any occasion applicants or their representatives have been allowed to appear before this authority. We are told that it has shown some independence by not agreeing to certain of BEA's recommendations. More detailed information on this would be welcomed.

By pointing out the need for a real licensing authority Mr Masefield has proved beyond doubt the correctness of your note.—Yours faithfully,

STUART BOWES

London, S.W.1

Books and Publications

A Counsel of Patience

The Curtain Isn't Iron. By Joseph C. Harsch. *Putnam and Company, Limited.* 190 pages. 8s. 6d.

Mr Harsch, so well known to BBC listeners, did well to publish this stimulating little book in London as well as New York. It should save us from judging too hastily that Eastern Europe's five satellite states have already taken on the "monolithic" form that Soviet policy has designed for them; and, what is just as important, it reminds us of the erratic and sweeping generalisations to which American public opinion inclines. Mr Harsch does his best to correct some of these and to plead for patience. His view of the wise American policy for the future might be summed up in six words: "Keep Jugoslavia independent and be patient."

It is useful to have the reminder that five years of pressure from Moscow has met with serious reverses. The iron curtain, as a strategic obstacle, is weak at its flanks, for in the north Finland beat off in 1948 an attempt at a *Putsch* on Czech lines, and in the south Tito's defiance has survived for two and a half years. In Austria there has been "the most complete and finished victory yet won by the west"—a Socialist victory, Mr Harsch points out. In Poland far more energy has gone into national recovery than into Sovietisation, even with Rokossovski in the seat of power. Ideas do penetrate the curtain. Nationalism still brings Poles and Czechs into conflict with anyone who tries to "co-ordinate" their industrial planning. The fanaticism of the Communist centre grows cold around the fringes.

Mr Harsch wants Americans to realise that it is useless to dream of a return to prewar ways. If an east European country should succeed in breaking away from the Russian sphere, it will have to keep police rule—to control the agents of the Cominform. It will want, also, to keep the main features of its social revolution, and to keep the state in its new administrative role. It will not want German hegemony to take the place of Russian. In fact, if the Americans had liberated the east they would now be goading on governments to many of the reforms that have been accomplished.

There is much to be said for Mr Harsch's counsel of patience, for the plain fact is that no one is ready to go to war to liberate Eastern Europe. But is he not a little too optimistic? He sees the dilemmas of Russian policy as a westerner: in Poland the collective farm is needed to make the peasant politically reliable, but the effort to enforce it reduces production; the measures for security taken by Communist governments reduce their loyalty to, and respect for, Moscow; the effort to create an empire creates weakness instead of strength. Experience surely shows that Russians, confronted with such dilemmas, go ahead ruthlessly. It likewise shows that the Communist Party is a past master at eliminating political alternatives. Mr Harsch perhaps counts too much—though he does not say so—on the political qualities of the exiles in America.

There is one piece of advice to his fellow countrymen that Mr Harsch does not give, but which may be offered here: it is that American policy should work much more through European channels. If it is intellectual and political resistance that is to be kept alive, then France and Britain still command in Eastern Europe more respect than does the United States. But if there is to be one day a great act of liberation, it is to the Americans that eastern Europe will look to hold back the Germans.

Defence in a Nutshell

Defence in the Cold War. A Report by a Study Group of the Royal Institute of International Affairs. 123 pages. 5s.

This is an admirable piece of work. The products of group consultation tend to be compromise documents, in which every side of every question is set out and commonplaces take the place of conclusions. But Sir Ian Jacob's group has arrived at firm and specific conclusions, which their draftsman has set down in terse and clear language. The result is to make the report what the Americans call "required reading."

The drafting is so economical that it is hardly possible to summarise the argument without distorting it. It must suffice for a brief review to pick out one or two of the more striking of the specific conclusions. In the view of the group, the danger against which it is necessary for the Western nations to be prepared is not so much that of open war *à la* Hitler as of a long-drawn-out cold war waged by the Russians. This is defined as "all mischief short of war"; recent events suggest a revision to "all mischief short of war directly involving the USSR itself," and even this may prove to be unduly optimistic. But it still seems the most probable hypothesis; and it carries with it an important corollary—that the present programme of building up strength must be a long-term one. That means that it must be pursued by methods that either are, or can be made to be, compatible with the democracies' normal pursuit of happiness. There might have been more discussion in the report of how this is to be done—particularly, perhaps, on the economic side. The true argument is not so much whether the democracies can "afford" an adequate programme of defence, either materially or spiritually, but what happens to them in the affording.

The report is insistent that the crucial area of Western defence is in Europe. This, of course, is quite right; and it is also quite right to insist that the defence forces necessary to make Europe secure should not be under-rated—the group puts them at 50 to 55 divisions, at least a third of them armoured, a tactical air force of 5,000 jet-fighters and 1,000 tactical bombers. Perhaps, because of this perfectly proper concentration upon Europe, the report's recommendations for other parts of the long front are on the verge of being weak. There is a suggestion, for example, that

> if Western policy—or an Asian Government—could build up an association of South Asian States with Governments strong enough to deal with the internal threat of Communism, it is for careful consideration whether the interest of the Atlantic Powers would not be better served by this group's declaring armed neutrality in case of war than by its taking part in defence preparations that would cause a further drain on the war potential of the West.

Is this not the Third Force idea in an Asian guise? And is it not optimistic in the highest degree to expect the conditions to be fulfilled? Or again, it is a little disturbing to find, in a report so well informed and obviously authoritative as this, that less space is given to the Middle East than to Spain.

But there are minor blemishes. Those who wish to have a convincing, balanced and readable view of the problem of Western defence could hardly do better than spend five shillings and three hours on this report.

No Thoroughfare

Return From Utopia. By Richard Law. *Faber and Faber.* 206 pages. 12s. 6d.

"A perfect society is no more to be realised than a perfect human being, and the search for Utopia has always ended in disillusionment. . . . To turn our backs upon Utopia, to see it for the sham and delusion that it is, is the beginning of hope." There is more to these prefatory remarks of Mr Law's than a warning against rushing one's fences, or aiming at overambitious objectives. Utopia is a delusion not merely because it is unattainable, but because, were it attained, all the specifically human virtues would wither in its atmosphere.

The bulk of "Return from Utopia" is, however, concerned with wrong roads to earthly perfection rather than with the hollowness of perfectionism itself. Mr Law is an able and warm-hearted Tory, with the qualities and defects which that description implies. He has the historical piety, the sense of individual dignity and obligation, the combination of realism with charity towards his exasperating fellow-mortals, which is the strength of his kind; he has also the peculiar unwillingness to think things through, the propensity to conduct arguments at the level of intellectual pat-ball, and the incapacity to imagine other viewpoints than his own, which are among its characteristic weaknesses. He has much that is sound to say about the political, economic and social characteristics of the world of today, about Britain's position in that world and the errors of British policy both before and after the second World War, about the planned economy, the free market, the relationships of the British Commonwealth, America and Western Europe in the economic and political fields; and he excels in the quotable phrase—"Self-control, even more than vigilance, is the price of freedom," or, in a different strain, "The British capitalist has been thinking mainly of preserving his fortune, the American intent upon winning his." He also shows evidence of a capacity to master, when the necessity occurs to him, economic arguments of some complexity.

Yet he can discuss the question of public control, its boundaries and techniques, or the nature of the dollar problem, or the causes of depression, with the dogmatic naïveté to be expected in a Brighton-to-London Pullman; while his picture of a Britain sunk in lethargy and frustration suggests rather the mutual disgruntlement of an Angela Thirkell teaparty than the findings of an ordinarily wideawake observer. Again and again he lays himself open to attack; any clever young Socialist could make mincemeat of him, and doubtless plenty will. Anyone who values wisdom as well as cleverness, however, will discount the particular errors, the blind patches and conduct his private controversy with Mr Law in different terms—terms relating not to the expediency or inexpediency of this or that political or economic measure, but to the "true end of man." Mr Law's prescription of religious—and specifically and dogmatically Christian—revival cuts him off from a good many of his natural allies; but one need not share his dogma to feel that there is, in his view of the human problem, more realism than can be found in many works less intellectually vulnerable.

The Social Sciences

The Science of Humanity. By K. G. Collier. *Thomas Nelson and Sons.* 339 pages. 12s. 6d.

It is a pity that this book attempts so much in a modest space, because its intentions are admirable, and the author is a thoughtful and stimulating writer. As it is, however, the book is neither a clear textbook of principles and methods, nor a thorough discussion of objects and achievements. It is directed to the teachers, students and enquiring laymen who are increasingly falling under the spell of the prestige of "science"—that is, the self-confidence and solid cohesion of the natural sciences; and it sets out to describe the methods used and the results achieved in the application of scientific principles in the various social sciences, with the object of inspiring the same enthusiasm for them, within the proper limits. As if this were not a big enough bite to chew in one book, however, the author goes on to discuss the problems of human welfare at considerable length in an admittedly speculative way. However good his opinions and conclusions are, in going so completely against the canons of scientific objectivity he has described in the earlier chapters he will disillusion and confuse the reader and blunt the point of his lesson.

The exposition thus compressed into half the book is planned on somewhat grandiose lines, with chapters on evolution, heredity, instinct, neurology, endocrinology, psychology, anthropology, sociology and economics; statistical theory is developed *en passant*. Some of these subjects are left in the air, and are barely referred to in the subsequent discussion; if they had been omitted entirely, there would have been space for a more leisurely development of the others. As it is, however, the ordinary reader will probably be bewildered and discouraged in trying to assimilate this extensive field of knowledge so rapidly; the author, as a teacher, should know the dangers of trying to cram too much into his pupils' minds, and might have been wiser to content himself with a clearer and more rudimentary treatment.

In spite of all this, the book contains a great deal of useful material presented in an interesting way, and in good hands would, as the author intends, prove valuable as a basis for discussion groups and classes.

Cold News on Hot Money

Capital Imports and the American Balance of Payments, 1934-39. By Arthur I. Bloomfield. *University of Chicago Press.* 340 pages. 45s. net.

In the six years from the end of 1933 to the end of 1939 the United States ran a net surplus on current account of just over $2.6 billion. It also enjoyed an identifiable net capital inflow of $6.0 billion and an unidentified net inflow on either current or capital account of $2.4 billion. In consequence, just under $10 billion of gold and just under $1 billion of silver poured into the country in these six years. By all the accepted concerns of orthodox economic recovery this vast and prolonged movement should not have happened. The countries that were losing the gold should have leaped to their bank rates, cut down internal employment, incomes and spending, and set their balance of payments to rights. In America, as foreign funds poured in, incomes and spending should have risen and the rate of interest should have fallen far enough to encourage American industrialists to inflationary excesses and foreign speculators to shift their funds elsewhere. In the 1930s, however, deficit countries were unwilling to cut down their employment levels below the miserable level then existing; American industrialists were much too bemused by slump psychology to be encouraged by a low rate of interest; and foreign "speculators," who wanted to get the Atlantic between their funds and Hitler, were not primarily concerned with interest rates at all.

The great virtue of Mr Bloomfield's book is that it contains an exhaustive study of the sources of this capital inflow into America and of the channels through which it flowed there. This hard core of statistical research is so well done, in fact, that an unexpected reward awaits those who plough through the dry crust that surrounds it. Unfortunately, however, it is a safe forecast that only a few unusually diligent students will do so. For Mr Bloomfield devotes an unconscionable amount of space to explaining to the already convinced why the dead horse of classical monetary policy should not be too soundly flogged for failing to function in the 1930s; in some chapters, indeed, he prolongs this agony by elevating every platitude ever uttered about hot money to the status of an economic theory—and then tracing its development back to the ark. In so doing he drowns the substance of three or four very interesting—if somewhat out of date—articles in the 340 pages of a rather dull book.

Humorist and M.P.

Independent Member. By Sir Alan P. Herbert. *Methuen.* 503 pages. 21s. net.

The significance of this book is threefold. First, it is a slice of autobiography of one of the most engaging figures of our day. Second, it is a social commentary, a "documentary" of that tremendous period covered by the years immediately preceding the war and by the war itself. Thirdly, it is a critique of the working of the Parliamentary system and of the party system in especial. In one volume, A.P.H. has compressed material enough for three.

A.P.H.'s Parliamentary period (he declines to call it a "career") was marked by hatred of solemn humbug and a passion for human freedom. The two combined led him into a whole series of one-man campaigns against his pet aversions. The divorce laws, the betting laws, the law of libel, the entertainments tax, the wrongs of merchant seamen, all these and others impelled him into action. The degree of success that he achieved was, for one man, very remarkable. Apart from bringing about the biggest reform of the divorce laws for some generations, he initiated all sorts of other changes which, even when not brought to full fruition by him, were subsequently completed by others. It takes nearly two pages of print to record his "Won Causes."

What made his campaigns so remarkable, and what indeed contributed greatly to his success, was the mixture of moral indignation and irrepressible wit and humour which he brought to the job. He will for long remain, perhaps for ever, the one member who has had the impudence to make a Parliamentary speech in verse of his own composing. This was his Irish ancestry very visibly protruding.

In its third aspect the book constitutes a critique of Parliament. A.P.H. makes no secret of his affection for the queer archaic forms of Parliamentary procedure. He values the historical continuity of its traditions, and feels to the full the force of its collective personality. He is in every sense "a Parliament man." But he was a very unusual one, and in his comments on the party system and the place of the Independent in politics he probably reaches as just an assessment as has been published anywhere. He is sure that "the party system is right and necessary." All cannot be fly-halves—there must be a scrum. There must be regular troops, however gallant and showy the guerrilla life in the woods. There must even be the Orderly Room, with Whips who know everything and can guide the less well-instructed. The King's Government must go on, and that means that Ministers must be backed by loyal reserves. Similarly, the Opposition must be governed in an orderly manner; or they will become a ragged and impotent rabble.

Yes—but! . . . But there are all sorts of issues which Governments desire to dodge. They are issues which may bring them into conflict with the "organised minorities" by which Britain is so largely governed. They may be issues on which votes are easy to lose and hard to come by. But they may well be issues which in the public interest ought not to be shirked. Here is the field for the Independent who is prepared to "die daily" in defence of what he believes. The long list of Independents from Cobbett to Plimsoll, and from Plimsoll to Herbert, and the issues they insisted on bringing to the fore, shows how necessary they are.

The abolition of the University seats—in some ways the meanest thing done in the last Parliament—removed the senior burgess for Oxford, and closed a door by which many able and independent men have been able to enter Parliament. Some day, perhaps, university representation will be restored. In that case A.P.H. may again grace the Westminster proceedings. In his last words to the House A.P.H. said—"Whether we go up or down, let us show that we can be gracious, and gallant—and gay." He himself was gloriously all three combined, and he has left a notable record of himself and his work.

Ready in January, 1951.

OXFORD STUDIES IN THE PRICE MECHANISM

Edited by T. WILSON and P. W. S. ANDREWS.

Probable price, 21s. net.

This collection of papers on the price-system consists partly of articles originally published in *Oxford Economic Papers* and partly of new essays. CONTENTS: The Rate of Interest as a Weapon of Economic Policy, by R. S. SAYERS; The Significance of the Rate of Interest, by H. D. HENDERSON; Summary of Replies to Questions on Effects of Interest Rates, by J. E. MEADE and P. W. S. ANDREWS; Interest, Prices, and the Demand Schedule for Idle Money, by A. J. BROWN; A Further Inquiry into the Effects of Rates of Interest, by P. W. S. ANDREWS; Business Men and the Terms of Borrowing, by R. S. SAYERS; Trade Balances and Exchange Stability, by A. J. BROWN; The Fundamental Elasticities in International Trade, by A. J. BROWN; Price Theory and Business Behaviour, by R. L. HALL and C. J. HITCH; Industrial Analysis in Economics, by P. W. S. ANDREWS; Agriculture and the Price Mechanism, by B. D. GILES; The Results of Empirical Studies, 1936-9, by H. W. ROBINSON; The Experience and Lessons of the Past Ten Years, by H. W. ROBINSON.

Shorter Notices

International Economic Disintegration. By W. Röpke. *Hodge.* 283 pages. 21s.

THIS reprint of an important work which, written before the war and first published in 1942, did not for obvious reasons get the attention which it deserved, is more topical than one would think. Professor Röpke's underlying thesis is the sense as that which forms so essential a strand in the argument of his more recent "Crisis of Our Time" and "Civitas Humana": that the market economy, whether nationally or internationally considered, is not "sociologically autonomous" but "a highly sensitive artifact of occidental civilisation," and that its increasingly visible shortcomings and partial collapse are due not to any inherent contradiction, but to the breakdown of the social and international code of decent behaviour within which it functioned. The analysis of that breakdown, the sequences through which it takes effect, the different aspects which it assumes in differently characterised communities, occupy most of his attention; on the more positive side he is content (while referring the reader, in this edition, to the later works named above) to outline the agenda of necessary inquiry into the "rational scheme of international division of labour" in a healthy society. Necessarily, some of the matter dates; but more often it is with an uncomfortable shock that one reminds oneself that the policies which Professor Röpke is criticising are those of the nineteen-thirties, not those of today, and that the country pre-eminent in their pursuit is not Socialist Britain but Nazi Germany.

It is time, incidentally, that a protest was registered against the repulsive production of Professor Röpke's books. All have been unpleasantly bound and hardly less unpleasantly printed; the present volume is the worst of the lot.

Economic History of England. By H. O. Meredith. *Pitman.* 434 pages. 10s. 6d.

No history can be completely up to date, and events have already overtaken this fifth edition of the Meredith classic, edited by C. Ellis; but its penetrating evaluation of the salient features in English social development enables the reader to draw illuminating analogies between his own condition and the evolving experience of his forebears which created it. The wealth of information is enhanced by the logical and epigrammatic style of the writer and his balanced and humane judgments.

The book, in fact, has a threefold utility. First, it is a well-planned survey of the action and reaction of economic and social changes, based largely on Cunningham's great work, "The Growth of English Industry and Commerce," whose more intricate research is here reduced to easily assimilable form; secondly, it is a reference book for all who seek succinct information on trade, money, agriculture, industry and the like; and, thirdly, the general surveys which introduce each section would in themselves form a book, giving the non-specialist an admirable picture of the growth of English life and character from mediaeval times to our own.

Mid-Century: The Social Implications of Scientific Progress. Massachusetts Institute of Technology. *John Wiley and Sons, Inc.* 549 pages. $7.50. *Chapman and Hall, London, E.3*

THIS most attractively produced commemorative volume provides a verbatim record of the proceedings of the Mid-Century Convocation of the Massachusetts Institute of Technology, held in the spring of 1949; proceedings chiefly memorable to the casual newspaper reader as having afforded the setting for perhaps the greatest of Mr Churchill's post-war speeches. The record is annotated, edited and supplemented by the institute's Dean of Humanities, Dr J. E. Burchard, with skill, grace, dignity and occasional apt humour; and much of the matter is eminently worth preserving. Nevertheless, it is questionable whether a volume so massive, so costly, and necessarily containing so much of merely subsidiary or passing interest, was really the best form in which to preserve it.

Le Franc, 1938-1950. By J. G. Merigot and P. Coolhois. *Paris:* R. Pichon and R. Durand Auzias. 426 pages.

THE price of this book is not printed. That fact—and it applies to wellnigh every book published in France—epitomises its subject matter: the depreciation of the franc. When the currency is as unstable as it has been in France over the past 25 years, it is far safer to pencil in the price of a book and so make it easily amenable to periodic adjustment. The authors have provided a magnificently documented history of the French franc between 1938 and 1950. In their interpretative passages, however, they so abhor the mechanistic approach, even with its Keynesian refinements, and incline so much to the psychological ("l'inflation est l'inadaptation pathologique des offres et des demandes de marchandises et de monnaie") that they lose sight of the most important of all factors in the depreciation of the franc, namely, the chronic inability of the French Government to meet its outgoings out of revenue. A little more emphasis on this basic factor would have given far greater realism to this otherwise excellent study.

No Woman's Country. By Michael Langley. *Jarrolds.* 221 pages. 15s.

MR. LANGLEY, who has written from all over the Middle East for serious journals, now produces a jaunty book about the Sudan. A practised hand at picking up facts, he gives a considerable amount of information about the country. But he has chosen to present it in a way that will appeal only to those who like wading to knowledge through a sea of prattle. The items emerge higgledy-piggledy in an order dictated only by his zigzag line of progress across an inadequate map. Banter with air hostesses and chapters called "Bongo! Bongo! Bongo!" are not to everyone's taste in their search for details of the Sudanisation of the Civil Service, the state of mind inside Gordon College, the rate of Nile damming, and the virtues of the Gezira scheme of land tenure. Yet these are all there, but they are uncritically recorded. Lonely English enthusiasts for their work are never disinterested showmen, and Mr Langley, with his experience, should have known better than to take everything at its face value.

The Lovely Land. A Lyrical Interpretation of the Realm and People of Sweden. By S. F. A. Coles. *Chapman and Hall.* 251 pages. 18s.

"HER ROYAL HIGHNESS—with whom I had enjoyed a ten minutes' conversation . . . only a few days before." ". . . the nylon-encased limbs of a blonde *flicka*." These phrases, selected at random, give a fair idea of the quality of this book. It is a curiously embarrassing mixture of egocentric travel reporting and spurious and often irrelevant erudition. Factors of prime importance to understanding the various aspects of Sweden under discussion tend to be omitted. On page 145, for example, the way in which Sweden has translated "into reality the Utopian dreams of other nations" is attributed entirely to the fact that it has been at peace for well over a century. But the country's late industrialisation and its possession of certain valuable resources are at least as important.

It is indeed difficult to praise this arch and ill-balanced book. Chapter 26, consisting almost entirely of the Swedish historian, Selander's, explanation of the Swedish character to the PEN Congress in Stockholm in 1946, is excellent. But the adulation, the uncontrolled "lyricism" and the trite sentimentality of the rest of the book render it quite unworthy of the land and people it purports to interpret.

The Diary of Sylas Neville, 1767-1788. Edited by Basil Cozens-Hardy, D.L., M.A., F.S.A. *Geoffrey Cumberlege. Oxford University Press.* 357 pages. 21s.

ALTHOUGH Dr Sylas Neville clearly possessed considerable ability, his career turned out to be singularly useless and profitless. But he left behind him a diary which provides many vivid, amusing and informative sidelights upon the life and events of his age. He was at various times a gentleman of leisure in London, a minor country squire in Norfolk, a medical student in Edinburgh and an unsuccessful doctor in Norwich. In his earlier years he professed a violent and vituperative Republicanism, and expressed great indignation over the wrongs of the "poor Americans." He was both a connoisseur of sermons and of the theatre. He cultivated music, the arts and antiquities with no less zeal than the beauties of Nature. He travelled widely throughout this country, and noted carefully all he saw from the houses of the great (the Duke of Richmond's house at Goodwood was "for a Duke's seat . . . the meanest I ever saw") to the factories of Birmingham, in one of which he was amazed by the variety of different operations required to produce a single button. This volume contains about two-thirds of Dr Neville's diary, admirably edited with a judicious sprinkling of helpful footnotes. It seems a pity—but is perhaps inevitable with a character capable of such inconsistencies and naïveties as Dr Neville—that amongst so much that is eminently worth recording there should still have crept in a certain amount that hardly seems worth it.

The Market for College Graduates. By Seymour E. Harris. *Harrard University Press.* 207 pages. $4. Geoffrey Cumberlege 32s.

THE Korean war has solved the short-term problem of finding jobs for the half-million students who graduated from American universities this year, but the long-term problem remains and is brought down to hard facts in this book. If America comes anywhere near to achieving its ideal of making a college education available to all who want it, there will be 15 million graduates alive and wanting work in 1970, five time as many as were employed in 1940, with no prospect of a similar expansion in professional opportunities. As long as a university education is regarded as a training for a particular job rather than for life in general, whether lived as a farm hand or as a lawyer, the author thinks that there is a real danger that the attempt to give the highest education to the highest number will lead only to a discontented and frustrated intelligentsia.

AMERICAN SURVEY

Fruit of Treason

Washington, D.C.

ONE of the first problems of the new Congress—and one which should, but probably will not, be tackled by the old one before it dies—will be the Internal Security Act of 1950. It is under this Act, known by the name of its author, Senator McCarran, that many thousands of prospective visitors to the United States have either been refused visas, turned back on arrival or kept waiting on Ellis Island for days or weeks before being allowed to land. There is much in the Act which needs amendment, but the passage which has caused the immediate trouble at American consulates all over the world and at home ports is that part of section 22 which states that

> any alien who is a member of any one of the following classes shall be excluded from admission into the United States; . . . (2) (C) (IV) the Communist or other totalitarian party of any state of the United States, of any foreign state, or of any political or geographical subdivision of any foreign state. . . .

The language of this passage is quite clear: membership, even in childhood, of any Nazi, Fascist or Falangist party is enough to warrant the exclusion of any individual. As a result, the musical life of the United States came near to complete disruption. For a time it seemed likely that the Metropolitan Opera season would either have to be abandoned or a makeshift opera house built on Ellis Island. Mr Joseph Szigeti spent five unexplained days in custody and it was only lack, on the part of the immigration officials, of enough courage to enforce the law rigidly that saved Mr Arturo Toscanini from being sent back to Italy. And all three of the chief candidates on November 7th for the Mayoralty of New York, had they been born a few years later, would have been sent packing when they applied for admission to the country if the McCarran Act had been on the books; all three were born in Italy.

Section 22 and the wording chosen in a year when few Senators lose much sleep over the possibility of German or Italian aggression (if, indeed, Senator McCarran and the other chief supporters of the Bill ever did) are interesting because they exemplify two enduring American characteristics: obsession with ideologies and addiction to egalitarianism. The enemy is defined as Communism, pure and simple, rather than Russian expansionism using Communism as its weapon of the moment. And, since Communism is a totalitarian philosophy, it would be grossly unfair, the reasoning runs, to proscribe one kind of totalitarianism without, at the same time, proscribing all kinds. The Congress of the United States sees nothing inconsistent in denouncing the French for their reluctance to accept, as defenders of democracy, German divisions which are unlikely to be made up exclusively of proven anti-Nazis, while simultaneously passing laws which suggest that their own nation cannot even endure the presence, to take one example, of a man who joined the Nazi Party to keep his job and feed his family, but who resigned in disgust in 1938. It is obviously a waste of time and valuable manpower to worry about such people. In the year 1950 it would be absurd to pretend that any visitor or immigrant is a danger—a clear and present danger, in the precise definition of Mr Justice Holmes—unless he is, to a greater or lesser extent, an agent of the Soviet Union.

It is the contention of the Attorney General in a petition filed on November 22nd with the Subversive Activities Control Board (set up under the Internal Security Act) that the Communist Party of the United States is a Communist-action organisation, as defined in the Act, which requires such organisations to register by October 23rd. None have done so. There is hardly anybody in the United States today who believes that the Attorney General is exaggerating or that his contention does not apply to the Communist parties of other countries as well. But the registration of resident members of the Communist party and the exclusion of others who try to enter the country is only a small, though very necessary, part of the whole attempt to tighten the hitherto loose security methods of the United States.

*

Until recently, Benedict Arnold had been for 170 years not only the prototype of all traitors, but also the only one whose existence the United States was prepared to admit. The only legislation under which traitors could be tried was so weak that during, and after, both wars any number were either not brought to court, or rewarded with sentences which suggested that juries took a lenient view of treason. So the fiction grew that "the American way of life" was uniquely proof against foreign ideologies or internal dissatisfaction. But, during the second trial of Mr Alger Hiss, Mr Julian Wadleigh, who had admitted to stealing secret papers from the State Department and giving them to a Communist agent, was asked what Mr Alistair Cooke calls "the most sacred challenge of our day": "Did you believe in the American way of life?" It was something of a shock when he answered: "Substantially I did." The obvious sincerity of Mr Wadleigh, who is described by Mr Cooke as "a walking symbol of the shattered gallantry of the idealistic Left, a fugitive from the ruins of the Popular Front and the classless society," showed that, during the nineteen-thirties, at least, there had been honest men who believed that the American ideal stood a better chance of fulfilment under a Communist state than under Hooverian capitalism.

This discovery, during the Hiss trials, that men and women of American ancestry (as well as many immigrants and children of immigrants) could betray their country because, as Mr Wadleigh said, "I thought I was doing the right thing according to my principles at that time," has led the public and the Congress to concentrate on those who hold mistaken beliefs rather than on those who give aid and comfort to the enemy. Communists, more than traitors, are the present quarry. Communism is an alien philosophy, and

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

162861

the more picturesque parts of Mr Whittaker Chambers' story—of cells, apparatuses, Russian Colonels and men known only as "Carl"—which had a flavour of foreign intrigue, gave support to the idea that, without continuous renewal from abroad, Communism at home would eventually wither.

*

But there were other parts of Mr Chambers' evidence which should have been studied with more care than the dramatic passages. He said, among other things, that those who were to do active work were not given party cards and it is quite clear that, whatever happened at one time, espionage is now carried out entirely by men and women who neither belong to nor have any contact with the Communist Party. Those who are ordered by their Soviet masters to work their way up to positions of importance in the federal government are, like spies in every other country, unlikely to be found sponsoring subversive organisations (or even mild liberal ones). They have probably joined the local Rotary Club and are busily denouncing those of their neighbours who doubt whether Formosa is America's first line of defence. Such people will not be reached by the McCarran Act which will, as the President said when he vetoed it, "actually weaken our existing internal security measures and would seriously hamper the Federal Bureau of Investigation."

Nor will the Internal Security Act prevent the Russians from using a simpler method of getting what they want than that of infiltrating government departments or setting up conspiratorial cells. And it is a method which fully accords with "the American way of life" (subsection "Freedom of the Press"). The stealing of secret documents is now certainly a dangerous trade for officials; the publication of their contents by newspapers is, on the other hand, a meritorious public service. All the microfilms found in the famous Chambers pumpkin, underrated though their importance may have been, hardly added up to the single document published in the *Chicago Tribune* three days before Pearl Harbour. And the North Koreans would probably have paid a battalion of spies to get the detailed information about the time, place and strength of a coming counter-attack which the United Press sent out during the most desperate days in the beach-head. The Soviet Union would be well advised to place its best agents, in future, on the staffs of anti-Communist newspapers, allowing them to be fed by expendable characters within the government. Transmission of information would, under this system, cease to be a problem; publication would take its place. And the Russian underground would, no doubt, pick up, as well, one or two Pulitzer Prizes for distinguished reporting.

There has been, since the end of the war, a tendency in other countries to think that the United States has become hysterical about its own Communist Party. American opinion, on the other hand, believes that other countries (and the United Kingdom, in particular) have been too lax in their treatment of their own. Both may well be mistaken, because the United States, as Russia's chief antagonist, is logically the main objective of the Soviet Union and the destination of its best agents. The United States seems hysterical because its hurried legislation is designed only to harry amateurs or penitents. So it will remain until there is a thorough understanding that what matters is the amount and quality of the information which is illegally transmitted from Washington to Moscow—not the beliefs of those who transmit it.

American Notes

Raising the Sights

Even before the large-scale intervention of Chinese troops in the Korean war cast a "more ominous shadow over the prospects for world peace," Congress was ready to give the President his supplementary military appropriations quickly and with few questions. The unexpectedly large amount requested, $16.8 billion, is not explained by the Chinese aggression, for the figure had already been fixed, but now the money will evidently be spent more rapidly than was planned. The increasing gravity of the world situation was responsible for the great urgency of the President's accompanying message; as Mr Truman said, the United States must now raise its sights, in terms of both manpower and production. How far and how fast they will have to be raised, no one yet knows; all that is certain is that for the moment they must go up as quickly as possible and that the rise must not be checked by even a temporary shortage of money.

The latest request for funds is therefore intended only to speed the present partial mobilisation and to lay the foundations for a rapid full mobilisation should it become necessary. The new appropriation will in no sense be a war budget, even though it brings the total to be spent on defence in the current fiscal year to three times the amount estimated last January, an amount roughly equal to the $12.4 billion spent during the first four months of the Korean war. More money may well be needed before next July and the services now have high hopes of being given the $50 billion they want in the 1952 budget. The following table shows what partial mobilisation means in terms of men and money:—

	Strength (thousand men)		Appropriations ($ Million)	
	June 30, 1950	June 30, 1951 (projected)	Now requested	Total for 1951 Fiscal Year
Army	593	1,265	9,211	16,461
Air Force	411	651	4,603	13,946
Navy	382	689	2,979	10,749
Marine Corps	74	166		
Department of Defence	...	...	51	684
TOTALS	1,460	2,771	16,844	41,840

In terms of arms these new funds mean an additional $4 billion for tanks, guns, ammunition and vehicles for the Army. The Air Force will have $2 billion, in addition to the $3 billion it has already been allocated this year, for aircraft; in consequence the 70 group goal should be reached by next summer and 85 groups are in view for a year later. The Navy is to speed up work on ships already being built, to convert additional aircraft carriers and to order 18 mine sweepers.

The Atomic Energy Commission's sights are being raised as well; it is to expand its output of fissionable materials and of atomic weapons, at a cost of over $1 billion, as its answer to Russian aggression. Members of Congress will certainly agree that this is the right answer, however much they disagree about the conditions which should govern the use of the bomb. The even more controversial hydrogen bomb has come one stage nearer to actuality, with the announcement that 250,000 acres are being set aside in South Carolina for the plant where tritium and other materials will be made for the bomb by the du Pont Company.

Mobilising Metals

The shortage of raw materials for defence production was underlined for Americans, as the Prime Minister arrived in Washington, by a new batch of controls on the use of critically scarce metals for civilian purposes. These limitations on copper, zinc and nickel—aluminium and cobalt were already restricted—do not reflect the latest increases in the armament programme, which Mr Truman has just put before Congress; these, and those still to come, will undoubtedly bring more drastic and widespread regulations for civilian industry. But until the Defence Department makes up its mind, or has it made up for it by events, on the degree of mobilisation that is necessary, the National Production Authority has nothing to guide it but guess-work when calling up metals. In such a fluid situation, it will not be surprising if the protests of businessmen and trade unionists are justified to some extent and if shortages of raw materials for civilian products hasten and intensify the industrial dislocation inevitable during the change-over to defence contracts.

NPA is understood to be willing to relax its orders in individual cases of special hardship, and it has already had second thoughts about aluminium. The cut-back in civilian use of this metal is now to come gradually, and not until March will the full limitation be imposed, to 65 per cent of the average employed in the first half of this year, when demand was lower than at present. The complaints of manufacturers may also explain why the latest series of restrictions turned out to be less severe than had been expected, but it may be that NPA barked worse than it intended to bite in the hope of checking price rises. Civilian consumption of copper is being curtailed by from 15 to 20 per cent, zinc by a straight 20 per cent, nickel by 35 per cent.

NPA considers that these limitations are the minimum necessary to ensure that adequate supplies will be available for military production; they apply only to the first quarter of next year. After that industry will really begin to feel the impact of the defence programme, and then much more comprehensive controls on raw materials can hardly be postponed. The copper order brought with it a hint of the next stage in the mobilisation of metals. It was suggested that the use of copper for non-essential purposes may soon be forbidden, in order to ensure that enough will be available for products in which there is no satisfactory substitute for copper.

Wages on the Escalator

The steel industry, by agreeing to an 11 per cent increase in wages, ranging from 12½ to 28 cents an hour, has made certain that there will be no repetition of last year's strike at a time when it might endanger national security. At the Government's urgent request, price increases have been confined to an average of $5.50 a ton, the amount by which the rise will increase the cost of making steel, and the industry has agreed to absorb increases in other costs which will amount to nearly as much.

But higher steel prices, however moderate, cannot fail, in time, to push even higher the cost of living, which in October had already reached a new peak. And this in turn will generate more wage demands, despite the steel industry's insistence that its agreement concludes a round of post-war wage increases, rather than initiating a new one. The degree to which prices and wages are fellow-travellers on the same upward escalator was underlined last week by the news that a million workers will automatically receive rises of two or three cents an hour to compensate them for the rise in the consumers' price index over the last three months. This now stands at 178.4 per cent of the 1935-39 average, 31 per cent higher than in 1946 when price controls were still in force. Further increases are expected, and the modernisation of the index now going on, to make it realistic by including the cost of television sets, home permanents, frozen cake mix, and unrestricted rents, will put the employers under pressure to make even larger adjustments. Most of the large automobile firms have accepted cost of living clauses, patterned on the original General Motors formula, and this is helping to increase prices of cars.

The trade unions clearly prefer this method of dealing with higher prices—"built-in inflation" though it be—to the imposition of price controls. This is because the Defence Production Act insists that if price controls are imposed on an industry, wage controls must not be far behind. How far they may lag, and whether cost-of-living clauses are to be exempt from any wage freeze, are two of the headaches in wait for the new Wage Stabilisation Board.

Most businessmen believe that now the steel workers have caught up with the wage procession, there is no excuse for delay in controlling wages. Mr John L. Lewis, whose contracts with the coal owners do not expire until April, would not agree, but Washington, in view of the speed-up in defence production, is resigned to at least some price and wage controls by next spring. After, it is said, some forty rebuffs, the Administration has at last found a man brave—or foolhardy—enough to take on the job of price administrator in Mr Michael DiSalle, the Mayor of Toledo, Ohio. The cast of economic stabilisers is now complete.

Crime and Punishment

The Kefauver committee investigating organised crime has struck such terror into the underworld that it now has to keep its itinerary secret for fear of finding the birds flown when it arrives in a new city. But the accomplishments of Senator Kefauver, himself a Democrat, are regarded with some sourness by his own party and with enthusiasm only by the Republicans. It is held by a number of Democratic bosses that the ill-timed searchlight he turned on murky corners in the big cities was a factor in a number of Democratic defeats in November.

The outstanding case is that of Senator Lucas, in Illinois. One of the contributory causes of his defeat was the nomination on the same ticket of Police-Captain Gilbert to be sheriff of Cook County, and dispense its $2 million patronage. Captain Gilbert appeared before the committee just before the election, and the man whom Chicago newspapers call the "world's richest cop" conceded that he had accumulated a fortune of $360,000 on a $9,000 salary—he said by shrewd speculation on the markets. Of 187 gang killings during his term of office, he had brought not one murderer to justice. In the scramble to defeat Captain Gilbert, Senator Lucas lost votes in Chicago which he badly needed to compensate for Republican majorities in rural and suburban districts.

Allegations of criminal influence also played an important part in the surprising victory of Mr Impellitteri over the two

machine candidates in New York City. The Acting Mayor made the most of the police scandal which broke almost as soon as he took office. He demonstrated the independence assumed for the election, and added insult to the injury of running at all, by charging that Tammany Hall, the Democratic organisation in Manhattan, was controlled by Mr Frank Costello, ex-convict and reputed overlord of the gambling rackets. Friendly overtures from Tammany have gone unanswered by the new Mayor: his new broom is itching to sweep out the old residents and install his own tenants. Having failed in his first attempt to dislodge Mr DeSapio, the leader of Tammany, a grand jury is now investigating accusations, made during the campaign and since, that hoodlums and gamblers exercise influence over Tammany's appointments.

The jubilation of the Republicans at the amount of dirty Democratic linen being washed in public should be tempered by a realisation that temptations are seldom spread before the party out of power. A Republican regime in Philadelphia has not escaped Senator Kefauver's eye. And the Democrats, if they were honest, might admit that Senator Kefauver will have done their party a good turn, in the long run, if he succeeds in demonstrating that, in politics at least, the toleration of crime does not pay.

Investment Bankers on Trial

The investment banking business should be an open book to those who have the patience to read the evidence in the anti-trust case against seventeen leading firms and the Investment Bankers Association just opened by the Attorney General. Judge Medina, who not long ago presided at the trial of the eleven Communists, confesses that he comes to the case with no knowledge of investment banking, but with a determination to be educated, at whatever cost in interruptions to the legal talent on both sides. It is certain to be a lengthy and contentious process.

The case has been hanging fire since 1947, when the government first filed its charges. These are that the defendants, among whom are numbered Morgan Stanley and Company, Lehman Brothers, and Kuhn Loeb and Company, have conspired successfully since 1915 to monopolise and restrain the offering of new securities to the public. These seventeen firms are said to have controlled 83 per cent of all new security issues of $1,000,000 or more in the fifteen years from 1922 to 1947; 93 per cent of their business is alleged to have been obtained by participating in syndicates managed by one of their number. The rest of the 4,000 investment banking firms had to be content with a meagre 17 per cent of the pickings.

The practices which, it is complained, were used to perpetuate the monopoly included agreements to recognise that a banker who had supervised a company's financing at one time had a traditional right to supervise it for ever after, and that firms which had taken part in a syndicate had established rights to similar shares in future flotations. Shopping around for better terms was frowned upon. Competitors were frozen out, or their acquiescence obtained by admitting them into syndicates, with the result that the companies were deprived of the benefits of competitive bidding. The prosecution cited in particular an agreement in 1941 and 1942 with institutional investors, who were to withhold bids for new issues in return for a promise that they would receive at least half the securities involved.

The defendants, who have not yet had their day in court, will urge that this agreement was undertaken with the approval of the State Superintendent of Insurance and was designed to reserve some share for the smaller insurance companies. On the broader charge, they will deny the existence of any conspiracy, and will plead that the practices complained of are standard in the industry. This is an argument, however, which did not avail the cement industry when the Supreme Court ruled against its basing-point pricing. Self-defence might be a more effective plea: it is well known that increasingly the larger industrial companies rely on their own retained profits for financing and, according to the bankers, insurance companies and other institutions have taken more than half the new industrial securities in the past six years. These, however, are relatively recent developments.

Charity at Home

To those in foreign countries who have been at the receiving end of the cornucopia filled by private American charity, it comes as a surprise to learn that in recent years only one per cent of such charity has gone to foreign relief. The figure would be higher if the sums contributed indirectly through religious bodies were included, and higher yet if allowance were made for gifts sent to personal friends and acquaintances. Furthermore, the "statistically-average family"—two parents and two children, with a gross income of $5,004 a year—contributed $120 to the Marshall plan in 1949 alone, in the form of taxes. In that family, charity nevertheless begins at home, for it spent $111 on tobacco in the same year, and $218 on alcoholic beverages, while only $97, less than two per cent of its income, went to help others.

According to the comprehensive report on philanthropy since 1929, just published by the Russell Sage Foundation, families with annual incomes below $5,000 nevertheless contributed some 80 per cent of the amount given to charity by individuals. This is explained by the large number of families in the low income group but, when judged by percentage of income, the poor give as much as do the rich, with the exception of a few outstandingly large contributors, and more than do those in the middle income groups. Individual gifts make up 74 per cent of total philanthropic income, interest on capital 14 per cent, bequests and gifts from charitable foundations 7 per cent, and contributions from corporations only 5 per cent. These corporate gifts are usually made during the annual and much-publicised collections organised by the Community Chests to help groups of local charities. In 1945 business contributions to charity reached a peak of $266 million, but have declined now that there is no longer an excess profits tax collector, in whose eyes charity covered a multitude of profits.

The total amount given to charitable organisations to which contributions are deductible for purposes of taxation stood at $4 billion in 1949. It had more than tripled in twenty years, although the increase was of course much smaller in terms of the purchasing power of the charitable dollar. Half of this money goes to religious agencies, which are responsible for many types of benevolent institution. Health and welfare agencies were given 15 per cent, higher education 8 per cent, and "charity rackets" got away with 3 per cent.

Shorter Note

"Dollar-a-year" men are returning to Washington, even though President Truman disapproves of people working for the government for nothing and continuing to draw remuneration from their former employers. He feels that in an emergency such highly qualified men should be ready to work at the much lower federal rates of pay. But the present defence programme looks comparatively permanent and it has proved practically impossible to find competent men who are prepared to take responsible government jobs at government salaries. Mr Truman has therefore agreed that they should be allowed to work without compensation, when there is no other way of obtaining men of the necessary experience and ability.

Expediting British — American Trade

An American bank can provide valuable assistance in the conduct of trade with the United States. Through its three offices in London, the Chase National Bank puts its extensive American facilities and contacts at the disposal of the British businessman for the furtherance of his trade abroad.

THE CHASE NATIONAL BANK
OF THE CITY OF NEW YORK
A United States Corporation with Limited Liability
LONDON — 6 Lombard Street
51 Berkeley Square Bush House, Aldwych

Guaranty Trust Company of New York

This bank, through its New York and European Offices and correspondents throughout the world, provides complete banking facilities designed to meet the requirements of banking institutions, corporations, firms, governments, and individuals wherever located.

THE WORLD OVERSEAS

Revolutionary Policy in Asia

(By a Correspondent)

IN the recent foreign affairs debate in the House of Commons the Foreign Secretary declared that he did not pretend to know what were Chinese "motives or intentions" in their intervention in Korea. As the Minister is supposed to keep himself informed of the policies of foreign states, he showed a curious vagueness, and even bewilderment, in speaking about the actions of Communist China. Yet, as an old trade-unionist, Mr Bevin might be expected to have taken an interest in the so-called "Conference of Asian and Australasian trade unions," which was held a year ago in Peking as a regional conference of the World Federation of Trade Unions. At that conference—which immediately followed Chinese celebrations of the 32nd anniversary of the Russian October Revolution—certain leading Chinese Communists made their intentions crystal clear, and recent events in the Far East take on an added significance in the light of their speeches.

The conference was attended by 117 delegates from 13 countries—the Soviet Union, China, Mongolia, Korea, India, Vietnam, Burma, Siam, Indonesia, Ceylon, the Philippines, Malaya and Persia. It was also attended by M. Louis Saillant as General Secretary of the WFTU and by such Communist specialists in international trade-unionism as Toledano, Le Leap, Pena, Zupka and Blokziil. The official trade union organisations of Australia and New Zealand refused to send delegates, but Mr E. V. Elliott attended as representative of the Communist-controlled Australian Seamen's Union. The conference had nothing to do with what western countries usually understand as trade union affairs; it was essentially a Communist political gathering, and much of its time was taken up—even in the public meetings, and much more in committees behind the scenes—with discussion of international revolutionary action. Indeed, it was obvious from the start to discerning observers that the conference, and the permanent liaison bureau which it set up, were intended to provide an Asian counterpart to the Cominform in Europe. The reason why the WFTU was used for this purpose in November, 1949, whereas it had not been so used at the time of the creation of the Cominform—an overtly Communist political organisation—was that in the meantime the British TUC, the American CIO and other democratic trade union groups had withdrawn from the WFTU.

This body had from the outset been designed by the Soviet Government and the Communist leadership in the French trade unions as an instrument of international Communist propaganda and intrigue; and it was the pro-Communist activities of its packed secretariat which finally compelled the British and American unions to leave it. But, as long as the latter remained within it, it could not simply be used for the old Comintern functions of co-ordinating the policies of Communist parties in various countries; so the Cominform had to be set up as a separate organisation. Only after the non-Communist elements had withdrawn from the WFTU could it be used without obstruction as a new Comintern. This stage had been reached by the time of the Peking Conference in the autumn of 1949, and there was no serious attempt to conceal the exclusively Communist character of the occasion. Nevertheless the WFTU, as a substitute for the old Comintern, had, and has, the advantage that it can be used to control workers who give no direct allegiance to any Communist party.

The holding of the conference for the Asian and Australasian unions in Peking was a gesture of tribute to the victorious Chinese Communists and also of appeal to the peoples of Asia on a pan-Asian basis. However, the non-Asian element was by no means absent; Saillant and three Russian delegates, Soloviev, Yakovlev and Rostovsky, played an extremely important part at the conference. The Chinese end of the business was in charge of Liu Shao-chi, and it was from him that the delegates heard the most authoritative exposition of Marxist-Leninist doctrine in its application to the current situation in Asia. Liu declared that—

> the Chinese people's revolution against imperialism and feudalism was the direct continuation of the October Revolution. Stalin had said that the October Revolution constituted the first stage in world revolution, for the further expansion of which it provided a strong base. . . . The Chinese revolution greatly strengthened and expanded the base for developing world revolution. . . . The revolution would grow at an unprecedented rate; as Molotov had said, the world was now in an age in which all roads led to Communism. . . . The dying reactionaries and imperialists were in utter panic. . . . They were all "paper tigers" who could and should be struck down, as they had been long ago in the Soviet Union, later in the new democracies [of Eastern Europe] and now in China; they would be struck down in other countries too, if only the people in those countries would unite together to fight resolutely against them instead of believing in their deceptions and threats.

Liu Shao-chi and other speakers stressed the importance of forming "national liberation armies" on the Chinese model wherever possible, to fight against the "imperialists" and their "lackeys" (in which category were placed the governments of India, Burma, Indonesia, the Philippines and South Korea). It was emphasised that revolution could not be achieved except by force, and that Chinese Communism had been successful because the Chinese working class had been "untainted by traditions of social democracy." China followed "the political line of internally carrying out the people's democratic dictatorship under the leadership of the working class and internationally uniting with the Soviet Union and the revolutionary peoples of the world." The manifesto adopted by the conference read in part as follows:

> The Conference calls on the workers and all the oppressed peoples of Asia to resist with determination the armed offensive of the colonialists. . . . Working men and women who still suffer under the persecution and violence of imperialism! Thanks to the victorious struggles of national liberation, and particularly the great victory of the Chinese people, the national liberation movements will inevitably develop still further in a number of Asian countries. . . .

The record of Communist strategy and activity in Asia since this meeting just over a year ago has shown that the speeches made on that occasion still provide valuable pointers to the mood and intentions of the Party in China and elsewhere. In the absence of direct information from Peking they should receive more attention than they have.

Constitution Making in Pakistan

[FROM OUR KARACHI CORRESPONDENT]

QUICK-FIRE legislation has become the order of the day in Pakistan, and Karachi's hard working officials seem prepared to produce, at a moment's notice, Bills covering anything from preservation of ancient monuments to punishment for sending indecent telephone calls. Prolonged deliberation, on the other hand, has attended the framing of the constitution. The first big step was taken in March, 1949, when the Constituent Assembly passed the "objectives resolution," which established Pakistan's future character as an Islamic—but not theocratic—state. Committees set up for the purpose have now produced interim reports on fundamental rights and basic principles, and these reports have been debated in a recent session of the Assembly.

The fundamental rights report has been adopted. The big question was whether the Hindus, and other minority communities in Pakistan, could ever feel themselves at home in a state whose ideology was based on principles of Islamic democracy and Islamic social justice; no one could quarrel with the idea of a state wedded to the idea of democracy and social justice, but what exactly was the effect of the religious qualification? A partial answer to these questions was provided by the debate, at the conclusion of which the spokesman of the Hindus from East Pakistan—who form the official opposition party—announced, amid cheers, that the minorities had now nothing to fear in Pakistan. The Prime Minister chimed in with the claim that the minorities were as safe in a godly state as they would be unsafe in a godless state.

Eleven Million Hindus

All this is satisfactory as far as it goes, but mere guarantees of safety or absence of fear are not enough. The 11 million Hindus will not really feel at home, unless they get the sense of really belonging to Pakistan, and being as good Pakistanis as their Moslem brethren. Whether this happy conclusion can ever be reached depends partly on the Hindus themselves, and partly on the spirit with which the admirable provisions of the fundamental rights report are worked in practice by Pakistani officialdom—especially at its lower levels—and the Muslim public.

All citizens are to be equal before law, and no persons are to be deprived of life or liberty save in accordance with law (though the right of habeas corpus can be suspended by the government in case of grave emergency). All forms of forced labour are declared unlawful, and so is the practice of untouchability. The right to profess and practise any religion is guaranteed, subject to public order and morality, and every citizen is assured of freedom of speech, freedom of association, etc. It only remains for this charter of individual liberties to be implemented in the spirit as well as according to the letter of the constitution. The comparatively few opponents of the present government profess to be extremely sceptical on this point.

The report of the basic principles committee met with a very poor reception, particularly in East Pakistan, where some organs of the press had been describing it as undemocratic, un-Islamic and fascist. Even the Provincial Moslem League appears to share in the dissatisfaction, and some of the office bearers have publicly denounced the committee's proposals. Briefly, these are that the state should consist of a federation of the provinces and acceding states. The executive power of the federation is to vest in the head of the state, who is to be elected by a joint session of both Houses of the central legislature. The legislature is to be bicameral: the upper house will be called the "house of units," and will represent the legislatures of the units of the Federation; while the lower house will consist of members directly elected by the people and will be styled the "house of the people."

From the earliest days of Pakistan, the Eastern Province has always tended to smart under a sense of neglect, and a feeling that Karachi, and Western Pakistan generally, would like to treat it as an outlying colony. What the East Bengalis now particularly resent is the recommendation in the report that the several provinces, including backward Baluchistan, are to have equal representation in the upper house. This is considered to be a device intended to deprive the East Pakistan representatives of the majority to which they would normally be entitled in the legislature, as a whole, having regard to the fact that their province holds 58 per cent of the population of Pakistan. The committee's recommendation that Urdu should be the national language of the state is also naturally unpalatable to East Pakistan, which has long urged that Bengali should be given equal status. These and other objections have been put forward so vociferously that the government has decided to defer further consideration of the basic principles report until early in 1951, in order to give those interested full opportunity to offer suggestions on the subject.

The East Pakistan view, broadly, is that the proper solution for a country of Pakistan's peculiar geographical structure would lie in the setting up of a federation of two provinces, and two only, East and West Pakistan. The powers of the federal centre would be limited to defence, foreign policy and currency. Most observers would support this scheme up to a point, but not all the way. They would not care to see the centre unduly weakened, but would be happy to see the provinces of Western Pakistan integrated, in the interests of economy and efficiency. The North West Frontier Province, the Punjab and Sind put together contain fewer districts than pre-partition Punjab; and they are individually too small to support top-heavy legislatures which merely become breeding grounds of squabbles and jealousies.

France's Non-Partisan Party

[FROM OUR PARIS CORRESPONDENT]

NOBODY quite knows whether the French general election will be held next spring, next autumn or next summer. Climatic reasons and the unwillingness of any party to step victorious from the hustings straight into the monumental budget of 1952 may tell in favour of the spring. But other events may have an opposite influence.

New parties are rather rare in the world nowadays. The electoral *début* of General de Gaulle's *Rassemblement du Peuple Français* is therefore an interesting West European phenomenon. Its statute describes its aim as to

> rally those Frenchmen and French women who, under the inspiration of the French resistance, wish to unite in order to promote and sustain the effort of national renovation and those reforms which should enable the Republican State to lead the Nation.

Associated with General de Gaulle in the RPF's *Conseil de Direction* are a number of members of *La France Combattante*, the name given by the General during the war to all those who continued the struggle after the armistice. These *compagnons* include M. Jacques Soustelle, Secretary-General; M. André Malraux (Propaganda); M. Gaston Palewski (foreign affairs); M. Louis Vallon (labour and social action); and General Billotte (Defence). In the National Assembly that was elected in 1946 there has grown up a small Gaullist "inter-group" traversing the Radical and Right parties. At the head of this is M. René Capitant (Radical) who succeeded M. Giacobbi, author of the much-debated project for electoral reform, who resigned early this year. Outside Parliament the RPF contains former Communists, Socialists and MRP (Centre Catholic) as well as

Radicals and Right. The *Rassemblement* functions through all the normal organs of a political party. In addition the General has assiduously addressed *militants* and influential *sympathisants* at private meetings in country houses all over France.

Where lies the strength of the RPF? It made its first appearance at the municipal elections of 1947, and had a definite success in the larger towns. The *Rassemblement* now controls the municipalities of Paris, Marseilles, Bordeaux, Lille, Strasbourg, Metz, Nancy, Besançon, Saint-Etienne, Brest, Le Mans, Algiers. Similarly, it made its mark in the elections to the Council of the Republic (Senate), in which there votes a college delegated by the communes, and also in the cantonal elections (county councils). On one authoritative estimate the RPF has a good chance of winning a general election in 20 departments holding 100 seats in the Assembly—all but three north of the Loire.

In the measure that it is not Communist, Paris also tends towards Gaullism. In another 25 departments (200 seats) the RPF has again a strong following. It is weakest in the hills and valleys of the south centre where, if Communism does not reign, there is a general distaste for national politics of any colour, deputies being held down to less theoretical matters such as cheese, pigs and wine. Gaullist deputies are not likely to be elected in urban constituencies suffering from grave economic hardship. For often these areas send Communists to Paris to vote for more houses and less guns although, in the local elections, they may vote for non-Communist personalities who know the ins and outs of local problems. It appears that the *Rassemblement*, in spite of the unconservative and unconventional character of its leaders, has gained ground at the expense of the Radicals and of the Right rather than of the other parties.

Can De Gaulle Gain Power?

The crucial questions in regard to the election of 1951 are: Is pure proportional representation to be abandoned? If so, which parties will win the seats which the Communists, MRP and perhaps Socialists are expected thereby to lose? In the opinion of most, the worst possible outcome would be a vote under the proportional system that returned the Communists with their present 180 seats, and at the same time elected 150 to 170 Gaullists. For in that event no Third Force coalition would be possible. Nor, on the other hand, would the RPF be likely to muster a coalition of its own. It is argued further that, even if Gaullists, Radicals and others could collect 320 votes in parliament, opposition in the country would be too strong to permit of the forceful government that the General, as Prime Minister, would certainly demand.

All this, however, is sheer speculation. In any case, much depends on the international problems that haunt the existence of Western Europe. Hitherto the question of defence has never assumed tragic proportions. The grave statement issued by General de Gaulle in the holiday season made no deep impression. It is true that eighteen months' military service has been willingly accepted, save by the Communists; but the comings and goings of MM. Moch and Petsche between Paris and Washington in the autumn evoked no sense of overwhelming urgency. At his meeting in the *Vélodrome d'Hiver* at the end of October, which was attended by 20,000 people, de Gaulle appealed especially to the national indignation at the reverses in Indochina, demanding immediate reinforcements and vigorous action. This appeal has scarcely reverberated in the country at large. There is, indeed, much anxiety about Indochina—more and more families have dead—but the national will still seems to hesitate between the General's refusal to "internationalise" the problem and an admission of the need for American help. In any case, it is improbable that de Gaulle will be able to precipitate an election on the matter of defence, whether Indochinese or European.

Is the RPF condemned to impotence unless the conditions of 1940 are repeated? De Gaulle concluded his address by saying that if ever a disaster fell upon France, Frenchmen should know that the *Rassemblement* offered an "alternative government." Such a course would be in the logic of such an event. But if the peace is kept, the RPF must stand as an ordinary party with a philosophy and a programme. It is, indeed, not at all clear what the RPF's "effort of national renovation" concretely represents in the minds of its leaders. For in the expression of his *mystique* the General is freer with his negatives than his positives. He declares that France must have a large, first-class army and that *les partis* are incapable of giving it one. This is probably true. It is also probably the case that the parties, for the reason of their very existence, cannot agree upon any national policy which imposes drastic sacrifices upon the whole electorate or part of it. (Housing is a conspicuous instance of the government's failure.) The best hope would seem to be the emergence from the elections of a coalition in which the Gaullists could, without arrogance, exert their influence to create a more efficient regime. The "all or nothing" attitude, which monopolises patriotism and despises the parties, is unlikely to pay electoral dividends. The Cross of Lorraine must not be made too hard for non-crusaders to bear.

The Danger in Nepal

[FROM A SPECIAL CORRESPONDENT]

If the latest Chinese intervention is to be interpreted as part of a planned design of world Communist aggression, calculation of opportunity in Nepal may depend upon whether or not India now takes a realistic view of events there. It is therefore desirable to set forth the fairly startling facts about the King's activities and his deposition. King Tribhuvana, whose ancestors have for some time past in history been enfeebled and deprived of any constitutional role, except as symbols incarnating the god, Vishnu, was first believed to be implicated in the anti-Rana revolution of 1940. But after inquiries had been completed in 1942, Maharaja Joodha, the then Prime Minister—that is, eldest legitimate member of the Rana family—accepted the view that he was innocent, notwithstanding sustained depositions to the contrary. The King then sought to leave Nepal on the grounds that he needed a cure for thrombosis; but Colonel Denham White, a well-known member of the Indian Medical Service, decided that his condition was not in any way serious. Later, following an "incognito" visit to Calcutta, the first he had made outside his country, the King desired to abdicate, but was prevailed upon by the Maharaja—the Prime Minister—to remain until the Crown Prince was older.

After a second visit to Calcutta the King again wished to abdicate and live in India. Maharaja Mohun, the present Prime Minister, while not objecting to abdication if the King would remain in Nepal or anywhere other than India, refused to consent. When a second revolt against the Ranas took place in September of this year, the King was considered to be its sponsor, and it was obvious, even apart from admissions then made by those involved, that a further attempt was being prepared. The Nepalese Government accordingly warned Delhi of an expected invasion by the Nepalese National Congress (NNC) through the Indian Ambassador at Katmandu, who was also personally influential and associated with the NNC and with the two exiled members of the Rana family supporting it. During this period, *Blitz*, a Communist-like journal, published in Bombay, was openly promising the support of the King and of the Indian Congress for the projected invasion; since that invasion took place, it has revealed the whole plan of campaign in remarkable tactical detail.

When this revolt was put down, the King again sought to leave Nepal for medical treatment. It was after this final refusal to permit him to live in India that he escaped to the Indian Embassy, taking his three sons and his eldest grandson, and leaving the two younger children at the palace. While at the Embassy he refused to see the Prime Minister or any of his delegates. Only when the Indian Ambassador offered a peaceful settlement if the King were allowed to fly to India, did the Nepalese Government, more shrewdly interpreting the small effect which the King would now have upon the situation, agree and decide to place the King's elder remaining grandson upon the throne. There could hardly have been an alternative to this action in view of the King's complicity with the Nepalese National Congress through the apparent agency of the Indian Embassy. The invasion itself, seeking to import "democracy" in a foreign interest and to exploit the difficulties of the King to secure a change of constitution, began from some nine points along the border. It was aided by adventurers of the type which fomented the terrible Sikh slaughter of Muslims in the Punjab in 1947, and who were involved in the invasions of Kashmir in 1947 and 1948.

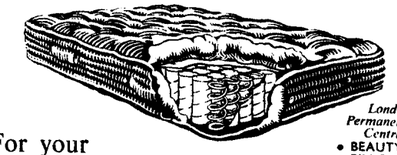
Does London Wait on Delhi?

Nepal is now deeply perturbed, in view of the past loyalty to Britain and to the sub-continent shown by large and heroic contributions of men and money in two world wars, over British delay and London's seeming attendance upon Delhi in the matter of recognising the new King. This loyalty has been entirely due to the Ranas, whatever their motives and however interpreted by different British emissaries; and therefore it is unfortunate that much British reporting of events from India has been unduly coloured against them. The most authoritative view—of the very few persons, past and present, who can really judge—is that during 104 years of rule by the Ranas, they have made considerable advances. They have abolished slavery, *suti* and a savage penal code, and have replaced them with a fairly modern administration and code, also developing roads, hospitals, electrification and education—the latter even in outlying towns. Their rule has varied from the savage to the resolute; but progress has been sustained and it is amazing that such a steady advance on so broad a front has been made in such conditions.

If firm measures were now to be taken in India to prevent efforts to twist every progressive move to particular ends, the sincerity of the Ranas in helping democratic development could be fairly tested. Unfortunately, Pandit Nehru has been misled—as he now perhaps knows—regarding the desire for change in Nepal itself; and neither doctrinaire sponsoring of the ex-King, nor intransigent effort to foist the NNC on a country to which they are now alien, can lead to anything but chaos.

Should India Buy Food?

It now looks as if the amount of food lost this year in India through natural calamities—drought, floods and cyclones—may amount to 6,000,000 tons. This is about twice the normal loss, and Delhi faces a very severe problem in its import policy. On the one hand, there are those who point out that, even without any loss from natural causes, Indian food production is about 10 per cent below minimum needs; therefore an annual import programme of at least 4,000,000 tons is a necessity—since there is little chance of the grow-more-food campaign succeeding sufficiently to bridge this gap in the immediate future. On the other hand, there are the more ruthless realists who claim, with much justification, that unless food imports are restricted, it will never be possible to devote sufficient foreign exchange to buying the capital goods essential to any serious attempt to raise the Indian standard of living.



For the Congress Party this is a frightening political dilemma. The present government leaders need at least to hold out prospects of better conditions, if they are to counter Communism; and the Colombo Plan offers them a great opportunity of doing so by turning the spiral of Indian production upward. Yet the temptation to cut food is dangerous. And it is by no means proven either that the shortage of food will galvanise cultivators to grow more—indeed, as prices rise, they tend to grow less—or that a switch to cash crops will be practicable. It is argued that cotton prices are three times those of food, and that increased exports of cotton could be used to buy more food. But it would be most unwise for India to rely more heavily than at present on food being available abroad, even if the funds are available for it. There seems, in fact, little alternative for Delhi to the policy it is at present pursuing—of restricting food imports and trying to encourage production at home.

Boom Conditions in Belgium

[FROM OUR BELGIAN CORRESPONDENT]

The Belgian economy is now feeling the effects of the new world economic conditions brought about by the Korean war. According to the provisional index the volume of industrial production reached an all-time peak in October at 140 per cent of the 1936-38 level. The basic coal and steel industries have not passed the exceptional levels reached at the beginning of 1949, but the textile industry is experiencing a rate of production higher than in the spring of that year. This rapid increase in industrial activity, however, is not a direct effect of rearmament, since the North Atlantic Treaty

Organisation (Nato) has not yet fulfilled Belgium's hopes of becoming one of the chief arsenals of the western camp. The Nato "task forces"—or inquiry teams—which have recently been visiting Belgium have concluded that it would be possible to produce there large quantities of military supplies, such as small arms and Bailey bridges. That is as far as matters have got; Nato has neither placed any orders with Belgian industry nor settled the important question of how these orders are to be paid for. There have, in fact, been only a few orders made directly by the Belgian, French and British Armies to the textile industry, and some orders linked directly with the operations in Korea.

The origin of the present boom must therefore be found in the preoccupation of every industrialist and merchant with rebuilding the stocks which were depleted as a result of the massive purchases of July to September. This movement was accelerated here by the coincidence of international and national difficulties, occurring at a time when the tendency of prices in Belgium to go down still prevailed.

A first result of the improvement in production has been a rapid decline in the unemployment figures, which dropped from about 300,000 at the beginning of the year, and 260,000 in November, 1949, to approximately 175,000 in November, 1950. In fact a labour shortage is being increasingly felt in many industries, and particularly in the coal mines. Despite the restrictive policy of the trade unions an agreement has recently been reached allowing one thousand Italian mine workers to return to Belgium. If the peculiarities of Belgian unemployment statistics, and the age distribution of the unemployed, are taken into account, there does not seem to be much manpower left with which to increase industrial production although the unemployment figures are likely to go up again in the winter months.

There is no Belgian legislation concerning labour allocation and reliance must therefore be placed on economic incentives as the only means of inspiring a proper distribution of labour. Another difficulty lies in the fact that the coal, steel and metal engineering industries, which are likely to benefit most from a development of military production, are largely situated in the Walloon part of Belgium where unemployment has been very low for years.

Foreign Trade Deficit

The rapid change in the economic outlook since June has brought, as is usual in Belgium, profound changes in the balance of foreign trade. The Belgian trade balance is ordinarily positive at the very beginning of a recession as was the case for example in the spring of 1949. At the start of an upturn the replenishing of stocks results in a severe unbalance of trade. Accordingly since July deficits have been recorded which reached 3,600 million francs in September and 2,700 million in October as against an average of 1,600 million in 1949. This is partly due to the social and political troubles in industry and the ports during the summer and partly also to the quick reaction of Belgian consumers and importers to increasing prices and demand. This trade deficit is reflected in relations with the European Payments Union (EPU). Belgium has been a debtor for the last few months, instead of a creditor as had been expected.

The gold and foreign currency reserves at the National Bank between June and November decreased by 8,000 million francs. This decline has affected the amount of credit extended by banks, and has provoked some restrictive measures by the Central Bank, such as the increase of the rate of discount to 3.75 per cent in October, new regulations on the import of Belgian notes and the restriction of consumer credit. The prospects for the future of the trade balance are much better, since exports are rising again. In October they reached the record figure of 7,700 million francs as against an average of 6,650 million in 1949.

Prices have recently been rising rapidly even at the retail level. Since June the official retail price index has risen by approximately 7 per cent up to 395 in October. This fact, together with increasing employment, has produced large demands for wage increases, which have been partly satisfied since the summer.

In order to prevent the inflationary spiral of wages and prices, an agreement was reached on October 23rd between the organisations of employers and the trade unions, which stipulated that the producers and the Government should take measures to ensure a 5 per cent decrease in retail prices by December 10th, wherever there has been an increase since July. Even if this experiment succeeds, the worker will receive a cost of living allowance compensating him for the higher prices paid during September, October, and November. If this attempt fails wages will be increased retroactively to October 1st, according to the rate of increase registered on the official retail price index.

The Government has launched, with the collaboration of the employer organisations, a campaign for lower prices. The price adjustments achieved so far range from 3 to 10 per cent and are the result of sacrifices by producers and traders and of fiscal adjustments. The retail price index for November has already decreased to 388 from 395 in October.

Revival of New Zealand Labour Party

[FROM OUR NEW ZEALAND CORRESPONDENT]

JUST a year after its defeat in the Parliamentary elections, after 14 years of office, the New Zealand Labour Party is trying to take heart of grace from the results of the triennial municipal elections held in mid-November. Labour made substantial gains, but these have to be set against the virtual "black-out" of the party at the municipal elections in 1947 when the party failed to gain one seat on the city councils in Auckland, Wellington and Dunedin. Only Christchurch of New Zealand's four main centres gave Labour any success; there, 5 seats out of 19 were won.

This year it is Christchurch, which for many years had a radical reputation in local politics, which has again given Labour its greatest encouragement. Christchurch alone of the four centres voted in a Labour mayor (the councils do not elect the mayors in New Zealand) and Labour also won 12 of the 19 seats on the city council. Labour mayoral candidates were defeated in Auckland, Wellington and Dunedin. But the margin of Labour's failure in Dunedin was unexpectedly slender, and Labour won 6 of the 12 council seats. In Auckland Labour won 3 seats out of 21 and in Wellington 6 out of 15. But in the populous Wellington "dormitory" suburb of Lower Hut the entire Labour ticket of 12 candidates was elected.

Anti-Labour candidates in the municipal elections are sponsored by a series of organisations with local autonomy, known as Citizens' Associations. The National party, the rival of the Labour party in the parliamentary field, takes no official part in municipal politics. But the Labour party, which uses the same organisation to fight both parliamentary and municipal elections, argues that the distinction between the National party and the Citizens' Associations is more nominal than real.

Hence Mr Walter Nash, acting leader of the Parliamentary Labour party during the grave illness of the leader, Mr Peter Fraser, was quick to comment on the results of the municipal voting as "the conscious, determined expression of the resentment of the electors against the most grave breach of election promises recorded in the history of New Zealand."

Mr Nash may have overstated his case because the connection between Parliamentary and municipal voting is not very close. In Dunedin, in recent years, for instance, all parliamentary seats were held by Labour, while all city council seats

Aspects of enterprise

No. 3.

The imposing range of new buildings at Cheadle Heath is probably as fine a centre for specialised research and development as can be found anywhere. Under ideal conditions engineers and scientists tackle many problems in coal cleaning, carbonisation and combustion, chemical plant design, materials handling, and the milling of wheat and other cereals. The 90-foot tower (housing an experimental flour mill) which dominates the site, though flippantly known as "the Simon Hippodrome", symbolises a determination to maintain leadership in the Simon fields of engineering design and contracting.

BP PLAYS A BIG PART

IN BRITISH PROGRESS

By stepping up refinery output and speeding up deliveries and distribution, Anglo-Iranian Oil Company HELPED TO END PETROL RATIONING in Britain.

This picture shows the main oil loading lines at an oil and cargo loading jetty in the Middle East—believed to be the largest of its kind in the world. Last year BP increased their sales of crude oil, motor spirit and other refined products by as much as four million tons. Continued progress this year is bringing Branded Petrol nearer.

were held by non-Labour candidates. Further, municipal voting is much lighter than parliamentary voting.

Nevertheless the Prime Minister, Mr Holland, who has candidly admitted his inability to redeem his chief election promise—"to make the pound go further"—must regard the municipal voting with some misgiving, although his government is secure for two more years. The *New Zealand Herald*, which is published in Auckland, the area whose support put Mr Holland's party into office a year ago, adopts the role of elder brother in giving Mr Holland a little advice. "The Government cannot afford to disregard the latest municipal polling," it says. "Defeated nationally, Labour is nevertheless working for its own revival."

The first parliamentary session with the Holland Ministry in control ended on December 1st. A near-record in Bills passed is being claimed, but many of them are of trifling importance. There is no doubt that the country is becoming increasingly critical of the new administration. And Mr Holland and his followers will need to tackle problems like the cost of living and the burden of taxation with considerable resolution in the next year or so to hold the ground they gained at the polls last year.

Swiss Struggle Over Taxes

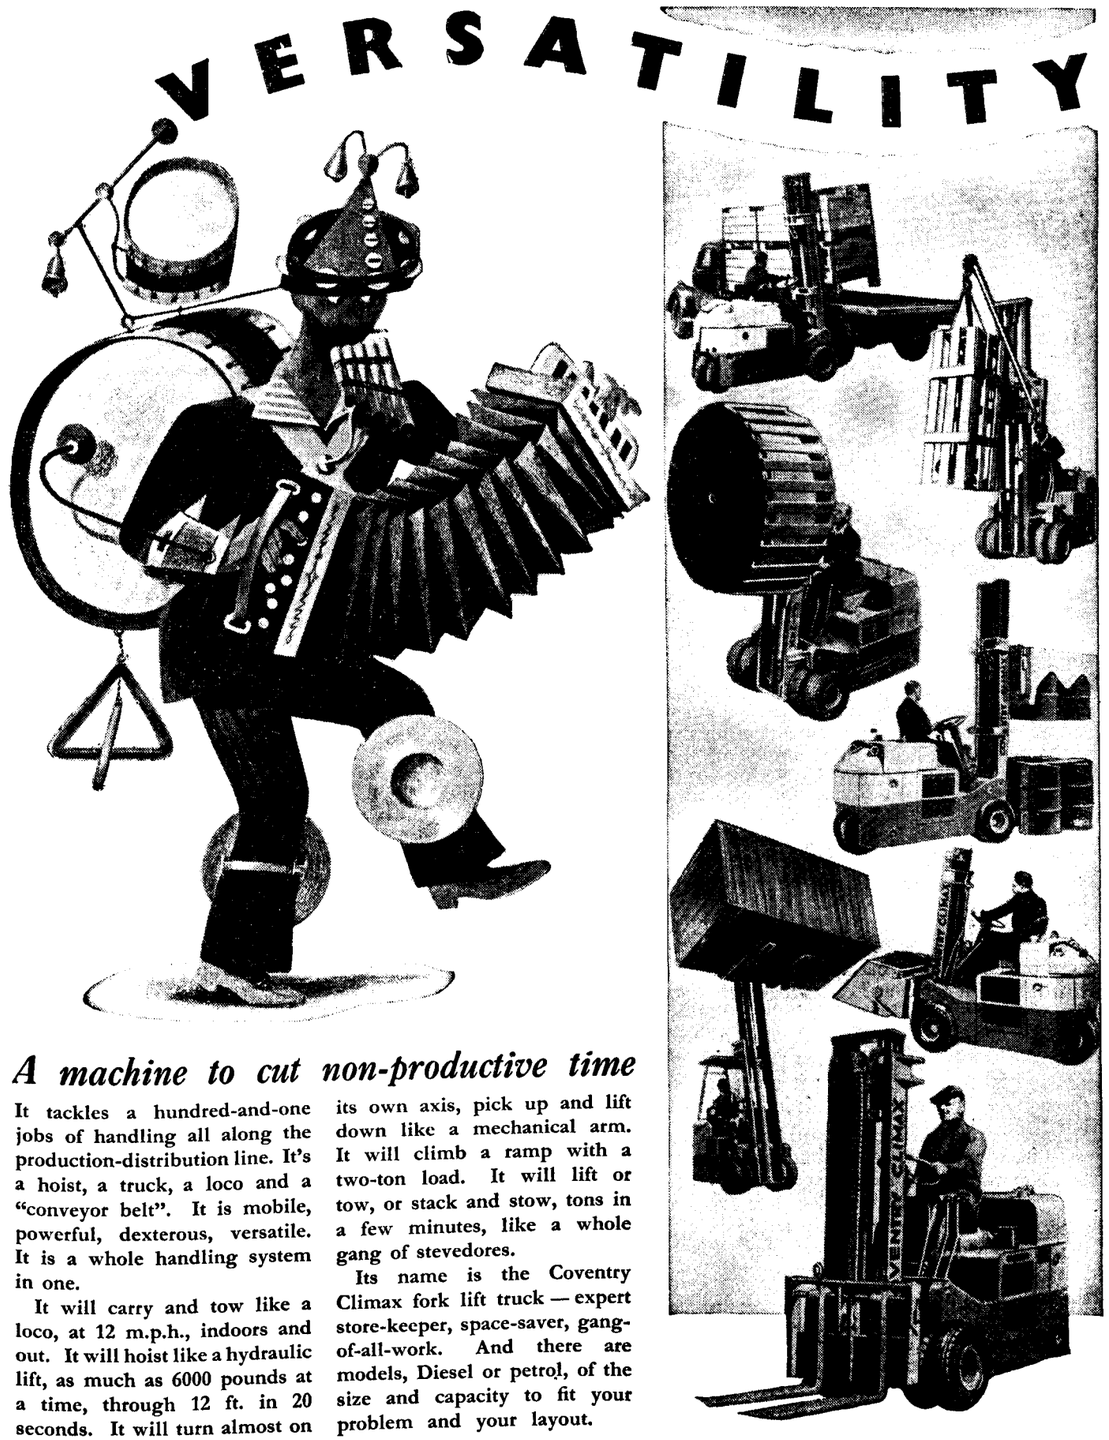
[BY A CORRESPONDENT]

IT is one of the strangest paradoxes that so prosperous a country as Switzerland has been struggling without success, ever since the end of the last war, to cover its ordinary expenses by legal means—in other words, to evolve a fiscal system which shall no longer be unconstitutional. Perhaps it is because of their prosperity that the Swiss are finding it so difficult to accept the necessity of an income tax levied by a central authority, in their case the Confederation. In any case, to ask a sovereign people by referendum whether it agrees to apparently fresh taxation rather invites a negative answer.

For the last two years there has been a disquieting tendency to vote "agin the Government" at all costs, democratically elected though it be. It has been branded—not without considerable justification—as arbitrary, as extravagant, as bureaucratic. This state of the popular mind led to the "No" vote on September 11, 1949, which sharply curtailed the power of the government to levy taxes by emergency decree. But the red herring—though again the argument was not entirely irrelevant—was the cry which came from the French-speaking Swiss that the federal income tax was a violation of the rights of the Cantons. In order to placate them, and also at the behest of many of the richer industrialists in the country, a plan was worked out by which 70 million francs per annum were in future to be provided as Cantonal quotas (*Kontingenten*) to the *Bund*, which was itself only to levy direct taxes on corporations. Since something like 700 million francs revenue had to be replaced this project was inadequate; moreover, it involved endless difficulties as to the allotment of the contributions of the Cantons which would in their turn be forced to raise more income tax. The trade unions and co-operatives came out strongly against the plan, which was rejected by 486,506 votes and 16 Cantons against 267,540 votes and 6 Cantons in the referendum of June 4, 1950.

This meant that the provisional financial order voted on December 21, 1949, would lapse at the end of this month, with no legitimate way open of raising nearly half the federal revenue—unless some other plan were accepted by the Swiss people in the meantime. A programme was now drawn up by which the federal taxes levied for the last ten years by special powers were to be legitimised, though more low incomes were to be freed from the income tax, and the sales tax was no longer to affect food; a further 400 million francs were to be put aside for social relief in emergencies. This plan, if accepted, was to function from 1951 to 1954 inclusive. The referendum upon it was fixed for last Sunday, December 3rd.

The opposition was not inconsiderable. It was strong again in the Canton de Vaud. It was backed in Zurich by the Migros chain-store chief, Herr Duttweiler, who has a certain flair for fascinating housewives—though Switzerland is one of the few countries where they do not themselves vote. The opposition declared that it was absurd for the others to say that the Treasury would be empty, since trade is booming and the *Bund* growing rich on customs duties—and it would be easy enough to borrow. The government and its supporters answered that this was no moment for foolhardiness. The new five-year rearmament programme which is to cost 1,400 million francs (to be raised outside the ordinary budget) will involve more than enough borrowing. It is thought that the increasing international tension was the decisive factor and defeated the desire to vote with the opposition. In fact 516,757 people voted Yes and 227,329 against, there being hostile majorities only in the Cantons of Geneva and Vaud. Direct democracy has thus saved its reputation, even though only 53 per cent of the electorate voted.



Eritrea and Ethiopia

HISTORIANS in the 21st century, writing of the 20th, will no doubt remark that it conducted some curious experiments in framing peace settlements. "One of these," will run their record, "was the allocation of conquests according to the vote of states that had nothing to do with the fighting. These voters, moreover, usually shouldered none of the responsibility for giving effect to their vote." Eritrea will be one of the instances cited.

It was captured from Mussolini by the 5th British and 4th Indian Divisions in 1941. Nine years later, on December 2nd, forty-six affirmative voters (principally Latin Americans and Moslems who were neutral at the time of the conquest) decided that it should be neither divided ethnographically nor awarded to Ethiopia. As the result of a vote taken in full Assembly at Uno, it is to become an autonomous unit, federated to the Ethiopian crown. Ten states voted against this solution and four abstained. It is probably no more acceptable, and has certainly been very much more expensive to attain, than would have been a Solomon's judgment carried out in the flush of victory. There was good enough reason for such a judgment in a territory that consists of well-marked parts. For its greater part, Eritrea is linked to Ethiopia by ties of geography, race and religion; for its lesser, and anti-Ethiopian part, it is similarly linked to the eastern Sudan.

But the British taxpayer should be thankful that there has been any verdict at all. For nine years he has paid the bill for caretaking in Eritrea. During that period, he has successively seen: the Four Powers fail to agree on disposal of their gain, the problem pass to the General Assembly, the wishes of the inhabitants, and the submission of another report on which its authors could not agree. In 1950, he has witnessed a considerable growth of unrest and lawlessness among the impatient Eritreans.

The solution now offered has some merits. In particular it safeguards the Eritrean public services, which are considerably ahead of those in Ethiopia, against falling to the Ethiopian level. Provided that federation—a difficult technique even between advanced states—can be made to work between two inexperienced peoples, the arrangement may give birth to a type of relationship as yet unknown in Africa. It would therefore be best for the British to forget about their preference for dividing the territory, and to wish both Eritreans and Ethiopians good luck in their venture.

A machine to cut non-productive time

It tackles a hundred-and-one jobs of handling all along the production-distribution line. It's a hoist, a truck, a loco and a "conveyor belt". It is mobile, powerful, dexterous, versatile. It is a whole handling system in one.

It will carry and tow like a loco, at 12 m.p.h., indoors and out. It will hoist like a hydraulic lift, as much as 6000 pounds at a time, through 12 ft. in 20 seconds. It will turn almost on its own axis, pick up and lift down like a mechanical arm. It will climb a ramp with a two-ton load. It will lift or tow, or stack and stow, tons in a few minutes, like a whole gang of stevedores.

Its name is the Coventry Climax fork lift truck — expert store-keeper, space-saver, gang-of-all-work. And there are models, Diesel or petrol, of the size and capacity to fit your problem and your layout.

COVENTRY CLIMAX *fork lift trucks*

THE BUSINESS WORLD

British Electricity's Horizon

THE electricity supply industry never lacked faith in its commercial mission ; when the British Electricity Authority took the industry over in 1948, it acquired in Lord Citrine a chairman no less inclined towards such evangelism. In this vein, Lord Citrine turned this week from the severe precision with which he had been expounding the results of the second year's operations of the British Electricity Authority to utter a dramatic warning that the developing power supply situation " is not only serious but may be dangerous or even disastrous." His complaint (he berated the press, perhaps disingenuously, for wanting to hear it again) was that BEA was being prevented from building generating plant fast enough to overtake the perpetual march of peak demand ; because of these hampering uncertainties it was impossible to give any promise about the ending of load spreading and power cuts. Lord Citrine spoke of the delays of manufacture, but absolved the makers of plant of " delinquency " ; he urged that it was folly to export vital equipment such as boilers, but he conceded that if exports were curtailed " it would not follow that the proportionate aid to our programme would be the same." The burden of his complaint fell upon the Government's curtailment of the electricity capital programme ; it remains the second largest item, after housing, in the national investment programme, but it is not enough.

These strictures were probably meant to attract as much attention as the details of the authority's activities in a year that ended eight months ago. That is not a matter for surprise, for an impending power crisis (emphasised by this week's power cuts and by an imminent possibility of a coal crisis) is naturally more important than history. But Lord Citrine was also expressing forcefully a philosophy which imbues the whole report. The urgency of expanding capacity as the only conceivable way to reach and keep pace with ever buoyant demand is its central theme ; it occurs again and again throughout the report (which is lengthy, comprehensive, but better sign-posted than last year's).

In its second year the authority sold more electricity to more consumers than ever before in the industry's history—and at a higher price than for more than 15 years. It sold 41,500 million units, 6 per cent more than the previous year, and nearly double the sales of 1939. Its total of 12,634,000 consumers was 452,000 more than a year earlier, 918,000 more than at the vesting day in 1948, and 2,500,000 more than before the war. Half of the units went to industry, a third to homes, and an eighth to commerce. Compared with 1948-49, farm consumption increased by 20 per cent (though it was less than one per cent of the total), commercial use by 10 per cent, and industrial by 8 per cent ; but domestic consumption, largely because of milder weather, was only 2 per cent higher. Since expenditure did not rise to the same extent, the British Electricity Authority was able to show a higher surplus on its combined accounts of £7.2 million against £4.4 million in 1948-49. The 1949-50 surplus represented only 3¼ per cent on the total year's turnover of £214.5 million ; this had risen by £16.7 million compared with the previous year, almost entirely through higher sales of electricity at a slightly higher price (1.2d. per unit against 1.174d. in the previous year and 1.133d. in the last year of the supply companies and public authorities). The rise in revenue was accompanied by a rise in combined expenditures from £193.4 million to £207.3 million, which represented a slight increase in terms per unit sold from 1.19d. to 1.2d. Costs of generation and purchase of electricity fell by .01d. per unit sold, but this economy was offset by an equal rise in administrative and general expenses and higher depreciation charges. This rise in administrative costs completely absorbed the authority's successful efforts to shave a little off station costs ; higher thermal efficiency helped here, but the main factor was one over which BEA had no control—a fall in fuel prices by 1.9 per cent.

★

As in 1948-49, BEA has paid no income tax or profits tax. It has escaped not because it is a nationalised industry but because it is spending such large sums on capital expansion. The claim for initial allowances on such expenditures has meant that no liability to income or profits tax has been incurred in its first two years, though in the current year a liability to profits tax is likely to arise. The report discloses that the BEA considered, but for the present decided against, setting up a special taxation reserve to spread the initial allowances over the effective lives of the assets concerned, for which depreciation is charged in the accounts on a straight-line basis. In Lord Citrine's words, this decision arose from a conviction that any eventual curtailment or cessation of the present rate of capital expenditure was " entirely hypothetical—we can foresee no period in which we shall cease growing, and we do not think the tax question will arise." No doubt BEA is correct in its assumption that for some years after 1950-51 the pace of construction will not slacken ; but that is not to say that it will never slacken or that the present rate of initial allowances is immutable. On the broadest grounds, the decision seems open to argument.

Each of the Area Boards contributed towards the authority's combined surplus, but there was a loss by the central authority which has to be made up from the central reserves. The central authority's tariffs did not meet the authority's outgoings, and the current tariff has been increased to correct this deficit. The average price of electricity sold to domestic, commercial, and small power users rose last year from 1.446d. to 1.515d. a unit, while the price of power (largely for industry) dropped from .930d. to .925d. During its two years of operation the BEA has slightly raised prices to domestic consumers, and last year it reduced prices to industry ; Lord Citrine used this evidence to deny that the authority was now favouring increased consumption by the domestic consumer more than it encouraged extra

industrial use. The fact remains, however, that compared with average prices before the war domestic consumers pay less, while the industrial consumer now pays nearly a half more. The chart of comparative price indices which the BEA exhibits in its report shows that the rise in the price of electricity purchased by the domestic consumer has been scarcely perceptible compared with the increase in other prices and wages. This hardly suggests any forceful attempt to apply disincentives to the consumption of electricity at peak periods.

During 1949-50 the BEA brought into commission 831,000 kW of generating capacity, against 566,000 kW in the calendar year 1948. Progress has been made towards standardising layout and equipment for power stations, and much of the plant approved was of the unit type in which a single boiler is associated with each turbo-alternator ; two stations were planned for 100,000 kW turbo-alternators and boilers twice as big as any now in use in Britain, and experimental work was begun on the 275,000 volt " super-grid." These developments suggest that the BEA is concerned to keep abreast of technical development. The problem is to find the means. During 1949-50 the BEA spent £117.13 million on capital plant and construction. Estimates for investment in 1950 were cut by the Government to £102 million. But construction of generating plant, which is now costing considerably more than £50 per kW, was not curtailed by the Government ; it is limited only by manufacturing capacity. Programmes now prepared by the BEA call for the addition of 10,330,000 kW of new generating plant by 1955 ; of this 1,745,000 kW has been installed, and the remainder calls for a 50 per cent increase in plant capacity in five years, and a capital expenditure of perhaps £350 million on generating plant alone. Higher costs of new installations will involve higher provisions for depreciation ; these are already beginning to mount, and would have to rise a good deal more before they were sufficient to cover the cost of replacing plant. It is obvious that as new plant comes into service an increase in the average price of electricity will be inevitable.

Will this capital programme buy off the need for load-spreading and power cuts ? The official answer is based on a number of favourable assumptions, but, even so, the present winter and the next two will see plant shortages of 1,889,000, 1,745,000 and 1,702,000 kW respectively, and these will mean load-spreading and cuts at peak hours. Again, on most favourable assumptions, shedding should be " comparatively infrequent by the winter of 1954-55, and very exceptional in the three following winters." The ambition of attaining the plant required to meet the hour or two of maximum demand in the hardest winter seems undimmed ; but the practical hope of doing so seems each year to recede farther into the distance.

★

It is still unfashionable, and certainly unpopular in the industry, to admit any alternative possibility. Such an alternative can easily be summarised: how can the consumption of electricity be spread to reduce the height of the peak load but not to reduce total consumption ? The very figures produced each year by the authority, and its setting back of that halcyon day when the last suburban housewife can switch on her last space heater or toaster on the coldest morning in the year argue the alternative case. Last year the biggest shedding of load (in a mild winter) was 1,140,000 kW. To satisfy this load would entail an expenditure on new plant of about £60 million. But the load shed represented only 0.076 per cent of the year's total output ; if it had been satisfied it would have produced much less than £200,000 of extra revenue. By load-shedding and load-spreading, the BEA has recently increased the load factor on the system ; but its future plans will almost certainly bring it down again from what the BEA's deputy chairman earlier this year called " its artificially high level." Closely analysed, this is a problem of inducing domestic users to take their power requirements off the peak. They have been persuaded that power for space heating and water heating is a natural right at any hour at a uniform tariff, and they are not to be blamed because they have imposed an uneconomic and at present insupportable peak load on

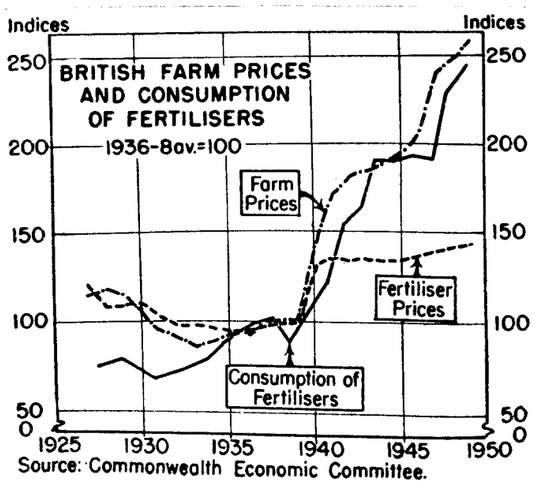
the supply system. The technical difficulties in checking consumption according to time of day (which may differ from day to day) and the problem of framing tariffs which would make each consumer bear the real economic cost of the power he buys at the time he uses it, argue themselves. The industry seems quite convinced that they cannot be solved, but that may represent no more than a victory for technical ambition over the best kind of long-term economic planning. This is no temporary problem. There is no assurance in BEA's own vast horizon that at some future level of installed capacity it will as a matter of certainty be able to supply every demand made upon it ; in the long run BEA may be forced to turn back and consider hard and unpopular economic truths. One of the most important of these, surely, is that no consumer, industrial or domestic, should be able to impose a load on the system on terms that do not cover the true cost of meeting his additional demand. It is hard to believe that by the right combination of technical resource and realistic tariffs this lesson cannot be taught—to the great benefit of the country, of BEA, and of its consumers.



Fears about Fertilisers

SINCE the war a great expansion of food production has been achieved by farmers throughout the world. This new agricultural revolution has been based on improved yields per acre and per man employed ; it has combined greater knowledge of plant and animal biology with greater advances in the use of power and machinery on the land ; and it has been given the most forceful encouragement by high prices for agricultural products. The five years have not been a period of smooth progress for there have been temporary scarcities of machinery and fertilisers and intermittent scrambles for supplies. But until recently it had been supposed that these shortages had been largely overtaken. In particular, it seemed possible that production of certain fertilisers might even begin to run slightly ahead of an expanding scale of consumption throughout the world. There is enormous scope for more intensive use of fertilisers in the underdeveloped areas of the world, but in the regions of established agriculture it seemed that consumption of fertilisers might increase somewhat less rapidly and could be met quite comfortably.

That prospect has changed dramatically in a few months. The problem now is to maintain the output of fertilisers in the face of certain critical shortages of materials. So far as this country is concerned, there is also the unresolved question of how the British farmer is likely to react to rising prices for fertilisers. Last July he lost the advantage of half of the subsidy, and within a month prices rose by more than 20 per cent. The other half of the subsidy expires in July next year, and prices are likely to rise again at least as sharply. There is no doubt that cheap subsidised fertilisers encouraged the farmer to build up reserves of fertility in his land ; the low price was accepted with enthusiasm as an opportunity of partly turning into capital an expenditure that the tax inspector was willing to allow as a charge against profits. But it may not follow that higher prices will have the contrary effect. Fertilisers (including lime) account for only 7 per cent of total farm costs in this country ; hence their increased cost to the still prosperous farmer above the margin may not be so very painful. The accompanying chart, taken from the Commonwealth Economic Committee's recent survey,* relates the consumption of fertilisers in Britain to farm prices and fertiliser prices. The match between farm prices and the consumption of fertilisers is remarkably close, but there is a much less distinct conformity between consumption and prices of fertilisers. The same contrast is true also in the United States and Canada. The survey concludes that " apart from the long-term upward trend in consumption, farmers tend to increase their use of fertilisers in times of prosperity or restored confidence." On this argument, if British farmers come well out of the annual price review next February, their demand for fertilisers should be maintained.

TABLE I—BRITISH FERTILISER PRODUCTION AND CONSUMPTION

Potash fertilisers	...	75·0	...	234·2

Source: Commonwealth Economic Committee.

Phosphates are the most important type of fertiliser used in Britain ; they accounted last year for over half of the total of all fertilisers consumed. Of the phosphate fertilisers, superphosphates alone account for more than half and basic slag for more than a quarter. British production of phosphatic fertilisers depends on imported raw material and in recent years output has been insufficient to cover consumption ; part of the deficiency has therefore had to be filled by imports. In the first ten months of this year practically the whole of the 116,000 tons of manufactured fertilisers imported into this country consisted of superphosphate, mainly from the Netherlands and Belgium. Home-produced superphosphates are made from imported phosphate rock from Morocco, Tunis, Algeria and the United States, and from sulphuric acid made in this country from imported sulphur. So far no shortage of phosphate rock has occurred, but already there is a very real shortage of sulphuric acid owing to the reduction in exports of raw sulphur from the United States. World demand for sulphuric acid for all purposes has increased very considerably since the war, and more sulphuric acid is now made from elemental sulphur because the process has the advantage of lower capital and running costs. The United States is the main source of elemental sulphur and its reserves are declining. It is possible to make phosphatic fertilisers without using sulphuric acid, but these processes require either nitric acid (which is more costly than sulphuric) or great heat, and that in turn demands cheap and abundant supplies of suitable fuel.

In 1944 the Government decided to expand the domestic manufacture of superphosphate so that British production would cover postwar requirements. A project submitted by Messrs. Fisons Limited was accepted and a new factory built at Immingham was opened a few months ago. Increased production was planned on the assumption that adequate supplies of sulphuric acid would be available. Recently, however, the Government announced that the supply of sulphuric acid to the superphosphate industry would be reduced during the current season (1950-51) and that imports of superphosphates would be increased to make good the loss in the home production. It is not clear where these superphosphate imports are to come from. This country is not alone in suffering from the sulphur shortage. Basic slag, the other important phosphatic fertiliser, is a by-product of the steel industry. Despite the remarkable increase in British steel production in recent years, the supply of high-quality slag has not fully met agriculture's requirements. Imports of basic slag have increased steadily during the past three years, and yet farmers have still gone short. As the new steel plants come into production, it should be possible to increase the amount of basic slag supplied to the fertiliser industry, but this depends upon the rate at which the steel industry itself is able to work, and its own raw materials are short enough to temper any optimistic assumption that the output of basic slag can be sufficiently increased to offset the shortage of superphosphate.

★

This prospective shortage of phosphatic fertilisers could be a serious matter for British agriculture, though its full effects might not be felt for some time. Since the war, British agriculture has been in the process of change from its wartime concentration on arable crops to livestock farming. Under the Government's long-term agricultural programme, the output of meat and dairy produce is expected to increase to 110-125 per cent of the prewar level by 1953. But older methods of grazing that left pastures to look after themselves have long been superseded by scientific management of grasslands with proper grazing rotation and liberal use of phosphatic fertilisers. It is doubtful whether, to take one example, high milk yields could be maintained for any length of time unless pastures were maintained in good condition. This changeover from arable to livestock implies an even greater use of phosphates. The present state of world politics might put this programme into reverse, for in war or near war governments think of bread first and meat second. If it should happen that arable farming is again encouraged, consumption of phosphates could be allowed to fall and demand would become more insistent for nitrogenous fertilisers.

British production of nitrogenous fertilisers in recent years has exceeded agriculture's requirements and an important export trade has been developed. Sulphate of ammonia, the main type, is manufactured from nitrogen produced from the atmosphere or obtained as a by-product from the gas and coking industries. " Nitro-

"chalk," the other important nitrogenous fertiliser, is made from a mixture of ammonium nitrate and calcium carbonate. Supplies of these materials are more or less adequate; in the crop year 1949-50, British production of nitrogenous fertilisers amounted to 259,000 tons (nitrogen content) compared with domestic consumption of 213,000 tons. Military requirements for nitrogen will no doubt increase during the next twelve months, but they will probably be met without causing any shortage in the supply of nitrogenous fertilisers. Only last summer the supply of synthetic nitrogen outstripped consumption to such an extent that producers disposed of their stocks and accepted a fall in prices of 25 per cent. But the rapid course of events has since caused prices to rise again. Government-owned nitrogen plants in the United States which were closed down some months ago are being reopened; but their output will be devoted entirely to war purposes, and it is probable that the construction of the new plants in Europe, which had been delayed on financial grounds, may now be speeded up.

The third plant nutrient is potash. All supplies of potash used in Britain have to be imported. In the ten months to October, almost 7,000,000 tons of potassium compounds were imported, of which over 6,500,000 tons consisted of chloride (muriate) coming from Germany, France and Spain. World production of potash has increased by 56 per cent during the past three years, and according to the Food and Agriculture Organisation output should further increase by 10 per cent during the current season. Europe is the world's largest producer as well as the world's largest consumer of potash, but a third of its output is located in the Eastern zone of Germany. Recently, however, drillings in North-east Yorkshire have located a rich seam of pure potassium chloride and when this area can be exploited this country should in time have little dependence upon imports.

Thus the main fear about fertilisers is the prospective shortage of phosphates. But plant nutrients, like food nutrients, need to be assimilated in a balanced form to be effective, and a serious shortage of any one of the three main plant foods (nitrogen, phosphate and potash) may affect the consumption of the other two. The use of compound fertilisers has increased steadily since the war and their production could be seriously impeded if, say, the supply of phosphorus in a usable form were drastically reduced. At the moment the shortage seems to be confined to the British market, and it arises directly from the sulphur shortage. Production and consumption of phosphates and potash in the United States are expected to increase during the current season, and consumption of nitrogenous fertilisers is also expected to increase though production may decline. The United States is the world's largest producer and consumer of all three types of fertilisers. In Europe, too, fertiliser production is expected to expand, and as continental countries still depend on pyrites rather than upon elemental sulphur for the production of sulphuric acid, they should not be immediately affected by the sulphur shortage. But apart from this country, there are many others—including Canada, Australia, New Zealand and India—that need to import considerable quantities of sulphur, and unless sulphur or sulphuric acid can be imported their domestic production of superphosphates and ammonium sulphate would be severely reduced.

Agricultural production can be maintained for some years despite a shortage of fertilisers since the reduction in soil fertility does not become immediately apparent. But once land deteriorates, it takes a long time to recover, and meanwhile the world will be faced with lower yields and a smaller output. Present steps (such as those outlined in the recent Fisons report) to increase the supply of sulphuric acid based on pyrites may therefore be wise policy, even though they take time and will cost more.

Business Notes

Markets Mark Time

While the discussions between President and Prime Minister were proceeding and the military situation in Korea remained frightening and obscure, it was not to be expected that the Stock Exchange could stage an effective rally. It is something that the more persistent type of selling, of which there was another bout on Monday, has largely ceased and that the "bears" are less confident than they were a week ago that the Korean situation is beyond redemption. They have been quick to react to the straws in the wind—straws at which the rest of the world has largely clutched—suggesting that the Chinese would come to a settlement. That reaction accounted as much as anything else for the small gains of an eighth of a point in the gilt-edged list on Wednesday; but it still left a tally of losses that will be made good only by news of a much more positive character.

Report had it that the authorities were preparing to call the 1951-53 National War Bonds on the earliest day last Friday; if they had any such plans they were frustrated by the Korean crisis. Perhaps by June 1st next year the outlook will be clear enough to enable them to take a decision for repayment on September 1, 1951; but given the present speed of events, this is to look ahead much too far. There is a most awkward budget prospect which the Chancellor did not minimise in his speech to the Foreign Press Association this week; £300 million extra for defence together with £300 million of additional exports to maintain the balance of payments will certainly absorb more than a £500 million increase in output which it is possible to assume only under favourable conditions. In fact, industrial spokesmen are daily voicing increasing alarm at the prospect of dislocating shortages of essential materials—the list includes all the fibres, all the non-ferrous metals, coal, many chemicals, and several types of steel.

Some check to the rise in productivity was to be apprehended from the growing importance of defence orders and the changes in production lines that these orders would entail. Now industry fears disturbances far more profound than those, and industrial shares have not ignored these fears. Where the direct gains of defence and of the scramble for commodities are obvious—as in shipping shares and copper issues—the market has responded well enough. But the general caution in industrial share dealings is reflected in the movement of the *Financial Times* index of ordinary shares from its peak of 118.2 on November 20th (on that day it equalled but did not break through its previous "high" on September 22nd) to 113.4 on Tuesday. The midweek recovery—such as it was—raised the index by only one-fifth of a point and left "undated" gilt-edged still fractionally above a 3½ per cent yield basis.

Debate on Raw Materials

Anxiety about the shortage of raw materials increases daily. Mr Attlee flew to Washington last weekend to consult with President Truman and the effect of present scarcities of materials on defence was an important item on the agenda. At home, Mr Shinwell, the Minister of Defence, suggested that American stockpiling might lead to British unemployment—which is perhaps one way of restating what the debate is about. On Thursday, the Minister of Supply made a statement on allocation that was also in the main a restatement of the problem. Positive action lags well behind the debate. Perhaps something may emerge from the working party which has been set up in Washington to give urgent study to these problems. The recommendations of the Council of the Organisation for European Economic Co-operation about commodity policy seem unlikely to secure that something will be done, as well as said, about the threat of dislocating shortages. The OEEC's purview in the field of commodities is itself limited because the member countries do not comprise both the main producers and the main consumers of staple commodities. In these circumstances, the report can be no more than a hopeful attempt to inspire some form of co-ordinated policy about materials on the part of the countries of Western Europe. Much will depend on what the OEEC mission now in Washington is able to do.

The report asks member countries to increase their production (both at home and in their overseas territories) of coal, metal ores and sulphur; to utilise more fully their existing productive capacity for coke, aluminium and pulp; to extend production of coke, electricity, aluminium and pulp made from fibrous materials; and finally to increase the recovery of ferrous scrap, sulphur-bearing materials, waste-paper and rags. It also recommends members to restrict the domestic consumption of scarce materials and to encourage the use of substitutes, particularly for hides and skins. Perhaps the most important recommendation, and certainly the most difficult one to carry out, is that member countries should discourage speculative buying and check undesirable private stockpiling by taking all necessary internal measures "especially in the sphere of financial policy."

If countries were to act in accordance with these precepts, major changes in their present economic policies could result. Does the plan for increased coal output, for example, mean that Britain ought to allow Italian miners to work in British pits to offset the shrinking numbers of British miners? It is easy to recommend that new capacity for producing coke, electricity, aluminium and pulp should be set up, but less easy to achieve in countries where full employment already obtains, where rearmament is to be expanded, and where the switching of further resources into new investment would be a stupendous task.

* * *

Aspects of International Co-operation

The council is of necessity even less specific when it turns to recommendations about staple commodities mainly produced and consumed by countries outside OEEC. The United States is asked to ease the shortage of kraft pulp, sulphur, cotton and cotton linters and to enable ECA funds to be used to purchase coal from the United States. Britain is requested to convene another wool conference and the Secretary-General of OEEC is asked "to discuss with producing and consuming countries . . . the feasibility of holding international conferences" on timber, pulp, copper, zinc and nickel. There is no indication whether these conferences should be held under the *aegis* of OEEC or of United Nations. If they are convened as international study groups, then countries of the Soviet bloc, being members of United Nations, would have to be invited. On the other hand, the OEEC is hardly the appropriate body to stage them. That task would be better left to the United States.

Postwar experience of commodity conferences does not encourage any wild hopes of immediate results. The increased threat of war might make producers and consumers more accommodating to the other's point of view. But if success is to be achieved, the lead must come from the United States and Britain as the two countries concerned with the bulk of the output and consumption of most of these materials. At least they must pursue the same end. If producers are to accept an international scheme to ensure "equitable distribution" (whatever that may mean) now, they will want some guarantee that market prices will not fall below costs of production when the political atmosphere clears. The cost of securing allocation now is likely to be a heavy one for consuming countries. But in the circumstances it may be inevitable.

* * *

Allocation and Scarce Metals

On Thursday Mr G. R. Strauss, the Minister of Supply, made his long-awaited announcement on the allocation of scarce metals. Those who hoped for cut-and-dried plans on how the supplies of such metals as zinc, copper and nickel would be distributed among the different consumers, were disappointed. The Ministry has so far decided to take no specific action, though the Minister said that "measures under consideration in consultation with industry include restrictions on the export of semi-manufactures, the prohibition of the end uses of [scarce] metals for inessential articles and the institution of allocation schemes." If this formula means anything, it is surely that the onus of allocation will be left to industry.

As for the rest, the Minister contented himself with a review of possible supplies of five scarce metals (zinc, copper, aluminium, nickel and steel) during the first part of next year. Even here he added little to what was already known. Zinc was desperately short and supplies of ordinary grade "may have to be restricted . . . to little more than 50 per cent of the rate of consumption during the first nine months of 1950." A severe shortage of special shapes of copper will affect certain manufacturers, otherwise consumption will be the same as in the first half of this year, which was 10 per cent less than the current rate. But civilian consumption will be reduced as rearmament progresses. Aluminium supplies will be restricted to 15,000 tons a month against 17,000 tons a month this year and defence requirements have to be met out of this reduced supply.

On nickel, one of the most serious shortages, the Minister merely stated that there was apparently no prospect of larger supplies "in spite of the growing demand for defence purposes." Steel offered the only gleam of hope in this atmosphere of gloom. According to Mr Strauss, there is no real shortage of "general" steel, but he added that production in 1951 may be affected by difficulties in supplies of steel-making raw materials, particularly imported scrap and imported iron ore.

* * *

More or Dearer Exports?

The Chancellor of the Exchequer declared on Wednesday that, even after allowing for an increase in invisible earnings, British exports next year would have to increase by £300 million (or 14 per cent on this year's rate) to pay for the same volume of imports, because of the deterioration in the terms of trade. This is conceived, however, on certain assumptions—first that the exchange value of the pound is unaltered, and secondly that the average price of British exports does not rise. What is regarded in the Chancellor's notation as an increase in the country's real burdens could in other circumstances be brought about by a change in relative prices. The question clearly arises whether British exports, despite their recent rise in price, are not being sold too cheaply.

British export prices in October showed the sharpest rise for many months. The Board of Trade index rose by 2 per cent chiefly because of higher prices for wool and cotton goods. Prices of metal and other manufactured goods also rose, though only slightly. This change—encouraging so far as it went, because it suggested that the country was obtaining better value for its exports without losing any competitive ground—was completely offset by a very sharp increase in the cost of imports. The index of import prices rose by 4 per cent, the biggest jump since devaluation. Raw materials alone rose by 7 per cent, reflecting higher prices for wool, rubber and cotton, while the rise in prices of non-ferrous metals and refined petroleum during the month caused an increase of 2 per cent in the price index for manufactured imports.

The deterioration in the terms of trade since the end of June (when fighting started in Korea) in continuation of a persistent trend since September last year (when devaluation took place), has become quite alarming. The cost of imports

BRITISH IMPORT AND EXPORT PRICES
(Board of Trade Indices: 1947 = 100)

	1949		1950					
	Sept.	Oct.	May	June	July	Aug.	Sept.	Oct.
Import Prices:—								
Total	110	118	132	132	134	135	137	143
Food, drink and tobacco	107	115	124	125	125	125	124	126
Raw materials	118	125	148	148	154	157	163	175
Manufd. goods	105	117	124	124	124	126	127	130
Export Prices:—								
Total	113	113	119	119	121	121	121	123
Metal goods	114	114	117	117	119	119	119	120
Textiles	116	115	124	125	126	126	127	129
Other manufs.	106	106	110	110	111	111	111	112

has risen by 8 per cent since June whereas export prices have risen by only 3 per cent. Compared with September, 1949, imports are now 30 per cent dearer and exports barely 9 per cent dearer. These figures illustrate the additional strain that the world inflation is imposing on the British economy.

Contrary to economic argument, most manufacturers and exporters seem reluctant to raise their prices until they actually come to use higher priced raw materials. But since a large part of Britain's exports go to primary producers, who are enjoying very high incomes, it might well be possible to fix the prices of British manufactured exports rather nearer their current replacement costs without losing sales. Such a policy would undoubtedly be frowned upon in certain circles—for it might also be held to apply equally at home, and that would never do. But if the British rearmament programme reduces the volume of exports next year, prices will rise under the pressure of market forces. To anticipate that move now, even if prices to the domestic market have to be increased at the same time, would only establish more quickly the inevitable fact that sooner or later prices come to reflect inflationary forces.

Tackling the Sterling Balances

Slowly, and not very surely, the British Treasury is undertaking one of the tasks to which it should have given priority five years ago; it is bringing the problem of the sterling balances under long-term control. Negotiations for a permanent settlement with Egypt are now in full swing in London. It was pointed out in *The Economist* of November 25th that at the end of August Egypt's blocked balances amounted to £238½ million and its free balances to £42 million. Mr Gaitskell has now revealed that Egypt's total balances amounted to £272 million at the end of September—an apparent drop of £8½ million on the month. This confirms other evidence that Egypt is now becoming one of the most profligate spenders of accumulated sterling. Egypt still seems to have some release rights attached to its blocked balance from former agreements. There is a danger, however, that Britain may now yield liberal further release rights in order to secure a tidy long-term settlement—and this despite the fact that an unrequited drain on British productive resources could not fall at a more inopportune time than the present.

Meanwhile, satisfactory arrangements have been negotiated—and written into the Colombo Plan—for a long-term settlement of the sterling balances held by India, Pakistan and Ceylon. Between 1946 and 1949 releases for capital transactions amounting to £270 million and for current transactions amounting to £340 million have been granted to these countries. In the six years from 1951 to 1957 only a further £246 million will be released. India (whose current balances are believed to amount to about £620 million) will draw out £210 million, in annual instalments of £35 million. Pakistan (whose current balance cannot be much above £100 million) is due under the plan to draw out £16 million, of which £10 million will be for 1951-52; a fuller agreement with Pakistan is now in the course of negotiation. Ceylon (whose current balance is believed to be between £30 and £40 million) will draw out £21 million, in annual instalments of £3 million, in the seven years 1950 to 1956. By the end of 1957 the sterling balances of all these countries will be down to the "normal" level required as a currency reserve. This rock-bottom level, incidentally, has already been reached by Israel, another heavy sterling creditor of the early postwar years, whose balances are now likely to be below £20 million. The Israel Government's Economic Adviser, Mr David Horovitz, has been in London this week and has, in all probability, been swept into the preliminary talks required by the current fashion for negotiating permanent settlements.

The countries mentioned above, together with the EPU countries with which permanent settlements are already negotiated, accounted for about £1,300 million of the £3,471 million of sterling balances outstanding on June 30th last. Rather over £1,100 million of the rest was held between the colonies (holdings about £580 million) and Australia (holdings over £520 million); the future utilisation of these balances is likely to be regulated by gentleman's agreements between Britain and the governments concerned. The remaining £1,000 million or so includes a certain amount of "water," such as the £175 million pensions annuity held by India and Pakistan and the working balances held in London by overseas banks. The significance of this move towards long-term settlement of the problem of the sterling balances should not be underestimated. The sterling balances have always provided one of the biggest stumbling blocks to the restoration of convertibility. Provided there is no spoiling by the Egyptians, the prospects for long-term settlement are now better than they have ever been.

New Deadlock in Buenos Aires?

The new bout of Anglo-Argentine negotiations, which was foreshadowed in *The Economist* on November 18th, started—and ended—in Buenos Aires this week. Sir John Balfour, the British Ambassador, tersely informed newspaper correspondents that no progress had been made and that another immediate meeting was unlikely. This breakdown followed confident forecasts of an early resumption of meat shipments, with the price provisionally invoiced at £97 a ton. A fuller agreement on overdue sterling remittances—and, possibly, on a British loan to Argentina—was expected to follow later. It has not yet been made clear whether failure to negotiate a stop gap pact of this sort was due to British opposition to interim agreements or to the introduction of new Argentine demands.

Meanwhile, the delegation from the Argentine Central Bank, led by Mr Eduardo Grumbach, has arrived in London; Mr Grumbach's nominal objective is to complain about the "discriminatory" operation of Argentina's sterling exchange guarantee, but, up to Wednesday at least, it was

Closer Uniscan Ties

The family ties between the Scandinavian countries and the sterling area have been greatly strengthened by Exchange Control Orders issued this week. Their effect is to remove the Swedish, Norwegian and Danish crowns from the list of specified currencies. This means that proceeds of British exports to Scandinavia need no longer be repatriated and that residents in the United Kingdom may from now on maintain bank accounts in these three currencies. The move may be regarded as a symptom of increased confidence in sterling, and of the attainment of reasonable equilibrium in the balance of payments between the sterling area and the Scandinavian countries. The British authorities have always professed the desire to simplify exchange control procedure wherever this can be done with reasonable safety. By exempting exporters to Scandinavia from the necessity to fill in form CD 3 (the form through which the authorities check that the proceeds of exports are ultimately remitted home), traders will be saved time and effort and a considerable volume of checking work will be taken off the exchange control department at the Bank of England.

These relaxations, welcome as they are, raise an interesting problem of reconciliation. Britain and the three Scandinavian countries are all members of the European Payments Union. The underlying principle on which EPU works is that there shall be no discriminatory payments arrangements between the member countries. How is it possible to reconcile the concessions granted to the Scandinavian countries, through removal of their currencies from the "specified" list, with the non-discriminatory philosophy of EPU? The British answer is that the spirit of an agreement should prevail over the letter; that EPU was intended to foster the expansion of intra-European trade and that the regionalism of the Uniscan arrangements is fully in keeping with that spirit of expansion. This explanation is no doubt acceptable to the functional empiricism of the Briton, but it may appear less convincing to the strict logic of the Continental. On the other hand it is clear that arrangements such as those negotiated with Scandinavia must be reciprocal. If other European countries were unwilling to reciprocate the relaxations in exchange control that Britain is prepared to make, the charge of discrimination could not be levelled against Britain. If this is the explanation, it is to be hoped that no time will be lost in making it public.

The Covenant Clamps Down

Violation of car covenants on a truly magnificent scale was attributed last week to a London businessman, who was alleged to have placed fourteen separate orders for motor cars and to have broken four covenants before the British Motor Trade Association caught up with him. To control this enterprising man, the Association obtained a court injunction; for the better control of other buyers of new cars, the Association and other motor organisations issued a new and tighter car distribution scheme last week. From December 1st, purchasers of new cars will be bound by covenant to retain them for two years, instead of one. Moreover, dealers are forbidden to sell a car to anyone "who has already had a new postwar car of any make which is still in good running order or who has disposed of such a car." According to the industry, the new restriction stems from the failure of the government to increase the present low allocation of new cars to the home market in 1951. Last week the Minister of Supply announced that only 110,000 cars will be available for home purchase next year.

Enforcement of the scheme is left to the dealer, possibly on the theory that he gets the biggest share of profit in a car sale, and should therefore bear the biggest share of abuse from the public. Certainly the plan puts him in a difficult position. It ought to be simple enough to find out if a prospective buyer has owned a postwar car: presumably a telephone call to the British Motor Trade Association will produce the name of anyone who has signed a car covenant since the end of the war. But if the would-be purchaser has already disposed of a postwar car, simplicity vanishes. Short of adding a private detective to his staff, it is difficult to see how a dealer can trace this car and judge whether or not it was in "good running order" when sold. And surely it is asking much of a motor car dealer that he deliver new cars only to those "whose need it is most important in the national interest to satisfy."

Whether the industry would have devised such a scheme except under a strong urge from the Ministry of Supply may be open to doubt. Protests from some manufacturers led to greater discretion being given to dealers than was first intended, so that this section is now admitted to be full of loopholes. It is not likely to be taken seriously by the manufacturers and dealers of the higher-priced cars and it may be significant that the Ministry of Transport tried and quickly abandoned at the end of the war a much more concentrated scheme for priority deliveries. There are roughly 15,000 motor dealers, of which 8,000 handle fair numbers of new cars. They are now delivering orders for popular makes taken in 1946. The Society of Motor Manufacturers and Traders speaks, in its official statement, of "stamping out abuses" by means of the new regulations, but is this language justified by the facts? The high prices of postwar second-hand cars are in part the premium for immediate, as distinct from four years' delivery. Why is it that the impact of pressure of demand on any market in which physical supplies are controlled should always be regarded as "abuse"? Might it not be a perfectly natural economic response to an artificial situation?

* * *

Malayan Rubber Tax Modified

Details of the revised Malayan rubber tax were published this week. The basis of calculation has been altered so that there will be little or no delay in the impact of the tax; it will rise at a less rapid rate than was originally proposed, but it will still be appreciably higher than the existing 5 per cent *ad valorem* export duty. The Rubber Growers' Association has stated that the modification does not represent an agreed settlement between rubber producers and the Malayan Government. The decision was taken solely by the government, and rubber producers still smart from the fact that their industry alone has been singled out as a source of extra revenue to combat internal inflation.

The method of calculating the tax is certainly complicated and it includes a cess for replanting calculated on a different formula. The amount of duty payable is shown in the accompanying table, which also gives the existing rate of duty and the one originally proposed five weeks ago which was discussed on page 768 of *The Economist* of November 11th. Even in its modified form the new tax is high but it does not increase so rapidly in a period of rising prices as did the tax originally proposed. The duty will be fixed weekly and the price used will be the average of prices ruling in the preceding fortnight. This is indeed an improvement on the first idea of altering the tax only every three months and of basing it on prices ruling three to six months earlier. When the price of rubber does not exceed 60 Malay cents (1s. 4½d.) a lb. the existing rate of duty will apply and no replanting cess will be levied.

The existing levy of ½ cent a lb. paid to the Malayan Rubber Fund to finance research and propaganda will still be payable irrespective of the price of rubber or the export duty. Although the modified tax comes into force on January 1, 1951, the Malayan Government has kept to its original intention that between January 1st and April 4th the tax will be 20¼ cents (5½d.) a lb., unless the price of rubber falls below 126.7 cents (2s. 11½d.) a lb. during the period. Forward contracts for 1951 which were made before September 24th will be charged, after examination by a special committee, at the new rate of duty after January 1st.

MALAYAN RUBBER EXPORT DUTY

Price of Rubber per lb.		Existing Duty	Original Proposal	Modified Version
Malay cents	pence	cents per lb.	cents per lb.	cents per lb.
60	16¾	3	3	3
80	22½	4	7	7
100	28	5	12	11
120	33½	6	18	15
140	40	7	25	19
160	45	8	33	23
180	50½	9	42	27
200	56	10	52	31

The Malayan Government has certainly yielded to the outcry against its first proposal, though not perhaps as much as rubber producers had hoped. The rubber industry makes less of the charge that the modified tax is too high than of the complaint that it has to bear the fiscal burden of the Malayan Government's anti-inflation programme. The rubber market is very sensitive. Indeed in the past week the London price dropped 4½d. and closed on Thursday at 4s. 3d. a lb. The report that the United States Government might take over the purchase of all American imports caused the price to fall by 6½d. on Monday. In these circumstances it is debatable whether rubber ought to shoulder the whole fiscal burden. Would a simpler and lower yielding export tax on rubber and the other main exports from Malaya have served Malaya's purpose equally well?

* * *

The Coal Board's Loss

The bare civility of the letters exchanged between Sir Eric Young and the Minister of Fuel and Power following the conversation which led to Sir Eric's resignation from the National Coal Board reveals at any rate nothing about coal. Both have since categorically denied that the resignation had anything to do with the coal crisis, and Mr. Noel-Baker has added that it did not arise from any dispute over the policy—or the constitution—of the board. Sir Eric Young, who was the last mining engineer on the board—and the last member with direct experience of the industry before the board was created—was one of the original two production members. Sir Charles Reid, his first colleague, resigned in May, 1948, on the ground that the board could not operate successfully through the organisation it had set up, and not long afterwards produced detailed suggestions for limiting the number of areas, abolishing divisional headquarters, and delegating powers from the central board. At the time of Sir Charles Reid's resignation Mr. Young, as he then was, denied rumours that he was not "in harmony" with the board, though he confirmed his agreement with Sir Charles on many points. The unexplained departure of the board's most prominent mining expert, at the end of a year in which the NCB has shown itself either unable to recognise clear danger signals or unable to devise means to combat the dangers, and shortly after the publication of its elaborate 15-year production plan, is disquieting.

Nor was the week's statistical report of the industry's performance much more encouraging. It is something gained that the National Union of Mineworkers should call for Saturday working at more pits, and that perhaps 270,000 tons should be raised last Saturday against about 100,000 tons a week earlier. Mr. Churchill, and other people who share his regard for men in a bitter and dangerous calling, may gracefully express the nation's thanks to the miners who work on Saturdays; but that does not alter the fact that the week's total production, though increased to 4,510,000 tons, was lower than that of the corresponding week in 1949 and could largely have been expected from the extra effort normally put in at this time of year by miners who want a little extra money for Christmas. The test of the NUM's appeal will come in the weeks after Christmas. The risks of serious industrial dislocation will be high unless output shows a rapid and permanent gain.

New Light on New Issues

Before 1914 the main business of the London new issue market was foreign investment; long-term issues on foreign account were over £200 million a year at their peak, while home issues were usually only about £30 million a year. All too often, moreover, the main purpose of domestic issues was to make a quick profit for the promoters. It was not until the inter-war period that new types of issuing house sprang up for the home market—houses that are more interested in enhancing their good name with each issue they handled than in making a quick profit. The emergence of these houses, together with improvements in the law and in Stock Exchange regulations between 1914 and 1945, gave London the sort of mechanism for long-term capital provision that it had long required. "The emporium had been rebuilt and re-equipped regardless of expense; . . . the shop assistants, scientifically trained and hygienically clothed, stood awaiting business. But where were the customers?"

This question, garbed in this metaphor, was the main theme of Professor Frank Paish's inaugural lecture on taking up the Chair of Business Finance at the University of London this week. The full text of his address will deserve close study in the City when it is reproduced, in due course, in *Economica*. Professor Paish pointed out that the Midland Bank's figures of non-Government new issues averaged £145 million a year in 1948 and 1949; the corresponding figure in the five years ending 1937 was £163 million, in the five years ending 1930 it was £284 million and in the pre-1914 era it was probably over £200 million. Expressed as proportions of national income, the fall in new issues is even more striking—from nearly 10 per cent before 1914 to 7 per cent in the 1920s, to 4 per cent in the 1930s and to less than 1½ per cent in 1948-49. Professor Paish cited figures to show that this fall was not due to any fall in the proportion of the national income being saved and invested. It was due, he believed, to the change in the origins of savings; personal saving probably accounted for more than two-thirds of all saving in 1914 but, on the basis of the latest official figures, far less than one-sixth of it in 1949. Professor Paish believed that, by dint largely of sales of existing securities to institutions and to the National Debt Commissioners, private investors still managed, in 1949, to put up funds for half the new issues coming on to the market; the increase to over 75 per cent in the proportion of new issues (other than issues to shareholders) that were made by way of placings, however, was a clear sign of the increased importance of insurance companies and other institutions in the new issue market. The increased importance of institutions as investors provided strong support for their fellow—and weaker—shareholders in any struggle with boards of directors; Professor Paish was not therefore inclined to regard their growth in relative importance as undesirable. He did, however, regret the fall in new issue business as a whole, and saw the only glint of hope "in the very long-term" when "Government expenditure might some day

begin to rise more slowly than national income," thus generating a fall in the relative level of taxes and an increase in net personal savings available for investment.

