consideration. If the intervention of the free nations brings the Korean episode to a speedy and successful end, then, clearly, political necessity and military advantage will have gone hand in hand. But if the Korean campaign is lost or bogs down in a long-drawn-out struggle, the commitment of a large part of the free nations' military reserves to one particular spot might positively invite Communist adventures in other areas. It is true that the Russians have so far adopted a non-committal attitude over Korea, contenting themselves with denunciations of "American aggression" and of the "illegality" of the Security Council's action. But the possibility of them increasing their support to North Korea or intensifying their pressure on some other weak spot along the Soviet periphery cannot be ruled out. They enjoy, after all, a central position and can strike in many directions without actually committing Soviet troops. A western intervention in Korea does not automatically put a stop to these dangerous possibilities. It is only a first step. The crucial question now is to determine how the west's will to check aggression—which the Korean action has made plain—can be translated into the ability to check aggression, which has yet to be proved.

The Communists will become convinced that aggression does not pay on two conditions only. The first is that local coups

can be checked by the speedy and successful application of western force. The second is that these local interventions do not so weaken and disorganise the nations of the free world that they are unprepared for the general conflict that would be unleashed if the Russians, in their folly, were to commit direct aggression and launch an invasion not by their satellites but by their own troops. One has only to set out these conditions of successful deterrence to realise how very far the free nations are from being able to fulfil them. Their level of armament, degree of preparedness and readiness for mobilisation are such that even relatively small police actions place a strain upon their military resources. If the strain were repeated or multiplied, their interventions might become progressively less effective. Unless, therefore, they are prepared to reconsider at once and drastically the whole scale of their military effort, it is impossible to see how the Korean intervention can fulfil its real purpose—which is not, heaven knows, primarily to restore an unstable little state below the 38th parallel but to serve notice on the "Communist half" that aggression does not pay.

*

There is no denying that a policy of increased armaments is probably the most unpalatable prospect the democracies can be asked to face. It is a tremendous irony of the postwar world that the Russians, whose own disarmament has been partial, who have armed Far Eastern Communism and who in Europe have embarked on the most hazardous of all military policies—the rearmament of Germany—can still pose as peace-lovers. It is a still greater irony that they can, while remaining armed themselves, brand as warmongers the democracies, whose sense of distaste and repulsion at the grim necessity of rearmament can hardly be exaggerated. The inhibitions are not simply psychological. They do not only spring from the demand for peace which free speaking and freely governed peoples can make vocal and effective. The economic difficulties are immense. In the 1930s both Britain and the United States had unused resources which could be mobilised for rearmament. Today, however, the decision to expand the armament of the free world involves a real abandonment of other social expenditures. In fully employed economies, whose tendency is towards inflation, the choice of guns involves less butter. The necessities of defence must begin to touch a most sensitive spot—the pocket of the electorate.

The problem of speed is not much less difficult than the problem of scale. The policies of the Atlantic powers are at the moment geared to the expectation of maximum effort in two or three years' time. The aim is complete defence by 1953 or 1954. The lesson of Korea is, surely, that the defence that is available within six months, or six days, has far greater value than possibly better and more technically efficient defence that would nevertheless not be ready for another two years. The time-tables of military planning have to be given the urgency of near-war. Yet if there is one lesson more than another taught by the experience of 1939, it is that nothing is more difficult to create than genuine urgency when the "shooting war" is not actually on the doorstep.

The gravest and most unpalatable of all the decisions involved in western defence is, however, the question of the atom bomb. It is here that the west feels most deeply its pacific convictions, and here, too, that the Communists, with their petitions to outlaw the bomb, have used their peace propaganda to greatest effect. Nevertheless, as Mr Churchill reminded the House of Commons, the free nations must know that, with no effective strategic line in Europe, and with the Korean adventure to remind them that Communists, like nature, abhor a vacuum, the atom bomb is the basis of their security. If, out of moral conviction and pacific intent, they abandon this weapon in advance and virtually inform the Russians that it will in no circumstances be used, they only reveal their own strategic nakedness. Fuller mobilisation of western military resources and the speeding-up of the western military time-table may create within a reasonable time a situation in which the vast frontiers of the free world can be held without reliance upon the deterrent effects of the atom bomb. But it would be blindness to believe that such is the position today.

These difficulties are not stressed in order to hint that the task of effective defence is beyond the democracies' capacities. On the contrary, the Korean incident may well provide the impetus necessary to translate the palpable need for greater military preparedness into terms of actual policy. Tragic as was the start of the incident, discouraging as the opening phases have been, the campaign can be the turning-point in the western powers' ability to meet the challenge presented by the Communist decision to use force. The issues that must now be faced have been inherent in western policy ever since the attempt to contain Communist expansion became the official strategy of the west; but so far it has been possible to postpone or delay or simply gloss over the really difficult questions of scale and expense and speed. Now, however, the Korean episode has come in time to give the democracies that stimulus to urgency and inventiveness without which their policy of containment would always have been found wanting. Who knows how long, without the jolt of Korea, the defence of the west might have been allowed to drag on in relative ineffectiveness? Who knows how long governments might not have hesitated, for fear of their own electorates? Now the warning has been given in terms which no one will misunderstand.