* * *

Wool Still Rising

The wool market has more than recovered from its temporary setback in October and prices last month reached new record levels for all categories. Merino (64's) averaged 216d. a lb. against 206d. after its initial jump in September and 106d. in November, 1949. The rise in prices for fine and medium crossbreds has been even sharper. In an attempt to reduce their raw material costs manufacturers are now switching to lower counts, and the price spread between grades has narrowed appreciably. Demand during the past week in the dominion markets and in London has remained very firm, though buyers are naturally apprehensive about the present height of prices.

Current trends in wool consumption in the main consuming countries offer little hope that prices might ease in the near future. Activity in the American and British wool textile industries is being maintained at a very high level—higher even than in the first half of this year—and the concentration is on worsteds rather than woollens. Output in Western

Source: U.K.—Dominion Wool Disposals Ltd.

Germany is still expanding and its yarn production is now well above the total output in 1936 for the whole of Germany. In France, Belgium and the Netherlands production is also rising, but the increase in the second half of this year has been much less marked.

Two months ago the wool study group thought that the use of alternative materials by the wool textile industry might ease or at least prevent any further increase in the demand for the reduced supplies of raw wool. Like many other forecasts in wool, this one is proving to be wrong. Reduced exports of American cotton implies that rayon and synthetic fibres are likely to be used to an even greater extent by the cotton industry. Yet the world output of rayon is itself restricted by the shortage of cotton linters and woodpulp. The British wool textile industry is using more rayon than it did a year ago, but the total quantity is still only a fraction of its annual consumption of raw wool. Even the supply of shoddy and mungo is likely to be restricted, as the fear of a clothing shortage is making the public less willing to discard its old clothing. As prices of new clothes rise under the impact of dearer raw materials, this tendency is likely to be increased. Moreover, the wool market has still to feel the full weight of American, British and European demand for military uniforms.

More About the Tea Market

Slowly a detailed scheme for the reopening of the London market next April is emerging from the joint discussions between the tea trade and the Ministry of Food. Speed is not vital at this stage and it is well that full consideration is being given to all the problems likely to arise when the London tea auctions are resumed so that they will be able to operate

smoothly. Tea brokers are grateful for this new freedom, even though it is prescribed by government regulation, for they are convinced that, if after a trial period they can prove that private trade can handle tea imports better than the system of centralised purchase, full freedom will be restored to them.

The arrangements so far made allow for two types of imports for home consumption. The first is tea sold in the auctions on estate account; the flat-rate subsidy of a shilling a pound on these teas will be paid by the Ministry of Food to the brokers when the tea is sold. The second category of imports is private purchases by the big concerns direct from estates or from the Calcutta and Colombo markets. The subsidy in this instance will be paid as the teas are taken out of bond for consumption in this country.

Buyers will still be allotted a maximum buying quota dependent on their ration registrations. Part of this quota will be met by allocations from the Ministry's stock and the remainder will form their maximum purchase at the auctions during the period. Those firms buying direct from producers must state how much of their imports is to be debited against their allocation for each four-weekly period before arriving at their maximum purchases at the London auctions. Buyers therefore will have to work to a maximum purchase and to maximum prices determined by controlled retail prices for tea and the fixed subsidy. Brokers must act solely as agents and are not permitted to "buy over," i.e., carry stocks.

The value of this experiment of private trading in a rationed and subsidised food is that it enables all the technical experts in the tea trade—the samplers, tasters and valuers—to practise their skill once more, and it will also give considerable scope for tea to be bought according to quality. The trade are confident that with Mincing Lane in operation again Britain will not only obtain larger supplies at reasonable prices but that it will also enjoy a great improvement in the quality of tea marketed. There is, moreover, a possibility that rationing may be discarded within the next two years. Tea production in Indonesia is at long last beginning to recover fairly rapidly, while improved methods of cultivation in India and Ceylon are yielding larger crops from the same acreage. If political conditions permit this increase in production to continue, supplies may be adequate in 1952.

Austin and Defence

The first motor firm—and indeed the first firm in any industry outside the munitions field proper—to report the use of additional manufacturing capacity for defence contracts is Austin Motors, which has leased the aircraft factory beside its own Longbridge works which it managed for the Ministry of Aircraft Production during the war. Here it will begin manufacturing not only the new four-wheel drive vehicles (roughly corresponding to the jeep) for which an Army contract has already been announced, but some of the four-cylinder engines for these vehicles and "a large number" of eight-cylinder engines (presumably for use in 10-ton vehicles and possibly, in pairs, in tanks). These engines are from the Rolls-Royce "B" range designed for the Fighting Vehicles Division of the Ministry of Supply.

Mr Leonard Lord, who announced this expansion of output for defence at the company's annual meeting this week, believed that it should not interfere with normal production, "always providing that the materials are made available." It will be superimposed upon a record production of civilian cars and commercial vehicles, amounting to 157,628 in the year to July; in the three months that have elapsed production has run at the rate of more than 165,000 vehicles a year, plus 300 tons of spares a week; even this high rate is still limited by sheet steel supplies. The firm sold 80,000 of its light A.40 saloons abroad during the year, and 15,000 of its new two- and five-ton trucks, for which it has now orders

THE
'BANK-INSURANCE'
GROUP OF TRUSTS

British banks and insurance companies conform to the Three Golden Rules for investors: ONE—They provide essential services to trade and industry. TWO—They are managed with skill and prudence. THREE—They allocate a large part of profits to reserves.

A most convenient and economical method of obtaining a freely marketable investment in these high-grade equities is by a purchase of Units in the 'Bank-Insurance' Group of Trusts. Apply through any Stockbroker or Bank for leaflets, prices and dividend rates.

Bank-Units: *33% of the Trust Fund is spread over the $ shares of the big 5 Canadian Banks; 23% is in other Dominion & Colonial Banks and 39% in Home Banks and Discount Companies.*
Offer Price, 5th Dec. 23/6½. Yield £3/9/4%†*

Insurance-Units: *A spread over the shares of 30 British Insurance Companies; a considerable part of their premium income is earned in $ and the sterling value of their very large $ investments has greatly increased as a result of the revaluation of the £.*
Offer Price, 5th Dec. 22/4½ Yield £3/8/5%†

Bank-Insurance Units: *36% of the Fund is spread over British Insurance Companies; 16½% over $ shares of Canadian Banks; 14½% in other Dominion, Colonial and Overseas Banks and 28% in Home Banks and Discount Companies.*
Offer Price, 5th Dec. 21/11½. Yield £3/10/2%†*

** Subject to reduced rate of tax, allowing for D.I.T. relief.*
† The yield is calculated in accordance with Board of Trade requirements.

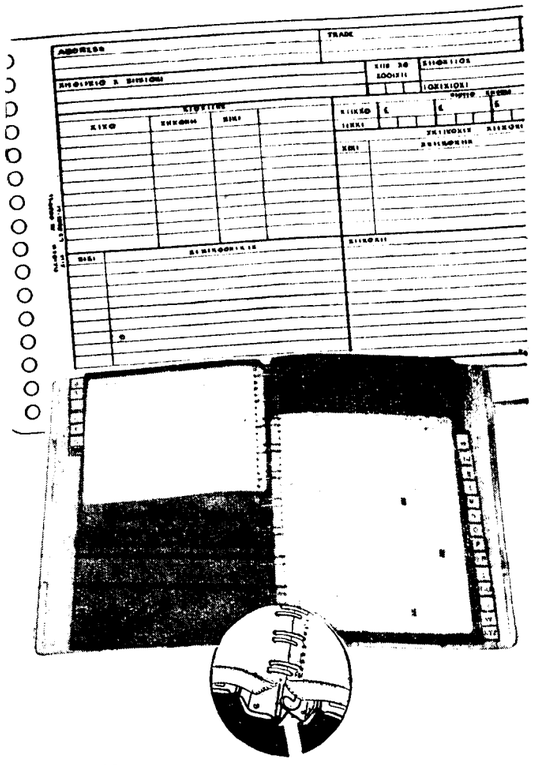
SULPHUR



"BRING me fire, that I may purify the house with sulphur" wrote Homer in the Odyssey. This yellow rock, which burns to form choking fumes, has been known since the earliest days of civilisation. Pliny describes the surface desposits of sulphur in Sicily and explains how it was used in medicine and for bleaching cloth. The Sicilian deposits were for centuries the main source of sulphur, but today the vast underground beds in the United States provide most of the world's needs. Industry uses sulphur for bleaching and agriculture for spraying fruit trees. Medicine has always used sulphur, which is one of the elements in Epsom salts and the healing waters of Spas. It is also a constituent of drugs like the sulphonamides. But the greatest use of sulphur is in sulphuric acid, a chemical so vital to modern industry that its consumption is a guide to a nation's industrial activity.

I.C.I. makes hundreds of thousands of tons of sulphuric acid every year. It is essential in the manufacture of fertilizers, textiles, dyestuffs, drugs and plastics. Without sulphuric acid industry could not carry on.

NEW VISIBLE Sales and Purchase LEDGER SYSTEM

500 to 15,000 RECORDS HANDLED BY ONE CLERK

Nowadays, *visible* records tend to replace other forms of records—including bound books, "blind" cards, etc. High labour costs make this change desirable. Here is a new system, Shannoleaf, which is replacing old methods. Each record has an overlapping visible edge—for quick sighting, posting and reference. Each record has a perfectly flat writing surface and is firmly held in position. Removal and replacement is done by a simple flick of the trigger—no keys, no cumbersome mechanisms. The stream-lined binder is only 2¼" thick—the slimmest system ever made. The records themselves—whether standard (lower in cost, quicker in delivery) or specially printed—cover every conceivable need. Just write "Shannoleaf" on your letterheading for full details by return.

covering the current year's whole output. Such prosperity should be spread, Mr Lord declared, in higher wages and in the increased dividend; he noted that the Exchequer was getting its share from the $33,936,000 that the company earned by North American exports as well as from taxation. The shareholders, not unmindful of another spreading of prosperity in which the Exchequer managed to share this year, commiserated with Mr Lord in the retrospective removal of most of the tax-free gift they gave him last year, and passed a resolution asking the board to see what could be done to recompense him.

Electronic Computors for Defence

The significant difference between the electronic computor built by the National Physical Laboratory and similar machines here and in America lies in its size. Although it is made up of 800 valves, compared with the 20,000 used in the best known of the American machines, it is believed to be among the fastest now working. It was to have been a pilot model for a full-scale computor and its size was kept to the minimum compatible with its doing useful work. But now that its designers see a way to expand its calculating capacity without increasing its size, the larger model has become unnecessary.

Electronic computors were developed to handle mathematical problems which can take weeks or months to work out on ordinary calculators; some of those sums have never been attempted simply because of their length. The machines' greatest value is in handling a long sequence of inter-related calculations; by using electrons which move at speeds measured in millionths of a second, these problems can be resolved in minutes, provided they are fed into the machine in a suitable form. The technique of planning a programme for the machine, according to the calculation it has to solve, is perhaps the most difficult aspect of its use.

The NPL computor is of importance to industry for it is the first in Britain available for general service. The more accurately industry requires to know the behaviour of physical and chemical structures, the more valuable the computor can be in reducing the time and cost of establishing this knowledge. But the salient feature of the NPL machine—its combination of high speed and small size—is not fundamental in what might be called its routine mathematical work, except that fewer valves should mean fewer potential break-downs. If the machine were to be applied, say, to solving problems involved in an anti-aircraft defence network, such characteristics would be most important. For instance, if the computor were used in conjunction with long-range radar, it might work fast enough to provide anti-aircraft guns with data of a degree of accuracy hitherto unknown on the course and speed of incoming enemy aircraft and possibly of guided missiles. Such calculations would take several days to work out by ordinary mechanical methods. Much practical experience with the machine would be needed before such applications in defence could be perfected, but reports from the United States suggest that a computor has been designed to help to direct guided missiles on to an incoming target. The day may soon arrive when every gunnery officer must be a Senior Wrangler.

Television's Half-Million

The 500,000th television licence was issued late in October, and its sale marks the end of the industry's most difficult development period. Total sales for 1950 are expected to reach 400,000 receivers and next year, with the Holm Moss transmitter opening in June and the Scottish transmitter by the end of the year, sales may reach 700,000. Output in the industry is at the moment at the rate of 50,000 receivers a month a rate appreciably higher than earlier in the year.

There have been considerable changes in this pattern of rising demand. As the quality of the receivers has improved and the margin of quality between the products of different manufacturers has become less marked, demand has swung from high-priced large sets to small table models some £40 and £50 cheaper. Shortage of money may have something to do with this, but a stronger reason is that the table receivers now give almost as good a picture, even on the fringes of the reception areas, as do the more expensive models.

By far the largest number of sales continue to be made in the London region covered by the Alexandra Palace transmitter; its range, thanks to improvements in both transmitters and receivers, extends to the South Coast and as far as the Isle of Wight. The opening of a market for television sets in a new area requires a good deal of patience, and some manufacturers who had overlooked the need to break down this initial resistance have been disappointed this year at the slowness of receiver sales in the Birmingham region.

The estimate of next year's potential sales may or may not be accurate; the industry's chief concern is whether the re-armament programme will prevent it from producing enough receivers. No official indication has yet been given of the demands which will be made upon the industry but certain facts are clear. Radar equipment is urgently needed, and aircraft manufacturers complain of difficulty in obtaining radio and electronic equipment for their expanded production programme. Moreover, production of guided missiles will make heavy demands on manufacturers of radio components, if not on radio assembly firms themselves. The industry is at least not blind to the possibility that production of radio and television receivers might have to be restricted.

Natural History of Steel

Long-term estimates of future steel demand, as Sir Andrew McCance remarked recently, tend most commonly to be made by self-appointed experts outside the industry on the apparent basis that the less they know about steel, the higher they set their sights. Sir Andrew is deputy chairman and managing director of Colvilles' and is an acknowledged expert within the industry—yet his own analysis and projection of the course of steel production, delivered in the third Harold Wright Lecture at Middlesbrough,* were based upon a highly original method that can hardly have been less foreign, though it was infinitely less repugnant, to most of his colleagues in the massively practical business of steel-making.

His method, too intricate to be more than sketched here, involves an almost biological approach to the growth and form of a steel industry as a "natural" phenomenon. In his study of the development and structure of steel industries in Britain and the United States, Sir Andrew has been able to trace certain statistical regularities which hold good for each. The output of the largest unit in each industry, for example, bears a similar (as Sir Andrew would argue, a natural) relation to the total output of the industry; and the numbers of works of given sizes, expressed as percentages of all the works in the country, seem to follow a simple exponential distribution. In steel production, the distribution of furnace sizes, expressed as a fraction of the total number of furnaces, corresponds for both countries: "our furnaces and theirs are adapted subconsciously to the magnitude of the industries which they serve." Sir Andrew put forward a semi-empirical formula that might be expected to match the course of development in steel production since steel-making began; this formula does, in fact, follow the statistical records for both countries with a surprising degree of concordance.

* "Production in the Steel Industry: Its Growth, Distribution and Future Course." (The Cleveland Institute, Middlesbrough.)

When he came to carry these calculations forward, Sir Andrew McCance concluded that there is no evidence that the steel output of Britain and America, in the near future, will rise to a maximum and then decline; given the present trend, he estimated, British steel production should be 17½ million tons a year by 1960, 20.7 million tons by 1970, and 24.6 million tons by 1980. His demonstration that the ratio of British open hearth steel output to American is proportional to the square of their respective number of furnaces has a certain practical significance for productivity comparisons. Since larger units of plant give a greater output per man employed, it suggests that the productivity per man in any country increases automatically with the size of the industry in that country. "Thus we in Britain can only expect our average productivity to equal that of the United States when our steel industry more nearly approaches the American industry in size," concluded Sir Andrew. "The chances of our ever doing so, therefore, seem small." Applied to industry in general, this heretical suggestion (to be kept at all costs from the Society for the Prevention of Cruelty to Productivity Teams) opens appallingly simple possibilities. Can it be that certain things about British industries are rather smaller because they are not so big?

Shorter Notes

The most important result of the segregation scheme announced this week by Brown Bayley's Steel Works, Ltd., after agreement with the Ministry of Supply, is that control of the Hoffman Manufacturing Company, the ball-bearing makers, will now remain in private hands. Brown Bayley's, which owns 52 per cent of Hoffman's ordinary capital, is to retain this holding, its 88.5 per cent interest in the Farnley Iron Company, its South African subsidiary, certain quoted investments with a market value of £6,770, and an amount to enable it to pay dividends up to February 15th, the vesting date for steel nationalisation. All other assets will be sold to a new company, Brown Bayley Steels, Ltd., which will be taken over in return for compensation of £1,128,750 in British Iron and Steel stock.

★

Sales by the wholesale textile trade to retailers in October were the highest ever recorded. The monthly index prepared by the Wholesale Textile Association in collaboration with the Bank of England rose by 30 points to 186 (1947 = 100). The wholesale trade has resumed its prewar function of acting as a cushion between retailers and manufacturers. The heavy retail sales of clothing in September no doubt forced shops to restock in the following month; the large wholesale sales in October might have even covered some voluntary stock building by the larger retailers. But the public's scramble for clothing has tended to die down, and more recent reports suggest increased consumer resistance.

★

A policy decision of some significance is revealed in the report of the Woolwich Equitable Building Society for the year ended September 30th. During the greater part of the year the board decided "as a measure of prudence in times of difficulty and uncertainty" to restrict new mortgage advances. The accounts show that these have fallen from £13.9 million to £11.9 million. Since the Society also obtained a further net increase of funds, particularly in respect of new shares, the year's changes have brought about an appreciable strengthening of the Society's liquid resources. Investments increased from £8.1 million to £10.5 million and the balance sheet shows that investments, cash and other quick assets now comprise 18.3 per cent of total assets compared with 16 per cent at the end of September, 1949.

British-made..for British trade!

Burroughs new plant (foreground building) at Strathleven, Scotland, was formally opened on October 3rd of this year. Its 150,000 square feet of production space, coupled with Burroughs output from Nottingham, England, assures increased production of Burroughs business machines.

New factory for Britain's 52-year-old producer of figuring, accounting and statistical machines

BURROUGHS business has been expanding in Britain since 1898. With its factories in Nottingham and Strathleven, with its widespread service organization, it is creating employment for more and more men and women throughout the British Commonwealth.

The new Strathleven plant is welcome news to business and government. More Burroughs machines for British business, more for export, too.

There is a Burroughs office near you. Why not phone today?

Wherever there's business there's

Burroughs

BURROUGHS ADDING MACHINE LIMITED,
Avon House, 356-366 Oxford St., London, W.1
Factories: Nottingham (Est. 1898); Strathleven, Scotland

ADDING · CALCULATING · ACCOUNTING STATISTICAL MACHINES

An Annuity

will offset reductions in income

For a man aged 65 (or a woman aged 70) the gross income for life from an annuity is over 10% of the purchase money.

(For residents in some countries payments are exempt from U.K. tax.)

INTERNATIONAL BANKING SURVEY

This survey, and the accompanying special 16-page selection of International Banking Statistics that appears in this week's issue of the RECORDS AND STATISTICS *supplement, is complementary to the similar survey and statistical analysis of banking in the British Commonwealth published on June 17th and 24th last. These half-yearly features together comprise the new form of* THE ECONOMIST BANKING SUPPLEMENT *which has been published for many years.*

Is the Dollar Shortage Over?

IT is clear that the dollar shortage is no longer the most pressing financial problem confronting the world today. It is not so clear, however, whether this is more than an evanescent phenomenon in the history of the 1950s. With American resources stretched to meet a boom that is already an inflation, with American gift dollars still flowing out to the world at a rate of several billions a year, and with the ramparts of import control set up in the period of dollar shortage still enthusiastically manned by cautious Governments the world over, it is not surprising that America's gold reserves should be running down and that the world's dollar balances should currently be mounting. Will this state of affairs continue once the artificial elements in the present situation have disappeared?

It is, as a rule, unwise to distinguish too finely between the artificial and the normal; if the history of the last generation has taught any lesson, it is that "normalcy" rarely comes. But the dollar shortage seemed such a persisting phenomenon during the years of its greatest gravity that it does perhaps provide one of the few exceptions where the analyst may flout the rule. It is worthwhile, therefore, to examine the stages of the world's three-and-a-half-year-long advance towards dollar equilibrium and to examine how many of the marches in that advance were due to the slow functioning of economic laws (on which Lord Keynes set so much store in his last article) and how many were due to such extraneous and exceptional factors as the attack upon Korea.

The move towards balance in the United States' external payments took part in three distinct stages. The first stage was the period of slow, though irregular, progress from early 1947 to early 1949. The second stage was the spurt towards balance between the devaluations of September, 1949, and the outbreak of hostilities in Korea. The third stage, on which statistical documentation is still inadequate, dates from President Truman's "rearmament message" to Congress last July. Seen in this perspective, the story is one of ever-accelerating world recovery—though admittedly of recovery from an initial position of abysmal crisis. In the second quarter of 1947 the United States' current external surplus amounted to $3,165 million—or, in other words, was running at the fantastic rate of over $12.6 billions a year. This $3,165 million surplus was partly bridged by $1,405 million of Government long-term lending abroad (chiefly, of course, the loan to Britain) and by $617 million of "unilateral transfers" (which is American balance-of-payments terminology for dollar gifts) to UNRRA, etc., and later, under ERP. Despite this, the world's gold and dollar holdings ran down by $1,176 million in that quarter—a rate of depletion which, if continued, would therefore have meant that there would not have been a single dollar or ounce of gold left outside the United States by the end of 1952.

The recovery from this crisis can be seen in Table I. This table lists the factors leading to the move towards equilibrium in America's balance of payments as shown in the second quarter's figures of each year from 1947 to 1950. The second quarter of each year has been chosen for comparison because presentation of the table in this fashion seems to provide the best thumbnail sketch of the trends. The second quarter of 1947 was the period in which America's current account surplus reached its height, the second quarter of 1948 was the period in which European recovery first became apparent, the second quarter of 1949 was the period in which the American recession began to show itself (but was also a period not so distorted by speculative capital movements as the third quarter of the year), and the second quarter of 1950 was the period of what seemed to be approaching "normalcy" but was actually that of approaching storm. The second quarter of 1950 also happens to be the latest quarter for which full American balance of payments figures were available at the time that this issue of *The Economist* went to press.

TABLE I—BRIDGING OF DOLLAR GAP

Changes in US Balance of Payments Figures between April-June Quarters of each pair of years
($ Million)

	1947-48	1948-49	1949-50
Decrease in exports	883	— 65	873
Increase in imports	330	— 132	232
Decrease in invisibles	118	7	180
Decrease in surplus on current account	1331	— 190	1285
Increase in US gifts abroad	460	606	— 457
Increase in Govt. long term investment	—1278	— 21	— 85
Increase in private long term investment	109	15	— 163
Other capital transactions	— 375	— 118	159
Other influences (unidentified)	322	— 80	293
Diminution in drain on world gold and dollar reserves	569	210	1034

The convention used in Table I is that each influence that tended to bring America's external tables into balance is treated as a positive item and each influence that tended to make the dollar shortage worse is treated as a negative item. It will be seen that between the

Spotlight on Australia

In the business world today attention has been focussed on the remarkable industrial development in Australia. The Union Bank of Australia has therefore published two Booklets: "*Industrial Australia*" containing authoritative information on industrial resources, markets, labour and finance, "*Company Formation in Australia*" providing a general guide to Company Law with notes on current taxation and the establishment of a business in the Commonwealth. Anyone contemplating business in Australia, will find in these Booklets the preliminary information they require. Copies of these Booklets will be sent on request.

second quarter of 1947 and the second quarter of 1948 America's current account surplus declined by no less than $1,331 million. The main influence behind this decline was the $883 million drop in United States exports as restrictions against dollar goods all over the world came clamping down; there was also, however, a sizeable increase in American imports and a decrease in America's invisible surplus. This very large fall in America's current account did not prevent the gold and dollar holdings of the outside world from falling by $607 million (a figure that was $569 million less than the $1,176 million drop in the second quarter of 1947). This large fall in world gold and dollar holdings was partly due to a decrease in long-term United States Government investment overseas and a running-down of the short-term balances that America held abroad (this latter item accounts for the main part of the $375 million deterioration in "Other Capital Transactions" in 1947/48). The gap caused by this deterioration in the world's balance with the dollar area on capital account was not completely bridged by the first flow of ERP funds, by the increase in private United States investment overseas (mostly in Latin America), and the decrease in speculative and largely illegal movements of gold and dollars out of soft currency countries (which probably accounts for the major part of the improvement shown under the heading "Other Influences—Unidentified").

Between the second quarter of 1948 and the second quarter of 1949 there was a small aggravation of the world dollar shortage as a result of a widening of America's surplus on current account. Too much should not be made of this factor. The $65 million increase in United States exports shown in the table was more than accounted for by the increase in exports to Canada; the $132 million decrease in the United States imports was largely due to decreased imports from Latin America and ERP countries—though not, oddly enough, from ERP dependencies (which includes the outer sterling area). Moreover, this deterioration in the flow of dollars to the outside world on current account was far more than offset by the increased flow of capital account and particularly in United States Government unilateral transfers; it should be noted, however, that short-term balances held by Americans abroad were running down at a faster rate than in the second quarter of 1948 and that speculative movements of capital through the web of exchange control were increasing—as a result no doubt of the first flutter of pre-devaluation fears.

TABLE II—US BALANCE OF PAYMENTS

* Receipts by area concerned shown as (—).

The story can now turn to the remarkable recovery between the second quarter of 1949 and the second quarter of 1950—the period that bridges the worldwide exchange rate realignment of September, 1949. The $1,285 million decline in America's surplus on current account in this period, to a quarterly surplus of only $739 million, is shown in some detail in Table II. It may be convenient, however, to summarise the position by reference to Table I first. It will be seen from this that by far the greater part of the improvement was due to a decline of $873 million in United States exports—that is to say a decline of 25 per cent. Between these two periods United States exports to ERP countries declined by 33 per cent., those to ERP dependencies by 50 per cent, those to Latin America by 27 per cent. It is very doubtful indeed whether American exporters would have been willing to accept this decline in their overseas sales if it had not been all too easy to sell the goods concerned in the booming home market. It should also be noticed that there were some signs at the end of this period that American exports were moving up again; American exports in the second quarter of 1950 were some $34 million more than in the first quarter. Some of the rigid creeds of self-denial that sterling area and other governments had imposed upon themselves at the time of devaluation were proving just a little difficult to bear. There was, however, no sign in June of any slackening of the rather slower rise in United States imports, nor yet of a decline in the volume of dollars flowing out of America in payment for invisible transactions; by this time, in fact, America's current invisible surplus had dwindled to a bare $600 million a year—and was still going down.

The main improvement in the capital account between the second quarter of 1949 and the second quarter of 1950 was the great increase in confidence in sterling and other soft currencies. This undoubtedly led to the increased accumulation of American short-term balances abroad and the reversal of the flow of speculative capital to America. This "confidence movement" offset three-quarters of the $457 million decrease in unilateral transfers from the United States between the second quarter of 1949 and the second quarter of 1950.

To sum up the position on the eve of Korea therefore: The world was at this period receiving unilateral transfers from the United States Government at the rate of almost exactly $5,000 million a year and was adding to its gold and dollar holdings at a rate of just under $2,550 million a year. The difference between these two figures was chiefly explained by the fact that the United States' surplus on current account was still running at a rate of just over $2,950 million a year; this latter figure, though large, was some $9,600 million less than the rate at which the current account surplus was running at the peak period of 1947. This remarkable bridging of some three-quarters of the original (1947) dollar gap on current account was due to a decrease of over $6,700 million in the annual rate of United States exports, an increase of over $1,700 million in the annual rate of United States imports and a decrease of over $1,200 million in the annual rate of the

A COMPREHENSIVE BANKING SERVICE

In their capacity as private bankers, Glyn, Mills & Co. have always arranged that the service placed at the disposal of their customers should be truly comprehensive, covering all financial problems from those of the large public corporation to those of private individuals. They are equally well equipped to accept duties as Company Registrar, or to act as executor or trustee for large or small estates.

United States surplus on invisibles. If recession had come in the United States this autumn, the main problem for the older industrial countries of the world would have been to keep their exports competitive to third areas with United States exports—in other words their main problem would have been that of keeping the same degree of price flexibility within their economies as the United States was maintaining within its own. The actual and potential dollar problem was heightened by the fact that some other countries that were running a current account surplus (or would be running a current account surplus in an American recession) also required payment in dollars. It must also be recognised that the depletion of imports from the United States has been partly achieved by discriminatory restrictions rather than by improvement of competitive efficiency. But allowances of this sort must not be allowed to dim the fact that even before Korea the countries of the old world had proved themselves to be able to maintain a tolerable standard of life at a rate of imports from the dollar area that generated no more than a manageable dollar deficit on current account.

Since Korea the most striking development has been the rapid increase in the volume of United States imports. In August these amounted to $819 million—or some 23 per cent above the monthly average for the second quarter. United States exports in August were some 8 per cent below the second quarter's monthly average and, in consequence, the country ran a visible deficit (of some $58 million) for the first month in thirteen years.

It would be unwise to draw too many conclusions for the immediate future from these figures. Many questions about the future scale of stockpiling, of mutual defence aid and of the effect of rearmament programmes on the old world's own export effort have still to be answered. But it would be equally unwise to allow the exceptional nature of the present dollar glut to serve as an excuse for closing one's eyes to the remarkable progress that had been achieved before these exceptional circumstances arose. If "normalcy" ever returns, and if any scheme for irrigating the backward areas of the world with dollars comes with it, the dollar gap may conceivably prove to be manageable without any such comprehensive and drastic a system of exchange control as that with which international banking is currently cluttered. Until normalcy does return, the world dollar shortage should be less, not more, serious than the shortage that obtained on the eve of Korea. The conclusions that central banking authorities the world over should draw from this picture are as obvious as they are ignored.

EPU Teething Troubles

THE agreement for a European Payments Union, which was formally signed in September last, began to operate from July 1st and figures are now available covering its operations for the four months to the end of October, 1950. These figures show clearly that the EPU is being subjected to strains greater than those anticipated at its birth. It should be recalled at the outset that the philosophy that EPU was intended to foster was that of free transferability of currency and multilateral trade within a small, specified group. The EPU agreement therefore led, first, to a system of multilateral payments in which each member country would be concerned with its net surplus or deficit with the group as a whole and would no longer have to worry about its bilateral position with each other member, and, secondly, to trade liberalisation measures operated without any discrimination. The logical outcome of the system was that within the group of members there could no longer be differential softness or hardness of currencies.

In order to help the creation of this system a cushion of credit was provided; each member country was allotted a quota (based on its 1948 trade) within which it would extend credit and, conversely, obtain overdraft facilities. In addition, some countries likely to be in surplus with their colleagues were launched on their EPU career with initial debit positions; these were intended to cushion the impact of their surpluses on the resources of EPU. Others, for opposite reasons, were given the benefit of initial credit positions. Finally, provision was made in the agreement for gold payments after a certain proportion of a country's quota had either been drawn from or accumulated with EPU. These gold payments were to provide the element of incentive in the scheme; it was hoped that the prospect of these would induce countries to increase their exports to other members and encourage the chronic debtors to become solvent. It is important to note, however, that nobody expected gold payments or receipts to become widely operative at an early date. It was recognised that Europe could not afford a system of unrestricted trading in which payments would be widely made in gold or dollars—simply because the gold and dollars were not there to lubricate it.

These intentions have been far from fulfilled in the experience of EPU to date. The experience of the various member countries after four months of operation of EPU can be summarised as follows:—

Austria.—A cumulative deficit of $10,700,000 has been run up. This has been set off against an initial credit balance of $80 million and, consequently, no use has yet been made of the quota.

Belgium/Luxemburg.—The cumulative accounting position at the end of four months was precisely zero, so that neither the initial debit balance nor the quota has yet been utilised.

Denmark.—A cumulative deficit of $28,600,000 has been incurred and settled by a credit from the Union of that amount. Denmark was not allotted any initial debit or credit balance.

France.—A cumulative surplus of $161,700,000 has been settled by the grant of a credit of $132,900,000 to the Union and a receipt of gold from the Union amounting to $28,800,000. France was not allotted any initial debit or credit balance. The French situation changed abruptly in October. The cumulative surplus at the end of September was $185,600,000 but a deficit of $23,900,000 was incurred in October.

Germany.—A cumulative deficit of $289,500,000 has been settled by the receipt of a credit of

$185,900,000 from EPU and a payment of gold of $103,600,000 to EPU. Germany received no initial credit or debit balance.

Greece.—A cumulative deficit of $53,300,000 has been settled by drafts on an initial credit balance that amounted to $115 million. No part of the quota has therefore yet been used.

Iceland.—A cumulative deficit of $1,600,000 has been settled by drawing from an initial credit balance of $4,000,000.

Italy.—A cumulative deficit of $17,100,000 has been settled by receipt of credit from the EPU. Italy was not allotted an initial credit or debit balance.

Netherlands.—A cumulative deficit of $72,700,000 has been settled by drawing the whole of the initial credit balance of $30 million and rest by a credit of $42,700,000 from EPU.

Norway.—A cumulative deficit of $25,300,000 has been settled by drawing on the initial credit balance of $60 million. The quota is not yet in use.

Portugal.—A cumulative surplus of $22,300,000 has been settled by granting a credit of $22,300,000 to the Union and the balance of $4,100,000 has been taken in gold from the Union. Portugal was not allotted an initial credit or debit balance.

Sweden.—A cumulative surplus of $13,800,000 has been totally settled from an initial credit balance. Consequently the quota is not yet in use.

Turkey.—A cumulative surplus of $10,600,000 has been settled by the grant of a credit of $10,300,000 to EPU and the receipt of $300,000 in gold from the Union. Turkey has confounded expectations and its current trading has moved in a direction contrary to that which had been anticipated. Turkey was given an initial credit balance of $25 million, but the anticipated deficit has not been incurred.

United Kingdom. — A cumulative surplus of $290,600,000 had been accumulated by the end of October. This was settled by use of the whole of the initial debit balance of $150 million and by a credit of $140,600,000 million granted to EPU.

It will be clear from this summary that three positions dominate the EPU picture. They are the surpluses accumulated by France and the United Kingdom, and the deficit incurred by Germany. The French surplus is less menacing than it appeared at the end of September. At that time France had a cumulative surplus of $185,600,000. The reduction in October indicates how far the surplus accumulated over the July-September quarter is due to purely seasonal influences, including tourist receipts at the height of the summer.

The British surplus is largely due to substantial and high-priced sterling area exports to Europe. The surplus was to some extent anticipated, as may be gauged from the fact that the United Kingdom was handicapped with an initial debit balance of $150 million. The speed with which that debit balance has been wiped out and the fact that within four months an approximately equal credit balance has been accumulated by the United Kingdom with EPU, suggest, however, that the estimates of sterling area earning power erred on the side of understatement. Official guesses in the dark by British representatives at the beginning of EPU suggested that the United Kingdom would neither lose nor gain appreciable quantities of gold through this mechanism. If recent trends are even approximately maintained, gold will soon be flowing in substantial quantities from EPU to the British reserves. One of the remedies for this situation would be to extend to the whole of the rest of the sterling area the trade liberalisation proposals that members of OEEC have extended to one another. It is probable that import policy in certain dominions and colonial territories is still weighted against former hard currency countries such as Belgium and Switzerland ; such considerations should no longer have any validity in sterling area dealings with EPU countries. The earlier that fact is recognised and the quicker the sterling countries concerned liberalise their import policies for European goods, the better it will be for all concerned.

The main structural difficulty with which EPU has so far had to contend, however, is that of Germany's cumulative deficit. It was soon realised that the free economic policy pursued by Germany—and the extremely liberal import policy that went with it—meant that the credit lines put at its disposal would be rapidly used up. Part of the trouble was that the quota allotted to Germany under EPU was wholly inadequate. It was based, as were those of all other member countries, on the total of their visible and invisible trade in 1948, a year when West German trade was still limping at a low level. This anomaly is being partly remedied by a grant to Germany of an exceptional credit of $120 million extended on condition that Germany accepts the main outlines of a report drawn up by two experts sent from the OEEC—Mr Jacobsson and Mr Cairncross. The main feature of their recommendations, which have been accepted by the Management Committee of EPU and by the Council of OEEC, is a suggestion that there must be some reimposition of controls, notably of import licences, and that these must be reinforced by stern fiscal and monetary measures if Germany is to be rescued from its present position as a structural debtor. The gist of the report was reassuring in that it pointed out that Germany had accumulated its deficit largely by paying cash for its imports while encouraging its export drive by the grant of generous credit facilities. This means that German traders in the last few months have been making immediate payment of foreign exchange debts and allowing the maximum prolongation of the date on which foreign exchange receipts are accepted and converted into domestic currency. It is not clear how far this has been due to official policy and how far to the ordinary symptoms of distrust of a weak currency. It may well be that a final correction of the German deficit position will not be possible until the mark has been at least moderately devalued.

The strains to which EPU has been subjected in its first four months of life inevitably raise the question whether this organism is able to encompass the considerable disequilibrium that still persists in intra-European balances of payments. EPU is a brave attempt to allow the principles of multilateral trade and free transferability of currencies to be reborn within Western Europe and related monetary areas. In view, however, of the volume of trade that has to be cleared through this new mechanism and of the abnormal influences to which that trade has recently been subjected (as a result, largely, of stockpiling and artificially high commodity prices) it may be that the credit margins

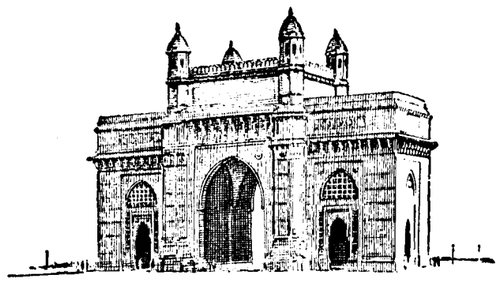
Time for Eastern trade



Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

Head Office : 38 Bishopsgate, London, E.C.3.
Manchester Branch : 52 Mosley Street, Manchester 2.
Liverpool Branch : 27 Derby House, Liverpool 2.
New York Agency : 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in

provided in the original schedule of "quotas" are inadequate. The compulsion to make gold payments is already a looming threat before the Netherlands and Denmark—as well as being a present source of strain on Germany. In the prevailing circumstances these threats and this strain may introduce an element of restriction into intra-European trade. It is still too early to pass a verdict on the operations of EPU, but the first four months of its life have revealed dangers and problems that it would be unwise to disregard.

Interest Rates in Europe

SINCE the end of the war the main internal financial problem in all West European countries (except Switzerland) has been the high level of intended investment and the low level of voluntary savings. Some countries, including the Scandinavian countries, Holland and Britain, have tackled this problem largely by restriction of investment and consumption through physical controls and by forcing new saving through budget surpluses. Others, including Germany, France, Italy and (perhaps less consistently) Belgium, have relied much more heavily on high interest rates. The difference between the cheap and the dear money schools has been not so much a difference of political philosophy as a difference of historical experience ; it may be noted that the keenest exponents of scarce money have been those countries where hyper-inflation in the recent past has undermined public confidence in the national currency so severely that any increase in the volume of money is apt to give rise to widespread and reminiscent alarm.

In these circumstances it is not surprising that since 1948 no country in Europe, and perhaps no country in the world, has been harnessed to interest rate discipline more deliberately than Germany. Between the end of the war and the currency reform in mid-1948, Germany had no monetary policy (and, for all practical purposes, no money). At the opening of the D-Mark era the central bank discount rate was pitched as high as five per cent. It was lowered to four and a half per cent in May, 1949, and to four per cent in July of that year. Two months ago, in an effort to stem the deficit on the balance of payments, it was raised to six per cent. The discount charges of the German commercial banks, though not uniform, are all based upon this cost of rediscounting at the central bank and are generally one and a half per cent above it. In Bavaria there is an additional discount commission of one per mille per month. In Rhineland-Westphalia, where the banks finance the Ruhr industries, the commission is from 1/24th to 1/8th per cent. In Hamburg, the centre of foreign trade financing, the banks charge one per cent above central bank rate plus a commission up to $\frac{1}{4}$ per cent per month. In other words, the average rate on a bill of exchange in Germany is now rather over seven and a half per cent ; charges for acceptance credits are slightly higher than this.

Advances are more costly still. Commercial bank loan rates are based on the central bank loan rate, which is one per cent above discount rate—that is seven per cent at the present time. The commercial banks charge from one half to one and a half per cent above the central bank loan rate plus a commission of $\frac{1}{8}$ per mille per day. This means that a bank loan costs the best part of ten per cent per annum. The cost of long term borrowing is correspondingly high. Even when short loan rates were two per cent lower than they are now few Government-guaranteed bond issues were made at less than six and a half per cent per annum for ten years—and these were usually aided by various tax concessions.

In general, the policy of dear money in Germany has proved remarkably effective. Bank rate was originally raised in the early months after the currency reform when prices were rising sharply and traders were known to be borrowing money to hoard goods. This rise in interest rates was coupled with quantitative restrictions on bank credit. Minimum reserves against deposits were raised and the banks were requested to deny credits for any "unessential" purposes. Immediately these steps were taken stocks were disgorged in exemplary text-book fashion, prices fell and unemployment rose. It became apparent indeed that deflation was going too far. Consequently, minimum reserves and interest rates were lowered and the volume of credit was allowed to expand steadily for two years. As the cost of borrowing fell, unemployment steadily declined. Towards the middle of this year, however, Germany began to exhaust its foreign exchange resources. In part the sudden drain was the direct result of import liberalisation and represented a once-and-for-all demand for goods that had previously been kept out by controls. Much of it, however, was of a speculative nature and was financed with borrowed money. In October, therefore, the Bank Deutscher Laender raised its discount rate to six per cent and required the banks to maintain higher minimum deposits. These measures have had a speedy effect. Traders who had previously hoarded foreign imports, in particular raw materials, against borrowed money, have started to disgorge their stocks, for they have been virtually prevented from obtaining additional finance for further imports. These drastic monetary moves have not, of course, yet restored the German balance of payments to its former state of subsidised equilibrium. But the drain on foreign exchange has been sharply reduced without restoration of the physical controls that had been dismantled shortly before.

In France the interest rate weapon has been employed with less severity, and also with rather less effect, than in Germany. But it has undoubtedly played an important part in ending inflation. After the liberation, France first continued its prewar and wartime cheap money policy. The rate for tap treasury bills remained at one and a half per cent until January, 1947, when it was raised, modestly, to 1.625 per cent ; in October of that year it was lifted again to two per cent. The discount rate for treasury and commercial bills was 1.625 per cent at the beginning of 1945 and remained unchanged until January, 1947, when it was raised to one and three quarters per cent for treasury bills and to two and a quarter per cent for commercial bills. In several stages these rates were raised to three and a half per cent and four per cent respectively by October, 1948. By similar stages a bank overdraft had come to cost eight per cent and more by the end of 1948.

This, however, proved to be the peak of the French Government's dear money campaign. Since then the rate on treasury bills and commercial bills has merged again and fallen ; it fell as low as two and a half per cent in June this year. The cost of a bank overdraft, though also lower, has not fallen *pari passu* ; it still stands at around seven per cent. The regime of dearer money was buttressed by quantitative restrictions on lending. Up to April of this year the banks had to obtain approval from the Banque de France for any credit in excess of Frs 50 million ; since then the ceiling has been raised to Frs 100 million. There is also a limit to the value of bills the central bank will rediscount for any one bank.

The high-level of short-term interest rates in France is reflected in the return on *rentes*. The one government bond issue that has been a success since the war was the irredeemable reconstruction loan issued in January, 1949, which carries five per cent interest ; this return will be raised if any other issue carrying a higher rate of interest is made by the French Government before 1960. The loan, however, was a success, not only by virtue of the return it offered but also because holders of 3 per cent and 3½ per cent *rentes* could tender these issues in payment of half their subscriptions to the new loan. The long-term rate of interest is currently quoted at somewhat over five per cent. In 1945 the annual average for the long-term interest rate was 2.99 per cent, in 1946 3.17 per cent, in 1947 3.91 per cent, in 1948 4.62 per cent and in 1949 4.78 per cent.

One of the most interesting results of high interest rates in France has been pressure on the London money market. French merchants are constantly attempting to finance themselves in London because of the lower rates ruling there. It has suited the authorities in France well to see merchants and manufacturers obtain accommodation in London at a time when France was short both of sterling and of internal loanable funds.

The discrepancy between interest rates in Italy and in Britain is also the main reason why Italian banks have striven to borrow in London and pass the credits obtained here to their customers in Italy—at the much higher Italian rates. But although France has obtained access to the London market, credit facilities have been consistently—and properly—refused to a country as flush of sterling as Italy. At present, the Bank of Italy's discount rate on treasury bills is four per cent ; it has been lowered to this level in three stages from five and a half per cent in 1947. A bank overdraft in Italy costs close on 10 per cent, the return on irredeemable government securities is over five per cent, and that on long-term government stocks six and a quarter per cent. There is at present a divergence in the movement of short- and long-term rates. Although the lowering of the central bank's discount rate has brought down the bank advances rate from the peak of twelve per cent in 1947 to something under ten per cent, the long-term bond rate has, if anything, risen over the same period. Very heavy reliance has been placed on the interest rate weapon in Italy ; the Government has run a constant budget deficit and there has been a virtually complete abolition of physical controls.

Belgium no longer falls into the camp of strictly dear money countries, although it is true that monetary discipline has always been preferred there to physical controls. Immediately after liberation, Belgium carried through a drastic currency reform that eliminated much of the wartime excess of funds. Since then a policy of balanced budgets has been vigorously adopted. Credit restrictions were also enforced with considerable severity from the end of 1946 until September of last year when the level of unemployment rose high enough to cause real concern. Bank rate in Belgium was raised from one and a half to two and a-half per cent in November, 1946, to three per cent in December and to three and a half per cent in August, 1947 ; it was lowered to three and a quarter per cent in October, 1949, but brought up to three and three-quarters per cent in September this year. Throughout these years bank accommodation has cost around five per cent, but the yield on government securities has been falling steadily. Four per cent "unified debt bonds" which yielded 4.7 per cent early in 1949 have since risen to give a return of 4.35 per cent.

The most interesting feature of European monetary policy in recent months, however, has been the way in which some former cheap money countries, especially those in Scandinavia, have made at least a modified return to monetary weapons. For a long time Sweden led the way as the most uncompromising cheap money country of all. Until the end of last month, bank rate was fixed at two per cent, and the commercial banks' advances rate was between two and a half and four and a half per cent ; call money rates declined from two to one and a half per cent in the early postwar years. In addition, until last August the Riksbank open market policy kept the yield on long-term Government bonds pegged at three per cent and steadily lowered the yield on short-term bonds from two and a half to two per cent. The main disinflationary weapon wielded by Sweden's Social-Democratic Government has always been that of budgetary policy (coupled, in 1946, with appreciation of the kroner). Towards the end of last summer, however, the Riksbank removed the peg from the securities market and, at the beginning of this month, bank rate, was raised to three per cent. At the moment of writing, the whole structure of interest rates is on the move to accord with these changes.

Whereas Sweden has been in a relatively strong external position throughout most of the postwar period, Norway has been more or less constantly in payments difficulties. Yet, until recently, it too pursued a policy of cheap money. The return on long-term Government bonds was maintained virtually stable at two and a half per cent, until a few months ago ; since Korea it has risen somewhat and is currently around 2.65 per cent. Bank rate was lowered to two and a half per cent in January, 1946, and bank advances have cost between four per cent and four and a half per cent throughout the postwar period. Latterly, however, a new system of control over the commercial banks has been introduced in Norway.

Denmark belonged to the cheap money camp in the early postwar years, though interest rates were higher than in the other Scandinavian countries. In the past few months there has been a distinct move towards a dearer money policy. Bank rate was raised from four to four and a half per cent in July and then from four and a half to five per cent last month. Discount charges of the commercial banks to their customers now range up to six and a half per cent, and the yield on long-term government securities has risen from three and a half per cent in early postwar years to rather more than four and a half per cent in the last few months. The recent return to monetary policy has been prompted by the grave

deficit in Denmark's balance of payments. After the recent changes in discount rate Denmark must be counted as a relatively "dear money" country.

Holland, too, has made some outward show of retreat from a cheap money policy. Bank rate was raised to three per cent in September after remaining at two and a half per cent since 1941. It seems, however, that a rise in bank rate in Holland has less effect on the structure of other interest rate than it would have in other countries. The long-term interest rate on Government bonds in Holland still stands at about three per cent. Holland's cheap money policy in immediate postwar years was accompanied by external payments difficulties and by an unbalanced budget. Until about 1949 the budget was gravely in deficit and the banks became more heavily loaded each year with Government securities. The policies pursued were out of keeping with views held by the Nederlandsche Bank, in many ways of all European central banks the most orthodox minded. The majority of Dutch commercial banks, too, are in disagreement with the ultra-cheap money policies pursued, although their portfolios are by now so loaded with Government securities that a rise in interest rates would cause substantial losses. But a large measure of financial stability has been regained in Holland, thanks to a balanced budget.

America's Uneasy Money

TO the juiceless annals of American financial journalism, this summer's struggle between the Federal Reserve Board and the United States Treasury introduced a meaty chapter of power politics on the loftiest level. Headlines bloomed in the midsummer columns of financial pages: "Battle of the Billions!"; "Federal Reserve Squeezes the Treasury." Behind the headlines was a real conflict: the Treasury, charged by the Constitution with the responsibility of managing the national debt, wanted to keep interest rates low so that it could refund the old debt and raise new money for defence at the lowest possible cost. The Federal Reserve Board, charged by Congress with the responsibility of managing the money supply, wanted to raise interest rates, so that banks would be less able to grant inflationary loans. More important, it wanted to be free of the necessity of supporting an artificial price level for government bonds, which monetised the debt and sapped the "Fed's" power to restrain credit by flexible controls—and threatened to force the Government towards reliance on physical controls.

Hostilities broke out on August 18, 1950, when Mr Snyder, Secretary of the Treasury, announced that he would refund $13.5 billion of government bonds and certificates, maturing September 15 and October 1, with a new issue of 13-month notes, bearing 1¼ per cent interest. This was a direct slap at Mr McCabe, the Chairman of the Board of Governors of the Federal Reserve, and at Mr Sproul, President of the Federal Reserve Bank of New York, who had made a personal appeal for higher interest rates. Almost simultaneously with the Treasury's announcement, the "Fed" took counter-action: it approved a rise from 1½ per cent to 1¾ per cent by the Federal Reserve Bank of New York in its rediscount rate, the fee it charges for discounting bank commercial paper. Of little practical effect in itself, the rise warned banks that tighter credit restrictions were coming.

But the Federal Reserve still had to deal with the Treasury's $13,5 billion worth of notes. It began buying up the September 15 and October 1 maturities from bondholders who were disappointed at the low rate on the refunding issue. At the same time, it sold from its own portfolio, big blocks of Treasury securities, of shorter term than the forthcoming issue, with yields greater than 1.30 per cent, compared to the 1.25 per cent which Mr Snyder was offering. Not many bondholders were drawn to Mr Snyder's poor bargain: when the results of the refunding were announced on September 30, it was found that some $2,376 million of the old issue had been turned in for cash, while most of the rest had been sold to the Federal Reserve. It had soon become plain that the issue could not be refunded at the low rates that the Treasury wanted; the Federal Reserve absorbed Mr Snyder's unwanted notes to prevent the collapse of the government's borrowing programme. Later, by selling masses of government securities at improved yields, the "Fed" managed to nudge interest rates in the right direction: six weeks after the feud with the Treasury broke into print, open market money rates and loan rates had all increased a few fractions of a point.

To win this small victory, the Federal Reserve had to turn the government securities market on end. In the first week, it bought and sold $2½ billion of securities;

by the end of October, its holdings of government notes had jumped to $14,239,218,000, more than double the amount on hand at the end of July. The wide variations in the "Fed's" holding of these notes is perhaps the most striking feature of the accompanying table. Perhaps impressed by the tumult he had aroused, Mr Snyder retreated a bit. Two weeks ago, he offered to refund more than $8 billion in securities by issuing 1¾ per cent five-year notes. This is ¼ per cent better than the last five-year notes, issued early this year.

In this way a point was scored by the forces of "harder money." But the skirmish shocked many American business men who had never plumbed the depths of the disagreement between the two agencies directly responsible for the nation's financial stability. Actually, the capacity for disagreement is guaranteed by law. The Federal Reserve system was created by Congress

in 1914 to provide a central banking service, after a 78-year hiatus during which the Treasury had struggled to control the currency and manage the debt through a makeshift network of private banks. The Board of seven governors is appointed by the President for 14-year periods, but is not required to do his bidding. The Board supervises a system of 12 regional Reserve banks, each owned by privately operated "member banks" which, last year comprised 49 per cent of the 14,000 banks in the United States, and held 85 per cent of all commercial deposits.

For 25 years, the Federal Reserve controlled the money market, and the Treasury carefully sought its advice before announcing interest rates on new government securities. But this relationship was reversed by the entrance of the United States into World War II. The national debt was already $47.9 billion, after the enthusiastic deficit-financing of two Roosevelt Administrations, and Mr. Morgenthau, the Secretary of the Treasury, quaked to think of the cost of servicing it after it had been swollen by a second world war. He therefore embarked on the lowest-cost government financing in American history, ranging from $\frac{3}{8}$ of 1 per cent on 90-day Treasury bills to $2\frac{1}{2}$ per cent on long-term bonds. The Federal Reserve agreed to manage the money market to suit the Treasury's plans, and it stood ready to buy at par all government securities that were offered to it, thus keeping prices steady and interest costs artificially low.

After the war, short-term rates were permitted to rise a bit, but the case for pegging the long-term market seemed as strong as ever—at least to the Treasury. The national debt had risen to $279 billion, much of it held by savings banks, commercial banks and insurance companies, and both the Treasury and the Federal Reserve feared that a crash in bond prices might bring these institutions tumbling down. In a single year, Federal Reserve holdings of government bonds rose from $970 million to $11,181 million, as the system held the price-line by buying bonds at par. When confidence returned to the postwar bond market, the Federal Reserve decided to retreat from the artificially low interest rate policy, and it thought that the Treasury should point the road back by offering slightly higher rates on its refunding issues. But the Treasury continued to charge full tilt to inflation under the banner of cheap money. Interest on the debt was costing the government $5 billion a year, and Mr Snyder, as Secretary of the Treasury in an Administration under constant fire to reduce expenses, continued to push out refunding issues at the same old low rates.

The Federal Reserve soon found that it was the main gear in a money-making machine. Before the war, the Board balanced the credit supply by selling securities to banks in an inflation, thus decreasing their reserves and money-lending power, or by buying in securities in a recession and thereby pumping new money into the banking system. But the guaranteeing of a stable market for low-interest government bonds in an inflationary situation meant that banks could get as much money as they wanted for commercial loans simply by selling off a portion of their government portfolio. The Federal Reserve was equally powerless to check inflationary lending by increasing the rediscount rate. Since the guaranteed market made their bonds as good as money, the banks had no need to rediscount their paper with the Federal Reserve. About the only

ROTTERDAMSCHE BANK

OVER 80 YEARS

For more than 80 years our institution has been handling international banking business of every description. Our fully experienced Foreign, Documents and Merchandise Departments will gladly give you any service and information you may require

ROTTERDAMSCHE BANK
Rotterdam - Amsterdam

Established in 250 places in the Netherlands

THE

ANGLO-PALESTINE BANK LTD.

6 Gracechurch Street, London, E.C.3

General Management - - Tel-Aviv

Established in 1902, the Bank has played an important part in the development of Israel and maintains the closest touch with leading commercial, industrial and agricultural circles. Shortly after the establishment of the State, the Bank was entrusted with the issue of the Israel Currency, and became sole banker to the Government. Its wide local experience, network of branches in Israel, office in London, and correspondents the world over, continue to be at the service of those wishing to transact business with Israel. The Bank's General Management will gladly give information to all inquirers.

one of the old orthodox weapons left unspiked was the Board's power to order member banks to increase the reserves that they are required to deposit with the regional Reserve banks. Any such increase cuts the supply of credit at a single blow; it is as effective as a meat-axe and just about as dangerous. Many responsible business men believe that a badly-timed increase of reserve requirements helped bring on the depression of 1937-1938, as well as to bring on the minor recession that precipitated the wave of worldwide currency devaluations in 1949.

The Board's skirmish with Mr Snyder received little support from the banking community, which tends to regard the Federal Reserve as just another control board. The American Bankers Association met in national convention in September, but piously declined to take sides in the controversy, an omission that *Fortune* magazine denounced as "downright poltroonery." However, many individual business men spoke up for the Federal Reserve, among them such manufacturers as Mr Lewis H. Brown, chairman of the board of Johns-Manville Corp., a building supply firm whose postwar prosperity benefited mightily by the Treasury's cheap money policy. "An increase of $\frac{1}{8}$ of 1 per cent in market rates of interest over the next year need not cost the Treasury more than $55 million on the securities it must refund," said Mr Brown, "while an increase of 1 per cent in the consumers' price index would cost the economy something like $4 billion."

As it spars with the Treasury over monetary policy, the Federal Reserve continues to fight inflation with selective controls. When Regulation W, revived in September, failed to bite immediately and deeply into the expansion of hire purchase credit, the "Fed" promptly added more teeth to it. An American must now pay $33\frac{1}{3}$ per cent down on an automobile, or 25 per cent on a refrigerator, and he must pay off the balance within 15 months. Similarly, to hold down the housing boom, the "Fed" has imposed Regulation X, requiring stiffer terms on purchases of new houses. The Board hopes that Regulation X will limit new housing starts in 1951 to about 800,000, compared to 1,300,000 this year. But the effect of these regulations has not yet been measured: the cost of living index in October rose to 174.8 per cent of the 1935-1939 average, thus breaking the postwar record set in 1948. The money supply has also broken all records, hitting $171.1 billion in September, largely in consequence of an increase in bank loans to business.

As inflation grows stronger, so do proposals for damping it down. Many have seized upon a proposal, made by a Senate subcommittee last year, that the Treasury be directed by law to follow the lead of the Federal Reserve in setting monetary policy. This assumes that an "outside" agency can be made strong enough to take the government by the scruff of the neck—President, Treasury, Congress and all—and heave it along the path of virtue. But as a practical matter, a central bank that consistently opposes the government on basic fiscal policy is in danger of being legislated out of existence. To win a hearing for its views, the Federal Reserve Board may have to join the President's official family, on a Cabinet status equal to that of the Treasury. This might allow the Federal Reserve to mould monetary policy through influence on the government's economic policies, but it would spell an end to its cherished independence as a semi-private institution.

COMPANY MEETINGS

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

SOMETHING AMISS WITH TAXATION SYSTEM

MR J. S. CROSSLEY'S VIEWS

The twenty-fifth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) will be held in London on December 28th.

The following is an extract from the statement by the chairman, Mr J. S. Crossley, circulated with the report and accounts for the year to September 30, 1950:—

When considering our figures for the year, a striking change to be found in the balance sheet is the increase in deposits amounting to £41,000,000. This has taken place mainly in South Africa, where last year a heavy reduction was shown. It was there that the effects of devaluation were perhaps most quickly felt, enabling us to restore much of our former high level of liquidity within the space of a few months. The principal earning assets do not show any remarkable changes, but, as might be expected, the increased activity has resulted in slightly larger net earnings. We are proposing a repetition of last year's dividend.

BUSINESS DRIVEN ABROAD

The review of our figures for the year seems to me incomplete without some reference to the question of taxation. Our profit, as you know, is struck after full provision for taxation has been made. During the five years that have elapsed since the war, we have been paying taxes (on the average) at an annual rate of more than double the annual rate of the five pre-war years. The main beneficiary has, of course, been the United Kingdom Treasury, but a large sum is also paid in taxes to dominion, colonial and other overseas Governments. This is not the place, I think, to discuss in detail the incidence of the present tax regulations which form an involved subject. You will, however, have seen that certain United Kingdom companies, whose business lies mainly overseas, have transferred their domicile in order to reduce their liability to tax. It may safely be assumed that such an important step was taken only after full consideration. The sums involved are substantial, and these companies also have to consider, among other things, their ability to compete with companies which do not suffer the disadvantage of having their control in the United Kingdom.

A SIGNIFICANT MOVEMENT

This movement is not yet large, but it is significant, and, if reports are correct, other important companies may shortly follow suit. One would think that this trend might well cause anxiety to the authorities, for it suggests that the tax regulations bearing on these matters are not soundly based or are inappropriate to present conditions. Regulations need occasional examination and overhaul, and it is perhaps rather much to expect that our over-worked Treasury officials should have had time for this in recent years. But the current trend raises an issue calling for dispassionate consideration from the highest authority.

It is evident that there must be something seriously amiss with a system which has the effect of driving much valuable business beyond the boundaries of the United Kingdom. The loss of revenue likely to arise by adopting a more flexible system is probably not very large and is certainly incomparably less than the loss which the Exchequer may ultimately suffer if we persist on our present course, which would surely jeopardise assets more precious than mere revenue, by weakening the strong ties of mutual interest which now exist. If we cannot devise some means by which we can share equitably in these enterprises with our friends overseas, both we and they will be deprived of great opportunities for working together, with results for the future which are incalculable.

So far as we are affected in this bank, a matter that has been causing us some anxiety has been the dwindling body of our overseas stockholders. Apart from Barclays Bank Limited, our stockholders now number more than 9,500 and at one time a useful number of them were resident overseas. We believe it is of great value to us to have a large and influential body of them resident throughout all the territories we serve, but the overseas stockholder in a British company is now subject to such heavy disadvantages that his days appear to be numbered.

AFTERMATH OF DEVALUATION

When in my statement last year I referred to the highly topical question of sterling devaluation, I ventured to suggest that the result of this move need not all be unfavourable, but that under our existing system of controls there was no means of ascertaining precisely what the proper rate should be. Any rate which may be chosen in this arbitrary fashion may prove to be out of relation to the true value of the currency. Today, one year later, it may well seem that the rate then chosen was too low, but those who are now urging an upward revaluation of sterling against the dollar should first consider the wider aspects of the question.

The issue is not merely a domestic one as sterling is a world currency, which, in spite of its limitations, still forms the basis of exchange for a large part of the trading area of the globe. The devaluation, which was forced upon us a year ago, administered a severe shock to this entire system.

NEED FOR STABLE CURRENCY

The improvement which has taken place is due in part to the immediate stimulus given by devaluation and also to some of the consequences flowing from the American rearmament programme. We should nourish this tender growth, whatever its cause, but even at the present rate of improvement conditions will need to remain favourable to the recuperation of sterling for a long time before it can be fully convertible again for current payments.

We cannot afford to repeat the fiasco of 1947. On the other hand, we should make it unmistakably clear that we intend to work steadily towards the goal of full convertibility. Without making dangerous experiments we should aim at a gradual relaxation of restrictions as and when possible. In this way we should be putting the real strength of the position constantly to the test while at the same time giving much needed encouragement to the principal trading nations of the world. Our aim should be to ensure that the underlying strength of the pound becomes such that it can freely take its place in the exchange markets. But this time let us first be sure that it is fit to face the competitive world once more, for there are few things capable of bringing greater benefits to mankind than a sound and stable currency system without which a healthy trade cannot survive.

BANK OF MONTREAL

WORLD UNREST

MR B. C. GARDNER'S VIEWS

The one hundred and thirty third annual general meeting of the Bank of Montreal was held on December 4, in Montreal.

Mr B. C. Gardner, M.C. (the president), in the course of his speech, said: We meet to-day under conditions significantly different from those of a year ago. In many important respects the past 12 months have been, for Canada, a period of continued progress. Industrial expansion and development of new resources have been proceeding apace. In summary, the year's developments have once again confirmed the views of those, at home and abroad, who have maintained a reasoned confidence in the Canadian business outlook and in this country's impressive long-run potentialities.

That, in brief, is the brighter side of the picture. But there are shadows also. A year ago it seemed that, on a broad front, the forces of inflation were subsiding. To-day we are witnessing a marked revival of inflationary pressures, and in Canada both wholesale prices and living costs are at all-time peaks. This, of course, is but one of the manifold problems and anxieties brought about by international tension and unrest.

Fiscal and monetary measures alone cannot provide a smooth transition from a peacetime economy to partial mobilisation. Intelligent public co-operation is vitally necessary.

VALUES TO DEFEND

We are coming to learn that national security in a dangerously uncertain world must be paid for by productive effort, by sacrifice, and by liberal use of common sense. Above all, let us not forget that we have in this happy country much to defend. Whatever our shortcomings as a nation, the Canadian concept of the good life stems from a belief in the inherent value of the individual, a belief which has its roots deep in religious principle and democratic tradition. These are values which we take for granted, and it comes rather as a shock to realise that over large areas of the earth's surface they are not recognised as ideals. To preserve our legacy and to enrich it we, with other nations of good will, must at all costs be strong, resolute, and united.

Within the experience of a single generation this country has played a worthy part in two world wars and in post-war reconstruction. We have also achieved tremendous economic and social progress. Once more we face another challenge, different in nature from those confronting us hitherto. To meet it will test those qualities of enlightened and intelligent citizenship which will determine not only our national stature but also our influence for peace.

GENERAL MANAGER'S REMARKS

Mr. Gordon R. Ball, general manager, said, *inter alia*: The one hundred and thirty third general statement of the bank shows a traditionally strong balance-sheet position at the close of a year of intensive business activity. The balance-sheet retains its traditional liquid character. Cash in the form of deposits with notes of the Bank of Canada aggregated $222 million, equivalent to 11.33 per cent. of our deposit liabilities in Canadian dollars. Total cash assets at $376 million were equivalent to 17.9 per cent. of all public liabilities. Quick assets, including cash assets, investments and call loans total $1,602 million, equivalent to 76.2 per cent. of all liabilities to the public. Total deposits at the year-end stood at $2,063 million, compared with $2,019 million at the end of the previous year.

The report was adopted.

K.M.S. (MALAY STATES) RUBBER PLANTATIONS

HEAVY BURDEN OF TAXATION

SIR JOHN HAY'S STATEMENT

The fortieth annual general meeting of the K.M.S. (Malay States) Rubber Plantations (1911), Limited was held on December 5th at 52, Gracechurch Street, London, E.C.

The following is an extract from the statement by the chairman, Sir John Hay, which has been circulated to stockholders.

Despite the heavy burden of taxation which the industry already bears, the Malayan Government has recently been busy devising and advancing a succession of proposals for extracting still greater revenue from the rubber industry. These proposals, in some respects at least, have been so novel and unpracticable, and supported by arguments so varied and contradictory, that one is inevitably reminded of the boast made by the Queen in "Alice Through the Looking Glass"—"Why, sometimes I've believed as many as six impossible things before breakfast." Two proposals for increasing export duty have already been submitted to the industry and rejected as being both oppressive and unworkable.

Although the worst excesses of the two earlier proposals have been modified, the latest one is still of a kind which is ill-suited to rubber, the price of which is so notoriously unstable. It includes a new provision under which some proportion of the export duty in excess of the former rate is to be returned to contributors for the purposes of replanting. Whilst there is undoubtedly a responsibility upon Government to help the smallholder to replace his old trees with high-yielding stock, the proposals now being advanced are too evidently the fruits of hasty improvisation and not the outcome of any well-considered plan.

Under the latest proposal the provision of funds for replanting is made dependent upon an indefinite continuance of rubber well above 60 cents per lb. There is nothing in the history of the industry to warrant such an assumption. Replanting is essentially a continuing long-term operation and cannot be financed on the uncertain basis that if rubber is high, money will be forthcoming. But if perchance the price falls to its more normal level of 60 cents or less the source from which the necessary funds are to be drawn dries up. Moreover, the difficulties of replanting smallholdings are by no means merely financial and there is no evidence at all that any serious thought has been given to the manner in which the many other difficulties are to be surmounted.

GOVERNMENT'S QUAINT ARGUMENT

As far as estate owners are concerned in this matter of replanting, quaint argument seems to have been advanced from official quarters which is reported to run somewhat as follows: Replanting by estate owners at their own pace when planting stock and labour are available leads to inflation, which must be checked. There must be substituted for such initiative working under private enterprise a Government-sponsored plan, under which estates and smallholdings must advance together to replanting, making excessive and simultaneous demands on planting stock and labour which cannot be supplied and the necessary finance is to be derived from a source which under certain not unlikely circumstances may yield nothing. These remarkable proposals no doubt bear the now familiar label, "economic planning."

If, despite the considerable contribution already made to Government revenue by the rubber industry, about 40% on very rare occasions enjoys any real measure of prosperity, there is a good case for its paying more, the industry would willingly do so provided the burden is fairly shared by other industries and commerce which in the post-war years have enjoyed better fortunes than rubber. But the manner in which any further taxation should be levied should be made a matter of careful consideration to be discussed freely with the industry and should not be the subject of hasty improvisations and ill-aimed shots.

FISONS, LIMITED

RECORD SALES OF FERTILIZERS

CONTINUED INCREASE IN DEMAND

MR F. G. C. FISON'S REVIEW

The fifty-seventh annual general meeting of Fisons, Limited, was held on December 4th in Ipswich, Mr F. G. C. Fison, the chairman, presiding. The following statement by the chairman was circulated with the report and accounts:—

During the year important changes have taken place in the functional and operational duties carried out by members of the board. The position of managing director has been abolished and Mr. P. T. Chevallier, who has occupied this position for the past 20 years, has been appointed a vice-chairman of the Company.

We have elected Mr A. Wormald to the board and have appointed him to be commercial director. Mr Wormald came to us from British Nylon Spinners, Limited, where he gained very considerable experience as head of their commercial department, and we believe his appointment will be of great benefit to our organisation.

THE ACCOUNTS

During the course of the year we raised new permanent capital by the issue in September, 1949, of £2,219,278 ordinary stock, and in April, 1950, of £3,500,000 four and a-quarter per cent. first mortgage debenture stock.

This year the accounts are presented in a simplified form, such elaboration as is necessary to comply with the Companies Act being provided by way of notes.

The consolidated trading profits of the group, after providing for the ordinary expenses of the business, have risen from £707,438 to £1,233,724.

It was reported last year that the Government is removing the subsidy on fertilizers in two equal stages, on July 1, 1950, and on July 1, 1951. There is no doubt that the prospect of increased prices resulted in some stockpiling by our customers, and to that extent our fertilizer sales were inflated. A similar position may arise during the current year.

A further £292,829 has been added to the reserve for future income tax in respect of relief obtained from initial allowances and certain annual allowances in respect of new plant which was not in production during the whole of the year.

From the profits available for appropriation by Fisons, Limited, we have transferred £50,000 to the reserve for special depreciation and obsolescence, bringing that account up to £450,000, and £132,201 to general reserve, bringing that account up to £250,000.

FERTILIZERS

Our sulphuric acid plants have continued to operate to capacity and in May the new contact acid plant at Immingham commenced production. This plant is the largest and most modern of its type in this country and its coming into operation has made a very material contribution to our sulphuric acid requirements. The high efficiency of this plant fulfilled our best expectations during its initial operation. Despite this large increase our demands for sulphuric acid still exceed our production.

Our superphosphate producing plants have also operated at full capacity and in addition we have increased our capacity with production at Immingham. Construction of the triple superphosphate section of the Immingham factory has not been as rapid as was hoped a year ago, unfortunately a common experience these days with all new construction, but we still anticipate that we will be able to make some quantity of triple superphosphate available to agriculture this season.

INCREASED PLANT CAPACITY

We have continued to increase our compound granulation capacity and a new plant at our Goole works came into operation during the year. Our capacity will be further augmented when units at Barking and Immingham come into production during the year.

All our factories have been maintained in good working order during the year and our production, particularly in compound fertilizers, has been increased to meet the demand.

Our production of sulphuric acid, superphosphate, compound fertilizers and basic slag were all materially higher than last year.

Under the auspices of the Anglo-American Council on Productivity a productivity team from the fertilizer industry visited the United States during the autumn of 1949. Of the twelve members of the team our company provided six, consisting of a works manager, an engineer, a chemist, a foreman, a charge-hand and an operator. Their report has been published and, while there is much to be learnt from it, it is satisfactory to note that, taking account of the different circumstances, our works methods are not behind those of the United States.

I am pleased to say that our relations with the trade unions who represent our employees, and indeed with all our factory employees, remain happy and cordial. This is a state of affairs which has existed for many years and of which we are proud.

REMOVAL OF SUBSIDY

On July 1, 1950, the Government removed the first half of the subsidy on fertilizers, which has resulted in a rise of price to the farmer. As compared with a figure of 100 in 1939 the official figures indicate that in July, 1950, the prices of all farm products had increased to 243, whereas fertilizer prices had only increased to 189. There is no doubt that the use of fertilizers is still extremely profitable and there is room for an increase in their use.

Our sales of fertilizers in the United Kingdom have again increased and constitute a record in our history. A comparison with the previous year is interesting—

	1949	1950
Fertilizer sales in tons	1,477,000	1,823,000
Value of fertilizer sales	£10,428,000	£13,591,000

Although our main fertilizer business is in England, we have a valuable section in Scotland which is also expanding, not only in fertilizers, but in the manufacture of feeding stuffs and trading in farm produce.

A large part of our business is done with the members of the National Association of Corn and Agricultural Merchants, with whom we work on a most friendly basis.

PROGRAMME OF EXPANSION

It will be seen from this review of the operations of the company for the past year that the demand for fertilizers continues to increase and that the company, by the expenditure of a great deal of capital, has equipped itself for meeting this increasing demand. This programme of expansion was embarked upon as a direct result of a request made by the Government in 1944 to submit plans for the extension of manufacturing capacity for soluble phosphates in the United Kingdom to meet the requirements of agriculture. The projects which we submitted were approved by the Government and are now in production.

It should be explained that the manufacture of superphosphate can be increased as a temporary measure by the purchase of sulphuric acid from outside sources at a high price, and during the past ten years nearly all companies producing superphosphate have thus temporarily increased their production, which has involved them in little capital expenditure. But it has only been possible because the Government have subsidised the expensive and uneconomic sulphuric acid which the industry required, which was often transported great distances.

The extensions of production which we undertook at very considerable capital costs were regarded as permanent additions to the manufacturing capacity of the United Kingdom and were based upon economic supplies of sulphuric acid.

SHORTAGE OF SULPHURIC ACID

During the last few months the threat of a serious shortage of sulphuric acid has developed owing to a reduction in the amount of sulphur available from the United States.

The Government have, therefore, decided to reduce the quantity of acid available to the superphosphate industry for the 1950-51 season and have, to our great surprise, also seriously reduced our supplies of economic acid for the important permanent projects referred to above, while continuing the supply of some acid at uneconomic prices to the superphosphate industry.

We have objected most strongly to this treatment and have received an assurance that for 1951-52 our representations will be further considered.

For the current year our production programme is seriously affected. On the other hand, the Government have purchased foreign superphosphate to make good the loss of home production due to the acid cut, so that we hope the general volume of our sales will be maintained. It will be understood that our costs of production must be increased by this procedure.

In the meantime, we are examining proposals to increase our supplies of sulphuric acid, but it must be two or three years before we can satisfy our requirements.

POTASH IN N. E. YORKSHIRE

In last year's statement I said that we had embarked on a programme of drilling to ascertain the possibilities of winning potash in North-East Yorkshire.

You may have already noted from announcements in the Press that we have completed the first part of our programme at Robin Hood's Bay and I am glad to be able to tell you that the results have proved highly satisfactory. The site for drilling was selected by our geologists after careful consideration of all the factors and in particular an area was chosen where it was believed that the potash would be at a minimum depth. The results of the test bore have justified their choice.

Examination of the cores shows the presence of a zone containing potassium chloride extending for over 30 feet with a 7-foot rich seam averaging 23 per cent. K_2O at 3,455 ft., of this a 12-in. thick band is pure potassium chloride and gauged by Continental standards may be regarded as a remarkable find.

A study of the detailed mineralogy of the cores has shown that whilst correlation of the "salt zones" throughout the area should not prove difficult, the distribution of potash within these zones is not easily predictable. But in view of our favourable results we decided to proceed with further bores, by which it is hoped to make an assessment of potash reserves over a considerable area.

It is of interest to note that for the year ending June 30, 1950, potash supplied for agricultural use amounted to 234,000 tons K_2O, of which our company was the largest single user. As the industrial use of potash only amounts to some 10,000 tons K_2O per annum, it must be evident that our interest in winning potash in Yorkshire is a logical development to our business.

ASSOCIATED COMPANIES

Our associated company in Canada, International Fertilizers, Limited, has maintained its business well in spite of an overall reduction in consumption of fertilizers in that country, due largely to low prices for the potato crop.

In South Africa we have increased our sales substantially and the demand still exceeds the supply. The Government of South Africa have decided to continue the rationing of fertilizers until the end of 1951.

In Rhodesia our new factory is now in operation and granular fertilizers will be available for the 1951 season.

PROPRIETARY PREPARATIONS

During the year the turnover of our proprietary preparations has been well maintained.

The growing importance of the company's interest in ethical medicinal specialities has led us to reorganise this section of our business and we have formed a new company, Benger Laboratories, Limited, which will be entirely concerned with the development of these products. New specialities introduced during the year include "Hyalase" and "Dextran-Benger," the latter being an infusion solution which can be used in cases where blood and plasma would otherwise be required.

While the demand for fine chemicals in the home market has continued at a high level, substantial increases have been gained in the export market, and for certain products we are sold forward for many months ahead.

Special attention is being paid to finding new uses for our products and at the same time to the expansion of the range.

Our milk factory at Coleraine has been operating at full capacity. This plant has performed valuable service in dealing with the increased production of milk in Northern Ireland.

I would like to express my appreciation to all those working in our organisation for the valuable services they have rendered to the company during the past year.

The report and accounts were adopted.

HARRIS LEBUS, LIMITED

A BIG IMPROVEMENT

The third annual general meeting of Harris Lebus, Limited, was held on December 6th in London, Sir Herman Lebus, C.B.E., J.P., chairman and managing director, presiding.

The following is an extract from his review circulated with the report and accounts:

The profit for the year to July 14, 1950, before charging taxation, amounts to £569,650, as compared with £320,022 for the preceding year, an improvement of £249,628 after charging against profits in 1950 items for which no comparable charge was made in 1949. The proposed Ordinary dividend is 8 per cent.

The improvement in the timber supply situation continued and veneers which we use in our production, together with plywood from certain sources, have since then been freed from Government control. In the furniture we make we are unfortunately still precluded from using hardwood from dollar sources or softwoods of any kind, but we have been able to satisfy our timber requirements to the full largely by increased purchases of Colonial timbers, and the forward supply position at this time appears to be satisfactory.

During the year there has been a significant increase in the price of oak and beech, whilst other timbers have in general shown an upward tendency. The prices fixed by the Government for some types of plywood have on the other hand been substantially reduced. There has been a steady increase in prices of other materials and this tendency appears to be continuing.

In my review last year I drew attention to the revision of the Board of Trade utility scheme, which had been made during the year then under review. There have been no further changes of importance in those regulations since that date. The freedom of design possible within the limits of the regulations and the price control structure have enabled competition to operate again within the industry and I am satisfied that your company is more than maintaining its leading place as suppliers of low-priced furniture of a high standard of quality.

THE PAST AND THE FUTURE

At the last annual general meeting I was tempted, in view of the satisfactory state of your company's trade at that time, to make some sort of forecast as to the financial results which could reasonably be expected in the year we are now considering. I refrained from doing so, however, because in the grave situation of our country factors might arise "which could quickly and adversely affect sales and profits." During the latter months of your company's financial year, and unfortunately into the present financial period, the whole industry suffered a sharp recession of trade, which affected your company's sales and profits. This recession has, however, not persisted, at any rate so far as your company is concerned, and sales and the order book are now satisfactory.

The national and international situations cannot be said to have improved over last year. The difficulties in the Far East, the Government rearmament programme, the expectation of a General Election in the not far distant future are but some of the factors which create a state of uncertainty and make it unwise for either your directors or for me to attempt to forecast the trend of profits to be expected in the company's current financial year. I affirm, however, that the company's products, methods of production and methods of marketing continue to improve and reinforce the confidence of your directors in the future of your company.

The report was adopted.

AUSTIN MOTOR COMPANY

A GOOD YEAR

MR L. P. LORD'S REVIEW

The thirty-sixth annual general meeting of The Austin Motor Company, Limited, was held on December 6th at Longbridge Works, Northfield, Birmingham, Mr. L. P. Lord (chairman and managing director) presiding.

The chairman, in the course of his speech, said: We have had a good year, free from stoppages of any kind, although output has been restricted by the lack of sheet steel. However, the freer flow of production has allowed us to keep down the amount of material in progress, and this is reflected in the value of stock and tools, which is practically the same as for last year, although production was 24 per cent. higher in the year under review.

DISTRIBUTION OF PROFIT

The motor industry is Britain's largest exporter, and your company is the largest within that industry.

The Exchequer has, of course, benefited doubly: firstly by the foreign currency which we have brought to England, and secondly by their large share of the profit earned. The workpeople have also benefited by higher wages and regular work; thus prosperity is spread. It is fair that the shareholders—there are thousands of small ones, in fact over 20,000 altogether, many of them workpeople themselves—should benefit from this prosperity, and therefore the dividend on the Ordinary shares has been increased.

The following figures illustrate to you how the benefits arising from the prosperity of the company are shared. For the year ended July 31st last:

1. We paid in wages and salaries £9,526,000 gross.

2. We had to provide for taxation £2,481,522. It should also be remembered that in addition to this the Government collects taxation on wages paid and in the form of surtax on some of the dividends.

3. On our export trade to U.S.A. and Canada we collected $33,936,000.

4. We propose to pay in dividends to our Ordinary shareholders £340,316 net.

Last year I referred to the institution of a Supplementary Provident Fund. Satisfactory arrangements have now been made with the Board of Inland Revenue, and the necessary Trust Deed was executed on April 17th last.

PRODUCTION

We have still maintained our position as the premier exporter of cars and commercial vehicles. The production of 157,628 vehicles is an increase of 24 per cent. over last year, and therefore a new high record. For the first fifteen weeks of the current financial year, that is since July 31st last, production has risen again, and is up by 11 per cent. over the year under review, and for the three months ended October 28th has been running at the rate of over 165,000 vehicles a year plus an average of nearly 300 tens of spares a week. Increased supplies of steel would make still higher output possible.

The new models, shown for the first time at Earls Court in October, have been very well received, both at home and overseas. It is obvious already that the new "Hereford" will be a very worthy successor to the "Hampshire."

For a model introduced just three years ago the A.40 has not only maintained but increased its popularity, over 80,000 having been despatched to world markets in the year; in fact, it is universally acclaimed as the world's best light car.

The new "Loadstar" 2- and 5-ton trucks, introduced just a year ago, have also proved exceptionally popular overseas, more than 15,000 having been exported in the year.

With both these models we entered the current year with an overflowing order book, and at the present moment have truck orders in hand for the entire production of these vehicles for the rest of the current financial year.

You will have seen from announcements already made that we have secured a contract for the manufacture of several thousand four-wheel drive light fighting vehicles for the army.

The initial contract was for the vehicles without the engines. Within the last few weeks we have received orders for four-cylinder engines to fit into these vehicles and also for a large number of eight-cylinder engines.

I have stated that these orders should not interfere with normal production, always providing that the materials are made available. The question has naturally arisen in many minds as to how we are going to find room for this extra work. That has been overcome by taking a lease of the whole of the aeroplane factory at Cofton Hackett adjoining the Longbridge Works.

EXPORT

I have mentioned in previous years that we could not expect our intensive overseas operations to be very remunerative in the early stages; in fact, as you know, we did make initial losses in America. However, our policy has turned out to be the right one, and I am pleased to be able to tell you that all our trading subsidiaries have earned satisfactory profits. We have, of course, made profits from devaluation in America and Canada. These are shown clearly in the accounts and will not recur unless the pound is again devalued. If, however, the pound is revalued upwards some losses may be incurred, although, naturally, we are watching our stocks very carefully and are keeping our commitments down to the minimum. In order to strengthen the balance-sheets of the Canadian and American subsidiaries, all the profits and gains they made have been retained and no dividends have been paid to the parent company.

Turning to our general export business, we have had another excellent year. Our total sales to world markets outside North America exceeded £33,000,000, which figure included nearly £3,000,000 for spare parts and components. This total compares with £19,700,000 in the previous year and represents a 68 per cent. increase.

IMPORTANCE OF AUSTRALIAN MARKET

Australia continued to hold first place in our export shipments, and absorbed over 42,000 of our cars, vans and trucks. Outside Australia and the American continent, to which I shall presently refer, our best results were in Belgium, Sweden, South Africa and Eire, in that order, but these markets combined represented only one-third of the Australian volume. We are well in the lead in Australia and we must make sure that we maintain that position.

In Canada and U.S.A. the year was equally satisfactory, our turnover in Canada being over £9,000,000, or a 275 per cent. increase on the previous year. In the U.S.A., with sales of just under £2,000,000, the increase was 128 per cent.

The report was adopted.

TOWN TAILORS LIMITED

RECORD NET PROFIT

The twentieth annual general meeting of Town Tailors Limited, was held on December 4th at Leeds, Mr. Hector M. Frazer, chairman and managing director, presiding.

The following is an extract from his circulated speech:

It is with pleasure that I have to report another period of steady progress by the parent company and its subsidiaries for the year ended July 29, 1950. The net profit of the group is £370,609, after charging depreciation and all expenses (apart from taxation) —a new record. The increased profit is entirely due to a substantial rise in turnover, occasioned by the better value we have been able to give our customers consequent upon our lowering of profit margins. The year's results reveal the benefits which have accrued to the company and to the public by the reorganisation of production methods. Our quality of workmanship has been fully maintained and given satisfaction.

This record profit is apportioned as follows:—

		Amount £	% of Profit
Taxation (estimated)		197,801	53·4
Sundry allocations:—			
Welfare, insurance fund, expenses of capital increase, special depreciation		9,503	2·6
Ploughed back into the business		126,592	34·1
Represented by:—			
Additional fixed assets	£ 89,025		
Additional net current assets	37,567		
Proposed dividends		36,713	9·9
		£370,609	100

THE DIVIDEND

To conform with the "limitation of dividends" request of the Chancellor of the Exchequer, dividends are being limited to the same monetary distribution as for last year. Your directors recommend a final dividend at the rate of 23½ per cent. to be paid to Ordinary stockholders which, together with the interim dividend, makes a total of 40 per cent. for the year. As this amount is payable on the increased capital, it is equivalent to the former rate on the original capital (or 6½ per cent. on the real capital).

It is interesting to note that the country is now experiencing a plethora of claims for wage increases supported by the argument that justice demands that wages should keep abreast of the rising cost of living; yet a similar right is denied to those who rely on dividends for their sustenance.

During the past year the orders placed by our customers have outstripped our production capacity, and we are constantly building up our labour force to keep pace with the demand for our products. Owing to the impossibility of obtaining sufficient quantities of a certain type of cloth from manufacturers, another mill has been purchased where the company is to extend its weaving operations to cover export and home trade requirements.

We have decided to recommend a bonus issue to the holders of our Ordinary stock of one Ordinary stock unit of 2s. for every three Ordinary stock units held.

Sales for the current year have been high, due no doubt to the foresight of the public in purchasing their requirements before the recent high advance in the price of wool is passed on to them. When that stage has been reached, consumer resistance may become an important factor. Beyond this the future is uncertain, but I have no reason to believe that your company will be any less successful than in the past.

The report was adopted.

THE FINANCIAL NEWS LIMITED

PROFITS MAINTAINED

MR BRENDAN BRACKEN'S REVIEW

The fifty-third ordinary general meeting of The Financial News Limited was held on November 30th at Winchester House, Old Broad Street, London, E.C., Major-General Guy P. Dawnay, C.B., C.M.G., D.S.O., M.V.O., the vice-chairman, presiding in the unavoidable absence of the chairman, the Right Hon. Brendan Bracken, M.P.

The secretary (Mr. A. E. Knock) read the notice convening the meeting and the report of the auditors.

The vice-chairman then read the speech of the chairman, as follows:

Gentlemen, with your permission I will take the report and accounts as read. (Agreed.) Apart from an improvement of some £13,000 in the net liquid assets position, the balance-sheet figures show little change from those of the preceding year, and they call for no comment. The consolidated profit before tax for the year ended June 30th last amounted to £119,740, which compares with £114,379 and £117,935 in the two preceding years.

The slight increase in our profit arises principally from the fact that we have received a modest first dividend on our investment in W. Speaight & Sons. Our three subsidiary companies, the Investors' Chronicle, Limited, the Practitioner Limited and the Banker Limited, have all traded at a profit substantially similar to that earned in the previous year.

We are recommending the payment of a final dividend of 35 per cent. making an unchanged total of 60 per cent. for the year. As I stated last year, this 60 per cent. is equal to about 12½ per cent. on the capital employed in the business.

THE FINANCIAL TIMES

The Financial Times earned substantial profits in the year ended December 31, 1949. It continues to earn good profits, but we shall be fortunate if we can maintain this good result. The costs of newspaper production rise monotonously. As you probably know, the printing works in which *The Financial Times* is interested have suffered considerably from the recent protracted printing dispute. Restrictions on the use of newsprint have lately been reintroduced on a near wartime basis. The effect of these restrictions has been to reduce the number of pages which *The Financial Times* can publish, and this, of course, must have an effect on advertisement revenue.

So far we have contrived not to restrict the circulation, which in recent months has been growing, but, unless there is some easing in the newsprint position, I fear that we shall once more be compelled to peg the sale. Our plans for introducing new features and for improving existing features are therefore at present frustrated. *The Financial Times* has qualities of resilience and enterprise which, I have every confidence, will enable it to surmount most of the baffling problems that confront the press today.

THE INVESTORS' CHRONICLE

The Investors' Chronicle maintains its high position in weekly financial journalism. It naturally lost much revenue through the recent printing dispute. It was only by the strenuous efforts and ingenuity of its staff that the paper was able to maintain a weekly service for readers. The emergency issues which were produced during the stoppage at London printing works left much to be desired and were costly to produce, but they enabled readers of the paper to enjoy some continuity of service. I am hopeful that the greater part of the revenue lost during the dispute will be recovered in the remaining months of our financial year.

The Practitioner and *The Banker* were fortunately not affected by the dispute, since they are not printed in the London area. *The Practitioner* goes from strength to strength and its editors and management are to be congratulated on the great services which the paper renders to the medical profession.

THE ECONOMIST

The Economist, of which we own half the share capital, suffered as severely as *The Investors' Chronicle* in the recent dispute. Here, too, magnificent efforts were made to overcome the difficulties with which that newspaper was confronted. Well does it deserve its present prosperity.

Had I been addressing you three months ago, I should have been able to give you very satisfactory reports upon the two printing companies, St. Clements Press and W. Speaight & Sons, in which we are directly or indirectly interested, but the recent dispute has had a sharp effect upon their profits. Since the resumption of work, both companies have been extremely busy and I am hopeful that they can retrieve a goodly part of the profits lost through this deplorable dispute in the printing industry.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Viscount Moore, O.B.E., was re-elected and the remuneration of the auditors, Messrs. Price, Waterhouse & Co., was fixed.

UNION FREE STATE COAL AND GOLD MINES LIMITED

PROGRESS ON HARMONY LEASE

MR G. V. R. RICHDALE'S ADDRESS

The annual general meeting of Union Free State Coal and Gold Mines Limited, was held in Johannesburg on November 24th.

Mr G. V. R. Richdale, the chairman, who presided, in moving the adoption of the report and accounts, said that the report of the directors and audited accounts for the year ended June 30, 1950, together with the reports of the consulting engineer and the managers of the Harmony property and the Raleigh Colliery had been in shareholders' hands for some time. Those reports, together with his statement which accompanied them, had dealt comprehensively with the affairs of the company during the period under review and he proposed to comment only on the progress achieved since the date of the statement.

ISSUE OF HARMONY SHARES

Formal ministerial consent to the grant of the Harmony lease had been received in a letter from the Secretary for Mines dated September 29, 1950, and at an Extraordinary General Meeting of Harmony Gold Mining Company Limited, held on October 6, 1950, the authorised capital of that company had been increased from £5,000 in 20,000 shares of five shillings each to £3,000,000 in 12,000,000 shares of five shillings each. At the same meeting, the Board of Directors were authorised to issue a further 7,980,000 shares, making the issued capital of the company £2,000,000 in eight million shares of five shillings each and leaving four million shares in reserve.

The company was entitled to subscribe for a total of 4,014,240 Harmony shares, including those already subscribed in the initial capital and 501,780 shares for which it would subscribe against receipt of its proportion of the total vendor consideration of £250,000. While the Board had always recognised that shareholders would wish to have as large a participation as possible in the Harmony company, it was, nevertheless, considered to be in their interests that their Union Free State Coal and Gold shareholdings should be safeguarded against too sharp a fall in value when the shares became ex-Harmony rights on the Stock Exchange.

OFFER TO SHAREHOLDERS

It had, therefore, been decided that the rights in respect of 2,213,235 shares should be offered to shareholders in the ratio of three Harmony shares for every ten shares held in Union Free State Coal and Gold Mines Limited and that the balance of 1,801,005 shares, together with any rights offered to but not taken up by shareholders, should be retained in the company's portfolio.

As soon as the Harmony company received the proceeds of that issue it would refund to the Company an amount expected to be of the order of £1,400,000 which would have been expended up to that time on development of Harmony property, together with interest thereon calculated on a daily balance at the rate of 4½ per cent. per annum. In that connection, he mentioned that expenditure of £991,334 mentioned in his statement as having been incurred by the company on Harmony property, did not include the value of stores and materials which, when taken into account, brought total expenditure on behalf of that company as at June 30, 1950, to £1,038,491.

SHAFT SINKING

Shaft sinking at Harmony was proceeding satisfactorily. The No. 3 shaft had reached a depth of 606 feet on November 23rd, while the ventilation shaft was at a depth of 733 feet. Permanent headgear at No. 3 shaft had been completed and one of two permanent winding engines was in use. Steam hoists at the ventilation shaft were now in commission; the compressor house was nearing completion and good progress was being made with workshops.

A further 13 permanent houses had been erected bringing the total number now completed and occupied to 31. In addition, 45 houses intended for the future use of married native employees were temporarily occupied by European families pending completion of further accommodation for Europeans. A total of 43,000 feet of piping had so far been laid from the Welkom Ring Main, a further 21,440 feet having still to be laid.

RALEIGH COLLIERY

At the Raleigh Colliery, the erection of a coal-washing plant was proceeding and should be in operation early next year. A change house, lamp room, four senior staff houses and six workmen's cottages were now finished, while single quarters were already occupied. The manager's house was in the course of construction.

Coal-drilling programmes in the Coalbrook area and in the Ermelo district had been completed, but it was too early to draw final conclusions from the results obtained. Drilling on Farm Braakfontein in the Newcastle area of Natal was still in progress and, although analyses so far available had been encouraging, it was not yet possible to assess with accuracy the true potentialities of that area.

The report and accounts were adopted.

GLAXO LABORATORIES LIMITED

SUBSTANTIAL HOME AND OVERSEA PROGRESS

RESEARCH AND DEVELOPMENT SAFEGUARDED

The sixteenth annual general meeting of Glaxo Laboratories Limited was held on December 5th, in London. Sir Harry Jephcott, M.Sc., F.R.I.C., Ph.C., the chairman and managing director, presided.

The following are extracts from his circulated statement: £250,000 has been allocated from the profits of the year to reserve for obsolescence and £250,000 to general reserve. In addition, a new reserve has been set up—reserve for future research and development; further reference is made to it below.

The fixed assets have increased by about £750,000 as a result of the completion of plant extensions at Greenford and elsewhere. The extending operations of the subsidiary companies are reflected in the increased investment in these companies. Stocks have necessarily increased with the company's expanding business, but they are smaller than is desirable for the smooth flow of work, and their further increase must be expected.

OVERSEA ASSETS

It is the purpose of the consolidated balance sheet to show the total value of the assets of the group expressed in sterling. In the absence of free rates of exchange, the conversion of oversea assets becomes arbitrary and liable to fluctuation. Current assets and liabilities are converted to sterling at the rate ruling when the accounts are closed and fixed assets at the 1949 values, plus additions at the rate ruling when acquired. Should circumstances vary, consideration would be given to revaluing the assets affected. The directors are satisfied that the fixed assets in the accounts of the subsidiary companies are conservatively valued, and in their opinion this valuation is as fair as possible in existing circumstances.

The true value of these assets must be measured within the ambit of our total activities, some profit accruing to the parent company from exports to subsidiaries. All subsidiaries have operated profitably, although from some companies dividends reasonably commensurate with the investment could not be transferred to this country.

CAPITAL EXPENDITURE

A further expansion of business has resulted in increased trading profit. This result is the more satisfactory in that it has been achieved in spite of many price reductions.

The level of dividend upon the ordinary stock was in the past mainly related to the need to conserve our financial resources over a long period of years. Having regard to all the circumstances, and not least to the fact that more than one-half of our business is transacted overseas and to the hazards of such business, a final dividend of 12½ per cent., making 17½ per cent. for the year, is recommended for approval. In the opinion of the directors the distribution of less than one-twelfth of the profits by way of dividend reflects in full measure a policy of moderation and restraint—a policy with which they are in full accord.

We are at present committed to capital expenditures amounting to £691,000. These are far from adequate to provide for the expansion of business that is envisaged and further capital expenditure is projected that at home and overseas exceeds £2,000,000 in all. Effect will be given to the schemes as rapidly as circumstances permit.

Owing to the continuing expansion of the business and to the magnitude of the development programme, it may not be possible indefinitely to finance the growth of the business from our present resources. The directors therefore consider it timely to increase the authorised capital by £1,500,000. It should, however, be clearly understood that there is no present intention of issuing further capital.

PRODUCTIVITY

Throughout the year particular attention has been given to increasing the efficiency of all manufacturing processes and thereby the company's productivity. In this respect we have welcomed the reports of the Anglo-American productivity teams and have benefited from the participation in them. We believe that further benefit will follow from the continuous development of friendly interchange between American and British industries.

The saving from economies in production has enabled us not only to absorb the considerably increased cost of many of our raw materials but also to give to our customers the benefit of price reductions. In the aggregate these price reductions have been substantial, especially for our antibiotic products. During the year further reductions have been made in the price of penicillin and streptomycin, which have resulted in a saving of no less than £300,000 to the hospitals of this country.

EXPORTS

Our oversea and export business continues to make excellent progress. During the year the total sales overseas by the parent company and its subsidiaries have increased by more than 30 per cent. This is a real achievement for a company of our size.

Our investment overseas continues to grow, and it will be necessary to increase it as further development becomes desirable. Admittedly, oversea investment presents to the stockholder a greater risk than does expansion at home, but it is only by taking such a risk that our oversea business will progress further and the exports from this country continue to increase.

While most of our oversea and export business is within the sterling area, it is especially satisfactory to report that we now have a substantial dollar export business. With the object of further enhancing our dollar sales, we have recently formed a Canadian subsidiary company, Glaxo (Canada) Limited.

RESEARCH

Expenditures upon research and development steadily increase and are now more than ten times greater than in 1939. During the year the research department at Greenford has more than doubled. The new research laboratory for work on antibiotic substances and related problems at Sefton Park has been in occupation since June. In addition, development facilities at Ulverston have been increased and further expansion is planned.

We believe that we have a very effective research organisation and, although it would be inappropriate for me to mention the problems upon which they are at present engaged, I am well satisfied with the progress made. It is of the nature of research work that success cannot be guaranteed: research expenditure must in any event be continued over a period of years if results of value are to be achieved. We consider it wise to make such financial provision as will ensure continuity of this work and we have now created a reserve for future research and development specifically for this purpose. Should less favourable years await us we shall not hesitate to draw upon this reserve to maintain our work of research and development, for upon it we believe the long-term future success of the company largely depends.

I take this opportunity of acknowledging the excellent work of those outside our own organisation, with many of whom we have had happy business relations extending over more than 30 years, and of our own staff at home and overseas which has made possible the accomplishments of the year.

The report and accounts were adopted and the capital increase was approved.

NATIONAL CANNING COMPANY

A BONUS ISSUE

MR S. W. SMEDLEY'S ADDRESS

The nineteenth annual general meeting of the National Canning Company, Limited, was held on December 4th, in London, Mr S. W. Smedley (chairman and managing director) presiding.

The following is an extract from the chairman's speech:—

The profit of the group, after taxation, amounted to £414,332. Of this sum £309,924 has been retained by the subsidiary companies and, in addition, the subsidiary companies have applied a total of £5,000 to pension reserve funds.

The National Canning Company's own profit and loss account shows a surplus for the year of £98,078, which, with last year's carry forward, leaves a sum of £249,033 available for distribution. Of this sum, £30,000 has been transferred to the general reserve fund and, after payment of the dividend of 20 per cent. recommended by the directors, the carry forward will be increased by £18,578.

I should perhaps tell you that we are taking steps to centralise our farming activities. In July last we purchased a farm near Wisbech and this farm, together with the farm at Evesham and our Scottish farms, will now come under one management. The company now owns a total of 2,472 acres.

This year, in certain lines, particularly in the case of canned peas, we have again increased our pack. So far as canned and frozen peas are concerned, the season has been a favourable one, and I believe that this year's pack of canned and frozen foods is undoubtedly one of the best we have ever turned out.

PRICE OF CANNED FRUITS

For some time past I have been of the opinion that certain varieties of canned fruits, particularly strawberries and other soft fruits, were priced too high. Your company has always been looked upon as a leader in the industry, and I felt it was appropriate that we should make a move in helping to combat the general increase in the cost of living. The price we have to pay for our raw materials governs the price paid by the ultimate consumer and this summer afforded us the first opportunity since the war ended of reducing the price of certain lines we process. Where these reductions have been made it must be borne in mind, however, that our goods are still in short supply, and we are not always able to ensure that any reductions in price which we make are passed on to the consumer.

There is now evidence, which has been growing for some time, that the nature of

public demand is changing. However, we endeavour to adjust our activities to meet the requirements of the public, and while there is a certain amount of difficulty in obtaining adequate supplies of cans, I think you may take it that all the signs point to another satisfactory year's trading.

You will have seen from the notice you have received of the extraordinary general meeting, to be held after this meeting, that a resolution will be proposed to increase the authorised capital of the company to £750,000. There is also a second resolution in which it is proposed that the issued ordinary share capital should be increased to £467,500, by capitalising £42,500, part of the general reserves of the company and issuing 42,500 fully paid ordinary shares to the existing ordinary shareholders in the ratio of one new share for every ten shares held.

The report was adopted.

At an extraordinary general meeting subsequently held, resolutions were passed approving: (1) an increase in the authorised capital of the company to £750,000, and (2) the capitalisation of part of the general reserves and the issue of the bonus shares to existing ordinary shareholders.

NORTH BRITISH RAYON

WORLD'S CHEAPEST TEXTILE FIBRE

The twenty-second ordinary general meeting of North British Rayon, Limited, was held on November 30th in London, Mr Ernest Walls, the chairman, presiding.

The following is an extract from his circulated statement:

The year to June 30, 1950, now under review, coincided for the main part with the first year of the devaluation of the pound sterling in September, 1949.

Increase in prices of our imported materials began immediately after the devaluation and continued through the year. It affected not only our most important material imported wood-pulp, but also our chemicals and numerous sundry supplies. Later on we had the rises in base metals and other primary materials which have been so notable a feature in recent months. The year's trading results were, however, only partially affected by these increased costs. We were well situated with regard to stocks of materials so that we reaped the benefit and were able in this way to maintain our profit margin. But the deferred effect of devaluation and of the rise in world prices is certainly being felt in the present financial year.

Output showed a moderate increase during the year. Demand is very strong, both at home and abroad, and likely to continue so. The ever rising prestige of rayon has been reinforced to a remarkable degree by the somewhat sensational increase in the price of natural fibres, wool, silk, and cotton during this year. Rayon is today the world's cheapest textile fibre and in versatility and adaptability never ceases in its forward stride.

Capital expenditure during the year amounted to £117,309, making a total of £552,000 since the end of the war. The year's expenditure has been partly at Jedburgh, Scotland, and partly at Holmfirth, Yorkshire, where we have just completed our new processing works, which for its size will, I believe, stand comparison with any similar plant in this country.

DEVALUATION AND RISING COSTS

Following the end of the company's year, as I said, we were experiencing the deferred effect of the rise of costs due to devaluation. By this time, also, the general rise in world prices of primary materials had begun to make itself felt. In addition, the price of Canadian as well as Scandinavian woodpulp was steeply advanced. The freeing of the Canadian exchange has also worked against us. All this coincided with the end of the so-called wages freeze, resulting in a large increase in our wages rates as from mid-October.

Since September, 1947, the rayon industry had suffered successive increases in cost of materials and labour, but had endeavoured to offset them by increased output and productivity, with the result that the selling price of rayon was held steady during these years. This was a remarkable achievement, but to absorb the succession of increased costs was beyond any possibility and an increase in the selling price was established as from October 16th.

The advance is very moderate in relation to the heavy increase in costs we have to bear, and if we are to maintain our recent levels of earnings we shall still need to continue even harder than before to apply ourselves to the task of increasing productivity by reducing unnecessary waste of materials and labour, by ingenuity and invention, and generally by better and harder work on the part of all concerned, which is the only road by which this industrial island can ever find its way back to real prosperity. We have not been unsuccessful in that direction in the past, and I am confident that we shall have the co-operation of everybody employed in the North British organisation in bringing these further efforts to a successful result.

The report was adopted, and the proposed dividend of 10 per cent., less tax, was approved.

INDIAN IRON AND STEEL COMPANY

INCREASED PRODUCTION

MR T. LESLIE MARTIN'S SPEECH

The thirty-third ordinary general meeting of The Indian Iron and Steel Company, Limited, was held on November 13th in Calcutta.

Mr T. Leslie Martin, the chairman, who presided, said: Production for the year showed a welcome increase which has enabled us to cover the reduction in the selling prices of pig-iron imposed as a consequence of the 1949 Tariff Board inquiry and to show a balance of profit sufficient to maintain the dividend at the rate of 10 per cent. per annum.

The main features of the accounts are the final allocation and consequent additions to fixed capital expenditure of approximately Rs.3½ crores and an increase of some Rs.1½ crores in borrowing. The major item of new capital replacement plant is the new battery of 72 coke ovens at your Hirapur works to take the place of the range of four old and original waste heat type batteries which had become obsolete. The new battery came into operation towards the close of the year under review and has already shown a marked improvement in the quality of furnace coke coupled with a considerable reduction in production cost. With the completion of this project at a cost of some Rs.2½ crores we are once again not only fully self-supporting in the matter of our coke requirements and have been enabled to discontinue the outside purchase of coke at relatively high cost but, also, to supply a fairly large quantity of coke to the Government's fertiliser plant at Sindri. The increase in borrowing is a direct result of this expenditure and consists of the sum of Rs.1 crore advanced by the Government of India against an agreed total of Rs.1½ crores and taking further advantage of overdraft facilities.

DEPRECIATION AND TAXATION

The increase in capital assets is only partly reflected in the increased allotment for depreciation, the provision for which has been raised from Rs.30 lakhs to Rs.32½ lakhs representing about two months of the year under review. This reserve must necessarily be further raised in subsequent years to cover the proper annual depreciation charge on this account.

I should, perhaps, amplify the remarks in your directors' report concerning the somewhat complicated position in regard to taxation that results where heavy capital expenditure is incurred. In computing assessable profits for taxation purposes initial depreciation is allowed in respect of buildings and plant in the year of their installation at rates of 15 per cent. and 20 per cent. respectively on cost, while a further special allowance is granted in the earlier years equal to the normal depreciation allowance. The sole object of these allowances is to offer the inducement of a taxation concession as an encouragement to industry to re-equip, and not for the purpose of an extra distribution in the shape of higher dividends. In the case of your company these extra depreciation allowances exceed the sum of Rs.80 lakhs with an immediate relief in outgoing cash for taxation purposes of some Rs.33½ lakhs, but it must not be overlooked that this so-called "saving" in taxation has to be met in future years and, consequently, must be provided for. At first sight, it would seem to be a valuable concession, but it is necessary to examine the position in closer detail. The law provides that the total depreciation allowable for taxation purposes in respect of any individual asset is limited to the original cost of that asset and extra depreciation is permitted for taxation purposes during the earlier years of the life of that asset. Conversely, the depreciation allowance will be reduced in later years and the original liability for taxation will have to be met. It is not escaped but merely deferred. Assuming the rates of tax remain constant, it will be seen that the so-called "saving" in taxation in the earlier years by reason of the enhanced depreciation allowable must later be offset by a corresponding increase in taxation when this depreciation is no longer available, and has become exhausted. What, therefore, appears to be a taxation concession proves, on examination, to be nothing more than a deferment of a definite taxation liability to be met at a later date. It will, therefore, be seen that where depreciation allowances of the magnitude involved in the present case are concerned, it would be more than folly to ignore the deferred taxation liability, and this explains the appropriation in the accounts for the year under review of Rs.33½ lakhs to a reserve for taxation contingencies.

BENEFITS OF MODERN PLANT

The installation of replacement plant of the latest and most modern design has shown considerable benefits and further expenditure of approximately Rs.2 crores must be incurred during the next year or so to bring your plant, both at Hirapur and Kulti, completely up to date. This should show further benefits to the company's operations, not only by increased production but by reduction in costs also. As you are aware, your

directors had planned to raise additional capital by the issue of further Ordinary shares and a new issue of Preference shares, the total proceeds of which would have amounted to some Rs.3 crores. Such an issue would have enabled us, in addition to financing necessary further capital expenditure, to relieve to some extent the heavy indebtedness of the company on loan account, which cannot be allowed to remain a permanent feature of our accounts. With the prospects of an improved profit margin and a saving on interest charges it is, therefore, a matter for regret that the reaction to the announcement of the company's application to the Controllers of Capital Issues in Delhi and London was so clearly unfavourable in certain quarters that your directors had no option but to abandon for the present and to defer the proposal for the issue of Ordinary shares and to increase the amount of the proposed issue of Preference shares from Rs.1 crore to Rs.1½ crores to ease the position to some extent. I do not think that shareholders fully appreciate the fact that during the past ten years as a result of the last war there has been little opportunity to install new modern plant in replacement of old and obsolete machinery. There was no alternative but to defer action until this became possible. We commenced our replacement and modernisation programme in 1946-1947, that is by ordering the plant, and during the past two years or so have been busy on its installation. The cost of this, as you should fully realise, has been inordinately high and rather more than double when compared with pre-war prices. This has, naturally, been a heavy drain on our finances and is responsible for the present extremely tight cash position. The present issued capital of Rs.2½ crores falls far short of the real value of your plant at Hirapur and Kulti, which, based on present day values, is more in the region of Rs.15 crores on a conservative estimate. Under these circumstances, your Board considered themselves as fully justified in putting forward a proposal to raise fresh capital and I repeat the reception this proposal received is greatly to be regretted. In short it amounts to this, if you will not give us the tools it is not easy to understand how we should be expected to do the job.

It has been pleasing to note that there have been signs of improvement in the general economic position of the country of late. It must be realised that any acceleration in this direction is entirely dependent upon the expansion of industry in India and the forthcoming of the necessary investment capital.

The report and accounts were adopted.

KAMUNING (PERAK) RUBBER AND TIN COMPANY, LIMITED

PRICE OF RUBBER AND STOCKPILING

SIR JOHN HAY'S VIEWS

The forty-first annual general meeting of The Kamuning (Perak) Rubber and Tin Company, Limited, was held at 52/4, Gracechurch Street, London, E.C., on December 6th.

The following is an extract from the statement of the chairman, Sir John Hay, which had been circulated to stockholders:—

The rapid and dramatic rise in the price of rubber which has occurred since June last—the end of our financial year—has focused unusual attention on rubber, has been productive of statements which have little foundation in fact and, too often, of expressions of ill-justified feelings. It is impossible for me, within the limits of what should be a brief speech, to deal with all of these but it is not desirable that all of them should pass without some correction. To attribute this rise in price to the machinations of producers is mere foolishness and the story of "rubber barons" gathering round the table to manipulate the price for their own profit is, of course, a fiction unworthy of inclusion in a schoolboy's story-book.

The cause of the rise in the price of rubber is easy of diagnosis. As has recently been acknowledged and emphasised in responsible quarters, the rise in the price is due to stockpile purchases rendered urgent by the course of political events engendering apprehensions regarding the certainty of the continuance of supplies. Such purchases have turned what would otherwise have been a surplus of production into an acute shortage and even the merest tyro must understand that persistent buying in the face of a shortage inevitably raises prices to an abnormally high level. The rise in the price of rubber is, however, no isolated phenomenon. What does distinguish rubber from other world commodities is that up to very recently it continued to be sold in the postwar period at little above its prewar price whilst all other values had long ago risen substantially. Even allowing for the high price to which it has recently risen, the average price for 1950 up to the end of October is only a fraction above 2s. 4d. per lb.

A short time ago *The Times* published a table showing the average prices of world commodities for the period January/September, 1950, as a percentage of 1939 prices. Of the sixteen commodities listed, over the period mentioned rubber showed the smallest rise. The truth is that there is a whole range of world commodities the prices of which are much too high for general economic health, but within that range rubber is the least of the offenders and if remedial measures are to be considered they should first of all be applied in the more flagrant cases which include many commodities of which on balance we are buyers, not sellers.

Rubber is a world commodity sold on a world market at a world price. No unilateral or even national action could determine price or the direction of supplies. Control of prices and supplies could only be effected by agreement on a wide international basis reinforced by administrative action within producing territories which in too many instances would, under present disturbed circumstances, prove impracticable. Rubber producers would welcome a decline in the tempo of stockpile purchasing with its promise of greater stability of price at a lower level. They are only too acutely aware of the fact that purchasing for this purpose can only be temporary and that when that ends a situation may confront them under which supplies of rubber and rubber substitutes may be in excess of demand.

HIGHER COSTS AND TAXATION

In the meantime the first benefits of the present price of rubber go deservedly to labour and, perhaps less deservedly, to Government. It is difficult in a short sentence to contrast directly the rise in the price of rubber with the rise in wages, but the figures at my disposal show that as compared with 1941 the average price of rubber for 1950 shows an increase of 141 per cent. whilst wages to labourers on rubber estates have increased over the same period by 160 per cent. to 350 per cent.

A large part of the increase in wages was granted before the rise in the price of rubber had taken place and such subsequent increases as have been made were granted in full realisation of the fact that the present high price of rubber can only be of a temporary duration whilst wage increases, once given, are liable to become permanent. Moreover, in addition to cash wages, labourers on rubber estates receive benefits in kind, all supplied by their employers, such as housing, medical services, including maternity grants, and recreational and educational facilities, the cost of all of which has multiplied several times since 1941.

As far as Government is concerned, the proceeds of the 5 per cent. *ad valorem* duty will in the current year yield to the Government of Malaya four times as much as was originally estimated, whilst the 30 per cent. Income Tax will also give a substantially increased return. In respect of producers registered in this country the United Kingdom Government, as is well known, levies taxes up to 55 per cent. of profits. Despite these heavy imposts, it is undeniable that producers will for the time being earn larger profits, but if the rubber producing industry is to be left to bear the burden of long lean periods which has more or less been its lot for the last twenty-five years and is to be deprived of the benefits of these rare profitable intervals, then by no means can it set aside the sums necessary for replanting, the rehousing of labour and similar progressive measures.

As compared with others, this company is probably regarded as being outstandingly successful and yet, including the dividend of 15 per cent. which has just been paid, the average return for the past twenty years has been only just over 5 per cent. For the industry as a whole the return has probably been about half that. Not only its past history but the composition of its ownership should abate Government's tendency to impose too readily increasing burdens on the rubber producing industry. Of the total production of rubber at present coming from Malaya 42 per cent. is derived from smallholdings of only a very few acres each, the owners of which at frequent intervals over the last twenty-five years have been forced out of production by low prices. Ownership of the more highly organised rubber estate is also widely diffused.

Our own case is perhaps typical. This company, modest in size, has nearly 3,600 stockholders with an average holding of no more than £56 and there are only 47 stockholders who each own £500 or more. Thus the labours and the savings of the small man have been united together to form the rubber producing industry, our greatest Colonial enterprise, the outstanding postwar achievements of which are neither too well known nor appreciated. It would seem that the main fault of the industry lies in its failure to tell its own story. This statement may help to some small extent to repair that omission.

FILLERYS TOFFEES

SIR HERBERT MORGAN'S SPEECH

The sixteenth annual general meeting of Fillerys Toffees Limited was held on November 28th at Birmingham.

Sir Herbert Morgan, K.B.E. (the chairman), in the course of his speech, said: The position of the company, which has been improving year by year, is sound and the profits are satisfactory; the result of efficiency in production and administration.

The improvement has been brought about by a considerable increase in our output due to two principal causes. The first is the exceptional quality of our toffee which it has been our policy to maintain at all costs. The other reason is the increase in our export sales which are three times as great as those shewn in the last accounts. Of this, by far the larger part is represented by exports to hard currency countries. This represents a considerable achievement.

The position so far as raw materials generally are concerned is that many of these remain subject to allocation of supplies from the Government, but, except sugar, are available in increased quantities, particularly glucose and fat. Supplies of sugar are one of our main anxieties and there seems little hope of an immediate improvement.

One of the commodities has, however, been freed from general allocation. Condensed milk, which is so vital to the manufacture of good toffee, is now available in unlimited quantities.

Our agencies abroad, and our representatives who keep in touch with our export trade in particular, tell us that the public are asking for "Fillerys" and when possible insisting on "Fillerys" without any mention of the word "Toffee." That is popularity indeed. The Toffees of Good Taste.

The report was adopted.

BRITISH CELANESE LIMITED

SALES AGAIN A RECORD

SUBSTANTIAL EXPORT BUSINESS

MR G. H. WHIGHAM'S ADDRESS

The thirty-first annual general meeting of British Celanese Limited was held on November 30, 1950, at Winchester House, Old Broad Street, London, E.C., Mr G. H. Whigham, the chairman, presiding.

Mr W. H. Poxon, F.C.I.S. (director and secretary), read the notice convening the meeting and Mr T. Lister, of Messrs Thomson McLintock & Co., read the auditors' report.

The chairman said: Ladies and gentlemen,

I regret that Dr Camille Dreyfus, who is at present in America, and Sir William Alexander, who is indisposed, are unable to be present.

I propose, with your agreement, that the report and accounts be considered as read.

The net profit before taxation constitutes a further record and shows a substantial increase over the previous year.

Dealing with the balance sheet of British Celanese Limited, the financial position shows that a further strengthening has taken place during the year. This is reflected in the reserves (excluding the item future taxation) which have increased from £2,274,000 to £3,149,000.

After providing for future taxation, working capital has increased from £5,324,000 to £6,334,000, although no new money has been raised and despite the fact that £1,046,000 was expended on the item land, buildings, plant and machinery; £159,000 on additional trade investment and investment in subsidiary companies, and £88,000 on the reduction of fixed long-term liabilities.

Total current assets have increased by £1,783,000, whereas total current liabilities, together with future taxation, have only increased by £773,000. Ignoring the item future taxation, total current assets are now approximately three times total current liabilities.

TAXATION AND DIVIDENDS

A further £285,000 has been placed to the credit of taxation equalisation account which now stands at £765,000. The larger amount set aside this year arises mainly because the increased rate of the initial allowances announced in the 1949 budget was effective during the whole of the financial year under review, whereas it was only effective for a portion of the previous year.

You will have noted from the report that the directors recommend a dividend of 10 per cent. as compared with 8 per cent. for the previous year. In this connection, I would point out that the substantially improved results during recent years have been largely due to the costly technical and commercial development and plant expansion carried out in past years. Since the end of the war, expenditure on plant expansion, modernisation and replacement alone has amounted to £4,377,000, in addition to which further substantial sums have been utilised for working capital. Notwithstanding these factors, £1,800,000 only has been raised by the issue of new capital (in the form of first preference shares).

TRADING

I am pleased to report that the year's sales constituted another record both as regards volume and value. Each of the main products made its contribution to this. Last year I referred to a falling off in the demand for plastics, but this year sales have recovered to a very marked degree.

In the home market there has recently been a number of indications that the rise in the cost of living and the increases in the prices of many cotton and woollen goods have forced the public to become more selective in their purchases of clothing. The Wholesale Textile Sales Index shows that sales of some important articles have fallen off sharply. This tendency has not been reflected in the demand for your company's products. Indeed, despite increased volume and turnover, we were very far from being able to satisfy the requirements of our customers.

To compete in the export market necessitates an outlet in the home market denied at present by the incidence of purchase tax. It is difficult to market fashion fabrics for the export trade without this home trade outlet, and the present purchase tax rate of 66⅔ per cent. on the wholesale price of non-utility fabrics for the home trade seriously complicates this desirable form of export trading.

The recently proposed modifications in the continuous filament rayon fabric utility schedule, the principle of which has been agreed by the Board of Trade, should permit of a greater variety of fabrics being sold free of purchase tax, and will, therefore, to some extent alleviate the position as regards export fabrics, but we still feel that purchase tax should be abolished on all types of rayon goods.

EXPORT BUSINESS

A substantial part of the company's turnover is represented by export business, and here also figures are higher than ever before.

Devaluation helped the company to re-establish itself in certain of the hard currency markets, and very special efforts have been made to expand our sales in these countries. During the year members of our sales and technical staffs have visited these countries and studied market requirements at first hand, and hard currency sales show an encouraging increase.

For the remaining export markets business in the main is now limited by our ability to supply, but we view with concern the recent abnormal increases in the tariff on British woven rayon goods into Australia. The new duty is at approximately 10 times the previous rate, and this imposition must indeed be a very questionable advantage to Australia since their own weaving industry can supply only a small proportion of Australia's requirements

In some markets we are having to refuse certain export business that is being offered to us both in yarn and fabrics.

HARD CURRENCY SALES

We have, of course, to give preference to hard currency sales. Otherwise, wherever possible, we endeavour to be selective and to direct our efforts to building up a regular and steady export business based for the most part upon branded lines. Export orders are offered to us today which would give a better profit per unit than our regular export trade, but these are refused since they are offered in circumstances where there is small likelihood of repeat orders or of our being able to build up any goodwill. Our aim is to consolidate our export business, although this policy involves penalising, to some extent, our long-suffering home trade customers who continue to press us for more goods than we can give them in practically every section of our business.

As a matter of interest, the volume of our textile exports during last year was nine times the prewar figure; the value, of course, shows a much larger increase.

PLANT EXPANSION

As indicated in my speech last year, it is the board's intention to undertake a considerable amount of plant modernisation each year, and, pursuant to this policy, your board have approved during the year further substantial expenditure, the major part of which is in respect of Spondon Factory, where good progress continues to be made.

As regards the proposed yarn spinning plant at Wrexham, site levelling and other preliminary work have been undertaken during the year. Certain difficulties of terrain have been encountered in excavating for plant foundations, also delays have occurred in finalising the lease as well as in securing satisfactory arrangements for the necessary services; in consequence, it has not yet been possible to commence the construction of the plant. It is expected, however, that these difficulties will shortly be resolved. While it is the present intention to utilise a portion of our cash resources for the project, it will be necessary, as I intimated last year, to raise further capital in this connection.

At our Wigan, Jarrow and Blyth factories plant installation continues satisfactorily, and production is progressively increasing as labour becomes trained.

FUTURE OUTLOOK

The future outlook is overshadowed by the world political situation with its accompanying uncertainties. Apart from this, the events of the past year give plenty of support to a confident long-term outlook for rayon, and especially for acetate rayon.

We are fortunate in having cellulose acetate as the main basis of our manufactures. In the hands of our production and technical staffs, it continues to show wide

capabilities of progress and versatility in application. These advantages apply not only to its methods of manufacture but also to the yarns and plastics made from it. Our yarns have shown their adaptability to modern processing methods and our plastics to the most modern technique in producing film sheet and moulded materials.

Germany and Japan are rapidly recovering from the low immediate postwar levels of their production and exports of rayon. Germany's output and exports in 1949 were nearly double those in 1948, while Japan trebled both output and exports. Even so, the volume of yarn coming on to the world markets from these two countries is, in view of the demand, not yet sufficiently large to be a disturbing factor. Obviously, it can only be a question of time before adjustments in the existing markets will have to be faced. It is, nevertheless, worth bearing in mind that the bulk of the capacity that remains to be brought back into production by these two countries is chiefly designed to produce viscose and not acetate rayon.

INCREASED PRICE OF YARN

We have recently announced an increase in the price of Celanese yarn—the first increase since 1947, and I would like to make a few remarks in explanation of this. It is the policy of the company to keep the price of its yarn as low as possible consistent with a reasonable return on the large capital employed and having regard to the high cost of plant replacement and technical development.

Since 1947, there have been various increases in the cost of fuel, transport, other services and wages, which until recently we have been successful in absorbing by improved techniques and higher production. During the last few months, however, the prices of our main raw materials have, due to abnormal circumstances, increased to such an extent that we had no alternative but to raise the price of our yarn.

This country is almost entirely dependent upon external sources for supplies of cellulose, our main raw material in the form of cotton linters and wood pulp—and the position has become difficult not only on account of price but also on account of availability.

We are also large consumers of liquid organic chemicals and, while we are at present not unduly disturbed about supplies of these, the prices are also advancing.

COMPENSATING INCREASING COSTS

The increases we have made in our yarn selling prices will about compensate for the increase in costs with which we are now confronted, but the price rise would have had to have been larger were it not for the fact that we had on hand stocks of low-priced raw materials. Unless our raw materials become available to us at prices very much less than those we are paying today, a further increase in the price of our yarn will be inevitable.

Despite this recent price increase, Celanese yarn is still only about 60 per cent. dearer than prewar, whereas cotton and wool, the chief natural textile fibres, have increased in price some six or seven times. Before the war, Celanese yarn was more than three times the price of cotton yarn; today it is nearly one-third cheaper than cotton yarn; the comparison with wool is even more favourable. Even should the prices of natural fibres fall somewhat from their present high levels, the competitive position of Celanese yarn would remain extremely favourable.

The number of people employed by the group at the end of the financial year was over 15,000. Several of our factories have been established in development areas where we are progressively employing more people.

I take this opportunity, on behalf of the Board, of thanking all our employees for their excellent services during the year under review and for maintaining and increasing the output and distribution of our various products.

The report and accounts were approved, the retiring directors re-elected, and the new articles of association were adopted.

NOTICES

WEST AFRICAN INSTITUTE OF SOCIAL AND ECONOMIC RESEARCH

UNIVERSITY COLLEGE, IBADAN

Applications are invited from ECONOMISTS for posts at the Institute, on the salary scale £900—£1,300 p.a. F.S.S.U. Partly furnished residential accommodation at not more than 10 per cent of salary. Passages for members of staff and wives paid on appointment and leave. Considerable research facilities offered.

Applications (six copies), giving full details of qualifications and experience and the names of three referees, should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date December 16, 1950.

UNIVERSITY OF BRISTOL

The University proposes to make an appointment to the Chair of Economics made vacant by the retirement of Professor Hamilton Whyte, and has also decided to establish a professorship in applied economics, e.g. social economics, industrial economics, public administration.—Further particulars of these appointments may be obtained from the Registrar, to whom applications for either Chair should be submitted not later than February 1, 1951.

ADMINISTRATIVE STAFF COLLEGE

Applications are invited for the post of Director of Research at the Administrative Staff College. Candidates should have exceptional qualification in one of the Social Sciences and have demonstrated their capacity to contribute to learning by research. Salary will be equivalent to that of a University Reader or Professor according to the age and experience of the selected candidate, with allowances. The College is a member of the F.S.S.U. The successful candidate will be expected to take up duty in May or September, 1951.—Applications should be sent not later than December 31, 1950, to the Principal, The Administrative Staff College, Greenlands, Henley-on-Thames, from whom further information can be obtained.

PETROCHEMICALS LIMITED has a vacancy for junior Executive to act as Liaison Officer with its overseas selling organisation. Candidates must be fluent speakers of French, have either University degree in chemistry or good previous technical background in general chemical or allied industry, and preferably have had previous experience of export sales. The appointment calls for pleasant personality and qualities of tact and discretion. Frequent travel to Western Europe may be involved, but work is normally in London. Salary according to qualifications and experience. Generous non-contributory Staff Assurance Scheme.—Apply in strict confidence, giving full details of age, experience, etc., to Export Manager, Petrochemicals Limited, 170 Piccadilly, W.1, marking application "Liaison."

OLD-ESTABLISHED East India Merchants, with offices in Singapore, Indonesia, Sydney, New York, etc., require Manager, Senior Assistant for their Export Department in London (textiles, hardware, building materials, chemicals, pharmaceuticals, etc.).—Write full particulars, qualifications, etc., to Box 544.

ASSISTANT SECRETARY-ACCOUNTANT. — Major Company invited to consider appointment of person now concluding full-time study for qualification with comprehensive supporting experience. Age 33 years.—Box 542.

INFORMATION bulletins, Journals of Societies or Institutions: Consultant editor and designer will undertake production, layout and finalization of text for printer. Moderate fees. Inquiries invited from Embassies, literary, social and industrial bodies.—Box 547.

PETROCHEMICALS LIMITED has an outstanding vacancy in its Export Department for senior Sales Executive to hold overall responsibility under the Export Manager for sales to Europe. The appointment is at London Head Office. Candidates should preferably be not more than 40 and have sound technical background in general chemical or allied industry. Fluent knowledge of French and/or Italian and/or German essential (in that order of proficiency) as well as previous first-class experience of export selling. Salary to successful candidate will be commensurate with the responsible nature of the appointment. Generous non-contributory Staff Assurance Scheme. —Apply in strict confidence, giving full details of age, experience, etc., to Export Manager, Petrochemicals Limited, 170, Piccadilly, W.1.

MONSANTO CHEMICALS LIMITED require Sales Trainees in the age group 21/26, of good general education. Some commercial experience an advantage and knowledge of Export practice desirable.—Apply, by letter only, giving full details of age, education, and experience to Chief Personnel Officer, Monsanto Chemicals Limited, 8, Waterloo Place, London, S.W.1.

ASSISTANT STATISTICIAN required in London office of leading Merchant and Agency House. Should have Honours Degree in Statistics or Economics. Age under 30 preferred. The post holds interesting future possibilities for a highly intelligent and adaptable man.—Write, giving full details and salary asked, to Box 614, Dorland Advertising, 18-20, Regent Street, London, S.W.1.

APPLICATIONS are invited for Executive position requiring extensive knowledge of engineering industry. Experience in merchandising of machine tools and engineers supplies and ability to assess and exploit sales potentialities of such articles, through existing sales organisation. Suitable salary will be offered to the right man who must have the experience, personality and energy to share control of existing, well-established company. Prospects will depend on ability of successful applicant to take full share in profitable development of business. State age, qualifications, experience and salary level in confidence to Box 516.

A VACANCY exists in a large organisation for a young man about 30 years of age who holds a degree in economics with honours in statistics. Some knowledge of Powers Samas accounting machines and methods would be useful but not essential. He would be given a period of training in the Head Office of the organisation and if in 4 or 5 years he is satisfactory he would take over the management of the organisation's Statistical and Sales Analysis Department with a four figure salary.—Apply giving age and full particulars to Box 536.

INCORPORATED Accountant, Graduate (32), holding senior Public administrative post, seeks appointment with responsibility in mercantile, commercial or industrial organisation; energetic, adaptable, tactful; references.—Box 545.

LADY Graduate (age 21-30), required by marketing research organisation in Oxford for position of Research Assistant in statistical department. Statistical knowledge essential (preferably with economics degree though mathematics considered). No previous experience necessary. Write, Personnel Manager, Nielsen, Oxford.

CHRISTMAS AND NEW YEAR HOUSE PARTY AND WINTER SPORTS HOLIDAYS.—Join an informal party of professional and university people and enjoy Christmas in pleasant surroundings and interesting company.—Full details of these and other arrangements from Erna Low, 9, Reece Mews, London, S.W.7. KENsington 0911.

ECONOMIC JOURNAL, 1911-49. Unbound. Complete. Good condition. What offers?—Box 541.

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 2, 1950, total ordinary revenue was £82,717,000, against ordinary expenditure of £64,980,000 and issues to sinking funds nil. Thus, including sinking fund allocations of £11,271,000 the surplus accrued since April 1st is £99,063,000 compared with a deficit of £47,524,000 for the corresponding period a year ago.

Success of a Mission

TWO things have happened since Mr Attlee left for Washington which have changed the specific context in which his talks with Mr Truman began. There are whispers of Chinese willingness to negotiate a cease-fire in Korea, and there appears to be a chance that, even without it, the position of the United Nations forces can be stabilised. If either of these possibilities materialises, Britain and America will be faced with a more precise problem in their relation to each other and the rest of the world than was apparent when the President and the Prime Minister met last week. Are they prepared to negotiate with the Chinese? If so, on what terms? This, there is no denying it, is the main question to which no answer was given in Washington.

Before judgment is passed on what was achieved there, it is only fair to remember that the question had hardly arisen in this clear cut form when the two men met, and that they could not have been expected—they might even have been wrong—to produce a unanimous answer. They came to the meeting with different mandates, and to have reconciled them before they parted could only have exposed one government or the other to the full blast of public opinion on the disappointed side. It is not by the measure of their agreement on specific issues but by the extent to which they have improved the prospects of agreement on all issues current and future that the success of their meeting must be judged. By this standard, it was largely successful. Mr Attlee went to Washington to do three things. First and foremost, he went to close the rift in the Anglo-American alliance, or, rather, to assure himself and Mr Truman that there was no rift. This was entirely distinct from the need to iron out differences of policy; it was the need to overcome a crisis of confidence such as might have led to a permanent divorce. He went, secondly, in his own words, "to align our policies in the new and troubled situation in the world." Finally, more or less coincidental in timing but important for all that, he went to sort out the confusion over the atom bomb.

The crisis in confidence is over—over, that is, for the heads of the two states and their officials, though it remains to be seen how far it is over for the peoples of the two nations. So far, despite some outrageous behaviour by the extremists on each side, public opinion on both shores of the Atlantic has been moderate and sensible; whether this continues may depend on how great a strain, and how soon, events will impose on it. But it is a great "source of satisfaction" to the whole western world "that the views of the two governments on basic problems are so similar" and a great comfort to hear, if with some wishful thinking, that "the peoples of the United States and the United Kingdom will act together with resolution and unity to meet the challenge to peace." This affirmation of Anglo-American solidarity has immediate and tangible advantages. It will help to overcome the domestic crises of confidence which were threatening the two heads of state in their own countries. It will strengthen the faltering

determination of the rest of the free world to face the bitter realities that determined resistance to Communism must now entail. Above all, it makes possible that cool-headed approach to the strategy of the coming months in which lies the best chance of avoiding war—and the absence of which, in America at least, might have become a very serious danger to peace. This has borne immediate fruits in the three powers' reply to the Russian note, agreed in Paris last weekend.

On the atom bomb, Mr Attlee has done the best that could be expected. He has got an assurance from the President that he hopes never to have to use it, and that he has no immediate intention of doing so. Further, he was assured that he would be told if and when the President felt differently about it, though he received no promise that the President would be guided by British reactions if he ever felt that he ought to use it. None of this is new, but such was the state of international nerves that it needed restating. Immediate flutterings in Western Europe and Asia about an imminent atomic attack have been stilled. The President has retained the right to make the final moral decision, but this is a right which in practice must always be his.

*

Though there are gaps, and very important ones, there has also been impressive progress in the alignment of policies. Briefly, there was unqualified agreement about the need for a united front in Europe, and upon the broad balance of effort between Asia and Europe. Both issues were at stake when the Prime Minister went to Washington, and on neither could the West afford uncertainty. On the other hand, there was almost no explicit alignment on the Far East, and apparently no mention at all of the vital strategic area which lies between—the Middle East. With the short time and full agenda before them, the delegations may perhaps be pardoned this omission. But the fact remains that the Middle East is just as vulnerable and strategically as vital to the West as any area on the globe bar Europe itself, and there is no reason to suppose that the Russians will allow time for it to be made more secure.

The two Governments were agreed that they had "no other choice but to devote themselves with all vigour" to building up their own defence forces; they will expand their production for the common effort; they will jointly distribute existing supplies of raw materials in the common interest and jointly set about increasing these supplies. In other words, they will do what has got to be done to defend Europe—and, within the limits of healthy civilian economies, they will do it now and count the cost afterwards. This is the kind of lead that Western Europe has needed for some time. If the President and his advisers had not been hamstrung at home, Europe might well have got it already from America, but it is all the more effective for Britain's unconditional association in it. It was supported by the unanimous agreement that the integrated force must now exist in truth as well as in theory, and that the force should be launched by the appointment of its supreme commander as early as possible. Finally, these decisions were given their essential perspective by a joint reiteration that the purpose of all these preparations is peace, and that it is still open to Russia to render them unnecessary.

All this means that China's latest actions have not succeeded in distracting attention from the main battle-field of the cold war, which is Europe. It is accompanied by a stolid declaration that the two powers will continue to help the free nations of Asia against Communist aggression. This alone will clearly not keep Asia with them. But it is a statement of policy which clearly needed to be made—provided always that the two governments really felt there was still a chance that they could mean what they said.

*

It is on the implementation of this general policy, however, that visible agreement peters out. Some possibilities of flat disagreement were, it is true, ruled out. There shall be no appeasement and no reward for aggression on the one hand, and on the other, there is readiness to end hostilities by negotiation. The extremes have thus been eliminated: the extreme British Left which might press for peace at all costs; and the extreme American Right which was pressing for war against China with no punches pulled. To realise how enormous a gain this represents, it is only necessary to glance back at the fears of two weeks ago. It is now clear that Communist aggression in the Far East is not going to achieve its primary purpose of driving the free nations apart. And it is also clear that nobody in the western countries is going to allow himself to be driven by anger or chagrin at what has happened in the Far East into precipitating another world war. These are achievements of the highest importance.

But if these terrifying extremes have been ruled out the ground between them is still bleakly blank. It is still very difficult to see how the problem of Korea itself is to be resolved. It has become clear in the last two weeks that virtually every member of the alliance of the free nations, except the United States itself, would be willing to accept the Chinese Communists as members of the United Nations and to engage with them in a discussion on the future of Formosa, if by these means a satisfactory and honourable end could be put to the fighting in Korea. But the Americans have made it equally clear that they will accept neither condition. On the letter of the communique and subsequent semi-official statements, they are, it seems, prepared to negotiate in terms of Korea alone and not in the broader context of Chinese questions generally. Furthermore, they insist on a cease-fire first, and talks afterwards. But there is no sign that the Chinese will agree to this. Sir Benegal Rau believes that the Chinese want a peaceful settlement which, if they and Mr Vyshinsky are really speaking with one voice, might mean that they would settle for the moderate price of a seat in the United Nations and a share in discussing Formosa—in addition, presumably, to a settlement in Korea which left at least a buffer state on their own frontier. But there is no reason whatever to believe that they will accept the much lower price that the Americans are offering.

For all the hopeful messages that are appearing in the press, it is thus difficult to see a way out of the deadlock. There is certainly no possibility whatever of a general settlement in the Far East. Those who cling, rather pathetically, to the belief that, with one or two small concessions, the Chinese Communists will be ready to settle down as good neighbours, are flying in the face of obvious facts. The evidence is that Mao's policy is as aggressive and as expansive as Stalin's and that, if he is prepared to treat at all, it will be for purely tactical reasons. It would be pleasant to be able to believe that the Far Eastern problem can be solved; but it cannot. The best that can be hoped for is a temporary *détente* in the present international tension and an end to the actual fighting on terms that do not reward aggression. But even that, in the view of the majority of the United Nations, would be worth a good deal. Whether or not it can be achieved depends more than on anything else on the military situation in Korea. If the Chinese are encouraged to believe that they can force further large retreats on the United Nations forces, it is difficult to see why they should have any interest in being moderate. But if they think that they have got about as far as they can go (and General Collins's report encourages the belief that it may be so), then they may be willing to allow deadlock to become stalemate, in which case diplomacy can get to work.

Much also turns, of course, on the choices that the Americans make in the dilemmas that confront them. But at least we now know that any decisions will be reached with a full sense of responsibility and in the light of an appreciation of the world situation that is closely similar to the British. The great comfort that Mr Attlee brings back from Washington is the assurance that loyalty to the American alliance is not merely the compulsory policy for Britain but also the one that we should wish to follow.

Desperation in Coal

IT has taken the National Coal Board only four years to acquire all the characteristics of an *ancien régime*, rigid, unimaginative and helpless before forces which its function is to control. Like other regimes of the kind, it is by refusal of reforms putting itself in danger of making revolution inevitable. If a fuel crisis comes in February it will probably be beyond the power, if not the wish, of Mr Noel-Baker and the Labour Party to preserve the present organisation of the coal industry. And even if this winter no one loses his job for lack of the one material this country can still have for the taking, that is unlikely to mean for the Coal Board more than a post-ponement of its own crisis.

This conclusion is as uncertain as most attempts to see present affairs in historical perspective. But no thoughtful observer of Tuesday's debate in the House of Commons, and of the events that have led up to that debate, can avoid at least some strong suspicion that it is the right conclusion. To anyone of any party it must be unwelcome. No serious politician or practical economist, whatever his reservations about other early measures of the Labour Government, opposed the nationalisation of coal in principle or even criticised comprehensively the particular form laid down for it in the 1946 Act. This, if any, was the case where change of ownership might directly work large and rapid improvements both in welfare and in efficiency. It would have been foolish to imagine that the ideal new organisation had been found at the first attempt; it was reasonable to think that by gradual modification, with the ready learning from experience that the brave new spirit of the industry would stimulate, the initial defects could be smoothly removed, and the National Coal Board could in time settle down to provide the coal the country wanted with a high standard of living for the miners.

Four years is a reasonable trial period for most organisations; and at the end of it we are importing coal. It is perhaps still necessary to emphasise that the forces which have brought the country again to this situation, the forces that the Coal Board has proved unable to master, are in no way the product of nationalisation. They are, essentially, the unwillingness of men to be (and, especially, to remain) miners, and the unwillingness of miners to get coal. And these attitudes are the product of economic changes extending over thirty years and more. They have been made acute by the social revolution involved in full employment after years of depression in the coalfields. Though its worst effects may be modified, the revolution is in substance permanent. Nothing will quickly re-establish in the new conditions either the coal industry's ability to attract and keep workers or the miners' will to work. Gradually, no doubt, the status as well as the financial rewards of mining can be raised. Gradually, no doubt, the miners and their wives will become accustomed to the new standards of living open to them; it will no longer be a big minority that prefers three days a week of leisure to high earnings. But these, even on the best assumption, will take a long time. In the short run there are no effective remedies. It is doubtful whether the conventional way of drawing fresh labour into an industry, by putting up real wages, would increase output at all. The extra miners—"green" labour whose productivity would be low—might contribute less output than would be lost by higher absenteeism if the experienced men could earn as much in three days as they now get in four. This seems to be the Coal Board's fear. Whether or not it is justified is difficult to tell in the absence of convincing evidence about the miner's motives for taking irregular days off; that this evidence has not been collected is, indeed, one of the symptoms of the Coal Board's inadequacy to its tasks.

*

There is no reason to take seriously claims that better organisation or any other specific could quickly restore the coal industry to health. The Board's failure is not so gross and direct as that would imply. The fact remains that the Board has in four years failed to make such small impression on the coal industry's problems as could reasonably be expected. Output per man year remains even in 1950 nearly 10 per cent smaller than it was in 1937. Absenteeism has barely been reduced since the five-day week began. Even output per manshift worked is only a little above the prewar level, and after the improvement of 1948 and 1949 has shown hardly more than seasonal changes this year. All the scarce machinery and equipment poured into the mines during the past ten years has perhaps arrested what would otherwise have been a continuous decline in productivity; more than this could be said even for the limited and unsatisfactory mechanisation of British mines between the wars. It would have been too much to expect the Coal Board to remove in four years all the bitterness of the past and revolutionise the miner's attitude to his job; but what it has failed to do is to produce even those immediate improvements in the psychological atmosphere of the industry on which the advocates of nationalisation so confidently counted. Judged by the figures, the miner

does not work any more willingly for the state than he did for the capitalist.

The immediate question is whether, now that coal supplies have again sunk to the point of crisis, the Coal Board can succeed where for four years it has failed. All that happened this autumn was that the drift of workers from the mines, which has been going on steadily since early in 1949, got to the point at which it balanced the diminishing improvement in productivity. The Board is doing nothing that looks in the least likely to alter these trends. Saturday working will no doubt yield some extra coal again today. Previous experience provides no reason for thinking that after Christmas, when the miners' usual seasonal effort is exhausted, it will make any net contribution at all to output.

Most of the further measures that Mr. Noel-Baker outlined on Tuesday are rather feeble repetitions of remedies of proved ineffectiveness. Proposals to recruit Irish and Italian workers, even if they ever come to much in practice, are not going to revivify mining manpower when attempts to draw on the much more extensive sources of foreign labour available in 1947 had little effect. The promise of special Government action to provide miners with houses also repeats a type of administrative discrimination in favour of the mining areas that has proved to be of little use. And while it is no doubt sensible that miners should be discouraged from entering the Forces, the numbers involved cannot be large. The total result of this programme may be to limit to, say, 15,000 what would otherwise be next year another fall of 20,000 in mining manpower. The smaller reduction will be as adequate as the larger to ensure, unless there is a sharp improvement in productivity, that there will be an acute fuel crisis next winter if it is avoided this winter.

There is, in other words, no prospect of relief along the lines of policy that the Coal Board has followed for the past four years. If these are the only measures possible, then the sooner the Government settles down to the organisation of a siege economy in the use of coal, the better it will be. If this defeatist conclusion is unacceptable, as it surely must be, then the one alternative must somehow be found. There has to be some new, truly imaginative, effort to reverse the forces that are pulling coal output so far below demand ; what is necessary is not to scrape round for foreign coal here and foreign workers there, but at last to achieve that sharp revival of an ailing coal industry which was hoped from nationalisation four years ago.

There is still no inevitable reason why this revival should not be achieved, if it can be achieved at all, by the National Coal Board. Plainly, that is the best chance. No one wants to have to make a fresh start in organisation at this stage. The coal industry has suffered quite enough from the inevitable delays in getting management running smoothly after the upheaval of 1947. To be forced now to a drastic reorganisation, or even to radical changes of personnel in the top posts of the industry, would be to take an enormous risk of doing far more harm than good. Yet public opinion (and, one may guess, the Government) is losing patience. Coal will certainly not be won by timidity. The last thing the Coal Board can afford to do is to shrink from novel or drastic measures in fear that they will provoke criticism. It should not even shrink from incurring extra costs—provided that they are less than the extravagant price of shipping coal from the United States.

No one can honestly pretend to certainty about what new policies would be effective. Probably an increase in wages, at least enough to keep pace with the cost of living, has to be tried. That will mean an increase in the price of coal and a further rise in the cost of living ; but if it is inevitable in any event, it will be more likely to do good as an act of deliberate policy now than if it appeared to be given late and reluctantly under union pressure after wages in other industries had already risen. Probably a drastic decentralisation within the present organisation—not so much from the London headquarters to the divisions and areas as from the areas to the individual managers in the pits—would still do as much as anything quickly to secure at any rate some small increases in output. No solutions are simple. What it is impossible for the outsider to believe is that there are no solutions at all, that nothing more than is being done can be done. When one has made every reasonable allowance for the intractability of the coal industry's problems and for the difficulties that beset a large new organisation in its early years, the Coal Board's record encourages no confidence in its capacity to make the imaginative effort of formulating new policies. If new policies are not apparent soon, the assumption will have to be—if only because the other conclusion is so grim—that the failure is in large part human and organisational. All that could then be done would be, of course, to scrap the Coal Board as it now stands and to replace it by some twenty or more coal corporations. That is the one alternative which has been seriously thought about. Whatever the arguments for such a revolution in the long run, it would be a desperate measure of last resort when the urgent need is for more coal quickly. The onus of finding ways of avoiding measures of last resort clearly lies upon those who so confidently put forward nationalisation—and this particular form of centralised and cumbrous nationalisation—as a panacea.

Commonwealth Conference

IN three weeks' time the Prime Ministers of the Commonwealth will be meeting in London for about ten days to discuss foreign affairs. Mr Attlee sent out his invitation before the Chinese launched their attack in Korea, but it is obvious that the value of his decision has been enormously increased by what has happened since. Recent world events have rubbed home the fact that the whole Commonwealth, western as well as eastern, is faced for the first time by a common danger. Communist pressure in both Europe and Asia is certainly controlled with much greater singlemindedness than ever came out of the Berlin-Tokyo axis. This not only accentuates the importance to the Commonwealth itself of any decisions that may be reached at the conference, but will emphasise the role of the Commonwealth to the rest of the free world. The universal emergency has already disclosed considerable internal divisions of opinion, and has thrust more importance on some member countries than others. Nothing, for instance, can detract in the immediate future from the importance of India's views, either inside the Commonwealth or at Lake Success—where Delhi has been proved right about Chinese intentions and where the patience and wisdom of Sir Benegal Rau have won him a high authority.

In these circumstances, the internal workings of the Commonwealth may well stand in need of some review. Its members have never maintained closer contact than they do now ; it is a remarkable fact that, whereas London sent 5,656 telegrams to Commonwealth countries in 1938, the figure for 1949 was 21,790, while at the present moment they are going out at the rate of over 60 a day. Yet it is far from certain that the members of the Commonwealth are obtaining the maximum value from this contact in terms of world influence. The peculiar position of India, Pakistan and Ceylon as representatives of that almost indefinable thing, Asian opinion, and the growing economic and military strengths of the older dominions have shifted the balance of influence inside the Commonwealth. It is worth asking, as a result, whether any improvement might be made in the Commonwealth's internal machinery in order to allow for these changes.

The evidence would certainly seem to suggest that mere written communication, for all the increase in its volume, is not proving to be enough. There has been a notable increase since the war in the frequency with which the statesmen of the Commonwealth meet in person. It is little more than two years since the Prime Ministers themselves last met in general session in October, 1948—and they have had a special meeting in the interval, in April, 1949, to deal with India's decision to adopt a republican constitution. There have also been meetings of the Commonwealth Finance Ministers in July, 1949, and of the Foreign Ministers at Colombo in January, 1950.

For all this effort, there is still something missing, as is shown by the willingness of the Prime Ministers to come together again and by the long list of topics that they are likely to review. The date of the meeting had to be chosen with considerable care just because each Prime Minister was anxious to be present (except Dr Malan, whose health forbids the journey and who will be represented by another Minister). The date chosen is a compromise, enabling each Prime Minister to put off a minimum of other engagements in order to be present ; but all have put off some, not the least being Mr Nehru, who has expressed a strong desire to come. As is traditional on these occasions, there is no agenda for the conference ; the Prime Ministers fix this themselves on the first day. But the subjects to be discussed are expected to include recognition of the Peking government—only India, Pakistan, Ceylon and the United Kingdom have so far recognised it—the development of the struggle in Korea, the future of South-east Asia and the Chinese invasion of Tibet. Asia is at present the main front in the cold war, and, if any general agreement is to be achieved on Commonwealth policy towards the Communist powers, most of the discussion must be devoted to the Orient. In addition, the conference is almost certain to discuss the economic and political progress made in Europe during the past year and the steps that are being taken to build up the North Atlantic Treaty Organisation, including the rearmament of Germany. Up to the present there has been no clear suggestion that the Middle East will be discussed at any length, but it would be a serious mistake not to do so ; the Commonwealth has as deep an interest in this part of the world as it has ever had in the past.

★

With so much importance attaching to a meeting that can only with some difficulty be arranged, it is inevitable that the question should once more be raised whether there is not need of some central organ for the Commonwealth by which policy can be hammered out in the intervals of Prime Ministers' meetings. Voices have recently been raised in Australia to suggest that a permanent central committee should be established, to help in this and any matters, whether foreign or internal, affecting the Commonwealth as a whole. This suggestion has not so far found favour elsewhere in the Commonwealth, and Mr Menzies, the Australian Prime Minister, is understood not to have pressed it when he visited London some time ago. For the United Kingdom, Mr Attlee has lately stated in the House of Commons that he does not consider a sufficient case had been made out for such a committee. Nevertheless, the Australians nowadays consider it necessary to keep a Resident Minister rather than a High Commissioner in London. And it is certainly arguable that the increasing frequency of Ministerial meetings since the war suggests a growing desire to align Commonwealth policy as a whole, rather than merely to exchange information.

Mr Attlee's recent visit to Washington provides a clear example both of what the present system of consultation between the members of the Commonwealth can and of what it cannot achieve. Mr Attlee kept the members of the Commonwealth informed of his views and intentions before he left ; he also summoned the High Commissioners to Downing Street after he had seen the French Premier, M. Pleven, so that when he took off, he was as fully briefed on the views of the Commonwealth governments as they were on his. Undoubtedly, this lent both breadth and weight to the views he put forward in Washington. But he did not go there as the representative of the Commonwealth, nor could he commit any government but his own.

In circumstances like these, it is a great temptation, especially to those whose minds naturally incline to the idea of federalism, to expatiate on how much greater would be the authority of Britain in the counsels of the world if the Commonwealth would speak with one voice and pursue one policy. That is true enough ; but it is an academic statement with very little relation to the actual state of affairs. The truth is that the Commonwealth could not speak with one voice, because it is not all of the same mind. This also can be illustrated by the Far Eastern crisis. In spite of the shaking that Delhi has had from Chinese action in Tibet, Mr Nehru preserves an impartial silence about the Russians. Speaking as recently as December 5th, however, Mr Lester Pearson, the Canadian Foreign Minister, clearly stated his view that the leaders of the Soviet Union might "gamble with the future of the world in order to extend the boundaries of the system under their control." India, it may be said, comes nearest to seeing the Russian point of view among the members of the Commonwealth, and Canada the American. Both, on the other hand, are on record in favour of a cease-fire in Korea, followed by a settlement—although their motives are not quite the same ; Mr Pearson wants it in order "to reach a *modus vivendi* with the Asian Communist world," since "we must guard freedom by wisdom as well as by arms." Mr Nehru dwells more simply on the need at almost any cost "to avoid the terrible alternative of a catastrophic war."

★

Both these views spring from deep conviction, and it would be impossible to reconcile them merely by meeting round a table in London or elsewhere. In fact, neither side would wish to reconcile them. If the Commonwealth were an organisation which felt itself compelled to reach a common view on all matters of importance, there would be much less willingness to belong to it. This is the essential fact that should be grasped by all who concern themselves with the organisation of the Commonwealth. Rightly or wrongly, there is no possibility at all of creating any central organs which can take decisions binding on the Commonwealth ; the Commonwealth governments insist on remaining entirely free to pursue their own policies, and the oldest of the Dominions is no less insistent than those who, having only just attained to full sovereign status, might be expected to be most jealous of it.

But to say this is not an end of the matter. What fruitful possibilities lie in closer consultation can be very easily seen by imagining what pleasure there would be throughout the Commonwealth if the Prime Ministers were, by some magic, to find it possible to meet, say, every three months. This is not, of course, within even the widest bounds of possibility, but the idea suggests a line of thought. If the men at the top cannot meet so often, is there any way of enabling others to fulfil part of their function for them ? If the Prime Ministers cannot themselves meet very often, could they appoint deputies, as has been done by the Foreign Ministers in the North Atlantic Treaty Organisation ? If this meant calling the High Commissioners in London by a new name, it would serve very little purpose. Indeed, the essence of such a proposal is that the deputies would not be, as the High Commissioners are, rooted in one spot away from home, but that they should come to each meeting fresh from their own capitals and that each should act as host in turn. This, incidentally, would also avoid the difficulty of finding men who are of sufficient standing in the politics of their own country to know the minds of their governments and are yet willing to risk that standing by residing abroad. Whether such a proposal would commend itself to the Commonwealth governments is difficult to say before it has been widely discussed. But it would be as foolish to wave away all such suggestions and pretend that the Commonwealth needs no machinery as to rush to the other extreme and propose federal solutions which nobody will accept. Though all the Commonwealth governments would equally reject the idea of being compelled to find a common policy, all of them are willing and anxious to do what they can to arrive at their policies in common.

Is Full Employment Secure ?—II.

The Forced Draught

THE first article of this series set out to examine how far the general public's confidence in the permanence of full employment—which is based entirely on the belief that the economists, under Keynes's leadership, have discovered effective means of heading off any incipient slump that might put in an appearance—is shared by the economists themselves. It was pointed out that recent work on the theory of industrial fluctuations, without rejecting Keynes's conclusions—indeed, with a full use of the weapons of analysis he forged—has shown a tendency to re-emphasise the "real," as distinct from the monetary or institutional, causes of fluctuation. So long as there is any economic progress, there will be changes, from time to time, in the appropriate relations between capital creation and consumption, and these changes, even without any mismanagement of the monetary system, will render some resources of labour or capital redundant and unemployed—or at least they would do so in the absence of remedial action.

What remedial action can be taken to neutralise the disturbing effect of these "real" changes ? The simplest remedy of all is the totalitarian remedy. Given, in any sphere, the prospect of a superfluity of labour, one can always find some perfectly genuine social need which that labour can fill but will not fill of its own accord, and direct (or if necessary march it off) to fill the need. If the labour to be regarded as superfluous is that of the careless, the unpunctual, the chronic absentees, the askers of awkward questions, the politically unreliable elements, then stability and relative freedom of choice for the rest can be neatly combined with the requirements of industrial discipline and the security of the regime. There is no reason to doubt the Communist claim to have solved the problem of unemployment —any convict establishment could claim as much— nor to wonder at the remarkable reticence of Communist spokesmen on the mechanics of the solution. By the same token, machinery which would be idle, and

stocks which would be unsaleable, were consumers left to purchase what they preferred, can always be kept moving by a sufficiently wholehearted use of either rationing and prohibition or tax and subsidy. The various disharmonies which produce, in a free economy, fluctuations in the level of activity, are not abolished in a totalitarian setting. They are merely translated into variations between a greater and a lesser use of servile or semi-servile labour, between a more and a less acutely uncomfortable shortage of those things which the public most wants.

The next simplest solution is that in practical favour in Britain today: look after demand and supply will look after itself. Keep up a steady forced draught of inflation —or, given an inflationary situation, do nothing effective to reverse it—and almost anything will be saleable and almost any worker consequently employable. Were this solution permanently effective it would, for all its disadvantages, have much to commend it. It requires lenders to be permanently fooled into making a free gift to borrowers of a fraction of their capital each year (which is what all savers under the National Savings scheme have been doing for the last ten years). It assumes that, failing the necessary supply of voluntary savings, the government can raise enough capital to provide, directly or indirectly, for the appropriate level of investment, without driving taxation up to heights that would be seriously injurious to incentive or enterprise. It assumes that consumers really do not mind very much whether they can purchase their first choices or only their second, third or tenth. It assumes that the discrepancies between the outputs of various goods (between consumer goods and capital equipment, electrical apparatus and generating plant, bricks and bath tubs) do not widen to the point of actual breakdown. If all these conditions can be fulfilled, and if any incidental balance-of-payments difficulties are left out of account, it may very well be argued that the inconveniencies and wastes involved in continuous inflation are unimportant beside the greater waste and far more humanly repugnant hardships and frustrations of slump.

So, in fact, it is argued today. Britain is doing very nicely ; production and productivity are rising fast, and were it not for the prior claims of defence and of the balance of payments the standard of living would be rising to match ; though prices are creeping up, wage and dividend restraint has kept the movement within bounds ; the chronic shortfall of savings is a nuisance, but has had no catastrophic effect. When any particular groups of workers have found their livelihood threatened by an emerging disharmony—by an over-supply of fishing boats, for example—it has always so far been possible to pull a subsidy or other special concession out of the hat, and to pacify or ignore the complaints of consumers. Why worry?

The trouble is that physical disharmonies and discrepancies are cumulative. Encourage, or undertake, investment with a view to maintaining demand through the "multiplier effect," and there is no guarantee that the things produced by that investment will be such as consumers will eagerly buy. Encourage, or undertake, spending on consumer goods through lower taxation, increased allowances, or social services, and there is no guarantee that the things demanded will be such as existing capital equipment is fitted to produce. Unless this dual process starts from a very low level of employment, in which a wide assortment of idle resources of all kinds is standing ready to be called into action, it is bound soon to encounter bottlenecks. Acute shortages of the labour and equipment in strongest demand will appear ; they will bring either steep cost increases or physical controls, or both, long before there has been a complete absorption into employment of all the men and equipment unlucky enough to be specialised in producing the things least in demand. This need not, it is true, immediately frustrate the expansionist policy. If bottlenecks and consequent specific restrictions prevent the public getting what it primarily wants, then its expanded buying power will be diverted to the second best, and will provide employment for the less fortunately specialised labour and equipment. Thus a boom that shows signs of faltering can be established, for the time being, to the satisfaction of the planners, with whatever concomitants of cheerfully rising production indices may be permitted by technical progress and by the looting of past savings through inflation.

But the next time the expansionist recipe has to be used, the partial shortages will appear earlier and be more stringent. The residue of unemployed resources, human and other, will be more obstinately resistant to absorption. For both shortage and superfluity will have been merely masked, not done away with. They will continue to underlie, even between incipient depressions, the apparently healthy balance of the economy. Inflation must be carried further, savers bled a little more severely, a little more economic initiative transferred from private producers and consumers to the state, before the tide of demand refloats the fish-out-of-water of a disjointed economic system. And so for the next time, and the next, until either control reaches a totalitarian comprehensiveness or inflation breaks bounds and, by discrediting the entire mechanism, leaves the economy to face, ill-equipped both institutionally and physically, the painful task of readjustment on the old lines.

★

Must one conclude that the Keynesian technique of stimulating or maintaining demand is a habit-forming and eventually ineffective drug? The answer depends, surely, on how much is expected of it. If it is used as a substitute for particular adjustments, as a means of evading the discomforts involved in the unequal growth or occasional shrinkage of particular industries, as a guarantee that no worker, however little worth his pay, shall ever lose his job, however little use that job may be—then there appears no escape from pessimism. But it should not be impossible to use the Keynesian technique as other potentially dangerous drugs are successfully used every day—that is, in conjunction with measures to make it, as soon as possible, unnecessary. The proper course of action for particular groups of business men and workers engaged in unremunerative pursuits is either to lower their claims, direct or indirect, on the consumers, or to seek another occupation. In no circumstances can this course be entirely pleasant. Not even the classical economists, with their assumption of automatically adequate total demand, regarded it as such. Given that total demand was adequate the thing was possible ; that was all they claimed, and no monetary policy can, in the long run, do more than provide the conditions in which the classic claim holds good. No such policy can indefinitely underwrite physical discrepancies and unwarranted economic claims ; which is as much as to say that no such policy can entirely and permanently avert those "real" fluctuations which underlie the trade cycle. It can, properly and cautiously

used, ensure that they shall be comparatively mild; it can avert the catastrophic aggravations introduced, as in 1931, by monetary and credit deflation; and it can be supplemented by every kind of administrative measure to smooth and expedite particular adjustments and to reduce the discomforts, and ease the anxieties, which they impose upon the economically weakest.

This proper and cautious application, however, can hardly be carried out under the influence of a public opinion convinced that 100 per cent employment is a possible norm and that a decline, say, from 98.5 per cent to 98 per cent calls unequivocally for a bucketful of priming in the pump; that the appearance of a shortage of A and a surplus of B is the signal not for a transfer of resources, but for a ration scheme and a subsidy; that a man's job, useful or useless, is a man's indefeasible property. Such, without exaggeration, is the state of public opinion today—not, emphatically, on the Left alone. It would be a dangerous state even without the complications, to be considered separately, of international trade.

(To be continued)

NOTES OF THE WEEK

Regrouping in Korea

The military situation in Korea has not been made any clearer by the partial blackout on information about the fighting which was imposed by General MacArthur's headquarters last Saturday. Far too much information about the detailed movements and intentions of the UN formations has been appearing in the British and American press ever since July; but to restrict the briefing of correspondents and to demand a "voluntary self censorship" is to place an obligation upon the press which should fall on the soldiers, and leaves the whole military situation shrouded in mystery punctuated by flashes of indiscretion. The wartime practice of giving war correspondents a full and accurate account of current operations, followed by an official censorship of their despatches, is more orderly and just.

Nevertheless the period of chaos and confusion seems now over. The Eighth Army has halted on an arc north of Seoul and the 10th Corps is being evacuated by sea from the Hungnam beachhead, while most of the South Korean forces in the far north-east have been successfully extricated. The Eighth Army clearly intends to fight where it stands. Operations during the past eight or nine days have illustrated the weak point of the Chinese armies—the lack of armoured or mobile divisions to exploit an initial success—with the result that General Walker has had a fair breathing space in which to build up his new position. If the Chinese conclude that the main defensive position is too strong for direct assault, they may yet decide to pin down the British and American formations of the Eighth Army by a large concentration of forces opposite their front, while launching the reformed North Korean divisions against the Kaesong-Chunchon flank of the perimeter (held by South Korean divisions), with a view to driving southwards and linking up with the guerrilla forces operating in Southern Korea. Kim Il Sung, the Prime Minister of North Korea, has issued two bellicose directives to the North Koreans during the past week, which suggests that his troops are being prepared for this role.

Until the Chinese intentions have been made clear it is obviously difficult to decide whether to use the 10th Corps and South Korean Capitol division to reinforce and extend the Eighth Army's position north of Seoul, or whether they must be employed to protect Pusan and the supply route to Seoul. Guerrilla activity is making the route from the south increasingly precarious and it may be necessary to base the supply of the Eighth Army on Inchon—the Piraeus of Seoul—which is an indifferent port but provides a safe passage for reinforcements and supplies to within a short distance of the front.

As a correspondent on page 1088 points out, it is difficult to believe that there are any sound military reasons for concluding that the Chinese must inevitably be able to push the United Nations forces out of Korea. Now that the Eighth Army has had time to dig itself in and to learn that infiltration does not necessarily involve withdrawal, the technical advantages of the United Nations forces should begin to reassert themselves.

* * *

Tangled Policies at Uno

Unreality in war never lasts long; it is a pity that the same cannot be said of diplomacy. The last few days at Lake Success have seen the launching of several well-meant proposals which, unless the Chinese and their malevolent Soviet tutors change their tune, may unfortunately maunder on into long-drawn-out confusion, presumably designed by them to discredit the United Nations and bleed America's fighting strength. Let there be no mistake about this. Until the Chinese show some sign that they will not again unleash their forces—or those of North Korea—no resolutions at Uno can stop the Korean war going on unless it is ended by either evacuation of UN troops or by the unlikely defeat of the Chinese.

The Americans have only grudgingly supported a motion in favour of a cease-fire; and the British, in the words of Mr Kenneth Younger, would not "dream of supporting the proposition" if the price to be paid is victory for aggression. Sir Benegal Rau, the indefatigable Indian delegate, deserves immense credit for the way he has continued to marshal his team of Asian and Arab states through a haze of doubt and uncertainty even about the simplest objectives of the Chinese. But unless his patently sincere and friendly attitude can break through the barriers that they have built around themselves, Uno can offer little more than a meeting ground for hopes.

The course of events in the General Assembly has been extremely confusing. Three separate sets of proposals are under negotiation or discussion: one by the six Security Council powers demanding Chinese withdrawal; another by the Soviet bloc condemning American violation of Manchuria and aggression against Formosa and Korea; a third by a group of Asian and Arab states aiming at a cease-fire and then a general Far Eastern settlement. The political committee of the General Assembly, after tortuous discussion throughout Monday and Tuesday, voted on Wednesday by 51 to 5 (the incorrigible Soviet bloc)—with Nationalist China sensibly abstaining—to defer the first and second sets of proposals in favour of trying to arrange the cease-fire. This proposal, designed to appoint the President of the Assembly with two other persons "to determine the basis on which a satisfactory cease-fire can be arranged," was due to go before the plenary assembly on Thursday.

* * *

The Russians Stir the Pot

The motives behind Russian tactics in the Assembly are still obscure—almost as obscure as the long-term aims of the Chinese. Moscow appears to have voted in two contrary senses and against its own interests. For on Tuesday it even opposed—with 5 votes to 48—the political committee's decision to postpone discussion of the firm six-power resolution demanding the withdrawal of Chinese troops. Two possible reasons for this action spring to mind; one chooses between them according to one's estimate of the Russians' view of Uno's usefulness. Either they wanted to leave nothing undone which would tie the proceedings into as many knots as possible, thus frustrating all action. Or they are still anxious, wherever possible, to avoid running directly counter to world opinion, in so far as it is expressed by Uno decisions.

The main point emerging from all this was probably best expressed by Sir Benegal Rau when he suggested that China with Russian support, appears to be moving to a kind of Monroe Doctrine in regard to any territory adjoining its own borders. Certainly the strident and hissing hostility of General Wu's voice, as he has addressed the Assembly, has had some bitter echoes of the past. The white man is obviously expected to pay for several decades of extra-territoriality and treaty ports.

In directly opposing the cease-fire motion the Russians acted true to form. But it is also reasonable to suppose that they may have done so because they are now prepared to back China up to the hilt over Formosa. By miscalculating American and United Nations attitudes and attacking South Korea in force, the Communist camp spoilt Peking's chances of attacking its main objective, Formosa. Moscow and Peking appear to have aligned their policies closely; if so, every advantage gained from success in Korea must be pressed home in the battle for Formosa. The Communist powers feel on top of the situation in the Far East, and mean to exploit to the full the discomfiture of the Americans while they can. This does not bode well for any rational settlement.

* * *

Aid Suspended

December 31st has been chosen as the formal date when Marshall aid to Britain stops. This country loses the support without which it could not have had, through two postwar years, its food, its full employment, and its rising production. There can be neither regret nor complaint that the support has been taken away eighteen months early. The sterling area's dollar gap was closed a year ago. It is perhaps the best expression of the spirit in which aid was given that the Americans have willingly waited through 1950 to see that this achievement appeared reasonably secure; they have been content in the meantime to go on taxing themselves not to finance their own exports but to rebuild the monetary reserves of the sterling area to a higher level than they were when the European Recovery Programme began.

The only cause for regret is in the circumstances that have enabled the sterling area to close the dollar gap so long before the middle of 1952. The reason is not that Britain's capacity for earning dollars has proved to be greater than anyone expected in 1948. What is different from expectations is the shape of the world economy. The extended postwar boom has given place not to a normal competitive world but to the dangerous and unwelcome necessity of a rearmament boom. It is on this, now that the immediate reliefs flowing from devaluation are exhausted, that the present strength of sterling rests. Marshall aid is suspended not because Britain has achieved what was thought impossible before 1952 but because 1952 as it was foreseen in the comparatively hopeful days of 1948 has been indefinitely postponed. The ability of the postwar British economy to survive in competitive conditions remains untested.

This the United States has recognised, in spite of the booming British gold reserve, by leaving open the possibility that aid may be given again before 1952. Everyone in Britain must be as determined not to take advantage of it as he is grateful to the Americans for the offer. Marshall aid is the most straightforwardly generous thing that any country has ever done for others, the fullest expression so far of that American idealism on which all the hopes of the West depend. That the dollars put into the recovery of Europe have also been a fruitful investment for the United States is the measure of the way in which the interests of the Atlantic community are bound together. Without Marshall aid the North Atlantic Treaty would have been impossible. The suspension of aid means merely that Britain has become a stronger partner in the wider co-operation that has grown from it; and it is by making the British contribution to the Western partnership fully commensurate with Britain's strength that gratitude for the generosity of the American people can best be shown.

The Battle of the Cost of Living

Mr Douglas Jay's weekend speech at West Hartlepool provided a suitably confused postscript to last week's Parliamentary debate on the cost of living. An astute speaker on this theme enjoys rewarding possibilities of unnoticed transition between what are really two very different subjects: between the cost of living—which is the converse of the standard of living, the relation between income and what income will buy—and the cost of living index, a statistical device establishing the relation between the monetary unit and a more or less suitably selected "basket" of commodities. What happens to the former is a matter of productivity, of the terms of international trade, and of inflationary or deflationary changes in the money income of the community; what happens to the latter depends at least as much on what jiggery pokery of ration, subsidy and tax is applied to goods selected for inclusion in, or exclusion from, the basket in question. Mr Jay, skilfully modulating from one meaning to another, regretted that, owing to rearmament, "we could not now enjoy relaxations and advances in standards which would otherwise have been possible" and that it was necessary to "fight the battle of the cost of living"—a mild warning, to say the least, of the actual decline in standards which is to be expected.

The "battle of the cost of living," he explained, was to be fought by controls, "distributing the cost of rearmament fairly." And he supported the case for controls by statistics showing how much better Great Britain had managed, with a fall of only one-sixth in the purchasing power of the pound since 1945, than had the United States and Canada, with falls averaging a quarter during the same period, or than New Zealand with an increase in food prices, since Labour's electoral defeat there, of twice the British percentage. Neither standards admittedly higher than those of Britain (and rising faster), nor the merits, presumably recognised in principle even by Mr Jay, of freedom of expenditure, nor those of honest social accounting, outweigh in his view the advantages of statistical presentation bestowed by the combination of ration, subsidy, tax, and ingeniously selective weighting. The "battle of the cost of living" certainly has to be fought, and in that battle, given the urgencies of defence, only the most unreconstructed adherent of the Manchester School would deny a part to controls. But it should be fought to keep down the real cost of living, to preserve the standard of living so far as may be; not to impose, to the disadvantage of that standard, a deceptive stability or an ingenious statistical artifact.

* * *

Durham and London Airport

After maintaining, in the face of expressed Ministerial disapproval, its original decision to require all its employees to be members of a trade union or professional organisation,

Durham county council now appears to be having second thoughts. This change of mind does not imply a change of heart. It is merely that the Labour councillors now realise that professional people—teachers, doctors, nurses—cannot be coerced by their employers into joining a trade union or professional association. For one thing, the associations themselves would not merely dislike having their membership increased by coercive measures but would actively fight against it. Secondly, if the Durham councillors found themselves unable, because of their insistence on the closed shop principle, to carry out their obligations to provide health and educational services, they would very likely have found themselves deprived of their Government grant.

The lesson of Durham county council's action, as of Willesden borough council's similar action in 1946, is that members of the professions need not worry about attempts to apply the closed shop to them. There are powers that will fight for them. On the other hand, attempts by unions or unionists to compel employers to apply the closed shop are a very different matter. A Birmingham firm recently dismissed a hundred workers who went on strike because it had refused to enforce the closed shop. Not many employers are strong-minded enough to do this. It is, for instance, still not certain who will be the ultimate victor in the dispute at London Airport. Here a hundred or so electricians went on strike because British Overseas Airways Corporation suspended 25 men who refused to work overtime in protest at the continued employment of two electricians who are non-unionists. The strikers have now returned to work, but the question of the two men's joining a union is still under discussion.

Except in the case of Durham, the Government's attitude over the closed shop has been equivocal. But a strike on this issue, which costs BOAC £320,000 and possibly loses it traffic permanently, ought to have called for stronger Government action. Again, it is possible—though not certain, as an appeal on the case in question has gone to the National Insurance Commission—that a person who is dismissed because he does not belong to a union can be refused unemployment benefit on the grounds that he contributed to his own dismissal. If penalisation can be carried this far, the Government will not be able to stand aside much longer.

* * *

The Bomb

To many it has come as a shock—and a salutary shock—to realise that there are limits to what even the Prime Minister can say to Parliament about the atomic bomb. Mr Attlee's right to be consulted by President Truman about its use rested on little more than American confidence that his judgment and discretion about a vital military secret could be trusted absolutely. To demand that he should reveal details of what was said in Washington is to ask him to kill the root of that confidence and all possibility of future consultation. On Tuesday Mr Attlee very properly asked the House of Commons to accept his "assurance that there is no difference of opinion" between him and Mr Truman on this vital matter.

If there is one piece of intelligence that would, if it reached Moscow, decisively assist the Kremlin in planning its campaign of imperialist expansion, it is knowledge of the considerations of ethics, politics, place and time that would weigh with the President if the use of the atomic bomb was called for. It is because of their uncertainty on this score, because they move uneasily between respect and contempt for the scruples of free opinion, that Communists have been at such pains since 1948 to persuade people that to start a "war of liberation" is not an act of aggression, whereas the use of atomic weapons to stop it is a "crime."

To encourage such doubts about the resolve behind the free world's main deterrent to aggression—for that is what the bomb has been since 1948—is to increase the risks of miscalculations in the Kremlin's strategy. It is the right, indeed the duty, of MPs to express privately to the Prime Minister their misgivings about a strategy over which Parliament has incomplete control; although that is part of the price of partnership in collective security. But the more doubts they express in public, the more they encourage would-be aggressors to take the plunge. It is no reflection on Mr Attlee's calm and firm handling of the present international situation to recall the time when his party's pacifism proved a real threat to peace, and contributed not a little to the climax of appeasement. We are still, after all, in what Halévy called the "era of the tyrannies."

* * *

Invitation to Moscow

It is not unlikely that the international control of the use of atomic energy will again come up for discussion between governments. Moscow will receive shortly from London, Paris and Washington replies to its Note of November 3rd suggesting talks on the demilitarisation of Germany; and it is understood that they will propose in not unfriendly terms that the deeper and more general causes of international tension should be discussed. The three western governments could not accept the Russian invitation as it stood; partly because talks about Germany without some fund of goodwill would have been fruitless, partly because it was accompanied by a copy of the uncompromising Prague programme—that is to say the terms of a German settlement already agreed between the Soviet and East European governments.

If the Russians accepted this wider basis of discussion, the powers would presumably follow their normal procedure: preparation of agenda, followed by a meeting of the Foreign Ministers. The work on the agenda will show fairly soon in what mood they might meet. It should be apparent in every capital that this could be a crucial meeting, on which public opinion—especially in France—would set high hopes. Mr Vyshinsky would have everything to gain by taking up an attitude different from that which he has consolidated in previous meetings.

There are a number of risks that public opinion should foresee and think about in advance. One is that the exchanges might begin in secret and then leak—officially but copiously—to the press. This happened in the past; it merely brings out the undiplomatic qualities in each Minister and substitutes brawling for negotiation. Another is that a wide agenda would lead to the appearance at the table of China and to a grand confusion of European and Asian affairs. Another is that all the resolution so painfully mobilised behind Atlantic defence plans—and the inclusion of Germany in them—might be undermined by a few of those bonhomous smiles which Mr Vyshinsky can command, when his instructions allow. The risks would be considerable, but they would not be all on one side. For Russian policy has suggested, both officially and unofficially, some far reaching proposals for pacification. To carry them out would require drastic modifications of the Soviet Union's relations with the outside world.

* * *

Taxing Capital Gains

Most of the inequality of incomes depends, as is well known, not on unequal earning but on unequal ownership of income-yielding property—a form, and degree, of inequality for which there is very little to be said either on economic or on general social grounds. The wider distribution of property is, indeed, a step towards economic democracy which might have secured the support not only of Socialists but of the entire Radical wing of public opinion, had it not become confused with a very different aim—the

actual abolition of property, at all events as a source of income. The author of the Fabian pamphlet "Towards Equality"* retains most of the traditional Socialist attitude towards property as such (though, as a sociologist, he realises that deep-rooted institutions can only be modified gradually) and the appeal of his arguments is narrowed accordingly; but he provides some useful and significant information on the persistent inequality of property, a suggestive discussion of its causes, and a reasoned survey of the possible means of reducing it.

The statistics of ownership are notoriously tricky, but, assuming that no fresh errors have crept in, application of the methods used before the war by Dr Campion in his "Public and Private Property" show that in 1946-47 1 per cent of the population owned 50 per cent of the wealth, as against 55 per cent in 1936-38 and 65 per cent in 1911-13. This is an unimpressive result of forty years of death duties. The obstinate survival of inequality is ascribed less to the comparative ease with which very large fortunes can be reconstituted by automatic saving—a factor which post-war taxation has made insignificant—than to the existence of untaxed capital gains. This conclusion, the author admits, has to "rely on deductive arguments," but they are arguments not easily controverted. What measures, then, should follow? Death duties cannot be pushed much higher; the capital levy is both relatively unprofitable and a source of maximum dislocation and resentment. Mr Cooper-Willis reaches a conclusion in favour of the taxation, American style, of capital gains. The Fabian Society is traditionally in the van of socialist thought, and it may well be that the Labour Party's allegiance, long given to the capital levy, is about to be transferred to the capital gains tax. The difficulty about it is that either the taxpayer is refused permission to set his capital losses off against his capital gains (which is illogical and unjust), or else persons who, in the ordinary sense of the word, are very rich can wholly escape taxation in years of falling prices. There are other snags as well in the capital gains tax—for example, should "gains" be taxed that are simply adjustments to the falling value of money?—but it looks as if the public is going to hear more about a fiscal expedient with such obvious superficial appeal to the Left.

* * *

Money for Social Science

Research in the social sciences is discussed in two reports published in the past few days. They discuss the progress made since the Clapham report on "the provision for social and economic research" was issued in 1946, and since the Government agreed that additional financial assistance to the universities should be given for this purpose. This assistance has increased annually and for the year 1951-52 will be £400,000.

How has this money been spent? What research has been encouraged by it? Are research workers being trained in adequate numbers? Will the new developments be sufficiently established by 1952 to allow the grants specially earmarked for social science to be absorbed in the general Treasury grant to the universities? An attempt to answer these questions is made in a broadsheet—"Government Aid for the Social Sciences," Planning No. 321—published by PEP (Political and Economic Planning). In most cases the answers can only be tentative, partly because many new schemes have only just started, partly because the fruits of research are always so hard to assess. In criticism of the universities it might, however, be said that so far they have used the special grants mainly to keep pace in the social science departments with the growth of the universities as a whole, instead of using the normal grant for this purpose and the special grants for special purposes. As a result many new schemes of development and research are only just starting; it is doubtful whether they will be sufficiently well advanced by 1952 to seem worth while in open competition with the claims of better established departments. PEP therefore urges that the earmarked grants should be continued, particularly in order to shelter the newer social sciences, such as social medicine, social anthropology and social psychology. What the universities have done is to concentrate on increasing the numbers of students and teachers. Though this provides research workers for the future, as is essential, it does not ensure that they will be used unless the lines of research have been laid down clearly enough to establish their claims on public money.

The second report (Cmd. 8091, 6d.) comes from the standing Interdepartmental Committee on Social and Economic Research. It follows up the Clapham report's recommendation that the vast amount of material collected, often for other purposes, by government departments should be made available for those doing social research, that it should be collected in such a form as to be of general value, and that departments should be encouraged to undertake social research themselves or to sponsor it in the universities. The report gives an account of modest progress in all these fields.

* * *

The Double Red Line

Russian propaganda is making no secret of the fact that the object of Moscow's diplomacy is to split the United States from Europe, and the European governments from the organised workers. Neither the purpose nor the technique used is new; and it is doubtful whether open encouragement of dissension by wireless and newspaper is by itself any more effective than the more personal and surreptitious methods used in the aristocratic diplomacy of the past. But

Long service awards promote staff goodwill

We at 112 have helped many World famous organisations in the realisation of Staff Goodwill and the years of consultation with executives in different industries enable us to offer valuable assistance in deciding "What is the right gift" for a Long Service Award. We shall be happy to place our services at your disposal if you are interested.

what is new and strikingly effective is the Communist technique of playing on the pacifism of the western democracies with appeals to the self-interest of the individual.

It has never been easy to remind the average British voter what his standard of living owes to national power, world-wide interests, and priority in vital markets—all advantages won by the exercise of strength and influence in the past. But Communist propaganda finds no difficulty in explaining—or appearing to explain that the effort to maintain those advantages means, in present circumstances, a halt or falling back in progress towards better times. It points to rising prices—and blames American stockpiling; to heavier taxation—and blames rearmament; to the threat of inflation and falling standards—and blames a warmongering capitalism bent on destroying the Soviet Union. At the same time it drums in the idea of Russian peacefulness and American ferocity. In this propaganda policy, which is being followed by Communist parties all over Europe, the ingenious and insidious feature is not the individual point of argument, but the way in which the two main themes, pacifism and industrial unrest, are combined. If the loyal Social Democrat trade unionist, enemy number one of the Communist Party, agitates for higher wages to keep pace with rising prices, he finds himself willy nilly associated with persons and organisations who declare that rising prices are entirely due to the foreign policy of Mr Acheson and Mr Bevin. In other words, to defend his standard of living he is called on to oppose his government's foreign policy and his country's vital overseas interests. The moderate Left in Europe—and this country—will have to be much more active in exposing this dialectical trick than it has been hitherto.

* * *

Schuman Plan's Final Stage

The Schuman plan has temporarily been cast in a shadow by the crisis in the Far East; but it is now bound to assume new importance as part of the effort to speed up the defence of the west.

So far as the technicians' work is concerned, the plan is said to be all but complete. The ideal of a single internal market has been preserved, by an arrangement that will give coal to the Belgian steel industry at the single market price—an average of about $10 per ton. On commercial policy—the trade relations of the group with the outside world—only a makeshift agreement has been reached. The Dutch failed to convince their partners that the low-level Benelux tariffs should be adopted by the whole group, and they have accepted a compromise allowing them to import a percentage of their coal and steel from outside the Schuman area at their own low tariff rate. This is an interim measure which is to operate until a common tariff policy can be fixed for the whole group.

Also troublesome has been the Italian demand for the inclusion of French North African iron ore within the Schuman area in the hope of getting larger and cheaper supplies. This suggestion the French rejected, presumably because they would find it more profitable to sell freely to the world at large and because they are not anxious to help Italy to maintain its uneconomic steel industry. As the largest importers of North African ore, the British steel industry will undoubtedly welcome this decision; but France may yet give the Italians some concessions through a long-term bilateral trade agreement.

One final technical point which still causes controversy with the Germans is the French attitude toward trusts and cartels. If in the end the French proposals are accepted, it will mean that no mergers within the coal and steel industries of the area can take place without the approval of the High Authority, and no firms will be allowed to control more than 20 per cent of the common market in either commodity. There would also be a ban on any moves between individual firms to fix prices or to allocate markets and sources of supply.

Much work now remains for the politicians, before the Schuman plan becomes what its authors—especially the French—intended: the firm basis for Franco-German *rapprochement*. For Bonn the outstanding political attraction was that Germany, for the first time in postwar Europe, would be treated as an equal by its neighbours. It is for this reason that Dr Adenauer has been demanding the abolition of the Ruhr Authority.

Since the discussions opened, however, the problems of West European co-operation and military security have become too urgent and too far-reaching to be settled by a local industrial agreement alone. All the partners to the plan—and particularly Germany and France—must now consider the politics of the project against a world background. If, as a result of this reconsideration, Germany can be convinced that its political aspirations will not be thwarted, and if France can be persuaded that a rearmed Germany will not bring Europe into open conflict with Russia, then the plan may achieve its original political objectives.

* * *

Chloramphenicol on Prescriptions

Mr Bevan's latest appeal to doctors to resist "importunate demands" from patients for branded drugs coincides with the announcement that supplies of chloramphenicol are now large enough for it to be generally available on doctors' prescriptions. There is no contradiction in this. What Mr Bevan is trying to stop altogether is the prescribing for health service patients of proprietary drugs and preparations which are advertised to the public. He is also trying to encourage the prescribing of the standard equivalents for proprietary drugs as a whole, whether publicly advertised or advertised solely to the medical profession. There is no standard equivalent of chloramphenicol, which is an antibiotic known, until it was synthesised, as chloromycetin. Its cost, although unmentioned by the Ministry of Health, is high.

Chloramphenicol's chief and unquestioned value is in the treatment of typhoid fever. In this disease, the cost of treatment with chloramphenicol, which is estimated by the *British Medical Journal* and the *Lancet* respectively as at least £7 and £10 a week, is more than offset by the considerable reduction in the duration of the illness. The other diseases for which the use of chloramphenicol is unquestioned, such as typhus, are rare in this country. Its use in the treatment of virus pneumonia, in which penicillin and the sulphonamides are ineffective, is unquestioned at the moment because aureomycin, which is reported to be more effective even than chloramphenicol, has to be imported from America.

More questionable would be the use of chloramphenicol as a routine treatment for whooping cough, in which its effectiveness has not yet been fully established. Nor does the Ministry of Health accept some claims that it has a place in the treatment of ulcerative colitis or is effective in gastro-enteritis of infancy. In short, the medical press is right to warn doctors that the drug should be used with discrimination; in particular that they should not prescribe it blindly before making a diagnosis even if faced with "importunate demands" for this latest wonder drug. It is worth pointing out, by way of comparison, that a week's treatment with penicillin or the sulphonamides is said to cost ten shillings.

THE ECONOMIST 22 RYDER STREET, LONDON, S.W.1

The LCC's Magnifying Glass

The London County Council last week had before it the annual housing accounts for 1949-50. To examine these accounts is like looking through a magnifying glass at the problems of housing authorities all over the country. Scores of towns are meeting the same difficulties on a smaller scale in the same way. If the LCC's dilemmas and difficulties are discouraging, they are only more obvious than those which occur elsewhere.

The LCC last year spent £5,900,000 on the running costs of housing built between 1919 and 1950. The bulk of this was for interest charges, repairs and maintenance. The tenants contributed in rent £3,300,000, the Exchequer £1,300,000, and the ratepayers £1,200,000. The tenants thus meet only a little over half of the costs of the houses they live in and the ratepayers, instead of providing the equivalent of one third of the Exchequer contribution (as was intended under the 1946 Housing Act), pay a nearly equal contribution. Separate accounts for houses built since 1945 would show an even heavier burden on the ratepayers.

The LCC's building costs are very high, higher probably than those of most other large authorities, while rents have been kept relatively low. The cost of repairs has risen from £6 a house in 1938-39 to £18 a house in 1949-50, without any increase in prewar rents; as a result, annual outgoings other than interest charges and income tax now absorb 55 per cent of the income from rent, compared with 37 per cent before the war. It is hardly surprising that the repair fund is dwindling rapidly and that ratepayers are paying through the nose. It would seem reasonable to expect the authority to think out its policy afresh. Not so the LCC. As recently as November 21st the council reaffirmed the principles on which the rents of its dwellings have been fixed. These make rents depend on "comparability" with other dwellings; costs of construction and maintenance are explicitly excluded from the calculation. At the same meeting the council approved expenditure on a large new scheme of mixed houses and flats at Putney, at an average cost of £585 a room.

Standing Tariff Conference

There have as yet been no reports of any striking achievements by the contracting parties to the General Agreement on Tariffs and Trade (GATT), now meeting at Torquay. A first and promising step has been taken, however, toward turning the organisation into a more stable body which will work continuously on the problems of international trade and tariff restrictions.

The main barrier to such a step has been the hope that the American Congress would ratify the charter of the intended permanent institution—the International Trade Organisation (ITO). But for some time it has been clear that the US Administration would not even submit the charter to Congress; other controversial pieces of legislation are more pressing, and it is far from certain that the Administration could persuade Congress to accept such a broad and binding agreement on international trade policy.

One way out of the dilemma was suggested by the Canadian delegation last week and seconded from Washington. Their proposal was to set up a permanent committee for GATT which would prepare the ground for the bi-annual sessions of the contracting parties and provide a channel for constant consultation between governments. In a statement issued by the State Department the United States has promised to support this proposal and to make American participation in GATT more effective by taking the only two realistic steps at its disposal.

The first is to renew the request to Congress for passage of the Bill for simplifying customs. For traders who do business with the United States the most important effect of this Bill would be a new tendency for American customs to assess the duty on foreign goods on the basis of the lowest, instead of the highest, possible value. The administration also intends to seek Congressional authority for helping to set up more permanent machinery for GATT, and it will do so at the same time as the Reciprocal Trade Agreements Act comes up for renewal next spring.

There is considerable hope that Congressmen will show a more co-operative spirit toward GATT than to ITO for the very good reason that, through the Trade Agreements Act, they have effective control over American actions in GATT. At present, negotiations carried out by the administration within GATT are strictly limited by the powers given it under this Act, which Congress can at any time refuse to renew. To have passed the ITO charter, on the other hand, would have meant subscribing permanently to a far-reaching set of international trade rules—rules that included unattractive escape clauses by which the rest of the world could discriminate against the dollar on the plea of balance of payments difficulties. The present compromise, if adopted by all the signatories, will make it possible for GATT to do much of the practical work that could have been accomplished by ITO—that is, if the contracting parties are minded to take any further steps towards the freeing of trade.

De Lattre for Indo-China

Within a few weeks both of France's leading soldiers have now found themselves involved in the desperate problems of Indo-China. Since General Juin undertook his mission to Saigon and drew up his report in October, Paris has searched its soul long and hard in an effort to find ways of bringing to an end this terrible colonial war. The result has been, amongst other measures, two important changes designed to streamline the administration: first, to combine military as well as political responsibility under the Minister for the Associated States of Indo-China, M. Letourneau, and second, to combine in one person the offices of High Commissioner and Commander-in-Chief on the spot. That person, now vested with unprecedented powers in Indo-China, is General de Lattre de Tassigny.

General de Lattre is reported to have insisted that civil and military authority should lie together in his own hands as a condition for accepting the military appointment. And well he might. From his own point of view it is a brave decision to have accepted the post, when he has a great reputation to lose and little to gain. He has been the creator of the new French army and still holds the high ranking command of all land forces in the Western Union defence organisation, which is about to be absorbed into a new supreme Atlantic command. General de Lattre is a glamorous and forceful personality with a keen political sense. But the hopes that France pins on him are almost desperate.

What can the General achieve, where so many have failed and so much has already been lost, and when large-scale Chinese infiltration of the rebel Viet Minh forces looks like turning Indo-China into a second Korea at any moment? There is one interesting possibility—it is nothing more—which it would be easy to overlook. The Viet Minh is not yet under complete Communist control, and the Vietnamese hate the Chinese. The Viet Minh radio has conspicuously not welcomed the possibility of China's intervention against the French with troops, although it sounds none too sanguine about its own chances of quick victory. It may be that the French, if they could stabilise their line by hard fighting, could even now, at this eleventh hour, reopen with

Ho Chi-minh, from a position of strength, the negotiations which were broken off in 1946. At the least, some of his supporters might be won over by a generous offer. Short of some novel and dramatic move of this kind it is difficult to see how the fighting in Indo-China can end either soon or successfully.

Lavish Administration

In the autumn of 1939 the Treasury, as Mr R. M. Titmuss recently pointed out in the second volume of the official civil history of the war, was questioning some proposed expenditure on temperature charts, costing a penny each, for the use of evacuees. It also questioned, as being "a waste of money," the provision of extra lavatory accommodation at wayside stations for the use of travellers on the evacuee trains. To see just how far policy has gone into reverse, the taxpayer should read the evidence taken by the Committee of Public Accounts in the first session of this Parliament (HMSO, 15s.).

The evidence is remarkable confirmation of, first, the extent to which the Treasury has lost its prewar control over departmental expenditure; and, secondly, of how lavishly conceived postwar administration has become. "I am not pretending that it is done economically," said an official witness about the Home Office college for training firemen—hardly an overstatement, since it was later revealed that the college has 59 domestic staff to look after 35 students. It is the Treasury's wish that Government hostels should be self-supporting—yet the net charge on public funds for hostel services in 1948-49 was £8,400,000. A sudden increase to cover the cost might be thought "harsh and tyrannical"; even a small increase has first to be negotiated through the Whitley machinery where civil servants are concerned. Why, then, pertinently asked the Public Accounts Committee, cannot costs be reduced by, say, requiring the hostel dwellers to do the washing up and make their own beds? No, came the official reply; this would not be a reasonable request to make to a man after a hard day's work.

So the process, of divesting the official of his old Poor Law mentality, goes on—to the taxpayer's detriment. The lavish conception of the health service is well known; to the committee, a Ministry of Pensions official revealed that whereas the war-disabled came to its central or regional depots to be fitted for surgical boots, in the case of the health service the fitters had to go to the patients. It is understandable that the Government should abandon workhouse standards for its new services. It would also be desirable that it should provide the best possible services—if the country could afford it. Since it cannot be afforded, is there not a case for some lowering of standards? Should not some at least of the free services be utility schemes, of first-class quality but without the frills?

* * *

Odd Jobs and Telephones

The striking point about the Post Office which emerges from the account of its work published this week (HMSO, 2s. 6d.) is the extraordinary variety of its activities. From fixing the positions of ships at sea it moves easily on to providing tobacco coupons for old age pensioners. It relays a chairman's speech to simultaneous meetings of shareholders in London and New York, and it takes in its stride the provision of morbidity statistics for the medical profession. Indeed, so wide is the range of its interests that one tends to overlook what seems, by comparison, to be the child's task of collecting and delivering letters.

The chief complaint against the Post Office since the war has been its failure to meet the demand for new telephones, and the explanation given in the report is not entirely satisfactory. The waiting list has grown from 200,000 requests for new telephones at the end of the war to 550,000 in March this year. Altogether, 2,600,000 new telephones were installed during the same period, making a total of more that 5,000,000 telephones in use in Great Britain. The rate of expansion has been twice as fast as it was in the ten years before the war, but it has been far too slow to keep up with demand.

The reasons given are, first, the delay involved in re-establishing telephone engineers who had been to the wars; second, the shortage of materials and labour; and third, the limitations imposed on capital development. The reasons would be more convincing if in the same report the Post Office had not made so much of other new developments in the services it provides. It takes justifiable pride, for instance, in having played a major part in extending the BBC's television service to the Birmingham area, in increasing the number and range of overseas telecommunication links, and in expanding the areas served by the speaking clock. Would it not have been better, though less spectacular, to have used the materials and labour involved for working off a part at least of the growing waiting list of new subscribers?

Apart, however, from its failure to deal adequately with the lack of telephones, the Post Office's record remains good. It is about to perform the annual miracle of sorting the Christmas mail, and it would be ungracious at this moment further to criticise its services.

*

CORRECTION

In the map of the Middle East printed on page 985 of *The Economist* of last week the port of *Iskanderun* and the oil fields of Dahran were misplaced. The former is in Turkey, at the north-eastern tip of the Mediterranean. The latter are in Saudi Arabia.

Mitigating Scarcity

No one will deny that a defective harvest is a great national loss. It is a loss of the labour and capital which have been expended with a view to a given result. . . . And what we have really to consider is, what policy in such cases is best calculated to avert, or at least to mitigate, the evils of scarcity and famine. Now, under the Corn Laws, what happened when the country was visited by a bad harvest? Our sudden demand for grain was unaccompanied with any corresponding demand for our manufactures; the balance of trade became suddenly unfavourable to England; the foreign exchanges were deranged; an export of bullion took place; financial crises and commercial embarrassment ensued; and labour became least in demand just at the moment when a high price of food rendered full employment of more importance than at any other time to the working population. It is surely of the greatest importance, then, if we can avoid such an aggravation of an evil which is itself beyond our control. It is surely of the first consequence that the home harvest being defective to the extent of *twenty millions*, we should be able to import that which our own lands have failed to produce, and that such an import should secure an immediate increased demand for the other products of the country to a corresponding amount. In such a case we readily admit that the country is all the poorer, in consequence of the loss of twenty millions worth of produce caused by a defective harvest. But, such a calamity occurring, it is unquestionably a mitigation of it, and not an aggravation, as the old law was, if the deficiency can not only readily be supplied from other countries without any suddent or serious enhancement of price, but if also, as a consequence of such imports, we have at the same moment an increased demand for British manufactures and British labour.

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship.' But . . . have you ever stopped to ask yourself

"Who are Britain's Craftsmen?"

*Introducing Ernest Langley. He started as a smith in 1899, specialising in coach building work. His hammer has shaped ironwork for undercarriages of Royal coaches and, in later years, luggage grids, seat fittings, structural ironwork and bumpers for the superb luxury cars included in Britain's impressive total of vehicles for Export.**

But . . . does craftsmanship mean only hand-craftsmanship? When the motor car industry adopted mass production, was craftsmanship forgotten . . . even though it may no longer be easy to throw the limelight on one man, or one part of the process? And must there not be craftsmanship at every stage if the finished article is to be a masterpiece? Monsanto think so and they follow this rule in making chemicals for a long list of British industries. With chemicals for tanning, chemicals for paints and varnish, chemicals for wood preservation, Monsanto play an important part in the great body-building firms of the Car industry.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

Ashore for Christmas! ALL IS CHEERFUL hustle and bustle on the quay. Some fishermen are being met as they land, many who live near are hurrying off to precious hours with their families. Others, from distant ports, are looking forward to a warm Christmas welcome at the Deep Sea Mission's port institute.

During Christmas, many even of those with homes near by will be found at the Mission, bringing their families with them for a Christmas service and a happy gathering. At Christmas the Mission means happiness and comfort not only to the men who come ashore, but also to the lonely families of fishermen still at sea—and of those other fishermen who, alas, will *never* return.

MOSE COUPON FOR CONVENIENCE

Won't *you* help this Christmas to keep all this Christian happiness in being? The Mission is not state-aided, but depends on the voluntary support of Christian men and women everywhere. Won't you send your gift now—in good time for Christmas? Address it, please, to the Secretary, J. W. Donald—

A Very Important Person —

The Brewer

His training is long and thorough, covering a wide range of subjects, from biology to bottling, and from malting to cooperage.

What makes his job so highly skilled — and so exacting — is that his raw materials, barley, hops and yeast, are natural living things needing constant supervision. Indeed all these ingredients may vary in flavour from district to district and from year to year; so the brewer must forever be applying his art to ensure that local tastes are met and that beer at its best comes to you across the counter.

Letters to the Editor

Still in the Air

Sir,—It seems a pity that the basic economic realities of housing have been so pitifully neglected by both main parties. Brigadier J. G. Smyth's letter to you was a striking example of the extent to which the housing question has been used merely to score debating points.

May I point out that:

1. According to the type of brick used and the gradient of the land, a house absorbs anything from 5½-10 tons of coal in the baking of bricks and the burning of cement alone. 100,000 houses would absorb not less than 650,000 tons of coal, apart altogether from the coal used in the manufacture of the metal components, etc.

2. A large number of other critical commodities, such as timber, rubber, steel, aluminium, zinc and so forth are all involved and can, under present circumstances, be directed towards housing only at the expense of other forms of construction.

3. Even if standards were reduced and output per manhour raised to prewar level, and whether houses are built traditionally or in factories, not less than 1,600 manhours per house nor more than 1,850 manhours are required. Thus, allowing for the increased output of the labour employed on the 200,000 houses now being built, a further 65,000 men, apart from those engaged in the manufacture of domestic appliances and other factory-made components, would be required to raise the output by 100,000 houses.

4. 160,000 standards of timber are required to raise the housing output by 100,000 houses per annum. Even supposing that this quantity of timber of house building quality is available, what should we have to go without in order to provide the necessary hard or soft currency without disturbing the present foreign trading situation?

5. There is no question that in the course of time cuts could be made in other forms of construction in order to find the labour and basic commodities necessary to increase the housing output by 100,000 houses per annum. It is, however, probable that these cuts would produce an unbalance, both in the output of other buildings and in the effect that the stoppage of, say, factory and office building would have on our foreign trading position, to say nothing of our more essential internal social services such as education. Neither Government nor Opposition has made the slightest effort to define these cuts qualitatively or quantitatively.

Output can be raised, materials can be found, without seriously affecting our internal productive position, but only at the cost of research and development and co-operative technical effort on the part of the many organisations concerned, both professional, trades union and commercial. The description of these steps would be so long that I must apologise for the destructive nature of the rest of this letter.—Yours faithfully,

London, W.2 A. R. PERRY

German Deflation

Sir,—Mr Bonn maintains that the loss of the foreign exchange reserve of Germany is due to an "import crisis." He should consult the German foreign trade and exchange reserve statistics (which he does not bother to quote in his long letter) which show the following development:

($ Million)

	1950			
	July	Aug.	Sept.	Oct.
ERP Countries:–				
Exports	123·4	126·3	...	...
Imports	120·7	133·1	...	...
Balance	+ 2·7	— 6·8	—18·0†	...
Total*:—				
Exports	172·2	177·6	166·4	...
Imports	225·4	205·3	239·6	...
Balance	—53·2	—27·7	—73·2	...
Loss of reserves in EPU	29	53	104	103†

* Excluding aid. † Preliminary.

If we take Marshall and other Aid into account Germany still had a *surplus* of some $4,000,000 even in August, and a deficit of less than $60 million in September. In October the trade position seems to have improved slightly. Thus the exchange losses can only be explained by a wild forward buying of sterling and commodities unchecked by controls. They have little if anything to do with high output in Germany which is mainly a consequence of increased exports: the increase in imports could not have entered the production process by September.

Professor Bonn accuses me of being afraid of the success of the Cairncross and Jacobsson recommendations. He is quite right: unlike the "liberal" eulogists of the present German regime I am opposed to the deliberate creation of unemployment and distress as a means of balancing foreign payments while luxury imports stream into the country and large speculative profits are made by ruthless entrepreneurs. The effects of such a policy do not create an auspicious background for a fight against Communism.—Yours faithfully,

THOMAS BALOGH

Balliol College, Oxford

How to Pay for Defence

Sir,—In *The Economist* of December 2nd you implied that, failing retrenchment in Government expenditure, the £300 million additional defence expenditure must be found from the "reserves of taxable capacity." The estimated budget surplus for the current fiscal year is well in excess of the sum of £300 million in question. Should not consideration therefore be given to the alternative of reducing the capital investment progamme?

The finance of capital formation as shown in the Economic Survey for 1950 is summarised as follows (in £ millions):

Public saving	680
Private saving	1,805
Borrowing abroad	—50
	£2,435

As you point out, increases in taxation have the effect of transferring money from the private savings sector to the public savings sector—without necessarily affecting the total. Under current conditions, since private savings are derived almost entirely from company savings and hardly at all from personal savings, the effect of increased taxation on consumption is very difficult to predict.

Much of the extra £300 million required presumably represents equipment as distinct from manpower. Surely it is more proper therefore to provide for that part by a planned reduction in the civil investment programme, rather than by relying entirely on increased taxation, much of which—though in economic terms it may be labelled progressive—is nevertheless regressive in terms of personal effort.—Yours faithfully,

LEWIS G. WHYTE

London, W.C.2

China and Lake Success

Sir,—It was with concern that I read in *The Economist* of November 25th a note referring to China and the United Nations. You rightly point out that peace in the Far East may well depend on these negotiations. But you present an unbalanced account of the causes of the present tension there. Undoubtedly much blame must be attached to the Chinese attitude, but in referring to the Western Powers' policy of pacification, you seem to have overlooked the open support afforded in the past (and possibly in the future) to Chiang Kai-shek, the "neutralisation" of Formosa, and the "hints" cast out by General MacArthur and the Republican Party. To call the Chinese intervention in Korea "eleventh hour aggression" is to ignore completely the fact that she had clearly warned the United Nations that she was prepared to defend her own interests in North Korea.

I think it is time we realised that if the United Nations is to achieve any authority in the east, it will have to cease to be what you call a "club," and at least pretend to be the organisation of nations which its name and purpose imply. If admission to membership is made dependent on the conditions of power politics, then we can hardly complain if the United Nations is considered to be merely a puppet of the west.—Yours faithfully,

Bangor RONALD G. EVANS

Books and Publications

A Fresh Approach

The United States: The Presidents, The Parties and The Constitution. By Herbert Agar. *Eyre and Spottiswoode.* 750 pages. 25s.

The history of the United States can be viewed in many lights. It can be seen in terms of the growth of "a more perfect union," as a case history of the federal idea. It can be written in terms of the immigrant—at least down to the Immigration Act of 1921. It can be treated in terms of the westward movement, of a constantly expanding Frontier, physical and psychological. Mr Agar, to the great benefit of British readers, has chosen to tell it primarily in terms of the American party system. In so doing he focuses attention on a factor which most histories of the United States take for granted, or else explain in terms which, though adequate for an American brought up to breathe the American political air, remain puzzling and insufficient for the average British reader. Federalism, immigration, the Frontier—these are distinctive American themes without any proper counterpart in English history; consequently the British reader treats them with respect, admits his ignorance and goes to school in all humility before them. But parties are part of the great Anglo-Saxon heritage, no more novel than the Common Law; surely Democrat and Republican are only American for Liberal and Conservative, or at worst for Whig and Tory? Immediately in place of an understanding based upon recognition of differences there is confusion (and even recrimination).

No one has had better—or perhaps more painful—opportunities of observing this fertile misconception at work than Mr Agar. His long labours in the field of Anglo-American relations have made him sharply aware of the problems which arise from British misunderstanding of the American political process. In "The United States" he has set out to explain and justify that process not by *a priori* reasoning or even contemporary depiction but by a more convincing argument, its operation throughout American history. It is in this that the originality of his book resides. It is not, and does not pretend to be, a work of original scholarship, if by that term is meant a structure built solely out of the masonry of primary sources. Mr Agar acknowledges freely his debt to other secondary authorities. But he has made his material his own, whether its immediate provenance be Henry Adams (and who is better entitled to draw on that sagacious counsellor than the editor of "The Formative Years"?) or Allan Nevins or William Allen White. Wherever the bricks may come from, the architecture is his own, fresh, persuasive and perceptive.

The American political process, as Mr Agar sees it, is the search for the possible and the acceptable, the constant effort to maximise agreement, to harmonise differences on the plane of action if possible, but of inaction if it is not possible. It is the avoidance of extremes, the cultivation of compromise. Thus the Civil War and Reconstruction stand out as the great failures, the breaking of the political dykes. By comparison even the dollar-chasing, trust-building seventies, eighties and nineties, the "brown decades," as Lewis Mumford called them, shine brightly as at least an era that *worked*. Such a theme might in many hands easily result as that vulgarest of treatments, history as the record of the successful. There are one or two moments, as when we are bidden to genuflect briefly at the shrine of Mark Hanna and McKinley, when we seem to teeter on the edge of such an interpretation. But Mr Agar's sense of values reasserts itself in time; he has too shrewd an appreciation of the Laocoon convolutions of morality and interest for such an implication to go unchecked.

The price of any perspective is that some things look out of shape. It seems odd at first to read a 700-page history of the United States and never encounter the name of Gettysburg. Readers brought up on the "What porridge had John Keats?" theory of history will find plenty more such omissions in these pages. But they can satisfy their appetites elsewhere. The task which Mr Agar has set before himself is different and his concentration on it is rightly somewhat exclusive. He has set out to explain the American Union in terms of its most distinctive, vital and misconstrued activity. It cannot be doubted that he has signally succeeded.

The British Political Tradition

The Conservative Tradition. Edited by K. J. White. *Nicholas Kaye.* 256 pages. 16s.

This volume is the fourth in the enterprising series, "The British Political Tradition," which is appearing under the general editorship of Mr Alan Bullock and Mr F. W. Deakin. The method used is to illustrate each of the distinct strands in British political history by means of a longish introduction to carefully arranged and annotated original material—speeches, quotations, letters and so on—so that the student may see for himself the sources from which historians draw their judgments. Mr White's introduction is clear, entertaining and original, and more than maintains the standard of the earlier volumes. He begins with Bagehot's definition of natural conservatives as people with "enjoying" natures and shows how the philosophical basis of Conservatism is based on three principles:

The first is the radical inadequacy of the political as a final account of man; the second is the organic conception of society; the third is the rejection of "Will" as the sanction, or sanctification, of law.

These principles he illustrates with quotations from sources as diverse as Burke, Coleridge, Disraeli, Hugh Cecil and Quintin Hogg, and ranging in time from Pitt to Pickthorn.

This is the best part of the book, and for anyone who is inclined to regard the Conservatives as permanent empirics, it is a valuable corrective. The second half of the book, which deals with "The Traditions and the Changing World," from Burke to Joseph Chamberlain, and the section of the introduction which covers it, are no less interesting. In particular, it is valuable to trace through the original words the immense size of Disraeli's achievement in educating his party and bringing Conservative policy into alignment with modern conditions. But it is not a true picture of the whole of the Conservative tradition. It presents only what is best and omits the diehardism, the crass nonsense, the failure of perception and action, which are as much a part of the Conservative as of the Liberal or any other political tradition. This is not the fault of the author, although Mr White is at times too ready to abandon the role of guide for that of advocate, but of the anthology form of the book. Within its limits this volume presents a fair picture of the Conservative without the warts, and if it omits these it is clearly because the speeches of reactionary backbenchers, or the turgid leading articles of Conservative newspapers, are too dull for all but the most persevering student to wish to read.

Keen-eyed Traveller

This My Voyage. By Tom Longstaff. *John Murray.* 324 pages. 21s.

Mr Tom Longstaff is one of the most distinguished and best known of living British mountaineers. With a good fortune which now seems irretrievably of other days, he has been able to spend a great part of his life travelling and climbing in remote and rugged parts of the world, a doctor's skill for his passport, and a zest for observing and enjoying every aspect of nature, for his inspiration. "The more the traveller knows what may be seen, the more he will see"; and this book contains a good deal more of what Mr Longstaff has seen than of what he has done. It is arranged by regions—Alps, Caucasus, High Asia, the Rockies and the Arctic—and though the thread of personal experience is preserved, the peoples and histories, flowers and animals of these varied regions, as well as their mountains and glaciers, are included in the tale. For the ordinary reader, this book thus stands above most others of its kind, whose bald accounts of camps and climbs can only make their full appeal to those who have taken part in similar exploits. The author confesses his preference for lands filled with the tradition of old civilisation, and enjoys recognising a legend of Herodotus in the mouth of a Nepalese soldier, or tracing the route of a 16th century Mohammedan invasion of Tibet; by contrast, the Selkirks and Rockies, empty of this human element, seem malignant and aloof. Thus he travels, not with the grim resolve of the explorer seeking the unknown, but rather as an adventurous and well-informed tourist.

There is, of course, plenty to show that the author is a tough and skilful climber, who can rate as his finest climb a day of snowy knife-edges and iced finger holds, ending in a night spent dangling legs from a ledge at 14,000 feet, taking turns to keep warm with a lantern. He was the first man to glimpse the inner sanctuary of Nanda Devi, the hidden pasture guarded by a double ring of 20,000 foot peaks seventy miles in circumference—a glimpse which was not repeated for twenty-nine years. The stories of his climbs are told without sensationalism, but with a vividness quite remarkable in view of the lapse of time. It is a pity that this agreeable book was equipped with such disappointing photographs; however, the maps exhibit a rare virtue—they mark very nearly all the places named in the text.

Eighteenth-century Nobleman

Pembroke Papers (1780-1794). Edited by Lord Herbert. *Jonathan Cape.* 509 pages. 25s.

Family letters, like family conversations, are sometimes a shade tedious to the outsider, but Lord Herbert's latest selection of papers from the muniment room at Wilton, in which the central and most engaging figure is Henry, 10th Earl of Pembroke, will certainly banish tedium. This soldier and horseman, who was also a gifted amateur of music, medallions and, let it be said, pretty women, moved easily in his aristocratic circle, relishing the delicious and malicious gossip of the day, watching every move in the ruthless jockeying for place and position with a tolerant expert eye. Tolerance, indeed, was a virtue his wife and son had also great need of, both in regard to his peccadilloes abroad, which he describes with soldierly frankness, and to his natural son at home, to whom he denied neither parental affection nor name (in the anagrammatic form of Reebkomp). Lady Pembroke consoled herself with good works and devout correspondence with Queen Charlotte, near whom she finally settled, resigned and uncomplaining, in her own house in Richmond Park.

George, Lord Herbert, was bombarded by his father with constant instructions as to the management of the estate, the mating of his dogs and the use of patent carriage wheels, and advice on everything under the sun from finance to physicking and the purchase of commissions. But amid the multitudinous interests these letters reveal, one topic is constant on almost every other page—the horse. And the horse not as a noble animal and a friend to man but as transport. "What we're all at is this," writes gallant Major Floyd of the Light Dragoons, whose letters are second only to Lord Pembroke's in charm and raciness, "a damn'd good horse at little money." For swapping, for trading in, for overreaching one's friends, the horse was the equivalent then of the second-hand car today, and we cannot but admire in these pages the honest determination of buyers and vendors to outswindle each other.

The shifting glittering kaleidoscope of eighteenth-century society shown by this book—corrupt, complacently privileged and fabulously incompetent—stands in shocking contrast to the well-meant virtues of the Welfare State. Yet in some strange way it worked, and within a decade or so was destined to bring Britain to a point of prestige and power which she has scarcely attained since.

Life in India

Interview with India. By Margaret Bourke-White. *Phœnix House.* 192 pages (including 64 pages of plates). 16s.

Miss Bourke-White is a famous photographer, and in this book she has put together some of her best camera studies of India, taken during three trips for *Life* magazine from 1946 to 1948. Around the photographs she has written an autobiography which, while designedly disjointed, succeeds in giving a series of character sketches that make the pictures real. She describes, for instance, the Calcutta riots of 1946, the agonies of the great migrations in 1947 and Gandhi's last fast in 1948. She gives her own lively personal impressions of men and women, ranging from Jinnah—both before and after the foundation of Pakistan—Nehru and Patel to Sannaligappa, a Mysore peasant, and Sheikh Abdullah of Kashmir.

Miss Bourke-White has made a sincere attempt to convey something of that elusive and almost indefinable element, the spirit of India. Her photographs are magnificent, and, if they lead the reader on to absorb her text as well, he can hardly fail to increase his fundamental understanding and sympathy for this strange, sad and certainly mysterious country.

The Loud Bassoon

How to Run a Bassoon Factory and Business for Pleasure. By Mark Spade. *Hamish Hamilton.* 262 pages. 7s. 6d.

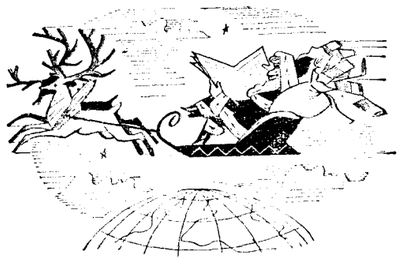
Many readers of, and some writers for, *The Economist* suffer from the painful occupational disease of taking business seriously. For such sufferers there is now available an almost infallible specific; seven and sixpence worth of Mr Mark Spade, with an introduction by Mr Nigel Balchin (who, for the best of reasons, brings sympathy and understanding to the job) thrown in. Here they will find the low-down on Finance ("Avoid Debentures. They are nasty, inevitable things like the gas bill") on Motion Study (exemplified by analysis of Right and Wrong motions involved in getting past the ticket collector without a ticket), on Psychology ("The main idea is to place people in positions where they may use their natural Bent. If people have no natural Bent, but just stay straight all the time, they are suitable as Cashiers"), on Salesmanship, Costing, Market Research, and Welfare—all the above with special reference to the manufacture and marketing of Bassoons.

This volume also contains, under the title "Business for Pleasure," Mr Spade's more general views on the entrepreneur and his problems. These are emphatically worth study, not merely by business men but, perhaps even more emphatically, by the disinterested administrators of the Public Sector. Consider his summary of the merits of Planning: "In an unplanned business things just happen, i.e. they crop up. Life is full of unforeseen happenings and circumstances over which you have no control. On the other hand in a *planned* business things still happen and crop up and so on, but you know exactly what would have been the state of affairs if you hadn't." What Economic Survey could say fairer than that?

Mr Spade, in fact, had a prophetic eye for the essential immutability of the economic problem. Mr Balchin refers mournfully to the "odours of old-world lavender" pervading these prewar pages. The remedy is in his own hands. Let him provide himself with a ouija-board as soon as may be, and give his—or rather Mr Spade's—readers, preferably in time for Christmas, 1951, the magnum opus on How to Avoid Making Bassoons in a Planned Economy, which that lamented genius did not live to complete.

Reference and Text Books

Building Societies Year Book, 1950. *Francy and Company, Limited.* 517 pages. 15s. 6d.



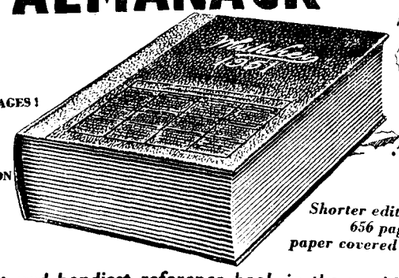
The official handbook of the Building Societies Association gives a general summary of the operations of the building societies for 1949, statistics of membership and assets from 1870 to 1949, and comparative analyses of building society accounts from 1938 to 1949. Details and accounts are given for the members of the association and there is a full report of the Annual General Meeting held in May, 1950.

During 1949, saving through building societies increased by £96 million to £1,056 million and the number of investors increased by 42,185 to 2,857,562. Repayments of advances and interest totalled £198 million and new advances reached nearly £276 million.

The Directory of Directors, 1950. *Thomas Skinner.* 784 pages. £2.

The seventy-first annual issue of this directory follows the normal practice of listing the names and addresses of the directors of the principal companies in the United Kingdom and of a large number of private companies. Where possible the connections of directors with business associations and institutions are also given.

For Friends abroad



Are you wondering what to give, this Christmas, to a friend overseas? One answer—and a good one, too—is a year's subscription to the Manchester Guardian Weekly. Here is something for which exile is apt to sharpen the appetite—the quiet, authentic voice of the England behind the England of the headlines. Here the events of the week are reviewed with an adult appreciation of what makes news. Reviews of books, music, art and the theatre are intelligent, readable, leisurely. And comment, political or otherwise, follows an honoured tradition of editorial freedom. A weekly glimpse of an England remembered—and loved.

THE SECRETARY YOU NEVER HAVE TO RING FOR...

TIME-MASTER—the electronic dictating machine

THE SCIENCE of electronics is revolutionising many of our concepts. And your ideas about the time and place for dictation will be revolutionised by the Dictaphone Time-Master—the new, *electronic* dictating machine.

First, the Time-Master is so compact, streamlined and lightweight (4¼ inches high) that you can take it anywhere and everywhere: and dictate to it whenever you wish.

Then, its recording medium is the unique plastic Memobelt. Each Memobelt takes 15 full minutes perfect dictation. Each is so flexible that it folds flat for filing. So light that up to ten can be posted in an ordinary envelope for 2½d.

Crystal-clear recording.
No waste of your secretary's time because she "didn't quite hear that." Memobelt recording is outstandingly clear from beginning to end because the Memobelt still carries on the famous Dictaphone principle of cylindrical recording.

Rapid transcribing.
Your secretary can adjust volume, tone and speed—by the simplest of controls. There is a pedal to back-space or repeat as often as she may wish—all instantaneous and uniform in action.

Write for TIME-MASTER literature to Dictaphone Co., Ltd., Dept. O, 107, Kingsway, London, W.C.2.

AMERICAN SURVEY

Bridging the Atlantic

Washington, D.C.

IT was a sombre little group of officials, reporters and photographers who waited as the *Cathay* (BOAC, at least, had not lost its sense of humour) nosed out of the raincloud over the Maryland shore of the River Potomac and lowered itself, with the diffidence of a stranger, on to the airstrip. The previous twenty-four hours had seen crisis develop into what seemed like disaster and anxiety give way to what looked like panic. Nothing could have been more timely than the arrival of Mr Attlee. It gave a purpose, a pattern and a direction to the next few days and, by the time he left for New York, General Collins had come back from Tokyo with reassuring news of the military situation and Anglo-American confidence had been renewed.

That mutual confidence should have drained away with such appalling suddenness in the week before the Prime Minister's arrival was a triumph of irresponsible reporting. Mr Truman's choice of words, when he was asked, at his press conference, whether the use of the atomic bomb was being considered, could no doubt have been bettered. But his meaning should have been clear to anyone who listened to all the questions and was willing to put the answers in perspective. Having succeeded in scaring London with their messages from Washington, the news agencies, associated and united in their irresponsibility if in nothing else, proceeded to scare Washington with reports from London of impending Munichs and a government bent on "appeasement." It was a relief to everybody when the door of the *Cathay* opened and the British party filed out with not an umbrella to its name.

There was evident throughout the week a certain irritation with Mr Truman and Mr Attlee for not being Mr Roosevelt and Mr Churchill. It was felt that the world's problems should be solved by a few sweeping gestures—the despatch of an armada in one direction and an ultimatum in another. It would be a pity, one commentator remarked, if this conjunction of two mountains brought forth only a mouse. But, in reality, two men who disposed of the strength of mice were trying to bring forth a mountain. They were late in starting, too, and what they decided about strengthening the Atlantic community and the distribution of raw materials should have been decided six months ago. But, provided all concerned do not go to sleep again—and one of the Truman Administration's greatest weaknesses is its tendency to think that brave words and grave decisions, once planted, grow untended—the week's conversations should do much toward the building of strength in the west.

Strength in the east is another matter, as the absence of any hint of decisions in the final communique showed. But it is difficult to see what decisions could have been taken at a time when the military situation was so obscure and General Wu was playing the inscrutable Oriental with such infuriating success. At least nobody tried to pretend, by either omission or implication, that the two governments really agreed on the points on which they obviously did not. But the discussion of these points was probably more valuable to the two men than the discussion of those subjects on which they could easily agree and which could—in the present atmosphere—have been settled, though probably not as quickly, without dramatic flights and melodramatic headlines. To understand the reasons for differing points of view, whether they are rooted in moral principles or the pressure of public opinion, takes much of the sting out of disagreement. The most important of all the meetings may well, therefore, have been none of the six formal conferences, but the dinner party at the British Embassy at which, for four hours, Major Attlee (ret.) and Captain Truman (ret.) revisited the trenches of Northern France and discussed the decay of generalship since the Golden Age of 1918.

*

Much of the satisfaction of those who took part in the talks on the American side must have been dissipated by the distressing spectacle which the Congress of the United States put on for the benefit of the visitors. The Republicans in the Senate, like the stock market when their party was last in power, are always able to surprise the experts by sinking a little lower when even the pessimists think the lowest point has been reached. One of them evaluated the predicament of his country's troops in Korea in terms of its effect on the Presidential election of 1952 and Senator Taft was reported by the *New York Times* as being "in a confident and happy mood" as he told the Republican Executive Committee that the Democrats were "demoralised." A stranger reading the *Congressional Record* for the week might have imagined that Mr Attlee was an emissary of the Union of Soviet Socialist Republics come to demand the surrender of all the United States held most dear, rather than the Prime Minister of the country's most patient and substantial friend.

But it was in their treatment of Mr Acheson that the Republicans finally over-reached themselves. They chose that week to propose a resolution demanding the resignation of the Secretary of State in the name of national unity. Consideration of the resolution, known as the Ives Resolution after the Senator from New York who was sent to Washington by Mr Dewey, was postponed, at the last minute, on the advice of one or two of the more astute members of the Republican Policy Committee, until after the visitors were safely back in London. And Mr Dewey himself, who knows a political gaffe when he sees one, issued an implied rebuke to his protégé by saying that

> obviously the prestige of our country is at a very low point. Other free nations are, for the first time in recent years, showing an unwillingness to follow our leadership. . . . This is not the time for further criticism. The President and our Government are engaged in the most difficult of conferences. The decisions must be calmly reached and they must be right.

But the atmosphere created by the "Asialationists" (on the same day that this admirable term was invented the sponsors of the Ives Resolution provided a handy list of who they are) was not an easy one in which to reach decisions calmly, either for the Administration or the British party. Even the decision to issue a communique of 2,000 words, containing an unusual amount of information, must have taken a little reaching. It must have been a temptation, under the circumstances, to publish a few words about "unity of purpose," leaving the press to speculate as it pleased about the two subjects on which it was known that disagreements had not been resolved—which became known as "the limited war" and "the package deal."

Neither, however, is an immediate problem and, perhaps neither will ever become one. Whether to continue the war against China by other means, if the United Nations forces are driven out of Korea, depends first of all on developments in the military situation. Whether to negotiate with China on Korea alone, or discuss Korea, Formosa and representation in the UN all together, depends, in the first instance, on Chinese willingness to negotiate at all. The decisions of both governments will depend, in the end, on public opinion in the two countries. One point on which the President and the Prime Minister probably agreed heartily was how much easier their jobs would be if they could reach conclusions on the basis of the facts of the situation rather than that of the fancies of the public.

Industry on the Move

PRESIDENT TRUMAN has asked Congress to authorise the building of eight new centres for the more vital government departments, outside of Washington, but within easy reach of the capital. The main purpose of this plan is to ensure that it will take several atom bombs, instead of one, to wipe out the country's key administrators, but it would have the incidental advantage of permitting the demolition of some of the emergency buildings which have for so long disfigured Washington. This limited scheme of dispersal, however, may seem inadequate to members of Congress who have been playing with the idea of dispersing themselves in the event of war, and of legislating either from a special train or by television. If such an important industry as the government is to move at all, some Congressmen would like it to move into their own districts and benefit their constituents ; but it might not be an unmixed benefit to a district to be turned into a target area.

The President's proposals for the dispersal of the government follow those of the National Security Resources Board for the dispersal of industry in general. It recommends that firms building new plants of national importance should put them several miles from other tempting targets, so that two factories cannot be killed with one atom bomb. But the NSRB does not consider it "economically feasible" to break up established industrial centres and scatter them across the country. The Air Force burnt its fingers on this politically hot potato some time ago, when it moved certain aircraft contracts from the vulnerable coastal districts of the states of Washington and Connecticut deep into the hearts of Texas and Kansas, where factories are safe from surprise attacks launched from aircraft carriers or submarines. The unemployment the manufacturers left behind them caused a storm in Congress which taught the services to be more discreet in their attempts to disperse the country's military production. Soon, however, there will be more than enough defence contracts for everyone and no question of taking work away from anyone, but only of finding factories that can handle additional contracts.

*

The comparative safety of such states as Colorado and Nebraska, which gives a patriotic flavour to local boosting, is naturally made much of by Chambers of Commerce trying to bring business to this least industrialised part of the country. It is true that the 1947 Census of Manufactures show some of these states, notably Kansas and Nebraska, with large percentage increases since 1939 in the value added to goods by manufacture (the Department of Commerce's standard of industrial activity), but the actual amounts remained low. New Mexico is the best example of this: with an increase of over 500 per cent since 1939, the total value added was still only $55.5 million in 1947. The latest defence programme should help this area as the war-time one did ; it will involve the reopening of the stand-by aircraft plants in the great plains and put a premium on the mining and related activities of the mountain states, even if it does not bring new factories. The government has for some time been making use of these states for its ever-expanding research activities ; the sparse population makes secrets comparatively easy to keep, the wide open spaces have room for bombing ranges and rocket proving grounds.

But it is the sparse population and wide open spaces that make these central states unattractive to industry in general. Farm prosperity has brought a big increase in average incomes during the past ten years ; individuals have far more to spend than they used to have, but there are not enough of them spending to make a consumer goods market sufficiently large to appeal to secondary industries. This year's census showed that population in the central plains had increased less than

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

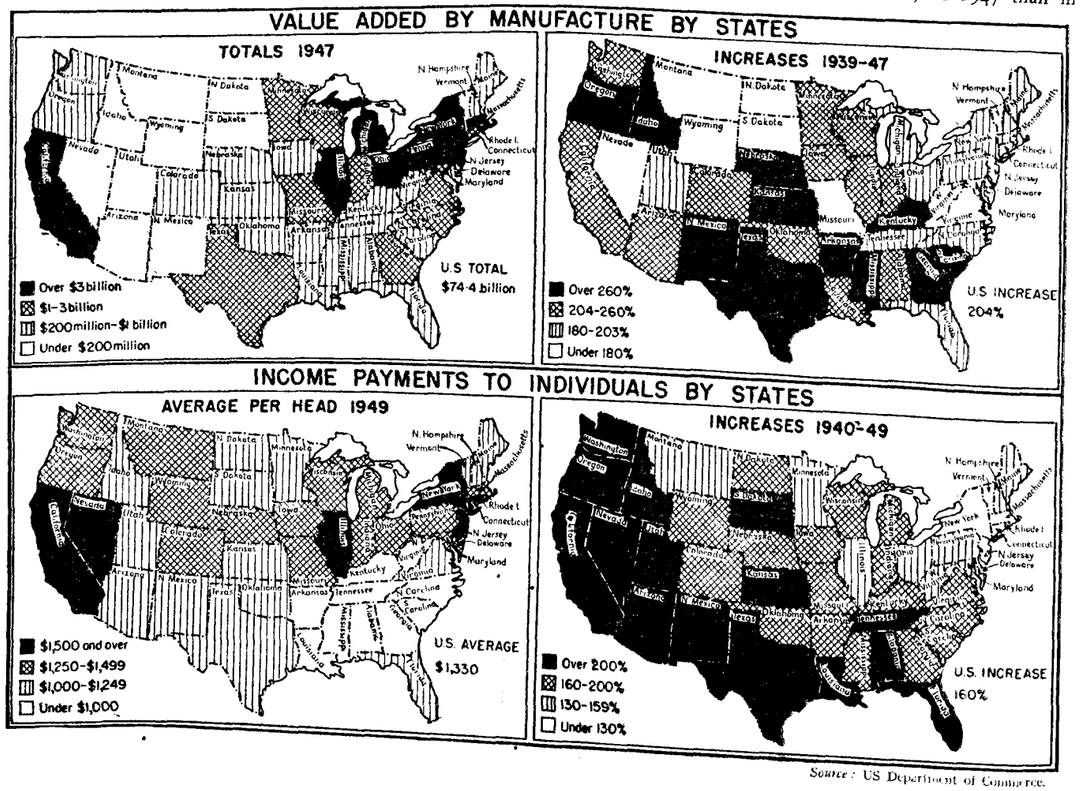
LONDON N.W.5, ENGLAND.

the national average since 1940. The same is true of the south-eastern states—South Carolina, Georgia, Alabama and so on—yet these have shown important gains in industrial activity.



These south-eastern states have much poorer farms and more inhabitants than those further west. With fewer people on the land and improved farming methods made possible by higher agricultural prices, a larger proportion of the inhabitants is living above the subsistence level than in 1939. As a result, in this area the loss of population has meant an improved market for consumer goods, even though individual incomes are still very low. Industrial wages are not so far below the national average as they used to be, and trade union activity has to be reckoned with more seriously than it did when the textile industry first fled south from New England, but these advantages still exist. War industry left the area with a trained labour force and empty factory space; recent industrial developments have found new uses for its agricultural products, its lumber and wood pulp and its chemicals; it has adequate power, in the form of both electricity and natural gas.

The south-east is becoming a diversified economic area that generates its own growth and this is even truer of the south-west, which nowadays means Texas; and the level of prosperity is higher here, thanks largely to oil. The west coast is another area of this type and its most important state, California, now seems as if it may be near economic maturity. The war brought not only a temporary expansion in aircraft production and shipbuilding, but also entirely new industries with postwar uses; the long-desired steel mill was the most important of these, since it was followed by metal-working industries of all kinds. The workers who came to the west coast during the war stayed permanently, so that California alone now has ten million inhabitants, 50 per cent more than in 1940, and their average income last year was amongst the highest in the country. To meet their demands for clothes, furnishings and personal services, local firms have expanded until many of them rival the old-established national corporations. Not to be outdone, the national corporations, leading automobile firms, for example, have opened assembly plants and distributing centres on the west coast.

*

These were additional plants, not old ones transferred. Practically none of the increases in industrial activity in the south and west have been at the expense of the traditional industrial centres on the east coast and Great Lakes. This has been an expansion, not a migration, of industry. During the war strategic considerations and shortages of manpower encouraged industry to spread. And it went on spreading after the war, when it was falling over itself to make up for lost time and to satisfy the rapacious demand for consumer goods generated by wartime shortages and the increase in population. The development of fresh markets was not the only reason for this: rising freight rates, the importance of air and road transport, new processes which needed plentiful and cheap electricity, the difficulty of finding room for lengthy modern assembly lines in overcrowded areas, all had something to do with it.

As a result, the Census of Manufactures and the Census of Population both found that growth had been below average in the north-eastern states and that even the more recently developed Great Lakes area was hardly holding its own. Nevertheless the main concentration of industrial strength remains in these regions. In 1949 the north-eastern area accounted for more than one-third of the nation's total income. More than twice as much value was added by manufacture in New York ($9.6 billion) in 1947 than in California ($3.9 billion); Pennsylvania, Ohio and Illinois were all over $6 billion, with Michigan not far below it, while Texas added only $1.7 billion.

Source: US Department of Commerce.

In 1949 the postwar period of industrial expansion seemed to be over. But by early last summer it began to look as if this were no more than a pause to gather strength, and the Korean war has sent the United States shooting up on its third period of manufacturing growth in ten years. Expenditures on new plant and equipment are to break all records in the first quarter of 1951. So far it is mainly an expansion of civilian industry, inspired by business's desire to get ready for the sustained consumer demand that is guaranteed by the full employment that the defence programme will bring with it, and by the Administration's desire to counter inflation with a plentiful supply of goods. But expansion is coming in the defence industries and the first step has already been taken, in the rules governing tax amortisation for such expansion, to ensure that some at least of these new plants will be in the safer parts of the country. But even some of the expansion for civilian purposes may be in those parts. For the chief consideration now will be not markets, but manpower, and the search for labour is likely to take manufacturers back into the unindustrialised central area as it did during the war. The next Census of Manufactures may show that industry, having spread out all round the edges of the country is at last spilling over into the middle, and has gone a stage further in the gradual process of finding its own level.

American Notes

Invoking the Emergency

The expectation is that on Friday night President Truman will broadcast a proclamation of national emergency to dispel illusions at home, and on either side of the iron curtain abroad, that the United States will tolerate "business as usual" in the present crisis. Such a proclamation is the key which unlocks certain powers not normally available to the President. Some go back to the 1914-18 war. The Defence Production Act passed this autumn greatly widened the President's authority to press forward with rearmament and the powers which may be used only in an emergency are consequently fewer than they were when President Roosevelt took the same step in 1940. But there are a number of concrete benefits to be obtained, among them the right, sought by the Department of Defence, to retain National Guardsmen in service as long as it sees fit, and that to impose priorities on communications and shipping.

Official recognition of the crisis will make it easier for the country to accept the speed-up in mobilisation involved in telescoping three years' rearmament into two or less. But what has decided the Administration to act now, instead of in the New Year, is as much the domestic course of prices as the course of the Communist armies. The Department of Defence is as vitally concerned in the first as in the second; military appropriations begin to melt under rising prices almost before they are voted.

The voluntary method of controlling prices had its first, and perhaps its last, trial ten days ago when the Economic Stabilisation Agency appealed in vain to the Ford Company and the General Motors Corporation to rescind the rises they had announced. They refused on the ground that labour costs had gone up 11 per cent during the year and materials—many of them being stockpiled by the government—by from 5 per cent to 300 per cent. They cited particularly the fresh increase in the price of steel, the government's raising of synthetic rubber prices, and the reduction in the number of cars they can produce, in view of limitations on materials and restrictions on credit.

If the General Motors Corporation, which is on the way to earning a $1,000,000 profit this year, turns a deaf ear to the stabilisers, Congressmen have few hopes of other industries. But the newly appointed Price Administrator, whose organisation so far consists of a desk and telephone, will be in no position to enforce general price controls for at least another two or three months. The Office of Price Administration, during the last war, had nearly 70,000 employees. The authority to freeze prices and wages does not depend on the existence of an emergency. But the willingness of the public to accept even the individual ceilings which ought to be imposed at once may well do so.

Communism and the Courts

The eleven Communist leaders who were convicted in New York last year of advocating the overthrow of the government by violence have now presented their final appeal without benefit of the British Mr Pritt, since the Supreme Court refused to postpone the hearing until he was able to appear. The Communists lost publicity through this refusal, but probably little else; their American lawyers argued their case with ability, and with a restraint that helped the bench to do its legal duty and forget that these same lawyers had been convicted for contempt of the court which originally tried the case. The Supreme Court's decision, which will not be handed down for some time, is expected to be either a landmark or a landmine for anti-Communist legislation. The case gives the Court an opportunity of deciding, for the first time, whether the Communist Party is a subversive organisation and whether Congress may constitutionally pass legislation specifically directed against it. Such a decision would affect not only the Smith Act of 1940, under which the case was brought, but also the recent

McCarran Act and numerous anti-Communist laws in the states.

One of the most discussed of these laws, New York's Feinberg Act, has recently been upheld by the State Court of Appeals, which believes that the legislature is entitled to disqualify Communists from teaching in the state schools. The Supreme Court, however, to the delight of Communists and fellow-travellers, has just reversed another decision that affects the enforcement of anti-Communist legislation. It has ruled that a Mrs Blau, convicted of contempt of court for refusing to answer questions about her Communist connections, was justified by the constitutional guarantee that no witness can be compelled to give evidence against himself; if she had admitted membership of the Communist Party she might have become liable to prosecution under the Smith Act. A number of similar cases are now pending against various persons who have refused to give evidence before Congressional committees.

The Constitution—the fourth amendment which forbids arrest without a warrant—is also partly responsible for the refusal of a Federal Court of Appeals to uphold the conviction of Miss Judith Coplon, who passed secret documents to a Russian on the staff of the United Nations. The court had no doubt of her guilt, but the detectives who laid a trap for her were so busy springing it that they forgot the warrant; furthermore, they did not succeed in convincing the judges that they could have got sufficient evidence against her if they had not tapped her telephone wires. Miss Coplon is not, however, yet safe from gaol. And only the Supreme Court now stands between Mr Alger Hiss and his five years' sentence, for in this most controversial of all anti-Communist cases the Court of Appeals could see no reason to reverse the New York verdict.

Preparing for the Worst

A real sense of urgency, to breathe belated life into civil defence plans, has at last been provided by the Chinese willingness to risk a third world war. Mr Truman has not only set up, by executive order, a Federal Civil Defence Administration, and appointed Mr Millard Caldwell, a former Congressman and Governor of Florida, to direct it; he has sent to Congress the Bill to put this agency on a permanent footing. It envisages the spending of $3.1 billion in the next three years by the federal, state, and local authorities. Washington would contribute about 54 per cent of this, taking full responsibility for the warning system and for regional stockpiles of medical supplies and other equipment, and matching, on a dollar for dollar basis, local spending on the proposed $2 billion shelter programme. These funds, however, will only be available to states containing official target areas—a very necessary safeguard against overbuilding. A number of cities hope to solve their peacetime traffic problems, as well as wartime defence ones, by building shelters convertible into underground parking lots.

The Bill is what the states and cities have been waiting for with growing impatience and irritation. The civil defence report issued in September by the National Security Resources Board alarmed many of them by proclaiming that civil defence was primarily a local responsibility and that the role of the Federal Government should be restricted to guidance and some supplementary aid. As most of the 140 or so primary target cities are already struggling with deficits, they were anxious that the Federal Government concede at least joint responsibility and take the lion's share of the financial burden.

The Administration would like to see the Bill passed at this short session, for all but four of the state legislatures meet in January. But Congress has taken fright at the drafting which, it argues, would make the Administrator a virtual dictator in an emergency. It is also suspicious of his right to encourage and approve state mutual aid compacts, a most necessary part of protection against atomic attacks. The right to approve inter-state compacts has always rested with Congress. The Department of Defence has, however, dealt with one objection; it has registered its reluctance to supervise civilian defence on the understandable ground that it has enough to do in other fields. One more sore point is the decision of the federal authorities to deal only with the states; mayors of large cities would prefer to deal with Washington direct, rather than through state legislatures, many of which are notoriously unsympathetic to urban problems.

*

The federal organisation does not accept all the blame for past delay. It suspects the communities of "buck-passing" and is particularly critical of the "take-to-the-hills" mentality of some. Apart from the physical impossibility of evacuating large cities in time, war production requires that a bombed centre "get up off the floor and fight." Preparations are naturally farthest advanced on both coasts, which are uneasily conscious of their vulnerability. Governor Dewey has shown commendable energy in completing a mutual aid pact with New Jersey, and a larger pool of the New England and east coast states is in the making. New York City has actually sacrificed the sirens on its ambulances and fire engines to reserve them for a greater emergency; and shelter signs have gone up on four buildings. One of the greatest needs, however, is for an adequate warning system. The radar net will not be complete for at least two years, and in view of the makeshift nature of the present system, and the high speed of jet aircraft, the Air Force, temporarily at least, has abandoned its "blue" and is concentrating on a "red," or immediate, danger signal.

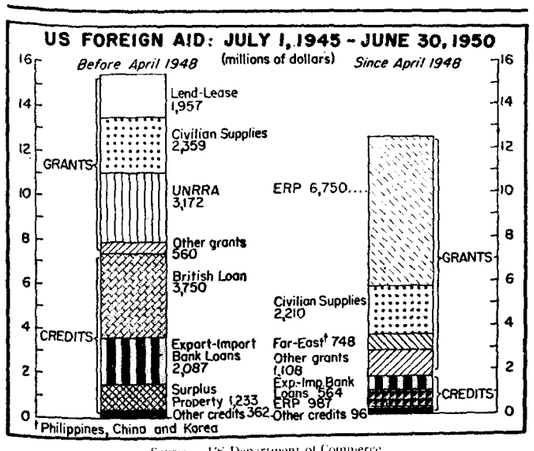
Wool-gathering

The Senate Preparedness Subcommittee, set up during the summer as a watchdog for the defence programme, has continuously snapped at the Munitions Board's stockpiling plans. In its latest report it drops the deficiencies in the rubber programme in order to get its teeth into the wool shortage, made topical by, although not responsible for, the lack of warm clothing for the troops in Korea. The Munitions Board, says the committee, was "obviously doing plenty of wool-gathering (but) none of it was for the stockpile." Its shortcomings will cost the taxpayer a great deal of money, for the wool for several million new uniforms must now be bought on a very inflated market.

Even before this latest increase in demand, the Commodity Credit Corporation's bags were empty of wool, even though four years ago they held the record stock of 540 million lb., greasy basis. The United States, which between the wars got about 75 per cent of its apparel wool from its own sheep, is now importing that proportion. The sheep population, at 27 million head, has been almost halved since 1942, while consumption of wool has increased by over 50 per cent since before the war. Domestic production of wool this year will be about 110 million lb., scoured basis, and may be slightly less next year, while consumption, for clothing and carpets together, is running at an annual rate of over 600 million lb. The difference must be made up by imports, coming largely from Australia and Argentina and therefore likely to be interrupted in wartime.



The Munitions Board's defence is that it had neither authority or money to buy wool until after the Korean outbreak. It was then authorised by Congress to acquire 100 million lb. of scoured wool for a war reserve, but its attempt to pre-empt this from this year's Australian clip failed. It is now to be acquired on the open market and will be stored in the form of materials and knitting

wool for the use of the armed forces, but, according to the Preparedness Committee, little has as yet been bought. The Department of Agriculture last August produced a scheme for increasing the sheep population by about a third in the next five years, by improved farming and marketing practices. Science may speed up this form of wool-gathering, for experiments with hormone drugs are enabling ewes to lamb twice a year. Science is also finding another solution for the wool, although not for the lamb chop, shortage, and one which may eventually send the sheep down the same road as the silk-worm. New synthetic yarns, notably Orlon and Dynel, are said to have the weight and warmth which nylon lacks. The high price of wool has led to an increasing use of rayon for suits and carpets; even the Quartermaster-General has confessed to making experiments with mixed fibres as substitutes for pure wool in uniforms.

Five Years of Foreign Aid

Under the Marshall aid that is to be suspended at the end of the year, Britain received a total of almost $2.7 billion, more than any other single country. This priority is, however, much reduced when the aid given by Britain to other participants in the plan enters into the calculation. From the beginning of the European Recovery Programme in April, 1948, to the end of the 1950 fiscal year, on June 30th last, the net aid received by Britain was $1,978 million, while France received on this basis $1,881 million. No other country has received anything approaching this proportion of Marshall aid, but during the same period grants to Germany, mainly under other programmes, amounted to nearly $2 billion.

Source US Department of Commerce

These figures are taken from an article on the foreign transactions of the US government in the November issue of the *Survey of Current Business*, which reviews American foreign aid programmes over the five years from July, 1945, to June, 1950, when their purpose was to help the free world recover from the last war rather than prepare for the next. Now the United States is planning to spend 60 per cent more this year on its own defence programme than it spent on foreign aid throughout the five previous years. In addition, the authorised expenditure on the Mutual Defence Assistance Programme is only a little less than the sum in grants and credits used under ERP during its first two and a quarter years of life.

After subtracting returns on grants, and principal collected on credits, the net foreign aid provided by the United States during the five postwar years amounts to almost $26 billion. The accompanying chart shows the striking change in the make-up of foreign aid which accompanied the beginning of the Marshall Plan. Before that, grants were used chiefly for direct relief and civilian supplies for occupied areas, while assistance for reconstruction took the form of credits. But after the middle of 1948 foreign aid became almost entirely a matter of grants. Even when principal and interest payments to the United States reach their peak in 1952, they will only amount to about $500 million a year. The American taxpayers certainly deserve any relief that the success of their efforts to foster European recovery can give them.

Shorter Notes

The Federal Power Commission has followed Solomon's example and has divided the New England market between the two natural gas companies who had been unable to agree on a joint scheme for the distribution of the fuel that the area feels will make all the difference to its prosperity. The decision means that Boston and Providence may have to wait some time for natural gas, since the company that was awarded this part of New England does not yet have sufficient gas to supply it.

*

The prolific American hen is laying even better than the government bargained for and, as a result, egg prices will not be supported in 1951, for the first time since 1942. The level at which prices were supported was reduced this year from 47 cents a dozen to 37 cents, but the hens were not deterred from laying about 300 million more eggs. The Department of Agriculture already hold some $100 million worth of perishable dried eggs, and nearly all of this will be a complete loss. Next year the poultry farmers will suffer, but taxpayers will gain; so may housewives, since egg prices may become more reasonable. But high consumer demand, not price support, is the reason why eggs have recently been at their most expensive for thirty years.

THE WORLD OVERSEAS

Men *versus* Material in War

(From a Correspondent lately in Korea)

THE boy David was giving away much weight to the formidable Goliath, but the slingshot did the trick. There ended the first lesson on the value of firepower. In Korea today Goliath, in his plodding battalions, treats the slingshot with contempt, as though it were not in fact modern, heavy-calibre, shaped, charged and jet-propelled—the heaviest potential fire-power in the world. A highly mechanised and armour-plated army is taking a strategical and tactical beating from a mass of under-equipped foot soldiers, flagrantly flouting all the theories of the best-placed contemporary experts. There are probably excellent broad planning and political reasons why the UN armies—supplied, mobile and with the initiative in the advance—were checked and finally routed by the peasant Chinese. The alleged mistakes of General MacArthur—second rate intelligence, calculated or miscalculated provocation—are still matters for furious conjecture. These factors alone, however, vital to the long international view, are not enough to explain this demonstration of the foot-slogger's superiority over the machine.

One has now come so completely to distrust GHQ's assessment of enemy strength and intentions that no really valid figures of enemy strength exist. It would seem that the forces are not so fantastically disparate as was usually accepted, when Tokyo talked in terms of astronomical divisions. For all that, odds of three to two, with a practically limitless strategic reserve of Chinese waiting to press home the advantage, weigh heavily against the United Nations. Nevertheless, previous army axioms, that one heavily armed technical soldier on the defensive can hold three light attackers, have been upset—largely, of course, because since the last Chinese offensive there has been no defensive. Unlike the long summer stand on the Naktong-Pohang perimeter, the UN behaviour has been forced and urgent retreat, with no opportunity of grouping for a stand even if a good and big enough defensive feature presented itself. Aggressive defence can only take place when the 8th Army, by *force majeure*, is compressed into a tenable beachhead.

Sub-Zero Fighting

In spite of the apparent metamorphosis in Korea, it can be argued that not many factors in what General MacArthur calls the "new war" are basically different from the earlier campaign, except the nationality of the enemy and the character of the climate. Korea is now cold and hostile, where it was hot and hostile. The Manchurian Chinese, with their quilted uniforms and their experience of the winter Gobi winds, are probably physically more at home in this sort of sub-zero fighting than the Americans or British. Apart from that, it is still the same war: superior manpower against superior weapons, with the men winning. It must be remembered that the entire campaign, from July onward, has been almost devoid of what could be called rearguard fighting, and even now the only delaying stands that have been made, outside Pyongyang and the Chongchon River, have been made by the British brigades.

Since the war's beginning one thing has been wholly clear: that a wheelbound army will always be at a disadvantage against superior numbers in mountainous country. At the risk of being boringly repetitious, every observer in Korea has argued over and over again that so long as the UN forces refused to abandon their jeeps and trucks in action and try to get above the enemy—i.e., on the hills—they would always be facing opposition fore and aft, whether from North Koreans, guerrillas or Chinese. The word "roadblock"—frequently meaning a single mortar position or machine-gun covering the rearward road—was constantly considered a good reason for pulling back an entire column to avoid flanking. Only the Marines, the British brigades, and certain specialised American units seemed to have any knowledge of what was known as "fighting on the slant." Initially and, indeed, for months the whole emphasis of training was on anti-tank action; and as it turned out this was exactly the wrong kind of war for that, nine times out of ten, just as the excellent and efficient 3.5 rocket projectile was little use against dispersed companies of nimble little men on hillsides.

At this moment the Chinese are in the splendid military position of having split the UN forces in two, without any need to fight on the awkward east-west axis. The communications of Korea, with its rugged hilly spine, are at their worst in the lateral sense. Even radio communication is chancy; walkie-talkies and tank radios are apt to black out among the mountains—another factor which interferes in no way with the activities of the enemy. Korea has always been a country much more simple to divide, as Nature did it, longitudinally, than as the politicians tried to do, by latitude.

The Chinese, with the regrouped North Korean divisions, are now showing how effectively a lightly-found army makes up in mobility what it lacks in heavy equipment. The lines of communication are not now notably longer on one side or the other, if it is assumed that the 8th Army are using Inchon as a supply port. But the Chinese are unencumbered with all the ancillary services so necessary to keep an American force in good heart—the hygienic and entertainment services, the aid posts, the bulky variety of canned rations.

The fact that the Chinese are at the gate of the homeland and know just what they are fighting for gives a subtle weight to the Chinese tactic—in their old military tradition—of attacking always in such a fashion as to leave to the enemy a practicable line of retreat, on the principle that soldiers will always fight more dangerously when there is no alternative but to fight. As far as the Americans are concerned there are obvious precedents; their most celebrated military moments have all been in last ditch stands—Wake, Bastogne, Bataan. The fierce resistance of the encircled X Corps on the east coast has been another example.

All these things have their bearing on the situation. But none of them explains the greatest puzzle of all—the failure of the air arm to interfere with the enemy's plans. The UN forces have throughout held absolute superiority in the air. Until a few weeks ago there is not a western commander who would not have conceded all the foregoing advantages to the enemy and yet reckoned, with command of the air and heavy aircraft resources, at least to have disrupted the enemy's advance tactically, without consideration of bombing Manchurian bases. The Chinese may be mobile and elusive in rough country; but it is scarcely reasonable to expect a pursuing army in full cry to crawl along the hilltops and gullies and not make use of the few roads. Admittedly, on several occasions the Chinese columns have been severely cut up from the air; but they continue to advance. Admittedly the weather conditions have been intermittently bad; nevertheless frontline reports suggest a consistent weight of sorties. No one who has ever been subjected to low-level rocket strafing from an unopposed air force will understand the apparent Chinese immunity to it.

Who Helped the United Nations?

WITH the quick ardour of old warriors charging off to a new Crusade, 52 members of the United Nations approved the Security Council resolution of June 27th to repel the North Korean invasion. But when the Secretary-General pressed on with the obvious sequel, a call for ground troops to do some fighting, the pace slackened. After five months of war, just 16 nations have made an active contribution to the Korean campaign. And last week, as the Chinese assault placed a brutal premium on each body in the line, it was revealed how unequal that contribution has been. The United States has 140,000 men in the field, the South Koreans another 100,000. To help restore the peace and to uphold the principle of collective security, the other nations of the free world have sent 20,000 men.

It is true enough that some of the units have contributed a fighting power beyond their numerical strength. When the advance party of 4,500 Turkish troops arrived in Korea on October 19th, only to be held in the rear areas, an officer complained: "We are jealous. We wish we could be there to join the fighting." Six weeks later, the Turks were fighting a gallant rearguard action.

With its 27th and 29th infantry brigades and the dozen or more warships of its fleet in Japanese waters, the United Kingdom has made the heaviest contribution next to the United States and South Korea. Canada has three naval vessels and some air transport in Korea, as well as 10,000 men training for special duty in the United States; but its first ground troops, a battalion of Princess Patricia's Light Infantry, arrived in Japan only this week. Australia has had a battalion of infantry in Korea since September 28th, plus an air squadron and three naval vessels; New Zealand sent a 1,000-man artillery force early this month. France has provided 1,000 volunteers, the Philippines a 1,200-man regimental combat team, the Netherlands 1,300 infantrymen and one destroyer, South Africa an aircraft squadron of 207 men. Greece contributed a battalion of infantry, as well as a few aircraft which saw their first action on December 5th. Other Uno aid adds up to a small mixed bag of ships, planes, medical supplies—and good will.

The modest size of this contribution has been fully noted by the American press, in its lunatic section, xenophobic division. In fact, American military leaders are themselves partly responsible for stemming the flood of volunteers from non-Communist countries. American commanders in the United Nations force have been unwilling to accept anything less than 1,000-man units of fully trained and equipped troops, and they have been unable to spare ocean transport to get volunteers to the combat area. In effect, this has limited participation in the fighting to those nations which can train their troops to meet American standards, provide them with American-approved equipment and deliver them to South Korean ports. Whether this is the controlling factor or not, it appears now to the soldier that the United Nations' experiment with collective security has become the old-fashioned spectacle of war between two interested parties.

Sanctions against China?

THE question of applying economic sanctions to China is one of the lesser uncertainties about western policy towards the Communists remaining unresolved. The complete answer obviously depends on what decisions are made about the greater uncertainties. But in the meantime the Americans have made their own position clear; they—that is the Government—do not intend that the United States shall in any way assist China's external trade. They will have difficulty in carrying the merchants with them; but they are determined to try.

When, some months ago, the prohibited list of strategic exports to Russia and Eastern Europe was extended to China, the total volume of useful goods going into the country from non-Communist sources was not substantially reduced. On December 2nd, the United States Government made export licences compulsory for all American exports whatsoever, destined directly for China, Hongkong or Macao. On December 4th, they extended these regulations to goods from all sources passing through American ports. On December 8th, they closed the last door in their own house by the decision to prevent American aircraft and ships from carrying goods of any origin bound for these destinations.

These measures by themselves do not constitute effective economic sanctions. To do so, they would have to be adopted by Britain, the rest of the sterling area, and the main machinery exporting countries of Western Europe—and possibly enforced by closing the Hongkong market to China trade. Despite an outcry by the Republicans against the "iniquities" of the Hongkong traffic, it does not seem as if the Americans are putting immediate, or at any rate public, pressure on the British to do anything further about it.

During the Washington talks with Mr Attlee, Mr Acheson suggested that, if negotiations proved impossible, the United

Nations should embark on a "limited war" against Communist China. By this he meant that the fighting in Korea should be reinforced by the imposition of economic sanctions through a naval blockade of Chinese points of access to non-Communist supplies. In deference, however, to British feelings on the subject; it was agreed on both sides to shelve the question, at least for so long as the continuance of war in Korea remained only a hypothesis. Mr Attlee, in his speech to the National Press Club on December 6th, made a delicate but revealing reference to Britain's difficulties. "As long as the Stars and Stripes flies in Korea," he said, "The British flag will fly beside it." But, for anything else, Britain cannot avoid her "special position" in Asia; through her Commonwealth associations, past and present, it has ties and friendships there which America has not.

This particular instance is disturbingly reminiscent of the time, in 1935, when the League of Nations had to decide whether to impose economic sanctions on Italy. Again, the British felt they had special responsibilities—to prevent Europe going to war. They respected these responsibilities by restraining the League from imposing the complete sanctions which its Covenant demanded under the circumstances, with the result that a limited embargo on essential exports to Italy was imposed, but oil was excluded from it, and Italy's capacity to make war was barely affected.

In taking a moderate line about a blockade of China, Mr Acheson has shown wise reticence. For, if it is to be done, it will have to be handled with extreme tact and care. It is uncomfortably probable that Hongkong has so far remained unviolated by the Chinese because, on balance, it suits them to keep this link with Western commerce. Fifteen per cent of Hongkong's total imports come from the United States, and these will be severely cut by the recent American embargoes. Any further reduction can only be made in the light of a balanced view of Far Eastern strategy. But the British cannot escape the fact that, if war with China does go on, further reductions will have to come.

Germany's Export Drive

THE Federal German Republic is not turning its back on liberal foreign trade as a result of the crisis in its balance of payments which came to light in the European Payments Union last autumn. On the contrary, the OEEC recognised, after the Cairncross-Jacobsson investigations, that the exhaustion of Germany's credit with EPU was due to temporary causes which would be set right without reverting to the narrow policy of throttled imports. The Erhard Ministry of Economics breathed a sigh of relief. This justification from outside offset the painful effect of the criticism of Germany's excessive liberalisation, in the internal and external spheres, which came from the EPU experts.

Statistics fully bear out the conclusion that the initial EPU credit granted to Germany did not correspond to the present volume of its trade. They also confirm that, by next spring, German imports will not only be higher, but the foreign exchange will be there to pay for them—provided the Bonn Government really carries out the reforms which it proposes to undertake.

German exports have been increasing at a higher rate than imports, in spite of the importing spree that followed liberalisation and, more recently, the Korean crisis. During each of the last two years, exports have increased by 100 per cent. Moreover, as the OEEC has stressed, the increase in finished goods, which represent Germany's traditional and most valuable exports, has been still larger than the general rise. In the last twelve months, the export of finished goods has risen by no less than 150 per cent. Machinery exports have trebled during 1950. In part, Germany's return to its pre-war markets, such as Latin America, Turkey and Jugoslavia, has been achieved by granting better credit facilities than those offered by its competitors. The large sums outstanding for German machinery exports accounted to a considerable extent for last autumn's crisis in EPU. Something is now being done to remedy this fault. As far as Jugoslavia is concerned, however, the Germans can justly claim that they granted extensive long-term credit for political reasons, on pressure from the occupation powers.

In spite of the great increase in imports, Germany's deficit fell from $1,100 million in 1949 to half that figure in 1950. In October this year 84 per cent of total imports, which amounted to $312 million, were paid for. For the first time, exports rose above the 1936 level. During the first ten months of this year, 81 per cent of imports were financed by Germany itself.

Reform Rather Than Planning

It is more than likely that, in spite of bottlenecks in coal and imported raw materials, the tide of German exports will continue to rise. This assumption is made in the programme of reforms which the Bonn Government has submitted to the OEEC in order to carry out that body's recommendations and qualify for the additional credit from EPU. The cure for Germany's deficit is being sought in expanding German markets, particularly in Britain and the rest of the sterling area. Owing to the rush to lay in supplies of raw materials, and the rise in prices, the sterling area, with France, accounted for some 90 per cent of Germany's deficit with EPU at the time of the crisis.

It is the Government's policy to increase still further the percentage of finished goods to total exports, which is still 10 per cent below the 1936 figure. The manufacturing capacity to do so exists, and so does the demand in other countries. Germany is in the happy position of being able to increase exports without starving the home market. The export drive which has now been planned as part of the Government's programme will, it seems, consist less of measures to divert manufactures from the home market than of financial and fiscal aid to expanding export industries. For the first time, an attempt is to be made to guide investment into economically desirable channels by the somewhat negative means of limiting the present extraordinary power of enterprises to build up tax-free capital for reinvestment in their own concerns. The payment of dividends will be encouraged with the idea of establishing a market for new issues. Such measures represent reforms of abuses rather than a return to state planning and controls.

Though the main effort is to be made in expanding exports, some reforms are also intended to limit luxury and speculative imports. Here, too, the measures taken will merely check the excesses which were characteristic of German liberalisation. Fiscal means will be used rather than quotas, though some imports, such as eggs, have been removed from the free list. The *Bank Deutscher Laender* will maintain the measures it took to meet the initial crisis, notably those to tighten money and stop the *Land* Banks from issuing foreign exchange permits to all and sundry. No radical deflation, however, is intended. Nor, if it can help it, will the Government go far in controlling raw materials. It is, however, pressed on two sides; by the need to foster export industries, and by the American demand that, in face of rearmament, German consumers should be controlled to at least the same extent as in the United States. At present, rationing of basic materials is being carried out where possible, by the industries themselves; but the Government will find it hard to avoid some measure of state controls. They will, however, be called something more palatable than "rationing," in order to avoid recreating the black market psychology which the Erhard policy has done so much to overcome. If fiscal means can effectively weaken the pull of the home market, and Germany's customers play their part, the most satisfactory solution for the balance of payments problem may really have been found.

Eastern Europe Tackles the Coal Problem

EASTERN EUROPE, no less than Western, is worried about its coal supplies and energetic efforts are being made to stimulate and increase production. It is true that there do not seem to be as yet any severe shortages—although Hungarian industry has been ordered to economise; nor, except in Czechoslovakia, has there been a failure to fulfil planned targets. But Poland, Czechoslovakia and Hungary are all in the first stages of ambitious—and in some respects complementary—five- or six-year economic development plans, which will be gravely handicapped without greatly increased supplies of coal.

The Czech planners not only increased their original coal target for 1950, but, as a result of a special order from the Communist Party, introduced last spring an extra "super-plan" which is supposed to produce an additional 1,600,000 tons. (Since September neither the normal nor the super-plan has been completely fulfilled.) The Hungarian Cabinet has recently resolved that coal production in 1951 must be increased by 20 per cent over this year's production, which in November was reported to have increased by 13 per cent over last year's figure. The Polish miners are said to have already dug 4,000,000 more tons of coal than last year, and to have exceeded this year's target by 1,200,000 tons in eleven months. But Poland, with the largest coal resources, must provide not only for its own increased needs, but also, it appears, for any gaps in the supplies of the other Soviet satellites; and the Polish six-year plan envisages an increase in production of over 25 per cent to 100 million tons a year by 1955.

Help from the Russians

Throughout Eastern Europe the shortage of trained manpower for industry hampers the recruitment of extra labour for the mines. Increased production must be secured through greater mechanisation and through stimulating a much greater productivity of labour. According to the Polish deputy Minister of Mining, Mr Lesz, only 5,000,000 tons of Polish coal are loaded by mechanical means at present. By 1955 it is planned that 65 per cent of Polish coal shall be loaded mechanically, so that at least 20,000 coal loaders will be able to train as skilled workers. The Polish Minister of Mining, Mr Nieszporek, said at the Miners' Day celebrations on December 4th that the past year had marked a turning-point in the mechanisation of Polish coalmining, thanks to the "brotherly help" of the Soviet Union.

A certain amount of Soviet mining machinery does in fact appear to have been delivered not only to Poland but also to Hungary (for example, drilling machines for the Dorog mines) and to Czechoslovakia. But in Hungary the mechanisation of the mines seems, so far, to have been carried out with little enthusiasm. There has even been what Mr Rakosi called "a certain amount of antagonism towards mechanisation." He also actually admitted that "political motives sometimes play their part," and implied that a certain amount of prejudice has sometimes been exhibited against machines and technical methods known to come from the Soviet Union.

The chief obstacle to increased coal production in Eastern Europe clearly lies in the unco-operative and unresponsive attitude of the miners themselves, which makes any increase in labour productivity hard to achieve. Absenteeism is widespread; in Hungary as many as 25 per cent of the workers were recently reported as absent from one mine either with or without authorisation. Drastic measures have recently been introduced to restore discipline. For instance, underground workers who have not missed a single shift in the

FOR YOUR INVESTMENT PORTFOLIO

THE Investments offered by the Co-operative Permanent Building Society are of immediate interest to private investors and their financial advisers.

Individual investors may invest up to £5,000 maximum which earns 2¼% per annum with income tax paid by the Society.

Capital never fluctuates in value, and is solidly secured by first mortgages on private houses throughout the country. The Society's Funds are in excess of £60,000,000.

ESTABLISHED 1884

year will be given a "loyalty bonus" which may amount to as much as 20 per cent of their basic annual wage. If they miss one shift the bonus will be cut by a half, and if they miss two they will lose it altogether.

A special effort is now being made in Hungary to persuade all miners who possess smallholdings to give them up. It is argued that the miner with land not only stays away to cultivate it, but cannot give of his best when working in the mines. As Mr Rakosi put it, "all he is thinking of is to go home as quickly as he can to go rooting in his land."

The East European governments rely heavily on stimulating production by increases in the basic wage rates and the development of the system of incentive payments on the Soviet model. The Poles have raised the basic wage in the mines by 22 per cent while increasing the norm by 10 per cent. The Hungarians have recently introduced a series of "achievement bonuses" which increase according to the extent to which the miner exceeds his monthly norm. Last autumn the Czech miners received a "loyalty bonus"; this was paid although the miners' performances did not really qualify them to receive it. All these financial incentives, however, lose a great deal of their point so long as norms are constantly raised and so long as prices remain high and consumer goods in short supply. The constant incitement to engage in special shifts ("peace shifts," for example) and in socialist competitions, also does not have entirely satisfactory results. It leads to what the Czechs call *sturmovstina*, or spasmodic output records—not at all the same as a steady and reliable increase in production. To achieve this the authorities are making great efforts to improve the standard of living of the miners and to provide them with better housing and transport.

Labour Unrest in Finland

[FROM A CORRESPONDENT]

THE crisis which began with the Finnish engineering strike in September is not yet over. The strike ended on November 1st, when a new wage settlement was reached and the Premier promised measures to stabilise wages and prices. But the implementation of the agreement has caused further disputes between unions and government, and the loss of some parliamentary support has made the Kekkonen Ministry's position most precarious. Obstacles to the formation of a strong coalition government appear insuperable, while a dissolution followed by electoral agitation could hardly improve the situation.

The immediate cause of the strike in the engineering industry—which employs one-third of Finland's industrial labour force and supplies a high proportion of the goods delivered to the Soviet Union as reparations, was the uncertainty and complexity of wages. Most of its workers received piece rates, and the basic time wage formed only a comparatively small part of their earnings. The rest was made up by a series of cost-of-living allowances and bonuses for different types of work. The piece workers, and the small number of skilled time workers, did reasonably well in practice, but few knew how much they were entitled to. Their sense of insecurity was increased by the widespread fear that, as reparations come to an end, the industry's markets would decline and the employers would be able to reduce their wages by removing some of the bonuses. As for the 10 per cent of unskilled time workers, their pay was definitely low. The metal-workers union thus demanded for the majority of workers a simplified system, and for the minority of unskilled better pay. These two aims were to be achieved by introducing a much higher basic time rate. The employers feared that if the basic rate were raised the bonuses and allowances would also be raised. In this case the costs of the industry would be intolerably high. They are already too high to allow it to compete in most foreign markets. Its best customer for the next five years is likely to be the Soviet Union, which undertook by the trade treaty of last June to buy its products at "world market prices." Should costs rise still further the industry would have to sell to Russia at a loss.

With both sides equally determined, the government-appointed mediator was unable to secure a compromise, and the strike began at the beginning of September. A month later, the central Trade Union Council (SAK) threatened to declare a general strike on October 22nd unless the metal-workers' demands were granted. The government then set up a conciliation committee, consisting of the Minister of Trade and Industry and the two most prominent representatives each of SAK and of the Central Employers' Organisation. This committee's proposals were accepted by SAK at the last moment, and the general strike was averted. At the end of the month the metal workers decided to accept them, by a very narrow majority, and on November 1st they went back to work.

Farm Prices Raised

The effect of the new agreement was to raise the wages of the worst-paid workers by about 4 per cent. and to maintain the existing level for the rest. A new Committee for Stabilisation of Wages and Prices was set up. As a concession to the workers, a prominent Social Democrat was appointed as its chairman. On November 5th, however, SAK declared that it would not take part in the committee.

The task of maintaining the workers' standard of living is in any case extremely difficult. The economic conflict between farmers and townsmen, familiar in most European countries, is especially acute in Finland and is an important cause of the recent strikes. In the interest of the farmers, and especially of the minority who have considerable surpluses to sell to the towns, the present government, dominated by the Agrarian Party, raised some farm prices last May and promised to raise others in the autumn. The farmers' claims are by no means unreasonable, and their votes are important to the Agrarians To satisfy both them and the workers it will be necessary to spend more money on subsidies, and it will not be easy to find more revenue. The inflation of the last year has already made the present exchange rate of the Finmark quite unreal. Devaluation can probably not be postponed much longer.

Apart from wage rates and cost of food, the third, and perhaps the most important cause of the strike was the rivalry of Socialists and Communists for control of the trade unions. The Socialists recaptured the unions after the first post-war gains of the Communists. At present they have a majority of about 60 per cent in SAK. In the metal workers union the majority is smaller. One reason for the strike was to strengthen their position in this industry by showing that they were better protectors of the workers' interests than the Communists. Whether they have succeeded remains to be seen. The Communists, who did not initiate the strike, and treated it as a dishonest manœuvre by the "right-wing socialist traitors to the working-class," did their utmost to prevent its conclusion. When conciliation proposals were put to a ballot of the metal workers, 10,500 voted for acceptance and 9,400 against. When it is remembered that only a third of the workers took part in the ballot, and that the Communists always mobilise every possible supporter, the opposition is not quite so impressive as at first sight. In the municipal elections at the beginning of October, the Communist vote increased by 2.5 per cent and the Socialist by 3.2 per cent. There is thus no evidence yet that the Socialists have lost ground to the Communists. This will largely depend on the practical effects of government economic policy in the next months.

Five years of STEEL progress

Steel was the first major industry to embark on a great post-war development plan of modernisation and expansion.

* * *

Management and men have co-operated in getting the most out of existing plant, and there has been willing agreement to keep the furnaces working continuously.

* * *

In research and training, in development and in securing raw material, the common services available to all firms in the industry have been steadily expanded.

* * *

Output has risen from under thirteen million tons to over sixteen million tons a year, prices have been kept below the level of other great steel producing countries and our exports of goods made from steel are more than twice pre-war.

In five years of progress the steel industry has shown what can be done by enterprise and co-operation.

STEEL is serving you well

Industry and Raw Materials

FOR the past six months it has been quite obvious that if British industry were to fulfil all that is expected of it for defence, exports and essential home requirements, the biggest limiting factor would be the supply of key raw materials. Even when the Government's intentions about defence were limited to the extra amount of output that could be devoted to rearming without disturbing anything else, additional output clearly implied more raw materials. Events have since shown that the aims were too modest and that extra raw materials for defence are simply not to be had "without disturbing anything else." British industry, which has been none too well informed in recent months about the Government's intentions on production for defence, is now exhibiting an understandable state of nerves, and it could become an easy prey of the more excitable line of prophecy which holds that, within a few weeks, vital sectors of industry will be shuddering to a standstill for want of raw materials. This note of hysteria is helping neither industry nor defence; the prospects are quite serious enough without it.

The past week has brought little enlightenment about the exact ways in which commodities are to be shared to the best advantage among the North Atlantic Treaty Powers and allocated among industries to obtain the most urgently needed end-products. The joint communique issued at the end of the Washington talks stated that the President and the Prime Minister "recognised the necessity of international action to assure that basic raw materials are distributed equitably in accordance with defence and essential civilian needs." That form of words might imply that a full system of international allocation may eventually be worked out. But as the statement proceeded to make plain, immediate action is confined to "immediate problems of raw materials shortages and consideration of these specific matters will continue." What has been gained is the principle of *ad hoc* negotiation designed to limit the impact of specific and critical shortages. It is true also that the communique recognises that "the maintenance of healthy civilian economies is of vital importance to the success of our defence efforts." But British industry is certain to find that in future debate about the division of supplies of essential raw materials it will be defence needs, rather than civilian requirements no matter how "essential," that govern American views. It may be that as an outcome of the Washington talks British industry can expect to receive rather larger supplies of certain scarce materials than might otherwise have been the case; it may, for instance, already be possible to share more effectively the supply—and the shortage—of zinc.

But procedure of this kind for every case as it arises—usually at short notice—would be tiresome and it is doubtful whether official machinery would be able to take quick and effective decisions. Nor, to turn attention homewards, is there any sign of effective steps to "ensure the proper distribution in the national interest of those metals where a severe shortage persists." This is a quotation from the Minister of Supply's statement of ten days ago; it dealt entirely with metals and disclosed that measures to secure "the proper distribution" that were now under consideration in consultation with industry included restrictions on the export of semi-manufactures, "the prohibition of the end uses of these metals for inessential articles," and the institution of allocation systems. But schemes of this kind take time to devise and even more time to make effective; the efficiency of controls at their best was never high and whether or not a few specific controls can be devised and given a fair chance to work effectively, the fact is that allocation has been introduced for only two metals—for zinc from October 1st and for copper from January 1st. If allocation is being carried out at all, it is by the larger suppliers of metals, raw materials and components, applying with what wisdom and patience they can command their own ideas of what constitutes the "national interest." Such an informal system of rationing may not give inferior results to a system of detailed controls working on arbitrary lines and using much manpower. But it cannot guarantee that scarce materials will in fact be used for defence, exports and essential home needs, in that order. Who is to control their end use, unless the manufacture of "inessentials" is again made illegal? Who is to measure the damage to productivity caused by interrupted supplies of materials and components and by the concealed unemployment that will occur in civilian production?

The risk is a slow building up of defence output and waste in other parts of the productive machine arising from scarcities of materials and the reconversion of industry to defence needs—not breakdown but growing inefficiency in the vital parts of industry.

★

It has been said in these columns that supplies of most industrial materials would suffice for the needs of the free world, but not also for stockpiling at a high rate. It would be too simple a view to attribute the fall in the stocks held by British industry solely to American stockpiling; other factors such as bulk purchase, and unrealistic price policies have played their part in denuding industry of adequate stocks of basic materials. The most recent information about stocks is given in the panel on page 1095; this shows the serious contraction in stocks during the past twelve months. With only a few exceptions (lead and cement among them) every raw material—whether home produced or imported, whether metal or fibre or chemical—is scarcer than it was at the time of devaluation. There had, of course, been some extra buying in the expectation of devaluation, but the stocks then laid in have been heavily drawn upon this year and in every case are well below what is needed to ensure rising output on which the Government has hitherto been naively counting for meeting defence needs. It must be recognised that shortage of materials now compels deliberate choices among different ends; that although rearmament in Britain has so far played no important part in producing the shortages it will be affected by them unless other competing uses are restrained. Growing defence demands that are inexorably met in full can only heighten the effects of material shortages on civilian production; in the main these are still of immediate concern for industry's buying and stock departments, but they are beginning to penetrate into production and will soon do so fast.

To these world-wide shortages of basic materials will be added other shortages of domestic origin—coal, power, certain types of steel, and certain types of labour. The coal shortage, itself a consequence of too little willing and suitable labour, casts its threatening shadow beyond the next critical ten weeks, but it will need good luck and good weather to avoid dislocation of industry even though exports of coal have been cut and imports resumed. Economy in power will be enforced by load spreading and cuts; these are already having a damaging effect on output and in a hard winter lack of power would be a handicap to any expansion of industrial output even if there were no shortages of other kinds. Perhaps the one really serious shortage of skilled labour—apart from the departing miners—is the limited number of engineering draughtsmen available; these will have to be drawn from civilian work in considerable numbers as the defence programme gathers momentum. "Shortages" of skilled labour have been reported in a variety of industries since the war, but the recent expansion of output has been achieved despite them; transference between departments or between firms will probably resolve any extra needs imposed by defence. There is as yet no real shortage of general types of steel; sheet and strip and tinplate are not new shortages, though they have been accentuated by the decline in the small supplementary imports and by the lack of aluminium to serve as a substitute in certain uses. Nevertheless the steel industry, as a later note explains, is preparing for certain difficulties next year, and has begun to reduce its export commitments; these steps, it is hoped, should enable the steel industry to meet normal demands but will allow no room for any expansion of stocks.

II.—Impacts on Production

Shortages of materials have already made their impact on production in certain industries concerned with the processing or semi-fabrication of materials for use by other industries engaged in finishing and assembling. These primary industries include galvanising, the vulcanising of rubber, metal plating, and sulphuric acid production, but even here the effects of shortages are by no means uniform. Galvanising is likely to be affected to a greater degree than zinc die-casting, since supplies of high-grade zinc used in casting are easier than supplies of normal grades; in the iron and steel industry, however, the shortage of zinc—at this stage, at least—presents a problem of replacing stocks rather than a threat of immediate curtailing of production. Brass producers and fabricators, like the die-casting firms, have already been using zinc stocks intended for 1951, for recent supplies—representing no more than 90 per cent of the low consumption of 1949—have been inadequate to meet this year's expanding needs. Metal plating firms, many of which have turned to zinc in recent years as a substitute for cadmium have found themselves in difficulties caused by the sudden shift in the supply of the alternative metal; nickel has been informally rationed by suppliers for some time, and chrome, apart from its price, is likely to become scarce. The Ministry of Supply's estimate that supplies of ordinary grades of zinc in the first quarter of next year may have to be restricted to little more than half this year's rate of consumption has brought many despairing complaints that production would become uneconomic and firms would have to close; there is a natural tendency for any trade caught in such circumstances to make the most pathetic case for itself, but it is a fact that many of these firms are extremely small productive units. The rubber industry uses large quantities of zinc oxide, the use of which has already been cut to a minimum this year because of high prices and cannot be reduced further without affecting output; it also uses some sulphur, and the cuts in supplies of "regular sulphur" may soon bring about a reduction in the industry's output of tyres and other rubber products. Many of these processing trades are affected by the dire shortage of sulphuric acid; producers have already been rationing their customers for several months and there is no speedy and cheap way of increasing the supply of acid.

Simultaneous shortages of materials such as now exist may not necessarily be cumulative in their effect upon any one industry or on the whole economy. For example, the shortage of copper is felt less by makers of brass alloys since zinc itself it so short; the scarcity of sulphuric acid affects the tinplate industry at present less than it would if supplies of sheet were not already short. If sheet steel were adequate, the shortage of zinc die-castings, which make up about 65 per cent of the castings used in a car, would become the limiting factor in car production. The motor industry expects difficulty in the supply of components using non-ferrous metals, such as door handles, sump and gearbox casings, and carburettors, and it is already beginning to cut down the use of plating on external trim. Sheet supplies in the first quarter of next year have been cut to an extent which might cut car production by 5 to 10 per cent below the present record rate; after that, zinc shortage might become the most important limiting factor on output.

The rayon industry will be affected by shortage of sulphuric acid as well as of "regular sulphur," but they have some power to control their acid supplies since their own acid production has already been partly converted to use pyrites. But the shortage of cotton linters and spruce pulp is beyond their control; the industry is hopeful about maintaining present output, but these basic shortages are likely at least to limit any expansion of rayon supplies next year. Hence those textile manufacturers in Lancashire and Yorkshire who are anticipating—but not yet experiencing—cuts in production through the shortage and high prices of their own natural fibres may have less opportunity than they hoped for substituting rayon for natural fibres.

★

Makers of electrical equipment, who together are among the largest users of non-ferrous metals, also require sulphuric acid, fabric-based plastics for insulators and paper; this industry will be forced to squeeze the consumer end of its wide range of products; but the scope for big savings has diminished since the demand for domestic electrical appliances—apart from refrigerators and washing machines—has recently been running no higher than the replacement level. Here the choice between making essential products and of limiting other production is likely to be easier in method if not simpler in content; most of the larger firms manufacture heavy and industrial equipment as well as consumer goods. Shortages of materials seem unlikely at present to affect the radio and television industry, for this requires small amounts of materials, some of which can be replaced by substitutes; but its booming curve of domestic production and exports is likely to be crossed next year by the demands of defence production for components. Cable makers, faced with shortages of rubber and sulphur for vulcanised insulating material and short of metals for electrical conductors, have so far managed to maintain production from stocks.

Apart from sulphuric acid, which has almost universal applications in industry, and phthalic anhydride, used to make plasticisers for the paint and plastic industry, no serious shortages of chemicals should develop next year. The industry will be bringing into operation new petroleum and chemical plants which will ease the recent shortages of alcohol and acetone and the long-standing lack of phenol. The plastics industry indeed should not be greatly affected by shortage of materials during 1951, though naturally if any large-scale demands for substitution were to develop through shortage of metal castings or of insulating materials, its capacity would probably be insufficient. Supplies of chemicals generally are expected to be somewhat lower in the first quarter of next year than at present, but still higher than the rate earlier this year.

Production of alloy steels has not yet been affected by the shortages of non-ferrous metals, but large consumers of stainless steel, including the makers of equipment for chemical, petroleum and food processing and the manufacturers of domestic equipment such as washing machines, are expecting serious difficulty. Nickel and chrome, the two alloying metals concerned, are already scarce; and if the production of gas turbine engines for the defence programme expands considerably these power units—which use large amounts of nickel-chrome alloys—will take an ever-growing share of supplies which are unlikely to be increased.

In most industries the impact of shortages will be graduated largely by the financial power and sagacity each firm has been able to deploy in recent months in the accumulation of private stockpiles. These provide advantages for the more highly organised industries and for larger firms that are able to exert strong claims on their suppliers. Government allocation, however it materialises, might tend to produce the same result. Apart from basic allocations, the firms that require priority for defence or export orders tend, as a rule, to be the large ones. In the mass of small firms engaged in the light engineering industry, many firms have been simply met with refusals of orders for zinc, aluminium and steel sheet, or with offers of delivery in more than six months time. Since many of these firms have not been particularly busy in recent months, and few hold substantial stocks, this drastic curtailment of materials may force some to close down; it has already forced

some in the Midlands and North to lay off redundant labour. Without Government pressure, "inessential" firms are certain to suffer in the competitive struggle for supplies. But their potential contribution to defence and exports is not to be despised and should not be wasted.

III.—Outlook for Supplies

"We have agreed to work closely together," the Washington communique records, "for the purpose of increasing supplies of raw materials." This is a long range intention and it may have important results eventually. But it cannot affect the short-run prospects of British industry. In this third section an attempt has been made to calculate the prospective supply of certain raw materials that may become available to British industry during the first half of 1951. Such supplies will have to be devoted to all uses: defence, export and home needs.

Among the non-ferrous metals, *zinc* is perhaps the most seriously short and the shortage will have widespread effects. The Minister of Supply has stated that supplies of all grades of zinc in 1951 "will, as far as can be seen at present, involve further cuts in consumption"; supplies of ordinary grade used for galvanizing, brass-making and zinc oxide will be particularly short and consumption in the first three months of next year may have to be reduced to a little more than half of the level recorded in the first nine months of 1950. Zinc consumption between January and October has averaged 20,000 tons a month, a rise of 20 per cent compared with 1949 when consumption was unusually low; of this quantity 10,500 tons consisted of the ordinary grade. Total stocks at the end of October amounted to 41,000 tons against 65,100 tons twelve months earlier. Stocks of ordinary grade zinc have declined more rapidly than those of electrolytic and high-grade. At the end of October, 1949, ordinary grade zinc stocks totalled 35,100 tons while at the end of October, 1950, they were 20,000 tons; on the other hand, stocks of high grade zinc fell during the same period from 30,000 tons to 21,000 tons.

Prospects for zinc supplies can be readily summed up. The current level of consumption is 240,000 tons a year, of which 126,000 tons is of ordinary grade zinc. Home production might yield 70,000 tons for the year (55,000 tons ordinary grade). Hence if stocks are not to be further reduced, imports would have to be of the order of 170,000 tons against an annual rate of 145,000 tons so far this year. Such an increase in imports next year of the order of 25,000 tons would only seem possible if metal could be purchased from the United States, and unless the United States Government modifies its present plans, British imports from America are, in fact, likely to be smaller. If the cut in consumption of ordinary grade zinc, as outlined by the Minister of Supply, is put into effect, a saving of 15,000 tons for the first quarter would be achieved.

The outlook for *copper* seems less serious. Consumption this year has so far been only slightly larger than in 1949—incidentally the smallest for any year since the war. Yet stocks have declined; at the end of October they amounted to 120,400 tons against 143,900 tons twelve months earlier. Imports of unwrought copper have averaged 26,800 tons a month this year compared with 25,900 tons a month in 1949. Rhodesian production could still be expanded if enough fuel can be got to the smelters. The present level of copper consumption could be maintained without any undue running down of stocks, provided that supplies from Canada and the United States are not reduced. But that is a big assumption. Both these countries supply special shapes of copper and there is no guarantee that these supplies will be adequate. Indeed there is every reason to believe that they will be much smaller than this year for the United States is consuming an ever increasing quantity of its own and Canadian production. This shortage, however, will affect only certain manufacturers, who might, as the Minister of Supply suggested, be able to make do with other shapes.

Supplies of virgin *aluminium* next year are to be reduced to 15,000 tons a month from the current level of 17,000 tons a month. Consumption between January and September averaged 14,400 tons a month, but it is believed to have increased sharply since last year consumption averaged 15,000 tons a month. No stock figures are disclosed for aluminium, but imports this year

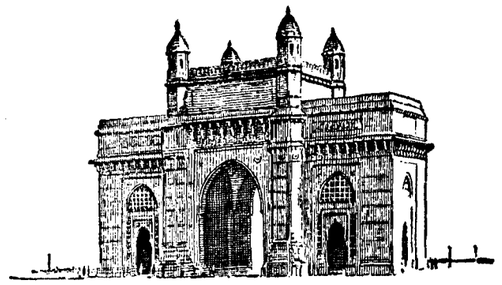
INDUSTRIAL AND COMMERCIAL
I. C. F. C.
FINANCE CORPORATION LTD.

SHAREHOLDERS
THE ENGLISH AND SCOTTISH BANKS

I.C.F.C. in the Midlands



An office of the Corporation is now open in Birmingham to deal with enquiries and proposals.

I.C.F.C. since its establishment in 1945 has made available over £20 million in amounts from £5,000 upwards to some 330 small and medium-sized businesses, mostly private companies, by way of long-term loans and share capital. It offers economy, despatch and flexibility in method.

The purpose of the new office is to bring I.C.F.C.'s facilities closer to Industry in the Midlands.

Full particulars of the facilities offered may be obtained from

The General Manager, 7, Draper's Gardens, London, E.C.2.
The Birmingham Manager, 214, Hagley Road, Edgbaston, Birmingham.

The Gateway to India

Businessmen need go no further than London to find the key to the gate, for the National Bank of India can provide all commercial banking facilities needed for trade with the subcontinent of India. Moreover, the Bank's specialized knowledge of this area and of East Africa can be of great value to those interested in developing trade with these territories. Enquiries are welcome at Head Office and branches.

A comprehensive banking service is available at the Bank's branches in

INDIA PAKISTAN CEYLON BURMA KENYA ZANZIBAR UGANDA TANGANYIKA and ADEN

NATIONAL BANK OF INDIA LIMITED

FINANCE AND OVERSEAS TRADE

The financial arrangements involved in trading with countries overseas can present many complications. The Three Banks Group has wide experience of this aspect of modern Banking practice, and with many important contacts overseas is particularly well placed to handle such problems and tender advice based on accurate knowledge of local conditions. The need for increased exports is leading to considerable expansion of the Group's activities in this direction.

will be some 30,000 tons lower than in 1949 and stocks in this country will be reduced by nearly 25,000 tons. The cut in supplies next year by 2,000 tons a month seems to substantiate this estimate. *Tin* consumption has increased this year, though it is still smaller than in any of the postwar years except 1949. Manufacturers can buy supplies if they are willing to pay the price, though the purchases for the American stockpile have created a dearth of spot supplies from time to time. *Lead*, too, is in relatively comfortable supply. Australia provides the bulk of Britain's imports and the quantity received this year has been much larger than in 1949; stocks have also increased.

*

Unfortunately this is not true of the alloy metals. Statistics relating to consumption and stocks of most of them are not available but a certain amount of information can be gleaned from the trade returns. Imports of *manganese*, *chrome* and *nickel* have been much smaller this year than in 1949 and there seems little prospect of larger supplies, at least of manganese and nickel, next year. China and Russia are two important sources of manganese, though British supplies are obtained largely from West Africa. Nickel is already acutely short and America is purchasing supplies outside Canada, the world's largest producer. Slightly smaller quantities of *tungsten* ore have also been imported this year and if there is any substance in the report that the United States is buying 5,000 tons for its stockpile, a shortage may become apparent in 1951. In contrast, imports of *cadmium* this year have been large and stocks have increased, while imports of *antimony* and *molybdenum* have also exceeded last year's level.

The textile shortage will be the one most obviously apparent to the public, for all three clothing fibres—cotton, wool and rayon—are affected. *Cotton* consumption has declined slightly and the monthly average in the first nine months of the year amounted to 78.3 million lb. compared with 81.8 million lb. in 1949. Imports this year have been slightly larger than in 1949; the smaller supplies from the United States were offset by larger quantities from East and West Africa, Egypt and Brazil. But despite reduced consumption, stocks have been run down; at the end of September they totalled 663 million lb. against 753 million lb. twelve months earlier. Normally, Britain would have increased its purchases of American grown cotton this season to replenish its stocks, as purchases were cut in July, 1949, to reduce dollar expenditure. The severe export restrictions imposed by the United States two months ago will mean that stocks in this country may have to be reduced still further. Under the American quota system, supplies to Britain were cut proportionately much more than those to other countries, presumably on the assumption that substitutable cottons are grown in the sterling area. In fact, Nigeria is the only Commonwealth area which produces cotton of the American standard staple. The lack of American cotton may not reduce activity in Lancashire immediately, but it will certainly retard the recovery in output that has taken place in the past three years, and it will present spinners with great difficulties in switching to other growths. Certain reports suggest that in consequence of the Washington talks the United States will raise its export quota to Britain; even if this happens supplies will still be inadequate. The cotton shortage is a direct result of the drastic restriction imposed on American cotton acreages twelve months ago. If next summer's crop reaches the target of 15 million bales, the immediate crisis will be surmounted. Next year this country might be able to import 1,000 million lb. of cotton compared with about 1,035 million lb. this year, but only if the United States increases its export quota.

The *wool* shortage arises from natural causes. Ever since the end of the war world consumption has exceeded production, and the gap was bridged by stocks accumulated during the war. These stocks are now virtually exhausted, so that world consumption will in future be restricted to the annual clip. World consumption in 1951, therefore, will have to come down by between 10 and 15 per cent, and there is no hope of using other fibres to make good this loss. The wool industry can buy as much wool as it is willing to pay for at the auctions, but prices are dizzy enough, and consumption next year will almost certainly have to decline by about 10 per cent.

Consumption of both the hard hemps (*sisal* and *manila*) and of the soft hemps has been running at a higher rate this year than in 1949, and though imports have been more or less maintained, stocks have fallen. At the end of September stocks of hard hemps amounted to 10,800 tons against 14,600 tons twelve months earlier, while stocks of soft hemps fell during the same period from 7,370 tons to 5,630 tons. World production of sisal is expanding slowly, but demand, which was firm even before the invasion of Korea, has since been inflated by heavy stockpile purchases by the United States. If American buying shows no further increase, imports into Britain next year could be maintained at least at the 1949 rate. Figures for *jute* consumption and stocks

have not been published by the Board of Trade for several months. It is, however, quite safe to presume that stocks are low. So long as Pakistan has to rely on Chittagong as its main outlet, no large-scale increase in exports is possible. The illicit transport of raw jute from East Bengal to Calcutta is growing, and some reports suggest that the quantities involved form a sizeable proportion of Pakistan's total crop; if so, this development offers no encouragement to expect larger exports through Chittagong.

Sulphur is critically short, and difficulties of sharing sulphuric acid supplies among many industrial users have already been noted. Elemental sulphur comes largely from the United States, where known reserves are put no higher than seven years' supply. Even without war in Korea, sulphur would have been short, though industry might have had more time to shift its arrangements accordingly. Last year American producers asked the United States Government to restrict sulphur exports to conserve the rapidly dwindling reserves. British imports of sulphur, virtually all of which come from the United States, have in fact been larger this year; they amounted to 382,500 tons in the first ten months of this year compared with 323,500 tons in the corresponding period of 1949. Consumption both for sulphuric acid and for regular use has been higher than last year, while stocks, at least for sulphuric acid, have declined, though not to any alarming extent. Like most shortages, that of sulphur has afflicted industry before it has affected the statistics. American exports have recently been seriously reduced, and stocks in this country, although they may have increased during the past twelve months, are now equivalent to only 2½ months' supply. At such a low level, production can only be maintained if a steady flow of raw materials is assured, and that flow has been interrupted. To estimate how short sulphur is likely to be next year is difficult, but unless special assistance is given by the United States Government this country may receive no more than 250,000 tons.

Consumption of *woodpulp* in Britain, both for paper-making and industrial uses, has been much higher during the first nine months of this year than in 1949. Imports to September averaged 110,000 tons a month, the same rate as last year. Yet stocks for paper-making in September were only 250,300 tons against 361,600 tons twelve months earlier; and during the same period stocks of industrial woodpulp fell from 71,500 tons to 53,200 tons. Woodpulp is scarce throughout the world; increased consumption in the western hemisphere has reduced the exportable surpluses available to Europe. The problem in 1951 will be not to increase imports, but to struggle to maintain this year's rate. It will not be easy.

Rubber is the one bright spot in a world oppressed with shortages. Consumption has been rising this year, and so have imports; they have been some 40 per cent larger than in 1949. But although stocks have declined in the last twelve months (at the end of September they amounted to 40,300 tons against 47,400 tons twelve months earlier), supplies next year ought to be adequate, and they may be more than adequate. The sharp rises in rubber prices in recent months testify to the pressure of temporary squeezes—a lack of spot supplies caused mainly by large-scale American stockpile purchases. But the continued expansion in world production of natural rubber and the resuscitation of American production of synthetic rubber on a wartime scale should provide supplies next year adequate to meet current consumption and to slake the hoarding thirst of both governments and manufacturers. There is indeed a risk that British consumption next year might decline owing to the shortage of sulphur for vulcanising and of other materials.

This survey does not pretend to be exhaustive. The examples have been chosen first because statistical data on their production, consumption and stocks are adequate to permit a rough quantitative estimate of likely supplies in 1951, and secondly, because they form a representative collection of the main raw materials. The story they tell is impressively uniform and unmistakably serious. It is quite plain that British industry, committed to an expanding defence programme, a high level of exports, large plans for industrial and social investment, and an unchecked demand on the part of consumers to consume, has simply outrun any conceivable possibility of feeding itself with the raw materials that it requires. Something must be made to give, and quickly, unless production, prices and planning for defence are to founder.

Business Notes

Paradoxes in the Markets

Not surprisingly, the most striking aspect of the behaviour of London stock markets in the recent past has been the evident reluctance of investors to "take a view"—in either direction. This week's experience, in particular, suggests that the markets are almost as concerned to cover themselves against the possibility of sudden good news as against the possibility of bad. The modest rally that developed ten days ago, after the first suggestions that the Chinese Communist forces might stop at the 38th parallel, has since made further headway—thanks to the pause in military activity on the main Korean front and to restrained satisfaction at the outcome of the Truman-Attlee talks. Thus the end of the difficult Stock Exchange account on Tuesday was marked by bear covering that raised the industrial share index of the *Financial Times* by half a point; while, more surprisingly, the first day's dealings for the current three-week account produced a further rise of 0.7. This carried the index to 114.8, or 1.4 above the low point reached on December 5th and 3 points below the level at which it stood just before the main crack at end-November. Once again, the London market has shown itself to be much less volatile than Wall Street, where the Dow Jones average for industrials has swung from 235 on November 27th to 222 on December 4th and back to nearly 229 on December 13th.

But, if London markets have held their ground and have refused to be stampeded, it is still rather astonishing that the international shocks and fears of the past three weeks have wholly failed to produce the expected stoppage in the flow of new issues. This, if anything, has actually gathered pace—for in this period there have been at least a dozen such operations in train. Still more surprisingly, the more important of them seem to have been largely immune from the effects of the current malaise. True, this week's news disclosed that 48 per cent of the City of Brisbane loan had been left with underwriters; but it also revealed an outstandingly successful

outcome of the large Dunlop operation. Of the stockholders to whom the £4,147,000 of new stock was offered, no less than 95 per cent took up their quota, while the remaining 5 per cent was much more than fully covered by applications above the quota—so that "excess" subscribers for amounts over 1,001 units secured only a 1 in 20 allotment. This result has obviously put heart into other prospective borrowers. Among various announcements about pending issues, the most important, perhaps, is the definite statement from Tube Investments that its issue of 5,000,000 4½ per cent redeemable preference shares (at 20s.) is to be made "as soon as possible." Meanwhile, a further tranche of coal compensation stock was due to be allotted just after this issue of *The Economist* went to press. In view of the recovery that has occurred in industrials this week, it is perhaps unfair to attribute—as some people in the market have done—the very restrained rise in gilt-edged securities to the imminence of this operation.

* * *

Marshall Aid Suspended

No further Marshall dollars are to be allocated to Britain. Technically, the suspension is due to take effect from January 1st next. But as the sum of $175 million now fixed as the total of allotments of aid to Britain for the current Marshall year had already been fully allotted by mid-November, the decision is, in effect, retrospective. This suspension was the inevitable conclusion to which the discussions on this subject between the Chancellor of the Exchequer and Mr William Batt, minister in charge of the ECA mission to the United Kingdom, were predestined. The official statement on the result of these discussions, made in the House of Commons by the Chancellor on Wednesday, stressed that the two governments had been guided in their decision by two considerations. The first was that the economic recovery of Britain and the sterling area had made such good progress that the dollar deficit had disappeared in recent months. The second was that the United States economy would now be called upon to bear the much heavier burdens imposed by the increased defence programme, including mutual aid to other north Atlantic treaty powers.

The suspension of Marshall aid to Britain is not an abrupt, guillotine operation such as the 1945 termination of lend-lease. Although no further allotments will be made, the goods in the pipe-line—estimated at a value of about $200 million—will continue to flow to their destination as gifts. This substantial amount of aid already allotted but not received includes expenditure on a number of capital projects such as those of the Steel Company of Wales and the refining and distillation equipment being built in Britain by the big oil companies. These are long-term projects, and the Marshall aid that has already been allocated for them will be reaching its destination up to the spring of 1952.

Apart from the aid supplies still in the pipe-line, Britain will continue to receive the benefit of certain special ECA programmes, including those for fostering overseas development, the production of scarce materials and the interchange of technical knowledge to encourage higher productivity. The finality of this week's announcement is further softened by the assurance that aid is merely "suspended" and that it may be reinstated if the economic situation of Britain and the balance of payments show any serious deterioration. In any case the United Kingdom remains a full participant in the Organisation for European Economic Co-operation and in the European Payments Union.

* * *

Counterpart Fund Agreement

In spite of these reservations it must now be assumed that for all practical purposes the British economy will have to proceed unaided by assistance of the kind received since April, 1948, when the Marshall dollars began to flow. Since then and up to September 30, 1950, the imports that have reached Britain under Marshall aid are valued at $2,366.8 million, or 12 per cent of total British imports, while the total of Marshall aid allotted to the United Kingdom up to date amounts to $2,694.3 million. The suspension of Marshall aid does not imply that dollar imports will have to be cut further. The Chancellor said this week that, though such imports would have to be controlled as before, the suspension of aid as such would not cause any reductions in supplies. If there are to be such reductions, they will be the result of scarcities of the goods concerned and not of inadequacy of dollars at Britain's disposal. In gauging the measure of British Marshall aid receipts, allowance should be made for the fact that part of the aid has been passed on, indirectly, to other OEEC countries through the two intra-European payments schemes and their successor, the European Payments Union. Including the credit balance that has been built up with EPU to the end of November, the total of aid given to other OEEC countries by the United Kingdom amounted to some $450 million, or $390 million net allowing for amounts received by Britain by way of IEPS drawing rights.

An important incidental agreement reached between the Chancellor of the Exchequer and Mr Batt in the course of their discussions concerns the use of the ECA "counterpart" fund in Britain. Ever since September, 1949, the nominal sterling counterpart of the aid received had been left to accumulate in the Treasury's special account at the Bank of England and had by Wednesday of this week reached a total of £266.4 million. This accumulation of sterling balances indicated disagreement between ECA and the British Government about the exact manner in which these funds should ultimately be used. The British Government wished to employ them in appearance as well as in deed in the repayment of

government debt. The Americans would have preferred to see them linked with some specific investment projects. The Chancellor of the Exchequer at his press conference this week suggested that the British view had prevailed in this matter. It may be assumed, therefore, that before long the Treasury special account at the Bank of England will disappear. The funds on the account will be used, through a book transaction, to cancel the special securities created for the employment of counterpart funds. These securities, in the form of Treasury interest free notes, form part of the national debt, and have been held by the Bank of England as a contra investment item to its liability on the deposits in the Treasury special account (the counterpart fund). The extinction of the fund will therefore be a painless operation for all concerned: it will have no financial effect, but will at last correct the abnormal distortion of the Bank return and the corresponding distortion of the "paper" level of the national debt.

* * *

Exports and the Trade Surplus

Yet another record was achieved by Britain's export industries last month. The total value of exports in November amounted to £212 million or £10 million more than the previous peak reached in October. Re-exports also increased slightly and totalled £10.3 million. The cost of imports, however, rose more sharply than the value of exports, so that the adverse balance (imports valued c.i.f. and exports valued f.o.b.) increased to £12.3 million for the month; in October it was only £11.4 million. Yet the recovery in Britain's trade balance in the second half of this year has been almost staggering. For the first time since before the war, Britain has enjoyed a surplus in its visible trade; in the five months to the end of November this surplus was of the order of £58 million. As visible trade was in deficit to the extent of £108 million in the first half of the year, the total deficit for the full twelve months is likely to be no more than £50 million and may even be £10 million less than that if the December trade figures are anything like the November ones. Invisible receipts have also been rising; they earned a net surplus of £160 million in the first half of the year and conceivably may reach a total of fully £350 million for the twelve months. Thus the overall balance of payments for 1950 might well show a surplus of the order of £275 million. There are many doubts about this kind of rough and ready calculation; what cannot be gainsaid is that the external surplus this year will many times exceed the notional figure of £50 million assumed in making the economic plan for 1950.

More important, however, is the fact that Britain's deficit with the dollar area has been reduced to negligible proportions. Exports to both the United States and Canada achieved new records in November. Shipments to the United States amounted to £13.8 million, which was £5,000,000 above the average for the first ten months of the year, while exports to Canada reached £14.5 million or £4,400,000 above the January-October average. In terms of US currency, British exports to North America earned $79.1 million last month against $70.5 million in October (the previous peak) and the monthly average of $40.7 million for 1949.

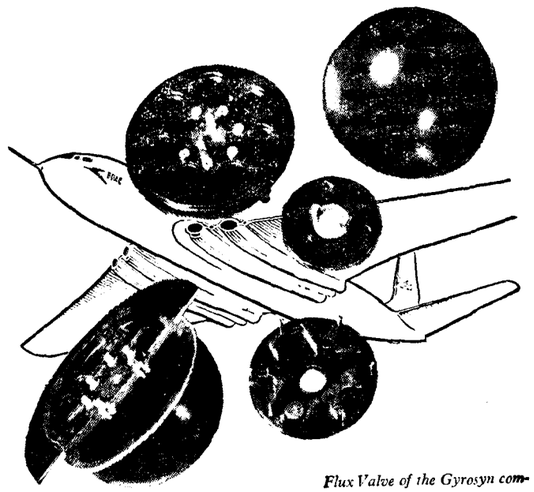
As good as these figures are, there is still no cause for undue jubilation. Next year Britain will be without Marshall Aid, and must pay its own way with the dollar area. This year Britain has enjoyed all the advantages but few of the disadvantages of devaluation and of an American inflation. The higher cost of raw materials and foodstuffs has still to be borne. Since June economic conditions have been anything but normal. People have been buying almost irrespective of cost for fear of shortages. It is, indeed, problematic whether such a state of affairs can persist. Fears have already been expressed about maintaining British motor car exports next year, and vehicles form Britain's largest export.

Argentina and Meat Supplies

The meat negotiations with Argentina have been broken off and the British ration is to be reduced from 1s. 6d. a week (of which 4d. is corned beef) to 1s. (of which 2d. will be corned beef). The Argentine Government has neither earned nor deserved sympathy in this country during the past three years, and it is to be hoped that the British public will accept with docility the smaller meat ration rather than seem to support Argentina's exacting terms. But this muddle of negotiations needs to be put in perspective.

When negotiations first opened last summer, Argentina asked for £140 a ton for this season's shipments but was willing to accept the existing price of £97 10s. a ton on account until agreement had been reached, with the condition that the price when agreed would apply retrospectively. Britain was more concerned with getting a settlement on the vexed issue of remittances and countered the Argentine proposal by offering £90 a ton. Shipments of Argentine meat were then cut off—not because the British side refused to pay £140 a ton, but because it refused even to maintain last year's price until a new one had been agreed. The cut in the meat ration is virtually a direct consequence of these British tactics. When Britain somewhat belatedly said it was willing to accept £97 10s a ton as a basis of negotiation, Argentina, with the fever of world inflation in its nostrils, refused the offer, and sat back, conscious above all else that its bargaining power had increased. To realise these facts is not to condone the methods of negotiation exploited by the Argentine Government since the war. But they do illustrate once again the limitations and dangers of government-to-government trading in peacetime. It is impossible to believe that if the purchase of Argentine meat had been in the hands of private traders—assuming meat rationing and subsidised retail prices—supplies would not be coming forward.

The breakdown causes a pretty predicament about meat supplies. Argentina has been providing approximately a third of the supplies and this quantity will not be made good from other sources, even if Uruguay agrees to resume shipments to this country. Supplies of home-killed meat will now begin to decline very sharply and will not increase again until April or May—and then the increase will be quite modest. Supplies from New Zealand and Australia will be coming through in greater volume during the first part of the year, but they will suffice for no more than the reduced ration. Only a small quantity of beef has so far come from Queensland area that is being developed as a new source of supply for Britain. From these two dominions Britain might get 50,000 tons more than last year, against a loss of 250,000 tons from Argentina. British stocks are low; at present they may represent no more than eight weeks' supply.



Yet breakdown was always implicit in the negotiations; it does not follow that if Britain had agreed to maintain last year's price of £97 10s. until a new price was agreed, Argentina would have continued to ship meat once it became clear that this country was unwilling to pay £140 a ton. But there would have been an opportunity to build up stocks before breakdown occurred. Mr Webb must surely be envious of Mr Strachey who last year was being criticised for having amassed such large stocks of meat that fifteen refrigerated ships had to be used as cold stores.

* * *

Still Enough Steel?

With November production at the record rate of 17,472,000 tons a year to back its confidence, the steel industry is still certain that output of steel (except for a few types) is, and will continue to be, high enough to satisfy the physical demands made upon the industry—though not the comfortable level of stocks that every user would like the chance to accumulate. Orders continue to increase, but

BY SPIRAX

The two Courses on steam utilisation are conducted by correspondence and are free of charge. Since the Courses were started, seven or eight years ago, between 9,000 and 10,000 people have enrolled.

Those taking the Courses are not, as one might have supposed, only the very young or the very studious. There are those who are re-learning what has been forgotten over the years as well as those learning for the first time.

Besides apprentices there are managing directors: besides college pupils there are college professors: there are some with scanty education and others with quite sonorous "gongs" after their name. The "students" in fact are a most interesting cross section of both industry and engineering at all levels of age, authority and experience.

The only common denominator is a desire to know more about steam and its utilisation in industrial process heating.

There is a Simplified Course for those with little or no technical background, and an Advanced Course for those who already know something of the fundamentals of steam and heat. Folios are mailed at about monthly intervals.

You may be interested to have details of the two Courses, either for yourself or for somebody else at home or abroad.

Correspondence to: **Spirax Manufacturing Co. Ltd.**
(Economist Enquiries), Cheltenham, Glos.

NOTES ALREADY APPEARED: *Jan.* 14, "A sensible policy for process steam"; *Jan.* 28, "Who controls your steam stores?"; *Feb.* 11, "Do you get full value from your steam?"; *Feb.* 25, "What steam costing will tell you"; *March* 11, "Meter your steam to get the facts"; *March* 25, "Why have a boilerhouse?"; *April* 8, "Four pillars of process steam wisdom"; *April* 22, "Process heat transfer decides plant earnings"; *May* 6, "Resistant films *v.* process economy"; *May* 20, "The air film handicap on output"; *June* 3, "Removing the air film handicap"; *June* 17, "Water film against process output"; *July* 1, "Individual steam separation"; *July* 15, "How are your steam traps chosen?"; *July* 29, "Better steam trapping, better output economy"; *Aug.* 12, "The steam circulation system"; *Aug.* 26, "Steam pressures under control"; *Sept.* 16, "Thermostatic control simplified"; *Sept.* 23, "Intelligent use of 'waste' heat from steam"; *Oct.* 7, "Flash steam on the agenda"; *Oct.* 28, "Better condensate return systems"; *Nov.* 11, "A place for the automatic pump"; *Nov.* 18, "Heat transfer summing up"; *Dec.* 2, "The more you know about Process Steam."
STILL TO APPEAR: *Dec.* 30, "For advice on process steam problems."

HALT! WHO GOES THERE?

Unless it is stopped, corrosive water eats insidiously into the iron and steel pipes of many industrial water systems. This corrosion is a trouble-maker which brings dislocation of work and high maintenance costs in its train. But Calgon (Albright & Wilson's Sodium Metaphosphate) introduced into the system by what is known as Threshold Treatment will halt corrosion and banish the troubles that arise from it. A few parts of Calgon in a million parts of water effect a cure — a cure which our technical department will be pleased to discuss with you.

Incentive

THE SHAREHOLDERS of John Laing and Son Limited are working members of the firm. You will find them driving cranes or mechanical shovels, laying bricks or leading a gang, costing contracts in detail, managing or directing—active in some way as part of the team at home or overseas.

Not every member is a shareholder. It is a privilege reserved for long service, loyalty, ability to lead and to set an example.

So at key points, from head office to the remotest site, are men to whom the firm belongs. That is the finest incentive in the world, and the surest guarantee of good work for those who entrust their construction to John Laing and Son Limited.

LAING

For speed and efficiency in building and civil engineering

JOHN LAING AND SON LIMITED · *Established in 1848*
London, Carlisle, Lusaka, Johannesburg

"I hear

Henry's lost his partner.

Died suddenly last week."

"Bad luck.

Will the business

be able to carry on?"

Yes of course—the partnership was covered by a Scottish Temperance Life Policy, which safeguards capital should one of the partners die prematurely. Write for further details to The Scottish Temperance & General Assurance Company, Dept. N, 109 St. Vincent Street, Glasgow.

the general shortage of which some consuming firms complain suggests they are dependent upon stockholders who are diverting steel to their own use (e.g. for structural engineering), taking special care of consumers with whom they are closely associated, or holding on to their stocks as safety-first policy. Stocks of steel at all points throughout the economy have been drawn upon in recent months, but they remain satisfactory in volume. In anticipation of expanding home consumption, the industry has taken steps to curtail the additional export commitments it entered upon earlier in the year when home orders declined.

The industry is not yet seriously affected by the shortages developing in some of the processing materials it uses, notably zinc for galvanising and sulphuric acid for pickling; these have not yet upset production, but the prospective cuts in supplies next year would become serious if defence needs greatly increased the demand for wire. As for its basic raw materials, the steel industry expects difficulties but hopes to surmount them. Pressure upon shipping caused by the import of coal is affecting the flow of supplies of foreign iron ore, just as the failure of coal exports to countries such as Sweden is affecting their readiness to guarantee supplies. Coke is a difficulty of long standing. The industry is disposed not to exaggerate the difficulties of scrap supplies next year; German scrap shipments, which in the last full year amounted to about a million and a half tons, will fall considerably by the middle of 1951, and the industry will have to find supplies elsewhere, but it is outwardly sanguine about its chances of doing so. In recent years fears of a scrap shortage have generally turned out to be exaggerated, and the steelmasters' confidence may still be well founded; but scrap is a real problem—and one which the nationalisers, taking over on February 15th, may face with a good deal less equanimity.

* * *

Coal Charter Difficulties

The Ministry of Fuel and Power could scarcely have chosen a worse moment to appear in the chartering market for the carriage of American coal imports. Not only are other European importers urgently seeking tonnage for American coal, but tramp shipping under all flags is already actively engaged, mainly in distant waters, in transporting the large-scale movement of bulk cargoes consequent on the Korean affair. In any event, shipowners are never eager to engage in trans-Atlantic voyages, in ballast outwards, during the rough winter months, and the figure of 40s. per ton with which the coal charterers tried to do business at first had little to commend it. A few early fixtures of spot tonnage were arranged at 50s., but soon it became apparent that even 60s. might fail to secure the tonnage required. About half a million tons has now been fixed, with the rate apparently established at 65s. for January voyages, 62s. 6d. for February, and about 57s. 6d. for March.

There was a serious doubt at one time whether any tonnage would be available for trans-Atlantic coal at any price, and the Economic Co-operation Administration in Paris saw fit to request that 25 more vessels should be released from the United States' "mothball" fleet for the emergency. The British Government seems to have contemplated the possibility of resuming the licensing of voyages under the wartime powers which it still formally retains, and urgent consultations took place between the industry and the Ministry of Transport. As it has turned out, the Government has been able to obtain the tonnage it has acquired only because some of the British liner companies agreed to release certain vessels which they had already secured for themselves on time charter to assist with the present heavy shipments of export cargoes. Thus the failure of the Ministry of Fuel and Power to realise the seriousness of the coal situation in time prevented the coal charterers from securing the necessary tonnage sufficiently far ahead at easier rates; and the solution of the tonnage crisis will have the lamentable effect of reducing export shipments during the winter months.

* * *

Anglo-German Payments

A new Anglo-German Payments Agreement was signed in Frankfurt last week. It replaces the agreement that had been in existence since August, 1949. Under these earlier arrangements, it will be remembered, trade between Germany and the sterling area had been conducted exclusively in sterling and a credit "swing" of £7,500,000 had been provided in each direction; thus, if the German sterling balance or overdraft in London exceeded this figure, the excess became convertible into gold or dollars. Negotiations had to be started to amend this bilateral agreement when both countries became members of the European Payments Union and when the gold clause in the agreement ceased to have any applicability; the agreement signed last week is the outcome of these negotiations and it duly conforms with the provisions of EPU. It inherits from the previous agreement the provision that payments between residents of the sterling area and of the Deutsche Mark monetary area will normally continue to be settled in sterling. The British Government has indicated, however, that it will raise no objection to a German proposal that may permit trade between the two areas to be invoiced in Deutsche Marks. Despite this concession the British Exchange Control will continue to insist that British exporters to Germany convert the proceeds of their exports into sterling and bring them back to the United Kingdom.

In order to reconcile this condition with the concession permitting invoicing in Deutsche Marks, machinery will have to be created for the conversion, outside official channels, of Deutsche Marks into sterling. For this purpose efforts are to be made to start an unofficial market in Deutsche Marks in London. A similar market is already operating in Germany. The exact procedure and mechanism remain to be evolved, but it is clear that dealers in London will be acting as principals, as they now do in the case of Canadian dollars; since Deutsche Marks are not a specified currency, however, dealers holding positions will not have the right to cover them at official rates with the Bank of England. Unless, therefore, the German central bank provides a measure of support and cover for the market in London by an undertaking to take Deutsche Marks at a given rate against sterling, this new unofficial market can hardly expect to acquire much importance, and it is probable, therefore, that the normal procedure will be to invoice trade between the two areas in sterling. The establishment of an unofficial free market in Deutsche Marks will, however, prove an extremely interesting testing ground in which to prove the real value of the German currency. It cannot be long now before the existing "conversion ratio" of the Deutsche Mark, which gives an equivalent of 11.8 marks to the £, makes way for a genuine rate of exchange. After the recent performance of Germany as a member of EPU, it would not be surprising if the announcement of an official rate of exchange was made the occasion for effecting a devaluation of the mark.

Higher Christmas Spending?

Christmas shopping seems to have started early this year and is being imposed on top of a higher general level of demand. In the first two weeks of the main shopping season, from November 22nd to December 6th, the active note issue rose by £28½ million to £1,308 million; in the same period last year it rose by £23½ million to £1,284 million. Ever since June the general level of the note circulation has been some £20 million higher than in 1949. This fact, together with the signs of a Christmas shopping spree, made last week's increase of £25 million in the fiduciary issue inevitable; at

£1,375 million the issue is now at its highest level since early 1948. In the week to last Wednesday the active circulation rose by another £31 million, to £1,339 million ; this increase, the largest weekly movement ever experienced, leaves the note reserve in the banking department at only £36 million —despite the rise in the fiduciary issue. And between now and Christmas another £10 million or so must be expected to flow out.

The implication that spending has increased since Korea is confirmed by the recent figures of " small " savings and by movements in the retail price index. The cumulative deficit of the " small " savings movement between June 24th and December 2nd amounted to rather over £54 million, compared with rather over £47 million in the same period of 1949. The value of retail sales, too, was running about 12 per cent higher between July and October, 1950, than in the similar period last year ; it is true that sales in the month of October were only 8 per cent above those in October, 1949—but sales last year were boosted by the shopping rush to beat new rationing schemes that were expected after devaluation but did not materialise.

It is difficult to gauge how far the increased level of spending since the summer has been due to higher prices and how far to private " stockpiling " of clothing and other goods likely to become both more expensive and more scarce in the months ahead. In the thirteen months following devaluation the official index of retail prices rose by less than 3 per cent. Until last May, at least, the relative stability of the official index was probably accompanied by a similar stability of the general level of retail prices (as an interesting article by Professor R. G. D. Allen, in the current *Bulletin* of the London and Cambridge Economic Service, suggests). It is doubtful, however, whether this stability has been maintained since—and it seems quite certain that it will not be maintained in the months to come. In these circumstances it will not be surprising if many Christmas purchases this year are regarded as household investments—in which case the British people may now be in the early throes of an austerity version of America's post-buying boom.

Dollars for Ceylon's Central Bank

It is clear that there has been some family disagreement between Britain and Ceylon in the past few months on whether Ceylon's (comparatively small) net dollar-earnings should be handed in automatically to the sterling area central pool. The principle of a common reserve of hard currencies is, of course, one of the two unwritten laws around which the whole sterling area system revolves. (The other is the principle of freedom for capital movements, including especially free access to the London capital market.) Ceylon happens to be one of the comparatively few independent sterling area countries that is required to make some sacrifice under the first principle of sterling area membership in order to obtain undoubted benefits under the second principle ; its immediate neighbours belong to the other category of members, that which gains from both principles at the same time. Ceylon's desire not to lose from the swings while still gaining from the roundabout has been reinforced since 1949 by the establishment of its new central bank ; this bank, which was founded under American tutelage and is operating under American governorship, is required by its constitution to hold a reserve of convertible currency or gold. It was for this reason that the Government of Ceylon decided last year to hold back part of its net dollar earnings to plough into this central bank reserve.

Mr Gaitskell explained in a written Parliamentary answer last week that a provisional agreement between Britain and Ceylon has put an end to this anomalous situation. Britain has agreed to set aside £4,000,000 of gold and dollars for the Bank of Ceylon from the central dollar pool ; in return Ceylon has apparently agreed to sell all its current dollar earnings for sterling (as other sterling area members do)—but has asked that this should be reviewed " when experience of these arrangements has been gained." Mr Gaitskell pointed out that the gold reserve of Ceylon's central bank would now " be relatively as favourable as the corresponding reserves of the central banks of the other independent members of the sterling area dollar pool." Analysis of the balance sheets of these other central banks shows that India and Pakistan now hold the same amount of gold as they did before the war (their combined holding comes to $274 million), while the gold holdings of Australia and New Zealand mounted from $37 million to $117 million between 1939 and 1949 as a result of the operation of their own gold mines. The new agreement with Ceylon is therefore justifiable solely on the grounds that it provides an initial—and stable—reserve for the central bank of Ceylon. Any suggestion that this reserve should mount *pari passu* with the new bank's liabilities would be incompatible with Ceylon's continued access to the advantages of the sterling area.

How Steel Came to be Nationalised

Sir Ellis Hunter speaks with a dual authority. On Thursday, in his capacity as chairman and managing director of Dorman Long, he was able to point with justifiable pride to the part that his company has played in raising the output of steel to record levels and to its contribution towards the steel industry's aim of rising productivity. This is a continuing process. The second stage of Dorman Long's development programme was started rather more than a year ago and satisfactory progress is being made with its main feature—the construction of the new steel works at Lackenby. It now becomes possible to concentrate closer attention on stage three, and to give it a certan change of emphasis. Development is no longer considered solely as a matter of replacement of old plant—nor should it be, at a time of booming demand for steel—but rather as a means of adding to output. This will mean that new capacity has to be operated in tandem with old plant, and that may call for a certain amount of re-designing and revised ideas about plant location. Now that the South Wales strip mill is nearing completion, it becomes possible for Dorman Long to proceed with its deferred plans for the installation of the beam mill at Lackenby and for large new blast furnaces at Cleveland—projects of greater magnitude than those finished or now in hand and which will take several years to complete.

Sir Ellis is also president of the British Iron and Steel Federation, and although he was not speaking in this capacity to Dorman Long stockholders, the fact lends the greater weight to his observations on nationalisation. In his review of the government's attitude towards the industry since 1946, Sir Ellis showed that the experiment of public control over the industry exercised through the Iron and Steel Board (disbanded in March, 1949) had proved its worth. He disclosed that in 1947 negotiations took place between the industry and " Cabinet representatives " which resulted in an understanding that the board could be given additional powers to enable it to act positively, and not merely as a negative control. These discussions were suddenly broken off, and nationalisation was ordered. This history of events does not add much detail to what was openly being said in the political corridors three years ago, but it is important to have it set down with full authority. Equally, the intention of the industry to conduct its affairs to attain the highest level of public service has always been clear, except to those who refused to believe it. The consequences of nationalisation for the industry as a whole are frightening at this juncture of the nation's affairs. And for Dorman Long stockholders there is a sad tailpiece: some £13 million of compensation stock will be awarded to them in return for £14½ million of net current assets, plus the whole of the fixed assets which stand in the books at £8,000,000 but are worth far more

Over 10,000 work in this

"IDEAS DEPARTMENT"

The " Ideas Department " of the Hoover Organisation numbers over 10,000 men and women — for the entire staff is eager to improve efficiency, and ideas and suggestions are always welcomed from any source, down to the youngest apprentice.

Suggestion boxes are placed in each section of each factory, and every week large numbers of suggestions are received. Contributions also come, of course, from members of the sales organisation and others whose work is away from the factory.

All suggestions which are put into effect — a very considerable number — win awards for those who submit them. Suggestions are of many kinds. Some are of a technical nature — for improving Hoover products or methods of manufacture; some deal with organisation and administration; some are concerned with staff activities, and so on.

The suggestions are not only valuable in themselves but are a further indication of the friendly and intelligent co-operation that has always existed between Hoover staff and management.

Tube Investments' Second Wind

Though the recession in overseas demand for British cycles which Mr Ivan Stedeford last year warned Tube Investments shareholders to expect did materialise, developments in Korea brought back the sellers' market overnight. Today's problem for the industry, which has been working to capacity with full orders, is to find the materials to continue filling those orders:

> It seems unavoidable that the industry must soon be faced with a period during which the priority needs of the armament programme will impose restrictions upon cycle production generally, in terms of finish as well as of quantity.

An even more serious materials problem for the group may arise from lack of aluminium for its new rolling mills in South Wales, which are due to come into operation in six months' time. Imported supplies of virgin aluminium are likely to be cut by more than 10 per cent, while the industry as a whole has been expanding capacity to a level where virgin metal requirements in 1951 will be at least 25 per cent higher than in 1949-50. Mentioning the possibility of Anglo-American agreement upon equitable distribution of materials for defence, Mr Stedeford hoped it might not be necessary to postpone starting up the new mills.

These form part of the group's first postwar five-year plan for home development (paralleled by a policy of investment in manufacturing subsidiaries overseas) that is costing some £15 million and is now almost complete. Tube Investments is now proposing to embark upon a second development programme, involving another £10 million over the next three years, for re-equipment and new plant. These plans explain the increase in the group's capital by £10 million and the decision to issue "for cash at par as soon as possible" 5,000,000 £1 4½ per cent preference shares. But Mr Stedeford drew attention to another feature in the group's financial position: though it has ploughed back more than £2,000,000 this year from its profits of £6,282,651, additional working capital to finance its expanding activities absorbed over £4,000,000. This means that the company ends the year with £2,000,000 less in cash than when it started, some 57 per cent of profits having gone in taxation. As Mr Stedeford pointed out, this means that the earnings retained in a business to finance increased productivity are now so heavily taxed that a company may be forced to borrow money or raise new capital simply because it has become more efficient; from the national point of view, industry is taking up private savings for working capital while much of its own savings are being taken by the Government to be used for current expenditure.

* * *

Copper Exodus Pros and Cons

Mr R. L. Prain's explanation at the Roan Antelope Copper Mines meeting of the reasons that had led the directors to decide against transferring the domicile of the company to Rhodesia appear to have caused some disappointment. But shareholders not only of Roan Antelope, but also of Rhokana, Nchanga, Rhodesian Anglo-American and Rhodesia Copper Refineries, who are to vote on this question at meetings called for Tuesday and Wednesday next week, should by no means dismiss Mr Prain's case. He confessed that "if the tax saving accruing to the company were the only considerations, there would be little doubt in our minds that we should seek to transfer control of this company (Roan Antelope) abroad." But part of these savings would go in higher dividends in order to leave American shareholders and British corporate shareholders as well off in terms of net dividends; there would be a net gain under present circumstances; but if Rhodesian taxation were to be increased (which is not inconceivable) the apparent advantage of transferring the company's domicile would be reduced.

Mr Prain argued further that it would be unwise to commit the company "to a new and unknown method of control based on an apparent tax saving which is not new in principle and which may very well prove to be temporary in character" before the tax authorities in this country had been thoroughly apprised of the dangers inherent in the effects of high taxation on the mining industry. Again, movement of domicile would entail restrictions on the movements of the company's chief executive officers into this country, and would destroy "the well-tried conception that overseas mining should be undertaken by strong finance groups resident in one of the world's finance centres." Mr Prain made it clear, however, that if the status of Rhodesia was changed from that of a colony into a dominion, the board would think again very seriously.

* * *

Producing Synthetic Rubber

To suggest that Britain's rubber industry should consider producing synthetic rubber even if it were confronted by conditions of assured world peace might seem heresy to a country whose rubber industry has been firmly founded on the natural raw material. But the suggestion made last week by Mr G. E. Beharrell, managing director of the Dunlop Rubber Company, is of more than academic interest. Special purpose synthetic rubbers have been developed that command a market at prices appreciably higher than those for similar products made from natural rubber; on the other hand, general purpose synthetic (GR-S) which is used in tyres is still considered inferior in quality to the natural product. But at the moment the technique of developing and using these synthetic rubbers is largely a monopoly of the United States and Canada. American rubber manufacturers have been forced by circumstances to acquire a skill in mixing synthetic and natural rubber to produce an article that consumers will buy. In this respect Britain has certainly lagged far behind; and who can say whether within the next five years a synthetic rubber will not be developed that will be just as suitable as natural rubber for tyres? In the development of rayon Britain was not behindhand.

The finance required to start a synthetic plant in Britain would be considerable and the risk involved in the enterprise probably too great for any single commercial organisation to assume. But the government might be persuaded to help, with an eye to the military value of such development. The main problem, however, is likely to be the supply of raw materials: the United States is already encountering this difficulty in re-opening its war-time plants. General purpose synthetic (GR-S) is made from the fusing ("copolymerising" is the technical term) of styrene and butadiene. Styrene is made from benzol obtained as a by-product in the manufacture of coke or from petroleum, and benzol is also required for many other materials, including aviation spirit, DDT, plastics, nylon, and synthetic detergents. Butadiene is obtained from either petroleum or industrial alcohol.

The increased cost of these raw materials made the US Reconstruction Finance Corporation raise its selling price of GR-S last week by 6 cents to 24½ cents (1s. 9d.) a lb. With natural rubber priced at over 4s. a lb., GR-S is still cheap. But this move is not without interest to rubber producers, since the price of GR-S is in effect a floor price for their own product. If natural and synthetic rubber are allowed to compete freely, the price of natural is unlikely to fall below 2s. a lb. so long as GR-S sells at 1s. 9d. As production costs in Malaya are under rather than above a shilling a pound, rubber producers would seem to be assured of a handsome profit.

AUDITORS' REPORT.

EDINBURGH, 16th *November*, 1950.—We have examined the Books of THE COMMERCIAL BANK OF SCOTLAND LIMITED, kept at the Head Office and the Returns from the Branches for the year ended 28th October, 1950, and have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit. In our opinion proper books of Account have been kept and returns adequate for the purpose have been received from the Branches.

We have checked the Cash at the Head Office, the London Chief Office and the Glasgow Chief Office. We have verified the Money at Call and Short Notice in London and the balances with other banks, and have seen the Treasury Bills, Treasury Deposit Receipts and Certificates for Government and other Investments.

The above Balance Sheet and Profit and Loss Account are in agreement with the books and Branch Returns. To the best of our information and according to the explanations given to us, the said Balance Sheet and Profit and Loss Account give, in the manner prescribed, the information required of a Banking Company by the Companies Act, 1948. We are accordingly of opinion that on the basis authorised by the Act (1) the Balance Sheet gives a true and fair view of the state of the Bank's affairs as at 28th October, 1950, and (2) the Profit and Loss Account gives a true and fair view of the profit for its financial year ended on that date.

MAURICE CRICHTON, C.A., *Auditor.*

Abridged Particulars for Information Only

Application has been made to the Council of The Stock Exchange, London, for permission to deal in, and for quotation for, all the issued Ordinary Shares in the capital of the Company.

ADA (HALIFAX) LIMITED

(Incorporated under the Companies Act, 1948)

Manufacturers of ADA Washing Machines and AJAX Machine Tools

SHARE CAPITAL

Authorised	*Issued and Fully Paid*
£400,000 in 8,000,000 Ordinary Shares of 1s. each	**£400,000**

Neither the Company nor either of its Subsidiaries has any Mortgages, Debentures or Loan Capital outstanding.

The Advertisement showed, *inter alia*, that Ada (Halifax) Limited was incorporated in England on the 4th December, 1950, as a private company and on the 12th December, 1950, was converted into a Public Company. The Company, in pursuance of one of its main objects, has acquired the whole of the capital of Ajax Machine Tool Company Limited.

The business was founded in 1940 and since early 1942 has been conducted by Mr. G. Carter and Mr. K. W. Howarth. From 1940 to 1944 the business was confined to the manufacture of machine tools. In 1944 it was decided to broaden the scope of the business by undertaking the manufacture of Washing Machines for which it was felt that there would be a large post-war demand. Manufacture of "ADA" Washing Machines began in 1945 and bulk production was started on a small scale in August of that year and the sales have steadily increased as is shown by the following figures :—

	Number of Machines Sold
Year ended 30th April, 1946	**964**
" " " 1947	**3,321**
" " " 1948	**6,863**
" " " 1949	**8,526**
" " " 1950	**15,310**
Six months ended 31st October, 1950	**12,186**

"ADA" Washing Machines are now being produced at the rate of over 24,000 per year and, in the opinion of the Directors, there is a large unsatisfied demand for them.

The net profits of Ajax Machine Tool Company Limited for the year ended on the 30th April, 1950, calculated on the basis mentioned in the Advertisement and after making the deductions therein mentioned but before all taxation, amounted to £113,686. Taking into account current sales of, and demand for, the Operating Company's products the Directors consider that, in the absence of any substantial change in present trading conditions, the net profits of the Operating Company for the year ending on the 30th April, 1951, calculated on the same basis and after making similar deductions will not be less than £200,000 (before taxation).

The first accounts of the Company will be made up to the 30th April, 1951, and will cover a period of approximately five months. The Directors propose, in the absence of unforeseen circumstances, to recommend the payment of a dividend on the issued Ordinary Shares of 8⅓ per cent. actual (less tax) in respect of such period, equivalent to an annual rate of 20 per cent. (less tax).

On the basis of profits at the rate of £200,000 per annum, the gross earnings yield on the nominal amount (£400,000) of the issued Ordinary Shares is 50 per cent. (before taxation) while a dividend at the proposed rate would in a full year absorb approximately one half of the profits remaining after deducting profits tax at the current rates on retained and distributed profits.

A copy of the advertisement giving the particulars required to be advertised in connection with an application made to the Council of the Stock Exchange, London, for permission to deal in, and for quotation for, all the issued Ordinary Shares in the Capital of the Company may be obtained on application to the Registrars and Transfer Office:—

WHITEHEAD INDUSTRIAL TRUST LIMITED,
Mitre House, 177, Regent Street, London, W.1.

upon to make £1,650,000 of net sterling payments in London. This sudden check to a ten-year-long phase of currency expansion came as a complete surprise. In the year to June, 1949, the expansion of currency had set a new high record ; money in circulation rose by £20 million to £67 million. The board's administrative arrangements had been thrown out of gear by that expansion—so much so in fact that special aeroplanes had to be chartered to fly the notes and coin (which are printed and minted in London) out to the territories concerned. This year the board was determined not to be caught napping again. It shipped out large supplies of notes and coins to build up stocks in its local strong-rooms in advance of expected mass orders from the banks ; those orders never came and the currency, presumably, has remained in the strong-rooms ever since.

In the year to June 30, 1950, West Africa's visible surplus with the United Kingdom seems to have amounted to between £25 and £30 million—much the same as the surplus shown in the year before ; moreover, West Africa's visible surplus with the United States was almost certainly higher last year than it was in the year to June, 1949. It is surprising therefore that the currency circulation has gone down. Two factors may explain the anomaly. Firstly, the Cocoa Marketing Boards may have succeeded in damping down inflation by holding back a larger share of export proceeds from producers and ploughing it into their reserve fund (which will serve as a cushion for producers in bad years). The Board's original off-form cocoa price for the 1949-50 season was set at a period when the world price of cocoa was low and was therefore, between 15 and 20 per cent lower than that originally offered for the 1948-49 season. Secondly, local shops may have been running down their stocks and running up their cash reserves. Both these factors would cause a higher proportion of the increase in liquid funds in West Africa to be held in the form of bank deposits rather than notes.

Shorter Notes

No hint has been given of the reasons that prompted Tootal Broadhurst Lee and two of its associated companies to withdraw from the price agreement reached in 1947 by more than two hundred Lancashire members of the Yarn Spinning Association, and last week renewed for a further year. Present boom conditions in the cotton industry have obviously nothing in common with the circumstances in which similar minimum price agreements foundered in the 'thirties, and the last thing the industry need think about is price cutting ; the decision is interpreted in Lancashire as a reminder of the independent policy of its most integrated undertaking.

★

In the year ended March, 1950, shipping registered at 50,248,551 tons entered and left the port of London ; this was 4,250,000 tons more than in the previous year and about 81 per cent of the shipping using the port in 1938-39. The tonnage of goods passing through the port, at 40,740,998 tons, was higher than in the previous year despite the two dock strikes, and was within a million tons of the 1938 tonnage ; imports declined, mainly owing to a reduction in petroleum, but exports shipped through the port reached a new record of 5,092,867 tons.

★

In the year to September 30th, deposits held at Barclays Bank (DC and O) rose by £41 million to £382½ million—largely as a result of increased prosperity in South Africa. The bank's year of good trading was reflected in the rise in net profits, by over £16,000 to £683,201. In his address to stockholders Mr. Julian Crossley stated that high British taxation was reducing the willingness of overseas investors to hold stock in British domiciled companies such as the bank ; he also came out strongly against an arbitrary revaluation of sterling.

SECURITY PRICES AND YIELDS

THE COMMERCIAL BANK OF SCOTLAND, LIMITED

ANOTHER SUCCESSFUL YEAR

DEFENCE EXPENDITURE—NEED FOR OTHER ECONOMIES

LORD ROTHERWICK'S REVIEW

The annual meeting of the shareholders of the Commercial Bank of Scotland, Limited, was held in Edinburgh on December 14, 1950. The Rt. Hon. Lord Rotherwick of Tylney, the deputy-governor of the bank presided in the absence, through illness, of the governor the Earl of Mar and Kellie, K.T.

The deputy-governor said:—

It is unfortunate that the Governor of the Bank, the Earl of Mar and Kellie, is still not well enough to take his place here today, and I am sure it will be your wish that I express to him your sympathy and the hope that he will soon make a good recovery.

For myself, I have pleasure in presiding again at the annual general meeting of the shareholders of the bank, and in submitting a report by the directors which, notwithstanding the uncertain and difficult times through which we are passing, will, I am satisfied, show that the business of the bank continues to be conducted with the same care and success as hitherto.

DEVALUATION

When last I addressed you, the outstanding feature in the economic situation of the country was the devaluation of the pound sterling, which had taken place a few months before, and I expressed the view that if any real benefit were to accrue from this expedient, it must be accompanied by a very considerable expansion of our export trade—a state of affairs which seemed to me to be difficult of achievement unless some incentive were offered to both industry and the individual in the shape of a substantial reduction in the burden of taxation.

TREND IN THE RIGHT DIRECTION

The recently published White Paper dealing with the balance of payments brings some evidence of a trend in the right direction: An overall surplus of some magnitude is brought out for the first half of 1950: gold and dollar reserves have reached levels which hardly seemed possible a year ago, although in recent weeks, warnings have been uttered from official quarters to the effect that these reserves are still below what is considered necessary and that much remains to be done.

DEFENCE PROGRAMME

These warnings cannot be ignored, and, indeed, it is difficult to see how the situation may be affected by the recent decision of the Government—with the full approval of the vast majority of the people of this country—to embark upon a programme of defence which, over the next three years, will call for expenditure of something of the order of £3,400 million. This decision—set alongside the increased defence expenditure envisaged by the United States of America—may transform the economic outlook of the free world; but I hardly think that this is either the time or the place to indulge in speculations as to how events may turn out. Certain it is, however, that this vast expenditure on re-armament—coming at a time when all of us might reasonably have looked for some improvement in our national and individual circumstances following upon our efforts towards that end during the last decade—cannot be merely superimposed upon our present economy in the shape of further taxation unless it be that the most stringent economies in non-defence expenditure are contemplated by the government. World trade, commodity prices and currency values will all be affected by these new expenditures, and much will depend on the manner in which they are to be financed.

With regard to Scotland, which is of first importance to us as a bank, I see no reason for varying the views I expressed a year ago as to the spirit of enterprise which is evident; but here also, prospects must be viewed against the background of circumstances which I mentioned earlier, and I am sure you will agree that it would be idle for me, at this juncture, to make any forecast as to the future.

BALANCE SHEET ITEMS

I would now ask you to consider the balance sheet, from which you will find that paid-up capital is unchanged at £2,600,000, while the reserve funds to which £100,000 has been added, now stand at £4,000,000, and are £1,400,000 in excess of the paid-up capital.

Notes in circulation, amounting to almost £12,500,000, are higher on the year by almost £200,000; but the circulation figures vary from day to day, and no definite conclusion can be drawn from this relatively small increase.

Deposits and other credit balances at £118,074,000 are greater than a year ago, by almost £4,500,000. These are record figures which are well spread over our network of offices, and the steady growth persists despite the heavy drawings upon us by expanding industry.

Acceptances and engagements on account of customers at £3,938,000 are down on the year by £112,000, but this slight fall has no special significance.

ASSETS

On the assets side, cash, balances with other banks, money at call and short notice in London, British Government Treasury bills, British Government deposit receipts and other investments—which are almost entirely British Government securities—produce a total of £105,322,000, equivalent to almost 81 per cent. of our liabilities to the public in respect of notes in circulation and deposits. The market value of our investments is in excess of the figures appearing in the balance sheet.

At £30,159,000, bills discounted and loans and advances, together show an increase of a little over £3,165,000, and while such a trend bespeaks an active and expanding business throughout our various offices, it is also a reminder of the burden which is being carried by industry today: crushing taxation—and the method of its application over a number of years—has made it impossible for industrial concerns to build up the funds necessary for re-equipment and the financing of raw materials at the high prices ruling today, with the result that there are few concerns which do not find it necessary to rely upon their bankers to a greater extent than would normally be the case. The situation is one of the greatest difficulty because of the need of the banks to give heed to the restrictions which have been laid upon them from time to time with the object of keeping certain types of borrowing within bounds, and it is likely that the task confronting the banks will become more difficult in the coming months.

YEAR'S PROFIT

As to the results of the operations of the year, you will observe that profit is more by £18,975, which may be regarded as satisfactory when account is taken of the burden of taxation, increasing costs, and the difficulties of the financial situation generally. Out of the sum available, the directors have allocated £100,000 to reserve fund, and £100,000 to increase the fund for officers' pensions. For some years past it has been customary to allocate a substantial sum to the widows' fund; but on this ocasion that has not been necessary as the fund, for the time being at least, is in a reasonably satisfactory condition.

DIVIDENDS

Interim dividends on the "A" shares of 7½ per cent., and on the "B" shares of 5 per cent., less income tax, were paid in July last, and it is now proposed that a further distribution of 7½ per cent. on the "A" shares (making 15 per cent. for the year) and 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income tax, be approved. After payment of the dividends and allocations, the carry forward to next year's account amounts to £77,000.

TRIBUTE TO THE STAFF

It would not be appropriate were I to conclude without referring to the valuable service rendered by all members of the staff, the result of whose efforts are reflected in the report I have presented to you today, and on behalf of our shareholders and customers alike, I offer them our sincere thanks.

Since last we met, Mr Robert Candlish Henderson, K.C., LL.D., who was appointed an ordinary director in 1924, made known his desire to retire from the board. During that long period Mr Henderson rendered valuable service to the bank, and his sound judgment and wise counsel were highly esteemed by his colleagues. The fact that he found it possible to continue his connection with the bank by accepting the invitation of the board to join the number of extraordinary directors gave much pleasure to us all, and I am happy to greet him here today.

It is proposed that the Earl of Mar and Kellie be re-elected governor. That I be re-elected deputy governor, and that the extraordinary directors whose names appear on the list, be re-elected.

It is also proposed that Mr Douglas Ainslie Foulis, D.S.O., O.B.E., the ordinary director who is due to retire at this time, be re-elected an ordinary director of the bank.

During the year, Mr William Annan, C.A., one of the auditors, resigned his appointment, and the board recorded high appreciation of his services, extending over a long period. In his place, by virtue of the powers conferred upon them by the constitution, the directors nominated Mr Ronald J. Henderson, D.S.O., O.B.E., C.A., Edinburgh.

Mr Maurice Crichton, C.A., Glasgow, and Mr Ronald J. Henderson C.A., Edinburgh, will, under the provisions of the Companies Act 1948, continue in office, and a resolution fixing their remuneration will be proposed.

I now move that the report and accounts be adopted, and I shall call upon Mr Douglas Mure Wood to second the motion. After that has been done any shareholder who may have any observations to make will have an opportunity of doing so before I put the motion to the meeting.

The resolution, having been seconded by Mr Douglas Mure Wood, was put to the meeting and carried.

At the close of the meeting cordial votes of thanks were accorded to the directors and the staff for their services during the year and to the deputy governor for presiding.

THE NATIONAL BANK OF SCOTLAND LIMITED

CONTINUED PROGRESS

The one hundredth and twenty fifth annual general meeting of the proprietors of The National Bank of Scotland Limited, was held in the bank's head office on December 14th, the Most Hon. the Marquess of Zetland, K.G., P.C., G.C.S.I., G.C.I.E., the governor of the bank, presiding.

The governor, in the course of his speech, said the balance sheet as at November 1, 1950 is in itself sufficient evidence of the continued progress of the bank, but there are one or two features upon which some comment may be thought to be appropriate. Our deposits, at £96,300,000, are higher by £1,400,000, while on the other side our discounts and advances, amounting together to £23,400,000, show an increase of practically the same amount. Our liability for acceptances, endorsements, guarantees, forward exchange and other obligations undertaken on behalf of customers, has expanded notably from £4,700,000 to £8,300,000. This growth is mainly accounted for by the greater part the bank has taken in the finance of international import and export trade, many of the transactions, involving quite important sums, being concerned with shipments from one part of the world to another, never touching the shores of the British Isles but earning for our country valuable sums in foreign exchange. The reward the bank receives for the services thus rendered is part of our "invisible exports" which help to bridge the dollar gap.

Our profits, at £300,800, are fully £7,000 higher, but once again, pursuing our traditional policy, the amount set aside for distribution as dividend is little more than one-third of our earnings, absorbing only £107,800 net, and we have been able to appropriate towards building up the inner strength of the bank—£60,000 to investment reserve, £40,000 to heritable property account, £75,000 to trustees for the officers' pension scheme, and to make in addition a donation of £10,000 to the staff widows' fund, leaving to be carried forward £118,000.

TRADE AND INDUSTRY

A year ago when I addressed you I suggested that it was much too soon to assess the full consequences of devaluation, but some of you may remember that we were asked by the politicians to believe that devaluation would make relatively little difference to costs and that great benefits to our export trade would follow. It was, of course, easy to prophesy that exports would benefit, as indeed they have done, because the lowering of the price of British articles when converted from pounds into a foreign currency such as the American dollar made it easier for British goods to obtain an increased entry into such a market. Regularly, month by month, we see quoted impressive figures of the growth of British exports expressed in pounds sterling, but what receives singularly little attention is the cost in terms of imports of the essential raw materials that have to be acquired in the international markets for conversion into these same exports, and it is easy to delude ourselves into thinking that the situation is now entirely happy, if we look at the export side only. A considerable part of the initial advantage in the export markets arising from devaluation could be found in the stocks that were already on hand, acquired at pre-devaluation figures upon which an immediate profit could be secured, but as later purchases of raw materials have to be made to replace those which have been manufactured and sold, the initial advantage will evaporate and, unless we look to our other costs, may eventually disappear. Indeed, some of the less pleasing effects of devaluation are now beginning to show themselves, and in this connection wool is as good an example as any.

We can share in the pleasure and encouragement the Scottish pastoral farmers have received from the higher prices for their wool clips, the profits on which will in due time be returned through the Wool Marketing Board instead of being retained by the Treasury as was the case during the period of control, but if their problems have been eased, another set of problems has been created for the manufacturers, especially those who have to seek the bulk of their requirements from Australian sources. The rise in the price of wool has been phenomenal, twice that prevailing twelve months ago, and in some grades as much as ten times compared with 1939. Wool, being an international commodity, is subject to the free play of international forces and currencies and it was inevitable, when both the British pound and the Australian pound were devalued as against the dollar, that the price of raw wool would move upwards. Added to that is the effect of demand having outstripped the immediate supply.

So long as our manufacturers have on hand old stocks to blend with the new and can average out the price of the finished cloth, the effect of the new wool levels can be retarded, but looking ahead one cannot but wonder how the consumer who is always the final judge will respond to the higher prices that will be inevitable when the old stocks have all been converted into cloth. Two years ago I endeavoured to explain how the crushing burden of taxation was depriving industry of the capital which is its very life blood. At that time I had in mind more what was required for modernisation and improvement of plant, but the problem may be even more acute if, with wool as our example, industry is prevented from adding to its resources to purchase and carry its working stocks of raw materials.

SCOTTISH TRADE CONDITIONS

Let me now turn for a moment to Scottish trade conditions. It is satisfactory to record that shipbuilding orders have been placed in considerable volume which will ensure active employment for a good long period ahead, not only in the yards but also in the many establishments which supply the engines and machinery. The jute trade remains troubled over supplies of the raw material, the differences between India and Pakistan, of which I have made mention in the past, being apparently no nearer solution, while little gunny cloth is obtainable from Calcutta for the bags which formed quite a considerable part of Dundee's manufacture. The harvest has had mixed results, and has been expensive to ingather. Farmers in the East and North have fared much better than those in the West. Fishing remains uncertain and its major problem, would seem to lie in obtaining the reopening of the Continental market.

We all welcome the bringing into operation of the first of the major schemes, that at Loch Sloy, of the North of Scotland Hydro-Electric Board. As one by one these various schemes are completed and come into production Scotland should have a more stable and assured electricity supply, attracting as we may earnestly hope within our land still more of the new industries which are seeking a home within the British Isles. It is worthy of remark that 75 per cent. of the American and Canadian concerns which have set up new factories in Britain have done so in Scotland.

The report was adopted.

CANADIAN BANK OF COMMERCE

INDUSTRIAL GROWTH AIDS ARMS PROGRAMME

The annual meeting of the Canadian Bank of Commerce was held on December 12th in Toronto.

The President, Mr Stanley M. Wedd, in the course of his address, commented on the impact of Korean hostilities on Canada's economy. He went on, "The latest official estimate of the value of our production for 1950 is $17.5 billion—an increase of about $1,400 million compared with last year."

After stating that the rate of capital investment in Canadian industry showed little sign of slackening, he dealt with the labour force and said, "It would seem to be a matter of real urgency that the labour force be expanded, and since this can be done to only a very limited extent from the manpower resources now available, the immediate implementation of a well-integrated immigration policy would seem to be the proper solution."

The expansion of Canada's proven reserves of petroleum, the completion of the new oil pipe-line from Edmonton to Superior, Wis., and the decision to build a railway to tap the rich Quebec-Labrador iron ore resources were then touched upon briefly.

Looking at international trade, he said, "The ability of Canada to cushion the effect of a decrease in exports to sterling countries by an increase in exports to the United States is another evidence of the adaptability of the Canadian economy."

The President dealt extensively with the decision to free the Canadian dollar in October and felt that the decision was one with much to commend it.

"The supplementary budget brought more clearly into focus our responsibilities as a member of the United Nations. It also emphasised our role as a signatory to the North Atlantic Defence Pact," continued the President, who hailed Canada-United States military integration in these words: "The new agreement re-affirms the principle of co-ordination in defence purchasing and allocation of materials between the two countries. It also indicates that problems of purchasing ability which hindered co-ordination in the postwar period may well be avoided."

IMAGINATIVE TAX POLICIES URGED AS INFLATION CURB

After commenting that the growth in total assets reflected the increase during the past year in Canadian business, Mr James Stewart, vice-president and general manager of the bank, said: This year costs again are moving upward, and doubtless we shall be confronted with many anti-inflationary proposals. Taxation must raise the revenues necessary to finance much of the defence programme and in general is an important fiscal means for "siphoning off" purchasing power. While the tax structure should be arranged to assist in restraining inflationary tendencies, yet at the same time it should not hamper or retard the industrial programme necessary to meet military and domestic requirements.

The choice of taxes and their rates loom large in our planning. I know that in certain quarters the excess profits tax has its adherents, yet, because of its tendency towards encouraging unnecessary spending, it has, particularly under conditions of full employment, an inflationary potential. A further equally important argument against such forms of taxation is that in our economy, part of which is in the developmental stage, every encouragement should be given to expanding new businesses and industries. Retention of profits is one of the best methods of capital expansion. Serious consideration should be given to setting the rates of corporation income tax at sensible levels. In the long run this might be a better

revenue-raising arrangement than an excess profits tax.

The report was adopted.

THE ENGLISH, SCOTTISH AND AUSTRALIAN BANK

ANOTHER SATISFACTORY YEAR

THE HON. DAVID BRAND'S REVIEW

The fifty-eighth annual general meeting of The English, Scottish and Australian Bank Limited was held on December 13th in London, the Hon. David F. Brand, the chairman, presiding.

The following is an extract from his circulated statement:—

I am pleased to report another satisfactory year of trading operations by your bank, in a period when Australia has enjoyed a high level of financial prosperity, resulting chiefly from greatly expanded export receipts, good seasons generally and a strong demand for manpower in all sections of industry.

At the same time, I have a duty to add my voice to others that have stressed the growing danger to Australia's economy of strong inflationary pressures which, if unchecked for too long, or checked by unwise means, can do inestimable harm to all sections of the community.

Reference was made in my last report to the advance policy of the Central Bank, which is directed towards restriction of bank accommodation in those enterprises that are least essential to proper economic balance, or whose trading structure indicates that monetary needs should be met by share capital or long-term borrowing outside the banking system. The advance policy has remained fundamentally unchanged during the year. We are in accord with its anti-inflationary objectives, and have co-operated fully with the Central Bank in applying these principles to all lending propositions.

As a result, the balance-sheet shows a reduction of £5,168,000 in the total of advances, which now appear at £45,271,000.

On the other hand, our deposits have been built up, both interest bearing and current account, which, with bills payable and other related liabilities, now stand in the balance-sheet at £93,708,000—an increase of £14,658,000. Deposits in the Australian banking system for the past year again showed a heavy increase, major factors being further substantial additions to the Commonwealth's overseas funds and expansion of advances by most banks.

IMPROVED LIQUIDITY

The total of cash in hand, etc., money at call in London, special account with the Commonwealth Bank, and bills receivable, etc., now equals 12s. 11d. in the £ of deposits, current accounts, etc., compared with last year's figure of 12s. 8d. in the £. Adding to public deposits, etc., the Commonwealth Bank of Australia special deposit account, the ratio becomes 12s. 2d. in the £ as against 10s. 4d. last year.

I would draw your attention particularly to the balance-sheet item, "Commonwealth Bank of Australia, special deposit account." This item represents the balance of loans made to this bank (at 3½ per cent. per annum) by the Commonwealth Bank during the period when our advances were increasing. During the year under review our improving liquid resources facilitated a reduction of £12,345,000 in these Three and a Half per Cent. loans to a total of £5,583,000 at June 30th last, thereby enabling the bank's earnings to be maintained at an adequate level. In the same period our lodgments with the Commonwealth Bank at one-half per cent. increased by £4,418,000 to £35,212,000.

A substantial upward movement in gross profit has again been recorded; but as on previous occasions in recent years expenses of management have also risen (mainly through increased arbitration salary awards) and taxation estates are higher, resulting in a net profit of £259,310—an improvement of £21,345 on last year's result.

Having paid an interim dividend of 2s. per share, the directors again recommend a final distribution of 4s. per share, making a total unchanged dividend of 6s. per share, less United Kingdom income tax of 9s. in the £.

An allocation of a further £35,000 has been made to the officers' provident fund, after which £59,310 of the net profit remains unappropriated. This has been added to the carry-forward, increasing it to £456,548.

The report was adopted.

ALLIED BAKERIES, LTD.

FURTHER PROGRESS

The fifteenth annual general meeting of Allied Bakeries Limited was held on December 12th in London.

Mr W. Garfield Weston, the chairman, in the course of his speech, said: The gross revenue in the consolidated profit and loss account at £3,258,000 shows an improvement of £388,000 as compared with last year's figure of £2,870,000, and the net profit before taxation has increased by £221,000 from £2,404,000 to £2,625,000.

During the year the directors put into motion steps necessary to secure the highest possible degree of technical and administrative efficiency. First, our interests were divided into geographical areas for convenience of local administration, namely Southern, Northern and Scottish Bakeries respectively, with a fourth section for Biscuit Manufacturing Companies. Secondly, high executives and leading technical staff were re-deployed to the best advantage.

The third step will be to reduce the number of operating companies by amalgamations and absorptions to reduce operating costs. I am pleased to say that the first results of this change-over have been most encouraging.

Some financial writers have suggested that our company may soon have to raise further capital in connection with our schemes of expansion and modernisation, and I would like to clear this point up by indicating that no such action is at present contemplated by the board. Moreover, our planned policies will continue so long as suitable channels for new activities become available to us.

THE DIVIDEND

I should now like to refer briefly to the retention of our ordinary dividend at the level of 20 per cent. As you know, the policy of the Government is to limit spending power and it has pinned great hopes to wage freeze and dividend limitation policies. These restrictions would be readily accepted by all if the cost of living were stationary, but there is a growing body of opinion that the present inflationary tendency justifies a moderate increase in personal incomes.

Because the present rearmament push has slowed down deliveries of new equipment, the calls on our liquid resources during the current financial year will prove to be lighter than was originally anticipated, and this will enable the board to reconsider its dividend policy (with especial reference to the claims of the smaller shareholders) when the directors meet shortly to consider the first interim ordinary dividend on account of the year ending March 31, 1951.

At the request of the chairman, the meeting was addressed by Mr A. Barrowman, Mr A. E. Ellison and Mr J. Thomson, each of whom described the progress made in the Bakery Group for which he was responsible, and also by Mr W. P. Van Sickle, for the Biscuit side of the business, and Mr C. M. C. Symes, general sales manager for the three Bakery Groups.

The report was adopted.

WALTER SPENCER AND COMPANY, LIMITED

A DIFFICULT YEAR

The fourteenth annual general meeting of Walter Spencer and Company, Limited, was held on December 13th at Sheffield, Mr E. Ransom Harrison, F.S.A.A., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to September 30, 1950:—

The year under review has been one of great difficulty and towards the end devaluation began to take effect and has now caused very considerable increases in the cost of raw materials used in our specialities.

IMPROVEMENTS COMPLETED

The scheme of improvements I referred to last year has not yet been completed, but the new boilers and conveyors are now on site and erection will proceed with all speed; every effort will be made to commence the new plant by the end of November. This should effect considerable saving. It is estimated that the sum still required for capital expenditure is £28,677. In addition certain existing plant has been modernised and is now giving satisfactory production.

Due to the increased capital expenditure and to the company's practice of providing for depreciation each year a sum not less than the Inland Revenue allowances, the charge for depreciation is £12,397 compared with £9,318 in the year to September 30, 1949. Although the profits earned for the year to September 30, 1950, are less than for the previous year, the reserve needed for income tax on those profits is greater because the benefit obtained from initial allowances is not so pronounced as in the previous year. A further transfer from profit and loss account to contingencies reserve is recommended.

TURNOVER AND EXPORT TRADE

The output has shown some slight decline in both the home and export trade but this is mainly due to the fact that until the new scheme is completed we are working under great difficulties, as part of the old plant has had to be dispensed with. With regard to the future, we have a very satisfactory order book both for home and export trade and already the current year shows a pleasing increase.

Your directors recommend a final dividend of 7½ per cent., less income tax, making with the interim dividend of 5 per cent., less income tax, paid on May 31st last, a gross dividend of 12½ per cent., less income tax, leaving a sum to be carried forward of £8,093. It is with regret that your directors recommend a reduction in the final dividend, but they consider this a prudent course, especially as the higher cost of raw materials referred to will need a heavy outlay to carry on production in our specialities for which there is a great demand.

I may point out that a very considerable capital outlay has been met and the further expenditure under review is provided for without making any further share issue. No effort will be spared to restore the dividend at the earliest possible moment—and if the restrictions on raw materials do not curtail output I anticipate no difficulty in this direction.

Mr P. B. Henshaw accepted an invitation to join the Board. Recent changes have taken place in the staff and we are pleased to record advancement for some of our old members to positions of greater responsibility, and the Board express their appreciation of the co-operation of the staff and workpeople during the year.

The report was adopted.

DORMAN, LONG AND COMPANY, LIMITED

GOVERNMENT JETTISON AGREEMENT ON INDUSTRY'S FUTURE

REVIEW OF RECORD PRODUCTION

The sixty-first ordinary general meeting of Dorman, Long and Company, Limited was held on Thursday, December 14, 1950, at Caxton Hall, Victoria Street, London, S.W.1.

Sir Ellis Hunter, chairman and managing director, who presided, in the course of his speech, said:—

The year has been one of mounting production and we are again able to report new record outputs. Iron production reached 1,206,554 tons, an increase over the previous year of 18,106 tons, while steel ingot production increased by 52,147 tons to 1,694,742 tons, and rolled steel production at 1,376,989 tons showed an advance over the previous year of 63,986 tons.

This striving after the highest possible productivity has been the industry's consistent policy since 1945. The whole of the industry has participated in this endeavour and no section has failed to make the necessary effort. More than three years ago the men agreed to the introduction of the continuous working week in the melting shops when in many other important industries there was pressure for the introduction of the five-day week. In 1945 managements produced their co-ordinated plan of national development and, what is more, they put it into operation and have made good progress ever since. They have also used to the utmost the resources of their own organisations and of the industry's organisation to secure adequate supplies of raw materials and a free flow of the industry's products to the consuming trades.

NO NEED FOR EXHORTATION

And in all this work there has been no need to urge either men or managements. Repeated exhortations to produce more which were showered upon industry generally were not required in the case of iron and steel where the need was recognised long before it was acknowledged elsewhere.

All employed in the industry, whatever their status, are entitled to full credit for this record of unstinted effort.

The higher outputs in the past year have had to be achieved, however, not in any atmosphere of encouragement, but against a background of disturbance caused by the Government persisting with the project of nationalisation. The policy now being pursued cannot as the Government allege dissipate the uncertainty that surrounds this issue. Both opposition parties have pledged themselves to the repeal of the Act.

The production record of the industry in recent years is a reflection of its endeavour to do its utmost to give the nation what it needed and the Government might have been expected in the present circumstances to be content to hold their hand and allow the industry to continue with its efforts undisturbed by political action.

This problem of the relationship between the industry and the State has been shown to be capable of permanent settlement on a basis that involves the fullest protection for the public interests.

In September, 1946, the Government itself established an iron and steel board, including four members with wide experience of the industry, as well as a consumer representative and two independent members, one of whom was chairman. It continued to operate until March, 1949, and provided a remarkable demonstration of successful public control, in full co-operation with all branches of the industry. Nor was there any insurmountable difficulty in according to the board such powers as would remove any possibility of its being suggested that it could only act negatively.

AGREEMENT WITH GOVERNMENT JETTISONED

During 1947, negotiations were conducted between the Federation and Cabinet representatives and an understanding was reached providing for giving the board additional powers and functions to meet any such criticism. We had hoped that at last the relations between the industry and the State would be placed on an effective and permanent basis, but the discussions were suddenly terminated without any reason being given beyond the bald statement that the Cabinet had decided to proceed with nationalisation.

The Trades Union Congress have shown more perception and realism on this matter than the Government. In their report issued at the end of August this year the T.U.C. urged the desirability of considering whether other forms of public control might not be better than outright nationalisation. This is what the report said: "It may, however, be that in important cases a more practical means of public control, alternative to both public ownership and development councils, would be the statutory board of control."

This is precisely what we thought we had achieved in our negotiations with the Government in 1947. The opportunity which was cast away three years ago was surely recreated by this pointed suggestion from the T.U.C. It offered the Government, had they not really been obsessed with nationalisation for nationalisation's sake, an admirable chance of reviving this sensible course of action. But instead of adopting this course, the Government proceeded to implement the Iron and Steel Act and even declined to avail themselves of the opportunity for delay with which they had provided themselves in the Act.

There need be no speculation regarding the attitude of the leaders of the industry because they have declined in the present political situation to nominate members to serve on the Corporation which has been set up. The answer is simple and can be stated categorically. We shall continue to conduct our affairs with only one purpose in view, the continued development of the industry for the highest public service, endeavouring to raise productivity and increase efficiency so that our products are available in the largest possible quantity at the lowest possible price.

The company's record outputs at the iron and steelworks are matched by equally successful operations in the other departments and by the subsidiary companies. All this is reflected in highly satisfactory financial results on the year's working.

TREATMENT OF SHAREHOLDERS DEPLORED

The full amount of the initial allowances has again been written off capital expenditure in the past year. Your directors have consistently followed this practice since these allowances commenced. They are of opinion that all practicable steps should be taken to offset the effect of inflated costs of development work. If, instead of adhering to their policy of retaining profits in the business in this and other ways so as to provide for increasing needs for larger working capital, as well as for heavy commitments involved in the company's development schemes, they had increased dividends, the shareholders would probably have received more compensation under the Iron and Steel Act; but the company would not have been so well placed to implement its part in the national development programme. Paradoxically, shareholders of companies which have adopted a less conservative policy will receive greater consideration if and when their holdings are taken over by the State. The Dorman, Long group's net current assets, after deducting current liabilities and provisions, amount to £14,500,000. The compensation payable to the company's debenture holders and shareholders is £13,000,000, so the State will take, without consideration, £1,500,000 of current assets, in addition to the whole of the valuable fixed assets, which are worth far more than their book value of £8,000,000, following a year in which the group profit is over £6,250,000.

About two-thirds of our 26,000 members hold 100 shares or less. They are not speculative investors who are constantly operating on the market and for whom the criterion of market prices might have some relevance, but small investors who have put their savings into the company and kept them there in bad times as well as good. Your directors deplore the injustice to be perpetrated on these shareholders and earnestly hope that if vesting does take place before a General Election the Opposition Parties will bear these facts in mind when considering their proposals for the subsequent repeal of the Iron and Steel Act.

DEVELOPMENT: STAGE TWO

A start was made in the autumn of last year on stage two of our major development plan, the main item being the construction of our new open hearth steel works at Lackenby with which satisfactory progress has been made. The whole project has been designed by our own staff and is being built by the Dorman, Long Group. This is a striking example of the extent of our resources and the versatility of our engineering and technical staffs.

Virtually, all our major developments up to stage two have been designed to improve the efficiency of our production by additions to and replacement of existing plant rather than materially to increase output. They have, however, contributed to the general increase in production by reason of the improvement in efficiency which has been secured. Demand for heavy structural steel which, of course, is the particular field in which we are specially interested, has been maintained at a high level and tends to increase.

This tendency gives additional encouragement to the implementation of the next stage in our plant development programme. In these circumstances adjustments to stage three must be considered which would permit the new capacity being operated for a period in addition to our existing equipment, rather than making the replacement of present units the sole consideration. There are also proposals which would lead to an expansion of rolled steel output at our existing works. Stage three of our developments provides for the installation of the beam mill at Lackenby and the construction of new large blast furnaces at the Cleveland Works.

MAGNITUDE OF STAGE THREE

Pressure on plant makers in this country in the immediate postwar period was so great that the major strip mill development in South Wales had to take precedence over our own mill construction project. The overall progress made with the industry's national development plan, however, has been such that the third stage of the Dorman, Long development programme could now be put in hand at an early date.

Our developments are essentially a continuing process and should not be regarded as isolated projects. They are stages in a long-term policy designed to ensure economic production and to assure to Dorman, Long a full share in the steel industry's expansion.

The report was adopted.

GREAT UNIVERSAL STORES

ANOTHER RECORD YEAR

MR ISAAC WOLFSON ON THE OUTLOOK

The thirty-second ordinary general meeting of the Great Universal Stores Limited was held on December 12th at Winchester House, Old Broad Street, London, E.C., Mr Isaac Wolfson, chairman and managing director, presiding.

The following is the chairman's statement circulated with the report and accounts for the year to March 31, 1950:—

I have pleasure in submitting the accounts of your company together with the consolidated accounts of the group. The consolidated trading profit is £5,896,913, as compared with £4,576,290 for the previous year, an increase of £1,320,623. To the above-mentioned trading profit must be added £54,194 in respect of dividends from trade investments and sundry items receivable, making a total revenue of £5,951,107. From this has been deducted £461,308 for depreciation, £44,974 for auditors' remuneration of the group, £426,773 for interest paid, and £437,462 for the proportion of profits relating to outside shareholders of subsidiary companies.

APPROPRIATION OF PROFITS

This leaves a balance of £4,580,590 from which the substantial sum of £3,019,367 for taxation must be deducted leaving a net distributable revenue of £1,561,223.

During the year under review the freehold and leasehold properties of the group with the exception of properties overseas were professionally revalued which resulted in a surplus amounting to £3,313,023. These assets have accordingly been increased by this amount, and the surplus has been transferred to capital reserve in the accounts of the companies concerned. Properties now stand in the balance sheet at £9,730,390, being an increase of £3,876,128.

RESERVES

Capital reserves after writing off the above amount then stand at £4,430,504, as compared with £3,806,946 last year, an increase of £623,558. Furthermore, revenue reserves and undistributed profits (apart from £2,039,296 reserve for future income tax) amount to £3,350,479, having been augmented by £1,005,290 during the year.

The above total reserves amount to £7,780,983 and are applicable to the issued capital of the parent company which consists of £2,250,000 preference and £1,319,979 ordinary stock or £3,569,979 in all. They are therefore over twice the amount of the total issued capital, or nearly six times the amount of the issued ordinary capital of the parent company.

As mentioned in the directors' report, we have succeeded in acquiring on advantageous terms the whole of the outside minority interest in the equity capital of the British and Colonial Furniture Company, Limited. This purchase will be of benefit to the former company and the group as a whole in that it has now become possible to co-ordinate the administration of the above concern with other units of our furniture division, which will permit of substantial economies in costs of operation.

Debtors of £4,397,416 represent short term credit accounts for the sale of goods other than furniture and the like. These show an increase in the ordinary course of trade. The average amount outstanding continues at just over £3 per customer. In the normal course of business an amount equivalent to the hire purchase debtors outstanding at a given date is collected over the ensuing period of a year and in the case of short term credit debts outstanding these are collected within the following 18 weeks.

Thus at the date of the forthcoming annual general meeting two-thirds of the amount outstanding as at March 31, 1950, under hire purchase contracts and the whole of the amount outstanding under short term credit accounts will have been received. This should be kept well in mind when considering the bank loans and overdrafts at £7,230,976 as compared with £6,252,254 last year. As against this there are balances with bankers and cash in hand of £2,901,763 so that the net liability to bankers is £4,329,213 as compared with £3,972,302 last year. As stated in previous years these loans and overdrafts largely arise from long-standing arrangements in connection with the Jays and Campbells furniture group of companies. The increase in the above amount mainly arises as a result of the consolidation of subsidiaries acquired during the year.

Debentures, mortgages, etc., are £3,940,868. These show an increase on last year largely due to items falling under this heading of newly consolidated subsidiaries which includes £391,480 mortgage debenture stock of Smart Brothers, Limited. These borrowings are repayable over a long period of years and in effect are working capital.

Total current assets at £38,464,733 represent an increase of £9,277,139 in relation to last year whereas total current liabilities have only increased by £6,000,341. The surplus of current assets over current liabilities is now £14,725,911 as compared with £11,449,113 last year.

GROUP'S RECORD YEAR

The year under review has again been a record one for the group. Turnover again showed a large increase. Falling profit margins coupled with a tendency for expenses to rise which is the experience of the distributive trade as a whole became evident during the year.

Prices of all goods have risen so much in relation to prewar and subsequent years that comparative sales figures in money values can be misleading. The true test of good trading and service is if the actual volume of goods in numbers of articles shows an increase. This is so in our case.

While prices have continued to rise recently the purchasing power of the public has not increased to any like extent. It therefore follows that greater discretion is being exercised by the buying public in seeking out the exact articles it requires at the prices it can afford to pay. Manufacturers must pay greater attention to improved methods of production to offset the price increases in raw materials. Those who do not will find demand for their output falling. Value and service to the customer has become more important than ever.

As I have mentioned in my previous annual statements our constant endeavour is to achieve a very high degree of efficiency within the group which must result in improved value and service to our large body of customers.

Sales for the current year show an increase over the year under review and trading profits are being held. I am hopeful that the results for the current year will be at least as good as those now presented to you.

The report and accounts were adopted.

REGIS PROPERTY

BURDEN OF TAXATION

The twelfth annual general meeting of Regis Property Company, Limited, was held on December 14th in London, The Rt. Hon. Lord Kennet of the Dene, P.C., G.B.E., D.S.O. (the chairman), presiding.

The following is an extract from his circulated statement:

Profits subject to taxation show an increase of £18,598, but increased provision for taxation absorbs a further £17,099. Thus the net profit of the group for the year has risen from £75,096 to £76,595.

Nearly 92 per cent. of the increase in profit has been absorbed by taxation. Increased profits tax has, of course, been incurred, but the greater part of this increase in taxation is due to an inconsistency in the rate of annual charge arising out of the fact that increased mortgage interest has been charged this year for the first time. The additional revenue which we look forward to earning in 1951-52 from our new office building should not be subject to more than the normal percentage of tax applicable to the year in which the income arises.

DIVIDEND RECOMMENDATION

It is now recommended that we should pay a final dividend of 8 per cent., less tax, making a total distribution for the year of 12½ per cent., less tax. The small increase in the proposed dividend is in relation to the increased receipts arising from the restoration of the war damaged section of Plantation House in respect of which the company itself has incurred additional expenditure over that provided by the War Damage Commission in order to improve the property.

After appropriations the combined profit of the group to be carried forward is £24,857, and including this amount the revenue reserves and surplus shown in the consolidated balance-sheet now amount to £55,249.

Our properties continue to be fully let and seem likely to remain so; but expenditure on repairs and the cost of all the services which we render for our tenants continue to increase, and legislation to permit some compensation for this additional burden still seems to be far away.

PLANTATION HOUSE

The building of a new section of office premises in the City of London adjoining our Plantation House property is proceeding rapidly and all the available space has already been booked by prospective tenants.

We have entered into an agreement to purchase the leasehold interest in this property on the completion of the building and we hope that we shall be in possession of the new block in not much more than six months from now.

We estimate the cost of the leasehold to be in the neighbourhood of £950,000, the finance for which has already been arranged, and there is no doubt not only that this new property will yield an attractive return to the shareholders but that the long-planned steps which will have led up to our investment in this leasehold will turn out to have greatly strengthened the financial position of the company. Our properties including this leasehold will have a market value greatly in excess of their book value.

You will, I am sure, readily appreciate the advantage in the company's applying its resources and experience more equally in the management of first-class office properties as well as flats, particularly in view of the great difficulties under which landlords of flats operate so long as the Rent Control Acts remain unamended and tenants do not have to meet the greatly increased cost of repairs.

The report was adopted.

TUBE INVESTMENTS LIMITED

RECORD OUTPUT, TURNOVER AND EXPORTS

MR IVAN A. R. STEDEFORD CALLS FOR FIRM POLICY IN REARMAMENT PLANNING

At the annual general meeting of Tube Investments Limited, at Birmingham on December 13th, Mr Ivan A. R. Stedeford (chairman) said that new high records had been achieved in output, turnover and sales, and that this had resulted from a combined operation in which all employees had worked with a will and in good fellowship.

T.I had extended, with quite remarkable results, the application of redeployment and scientific production management to lower costs and increase productivity, and for over a year had been introducing the newest techniques in standard costing and budgetary control, urged upon British industry within the past two months in the Specialist Productivity Team's report on U.S. management accounting. The Residential Training Centre for supervisors had proved to be of great value in helping supervisors to adjust themselves to the new responsibilities which came with new production systems. Promising results had also accrued from the courses for young men on the shop floor who sought promotion through training. Experience had shown that the talent and special qualities required of supervisors were latent in many young men who would remain undiscovered without the stimulus of training.

GROWTH OF CYCLE DIVISION

The profits for the trading year covered by the accounts amounted to £6,282,651. Each of the five divisions has made its contribution to these record results. The Cycle Division, which produced bicycles and components under the world-famous names of Hercules, Phillips, Norman, Armstrong and Brampton, again achieved new high records with exports up by over 10 per cent. on last year's records; T.I. exports of bicycles represented more than half of the British total. These good results might appear to be at variance with the warning he sounded last year, when he said that the time might be approaching when the British productive capacity of bicycles would outstrip the demand; but he indicated then that T.I. were well equipped to hold and extend their trade, and this they had done. The published export figures for the six months following the statement showed a reduction for the industry of 17¼ per cent. But the Korean developments caused a sudden change, and overseas a sellers' market for bicycles returned overnight. The industry was set a further spell of very great activity, and it could be safely assumed that since Korea most, if not all, cycle plants in the country had been working to capacity.

This state of affairs was unlikely to continue. Already many materials essential for bicycle manufacture were in short supply, and it seemed unavoidable that the industry must soon be faced with a period when the priority needs of rearmament would impose restrictions upon cycle production generally, both in terms of finish as well as quantity, as it did during the last war. In this event, steps would be taken to see that T.I. plants secured suitable work to keep them fully employed during any emergency period.

CURBS TO ALUMINIUM DEVELOPMENT

The output of the Aluminium Division—and its sales at home and overseas—were expanding satisfactorily before the added impetus of rearmament, and good progress also had been made with the installation of the large rolling mills in South Wales. But for one seriously limiting factor which was outside our control, and about which he expressed concern twelve months ago, he could this year have described the prospects of this Division as good. The British aluminium industry has been warned that imported supplies of virgin aluminium might be cut by over 10 per cent. This reduction was serious. Over the last two years the industry, with full encouragement, has expanded its productive capacity, with the result that its requirements of virgin metal for 1951 would be 25 per cent. greater than its needs in 1949-50 for economic operation. From T.I.'s point of view, as the new mill was not planned to come into operation for another six months, the cut would rob the company more of what was to come than of what it had already enjoyed.

Recent Anglo-American talks had considered plans for an equitable distribution of raw materials for rearmament. If this principle were fully applied in regard to virgin aluminium, it would be reasonable to expect that this country would receive enough at least for its more efficient fabricating plant to operate economically. Whilst T.I. might be compelled to slow down some of its existing plant he hoped it would not be necessary to postpone the starting up of the new rolling mill in South Wales, which was not only strategically well-sited, but, incorporating all the most recent developments in technique, was, or would be, one of the most efficient producing units anywhere.

TUBE OUTPUT OF 403 MILLION FEET

The Steel Tube Division, with its great production of over 403 million feet of cold drawn, precision and welded tube, had achieved an all-time record output—unequalled during the best years of the war when we had more men working at more machines for many more hours. The greater part of this Division experienced a return of the sellers' market during the year. Despite great demands and rising costs, T.I. had recently been able to offer some price reductions. Under present conditions it seemed unlikely that there would be many more opportunities of doing this. The companies in the General Division also did well, constantly extending their range of products.

The Electrical Division, which manufactured the famous Creda and Simplex products, had improved its contribution to the group's results, and had gained its fair share of the available trade, both at home and overseas. There still remained, however, a number of factors beyond the industry's control which necessarily curbed the great potential demand for electrical appliances in the home, and this compelled T.I. to base expectations on a long-term view.

EXPORTS UP AGAIN

T.I. had had another record year for exports—the fifth in succession. Direct exports, at £14 million, were 10 per cent. better than the previous year's record, and were an eloquent contrast to the best prewar performance, which was just one-tenth of that figure. Sales to Canada, to the U.S.A. and to other dollar account countries were as much as 60 per cent. higher than in 1948-49. Devaluation undoubtedly aided T.I.'s special efforts in these markets.

Describing the company's postwar policy of overseas expansion, Mr Stedeford said that the newest development was the acquisition of a substantial interest in the Standard Tube Company Limited, of Canada, which would be renamed Standard Tube and T.I. Limited. It was a well-established and progressive concern already earning a substantial income. It had been mainly engaged in the manufacture of electrically welded precision tubes for the Canadian market. Its operations would be extended to cover a wider range of precision, mechanical and pressure tubes as well as other tubular specialities. The company, which owned a number of distribution depots throughout Canada, would supervise and promote the sale of T.I. products exported from the home factories. He believed that a closer integration of Canadian and British industry would be generally welcomed by the North American continent, and that a closely united Commonwealth was still a corner-stone of stability in a restless world. T.I. had also purchased the assets of Southern Engineering Supplies Limited, of South Africa, which manufactured electrical appliances.

FURTHER OVERSEAS DEVELOPMENTS

The factory of Hercules and Phillips Cycles (South Africa) Limited had already surpassed the planned maximum production of over 8,000 a month; the cycle factory in Madras, India, was in the process of construction, and plant and equipment was on its way to India. Initial production should start in the coming spring. Exchange difficulties with Argentina had prevented T.I. receiving the fruits of their tube-making partnership in Buenos Aires in association with F.A.C.A. Mauricio Silbert. The development of this company was being hampered by Argentine restrictions, which prevent the importation of needed plant and machinery, but, within the limits of its present capacity, very satisfactory progress had been made. There had been a change of plans in New Zealand. When he visited that country in March, it was evident that the rapid development of secondary industries there had created labour problems. He had talks with ministers and, with their unqualified approval, decided to postpone indefinitely the T.I. tube-making project.

T.I. now had subsidiary or associate companies in Australia, Canada, India, New Zealand, South Africa and Argentina. Over the past two years he had journeyed nearly 100,000 miles by air in T.I.'s interest, and the fruits of these overseas travels encouraged him to believe that still further trading exploration should be undertaken.

£10 MILLION HOME PLAN

On the home front, a five-year plan for what was in effect a technical revolution within the group could now be regarded as about completed. Since 1945 some £15 million had been spent in developing and expanding T.I., of which over £7 million had gone towards rehabilitation of plant, modernisation of factory layouts and works extensions. The board was well aware that further modernisation and specialisation was essential if T.I. were to keep ahead of foreign competition, and it had been decided to embark upon a second home development plan which would involve an expenditure of £10 million over the next three years.

The plan would touch upon most of the group's factories in Britain, but it embraced some important developments. They included a modern plant for the production and special heat treatment of high precision tubes for ball and roller bearing manufacturers, which would make the country for the first time almost independent of imported supplies of this vital product; also additional plant of the best design to produce long boiler and other high duty and specialised tubes, such as those required for power stations; also completely new equipment and layout for the production of high pressure steel cylinders, etc., of which T.I. was among the world's largest manufacturers.

These projects, which were not without their significance in the development of the country's military and economic strength, served to demonstrate that the main thrust of what he termed T.I.'s two-pronged development drive continued to be centred in the home country.

It might be felt that this record of past achievement and future development explained the purpose of the increase in capital and the issue of shares, for which confirmation would be sought at a meeting later that morning. The proposal was to increase the authorised capital by £10 million, and to issue for cash as soon as possible five million £1 4½ per cent. preference shares. He trusted he had shareholders' confidence that the money would be well spent.

OBSTACLES TO GREATER PRODUCTIVITY

A factor was creeping into Britain's industrial economy, the dangers of which might not be fully appreciated. It was that earnings retained in a business, and which would be needed to finance increased production resulting from greater productivity, were now so heavily taxed that many companies—he was referring particularly to smaller companies—would be unable to finance the additional output in the normal way, and would find themselves compelled to borrow or raise capital simply because they had become more efficient. The supply of cash savings, both private and business, was strictly limited, as taxation made accumulation difficult, and many companies might be unable to raise funds when needed, or might have to accept terms which would prove onerous when trade slackened. It meant that industry was taking up private savings as working capital to finance increased productivity, when much of its own savings—its undistributed profit—were taken away by the government to be used for current expenditure. Using capital as income in this way as a general taxation policy seemed to be basically unsound. A robust economy surely required that industry should be able to generate its own energy for maintaining day by day its competitive efficiency.

British industry had come to depend increasingly on a high volume of output for its competitive power. It was useless to conjecture how long world demand would sustain peak output. It would remain high for some time, but already it was known that the shortage of raw materials would force a restriction of output. As this happened, we might be faced with higher raw material prices, but would no longer be able to minimise their impact by increasing production; then we could expect the inflationary forces to get still more busy.

REARMAMENT PLANNING

Rearmament had brought an upsurge of activity which had given an impression of lessening economic difficulty but it would be strange indeed if rearmament, with its diversion of output from constructive purposes, turned out to be a blessing in disguise. The apparent benefits were largely deceptive, and any immediate advantages were likely to vanish unless the inflationary forces set up could be brought under control. It was, therefore, of first importance that the transfer of resources to defence activities should be carried out smoothly and efficiently so that civilian production, exports and technical progress were not damaged more than was unavoidable.

Owing to the somewhat haphazard manner in which the new defence plans had been set in motion, forces much more violent than ordinary demand and supply were now at work. The world's industrial production had in general expanded more rapidly than its output of primary commodities; this had coincided with a sudden acceleration of stockpiling purchases by some governments. As a result, the prices of important industrial raw materials had risen astronomically, while supplies of some were falling to famine proportions. The free nations of the world were suffering from shortages and the early spirals of an inflation which threatened to distort their economies and unsettle their social relationship.

It seemed still possible to bring these disrupting forces under control, though great damage has already been done. A firm financial policy was needed at home to restrain purchasing power and to maintain as much stability as possible, but the crucial correctives had to spring from international action.

Great encouragement was derived from the Anglo-American statement of policy following the meetings between our Prime Minister and the United States President. This recognised the necessity of international agreement to secure the equitable distribution of basic raw materials in accordance with defence and civilian needs, and it indicated that immediate problems of raw material shortages would receive further consideration. Further discussions then obviously were necessary, but, Mr Stedeford concluded, he would respectfully submit that it was already late in the day. What was urgently needed was the immediate application of a plan, even though it be a temporary emergency one, to achieve, not only the orderly distribution, but also the economic pricing of scarce supplies.

The report and accounts were adopted and the dividend approved.

ANSELLS BREWERY LIMITED

A SATISFACTORY RESULT

The fiftieth ordinary general meeting, being the forty-ninth annual meeting, of the stockholders of Ansells Brewery Limited was held on December 11th at Birmingham, Mr A. E. Wiley, chairman and managing director, presiding.

In the course of his speech, the chairman said: The trading profits of the group for the year now under review amount to £1,463,334, which is a small decrease over the previous year of £34,221. This result, I am sure you will agree, is very satisfactory. It has been a very difficult year in which a constant increase in cost of most materials and expenses has taken place, but fortunately, owing to the popularity of your company's products, the turnover has been considerably increased over that of last year.

The net profit for the year, after charging all items, including taxation, amounts to £461,452, being a decrease of £29,220 when compared with that of the previous year. After giving effect to the proposed appropriations, it is suggested that the balance of £307,075 be carried forward to next year's accounts.

IMPROVEMENT SCHEMES

In common with other members of the wholesale trade, it has always been your company's policy to encourage and assist in any improvement schemes. We are justly proud of the licensed premises that were built shortly before the war, and it is our endeavour to put up houses of as good a quality, to serve the public in the future on the development and redevelopment areas that are now being planned in so many parts of the Midlands. It must be remembered that if the present policy of granting lease of sites for licensed premises to take the place of sites where freeholds were previously owned is to continue, then the provisions of such leases, particularly as to length of term and rental, must be reasonable. It is economically impossible for us to put up houses of the same quality as were built before the war on short leasehold and I regard a term of 99 years as the absolute minimum which we can reasonably be asked to accept.

The question of the amount of ground rent also arises, and it must be appreciated that any exorbitant demand can only result in a reduction in the quality of houses we are able to build, and in the amenities these houses provide. As a matter of elementary fairness, the amount of ground rent we pay should be related to the amount we are asked to pay for licensed premises that are compulsorily acquired from us.

As you are aware, in 1949 the Chancellor of the Exchequer reduced the price of beer by 1d. per pint. This year he enabled the brewers to increase the gravity of their products by three degrees; taking the trade as a whole, these measures have been insufficient to stay the decline in consumption. Your directors feel that to get the best results from the rearmament drive, and to bring the price of beer within the reach of the average consumer, the price of beer should be reduced by at least a further 2d. per pint.

NEW ACCOUNTS

Mr Walter Scott, J.P. (Deputy Chairman and Managing Director), in the course of his speech, said: Our increased barrelage is the result of extra trade derived through newly acquired properties, and to a greater extent from opening new accounts with Free Trade customers, which the popularity of our beers has made possible.

If we had been content to rely upon our former outlets the effects of the heavy beer duty in depressing the consumption would have been much greater and it is disappointing that we have to show a somewhat reduced profit in spite of our success in increasing the output.

The bulk of the barley crop this year was harvested under phenomenally bad weather, much of it being ruined for malting purposes.

The report was adopted.

HERRBURGER BROOKS

(Manufacturers of Pianoforte Actions)

The thirtieth annual general meeting of Herrburger Brooks Limited was held on December 14th in London.

The following is an extract from the circulated statement of the chairman, Sir Louis Sterling:—

The directors are pleased to report that, after providing for taxation, the net amount available for distribution shows an increase over that of the previous year.

The position with regard to timber supplies has now improved and our stocks of this commodity are on a more healthy basis. Unfortunately the cost of most materials continues to rise and we feel much concern at the heavy increases which are already forecast in connection with woollen materials.

The piano trade is still almost wholly devoted to export business, although the Government has given permission for pianos to be allocated to the home market, subject to the satisfaction of all export requirements. Sales of pianos in the home market are at present negligible owing to the very high rate of purchase tax chargeable thereon. The purchase tax is at the rate of 66⅔ per cent., which makes the selling price to the public prohibitive. If the purchase tax was reduced to a reasonable rate I am confident that home sales would become very large and the Revenue benefit considerably. The position with regard to the home trade, however, is fully known to the authorities, and I can only hope that this matter will receive more favourable treatment at an early date.

The company is still operating also in directions other than those connected with the piano trade, and your directors will continue to endeavour to utilise the resources of the company to the fullest possible extent.

The report was adopted.

CROMPTON PARKINSON LIMITED

SUCCESSFUL RESULTS

MR ALBERT PARKINSON'S REVIEW

The thirty-seventh annual general meeting of this company was held on December 15, 1950, in London.

The chairman, Mr Albert Parkinson, M.B.E., in the course of his speech, said:—

I have come to the conclusion that many conditions we had been accustomed to regard as abnormal now constitute normality. Rapid and large changes in the prices of important raw materials, mainly increases: wars and rumours of wars; political uncertainties at home and abroad and the economic uncertainties that flow from them, have been our lot and have become almost commonplace in our industrial scene.

While it is our duty as individuals to work towards greater stability by every means in our power, it is our task in industry to meet the varying conditions with an organisation that by its flexibility and adaptability can continue to achieve success.

The accounts and reports now presented to you indicate the measure of our success and I have no hesitation in enlisting your support for an expression of gratitude to all employees of your company who have contributed to it.

In making comparisons with the previous period, you should have regard for the note on the consolidated profit and loss account calling your attention to the varying lengths of the accounting periods included in 1948-49. The 1949-50 figures are for twelve months in every case. This accounts for some of the increase in the amount written off fixed assets, although this increase is mainly caused by the normal provision caused by the further considerable capital expenditure during the year; the insatiable search for means of increasing the efficiency of production together with the much increased cost of normal replacements are responsible for such expenditure.

A close review of our taxation and other liabilities has revealed an excess of provisions made in previous years and the resultant sum of £109,500 has been added to the balance of profits unappropriated which now stands only £11,000 below last year's figure, notwithstanding the capitalisation of £216,821 in the new issue made during the past year. If account is taken of the increase in the balance of profits unappropriated in subsidiary companies, the total of unappropriated profits together with general reserves represents nearly 65 per cent. of the issued equity capital.

THE CONSOLIDATED BALANCE SHEET

Our latest balance sheet clearly indicates that the process of absorbing revenue reserves into the permanent financial structure of the company still continues. This process will continue so long as your board can find opportunities for profitable investment in expanding or improving production and in the working capital needed for the business. I feel confident that you will endorse this policy which has been so successful over the last twenty years and even longer.

During the past year our total net assets have increased by £488,823, our net expenditure on fixed assets has been £510,687 and a note on the balance sheet indicates outstanding commitments for a further £362,488. The figure quoted represents only the legal contractual commitments at the date of the balance sheet and your board has in hand and in mind other extensions and improvements that will call for substantial further sums.

Of the increase of £70,460 in trade investments, all but £5,322 is in respect of overseas interests, nearly three-quarters of which is for manufacturing companies.

Our net current assets continue to increase. At June 30, 1950, our liquid position was more favourable than it was a year earlier and we could at last point to some reduction in the figure of stock-in-trade and work-in-progress. These, however, are ever changing figures and with a continuance of the inflationary trend and our extensive plans for the expansion and improvement of our production processes we shall require to maintain the utmost control of our finances.

OVERSEAS

From our home factories we export about 20 per cent. of our production but, although we have no means of measuring the volume of our products that go overseas as part of larger units, e.g., pumps, compressors, washing machines and refrigerators, we believe that upwards of one-third of all we make in this country eventually adds its quota to the solution of our country's balance of trade problem. The difficulties of embargoes, import controls, tariffs and currency controls are common to all those engaged in our industry and I further believe that we have our fair share of success in overcoming them.

The increase of our trade investments in overseas manufacturing companies does not, of course, represent the extent of our interest in manufacturing operations in overseas countries. Altogether we are interested in sixteen overseas factories and have technical and production responsibilities in six of them. During the past year we have used every endeavour to foster the good relationships which exist between your company and its many overseas friends and several of our senior executives have travelled extensively abroad in the pursuance of this policy.

The education and training of employees is covered by four main schemes; the apprenticeship class, the occupational training scheme, the Crompton Bursary which provides educational opportunity in the widest sense for suitable applicants, and the Parkinson Empire Bursaries which make financial provision for travel and subsistence and provide a two-year training course in the company's factories for suitable young men from the British Commonwealth.

DIVIDENDS

A study of the consolidated balance sheet will emphasise the desirability of maintaining a conservative distribution policy. Furthermore, it is still very much in the national interest that everything possible should be done to counter the inflationary pressure which, if ever it assumes control of our economy, will lead to untold misery and distress. It is unfortunate that adequate means have not yet been discovered to make this restraint effective in controlling inflation, but I feel we should continue to do what we can to that end and take what consolation we can find in the thought that such enforced saving may well be to our ultimate benefit.

For these reasons your directors are again recommending the same distribution as last year except that owing to the increase of issued equity capital the final dividend and cash bonus on the ordinary and "A" ordinary stocks are expressed as 3¼ per cent. instead of the 7½ per cent. to which you have been accustomed previously.

Your directors look forward to the future with cautious optimism, confident of the ability of your company to maintain its position in our industry throughout the world.

The report was adopted.

SCOTTISH AUSTRALIAN COMPANY

ANOTHER RECORD YEAR

The annual general meeting of the Scottish Australian Company, Limited, was held on December 8th in London.

Mr J. Norman Eggar (chairman and managing director) in the course of his speech, said: It is my privilege and pleasure to speak to you about a record year, the second in succession. During the year we have consolidated our position in many directions. The purchase of the leasehold of Devoncourt in North-west Queensland is mentioned in the report, and there is every reason to think the station will prove a valuable asset. It incurred a small loss in the period under review, due simply to the fact that there was only a small turn-off of cattle. Kynuna, also, incurred a loss, but that station is only now recovering from the bad seasons of 1947 and 1948, when its stock was reduced to about 600 head. It is now carrying nearly 8,000 head, and weather conditions have been far better and I am confident that next year's results will show a great improvement.

TOO MUCH RAIN

There was far too much rain on our New South Wales stations, and it has continued right up to the present; it is unusual for that part of the world to cry out for relief from rain, but such is now the case. Warrana has had 14 inches of rain in the last few weeks and further losses of sheep and lambs are, I fear, inevitable. Blowfly has been taking, and will continue to take its severe toll as the result of these conditions.

Corrella-Warraweena has had the wettest season on record, with at times 200,000 acres under water. All the Riverina stations have shown good results. The harvest return was 69,000 bushels of wheat, 2,022 bushels of oats and 181 tons of hay. Wheat gave a slightly better return per acre than last year.

Due to losses by floods and blowfly, our stocks of sheep are down to 329,000, as compared with 372,000 in June, 1949. On the other hand, cattle are up to nearly 50,000 head, showing an increase of 15,000.

As regards the immediate future with wool prices as they are today, we can look forward to another good year.

THE ACCOUNTS

Coming now to the accounts, our wool clip realised £183,475 more than last year, but the clip was 1,200 bales larger. Sales of live stock realised £18,814 more. Receipts for wheat and other crops, including further payments from the Wheat Board on account of 1947 and 1948 crops, amounted to £33,540, a decrease of some £2,500 on last year. Our share of the special distribution by the Commonwealth Government amounted to £70,168. Working expenses on the properties are £48,071 up on last year. Administration expenses show an advance of £4,900, which I consider moderate.

With land tax, taxation absorbs the huge sum of £406,747. Slightly over 54 per cent. of our profits go to Australian and United Kingdom revenues. The final profit at £342,370 is £104,595 larger than last year. We propose to pay a final dividend of 6 per cent., making 10 per cent. for the year, and to add to it a bonus of 5 per cent. in consideration of the joint organisation distribution.

The balance sheet discloses a very healthy financial position.

The report was adopted.

SINGER MOTORS LIMITED

RECORD PROFIT FROM NORMAL BUSINESS

The annual general meeting of Singer Motors Limited was held on December 13th at the company's Birmingham works.

Mr A. E. Hunt, the chairman and managing director, presided. The following are extracts from his circulated address: The last financial year showed a record profit from the normal motor-car manufacturing business and it is very pleasant to look back to my remark last year that we had satisfactorily surmounted the final hurdle in the change to a complete post-war model and to note that our optimism, even though cautious, has proved to be fully justified. Our results have been better than our hopeful anticipations, for we succeeded in stepping up on our planning.

SM. 1500 REFINEMENTS

The models mentioned in my remarks last year continue—the 9 h.p. Roadster Series 4A and the SM. 1500 Saloon. The latter basically is unchanged, but interior refinements have been introduced. As to the Roadster, there is another edition, Series 4AB, which will be available in the new year with a changed front, including independent suspension.

In April this year the company took part in the British Motor Car Exhibition in New York, showing both models—the SM.1500 Saloon and the 9 h.p. Roadster. We feel we now have arrangements by which the small but useful volume of business we have already secured in the United States will increase.

We have complied with Government desires regarding export, and the good results of the past year will be a spur to greater efforts if indeed that is possible.

I wish I could say the three works in Coventry presented as good a picture to the eye as the Birmingham works, but although most carefully organised, until complete reinstatement of war damage has been effected, we cannot plan satisfactorily and so put an end to the many expedients which still have to be used to get sufficient production from the Coventry works. Unfortunately, the reinstatement of those works is proceeding extremely slowly.

SUCCESSFUL EFFORTS

Until now, when we have made a real success again in our own business of making and selling motor-cars, we have been careful not to take credit for the company's achievements during the war. The time has come when I feel I should not be denied the opportunity of saying that your company during the war did a job "second to none." But—it made no motor vehicles after March, 1940. However, your company "played the game," although as a result it was for more than five years deprived of the benefit of the research experimental work and knowledge which go with the manufacture of motor vehicles and which are so important to success in that sphere. Therefore when we resumed production of cars we were at a great disadvantage compared with other companies which were able during the war to make motor vehicles. How well we have surmounted this disadvantage and the difficulties which accompanied it is clearly demonstrated by the results of last year's trading.

We have not yet been given any indication of what we may be required to do in the immediate future for the Services programme, but we hope we shall be able to continue our own business. Whatever transpires, our loyal co-operation will again be available for the benefit of the country.

The report and accounts were adopted.

MALAYALAM PLANTATIONS

The twenty-ninth annual general meeting of Malayalam Plantations Limited was held on December 14th in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from his circulated statement:—

The tea crop at 13,503,100 lb. exceeded that of the previous year by over 1,264,000 lb. and the rubber crop by approximately 160,000 lb. and included 388,193 lb. of sole crepe. The profit per acre from tea was £16 4s. 1d. and from rubber £3 17s. 2d., compared with £10 1s. 2d. and £2 18s. 7d. respectively for the previous year

Exportable tea realised nearly 2d. per lb. and rubber about 1½d. per lb. more than in the previous year, but the f.o.b. cost of production of tea increased by just over ½d. per lb. and that of rubber by over ½d. per lb. As a result of rubber control in India this company is unable to sell its rubber at world market prices, but can sell only in India at the control price, at present 1s. 4d. per lb. Manufacturers in India are getting the rubber at control price and are encouraged by the Government to export and sell their rubber at world prices based on the world price of rubber. Rubber producers as a class are in effect now singled out for expropriation of their profits and for a discriminatory tax the cost of which should in fairness be borne by taxpayers generally.

I again draw attention to the heavy taxation demands made upon the company, necessitating provision this year of £357,488 or practically 60 per cent. of the profits.

We originally estimated during the current year to produce more tea and rubber than last year, but owing to severe drought revised estimates for 1950-51 are for 12,840,000 lb. of tea and 5,709,000 lb. of rubber.

The report was adopted.

ANGLO-SCOTTISH AMALGAMATED CORPORATION, LIMITED

SATISFACTORY RESULTS

The twenty-fifth annual general meeting of Anglo-Scottish Amalgamated Corporation, Limited, was held on December 12th in London.

Mr H. C. Drayton (the chairman), in the course of his speech, said, inter alia: The net profit attributable to the members of the Corporation for the year under review is £38,600, as against £45,000 last year.

If you turn to the consolidated balance sheet you will see that our reserves including undistributed profits which are available total £358,000, a figure which is considerably in excess of the capital of the company, which is £283,000. On the other side of the balance sheet, the valuation of our investments shows them to be worth £471,000.

The value of your ordinary stock today is 207 per cent., as against 209 per cent. last year, a result which, in view of what we went through between September, 1949, and September, 1950, is not unsatisfactory.

During the course of the year we made four issues involving an amount of £1,300,000.

As regards the current year, gentlemen, I cannot prophesy what is going to happen. We shall do our best to present to you next year as good an account as we can. We are equipped to take advantage of any turn in the markets. We have an efficient managing director and an efficient staff who, I am quite certain, will not miss any opportunity of bringing business to us.

The report and accounts were adopted and the dividend of 6 per cent., plus a cash bonus of 8 per cent. on the ordinary stock, was approved.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

INCREASED PROFIT

The annual general meeting of The Consolidated Gold Fields of South Africa, Limited, was held on December 14th in London.

Mr Robert Annan, the chairman, in the course of his speech, said: The accounts of the operating company, New Consolidated Gold Fields, Limited, cover a period in which the outstanding feature was the increase in the price of gold resulting from the devaluation of the pound sterling in September, 1949. Following upon this there has been a rapid rise in the price of other metals and, on the other hand, a substantial increase in operating costs and in the price of all supplies.

The gross revenue from dividends and interest at £858,942 is £123,499 higher than in the previous year and now constitutes 58 per cent. of the total revenue. There is a gross profit of £1,283,797, which is £254,986 greater than in the previous year. Taxation at £597,220 is greater by £64,090, leaving an available balance of profit for the year of £686,576.

The book value of investments at £10,540,652 shows a decrease of £16,429, representing the excess of sales at cost and depreciation over purchases, the greater part of the latter being increases in our investments in the Orange Free State. The consolidated accounts show an addition to the net assets of the operating company of approximately £1,030,000, of which £223,000 arises from profits for the year retained by the subsidiaries.

The report was adopted.

NOTICES

BRITISH Engineering Company with small, well-equipped works and young organisation already established in India requires a General Manager to take over at end of 1951 after one year's training in England. The appointment offers wonderful opportunity for man who has a desire to establish himself and the concern in a leading position. It demands the services of a man with solid engineering background, not necessarily qualified, together with a flair for getting best out of staff and works, and a sales minded approach to clients. Age about 40. High salary and exceptional privileges for right man, who will later have an opportunity to become Managing Director if able to grasp broad aspects of financial control.—Box No. G.3694, Bensons, Kingsway Hall, Kingsway, W.C.2.

Experienced P.R.O. will edit, make-up, produce House Organ, Catalogue, Directory, etc.—Box 548

BRITISH NYLON SPINNERS LIMITED, having planned considerable extension to their Pontypool plant, will shortly be appointing two Senior Executives to take control of large new nylon yarn production units. Candidates for these vacancies should be men of first class education, up to the age of 45, with degree in Engineering or Chemistry, and previous experience of modern production methods and technique in executive position; they should also have full knowledge of cost control and ability to secure maximum machine and labour efficiencies. These are senior posts with salary appropriate to the responsibilities and with considerable scope for advancement.—Write to the Personnel Manager, Pontypool.

INFORMATION bulletins, Journals of Societies or Institutions: Consultant editor and designer will undertake production, layout and finalization of text for printer. Moderate fees. Inquiries invited from Embassies, literary, social and industrial bodies.—Box 547.

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 9, 1950, total ordinary revenue was £45,927,000, against ordinary expenditure of £66,220,000 and issues to sinking funds £290,000. Thus, including sinking fund allocations of £11,561,000 the surplus accrued since April 1st is £76,479,000 compared with a deficit of £43,680,000 for the corresponding period a year ago.

THE ROYAL BANK OF CANADA

Head Office, Montreal
Offices in New York and Paris

Over 730 branches in Canada, the West Indies, Central and South America.

Incorporated in Canada in 1869 with Limited Liability.

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH ESTD. 1825

Branches throughout SCOTLAND

LONDON OFFICES: 37, Nicholas Lane, E.C.4; and 18/20, Regent Street, Piccadilly Circus, W.1.

Every description of Banking Service undertaken

TRADING OR ESTABLISHING in CANADA or the WEST INDIES?

If you are trading with or contemplating establishing a plant in Canada or in the West Indies, we can be of help to you.

Through 330 branches across Canada and 23 in the West Indies, we can provide information on business conditions, exchange regulations, exports and the establishing of branch plants.

Your enquiries will receive prompt and courteous attention.

THE BANK OF NOVA SCOTIA

108 Old Broad Street, London, E.C.2.

Established in Canada in 1832 with limited liability.

CHARTERED Accountants, 30-35 years of age, wishing to widen their experience, are invited to submit application for an appointment of interest and responsibility with a well-known industrial organisation. The post requires good personality and administrative ability and some experience of industry. A University degree would be an advantage. A commencing salary up to £1,500 per annum is offered with excellent prospects of advancement. Full particulars of qualifications and experience should be sent, in confidence, to Box 551.

A DIRECTOR of Research is required to become head of the Research Organisation of a leading Group of Plantation Companies in Malaya. This key post calls for a Scientist with a general training, of which the emphasis is towards Chemistry, Soils, and Plant Physiology. It offers exceptional scope for personal direction and initiation of research of the first importance to industries which are vital to the economy of the sterling area. It will, accordingly, be highly remunerated. Suitably qualified candidates are requested to write, in confidence, with full details of career and qualifications, to Box 644, Dorland Advertising, 18/20, Regent Street, London, S.W.1.

The Economists' Bookshop Ltd.

caters for specialists and students in

THE NATIONAL INSTITUTE OF ECONOMIC AND SOCIAL RESEARCH

Applications are invited for the following appointment to work on the Institute's Location of Industry project, which is officially sponsored. A research worker, salary range £600-£750 in accordance with the successful candidate's experience and qualifications. Appointment will be for one year in the first place with possibility of renewal for a further year. F.S.S.U. provision where appropriate and children's allowances. Good academic qualifications in economics essential and one of the following: (i) first-hand experience of applied economic research; (ii) experience of the problems of industry; (iii) general accountancy experience. The work will involve close contact with Government departments, industrial firms, etc., and it will require considerable travelling, for which suitable provision will be made. Applications in writing, with a statement of qualifications and the names and addresses of not less than two referees, should be made by January 5th to: The Secretary, National Institute of Economic and Social Research, 2, Dean Trench Street, London, S.W.1.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with Limited Liability.)—DIVIDEND NOTICE.—PREFERENCE STOCK.—At a meeting of the Board of Directors held today a final dividend of 2 per cent on the Preference Stock in respect of and from earnings for the year 1950 was declared payable on February 1, 1951, to stockholders of record at 3 p.m. on December 29, 1950. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, December 11, 1950.

CANADIAN PACIFIC RAILWAY COMPANY.—(Incorporated in Canada with Limited Liability.)—DIVIDEND NOTICE.—ORDINARY CAPITAL STOCK.—At a meeting of the Board of Directors held today a final dividend of 4 per cent (one dollar per share) on the Ordinary Capital Stock in respect of the year 1950, was declared payable in Canadian funds on February 28, 1951, to shareholders of record at 3 p.m. on December 29, 1950. The Directors point out that net earnings from railway operations for the year continue to show improvement over last year. Three per cent of the dividend declared today on the Ordinary Capital Stock is attributable to railway operations and 1 per cent to income from other sources. The interim dividend declared in August last was attributable to income from sources other than railway operations and the total dividend for the year is thus at the rate of 6 per cent, one half from each source. In recent years the declaration of the final dividend has not been made until after the close of the year to which the dividend applied. In future, so far as may be possible, an announcement in respect of a final dividend will be made before the close of the year. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, December 11, 1950.

Germans and Russians

TO inquire why it has taken so many wasted months to secure the appointment of General Eisenhower as supreme commander of the forces of the west is to come to the heart of Europe's defence problem as it now presents itself. Let no one imagine that the agreement reached in Brussels last Monday by the Atlantic Pact conference—on this appointment and on the contribution to be made by Western Germany—means anything more than the overcoming of differences between the allies themselves. It does not mean that Europe is any closer to having its 50 divisions than it was last September, when the Atlantic Council agreed it should have an integrated force. Everything practical to that end has still to be done. Nor does it mean that ten German divisions are henceforth available for General Eisenhower. It will be many, many months before the first German "combat team" is equipped and trained to take its place on the frontier of its own country. And it may be many months before any German government can be persuaded to accept the terms for participation in common defence that will soon be offered in Bonn. All that has really happened is that a paper problem of major difficulty has been solved—on paper.

The problem was this. In September Mr Acheson had to tell the other governments of the North Atlantic Treaty Organisation that their plans for rearmament—particularly for infantry divisions—were too modest to convince Congress that Europe would play the major part in organising its own defence. If Congress could not be given convincing evidence, then nothing that Mr Acheson could say would secure the appointment of an American supreme commander, the reinforcement of American troops in Europe and the sending of vast new supplies of arms and equipment. When the utmost that the partners offered to provide by 1952-3 was added up, it fell short of the 50 to 55 divisions regarded as necessary by Nato's own chiefs of staff. This was the shortcoming that drove Mr Acheson, with British support, to press on the French and others his proposal for the limited rearmament of the Germans and their contribution of 10 divisions to the integrated force that would one day exist. And it was this proposal that started the wrangle between the French and their allies about the form that this contribution should take.

For three months Europe has had to sit back and listen, while the arguments flew back and forth: about German brigades versus German battalions, about the rank to be given to German staff officers, about the difference between their integration into a non-existent European army or into a non-existent Atlantic army. Just in time for the Brussels meeting the usual compromise was reached. But meanwhile there had begun among the Germans—who had not been consulted—a most uncompromising argument against making, in present conditions, any contribution at all to western defence. Indeed, these three months have been used to bid up threefold the price of German aid; and the Americans and their allies now find themselves not very far from where they started in September. For the plain fact is that no German

will take rearmament seriously until the risks which it holds for him have been reduced. That is to say, he may be ready to join in defending Western Europe if Western Europe will show beyond any doubt its intention and ability to defend Western Germany—if there stand between the Rhine and the Elbe sufficient divisions to hold an initial thrust from across the Communist frontier. It is true he may make, or his statesmen may make, other conditions—discussed elsewhere in this issue—but his essential demand is for evidence that his western neighbours will stand fast in front as well as behind him. In short, the Germans are asking of Britain, France and their continental partners precisely what the Americans asked of them—a greater effort to give Germany a defensive screen of divisions on the ground. Because the British and Europeans have hesitated, the Americans turned to the Germans ; because the British and Europeans still hesitate, even a Chancellor as shrewd and loyal and patriotic as Dr Adenauer sees himself threatened with political disaster if he presses on parliament the defence programme that will soon be submitted to him.

As if there were not in this situation elements of confusion sufficient to satisfy any member of the Politburo, the Russians have now taken a hand in stirring the pot. Notes delivered in London and Paris during the weekend declare that the part the British and French have played in the Atlantic Pact and in planning German rearmament is a breach of the treaties of alliance signed with the Soviet Union. They arrived in time to be slipped into the brief cases of Ministers leaving for the Brussels conference and, what is more important, to influence the tone of the Notes which Americans, British and French are sending to Moscow this week, suggesting that the talks proposed six weeks ago by the Russians should range beyond the single question of "demilitarizing" Germany. Opinion in France—where consciences are deeply uneasy about German rearmament and where the fear of a "preventive" war by the Russians is widespread—seized at once on the connection of the Russian move with the second rather than the first event.

*

This French reaction should be clearly understood and firmly faced in this country now ; for it will almost certainly gather strength with time, and will play its part in any Foreign Ministers' talks on the causes of world tension that can be arranged. The French argue that the Russians are genuinely frightened that an independent Western Germany, with control of its own forces and arms industries, will rise up as America's main ally in Europe. In the long run, it is said, the Russians cannot take seriously the western talk of integration, of limited rearmament, of maintaining restrictions on arms industries ; for in the long run the Germans will break loose and plan a war of revenge in the east, dragging their allies with them. If the Russians are to stop such a process beginning—argue the French—now is the time, when the west is relatively weak and somewhat divided on this question. In short, to persist with planning a German force of 10 divisions is to run the risk of world war and to wreck the prospect of four-power talks.

Now clearly in this argument there is a kernel of sense and many layers of exaggeration. At no time has it been suggested than an independent Wehrmacht should arise and that Germany's armaments industries should be set up again. On the contrary, the question of keeping the German effort within bounds has been given such attention that three precious months have been wasted in arguing about it, and the chance of getting that effort quickly and willingly has probably been lost. The Russians have no real cause for alarm or complaint, either on the score of broken agreements or of danger to their own security. If they insist on regarding as unfair odds of three Russian divisions to one Atlantic division in Europe—and that is what the Atlantic Pact plan amounts to—then they are going beyond all limits of reasonable complaint. That figure has been chosen precisely to give Europe the bare minimum of security and Russia the minimum of provocation. For Moscow to question this would be to challenge the right of the Atlantic community—and of the whole free world—to adequate self-defence. In fact it has not formally done so, although it has referred to the Atlantic Pact from the first as aggressive.

*

Among all these conflicting arguments, one thing ought to be clear. To hesitate about bringing Germany into the western defence effort—or to appear to hesitate—because of the Russian attitude would be quite fatal. It would be fatal in its effect on the Russians themselves, who would be encouraged to believe that they can at any time hamstring the free world by uttering threats. It would be appeasement in the worst sense of the word. The Russians have no genuine grievance over the arming of Germany—which they did first and are still doing—and it is unlikely that they are now going to change their plans, whether they include war in Europe or not, because of a document signed in Brussels. To hesitate would also be fatal in its effects on the Americans. Mr Attlee has just been to Washington to convince the Americans that there is no thought of appeasement in London and to persuade them that Europe is the vital area. What could more completely undo the good that the Prime Minister's visit did than to attempt to appease the Russians by hesitating over something that is essential to the defence of the vital area ?

On the principle, therefore, there should be no hesitation and no wavering. But so much has been made of the German issue in the last three months that one might almost think that it was the most urgent and most vital part of the western defence effort. It is certainly on the programme ; but it is not the most urgent item. The co-operation of the Germans themselves must first be secured, and the securing of it will involve concessions of freedom and equality to the German government that will require further inter-allied negotiations. These further stages should be speeded up as much as possible ; but they stand between the present agreement and the recruitment of the first German soldier. To have put Germany so much in the forefront has done no good to anybody. It has encouraged the European allies to believe that somebody else is going to do the job for them ; it has enabled the Germans to put up their price ; and it has permitted the Russians to drive a wedge into western solidarity. The task now is to get on as quickly as possible with the job of multiplying American, British, French, Dutch and Belgian divisions, of equipping them and of moving them up to the defence line. That, and that alone, will provide a partnership within which Germans can make loyally and freely the contribution for which they will be asked.

State of Emergency?

THE proclamation by President Truman at the end of last week of a state of emergency in the United States was designed to serve two purposes. The smaller of these was to confer on the President certain legal powers that he will require in the period of mobilisation that lies ahead. The larger purpose was to signalise a climacteric—to make it clear that, in the last few weeks, the United States has crossed the watershed from a state of affairs that was still more peace than war to one that is definitely more war than peace. As a further symbol of the same thing, it is reported that the President is contemplating the offer of two seats in his Cabinet to leading members of the Republican Party—which is as close to a coalition as the Constitution can be driven.

Not unnaturally, the question has arisen whether some formal act corresponding to the proclamation of a state of emergency might not serve a similar purpose in Great Britain. And the talk of a coalition government, which in the present state of the House of Commons is never far below the surface, has welled up with renewed force. There have even been, according to report, for the first time some Labour voices to be heard on this theme—though still in the safety of anonymity.

From the legal point of view, of course, no proclamation is necessary. It is important that Americans should understand why. The reason is not that measures of mobilisation and control of the kind that President Truman is proposing to exercise under his proclamation are thought here to be unnecessary ; the reason is that the powers already exist. It may be that in mobilising a large part of the military reserves of the United States and in setting up machinery for industrial mobilisation, the President has moved further than the British Government in diverting manpower and resources to defence. But the difference is one of policy not of law, for the British Government already possesses—it has never ceased to possess since the crisis of 1940—all the emergency powers which President Truman has now assumed. The British Government could put every ex-officer and soldier back into uniform, commandeer factories, regulate the supply of every raw material, and ration all consumer goods, by a stroke of the administrative pen. Because the framework of wartime regulation was kept in being to serve the ends of the welfare state there is no constitutional necessity to demand a fresh sacrifice of liberty from the British people.

*

But what is the answer to the belief that a country really determined to give first priority to defending itself should give overt proof of its unity by suspending party politics for the duration ? The theoretical arguments for a coalition are unanswerable. It is true that there is already a high degree of unity on matters of defence and foreign policy on the floor of the House of Commons. There is something like a coalition of opinion, but that is not the same as a ministry of all the talents. It is certainly unfortunate that the abilities of the best Conservative politicians should not be harnessed to the service of the state. At a time when only skilful diplomacy offers a chance of staving off a disastrous running war with China, and when only determined leadership can unite the other Asian countries to the West, it is absurd that Mr Eden or Lord Salisbury should not be able to fill the vacuum left by Mr Bevin's ill health. At a time when the morale of Western Europe is visibly sagging for want of confidence, not only in its own military capacity but in the validity of its moral standards, it is tragic that Mr Churchill should not be able to speak with the whole weight of the British Government behind him. The defence quadrumvirate of Mr Shinwell, Lord Hall, Mr Strachey and Mr Henderson could be greatly improved upon by an influx of new blood.

But the practical, political obstacles to a coalition are at the moment almost insurmountable. In the first place, there is the stumbling block of iron and steel nationalisation. The Government has clearly demonstrated that this is the measure of appeasement towards its own left wing that it is not prepared to forgo. It is also the measure which the Conservatives oppose most strongly, with every confidence in the weight—though hardly the enthusiasm—of opinion behind them. The dropping of steel nationalisation would be an essential part of the Conservative price for entering a coalition, and it is a price that the Labour Party will not pay.

Secondly, the nature and the traditions of the Labour Party would make it exceedingly difficult for it to offer to share power with the Conservative Party on terms of near equality. There are many Labour Ministers who can remember from first hand experience the coalition of 1931, when a Labour Prime Minister became a cipher in the hands of the Conservatives. Moreover, there is the immediate danger that a coalition with the Conservatives would split the Labour Party down the middle. There are still a great many Labour members who hate the Tories more than they hate Russia, and there are several dissident and ambitious men, both in the Government and on the back benches, who would be only too pleased to lead a Labour opposition to a coalition government.

If a coalition is not at present a matter of practical politics, what action should the Government take to increase both the appearance and the reality of unity among the British people ? Is it Mr Attlee's duty to dissolve Parliament and hold a new election ? An election involves a month to six weeks of political bickering which would create disunity rather than unity, and, while it lasted, paralyse policy. This heavy price would be worth paying only if there were a reasonable certainty that it would buy something worth having. But there is no certainty that the British people would express such a strong preference for either party as to produce a government with a majority of, say fifty seats. For what the signs are worth, the probable result would be a Conservative majority of a few seats. Such a result would make a coalition more desirable than ever, since a Conservative government with a small majority would not enjoy Mr Attlee's immunity from serious labour trouble. But if the Labour Party will not enter a coalition of which they could be the senior partner, is it likely that they would enter one immediately after being beaten at the polls, as junior partner and for the express purpose of protecting the Tories from the unions ?

On every previous occasion when the question of a coalition has been discussed in these columns, the view has been expressed that it was not only impracticable but also undesirable. The time has come to change that

view. The well-known defects of coalitions still exist; but in our opinion they are outweighed by the gravity of the hour and by the need to use the talents that the Conservatives can deploy in the vital fields of foreign affairs and defence policy, and especially in representing British determination to the world (they have no similar advantage in other fields of government). But unfortunately, in our judgment, a coalition is still as impracticable as ever; and it is as well to be quite clear about the reason, which is that the Labour Party—or enough of its members to determine its policy—still prefers to get what it can out of leading half the nation than to share the duty of leading the whole nation.

It is a very heavy responsibility that the Socialists bear. Almost certainly, public opinion would welcome unity, and it should make its weight felt by every means in its power. Nor should they be left to suppose that there is nothing, short of a coalition, that they can do to create and express the national unity. If they insist on staying in office with the barest majority of the House of Commons and a minority—by all the evidence, a shrinking minority—of the people behind them, let them at least act like a government of the whole nation. If the deferment of steel nationalisation involves too much swallowing of pride, let them eschew any further controversial measures—for example, let the forthcoming budget be what the Americans would call a bipartisan one. Mr Attlee can hardly believe that, in an atmosphere of universal sacrifice, he alone is exempt from the necessity of demonstrating awareness that the times are no longer normal. If he cannot find a clear way to proclaim his readiness to lead the whole nation, then the public will have to proclaim its own state of emergency.

The Trouble With China

MR BEVIN uttered some surprising *obiter dicta* on China in last week's parliamentary debate. He said that the British Government knew, from information available to them, that the Chinese really wanted to stop the fighting in Korea. He also claimed that there was a great field open—"by treating the Chinese people the right way"—for keeping China from lining up permanently with Soviet Russia. These are misleading remarks. There is undoubtedly some truth in both of them, but it would be most dangerous to agree with either at its face value.

The Chinese Communists want peace, certainly—but only on their own terms. The Chinese people have long been hardened to war, having now seen more years of almost continuous fighting than any other nation in the world. In the latest round, they have moved for the first time to a foreign adventure, and with tremendous success. This has followed—like Napoleon's victories after the Directory—a profound revolution at home. These are heady experiences, and there can be little doubt that for the moment the Chinese are even more careless of world peace than the Soviet leaders—who see the glittering prize of world domination at stake in a sense that the Chinese do not.

What, then, are the Chinese terms? There have been many statements by official spokesmen during the past few weeks which show the consistent and increasingly aggressive line taken in Peking. It should have come as no surprise, therefore, when Mr Wu Hsiu-chuan, after two weeks of indirect answers, replied on Saturday to the United Nations' proposals for negotiating a cease-fire in Korea with three specific conditions—evacuation of Korea by the United Nations, abandonment of American protection for Formosa, and a seat at Uno. As far as Korea itself is concerned, the full implication of Chinese views may be gauged from an order of the day, issued after the capture of Pyongyang, by General Lin Piao, now commanding the 4th Field Army in Korea. "Comrades," declared General Lin Piao, "you have turned the tide of the critical military situation in Korea. . . . We hope you will advance heroically in order to bring about the *total annihilation* of the imperialist invaders." In saying "total annihilation" there is no reason whatever to suppose that that is not what the Chinese, in their present mood, mean.

Mr Wu gave full expression to his country's established and uncompromising views when he first arrived in New York. As a major statement of policy, the importance of his opening speech to the Assembly tends to be overlooked. He dwelt on all the main aspects of Chinese political thinking which have often been repeated in the flood of propaganda from Peking. He emphasised, amongst other things, two fundamental themes—that America is the arch enemy and that its aim is to encircle China. In this role, the Americans, he claimed, have taken the place formerly occupied by the Japanese. Here Mr Wu revealed something very deep-seated with the Chinese, when he quoted how

> one of the master-planners of Japanese aggression, Tanaka, once said: "To conquer the world, one must first conquer Asia; to conquer Asia one must first conquer Manchuria and Mongolia; to conquer Manchuria and Mongolia one must first conquer Korea and Formosa."

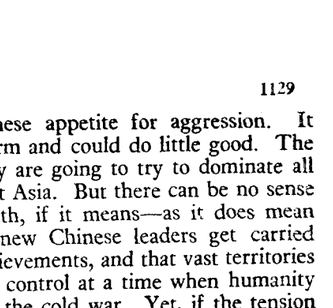
On Saturday, Mr Wu rounded this off by saying flatly that "an aggressor who invades Korea today invariably invades China tomorrow." If this is their belief, it is small wonder that the Chinese will not accept a cease-fire there with the Americans.

To understand the violent anti-Americanism in Peking, few Chinese pronouncements have been more useful than an article two weeks ago in the *Jenmin Jih Pao*, the Peking "People's Daily" or Chinese equivalent of *Pravda*. The article was headed quite simply with the instruction "Hate the United States," and it gave eight reasons for doing so. The Americans "started the war of aggression against Korea" and openly occupied our territory of Formosa. They are increasing the scale of their aggression in Korea every day. Their planes and warships "have incessantly provoked us"—American planes have infringed the Manchurian border many times. They are still aiding our bitter enemy, the bandit Chiang Kai-shek. They have kept us out of Uno. They are rearming the Japanese. They maintain "an immense net of military bases in the Pacific." They try, apart from open aggression, to work against us from the inside.

Last month the *People's Daily* effectively summarised the constant charges of encirclement. "The US imperialists," it said, "are making every effort . . . to retain influence over Tibet so that they may turn it into a military base for further aggression." The "invasion of Korea and . . . intervention in Vietnam are . . . intended to impose a military encirclement of China" in order to prepare "large-scale aggression against China"; for this purpose the Americans have also sent their naval, air and land forces "to invade China's territory of Taiwan" (Formosa). Mr Wu, in his first New York speech, also spoke in these terms, except that he included the Philippines and Japan in the American policy of encirclement. This phobia about encirclement undoubtedly springs from a tremendous new urge to national greatness which has swept through the Chinese people. Many of those who know China best believe that Communism has come to power on the crest of a wave of national rejuvenation. It answers a deep-felt longing for internal unification and reorganisation, which has been growing under the surface for perhaps a generation and which has gained impetus from every successive twist and frustration in the endless fighting of the last decade. The Chinese are a proud people and now they feel they have something to be proud about. Quite apart from being Communist, they mean to dominate Eastern and Southern Asia, and they mean to put an end to the last traces of Western colonialism in their part of the world.

★

If all this is true, it may well be asked what the western powers and the United Nations can do about it. Is Mr Bevin correct in suggesting that China can be won from the arms of Russia by the right sort of treatment? Is there a sound basis, in fact, for any part of the British Far Eastern policy of recognising the Peking government and of supporting its candidature for Uno at this stage? These are hard questions to answer, and it may be—it almost certainly will be—that no conclusive answers to them are produced for several months. Meanwhile, the continuing war in Korea and the pressure of Soviet imperialism force the western powers to make decisions, military, strategic and economic. On what are these decisions to be based?



Several leading facts stand out. Although it is no use crying over spilt milk, there can be little doubt that the Chinese feelings about Korea were less acute last June than they are now. Had Britain and America been able to act together, there might at that time have been some return (though it might have been small) from the policy of recognising the Communist government and proposing its admission to Uno. Equally, there is a chance that one day, given time, it may be possible to detach China from Russia. The national interests of the two countries by no means always coincide and, whether Communist or not, the Chinese have no intention of being dominated by the Russians—already they are wondering whether their size may soon enable them to become the senior partners in the Communist firm.

But neither the past nor the possibilities of the more distant future apply at this moment. All Korea might have been Communist and China would probably have had Formosa by this time if the North Koreans had not attacked in June. As it is, the train of events set in motion by that wanton act has given the United Nations no alternative but to stick to its guns. To retire from Korea, to hand over Formosa and to vote the People's Government into Uno after all that has happened would whet the Chinese appetite for aggression. It would probably do harm and could do little good. The Chinese look as if they are going to try to dominate all of East and South East Asia. But there can be no sense in smoothing their path, if it means—as it does mean at present—that the new Chinese leaders get carried away by their own achievements, and that vast territories fall under Communist control at a time when humanity is split to its roots by the cold war. Yet, if the tension in the Orient could be allowed to slacken a little, the People's Government should certainly be voted into Uno. Not to do so is to deny reality.

Korea remains the key point. At present, the Chinese will almost certainly not tolerate anything but the complete abandonment of all that the United Nations forces set out to achieve when they first landed at Pusan. If the present cease-fire does not work, it has therefore become more essential than ever that some part of these forces should succeed in remaining in Korea until it is possible to arrive at an honourable settlement. How much of Korea should be held is a matter that depends on the military situation, in view of the paramount necessity of not locking up any more of the free world's resources in the Far East—indeed, if possible, of releasing some. But that some part of Korea should be held is imperative.

Whatever happens, it is hard to see that there can now be anything but a painful period of tension and friction in the Far East, lasting at any rate for several months and perhaps for two or three years. The task of the western powers during this time must be to take the edge off Chinese aggressiveness, while always showing themselves ready to talk on a basis of friendly realism.

The Mark that ensured **PROTECTION**

In the early days, the Sun Fire Office used to provide each policy-holder with a special plaque or 'mark' bearing the number of his policy. This was affixed to the insured premises and in the event of fire, the Company's fire-fighters were authorised to extinguish the blaze only after the premises had been identified as being 'Sun Insured.'

Eventually, this practice was discontinued as Public Fire Brigades developed, but for more than two centuries the 'Sun' emblem has been recognised as the symbol of Service and Security to be sought wherever insurance is arranged.

Is Full Employment Secure?—III.

The External Menace

IT was argued in the first two articles of this series that even in a closed economy—a country having no dealings with the outside world and therefore exempt by definition from external disturbances of employment—it is impossible completely to flatten out all fluctuations of activity and at the same time to maintain dynamic progress and free choice of jobs and of consumption. The reason for this is that fluctuations are not caused simply by avoidable instabilities in the monetary system; they are also the fruit of "real" changes in the industrial structure of a developing economy. There is, however, no such thing as a closed economy in the real world—certainly not in the free world—and the history of trade fluctuations shows that, in practice, rapid changes in the external balance of payments of the large trading nations have been a disastrously efficient mechanism for transmitting, and amplifying, those fluctuations across national frontiers. Of course, if it were possible completely to abolish domestically-generated fluctuations, this international aspect of the matter would be less important; every country would simply have to be educated in its duty to stabilise its own economy, and perhaps shown how it can be done. But since domestic fluctuations cannot be wholly abolished the question of international transmission—the "export of unemployment"—becomes very important. One country may have a downswing of activity which, in the context of that country, is not particularly alarming. But suppose that country to be a very large and economically dominant one; suppose it to be so constituted that a slight variation in its total activity is translated into a large variation in its foreign trade; and suppose its currency to be one that is already scarce, or verging on scarcity—and immediately its slight recession becomes a very serious problem for other countries.

There are those who would recognise this combination of phenomena in what happened in the United States in the early part of 1949. The point is disputed. There are others who hold that the effect on other countries of the slight American recession of those months has been greatly exaggerated. But the present argument need not stop to examine the evidence for this particular example; it is enough to establish that the hypothesis is a perfectly reasonable one. Indeed, the discussion of methods of preventing the international transmission of slumps tends to resolve itself into a discussion of how to prevent American depressions from affecting the rest of the world. This is convenient as a means of focusing thought, and it is not wholly unjust, for it is clear in the memory of the present generation that one gigantic depression did originate in America and derived much of its terrible intensity from there. It is not in the least necessary to accept the popular Left-wing view that the natural state of so unregenerately individualist an economy as that of America is one of chronic underemployment and its natural influence on the rest of the world malignantly deflationary. Indeed, the events of early 1949 can be held to show how very rapidly a recession can be cured by an economy that still preserves competition and allows both prices and resources to move. But America has been unstable in the past; and to Europeans at least it seems clear that the American tradition and temperament, both in business and in administration, the American propensity to use both brakes and accelerator suddenly and fiercely, make for sharper divergences from the trend of economic progress than are to be expected elsewhere. There are, of course, compensations to be seen in the high and rapidly rising American standard of living. But though that is a point of very great substance it is beside the point of the present discussion. It is also true that if other nations' economies were less rigid, and the world market less nationalistically fragmented, adjustment would be quicker and easier. But that also does not destroy the thesis; justly or unjustly, the argument about the international transmission of slumps is an argument about how sudden American recessions can be prevented from leading to a sharp cut in American purchases from the rest of the world, to a dollar famine and thence to forced reductions in activity in other countries.

This was certainly the angle of approach of the commission of experts appointed by the United Nations to review the problem, whose report was published in January 1950. Though they did not say so in so many words, they were clearly thinking of the contingency of a slump in America creating an aggravated shortage of dollars. Their main proposal arose logically from this: they proposed that if America, because of trade recession at home, reduced its purchases from other countries, it should make available, through the International Monetary Fund, the dollars it would have spent in the absence of recession. Other countries would then be in no need to cut down their purchases in America, and the spiral need not begin to turn.

The experts' plan is, all too clearly, politically out of the question. At a time of relative depression and rising unemployment, American opinion is likely to demand higher tariffs, stricter customs procedure, a rigid adherence to Buy American rules, and Government economy—or, at all events, concentration of the benefits of government bounty on American recipients—and most unlikely to acquiesce in an unlimited grant of dollars to foreigners.

But there is also a theoretical weakness in the experts' plan. It is a plan for providing more money; it brings the international argument up to the point that the purely domestic argument had reached when the cure for depression was thought to be the printing of more money or the issue of more credit. The domestic argument has long since gone beyond that point because experience has shown that, once the trend has turned downward, the mere provision of more money may be very unsatisfactory. If it works, it may create all those evils of perpetuated disharmony indicated, in the first two articles of this series, as the result of treating "real" internal divergences by purely monetary means. Permanent full employment is not to be secure, internationally or domestically, by permanent inflation. But if this is the likely effect of large doses of extra money, small doses are likely to be quite ineffective: the new money may not be spent but may simply go to satisfy the rising "liquidity preference" of the public. This is the objection to the Uno experts' plan in the international field. The way in which a turn of the tide in America (or—as throughout this argument—in any other country) communicates itself to other countries is not only by the mechanistic channel of a falling off in American imports. It transmits itself much more quickly and, in the initial stages, more effectively by psychological means. When markets turn sour in America, they tend to do so all over the free world. When Uncle Sam says turn, we all turn. In such a bearish climate of opinion, the likeliest effect of making extra dollars available, as under the experts' plan, would be not an increase in spending and a consequent improvement in, or safeguarding of, employment, but a grateful grabbing at the extra liquidity which in such a climate is more valued than goods or the opportunity of profit.

*

It was from the realisation of this that the domestic argument, years ago, moved on to the idea of "public works." Money should not merely be provided, the state should see that it is spent. The next stage should therefore presumably be some international form of "public works"—that is, some projects of international investment that can be held in reserve in good times and put into action when slump impends to ensure that dollars are not merely provided but actually spent.

Here we enter a very shadowy field, in which opinion, even among the economists, has hardly begun to form. There has been plenty of discussion of international investment, but very little of the idea of using that investment as a deliberately contra-cyclical force. It is time that more exploration of the possibilities in this field was put in hand, for they may be considerable. But it is also, unfortunately, clear that there are both practical and theoretical obstacles to overcome. The practical difficulties are of the same nature as those that stand in the path of the experts' plan: a time which is, by definition, one of impending slump is not usually favourable for projects of lending and borrowing. In addition, there are all the disadvantages of public works schemes in general—the difficulty of so timing the preparatory steps of a long-term project as to ensure that the period of maximum expenditure falls at the right time; the difficulty of avoiding on the one hand a wasteful and politically deplorable curtailment of valuable schemes on the upturn, and on the other a frittering away of resources in international boondoggling on the downturn. To work out a policy of "international public works" would call for a degree of intelligent and far-sighted international co-operation which it may be optimistic to expect.

There are also the theoretical difficulties. The basic principle of "public works" is that when private expenditure falls off, public expenditure should be increased to compensate for it—that is, to offset a negative fluctuation in one form of expenditure by a positive fluctuation in another form of expenditure. In so far as the labour and other resources required by the two sorts of expenditure are the same (as when unemployed factory builders are set to building post offices) or can easily be transferred, the idea is workable. But if the labour and other resources cannot be moved, then "public works" simply increase the strains upon the economy. "International public works" might mean, for the United States, that the unemployed in the tobacco and cotton states would have to move into the states that make bulldozers and locomotives—and back again when the emergency passed. It might mean, in the under-developed countries, a similar alternation between, say, rubber growing and railway building. Work so provided, it may be urged, is better than no work at all; but it is a long way short of perfection as a full employment policy.

Again, there is the awkward fact that not all the dollar problems of the world are due to fluctuations in America; some of them are due to the high productivity of American business and the speed with which it exploits technical innovations. The effect of these may look very much like the "export of unemployment"; but if other countries refuse to import this sort of unemployment, they may be refusing to import progress.

It is, in fact, no more possible, in a free and economically progressive world, to find a completely satisfactory solution to the problem of international economic contagion than to prevent the ailment concerned from manifesting itself in the first place. In the one case as in the other, the danger arises of mistaking a situation properly to be met by a readjustment of real resources (uncomfortable though that may be) for one suitable for monetary treatment. In the one case, as in the other, failure to make this distinction and act on it must result in cumulative disharmonies and increased vulnerability for the future. In the one case as in the other, the actual application of monetary techniques, even where these are unmistakably appropriate, is a delicate task to be carried out without benefit of precedent and in the teeth of public ignorance and unrealism. In the international field, moreover, economic therapy is hampered by obstacles having no counterpart within national frontiers; by additional sectionalisms, by defective or defectively integrated machinery, by the sheer frictions of procedure, by the lessened rationality with which people generally tend to regard any question involving their relations with foreigners.

In the catastrophe of the thirties, economic paralysis struck across frontiers with the swiftness of an airborne epidemic, the counter-measures which almost irresistibly suggested themselves were strictly national, completely unco-ordinated, and from the world point of view entirely self-contradictory and destructive. Hope for the future must rest in a reversal of this contrast; in a concerted and mutually sustained international attack on the foci of depression whatever the national economy in which they first appear. There is hope along these lines. There is, certainly, more hope than in the opposite policy of insulation and the *cordon sanitaire*. That policy is not only objectionable in principle, because it would split the free world, but also unworkable, since it would demand controls too complex to be manageable by the administrators and too severe to be tolerable to a free public. But it must be admitted that the working out of effective policies for stability in a free world is still in a very early stage. As in the purely domestic field, the most that the economists can honestly tell the public is that they think they know how to moderate the incidence of a depression and prevent it from developing into a catastrophe, but that they do not yet know how either to prevent it completely or to cure it quickly.

(*To be concluded.*)

NOTES OF THE WEEK

SHAPE

All loyal and confident people in Western Europe and Britain will be glad to see General Eisenhower back, however much they may deplore the passions and events that have made necessary rearmament and the setting up of an integrated force with a Supreme Command. Both his personality and his command recall Shaef—something that worked in an efficient and friendly way. Perhaps even the Russians will remember the restraint shown by this victorious commander during the closing stages of the German campaign of 1945. After all the controversy that has surrounded General MacArthur's policy in the Far East it was not easy for Mr Truman to send forth yet another supreme commander. But he has chosen a man of conspicuous political ability, whose presence is a firm pledge of America's commitment in Europe.

One of his first tasks will doubtless be to streamline the cumbrous planning and executive organisation built up during the last two years. (A sign of that intention is the appointment of a powerful Defence Production Board which is to have an American chairman.) One wonders whether General Eisenhower's powers to overcome such vested interests as exist in the overlapping committees of Nato have been considered and defined. It is true he is to have the assistance of an international staff and that he is formally responsible to the Atlantic Council of twelve Foreign Ministers. But it is difficult to believe that an urgent, secret and effective military job can be done if the Supreme Commander cannot turn to some smaller body for political decisions.

Political problems will arise very quickly; for already national contingents are earmarked to come under his control. More countries are involved than took part in Shaef and all are represented by party governments responsible to parliament—not by weak governments in exile. There will, in fact, have to be some form of political integration at the top of SHAPE. The French suggestion of a European defence minister or the Canadian proposal for a supreme council may not provide all the answers; but they do show awareness of the fact—which Mr Bevin seems reluctant to face—that the planning of strategy and the disposition of troops in foreign countries is a part of foreign policy.

The Excursion of Mr Wu

The visit of the Peking delegation to Lake Success (which came there formally for the purpose, not of discussing Korea, but of pressing the Peking Government's accusation against the United States of aggression against Formosa) has not yet produced any cessation of hostilities in the Far East. It was, indeed, excessively optimistic to expect that the Chinese Communists, in the middle of a victorious military advance in Korea, with China suffering no retaliation for its audacious assault on the forces of the United Nations, would be ready for a cease-fire with no political conditions attached. The Chinese wanted a guarantee of the fruits of victory (including products of all the orchards of the Far East and not merely of Korea) if they were to desist from battering the army of the United Nations. The hope that the Chinese would be willing to stop fighting, merely to leave the field open for diplomatic negotiations, proved groundless. So on December 17th, after the Assembly had passed by 52 votes to 5 (with the Soviet bloc opposing) a resolution proposing an armistice without specified political conditions, Mr Wu announced that he and his delegation were returning to Peking. Meanwhile the Assembly's truce committee, consisting of the President of the Assembly, Mr Entezam of Persia, Sir Benegal Rau of India and Mr Lester Pearson, the Canadian Minister of External Affairs, let it be known that they would continue efforts at mediation, and were prepared to go to Peking if necessary.

Mr Wu's utterances at Lake Success were in general characterised by great bitterness and arrogance. His visit has certainly been a disappointment to those who hoped that to refrain from retaliation against China would induce a conciliatory mood on the Chinese side and that the presence of Peking delegates at Lake Success would facilitate a quick settlement. The Chinese, however, are deserving of some sympathy in that they have taken their stand on the well-established principle that it is the business of the victors in war to dictate terms and of the vanquished to accept them if they have no stomach for further fighting. So long as this attitude lasts, it makes a bargain impossible—unless, indeed, the United States and its allies were so resolved to avoid further fighting that they were ready in effect to capitulate to China's demands.

There is no such willingness. Nor should there be. It is not merely that the western peoples do not like seeing their troops defeated. It is even more an unwillingness to see the authority of the United Nations overturned by force just after it had been for the first time triumphantly asserted and vindicated at the cost of more than 30,000 (mainly American) casualties. The Chinese Communists, who see the United Nations as a mere instrument of American imperialism, may not believe this—nor is it much appreciated in Britain, where zeal for the United Nations has never equalled the enthusiasm for the League which existed at the time of the sanctions against Italy in 1935. Many Americans, however, realise that if a settlement on Korea, negotiated under Chinese duress, undoes the Uno decisions which the Korean campaign was fought to enforce, it is the end of Uno as an international authority.

Teeth and Monopoly

The members of the Monopolies and Restrictive Practices Commission were appointed twenty-three months ago. Their first (and, as an isolated study, admirable) report, on the supply of dental goods, was published last week. (HM Stationery Office, 3s. 6d.) It is distressing confirmation that the piecemeal investigation of monopoly practices, trade association by trade association, will never have many teeth.

The Association of Dental Manufacturers and Traders is concerned to maintain manufacturers' resale prices and thereby to limit competition between dealers. Its main sanctions are exclusive dealing and the collective boycott. The commission's analysis of their operation is discussed, with other aspects of the report, in an article on page 1156. The commission has no doubt that these practices have in the dental trade worked against the public interest. But they are restrictions of competition different only in degree, not in kind, from those used in many other industries. Even the difference of degree is probably in practice small. The dental trade is more tightly organised than most, but the commission did not find "any very great abuse" of the association's wide powers. The same verdict would probably be widely applicable. Because of the fear of public opinion, monopoly power is more discreetly used the greater it is; in other words, competition is little more limited in the dental trade than in many others, which are, superficially, much further from being "closed shops."

What the commission has shown, therefore, is that there is no case for legislation against restrictive practices in the dental trade that is not also a case for legislation against similar practices in a very large part of British industry. Two members of the commission explicitly recognise this point—which is, in effect, that the commission can do nothing of practical importance until the Government itself makes up its mind on the issue of principle. Mr Wilson has attempted to show some enthusiasm for the attack on monopoly by increasing the commission's membership from eight to ten, with the object of speeding up its enquiries. It is hard to see in this anything but an attempt to avoid the awkward question. The acceleration means that in a year's time the commission will have completed inquiries into six trades. The practical position will then be just what it is now. It would be no fairer or more reasonable to legislate for six (or fewer) individual cases than for one.

The only effective weapon against monopoly is a general prohibition of such practices as the collective boycott. But it is unfortunately significant that the dental trade association found that its restrictive aims could be furthered by registering itself as a trade union. It requires some idealism to think that the embarrassments of a vigorous campaign against the trade associations can be faced by a Government that dare not attack restrictive union practices—and that has been busy establishing exclusive trading by nationalisation.

Appealing from Tribunals

The decision of a King's Bench Divisional Court last week in the case of *Rex* v. *Northumberland Claims Appeal Tribunal* may have a considerable influence in restoring the rights of the recognised courts to review decisions made by administrative tribunals. The facts in this case were that a Mr Shaw, a local government servant, held both the offices of clerk to a local district council and clerk to a joint hospital board from 1936 until 1949, when the joint hospital board was replaced under the National Health Service Act. He claimed compensation for loss of office based on his total length of service in local government. The appeal tribunal awarded him compensation based on his length of service with the joint hospital board only, so he took his case to the High Court. The court was asked to decide, first, if the applicant's claim was justified under the regulations, and secondly—a point of much wider interest—whether the applicant had any right of appeal to the High Court at all. None was given by statute.

The High Court decided that it was competent to hear the appeal. The importance of that decision is that, in making it, the court had to find a way round (called "distinguishing") an earlier decision which stood in the way. In 1944 the Court of Appeal held that when a tribunal has been set up by statute and the statute gives no right of appeal to the High Court, the High Court has no jurisdiction over the decisions of that tribunal. Last week's decision is to the effect that, when a tribunal of this kind bases its decision on an interpretation of the law (as the Northumberland Claims Appeal Tribunal had), the High Court has power to review that decision and, if it considered the tribunal's view of the law to be wrong, to quash it. That it did in the case of Mr Shaw's application.

This decision does not open the door to appeals to the High Court from every administrative tribunal in all circumstances. But it does mean that, if the tribunal is required to base its decision on a view of the law, and if it gives its reasons when making that decision, the result is a matter which the High Court can review. The Lord Chief Justice concluded his judgment with the words: "It was very beneficial that they should do so because, now that many tribunals had been set up by various statutes, and they all desired to do their duty, it must be for their benefit that the Divisional Court should be able to give guidance to them."

Twin Notes from Moscow

The Russian Notes presented in Paris and London last weekend are, apart from minor variants in wording, identical twins. Considering the difference in strength and morale between France and Britain at the moment that fact is quite remarkable. Also remarkable is the restrained wording of the Notes and their timing, which is discussed in a leading article elsewhere. As this "correct" and skilful presentation of the Russian case against German rearmament is clearly intended for future propaganda use—as well as for formal diplomatic purposes—it is important to examine just what it says.

Britain and France are being addressed as allies of the Soviet Union under treaties signed respectively in 1942 and 1944. The occasion and the purpose of those treaties were provided by the need to crush the military power of Germany; but they also contain general undertakings about co-operation in the postwar world which have been flagrantly disregarded by Moscow. The Notes say that "the restoration of the German army in the western part of Germany" is "undermining the foundations and significance" of these treaties. And they also allege that German rearmament in any form is a breach of Potsdam. The Notes seem to show more concern about the future than the present. They emphasise that to allow the West German army to comprise one-fifth of the Atlantic force

> opens the gates for a predominant place, in the future, of the West German army among the armed forces of the West European countries.

They accuse German politicians of talking about "preparations for a new war in Europe" and of preparing to demand heavy armaments, the restoration of the General Staff and the restoration of war industry. All this amounts to "a serious threat to peace"; and the Notes end with a declaration that the "entire responsibility for the situation created" rests with the Government addressed.

These Notes will be seriously examined in the context of other Russian statements about German rearmament. But two things may be said about them now: the first is that their account of the causes and nature of what is being done to get Western Germany defended is exaggerated and untrue. The second is that the Notes are tuned into the wavelength of the peace campaign, the neutralists, the anti-Americans, and all who refuse to face the bleak facts of the cold war.

* * *

Deadlock in Bonn

The western Foreign Ministers, busy with Atlantic Pact matters and arranging a meeting with the Soviet Union, are still leaving Dr Adenauer in the corridor, adequately informed through the High Commissioners, but outside the discussions on Germany's fate. But the Germans no longer accept this treatment, and they are using the weapon of passive resistance, fortified by clamant protests.

A deadlock has been reached over the revised Occupation Statute which will only be resolved if, as appears possible, the Brussels meeting throws over the whole occupation system. It is obviously to the Germans' advantage to delay acceptance. They may be accused of blackmailing the western powers; but the concessions offered to them in the revised Occupation Statute were out of keeping with the new conception of Germany as an ally, as were the two provisos attached to them. The Germans retort that the occupation authorities are blackmailing them by making these two provisos: that Bonn should assume liability for the Reich debts, and guarantee to make raw materials available for export.

As it stands, the Foreign Affairs Committee of the *Bundestag* has refused to allow Dr Adenauer to sign a blank cheque for the Reich debts, and the *Bundestag* itself would

certainly do the same. In the background, the vociferous Dr Schumacher is warning the Chancellor not to oppose "the people's will" in the matter, and influential voices are heard demanding that against the Reich debts should be set the German assets abroad which have been confiscated as reparations. Tactlessly it is also being argued that Germany should not be even formally debited with all the relief received from American and British funds, because the Hague Convention stipulates that the people of occupied territories must be fed. Last week, the Bonn Minister of Finance, Dr Schaeffer, announcing the long-delayed Bill for equalising war losses among German citizens, made the gratuitously irritating statement that this share-out represented a German contribution to defence. The Germans have a way of making matters difficult for their friends by using such arguments.

The second proviso attached to the Occupation Statute has developed into the practical question of the Ruhr's coal and coke exports. Dr Erhard has fought to have the current quota reduced by 500,000 tons, and has succeeded in inducing the High Commission to recommend to the Ruhr Authority that 300,000 tons should be cut from December exports. For the next quarter, the Germans are ready to sell abroad only 5,000,000 tons instead of the 6,800,000 tons which the Ruhr Authority wishes to allocate. "Crises" in Germany are almost invariably exaggerated and inefficiently handled, the present coal shortage being no exception. Moreover, it may be argued that, while Germany is making no other defence effort, it should not have the same freedom as Britain to cut its coal exports. Nevertheless, it is clear that arguments will have little effect on the Germans in their present mood. Their demands for equality can most safely be met by abolishing the Ruhr Authority as soon as the Schuman Plan is in operation.

* * *

Uncertainty in East Africa

The statement on East Africa, made by the Secretary of State for the Colonies in Parliament last week, was intended to dispel the "growing uncertainty" of which Mr Griffiths has now become aware. The uncertainty largely springs from the European population. They are afraid lest too much power will be given too quickly to the Africans and that their own position in the dependencies will in consequence become untenable. The Africans, on the other hand, or at least the few of them who are politically conscious, are uncertain lest, in an attempt to defend themselves, the Europeans in the three dependencies should link up with each other and attempt to make Kenya, Tanganyika and Uganda into a self-governing colony on the Southern Rhodesian model.

It hardly needs saying that the fears of both populations are quite unjustified. Whatever may be happening in West Africa, there is no sign that the British Government is pushing on too fast with African political advancement in East Africa. Direct African representation on a legislative council which is still predominantly European in membership, and still has a large official element, is as far as policy has gone as yet. Similarly, there are few signs of the settlers in Kenya and Tanganyika making common cause. There are good economic reasons for a federation of the three territories, but its achievement is remote. Nevertheless, uneasiness and mutual suspicion, however unjustified, persist; and the interracial distrust is further complicated by the presence of the Indian, who is strongly entrenched in all three territories.

In East Africa Mr Griffiths's statement appears to have been received with cautious approval. In fact, however, it contains nothing new. He reaffirmed the ultimate objective of colonial policy in East Africa—self-government within the Commonwealth. He declared that in promoting that aim the proper rights and interests of all the different communities must be safeguarded—here, perhaps, the essence of the declaration lies in the word "proper"—and that the Africans must be educated, and their resources developed, to fit them to play their full part in the political and economic life of the territories. In the meantime, ultimate control will continue to be exercised by the British Government. In other, blunter, words, self-government is something for the very distant future. Perhaps the realisation of this will help to relieve the tension.

* * *

"A National Scandal"

Mr Bevan ought not to have been so ready to denounce as "quite disgraceful" the views of a committee of the British Medical Association, which described the "inadequacy of the present provision for the diagnosis, treatment, and aftercare of tuberculosis in this country" as a "national scandal." For ever since the health service was introduced, his Ministry has been strangely negative in its response to any suggestions for improvements.

It was not until this summer that a circular was sent to regional boards and management committees asking them to set aside beds for tuberculous patients—and in the meantime the waiting list for institutional treatment had grown to 11,000. The salaries of the chest physicians, the old tuberculosis officers of the local authorities writ large, are often reduced by the regional boards in respect of the prevention and afterecare work they do for local authorities, although in tuberculosis this work is as important as the actual treatment. The London County Council's proposal to establish a hostel for chronic infectious cases, 160 of whom are sleeping in common lodging houses, was turned down as too expensive—by a Minister who could sanction the free grant of notepaper, toothpaste and soap to patients in general hospitals. Before the health service was introduced, some local authorities used to contribute towards the cost of sanatorium treatment in Switzerland if a bed could not be found for a patient in their areas. Until very recently, Mr. Bevan flatly refused to allow the cost of treatment in Switzerland to be met from health service funds, although it would be little if anything higher than the cost of sanatorium treatment in this country. In its attitude towards BCG vaccination (that is, vaccination with the Bacillus Calmette Guérin, which in other countries is claimed to be successful in promoting immunity to the disease) the Ministry of Health has been conspicuously unenthusiastic.

What is also startling is that Mr Bevan should apparently consider it wrong for anyone to criticise strongly this branch of the health service. He must have known that that is an inevitable result of taking the responsibility for a service like this, or at least a large part of it, out of the hands of local authorities. Divide—and criticism is weakened. But centralise the service in a Government department, against whom the pressure of public opinion and parliamentary questioning can be brought to bear, and all the weak spots are given publicity. The chief architect of the National Health Service Act has only himself to blame that this has happened over tuberculosis.

National Parks in the Chrysalis Stage

The National Parks Commission, whose first report was published recently (HMSO, 4d.), has selected the Peak District, the Lake District, and Snowdonia as the first three national parks to be established. When the boundaries have been finally drawn, the management of each park will be entrusted to a joint planning board of the local authorities. The commission, however, will continue to give advice both locally and centrally. Meanwhile, it has its work cut out in shielding potential parks and other areas of natural beauty from too much development. It wisely recognises that so large a part of Britain cannot be sterilised from economic growth; but its optimism about achieving a satisfactory compromise between "amenity" and "enterprise" has still to be justified.

The commission's report includes "a few examples" of questions about development which it has handled. They give a misleading and patchy picture. The commission ought to tell the public what is happening in each potential park, especially as their problems differ so widely. The Lakes and the Peak, for instance, could be quickly spoiled in many ways and the closest control is desirable. The Pembrokeshire coast is chiefly in danger from the Service Departments and the South Downs from unsightly building. Recently, Dartmoor and the Brecon Beacons have also become the goals of Service Departments; Snowdonia is in danger from a formidable hydro-electric scheme. Some public bodies—the Forestry Commission, for instance—are co-operating quite well with the planning authorities; but the British Electricity Authority has still to show its regard for aesthetic values, and the Service Departments are the least accommodating of land users.

The commission will also have difficulty in reconciling its two objectives of preserving natural beauty and improving public access. Which is the more important? Available funds are limited. Is it better in the Lake District to subsidise the putting underground of electricity cables or the provision of cheap accommodation? The amenity societies will say the former, but the inhabitants of Manchester may disagree. In any event it would be farcical to make into a national park any area where neither of these purposes can be effectively pursued, which may prove to be the case with some of those on the original Hobhouse list. Perhaps during 1951 the commission will acquire enough authority to nurse at least some of its charges effectively.

Riots in Singapore

The only comforting thing to be said about the recent riots over the Bertha Hertogh case in Singapore is that they were not caused by the Communists. On the other hand, in much more than a hundred years of British rule over this city, there have never been such racial or religious disturbances in peacetime; casualties were reported as 15 dead and over 200 injured. It is a portent of the times, therefore, that even such a dangerously inflammable religious issue as the Hertogh case should have set fire to such a large section of the Singapore mob for so long. Rightly or wrongly, the Asian now senses that the white man is on his way out in the east, and he therefore acts aggressively on slight pretexts. In Singapore, the most serious aspect of all was the way in which the police—predominantly made up of Malays—showed such sympathies with the rioters as to perform their duties no more than perfunctorily at the height of the city's crisis. Hitherto, this smart and highly efficient force has been one of the foundations on which the administration of the colony has been built.

The case itself began some months ago when Mrs. Hertogh, whose home is now in Holland, claimed that a thirteen-year-old girl found in a Malay village was her daughter Bertha, whom she had entrusted to Che Aminah, a Malay nurse during the Japanese invasion in 1942. Che Aminah, who had acted as a devoted foster-mother, treated the child as her own and undoubtedly saved her life, refused to part with Bertha. When the case was first heard, a ruling was given in favour of Che Aminah. Mrs. Hertogh has six other children and Bertha, for the time being at least, preferred her Malay foster-mother to her real mother; there was therefore much sympathy with the court's decision. Che Aminah, however, then suddenly ruined her own moral case by giving Bertha in child marriage to a young Moslem teacher of twenty-two. On appeal, Mrs Hertogh had the verdict reversed last week by the Singapore Supreme Court and took Bertha back to Holland by air. Singapore is now returning uneasily to normal but apparently may have to face another critical period when a final decision in the Hertogh case is given in March.

Public opinion in every community in the colony hopes, meanwhile, that inquiry into the handling of last week's riots will be thorough. Singapore is a dapper, prosperous seaport, a key point in the strategy of the Far East and a show place in Britain's colonial empire. Neither the British nor the Singapore Government can afford to see the tragic events of last week repeated.

Patel—Pupil of Gandhi

The death, at the age of 75, of India's Deputy Prime Minister, Sardar Vallabhbhai Patel, must be linked with the passing of Gandhi as marking the end of the epoch in which India won independence. Of the great triumvirate, there is now only Mr Nehru left, and he is overworking to a degree which gives reality to talk of his resignation in the months ahead. Inside the Cabinet, the death of Mr Patel at present unbalances the political front in favour of the Left—and who, besides, can take his place as a firm home minister? The moment has come when the new India must throw up its next generation of leaders or see a decline from the eminence which it has attained in world affairs.

*

Our correspondent in India writes as follows:—Sardar Patel waited to die until his battle was nearly won. He had organised the Congress for Gandhi, he had remapped India, he had preserved its iron frame—the administration—he had limited the drift to the Left, he had knocked sense into the heads of the less responsible ministers, he had eased the transition for zemindars and rulers. The reconciliation of the Right, the return from revolution to stability was above all his handiwork. He had so successfully taken upon himself the drudgeries of everyday administration that Mr Nehru could immerse himself in foreign affairs without qualms. But he had not had time to shame and bully his own backbenchers into a responsible and cohesive policy for the coming elections.

Patel's devotion to Gandhi never obscured his vision of the possible and the necessary. No greater tribute can be paid to his magistral acumen than the devotion and respect he induced in his administrators—many of whom had viewed his coming into office with profound misgivings because of his reputation for vindictiveness. He was one of the few to realise that the government machine, like any other, must be oiled in order to work. Indeed, to the Services his death is that of a personal friend who was always impartial, yet fought their battles for them to the bitter end. The Princes, too,

We regret . . . .

to announce that the first printing of THE ECONOMIST DIARY 1951 *is sold out. A second printing is now in preparation and copies will be available in January.*

We suggest . . . .

that those who have been unable to obtain diaries should apply for copies from the second printing. Post-free price: U.K., 37/6*d.*; *Overseas*, 32/6*d.* THE ECONOMIST DIARY, 22 RYDER ST., LONDON, S.W.1.

have lost in him the only man whose shrewd sense of the historical process enabled him to make concessions in order to preserve peace. The integration of the States was carried out in a few months because Patel sympathised with the needs and ideas of the Right, although he was fundamentally the pre-1914 Lloyd George Liberal. It was he, for instance, who fought for adult franchise. How complete a Liberal he was emerges in his comment about some of his colleagues on the electoral committee: "The trouble with them is that they are not democrats; *I* trust the electorate."

* * *

Hospital Establishments

The position of the hospital registrars was raised in the House of Commons last week on the adjournment, and for the first time Mr Bevan was able to present his case at length. The greater part of his speech was devoted to a defence of his circular, which asks regional boards and boards of governors to make big reductions in their establishments of registrars. The opposition within the medical profession aroused by this circular is best measured by the fact that even the Socialist Medical Association has asked for its immediate withdrawal.

There are very few who will disagree with Mr Bevan when he says that the number of registrars in training for consultant posts should in future be closely related to the number of consultant posts likely to be available. Disagreement arises when this principle is applied, without warning and without agreements, to the present body of registrars who are told, in effect, to join the armed forces or the colonial service when they lose their jobs. There is even greater disagreement over the effect a wholesale reduction in registrars will have on the work of the hospitals. In last week's debate, the chairman of the North-West Metropolitan Regional Board said that 400 hospital beds might have to be closed in that region unless persons as skilled as the registrars can be found to undertake the work.

This points to the way out of the difficulty. Why should registrars be considered solely as consultants in training, who must leave the hospital service altogether if the luck of a consultant vacancy passes them by? Is there not a case for having another grade of hospital doctor between registrar and consultant? The medical profession's representatives objected to the widespread employment of the grade called "senior hospital medical officers" because they considered it a ministerial ruse for obtaining a consultant service on the cheap. Present circumstances may persuade them to change their mind. Mr Bevan, in the concluding sentences of his speech, hinted at a solution of this sort. If he is wise, he will withdraw the circular until his teams have completed their reviews of hospital establishments, and then look at the whole matter again in co-operation with the representatives of the profession and the hospital authorities. He may then achieve what he wants without creating such anger and discontent.

* * *

Students after Conscription

There could scarcely be a more crushing indictment of national service as it now operates than was given from the platform and the floor at the conference of the Universities in Great Britain held in London last weekend. It is rare for this annual gathering to generate so much heat. No one questioned the necessity for national service; its potential value for widening and maturing experience was widely accepted. The criticism was of the boredom, the dissipation of enterprise, and the demoralising atmosphere of inadequate training. The defects are not only in the services. The attitude of parents was also condemned. What boy is likely to make the most of his period of service, if his parents imply that it is a waste of time, and suggest that he should use as much as possible of his energy for studying what he will subsequently do at the university?

The practical question was whether boys should do their national service before or after going to the university. The differences of opinion are considerable. In a few subjects, such as classics and mathematics, a facility may be permanently lost if a gap of 18 months or two years intervenes between school and university; but many students can make better use of their university years if they have gone first from school to the services. So, at least, it should be. But Mr T. R. Henn, senior tutor of St. Catharine's College, Cambridge, claimed that in practice the effect of national service was often quite the reverse; students arrived from their service period bored and frustrated. They then started on their university courses with a heavy disadvantage.

Part of the criticism is no doubt exaggerated; conditions vary from place to place and the experience of some conscripts, particularly those who go abroad, is much better. The reactions of university students may also not be typical of the whole. But the criticism was too nearly unanimous for the services to ignore it. They have further reasons for self-examination. It is from the conscripts that they must recruit their regulars and from the university conscripts many of their best officers. If they cannot create a better impression at the start, regular recruitment is doomed.

* * *

Conspicuous Consumption

It is hard to share the enthusiasm of the officials of the BBC about the corporation's plans for extending the range and scope of television. Sir William Haley, the director-general, announced last week that over the next three years the corporation will spend £4,250,000 on capital investment, in the building of new stations and studios. In 1954—that is, thirty years before Nineteen Eighty-Four—85 per cent of the population will be able to enjoy the sight of television, and it is estimated that there will be a million and a half sets in operation by the spring of 1953. At the same time, £750,000 is to be spent on research for colour television.

It is very difficult to see the justification for such an extensive programme. Four million pounds is a great deal of money, even in relation to the budgets of other public corporations. But it is no measure of the demands which an extended television coverage will make upon the country's most precious resources, since television broadcasting involves the use of metals and electronic gear needed for defence. Moreover, the sums to be spent by the BBC are only a fraction of the expenditure of the community as a whole, if it is true that a million extra sets are to come into use within the next two years. It is difficult to believe that the production of television sets will not soon collide with the demands for expanded production of radar equipment.

The reason why the BBC—and the Government—are prepared to make such a tremendous effort to extend the scope of television is clearly because television has become the recreation of "the people." Before the war television was a diversion for the rich, but by about 1948 the lower income groups were acquiring sets at a much faster rate than the middle income groups; at the present day 68 per cent of the holders of television licences are said to earn less than £12 10s. a week. Indeed, the speed with which television aerials are appearing above the roofs of the rent-controlled houses in almost every working class area in London and the Midlands would make the late Mr Thorstein Veblen ponder whether his theory of "conspicuous consumption" should not be stood on its head. There would be virtue in this if it could be believed, as enthusiasts argue, that television was in fact bringing the arts and the world into hitherto mentally shuttered homes. In fact it is at the moment merely a novelty gadget, and as Mr Robert Silvey, the head of the BBC's audience research, concluded in a recent paper to the Manchester Statistical Society, "the extent to which TV is watched appears to depend only to a limited extent upon the nature of the programme transmitted."

* * *

The Turks and Collective Security

"Stir up trouble between the western allies" is the most constant of Communist propaganda directives, and is quite often successful. It has just been tried, with singular non-success, between the Americans and the Turks. The party line was to exploit Turkish losses in Korea, which have been high in proportion to the number of Turks engaged. "The United States units on the Turkish flank retreated without informing their commander and left the Turks to their fate"—this is a typical example of the statements made.

Nothing is further from the truth. The Turks are one of the very few non-Anglo-Saxon nations who took sufficiently seriously their duties under the UN Charter to equip a fighting unit and to deliver it at a Korean port. A Turkish brigade 4,500 strong sailed in September. Between November 26th and 30th it was thrown in to stem a breach in north-west Korea. For two days it fought against six divisions. Fighting next to a British regiment, which saw and appreciated its valour, it took its turn to serve as rear-guard on the retreat down the road to Sunchon. It lost over 1,000 men.

The Turks feel no resentment about the stroke of fortune which assigned them these tasks. They are a nation with a strong military tradition, full of the names and dates of fights in tight corners and casualties far from home. The radio programme which they are relaying to their troops in Korea is proof of their stolidity and quality. "We acted in accordance with our sovereign capacity as a nation which fulfils its obligations." "More men are volunteering at home."

It is true that there has been a party quarrel in Parliament over the procedure whereby the decision to send troops was taken. As in the United States, a declaration of war is the prerogative of Parliament. The cabinet, treating the UN "request" as President Truman treated it, decided that Parliamentary permission was not necessary. The opposition motion querying this decision has been defeated. What is more, the great majority of Turks—knowing the Russians as they do—are constantly exhorting their western allies to take a firmer line. To their minds, President Truman's declaration of a state of emergency was an end to a "false policy" of appeasement. "War is the kind of evil which pursues people who flee from it." Part of the explanation of this staunch attitude lies in centuries of experience of Russian bullying; part is that the Turks have immediately at their backs a social revolution which started as long ago as 1923 and which leaves little room for communist yearnings.

* * *

"For the Defence of Peace"

A new manifestation of the Cominform's "peace campaign" is now appearing in eastern Europe. In answer to the Warsaw "peace" congress's request that "warmongering" should be made a punishable offence, the parliaments of eastern Europe are obediently affixing their rubber stamp to laws "for the defence of peace." The Hungarian, Roumanian and East German parliaments have so far obliged and, at the time of writing, the Czechoslovak assembly is discussing the matter at a special session. These laws are said to be inspired by honest indignation at the "US war hysteria" and by a determination to stamp out what the Cominform Journal calls "the evil gospel of the frantic savages who scream that the time has come to exterminate the civil population."

These laws amount to nothing more than a grand propaganda gesture. Few individuals in eastern Europe will be so foolhardy as to suggest openly that the western powers are justified in building up their defences—even if they should be sufficiently immune to Communist propaganda really to believe this. And the east European governments, unlike those of the west, are under no compulsion to explain and justify to their people their own defence measures.

But in Eastern Germany the law has more sinister implications. It inflicts the death penalty on those guilty of warmongering on behalf of any warmongering state (i.e. the United States). It inflicts hard labour on anyone who "recruits Germans to participate in belligerent actions" (the preamble makes it clear that this does not apply to the "people's police"). Finally, it is said to apply to all Germans whether they live in Eastern or Western Germany. This means that the Federal Chancellor, the Mayor of West Berlin, all officials of the Bonn Government, and all Germans who may join any sort of defence force—to mention only the most obvious—will be liable to severe penalties, including death, if they are caught by the East German Government. The law is clearly designed to confuse the German people still further over the question of their own rearmament and to paralyse any efforts to build up the Federal Republic's defences. There need be no fear that Dr Adenauer or Herr Reuter will allow their actions to be affected by it. But the people of the Federal Republic are acutely conscious that they could be overrun by the Red Army in a few days, and unless they receive strong and resolute leadership this law may prove a cunning device to sap their will to resist aggression.

The President's Message

The Message does not convey the impression that the President is one of the intellectual giants of the age . . . Mr Fillmore claims to be a considerate and a just man, but he seems to have left his love of justice in the court where he practises so skilfully as a lawyer, and to discard it from the White House, where, to the injury of his reputation as a man and as a politician, he proposes to tax all the rest of the community for the advantage of certain manufacturers. . . . A great question has now been discussed in civilised society, more or less continually for nearly a century—namely, "How far a Government can promote national welfare by undertaking to influence production by bounties and duties;" and . . . experience year after year has confirmed the opinion that Government invariably does mischief by any such undertakings; and without saying one word to disprove or explain differently the records of experience . . . he goes forward from sentence to sentence, recommending this interference, proposing that undertaking—at one time condemning monopolies which do not and cannot exist, and at another proposing to create them—pretending in one sentence to guard labourers against capitalists, and then taxing them to enrich the class he stigmatises—distinctly proving, we think, that compared to the mighty subject he pretends to grasp, the intellect of Mr Fillmore is small and weak. The foreign policy of the Message, as far as we have observed, is unexceptionable. . . . It is humane, peaceful, and comprehensive. But the domestic policy—cockering up the several interests of the nation for contradictory and often-refuted reasons—is contemptible. It is a bundle of the smallest expedients we ever saw collected together . . . If the great spirit of Franklin, who described a Legislative Assembly regulating trade as the greatest fool on earth; or the bold and vigorous mind of Jefferson, be permitted to know what Mr Fillmore proposes, it must be overcome by surprise, if not by scorn and disdain, at the puerile schemes which Washington's successor borrows from the effete and discarded practices of the European statesmen of the last century.

Letters to the Editor

Controls for Father Christmas

Sir,—In many department stores at this time of year there are toy fairs, presided over by Father Christmas. In some there are notices to the following effect:

"Queue here to shake hands with Father Christmas (when operating)."

On the face of it, sound; fair shares and a reasonable working week are guaranteed. But the scheme should be rounded off by arrangements to deal with its disciplinary and incentive aspects. I suggest an impartial panel of bachelors and spinsters, administering a system of disincentives (e.g., postponement of presents till Christmas, 1952), for children adjudged guilty of (*a*) absenteeism, (*b*) queue-jumping; and a range of incentive inducements (e.g., a banana or a pool ticket) for children displaying (*a*) patient queuemanship, (*b*) kindness to lost parents.

There remains the problem of the child who, on reaching the head of the queue, kicks Father Christmas on the shins. Advanced penological thought would indicate that the most suitable corrective would be for the delinquent to be convinced (by an approved psychiatrist) that Father Christmas does not exist.—Yours faithfully,

JASPER ROOTHAM

London, N.1

Transport in Trouble

Sir,—I should be glad if you would allow me to reply to Mr George Morton's letter.

Mr Morton states that the costs of running their docks were well known to the railway companies from 1928 onwards. I can only say from my own experience that I know it to be almost impossible accurately to ascertain the individual costs of two closely integrated businesses. Bearing in mind the fact that the railway-owned docks were treated as adjuncts to the railway systems I find it difficult to believe that, however carefully the accounts were kept, the costings were not based largely upon assumptions; for the connection between the two undertakings was very intimate and many services were jointly performed. I believe that only the complete separation envisaged by the framers of the 1945 Transport Act has made it possible to give the actual cost of running our docks, to which traders and others interested were entitled.

The maintenance and improvement of some of the railway-owned docks was seriously hampered by lack of capital. The Port of Hull provides a good example of what can happen when a great port has to be treated as an adjunct to a railway system. It will take years to catch up arrears and to raise this port to standards commensurate with its importance as a trade harbour.

With regard to the canals, I know how often boats could be loaded only to a proportion of their normal capacity and even then had frequently to be hauled over patches of mud by means of a snatch block. It is not to be wondered at that, with the movement of canal boats so hampered at strategic points in the system, traffic was dwindling and did not revive even under the peak transport demands of the last war. The dredging of these canals has been the main preoccupation of the Docks and Inland Waterways Executive in an effort to increase the overall efficiency of our canal system. The results are already quite remarkable.

The grouping of the ports and canals has been a leading factor in reducing costs, and a thorough overhaul and reallocation of staff duties throughout the docks and inland waterways has given rise to considerable increase in efficiency.

To amalgamate the Docks and Railway Executives at this stage would seem to reverse the whole intention of the Act on this question. Mr Morrison has rightly said that competition, even among nationalised industries, is essential for efficient working.—Yours faithfully,

GEORGE CADBURY

Birmingham

Out-of-Date Pensions

Sir,—The continued increase in the cost of living and the prospect of additional taxation to pay for rearmament are bad enough for salary and wage earners, but for many ex-salary and wage earners, who have retired on fixed pensions which are now out-of-date, they are positively disastrous. Surely it is time that the pensions muddle was tackled?

The present position of such pensioners is not merely illogical but repugnant to ordinary ideas of fair play. Why should two people who have done exactly the same work in their working lives now be so placed that one retires on a reasonable pension and the other, because he retired before his employer's pension arrangements were adjusted to meet the increased cost of living, be hard put to it to find the money for the bare necessities of life? Again, it is accepted that most pensions represent deferred pay. Why should current pay be adjusted to meet the increased cost of living and deferred pay be left unadjusted?

There is only one fair and simple way out of the muddle, namely the way which many good employers have already taken. They have improved pensions *pari passu* with pay and have made the improvements applicable to past as well as future pensioners. Public opinion should compel other employers to follow suit and particularly the Government. So far the Government has been woefully behindhand in this matter, and many pensioners of the fighting, civil and local government services have had the rawest of deals. For the benefit of those who are not familiar with the facts let me give an example. There has been no adjustment of Civil Service pensions to meet the increased cost of living since 1939 except that provided by the Pensions (Increase) Acts of 1944 and 1947 and from the following examples of the adjustment provided by those Acts, it will be seen at a glance to be fantastically inadequate.

Pension (gross annual amount)	Percentage Increase Over the 1939 Level
£100	40
£300	20
£500	7
£700	5
Over £788	Nil

The larger percentage increases, in the £100-£300 range, are subject to proof of need.—Yours faithfully,

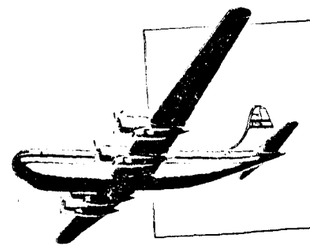
Amberley, Glos. G. D. ROKELING

Successor to Smuts

Sir,—As a student of South African affairs, I should like to call your attention to an error in *The Economist* of December 2nd in your correspondent's article "Successor to Smuts." The Nationalists were returned to power in May, 1948; Mr J. H. Hofmeyr died on December 3rd, 1948. An unfortunate impression is conveyed by the statement: "Lodged between these two disasters [the deaths of Hofmeyr and Smuts], a general election put the Nationalists in power." It was Mr Hofmeyr's liberal policy towards the non-European population that made him a Nationalist target in May, 1948.—Yours faithfully,

D. R. SCOTT-SMITH

St. Andrews



The Fun Fair Vote

Sir,—Politicians are always under pressure—in the United States mainly from their constituents, in Britain mainly from the Whips. But a rare occasion like the fun fair debate shows how similar is political human nature on the two sides of the Atlantic.

Of the 625 MPs, 136 (22 per cent) voted for Sunday opening. Of the 45 members who hold their seats by majorities of less than 1,000, only two braved the wrath of their Sabbatarian constituents (and one of those was Mr Morrison's Parliamentary Private Secretary). To put the matter in another way, members with precarious majorities contributed only 1½ per cent of the supporters of Sunday opening but 9 per cent of the opponents. And they were even more prominent (11 per cent) among those who avoided the division.—Yours faithfully,

PHILIP WILLIAMS

The British Dilemma

Documents on British Foreign Policy, 1919-1939. Edited by E. L. Woodward and Rohan Butler, assisted by Margaret Lambert. Third Series, Vol. III. *HMSO.* 677 pages. 27s. 6d.

The period covered by the present volume is the last three months of 1938 and the first three weeks of 1939. The editors, as in the earlier volumes of this collection, have limited their selection of material almost entirely to the telegrams and letters which passed between the Foreign Office and its posts abroad, the only important exceptions being the minutes of Mr Chamberlain's meeting with the French Ministers in Paris in November, 1938, and the minutes of his meetings with the Italians in Rome in the following January.

For two reasons, however, it is more than welcome as an important addition to the growing body of evidence concerning the outbreak of the Second World War. In the first place, the situation was so tense after Munich that information collected "in the field" temporarily acquired a greater influence on the formation of British policy than it possesses in normal times, with the result that the telegrams to the Foreign Office which are here reprinted are more important and relevant than has been the case in the earlier volumes. In the second place, the period after Munich is so critical for an understanding of the subsequent outbreak of war that even the unimportant moves, even the uninteresting telegrams, are essential for the proper reconstruction of events.

In this reconstruction the central problem from the point of view of British foreign policy is to explain why Great Britain, for the first time in its history, went to war over an Eastern European commitment. We will not solve that problem correctly unless we first grasp that the importance of Munich lay not in the fact that Great Britain, true to its traditional foreign policy, gave way there, but in the fact that, despite its traditions, it nearly did not do so. For it is this which explains Hitler's policy after Munich; and British policy in the same period, including the declaration of war itself, was dictated by the policy that Hitler pursued.

Right up to the Munich crisis Hitler was certain that Great Britain would be true to its traditions. He was convinced that, if he offered no direct challenge to Great Britain, if he deliberately neglected the German Navy, if he left France and the Low Countries alone, and if he chose his opportunities carefully for expansion in the other direction, Great Britain would give him a free hand in Eastern Europe. He had been so confident of this that he brought the Sudeten problem to a head without any scheme for general mobilisation or any thought of a general war; and it was the fact that he came so near to a war for which he was unprepared that made Munich the first serious blow to his hopes and plans. He disliked the Munich settlement, not because he did not get what he wanted in Czechoslovakia—the early chapters in the present volume show that he did, and that the Western Powers were powerless to stop him—but because he had to make an agreement at all, because it was not the Anschluss all over again.

After Munich, for the period covered by this volume, if not until the outbreak of war, he wavered between two conflicting beliefs; and the policy of the western powers wavered with his. On the one hand, he would not abandon altogether the hope that he might still obtain his free hand for further expansion to the East; and to this end he incited the German Press against British rearmament, officially reproached Great Britain on the same score, and concluded the Franco-German Declaration of December, 1938. On the other hand, he was forced to recognise that any further step might involve war with Great Britain; and for that reason he faced, belatedly, but for the first time, the need for naval rearmament, deciding, among other things, to take advantage of the clause in the Anglo-German Naval Agreement of 1935 which permitted him to build to equality in submarines with Great Britain. In either event, he would not settle down; and because this was obvious, because the Munich Agreement did not bring the improvement for which Mr. Chamberlain had hoped, the policy of the western powers similarly wavered, at least until the shock of the occupation of Prague in March, 1939 (which will be covered in a subsequent volume), between the urge to leave Germany free in the East, the possibility of buying Hitler off elsewhere with colonies, and the hope of deterring him by rearmament and by rapprochement with Italy if time was allowed. The initiative was all with Hitler; the British dilemma was acute; and, at least on these points, these documents, which also throw much light on the policies summarised above, provide the final confirmation.

International Affairs

A Short History of International Affairs, 1920-39. By G. M. Gathorne-Hardy. Fourth Edition. *Oxford University Press.* 540 pages. 21s.

Those of middle age who seek to inform and guide the readers of their newspapers about international affairs are only too liable to forget that a reader aged twenty-one will have only a book knowledge of the events that led to the last war; and that they themselves have only the most general memories of how the world looked five years after the war of 1914-18. It is therefore important that the very few books available should be scholarly, objective and constantly under check. It is standards such as these that Mr Gathorne-Hardy has observed while revising periodically the book he first produced under the auspices of Chatham House in 1934.

It has grown in size and in stature through the years. And the author has now added an epilogue in which he uses sixteen years' experience of watching over his history to offer some radical and far-sighted criticisms of the ways in which great powers now manage their foreign affairs. His theme is the failure of the peoples of the civilised world to eliminate war from international relations. He emphasises the spread of ideological warfare, the worthlessness of written agreements, the failure to distinguish between different types of war, the pretence that interest is not the sole guide of national policy, and the way in which pacifism has undermined the strength of the pacific nations. One hopes that the author will be invited to expand this analysis and so encourage the British—and more especially the American—public to examine the roots of democratic foreign policy. As a preparation for such analysis the busy general reader under 40 could not find a better book.

Picture of Russia

The Soviet Union, the Land and its People. By Georges Jorré. Translated by E. D. Laborde. *Longmans, Green and Company.* XVIII + 353 pages. 21s.

This book is an enlarged English version of a work by Professor Georges Jorré of the University of Toulouse. Part I sketches the physical features of the Soviet Union; Part II describes its inhabitants and their general mode of life before the revolution; Part III discusses the country's economic resources and the extent to which they have been developed under the Soviet regime; Part IV deals with the physical and economic geography of the main natural regions of the Soviet Union. Nearly 70 maps, diagrams and photographs illustrate the text, and a useful appendix supplies a list of some of the place-names which have been altered in recent years.

Within its limits the book draws a good general picture of the Soviet Union which will instruct the specialist as well as the general reader. It is skilfully composed, and its wealth of detail does nothing to blur the clarity of the outline. It is at its best and surest when describing the physical geography and the general economic resources of the Soviet Union. But its excursions into history are not always happy, and in discussing the country's economic development under the five-year plans it makes more misstatements and factual errors than a serious book of this kind ought to make. Most writers on Soviet affairs revel in such adjectives as "gigantic," "colossal," "enormous," "miraculous," "wonderful," and Professor Jorré is no exception. But he is in danger of overstating his case when he uses "enormous" to describe a city like Sverdlovsk, which had a population of 425,000 in 1939. Occasionally the reader will find what may strike him as apparently conflicting points of view lying side by side on the same page. For instance, on page 333 he is told that the Soviet Union "can boast of being in many respects in the van of progress." A few sentences later he reads that "the masters of the country were forced, in order to establish their ideal, to organise one of the most oppressive totalitarian regimes the world has ever known."

The translation by Mr E. D. Laborde, Assistant Master in Harrow School, reads smoothly and easily. But it is irritating to find the Kola peninsula constantly referred to as the Kolski peninsula, to have Mt. Kazbek in the Caucasus always misspelt Mt. Kazber, and to see the new name of Vladikavkaz invariably given as Ordzhonikidzevskaya instead of Ordzhonikidze. Professor Jorré can perhaps be pardoned for saying that Stalino (formerly Yuzovka) was founded by an Englishman named Youth. But his English translator might have guessed from the name "Yuzovka" that its founder was not an Englishman called Youth but a Welshman called Hughes.

A Scholar's Range

F. M. Powicke: Ways of Medieval Life and Thoughts. *Odhams Press.* 255 pages. 12s. 6d.

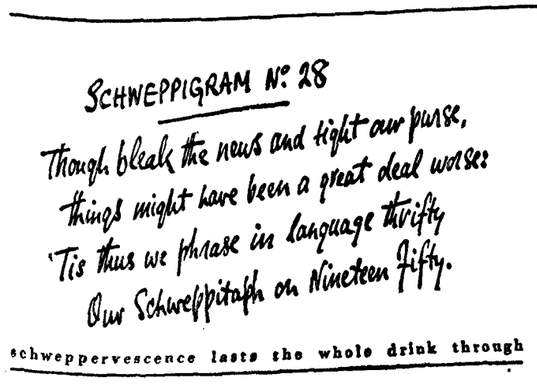
Like Stubbs, Sir Maurice Powicke was Professor of History at Oxford for nineteen years; but where one speaks of "the pupils of Stubbs" the fruits of Sir Maurice's tenure of the chair are summed up as "the Oxford school of history." The essays collected in this volume give a clue to the reason for the difference, for, although they have almost all been published before, when put together they show the extraordinary range of Sir Maurice's work.

The comparison which springs at once to mind is that with Maitland. Like him, Sir Maurice has the rare gift of combining scholarship of the highest order with a fine, simple prose style and the ability to relate single events and great causes. Take, for instance, the essay on "The Murder of Henry Clement." In itself this is surely one of the finest historical detective stories ever written, one whose unravelling demanded a vast amount of skilled research into many obscure corners of the Chancery's records. Yet, over and above the sheer excitement of the story, the reader is constantly but unobtrusively reminded of the ways in which the affair of the Lundy Island pirates touched every aspect of thirteenth century England: its king and government, the relations of church and state, the intricate network of feudal society. At the other end of the scale, in his discussion of "Some Problems of the Medieval University," Sir Maurice can suddenly focus the whole difficult and involved subject of the medieval examination system in one phrase: "It suggests a mental discipline as astonishing to us as the physical discipline suggested by a suit of medieval armour."

The essays are here published for the most part without their critical apparatus, and it would be interesting to see how many younger scholars would be needed to reconstruct the types of sources Sir Maurice has drawn on in the various essays: a guess may be hazarded that at least five such men would be needed. Breadth of knowledge is, however, only part of the point: what these essays contain is (to quote the author himself in another connection) "depth . . . depth as a dimension." Here is medieval society set out in all its variegated richness. For many years such suggestive articles as "Reflections on the Medieval State" have been pondered on by scholars. Now they can be read with equally rewarding results by those who are not specialists, for they can gain here an understanding of the medieval approach to the problems of freedom, of the search for truth, of civilisation itself. In one of the essays Sir Maurice sums up part of the historian's task, and in so doing provides the best definition of his own work: "pedantry is a kind of darkness, but he is trying to let in the light."

A Spanish Socialist

The Last Optimist. By J. Alvarez del Vayo. *Putnam.* 406 pages. 18s.



These are the memoirs of the well-known Spanish Republican journalist, diplomat and statesman. Journalism is the best school for diplomacy, Senor del Vayo maintains, at least for the modern top-ranking journalist who, by the nature of his profession, has direct personal contact both with men of affairs and the affairs themselves. Senor del Vayo tells how, the son of an army officer brought up in the gaunt precincts of the Escorial, he went abroad as a student to England, France and Germany. In the first world war he visited America, and began to make his name as a journalist by his hostile dispatches from Berlin for a Madrid paper. There followed, till 1923, a fruitful period as European correspondent for *La Nacion* of Buenos Aires—including a visit to Russia. Then he turned to politics in earnest.

Senor del Vayo's book breathes the spirit of the Webbs, Karl Liebknicht and Rosa Luxemburg. A heartfelt Socialist, he found himself as much opposed to King Alfonso and Primo de Rivera as later to General Franco. Intermittently in prison or on the run, he earned ministerial rank in the Spanish Republican government the hard way. In exile since 1939, he looks back on the life of a martyr to an ideal, the progress of humanity. As a mirror of the last thirty years, this is a worthwhile and stimulating book. It is a graphic account of the background to modern Spain.

Shorter Notice

Economics for Commercial Students and Business Men. (13th Edition.) Albert Crew. Enlarged and Rewritten by L. T. Little. *Jordan and Sons, Limited.* 591 pages. 12s. 6d.

The first edition of this book appeared in 1914 and a preface to the present edition states that much of the detail bears but little resemblance to the original. The work remains a clear elementary textbook designed to meet the requirements of examination candidates, and each chapter ends with a selection of questions set by various examining bodies. The section on international economics includes a description of the results of the Bretton Woods Agreements, and that on governmental economics includes chapters on state control and public ownership of industry.

AMERICAN SURVEY

Prospects for Unity

Washington, D.C.

ON Tuesday President Truman said positively enough that, just as President Lincoln refused to dismiss his Secretary of State, Mr Seward, at the behest of "a group of Republicans," so now he would refuse to dismiss his Secretary of State, Mr Acheson. That the President should need to make any such statement at so tense a time as this is explicable only in terms of the apprehension, self-questioning, obstinate wrong-headedness and sub-surface isolationism which defeat in Korea has stirred up in America. If some of the confidence that has been lost in Asia can be regained in Western Europe—if General Eisenhower's arrival is accompanied by signs of stouter hearts and busier hands—the picture in America will almost certainly improve very noticeably. But it is idle to pretend that, during the week in which a state of national emergency has been proclaimed, there have not been some joyless moments of confusion and disunity in and beyond Washington.

The story reached some sort of climax at a little before 6 p.m. on Friday, December 15th. At that moment, the typists in the White House were preparing the advance copies of the President's broadcast on the current crisis. The Republican Party Senators were meeting on Capitol Hill, a mile or so away. In the White House, the typists were typing:

> I am talking to you tonight about what our country is up against, and what we are going to do about it. Our homes, our Nation, all the things we believe in, are in great danger. This danger has been created by the rulers of the Soviet Union.

On Capitol Hill the Republican Senators were considering and preparing to vote on a resolution calling for the dismissal of Mr Acheson. The resolution declared that Mr Acheson had "lost the confidence of the Congress and the American people and cannot regain it." It was being voted on by Senators who were well aware that within 48 hours the Secretary of State would be boarding an aircraft to fly to Brussels. In the White House the typists were recording that

> He and representatives of these (the North Atlantic Treaty) nations will complete the arrangements for setting up a joint army, navy and air force to defend Europe. The defence of Europe is of the utmost importance to the security of the United States.

By the time the typists had finished their job and the duplicated copies of the President's impending broadcast had been distributed to the waiting newspapermen, the Republican Senators on Capitol Hill had passed the resolution by 23 votes to five. Republicans in the House of Representatives had already voted earlier in the day for a similar resolution "overwhelmingly, but not unanimously."

The opposition party had been willing at this moment of great danger to pursue to a climax a campaign which may come in time to be regarded as one of the most unlovely episodes in modern American history. For if it is true, as the resolutions of the Senate and House Republicans said, that Mr Acheson has lost the confidence of the Congress and the people, it can only be because a substantial number of those voting for the resolution lent themselves before and during the election to the vilification of a man against whom the charges were unproven. The most damaging of the charges had been that Mr Acheson had been "soft" to Communists in his department. It had never been shown that there actually were any Communists in his department, and the course Mr Acheson had pursued as Secretary of State had, in fact, been one of resolute, energetic and intelligent opposition to Communism everywhere.

Mr Walter Lippmann wrote in his column last week that Mr Acheson's "troubles" were due to his and the President's treatment of a great issue in foreign policy—the American course in the Far East—as though it were "like an appropriation or a tariff Bill that could be compromised and log-rolled." Mr Acheson's fundamental mistake was "his refusal to confide in the people—his refusal to debate the great issue." If Mr Acheson is now forced from office, this soothing and respectable explanation will no doubt be embraced by many of those who have cast the votes against him on Capitol Hill. Whether it will be as easy to believe as it is to embrace is another question.

*

Yet unity will have to be fashioned, and soon, if the programme Mr Truman put to the nation in his broadcast later on Friday night is to be effectively carried out. A stepped-up draft to bring the number of men and women on active service to nearly 3,500,000, higher taxes, preliminary price and wage controls, steeply rising output of war goods, to be achieved by more people working longer hours, an Office of Defence Mobilisation, directed by Mr Charles E. Wilson of the General Electric Company, to cut into civilian delights —these are measures for a single-minded America with confidence in its leadership.

For the time being, at least, the much-discussed fears that the United States may be setting out to do too much too quickly may be premature. If this crisis can be passed without war, the question whether the pace can be or should be maintained will be relevant enough; but for the time being, all circumstances considered, it will be difficult to criticise the President's programme on the ground that it is too big. Not that such criticism is likely to be heard at the moment in the United States. The country now seems scared enough and roused enough to want action on this scale. And although the noun "mobilisation," and the accompanying adjective "all-out," are being used sufficiently freely to move European readers to startled remembrance of the last time they heard these words, it can do no harm to keep current efforts in perspective. An aid to that exercise is to be found in a recent speech by Mr Zuckert, Assistant Secretary of the Air Force, who said:

> Forty-three per cent of the new budget is given to aircraft and related procurement. This will amount to about $6,000 million, a figure that exceeds the total Air Force Budget of last year. If this seems high, compare the rate of output under this programme with 1944, during the height of World War II. In that year we were turning out eight to ten thousand planes a month. Deliveries for all of last year would have been less than a week's production at the peak of the World War II rate. Under our programme, if it is approved by Congress, the output will still be only a small percentage of the World War II figure.

But it can be assumed that the proclamation of a state of national emergency has administered the "psychological jolt," the need for which was being urged by high officials during the unquiet week that followed Mr Attlee's return to Britain; and a greatly increased American effort can be forecast.

"Unity with our allies is now, and must continue to be, the foundation of our effort," the President said. That was a useful reminder, too. For the disaster in Korea and the human but unhelpful instinct to find someone who could be blamed for it, had provided an unpleasantly sharp demonstration that what the Prime Minister called "the latest propaganda attempt of the Cominform . . . to drive a wedge between our two peoples" was making some impression beyond the circle of Americans who have habitually used Britain as a roundabout route along which to attack the Administration.

There is little sign that any considerable part of American opinion yet understands that the British do not think it desirable to base a long-term policy for China on present indications, which may hold good for the short-term only. The British hope that the Chinese Communists, who are also nationalists, and the Russian Communists, who are also imperialists, may not always be going to want the same things. But for Americans it is easier to understand the "Up Guards and At 'Em" policy. A lot more time and thought than has yet been given on either side of the Atlantic could profitably be spent on an effort to ensure that, if the two peoples cannot agree on the matter of recognition and admission to the United Nations of the Chinese Communists, they should at least be brought to perceive that the explanation of the difference is not simply that one side of the Atlantic is hot-footed while the other side is cold-footed.

There is, in short, an important and urgent job of unifying to be done, at home and abroad. And now—as the Americans get down to their harder work, longer hours and heavier taxes, and as they see (as they should) Western Europe showing new signs of life and energy—now is almost certainly the time for all good men to come to the aid of the Atlantic Party.

Copywriters in the Kitchen

Washington, D.C.

EUROPEANS who gaze longingly at the illustrated advertisements in American magazines may find some consolation in the knowledge that they have had the best of the food by looking at its picture. There was a time when pride, and justified pride, was taken in cooking in every American home and in most American restaurants. It was pride based on the proper preparation, in a few simple ways, of an abundant supply of wonderful raw materials. But mass production has taken much of the quality from the materials—deep freezing may officially leave the vitamins untouched but it drains away the flavour—and the ingenuity of the canning industry has made it unnecessary for the modern housewife to know more than how to heat the contents of tins before serving them.

Cooking is still an art in the country, but in the towns, except in a few private houses where the income will still support an adequate cook or the family is stubbornly epicurean, food is largely tasteless when bought and deteriorates rapidly on its journey from the refrigerator to the table. And, in all too many restaurants, the caption writer has almost replaced the chef. Indeed, the colour photographer has been called in to help at one or two of the more progressive establishments where no expense is spared. Having studied the menu and made a tentative choice, the customer is shown the dish in Technicolor before being required, in the jargon of the modern salesman, to "finalise his preference."

The stomach would, perhaps, not be so disappointed by an average, or even rather poor, "hamburger" if its juices had not been set flowing like the mighty Mississippi by the expectation of a "Fresh, Juicy, Tender Salisbury Steak." There is, no doubt, some relation between this daily disappointment and the incidence of ulcers in the United States. But that the words mean more than the food itself is actually admitted in an entrancing little booklet left on the seats for the edification of passengers on the Pennsylvania Railroad. In a paragraph headed "What's In A Name," it says:

> We recently tried out chicken fried in a special way and offered it as Pennsylvania Dutch Fried Chicken. There were few takers. Then the name was changed to Fried Chicken Kentucky Style, and the dish became a best seller overnight. . . . Yes, names mean a lot in our business.

In a country as large as the United States few can avoid occasional meals on trains and many have to feed on them with some regularity. West of Chicago it is often possible to eat in restaurant cars with some appearance of pleasure, but in the East there is usually much to be said for taking a packet of sandwiches. The Pennsylvania's booklet is presumably an attempt to persuade its customers that things are not as bad as they taste.

But, though the method chosen would be thought curious in Lyons, it is typical of what is now considered in the United States more interesting than the quality of the food itself. Except for the paragraph on nomenclature and a short reference to a special department which is "constantly developing new dishes, improvements on old dishes, attractive and tasteful ways of serving them, new combinations, new techniques and new efficiencies" (a department without which Fouquet's and Lapérouse have got on nicely for years), the booklet's twenty-three pages are spent on peeps behind the scenes at the heroic efforts of the company to "streamline our service while cutting our losses."

After reading of these difficulties it seems almost churlish —as perhaps the booklet is intended to make it seem—to complain at being charged $1.85 (13s. 2½d. at the present rate of exchange) for a piece of tinned salmon about two inches in diameter, hiding its pink nakedness in a thicket of tired lettuce. Yet it is depressing that this should be the proud result of "a modern dining car commissary in Chicago, built at a cost of $600,000," "steaks pre-cut" and "pre-prepared" and potatoes pre-peeled by "our new automatic potato peelers," "fresh-caught fish . . . under modern deep freezing methods, purchased in quantity . . . quickly cleaned, filleted and cut into individual portion size" and "micro-wave energy, developed for wartime radar and harnessed in the Radarange to provide the fastest method

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

of food preparation ever known." After that, if there is something wrong somewhere it must be with the client's taste buds.

Ingenuity has taken the place of imagination in the American kitchen and it has proved itself a poor substitute. It can find a way to "bake an individual-size gingerbread in 15 seconds," to use a couple of dozen ill-matched ingredients in one salad or to serve a gastronomic Tower of Babel when a sandwich is ordered. But it is not fitted for the laborious task of perfecting *quenelles de brochet aux queues d'écrevisses*, though if it were ever faced with the problem of putting them on a menu it would know the answer—"Golden Brown, Creamy Cakes of Freshly-Caught Lake Plumbosket Wall-Eyed Pike with Rich, Coral Pink Sauce of Jumbo Colorado Crayfish." The richness of the language is designed to deceive the palate and it must be admitted that it has succeeded in doing so.

Historically, there seems to have been a melancholy progress from cooking as an art to selling as an artifice. At first, perhaps, as it became harder to get supplies of fresh meat, fish and vegetables, frustrated *restaurateurs*, aware that they could not produce their masterpieces out of tins or refrigerators, began to describe their wares nostalgically as they would have liked them to be. Probably this expedient was only too successful and soon made worry about the real quality of the dishes unnecessary. The store-cupboards began to fill with adjectives and the stockpot was used for rendering thick, creamy prose. And so the demand for chefs declined, and with it the supply.

Whatever the cause, the supply has so declined that it would seem that the cookery schools now turn out—presumably by some assembly-line system—finished graduates able only to prepare, with no great skill, some ten or twelve dishes which, as a writer in *Harper's Magazine* pointed out some months ago, form "The Basic, Universal, All-Weather New York Menu." They are, he says, and anyone who eats regularly in the restaurants of New York (and many other cities) will agree with him, "invariable and unchangeable" and he predicts that eventually all other forms of food will die out and only they will remain. Then the advertising profession will have succeeded in doing for food what it has already done for automobiles. With motor-cars indistinguishable from each other, the real competition is now over which advertising agency can whip up the most synthetic excitement about the appearance of a new model. With the basic dishes on the menu immutably fixed, the caption-writers will all start level and will all have the same chance of success. And the expert *restaurateur* will be the man with a nose for poets, not sauces.

American Notes

Summons to the Nation

That President Truman's declaration of a national emergency was a summons to the nation to make additional efforts rather than a summoning-up of additional powers for himself becomes very clear on analysing the powers he actually obtained by the declaration. Their number is much greater than their importance: among other things they permit the government to regain control over various factories and properties that have been sold privately, to alter the terms of service in the armed forces and the hours and wages of workers on government contracts, and to take over shipping and communications facilities. This last is probably the most important, for even the power to place military contracts by negotiation and avoid the delays of competitive bidding apparently must be extended by Congress. The President has also asked Congress to authorise the reorganisation of government bureaux, for reasons of efficiency, a request which may prove controversial in spite of the sense of urgency now prevailing in Washington.

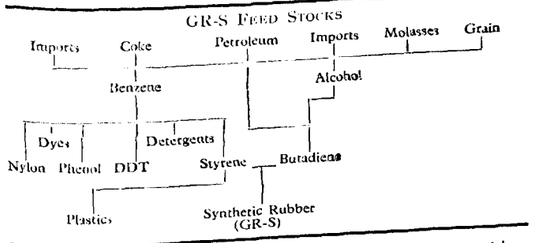
It did not need the declaration of a national emergency to give Mr Truman the powers under which he has acted so energetically this week. They were given to him in September by the Defence Production Act. There is no more striking evidence of the change in temper and tempo in Washington since that time than that Mr Truman has now willingly done the two things which he then refused to do. He has appointed a "czar," or potential "czar," for defence production and he is applying price and wage controls as quickly as possible.

The "czar," Mr Charles Edward Wilson of the General Electric Company, the Director of the new Office of Defence Mobilisation,

> shall on behalf of the President direct, control, and co-ordinate all mobilisation activities of the executive branch of the government, including but not limited to production, procurement, manpower, stabilisation and transport activities.

The Director is given control not only over the National Production Authority and the Economic Stabilisation Agency, set up under the Defence Production Act, but also over all the other powers given by that Act, now scattered through a number of government agencies and so far co-ordinated only by Mr Symington of the National Security Resources Board. Mr Wilson can, if he wishes, and it is thought he will, bring all these defence activities together into one agency. He has more authority and more freedom to use it than even Mr James Byrnes had in the last war.

The company headed by Mr Wilson's namesake, Mr Charles Erwin Wilson of the General Motors Corporation ("Engine Charley" as opposed to "Electric Charley"), is one of the automobile firms that have been the first to feel the chill of price control. Last week they refused the urgent request of ESA that they withdraw price increases on their new models and thus brought down on themselves a mandatory price freeze, until the stabilisers have decided whether these increases are justified by higher costs. General Motors has responded by freezing its cars in its dealers' showrooms. Meanwhile ESA has called for a voluntary ban on all price increases. Its readiness to try the voluntary method again in spite of its failure with the automobile industry is explained by the lack, as yet, of the staff and organisation required to administer and enforce mandatory price controls on a large scale and to work out the more complicated wage controls that must by law follow promptly after price ceilings.



* * *

Stretching Rubber

Recapped tyres instead of new ones are already waiting for the American motorist, and so presumably are the restrictions on speed and loads that synthetic rubber tyres make necessary. The amount of new rubber that may be used for civilian products is being held to a not unduly severe 90,000 tons a month, but as more synthetic rubber becomes available the proportion of natural rubber is being steadily cut back from the 52,000 tons permitted in November to 35,000 tons in February; this is to cover military as well as civilian requirements. If, as is expected, the government takes over the importation of all natural rubber, it will probably be sold to American consumers at prices rather lower than those at present prevailing.

In order to cover higher costs the government has recently raised the price of synthetic rubber, fixed at 18.5 cents a pound in 1943 and never changed, to 20.75 cents for butyl and 24.5 cents for general purpose synthetic (GR-S), of which the bulk of the output consists. With all synthetic rubber facilities coming into use, about a quarter of the GR-S is being made from alcohol-based butadiene which is more expensive than that based on petroleum. Little or no industrial alcohol is available for this purpose; beverage alcohol producers are apparently able to supply what is wanted, for the present at least, but at a prohibitive price. The government is relying on imports of surplus alcohol from France for most of the 140 million gallons needed for synthetic rubber plants next year, but this is not very satisfactory as a permanent solution.

Petroleum offers the best possibilities, through new refining processes, for increasing the output of benzene, the tightest bottleneck in the synthetic rubber programme. At present it is largely a by-product of the steel industry's coke ovens, but the planned expansion of steel facilities will bring little increase in output of benzene. Eventually, however, it may be produced directly from coal, as part of the oil-from-coal programme in which the government has been interested ever since the war. About 20 million gallons of benzene

will be needed next year to make styrene for the rubber programme and even this year's supply, at 210 million gallons, is running behind demand. Many of the best-known post-war chemical products depend on benzene and in styrene itself the plastics industry has its cheapest and, until it was diverted to synthetic rubber factories, its most plentiful raw material.

Although the synthetic rubber plants have apparently not been getting into production as quickly as was expected, they will be producing 50,000 tons a month before long and should reach the goal of 75,000 tons by the summer. But it will hardly be possible to allow unrestricted use of new rubber as long as the synthetic industry remains a cuckoo in the chemical manufacturers' nest, starving their other customers of alcohol and benzene.

* * *

No Monopoly by Merger

Congress has given the President and the Federal Trade Commission an unexpected Christmas present. It has passed a bill prohibiting mergers by the purchase of physical assets, when they tend to reduce competition or encourage monopoly. This is the first major change in the anti-trust laws in a decade. The Clayton Act prohibited such mergers when they were brought about by share purchases, but in the nineteen-twenties, when mergers were the order of the day, businessmen discovered they could get round the law by buying up the assets of their competitors. The FTC has been urging since 1937 that Congress close this loophole, and the President has included the request in most of his Congressional messages.

To support its contention that big business is a cannibal which consumes its smaller brethren, the Commission has published figures showing that, in the years 1940-1947, 2,500 firms disappeared through mergers, and that in the majority of instances it was a case of a big fish swallowing a small one. Businessmen are more impressed by the numbers of minnows still swimming about the economic aquarium; the number of firms has reached an all-time high of about 4,000,000 and has more than kept pace with the growth of the population. Two economists, writing this year in the *Review of Economic Statistics*, conclude that since 1940 mergers have been a small factor in making big business bigger, compared with retained earnings and new financing. They grant, however, that the knowledge that the eye of the FTC was upon them may have had a restraining effect upon business appetites. The Bill passed by Congress would not prevent the merger of small companies to form a larger one, nor prohibit mergers approved by government agencies.

The FTC must balance this Congressional sunshine against storm signals from another quarter. The Interstate Commerce Commission has agreed unanimously that Congress must return to the attack on the freight-absorption issue. It recommends another Bill making it clear under what circumstances businessmen may absorb freight charges without risking anti-trust prosecution. An earlier one, passed after the Supreme Court found against delivered pricing in the cement and rigid conduit cases, was vetoed by the President, on the ground that the judicial decisions clearly permitted freight absorption when no conspiracy was proven. With this industry vigorously disagrees and the Interstate Commerce Committee concludes that the FTC is unable, or unwilling, to give businessmen the guidance they are entitled to have, particularly at a time when they are being asked to expand defence production.

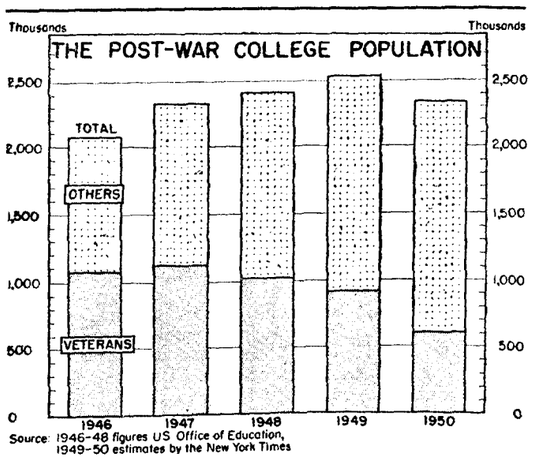
Combined Operations in Detroit

Willow Run, where the Ford Company turned out 8,000 Liberators during the last war, may be going back into aircraft production. The $100 million war plant was bought by Mr Henry Kaiser for less than a fifth of its value for automobile production. The Kaiser-Frazer Corporation has, however, never become quite established in Detroit; it is still the weak link in the Kaiser chain, which includes steel, cement, and aluminium. Already in debt to the Reconstruction Finance Corporation, it was compelled to request another loan when credit restrictions left unsold cars in its warehouses.

The RFC, whose loans to the far-flung Kaiser enterprises have caused raised eyebrows in the past, made two new and unusual conditions before adding another $26 million to its original $33 million investment. It insisted that the production of cars be halved by January, and that the company seek energetically for war contracts in order to keep its labour force together. Kaiser officials are consequently investigating the possibility of building Boeing-47 Stratojets, a cargo and troop transport, or an unnamed jet fighter. The company insists that even if it secures such a contract, it will continue to make automobiles as long as the materials are available, and Willow Run, with its 85 acres of floor space, is probably large enough to accommodate both. Other manufacturers, who expect that this kind of combined operation will be the pattern for 1951, think that new building will be necessary, perhaps in the south and west, as their present plants are not large enough for automobiles as well as bulky war items. So far, only 3 per cent of the labour in Detroit, which was the arsenal of the last war, is at work on defence contracts. The manufacturers, who expect shortages to cut this year's production of 6,500,000 cars to 4 or 5 million, or even less, are as disgruntled as the automobile workers at the bumpiness of the road to partial mobilisation.



The General Motors Corporation, at least, has decided to do something about the shortage of steel as well as shock the industrial community by echoing Fair Deal criticisms of the steel industry's "timid" expansion programme. It is lending the Jones and Laughlin Corporation $28 million at 3 per cent interest to help finance an expansion of 1.5 million tons in its capacity by 1953, of which 50,000 tons will be available to General Motors. This is part of the expansion which the government is prepared to assist by issuing certificates of necessity. These permit the new facilities to be written off, for tax purposes, in 5 years instead of 15 or 20, and more than $500 million worth have been approved

for the steel and refractory industries. The Jones and Laughlin Corporation has been outraged to find, however, that the certificates granted cover only slightly more than half the total investment, on the ground that some of this new capacity will still be of value when the emergency is over.

War Cloud over the Colleges

In the five years since the war the colleges and universities have become accustomed to the reassuring, if uncomfortable, sensation of overcrowding. They have come to assume that each year would produce an increased student body, and that the peak of enrolment lay somewhere in the future. Instead, this autumn the *New York Times* reports that there was a drop of 188,000 to a total of 2,300,000. This is more than accounted for by the tapering off of the GI scheme, under which the government has financed ex-servicemen's education to the tune of $8,000,000 in the last four years. But because it was to be expected, the loss of this handsome source of revenue will not be any the less painful. And beyond lies the threat that the colleges may lose 20 to 30 per cent of their men students to the armed forces, while a number of women students will go into war work. The number of resident students fell, during the last

war, from 1,500,000 in 1940 to 1,100,000 in 1944, and the latter included 278,000 full-time military students.

The consequence is likely to be a financial hurricane, particularly for the small, independent institution. With the rise in costs and the decline in investment incomes, private colleges and universities have come to depend on fees for three-quarters of their income, rather than the half which was usual before the war. Even publicly-controlled universities have been raising their charges. Already one out of every four liberal arts colleges is running at a deficit, and even bountifully endowed universities such as Harvard are living on their reserves.

The position now is that college students may have their call-up postponed until the end of this college year, provided they remain in good standing. Permanent exemptions, which must be renewed at intervals, are available under the law to students of engineering, medicine, science, and divinity. Under such a system there is a clear pressure on young men to concentrate on scientific studies, and a revision was recently proposed under which students of high ability, who remained in the upper half of their class, would have been offered deferment, whatever their specialty.

Not every one was convinced that this was either fair or desirable, but in any event the scheme has probably been torpedoed by the news from Korea and the increase in the goal for the forces from 3,000,000 to 3,500,000. The draft boards are eyeing hungrily the university reservations, and there is pressure for reducing the call-up age to 18. The colleges, which in the past provided much of the opposition to universal military training, have accepted the grim necessity with speed and patriotism. The American Association of Universities passed a resolution a fortnight ago favouring universal military training and service for all at 18, the age at which it would least interfere with educatien, though they asked for the exemption of those already at college, and the postponement of military service, but not basic training, for men whose education was of value to the defence effort.

Shorter Notes

San Diego's civic centre is decorated for Christmas with stars, which the Chamber of Commerce considers to be orange, but which make Admiral Standley see red. This local resident, retired both from the Navy and from the Ambassadorship to Russia, has demanded that these symbols of the Soviet should be taken down. The stars must be twinkling in the Stars and Stripes.

*

The Senate Judiciary Committee wants to set up its own Un-American Activities Sub-committee, patterned on the House Committee of the same name, but likely to be an even sharper thorn in the Administration's flesh. The committee would begin by enquiring into the enforcement of the McCarran Internal Security Act and would go on to a general investigation of subversive activities, which would almost certainly include a re-examination of Senator McCarthy's charges against the State Department.

*

Of the 76 members of the Eighty-first Congress who will not be serving in the Eighty-second 41, including four Senators, have been members for less than six years and will not therefore be eligible for pensions under the scheme drawn up in 1946. Another 20 must wait until they are 62 years old to become eligible; Senator Glen Taylor, of Idaho, has 25 years to wait. Only two are eligible for the maximum pension of $9,375 a year awarded for 30 years' service; the exact amount paid under the scheme depends on length of service and premiums paid.

*

Watering the milk may before long have become an accepted practice in America. Concentrated milk which, with the addition of twice the quantity of water, becomes exactly like "regular homogenised Vitamin D Grade A" milk is now on the market. The chief advantage, apart from saving space in the refrigerator, is that it may reduce the cost of distribution, which makes up such a large part of the price of milk.

*

The Red Cross has decided to be guided by the medical fact that human blood is unaffected by the race of its owner, rather than by the bigoted myth that white blood can be polluted by a transfusion of black or yellow blood. The race of blood donors is no longer to be recorded on their medical cards, a racial discrimination which Negroes have much resented.

*

When natural grassland in the dry Great Plains has been ploughed up for wheat, or overgrazed, grass will not re-establish itself naturally and a dust-bowl is almost inevitable. The Soil Conservation Service is now seeding 15,000 acres of Kansas land from an aeroplane, the largest experiment of this kind ever tried. It is cheaper than seeding such an area by hand but not so safe, for the pilot must fly below 50 feet.

THE WORLD OVERSEAS

Communism in Asia—I

Poverty and the Men in Power

(From Our Correspondent in India)

COMMUNISM in Asia is not like Communism in Europe. The doctrine and the end may be the same, the causes are almost entirely different. In Europe, Communism is an answer to frustrations that are more often spiritual than physical; in Asia it is the direct result of poverty, though very often poverty working at one remove. The most effective Communists are often not the poor themselves, but those who are disgusted by the corruption, inflation and injustice which poverty produces. In Asia the revolutionary fact is that it is getting steadily poorer. The consequent erosion of all hope in the future makes men ready for any desperate course; the Soviet Union's success suggests that terror and Five-Year Plans can enable even a backward society to pull itself up by its own bootstraps. If Mao Tse-tung can increase China's national income in any visible way (which might not be too difficult), while elsewhere in Asia the rot goes on, the future of Asian liberalism might well be bleak.

Communism in Europe is many things to many men. It is an interpretation of history which provides an alternative inevitability for those who no longer accept the will of God. It is a value judgment in economics which restores its self-respect to a working class too often left out and despised by Europe's hierarchical society. It is a technique of revolution, offering early power to the intelligentsia and the factory workman of whose interests Governments with a military and rural bias have usually taken far too little account.

None of these is of any importance in Asia. There is no anti-clericalism. Traditional religion still retains its hold, and, where it does not, it turns into agnosticism rather than militant atheism. Asian religions have no powerful hierarchies to serve as a focus for attack—in Europe Communism is a phenomenon of Catholic and Orthodox rather than of Protestant countries. Certainly Asia's societies are even more hierarchical than those of Europe; but for that very reason Communism is deprived of one of its most effective weapons. All European creeds appear to the Asian, by contrast with his own stratification, to have equality as their base; it is Liberalism, not Communism which is breaking caste. Communism appears only as the extreme statement of a general attitude. Indeed, the reactionary Asian is more afraid of the easy-going democracy of American social customs than of a Communism which permits the Russian official and manager full Brahmin privilege. Nor does Communism have the same appeal as a technique of gaining power in Asia as in Europe. The intelligentsia has had its interests very satisfactorily served by liberal nationalism; the proletariat barely exists; and Marx had only a nodding interest in peasants.

Tide of Babies

People in Asia go Communist primarily because they see no hope in the present system and feel that any change can only be for the better. That conditions in Asia are in fact desperate over very wide areas should need no emphasis. The Indian gets only 1,600 calories a day, the Pakistani and the Filipino only 1,800. In the countryside, the 3-acre holding and work for only three or four months in the year are usual; in many areas there is a steady increase in the landless—in India there may be some 60 million of them. In the towns, hundreds of thousands sleep in the street because the tenements will not accommodate more than ten to a room. There are still islands of relative sufficiency and content—Siam and parts of Sumatra for example—but even they are being gradually engulfed by the tide of babies.

In the past this poverty had limited political importance. It was accepted as fate, and there was all the authority of religion to emphasise the illusoriness of material wants But for fifty years now liberalism and nationalism have been undermining this resignation. The nineteenth century west believed above all in material progress. Therefore colonial governments felt the need to justify themselves in terms of increased welfare; therefore too the rising nationalist movements had to prove that the west had made them poorer, not richer. They found plenty of material to hand. They pointed out to the masses their poverty, and the masses responded.

Weakness of the Liberal Tradition

Once again, this has not been an undiluted advantage to Communism. One of Communism's strengths in Europe is its capacity for the organisation and exploitation of grievances. But in Asia no Communist outside China has been as effective in this way as the nationalists, Nehru or Soekarno or, above all, Jinnah whose whole career was built on the successful exploitation of a sense of grievance; and there has never been a strike organiser like Gandhi. Communist methods, with their slavish adherence to doctrine, lack the flexibility of a nationalism which could blame the grievances of capitalist and worker alike on the ruling alien.

The liberal nationalists were experts in opposition; their weakness now is that they are now in power. They have promised their followers, in all sincerity, in the best European style, the welfare state; they did not realise—they often still do not realise—that European welfare requires the surplus over subsistence of European national incomes. The men in power, therefore, whose efforts have made them national heroes, seem to grope and lose their way, and the regime loses its moral hold. Yet in Asia it needs a hold much firmer than in Europe. In the west, most people have cause for relative contentment. In Asia poverty gives nearly everyone reason for discontent, and so the whole atmosphere is "agin" the Government. This position is sometimes made worse by the fact that neither people nor Ministers are quite adjusted yet to power; they do not always remember that the Government is now their own, not an alien, if sometimes benevolent, machine. This atmosphere of opposition might, however, not matter if there were a liberal opposition to take advantage of it. But Asian liberalism seems to have exhausted itself in furnishing the great nationalist parties which now hold power; nowhere, not even in the Indian Socialists, has it been able to create an opposition too.

So far, indeed, the Communists have not succeeded in doing so either. Outside China and such special cases as Viet-Minh and the Hyderabad trouble, the Communist parties have neither effective organisation nor mass following. They are always being disrupted by the changes in the Cominform line and discredited by their obedience to Moscow. Nevertheless, because Communism is today one of the two great world doctrines, there is everywhere the feeling that the spread of discontent must eventually benefit them, and them only ; and this feeling in itself saps not so much the will as the ability to resist.

Discontent *is* spreading, because of poverty. It is not only that wider and wider classes of the population are awakening to the misery of their condition. Unless there is also economic equality, poor countries are always corrupt countries ; every little privilege, even the most ill-paid jobs, is so desperately needed. But an awakening Asian public opinion is no longer prepared to tolerate corruption. It may well be no worse today than it used to be, but people find it much harder to bear, and everybody has read of the unheard-of honesty of Mao's soldiers.

(To be continued)

Italy's Fading Visions

[FROM OUR ROME CORRESPONDENT]

AT present Italy seems politically in a sort of trance. It has been brought home by the recent international crisis that Italy with its 45 million inhabitants might disappear under the seafloor without anyone noticing it very much, provided the Vatican City could remain afloat as a beacon to believers in the younger continents and the stronger countries—also perhaps the tower of Pisa and Pompeii for the tourists.

The various visions which have kept the Italian political class in a certain moral tension since 1945 seem to have been fading. The idea of a " great return " of the nations to the bosom of the Catholic Church was one of these visions. Holy Year is said to have brought a million foreigners and two million Italian pilgrims to Rome, and the peasant pilgrimages have indeed been impressive. But the culminating act, the proclamation of the dogma of the Assumption, seems to have marked a stiffening of the hard theological core at the cost of a loss of influence among men of ideas in the west. The hopes of emergence of a great Catholic " underground " in Eastern Europe in reaction against Communist tyranny show no particular signs of maturing. Indeed, in Poland and Hungary the episcopates seem very much in two minds about making themselves martyrs for Pius XII. In comparison with the hopes of twenty years ago for a great apostolate to win over the heritage of Russian religion, and the enthusiasm at the nomination of the first Chinese cardinal in 1946, the present Vatican atmosphere betrays a certain depression. With this there goes some exhaustion of the Christian Democratic enthusiasm inside Italy. The party is a bit like the Congress Party in India, animated by memories which do not really give guidance for the future. Doubtless Signor De Gasperi is a notable leader and the Ministry is perhaps as good as any that could be put together ; but the party seems increasingly to become just an organisation for the sake of retaining power. Elaborate pacts now being entered into by the minor parties with the Christian Democrats for the sake of keeping out the Communists at the municipal elections in the next few months strengthen this impression.

Socialists in Limbo

The Saragat and Romita groups of Social Democrats in whose discords and approaches for reunion there was a year ago a certain lively interest, as developments which might affect the composition and colour of the Government's policy; seem to have receded into an academic limbo. The men are still round about, some of them are Ministers, and quite good Ministers, but the impetus which made them appear as possibly holding a key to the future has gone.

The whole group of people who found an answer to everything in the federation of Europe have dropped into the class considered by the vulgar as dreamers. The official line of foreign policy which was rooted in that conception sounds painfully unconnected with the tough problems of today, and Count Sforza's efforts to softpedal the military aspect of western co-operation have a pathetic tone. The colonial issue with its wistful emphasis on Italy's right to a share in the civilising mission of the west also seems to belong to the world of dreams, and the Right Wing journalists who parade it smack of antiquity.

The Italian Communists are not particularly triumphant about the redeeming exploits of Mao. For a party of 2,500,000 members which has never let Asia bulk very large in its interests or imagination the whole Asian factor seems to have exceeded sane proportions. A month ago Communism in Italy was on the downward path and it is doubtful whether Mao is going to rescue it. At the same time the distaste for Asia is two-edged and there are hardly any who want to see Italy mixed up in any way with the western campaign in the east. It is a blessing, perhaps, that Italy is outside the United Nations.

Fascism, despite all police measures, is certainly winning young people away from both Christian Democracy and Communism. But this should not yet be taken too seriously. In recent elections for a representative committee of Rome University students the Christian Democrat representation compared with 1948 fell from 39 to 24 per cent of the seats allocated in the various faculties while that of the Fascists rose from 13 to 31. All smaller parties lost heavily. This shows how things are moving in the student world. The Fascists (MSI) seem this time to have captured most of the previous Monarchist vote. The superficial situation, then, displays a stagnant equilibrium, and the ferments are frothy and noisome.

Dismay in Indonesia

[FROM A CORRESPONDENT]

THE first anniversary of the transfer of power in Indonesia falls on the second day after Christmas. Its main significance is that, under last year's Hague Agreement, disposal of Western New Guinea was deferred for one year. The Indonesians have interpreted this as meaning that New Guinea—which they call Irian—should be handed over to them by December 27th of this year. It is now clear that nothing of the kind will happen ; an extended meeting has taken place this month between Dutch and Indonesian representatives at the Hague, without any decisive result. Opinion in the Netherlands is now hardening against any further concessions, and Indonesian suggestions, which amounted to a proposal that the Dutch should temporarily continue to administer New Guinea, while sovereignty itself should be transferred to Indonesia, has proved quite unacceptable.

There is a feeling of great dismay amongst the Dutch in Indonesia itself over the New Guinea question. They are threatened with a serious boycott—and this really applies to all Europeans—if the negotiations with the Netherlands do not go the way Indonesia wants.

Anti-Dutch and anti-white feeling has become inflamed. This has aggravated the existing atmosphere of uncertainty, since security in Indonesia as a whole has been steadily getting worse for some time. The authorities called on subversive elements to hand in their arms by December 4th, but without great success. Those that did so were to be embodied in the army—which is already the cause of much trouble ; if the soldiers do not actually steal cars, for instance, they receive them, and the same applies to estate produce and anything else of value.

Threats to Foreign Owners

The staff on European estates have had to hand in their weapons, and estate guards have also been disbanded by Government order. Many estate-owning companies have ordered their staffs to leave when the guards leave—in a recent week 21 estates closed down in the Sukabumi area of West Java, to mention one area alone. There is a strong suspicion that the idea underlying this order about arms is to enable the estates to be confiscated on the score that they have been deserted. Theft is rife ; rubber is the chief attraction, the world market price being so high. Rubber trees are being spoiled as the thieves are cutting off as much bark in a night as a well run estate would take off in a year. If for some reason the price of rubber were to drop much in the next few months, there might be chaos in Indonesia.

In the tobacco area of Besuki in East Java, 500 tobacco sheds were recently fired by subversive elements. This is not only causing a great loss to the European companies involved, but also to the country in foreign exchange, as the tobacco involved is an export cigar type. Further, the Indonesian farmers now find themselves in the middle of a harvest with no possibility of disposing of their whole crop.

Cabinet Ministers, in their speeches, stress the need for an influx of foreign capital, but they seem powerless against the elements demanding an end to foreign ownership of business in Java. Moreover, the Minister of Labour has only one answer in cases of labour disputes—which is that the employer has to give in even if he is in the right. Not only does the employer have to meet all demands but he has to pay a percentage of wages during strikes ; the last case was Phillips, the electrical concern, which had to pay 75 per cent of normal wages for the strike period. This is causing the local manufacturer to adopt an attitude of " accede to labour's demands and make it up on prices."

Arabs in Dire Need

A THIRD winter of misery has set in for the Arab refugees. This article is designed to record the international arrangements for keeping them alive, and the longer term plans for supplying them with work and homes. But even a case-hardened correspondent cannot do this without first describing their misery, which makes all carefully worked-out resolutions seem remote and unreal. In camp after camp—most of them tented, a few hutted, with ragged cloths serving as partitions between the families—men, women and a swarm of children expose their misery under the bleak sky. Most are shoeless. All are shivering. The summer clothes in which they fled two and a half years ago are all worn out, and this winter's UN purchase of garments can run only to one article of clothing for every two refugees, plus one blanket per family. The grown-ups implore succour at least for their children, but what help can a visitor improvise? He can only feel self-conscious about his own warm coat.

This year's Assembly has set on foot the plans for a further period of meagre international help. Last year, it will be remembered, a plan was adopted on the strength of the economic report of a mission headed by the American expert, Mr Gordon Clapp. By its terms, $54 million was to be collected to cover the eighteen months to June, 1951, and during the months in question, as many as possible of the refugees were to be switched from existence on mere relief to a life in which subsistence was earned because some local work was provided. From the report of the UN Director of this operation, this year's Assembly has learned firstly, that $54 million would not have been nearly sufficient to inaugurate work for all in the period in question, and, secondly, that not nearly all the promised dollars have been received. The organisation established in 1950 and known as the United Nations Relief and Works Agency (UNRWA) has been vastly handicapped because receipt of funds has been so spasmodic. All has hung on the charity of governments of good will. Therefore, at no time has UNRWA been able to see its financial position for more than a few weeks ahead. During the period between May 1, 1950, and August 31st receipts totalled $11.9 million to cover approved plans of expenditure from May 1st to September 30th amounting to $12.5 million. Therefore:

> Only the fact that works projects did not develop as quickly as had been anticipated permitted the transfer of funds earmarked for works to the provision of basic relief. Even then it was only with the receipt of the 4th Quarter instalment of the United States contribution on September 25th that the Agency could allocate funds for the purchase of October food requirements.

It is obviously quite impossible to plan adequate relief, let alone works, on this hand-to-mouth basis.

By the end of August, 1950, contributions in cash, kind and direct aid promised up to June, 1951, totalled $39,960,000 ; contributions received were $9,938,000 only, almost entirely from the American and the British governments. This year's Assembly, which is asking for a fresh credit of $50 million to cover the period July, 1951, to June, 1952 (of which $20 million is destined for relief and $30 million for " reintegration ") has decided to adopt a less haphazard method of collecting promises. Last year, a mere round-robin was circulated. This year, a " negotiating committee " will call on states seated round a table to say what each can do or give.

No Hope of Return

But even if the whole $55 million is contributed, and even if it is given in the regular, predictable instalments that are essential to proper planning, the problem of what it will buy remains. To give but one instance of the difficulties that are being encountered, the price of all tents, blankets and camp equipment is soaring on account of events in Korea.

The Director's report to the Assembly contains, with these financial details, a long tale of domestic difficulties. One of these is the problem of morale. It is difficult if not impossible to convince these victims of war that the vast majority can never go back to their former homes, which are now inside Israel. Most were filled with false hopes by last year's Assembly resolution which said that they ought to return ; those who are living within sight of the hills of home spend hours gazing at their native land ; they are unwilling to build themselves better shelters in case this should prejudice their claim to be repatriated. Days spent in idleness do not improve the mood either of children or grown-ups. Out of 408,000 children between the ages of 1 and 15 only 31 per cent of those of school age are in school owing to the shortage of money, and therefore of teachers and pencils, books and blackboards. The funds at present available for schooling 200,000 children of school age amount to about 7d. per month per child. Grown-up hands are similarly idle for lack of materials. They would like to weave, but are short of looms and yarn. A potter becomes a different man if he can get some clay. But there are not nearly enough materials to go round. As each month passes, the problem of stirring people, educated or uneducated, from the prevailing inertia swells to greater and greater dimensions.

Public Works Projects

Part of the UN funds is to be devoted to public works projects, but these are even more difficult to set on foot than had been anticipated. There are at present 470,000 refugees in Jordan, 120,000 in Lebanon, 200,000 in the resourceless

Gaza strip and some 82,000 in Syria. But except in Jordan (which constitutes a special case since it has taken over Palestinian territory) there is suspicion of the foreigner who wants to introduce works, and a profound fear that he may wish to dictate all arrangements. So far, only about 10,000 refugees have been employed on such projects. Moreover, when the works are sited far from the existing camps, they simply increase the problem of shelter; blankets and mattresses are too few in number to permit of divided homes.

A few facts are clear from the experience of the last few months. One is that mere relief is going to continue to be a big operation and that the local Arab governments—none of them are wealthy and few of them good at administration—cannot possibly take it over. Another is that the inauguration of works projects is going to be slower and more expensive than Mr Clapp had thought. A third is that any foreign supervision of such projects will call for endless tact. Conditions are such that a warm word of sympathy is due to the international staff which is at present coping with the refugees out of highly inadequate resources. Some of the best of these workers are representatives of voluntary organisations—people accustomed to the country, speaking good Arabic, able to exercise their endless talent for mixing with the people and saying the right word in dark circumstances. The United Nations staff, less experienced though some of its workers are, are no less devoted to the frustrating task that they have in hand. But they labour under one immense disadvantage. By UN staffing rules, they are paid salaries at the New York rate plus an allowance dependent on distance from their ordinary domicile. This rate exceeds by as much as twelve to twenty times the rate paid to qualified refugees for the same work. No man or woman who really feels for the plight of the Arabs can be comfortable about such inequalities. Yet against their fat salaries must be set long hours of overtime, endless frustration, and the hardship of seeing more suffering than they have time or power to alleviate as they would wish.

Afghanistan on the Frontier

[BY A CORRESPONDENT]

THE British withdrawal from India has disturbed the balance of power in Asia to the disadvantage of the Western allies. In the last war India had over two million men on a war footing; her armies played an outstanding part in Burma, Abyssinia, North Africa and Italy; an Indian army stood ready in Persia to hold up a German advance south of the Caspian. If the successor States, India and Pakistan had shown themselves ready and able to follow the example of the former regime their attitude might have influenced Soviet policy. They are at the moment incapable of doing anything of the kind. The military potential of the sub-continent since Indian independence has lost much of its vitality, partly because the Indian army has been split up between the two countries; partly from the loss of the British element, especially in the technical services. Moreover the forces of each are tied up at home in case war should result from the Kashmir dispute.

The loss of influence is particularly noticeable in relations with Afghanistan. Under the British regime in India the major responsibility of the Indian army was to hold the North West Frontier. In the last war there was practically no anxiety on that score since the only great power that might have threatened its safety was the Soviet Union which was then in alliance with Britain. At the moment the position is different. The century-old menace to the North West Frontier has re-appeared.

The outlook is depressing. "I am buying arms" the Prime Minister of Pakistan said in Ottawa a few months ago, "because I have to defend the Khyber Pass." The implication was that the heavy burden of holding the great international frontier of the Commonwealth had fallen on the shoulders of his country. India which should have been ready to give powerful aid was completely indifferent. The Government of India had indeed gone out of its way to cultivate friendship with Afghanistan and had early in the spring of this year concluded a treaty of commerce with that country, despite the openly expressed hostility of the Kabul government to Pakistan.

It is obvious that this attitude of Kabul towards Karachi is a disturbing element in the problem of frontier defence. The Afghan Government, as is well known, has since the British left India persistently stressed its untenable claim to get back what it describes as Afghanistan *irredenta*, the country from the Durand Line to the Indus, with its population of six or seven million Afghans. In fact, the Afghan ambassador at Delhi, only three or four months ago, asserted that his Government did not recognise the Durand Line.

Campaign Against Pakistan

Up to a month or so ago, Russia had not shown any particular interest in Afghan relations with Pakistan. It is now associating itself with Kabul in the campaign of calumny against the latter, accusing the Pakistan Government of brutal oppression of the border tribes and the Prime

Minister of being a satellite of the western powers. It is more than probable that this new venture on the part of the Kremlin is due to the fact that the Pakistan Government has aligned itself with the western democracies, especially over Korea, and is turning its back on Russia. Encouraged, doubtless by Russian support, the Afghans have recently carried out incursions into Pakistan territory, on more than one occasion with the support of Afghan regulars. It is not surprising that the patience of the Pakistan Government is strained to the breaking-point. There is apparently a good deal of unrest in Afghanistan, especially among tribes on the eastern border and the important Hazara tribes in the middle west. It is unquestionable that the setting up of a great Islamic state pledged to democracy across the eastern frontier of Afghanistan is exerting a subtle influence on Afghan psychology.

The trouble is mainly economic. Trade is in a state of collapse, especially in the *Karakul* (Persian lamb) market. The large dollar balances built up by the Afghans during the war have been dissipated on ill-considered schemes of road improvement and irrigation, entrusted to a firm of American engineers. A loan of $21 million recently given by the World Bank should help to get these schemes completed, especially the great irrigation schemes on the Helmand. But to bring in an era of prosperity, strong measures must be taken to redress the disequilibrium between agriculture and industry. The main difficulty here is that while the capital city and the bulk of the population are south of the mighty barrier of the Hindu Kush, the country's resources in coal, oil and mineral wealth, and the best agricultural land on which long-staple cotton and sugar-beet are grown, lie on the other side. The requirements of power could, however, be largely met by hydro-electric installations.

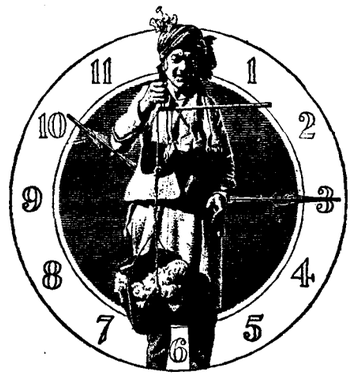
Dissensions have occurred in Government circles in Kabul, one consequence of which has been the dismissal of Abdul Majid, the able Minister of Economic Development. It will not be easy to replace him. There has been unrest in the army and plots against the ruling family. The *rapprochement* with the Soviet Union suggests that in an extremity the Afghan Government might look there for support. In taking such a step it would not carry the bulk of the people with it. But the danger is real: it can only be avoided by inducing the Kabul authorities to re-shape their policy. Their hostility to Pakistan is widely disapproved in the Muslim world; the Shah of Persia has offered mediation, an offer which Pakistan regards with favour. The United States Government is now urging the two countries to try to settle their differences round a conference table. The regime can only be placed on a firm basis by improving economic conditions. For this outside help is essential: it is not likely to be forthcoming from the western powers so long as the Afghans intrigue with Russia against Pakistan. With friendly relations established with the latter country, the way would be opened to progress.

Collectivisation in Poland

[BY A CORRESPONDENT]

THE Polish government is now concentrating its efforts on the tremendous task of settling the peasant problem. Yet it does not face the issue openly. In the Six-Year Plan (1950-1955), published by the Government and debated recently by the Party, detailed targets for industrial and even cultural development are given, but there is only very scanty information on the projected scope of collectivisation. Thus any speculation on the area which will be covered by collective farms in 1955 must be based in the first place on the targets for tractor production, since tractors in eastern Europe are the prelude to collectivisation. The Plan foresees that by 1955, 61,000 tractors will be supplied, of which 25,000 will go to state farms (*sovkhozy*). Almost all of the remaining 36,000 will go to tractor stations, and will be used chiefly on the collective farms (*kolkhozy*). State farms, at the end of the Plan, should cover an area of 2,000,000 hectares. If the 25,000 tractors are enough to work that area, then the remaining 36,000 would be sufficient for approximately 2,800,000 hectares of collective farms, thus giving a total area under state or collective farming of 4,800,000 hectares, or roughly 24 per cent of the total area under cultivation.

Thus as regards machinery the Polish Government evidently hopes to be better off than was the Soviet Government when it embarked on its collectivisation drive in 1928. But the peasants' hostility constrains the Government to go slowly for fear of jeopardising its food supplies during the period of industrialisation. Moreover, the peasants have a powerful ally in the Catholic church; in the Soviet Union the role played by the Orthodox Church was insignificant.



The one-day census, which took place on December 3rd, was symptomatic of the suspicious attitude of the peasants. The Government, fearing the peasants' unwillingness to supply true figures concerning their property, had to repeat time and again that the census has nothing to do with any new economic policy for the countryside. Reports on the inquiries in the countryside sounded like communiqués from a battlefield. Finally it was announced that the census had been carried out relatively quietly.

A recent article by Roman Zambrowski, member of the Politbureau of the Polish Workers' Party in charge of collectivisation, makes it clear that the rural population, which is still over 55 per cent of the total, is again, as in 1948, excited by rumours of a projected speeding up of collectivisation. There are mass attempts at hiding the grain and in some cases peasants have refused to take part in local administration. Even the poor peasant, on whom the Government relied as a potential ally in the struggle against the rich peasant, has been "disappointing."

In the last two years 2,000 collective farms have been set up and they employ just over 2 per cent of the agricultural manpower. Not all farms are on the Soviet model. There are still three categories, ranging from "Type I" in which labour and machines are common property, while land and cattle are privately owned, to the "Type 3" which is similar to the Soviet *kolkhozy*, and in which the peasant owns only a quarter of a hectare, a cow and poultry.

Zambrowski reports in a disillusioned tone that attempts to attract the poor peasant into the collective farms have not been successful. Less than 20 per cent of the present members of collective farms have been poor peasants who had owned less than 5 hectares of land, while 60 per cent had owned plots of 5 to 10 hectares. This failure to attract the poor peasant is the more striking when it is remembered that out of all Polish farms some 44 per cent are still held by poor peasants with plots of less than 3 and a half hectares.

Who should take the blame for this failure? On the Russian model the "right wing deviation," which "ignored" the poor peasant and did not struggle against the kulak. The ex-vice-premier and general secretary of the Party,

Time for Eastern trade

Ten-fifteen in England and the London, Manchester and Liverpool offices of The Chartered Bank of India, Australia and China have already opened to the public. At New York the day's work has not yet begun. In the East at Colombo it is tea-time and in Hong Kong business is finished for another day. But wherever business men engaged in the Eastern trade may be, they will find at the nearest branch of The Chartered Bank up-to-the-minute information, skilled assistance and efficient banking services.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(*Incorporated by Royal Charter* 1853)

Head Office: 38 Bishopsgate, London, E.C.2.
Manchester Branch: 52 Mosley Street, Manchester 2.
Liverpool Branch: 27 Derby House, Liverpool 2.
New York Agency: 65 Broadway, New York, 6.

Branches of the Bank are established at most centres of commercial importance throughout Southern and South-Eastern Asia and the Far East.

Wladyslaw Gomulka, now in complete disgrace, is again the scapegoat and may well end by meeting the fate of a Bukharine or Rykov. Hence the Party's task must be a merciless struggle against the right-wing deviation and an even more energetic fight against the kulak. The latter class must, in fact, still be strong if it accounts for 26 per cent of the total agricultural output and its grain supplies for the towns must be proportionately greater.

Thus the collective drive will first be aimed against the now existing 170,000 larger farms (approximately 5 per cent) covering 2,800,000 hectares (just under 16 per cent). Two years ago the farms of the wealthier peasants were still serviced by the state-owned tractor stations. Now they are no longer. They have been burdened with heavier taxes: while the poor peasant pays 2-5 per cent on the income from his output on one hectare, the kulak pays over 40 per cent. Up to this year the sale of grain was free. Now the rural communities fix the quotas of the richer peasants. Their ties with the town merchant are broken through state or co-operative trading and they are prevented from accumulating stocks, which they used to barter for labour with the poorer peasants.

The monetary reform, put into effect on October 28th, is also aimed at the wealthier peasants, who, though they did not have bank deposits, lent money to "medium" and small peasants before the harvest and were paid back in grain or labour. The debts of the small peasant have been reduced by two-thirds, the savings of the "kulak" have been reduced by the same amount, since he gets one zloty for every 100 while the worker gets 3 for 100.

The shortage of money, credit, machinery, and heavy taxation will, it is hoped, in the long run deal a fatal blow to the kulaks, while in the short run it will force them to throw their stocks of grain on the market. The reduction of debts, on the other hand, should help to intensify class conflicts in the countryside, dividing the peasantry into wealthy, "medium" and poor, the definition of a "medium" peasant depending not so much on the size of his plot as on his attitude towards collectivisation.

Over-Enthusiastic Activists

The approach to the medium and smaller peasants must be very carefully thought out. At the recent plenary session of the Party Council of the United Peasant Party (ZSL) the vice-chairman of the party executive, Stefan Ignar, enumerated some of the mistakes which political activists had made in their dealings with the smaller peasants. They had tried to force them into collectives through administrative and economic pressure; this was a "blatant deformation of the Party and State political line." They had carried out sudden one-day campaigns in villages which they had never visited before; these were of no value. Above all, they had tried to prevent the peasants from forming the less extreme Type I collectives; this resulted in the formation of fewer co-operatives than would otherwise have been possible.

> Where and when a higher type of co-operative was established against the opposition of the bulk of small and medium peasants, many of the original applicants withdrew. . . . In one village, for instance, 60 peasants volunteered for a Type 1 co-operative, and when the political activists foisted a Type 3 co-operative on them, only 16 peasants joined.

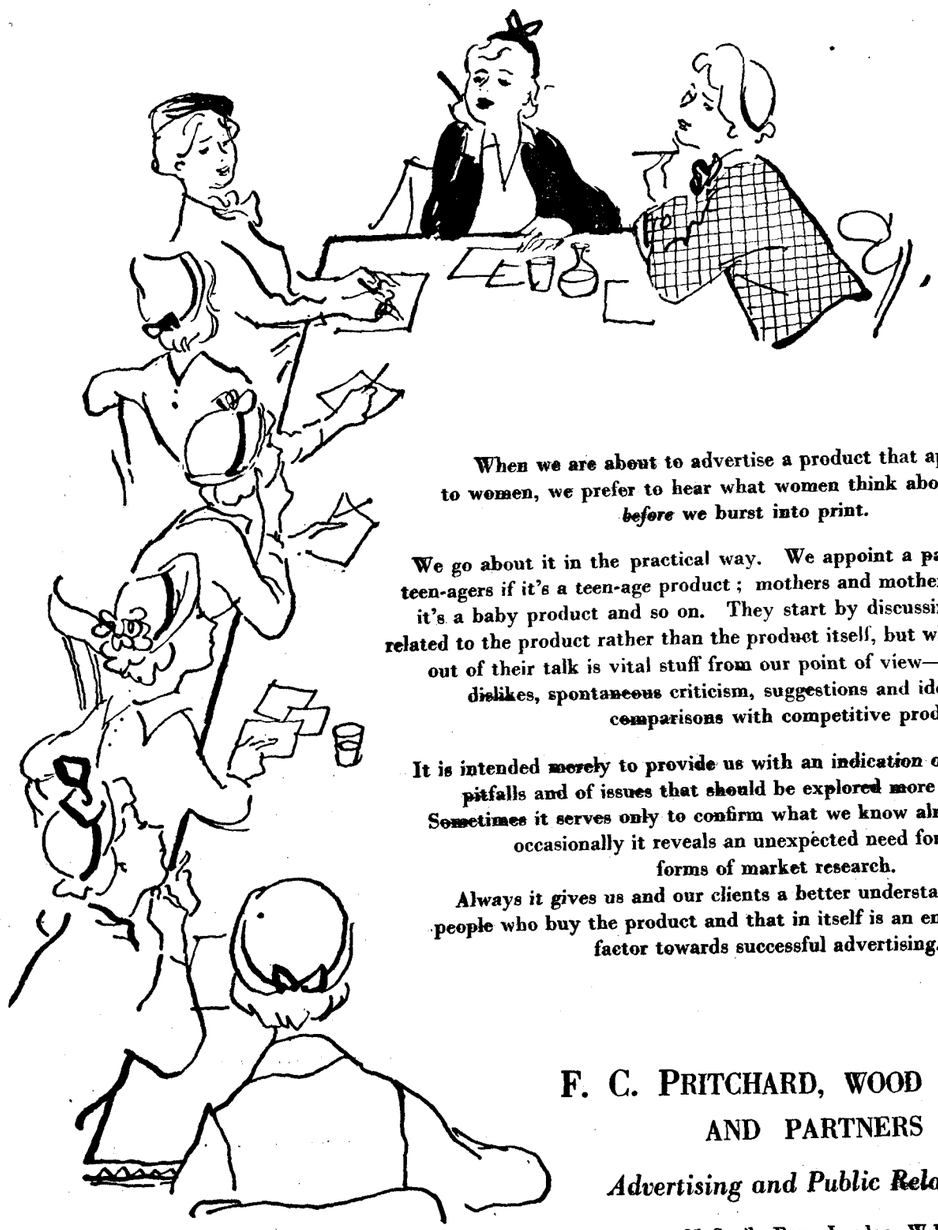
Ignar urged the activists to approach the peasants gradually, by helping them to iron out their local difficulties, by drawing them into the supervision of a Peasant Mutual Aid Organisation by setting up a welfare centre, or a people's sports team. In a word, the right atmosphere must first be created, and the peasants' confidence won.

For propaganda purposes scores of peasants are sent every month to the Soviet Union to visit modern collective farms. On their return they tour Polish villages with talks on the blessings of the collective system. Their propaganda is, however, often counteracted by the impressions of *many* Polish peasants, who during the war worked on Soviet collective farms.

Hitherto economic reconstruction and industrial development in Poland have on the whole been successful. But the new policy towards the countryside will be a much stiffer test, the peasantry, the largest class, being a much harder nut to crack, especially during a period of international tension. The Government must be aware that it will have to face the opposition not only of the wealthy, but also of the "medium" peasants. This awareness must have been increased in 1948, when at the first rumours of collectivisation, the peasants cut down their supplies of meat and grain, and corn had to be imported from the Soviet Union. The first stage of collectivisation has now been spread over six years. Whether the Government will be able to carry it out without tremendous upheavals will depend on its ability to manœuvre, to apply its own, more peaceful methods as well as on the international situation.

Political Deadlock in Finland

[FROM A CORRESPONDENT]



THE Communist Party of Finland, as of other countries, is led by loyal stooges of Moscow. Its spiritual father is the Comintern veteran, Otto Willi Kuusinen, the unsuccessful would-be liberator of 1939. Though rewarded for his past services with the decorative post of President of the Finno-Karelian Soviet Socialist Republic, he is believed to spend less time in Petrozavodsk than in Moscow. Whether he sends directives to the comrades at home, as did the late George Dimitrov during the interval between the "liberation" of Bulgaria and his triumphal homecoming, is one of the secrets of the Party. But though led by men who undoubtedly "appreciate the leading role of the Soviet Union in the struggle for peace and democracy," the Party can boast a legitimate Finnish ancestry. Its claim to represent the revolutionary traditions of the civil war of 1918, betrayed by the "right-wing socialist renegades," is accepted by a considerable part of the Finnish working-class, including many who have little admiration for Russia. With 38 seats in a parliament of 200, the Communists, with their *garniture* of approved fellow-travellers, are a force to be reckoned with. Though the Communist workers seek only economic and political advantages for their class within their country, party discipline enables Moscow's agents to use them as a weapon for their ends. The Finnish patriotism of the Communists, of which Finns will assure the foreign visitor with somewhat exaggerated complacency, is no guarantee against such use.

The fifth column is not Moscow's only weapon. Military power includes not only the armies across the eastern border but also the forces in the base at Pokkala, just outside Helsinki's suburbs. As an economic weapon, reparations, which will soon be paid off, are of diminishing importance. Their place is being taken by the trade treaty of June, 1950, which provides for a five-year exchange of goods whose yearly value is to rise from 13 million Finmarks in 1951 to 18 million in 1955. The share of the engineering and metal industry in Finnish exports under this treaty is to be 40 per cent in 1951 and is to rise to 70 per cent in 1955. By their interpretation of the phrase "world market prices"—for which the history of east European trade after 1945 provides some melancholy lessons—the Soviet leaders can put pressure on an industry which employs one-third of Finland's industrial workers. The trade treaty also gives them an excuse for maintaining in Helsinki a "trade delegation" whose numbers are certainly not justified by current business, and whose members presumably engage, under diplomatic cover, in other more interesting duties.

Holding so many strong points, the Soviet government can use its favour and displeasure to intervene in Finnish

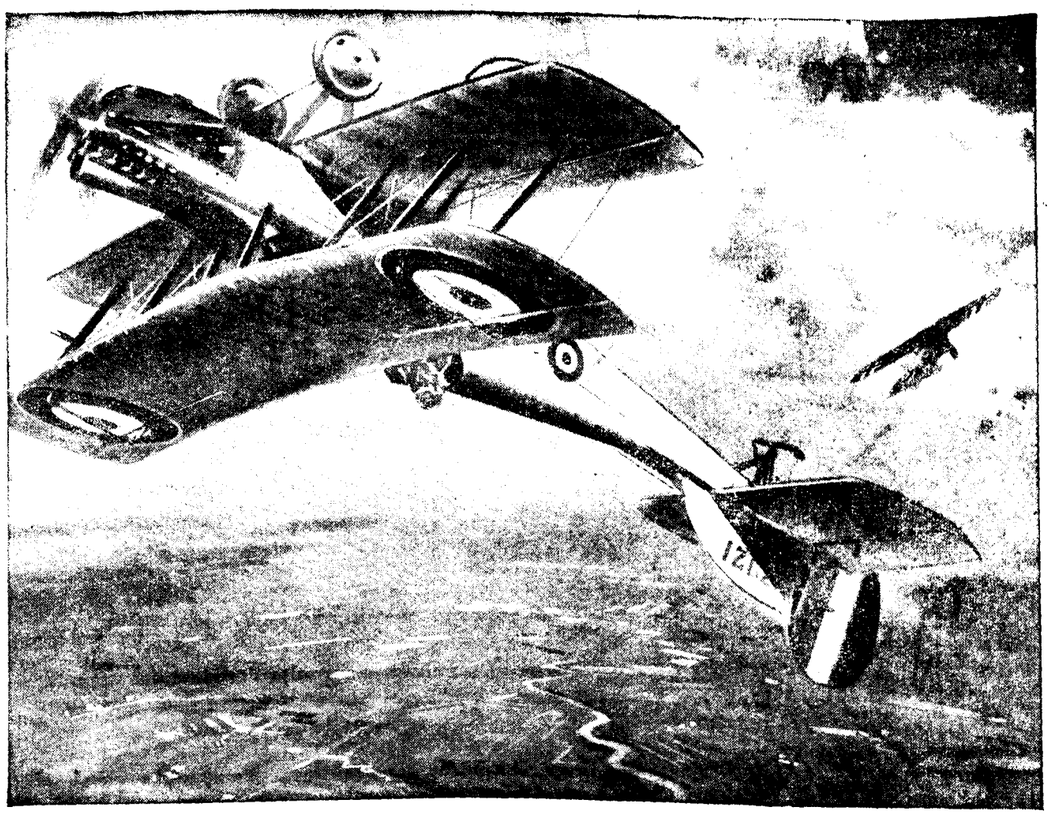
women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it *before* we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.



Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

We've solved some problems in our time!

WANTED—*an unspillable aircraft battery*. That was 1916. On the western front, British artillery observation pilots, harried by enemy fighters, were learning new evasive manœuvres in a very hard school. With them, right way up or upside down, went the batteries used for W/T communication with the gunners below. Every so often, inverted batteries lost their acid and put the wireless transmitters out of action.

¶ Chloride Batteries solved that problem quickly—and finally. A battery with each of its necessary gas vents constructed in the form of compartments within compartments, so as to make an acid trap, was soon in action: the first truly non-spillable battery, and the forerunner of every such battery made since.

¶ For more than half a century, each year has brought its quota of problems to this company. In industry, transport and communications here and abroad, we can point to tens of thousands of our Chloride, Exide and Exide-Ironclad Batteries each giving satisfactory service in the special job for which we were asked to design and produce it. Those are answers which time has proved to be right.

¶ Our battery research and development organisation is the largest and best equipped in the country—if not in the world. It is at industry's service always—ready at any time to tackle another problem.

politics. Moscow makes no secret of its hatred for the Social Democrats. The Fagerholm ministry of 1948-50 was treated with official coldness and unofficial abuse. The Kekkonen ministry which succeeded it in March has been greeted with smiles. The Prime Minister himself, a clever party organiser, and an expert in parliamentary manœuvre and intrigue, likes to feel a great and wise statesman. The role of the one man who can save Finland by winning the gratitude and friendship of the Soviet Union is attractive to the Prime Minister. It is one which Soviet blandishments encourage him to play. Kekkonen's personal feud with the Socialists intensifies the distrust between town and country, for which there are already economic motives. This, of course, suits Moscow. So does any intransigence among the industrial employers. Any indirect means that Moscow can find to encourage employers to antagonise workers will of course be used as thoroughly as any discontent among the workers themselves. To "sharpen" the class struggle at both ends is good Bolshevik policy. Kekkonen is no doubt as devoted to independence and democracy as the rest of his compatriots. But his policy can hardly be said to contribute to the national unity which is essential if both economic and political dangers are to be avoided.

In the last month there has been much talk of a government of national unity. In particular, it seems essential that the two largest parties, Agrarians (56 seats) and Social Democrats (55), should be included. On November 15th the Conservatives (32 seats), who till then had supported Kekkonen from outside his cabinet, proposed a vote of no confidence. The occasion was a minor dispute, but the purpose was to force a coalition. The government was only saved by the votes of the Communists. Against it were the Conservatives, Social Democrats and some Liberals, while some members of the Swedish Party (which is represented in it) abstained. On November 25th the Swedish Party announced its intention of withdrawing from the government unless it were "shortly" reorganised.

The coalition that the majority of the Finnish people would prefer is one of Agrarians, Socialists and Swedes, with the support in parliament of the Conservatives, and excluding the Communists. But this would be interpteted in Moscow as a "provocation against the great neighbour." When the United Nations troops were advancing victoriously to the Yalu river, the risk might have seemed worth taking; today it is more doubtful. Certainly Kekkonen is not the man to take it. He would prefer the solution which the Communists themselves suggest, a coalition of all parties except the Conservatives, including the Communists. Even the most complacent Finns, all of whom love to say "it can't happen here," know something about the results of this kind of coalition in Czechoslovakia and Hungary. The Social Democrats in particular are strongly opposed to such a combination. The remaining possibilities, a Socialist-Conservative or an Agrarian-Communist partnership, are improbable. A general election is likely some time in 1951, but it can hardly produce a parliament much different from the present. There is in fact a deadlock. For advocates of "Popdemocracy," or for the ingenious and inscrutable Kekkonen, the obstacle is the obstinacy of the Social Democrat leaders. For those who wish to save Finland from "Popdemocracy" the obstacle is the personality of Kekkonen.

So far the Finns have remained independent partly by their own efforts and partly by Moscow's tolerance. They have the advantages of a balanced social structure, a strong democratic tradition and complete imperviousness to any sort of cultural infiltration from Russia. To these must be added truly remarkable courage and calm. The Russians receive their reparations punctually, they do not need Finnish territory for further expansion, and they know how unpleasant Finnish forest guerrillas can be. So they have left the Finns alone. If one considers Finland in isolation, these things are all still true. But the future of Finland must depend on the time-table of Moscow's plans for Western Europe, and despite an outer armour of stolid complacency, most Finns realise how grave the situation is. As far as their fate depends on them, they can be trusted to act with realism and resolution.

Tito Gets His Bread

"While we are doing this thing," said Representative William M. Colmer, "let us do it graciously." And so, in record time, the authorisation of a further $38 million expenditure for the US Administration's famine relief programme to Jugoslavia has been passed by both Houses of Congress, practically in the form in which it was presented. The only major amendment, reluctantly accepted by the Administration spokesmen, is that the funds shall come from Marshall Aid appropriations, of which there will probably be a substantial surplus at the end of this fiscal year. (The actual authorisation was for $50 million to cover the $12 million already spent on wheat.) Otherwise Congress has imposed no ties which could in any way be described as ungracious. Marshal Tito is to distribute aid equitably under American supervision and with full publicity; this he is already doing with the emergency food shipments which began last month. He is to take note that the granting of aid does not imply condonation of his economic, political or religious practices; half the commodities shipped are to go in American vessels; and Mr Acheson is to report on the fulfilment of these conditions once every three months.

Scraping the Barrel

As long ago as last spring, the State Department realised that Jugoslavia would need further economic aid, and that, sooner or later, Congress would have to be asked to give it. But they feared that the temper of the Congressional camel was such that a request for Jugoslav aid might well break its back, and they tried to postpone it as long as possible. So they scraped all the other barrels first and found $31,400,000 for emergency shipments. In the United States the existing appropriations of the Federal Agencies were tapped; the residue of the Export-Import Bank loan was made available for purchases of food; and the President authorised food shipments amounting to $32 million under the Mutual Defence Aid Programme and ERP. Outside the United States, other western countries were asked to restrain their demands for outstanding payments from Jugoslavia and to extend as much credit as they could. The elections, and Senator Taft's determination to re-examine all foreign aid programmes augured even worse for the approach to Congress, and, until the last few weeks, it was expected that at best there would be a two months' struggle on the Capitol before any aid was passed. Now, the Senate has approved the authorisation by a majority of 60 to 21, and the House by 225 to 142.

The strongest factor in the Administration's favour was undoubtedly the importance of not losing Jugoslavia's thirty-two divisions. In his original message to Congressional leaders, the President made the following case: apart from his importance as a political symbol, Marshal Tito has the largest army in Europe bar only Soviet Russia; it is now clear that, so long as it is in his power, the West can count on this in an emergency, and, even without one, to immobilise at least an equal Russian force; but unless Jugoslavia is given immediate aid, Tito's ability to counter subversive elements within will be "seriously if not fatally" prejudiced. These and events in Korea are the arguments which conclusively won the day in Congress. If the President could recognise the importance of thirty-two Jugoslav divisions in November, events in the Far East have provided even more cogent reasons why Congress should recognise it in December.

THE BUSINESS WORLD

Monopoly under the Microscope

TWENTY-ONE months after receiving its first task from the Board of Trade, the Monopolies and Restrictive Practices Commission has issued its first report, on the supply of dental goods. This is not a large industry; the total cost of dental materials and equipment in 1949 was only £5,750,000—say five parts in ten thousand of the national income and one part in ten of the cost of dental services. This is a relatively small figure and it is larger than it would have been in the absence of the National Health Service. If it could be proved that the industry's prices are too high, or its trading methods inimical to the public interest, it would still be true that the industry has not thereby severely damaged the British economy. No substantial complaints have been laid before the Commission by users of dental goods; in the last resort, the biggest customer is the National Health Service, and the Ministry of Health has not looked into the prices charged for dental materials and equipment.

These are conditions in which it is all too easy to rely on the *minimum sensibile*—to use the old retort that the directors' fees would not provide a ham sandwich for the stockholders or, in this context, that a little extra on the cost of dentures is negligible per bite. But the questions that the Commission had to answer left no loophole for pleading of this kind. They were in substance two:

> (1) Does one person or group supply at least one-third of the British market for dental goods, or is one-third at least supplied by two or more persons who conduct their business in any way to prevent or restrict competition in production or supply?
>
> (2) Do these things if established operate against the public interest?

To answer these questions involves in the first place a careful examination of the structure and history of the dental goods industry, and this examination provides the grittier sections of the report. The industry is dominated by the Amalgamated Dental group and the Dental Manufacturing Company, which in 1948 were responsible for 68 per cent of home retail sales. The AD group is the larger of the two; it is the only manufacturer of burs ("drills" to the layman), but it does not make acrylic (that is, plastic) teeth and it sells as sole agent porcelain teeth made by an American associate company and by a British subsidiary. The AD group, the Commission concludes, supplies more than one-third of British supplies of dental goods (in 1948 the proportion is put at 46½ per cent).

In 1923 there was formed the Association of Dental Manufacturers and Traders of the United Kingdom. The ADMT came into being after a period of intense competition which had particularly involved the two firms of Claudius Ash and De Tray before their amalgamation. The Association has three main classes of members: dealers (of whom there are 17), manufacturers (33), and dealer-manufacturers (37). Manufacturer members are bound to supply dealer members only, and dealer members may buy only from manufacturer members. The election of any person to any class of membership is at the discretion of the Council; thus, refusal of membership deprives an applicant of the right to trade with members. In the management of the Association, the Council is in a position to wield great power; it can apply drastic sanctions, including expulsion and fines, to check any breach of the rules and indeed apply them against "unfair means in competition" or against business conduct "detrimental to the interests of the Association or the trade." All members are required to adhere to the retail prices fixed by manufacturers or by sole agents, and the ADMT holds that the exclusive dealing clauses, whereby manufacturers confine their sales to member dealers, are mainly intended to reinforce the resale price maintenance provisions. The Commission concludes:

> It is clear . . . that these two regulations, if used in conjunction with restrictions on admission to membership, can also serve to prevent the entry of competitors into the industry . . . the ADMT does restrict admission to membership and the exclusive dealing clauses cannot, therefore, be regarded merely as part of the resale price maintenance arrangements.

Competition by means other than reduction in prices of branded goods is covered by regulations defining "excessive services." Since 1935, and excluding the war period, of eighteen applications for dealer membership seven were eventually successful, and of the seven only one applicant was new to the trade. In the same period out of sixty-nine applications for manufacturer membership, thirty-eight were successful.

Several of the applications in recent years were from makers of acrylic teeth—an important new product. The development of acrylic dental materials and the attitude of the ADMT towards them provides an interesting slice of recent history. The Commission's report shows that the policy of the ADMT on this matter underwent considerable discussion. The Association sought to exclude the smaller manufacturers, and it was also apprehensive about "over-production" of acrylic teeth. In fact, no concern has been admitted to membership as a manufacturer of acrylic teeth; two applications by such manufacturers were rejected in 1948 though their output was in each case greater than the total output of dental goods of some manufacturer members of the ADMT. This new technique also involved the relations of Imperial Chemical Industries with the ADMT in an important way. The story is complicated, but the conclusions stand out. ICI developed the basic acrylic material (methyl methacrylate, in which they have a monopoly); this is used for denture bases and for teeth. The denture-base material had been developed with the assistance of Minerva Dental Laboratories (a concern outside the ADMT). In 1941, ICI (though not then members of the Association) agreed to confine their sales of two branded products to members of the ADMT,

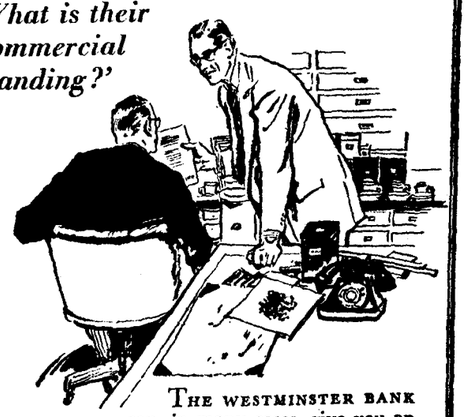
except for Minerva, who were allowed to buy on the same terms as members for a period of three years. The Commission's findings on what followed are of importance:

> ICI felt obliged to join the ADMT and to submit to its rulings in order to get satisfactory distribution of their dental products. . . . The ADMT was so powerful as to be able, not only to ensure that its members obtained a share in the distribution of "Kallodent," but also to exclude from a share in its distribution the laboratories whose technical services had greatly assisted the development of the product. Throughout, the ADMT applied its rules inflexibly. In particular we note its action in refusing an extension of ICI's special arrangements with the Minerva Dental Laboratories, in discouraging ICI from selling to dental laboratories even at retail prices, and in refusing to allow ICI to give an increased discount to hospitals at the height of the war.

This is power, and its exercise has only been mitigated by the fact that ICI since 1948 has sold to all purchasers denture base material identical with its branded product and from the first has sold tooth making material to all purchasers ready to take the minimum quantities.

In thus outlining the reactions of an established organisation with its set procedures towards new materials and new producers, the report serves a valuable purpose. How do these and other matters affect the public interest? On this the report is fair but firm. It finds that the Amalgamated Dental group has a high professional reputation and that

> the group has used with moderation the great power which it has derived from its substantial hold on the market and the support afforded to it by the restrictive practices of the ADMT.



But there are other features less clearly in the public interest. Its monopoly of the manufacture of burs is reinforced by agreements with two of the largest dealers which limit the extent to which the latter can stock burs made by other concerns. The report recommends that these distribution arrangements should be reconsidered. It also concludes that the prices maintained in this country for porcelain teeth sold by Amalgamated Dental under sole agency arrangements are "too high" and that a "substantial reduction" is desirable in the public interest.

When it comes to report on the Association of Dental Manufacturers and Traders, the Commission finds that the Association is responsible for eight chief practices that restrict competition and obtain their force and effectiveness through exclusive dealing and the collective boycott. The broad effect of the provisions that make this so is thus summarised in the report:

> (*a*) Dealers covering nine-tenths of the trade may not buy from any manufacturer who does not wish or is not allowed to join the ADMT.
>
> (*b*) Manufacturers covering nearly nine-tenths of the whole trade may not sell to any dealer who does not wish or is not allowed to join the ADMT.
>
> (*c*) If they break any of the ADMT's rules, manufacturer or dealer members can be boycotted by an overwhelming majority of the trade.
>
> (*d*) A manufacturer or dealer cannot leave the ADMT through disagreement with its rules or method of government without losing most of his business and so risking his livelihood.

The rules and regulations of the ADMT could involve "an extreme interference with the freedom of the subject to carry on any lawful business"; the penalty of depriving a member of his substantial livelihood is out of proportion to a breach of a trade association rule;

'What is their commercial standing?'

and an association covering so large a proportion of the industry and armed with such powers tends to become self-perpetuating. The Commission observes:

> These undesirable results are possible. . . . If we emphasise here that we have not found any very great abuse of the powers of the ADMT, we must also emphasise that, in our opinion, this is a tribute to the moderation of the men who control it, rather than to the nature of its rules and regulations.

Its final recommendation is in two parts. The Association is invited to revise its rules and policy in the light of the Commission's report. Secondly, it suggests statutory action not against detailed matters of practice that may conflict with the public interest, but against the two features that underpin the whole of these matters—exclusive dealing and the collective boycott. These features should be prohibited. But as the Lloyd Jacob report showed, they are not confined to the trade in dental goods ; the Commission leaves it to Parliament to say whether legislation against these features should be confined to the dental industry, but two of its members argue that general legislation is desirable and that "it would be wrong to enact *ad hoc* legislation against this industry."

It is difficult to quarrel with this view. It raises the fundamental question of the nature of the Monopolies Commission's tasks and powers. Its work is entirely *ad hoc* ; it is given jobs as the President of the Board of Trade may determine ; it has full powers of discovery of facts and no guidance whatsoever on principles. What is the intention ? Is it to allow monopolies to exist, but on pain of public examination (if the Board of Trade so orders) and on condition of tolerable behaviour ? Or is it to break down monopoly and trade restriction ? If the latter, there is really no way of securing these fundamental ends without legislation making such practices criminal, and allowing exceptions only with the positive consent of the Government. This is not how the Act is conceived ; it would be absurdly unreasonable for single industries—merely because their affairs have come under the microscope first—to be prevented by law from doing things that would still be lawful for others. There can be no unlawful exceptions to what is lawful without creating confusion and bitterness. And the prosecution of "the public interest" might be more easily secured if governmental attitudes towards restrictive practices had been consistent through the years, and were consistently applied now to all industry, whether publicly or privately owned, and also to the trade unions. The scholastic, detailed approach of the Commission's first report has its uses ; it has on this occasion described an industry of which too little was publicly known before. But this technique of looking at industry through the magnifying glass is not enough for dealing with monopoly. That calls for a macroscopic approach —some notion of the practices that ought to be forbidden to all industry. In short, it needs a policy. Perhaps one day there will be a government with courage enough to produce one.

Transformation in Shipping

SIX months ago few people in the shipping trade would have suggested that a serious physical shortage of merchant tonnage—at any rate in the Transatlantic trades—might arise by this winter. Steady progress in restoring war losses of merchant ships under most flags had continuously been improving the industry's capacity to meet trade demands, and freight rates, allowing for seasonal fluctuations, had been diminishing for more than two years to a level roughly 25 per cent below the 1948 average. Since then a transformation has taken place in the shipping market which, though it has not raised rates quite to the high levels of early 1948, has already caused speculation whether a return to wartime and early postwar controls may not be desirable or imminent. It is too simple to count this, like other shortages, as merely another result of Korean aggression. The campaign has, of course, created an abnormal demand ; but its requirements for sea transport do not approach the 1945 scale, and they have largely been satisfied by the recommissioning of vessels from the laid-up American reserve fleet.

What other factors have been at work ? The tramp freight market is an international market, free to find its own level in accordance with the laws of supply and demand, and the steep rise in rates has occurred particularly in the last few months. The best index of freight rates is that compiled by the Chamber of Shipping of the United Kingdom, based on fixtures in sterling made during each month, and related to the average for the year 1948 ; its fluctuations are shown in the accompanying table. It is normal for freight rates to reach their lowest level in the summer months ; the only immediate consequence of the outbreak of war in Korea was a slight recovery from the low May level. This upward trend continued fairly steadily throughout the summer months, but the curve has lately become much steeper. The American authorities decided that transport requirements for the Korean campaign should be met by withdrawing more than 100 vessels from the laid-up fleet, but while these ships were being made ready for service a considerable number of American ships had to be withdrawn from their commercial services under charter. This offered more employment to ships of other flags, and the first section of the market to respond was the North Pacific lumber trade, in which charterers were very soon taking tonnage at rates increased by some 30 per cent.

These attractive rates naturally began to draw tonnage from other routes, and a shortage of vessels occurred in Australian waters which forced grain rates up by some 10s. a ton. Meanwhile there was considerable activity in a trade which had been dormant since before the war, the carriage of soya beans from Manchuria to Europe. Despite its proximity to Korean waters, this trade continued, although the increased risks forced the general rates up from about 70s. to as much as 110s. On the North Atlantic, Cuban sugar charterers found themselves short of tonnage and were compelled to offer higher rates. At the same time the political and strategic situation was accelerating hoarding of vital raw materials, such as rubber, which involved sea transport of large quantities over long distances ; and the more recent accent on rearmament and defence programmes has increased these demands on tonnage. The general economic situation, too, helped to intensify the demand for dry-cargo tramp tonnage, for the liner companies found themselves unable to cope with the great expansion of British exports during the autumn without taking tramp ships on time charter ; rates for a round trip from the United Kingdom to Australia and back almost doubled between May and October. By November the resumption of chartering for Black Sea grain began to add to the pressure.

At this stage, freight rates in all markets had responded to the general trend, for the bulk of tramp shipping under all flags was engaged principally in distant waters on long voyages. A significant feature, reflecting the strange conditions which had developed, was the engagement of ships on such unusual tasks as carrying coal from South Africa to Sweden, and from Calcutta to Copenhagen. This was the state of affairs when British Government charterers suddenly chose to enter the market to obtain ships to carry coals to Newcastle.

★

With the North Atlantic practically denuded of tonnage, and other European coal importers competing for whatever is available, it is not surprising that the coal charterers have been having the greatest trouble in covering their requirements for the next two months, even at rates as much as 25s. above their own original ideas. Even at the best of times, from the charterers' point of view, coal imports call for higher rates than coal exports, for ships going outwards with coal are more assured of return cargoes and would otherwise have to travel in ballast. For coal imports from America the reverse is the case, and matters have been made worse for coal-burning steamers by the necessity of bunkering on the other side for both legs of the round voyage. This means that on the homeward voyage some 500 or 600 tons of cargo must be excluded by bunkers, while on the outward voyage a similar amount of deadweight which would reduce the rigours of a ballast trip in winter weather is missing. Again, the substitution of American for British coal at bunkering ports and depots over a wide area adds to the operating expenses of coal-burning ships in all trades.

Official failure to foresee months ago that coal imports would be needed—and to repair or accept this situation —has been followed by mishandling of coal charters. As soon as imports were inevitable, the authorities should have followed freight market trends very closely and quietly covered their commitments well in advance as best they could. If this policy had been adopted, the more serious disadvantages of the shortage of tonnage would have been more evenly spread among all charterers, while more ships would have been booked to remain in the Atlantic ; instead of which the coal importers have been left with the dirty end of the stick all to themselves. The best view of an international business such as shipping is, perhaps, not obtained from the office windows of a nationalised industry or of a Government department, and it is not therefore surprising that the authorities should expect British shipowners, rather than their competitors, to extricate them from a desperate position. A Government that still retains the powers of controlling voyages by licence is, of course, in a position to induce British shipowners to accept terms and rates which their competitors in a free market can refuse, but the necessity to exercise these powers has not arisen because the British shipping industry is accustomed to answering the call in a national emergency. In order to save the situation, not only have British tramp owners been advised to forgo more profitable alternative employment (thereby greatly strengthening the position of their competitors), but many of the liner companies have released vessels which they had already engaged on time charter. By doing so, their own problems are increased as well as those of exporters of motor cars and similar manufacturers that depend on liner service.

Profits, of course, are being made by tramp owners with the market in its present state, and these are probably sufficient to offset the lean months of the first part of the year. But they cannot be as great as many people would like to believe, for freight rates have only barely reached the 1948 level, while operating expenses have been rising steadily since then. The process has been hastened by the effects of devaluation, not only in respect of disbursements in hard-currency ports, but also of the consequent increases in prices of oil bunkers and other commodities. Quite recently the price of diesel oil rose by 15s. to 191s. 6d. a ton, representing an addition of some £2,000 per annum to the running costs of an average motorship, while the fuel oil which steamships use rose by 5s. to 134s. 6d. per ton, involving some £1,300 per annum extra on the fuel bill. Port charges everywhere are increasing, without any compensation in the way of speedier turnround in port. These rising costs affect shipowners under all flags, and liner companies in practically every trade have been compelled to notify shippers that freight rates must be increased, generally by 10 to 15 per cent. The margin between running at a loss and at a profit has been reduced so much that when tramp freight rates were at their lowest this year several ships were laid up and many other owners were contemplating this step.

WEIGHTED INDEX NUMBER OF TRAMP SHIPPING FREIGHTS
(1948=100)

	1948	1949	1950

Although it is a welcome change for shipowners to find themselves in a position to demand higher freights, the present tightness of tonnage has its disadvantages, and most shipowners would agree that a more even balance between supply and demand would be healthier. Too great an excess of demand brings in its train the danger of rationing, control, priorities and allocation. Furthermore, it brings back into the market all the least efficient tonnage and robs the owners who have invested in the most economical and efficient ships of the proper rewards of enterprise.

It is, however, significant that several orders for new tramp ships have been placed since freight rates showed definite signs of a sustained rise. This may indicate partly that owners consider that freight rates are likely to remain high for some time, and partly that there is little hope of shipbuilding prices ever becoming lower. The second consideration is probably the stronger, since shipyard costs have been rising at the rate of about one per cent per month since 1946, and the cost of raw

materials and labour is bound to be affected by the re-armament drive and current inflationary pressures. The higher shipbuilding prices become, however, the less chance tramp shipowners have of finding the necessary money to finance new tonnage, with taxation at its present level. To build a ship today costs three times as much as the original cost of the vessel which it is to replace. With income tax and profits tax at present rates, even with freights as profitable and the market as strong as it is today, shipowners are finding the greatest difficulty in accumulating replacement funds, and that difficulty will be accentuated as shipbuilding and operating costs continue to rise. The same problem affects all industries to a certain degree, but the life of ships is generally shorter than that of most industrial plant ashore and subject to greater wear and tear and the risk of loss by marine peril. On top of this there are the "balancing charges" introduced by the Income Tax Act, 1945. A clear example of the effect of these charges has been given by a tramp company which recently ordered three new ships. To help to pay for these the company sold two old vessels, at a price in excess of their written-down values; after paying tax on the difference, only two-thirds of the proceeds of the old ships' sale were available to pay for their replacement.

The problem of financing replacements for obsolescent ships is the major concern of the shipping industry today, and the firmness of the freight market does little to mitigate it, for rising costs are likely to be more prolonged than rising freights. Repeated warnings have been given about the deficiency in quantity and in quality of the present tramp section of the merchant fleet, but the Government has been adamant in its refusal to allow shipowners to set aside replacement reserves from profits before taxation. It is only when profits are being made that this reserve can be built up, and it would not avail to leave concessions until the freight market is in a depressed condition again.

Business Notes

Dividend Limitation in 1951

In recent months, the principle of dividend limitation, like that of wage-restraint, has been applied with perceptibly less rigidity than previously; and it is generally taken for granted now that, in the absence of an entirely new approach by the Government to the whole problem of personal incomes—and especially to the wages problem—the tendency towards flexibility will continue, though still within the bounds of "moderation and restraint." This prospect will not be altered by the advice that the Federation of British Industries, the Associated Chambers of Commerce, and the National Union of Manufacturers, have this week given to their members. The FBI reiterates its strong objection in principle to any rigid limitation, pointing out that this penalises precisely those companies that have exercised the greatest restraint in the past, and that the vital need for the attraction of savings into equity investments will not be served unless successful investment yields its due reward. It also reminds the Government that the pledge given by many companies twelve months ago that they would not increase their dividends was conditional upon stabilisation of wages and action to reduce Government expenditure. On both these counts, it is clear that the companies concerned have been freed from the letter of their bargain; but they have not taken any undue advantage of this freedom.

Despite these considerations, the FBI emphasises—as it clearly had a duty to do—that the inflationary dangers inherent in defence outlays plainly demand a continuance of restraint. The significance of dividend restraint, however, is regarded as political and psychological rather than economic, on the ground that the influence of dividends on inflation is trivial in comparison with that of wages and salaries—the levels of which were £710 million and £6,530 million respectively in 1949. In fact, however, even if the principle of dividend restraint were dropped altogether, the risk that any large increase in dividends would take place would be very slight. Though shareholders would become more importunate, most industrial concerns have long been acutely aware of the steadily growing strain upon their cash resources; they now face not only an aggravated problem of replacement of fixed capital at prices even further removed from the capital value allowed for income tax purposes, but also a menacing demand for more working capital.

Given the difficulty of its budgetary problem, it would be unrealistic to hope that the Government will be induced by these arguments (valid though they are) to relinquish its dividend policy at this stage. The FBI therefore does well to emphasise, in its "background" statement, the importance of retrenchment in public expenditure as a means of countering inflation. It would have done even better had it also stressed the vital need for policies of this kind as a means of minimising the reliance upon physical controls, which assuredly will otherwise be greatly extended as the defence pressure rises.

Britain's Surplus with Europe

The European Payments Union compensations once more reveal the United Kingdom as a substantial creditor in its transactions with other member countries. Complete results of the November compensations have not yet been published, but the figures relating to the United Kingdom show that it accumulated a sterling surplus of £35,086,071, equivalent to 98,241,000 EPU units, in its current transactions with other members. This shows some diminution on the surplus of £80 million accumulated in October, but it must still be accounted an extraordinarily high figure. To the extent of £567,143, this surplus was met by drafts on existing resources of other members. For the whole period, from July 1, 1950, up to the end of November, Britain's cumulative net surplus amounted to £149,383,214; this surplus has been financed as follows:

	£
U.K. net surplus	149,383,214
Of which existing resources have satisfied	11,078,928
Leaving	138,304,286
Deduct :—	
U.K. initial debit position	53,571,429
First 20% of quota	75,714,285
Balance of surplus	9,018,572
of which :—	
50% credit	4,509,286
50% gold	4,509,286

It will thus be seen that Britain has now reached the point at which its surplus is partially dischargeable in gold; the first gold receipt arose from the November compensations. It may be assumed that the bulk of the surplus earned in November was the work of the rest of the sterling area, whose raw materials sales to Europe have again reached an exceptional level. If, as may well be, EPU is to be the mechanism through which payments for defence materials are cleared, the figures in the months to come are likely to reflect such items to an increasing extent. In that event it may well be necessary to reconsider the allocation of quotas to member countries, especially now that a number of countries have reached gold point in their relations with EPU. It would be unthinkable that the co-ordinated defence programme for Western Europe should be halted in its tracks by the inability of one or other of the parties concerned to put up the gold required under existing EPU arrangements.

More Coal, but not Enough

The miners worked hard enough last week to cut more coal than at any time since Dunkirk—but shortage of wagons to receive it at the surface, through bad weather, came as a reminder that there are more factors in the winter coal equation than miners' hard work alone. Lack of transport at the pitheads, mainly in the East Midlands division, was responsible for a loss of 22,800 tons. The week's deep-mined output of 4,563,000 tons, although the highest this year, was 11,000 tons below the total of the corresponding "bull week" in 1949; opencast production was also lower, so that the week's total output was 4,758,000 tons, compared with 4,789,000 tons in the corresponding week last year. Saturday work produced 381,200 tons last week, the highest since the agreement on extension of hours was reached in 1947. On the other side of the account, consumption in the week ended December 9th rose sharply again to 4,827,000 tons, nearly 200,000 tons higher than the previous week and 283,000 tons higher than in the same week of 1949. Cumulative figures sum up the position clearly: for 49 weeks of the year, consumption was 7,483,000 tons higher than last year, while production for 50 weeks was only 1,270,500 tons higher.

In the next two weeks there will be one working day less than in the last two weeks of 1949, so that the miners can hardly be expected to turn out the 6,600,000 tons they produced in the last fortnight of 1949. Output from the mines may thus be somewhat below 204 million tons for the year, against the lowest target of 205 million tons; while opencast output, which is highly vulnerable to weather, is likely to be 500,000 tons or more below the 13 million tons aimed at.

Consumption, however, can be depended upon not to flag; there have been signs of a scramble for coal and coke and the depletion of stocks is unlikely to be any smaller than the 1,200,000 tons withdrawn in the last three weeks of 1949. Mr Noel-Baker's long-lost "safety level" of 16.5 million tons at the beginning of October would ordinarily have meant ending the year with about 14.5 million tons of distributed stocks; but on December 9th stocks were already down to 14.3 million tons, and by the year-end stocks may not much exceed 13 million tons. Even though deliveries of 1,200,000 tons from America should begin to arrive early in the New Year, and some of the exhorted miners may continue to work Saturday shifts, coal supplies will be tighter than during the last two mild winters—and it would be dangerous to hope that in the next month or two the weather will come to the country's assistance once more.

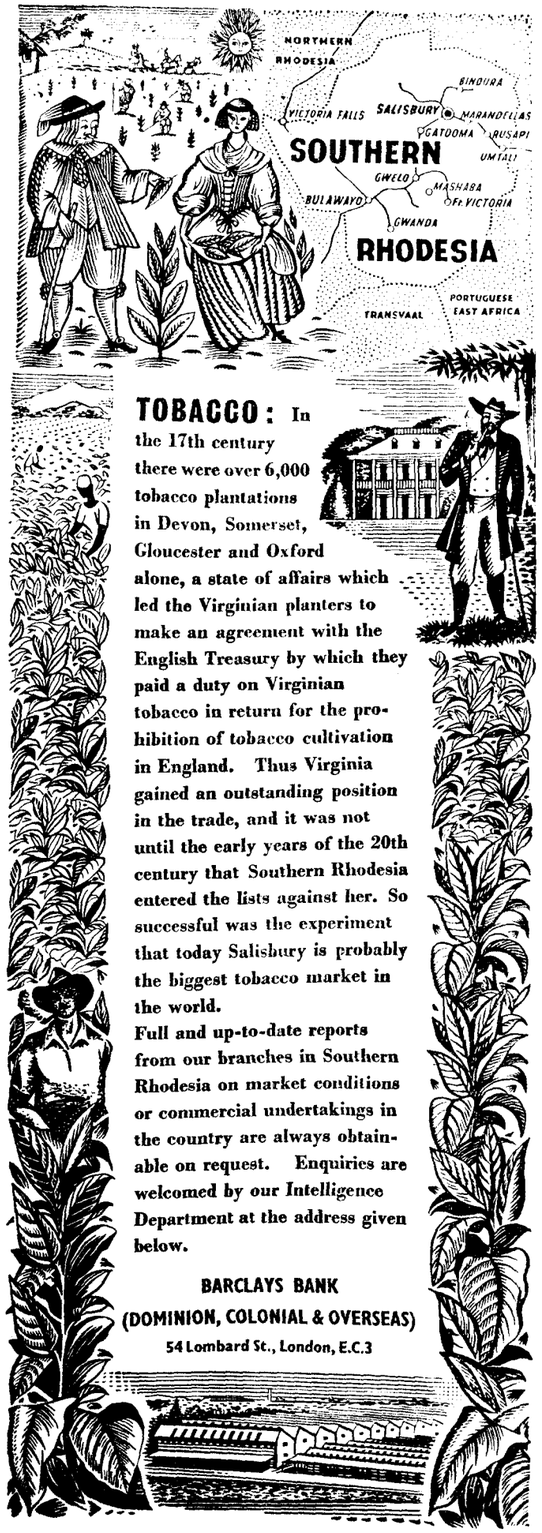
Allocation for Zinc—Quota for Copper

The base metal shortage has at last forced the British Government to restrict domestic consumption. A full allocation scheme for zinc will be introduced by the Ministry of Supply on January 1st, but details had not been announced when this issue went to press. Purchases of imported copper from the Ministry will also be restricted from January 1st; the maximum for any one month will be the average consumption in the first half of 1950. To blame these shortages on the Ministry of Supply alone, without acknowledging the capacity of the United States to suck in stocks from all over the world, would be unfair. But once again centralised purchasing has failed to procure an adequate supply of base metals. Until July, 1949, the system provided British manufacturers with dear non-ferrous metals: eighteen months ago, when the Ministry decided to base its selling prices on those ruling in the New York market, it tied its hands on prices but continued to gamble with stocks.

As has happened so frequently during the past five years, the Ministry's view of market trends has differed from that of the trade. Early this year, it seemed to believe that non-ferrous metal prices would fall and decided to liquidate rather than to build up its stocks. There were obvious signs at the beginning of the year that the resurgence of industrial activity in the United States would produce a rise in commodity prices and in base metal prices in particular. That evidence was apparently ignored. Even since hostilities began in Korea, the Minister of Supply more than once, and the Prime Minister on one occasion, assured Parliament that there was no fear of a shortage of raw materials. Britain now faces what could be its most serious production crisis since the war.

In a debate on raw material supplies in the House a week ago Mr John Freeman, the Parliamentary Secretary to the Ministry of Supply, repudiated the charges that the Ministry had failed in its job of securing adequate supplies of non-ferrous metals. He added:

> To the best of my knowledge, we have done everything which it has been possible to do to secure an adequate supply of materials which industry will need in the course of next year.



He said that the non-arrival of a large consignment of zinc from Belgium, which should have been delivered during the last three months of this year, was the main cause of the present zinc shortage. But Britain's stocks must be very low if the failure of one consignment could turn adequacy into shortage. Now, somewhat belatedly, the Ministry is willing to purchase zinc at almost any price. Its chances of buying any sizeable quantity are slim.

* * *

Prospects for Sulphur and Steel

On other raw materials Mr Freeman was less enlightening. No formal control of phthalic anhydride (used to make plasticisers for the paint and plastic industry) is at present being considered, though a system of priorities may eventually be established. Britain has been promised a shipment of 20,000 tons of sulphur from the United States for the manufacture of sulphuric acid and delivery is expected next month, while an emergency shipment of 7,500 tons for "regular" use has been arranged for delivery during December. But until the United States Government announces its export allocations for 1951, Britain must wait and see what sulphur it is likely to receive. It is extremely unlikely in any case that this country will receive anything approaching the 400,000 tons it purchased from USA this year.

The Government is apparently as confident about next year's level of steel production as the steel industry. Mr Freeman admitted that it was not known how much steel scrap could be imported next year, or indeed how much iron ore. But, assuming a middle course "between the most unfavourable and the most favourable assumptions," the output of general steel in 1951 should be "somewhere about the same level as in this year," that is 16¼ million tons. If industry could rely on this figure, the supply of steel will be adequate to meet Britain's "essential" needs—granted that "essential" is defined by the Government. But exports will most probably continue to be cut, at a time when the iron and steel industry is developing a valuable market in Canada.

TOBACCO: In the 17th century there were over 6,000 tobacco plantations in Devon, Somerset, Gloucester and Oxford alone, a state of affairs which led the Virginian planters to make an agreement with the English Treasury by which they paid a duty on Virginian tobacco in return for the prohibition of tobacco cultivation in England. Thus Virginia gained an outstanding position in the trade, and it was not until the early years of the 20th century that Southern Rhodesia entered the lists against her. So successful was the experiment that today Salisbury is probably the biggest tobacco market in the world.

Full and up-to-date reports from our branches in Southern Rhodesia on market conditions or commercial undertakings in the country are always obtainable on request. Enquiries are welcomed by our Intelligence Department at the address given below.

BARCLAYS BANK
(DOMINION, COLONIAL & OVERSEAS)
54 Lombard St., London, E.C.3

More serious, perhaps, is the fact that the long-term expansion in British steel production, which has been so impressive in recent years, may be checked.

* * *

Headache for Brassmakers

Manufacturers in the brass trade—which of all the industries affected directly by non-ferrous metals shortages is perhaps the most important supplier to industry as a whole—met the Ministry of Supply this week to discuss their metal allocations for 1951. It was not then clear what the quotas allowed for virgin copper (these may be about 10 per cent below consumption in recent months) would mean to brass firms; in any case, the adequacy of copper depends upon the 1951 quota allowed for zinc, which seems likely to be cut considerably more severely.

BRASS AND COPPER-BASE ALLOYS: MONTHLY OUTPUT OF MAIN PRODUCTS AND CONSUMPTION OF NON-FERROUS METALS, 1950

Product	Monthly Average: Jan.-June		October	
	Gross Output Tons	Copper Content Tons	Gross Output Tons	Copper Content Tons
Wire	1,541	985	1,607	1,175
Rods, Bars and Sections	10,955	6,625	12,756	7,715
Sheet, Strip and Plate	7,853	5,120	8,755	5,745
Tubes	1,400	989	1,499	1,057
Castings, etc.	3,916	3,133	3,514	2,811
TOTAL	25,465	16,850	28,131	18,499
of which Zinc Content		8,123		9,120

Even if scrap metal were to be left outside the allocation, those brass firms which have largely been supplementing their supplies with scrap would have little chance to continue to do so economically. Supplies from the Ministry have dried up, while commercial prices of scrap—in the very limited amounts which are now to be had—have shot up. In September brass scrap stood at what the trade considers a normal price—about £12 to £20 below its "mixture value" in terms of the virgin metals. By late October it equalled the mixture value, generally considered the upper economic limit; this week, through what the trade considers "false" but in fact entirely real economics, scrap is fetching nearly 40 per cent above its mixture value.

* * *

Scrap and Defence

Substitution of scrap, in any case, is an expedient much more practicable for one side of the sharply-divided brass trade than the other. The brassfoundries, which in number if not financial weight greatly outnumber other sections of the trade, can use very large proportions of scrap in their products, which include not only the finished items listed in the table but ingots of brass alloys for the remainder of the trade and other industries: some castings can be made from almost 100 per cent scrap. There are several hundred brassfoundries, scattered fairly widely throughout the country, though with concentrations in the Midlands and the North of England; and the typical productive unit is a very small one. Some firms employ up to 600 or 800 workers, and turn out a large proportion of the brassfoundries' total output (95,000 tons in the first nine months of the year). But the industry is one in which a skilled man and a boy with a ten-pound crucible, two hundred firebricks, and three bars of iron, can operate profitably; several successful firms began in that way, and even since the war some fine craftsmen have been starting out, with capital equipment costing perhaps £20 and five cwt. of scrap from a merchant on credit. These are wholly vulnerable to any shortage of supplies.

The other side of the industry turns out four main brass products—wire, rods, shapes and sections, sheet strip and plate, and tubes—and is far more concentrated economically and geographically. Many firms manufacture more than one of the main types of product, some all; and in some cases a brass firm will turn out similar copper products as well (though high-conductivity copper wire is a fairly specialised operation). There are about a hundred firms in the business, generally concentrated in the Black Country around Birmingham (wire producers less so), but there are important companies operating in London, Newcastle, Manchester, Southampton, Leeds, Glasgow and Edinburgh. Two or three of the largest companies employ several thousand workers, and on this side of the trade one firm accounts for about 22 per cent and another about 18 per cent of total output, though the average firm usually turns out about 5 per cent of the industry's output. Their production has grown since before the war by extension of existing factories rather than by new entrants, since a non-ferrous metals mill involves a large capital investment; but it has not attained the peak of the war years. These firms normally use only limited quantities of scrap.

Apart from its indispensability in marine engineering, motor manufacture, locomotive and other steam-raising equipment, and in much industrial machinery (plus large supplies of castings for building), the industry is vital for munitions. It is not yet fully informed of the demands that defence will make upon it or of whether special metal supplies for defence requirements may be forthcoming outside the quota. This factor, added to general fears of labour redundancy, may become the most serious of its future problems.

* * *

Long-term Contract for Aluminium

The immediate threat of an aluminium shortage in Britain has been averted by a new twenty-year contract signed by the Ministry of Supply with the Aluminium Company of Canada; but industry cannot expect any larger supplies, nor indeed a postponement of the cut in allocations from 17,000 to 15,000 tons a month announced by the Minister of Supply a fortnight ago. The contract gives Britain first call on 200,000 metric tons a year of virgin aluminium for the next twenty years; next year Britain will purchase 50,000 tons in addition to the 150,000 tons already under contract, and 220,000 tons in each of the two following years. In return the British Government has agreed to fund anew over a period of 20 years the loans made to the company during the war to extend its capacity, and it will lend the company a further $25 million to help to finance further expansion.

Next year, then, Britain should obtain 200,000 tons of aluminium from Canada and perhaps a further 30,000 tons from home output. If allocations are maintained at the reduced rate of 15,000 tons a month throughout the year, there will be a surplus of 50,000 tons in twelve months' time. Some 25,000 tons of this will be required to make good the sharp reduction in stocks during 1950, leaving only 25,000 tons to supply the rearmament programme and to help build a strategic reserve. Admittedly it will take time for armament contracts to be placed and for manufacturers to tool up, but if the Government has any sense of urgency, the new programme should be well under weigh by the second half of the year.

In 1952 and 1953 Britain will get an additional 20,000 tons a year. If monthly allocations in this country were then restored to 17,000 tons, supplies available for defence purposes would amount to only 45,000 tons a year, and this quantity would seem by any reasonable standard too small. The inference must surely be that allocations will have to be reduced not only next year but conceivably in both 1952 and 1953 as well.

Swedish and Norwegian Trade

This time last year the main preoccupation of those who negotiated Britain's bilateral trade pacts with European countries was to write into each agreement a high figure for total exports and a low figure for total imports—and then to urge British industry to aim at them; within the broad framework of these guesses at trade values, certain *sotto voce* understandings were arrived at about the quantities of each scarce commodity that the customer in question might possibly expect to receive. In drawing up trade agreements for 1951, the technique of negotiation seems to have entirely changed. The million pound sign has been swept out of prominence and the negotiators have had to get down to hard bargaining about stipulated quantities of scarce commodities. Under the Anglo-Swedish trade pact that was initialled in London last week, for example, Britain has provisionally offered Sweden 104,000 tons of iron and steel in 1951—more than double the quota of iron and steel exports to Sweden that was fixed for 1950. This, however, is but a poor sweetening of the bitter pill of reduced coal exports. Britain can allot only 500,000 tons of coal to Sweden next year—less than half the amount that was shipped in the first ten months of 1950 (though exports even then were below estimate). Britain has also promised Sweden that a "reasonable proportion" of any extra coal and coke that becomes available will be allotted to it; Sweden may also expect to receive some tinplate and textile yarns of which it is short. In return, Sweden's exports of timber to Britain in 1951 should reach 200,000 standards and its iron ore exports should be maintained at about the present rate (between 250,000 and 300,000 tons a month). Some British restrictions on the import of Swedish wooden and steel manufactures will also be withdrawn.

In its negotiations with Norway, Britain has followed the tactic of signing a general agreement first and discussing awkward details after. These latter discussions are now proceeding. Britain is asking Norway for more whale-oil, pulp, paper, ferro-alloys and aluminium. Norway's shopping list includes all the usual, and virtually unobtainable, items, such as coal, coke, steel and cotton yarns. One of the main preoccupations of the British delegation, however, is to persuade the Norwegians to ease some of their quantitative restrictions on imports—particularly those on imports of clothing and textile piece-goods. Since Norway is in acute difficulties on her balance of payments, it has restricted its intra-European liberalisation programme to a bare 60 per cent of total imports. The Board of Trade argues, with a certain air of discovery, that even a debtor country should sometimes be resolute enough to take a few risks.

Achievements at Torquay

The fifth session of the contracting parties of the General Agreement on Tariffs and Trade has been concluded at Torquay. The tariff negotiations, as distinct from the discussions on trade practices, will continue well into 1951. Among the subjects discussed in full session three deserve special mention. They are: first, the complaints made to certain governments, including that of the United Kingdom, on the discriminatory application of their import restrictions, secondly the protectionist effect of British purchase tax; and thirdly, the future of GATT and of the International Trade Organisation. The first of these subjects has unquestionably been the most controversial. Early in the discussions the representatives of Belgium, Cuba, Canada and the United States argued that the time had come for a progressive relaxation of restrictions imposed on hard currency imports by Australia, Ceylon, New Zealand, Southern Rhodesia and the United Kingdom. The International Monetary Fund was taken into consultation and expressed the opinion that such relaxations would be feasible, but

should be undertaken with due caution, having regard to present uncertainties. To these arguments, the representatives of the "impeached" governments answered that too much attention should not be paid to the recent marked increase in the sterling area's dollar reserves; they argued that the complainants had paid insufficient attention to the adverse factors operating in the present situation, the full force of which would not be felt until 1951. The discussion ended by the representatives of these sterling area countries "taking note" of the observations made to them and undertaking to convey them to their governments for their consideration. In other words, the deadlock on this issue was complete.

Britain appears to have been much more yielding on complaints against its purchase tax system. The Netherlands, supported by a number of other countries, had put forward the argument that exemptions from purchase tax for British made utility goods did not apply to goods of comparable quality and price imported from abroad. This was an infringement of the articles of GATT which recognise the principle that there shall be no discrimination against other member countries through the application of internal taxes. The United Kingdom representative had to admit the implacable logic of this argument. He pointed out that the utility system was not intended to act in a protectionist manner, that purchase tax had for some time been withheld from certain types of imported goods, and that there were good hopes of complete elimination of this particular type of discrimination.

The future of GATT had to be considered in the light of intimations from the United States delegation that the proposed charter of the International Trade Organisation would not be re-submitted to Congress. The United States Government does, however, intend to introduce legislation that would make American participation in the General Agreement on Tariffs and Trade more effective. This virtual abandonment of the ITO child by its parent has caused surprise and disappointment among certain delegations. It has also strengthened the need to give more permanent form to the sketchy organisation of the administrative machinery of GATT. That question has been submitted to a working party and will be further examined at the next and sixth session of the contracting parties, which is due to open at Geneva on September 17th, 1951.

Royal Commission on Taxation

The members and terms of reference of the Royal Commission on the taxation of profits and income were announced late last week. The chairman, Lord Justice Cohen, will be assisted by thirteen members including three members of the Tucker Committee (Mr Millard Tucker, K.C., Mr W. S. Carrington the chartered accountant, and Mr George Woodcock of the TUC); there are three industrialists (Mr J. E. Greenwood of Boots Pure Drug, Sir Geoffrey Heyworth, chairman of Unilever, and Mr W. J. Keswick); three economists (Dr Vera Anstey, Mr J. R. Hicks and Mr Kaldor); and the list is completed by Mr H. L. Bullock (TUC), Mr W. E. Crick (economic adviser to the Midland Bank), Sir Thomas Gill (CWS), and Miss Lucy Sutherland (principal of Lady Margaret Hall).

Their task will be long and difficult. The terms of reference are to inquire into the present system of taxing profits and income, including its incidence and effects, with particular reference to taxation of profits, salaries and wages. They are to consider whether "for the purposes of the national economy" the present system is the best way of raising the required revenue, holding the balance between the exchequer and the taxpayer. And finally they are asked to examine the present system of allowances, reliefs and tax rates and the equity of the individual tax burdens that result from them. All this is subject to the inevitable proviso—"to make recommendations consistent with maintaining the same total yield of the existing duties in relation to the national income."

It is unlikely that the Royal Commission will be able to get effectively to work until much of next year has passed. The first report of the Tucker Committee (on the definition of business profits) is not expected before February, and its second task on pensions schemes has yet to be undertaken. The work of the Royal Commission goes well beyond definitive exercises of this kind and raises fundamental issues about the incidence of taxation on economic activity and incentive. It is certainly time that these questions should be brought under authoritative examination.

Uranium from the Gold Mines

The announcement that uranium is to be produced by four South African gold mines (West Rand Consolidated, Daggafontein Mines, Blyvooruitzicht Mines and Western Reefs Exploration and Development) holds out the prospect of a considerable increase in the supply of uranium for Britain and America, for the gold mines are expected to become their third largest source of the metal. Discussions on the possibility of extracting uranium as well as gold from ores mined on the Rand have been going on for three years between the British, American and South African atomic energy authorities. The concentration of uranium is low in these ores compared with the uranium content of ores hitherto treated, but the urgent need for uranium justifies the speed with which the project is to go forward. It is customary to class as "uneconomic" deposits containing less than ten per cent of uranium and the present scarcity of uranium owes something to this rule of thumbb for few deposits contain as much. Yet there is, on average, 4 grams of uranium to every ton of the earth's crust and it is present in gold ores, shales, granites and several other minerals in proportions of up to one per cent. The ores to be treated in the four mines have concentrations of rather more than one per cent.

If atomic energy is to make a large contribution to world power supplies, the exploitation of these and similar low-grade ores will be inevitable. Sir John Cockcroft has said that an economic method of extracting uranium from them is the first major objective in an atomic power programme—without it the nuclear reactors will not have adequate fuel reserves. The South African project may in some respects prove the half-way house since the major cost of mining the ores will already have been undertaken to recover their gold content, leaving the uranium to be recovered as a relatively low cost by-product. One company alone expects to be able to handle 40,000 tons of ore a month by the time the uranium extraction plants are working; thus it is evident that the scheme should yield considerable tonnages of uranium metal. But the valuable part of that metal, the fissionable U 235 which is the starting point for all nuclear processes, is present only as one part in every 140 of natural uranium. The problem of uranium supplies depends very largely on the proportion of the non-fissile U 238 per ton of natural metal which can be converted into a fissionable, and hence a useful, form for the development of atomic energy.

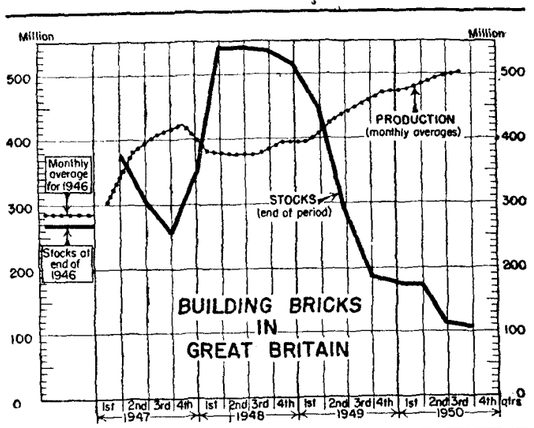
More Bricks and Cement

The Ministry of Works has warned brick and cement manufacturers to expect increased home demands next year and in recent weeks both industries have been discussing with the Ministry the steps they can take to increase home deliveries. The cement industry is already working to full capacity; increased supplies therefore involve finding imports to supplement home production. Output this year will exceed 9,500,000 tons and more than 700,000 tons of new capacity will have been brought into operation by the beginning of next year: thus, output in 1951 should reach, and may possibly exceed, 10 million tons. But out of this total the industry has to meet its export commitments. Exports have had to be kept down to about 1,800,000 tons this year, and it may prove impolitic to cut them further since a large proportion goes to the colonies and a growing tonnage to the United States and Canada.

Foreign producers with surplus output are becoming difficult to find. Germany and Belgium are the only exporters left among continental producers and the Germans have had some difficulty in getting the bags for their cement. Imports also bring other problems. Cement was selling this summer in Brussels at 80s. 2d. a ton compared with 73s. a ton in in London, and the Belgian price has since been rising. Whenever the Cement Makers' Federation has imported cement (and 110,300 tons were brought in during the first ten months of the year) the Federation sold it at ruling British prices and made up the difference from its own funds. Funds for such price equalisation are presumably not inexhaustible and the Federation obviously could not be expected to finance an import programme on the scale planned for next year. Does this mean that imported cement will have to be sold at its cost price, which with transport and handling costs, would be nearer £6 10s. a ton? This is certainly one of the questions which have been under discussion with the Ministry.



* * *

Labour Shortage in the Brickyards

The brick industry is working to only 80 per cent of capacity. The Ministry has asked for an output next year of between 7,000 million and 8,000 million bricks, compared with an estimated output of less than 6,500 million this year, and has at the same time sent out a questionnaire to find what total productive capacity would be. It is certainly sufficient for the proposed rate of production, which would restore output to the 1938 level, but shortage of labour may prevent such a rate from being reached. After the restrictions on building were announced in the autumn of 1947, large stocks accumulated in the brickyards; production had to be cut and many yards closed. The industry foresaw that the men who were dismissed then would prove irreplaceable and appealed without success to local authorities to store bricks on building sites so that the brickyards could continue working.

When demand rose again, the industry could not re-recruit enough men for production to keep step, and deliveries have been maintained by running down stocks. The accompanying table shows that while production has been rising, stocks have fallen to a very low level.

Output can be increased next year only by employing more men, and past experience suggests that it may not be easy to find them or keep them. Brickmaking is unpopular and even the highly mechanised firms making fletton bricks have difficulty in finding labour; it is even harder for the small brickyards, where the work entails a good deal of heavy labouring. It is not clear how the Ministries of Works and Labour, or the industry propose to find the extra men. Perhaps something less than disaster will occur if they cannot be found and the Ministry's target is not reached, for there are grounds for suggesting that the Ministry's estimates of both brick and cement requirements are high and perhaps too high.

* * *

Railwaymen's Wages

The dispute between the Railway Executive and the three railway unions provides yet another example of the determination of the railwaymen to take what they can get without giving anything in return. The Minister of Labour has been trying to break the deadlock, but he has not succeeded in bringing the two parties any nearer towards an agreement, and he has been obliged to appoint a Commission of Inquiry into the matter.

The dispute arose out of the insistence of the Railway Executive that certain conditions should be attached to their offer of higher wages to the railwaymen. In particular, they asked that the continued practice of "knocking-up" (which assumes that the alarm clock was never invented) and of providing guards for certain vans which did not need them should be abandoned. The executive insisted also that the principle should be firmly established that there must be some concessions on the part of employees towards improving

the efficiency of the railways before wages could be increased.

The unions, on the other hand, maintain that they have always been ready to discuss proposals for changing the conditions of employment, but they refuse to discuss such proposals conjointly with wage negotiations. They insist that the two sets of negotiations should be quite separate and that the one should not be contingent upon the other. There can be little doubt on grounds of principle and good sense that the Railway Executive's view is right. Higher wages without an improvement in efficiency must inevitably mean an increase in costs and neither the Transport Commission nor the country can tolerate that result. Nor is it acceptable that wages and conditions of work, which are intimately connected, should be kept in watertight compartments. The restrictive practices which the unions have gradually developed are as detrimental to the industry as low wages are to the employees. A *quid pro quo* agreement is the obvious and sensible solution from which both parties cannot fail to benefit.

* * *

Fall in Bank Advances

One of the most remarkable features of Britain's financial experience since the spring has been the way in which bank loans to industry have remained stable (and even declined) while bank lending to the Government has been forced continually upwards. The latest classification of bank advances by members of the British Bankers' Association shows that total advances outstanding in November were £8,000,000 lower than in August and £32 million lower than in May ; in the comparable periods of last year there were rises of £35 million and £45 million respectively.

It is true that the three months between end-August and end-November are months in which bank advances (other than those to the food, drink and tobacco group) are apt to show a reasonable fall ; the £35 million rise between August and November in 1949 was more than accounted for by a £15½ million rise in loans to the food, drink and tobacco group and an exceptional £21½ million increase in loans to public utilities. This year loans to "food, drink and tobacco" rose even more sharply, by over £19½ million, but loans to public utilities declined by £5,500,000 thanks to repayment of bank advances out of the proceeds of successive calls on the last May's Electricity loan. Repayments of bank advances out of the proceeds of the controversial ICI issue of loan stock also, no doubt, explained the £8,500,000 decline in loans to the chemical industry. The really surprising feature of the latest classification of advances, however, is that industries using wool, leather and rubber, non-ferrous metals and engineering supplies in general have this year maintained their seasonal habit of repaying bank advances in the autumn. The implication seems to be either that these industries were not willing to accumulate large stocks of raw materials at present prices or that their banks were not willing to grant new loans to enable them to do so. In either case it seems likely that the only firms that could have indulged in panic buying of raw materials, up to November at least, were those with ample liquid funds on hand.

* * *

Private Trading in Cocoa

The cocoa market has been given a further measure of freedom when export licences were discontinued this week. Cocoa may now be exported freely to any country without first obtaining government sanction. Private importation of cocoa beans was resumed in November and British manufacturers formed a buying panel to negotiate with the West African Marketing Board. Its first purchase of cocoa beans was announced a fortnight ago, when it bought 10,000 tons from the West African Board at 257s. 6d. a cwt. c.i.f. UK. The panel fixes only the total quantity and the price ; the individual members then make separate contracts. All manufacturers operating in the scheme must agree to buy at least 75 per cent of their annual requirements through the panel, excluding their allocations from the Ministry of Food stocks.

The total purchase made by the panel actually amounted to 13,000 tons, but 3,000 tons represented private purchases by members of the panel. The 10,000 tons was stated to be 21½ per cent of the panel's commitment for the present season, so that the total will be 46,500 tons, making British manufacturers' private imports this season some 62,000 tons. If total consumption for the season is taken as 102,000 tons, then allocations from the Ministry's stocks (which, incidentally, are sold at 220s. a cwt) should be 40,000 tons. Thus chocolate manufacturers in this country will continue to get a large part of their cocoa beans at a low price. Even the price of 257s. 6d. a cwt agreed last week with the marketing board was about 10s. a cwt below what was considered the ruling price.

The world cocoa crop this season is expected to be 10,000 tons larger than in 1949-50. According to estimates prepared by Messrs Gill and Duffus Ltd., world output should reach 752,300 tons, against 742,740 tons last season. As consumption in producing countries is expected to fall, the world exportable surplus is put at 703,300 tons, compared with 691,740 tons in 1949-50. West African production is again expanding and is expected to offset the smaller Brazilian crop. The swollen shoot disease is still rife in the Gold Coast, but scientists now believe that they have discovered a method of preventing it from spreading from the infected areas. It will no doubt take years to eradicate the disease, but at long last steps are being taken to contain it. The importance of controlling this disease can hardly be over-emphasised. Production in the area worst affected has declined from 105,400 tons before the war to 46,500 tons in 1949-50, while output in the rest of the Gold Coast increased in the same period from 166,000 tons to 203,500 tons.

ARSENIC

ARSENIC is a steel-grey, brittle, crystalline substance that is never found free in nature. It exists combined with sulphur or oxygen as an impurity in the ores of lead, copper or gold, and is produced commercially as a by-product of winning these metals. By far the largest producer is a mine at Boliden in the North of Sweden, but arsenic is also recovered during mining operations in Australia, Brazil, Canada and the United States. Arsenic may suggest weed-killers—or even "Old Lace"—but, though a large amount of the world's output is used for killing weeds and insects, it is also employed in many other ways. It is used, for example, in glass making, and by the textile industries in connection with dyeing and calico printing. Arsenic is also an ingredient of some sheep dips, wood preservatives and medicinal preparations.

I.C.I. uses arsenic for hardening the lead shot that is loaded into sporting ammunition, and for making wrought copper alloys of which I.C.I. is one of the Empire's largest producers.

SALES & PURCHASES

... keep them under control WITH THIS NEW SYSTEM

★ **STANDARD LOOSE SHEET RECORDS**
SALES & PURCHASE
STORES & STOCK CONTROL
PLANT & MACHINERY
CASE & CONTAINER
PURCHASE. HIRE PURCHASE
SALES. PERSONNEL

Here is the FASTEST visible system yet invented.

You see records quicker. You refer to them quicker. You post entries quicker. One clerk can control 12,000 records.

Any record can be removed or inserted in a split second. No keys or cumbersome mechanism—just a simple trigger action.

The streamlined binder is only 2¼" thick. It IS streamlined too. It slides into action. No lifting. And so light and compact, one or more can be carried about from place to place.

Standard records cover nearly all purposes. But you can have them specially designed by experts to do YOUR particular job (without fee).

Save clerical labour, valuable space. Keep salient facts before your eyes. Transfer your records to Shannoleaf . . . For full details write "Shannoleaf" on your letterheading. They will be sent you the same day.

NOTE.—An interesting new system has just been devised for the control of COSTING RECORDS. This would undoubtedly be of especial interest to your organisation. Just put "Shannoleaf for Costing Records" on your letter-headings for full details by return.

Commodities Still Booming

The rise in commodity prices since June has been universal and sharp. The accompanying table shows world prices of a selected number of commodities in recent weeks and months compared with December, 1949. It shows that in the first half of this year the rise in prices was patchy. Two items (wheat and sugar) actually fell, while tin was only slightly dearer. In this period the largest increase occurred in zinc which rose by over 50 per cent.

WORLD COMMODITY PRICES

Commodity and Unit	1949	1950						
	Dec.	June	Sept.	Oct.	Nov.	December 5th	December 12th	December 19th
Wheat (cents per bushel)	216¾	215½	223½	225¾	227	227⅝	235	219½
Maize (cents per bushel)	131	143	144½	154⅜	160⅛	164½	167	171½
Sugar, Cuban (d. per lb.)	4·38	4·30	5·85	5·85	5·30	5·25	5·25	5·45
Cotton, US middling (cents per lb.)	31·43	51·64	42·0	41·03	43·76	42·10	42·63	44·10
Wool, 56's (d. per lb.)	71	81	148	150	163	168	170	...
Tin (£ per ton)	599½	600½	811½	981	1,117½	1,182½	1,130	1,302½
Copper, electrolytic (cents per lb.)	18·50	22·50	24·50	24·50	24·50	24·50	24·50	24·50
Zinc (cents per lb.)	9·875	15·0	17·5	17·5	17·5	17·5	17·5	17·5
Tungsten (s. per unit)	92·50	126·9	235·0	235·0	265·0	305·0	335·0	367·50
Rubber, R.S.S. spot (d. per lb.)	15	24	45½	49½	59½	51	50	52

Note: Monthly prices taken at last day of the month except those for wool which are monthly averages.

Since June, prices have soared. Tungsten, a representative of the alloy metals, has trebled in price, tin and rubber have more than doubled, while wool is about twice as dear. Cotton has risen by nearly 50 per cent, sugar by 25 per cent (despite the prospect of a surplus in 1951), maize by 20 per cent and wheat by 12½ per cent. Zinc and copper have a dubious air of stability; the official market prices do not reveal that the grey market price of zinc is 30-35 cents a lb and of copper 45-50 cents a lb; both double their June level.

Shorter Notes

In the article "Fears about Fertilisers" in *The Economist* of December 9th, imports of potassium compounds into this country, referred to on page 1018, should have read 7,000,000 *cwt* and 6,500,000 *cwt*, not *tons* as stated.

*

The second issue of coal compensation stock was duly made on December 15th, for an amount of about £27 million. As expected, it took the same form as the first issue, of just under £20 million, made on June 15th last—namely, 3½ per cent Treasury Stock, 1977-80. In accordance with the terms of the Coal Act, whereby the value of the stock as compensation has to accord with what, in the view of the Treasury, is its value in the market at the date of issue, the allotment price was fixed at 103, compared with par for the original issue. The total of the compensation award to the coal industry was just under £165 million, so that nearly £120 million of stock remains to be issued.

*

Tin reached a new record price in London on Tuesday. Spot was quoted at £1,302½ a ton and three months delivery at £1,120 a ton, making the largest backwardation (£182½ a ton) yet recorded in the London market. The previous peak for spot tin was £1,300 a ton reached on November 8th.

COMPANY MEETINGS

SOUTH DURHAM STEEL AND IRON COMPANY LIMITED

RECORD GROUP PROFIT

FURTHER INCREASE IN INGOT OUTPUT

MR B. CHETWYND TALBOT ON NATIONALISATION

The fifty-second ordinary general meeting of South Durham Steel and Iron Company Limited was held on December 20th at Cargo Fleet Ironworks, Middlesbrough.

Mr B. Chetwynd Talbot, chairman and managing director, who presided said: Gentlemen, it is with the greatest regret that your boards record the death of your late chairman, Mr J. H. B. Forster, on November 28th last. Mr Forster had been a director of the South Durham and Cargo Fleet Companies for 20 years and chairman since 1947. By his death your boards have lost a valued friend, whose experience in industry was of the highest order and whose advice has been of the greatest assistance throughout the many years he has been actively associated with our companies. I ask you to rise and pay tribute to the memory of your former chairman.

The meeting having stood in silence,

The chairman said:—As you know, it is the intention of the Government to acquire the debenture and share capital of all scheduled firms as from February 15, 1951. In accordance with the provisions of the Iron and Steel Act it was incumbent on the scheduled firms to appoint a stockholders' representative in order to safeguard their interests on any question of values of securities which might arise with the Government. At a special meeting of the holders of all our classes of securities held on November 1st last, it was unanimously agreed to appoint Mr C. U. Peat, a partner in Peat, Marwick, Mitchell and Company, as stockholders' representative.

COMPENSATION BASIS

Since each class of South Durham security has a Stock Exchange quotation, I am afraid the valuation of our assets on a more equitable basis will not arise. Your directors have not yet been advised of the details of the issue of British Iron and Steel stock which will form the method of compensation for all classes of securities acquired. Under the relevant clause of the Act, compensation shall be satisfied by the issue by the Iron and Steel Corporation of Great Britain of such amount of British Iron and Steel Stock as in the opinion of the Treasury is at the date of issue of the value equal to the agreed compensation of the securities, regard being had "in estimating the value of the stock so issued" to the market value of Government securities at or about that date.

Until the date of transfer to the Iron and Steel Corporation of Great Britain—fixed for February 15, 1951—payments on a pro-rata yearly basis from the last date such interest or dividends were due or were paid on all debenture stock, preference and ordinary shares, will be made. On the aspect of nationalisation, or as the name which is commonly adopted of "Publicly Controlled Companies," I intend to refer later in my speech, after I have outlined the year's results and experiences of the South Durham Group of Companies.

RESULT OF YEAR'S OPERATIONS

The gross profit of the group for the year amounted to £1,550,665, to which the South Durham Company contributed, together with dividends received, a sum exceeding £1,000,000. This profit of the South Durham Company is a record amount during the 52 years this company has been in existence. The total profit of the group also comprises the highest level ever attained. It is not possible to accord to shareholders any increased share from these profits by way of a larger dividend, as under the Iron and Steel Act dividends are limited to certain defined amounts which have been paid for the last two years.

Out of the sum of £1,470,000 which has been set aside out of profits for the last three years for the purpose of development and to increase the efficiency of their properties, debenture holders and shareholders of this company and its subsidiary Cargo Fleet Iron Company Limited, on the basis of the terms of transfer enforced upon them, are destined to receive no share. In fact, by subtracting the gross amount of compensation in Government stock amounting to approximately £3,063,000 which will be receivable by debenture holders and shareholders on the basis of Stock Exchange quotations, now two years old or more, from the excess of current liquid assets over current liabilities, there is a surplus of nearly £400,000 in liquid assets over the capital sum at which the State will acquire your properties.

In other words, *without* including any amount for the fixed assets, which last year earned over £1,500,000 in profits, and also excluding compensation receivable in due course for our colliery fixed assets, you are being compelled in addition to hand over to the State the sum of nearly £400,000 in the form of liquid assets. Strenuously opposed as your board has been all along both to principle of nationalisation of the industry and to the unfair method of acquisition, I regret it is not possible to alter these terms which were incorporated in the Act when first published in October, 1948.

GROWTH OF OUTPUT

In his speech to you twelve months ago, the chairman referred to the high level of production which had been obtained at both West Hartlepool and Cargo Fleet. I am glad to be able to record that, comparing our financial year ended September 30, 1950, with the preceding year ingot output showed a further increase of 7 per cent., which is slightly in excess of the anticipated national increase for 1950. From our two plate mills at West Hartlepool a record output of 253,220 tons of plates has been achieved, which represents an increase of 11,900 tons as compared with our previous year's output. At Cargo Fleet considerable strides have been made in the production of broad flange beams.

During the year important orders have been obtained for export, in particular from Canada, and our product is now in great demand in our Commonwealth countries to meet imports hitherto supplied by United States and continental manufacturers. Our steel pipe production at Stockton continues to expand to meet the increased demand for all classes of medium and large diameter pipes for purposes of conveying water, oil and gas. During the year we have completed the fabrication at the Stockton Works and the erection in Ceylon and Portugal of the two largest hydro-electric pipe lines installed in those countries.

Our activities in structural steel work, steel storage tanks and welded fabrication work for shipbuilding and engineering uses in general, have been maintained at a high level of output. Your chairman informed you twelve months ago that our proposal to "hive off" these activities which are not related to the direct production of steel in its rolled form had been declined by the Minister of Supply.

BOARD'S POLICY JUSTIFIED

From these results, our policy of improving the efficiency and thereby increasing production at works which exist today has been justified, and has avoided capital expenditure on a considerably larger scale for purposes of replacement only of existing plants. Taking into account the mounting costs of capital construction, together with the existing high level of taxation, except in instances in which a new method of production is essential to ensure a high level of output and quality, it would seem to me that this country cannot afford the abandonment of existing plants which it is possible to develop to a high level of efficiency.

In order to maintain the existing level of ingot production, it is evident that increased outputs of iron must be produced in this country to offset the reduction of imports of scrap with which we are faced and which it is apparent will not be available in the quantities received during the last three years. In order to maintain a high level of production and thereby ensure continuation of employment, at the West Hartlepool works a new blast furnace of modern design was put into commission at the beginning of December, and an existing furnace will be enlarged to secure a further increased output of pig iron. Sanction has been received from the Ministry of Supply to proceed straight away with the construction of a further battery of coke ovens to ensure continuity of our requirements of coke. In addition, the work of extending the steel plant and the installation of two additional steel furnaces is going ahead.

During the year all steel furnaces at West Hartlepool have been converted to oil firing, with satisfactory results. Work has also proceeded with further modernisation of the slabbing and plate mills, and has been executed to avoid interruption of production. At Cargo Fleet, construction of the new 20 feet hearth blast furnace is proceeding, with the intention of bringing this furnace into production by the end of 1951. The installation of the additional steel furnace has commenced, and it is anticipated completion will be effected to coincide with the blowing-in of the new blast furnace.

CAPITAL COMMITMENTS

The estimated amount of capital commitments authorised by your directors for the development and improvement at the West Hartlepool, Stockton and Cargo Fleet works amounted at September 30, 1950, to £2,733,774. Since that date approval has been obtained for the building of the new battery of coke ovens at West Hartlepool, which increases this figure to approximately £3,000,000. This expenditure will be spread over the next three years, and provided there is no decline in the amounts available for putting aside to the development account, which now approaches £1,500,000, together with the income tax allowances on capital expenditure, and the amount of compensation we are entitled to receive for our colliery properties, except for periods of heavy

expenditure when loans of a temporary nature from our bankers may be required, it should prove feasible for the modernisation of West Hartlepool and Cargo Fleet works to be completed without recourse to a permanent increase in our capital structure.

I trust it will be the policy of the prospective proprietors of this industry—namely, the Iron and Steel Corporation of Great Britain—to pursue the policy adopted by your board and to plough back similar proportions out of earned profits to ensure that the schemes of modernisation and further development to secure technical efficiency on which the industry has already embarked will in no way be jeopardised.

FUTURE OF INDUSTRY

The attitude of your directors to the decision of the present Government to enforce the Act which the late Government, with its large parliamentary majority, drove through Parliament has been clearly defined on previous occasions. Without departing in any way from their convictions, your directors are aware of the great responsibilities which will continue to rest on their shoulders to ensure there is the minimum of disruption in effort on the change of ownership in this industry becoming an accomplished fact.

It has been our hope during the last two years, since the intention to nationalise became a political issue, that some means of an increased measure of control of the industry as it exists today could have been brought about by other means such as extending the powers of the now defunct Iron and Steel Board, without undue interference with the rights of the proprietors of the industry. In our case the number of debenture holders and shareholders amounts to 6,400, and all attempts which have been made to maintain that the industry was owned and operated by a few for their own benefit has already been disproved. It must not be accepted that, after February 15, 1951, the compulsory transfer of your holdings to the State finally disposes of the issue of public control through a corporation nominated by and responsible to the Government of the day, as compared with control by debenture holders and shareholders in their capacities as proprietors of the industry through the boards of directors elected by them.

Finality on this issue, which has been clearly recorded in a recent Parliamentary debate, still rests with the decision of the electorate, and I should remind you both the Conservative and Liberal parties have pledged themselves to return this industry to private enterprise. Should the trend of future events enable this industry to be returned to private enterprise, I consider it is our responsibility to our existing debenture holders and shareholders to ensure that priority is given to them to exercise their will in this matter.

52 YEARS' RETROSPECT

The South Durham Company became a public company controlled by a board of directors elected by shareholders in 1898. During the 52 years of its existence, your directors have pursued a policy of expansion in the range of output of finished steel which commenced originally with the manufacture of iron and steel plates. From this beginning the West Hartlepool works have been built up to become the largest producers of sheared plates on the north east coast. Within the last 25 years at our Stockton works important new industries have been established, which consume a considerable proportion of our steel output. These great strides in the increase of output of steel products and the achievements in engineering and fabricating activities are a clear indication that this company has contributed its share to the high level of efficiency which the iron and steel industry under private enterprise has reached.

This annual meeting is the fifty-second meeting which has been held, and though it seems improbable that the break in ownership on February 15, 1951, can be avoided, I cannot see by the proposed method of State control any advantages will accrue to those employed within the industry or that outputs of manufactured steel at a cheaper price or in greater quantities than the industry has already set itself out to produce will be available to the consumers of steel products.

Before closing my remarks, I wish to extend on behalf of the board and of myself my congratulations to our managers, our officials, our clerical and other staffs, and to our workpeople, for the excellent results of the past year of our operations and for the record level of output which by their exertions and team spirit has been obtained.

The report and accounts were adopted.

THE STRAND HOTEL LIMITED

The forty-third annual general meeting of the Strand Hotel Limited, was held on December 19th at the Trocadero Restaurant, London, Mr S. I. Salmon presiding. The chairman said:

I cannot let this occasion pass without paying tribute to the distinguished chairmanship of my predecessor, Major Gluckstein. He is an elder statesman of our industry and a man whose wise counsel has been sought through long years in this company. We gratefully acknowledge his leadership and we count ourselves fortunate that he continues with us on the board.

This is, perhaps, an appropriate time to make some comment on the tourist trade which is now so vital to our country, particularly with the suspension of Marshall aid. Publicity has made everybody aware of this although the important part that hotels play may not be so readily appreciated. A few of the irksome restrictions on our industry have been removed but some still remain, and those that affect food are a particular source of dissatisfaction to visitors from abroad and damaging to the Government's desire to maintain our reputation as hosts. The Festival year could prove the best advertisement this country has ever had. It should be the forerunner of an era of increasing traffic to this island, but are we to be deprived of the benefits this would bring by our present cheese-paring policy? It must be remembered that it is by our hotels—the visitors' homes while they are with us—that we are primarily judged. We desire to welcome overseas visitors; let us do it wholeheartedly.

For our own part, the three hotels in our group have contributed no small share in adding to the country's dollar resources. A large proportion of our accommodation during the past summer has been continuously occupied by overseas visitors, and the fact that our bookings were made from individual applications from all parts of the world is a tribute to our popularity and demonstrates the goodwill we enjoy. We heartily welcome our overseas guests, but I make no apology for stressing the needs of our own people on whose patronage also our business necessarily depends. The allocation of rooms during the summer season is no easy problem, and some disappointment could be avoided if some of the conferences that take place in London during this period could be held at other times of the year, and so even up the pressure on accommodation.

The report and accounts were adopted.

KOLOK MANUFACTURING COMPANY, LIMITED

RECORD SALES AND NET PROFIT

MR E. S. DUMONT'S STATEMENT

The forty-second annual general meeting of the Kolok Manufacturing Company, Limited was held on December 15th at Rochester Works, Tariff Road, Tottenham, London, N., Mr E. S. Dumont, chairman and managing director, presiding.

The following is his speech, which had been circulated with the report and accounts for the year ended August 31, 1950:

Ladies and gentlemen,—It gives me great pleasure to report that the sales output and net profit for the year have established new records. The net profit of the company is £84,162 as compared with £75,812 for the preceding year, and of the group £92,717 as compared with £82,632. This year's figure of net profit is shown after charging the cost of the premium for the pension scheme which was inaugurated during the year. Also I am glad to report that the new subsidiary to which I referred last year has made satisfactory progress.

ENCOURAGING PROSPECTS

The prospects for the current year, subject to the rearmament programme and its effect on the supply and cost of raw materials, are encouraging. The demand for carbon papers and inked ribbons, for which your company enjoys the highest reputation, has continued at a high level and the volume of business in hand remains satisfactory.

In order to meet this demand, additional machinery has been installed, and to sustain it we have constantly endeavoured to improve our manufacturing processes and the quality of our products. We have, however, reached the limit of our resources in terms of space, and it has become essential to extend the factory, the cost of which, including necessary alterations, is estimated at £45,000. The financial strength of the group has been well maintained, as shown by the consolidated balance-sheet, in which current assets, less current liabilities, stand at £233,114, as compared with £210,106 for the preceding year.

POINTS IN THE ACCOUNTS

The accounts submitted are generally self-explanatory, but I draw attention to the following points. Firstly to the increase of £14,427 in the parent company's balance-sheet in respect of investments. This represents the amount received by a subsidiary for settlement of a war damage claim which has, in turn, been paid to the former shareholders of the subsidiary by the parent company. Secondly, a further appropriation of £5,000 has been made to the superannuation reserve.

Your directors recommend the same dividends as were paid for the preceding year—that is, a final dividend of 110 per cent. (less tax) on the Deferred Ordinary shares, making a total of 150 per cent. for the year, and a final dividend of 6¼ per cent. (less tax) on the Preferred Ordinary shares, making a total of 30 per cent. for the year. These dividends will absorb £8,801 and leave a balance of £60,496 to carry forward, as compared with £44,978 last year.

In conclusion, I express my thanks for the exceptionally good work done by all our executives, staff and employees during the year and to the members of the Board for their valued help and co-operation.

The report and accounts were adopted.

CRITTALL MANUFACTURING

INCREASED COSTS AFFECT PROFITS

LORD BRAINTREE'S SPEECH

The twenty-sixth annual general meeting of the Crittall Manufacturing Company, Limited, was held on December 13th in London, Lord Braintree, chairman and joint managing director, presiding.

The chairman in the course of his speech said:

The trading profits of the group for the year under review at £458,555 show a decrease of £56,281 against the previous year. For the first time the results of Fenestra-Crittall A.G. are included, with a consequent alteration in the comparative figures for 1949. In the preliminary announcement to the press the chairman is quoted as saying that the reduction in trading profits is more than accounted for by increased raw material costs and other charges not passed on to the customer. I propose to enlarge on this statement because it reveals interesting developments in the company's working and epitomises the company's selling policy.

RISE IN ZINC AND BRASS PRICES

The most important material increases were in zinc and brass. The former, of which the wartime controlled price was £26 10s. per ton, rose from £63 10s. at the commencement of the period to £127 10s. at the end. It is now £151. The corresponding figures for brass were an average wartime price of just over 7d. per pound and rose from 10½d. at the commencement of the period to 1s. 6½d. at the end. The current price is 2s. 0½d.

The extra cost to the company as a result of the increases in these metals was in excess of £60,000. To this should be added:—For fuel, freight, petrol, additional pensions and incentive bonus to staff £62,000, making £122,000. By deducting the reduced profit of £56,000 from this figure we are left with £66,000, which can fairly be taken as some indication of our increased efficiency. During the year, by a regrouping of processes and the consequent introduction of a more direct incentive scheme, the productivity of our workpeople has increased by more than twenty per cent. As a result of this we have introduced an incentive scheme for the staff, which evidence to date leads us to hope will bear similar fruit.

In my view the policy of absorbing price increases, rather than passing them on to the customer, is the best possible incentive to efficiency, just as the automatic passing on of increases tends to achieve the opposite result. There must, of course, be a limit to the amount of increased costs which can be absorbed without putting up prices but, apart from the fact that the policy we have followed is a direct inducement to efficiency, there are undoubtedly directions in which an increase in price would have an opposite effect to that intended and would, in fact, result in a decrease in profit. For instance, if there are two prices for an article dependent on its quality, and the more expensive involves the use of material subject to an upward trend in price, to follow this trend would undoubtedly switch orders to the lower priced article and reduce the output of the higher priced, which must inevitably still further increase its cost and might conceivably result in the abandonment of this more expensive finish.

THE FUTURE

I referred last year to the very large volume of building work which lies ahead of us. War damage has hardly been tackled and there is still a huge volume to bring our power plants and industrial equipment up to date. The need for houses, schools and hospitals will be with us for many years to come, and we have hardly tackled the question of slum clearance. In my view, our attitude towards this future should be to do everything possible to keep down cost and to avoid putting up prices.

If we take the view that, because of the amount of work in sight, prices will stand an unjustifiable margin of profit, it must inevitably react against building in the long run, and already most building now going forward cannot be justified on economic grounds, but is simply going forward from sheer necessity. In speaking of future prospects we, of course, have the extremely grave international situation to take into account Just where we as a company shall be placed as a result of rearmament is difficult to say. In the past we have played a not inconsiderable part. Our present volume of trade is much in excess of a year ago, and, subject to the international cloud, we should undoubtedly produce a better result in the current period.

TRADE INVESTMENTS

The income from trade investments is virtually the same as last year, when I mentioned the reduction in the dividend from Crittall-Hope Metal Windows (South Africa), Limited, brought about by the recession in building which had taken place in the Union of South Africa. I may say that there has been no improvement during the past year. It has been possible to retain the same dividend in spite of a reduction in profit, but conditions continue difficult and have been increased by the shortage of steel in the Union.

It is hoped that the supply of South African steel will improve in the near future. Our Johannesburg factory is definitely geared to South African steel production. Our Port Elizabeth factory, on the other hand, was built with the idea of using British steel, and it is inconceivable that this will not eventually be forthcoming.

It is a matter of record that Darlington and Simpson Rolling Mills, of which we own half the equity, which together with our small preference shareholding was acquired at a cost of some £271,000, comes under the scheme for the nationalisation of steel.

Darlington has not yet reached the limit of its development, and I hope I shall be allowed to continue as its chairman and that its policy on which the metal window industry has been built will remain unaltered.

APPROPRIATIONS

The net profits of the company, after taxation at £232,194, show a decrease of £9,179. Adding thereto the amount brought forward from last year and the amount brought in from the Scottish company, there is available a sum of £411,797.

Apart from the transfer to future taxation referred to above, a further £50,000 has been transferred to general reserve, making it £500,000, and £50,000 to plant replacement reserve, making it £125,000. The justification for this latter is greater than ever in view of the continual rise in cost of replacement of plant.

After providing for the preference dividends and the interim ordinary dividend, there is a balance available of £210,484. Your directors are recommending the payment of a final ordinary dividend of 10 per cent. actual, less income tax which will leave a balance forward of £176,109—an increase of £15,588.

I told you last year that our hopes of a considerable increase in export as against the previous year had not been realised. I am pleased to tell you that the period in question shows a substantial increase and that our dollar exports now play a much more important part. In this connection we have concluded in the period an arrangement to establish stocks in the United States, and hope through this channel to materially increase our proportion of dollar exports.

The report was adopted.

LAKE VIEW AND STAR, LIMITED

DAMAGING EFFECT OF CRIPPLING TAXATION

SIR JOSEPH BALL'S SPEECH

The fortieth annual general meeting of Lake View and Star, Limited, was held on December 15, 1950, at The Chartered Insurance Institute, London, E.C.

Sir Joseph Ball, K.B.E. (chairman of the company), presided.

The chairman in the course of his speech said: The revenue from mining and retreatment operations was £1,508,101, as compared with £1,163,586 for the previous year.

An amount of £321,500 has been appropriated for U.K. taxation, the increase of £151,000 over last year's figure being accounted for by the increased mining profits earned, and to an increase in the profits tax due to the higher rate in force and to the larger dividend proposed.

Your directors recommend the payment of a final dividend of 1s. 6d. per share, making a total dividend for the year of 2s. 6d. per share, as against 2s. for the previous year.

The estimated ore reserves at July 1, 1950, total 4,292,400 tons, averaging 4.77 dwts per ton, an increase of 196,000 tons.

I regret to say that labour remains in short supply in Western Australia, despite the fact that the group migration scheme, which was started in 1949, is still in full operation.

BURDEN OF TAXATION

I cannot conclude my remarks without referring to the very damaging effect of the present crippling burden of U.K. taxation on mining companies registered in this country. The sources of British capital for new mining enterprises are being rapidly dried up by these heavy inroads on savings; and, mining companies are being deprived of the opportunity of setting aside the funds necessary to provide for unavoidable new capital expenditure.

For many years past, London has been the financial centre of the overseas mining industry, but today, what do we find? The growing scarcity of "risk" capital in the United Kingdom is driving mining companies to look for it elsewhere; and, there is an increasing tendency for companies to seek Treasury permission to transfer the seat of management to countries where, at the present time, the burden of taxation is both much lower and more reasonably applied.

We have received suggestions that we should transfer the control of the company to Australia but after careful consideration the board have come to the unanimous conclusion that the disadvantages arising from any such change are so great as to outweigh the financial gain to be derived from it.

The report and accounts were adopted.

COMBINED EGYPTIAN MILLS

VAST DEVELOPMENT PLANS

SIR JOHN REYNOLDS ON FACTORS AFFECTING EXPORT TRADE

The twenty-first ordinary annual general meeting of Combined Egyptian Mills, Limited was held on December 20th in Manchester, Lieutenant-Colonel Sir John Reynolds, Bt., M.B.E., J.P. (the chairman), presiding.

The following is an extract from his circulated statement:—

The trading profit at £1,252,242 compares favourably with 1949 at £1,244,750. It must be remembered that the "fine trade" experienced hesitation in its markets during the opening months of the year but subsequent trading fully made good the slow opening period. The profit constitutes a record for your company.

Your directors have considered it prudent to place a further £100,000 to stock contingencies reserve, which will now stand at £200,000. The operation of the "Cover" Scheme in theory protects us against fluctuations but there are eventualities which must be provided for in view of the abnormally high price of our raw material.

The burden of these prices and the wide fluctuations with which we have had to contend will be clearly illustrated to you when I tell you that the two sharp rises which took place in October alone will absorb an extra £400,000 of our resources. Your best quality of Egyptian cotton today is ruling at about 60d. per lb. over prewar, or a rise of some 800 per cent.

A further £150,000 has been placed to general reserve, bringing this reserve in our balance sheet to £500,000. We recognise that this ploughing back of profits is at the shareholders' expense. This increase in reserves should and does improve the value of his property, but is cold comfort to the man who reasonably wants income.

I desire to call attention to the very large amount required for taxation, for, out of the profits of the year no less than £485,710 has to be provided. Taxation demands, including in particular the tax on undistributed profits, have now reached a scale of pure expropriation and are such a burden on the resources of all companies as to be a profound brake on progress. The demands of Government must of necessity be heavy but the maintenance of taxation in peacetime at a pitch which allows no slack for emergency is profoundly disturbing. As a result of this taxation, satisfactory though the profits of your company are, they do no more than suffice to provide the new money which the steady modernisation of your mills demands.

Production figures continue to improve due to an increased labour force now standing at 8,085 as against 7,689 last year and to a steady tightening up of production methods and the elimination of bottlenecks.

As regards sales, our order book is now highly satisfactory and all mills are sold well forward.

OVERSEA MARKETS

During the year most of our former markets have been supplied with our yarns, and regular visits by representatives from our sales department have been made to many oversea markets. We believe in the closest personal contact with our customers. We have been happy to have many of these customers and agents from oversea to visit us at our mills, and the year, from an exporting point of view, has been one of promise.

Unfortunately, restrictions due to monetary controls and licensing difficulties have affected very seriously many of our markets: under this heading is included the current quota allowed for Western Germany. This is far too small for normal usage between our two countries. In many trade arrangements made on a governmental base we feel that cotton yarn should be classed as a vital product for export. It must be wondered sometimes whether our authorities dealing with these questions realise the full value of cotton yarn as an export.

It is interesting to recall that at the end of the last century the exports of cotton yarn from Lancashire were around 250,000,000 lb. per annum. In 1936-37 the average was approximately 160,000,000 lb. while last year (1949) yarn exported was 82,000,000 lb. only. In this calendar year (1950), unless there is a sharp upward trend during the remaining part of the year, the figures will show a further sharp contraction.

The production of spun rayons and fibres from other synthetics shows a progressive increase with a considerable improvement on our prewar figures. Further developments in this field are contemplated.

POSITION OF SHAREHOLDERS

It is regrettably fashionable at present in certain quarters to regard the shareholder as something of a parasite. His profits are largely appropriated by the revenue and any desire he may show for a share in increased prosperity is castigated as profiteering. That your board has been unable this year to improve the shareholders' position by larger distribution is not due to failure by them to understand his problems but to a desire to conserve the company's resources so as to assure so far as possible that the shareholders' property is in first-class order and so equipped that when the trade cycle turns, the less favourable conditions can be faced with confidence.

During the year we have expended £283,659 on capital additions and some £310,000 on repairs and renewals. We are further committed, as our balance sheet shows, to modernisation schemes which will cost £405,000 over the next two years and we have also continued to employ a firm of redeployment consultants.

I deprecate the measuring of improvement by the publication of larger and larger sums spent, as if spending alone would achieve its ends. Most spinning improvements must be geared to weaving requirements and all modernisation geared to the labour force available and to the acceptance by trade unions of redeployment without which modernisation may prove ineffective. Your board has planned its expenditure with these factors in mind fully aware that high-priced new machinery standing idle or underemployed due to shortage of labour or whatever cause, is even more disastrous than idle old machinery.

THE FUTURE

Our shareholders will wish to have some expression of opinion from the board about the future. No chairman would be so unwise as to prognosticate what the future holds, but it may suffice to say that the weeks since closing these accounts are satisfactory and that our sales forward, which cover some months of delivery, give us grounds for sober optimism.

The bitter lessons of the past have not gone unlearnt and we hope that the spirit of co-operation in the industry will not be destroyed by a return of the excessive individualism which marred the 1930s.

The price of long stapled cotton at approximately 800 per cent. over prewar is, of course, a danger to the trade. It would be a much greater danger but that competitive fibres are either relatively as high, as in the case of wool, or in very short supply, as in the case of synthetic fibres.

Some fears have been expressed on the availability of the types of cotton we require. Certainly the drastic reduction in the exportable surplus of American cotton, and the Brazilian cotton crop disaster, have created for the cotton consuming countries the most difficult situation experienced for many years past. I think I can safely say, however, that as far as our raw cotton supplies are concerned your board has every confidence that no insurmountable difficulties will arise during the coming year and that the necessary cotton will be forthcoming to meet our needs and any hoped-for increase in production.

Looking ahead, Japan is a clear and obvious problem, but your group of mills, being as it is in the quality range of goods, is not as vulnerable as some to the first flush of this competition. No reasonable man, however, can see a solution in the enforced restriction of Japanese effort; that way in the end lies war. We should not have to fear fair competition and can but hope that the rise in the standard of living in Japan will continue and thereby reduce the disparity between our two economies.

The earning capacity of your company is steadily increasing; we are well sold ahead and hope that our present improvement will not only hold but increase to the benefit of all those who share in the life of the company.

The report and accounts were adopted.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

The seventeenth ordinary general meeting of The Industrial Credit Company, Limited, was held recently at 9, Leinster Street, Dublin, Mr J. P. Colbert, the chairman, in the course of his speech, said: The year has been one of increasing activity in the company's business both rom the point of view of the variety of proposals submitted and the total demand for industrial financing.

Since the commencement of business in 1933 the company has, apart from its general industrial financing by way of loans, guarantees, etc., carried through 43 public flotations of capital. Some 25,000 persons in the 26 Counties have invested in these Irish industrials sponsored by The Industrial Credit Company, and I think we may fairly claim that, largely due to the operations of your company, Irish industrial securities now rank, in the opinion of the genuine investor, equally with first-class industrials quoted on the London Stock Exchange.

As regards the general finances of the company, we are constantly receiving projects for the establishment of entirely new industries involving large amounts of capital. In this regard one has all the time to bear in mind that, as compared with the prewar period, estimates for buildings, plant and machinery and also allowance for working capital are trebled.

If an investor had put an equal amount into each individual security publicly sponsored by The Industrial Credit Company his yield in the latest year would be just under 7 per cent. The total profit available for allocation amounts to £112,990.

The report was adopted.

HEENAN AND FROUDE

ALL RECORDS BROKEN

MR ALAN P. GOOD'S REVIEW

The forty-eighth annual general meeting of Heenan and Froude, Limited, was held on December 18th at Worcester, Mr Charles L. Hill presiding in the absence of the chairman, Mr Alan P. Good.

The following is an extract from the chairman's circulated statement:—

It is once again my pleasant task to review a year's trading which has surpassed all previous records, both by the parent company and by the group as a whole. The demand for your company's products in the home markets has again expanded and, despite the many difficulties in world markets, overseas orders have been well maintained with the overall result that orders received during the year were well in excess of deliveries, even though the value of the output from the works was the highest achieved in the company's long history of trading, and the order book stands at an all-time record. The taxed profits of the parent company, before crediting subsidiaries' profits, are sufficient to meet the net dividends on the whole of the issued capital, and the total net profits of the subsidiaries show a very satisfactory return.

The foundations of the business have been well laid in the past and the building has continued unabated every year, developing new products, improving the old and opening up fresh markets either direct by the parent company or by the acquisition of other businesses. In 1936, when the first public issue of the company's shares was made, the net profits of the parent company and its one subsidiary at that time were less than £23,000, and we have come a long way in a relatively short time from that modest figure to the group net profit of nine companies of £327,358 for the year under review. In the same period issued share capital has grown from £94,558 to £824,288, and group sales, spread over a wide range of plant and equipment for diverse industries throughout the world, have increased from less than £250,000 to well over £3,500,000.

COMPETITIVE PRICES ESSENTIAL

To maintain production at maximum capacity there must necessarily be a full order book and this can only be achieved by keeping the prices of the company's products at a competitive level; it follows that we must continually progress in production technique and keep our capital equipment up to the highest standards of efficiency; we must be able to replace existing machinery if and when more efficient machines are marketed. But with this there is linked the question of company taxation which places a severe strain on available cash resources and it is inevitable that a full order book, with much contract work of up to five years' duration, brings with it a high level of work in progress tying up working capital.

Every rise in the price of materials, in wages and in overhead expenses lessens the power of working capital to finance a given volume of production. The company must keep its liquid resources at a workable level by ploughing back a substantial part of taxed profits, and dividend limitation becomes a policy, in the particular circumstances as they affect your company, which we must apply of our own free will as being in the best interests of the company. Your directors recognise, however, that there is a wide disparity between the issued share capital and the value of the net assets of the company and its subsidiaries and accordingly, recommend a small bonus issue to the Ordinary shareholders on a one-for-ten basis. It is hoped to maintain the dividend on the increased capital.

The report was adopted.

WALMSLEYS (BURY) LIMITED

(Manufacturers of Pulp and Papermaking Machinery and Equipment)

GRATIFYING INCREASE OF PROFITS

The eighteenth annual general meeting of Walmsleys (Bury) Limited was held on December 15th at Bury.

Mr J. Wolstenholme, chairman, in the course of his speech said:

The annual accounts show that the Walmsley group has emerged from the first five postwar years in a healthy condition.

The group profit for the year to June 30, 1950, before charging taxation, is £424,498, as compared with £293,590 for the previous year.

After charging taxation and deducting the proportion of subsidiary company's profits attributable to minority shareholders the group profits become £196,222, as compared with £116,577 last year.

The sum of £20,000 has been set aside for reserves for pensions, debtors and stocks. The recommended dividends absorb £33,550, and there remains £142,672 to be added to the balance brought forward. This means that after providing for a final dividend of 10 per cent. on the ordinary share capital there remains an amount of £476,868 to be carried forward in the profit and loss account.

MANUFACTURING ACTIVITIES

The associated companies are Walmsleys (Bury) Limited, Bentley and Jackson Limited, Ashworth and Parker Limited—all in Bury—together with Walker Brothers (Wigan) Limited, and John Wood and Sons Limited, both at Wigan.

Paper and pulpmaking machinery represents by far the largest field in which we operate, and within this sphere come the major activities of Walmsleys (Bury) Limited, and Bentley and Jackson Limited. During the period under review Walker Brothers (Wigan) Limited have also made a very valuable contribution to the overall output of this specialised type of machinery.

Over the 12 months we have supplied single and double drum and endless rope haulage mechanisms and also sinking winders to collieries at home and abroad.

Inquiries and orders actually on hand indicate continuity of this nationally important work, and we intend to develop and, if possible, extend this phase of our activities.

During the 12 months under review Walker Brothers' railcar programme has been maintained. Delivery includes four complete railcars to Peru, all of which are giving satisfactory service.

Our refuse collecting and vehicle programme is perhaps our most difficult section.

The general engineering activities of the group have been more than maintained. I should like to refer to the valuable contribution made by Ashworth and Parker Limited.

With taxation carrying off such a large share of profits the board would be failing in its duty towards you and the employees of the company if ample provision were not made for the funds needed to sustain and where possible improve both the volume and quality of the work done. It is, after all, only out of profits after tax that business can renew its vitality, a point which appears to be frequently overlooked in some circles.

We feel justified in taking a conservative view of our resources in these unsettled times. We hope that the conservation and building up of strength which has gone on inside this company will, for many years to come, enable the provision of stable rewards to the three partners in the enterprise—namely, to the shareholders, to those who work in it, and to those who buy its products.

The report and accounts were adopted.

IND COOPE AND ALLSOPP

DEMAND FOR BOTTLED BEERS

The thirty-eighth annual general meeting of Ind Coope and Allsopp Limited was held on December 15th in London, Col. the Rt. Hon. Lord Courthope, P.C., M.C., the chairman, presiding.

The following is an extract from his circulated statement.

The National Government, followed by the Labour Government, have launched what has been described as the Welfare State, and our industry has been called upon to play a not insubstantial part in aiding collection of the revenue that has been required. Not only has beer become relatively much more expensive, but the very improved society that the duty on beer helps to finance is designed, through better education and increasing facilities for use of leisure time, to decrease excessive consumption.

With the continuation of this policy, to which all parties are wed, the trend over the years has been, and must continue to be, towards decline in the purchase of beer per head of the consuming population. That demand which is maintained will inevitably become more selective, and it has been with this in mind that increasing amounts have been and must continue to be spent in improvement of both the article for sale and the environment in which it is sold.

Increases in both group and parent trading profits have been due to growing demands for bottled beer, in particular Double Diamond, and to economies in production.

The directors recommend a final dividend of 20 per cent., less tax, on the ordinary stock, making 30 per cent. for the year.

The report was adopted.

SECOND INDUSTRIAL TRUST

RECORD GROSS INCOME

The thirty-ninth annual general meeting of Second Industrial Trust Limited was held on December 14th in London.

Mr Lionel A. Stride (the chairman), in the course of his speech, said:—Once more I have to tell you that the gross income of the Trust for the year under review constitutes a fresh record. At £113,216 it is nearly £8,000 higher. We have increased the transfer to general reserve from £10,000 to £15,000 this year, making a total for this reserve of £115,000. We recommend that a final dividend of 6½ per cent. should be paid, making 9 per cent. for the year, which will leave £61,831 to be carried forward, against £58,892 brought in from last year.

The revenue of the Trust has remained so buoyant, earnings this year on the ordinary stock being over 17 per cent., that we have been able not only to increase our reserves substantially, but also to recommend a small but no doubt welcome increase of 1 per cent. on the ordinary dividend. The increase is admittedly a modest one, but it is one we hope to be able to maintain provided conditions deteriorate no further.

The valuation of our investments at September 30th last, which stand in our books at £1,478,195, reveals this year an appreciation over cost of £485,027, or approximately 33 per cent.

It would be foolish for me even to attempt to forecast the future of the Trust over the next twelve months. However, stockholders may rest assured that the board is fully alive to the difficulties which may be ahead.

The report was unanimously adopted.

BIRMID INDUSTRIES

ANOTHER SUCCESSFUL YEAR

The annual general meeting of Birmid Industries Limited was held on December 15th at Birmingham, Mr Cyril C. Maudsley (the chairman) presiding.

The following is an extract from his circulated address: Your directors are very pleased to report another year's successful triding. During the year the capitals of three subsidiaries were increased, one by subscription in cash, one by issue of bonus shares and the third by purchase of the remaining outside holding. As a result of the latter transaction, your company now have 100 per cent. holding in all but one of the subsidiaries.

Capital and reserves amount to no less than £3,515,481, or almost 367 per cent. of the capital subscribed. The total capital employed is almost £4,500,000. There is a new item appearing under the heading of Revenue Reserves, namely: Stock Reserves —£75,000. Following the revaluation of the £ sterling, the price of virgin aluminium was raised by £22 per ton, namely: from £90 to £112, and since the close of our financial year the price has again been advanced by £8, making a total of £120. In the case of re-melt aluminium, the advances have been even greater, whilst the costs of zinc, copper, silicon and magnesium have also risen. Undoubtedly, one of the reasons for the increased costs is due to the unsettled state of world politics in general.

The profit and loss account shows a net profit for the year of £462,314, after charging a greater sum, namely £546,176, in respect of taxation. The net profit shows an increase of £179,381.

REVIEW OF ACTIVITIES

All the iron foundries have been very fully occupied throughout the year. The impressive expansion of the automobile industry has made heavier demands than ever before on our iron foundries. All have achieved record output, and have made considerable additions to production capacity in new and more modern equipment. Order books are satisfactorily full. Whilst pressure on aluminium foundries has not been so great as on iron, they have been working throughout the year at a satisfactory level of output. In particular, pressure die section has made notable advances in total output and in size and complexity of castings produced, and has spread production over a wider range.

Gravity die foundries have done well in every way. The sand foundries have not the same mass production opportunities as some of the other sections, and must rely more on the special demands of aircraft and heavy vehicle industries, which are subject to fluctuations. Excellent technical developments have been achieved herein.

Magnesium foundries have continued busy throughout the year, and the newer high strength alloys recently developed have proved their worth wherever high strength and low weight are needed at high and low temperatures. There is certainly a promising future for these. Orders books here also are reasonably full for some time ahead.

Our products do not lend themselves to direct export, with the exception of wrought light alloys, of which 16 per cent. of total output was exported during the year. However, about 70 per cent. of all the products of foundries and rolling mills form essential parts of export goods of high value.

Technical development and plant improvement have been actively maintained. Order books are well filled, but the effect of defence demands and metal rationing cannot be foreseen. You may be assured, however, that events will find competent and courageous management ready to cope with them.

The report was adopted.

KRAMAT PULAI LIMITED

MR H. ASHWORTH HOPE'S STATEMENT

The forty-second annual general meeting of Kramat Pulai Limited was held on December 14th at the offices, 73, Cheapside, London, E.C.

Mr H. Ashworth Hope, chairman of the company, presided.

The following is an extract from the statement of the chairman, circulated to members:—

In Malaya practically no prospecting has been carried out during the past twelve years and a number of the existing proved areas are nearing exhaustion. Prospecting is now a very costly undertaking owing to the increased cost of labour and the greater depth of the areas which frequently have to be examined. The Malayan Government compelled the company to bear the cost of providing 35 armed special constables to protect our large field party.

Even if prospecting started now it would be many years before sufficient payable areas were found.

TAXATION

No economy can support for long a rate of taxation which extracts over 40 per cent. of the national income.

We pay 9s. in the £ income tax and 30 per cent. on distributed profit or a total tax on profits used for dividends of 61.5 per cent.—more than 12s. in the £.

TERRORISM IN MALAYA

The public need to be roused to the pitch of indignation against the supine and hesitant policy of the British Government and particularly those British Far Eastern officials who advise the Foreign Office that recognition of the new Government at Peking by the British would help to counter the Communist terrorism in Malaya.

An assurance from the Government that the troops would remain in Malaya until the trouble was cleared up should have been given years ago. Counter propaganda alone is entirely futile.

His Majesty's Government announced in March its intention of contributing substantially towards the cost of the emergency. I was very sceptical of this promise and felt sure the Treasury would devise some scheme that would enable the contribution to derive its source from Malaya.

My doubts were justified when, on the instructions of the British Government, the Malayan Government announced its pernicious rubber tax amounting to eight times the existing duty, basing taxation on the false principle of uncertain future prices.

The public indignation aroused in Malaya compelled the Government to adopt a basis of taxation more consistent with equity and common sense.

In view of Sir Harold Briggs' public statement that there had been a notable rise in major guerrilla incidents during October, it is difficult to appreciate why he should give prominence to the intention of replacing units of the British Army by special police.

The Malayan Government is constantly appealing to the public, and in particular to the Chinese, to come forward with information which may lead to the rounding up of terrorist bands. Almost in the same breath we are told that the troops may be withdrawn at any time. How can this inspire confidence in the ability of the Government to protect those willing and anxious to give information. Any suggestion of a withdrawal of military strength must have the effect of stimulating Communist morale.

The report and accounts were adopted.

KLINGER MANUFACTURING

LARGER NET PROFIT

The thirty-seventh annual general meeting of The Klinger Manufacturing Company, Limited, was held on December 19th in London, Mr J. L. Callow, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year ended September 30th: The net profit for the year is £201,399, compared with £111,887 for the previous year.

An interim dividend of 10 per cent. free of income tax was paid on May 31, 1950, and your board recommend the payment of a final dividend of 20 per cent. free of income tax on the ordinary stock.

The increase in the company's profits is closely related to the programme of expansion, development and plant modernisation, which continues to be carried out in all departments. During the year under review, £200,641 has been expended on plant and machinery, and you will recall that £152,930 was spent in the previous year. As a result of the increase in plant, the quantities produced during the year were considerably greater than those of the previous year. Correspondingly, the value of our sales is larger than that of the previous year, and it is pleasing to report a substantial increase in our export sales.

MARGATE FACTORY

The Margate factory and training centre has also contributed to the progress reported. What was, in 1949, principally a training centre is now predominantly a production unit, and some 250 operatives are at work. Building has commenced on the new main factory which is being built for us by the Margate Corporation.

The expansion of our business has naturally involved some increase in the amount of stock and work in progress, but the company's stock position remains sound.

The issued capital of the company at September 30, 1950, was £164,750, but as you will have noted, our fixed and current assets at that date exceeded the million mark, amounting to £1,091,690. I have referred on earlier occasions to the large difference between the issued capital and the amount of capital and reserves. These you will note from the balance sheet amount to £754,295. Stockholders have already been informed of the board's proposals regarding capital issues which will provide further funds for development and working capital.

The satisfactory results now placed before you have been achieved in the face of ever-increasing difficulties arising from erratic movements in raw material prices and the innumerable restrictions which manufacturers have to contend with.

The report was adopted; resolutions were passed increasing the capital from £400,000 to £600,000 by the creation of 800,000 new ordinary shares of 5s. each; the capitalisation of certain sums and their distribution as a bonus issue of stock.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

ASSOCIATED BRITISH MALTSTERS

RESULTS EXCEED EXPECTATION

The twenty-ninth annual general meeting of Associated British Maltsters, Limited, will be held on January 8th.

The following is an extract from the circulated statement of the chairman, Mr H. Sutcombe Hume, C.B.E., M.C.:—

The results we are able to lay before you are better than we had hoped, and the profits for the year ended on August 31, 1950, show, after providing for taxation, a moderate increase over those of the two previous years.

The brewing trade in this country is, and always will be, our mainstay, in spite of the fact that we sell a substantial proportion of our output to the food trades, we do an appreciable amount of export to breweries all over the world, and we have a number of subsidiary activities in the animal food and other trades.

We are independent maltsters for sale, and when consumption is high we benefit greatly, but when it falls we are liable to suffer a disproportionate reduction in malt purchases from those brewers who make some of their own malt. We are proud to believe that we give such service and quality as convinces our brewer and other friends that it pays them to continue to patronise the independent maltsters who, like ourselves, have kept ahead of the times.

The introduction of the combine harvester, and the new basis upon which the relations with malting labour have been established, have meant heavy expenditure on buildings and equipment. In the old days maltings were nearly always small units dependent to a large extent on manual operation—a method which often produced excellent malt. But nowadays labour demands a high degree of mechanisation, and the farmer delivers from his combine in a few weeks a volume of material which formerly reached the maltster over half the year.

These two major changes have involved your group of companies so far in capital expenditure of about £1,000,000, and, as shown in the balance sheet, we have further commitments of about £500,000. Thus, while facing the prospect of falling trade and profits, we have had to provide for this heavy capital expenditure. With careful management we hope to be able to finance ourselves without resorting to further capital issues, and to maintain our dividend.

BARLEY PRICE AGREEMENT

The malting season of 1949-50 had few outstanding features. Thanks to the fact that it was the driest harvest for many years, we were able to handle the storage problem without undue difficulty. But the 1950-51 season we are now operating is a very different matter. From seed time to harvest the weather was very much less favourable than in the previous year, so that farmers not only had a very expensive harvest, but much of their grain crops was ruined.

So soon as the position was generally realised prices of barley rose rapidly until there was devised an agreement between the National Farmers' Union, the Brewers' Society, Maltsters' Association, and others, limiting the maximum price of barley to 140s. per quarter of 448 lb. on the growers' farm, plus the maximum merchant's commission of 5s. and the cartage, screening, and handling charges incurred. The otherwise wholly desirable step of removing price control was unfortunately badly mistimed and taken against the advice of people who were in a position to foresee the danger. The result has been to bring practically all grades of barley to the maximum price regardless of quality, and thus to encourage farmers to aim at securing the highest possible yield per acre instead of growing the finest quality for which their land is suited, as used to be the case when good quality commanded a worth-while premium.

The contingency reserve we have now built up to £550,000 is, in the opinion of your board, all needed both to adjust the value of our fixed assets and to finance the construction of the buildings and plant we are now installing to meet the changed conditions in our trade.

BROWN BAYLEY'S STEEL WORKS

HIVING-OFF OF NON-STEEL ASSETS AGREED

RECORD PRODUCTION AND SALES

MR J. W. GARTON'S STATEMENT

The thirty-second annual general meeting of Brown Bayley's Steel Works, Limited, was held on December 20th in Sheffield.

Mr J. W. Garton (the chairman) presided, and the following is his statement circulated with the report and accounts:—

You will have seen from the circular letter calling a meeting for the appointment of a stockholders' representative, that our application for hiving-off of certain non-steel assets, which was mentioned in my statement last year, has been agreed in principle. I had hoped that in sending out the accounts together with my statement I should have been able to put before you particulars of the hiving-off arrangements. This is unfortunately not yet possible, and I very much regret the delay, but as no doubt you will appreciate the work is very involved.

I would now refer to the year under review. I appreciate that your interest in these figures may be somewhat academic, but I would like to point out some of the interesting points.

THE ACCOUNTS

The net profit brought into the profit and loss appropriation account of the holding company is £348,998, as against £233,571 for the previous year. This is after allowing for the amounts of subsidiary companies' profits attributable to outside shareholders and the amounts retained by those subsidiaries.

During the course of the year certain of our outstanding taxation liabilities have been clarified, and we have been able to settle the amount due on an outstanding foreign royalty. The result of this is that we have been able to bring back as surplus £50,000 in respect of the provisions which we made to cover these possible liabilities. At the same time our taxation advisers have investigated our future tax liability, especially in regard to deferred repairs executed, and it has resulted in a transfer of £200,000 from the future taxation reserve to general reserve.

As last year we are obliged by the Iron and Steel Act, 1949, to retain our dividend at the same rate as in previous years. No special appropriations are recommended this year, and thus the whole of the surplus, after paying the dividends, is left in the profit and loss account, resulting in an increase in that balance of approximately £338,000.

IMPROVED LIQUID POSITION

You will observe that the company have continued to expend sums well in excess of the depreciation provision on additions and replacements to buildings, plant and machinery. The liquid position has improved considerably, and there is now a surplus of current assets over current liabilities of £1,549,656, as against £1,199,317 last year.

The fall in value of the quoted investments, as you see from the consolidated balance sheet, continued. The resultant loss is well covered by an investment reserve. Since the date of the accounts, the value of the underlying investments has improved.

SUBSIDIARY COMPANIES

The consolidated balance sheet of the Hoffmann Manufacturing Company, Limited, is produced as part of the year's report, and as you will see that company has had a very successful year ending on December 31, 1949. The position of this company in the ball bearing industry allows us reasonable hope for the future.

The South African Company had a very satisfactory year and further improved its trading position.

Our stainless steel fabrication works in Leeds had a good year, continuing the steady expansion to which I referred in my statement last year. The confidence then expressed has been amply rewarded, and we look forward to further expansion by this undertaking.

NEW PROJECTS

Of the various schemes mentioned last year, the forge and mill departments are now practically complete. Other projects are going on at an increasing rate, but there is still much to do.

OUTPUT

Once again your company has to report an increase in the ingot production, thus improving on last year's record. Consequent upon this our overall sales have been the highest yet attained.

Future output is dependent on the adequate supply of raw materials. The position is showing signs of becoming difficult. Steps to improve the position in respect of these matters are, the company understands, receiving attention at the very highest level.

In co-operation with our customers, we are continuing to develop types of special steels to meet particularly arduous requirements in service.

The recent decision regarding engineers' wages must of necessity materially increase our wages bill and consequently our costs of production.

Your company continues to provide much help to those employed here through its benevolent and welfare funds, particularly those who have grown old in our service. The canteen and sports facilities are much used, and despite the fact that they need heavy subsidies, this sphere of our activities might usefully be extended when time and materials permit. We have recently acquired 20 acres of land to be used as a new sports ground.

I would like, on behalf of yourselves and of your directors, to thank the whole of the employees, both present and past, who have, during the life of the company, loyally served it. It is no mere formality to say that our thanks are due to them for their continued co-operation and hard work, and we have no doubt that this excellent spirit will continue in the future.

The report and accounts were adopted.

HARRISONS AND CROSFIELD, LIMITED

FURTHER STRENGTHENING OF RESERVES

At the annual general meeting on December 19th, Mr H. Eric Miller, the chairman, stated that the group profit amounted to £1,157,263 before deduction of taxation; the net profit being £451,668. Group reserves and undistributed profits now total £2,129,000, an amount almost equal to the issued share capital.

The heavy additional rubber export duty recently imposed by the Malayan Government had rightly come in for castigation in the public press from so many angles that he could on this occasion content himself with voicing appreciation of the part played by the Rubber Growers' Association and the Rubber Trade Association in defence of the industry. From the political angle nothing could have been more inept than the administration's failure to take their Legislative Council into prior consultation before proceeding with an impost which was bound to be resented and could not have been more ill-timed. Along with others who were deeply interested in the course of events in Malaya, he regretted having to make that protest at a time when the Malayan Government had so many preoccupations on its hands. Was it even now too late for them to reverse their ill-judged policy in this matter?

The recent rioting in Singapore was a reminder of how much inflammable human material there was at hand for any spark to set alight. That applied with equal emphasis to Indonesia where the Japanese occupation had also left sinister legacies.

By contrast, North Borneo is like a peaceful oasis in a troubled world, and our advices indicate that in an unpretentious way rapid strides have been made in rehabilitating the working economy of the territory, where devastation during the Japanese occupation had been particularly harsh.

Business in China is only possible on a much reduced scale, but in Formosa, under the able guidance of Mr N. F. Myers, who has just returned after a short furlough, our offices there are doing a lot of useful work and making their contribution to the general pool.

Reviewing the tea industry he said that world production and consumption are now more nearly in equilibrium, but, until U.K. stocks are built up, he expects to see high prices continue, with inevitable fluctuations at Eastern auctions. The outlook for the tea trade here when the London auctions are resumed in April, 1951, is in no sense clear. The proposed auctions will be very different from our prewar free market. They are however one step towards re-establishing London as a centre of the trade.

Speaking of rubber he described the recent market fever which produced price fluctuations of up to 9d. a pound in as many hours as paralysingly harmful. There is a healthier demand for natural rubber at the lower level now current. The demand for this commodity is world wide and nobody is carrying stocks adequate for present-day conditions. Rubber has been outstandingly valuable in strengthening the dollar resources of the sterling area and now that Marshall aid is to be suspended, it is more than ever important that stockpile buying should be continued in an orderly manner.

The report was adopted, and a final dividend of 20 per cent. (making 25 per cent.) on the deferred ordinary stock was approved. At the ensuing extraordinary meeting a special resolution was passed adopting revised articles of association.

WRIGHT SADDLE COMPANY, LIMITED

SUBSTANTIAL INCREASE IN TURNOVER

The fourteenth annual general meeting of the Wright Saddle Company, Limited, was held on December 19th at Birmingham, Mr Arthur Colegate, M.P. (the chairman) presiding.

After he had dealt with the accounts, the chairman said: The turnover for the year ending August 31st exceeded very substantially that of the previous year. This resulted in an increased trading profit of £93,698 as compared with a profit of £66,861 for 1949. Out of this no less a sum than £46,000 has to be reserved for taxation.

Included in this amount is the sum of £6,500 which we are putting to a Taxation Equalisation Reserve Account to meet the deferred liability arising from the increase in the rate of Initial Allowance for Plant provided by the Finance Act of 1949.

INFLATED DEMANDS FOR TAXATION

In this connection I must point out what a tremendous drain on the liquid resources of the company these inflated demands for taxation are. At no time was it more essential than it is to-day that British industry should seek out every possible avenue by which its plant and equipment may be made the most efficient in the world. Unless we do this we cannot hope to hold our own in the world situation which is developing, when many of the markets to which we export are taking steps to become independent of British imports. It is in this respect that the taxation policy of the present Government is such a harmful one. There is little elbow room for experiments in new methods of production which may or may not succeed, yet such experiments are essential if we are to develop to the full the labour-saving possibilities that modern technology holds out.

We have had to face a year of unprecedented price increases in our most important commodities, namely leather, wool and cotton. These increases have forced us to raise very considerably our own selling prices, and even at these prices suppliers are often not prepared to enter into firm contracts for delivery. Unfortunately the full effects of these raw material price increases have not yet made themselves felt, as it is our policy to pass on to our customers the benefit of stock bought at lower prices, but as we work at comparatively small margins of profit it is inevitable that in the near future our selling prices will again have to be raised. I would point out that although profits have shown a good recovery this year they do not fully reflect the advantages anticipated from the fact that the past year's production was by far the highest in the history of the company. This fact was due to the sudden and rapid rise in the cost of leather towards the end of our financial year which more than absorbed the margin of profit which we should normally expect to make.

THE OUTLOOK

In spite, therefore, of a very full order book, the task of forecasting the future is almost impossible. We shall continue to do our best to meet our customers' requirements in quality, quantity and price. The internal efficiency of the company has never reached a higher standard than is the case at present. Many improvements in our equipment have been introduced and we shall continue our policy of endeavouring to improve the quality of our products.

The report was adopted.

JOSHUA HOYLE AND SONS

HIGHER OUTPUT AND PROFITS

The annual general meeting of Joshua Hoyle and Sons, Limited, was held at India Mill, Bacup, on Wednesday, December 20th.

Mr H. A. Enright, chairman and managing director, who presided, said:

Our turnover has expanded, the record figures for last year having been considerably exceeded. Our improved profits are largely due to increased production, reflecting the advantages gained by the costly schemes of modernisation and plant improvement and the various methods adopted to increase productivity

Our reputation stands very high, the demand for our goods is well maintained and our order books are healthy. Business is well divided between export, home trade and industrial users. In most sections we have been unable to satisfy the demands of our customers. We realise the importance of the utility programme and have continued to make a valuable contribution to it.

The trading profits of the group amount to £1,774,300, and I give below a summary of the manner in which the profits have been appropriated:

	£	Percentage of total profits
Taxation	921,050	51.91
Dividends—Net ...	215,926	12.17
Retained Profits ...	637,324	35.92
	£1,774,300	100.00

The total capital employed in the group is now £5,467,267, which is, of course, based on the depreciated value of the fixed assets.

The report was adopted and the dividend and bonus recommendations approved.

TENNAMARAM PALM OIL

INCREASED PRODUCTION AND OUTPUT

The twenty-seventh annual general meeting of Tennamaram Palm Oil Company, Limited, was held on December 20th, in London, Mr J. Bligh Orr (the chairman) presiding.

The following is an extract from his circulated statement:—

Final results for the year show trading profits almost identical with those of 1948-49. 1,084 tons of palm oil were produced, against 1,035 tons, while the output of kernels amounted to 238 tons, against 205 tons. The net price realised for palm oil was £76 1s. and for kernels £46 13s. 8d. For the calendar year 1951 the Ministry of Food have agreed to buy the whole palm oil output for £104 10s. per ton f.o.b. The market price of kernels has risen appreciably and of the new season's crop 79½ tons have already been sold at a net figure of £55 18s. per ton.

The figures are not unsatisfactory; I wish the same could be said of production costs. Our yield of palm oil is a low one, being only about half a ton an acre. Our overhead charges would be no greater on a 40 per cent. higher crop, which we used to obtain prewar. But the real trouble is the rise in labour wages and in the cost of materials.

All field works have been kept up to date. The acreage statement discloses the addition of 484 acres to our replanted and interplanted area. 134½ acres of our reserve jungle on Hopeful have been planted. The balance of 97 acres is now in hand.

Your directors now recommend payment of a final dividend of 8 per cent., making 12 per cent. for the year on both classes of shares.

The report was adopted.

LIVERPOOL WAREHOUSING COMPANY LIMITED

MR W. MILLIGAN'S STATEMENT

At the fifty-fifth annual general meeting in Liverpool on Tuesday (December 19th) the chairman presided and addressed the shareholders as follows:—

Once more it is my very great pleasure to submit for your approval a favourable report and statement of accounts on the last year's work. To me the result is all the more gratifying as for the last few years the cry has always been "full to capacity"—or very nearly so—and it was not easy to see where further improvement was to come from and yet—the record does still grow and we hope may continue to do so

You will, of course, recognise that owing to the seasonal movement of commodities and raw materials the total quantity of goods stored with us seldom remains static and that crop failures, international happenings and the peculiar purchasing procedures of the times tend to accentuate irregularity. Under these conditions large tonnages have at times to be housed or delivered within short periods, all of which make heavy demands upon warehouse facilities and labour; fortunately, owing to the spread afforded by our numerous warehouses, we are in a position to effect speedy intake and delivery and thus make a useful contribution to the clearance of the dock quays and to the rapid turnround of ships. These bulk movements, however, especially when made at short notice, tend to reduce rather than increase earnings, and you will accordingly appreciate that we have to keep a close eye on this problem, since our rental charges, which are our principal source of revenue, have been increased by only 25 per cent. over prewar. It is questionable whether any other branch of industry can equal this record and one could wish that charges for services throughout the country were kept correspondingly low.

In the course of the year four additional warehouses have been added to our available capacity and we expect to have some more in commission this next year.

Our subsidiary, the Sandon Motor and Engineering Company, Limited, continues to do good work and we expect will do better still when some new machines now on order, become available; we also hope to extend their premises in the near future. Their accounts are subjoined to our own and it is pleasing to see they show a gross trading surplus of £22,824, of which amount £10,000 has been placed to their general reserve. When comparing our own figures therefore with those of last year, this reserve of £10,000 must not be disregarded.

Here may I be allowed to remark that from the fact of no fresh communications being forthcoming you would doubtless conclude that the Capital Issues Committee had refused our application to capitalise part of our reserves. As you know, this proposal was made with a view to bringing our issued capital somewhat more into line with the amount actually employed in the business; we can only regret the attitude of the committee, which has recently refused us for the second time, but should any change take place in the situation you shall be promptly informed. Incidentally, you will perhaps have been interested to note from our balance sheet that the total of our stockholders' funds now stands at approximately £2,500,000—and you will appreciate that it is upon this capital sum, after deduction of the proportion attributable to our preference shareholders, that our ordinary dividends should be calculated.

You will remember that at our last meeting I announced the retirement of Mr Harry Gaunt but, following his withdrawal, your directors felt it desirable to strengthen the board and were unanimous in inviting Mr Harold B. Mack to fill the vacancy. Mr Mack is probably already known to most of you. He is a qualified accountant, is a director of the shipping firm, J. J. Mack and Sons, Limited, and of several other commercial firms, so that his wide and varied business experience should prove of much value to the company. In accordance with our articles Mr Mack retires at this meeting, but is eligible and offers himself for re-election.

I do not propose to take up time in going over all the details of the accounts submitted. Those details are very clearly set out. You have had some time to study them and I think you will agree they present a very clear picture of the company's financial position and there is little to be added in their connection. If there should be any questions I shall with pleasure endeavour to reply but first, I am sure you would wish me to thank one and all of our staff for their keen and devoted work throughout the year. Promptness and efficiency in all directions is the keynote to our success and I am proud to say that we continue to enjoy those attributes in the fullest degree.

The report and accounts were adopted.

The annual general meeting was preceded by an extraordinary general meeting of the company at which new articles of association (designed to bring the existing articles into line with the Companies Act, 1948, and with modern practice) were adopted.

NEW ZEALAND LOAN AND MERCANTILE AGENCY COMPANY, LIMITED

MR W. H. TATHAM'S REVIEW

The fifty-sixth annual general meeting of the New Zealand Loan and Mercantile Agency Company, Limited, was held on December 15th at Winchester House, Old Broad Street, London, E.C., Mr. W. H. Tatham, O.B.E., T.D., the chairman, presiding.

The following is an extract from the chairman's review circulated with the report and accounts for the year to June 30, 1950:

The company has had a good year and increased profits have been made in all branches of the company's business, especially in Australia but also in New Zealand.

AUSTRALIA

Increased turnover, both in quantity and value, in the wool and livestock departments were mainly responsible for the improved profits, though all departments had a good year.

Seasonal conditions were on the whole favourable, though some areas in Queensland and New South Wales had too much rain in June and July. Not only were large areas of land flooded and many sheep drowned, but also, owing to the difficulties of proper supervision, losses due to blow-fly were severe. The lamb casualties have been heavy in these areas during September due to diseases arising from the wet conditions.

We have continued to extend our interests by establishing sub-branches in favourable areas and we have also purchased some small country Stock and Station Agent businesses. The market for these businesses has become very competitive.

The results so far in this current year have been satisfactory in Australia and weather conditions are favourable. Generally speaking, Australia has now enjoyed, consecutively, a number of good seasons. It is as well to recollect that seasons in Australia can also be as consistently unfavourable.

NEW ZEALAND

The farming community in this Dominion has had a prosperous year which has reflected itself in increased turnover in all our departments. Unfortunately our costs have also increased, due mainly to higher wages and salaries. During my visit this year I found the outlook in the country noticeably more optimistic than when I was there in 1947 and generally keener and more confident. If this improved feeling can be maintained and lead to greater output per head, many of the difficulties being experienced by this remarkable country will disappear.

Business continues to be good and the outlook for the current year is satisfactory in both North and South Islands.

THE FUTURE

Generally speaking, weather conditions continue to be favourable in both Australia and New Zealand and not only is the condition of stock good but the numbers of both sheep and cattle are rising.

Stockholders will not need to be reminded that wool prices have increased sharply. It would appear that the demands for defence purposes, added to the fact that the demand by all consuming countries is still greater than available supplies, plus the fact that there is virtually no longer any reserve in the shape of the "J.O." stocks, are likely to result in a continuation of prices at levels much higher than hitherto.

Even at present-day prices wool has not risen proportionately as much as some of the other main commodities. Stockholders, however, will recollect the hazards of our business and that commodity prices can fall as fast as they can rise. It should also be remembered that these higher prices bring in their train increased costs of running the business.

The indications are that, subject to exceptional circumstances, the company will continue to make satisfactory progress during the ensuing year.

The report and accounts were unanimously adopted.

S. SMITH AND SONS (ENGLAND)

RECORD SALES AND PROFITS

The annual general meeting of S. Smith and Sons (England) Limited was held on December 19th in London, Sir Allan Bordon-Smith, K.B.E., D.L., the chairman, presiding.

He drew attention to the consolidated balance sheet showing that the total net assets were now £5,285,000 (£4,592,000 last year), and to the consolidated profit and loss account, which showed before taxation £1,101,000 (£850,000 last year) and the net figure of £420,000 (£346,000 last year). The balance carried forward to the S. Smith and Sons (England) Limited profit and loss appropriation account was £325,000, of which it was proposed to allocate £150,000 general reserve and £50,000 reserve for pensions.

He explained that in deciding to recommend the same ordinary dividend as last year the directors were adhering to their conservative policy which had served the company so well in the past, and that in the opinion of the board this policy should be maintained in respect of the year under consideration because of the need for conserving resources of the company in view of its capital commitments for extensions of the business.

Referring to progress made, the chairman noted that the policy of divisional segregation of the company's business had proved successful.

Smiths Motor Accessories Limited, the oldest member of the group, had made more progress than any other division. Striking development had been made in carheaters and controlled ventilation, which had become a very important section of the company's business. The new Witney factory for these manufacturers was now in production.

Smiths English Clocks, Limited, also reported an increased demand. Manufacturing facilities have been further developed, and it must now be considered as one of the largest clock and watch manufacturing organisations in the world and probably the largest exporter of clocks.

Continuing the policy of specialised factories, these were spread over a wide area including England, Scotland and Wales, and had aided the Government's Development Area Programme.

Smiths Aircraft Instruments, Limited, had maintained its already established pre-eminence in the instrumentation of the present-day aeroplane, record sales having been achieved.

Smiths Industrial Instruments, Limited, had progressed steadily during the year, specialising in industrial instruments of all descriptions.

Kelvin and Hughes Limited had continued to develop their range. The most noticeable development had been in their ship's radar equipment now being supplied all over the world in large quantities.

PROFIT SHARING SCHEME

The chairman stated that the board had for some time been considering the question of putting into operation some form of profit sharing scheme for employees of Smiths' own companies. This question was receiving a great deal of consideration and he was hopeful that in the near future some satisfactory scheme might be evolved.

During a long period of years an extremely valuable goodwill has been built up all over the world for all Smiths products and in order to meet the resultant demand further expansion of factories and sales and service facilities are imperative. The main capital requirements were for the development of the Witney factory for car heaters, a new sales and service establishment to make room for increased production in the Cricklewood Instrument Works, extensive extensions to the Cheltenham factories for the aircraft division, the equipping of the new alarm clock factory in Scotland and the general finance of a steadily increasing business. It was for the purpose of financing these projects that it was proposed to make a further issue of capital on terms attractive to shareholders.

Finally, in pointing out that it had been a record year, both as regards sales and profits, in the history of the company, the chairman thanked the managing director of the group, Mr Ralph Gordon-Smith, the general manager and all the executives and employees for the way they had worked together as a team to achieve these excellent results.

In seconding the adoption of the report and accounts the managing director, Mr Ralph Gordon-Smith, stressed how much the expansion of the business was due to increased exports (now over 50 per cent.) and how much this record year was attributable to the hard work and great efforts of all employees and executives.

The report and accounts were unanimously adopted.

At subsequent separate class meetings of the holders of 7½ per cent. cumulative preference shares, 7 per cent. non-cumulative preferred ordinary shares and deferred ordinary shares and at an extraordinary general meeting of the company, resolutions were passed approving the re-organisation of the capital of the company, including the issue of 3,167,514 ordinary shares of 4s. each to the ordinary shareholders on bonus terms.

THE ROVER COMPANY, LIMITED

CONSIDERABLE INCREASE IN TURNOVER

The fifty-fifth annual general meeting of The Rover Company, Limited, was held on December 20th at Birmingham, Mr E. Ransom Harrison, F.S.A.A. (the chairman) presiding.

The following are extracts from the chairman's circulated statement:—

The very satisfactory figures shown in the accounts are the result of a considerable increase in turnover; our output was over 20,000 vehicles, an increase of over 50 per cent. on the previous year.

Since my last report prices of our principal raw materials have risen steadily but, despite the consequent increase in our costs of production, we have, as a result of the expansion of our output, been able to avoid increasing the home market prices of our vehicles. As a result of this, however, our net profit when related to turnover is appreciably less than last year.

Raw material prices and wages continue to rise and while we shall endeavour to avoid increases in the prices of our vehicles, sooner or later this will be inevitable if the present upward trend in costs continues.

As our output has expanded, so has the volume of our export sales. Particular attention has been given to the expansion of sales to dollar countries and as a result our exports to hard currency markets have shown a very satisfactory increase.

The new Rover "75" model car has now been in production for over a year and the directors are confident that it will more than uphold the company's reputation for producing a medium-priced quality car. The Land-Rover continues to enjoy world-wide popularity and orders for this vehicle and for our cars will absorb our maximum output for many months to come.

Government restrictions on the sale of vehicles in the home market still continue, and we look forward to the time when we shall be able to give reasonable delivery to the many customers at home who wish to buy our products.

In March, 1950, the company had the honour to demonstrate the first car to be driven by a gas turbine engine, and the tremendous interest which was shown throughout the world has not only enhanced our reputation but that of the British Car Industry as a whole. This gas turbine car was exhibited in New York at the British Motor Manufacturers' Show where it again aroused very considerable interest.

The net profit has risen from £158,098 last year to £195,201 and it is proposed to transfer £76,000 to general reserve making this £650,000 and to pay a dividend of 20 per cent. and a bonus of 5 per cent. both less income tax.

The report was adopted.

NOTICES

UNIVERSITY OF SYDNEY, NEW SOUTH WALES, AUSTRALIA

(Senior Lecturer or Lecturer in Economics, Senior Lecturer in Statistical Methods (Faculty of Agriculture), Lecturer in Botany and Senior Lecturer in Agricultural Chemistry. Closing dates in each case December 31, 1950.)

Prospective candidates for the above-mentioned appointments which have recently been advertised are asked to note that new salary scales are now in operation as under:

Senior Lecturers ..... £A1,050—£A1,300
Lecturers ..... £A650—£A1,000

The conditions previously published regarding negotiations for increased salaries and amount of cost of living adjustments are therefore withdrawn. Further particulars concerning the posts may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5 Gordon Square, London, W.C.1.

EXPERIENCED Assistant Staff Manager, 36, on leave from abroad, seeks similar post in southern England. Excellent references.—Box 550.

TODAY'S difficulties in factory administration are a challenge to be met by the energy, drive, and experience of a successful Production Executive age 30 who is seeking alternative employment with an organisation employing 100 to 1,000 employees. Commencing salary £1,500.—Box 553.

MANAGEMENT and Industrial Consulting. Production-Engineering Ltd. invite applications for a senior position on their staff from men aged 30-40 with wide experience in marketing and preferably with a university degree. Applicants should have a real interest in the problems facing management today, and must be prepared to undergo training in the various aspects of consulting work. This is a permanent post with a high salary as well as Life Assurance and superannuation benefits. Write, giving age and full details of education, qualifications, experience and present salary, to Production-Engineering Ltd., 28, Bruton Street, London, W.1.

MALE CLERICAL ASSISTANT required by Major Oil Company in its Statistical Branch in London. Applicants aged 20-25 must have completed National Service and be in possession of School Certificate. Liking for figure work and numerical accuracy essential. Write, stating age, qualifications and experience quoting Department M.1452 to Box 6023 at 191, Gresham House E.C.2.

UNIVERSITY OF NATAL, DURBAN, SOUTH AFRICA

Applications are invited for the post of LECTURER IN ACCOUNTING.

Salary scale (Men): £550 x £25—£725. In addition a cost of living allowance, at present amounting to £208 for a married person and £83 4s. for a single person, is payable. The initial salary will be determined by qualifications and experience.

Further particulars and information as to the method of application, may be obtained from the Secretary, Association of Universities of the British Commonwealth, 5, Gordon Square, London, W.C.1.

The closing date for the receipt of applications is December 31, 1950.

THE ROYAL COLLEGE OF NURSING

Administrative Assistant (Woman) required, age about 35, qualified to act as Committee Secretary and to undertake administrative responsibilities; knowledge of law or economics an advantage. Apply in writing to General Secretary, Royal College of Nursing, Henrietta Place, Cavendish Square, London, W.1.

A VACANCY exists in a large organisation for a young man about 30 years of age who holds a degree in economics with honours in statistics. Some knowledge of Powers Samas accounting machines and methods would be useful but not essential. He would be given a period of training in the Head Office of the organisation and if in 4 or 5 years he is satisfactory he would take over the management of the organisation's Statistical and Sales Analysis Department with a four figure salary.—Apply giving age and full particulars to Box 536.

PUBLIC RELATIONS OFFICER required for a large group of companies in the milder western tropics employing many thousands in a variety of businesses, including agriculture, large stores, shipping, transport, printing, etc. The post is a new one and the officer will be required to work in close co-operation with existing personnel and advertising departments.—Reply, giving full details of age, experience, qualifications, previous earnings, and whether married or single. An academic qualification would be an advantage. —Reply, Box 549.

ASSISTANT SECRETARY-ACCOUNTANT. — Major Company invited to consider appointment of person now concluding full-time study for qualification with comprehensive supporting experience. Age 33 years.—Box 542.

Statistical Summary

EXCHEQUER RETURNS

For the week ended December 16, 1950, total ordinary revenue was £50,388,000, against ordinary expenditure of £65,000,000 and issues to sinking funds £230,000. Thus, including sinking fund allocations of £11,791,000 the surplus accrued since April 1st is £61,638,000 compared with a deficit of £76,665,000 for the corresponding period a year ago.

Mutual Confidence

THE resurgence of isolationism in the United States, touched off by Mr Herbert Hoover's speech last week (and commented on by our American staff in an article on a later page), has to be taken seriously. That does not mean that it has to be taken tragically. To judge by all the available indications, there are still large majorities in the American electorate and in Congress for the policy of collaboration with the other free nations of the world. There is no reason to be frightened of the outcome of the nation-wide debate that is now beginning. Indeed, when the American people give themselves time to reflect, they can hardly help seeing that the arguments both of interest and of honour are compelling. On the score of interest, it is obvious that they must try to avoid being left alone in the world with a tyrant who dominates Europe, Asia and Africa. The obligations of honour seem, for the moment, to have been forgotten; it is curious that, in the 51 extracts from newspaper editorials on Mr Hoover's speech printed in the *New York Times*, there is only one mention of the North Atlantic Treaty and none at all of the Charter of the United Nations, although the Hoover policy clearly implies the dishonouring of both these duly ratified American signatures. But this can only be momentary forgetfulness; there is no reason to suppose that the American people do not intend to stand by their pledged word.

Nevertheless, the Hoover speech has to be taken seriously. That Mr Hoover thinks as he does is not surprising, for he was an isolationist right up to Pearl Harbour. But the reason why this particular expression of familiar views has roused an echo is that it corresponds—although in a form so extreme as to be a caricature—to thoughts that are passing through minds that are wholly innocent of any form of isolationism. The American people have just had a demonstration of the fact that it serves no useful purpose whatever to send an army to a place where it can be cut off by superior forces. It is only natural that this demonstration should lead to the question—which the British people may well ask themselves too—whether the policy of reinforcing the troops in Germany is not running the same risk, unless and until there are really large European forces in reserve. The continental peoples have explained often enough the dangers that they run by rearming, unless the Americans and the British will stand in front of them while they do so. They cannot complain if the Americans (or the British, for in this our position is substantially the same) now mention the risks that they also run by standing in the front line without reserves.

Yet the only chance of peace is for both these sets of doubts to be removed, for all the members of the alliance both to play their own parts loyally and to have full confidence that others will play theirs. There is, obviously, a dangerous corner in the months ahead; but with mutual confidence it can be turned. It is not wrong to state these plain facts; what is criminal is to act or speak in such a way as

to destroy confidence whether it be the Hoovers on the other side of the Atlantic with their policy of desertion, or those on this side who miss no opportunity of derision.

The more technical aspects of General Eisenhower's task are discussed in the succeeding article. The basic condition for his success is the restoration, where it has been weakened, and the building up of this mutual confidence among the nations. The American part of this task can safely be left to the Americans; let no one suppose that Mr Hoover will not be, and has not been, answered. But the confidence must be mutual, and the Americans will not be able to make the answer to Mr Hoover fully effective without help from Europe. This is the essential point for people on this side of the Atlantic to grasp. They will not be able to have full trust in America unless they give America reason to have full trust in them. This is by far and away the most urgent task for statesmanship in the next few weeks. It is enough by itself to justify a national government in Britain, if only to allow Mr Churchill to speak across the Atlantic, as only he can do, with the authority of His Majesty's Government.

The imperfect confidence of the American people in the European defence effort is in part the result of a failure of public relations, at least so far as Britain is concerned. They do not know how much is being done. Until very recently the United Kingdom was devoting a considerably higher proportion of its total resources to defence than was the United States. It has certainly a higher proportion of its young men under arms, and has been suffering casualties in fighting Communists in Asia for much longer than the Americans. These things are true; but who in America knows them? Nor is this due to a breakdown in the public relations machinery; it has not been accidental. Mr Attlee and his Ministers, with their ears turned too much to the mutterings of the back benches and too little to the loud cries of Britain's friends abroad, have had the courage to act sensibly in secret conferences but not to speak their mind to the world. It is not that British Ministers remain unconvinced of the paramountcy of defence needs, but that they still think it not quite nice to talk about. Until yesterday the path of political safety at home was, or seemed to be, to apologise for the defence programme and to promise to keep it small. But in seeking this safety a much greater danger has arisen abroad. It is urgently necessary now to prove that the British defence effort is, and will be, big enough. The change of tone should be sharp and immediate.

Not all of the American distrust, however, is due to misapprehension. There is a basis of fact in the belief that America's partners are not doing enough. And though we in this country can honestly say that the charge lies far more seriously against the Continental countries, we cannot honestly deny that some of it sticks here. The spirit of the British defence programme is still, at least outwardly, that of last summer. It is to work out, somewhat esoterically, what proportion of the national resources Britain can afford to devote to defence without interfering with "economic recovery" and on the assumption of an undefined amount of American aid. This approach may have been reasonable as long as it could be assumed that the war in Korea would itself be on a small scale and, by its result, would contribute to preventing war elsewhere. But it is quite inadequate now. In practice it has already been modified. If only because of the rise of prices since July, the total of £3,600 million over the next three years has already gone by the board.

But the approach needs to be not merely modified; it should be reversed. The appointment of General Eisenhower should make it possible to fix the necessary British contribution in tolerably exact terms: *a* divisions, of which *b* should be armoured, a tactical air force of *c* squadrons, a Fighter Command of *d*, a Coastal Command of *e*, escort carriers and other anti-submarine craft to the total of *f* vessels. Let these figures be publicly proclaimed (the publicity will give no secrets to the Russians); let a solemn promise be given that they will be provided by such and such a date; and let the resolution be taken that nothing in the civilian economy shall be allowed to stand in the way.

Nothing less than this will now discharge the duty of the British Government. There is no need to be alarmist about the firmness of the Atlantic partnership. But no risks can be run with it, for if it were weakened there would be little hope (as there now still is in good measure) either of preserving peace or of surviving war. Above and beyond party politics, it is time for the British public to beseech Mr Attlee to act.

The Tasks for Eisenhower

IN the next few weeks General Eisenhower will take up his appointment as the Supreme Commander of the Allied Armies in Europe, returning to a position so similar in title to that which he vacated in 1945, yet so different in reality. In the last years of the war he was the commander of a powerful military weapon, backed by the entire economic resources of the United States and the British Commonwealth, and designed to deliver a knock-out blow to an enemy whose reserves of men and material were already diminishing. His task now is to create and deploy not an offensive but a defensive force over as large an area but with one third of the forces which he possessed in 1945. His political direction will be in the hands of not two, but twelve nations whose policies and economies are geared not to the single-minded end of military victory, but to the far more complex task of preserving peace by a show of strength. Napoleon returning from Elba had a simple task compared to that which faces General Eisenhower returning from Columbia.

The fact is that no military leader in modern history has been asked to undertake the kind of task at which General Eisenhower has now consented to try his hand. There are no precedents to guide him, there is no established practice to follow, no military or political manual has ever been written on the subject. But for this very reason, it is necessary at the outset to be clear about the different kinds of problem which will confront General Eisenhower and his headquarters of SHAPE (Supreme Headquarters Atlantic Powers, Europe). Deeply as the layman must feel himself at a disadvantage in discussing the actual techniques, it is important to establish certain yardsticks by which the success of General Eisenhower's mission can be judged. In the early days of the American Civil War a leading article in this journal said that "That amateur generalship which excels in anticipation has never been permitted in *The Economist*"; and while that rule holds true today, it is nonetheless valuable to attempt some rudimentary analysis of this particular, and supremely difficult, task of generalship.

Last week's meeting of the Atlantic Council which formally requested the services of General Eisenhower settled one other point of major importance, a rough definition of his area of command; this is to include the whole of continental Western Europe while leaving the existing North Atlantic Treaty organisation to cover both Scandinavia (in whose defensive preparedness he will, however, hold a watching brief) and the Mediterranean area (whose defences may be pulled together by a tightening of Anglo-American co-operation in conjunction with the defence of the Middle East). He will be responsible on military matters to the Standing Group in Washington, consisting of Lord Tedder, General Bradley, and General Elie, and through them to the twelve Defence Ministers of the Atlantic Treaty Organisation, although he is also armed with permission to deal direct with heads of governments in consultation with their Defence Ministers.

At the earliest date which he deems practical he will assume operational direction of three French divisions and, at a later date, of another two. The three American divisions in Germany will come under his command, to be followed by an unspecified number of new divisions in the spring. In addition, two British divisions in Germany and later another two will come under his command as soon as certain legal and constitutional difficulties (which were settled without any fuss in the last war) have been ironed out. To these will presumably be added rather less than a division of Belgian troops in Germany and a Dutch force of about the same size. The problem of German rearmament has been handled in such a way as to deny to General Eisenhower the use of trained German formations for at least another eighteen months. He will have a small and motley, but competent tactical air force—though many of its present machines are obsolescent—and such naval units as he requires. He will have the services of the "Uniforce" planning staff which has been serving the Brussels Treaty Organisation at Fontainebleau. Finally, he will be backed by the recent or forthcoming decisions of the various Nato powers to increase their output of men and weapons. This is the fragmentary material from which the most illustrious of modern soldier-diplomats is to be asked to build in a very short time a defensive system for Europe west of the Elbe so strong and so united that Soviet Russia will be permanently deterred from contemplating military aggression in the West.

*

General Eisenhower's problems would seem to sort themselves into four categories, none of which can be said to be less important than another, and none of which can be given a priority because all are equally urgent. First, there is the question of political direction. The present arrangements face General Eisenhower with two unsatisfactory alternatives. On the one hand, he can centralise his dealings with governments through the Standing Group in Washington, and run the risk of having very remote relations with all the governments participating in western defence except that of the United States. On the other, he can use his special powers and unusual prestige to deal direct with the Defence Ministers and Prime Ministers, and run the risk of spending his time in an aeroplane peregrinating round the capitals of Europe. It has already been announced that shortly after his arrival he will return to the United States to discuss the American contribution to European defence with President Truman; in view of the potential size of the American contribution this is not unreasonable, but the practice could not be indefinitely extended without jeopardising General Eisenhower's effectiveness as a commander. Somehow or other, possibly by creating political representation at SHAPE on the analogy of the positions occupied by Mr Murphy or Mr Macmillan at Algiers during the last war, or possibly by building the committee of deputies under Mr Spofford into a stronger body, General Eisenhower's lines of political communication must be simplified.

The second problem is the creation of a strong headquarters. At the present moment General Eisenhower has only the roof and the foundations. He has appointed an excellent Chief of Staff in Lieut-General Gruenther, and he has the Fontainebleau organisation which has done good work in codifying and standardising inter-allied service practice and procedure at the ground level. What is now needed is a strong team of American, British and French senior staff officers whose requests and judgments will command immediate respect in the various defence ministries. SHAPE will have to be the forcing house of theory on Western defence, and because the creation of a common plan and the growth of a body of common doctrine will inevitably involve modifications of national plans in training, organisation and in production, the quality of its planning must be of the very highest. A good headquarters cannot win a battle, but a bad headquarters can very easily lose one.

Closely connected with the question of staff is that of commanders. There is talk of appointing a Deputy Supreme Commander, either an air officer (on the analogy of Lord Tedder at Shaef) to watch the problems of tactical air operations and organisations, or a French general to command the ground troops, or even both. The idea of appointing a very senior officer to command British troops has also been put forward. But whatever pattern of organisation is eventually arrived at, whether contingents remain national or whether some are integrated into a European army, it is to be hoped that SHAPE will not go the way of other organisations and start building a large top hamper of command while the troops available are of the scantiest. The British troops in Germany will not add up to more than the strength of one corps for many months, and the whole tactical air effort at present available is little larger than that handled by an Air Vice-Marshal in 1944-45. At a time when it has been recognised as essential to prune the "tail" of the military machine, it would be nothing short of tragic if SHAPE were to begin by providing more employment for field officers than for private soldiers.

The third task, which ideally should wait upon the welding of SHAPE into a smoothly running headquarters but for which no such delay can be permitted, is the evolution of a master plan for the defence

of Western Europe. This is something much more precise than "the strategic concept" which the Atlantic Council agreed upon earlier in the year. First and foremost it involves an estimate of the minimum number of air and military formations necessary to do the job. It involves an appreciation of where and how, if war comes, the main battle will be fought, the areas of demolitions and minefields, the vital roads and bridges and a host of other problems, including the special problem of internal security against local sabotage. Fortunately, a great deal of the spade work for such a plan has already been done by the Fontainebleau organisation. But SHAPE will fail in its task if it is merely content to make do with the separate and unrelated contributions of the United States and the European nations. It must from the outset impose its own conception of its needs upon its supporting governments. It is because in mechanised war strategic decisions take so long to translate into terms of changes into quantity or design of guns, tanks or aircraft, that General Eisenhower must make his basic military appreciation with the utmost speed.

*

Finally, General Eisenhower has the task of eliciting from his supporting governments a steadily increasing build-up of the forces available for the defence of Western Europe. The present ten active divisions in Europe are wholly inadequate to perform anything more than a respectable delaying action. The twenty divisions which in present plans should be available by next autumn could present a more determined front. But, on the assumption that Russia would never launch an attack on the West with less than a hundred divisions, a force of twenty divisions would have little hope of administering that knock-out blow between the Rhine and the Elbe which most military observers believe is the only way to prevent the overrunning of Western Europe. Whatever may be the minimum figure which is necessary to create a permanent deterrent to the Russians, it can hardly be less than fifty divisions, at least a third of them armoured and all of them with an armoured component, supported by a tactical airforce of between five and ten thousand aircraft.

In theory the fixing of each nation's contribution towards the minimum figure of military and air formations should follow naturally upon the agreement of the central plan. But, in fact, every government can advance admirable arguments why it would not be possible to fulfil its quota. Moreover, the three most important countries have heavy and inescapable commitments outside Europe. Not only do their commitments elsewhere make it physically more difficult to put troops into Europe, but the fact that such troops will not be under their direct control will create a psychological reluctance to commit everything to General Eisenhower. He will have to be prepared to cajole, bully and threaten his several political masters if he is to get the forces he requires.

It has often been said of late that General Eisenhower's arrival in Europe will do a great deal to support the morale of public opinion in Western Europe. It is true that General Eisenhower's personal qualities can do a great deal to mitigate the friction between governments, and, indeed, one of his most valuable functions will be to persuade the members of the alliance to have confidence in one another. But the main task of persuading public opinion in Europe and in the United States that Europe not only can but will be defended can be accomplished only by overt proof that a steadily increasing number of military units are converging upon the frontiers of the West.

Back to Diplomacy

THERE is some occasion for cheerfulness in the fact that 1951 will open with a not unfriendly Note from the Americans, British and French lying on Stalin's desk. It is a sign that the three western governments are not so obsessed with cold war and conflicting creeds as to have lost all faith in the principle and method of negotiation. And if this turn of the year and the half-century should bring in return an unmistakable gesture of good will from Moscow, then the free world will feel some pride at having taken the initiative, whatever doubts it may have about the practical outcome of the conference that has been proposed. There is certainly a widespread feeling, natural to peoples who manage their affairs by free discussion, that the statesmen of the rival camps should meet and look one another in the eye before they decide that their policies are irreconcilable in any measureable time ahead—a feeling quite different from that bitter and ignorant pseudo-pacifism which is fanned by Communist propaganda. And it is this feeling that there should be one last attempt to return to diplomacy that lies behind the invitation to consider—in the words of the Notes:

> the principal problems whose solution would make possible a real and lasting improvement in the relations between the Soviet Union, and the United States, Great Britain and France and the elimination of the causes of present international tension throughout the world.

There must be no illusions about the motives behind this diplomatic gesture. It is not based on any concrete evidence that the Russians are prepared to discuss fundamentals or that they are ready to shift from positions taken up in previous negotiations. It is based rather on the need that the western governments feel to reassert their genuine and vital interest in peace and to convince a bewildered public opinion that its cause is just and reasonable. To make this gesture at this time of war in Asia was not easy, especially for Mr Acheson. But it was a sound instinct that led him and his colleagues to remind the world of what has been, throughout, the steady purpose of their policy. It is to place the free world in a position of political, economic and military strength from which it can negotiate with the Soviet Union on equal terms. A genuine peace settlement has been and always will be the object: but until such a position of strength had been reached there could be no settlement in the key places—Germany, Austria and Japan. For it was the anarchy and weakness of the Europe of 1946 and the Asia of 1949 that have offered to the Russians the openings for their policy of expansion. And it is their cheap and swift success in this policy which tempts them to continue it and keep the postwar world unsettled. It is evident, on the face of it, that the position of equal military strength has not yet been reached; but the method by which it is to be reached has been agreed in the latest consultations of the Atlantic Pact governments. To ask for talks now is to use the intense effort of the last two years for two purposes: first, to confront Moscow with the political and economic strength that has been built up; second, to show the free nations the nature of the relationship with the Communist world that they may reasonably expect in this second half of the twentieth century.

Clearly, this conference could be historic; but it will not be easy. Even the tête-a-tête talks of heads of state and government at Yalta did not induce complete frankness about national aims and policies; but they ended with a fairly general understanding of what these were. Past meetings of the Foreign Ministers, on the other hand, have generally broken down on matters of detail behind which those aims and purposes were masked. It is true that each side has voiced its demands and suspicions of the other in general terms; but always in a manner too patently rhetorical, too blatantly demagogic to provide bases for negotiation. In fact, it is time to consider whether the manner—just as much as the matter—of previous conferences has not contributed to their failure. In other words, it is worth asking whether public diplomacy has not now come to the end of its tether.

*

In the first place it is worth noticing that all fruitful negotiations in which the Russians have taken part since the war have been secret. The most recent and striking example was the exchange of views that took place at Lake Success between Mr Malik and Dr Jessup (from February 15 to May 4, 1949). It led to the lifting of the Berlin blockade and to the meeting of the Council of Foreign Ministers in May—at which there were fruitless talks on Germany. Likewise, the most speedy and effective negotiations that have taken place between the partners of the Atlantic Pact have been held in secret; their communiques have mostly been of almost Edwardian discretion. Indeed, it is not too much to say that the diplomatic results have been good in cases where the purpose of negotiation has been clear, the policy firmly laid down and approved by public opinion, the press held at arm's length, and security enforced on delegates and officials. By contrast, the method of open diplomacy by conference now hallowed at Lake Success has had almost uniformly bad results. The real successes of negotiation under Uno auspices have all been achieved outside the conference roof, sometimes outside Lake Success. Democratic supervision of foreign policy—with all its dangers and vices—has reached its extreme form with the publicity given to both Security Council and Assembly. The knowledge that the public is watching and listening—if not in the flesh then through its television and radio sets—has a deplorable effect on the manners and tactics of the diplomatists. Indeed, the stage has now been reached where the quality of representation in Uno is judged by its personal and dramatic appeal for television listeners.

It was clear to many people twenty-five years ago that diplomacy by conference, even between reasonably trusting allies, raised more problems than it solved. By bringing politicians into the seats of diplomatists it encouraged haste, posturing and wrangling; it promoted unrealistic ideas of equality between states of vastly different strengths; it appealed for public support in complicated and difficult issues which it had neither the knowledge nor the balance nor the patience to grasp. It produced compromises that depreciated the currency of international contract, and often made principle give place to expediency. If this was true of the first postwar settlement of this century, in which 23 separate major conferences were held between January, 1920, and December, 1922, how much truer is it today, when hardly a month passes without foreign ministers travelling to one exhausting public or semi-public meeting after another. Mr Byrnes recorded inside the cover of his book, *Speaking Frankly*, that between January, 1945, and October, 1946, he travelled 77,000 miles and spent over 250 days in international conference. What Mr Harold Nicolson said of the era of Lord Curzon is also true of the era of Mr Bevin; conferences are held in "circumstances of great publicity, of intense public expectancy and acute personal exhaustion." Nowadays he might add that hardly a speech is made without an eye to its propaganda use; and hardly a Note or a memorandum is exchanged without the half-suspicion that it will find its way to the world either through the American press or through Moscow Radio. Indeed, to score propaganda victories, to seize what is called the diplomatic initiative, has become one of the main activities of diplomacy—the sole purpose of which should be to clarify and improve relations between states.

If the conference that is now proposed is to be nothing more than another demonstration of public diplomacy then it is doomed in advance. It will profit only the men who can score the best propaganda points during its course. It will not produce results, for the simple reason that in such a meeting the Soviet representatives would arrive with rigid instructions and have no policy-

making powers; their job would be to do again what they do with such exasperating efficiency at Uno—to obstruct. If Stalin has anything explicit and promising to say about ways of relieving international tension he will certainly not have them said in public; it is not the Russian way to show the hand before the play has begun. Nor, for that matter, is it the normal western way. When there are important tariff or trade negotiations to be conducted, secrecy is insisted on from the first and is seldom broken. Why then not provide the same safeguards for talks that may be crucial for the future of peace? It has to be realised—especially in the United States—that the power to make Soviet policy is concentrated in the hands of two or three men; not in the Russian people, and that they cannot, and will not, display the workings of their policy for all the world to see. If there is to be negotiation with them, it should be begun and continued in conditions of secrecy so strictly enforced that they will be respected both by the press and its normal sources of diplomatic information.

Is Full Employment Secure?—IV

The Way to Go

THE three preceding articles in this series have attempted a brief summary of the present state of the full employment argument, as it is seen in the economists' eyes. The conclusions reached may, perhaps, have seemed disappointing to the layman, negative, and even reactionary when set alongside the confidence that the politicians profess to feel. To a politician, *post hoc ergo propter hoc* is not a fallacy but a maxim. Because full employment has been maintained for more than five years after the war, it has been the result of the policies adopted by the Government; and because they have done it so successfully for five years they can go on doing it for ever. The economist who points out that there has, since the war, been no threat to full employment and therefore no difficulty in maintaining it, and who professes scepticism about the outcome when next the threat does arise, must expect to be greeted with impatience. Yet he is, in fact, making claims which, to all generations before the present one, would have seemed to be very far-reaching. He is asserting that he knows how to moderate the trade cycle and to prevent a recession in trade from turning into a slump. And since nobody has ever yet succeeded in doing these things, that may pass for sufficient boldness.

On the other hand no economist who genuinely rejects the totalitarian solution can profess an infallible recipe for economic stability. What may broadly be called the Keynesian technique can only "work" on one imperative condition: that no attempt be made to aim at 100 per cent stability any more than at 100 per cent employment. In no field is the better more emphatically the enemy of the good; not merely in the sense that the good is delayed in the interests of perfectionism, but in the sense that the pursuit of perfection has results positively evil.

What the Keynesian technique can do, if properly applied, is to prevent the potentialities of progress from running to waste in chronic underemployment—as they did almost everywhere in the thirties and in some countries throughout the whole period between the wars. It can, in fact, safeguard the long-run upward trend made possible by technical advance and capital accumulation. It can also prevent fluctuations about the trend from running amok. Theoretical analysis and historical study confirm one another concerning the effect of monetary factors in widening the swing of the cycle, taking over with explosive force on the upgrade to create an inflationary boom and on the downgrade to create a deflationary slump. To cut out this amplifying effect is to produce in the economic climate a difference analogous to that which distinguishes, in the physical sphere, the temperature range of an English summer and winter from that found in Central Siberia. Such an achievement—if enough skill and wisdom can be found to bring it about—would be massive indeed; and it would be absurd to minimise it because it falls short of the ideal of a perpetual May morning in economic affairs.

★

Much, therefore, has been achieved by the economists in the last twenty years. Nor would anyone claim that they are at the end of the road, that there is nothing further to be done in developing the instruments of depression control. On the contrary, economic thought is now at a most interesting phase of development; the adaptation of government policies to the new objective of ensuring economic stability has only just begun; and there are still large adjustments to be made in the popular attitude. Along all these roads there is much progress to be made.

Economic thought on the problem of controlling the cycle has passed in the last generation through a number of stages. The first stage can be simply described as that of believing that the remedy is to pump money or credit into the system; depressions, domestic or international, are thought to be due to a lack of money and can be cured by supplying more of the purchasing medium. This first stage is brought to an end by the discovery that the extra money thus pumped in is often not used. The second stage is that of public works; it is the government's duty to see that the flow of aggregate spending is maintained, by increasing its own spending as private spending falls; the catch (apart from the effect on the public finances) is that public works may merely result in creating one instability to offset another.

It must not be supposed that these stages are false starts; there is something in the monetary remedy and something in public works. No one would now advocate credit restriction or governmental economy at the onset of a depression. But in a complete stabilisation policy it is now clear that something more is needed, and the immediate task for the economists is to discover what it is. Logically, stage three would consist of expedients for keeping up the flow of spending, not of the abnormal, emergency kind represented by public works and special subsidies, which carry the danger of permanent distortion, but of the ordinary normal types that would have occurred if the virus of depression had not taken hold. How can the ordinary spending of individuals, of firms, of nations, be stimulated when it shows signs of flagging? It is in this field that the explorations now need to be pushed, and there is still plenty of work for the theorists of the trade cycle to do.

★

But there is even more work to be done on the state of the public mind. In previous generations, the public attitude towards economic fluctuations was, perhaps, too negative, too fatalistic; they were too easily regarded as being as uncontrollable as the weather. But the public mood has now swung too far to the other extreme, and is far too ready to believe that unemployment can be and should be fixed at zero. The most immediate necessity is to convince a sceptical public that some variation, some fluctuation, in economic relationships is not only inevitable, but desirable if there is to be any economic progress at all. The public needs to be re-taught that there is such a thing as a "real" cycle, which corresponds to something of vital importance in the life of society. The essential nature of the "real" cycle is one of bedrock simplicity; it is a matter of periodical changes in the required division of labour and distribution of resources. Cycle or no cycle, it is constantly necessary that changes should be carried out, that workers should leave one occupation and enter another in response to particular changes in demand or supply; cycle or no cycle, in fact, the total of unemployment, of men between jobs, measures the slowness and difficulty of adapting from one division-of-labour pattern to another.

However minutely analysed, the cycle, considered as a fluctuation in business activity and employment, remains essentially the reflection of a periodic swing between two very different types of pattern, which one might call the burst-of-progress type and the fruits-of-progress type; a swing which is itself inevitable but which, if only adaptation could be instantaneous, would be as irrelevant to the general level of economic activity as a pioneer farmer's alternations between the extension and improvement, and the routine cropping and maintenance, of his holding. Only, of course, adaptation is not and cannot practically be instantaneous; in some instances it cannot be made at all; in others (e.g. heavy and highly specific equipment) it is simply not worth while. Hence, inevitably, cyclical unemployment both of workers and of other resources.

Nevertheless, the "real" cycle problem loses some of its mysterious nastiness when it is seen as a recurrent special case, an exacerbation, of the universal economic problem of properly adapting resources. For that problem can be tackled by the application of time-honoured economic and administrative virtues on the part of every individual member of, and constituent group in, the economy—not, indeed, in the hope of complete success, but with every prospect of considerable improvement on the position as it stands when Keynesian techniques have done their best. Whenever a trade union waives a restriction on recruitment or a demarcation rule unrelated to actual skill, whenever a firm institutes or improves a training scheme or introduces elasticity into age limits, whenever a local council overcomes the settlement Act mentality which bar outsiders from its housing list, mobility is increased and the reinstatement of the workless—whether their unemployment be due to cyclical or other changes in the pattern of the division of labour—is made easier. Whenever a rigid price is freed, a ring dissolved, a green light given to new enterprise, fresh employment opportunities are opened up to replace those which are dwindling, with the same result. The actual physical taking (or rather directing) of work to the workers, as in the Development Areas, has its role, though it is a remedy to be cautiously handled; and value also attaches, needless to say, to the improvement of the present job-finding and training mechanism. No single move of this kind is likely to have a sensational result, but in sum their effect could be considerable; and unlike those monetary remedies which, pushed too far, disable the economy using them from self-support in a competitive world, they are precisely the changes which, in any nation placed as is Great Britain, would be most conducive to assured solvency.

★

All this, it may be said, is all very well; but it cannot be accepted by the workers, any one of whom, with the best will in the world, may find himself left completely out of the new pattern, or—having based his family standards on full time and overtime—making do on the earnings of three days a week. Advocates of any policy, however salutary, which entails the acceptance of even minor fluctuations, simply "do not understand" the working-class mentality, working-class sufferings and working-class fears. They would feel, it is implied, very differently were their place in the changing pattern of economic activity less outstandingly privileged, from the point of view of stability, than it generally is. This may or may not be true; true or false, it is irrelevant. The mark set by the years of depression on working-class psychology, the trauma, as it were, whose chief symptom is an irrational clutching at the illusion of 100 per cent security, is an undeniable fact of practical politics with a powerful and ominous bearing on the chances of economic health; so is the aversion of horses from leaving a burning stable an undeniable fact with a powerful and ominous bearing on their chances of survival. In neither case is there any excuse for applauding or abetting unreason and self-destruction—let alone claiming superior virtue and sympathetic insight for doing so.

Nevertheless, if some residual fluctuations in employment are to be accepted as the price of freedom and progress, it is necessary—or so equity would suggest—for society to recognise more generously its responsibility towards those who individually pay that price. Much responsibility is, of course, taken already. To hear some of the more emotional advocates of perpetual brimful employment at all costs, one would suppose that a redundant worker could look forward to nothing but eviction and starvation; that nothing had changed in the lot of the workless since the Hungry Forties of the last century, nor in their prospects of reinstatement since the bottom of the 1931 slump. This is, of course, pernicious nonsense. Having said so much, however, one may still maintain that those—the majority—who do well out of a progressive and therefore fluctuating

economy, should out of their good fortune recompense the less fortunate for their ill-luck.

This means that the unemployed should be made more comfortable—to which at once the objection can be made that if the present standard is raised at all, there will be classes of workers whose income is actually higher out of work than in it—and one does not need to be a cynic to see the danger of that. But there has been a strange unwillingness, even on the left, to follow out the logic. The only reason why unemployment benefit must be kept as low as it is, is because the British system is one of flat-rate contributions and flat-rate benefits. Since the flat rate must, for safety's sake, be well below the lowest rate of normal earnings, any worker whose normal earnings are above the lowest suffers the sharpest cut in his standard of living when he falls out of work. This could be remedied—though admittedly at the cost of some administrative complexity—if contributions and benefits were made more proportional to normal earnings. Those who insist that zero unemployment is neither possible nor desirable are saying that unemployment is one of the normal risks of industrial life. If they wish that view to be accepted, they must be willing to urge that society should do more than it has hitherto done for those who become the victims of the risk.

The epoch-making White Paper on Employment Policy was produced by the coalition government in the middle of the war, when its subject matter was about as academic as it could be. Possibly it is only in such circumstances that an agreed formulation of agreed views can be arrived at, undisturbed by the passions arising out of daily emergencies. Since 1944 there has been some experience, at least of one side of the problem, and much thought given to it. It would be a good time for the institution of a new impartial inquiry, to chart the progress that has been made and to point the way for further endeavour.

(Concluded)

NOTES OF THE WEEK

Peking Rejects a Cease-fire

In rejecting the United Nations' bid for a cease-fire in Korea, the Chinese have acted true to the form they are establishing for themselves, and have pursued the logic of their previous arguments. Having decided to throw the Americans out of Korea, they must see little reason for stopping just when they think they have the enemy on the run and can use his discomfiture to press their other claims. Mr Chou En-lai, the Chinese Premier and Foreign Minister, eventually answered the two notes from Uno by means of a news broadcast last Friday. In doing so he repeated China's terms—namely, a complete withdrawal of Uno troops from Korea, coupled with the simultaneous abandonment of Formosa and the grant of a seat at Uno. Incidentally, Mr Chou En-lai was discourteous enough to say flatly that he would not bother to send a formal reply to Uno's representations. At Lake Success the UN cease-fire commission, consisting of the President of the Assembly, Mr Entezam of Persia, Sir Benegal Rau of India and Mr Lester Pearson of Canada, expected to draw up its report this week whether Peking replied directly or not.

Mr Chou En-lai expressed sympathy with the desire for peace of the thirteen Asian and Arab countries who had proposed the Uno resolution; but he twitted them with being dupes of Washington, a thrust that can hardly be expected to arouse feelings of friendship for China in the rest of Asia. With the failure of this attempt to get a cease-fire, no report from the three-man commission can effect the diplomatic crisis in the Far East or the tension it has created all over the world. The ball has been kicked by the Chinese straight to Mr Acheson's feet.

* * *

General MacArthur Accepts

As *The Economist* goes to press, the expected Chinese attack on the main position of the Eighth Army across the peninsula south of the 38th Parallel has not yet been delivered, although it seems beyond reasonable doubt that it will come. The announcement that the 10th Corps has now been landed at Pusan clearly indicates that General MacArthur is determined to minimise the risk of defeat in a major engagement, for the pressure on him to release it for rest and service elsewhere must have been considerable. Every day that passes without a Chinese attack increases the chance—which seemed so remote two weeks ago—that it may be possible to plug the gap in the Eighth Army front between Chunchon and the east coast.

Two events of the past week indicate that General MacArthur has accepted certain of the criticisms levelled against his previous handling of the Korean situation. First, Lieut.-General Ridgway has been appointed straight from a senior staff appointment in Washington to succeed the late General Walker in command of the Eighth Army, when it might have been expected that this command would have been given to one of General MacArthur's trusty subordinates in the Far East. Second, the 10th Corps has been placed under the command of Eighth Army, thus leaving General MacArthur with no direct hand in the tactical direction of the troops in Korea, and eliminating the chance of a repetition of the disastrous divergence between the two forces which contributed to the debacle of November 27th.

Paying for Defence

The Chancellor's *obiter dicta* on paying for defence are generally unexceptionable in principle. What is peculiarly hard to tell is how far their implications are accepted by Mr Gaitskell himself, let alone by other members of the Cabinet. To the Institute of Export last week he insisted on the sensible theme that the payment must be made "as we go." In one sense, of course, that is a truism. Armaments have to come out of current production. They can be produced without cutting the sum total of the world's consumption and investment only if enough workers and plant to meet the whole of the extra defence demands were previously unemployed. In those circumstances alone is it possible to finance rearmament by loans, instead of taxes, without resort to the forced savings of inflation as a means of reducing consumption?

There are, however, two ways in which a fully employed Britain in a pretty fully employed world may effectively postpone some of the burden of rearmament for its citizens. The Government can borrow abroad (or stop previous lending abroad); and, secondly, it can reduce the provision for the future represented by the country's internal investment in new plant, equipment and buildings. Presumably these are the two devices that Mr Gaitskell was proposing to rule out. The scope for the first is small whatever the Government's wishes might be. There is, it is true, currently a considerable surplus on the British balance of payments. But this is not so fat that it can be cut off with no harm done. Most of the surplus must be maintained if Britain is to play its part in the economic development of backward areas (and, especially, of South Asia) that is essential to the West's strategy for cold war. And British short-term debts to some countries—the sterling balances—are already so large that the piling up of fresh debts would be highly dangerous even if it were offset, in the "overall" balance, by long-term investments elsewhere or by a rising dollar reserve. The case against a general cut in investment at home is almost as strong. Such a stop to economic progress is one of the necessary costs of total war. It would be a short-sighted way of paying for a protracted cold war in which half the criteria of peacetime economics are still relevant.

But these excellent principles have unpleasant practical implications. If the economy is to sustain in 1951 both an export surplus and continued heavy investment at home, then "paying as we go" means not merely paying by taxes but also securing a high rate of saving out of the incomes left after those taxes. Mr Gaitskell has still to give an indication that he knows of any fiscal recipe which will combine those two conditions with the present rate of Government expenditure for civilian purposes. And if, as seems all too probable, he has no such recipe, is he already engaged on making his colleagues cut expenditure? Or will he have to fall back eventually on taxes that are bound to reduce saving and therefore to prevent genuine payment as we go? "Paying as we go" means something much more than just increasing taxes, and infinitely more than just more taxes on the rich—which is what his colleagues probably thought he meant.

* * *

Reviving Civil Defence

When the first details of the Hiroshima and Nagasaki atom bombings were released, and when later the nerves of the public were being assaulted by rumours of new lethal gases and bacteriological warfare, the resolution of the average British citizen gave way to a feeling of utter hopelessness about the possibility of protecting his home or his family if war should come again. To its great credit, the Home Office has never permitted such a defeatist attitude to colour its policy towards civil defence, and its programme of recruitment and training has at last begun to bear fruit in awakening public interest. Active recruiting for civil defence began about a year ago and there are now over 100,000 men and women in the Civil Defence Corps and its allied services. (The figure for the Civil Defence Corps alone rose by over 14,000 during November.) This is still very low: it represents a national average of only 2.02 per thousand of population and, oddly enough, London has almost the lowest percentage of any of the regions. But it does mean that by concentrating on the realities of rescue work, fire services, and ambulance work and by demonstrating the effectiveness of new measures, it is possible to enlist people's interest where ignorance will only frighten them.

A circular sent out to local authorities two weeks ago by the Home Office asks for a comprehensive review of all existing shelters, although it gives no authority to build new ones. When this is completed it will be possible to tell how much new work will be necessary to give adequate protection to the civil population in the event of air attack. What seems to be needed now is a programme co-ordinated between the various ministries and the various ministers to tell people in simple terms that simple precautions are worth taking (even the Anderson, though not the Morrison, shelter can be brought up to Grade A standard which gives good protection against atomic bombs). The New York civil defence authorities have recently published their estimate that an atom bomb would kill thirty thousand people and wound another thirty thousand—which does not seem a catastrophic figure for the most vulnerable of the world's cities. A recent article in the *Municipal Journal* estimates that 25 atomic bombs, delivered with a degree of perfect accuracy which is unlikely to be attained with any sort of anti-aircraft protection, would be needed to cause as many civilian air raid casualties as did the Allied bombing of Germany. It is time that some official estimates were given to the public in order that the ordinary citizen's confidence, or want of it, may rest on a basis of fact and not of vague fears akin to those unreal bogies of mass destruction of London by German bombers which gripped the population of London at the time of Munich. It needs to be remembered that the population of Britain, with six years of experience, with a large number of existing shelters, and the nucleus of a first-class civil defence organisation, is far better protected against casualties than any European country, or for that matter the United States.

French Arms Budget in Danger

That a majority of nearly a hundred in the French National Assembly should have boggled at discussing the rearmament budget on the day after Christmas is not in itself a serious matter. But it is one more sign that M. Pleven's understanding of the urgent need for France visibly and quickly to increase its defence effort is not yet generally shared by the legislature. The Prime Minister had two main reasons for introducing the device of separating increased expenditure on rearmament from the normal civil and military budget for 1951. He felt that it would underline the need for new taxes and thus increase the chances of getting them voted; and he hoped that in this way expenditure on rearmament might be voted by the New Year; he could then meet President Truman early in January with something already in the bank.

The Government asked, in the rearmament budget, for military expenditure of 355,000 million francs in addition to 385,000 million francs for military purposes included in the normal budget. This, they believed, would be sufficient to double their present army of five rather inadequately equipped divisions by the end of 1951; together with the provisions of the ordinary budget it would bring expenditure on land forces (other than in Indo-China) to 231,000 million francs, on the Navy to 99,000 million francs, on the Air Force to 129,000 million francs, with 49,000 million for joint services. Even these figures mean that the Government have so far evaded the difficult question of extending compulsory service to two years, which is the only basis on which 20 divisions could be raised and which, sooner or later, will have to come; and they certainly contain too little for guns, munitions and other arms. But they sufficed to show that, on any reasonable assumption about Mutual Aid, a minimum rearmament effort would require at least 165,000 million francs to be found by new taxes.

Though the rearmament budget as it reached the Assembly on Wednesday was, on paper, only 29,000 million francs smaller than the Government's original proposals, the finance committee have in fact cut the proposed revenue from new taxes by 82,000 million francs (the Government believe it may be as much as 100,000 million). The committee claims that the balance can be made up by the devious juggling with figures which they have recommended, but there is no disguising the fact that they have, in effect, tried to do just what M. Pleven hoped to avoid—to reduce the amount of new revenue that will have to be found if there is to be the real increase in the French defence effort that the Government believes necessary. It is clear that if the Assembly tries to follow the finance committee's lead, the Government cannot avoid forcing it to an issue of confidence.

Benelux Foundering

The proposed Benelux union is again foundering and in danger of sinking altogether. A mid-December conference which was to set the final seal on the union has been cancelled, and instead the finance ministers of the three countries are to meet to survey the problems that have led to the latest deadlock.

The heart of the difficulty is the Netherlands' mounting trade deficit which the Belgians are willing neither to accept as a joint responsibility nor to help liquidate. A deficit has persisted on a small scale for some time, but recently it has reached substantial dimensions. Already the Dutch have used up well over half of their credit total for the year with the European Payments Union (EPU) and will shortly have to start settling in gold.

Among the chief reasons for the widening gap are the shrinkage of the West German market for Dutch agricultural produce (the result of German attempts to right their own deficit), and efforts, in common with everyone else since the Korean hostilities, to build up stocks. Largely because of these two factors the EPU has been a disappointment ; both in Brussels and The Hague it was hoped that the multilateral machinery of EPU would take care of this Dutch liability, at least to the point where the partners could safely forge ahead with the Benelux union.

If the union is to succeed, there are at the moment only two possible solutions—both dependent on Belgian beneficence and political courage. One way out is for Belgium to accept guilders in payment for the Dutch deficit, which is, in fact, mainly with Belgium ; but this has been turned down because it amounts to extending more credit and might undermine the Belgian franc. Another approach open to the Belgians is to lower their barriers against Dutch agricultural products and thus enable the Netherlands to pay its way. The concessions granted to Dutch agricultural interests at last October's meeting of Benelux officials were not enough and suggestions for further adjustments have met with discouraging opposition from Belgian farmers.

As far as the Netherlands is concerned the problem of its trade deficit may have to take precedence over the ideal of Benelux. For if Belgium is unable or unwilling to narrow the trade gap in any other way, then it will have to be done by restrictions from the Dutch side on Belgian goods. Such a step would not only be a blow to trade liberalisation in Western Europe generally, but it would also mean a step backward for Benelux.

Parliament and the Public Corporation

A survey of nationalised industry is being undertaken by a new and disinterested research organisation, the Acton Society Trust. Its first pamphlet* is a dispassionate account of the unsatisfactory relations between Parliament and the principal public corporations. Three linked problems seem to emerge from this survey. The first is that debates on nationalised industries are much too prone to turn into party dogfights instead of the dispassionate enquiries which they should be. The relevant Minister seems as determined to defend "his Board" as the Opposition is to attack its every action.

The second problem arises from the fact that Parliamentary control of the Minister ought to be coterminous with Ministerial control of the public corporation ; but the latter is often an unknown quantity, being carried on secretly and informally, with the result that intelligent criticism may be frustrated or misdirected. The third problem concerns the inadequacies of MPs themselves. Too often they concentrate on questions about management, which ought in theory to be handled by consumers' councils, to the exclusion of the real issues of economic policy—which seem to be beyond the grasp of Members and Ministers alike.

There are no simple solutions to these problems. Possibly a spell of Conservative rule would instil a more objective spirit into the debates. No doubt in pragmatic fashion Parliament will gradually develop a code of procedure for dealing with its new responsibilities. But the real issue lies deeper. A public corporation is subject to some of the abuses of private monopoly, together with others all its own. On the other hand, Parliament itself is liable to put on the corporations political and sentimental pressures that frequently work against economic efficiency. What has still to be found is a system of checks and balances which will ensure that the consumers' long-term interest gets a proper recognition. There is a special onus on a Government which believes in nationalisation to seek earnestly for a solution.

Land, Food and Trees

The Country Landowners' Association has joined the critics of the Town and Country Planning Act. The novel part of its criticism refers to the effect of the Act on agriculture and forestry. The Association believes, following the more vigorous protests of the National Farmers Union, that too much farmland is being diverted to other uses, without due regard to the effect on "the country's finances." It wants such diversions to be related to a 20-year programme of land requirements ; it thinks that the Ministry of Agriculture should be compelled to explain its reasons at the local inquiry in cases where it has consented to the development of farmland. The association also suggests that conflicts between local development plans and the wishes of Government departments should be settled at Cabinet level.

This criticism is strangely ingenuous. The main effect of the Planning Act is that land use is now determined primarily by administrative action instead of by the free movement of land values. Whatever else it may do this change cannot but be beneficial to agriculture. Whereas previously (as prewar experience amply demonstrated) the best farmland had too low a financial value to prevent its purchase for development as required, the present arrangement enables the fate of every field to be the subject of representations from agricultural interests (who are entrenched on many county planning committees) and from the Ministry of Agriculture. The result is that, to a considerable extent, the best farmland is being saved from the development to which a free market in land would render it liable. The real complaint of farmers and landowners is that they no longer have any financial inducement to part with their land. It may be true that local authorities, whose costs of acquisition have been cheapened, are building in some cases to unnecessarily low densities. But even this point should not obscure the fact that the rehousing of the population at "new town" densities—a desirable but (for many years) improbable social objective—would probably cost the nation less than 2 per cent of its agricultural production.

On forestry, the Country Landowners' Association protests that the making of tree preservation orders is enabling local authorities "to interfere in the day-to-day management of woodlands." It argues that the Act ought not to permit the business aspect of forestry to be interfered with in the interests of amenity. This is true enough. It is also true that the interests of good forestry, as well as of the general public, require that the shrinking area of private woodlands should be replanted and extended, not indiscriminately cut down. The real difficulty at present is that both the local planning authority and the Forestry Commission have a strictly limited responsibility in the matter. Probably the main work would be best left to the Commission if it could be relied upon to display enough vigour and a proper regard for considerations of amenity.

Boom in Prisoners

The report of the prison commissioners for the year 1949 (HMSO, 4s.) well illustrates the modern view of judicial punishment. This view is, briefly, that offenders should not be sent to prison if it can be avoided but that once a prison sentence is inevitable it should be long enough to have both a reformative and a deterrent effect. Short sentences (that is, sentences of three months or less) still account for almost half of the total number of prison sentences ; but in 1913 the proportion was 91.5 per cent, and sentences not exceeding one month accounted for 78.2 per cent. Even as recently as 1938 just over half the total number of prison sentences were of one month or less, and a further 23.9 per cent were of sentences over one month and not more than three months. At the other end, sentences of three years and over accounted for 0.1 per cent of total prison sentences in 1913 and for 0.4 per cent in 1938. Ten years later the percentage was 1.5.

These longer sentences are one explanation of the rise in the daily average population of prisons and Borstals, which in April of this year reached 20,421, the highest figure for forty years. But it is now not the only explanation. In 1947, there was an increase to 47,827 in the number of receptions of convicted prisoners, and another marked rise to 54,768 in 1948.

This overcrowding of prisons has been aggravated by two provisions of the Criminal Justice Act of 1948. The new provision for preventive detention, which means a minimum sentence of five years, has increased the number of prisoners in this category from 30 to nearly 400. Secondly, by May, 1950, 1,610 people had already been sentenced to the new system of corrective training. It is too early to say whether these two forms of punishment are having the desired effect on the offenders concerned. But it is disturbing to find in the report evidence that the percentage of reconvictions of prisoners as a whole has been rising in recent years. Of prisoners received in the period 1936-40, 80 per cent had not again been received before the end of 1948. But the percentage was no better for those first received in 1945, that is, less than three years previously, and was only 82 for those first received in 1946. The modern penal system is evidently establishing itself only with difficulty in the physical conditions of prisons that belong to the past. To judge by the comments of prison governors and chaplains on the mental attitude of the modern prisoner, it also has much more difficult material to work upon.

The Wrong Premises

The proposal to build a new Foreign Office in place of Carlton House Terrace was withdrawn for further consideration when it came before the Westminster City Council last week. It is, however, too much to hope that this, by itself, will mean the end of the project, richly though it deserves to die.

The objections that have hitherto been voiced have been based on artistic grounds, and very firmly based, too ; for Carlton House Terrace, with the Duke of York's Steps in the middle, the Mall in front and Waterloo Place behind, is one of the very few places in London where noble architecture is combined with successful town planning. It is certain (if the town planning legislation of the past two decades means anything at all) that no private person or corporation would be allowed to do what the Foreign Office and the Ministry of Works are proposing.

But this is not the strongest objection. Why should there be a new Foreign Office at all—or rather, what is the case for building it now? At least four gigantic new office buildings for the civil service have already been built in London since the war and (so far as memory serves) only one of comparable size for private occupation. Yet, even with its swollen size, the civil service still represents only a small fraction of the office population of London. If resources can be spared for new office buildings, let the benefit go to some of those workers who have not had the advantage, for ten years past, of being able to requisition and commandeer what they wanted. Or at the very least let some impartial tribunal, not composed of civil servants, pass on the Foreign Office's claims to priority. This project is one more example of the lengths to which the civil service pushes the new doctrine that any activity of government is ipso facto more important and deserving of higher priority than any private activity—though it is the private activities that pay for both. How can the rulers of the country expect the public not to seize every opportunity of cheating the building priorities and the town planning regulations when they themselves cheat so frequently and so brazenly? The maximum possible fuss ought to be made about the Carlton House Terrace proposal.

* * *

Embargo on Hongkong

Living in Hongkong is like living on the slopes of a volcano: the people who do it come to regard their danger somewhat philosophically. The calm with which Hongkong has faced the growing crisis of the past eighteen months has therefore served only to emphasise more strongly the violence of the reaction against the recent American embargo on goods destined for China. Under the terms of several decrees published at the beginning of December, Washington has laid it down that no American goods except perishable food may be shipped to Chinese ports—including Hongkong and

You have investments...

You owe it to yourself and your family to protect your investments as far as it is possible in the uncertain conditions of today. You should watch the market as a whole, and know daily how, and why, the changes happen.

Men who mean Business read

THE

FINANCIAL TIMES

every day

Portuguese Macao—and that no American ships may be used to ship any China-bound goods from anywhere in the world; the order also holds good for materials destined for Russia and its satellites. After representations made through London to Washington, Hongkong has now been assured that its own essential supplies for local consumption will not be cut off.

These orders will undoubtedly hit the traders of Hongkong very hard even if, as some people fear, they do not take away a dangerously large part of its *raison d'être* in the eyes of Peking as its main channel of world trade. Reports from the colony indicate that the first accounts of virtual panic were much exaggerated. There was certainly a subdued excitement in the streets and the Chambers of Commerce met at once; but there is now a general feeling that the colony must await further developments before it can tell how severely its trade will be affected. Meanwhile the Chambers of Commerce are collecting factual evidence; on a rough estimate the income of Hongkong will be reduced by between a half and two-thirds. Ten years ago the proportion would have been higher; now, serious as is the loss of so much business with China, Hongkong has a substantial entrepôt trade with South-East Asia to fall back on.

What many people in Hongkong resent is not only the imposition of these economic sanctions but the way they have been imposed. It is pointed out that if the Americans want to retain any friends in the Orient, they will have to learn to co-operate with them. Hongkong is admittedly an extreme case, but it is still felt to be wrong to treat it so cavalierly. In the East, such abrupt resort to economic warfare looks like a sign of weakness; Hongkong feels that it is no victory "to throw our rice bowl in the enemy's face."

* * *

That Japanese Peace Treaty

A recent Chinese statement on the making of a peace treaty with Japan has not received the attention it deserves. On December 4th the Foreign Minister of the Chinese People's Government, Chou En-lai, issued a statement defining his government's attitude. He declared that the Chinese People's Government "must take part in preparing, drawing up and concluding the peace treaty with Japan," that the treaty must be prepared by the Foreign Ministers of China, the Soviet Union, the United States and Great Britain before being passed to a full conference of former Allied nations, and that the only proper basis for a joint treaty was to be found in the Cairo, Yalta and Potsdam agreements and in the Far Eastern Commission's resolution of June 19, 1947. He pointed out that these agreements, whereas they provided for the cession of Formosa to China and of South Sakhalin and the Kuriles to Russia, said nothing about any permanent American administration of the Ryukyu or Bonin Islands, which the American Government, he said, only wanted "to establish as military bases for aggression in the Far East." Further, according to Mr Chou's statement, the original inter-Allied agreements had absolutely prohibited Japan from possessing an army, navy, air force or gendarmerie, but America had already begun to rearm Japan under cover of various devices. The American plan was to make a rearmed Japan an accomplice in aggression against the peoples of Asia; but only a "democratic" Japan, "free from the control of foreign influence," could contribute to the peace and security of Asia.

The attitude of Russia and China makes it almost inconceivable that an agreed peace treaty can now be presented to Japan by the ex-allies of the Pacific war. The objective of both the Communist powers is to obtain a complete withdrawal of all American armed forces from Japan and adjacent islands, to eliminate any special American or non-Communist control of Japan, and to keep Japan disarmed as a power vacuum until it can be captured for Communism by Trojan Horse tactics. They must be expected to refuse consent to any treaty which provides for the preservation of a special American strategic and political position in Japan as a counterpoise to the Communist *bloc* in eastern Asia. Any compromise formula would be likely merely to produce fresh conflict, with civil war in Japan as a probable sequel.

Diplomatically America and Britain are in a weak bargaining position on account of their lack of foresight in the earlier agreements which Russia and China now invoke. Having given away Formosa, Sakhalin and the Kuriles without any territorial or administrative *quid pro quo* for the United States in or near Japan, they have no longer any cessions to trade with; having agreed to the total disarmament of Japan, they have no legal ground for claiming a right of Japanese self-defence. Moreover, as there is no Soviet occupation zone in Japan, rearmament there could not be justified as it is in Germany by the prior militarization of the *Volkspolizei*. A difficult problem thus confronts the Western powers; on the one hand it would be an error of the first magnitude for them to abandon Japan to Communism, but on the other, their past commitments are such as to give the Communist adversary a great propaganda advantage against the conclusion of any treaty which would not have that effect.

* * *

Arms before Aid

When the North Atlantic Council agreed last week to replace the military Production and Supply Committee with a Defence Production Committee, it looked as though it was simply falling into the bureaucrat's fallacy of believing that new and better results could be achieved by giving an old committee a new name. In fact, for the British and Americans at least, it was a recognition that mobilisation of military production could afford to wait no longer than the mobilisation of divisions. Until the Council of the OEEC has considered the Third Report, and the economic and financial working group of Nato in Paris has completed its findings on the economic impact of rearmament on members, which cannot be before the middle of February, there can be no final decision about the distribution of Mutual Aid during 1951. In effect, the North Atlantic Council decided last week—whether all its members realised it or not—that production for the military requirements of the Atlantic force should start now, before anyone can count their dollars.

The continental members of Nato have so far excused the fact that they have placed virtually no rearmament orders with their own industries on two grounds. They do not know, they claim, what they have got to produce, nor who is going to pay for it. In fact the most important achievement of the old Production and Supply Committee was to draw up a fairly detailed list of "high priority" equipment and where it can be produced. These are all things that must be included in any minimum rearmament effort, and on which immediate production could be started. One of the new committee's main tasks will be to see that orders are in fact placed, and placed now, before anyone knows how they are ultimately going to be paid for.

The task of the Defence Production Committee will be to continue the planning functions of the old group and to achieve the necessary production in the necessary time. It will have for the first time a permanent international staff and a full-time director to act as a ginger group in the various European countries. It is, indeed, difficult to see what more Mr Acheson had in mind when he proposed that the production effort should have its supreme commander. It is clear that the new committee's functions and the powers of its director will enable it to do no more than make recommendations to the Governments, which alone can place orders. This, it is true, is a less complete authority than that which General Eisenhower will exercise over the divisions under his command. But short of a surrender of all national sovereignty over military, and indeed all, production—which Mr Acheson did not propose—it cannot be made more complete.

* * *

Graduation for Houseworkers

Diploma day at Kendra Hall, the Croydon training centre of the National Institute of Houseworkers, made it evident that the Parliamentary Secretary to the Ministry of Labour, Mr Fred Lee, does not share the view, popular in some Labour circles, that the middle class woman only wants domestic help in order to have someone to order around. Indeed, Mr Lee referred to the houseworker's job as a very real social service—which, of course, it properly should be, if the words "social service" are to be interpreted as service to society.

It is probably by instilling, directly to its own trainees and through them to others, this sense of the importance and dignity of domestic work that the institute will do its most valuable work, by counteracting the prevalent view that it is the last resort of the moron and rural greenhorn. To establish a standard of wages, hours and conditions—though highly desirable, given the medieval ideas of some employers—goes only part of the way towards making domestic work attractive; indeed, the notion of housewife and help, each suspiciously consulting the book of the rules every time either one needs to run out to the pillar box leaving the baby irregularly in the other's charge, is sillier than anything in the Catering Wages Act. (One can hardly put it more strongly.) The evidence, fortunately, is that the workers emerging from the institute's centres do not in fact either meet with or display such a spirit; they have a professional rather than a trade union attitude to their work.

Time will show how successful the institute can be in counteracting a drawback to domestic work probably at least equal to its hitherto low status—its loneliness. The institute, said Mr Lee, "endeavours to bind its members together into local groups"—a task which must be difficult in the early stages while they are still very thin on the ground—and encourages them to "take part in local activities." No such endeavours or encouragement can make a kitchen as sociable a place as a shop, factory or office; on the other hand, the mutual friendship, which can characterise the relation of a hard-working mother to her trusted domestic help, and the affection of children, are advantages to which other means of livelihood yield few counterparts. The problem of the domestic worker is a problem of human relations. By imposing standards, inspiring self-respect, and setting a value on its diploma-holders both in their own eyes and those of their employers the institute can lay a foundation; the rest is up to the workers and the employers concerned.

The Piper and His Tune

The roles of concert promoter and concert-hall owner will be combined in a big way when the London County Council opens the new Royal Festival Hall. On such a scale this doubling up of parts is a new development in the musical life of Britain. Municipalities already own halls; they help local orchestras from the rates; they even act as concert promoters when they engage orchestras to play in their schools or public parks. On Tuesday the London County Council decided to go further and itself promote a series of about 65 concerts a year in its own hall; the concerts are to be shared out among the leading orchestras. The hall will also be let at a subsidised rent to a limited number of non-profit making concert societies, and for the rest of the time at a commercial rent to the ordinary run of musical and non-musical organisations.

This policy raises two new issues. The LCC will now become one of the principal concert promoters in London, with a box office as well as an educational interest in its ventures. The Council is not primarily interested in profits; it is interested in encouraging good music and it intends to leave the planning of individual programmes to the conductor or orchestra society concerned, while giving its own concert adviser the responsibility for co-ordinating the programmes. There remains, however, the basic fact that a committee of laymen will be ultimately responsible for keeping the balance between artistic and financial arguments that will often be diametrically opposed, and which expert orchestral organisers have hitherto found impossible to resolve. The LCC's great asset is its financial strength; it can stand the box office losses of musical experiment much longer than the ordinary promoter can. Nevertheless, even the LCC may hesitate to call persistently for a tune which the public shows an obstinate reluctance to pay to hear.

The second issue is how the new hall will affect the concert promoters who must rent it on commercial terms. Will the Festival Hall draw off business from the Albert Hall? Can it create a new concert-going public on its own doorstep? Can London support two large concert halls? The Albert Hall—whose council is asking for a Government loan of £353,000 in order to make improvements and repairs—has two advantages. It costs £150 a night to hire, while the Festival Hall will cost £200. Secondly, the Festival Hall, which seats 3,000, is to be acoustically good but economically will be on the small side. For all its defects, the size of the Albert Hall makes a full house highly profitable and in a series of concerts makes it possible to offset losses by bigger profits. In the Festival Hall the margin is much narrower, and the cost of a first-class conductor or soloist may be very hard to recoup. It remains to be seen whether impresarios will risk quantity for quality or play for safety in the Albert Hall.

Defining Problem Families

The main purpose of an investigation sponsored by the Eugenics Society into problem families in Bristol was to explore a method of enquiry which could be applied to the country as a whole, and thereby indicate how many families live in such subnormal conditions as to be classified as "problem." Four other pilot surveys are also being undertaken, and it may be that, when the results of all five are known, a definition of a problem family can be formulated.

The results for Bristol, which have now been published,* are, however, disappointing in this respect, as the author of the report readily admits. A great deal of factual information was amassed, most of which bears out the impressions of other observers in other areas. For instance, it was found that the problem family was usually a large one, the average number of children per family being 5.8. The bulk of the fathers belonged to the group of unskilled, or semi-skilled, workers, and among both parents the field worker found a high proportion who were mentally subnormal—though this finding must be accepted with reserve as no objective testing of intelligence was undertaken. Since so many of the fathers belonged to the unskilled class, it is not surprising that family incomes were low, but, since there has been little recent inquiry into the incomes and needs of problem families as a group, the Bristol findings in this respect have some value. It is estimated in the report that 53.4 per cent of the families whose income was ascertained had insufficient money for their needs. It is consequently not surprising that evictions for non-payment of rent were common, but it is surprising that of the 155 problem families 58 per cent were housed not in recognised slums but in council properties on housing estates.

Some weight must consequently be given to the recommendation in the report that problem families should not be removed straight from the slum to a council house but should first go through a probationary period in a converted "half-way" house. But this brings us back to the question not answered by the Bristol enquiry—how can a problem family be distinguished from one which, on being rehoused, will make good? Another question, also raised in the report, is whether children should be allowed to remain in shocking conditions if they appear happy, for one of the most surprising findings of the report was the comparative absence of the "broken-home" situation and the apparent happiness of most of the children. The problem of the problem family is how to raise it from its animal existence without destroying something much more valuable than soap and sanitation.

Stolen Stone

The theft of the Coronation Stone from Westminster Abbey has produced the kind of reactions that tempt foreigners to write very subtle and complex analyses of the British character. Some cannot help being amused by the thought of three hundredweight of sandstone being shifted under the very eyes of Scotland Yard and Big Ben—but would become very angry indeed if they thought London had lost the Stone of Scone for good. Others feel deep indignation that a revered symbol should have been made the object of something like an undergraduate rag. Scots happily settled among the English suddenly find themselves driven to take a view for or against the irredentists across the border. For they hear the English assuming—in a quite un-English way—that this must be the work of the Scottish Nationalists, whose views strike them as falling somewhere between the extremes of Don Quixote and Beachcomber. Probably everyone who is not determined to see the 80 year old Crown Prince Rupprecht of Bavaria crowned as the last of the Stuarts would have preferred to see this exploit attempted on April 1st and not on Christmas Day. If the Scottish Nationalists want to impress their views on Westminster they must behave better, not worse, than the English. Theft, of course, is serious but, in England, bad form can be worse.

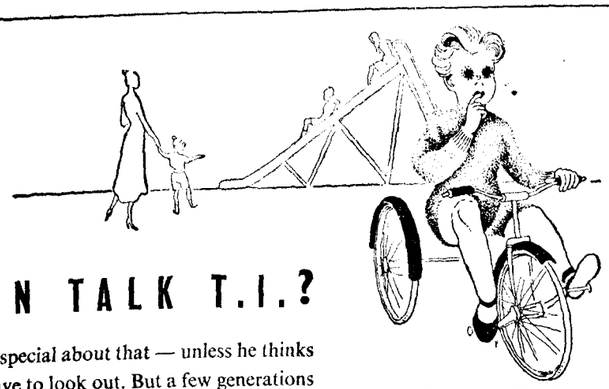
Correction

In last week's leading article on China a line from the extract from Mr Wu's speech was omitted in error. It should have read: "To conquer the world one must first conquer Asia: to conquer Asia one must first conquer China: to conquer China one must first conquer Manchuria and Mongolia. . . ." etc. It has since been pointed out that this Communist version of the Tanaka Memorial is incorrect. What Tanaka actually said was: "If we (the Japanese) want to control China we must first crush the United States, just as in the past we had to fight the Russo-Japanese war. But in order to conquer China we must first conquer Manchuria and Mongolia. In order to conquer the world we must first conquer China."



Change in Bank Rate

A considerable excitement has been produced in the City in consequence of the notice issued on Thursday by the Bank of England, that in future the minimum rate of discount would be *three per cent* in place of *two-and-a-half*; and especially as this has happened when the public mind was occupied in contemplating nothing as so certain as "cheap money." Many are loud in accusing the Bank of folly in having ever reduced the rate below three per cent, and for now creating a disturbance and alarm by again raising it. For our own part, through all changes we can recognise no sound principle on which the Bank of England can regulate its conduct but one, and that is in following the same rule with regard to money that merchants follow with regard to any other commodity, determining its price by the rule of supply and demand. The policy of lowering or raising the rate of interest at any moment must depend alone on facts, which are best known to the Directors of the Bank; it is just one of those parts of its management which must be left to their judgment and discretion. That the state of the "money market" was such as to render it necessary for the Bank to reduce its rate of interest to 2½ per cent at the time, in order to do justice to its customers and retain their business, we can have no doubt; as we may be certain price is never reduced without such a necessity. That the directors are now justified in again raising the rate to *three* per cent, is sufficiently proved by the state of the Bank accounts, showing as they do a considerably increased demand for "money." That there has been a great and legitimate expansion of trade during the period in question, quite sufficient of itself to account for such an increased demand for capital, as to afford a most satisfactory explanation of the change in the Bank accounts and to raise the interest of money from the very low and depressed rate of 2½ per cent, to the still low and very moderate rate of 3 per cent, we think no one will deny. And so far this ought to be a subject for congratulation, in place of apprehension and alarm.

DO CHILDREN TALK T.I.?

A small boy on a tricycle. Nothing special about that — unless he thinks he's a dirt-track rider, when you have to look out. But a few generations ago there was no T.I., and most small boys had nothing more exciting to ride than a tea-tray. No trikes, no children's bikes, no rocking boats, or chutes, or slides, or climbing frames, or half the things clever people manufacture from (as it happens) T.I. materials. Nor much help from Mother, either, with no T.I. to help *her* run the house.
Yet even to-day, funny thing, you hardly ever hear a child mention T.I.

The letters TI stand for Tube Investments Ltd., of The Adelphi, London, W.C.2 (Trafalgar 5633). They also stand for the thirty producing companies of the TI Group, whose specialist skills are co-ordinated in the general field of light engineering to produce essential mechanical parts for a thousand and one things which everybody uses.

THE SURNAME OF A THOUSAND THINGS

The most powerful aero engine in the world uses

NIMONIC 90

"Nimonic" is a registered trade mark.

The Armstrong Siddeley "Sapphire" gas turbine has successfully completed a 150-hour service type test at a rating of 7,200 lb. static thrust. This is equivalent to the combined power of the four piston-type engines in the B29 Superfortress. Nimonic 90 is the latest of the Nimonic series of nickel-chromium base alloys, specially developed to provide the high resistance to stress at extreme temperatures needed for the vital parts of gas turbines. Nimonic alloys are used for the moving blades of every British aircraft gas turbine in production.

Letters to the Editor

German Deflation

Sir,—Taking Mr Balogh's unsolicited advice, I reconsulted the German foreign trade statistics, on which my assertion that the German payments crisis was an *import* not an *export* crisis was based. Mr Balogh is misleading the reader by presenting statistics for the three summer months only (vacation months), when exports remained fairly stable. But exports have risen from a monthly average of $86 million (1949) to $128 million (April), $172 million (July), and $214 million (October)—which proves my point.

Forward exchange buying was, of course, one of the causes of the crisis; many importers, anticipating rapidly rising prices, bought ahead, but not for keeps (though some hoarded it). This is clearly demonstrated by the jump of imports from $188 million in June to $225 million in July and $312 million in October; Mr Balogh's selected figures again obscure the fact.

Mr Balogh justifies his attack on Cairncross, Jacobsson, OEEC, EPU, and the German Government (I come in merely as the innocent bystander, who unwisely likes fair play) by his duty to save this country from adopting their policy, were it to get into a similar plight. According to his own theories, *this can never happen*, for Great Britain is protected by the very system of controls the lack of which, in Mr Balogh's opinion, is responsible for Germany's difficulties. But Mr Balogh evidently has his doubts. So he warns us, were the impossible to happen, not to accept a doctrine which would land us in the same mass unemployment and capitalist orgies, as he predicts for Germany.

Would it not be wiser to wait and see how these remedies work? They are not so crude and simple as Mr Balogh wants us to believe. If his gloomy prophecies may come true, his warnings are quite superfluous; nobody in this country would imitate a policy whose failure had become evident. But, if it were successful, that would be just too bad—for Mr Balogh, though not for Britain.—Yours faithfully,

London, N.W.3 M. J. BONN

Road Haulage

Sir,—Your recent article on road haulage covered a wide field. There are certain points, however, on which it is to be regretted that further information was not provided.

The Transport (Amendment) Bill now before Parliament seeks, according to your article, "to extend the range of operations of private hauliers as restricted by the Act by such an extent as to threaten to deprive the nationalised section of the industry of the traffic that is—or should be—most profitable for it to carry."

This is exactly the language of the most bitter and uncompromising opponents of the new Bill. The Road Haulage Executive would not be deprived of anything by the extension of the permitted radius from 25 to 60 miles. At present, thousands of operators holding permits are working within that field together with the executive, and the Bill would merely provide that free enterprise hauliers could continue the work they have done in the past. To suggest that they would take the whole of the traffic not only puts in a rather unfavourable light the ability of the executive to hold its own under fair competition, but assumes that the free enterprise operators would be able to put a large number of extra vehicles on the road in the face of determined opposition in the licensing courts.

The strength of this opposition is largely ignored in your article. It should be stressed that in 1936 the number of A and B licensed vehicles was 143,000. Eleven years later, just before nationalisation, it was 162,000. The present figure is, of course, well below the prewar total owing to the acquisition of 40,000 vehicles by the Road Haulage Executive. The licensing system affords no chance of a rapid increase in the licensed fleet.

If this traffic between 25 and 60 miles *really* is the most profitable, there is everything to be said for not cutting the free enterprise operator out of that field *entirely*. I do not propose to argue here the pros and cons of integration, particularly as nobody has a very clear idea what the word means. If, however, 50,000 operators are to be left under free enterprise, they must surely be given some consideration. At the moment, the whole Transport Act is designed deliberately to favour the Transport Commission, while the unfortunate haulier is left to sink or swim under highly unfavourable conditions.

It is not true to say that the higher operating costs of nationalised transport are due to the need to keep within the law, higher wages, and the acquisition of worn-out stock. The imputation that free enterprise operators as a whole do *not keep within the law* is offensive and without foundation. A comparison of wage scales may well show that drivers and other workers are better off under free enterprise than under nationalisation. It is all very well for the Road Haulage Executive to speak slightingly of the standard of vehicles and equipment taken over. It should be remembered that operators have had to struggle along with these vehicles and equipment for years past, owing to the difficulty of obtaining replacements, but have, nevertheless, managed to obtain a profitable and highly efficient service as their customers are willing to testify.

The new Bill is not intended to reverse the process of nationalisation inaugurated by the Transport Act. It merely seeks to ensure that some of the more glaring injustices imposed upon hauliers remaining outside the nationalised organisation will be, if not removed altogether, at least to some extent mitigated.—Yours faithfully,

R. MORTON MITCHELL
Road Haulage Association, London, W.1

Forestry Problems

Sir,—Your issue of December 9th contained an interesting comment on private forestry. Memories are short, and it appears to be forgotten that the reason why a million acres of private woodlands are today in an unsatisfactory condition is the vast effort made during the war, when 60 per cent of the nation's timber requirements were drawn from home grown sources, nine-tenths of which were derived from privately owned woodlands.

Wartime emergency felling, which devasted thousands of acres of private woodland, hardly made itself felt in the state's forests, for the reason that these were not of an age to fell. As a result, the private owner is today confronted with a task quite different and far more arduous than is the Forestry Commission. With its prewar woods virtually intact, with ample public funds and relieved of the burden of taxation, the Commission can devote itself wholeheartedly to the straightforward task of planting up bare land on wholesale lines. The private owner has to cope with the costly task of rehabilitation, over and above any expansion programme which may be contemplated.

It was in the light of these facts that the Government programme envisaged a far lower planting target for private woodlands than for the state, and it is interesting to note that private planting, at 33,000 acres, is slightly ahead of the official target, whereas the Forestry Commission's planting is behind.

Progress with dedication has, no doubt, been slow; but the reason for this is well known. It needed two years of negotiation and agitation to convince the "powers that be" that the original conditions of the Dedication Covenant were not such as private owners could reasonably accept. Now that these blemishes have been admitted and removed, owners' organisations are backing dedication wholeheartedly, and proposals to dedicate are steadily flowing in. Neither in planting nor in dedication can it fairly be said that the private side of the industry has fallen down on its obligations.

In drawing attention to these facts I have no wish whatever to belittle the great work of the commission and its able officers, or the close spirit of co-operation which now happily exists between the commission and the private owner, and which is the best guarantee of future progress.—Yours faithfully,

R. G. PROBY
Elton Hall, Peterborough

Revolutionary Policy in Asia

SIR,—The use in your correspondent's interesting article on "Revolutionary Policy in Asia" of the term "World (sic) Federation of Trade Unions" for an organisation which has lost its non-communist representation is an innocent example of the way Soviet Communism's own terminology for its institutions tends to be accepted as a matter of course in the West, regardless of misnomers and propagandist colour. It would appear to be one of the more obvious tasks of cold political warfare to reform this casualness.

First of all, as the most simple change, we should drop the honorifics from the names of Soviet and "communist" organs: "People's" is a questionable epithet for a satellite government and applied to a police weapon under alien control it is grotesque. One-party plebiscites of a demonstrative character should not be reported as "general elections," and we should not strain after analogies in the system of representative democracy in order to translate the institutions of co-opiative oligarchies.

Secondly, the use of the word "communism" itself as the proprietary name for all the current products of Soviet strategy and politics needs revision, disguising as it does their ultimate reliance on blood and iron. The word should be invariably broken down into its various meanings between utopian socialism and the new-model fascism of the contemporary Soviet empire. We should, for instance, be freer with the word "Soviet," not only substituting it for "communist" on occasion, but adding it to the names of "national" communist parties to indicate their relation to the source of temporal and ideological power. To call Mr Pollitt a Soviet Communist is no more tendentious than to call an Archbishop of Westminster a Roman Catholic; neither, presumably, uses the respective expression to describe his own allegiance.—Yours faithfully,

MICHAL VYVYAN
Trinity College, Cambridge

Books and Publications

Personalities and Scholarship

The England of Elizabeth. By A. L. Rowse. *Macmillan.* 547 pages. 25s.

A new study of society in the reign of Elizabeth is an important event in the world of historical scholarship. Mr Rowse, by virtue of his past work on the Tudor period, is admirably qualified to attempt so ambitious a project. He has learning, a vivid sense of the past and marked evocative power both for personalities and events. The aesthetic pleasure which Mr Rowse takes in the ostentatious magnificence of the time makes his book both a splendid tribute to, and a fitting memorial of, the achievements of the age and he gives us a rich portrait gallery of greater and lesser Elizabethans. Mr. Rowse's admiration for the Elizabethan achievement makes his work a corrective to the more pessimistic study by Professor Tawney of agrarian society. The depressed peasantry had to pay the price, but it is the achievement of the governing class which interests Mr Rowse. He effectively attacks the view that the Elizabethan aristocracy was on the edge of extinction as the result of conspicuous extravagance, and shows that its salvation lay in sound estate-management.

An assessment of Mr Rowse's success must be made in terms of his power to explain the economic, administrative and political problems of the time, problems which, in his view, were solved with conspicuous success. He emphasises inequality as one of the foundations of the Elizabethan achievement. Disparity of wealth supplied an incentive, while the secular price rise provided both unearned increments and easy profits. Mr Rowse enjoys tilting at left wing prejudices, and states with the resonance of a manifesto "What was wrong with profit? The motive of profit has been responsible for far greater achievements in history than ever the absence of it has been." In this he is correct. But his other explanations are less satisfactory. He does not elucidate the relation between economic changes and government policy, and attributes to Cecil both "a mind of singular intellectual consistency directing the affairs of the country for forty years" and a quick responsiveness to opinion and pressure.

It is perhaps natural that a historian who dates his preface "Empire Day, 1950," should so often seek an explanation of personalities and policies in national character. Whereas Lord Keynes emphasised the impersonal factor of profit inflation as the basis of Elizabethan economic achievement, Mr Rowse considers aggressive nationalism to be as important. Again, he suggests that political absolutism was absent from Tudor England because of "the English habit of political restraint." Roman Law failed to establish itself in England, not because, as Maitland suggested, there was the corporate strength of the Inns of Court to combat it, but because "the instinct of the English for fact led them to prefer case-law." Mr Rowse, who prominently associates himself with Maitland as a dissenter from all Churches, has, however, his own mysticism and has not heeded Maitland's warning that "National character, the genius of a people, is a wonder-working spirit which stands at the beck and call of every historian." Again, Mr Rowse's admiration for all Elizabethan institutions leads him, a professed agnostic, to present a highly favourable picture of the Elizabethan Church at all levels. He ignores the evidence for the miserably inadequate economic status of the lower clergy as set out by Dr Hoskins, whose work Mr Rowse cites approvingly but selectively. The Tudor clergy suffered from impropriated tithes and the necessity of bringing up large families on incomes designed for one. From Dr Hoskins's survey Mr Rowse chooses as his instance of a prosperous Elizabethan clergyman a vicar enjoying one of the richer livings in Leicestershire.

As a result of this insistence on the greatness of the Elizabethan age Mr Rowse has ignored Professor Neale's revelation of the seeping corruption in court and society in the last decade of the reign. A staccato style together with much personal acerbity blurted out in such phrases as "the idiot people" are defects in a book which nevertheless has wide scholarship, unmistakable vitality and real understanding.

Policy and Tradition

Britain and Europe: Pitt to Churchill, 1793-1940. Edited by James Joll. *Nicholas Kaye.* 378 pages. 16s.

This is the third of a series of volumes planned to display, through passages selected from a variety of sources, some part at least of that many-sided, elusive thing we call the British political tradition. The present work is concerned with those strands of the tradition which have been woven into the pattern of our dealings with the European continent over the last 150 years. Mr Joll does not claim that the bundle of ideas, prejudices and psychological attitudes he exhibits were chiefly influential in shaping policy, that indeed would be difficult doctrine. What he does argue is that these notions appear with curious regularity embedded in statements of policy, speeches, letters and newspaper articles over the whole period. In that sense they can be said to constitute a political tradition on foreign affairs; a stock of attitudes and ideas carried down through several generations to be applied, without seeming incongruity, to a whole range of particular problems.

In his short Introduction Mr Joll shows considerable dexterity in classifying what he holds to be the characteristic features of this tradition. There is that deep strain of pacificism, as much economic as ethical in its roots, which covers, without altogether hiding, an older national propensity to fumble for a cudgel at the first sign of trouble among Britain's neighbours. Then a sense of physical detachment from the continent has always nourished isolationist sentiment, although, since it has not infrequently been matched by an ignorant contempt of foreign ways, it has sometimes led Englishmen to the opposite extreme of striving to thrust their institutions on other folk. Again generous sympathy with the downtrodden, vigilant concern with supposed strategic interests, and a respect for treaties have always worked, in their several ways, to involve Britain deeply in continental politics.

The passages from speeches, state-papers and the like, which form the bulk of the book, show these motives working like leaven in a variety of circumstances; as strongly in the bitter struggle with twentieth century Germany as they once did in the fight with Napoleonic France. Mr Joll might have chosen some less hackneyed examples, but there is force in his contention that the traditional is to be sought in the familiar. Those he has taken illustrate his rather difficult theme with emphasis and precision.

In short this is a work well suited to its purpose, provided its self-imposed limitation is recognised, namely that it is not a source book of foreign policy. A political tradition in foreign affairs must, of necessity, often be illustrated in particular foreign policies. Yet at all times the policy is larger than the tradition with which it is stamped.

A Family Business

Skilbecks: Drysalters, 1650-1950. By Donovan Dawe. *Skilbeck Bros., Limited.* 116 pages. 15s.

"A dealer in chemical products used in drugs, dye-stuffs, gums; sometimes also in oils, sauces, pickles, tinned meats, etc." On that definition the world is already, as the Pied Piper promised, one vast drysaltery. The author of this commemorative volume of three hundred years of successful drysalting prefers the more precise definition: "One who deals in various articles for dyeing." He is more interested in drysalters than in drysalting, and so he has not much to tell about the fascinating subject of vegetable dyes and the way they have been supplanted. What we have here is the history of a family business, typical in everything except its long record of prosperity. The premises of Messrs Skilbeck today are within a stone's throw of the site of those of the founder of the firm in 1650. From Richard Bagnall's hands the business passed into those of the Leppingtons and the Gouthits, one of whom married the first Skilbeck. Mr Dawe shows that, provided a firm stays in the same place, its history can be traced with astonishing accuracy from the parish, ward and livery records. Only occasionally does one of his worthy merchants break out of the mould imposed by the growth of a successful business, as when one of them suddenly built a warehouse in the Early English style to relieve the monotony of Upper Thames Street. Skilbecks is one of the oldest firms in the City. Few others can have had their original premises burnt in the Great Fire and their present ones damaged in the blitz; and few "house histories" have been treated in such thorough detail as this one.

Reporting Parliament

Our Hansard. By William Law. *Pitman.* 80 pages. 8s. 6d.

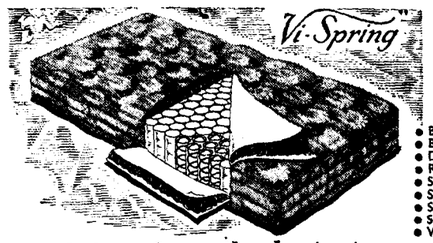
In 1948 Sir Alan Herbert, then one of the burgesses of Oxford University, published a little ditty exhorting the public to spend sixpence buying the *Weekly Hansard*. In 1771 the Lord Mayor of London and one of his aldermen were sent by the House of Commons to the Tower for the contumacy they had shown in supporting John Wilkes in his endeavours to have reports of debates published in the press. Thus the wheel has come full circle. This little book tells why. Its author claims that it is the first book ever written about Hansard reporting. It is certainly the most complete and it provides a great deal of detailed and interesting information.

The story of how the reports of Parliament developed from Cobbett's "Political Register," first published in 1803, into the "slim white-covered book" issued the morning after a sitting and containing a full and reliable account of the previous day's proceedings, is most interesting. *Hansard's* growth and expansion was far from easy and far from swift. It may surprise some readers to learn that a series of Select Committees spent thirty years considering the best way to report the proceedings and speeches of Parliament. Not until 1878 was the Stationery Office called upon to provide funds to improve the quality of the reporting, and not until 1908 was a staff of reporters "who shall be the servants of the House" appointed. All this and much more may be learnt from this useful book which appears at a most opportune moment. Shortage of newsprint has reduced the reporting of the proceedings of both Houses in the press to a level very far below what is right and proper in a democracy in which they still play a vital part. Anything therefore which stimulates a desire to know more of their proceedings is much to be commended.

Glasgow's Election

The General Election in Glasgow, February, 1950. Edited by S. B. Chrimes. *Jackson, Son and Company.* 189 pages. 15s.

These essays by members of the staff of Glasgow University originated from Nuffield College's request for help in collecting material for its general study of the election. At Glasgow the task was taken up with enthusiasm by 62 lecturers and students. It seems a pity that, though detailed co-operative reporting was elaborately organised, the result is expressed in a collection of definitely individual essays. There is little serious attempt to provide a coherent general appreciation; perhaps, however, that is why the Glasgow study has appeared before the Nuffield one. The predominant impression gained by the outsider is of how little account were local issues, and even local idiosyncracies of character. The "wild men of Clydeside" did not matter last February. There, as almost everywhere, the electors chose thoughtfully and "demurely" between—for all practical purposes—two highly-organised mass parties. And those parties were separated by remarkably few differences in current policy and by differences only of emphasis in basic principles; but the two were almost equally determined to avoid mentioning the most difficult practical decisions that either would have to make in office.



The important sections of the Glasgow survey are a lively description of the campaign and an analysis, both painstaking and penetrating, of the election issues. For the rest, there is much interesting information—such as the frequency with which divisional Labour parties in the safer Glasgow constituencies choose insurance agents as their candidates. The "conclusion and commentary" is distinguished by the author's ability to restate one thought in five consecutive sentences.

Planning American Agriculture

Wartime Economic Planning in Agriculture. By Bela Gold. *Columbia University Press. (London: Geoffrey Cumberlege.)* 594 pages. *55s.*

Production and Welfare of Agriculture. By Theodore W. Schultz. *The Macmillan Company, New York.* 225 pages.

A Framework for Long-range Agricultural Policy. By Oscar Heline and Donald R. Kaldor. *National Planning Association, Washington, D.C.* 68 pages. 50 cents.

Economics with Applications to Agriculture. By Edwin F. Dummeier, Richard B. Heflebower, and Theodore Norman. *McGraw-Hill Publishing Company, Limited.* 718 pages. 42s. 6d.

Not long ago the first of the books on this list seemed nothing more than an admirable piece of research into one aspect of American economic history during the nineteen-forties. It was the others that were of topical interest. Today the position is reversed: military requirements are bringing a renewed shortage of food and fibre; commodity prices are climbing and Congress, in its latest attempt to check inflation, followed its custom of protecting the farmer at the expense of the consumer. This is, in fact, just where Mr Gold came in, but it is where a curtain will be drawn over Professor Schultz's and the National Planning Association's attempts to make America take a long, clear look at the future of its farms under peacetime conditions.

The fourth book under review is an economic textbook, illustrated by examples from American agriculture. It is designed especially for use in the land-grant colleges which train agricultural economists and administrators. They are in charge of America's great example of economic planning—the farm programme which began as an answer to the depression of the thirties, developed into an answer to the hunger of the forties and, in the fifties looked like becoming a white elephant which would dwarf the plans of the so-called "socialistic" countries by its extravagance, its ineffectiveness and its inconsistency.

Professor Schultz, a firm believer in the necessity of government measures to ensure stability in agriculture, is one of the most constructive critics of the measures the United States government has actually taken. The present book is an analysis of the objectives and theories behind these measures, pointing out where they have gone wrong, but only incidentally indicating how they might be put right. The National Planning Association's pamphlet covers much the same ground, less comprehensively but more comprehensibly. Both emphasise that agriculture is only one important strand in the national economy and that the welfare and prosperity of the farmers are bound up in the welfare and prosperity of the country as a whole. Most members of Congress must realise this perfectly well, but so far they have failed to legislate as if they did.

Hunting the Consumer

Marketing Survey of the United Kingdom. Edited by C. Chisholm. *Business Publications.* 598 pages. 15 5s.

The 1951 edition more than maintains the deservedly high reputation of this survey. The prewar comparisons of purchasing power in different parts of the country have been revived, for the first time since the war, in the form of an index of "income levels." An ingenious statistical technique has been used to estimate, for each of the 145 largest towns in the United Kingdom, the comparative proportions of families with incomes of £7 10s. a week or more. These are regarded as nowadays the people possessing that "surplus" purchasing power, after buying essentials, which the seller of consumer goods is concerned to attract. Taking the average for the 145 towns as 100, the "index" figures range from 87 for St. Helen's to 119 for Bournemouth and Hove.

The survey contains also a useful analysis of postwar changes in the main marketing areas, including the extent of the revival in the development areas. The detailed market information is intelligently presented, and therefore readily useful as well as comprehensive.

The
MANCHESTER GUARDIAN
Annual Review
of Industry, Commerce and Finance
will be published on January 23rd, 1951

In the years before the war the MANCHESTER GUARDIAN published many special numbers and established a high reputation for their informative contents. Not least important was the Annual Trade Review, a supplement issued in January each year. It is now proposed to revive this Review in a more elaborate form and as a separate publication.

Printed on fine quality paper, fully illustrated and with a four-colour cover and inset, this issue will not only review industry, commerce and finance over the past twelve months but will survey the coming year in those fields. Business men and women will find it an authentic source of information and a most useful book of reference.

The following are among the contributors:

The Rt. Hon. Harold Wilson, M.P
President of the Board of Trade

Sir Charles Renold
Chairman, Renold & Coventry Chain Co. Ltd

The Rt. Hon. Oliver Lyttelton, M.P

G. N. Vansittart
Chairman, Vauxhall Motors

R. M. Shone
Director, British Iron & Steel Federation

100 pages, Price One Shilling

Order your copy from your newsagent, railway bookstall, or direct from the Publisher, Guardian Building, Manchester

AMERICAN SURVEY

Mr Hoover Sounds the Retreat

Washington, D.C.

SOON after the President had seen Mr Acheson last Thursday and heard his report on the Brussels meeting, he issued a formal statement in which he said that "the spirit shown by the countries of Western Europe has justified our confidence that the free states of Europe mean business." Mr Truman, unfortunately, was twenty-four hours late. It must have been pleasant for Europe to get such an encouraging end-of-term report from the form-master, but Mr Hoover, on the evening before, and his supporters in the Senate, during the morning, had undermined the President's right to adopt such attitudes. The question no longer was one of American confidence in Europe. It was: "Is Europe justified in putting her faith in the United States?" The answer to that question will be known when the debate within the Republican Party has been resolved. It may, in the absence of Senator Vandenberg, take some time to resolve, but it would be unduly pessimistic to expect that a point of view, which was argued and discarded ten years ago, will be generally accepted now just because it is presented again by the only surviving ex-President.

That Mr Hoover should have made such a speech is probably no bad thing. The isolationist fire has been smouldering under the surface of official soft soapsuds for a long time. Now it has blazed up and the world will be able to see whether it will quickly burn itself out or take hold of the entire country. That it was there was obvious to anyone who listened to the chorus of self-righteous denials immediately after the election. "I don't know what they mean by isolationist," Senator Taft said; "nobody is an isolationist today. . . . I would say that anybody is an idiot who calls anybody else an isolationist." Mr Arthur Krock called the *Manchester Guardian* "ill-informed," and Mr Raymond Moley also took it to task, for seeing "what it carelessly and slurringly called isolationism sweeping the country." "It might be as well from here on for all of us to use the terms isolationist and isolationism with more discretion," Mr Moley sententiously remarked.

Mr Hoover's policies are, apparently, "no isolationism." He says so himself. "Indeed," he said, "they are the opposite." (If Mr Hoover is right, then, as Mr Elmer Davis said the next evening, the dictionaries are wrong.) Whatever they are, whatever fraudulent phrases are used to describe them, they are the policies of a group of Republicans who think that they have found a solution by which they can buy an "uneasy"—that much Mr Hoover admits—peace at the expense of the rest of the world. To them the most important paragraph in Mr Hoover's speech was one near the end:

> We can hope that sometime the evils of Communism and the disintegration of their racial controls will bring their own disintegration. It is remote consolation, but twice before in world history Asiatic hordes have swept over a large part of the world and their racial dissensions dissolved their empires.

It is no coincidence that those close to Senator Taft have lately been propounding a new foreign policy based on this happy future for Europe—which is, of course, not isolationism at all, either.

The policy they have been getting ready to unveil for some weeks is based on their observation that the satellites are, generally, being governed by their own nationals and that they remain national entities—Poland is still Polish and Czechoslovakia Czech. If the iron curtain moved to the Atlantic, they argue, France, Italy and the rest of Western Europe would also be governed by their own domestic Communists and would remain recognisably themselves. Then, in the course of time, Titoism would develop or the Communist empire would begin to wither and Western Europe would break away again and, with its industry undamaged by war, would be able to rejoin the free nations of the Western Hemisphere, who would be waiting for them with the fatted calf. Senator Morse, who, no doubt, had heard of this pending stupidity, devoted some time to it in his speech in the Senate:

> It would be very fallacious to outline America's defence programme on the basis of the assumption that the particular pattern of history referred to by the ex-President will repeat itself. The great danger is that, even should it repeat itself, before the repetition takes place the United States may have ceased to exist as a free nation. . . . I know of no set of facts which justifies the assumption that the Communist segment of the world will collapse before it has its death struggle with the free areas of the world.

When what is behind his speech is understood, it becomes clear that Mr Hoover was not merely being stupid when he said that the spiritual strength of Western Europe must "express itself in organised and equipped combat divisions of such huge numbers as would erect a sure dam against the red floods . . . before we land another man or another dollar on their shores." He did not, as he pretended, think it could be done. He wanted to be sure that his terms were impossible—as these were—in order to be able to say that Western Europe had had its chance. Then the American people could take his advice and welsh on their treaty commitments with a clear conscience—which, as Senator McMahon pointed out, they do not intend to do.

★

That things should have reached such a pass is, in great part, the fault of the Administration, which has provided no leadership within the country and very little concrete information. Too much time has been wasted on propagating moral platitudes and not enough spent on describing what withdrawal from the world would mean in terms of lost industrial capacity and unattainable raw materials. As a result, Mr Joseph Kennedy can talk of the defence of Western Europe as a quixotic adventure and Mr Hoover can pretend to believe, or at least try to persuade the public to believe,

"AMERICAN SURVEY" is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

that American interest lies only in preserving western civilisation and "our cultural and religious ties with it."

The leadership given to Western Europe, on the other hand, has too often been drivership—it has consisted of exhortation rather than example. It is assumed in the United States that American remobilisation has been running in top gear for months. It has not. It went into third gear after the outbreak of the Korean war, but it dropped into second as soon as the Inchon landings were seen to be successful. And it is only since the Chinese intervention that a real feeling of urgency, one which will survive temporary successes, has been general in Washington. Even now Mr Marquis Childs can report that "the plain fact is that contracts for vital defence orders are not being placed at anything like the speed which the crisis calls for."

The appointment of Mr Charles Wilson as Director of Defence Mobilisation is the first sign that the United States is really starting to practise in earnest what it has been preaching in Europe. Lecturing the Europeans has become a habit, the recklessness of which Mr Hoover's proposals illustrate. Senator Morse pointed out that

> we Americans cannot take the position that we and we alone are going to dictate the terms of European co-operation. We Americans cannot take the position, from the standpoint of our own safety and the survival of the free way of life in the world, that all the freedom-loving nations within the United Nations, who have so much at stake and so much to risk, so far as the threat of spreading Communism is concerned, must abide by our decisions, our wishes and our mandates.

He might have added that even less can Americans take such positions when men who have once held responsible positions, and men who hold them still, are proposing to betray Europe for their own supposed advantage, giving as justification for the betrayal that it "would preserve a stronghold of Christian civilisation in the world against any per adventure." Some Christianity! Some civilisation!

The value of Mr Hoover's thinking is well shown by his use, in the year 1950, of the word "Gibraltar" as a synonym for an impregnable fortress. If he believes that, it is easy for him to believe that the Western Hemisphere, with Britain ("if she wishes to co-operate") to act as conductor for rockets and guided missiles, is also impregnable. At least, after this speech, it should be easier for Americans to forgive Western Europe for being "confused with fears and disunities" when Russian tanks are 150 miles from the borders of France. Mr Hoover is even more confused with them 3,000 miles away.

Pounds and Dollars

Officers of the three Chase Bank offices in London have a particular interest in the problems and opportunities presented by Anglo-American trade—further, they are intimately and continually familiar with conditions on *both* sides of the Atlantic.

Freezing the Economy

The icy blast which hit Detroit when the automobile manufacturers refused to take back their price increases has now spread, in a milder form, to the whole country. The Economic Stabilisation Agency has asked for a voluntary freeze of all prices at the levels prevailing on December 1st. Putting the order on a temporary basis recognises that there is not, as yet, the staff or machinery to impose and enforce thousands of regulations; it also relieves the Administration, for the moment, of the embarrassing necessity of imposing wage controls before an agreement has been worked out with the unions. But businessmen are left in no doubt that, if they increase their prices in violation of the "fair standards" laid down, they may expect retribution in the form of a "roll-back" as soon as the stabilisers get round to them.

The "fair standards" provide that prices may not be increased by any company earning profits before taxes equal to or larger than its average in the years 1946-49, though no company can be forced to produce any item at a loss, and the wind may be tempered, when a full compulsory system is set up, to the shorn lambs of the aircraft industry and others who did badly in the base period. Profits this year are expected to reach $40 billion, compared with an average of $28.8 billion in 1946-1949, so that there is room to absorb substantial advances in costs. Moreover, the Price Administrator has hinted that he might have to require lower prices for certain basic materials, which were raised before December 1st—a shaft directed, perhaps, at the steel industry which, to Detroit's fury, announced new prices just before the ice-age set in. It seems certain that the earliest extension of compulsion will cover metals necessary to the defence programme, such as copper, zinc and steel scrap, and oil.

The automobile industry, target of Price Regulation Number One, is also the first to have its wages frozen—until March 1st. But this is an empty consolation, for under the cost-of-living clause in its labour contracts, no increase is in any case possible until then. In the next two months the controllers must find some way of reconciling the insistence of the companies that they cannot continue these "escalator" clauses unless they are allowed to raise their prices, and the threat of Mr Reuther, for the automobile workers, that if the cost-of-living proviso is thrown out, the five-year contract with the manufacturers goes with it. Similar clauses are spreading like wild-fire; it was the linking of their wages with the cost of living, coupled with a substantial increase, which settled the year-old railway dispute.

The only way to stabilise wages, the unions insist, is to stabilise the cost of living, and in this the price of cars plays a small part compared with those of food and rent. But unfortunately, when Congress passed the Defence Production Act, it provided, with its farm constituents in mind, that food and farm ceilings might not be set below the actual price prevailing in June, or parity, whichever was higher. With

the exception of beef, veal, and lamb, most foods are selling well below parity—the farmer's equivalent, though a lordly one, of labour's cost-of-living clause.

* * *

Re-enter EPT

Like a nervous dentist probing an aching tooth, Congress has spent six months picking away at the problem of imposing a tax on the "excess" profits of American corporations. Its work has been punctuated by agonised cries from American business, which has damned EPT as the measure most likely to inflict the greatest amount of pain for the least amount of good. Last week Congress braced itself, and a House and Senate conference committee passed a new tax Bill which will take $3,200 million a year out of corporate profits, with 80 per cent coming from an EPT provision. The Senate has already approved the Bill, and House approval, followed by President Truman's signature, is expected early in the new year.

The Bill leaves undisturbed the 25 per cent tax on profits which are less than $25,000, but it increases the tax on "normal" profits beyond that amount from 45 per cent to 47 per cent. On "excess" profits, the new tax is 77 per cent. Most corporations may use one of two standards for determining what portion of their profits is excess: (1) everything above 85 per cent of their average annual earnings in the most profitable three years from 1946 to 1949 inclusive; (2) earnings greater than 12 per cent of the first $5,000,000 of invested capital and retained earnings, 10 per cent of the next $5,000,000, and 8 per cent of all capital above $10 million.

Although the new tax Bill has sharpened the businessman's anguish by making EPT retroactive to July 1, 1950, Congress has dulled the pain a bit with a few special provisions. Most important of these is the clause which limits the amount taken by combined regular and excess profits taxes to 62 per cent of a corporation's income. The Bill also attempts to avoid discriminating against certain industries, such as television or aviation, which have grown much faster or much slower than the average during the base period 1946-49. In the last war Congress tried to solve this problem by writing a general relief clause for hardship cases, with the result that claims for exemption from EPT came flooding in by the thousands, and many are still pending. In the light of this experience, Congress has established special rate bases for "growing," "depressed" or "regulated" industries and has set up conditions which companies must satisfy to qualify for softer tax treatment.

This new levy on corporations, combined with higher individual income taxes already written into law, will boost the nation's annual tax bill to $50.6 billion a year, compared to the $37.3 billion planned in the hopeful days before Korea. However, the pain is just beginning: Congress will be asked to pass still another "tremendous" tax increase in 1951.

* * *

Men Wanted

If Congress allows the President to regroup government agencies, for the sake of greater efficiency during the present emergency, those dealing with manpower will probably be brought together in one office under the new Director of Defence Mobilisation. If so, he will have control not only over the supply of labour for industry but also over that of men for the armed forces. For the moment, at least, there is little conflict between the two, except in the case of skilled workmen who are also military reservists or members of the National Guard. A number of these have been called up, but otherwise the services are filling their ranks with volunteers or, in the case of the Army, with conscripts too young to have become indispensable. Of the 8,500,000 men now in the 19-to-26-year-old group, which is liable to conscription, only about 250,000 are eligible for deferment because they are doing essential work, and most of these are employed on farms.

But over 7,000,000 more are exempt for other reasons, half of them because they served during the last war, the rest because they are unfit, have wives or other dependants or are students. The Army has already taken 200,000 of the remaining million, but there will be at least 500,000 more amongst those who reach the age of 19, or finish their educational deferment, this year. The rate at which conscripts are being called up has just been doubled, to 80,000 a month, and both the Army and the Air Force are mobilising more of their National Guardsmen, in spite of the lack of space in camps and the shortage of officers for training. By these means it should be possible to expand the armed forces from the 2,300,000, which is the approximate number of those now serving, to the 3,500,000 which is the President's latest target for the second half of 1951.

But the services will have to look further afield for the four or five million men which are the more distant target and for the 800,000 replacements which will be needed each year that such a force is maintained. The President has power to pull the strings of the draft somewhat tighter, by changing the very generous deferment provisions, and the Army might lower its physical standards. But it seems certain that Congress will be asked to draw more men into the conscription net when the law comes up for renewal in the spring, if not before. The commonest suggestions are that the minimum age should be cut to 18 and the term of service extended from 21 months to two years; veterans of the last war may also be drafted.

It will not be long before industry, too, has out the "Men Wanted" signs. It already has in certain aircraft centres, although elsewhere there may be transitional unemployment as factories are turned over from civilian to arms production. The Secretary of Labour has already arranged with business and labour representatives to set up joint manpower committees. Until labour shortages become more acute, their chief task will be that of co-ordinating the placing of defence contracts with the availability of manpower.

* * *

Protestant Co-operation

The twenty-five Protestant church organisations, which are co-operating with four Eastern Orthodox churches in the new National Council of Churches of Christ in the United States, have led the opposition to the appointment of an American diplomatic representative at the Vatican. It is therefore as absurd to accuse the new council of being "a whistle-stop on the train back to Rome" as it is to suggest that the free enterprise system could be threatened by an organisation with which both Mr John Foster Dulles and Mr Harold Stassen are closely connected. There is, however, perhaps slightly more substance in the third charge levelled against the National Council by the fundamentalist "Bible-believing" groups, who also say that it is "another mile-post on the road to a super-church." For this traditional objection to such national bodies is shared by the Southern Baptist Convention and the Missouri Synod of the Lutheran Church, neither of which has joined the council; between them they have over 8,000,000 members.

Other nation-wide Lutheran churches, however, have decided that the time has come for whole-hearted religious co-operation, and so have the other Baptist Conventions, whose total membership of nearly 8,500,000 includes President Truman. The largest single Church in the National Council is the Methodist, with 8,700,000 members, and others are the Presbyterian, to which 2,400,000 Americans belong, the Disciples of Christ, the Protestant Episcopal, the Congregational Christian and the African Methodist Episcopal, each with over a million members. The Friends have joined and so have various Evangelical churches, but the

Mormons and the Christian Scientists have not. Altogether the national churches participating in the council have over 31 million members, representing about 75 per cent of the organised Protestants and Eastern Orthodox communicants in the United States. There are altogether about 240 religious bodies in the country, with over 80 million members. The Roman Catholic Church, with nearly 27 million members, is by far the largest single unit.

The National Council is in no sense a merger of churches, or a new religious denomination ; it is only "a system of unified Christian enterprise," which will provide a centre for developing Protestant strategy on national and international issues. It is in fact an amalgamation of eight interdenominational service agencies, including the Federal Council of Churches of Christ, that have been built up to further specific mutual ends. The council will have four divisions, dealing with home missions, foreign missions, education and Christian work and social problems. The most telling argument in favour of this latest centralisation has been that it will ensure cheaper and more efficient administration and that such large-scale organisation will give more prestige to the Christian forces in American life.

* * *

Titanium for Defence

The unique qualities of a postwar, semi-light metal, titanium, is tantalising the defence planners. It attracts the Navy because it is as immune to corrosion from salt water and sea air as platinum ; it is resistant to hot acids and the strength-weight ratio of its alloys is claimed to exceed that of any other metal, a point not lost on the Air Force. The difficulty has been that the metal, a younger brother of titanium dioxide, the white pigment, is in such short supply that the whole production of titanium sponge, about 60 tons a year, is needed for research into its qualities.

Ilmenite, the ore from which it is taken, is plentiful ; the bottleneck is in the scarcity of refining plant and the high cost of the product—about $5 a pound for titanium sponge and about $15 a pound for sheet. Encouraged by the government, the Titanium Metals Corporation is planning a $15-20 million expansion in its extraction operations, but the largest project is the $30 million undertaking just opened at Lac Tio, in Northern Quebec. Here the Kennecott Copper Corporation and the New Jersey Zinc Company are beginning to extract titanium oxides and high grade pig iron from the largest known deposits of ilmenite in the world. These were discovered in 1941 in the Lake Allard region, and by 1946 it was reported that the deposits contained over 125 million tons of ore, about 35 per cent titanium dioxide and about 40 per cent iron. But the project would hardly have been undertaken on the present scale had there not been an improvement and simplification of the cumbersome and expensive methods of extracting titanium oxides. Five new-type electric furnaces are to be employed eventually, which will produce slag for American producers of the pigment and the metal. To do this has required building a 27-mile railway through the wilderness and constructing a 40-mile transmission line to carry electric power from the Shawinigan Light and Power Company. The extraction of titanium metal is also a heavy consumer of power, and further expansion by the National Lead Company in Nevada is dependent, in part, upon securing an adequate supply of cheap electricity at a time when it is in fierce demand for defence industries.

* * *

Spanish Omelette

When last autumn the United Nations debated the question of resuming full diplomatic relations with Spain, the United States, supporting such a resumption, emphasised that it would not constitute approval of the policies or practices of the Spanish government. President Truman did not at the time seem so certain of this as was the State Department, but he has now been convinced of the practical advantages of having a full Ambassador in Madrid, and has appointed Mr Stanton Griffis to that post. Mr Griffis will probably be instructed to use as long a spoon as possible when supping with General Franco, for most Americans share Mr Truman's dislike of seeing their country sit down to table with a dictator.

The table will not, however, be bare, for Congress has already cooked up some aid for Spain and Mr Truman has reluctantly allowed it to be served. The Marshall Plan appropriation, approved in September, carried a loan of $62,500,000 for Spain, which it was thought the President would impound. His objection was that the loan brought Spain into the European Recovery Programme by the back door ; the country had long been eligible in theory for loans from the Export-Import Bank, although in practice it was not a good enough credit risk. When the loan programme quietly got under way in November, this difficulty was glossed over by making the loans not to the government, but to private companies for individual projects which might make "substantial contributions to the Spanish economy."

That economy, such as it is, will inevitably be on the anti-Communist side in the event of war with Russia and, as the international situation has deteriorated, this argument has presumably carried more weight with Mr Truman. It is one which earlier carried weight with members of Congress not normally sympathetic to totalitarian regimes, or to the American cotton interests and Catholic voters who favoured a loan to Spain. These Congressmen were also encouraged to vote for the loan by the hope that it might be repaid with the bases in Spain which American military leaders say they would like. This is not the last time democratic dogma will be broken to make the anti-Communist omelette.

THE WORLD OVERSEAS

Communism in Asia—II

Poverty and Inflation

(From Our Correspondent in India)

IN Asia poverty has caused the whole of society to be rotted not only by corruption but also by inflation. Partly, of course, inflation is the consequence of the war and its devastation. But beyond that there is in modern Asian society a perpetual tendency towards inflation. Governments which have promised the impossible, and which also realise how desperate is the need of their society for capital investment, are always being tempted to finance welfare and investment alike by a budget deficit. Moreover, the modern social conscience demands that nobody should starve or die of unnecessary disease. There is, therefore, always a tendency for income to outrun production, and the economy is deprived of the correctives of famine and plague.

Inflation, by its gross aggravation of social injustice, also destroys the moral effect of the liberal reforms Asian governments have recently been so extensively making. In many places, the tenant is being given ownership; everywhere rents and interest have been controlled. Everywhere, too, taxation has been made sharply progressive. The resultant benefits in extra social stability would be more obvious if at the same time the black market were not constantly furnishing new examples of the wicked flourishing like the green bay tree. No system which does not command the moral respect of the people can survive. Capitalism is, therefore, dependent on the good behaviour of capitalists. A main reason why England has no Communism, where France and Germany have, is the Nonconformist conscience. Inflation and black market create a world where the big cars and the pretty women go to those who let wages lag behind prices, who sell under the counter and whose transactions are conducted in cash.

No wonder that the young and the idealist begin to hanker for more violent courses, that Parliamentary processes begin to appear too cumbersome for the cleaning of augean stables. The common law tradition of protecting the accused itself seems somewhat old fashioned when its main beneficiaries become profiteers.

Production Must be Expanded

In a normal society, the ideals of youth fade away with age and family cares and a secure job. But in an inflation even the able find themselves chasing the pot at the end of the rainbow. No matter how hard they work, no matter how many promotions they receive, taxes and the cost of living seems to go up as quickly as their pay, while the average member of the middle class faces a slow squeeze of all his standards, a slow destruction of all his hopes for his own future and those of his sons. When the shopkeeper flourishes and the clerk starves, revolution is round the corner, for the educated middle class will tolerate only so much.

All these problems could be solved if production could once be set on the road of expansion. There would be less corruption, for the struggle for life would become less grim. There would be a cure for inflation, because supply would rise. There would be room for welfare, since there would be a surplus with which to pay for it. Everywhere in Asia the first enthusiasm for the welfare state has died in disillusion, and men are beginning to talk of production, But so far the liberal state has shown no sign that it knows how to increase production. Its combination of large promises with small performance, inappropriate welfare with freedom for the profiteer, talk of nationalisation with the practice of private enterprise, is the worst possible atmosphere for development. Most of Asia—Malaya is the only notable exception—has been getting poorer for twenty years ; much of it has been getting poorer for fifty. Whatever test one takes one always gets the same answer of increasing poverty. India has 25 per cent less textiles per head than before the war, Japan has had its housing shattered, the Philippines have 1,800 calories per head per day against 1,900 in 1938. In 1880, India probably had its full requirements of 2,500 calories ; its present 1,600 leave no margin for millions above the basic requirements. Production and more production must then be the cry. Without it Asian societies risk becoming a madhouse where the starving fight for scraps. Already in Calcutta the great landowner's grandson is a clerk and his grandson will be lucky to be a doorman. Against such conditions people must eventually revolt.

Where are the Savings ?

Liberalism has, indeed, so far done well in Asia. It has given freedom and independence, a new respect for the dignity of man and a new concern for the under-privileged. But it is not very well equipped to solve the problem of production, for its whole assumption is that production is to be left to individual initiative ; and in societies without entrepreneurs or adequate savings, individual initiative, without aid from outside, in management and risk-taking ability as well as in money, cannot possibly do the job.

Yet the job must be done and done quickly. These societies have lost the stability which came from the belief that poverty was the will of God. Karma can no longer satisfy even the Hindu of the incorrectness of the western idea that man can improve his material condition by his own efforts. It is here, therefore, that poverty gives Communism its best chance. Free capitalism will fail without aid. Then Asia will turn to the capitalism-cum-terror of the Communists. As Asia sees it, the Soviet Union has shown that if the population is squeezed by enough liquidations and enough forced labour camps, even the most backward society can produce the savings necessary for development. Every western tremble before Soviet might is in Asia an argument for Communism —it is rarely realised that the Soviet Union was a great power even before 1917. If China should be able to follow the Soviet example, then liberalism will be irretrievably lost in Asia unless enough aid to permit the other countries to match the Chinese achievement is given at once. In order to meet the increase in population and give a margin for hope, an improvement in national income of 2½-3 per cent a year is required. To attain that, aid would not need to exceed £250 million a year, of which £150-£175 million would be for India, which has over half the population of the region (excluding China) and is the strategic and political key of the whole area.

The Soviet Union and China are dangerous examples for reasons which are wider than the merely economic. Asia has observed how profound is the western respect for force. It

is remembered that the quality of the Japanese Navy made Japanese honorary white men in a dozen countries and it has been remarked that Mao is treated more gingerly than Chiang ever was. Certainly nobody doubts that there would be no South African Group Areas Act if India and Pakistan had an American-size air force. Asia is profoundly sensitive about colour; and colour prejudice is fundamentally the result of the coloured man's poverty, with its concomitant ignorance and squalor.

Liberalism is today fighting a losing battle in Asia. It is not made for forced draft economies. The forced draft must come from elsewhere. If the West does not provide it through aid, the Soviet Union and terror will.

The Stakes in Austria

[FROM OUR VIENNA CORRESPONDENT]

THE Foreign Ministers' deputies having refrained from making news either by chewing up or swallowing whole the extremely over-ripe Austrian peace treaty, a certain amount of profit can be gained by trying to analyse just why the Russians have hitherto been so reluctant to leave Austria. It cannot be simply that they have established an economic stake in the country which would be reduced in value if the peace treaty came into force. The financial value of the assets to be foregone, though considerable, could never be a decisive factor in the rebuilding of the Soviet Union. It must be assumed that the main reasons for staying are either political or military, or a combination of the two.

In both respects Austria is the bolt that either holds Central Europe together or keeps it apart. Its frontiers march with those of six countries, two of which are western type democracies and two "people's democratic" regimes. The fifth is Germany and the sixth Jugoslavia. The backbone of Austria, which runs for some 400 miles from Switzerland almost to Hungary and as far as Jugoslavia, is the semi-circular bastion of the Alps where Hitler intended to make his last stand. The bastion itself lies in the zones of occupation of the three western states though they have only a few thousand men between them to man it. But while they are there, they do to some extent bar the door to the western and southern extension of Communist influence.

The converse of this picture is that the Soviet Union, while it controls the Austrian provinces of Burgenland, Lower Austria and the northern Danube district of Upper Austria, controls the extension of western influence to the "people's democracies" of Czechoslovakia and Hungary. Communism as an ideology has no interest whatever for nearly 39 Austrians out of every 40, so that it is evident that the departure of Russian troops would make a vast difference not only to the political power of the numerically microscopic Austrian Communist Party but also to the position of the regimes in the two satellite countries across the border. In the Soviet Zone Austrian passport control, both outwards and inwards, operates under Soviet direction. If the Russian officers order that an individual shall be allowed either in or out, the Austrians can do nothing about it. But when the Russians leave, the two rather fragile "people's democracies" will have a wholly unsympathetic regime on their doorsteps. No doubt when this time comes, the Austrians will be much too busy with their own internal politics to pay much political attention to their neighbours; but this is a fact which a totalitarian regime cannot easily appreciate. From the Soviet standpoint, unoccupied Austria would be the West's central bastion in which it would organise its advance towards the east. After all, that is the way the Soviet Union would treat Austria if it could.

In this connection it is unsafe to assume, as is so often done, that the Russian complaints about the alleged re-militarisation of western Austria are simply pretexts for delaying the signature of the peace treaty. It is true that the Soviet Government is in no hurry to sign. But it also does really seem to be convinced that the West is planning an attack on the Soviet Union and that it will use Austrian, German and any other cannon fodder it can lay its hands on. It has always been the object of Soviet policy to try to extend Communism without getting involved in war and there is no reason to suppose that this is not its policy still. If so, the Soviet Union will either try to hang on to its position in Austria until it can again advance westwards, or it will regard Austria as an outlying position of its version of the *cordon sanitaire* and stay until it thinks it is unsafe to remain any longer.

When the West Talks Back

If the Soviet Government thought that a Communist regime could be established in Vienna without risk of general war, it would of course establish it tomorrow. Ernst Fischer, Secretary of the Austrian Communist Party, was no doubt quite sincere when he said that the Communist strikes last September and October were not an attempt to seize power but that, if they had been, the Austrian Government would have been overthrown in a matter of hours. With Russian guns behind the strikers, this is certainly true and as Russian support was only given in a few localities and on a limited scale, the strikes should therefore be regarded as an exercise. The only reason Russian guns were not put at the strikers' disposal in Austria, as they were when the local Communists seized power in Czechoslovakia, was that the West is now beginning to talk back and the Kremlin has begun to believe that it now means what it says.

To the observer in Vienna with occasional opportunities to see round a corner of the iron curtain it seems that, if the time comes, it will be quite easy for the Kremlin to put its Austrian policy into reverse. It has negotiated the peace treaty of its own free will and got almost what it asked for. It can change direction without loss of face, and will certainly not consider the interests of the "people's democracies" any more than it did the interests of Jugoslavia in the case of Trieste. While the interests of the "people's democracies" are the interests of Mother Russia and world Communism they will be protected. While they toe the ideological line they will be supported provided the Soviet Union does not lose thereby. At the moment, the interests of the Soviet Union coincide with those of Czechoslovakia and Hungary in the matter of Austria. The fact that the Cominform has just accused *Rude Pravo*, the official organ of the Czechoslovak Communist Party, of "political and theoretical mistakes" is a sign that these interests may not go on coinciding for ever. It is conceivable, though unlikely, that President Gottwald, who, a few weeks earlier, had publicly praised *Rude Pravo* orthodoxy, will follow Tito to Coventry. Even if that were to happen, however, the paramount considerations would still be: What effect would signing the Austrian peace treaty have on the promotion of world Communism and the safety of the Soviet Union? Only the Kremlin can answer that one.

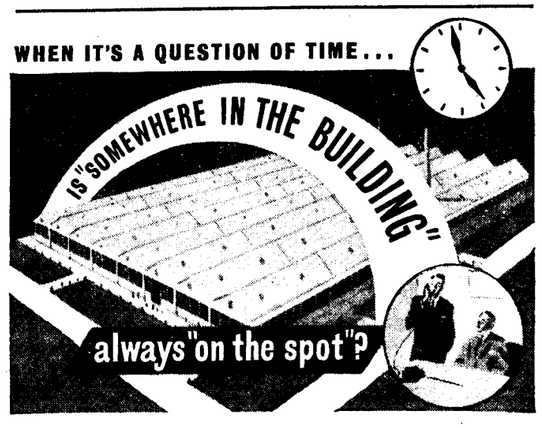
Leaders in Peking



FOR the world today Chinese Communism in terms of personality is Mao Tse-tung. He is sometimes called the Lenin of the Chinese revolution, sometimes compared to Stalin, sometimes regarded as a lesser Stalin and sometimes he is viewed with hope as an oriental Tito. But none of these analogies fits Mao very closely. Unlike Lenin, he was not the founder or original leader of the Communist party in China; unlike Stalin, he has not disposed of all rival or oppositional influences by physical elimination; and, unlike Tito, he was neither originally a soldier, nor has his personal achievement been primarily of a military order. Although his leadership is now well established and is consolidated by the offices he holds in the Central People's Government, his authority appears to be by no means absolute, and it may well be that the limitations of his experience will in the future give an increasingly strong voice to other leaders with somewhat different qualifications.

The original leader of the Chinese Communist party, founded in 1921, was Chen Tu-hsiu, a professor of Peking National University, where Mao Tse-tung, the child of a peasant family prosperous enough to give him an education, once worked as a library assistant. The university of Peking was the source of the so-called movement of May 4th, when in 1919 the students demonstrated against concessions made to Japan by the Chinese government of the day. The influence and example of the Russian Bolshevik revolution was added to this nationalist agitation, and the Communist party from its inception laid a strong emphasis on the anti-imperialist side of the doctrine, but for internal politics adopted the Leninist line, as pursued in Russia, of action based on the urban proletariat with agrarian revolt as an auxiliary device. The party gained its strongest initial support in the cities of Canton and Shanghai. It was obedient to the directives of the Comintern, and on instructions from Moscow subordinated itself to the Kuomintang in the campaign against the Northern war-lords, refraining from taking any action against the Kuomintang until it was too late. It was Chiang Kai-shek, and not the Communists, who made the *coup d'état* of April, 1927. The Communists were suppressed in Shanghai and other cities, and a number of their leaders were captured and executed. As Stalin had been responsible for the Comintern directives, a scapegoat had to be found and the blame was put on Chen Tu-hsiu, who was deposed from the leadership of the Chinese party. Chen refused to accept the blame, became a Trotskyite and was expelled from the party in 1931. He was subsequently arrested and imprisoned by the Kuomintang and disappeared from the political field.

Chen's successor was Li Li-san, who reported to Moscow that there was still strong support for the party among the urban workers and advocated attempts to seize large towns with the help of the Communist-led peasant forces which were at large in the countryside. When, however, events showed that there was no longer any revolutionary militancy in the towns, Li Li-san was in turn discredited; he was summoned to Moscow, where he publicly repented of his errors, and was put into cold storage in Moscow's foreign Communist community until 1945. Meanwhile, all that was left in China was the peasant guerrilla movement which had achieved unexpected successes in remote areas. The Comintern now gave this purely rural Marxism its blessing, and the new conditions of the struggle produced the new leader; this was Mao Tse-tung, who had been organising peasant revolt in his native province of Hunan and had later set up a "Soviet Republic" in southern Kiangsi.

In the years that followed Communism became known to the peasants of China as the Chu-Mao, a compound of the family names of Mao Tse-tung and his military commander-in-chief Chu Teh. Mao, half peasant and half student-intellectual, became linked in a most formidable partnership with a man six years older than himself, the son of a wealthy landowner, who had become a professional soldier and had also held high civil office in the provincial administration of Yunnan. In 1922, at the age of 35, Chu Teh underwent a conversion which carried him first into the Kuomintang and then into the Communist party. He handed over his wealth to his nine concubines for bringing up his children, cured himself of the opium habit, to which he was addicted, and went to Germany and France for four years to pursue advanced military studies. Returning to China, he studied Russian military textbooks which Chiang Kai-shek had brought back from Moscow, and evolved his own theory of

WHEN IT'S A QUESTION OF TIME...

'SOMEWHERE in the building' may easily mean half an hour's wait and innumerable interruptions of other people's work and business lost, just because someone 'can't find Mr. Smith'. This kind of thing does not happen in the best organised businesses. T.R. Staff Location locates anyone in a matter of moments, no matter where they are in the building.

strategy and tactics; holding a command under Chiang in Kiangsi in 1927, he rebelled and took his troops over to the Communists, joining up with Mao Tse-tung's force from Hunan.

If any parallel to his career is to be found in the Russian Revolution, it would be in Tukhachevsky. Chu Teh, however, has a stronger position than any professional soldier attained in relation to the Bolsheviks under Lenin. It has often been emphasised by foreign observers that the People's Army "is free from old-fashioned Chinese 'war-lordism'"; it is subject to rigorous discipline and to firm control by the party. But this docility of the army has been in large measure due to Chu Teh's own loyalty and does not diminish the real power which he embodies and of which he would dispose if there were ever to be a serious political split in the party. It is Chu Teh who has selected and brought forward the group of able generals whose names have recently become known to the outside world—Lin Piao, trained at the Whampoa Military Academy under Chiang Kai-shek and Bluecher, and a veteran of the famous Long March; Liu Po-cheng, trained in Moscow and another veteran of the Long March; Nieh Yung-cheng, trained first as a chemist in France and afterwards at the Military Academy in Moscow; Chen Yi, French-educated and former organiser of the Chinese Communists in France; Yeh Chien-ying, trained in Whampoa and Moscow and former chief of staff to Chu Teh. These are men with whom the party must reckon, especially in matters of foreign policy where issues of peace and war are at stake.

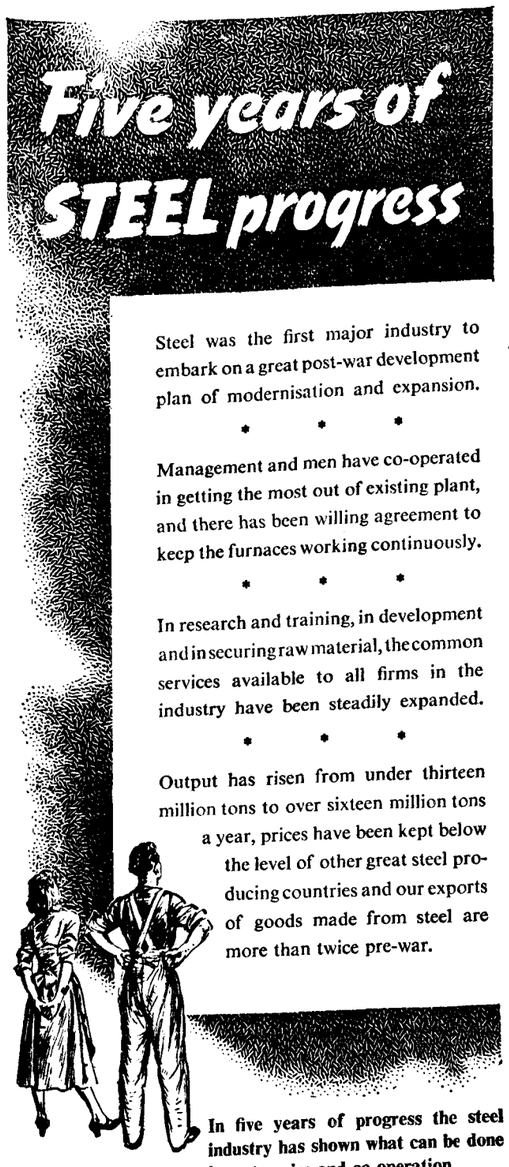
Who is the Kremlin's Favourite?

On the civil side Chou En-lai has the most prominent official position and is also the man best known to Western diplomats on account of his long service as "ambassador" of the Communist party in Chungking, and in the negotiations with Chiang Kai-shek arranged in 1946 by General Marshall. He is certainly the party's specialist in foreign diplomatic, as distinct from international Communist, affairs, and is generally considered abroad as the most moderate of the Communist leaders. But it is doubtful whether his influence in the party is as great as his public position would imply. For power in the party control of the party machine and its ancillary organisations is becoming more and more important as the regime consolidates itself as the possessor of state power, leading and governing 400 million people. The days of the Long March when the leaders were personally in contact with their followers with a minimum of formality have been left far behind. Moreover, the time of predominantly agrarian politics is over; now that the cities are under Communist rule, there is an inevitable change of proportion, not only because Communism must now get back to its proper course of basing itself on the urban proletariat, but also because the maintenance and expansion of industry has become of primary concern to the party. These conditions are not altogether favourable to Mao with his peasant background; he retains immense prestige on account of his past successes, but his previous lack of contact with industrial labour organisation is now a handicap to him.

The leader who has profited most from the new conditions is Moscow-trained Liu Shao-chi, who originally played a leading part in organising trade unions in Shanghai and who did not take part in the Long March and the sojourn in rural Shensi, but carried on underground activity organising cells among workers and students in Peking and other cities under Kuomintang rule. He became the party's specialist in industrial trade union organisation, and after his long experience of clandestine political management he has been given special charge of the administration of the party apparatus. He was the principal representative of China at the WFTU conference held in Peking a year ago, and his writings are more prominent in the Cominform journal than those of any other Chinese leader. A Communist of the most rigorous orthodoxy, he pays due deference to Mao as the supreme leader, but there seems little doubt that he exerts a powerful influence behind the scenes. He is said to be the Kremlin's favourite among the Chinese leaders, and though in certain circumstances this might be a liability, it is an asset as long as the Sino-Soviet alliance pays handsome dividends for China.

The Sardines Return

[FROM A CORRESPONDENT]



AFTER several years' desertion of their haunts along the Portuguese coast, the sardines have this year begun to come back. This is very important for the Portuguese fishing industry, since sardines normally supply over 50 per cent of the total catch. They can be caught all the year round and provide both food for the domestic market and an excellent raw material for the country's canning industry. (Moreover, some studies carried out by Portuguese biologists show that the sardines caught off the coast generally present a more interesting physiological and anatomical development than those caught elsewhere.)

The trouble with the Portuguese sardines is that they are rather elusive. Being essentially a migratory species, from time to time the number found off the Portuguese coast decreases sharply, or else they disappear from some sections of the coast and reappear in another. Experts on marine biology disagree amongst themselves as to why the sardines travel around like this. Changes in the temperature of the water, the winds, the movement of the ocean currents have all been blamed; so has the practice of intensive fishing and the use of certain condemned practices. Some biologists attribute a cyclical character to the sardines' migrations and maintain that a serious scarcity occurs every eight years.

During the last few years the Portuguese sardine fisheries have passed through one of the periodic crises due to the flight of the sardine. While in 1947 the production of the canning industry amounted to 38,736,992 kilograms, valued at 104,534,720 escudos, in 1948 it decreased to 25,308,190 kilograms, and in 1949 it fell still further to 15,146,833 kilograms, valued at 88,904,868 escudos. The average price per kilogram rose from 2.69 escudos in 1947 to 5.37 in 1948 and to 5.86 in 1949. On the domestic market the price per kilogram rose from 2.09 escudos in 1947 to 4.16 in 1948 and to 4.66 in 1949; and the amount consumed fell from 62,618,259 kilograms in 1947 to 19,649,665 in 1949.

The Portuguese Government, through its corporations, did its best to lessen the impact of the crisis on the 50,000 fishermen and their families who make their living from the sardine fisheries. It sent fishing boats to Morocco, reduced the price of fuel and made loans to the owners of fishing boats. It also increased to a total of 60 or 90 days a year (according to the size of the boat) the periods of 15 days during which the boats must not put to sea.

Steps were also taken to protect the canning industry which provides one of the most important Portuguese exports. At Matoshinos, where about half of the Portuguese fleet operates, a contract was drawn up which guaranteed a regular, although small, supply of sardines for the canning industry. This industry has, in fact, during recent years achieved notable developments, thanks not only to the intervention of the Government but also to its having obtained important markets abroad, especially in Great Britain. No new canning factories have been constructed, since it is legally difficult to do this; but many existing factories, especially those at Setubal, Matoshinos and Algarve have been completely reorganised. The manufacturing processes have been improved and standardised, and a better type of olive oil is now used. The Government is also building a tinplate factory for the benefit of the canning industry.

Steel was the first major industry to embark on a great post-war development plan of modernisation and expansion.

* * *

Management and men have co-operated in getting the most out of existing plant, and there has been willing agreement to keep the furnaces working continuously.

* * *

In research and training, in development and in securing raw material, the common services available to all firms in the industry have been steadily expanded.

* * *

Output has risen from under thirteen million tons to over sixteen million tons a year, prices have been kept below the level of other great steel producing countries and our exports of goods made from steel are more than twice pre-war.

In five years of progress the steel industry has shown what can be done by enterprise and co-operation.

A sensible policy for process steam—No. 26

For Advice on Process Steam Problems

BY SPIRAX

This is the final item in our series of Notes. Its purpose is to suggest what you should do when you are in need of advice on any kind of problem associated with process steam usage.

At Cheltenham we have a headquarters' technical staff engaged wholly on steam utilisation matters. In every industrial area of the country, and in many places abroad, there are resident engineers for discussion and advice on the spot.

There is a list of useful Technical Bulletins, Information Sheets, and Installation Drawings we have got out on a wide range of subjects to do with steam control, heat transfer and steam economy.

If you write to us we shall be very pleased. We have, of course, published these Notes in the hope that we might persuade you to do so.

Correspondence to: **Spirax Manufacturing Co. Ltd.** (Economist Enquiries), Cheltenham, Glos.

NOTES ALREADY APPEARED: *Jan.* 14, "A sensible policy for process steam"; *Jan.* 28, "Who controls your steam stores?"; *Feb.* 11, "Do you get full value from your steam?"; *Feb.* 25, "What steam costing will tell you"; *March* 11, "Meter your steam to get the facts"; *March* 25, "Why have a boilerhouse?"; *April* 8, "Four pillars of process steam wisdom"; *April* 22, "Process heat transfer decides plant earnings"; *May* 6, "Resistant films r. process economy"; *May* 20, "The air film handicap on output"; *June* 3, "Removing the air film handicap"; *June* 17, "Water film against process output"; *July* 1, "Individual steam separation"; *July* 15, "How are your steam traps chosen?"; *July* 29, "Better steam trapping, better output economy"; *Aug.* 12, "The Steam circulation system"; *Aug.* 26, "Steam pressures under control"; *Sept.* 16, "Thermostatic control simplified"; *Sept.* 23, "Intelligent use of 'waste' heat from steam"; *Oct.* 7, "Flash steam on the agenda"; *Oct.* 28, "Better condensate return systems"; *Nov.* 11, "A place for the automatic pump"; *Nov.* 18, "Heat transfer summing up"; *Dec.* 2, "The more you know about Process Steam"; *Dec.* 16, "Two Instructional Courses for Steam Executives."

These improvements have been justified by the increase in the sardine catch this year. In May, 1950, it sank to less than 325,000 kilograms, valued at about 2,542,000 escudos; but in August it was about 6,600,000 kilograms, in September about 8,200,000 kilograms and in October about 7,700,000 kilograms. The price of sardines in the canning industry, which in May was 7.83 escudos a kilogram, had gone down to 4.83 escudos in October. If the canning industry is to develop it must have more foreign markets; and it is, in fact, able to compete with other exporting countries, such as France and Morocco, not only in price but also in quality. But if the domestic consumption of sardines in the interior of the country is to be increased there must be more refrigeration installations and better communications.

Australia's Fight Against Inflation

[FROM OUR MELBOURNE CORRESPONDENT]

THE Australian people have become exceedingly "inflation conscious" in the last twelve months with the aggravation of the various factors which are combining to push prices up at a rapidly mounting rate. There is a general realisation of the connection between buoyant export prices and an increase in the community's purchasing power which is now threatening to drain a dwindling pound of still more of its value. Not only is inflation the nation's most pressing economic problem, but it has become a political Aunt Sally, with the Government and the Opposition each blaming the other for the present drift in prices.

The present Liberal-Country Party Government was returned to office in December last year on a pledge "to put value back in the pound." Coming as it did, soon after the devaluation of sterling, and with it the Australian pound, it soon became apparent that the chief task of the Government would be to prevent prices from getting completely out of hand. Unfortunately, inflationary pressures began to develop with increasing intensity; the final boost came in August, when the new season's wool auctions opened in Sydney with prices 50 per cent higher than at the close of the previous sales. This meant that the income to the woolgrower would rise from £286 million to anything up to £550 million, if the prices were sustained. And, so far, the wool market has more than held and shows every possibility of going up further.

The size of Australia's export income is the most powerful single factor affecting the economic prosperity of the country. This at first glance might seem to the outsider strange, for the gross value of rural production in 1949-50, estimated at £721 million, was only 27.2 per cent of the gross national product, and of the value of rural production, pastoral industry contributed something more than half. But although the primary industries of the Commonwealth contribute less than one-third of the value of the national product, fluctuations in the volume of export income have a profound influence on the volume of credit in the domestic economy and on the capacity of the nation to import.

If Australia's export income should rise in the current trade year by £250 million, as well it might if prices are sustained, this, in the absence of any specific measures to freeze the increase in income, would generate in the economy a secondary inflation of much more than £250 million by the time the new money had finally dissipated itself. This explains the great concern felt in Australia (inexplicable as it must be to other countries) at the great upswing in wool prices, when only 20 years ago higher prices for wool and wheat and metals was the prayer on everyone's lips. The spectacular rise in the price of wool was received in some quarters (not woolgrowing quarters) with gloomy forebodings—an ironical commentary on the apparent inability of the economy to meet the threat of rapid economic change.

The last Commonwealth Budget made some attempt to prevent the full blast of the higher wool prices from assailing the economy, by providing for a 20 per cent deduction of woolgrowers' proceeds at the point of sale which is to be held as an advance payment of income tax. This will, it is estimated, provide £103 million out of a total revenue of £738.7 million. This move would be generally anti-inflationary only if the funds so collected were immobilised in a special account in the Commonwealth Bank. As it is, the tax is being collected in advance to meet expanding Commonwealth expenditure.

To prevent the full effect of the rise in wool on the domestic market, the Federal Government has decided to pay a subsidy of £20 million to hold prices of Australian-made woollen goods. This, however, will have little effect on the general cost of living which is now subject to upward pressure from many points, aggravated markedly by the recent decision of the Commonwealth Arbitration Court to grant an increase of £1 a week in the basic wage. This could well add a further £100 million per annum to the nation's wage bill—a not inconsiderable sum in a total wage and salary disbursement of £1,190 million in the last financial year.

Selective Credit Policy

The latest official move to keep mounting inflation in check was the decision of the Commonwealth Bank, operating as a central bank, to require the trading banks to follow a more selective credit policy. Overdraft accommodation is to be closely scrutinised and borrowers are to be induced to obtain their working capital from outside the banking system. This means that increasing recourse must be had to new capital issues and to borrowings on mortgage and debenture. But no spectacular results can be expected from this as the tremendous expansion in the volume of money is not due basically to bank advance policy but to buoyant export income and to an expanding programme of public and private investment.

In this connection, the Government's announced intention of restoring some measure of control over new capital issues raises some interesting problems. In January, the Treasurer (Mr Fadden) announced a complete lifting of the control of new capital issues on the ground that this wartime control was no longer necessary. This was immediately followed by a succession of new and bonus issues by a wide range of companies, and undoubtedly contributed to the booming conditions on Australian stock exchanges. If the new bank advance policy compels industrial companies to seek capital in even greater volume from the market, the capital issues control will necessarily have to be administered with considerable latitude; for companies could well find themselves in an embarrassing position, unable to obtain working capital from either the banks or the market.

It seems impossible to hope for any early check to the rapidly mounting inflationary spiral in Australia in the absence of a downward turn in export prices. And that would quickly set in train a series of deflationary reactions with all their political, economic and social implications. The Budget could have been the instrument which contributed most to counteracting inflationary pressures in the economy; but measures such as increasing taxation to enable more expenditure on public works to be met from revenue, and more social services expenditure to be met directly from recipients' contributions, would have been politically inexpedient, although economically sound. But as long as nothing is done to check the forces of inflation at their very source—and it is not impossible to do this in the Australian economy—little can be expected from piecemeal measures directed haphazardly to isolated points of the economy.

SIMON ENGINEERING GROUP

Aspects of enterprise

No. 5.

Most of the shares in the Simon Engineering Group are held by the founder's descendants. To this extent it is a family business. But the mistake of concentrating the management in family hands has been avoided; no one family could provide the immense range of experience and ability to run such an enterprise, in which only the highest personal and professional qualities are good enough for the senior posts. Of thirty active directors of the various companies only two bear the name of Simon and only three more are members of the family by birth or marriage.

THE BUSINESS WORLD

Overseas Lending Again?

THE sector of the London capital market that caters for overseas issues has perforce been sadly neglected in recent years. The type of business that brought so much grist to the mill of the issuing houses, and subsequently so much support to the balance of payments of the United Kingdom, is but a small shadow of what it used to be. There are many reasons for this. The most fundamental is, of course, the fact that, at least up to the beginning of 1950, Britain no longer had a surplus on its current balance of payments from which to finance any net export of capital at all. Meanwhile, the habit of foreign lending among individual investors has largely disappeared. Government enterprise, in the shape of such institutions as the Overseas Food Corporation and the Colonial Development Corporation, has impinged—not always with conspicuous success—on spheres of a kind that might conceivably have attracted the private investor, at all events if the world were not still ridden with exchange controls and other protective devices. Last, but by no means least, the international situation has not lent itself to the expansion of overseas lending and promises to remain for some time a strong deterrent to this type of business.

For all that, Britain during 1950 has, in fact, been exporting capital on quite a substantial scale. The balance of payments figures suggest the order of magnitude involved. In the first half of 1950 the United Kingdom secured an over-all surplus of £52 million. In the second half of the year, insofar as may be gauged from the available figures of visible trade, the surplus may have approached £200 million. These are figures—and net figures at that—that are reminiscent of Britain's heyday as an exporter of capital. It may be true that the boom in Britain's balance of payments will not last long once defence contracts begin to impinge on export potential, and once the latest deterioration of the terms of trade exerts its full effect. But the time has plainly come when some hard thinking should be done on how Britain can most profitably invest any surplus that it earns from overseas.

It is difficult to ascertain from the published figures exactly what shape the outflow of capital has taken in 1950. A fair volume of capital export does, in fact, seem to have been canalised through the customary market channels. The Midland Bank figures of capital issues for the first eleven months of 1950 showed overseas issues totalling £46,323,000. The total is the largest secured since the end of the war. It is also larger than that for the last prewar year, comparing with £25,077,000 in the corresponding period of 1938. Much of this export of capital has been provided on what should prove remunerative terms. The full figures for 1950 will include, as the latest of such operations, the British participation in the Canadian Eagle issue. British shareholders' participating rights in recent South African mining issues, the loans to the Governments of South Africa, Jamaica and Cyprus, and a considerable batch of other African Government issues go a long way to make up the total. Although much of this money has been lent on near gilt-edged terms a fair portion has comprised equity investment that should, in time, bring a reasonable return to the investors concerned and to the British balance of payments. Moreover, beyond these issues involving the use of the open market, there has been a substantial, though not precisely measurable, direct investment in overseas subsidiary enterprises by parent companies in the United Kingdom. This, again, should prove a remunerative form of investment enterprise.

But an unnecessarily large proportion of the export of capital appears to be making its way out of the United Kingdom on terms that must be counted extremely unattractive to the creditor. Although the total overseas sterling balances will certainly show some increase for the year 1950, this rise will be the product of a combination of widely divergent movements. Part of the British export of capital has taken the form of releases of sterling balances owned by countries such as India, Palestine and Pakistan. The consequential repayments of external debt are yielding an interest saving of about ½ per cent—for this is the rate earned by the overseas countries concerned on the bulk of the balances now being liquidated. This repayment of sterling balances and the attendant export of capital will become hard-and-fast annual obligations with the implementation of the Colombo Plan, which envisages the release to India, Pakistan, Ceylon, Malaya and British Borneo of sterling balances amounting to £246 million over six years. There is much to be said for this programme and for the manner in which it is proposed to finance it. But it would be well to realise, first, that it earmarks a considerable proportion of the amounts that are likely to be available for British capital exports over the years to come; and, secondly, that this investment, in interest terms at least, offers very low returns.

*

An even more striking instance of heavy but low-yielding export of capital is that represented by Britain's participation in the European Payments Union. Since the Union began functioning on July 1st last, the United Kingdom has accumulated a net surplus of £149,383,000 with other member countries. Admittedly, a substantial part of this surplus has in effect been earned by the rest of the sterling area, and finds its counterpart in the increased sterling balances that have been built up by countries such as Australia, Malaya and West Africa. Nevertheless, it is between the United Kingdom and the other members of EPU that this new creditor-debtor relationship has been established. Of this net surplus, some £11 million has been covered by the utilisation of existing sterling resources held by the deficit countries—i.e., by drafts on their accumulated balances—and, for the reason already mentioned, may thus be reckoned to be yielding Britain about ½ per cent. Of the balance, about £53.6 million was covered by Britain's initial debit position with EPU, which yields nothing at all in interest, although an equivalent amount of conditional Marshall dollars has, of course, been received against that particular capital export. A further £80.2 million has been built up as a credit balance with EPU, on which the modest rate of 2 per cent per annum is earned. The residue of £4½ million of this cumulative net surplus has been taken from EPU by Britain in the form of gold. It would be reasonable to assume that, of this cumulative surplus of over £149 million, the credit balance of about £80 million built up with EPU roughly corresponds to the surplus earned through the direct trade between the United Kingdom and the other European countries concerned. On this assumption this export of British capital will, in fact, have been made at a rate of 2 per cent.

*

Although there are special reasons for all these unusual methods of external lending, the question ought at least to be raised whether Britain has reaped the maximum available financial advantage from the export of capital that has been possible in this past year. Admittedly, there are other than purely financial considerations at stake. Britain's participation in the Colombo Plan is intended to serve a greater purpose than the mere accumulation of overseas investments and reserves. Similarly, Britain's participation in the European Payments Union has as one of its objectives the restoration of a system of multilateral trade and payments, the benefits of which must be measured in other terms than mere yield on the direct investment. This, however, does not gainsay the desirability of getting the best out of a given situation. What is needed is that Britain should strive to secure the best possible overall return from the investment of its overseas surplus—the term "return" being here defined so as to connote other concepts besides yield, but not so as to exclude yield altogether. It may be questioned whether the repayment of sterling balances, the intrusion of Government corporations into spheres where commercial enterprises would give a better account of themselves, and provision of funds through the machinery of the Colonial Development and Welfare Acts are, in fact, calculated to secure the best over-all return. Apart from the loss of yield, the by-passing of the traditional new issue machinery, in canalising so large a proportion of Britain's capital exports to the Commonwealth, is leaving unused and barren a sector of the London market that has more than earned its keep in the past.

Doubts must also be expressed about the present form of Britain's export of capital to Europe. If so large a current surplus is being accumulated by the sterling area as a whole with Western Europe, why have so few European issues made their appearance on the London market? It would surely be preferable to make select loans to good European borrowers than to see virtually the whole of Britain's capital exports to Europe canalised through the EPU where they build up credits that have, as their main counterpart, claims by the whole Union on the weakest members of the European community. The absence of long-term loans to Europe must not, however, be attributed to any negative attitude on the part of the British authorities. A few proposals for European issues have been put up over the past year. The fact that none of them has yet met with success is due much more to the reluctance of London underwriters to assume responsibility for European issues in prevailing circumstances than to any unwillingness on the part of the authorities to allow the would-be borrower to join the queue. That has certainly been the fate of one or two Scandinavian projects, which would have been welcomed in official quarters had the attitude of the market itself been a little more congenial and receptive. In one or two instances, including a French proposal to borrow large sums in order to finance French participation in Middle East developments, there may have been some discouragement from official quarters, but this was due to the nature of this specific proposal and not to any antagonism to the general principle of lending. By and large, it can be said that the London capital market for overseas issues would have been opened to European borrowers had they been able to offer both terms and security that would have appealed to the general body of underwriters and investors.

Even though the malaise now affecting the provision of any risk capital in Britain may delay the reappearance of foreign issues on the London market, it can surely be claimed that the improvement in Britain's balance of payments with Europe is hastening the day when far greater freedom should be given to the movement of capital between Britain and Europe. Such freedom has been largely restored between Britain and the Scandinavian countries. There is little reason—other than fear that springs from what should now be a forgotten past—for maintaining the restrictions that still impede capital transactions between Britain and the other countries of Western Europe. It does not follow, of course, that such relaxations would lead to a remunerative export of capital from Britain. If the relaxations were truly reciprocal, it is much more likely, in existing circumstances, that they would be followed by the arrival in Britain of a substantial amount of European capital, seeking here the safety and protection that it is now difficult to find on the Continent. But if Britain is to take full advantage of its opportunities, it must not long continue to restrict all forms of investment overseas save those that are likely to prove least remunerative in terms of yield. It should be emphasised, however, that the new approach that is desirable to this aspect of external lending will require a reconsideration of the whole problem of export of capital. If private financing takes the place of one or other of the various forms of Governmental financing, it will impose no additional strain on the balance of payments. But if the opening of the door for the desirable expansion of private lending were not accompanied by some decline in the present volume of official lending, there would be risk of undue strain. The net resources available for all forms of lending are not likely in 1951 to approach the levels of 1950. It is the more important, therefore, to ensure that they are put to the best possible use from all points of view.

The Brewers' Dilemma

(By a Correspondent)

FOR half a century the brewing industry has been confronted with a persistent decline in the demand for beer. It spent some £75 million upon improvements to public houses between the wars. It has directed co-operative and competitive advertising at the public, and more concentrated campaigns at successive Chancellors. But all these policies have had a persistent flavour of the defensive: the industry is reluctant to admit that lower beer sales might have part of their origins in fundamental changes of social behaviour. It has not accepted any need for radical revision of its own policies or outlook, and it explains the fall in beer consumption and brewing profits—during a period of brimful employment—almost solely in terms of excessive taxation. This explanation is simple; is it also the complete answer?

Until the first world war, the industry's marketing problem was clear. Brewers made beer, and their prosperity depended on maximum sales. The marketing of beer was governed by a licensing system that forced brewers to own or control public houses and other licensed premises in order to ensure retail outlets. Such vertical integration might in any case have offered some economies, but it was primarily the licensing laws that determined the modern structure of the industry. The result is that some 80 per cent of the public houses in England and Wales are brewer-owned and three-quarters of the industry's assets are in licensed premises. In order to increase the number of selling outlets, amalgamation has been pursued until the number of brewers producing "for sale" has been reduced from several thousand in 1900 to 602 in 1949 (the *Brewers' Almanack* for 1950 records some 450 independent firms). Brewers are substantial owners of real estate, not for its intrinsic profitability, but primarily to guarantee selling outlets for their beer.

Until the first decade of this century, such an attitude could easily be justified. But this close association of beer and the public house has since been weakened by changes in social behaviour that have followed the placing of a host of new recreations, amusements, and amenities at the disposal of the working classes. Today the public house no longer has a monopoly either of beer sales or of the working man's leisure. Apart from increased consumption of beer in clubs, the list of new contenders for the public's leisure and money is familiar and still growing; it ranges from open-air sport to the dance hall and the cinema, from the "dirt-track" and the skating rink to television. What has the public house to offer to retain the patronage of both sexes and of all ages and social classes against these counter-attractions? It has long provided bowling greens, skittle alleys and dart-boards; it has experimented with paintings, poetry and plays; it has attempted, not very successfully, to revive interest in traditional "pub" games; but it can hardly add a greyhound track or a swimming pool. And where the installation of further attractions is possible—television might be one—it is still a question whether their provision increases the sales of beer to new customers more than it reduces sales to regular customers distracted by them from drinking. It may be that sales of beer in the public house and the general profitability of the public house are, in the mid-twentieth century, becoming conflicting objectives.

The industry unites in blaming the decline in consumption of beer on high duty and, in recent years, on low gravities. But the evidence for this case is not conclusive. Beer consumption rose generally throughout the nineteenth century as population and income grew; the peak of consumption per head seems to have been reached in the 1870s. In the present century the trend has unmistakably turned downward, though periods of artificially high or low consumption have resulted from abnormal causes—notably unemployment and war. Consumption since the war has been higher than it was immediately before the war, but has been falling fast this year, and there is no clear evidence whether it has settled down to a postwar norm. If the beer duty is responsible, it has to be remembered that it rose to 8d. or 9d. per pint only after 1939. In 1938 it was only 2½d. against ½d. early in the century; yet consumption was 33 per cent lower in 1938 than in 1900, in spite of increased population and purchasing power. More recently the failure of the 1d. cut in price following the 1949 Budget has convinced the industry that only a slash of 3d. or 4d. would revive the demand. This plea, unfortunately, harks back to days that may never return, of vastly different Budget commitments for social services. And the argument of "diminishing returns" in the revenue derived from beer is bound to be lost on any Chancellor who is not absolutely convinced that high prices are the one factor responsible for falling consumption.

The part played by lower gravities, again, seems difficult to prove. Average gravity was reduced during the war by Government order from 1040.78 degrees in 1938 to 1034 or 1035 degrees; but it had already been voluntarily reduced by the industry from 1055 in 1899 to 1041 degrees, partly to lighten the burden of successive increases in duty and partly to cater for the emerging taste for lighter beers. To argue from this past experience that the industry had discovered that 1040 degrees is the exact strength below which further reductions in gravity automatically reduce demand would surely be too charitable. Less has been heard of the gravity argument since the 1950 Budget, for although that made possible a three-degree rise in gravities (and a reduction in the index of retail prices), it produced no consequential rise in consumption save perhaps in bottled heavier beers.

What the public house is losing in importance in the distribution of beer, it is trying hard to gain through its other attractions. In the nineteenth century it was predominantly a shop for the sale of beer; in the twentieth century it is, at its best, a social centre valued for its atmosphere, company, comfort and recreational amenities. Have changing conditions in the supply and demand for beer, in the character of the public house,

and in other competing attractions undermined the basic reasons for brewer-ownership of public houses? The public house is no longer the only method of selling beer, and it may not necessarily be the cheapest method. Beer and the public house are becoming divorced in the economy of the brewing industry. Public house operation is less important to the brewer for the distribution of beer because other outlets have grown; selling beer is becoming less important to the public house in the maintenance of its clientele and profitability. The two factors must now be considered as potentially separate; not end and means but distinct entities—a commodity and a service that need not necessarily be provided jointly, but can be separately offered to the public on their individual merits. Beer will continue to be sold in public houses, but conceivably more may in time be sold for consumption elsewhere. Many firms have been able to expand their sales of bottled beer and powerless to prevent a contraction in their sales of draught beer. Many of them have made considerable enlargements of their bottling capacity. Public houses will continue to derive an important part of their revenue from beer, but conceivably sales of other beverages and food may eventually overtake it.

*

If these developments occur, neither need be considered calamitous by the brewers. But if they are to plan profitably for the future, they might pause to consider whether the methods of marketing their two products do not need to be conceived and executed independently. They may need consumer research and selling efforts consciously directed towards different social classes and age-groups, and towards different buying motives. Beer will need to be sold wherever the public chooses to spend its leisure time and spare money. Bottling and packaging must be adapted to cater for the needs of consumers wherever they may be—at home, at the club, or out of doors. In the middle-class economy of the future there should be an opportunity for expanded sales for consumption at home. There may be a lesson in the work of the United States Brewers' Foundation whose group advertising has made good use of cosy domestic scenes with the caption "Perhaps no beverages are more at home on more occasions than good American beer or ale." Again, should brewers be inhibited by over-sensitivity to the interests of licensees from developing door-to-door delivery? Here may be the only means of generating sales to middle-class and women consumers.

The public house may also need to develop a distinct selling technique if it is to free itself from its main preoccupation with beer. This might involve supplying any services it can economically provide that are demanded by its clients, not least food. It must extend its facilities, amenities and amusements and raise its standards as a place of social resort for both sexes (it is still largely a man's institution) and all classes (it is still mainly a working-man's haunt). Whether in this kind of development it can retain its *raison d'être* and distinctive place as an English social institution remains to be seen.

Some go-ahead brewers have read the signs of the times. One is marketing a "TV" pack; others offer door-to-door delivery; several are advertising beer for home consumption and appealing to women consumers. But only a handful would concede that radical economic changes are affecting their business. Even where modern selling policies are being adopted, it is not clear that the changing relationship between beer and the public house is accepted. At least the unchanged policy of advertising undertaken for the industry by the Brewers' Society does not suggest as much. In the nineteen thirties, total beer consumption slumped to 18.9 million barrels and average consumption per head to 14.3 gallons per annum. The Society's director conceived it necessary not only "to declare that England's is the best and healthiest beer a young man can consume" but also to show "all the good will and contentment the public house imparts in England." But the "Beer is Best" campaign was designed above all to increase the consumption of beer; and the public house was still only the instrument. Consumption revived to 25 million barrels in 1938, largely for reasons that had little to do with the slogan. But the latter had won a place in the affections of the industry, and after the war it was resuscitated—in entirely different conditions of low gravities. Indeed, after the 1950 Budget permitted beer to be strengthened, Beer became Better after many years of being Best. Advertisements publicising the attractions of the inn have appeared since the end of the war, but they usually end with the old slogan; the man in the street has not yet been invited to patronise the public house for its own sake.

If the sale of beer in bottle for consumption elsewhere should begin to overtake the sale of draught beer inside the public house, the smaller local brewer will face intensified competition from national (or regional) brewers with their advertised brands. There is nothing a brewer likes less than to sell another's beer in his houses, but he cannot exclude interlopers from the neutral territory of home, club, or dance-hall. The local monopoly of the small brewer, formerly maintained

by the high cost of transporting beer, will no longer protect him. For a time it may be preserved by the conservatism of local tastes, but improvements in transport and packaging will in time further increase the penetrative power of advertised brands.

Such competition may lead some small brewers to sell out to the larger; others may attempt to make their houses profitable by turning themselves into inn-keepers and hoteliers owning chains of "free" houses and selling the beer in greatest demand. Beer would then be supplied by a smaller number of specialist brewers who had disposed of their houses (the largest brewers already own few houses or none) or regarded them as an ancillary interest. The industry would then tend to separate into its two parts as the economic conditions in which the licensing system led to their integration faded away; the controversial "tied" house system might in time come to be recognised as a phase arising from the peculiar social and economic conditions of the nineteenth century. But such a division of beer production and distribution would take several decades to develop, particularly because of the brewers' massive investment in bricks and mortar. In the immediate future the marketing problem of the brewer is to adjust his selling methods to the divergent needs of the two products that, past conditions beyond his control have left in his hands. He may prefer to remain a brewer, but fate has made him also an inn-keeper. He is responsible to the nation for passing on to the future a social institution that until now, at least, has had no parallel in the world.

Business Notes

"Paying as we Go" in 1951

"In tackling the economic problems of defence, our policy must be, as far as we can, to pay as we go. Whatever steps are practicable and feasible to achieving this end the Government must and will take. . . ." In an address on the eve of the holiday the Chancellor of the Exchequer thus summed up the nature of the economic task that must be shouldered as the full impact of defence effort makes itself felt. It is to be hoped that he will keep this principle in the very forefront of his mind—and will succeed in impressing it upon his colleagues in the Cabinet—throughout the phase of preparation that is now under way for the next budget. No one knows better than Mr Gaitskell that the principle of "pay as you go" cannot be satisfied—as in former times it was widely supposed to be—merely by ensuring that Government spending, whether for defence or war, is financed by taxation rather than by borrowing, valuable though that precept is as a rule of thumb. The truth is that, whatever its financial policy, a country cannot shuffle off on to the future even a part of its burden of arms outlay unless it runs down its real capital assets or adds to its net indebtedness to other countries. These are processes that Britain dare not allow to proceed very far in this phase of semi-war, especially because the losses under both heads were very great in World War II and have by no means been made good yet. If this kind of strain is not to be resumed now, the whole of the additional defence demand for productive resources will have to be supplied from two sources alone—from an increase in the total volume of production and from a reduction in the volume of resources devoted to supplying the needs of consumers. In other words, except to the extent that productivity rises or hours of work are lengthened, the "real" level of consumption expenditure will have to be reduced—whatever happens to the money value of wages and other personal incomes.

It is a pity that Mr Gaitskell did not put his conclusion in this stark form—for it is only through really blunt speaking from Ministers that a public long fed upon half-truths and airy promises will ever grasp the unpalatable facts sufficiently to permit the Government to carry through the tough disinflationary policy that Mr Gaitskell's unexceptionable principle requires. To pursue the austere formula unswervingly will be difficult, if not actually impracticable, even with the fullest public support—if only because the impact of defence orders on the engineering industries will inevitably cause some diversion of supplies from the export drive or from home investment. The Chancellor remarked that the gap thus caused in exports will have to be filled by increased exports of consumer goods, otherwise the burden of defence will fall in "the wrong place." As for the repercussions upon home investment, he might have added that the "wrong place" here is unquestionably the maintenance and improvement of industrial capital. It is unfortunate, but undoubtedly true, that if investment has to be cut, the "right place" for the axe is social investment. All of which implies that the prescription for the coming budget needs to be one of retrenchment in civil expenditure—as well as in social outlays beyond the budget in its narrower sense.

* * *

Buoyant Exports

The detailed figures for November exports show an even more encouraging picture than the preliminary figures, which were discussed on page 1104 of *The Economist* a fortnight ago. It is now apparent that the month's expansion of exports was shared by a number of industries; a particularly notable contribution was made by textiles. The total value of exports for the month, at £212 million, reached a new peak—and the merit of this achievement is not diminished by the possibility that there may be some recession in December, because of shipping difficulties, the Christmas holidays and the curtailment in overseas shipments of coal, iron and steel. As can be seen from the accompanying table, the rising trend of exports in the past fifteen months is unmistakable, whether they are measured by notional values based on a standard month of 26 working days or by the index of volume (1947 = 100). During the early postwar phase, it will be recalled, it

BRITISH EXPORT DRIVE

			November	212	181
Year	152	139		...	...

* Adjusted to a standard month of 26 working days.

was estimated that Britain's exports would have to reach a volume some 75 per cent higher than in 1938 in order to achieve a balance in Britain's overseas accounts. That target was probably reached in October, and was certainly passed in November, in which months the whole balance of payments on current account was showing a really substantial surplus. The satisfactory state of the account at present, however, affords no guide to the future trend: when diversions of productive effort to defence become really marked, it will be difficult to maintain the present scale of exports; yet the bill for imports is bound to rise steeply when the effects of the increases in raw material prices are fully felt.

The largest contribution to November's rise in exports was made by the machinery group, which rose by £3,000,000 to £30 million—or to a level 29 per cent above the monthly average for 1949 and 18 per cent above that for the third quarter of this year. This increase was spread among nearly all export destinations; the main exception was the Soviet Union, whose receipts of British machinery were smaller even than in recent months. Vehicle exports rose only slightly during the month. The number of cars sent to Australia fell by over 3,000 to 7,331, owing no doubt to recent difficulties in obtaining shipping space; Canada thus became once more Britain's chief market for the month. Exports of iron and steel manufactures were maintained at their high October level, despite the fact that a larger proportion of Britain's output is now destined for the home market. The most welcome feature of November's trade was the buoyancy of textile exports. Cotton, wool and rayon goods all showed substantial increases on October, itself a good month. Cotton exports were £1,600,000 higher at £16,600,000, and wool textiles £700,000 higher at £15,100,000. Most of the other export industries more or less maintained their October levels.

Exports to both the United States and Canada reached record figures during the month. Larger quantities of chemicals, iron and steel manufactures, machinery, non-ferrous metals and rubber went to the United States and larger quantities of machinery, vehicles and woollen and worsted goods went to Canada. In fact the value of machinery exports to Canada was three times its 1949 average, while the value of vehicle exports was the highest since May.

Expedient for Zinc

The expected announcement on zinc allocation, which came as this issue of *The Economist* was going to press, has shown the scheme to be yet another expedient to cope with the bottlenecks that are arising in the supply of raw materials. According to the Minister of Supply, the Government "is anxious to avoid if possible adopting a fully detailed allocation scheme." Instead, the use of zinc, copper and copper alloys is to be prohibited in the manufacture of prescribed less essential goods as from February 1st. The list of prohibited uses is only a provisional one, but it covers a wide range of goods from ash-trays, hinges and flashings to hardware, hollow-ware and conduit tubing. The use of copper in the manufacture of these goods is prohibited merely to prevent its substitution for zinc.

The scheme is expected to reduce the consumption of zinc to the equivalent of about 60 per cent of actual average monthly consumption during the first nine months of this year; but the actual reduction will vary according to the type of zinc used. In January, for example, the consumption of ordinary grades, used mainly for galvanising and also for brass and zinc oxide, will be cut to 50 per cent; electrolytic zinc for rolled zinc products and zinc oxide will be cut to 70 per cent, and for brass to 85 per cent; this last percentage will also operate for the consumption of high purity zinc, used chiefly in die-casting. Allocations will be made by the Ministry each month; the February allocation will not be determined until the latter part of January, and it may differ from the January pattern, though the latter is believed to be the basis for the subsequent allocations. The administration of the scheme is to rest with industry, although a statutory order will be laid before Parliament prohibiting the use of zinc, copper and brass in the specified end-products.

How successful the scheme will be, only experience can tell. If industry co-operates fully in carrying out its intentions, a substantial saving in zinc could be achieved. But a grey market in the metal is likely to develop if manufacturers of those goods on the prohibited list hold any sizeable stocks of zinc or copper. The impact on the housewife and the general public will be delayed and to some extent cushioned by the use of substitute materials. But galvanisers look like having a very lean time next year.

* * *

Sulphur Rationed

The United States Department of Commerce announced last week the allocation of American exports of sulphur for the first quarter of 1951. The total export for the three months has been fixed at 200,000 tons of crude sulphur and 7,500 tons of refined sulphur. Britain is to get 81,465 tons of crude sulphur, or rather more than the very low allotment that British users had feared. France will get 20,125 tons and Germany and Switzerland 3,000 tons each. The British quota represents a cut of between one quarter and one third from the current level of consumption. But there is no guarantee that Britain will receive as large a quantity in the succeeding quarters. Countries such as Australia and New Zealand that are known to have fairly adequate stocks of sulphur at present have been allotted only very small quantities for the first quarter. They will no doubt receive larger quotas when their own stocks have been consumed, and these larger quotas will presumably be at the expense of other importers.

Because of the smaller imports of sulphur, the Board of Trade has decided to regulate the distribution of sulphuric acid, and of crude and processed sulphur as from January 8th. It could hardly have done otherwise. Details of the rationing scheme are expected to be published this weekend. It is difficult to see how British consumption of sulphur can be reduced by, say, 25 per cent—which must be the Board of Trade's minimum target—without causing quite serious dislocation to industry, for sulphur is used very extensively in both its regular form and as sulphuric acid. Unless new deposits are discovered soon, the sulphur shortage might persist for some years. Hence, although the development of alternative methods of producing sulphuric acid would take both time and considerable capital expenditure, it would be wise to initiate it as soon as possible.

Forward Dealing in Stock Markets

A modest, but none the less welcome, advance towards the restoration of prewar facilities for forward dealings on the Stock Exchange was announced this week. As from January 3rd next, subject to confirmation by the Stock Exchange Council, it is proposed to allow dealings for "new time" (that is, dealings for settlement in the next account) during the last Thursday, Friday, Monday and Tuesday of each account. By this overlapping of accounts it is hoped to provide more elastic and freer markets and to overcome the tendency for business to dry up towards the close of each account, when jobbers are more unwilling than usual to commit themselves by making firm dealing prices for any but small lines of securities.

This represents only a partial return to the unrestricted forward dealing facilities that the market enjoyed before the war. Forward dealings were completely suspended during the war when all business was put on a cash basis. Under the existing system, first half of 1949 dealings for "old account" have ceased on the Tuesday a week before settling day, and dealings for "new account" have started on the next day. It may well be asked why this latest concession has been limited to the extension of forward dealing to four days of each account and to one settlement only. If there is a case for freer dealings, that case should be pushed to its logical conclusion. If the reason for the half-hearted character of the Council's decision is a form of appeasement to the political forces that may be counted on to interpret

freer Stock Exchange dealings as "encouraging the casino," it is unlikely to carry any conviction in the intended—and purblind—quarters.

* * *

Spreading the Load Thinner

Three months in which power cuts have been more frequent, heavier and more extensive than last year have made it plain that the original electricity load-spreading plan for this winter (which was conceived and announced last June) was far too optimistic. The Electricity Sub-Committee of the National Joint Advisory Council to the Minister of Labour, which then asked industry to transfer 10 per cent of its power consumption at peak hours to other times of the day, has had second thoughts. Last week it raised the requested proportion to 20 per cent, the same as in 1949. It listed three factors in the worsened situation: a steeper increase in national consumption of electricity during 1950 than in 1949, a colder autumn (which might well have been allowed for), and an unexpectedly large "outage" of generating capacity during periods of peak demand. More breakdowns of plant, to which this third misfortune has largely been due, were expected from the large proportion of equipment that is more than 25 years old; unfortunately more failures occurred, too, among generating stations from five to fifteen years old, which are being overworked, and as "teething troubles" in newly-installed plants.

Load-spreading is settled in detail by regional boards for industry, and since the beginning of the winter several regions have been operating schemes transferring more than 10 per cent of peak consumption to off-peak hours. The new request does not, therefore, mean doubled load-spreading for the whole of industry. Unfortunately, however, it comes too late for any general introduction of special staggered working shifts, and it will present many business men with a pretty problem. The request, even if it can be fully complied with, cannot do more than reduce the frequency and severity of power cuts. The sub-committee hopes, however, that more adequate warning of these may be possible through detailed BBC broadcasts and eventually by shortwave radio (to be tested in Yorkshire with an existing transmitter). The sub-committee also admits that industry is bearing a disproportionate burden in power economy and adds its voice to those recommending "a more drastic approach to the commercial and domestic consumer." Specifically, however, its recommendation on this point comes down to "a forceful and aggressive publicity campaign"; its only other suggestion, that BEA should study the possibility of discriminating between classes of consumer in imposing power cuts, may meet objections upon the grounds of "technical difficulty." Such objections are always aired—along with the deep responsibility of disturbing established patterns of domestic life—as "conclusive" arguments against the possibility of charging something more nearly approaching the economic cost of electricity at the time when it is purchased. Not until the electricity supply industry is converted to such unfashionable economic sense or until enough plant is finally installed to overtake soaring consumption (and it is difficult to say which seems farther off), will these external controls upon power consumption become unnecessary.

* * *

Power on the Premises

The BEA'S continued inability to guarantee its most important customers adequate supplies of power is leading many firms to take renewed interest in generating their own electricity. Two alternative systems are being supported: the installation of small diesel generating sets such as many businesses purchased with the encouragement of the Ministry of Supply in 1947, and introduction of back-pressure or pass-

out turbines into factories using large quantities of steam in their own industrial processes. The first method, its proponents claim, is being frustrated because it is only up to March, 1952, that BEA is willing to waive its restrictions upon using such sets. Some firms in process industries also feel that their schemes for becoming entirely self-supporting and occasionally able to export electricity are meeting a traditional discouragement from the main supply industry.

Both systems, of course, are under as pressing an obligation as is BEA itself to prove economic use of the capital investment involved. Whether diesel sets, with a higher cost per kilowatt of installed capacity than large-scale generating plant, are an economic proposition for factory power generation in any but emergency periods is debatable; and certainly the BEA cannot be expected to welcome systems that involve purchasing no power in off-peak hours and then demanding supplementary assistance during peak hours (at its own uneconomic prices), thus merely accentuating its problems. The installation of turbines in process industries cannot usefully be discussed in general terms, though it may offer a considerably more worthwhile contribution to the general power supply problem; each case, however, can be judged only upon its economic merits—although there is certainly something attractive in the general principle of recovering some of the energy lost yearly by most industries using process steam. Some of the aggregate savings and contributions to national power supplies that engineers in these industries believe could economically be brought about are quite impressive and need the most careful examination —which indeed BEA would probably argue it is giving them. It is probably true in general, however, that the limited quota of Britain's investment programme that can be allotted to electricity supply is most economically used in large-scale generation—and no alternative schemes should be allowed to compete for any of the physical resources involved, such as boiler-making capacity.

* Use of "initial balances" and cumulative accounting position of member countries with the Union from July 1, 1950 to November 30, 1950.

now clearly superseded France as the dominant creditor of the Union. The main debtor is still Germany. During November the deterioration in the German position slowed down considerably, but, as the German credit quota had been exhausted by the end of October, the further additional deficit of $4.2 million incurred in November had to be covered by a gold payment. Since the end of November the additional EPU credit of $120 million has become available to Germany; this, together with the diminution in the German current deficit should, for a time at least, arrest the gold hæmorrhage that has been draining the small German reserve. Among the more unsatisfactory positions is that of the Netherlands, which incurred a fresh deficit of $23.1 million in November and is now approaching gold payment point; this situation provides a telling commentary on the latest difficulties that have arisen for the still incomplete Benelux Union. An interesting and significant movement is the accumulation of a deficit of $27.3 million by Switzerland since July 1, 1950. Switzerland, however, has abstained from using the credit facilities of EPU; it decided instead to settle the whole of its deficit in gold.

It will be seen from the table that debtors have paid some $156 million of gold into EPU, while creditors have withdrawn only $62 million. This disparity is largely explained by the overwhelming debtor position of Germany and by the fact that the surpluses have been distributed over a wide number of countries. When EPU was set up, it was argued that if intra-European trade were characterised by the emergence of one dominant creditor whose claims were distributed over a large number of debtors, EPU would soon run out of gold; it was for this reason that EPU was endowed with special ERP assistance. Until now, however, exactly the opposite position has obtained and the special working fund put at the disposal of EPU has not had to be used. All things considered, the teething troubles of EPU have been less excruciating than they at first seemed likely to be.

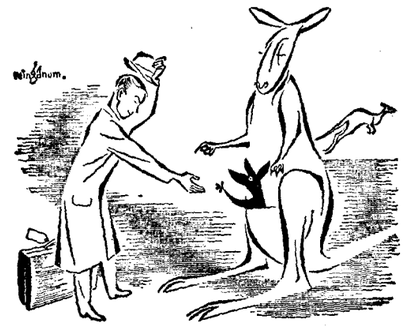
Commercial Conduct Rules

One of the main achievements of the fifth session of the contracting parties of the General Agreement on Tariffs and Trade at Torquay was the approval of a code of standard practices for import and export restrictions and exchange controls. This code was formulated on the assumption that the so-called transitional period contemplated both under the Charter of the International Trade Organisation and of the GATT agreement would prove to be far longer than had previously been expected. It was therefore thought that additional rules should be drawn up to regulate the operation of controls that might be a far more permanent part of the economic scene than was suggested by the ITO Charter or GATT Agreement.



The new code falls under nine headings. The first provides that the grant of an import licence should imply that the necessary foreign exchange will be obtainable by the importer within a reasonable time. The second is that any new or intensified restriction on imports should not apply to goods *en route* paid for or covered by an irrevocable letter of credit. Thirdly, it is suggested that goods definitely ordered at the time of new or intensified restrictions should receive special consideration if their delivery can be completed within a specified period and that such goods should be made available against any quotas or exchange allocation established for that particular type of goods. The fourth point deals with the administrative formalities in connection with the issue of import or export licences or exchange permits. The fifth pleads for a sufficient period, after the fixing of quotas, for particular classes of goods or allocations of exchange, to allow for communication with foreign suppliers and for the conclusion of purchase contracts. The sixth point suggests that when quantitative restrictions on imports are applied, licences should be issued not only to established suppliers but to qualified and financially responsible newcomers. The seventh and eighth points deal with customs formalities and consular legalisation of shipping documents. The ninth and final item in the code suggests that where, owing to exceptional and unforeseen difficulties, a country is unable to provide foreign exchange for imports, payments for goods already imported or licensed for importation should have

Christmas Currency Demands

In the week to last Wednesday the active note circulation increased by another £6.4 million, bringing the total expansion between the mid-November low point and the Christmas peak to no less than £78.1 million. As the accompanying table shows, this is the biggest seasonal demand ever recorded. Too much significance, however, should not be read into the recorded variations from year to year, because of the differing intervals between the Bank return dates and the actual holiday. This year, however, there is a straight comparison with the previous year—on both occasions the post-Christmas return reflected one day's reflux of holiday notes. It will be observed that Christmas demands for notes this year amounted to approximately the same proportion of the total circulation as was customary before the war.

The table shows the post-war trend of the active note circulation in some detail. It will be remembered that between

ACTIVE NOTE CIRCULATION

	November "Low"	Xmas Peak	Post-Xmas "Low"	Christmas Expansion	
	£ mn.	£ mn.	£ mn.	£ mn.	%
1938-39	476·1	504·7	471·9	28·6	6·0
1945-46	1324·6	1379·9	1322·6	55·3	4·2
1946-47	1363·4	1428·2	1364·5	64·8	4·7
1947-48	1340·5	1368·4	1231·6	27·9	2·1
1948-49	1233·1	1296·4	1224·5	63·3	5·1
1949-50	1259·9	1321·9	1245·5	62·0	4·9
1950-51	1279·6	1357·7	...	78·1	6·1

November, 1946, and November, 1948, there was a reflux of no less than £130 million of notes from active circulation, this reflux, which was motivated by a rumour that the existing note issue might be called in to check up on black market activities, almost obliterated the signs of the Christmas demand in 1947. Since November, 1948, the active note issue has been rising at a rate of about £20 million a year, but the seasonal efflux at Christmas, 1948, and Christmas, 1949, was not significantly different from that at Christmas, 1946. It remains to be seen whether the higher efflux this year has been due purely to higher seasonal spending or to a continuation of the general upward trend of the money-holding habits of the people as prices rise and possible scarcities throw their shadows before.

* * *

[illegible]ce in Wheat

[illegible]ble wheat may be seriously reduced [illegible] Although the Canadian crop, [illegible] bushels, is some 95 million bushels [illegible] in 1949-50, the bad weather in the prairie states [illegible]n late summer reduced the quality of the wheat. Canada has now plenty of low-grade wheat for fodder, but much less millable wheat than it had a year ago. And the same may also be true of the Australian crop. The present estimate (a provisional one) shows a yield of only 177½ million bushels against 216½ million bushels last season, but the almost continuous rain in the past two months in New South Wales and Queensland has seriously reduced the quality. Reports suggest that the amount of millable wheat may be sufficient only to cover Australia's domestic consumption and its guaranteed sales under the international wheat agreement. The Australian Wheat Board has, accordingly, suspended offerings of large quantities of wheat in overseas markets.

News from Argentina is no more cheerful. Estimates now put the outturn of the wheat crop at 204 million bushels, compared with 240 million bushels a month or so ago. Warm damp weather has encouraged the spread of rust disease, and the loss is said to be considerable. Argentina is not a signatory of the international agreement and hopes to secure a price appreciably higher than the agreement maximum ($1.80 a bushel). But prices for "non-agreement wheat" have been very slow to respond to smaller supplies. Wheat prices in the United States have risen appreciably in the past few weeks, whereas the rise in "non-agreement wheat" has been imperceptible. Indeed, the Canadian price at $1.95 a bushel is 3 cents lower than in September.

The American market is now conditioned almost entirely by domestic factors, for the current price of wheat even after deduction of the subsidy is well above the maximum agreement price. Of the domestic factors, the most important is the phenomenal rise in the consumption of maize. Last season American farmers consumed well over 3,300 million bushels, compared with a harvest of 3,378 million bushels. This year's maize crop is smaller ; the latest official estimate is 3,105 million bushels. But consumption is expected to reach at least 3,450 million bushels, so that reserve stocks will decline by 200-300 million bushels. Maize has risen much more sharply than wheat in recent months, and the narrowing of the two prices has been sufficient to encourage farmers to switch to wheat as a feed grain, and this demand has strengthened the wheat market.

Elsewhere in the world, importing countries have been reluctant to buy wheat outside the agreement. Stocks held by the larger importers are believed to be adequate to enable them to meet their requirements this season if they purchase only the quantities scheduled under the international agreement. If importers continue to follow this tactic throughout the season, prices for "non-agreement wheat" should not rise unduly. Britain and other countries of Western Europe have bought coarse grains from Russia, and they may have occasion to buy further supplies from Argentina ; if so, pressure on the market even for low-grade Canadian wheat should be lessened. This tactic, however, is a gamble and it deserves to be recognised as such. It can only be successful if next year's grain harvest is large. If any of the main export countries' crops were to fail, Europe might be faced with a grain crisis as serious as that of 1946-47.

* * *

Agreement about Building Incentives

The combined executives of the building unions have agreed to continue the experiment in wage incentives which they and the National Federation of Building Trades Employers initiated three years ago. Under this scheme the employer and unions agree on a target rate of construction at the start of a job (not all types of work are suitable) and a bonus is paid if the rate is exceeded. Both sides agreed that the target should be fixed so that with reasonable effort the men can earn 20 per cent more than standard wage rates; this was hoped to have the dual effect of speeding the rate of building and reducing costs.

The scheme's introduction, however, was strongly opposed by many employers and workers; and that opposition is by no means dead. Sir Harry Selley, president of the Federation of Master Builders, was expressing the opinion of many firms outside his own federation when he said that the decision to continue incentive schemes would merely entice labour from one builder to another. Nor was opinion unanimous in the scheme's favour at the summer meetings of the separate building unions. But after three years' experience there is some evidence that incentives do achieve their object. While it is difficult to separate the various factors which affect costs, the Ministry of Health's housing cost committee believes that where incentive schemes have been used, costs have been reduced by at least £15 a house. The Ministry of Works has also done a pilot survey of 163 contracts and this

survey suggested an average net saving of at least £2 in labour costs for every £5 spent in bonus while the saving in total costs averaged as much as £5.

Last week's announcement on the future of the scheme said that the Federation of Building Trades Employers and the Unions are together setting up regional offices to give advice on working wage incentives. The final decision to introduce incentives or not still rests with the employer; but either side can now ask for the regional organiser's help when the other will not co-operate. This joint machinery represents an attempt to check the growth of an alternative practice which could, if it became widespread, jeopardise the industry's whole wage structure. The essence of incentive bonuses is that extra earnings shall clearly be associated with extra effort, and as Sir Harry Selley said, firms paying incentive schemes attract labour from others in the same region which are not. Sometimes this serves the scheme's purpose by obliging builders to introduce incentives in order to keep their labour. But some employers choose the easier way of paying, unconditionally, a higher hourly wage. If any considerable number of firms should adopt this practice, the unions could not be expected to resist pressure to demand the higher wage for all their members.

* * *

Prospects for Vegetable Oils

World shortages of raw materials have not so far affected the main foodstuffs, though some hoarding has already occurred in certain of them. World supplies of oils and fats, for example, which made a remarkable recovery in 1949, have continued to expand this year and supplies still seem fairly adequate. The world total for 1950 has been provisionally estimated at 22½ million tons compared with 21¼ million tons in 1949 and 21½ million tons in the five years immediately prior to the outbreak of war. Meanwhile, world population has increased by at least 10 per cent so that supplies per head of population are still well below the pre-war level. World exports, though continuing to expand, are less than 80 per cent of the 1934-38 average.

The improvement in oils and fats is largely attributable to a greater output of vegetable oils; the output of animal and marine products is still much smaller than before the war. Hence Britain was able to discard soap rationing last September but has had to retain the margarine ration until supplies of butter increase. But the prospects of larger supplies of vegetable oils in 1951 do not look promising at first sight. Asia accounts for nearly one half of the world's exports. According to a survey prepared by the Commonwealth Economic Committee,* China is still the world's largest producer of vegetable oils, though it is by no means the world's largest exporter. Its main exports in recent years have been tung oil, soya beans, cottonseed and sesame. Before the war Manchuria was an important source of soya

beans and even this year it has exported appreciable tonnages. The Philippines, Indonesia, Malaya, Ceylon, India and Pakistan are all big exporters of vegetable oils, though the Philippines was the only country whose shipments in 1949 exceeded their prewar level.

If trade with China and Manchuria is interrupted next year, world exports of tung oil and soya beans will almost certainly be reduced. China provides almost the whole of the world's exports of tung oil, of which the United States is the largest importer and Britain second. Tung oil is used

Source: Commonwealth Economic Committee.

chiefly in the manufacture of paints and varnish and in the production of linoleum and oilcloths and as such could be replaced by linseed—if adequate supplies of the latter were available. Manchuria is still a large exporter of soya beans, though since the war the United States has developed an important export trade. If Manchurian supplies were to be cut off, the United States could probably bridge the gap in world exports, but it would have to extend its production even more than it has done in recent years and that will be no easy task. Supplies of cottonseed and sesame would also be reduced though not to any appreciable extent.

A serious shortage of vegetable oils would not occur unless Malaya and Indonesia were affected. Then, supplies of more widely used oils (coconut, palm and palm kernel) would be reduced. These threats may not materialise. But even if the present atmosphere of "near-war" continues, exporting countries next year may be less anxious to sell their output.

The Production Record

In contemplating the limitations that before long raw material shortages are likely to impose on industrial output, there remains the ironical consolation that the downturn will come from a record high level. Industrial production in [illegible] by the London and Cambridge index [illegible] in the Government's interim index, was higher than ever before, equalling or surpassing the previous record in March this year. On a working-day basis, both the "A" and "B" series of the London and Cambridge index rose by three points during the month and were a point higher than in July, the former peak; compared with October, 1949, these indices showed rises of eight and nine points respectively. Once again the outstanding performance among industries for which individual figures are

available for October was in the production of motors, cycles and aircraft, which rose 31 points to a record of 215, twice the prewar average and some 16 per cent better than a year ago. Chemicals and allied trades reached a peak of 139, which is a rise of only five points on the year but also represents a volume of production twice the prewar level. Both industries are likely to encounter some difficulties with raw materials early next year, motors perhaps more than chemicals; this prospect emphasises once more the extent to which Britain's production record, largely dependent upon exceptional performance in a prized few industries, is vulnerable to the abnormal demands and dislocations brought about by accelerated rearmament programmes here and elsewhere.

Note: Monthly prices taken at last day of the month except those for wool which are monthly averages. *December 27th.

minor materials such as quicksilver, shellac and tungsten. Tin slipped back from the record price reached on December 19th, and is now £100 a ton cheaper. In contrast, rubber has been rising—despite reports that world production figures for 1950 will show that a new record level was attained and despite a sharp decline in American civilian consumption in November following the U.S. Government's order limiting its use. The grey market prices for copper and zinc are still well above the official quotation shown in the table, but during the past week the Canadian price for electrolytic copper has eased slightly, from 26.00 cents a lb. to 25.95 cents.

The jute and sisal markets have also remained firm. Jute, at £120 a ton, is now back to its peak of last June and the Board of Trade has at last had to raise its selling price of raw jute very sharply, by £49 to £162 10s. a ton. Sisal, it may be noted, is nearly 50 per cent dearer than in June and some 75 per cent dearer than in December, 1949. The recovery in the Cuban sugar market in the second half of December is particularly significant, since it has occurred despite the reports that there will be a record world production in 1951. The Ministry of Food has agreed to pay more next year for sugar purchased from Commonwealth producers. The new price has been fixed at £32 17s. 6d. a ton f.o.b. compared with £30 10s. a ton in 1950.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

ANNUAL GENERAL MEETING

The twenty-fifth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held on Thursday, December 28, 1950, at 29, Gracechurch Street, London, E.C.3.

Mr Julian Stanley Crossley (the chairman) presided

The Secretary, Mr C. F. S. Pringle, read the notice convening the meeting and the auditors' report to the stockholders.

With the concurrence of the stockholders [illegible] the report and accounts and statement by the chairman, which has been previously circulated, were taken as read.

The chairman referred with regret to the death of Mr W. O. Stevenson, who had been associated with the bank since its formation in 1925. He spoke of the great loss the whole Barclay Group had suffered, and of how highly Mr Stevenson's wise judgment had been valued.

He referred also to the retirement of Mr E. L. Jackson, formerly a vice-chairman of the board and chairman of the South African board, and in expressing his appreciation of Mr Jackson's long and valuable services said how glad he was that these services would still be available, since Mr Jackson remained a member of the South African board

The chairman welcomed Mr C. Fitzherbert and Mr R. E. Fleming, M.C., who together with Mr A. S. Aiken, Mr A. T. Dudley, M.C., and Mr H. F. Oppenheimer had joined the board since the last meeting.

Referring to the fact that Lord Clarendon and Sir William Clark were to retire at the conclusion of the meeting, the chairman thanked them for their services over many years. He also paid tribute to Mr C. L. Dalziel, Mr A. B. Gillett and Sir Ernest Oppenheimer, who had retired from the board earlier in the year, and spoke of the benefit the bank had derived from their knowledge and experience.

The chairman also said that Mr O. Gordon, the chairman of the Rhodesian local board, would be retiring before the next annual meeting, and would be succeeded by Mr S. M. Pechey, at present an assistant general manager in South Africa. He expressed the bank's appreciation of Mr Gordon's long and valued service which, in various capacities, had occupied 49 years.

The chairman then moved the adoption of the report of the directors and the statement of accounts, and the payment of a final dividend of 4 per cent. actual on the "A" stock and "B" shares, less income tax at the standard rate of 9s. in the £ in each case.

The motion was seconded by Mr A. C. Barnes, deputy chairman, and carried.

The retiring directors, the Hon. G. C. Gibbs, C.M.G., Mr A. S. Aiken, Mr A. T. Dudley, M.C., Mr C. Fitzherbert, Mr R. E. Fleming, M.C., and Mr H. F. Oppenheimer, were re-elected.

On the motion of Sir Frank Newson-Smith, Bart., seconded by Mr Joseph Nissim, the auditors, Messrs Deloitte, Plender, Griffiths and Co., Price, Waterhouse and Co., Peat, Marwick, Mitchell and Co., and Cooper Brothers and Co., were reappointed.

A vote of thanks to the staff, proposed by Mr R. W. Foot, O.B.E., M.C. (a director), and seconded by Lord Knollys, K.C.M.G., M.B.E., D.F.C., was carried unanimously, and responded to by Mr R. D. Smith, a [illegible]

[illegible]anks to the chairman for pre- meeting was proposed by Mr [illegible]es, and was unanimously

WILLOWBROOK, LIMITED

FACTORS AFFECTING EARNINGS

The fifteenth annual general meeting of Willowbrook, Limited, was held on December 15th at Derby Road, Loughborough. In the unavoidable absence of the chairman, Mr A. H. Johnson, O.B.E., Mr W. Sutton (managing director) presided.

The chairman, in the course of his speech, said :

In common with other builders of bus and coach bodies, we have to report slightly lower earnings for the past year, brought about by the Government freeze of home market purchasing power in motor transport generally, and also by the unprecedented volume of changes in permitted dimensions and design of passenger-carrying vehicles.

The consolidated accounts show that our net profit for the year stands at £42,922, which, added to the amount carried forward from last year's accounts, plus £446 tax reserve not required, leaves us with a balance available of £67,806.

Of this sum, provision for taxation takes	£30,642
Interim dividend of 6 per cent. paid in March last accounted for	£5,973
The proposed dividend of 6½ per cent. will take	£6,471
Leaving a balance to carry forward of	£24,720

Our stock figure is higher occasioned by world prices and the necessity of stockpiling some of the more difficult of raw materials.

Affairs generally, nationally in particular, make it unwise to predict the course of future trading, but we have every reason to believe that with our usual most admirable co-operation between the employees, staff and management full advantage will be taken of all opportunities available.

The report and accounts were adopted.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

WIDESPREAD ACTIVITIES

The annual general meeting of the Birmingham Small Arms Company, Limited, was held on December 21st at Birmingham.

Sir Bernard D. F. Docker, K.B.E. (the chairman), said that the net profit for the year was £1,125,859 as compared with £833,243 a year ago, and there was a total net profit from all sources, after providing for taxation, of £604,606 against £500,907, which gave a total available for allocation of £876,268.

He was convinced that there was a market for Daimler cars in many parts of the world, where individuality is appreciated when coupled with reliability and a high grade of performance, and [illegible] spent considerable time in endeavouring to develop the trade both in America and the Continent of Europe. At the Small Heath Works they made shot guns, air guns, match rifles and sporting rifles which, at the comparatively modest prices at which they were sold, were meeting with a very encouraging demand. They made cycles and they exported them to many countries. They were the largest motor cycle manufacturers in the world and had been able to take a full share in earning dollars.

It seemed likely that at the appropriate time the Corporation formed in accordance with the Iron and Steel Act might exercise the option to acquire the steel interests of the Group. In that event they would lose from the Group one of the most outstanding contributors in the country to the development and production of special steels. He looked with alarm on the passing of that fine and progressive business into the hands of a National Board.

The report was adopted and the ordinary dividend of 10 per cent. was approved.