*

To say so much and to insist upon the overwhelming need for greater military realism in the west is not, however, to suggest that war is inevitable. It cannot be repeated too often that the overriding aim of western diplomacy is to find a *modus vivendi* with Russia, to achieve an accommodation of interests and even, if necessary, to make some sort of division of the world into spheres of interest a workable proposition. But the case of Korea has proved all over again what should have been realised already—that whatever line is fixed can be maintained only if the western powers put force behind it. Last year's withdrawal of American troops from South Korea was a direct test of the possibility of holding a line with little or no military backing. The Communists have seen fit to answer the question in the most unequivocal form—that of aggression. Henceforth, the way to a negotiated peace—which is and must be the main aim of the west—can lie only through strength. Korea has shown that there is no other way.

162861

Home Rule

IT is easy to forget that the British are not a homogeneous race and that the island which they inhabit is one political entity only because the political independence of two of its three races has been extinguished. For many years it was assumed that—whatever trouble the Irish might create—the political status of Wales had been irrevocably settled in the Middle Ages, and that the relation of Scotland and England had been fixed forever by the Act of Union. A generation ago this view went almost unchallenged except by a few romantic idealists such as Cunninghame Graham, for Macaulay had educated public opinion to believe in the perfection of existing constitutional arrangements, and in any case the government at Westminster dealt very gently with the liberties of both local institutions and of individuals.

But with the growth of centralised planning and the enormous expansion of the powers of the departments in Whitehall, there has been a growing demand in both Scotland and Wales for a greater measure of local autonomy than is granted at present. Last Saturday Lady Megan Lloyd George, the deputy leader of the Liberal Party, moved at a meeting in Llandrindod Wells, which included many of the leading figures in Welsh life, a resolution for parliamentary self-government for Wales. In Scotland the demand for home rule has since the war taken the form of support for the Scottish Convention, an ably led body which seeks the limited aim of a Scottish parliament with powers over domestic subjects. This organisation has so far secured about a million and a quarter signatures, or just under half the voting turnout in Scotland at the last general election. This week the appointment of a departmental committee under the chairmanship of Lord Catto, the late Governor of the Bank of England, to study Anglo-Scottish statistics has been announced. It is to be presumed that this committee will provide the groundwork for an official answer to the contention of the Scottish Convention that Scotland contributes more to the revenue of the United Kingdom than it receives back in benefits and services.

*

The record of official action during the past few years shows that the Government has responded, up to a point, to the pressure of Scottish and Welsh opinion for greater freedom and administrative autonomy. Since the end of the war an annual White Paper on Welsh affairs has been published. In 1948 the Government, though rejecting the proposal to create a Secretary of State for Wales, set up an advisory council for Wales and Monmouthshire. The concessions to Scottish national pride have been more extensive. Just before the war the administrative centre of the Scottish Office was removed from London to Edinburgh. In 1948 the Government strengthened the position of the Scottish Grand Committee of the House of Commons by enabling it to debate Scottish Bills in principle. But any proposals for effective home rule—that is, for the creation of a Scottish or Welsh parliament with control over domestic policy and expenditure—still meets with stony opposition in Whitehall.

It would be difficult to say exactly what it is that inspires the present demand in Wales and in Scotland for a greater measure of political freedom. National pride, the memory of old achievements and ancient wrongs, the wish to preserve Celtic culture, the desire to arrest London's slow drain of all vitality and talent, or a sheer anarchic dislike of strong government—all these play an important part in the minds of the leaders of the movements. But it is fair to say that the support which they have begun to acquire among ordinary people is due to the growing centralisation of all power and decision in the hands of the Government of the United Kingdom and its servants. The utilitarian arguments for home rule are becoming more cogent in Scotland and Wales as it becomes increasingly difficult to exercise any local initiative or take any important action without reference to Whitehall.

Thus what the leaders of the Welsh and Scottish home rule movements now demand is the very thing which the officials of Whitehall have persuaded generations of politicians to oppose—the hiving off of control from the central to local governments. To suggest that the Civil Service consciously sees its power threatened by demands for home rule, and consciously uses its influence with Ministers to oppose it, would be to paint too melodramatic a picture. The fact nevertheless remains that politicians, and whole parties, who are sympathetic to home rule when in opposition, find that it is not expedient to do anything about it when they are in office. Just what the arguments are that are whispered so potently in Whitehall, but which cannot be repeated in public, it is really very difficult to say. One suspects that it is not so much deliberate power-seeking as misplaced paternalism, a reflection of the growing belief that people cannot be trusted to decide things for themselves. They may be right; Scottish and Welsh governments might make a lot of mistakes. But what the official mind does not realise is that this is not by a long chalk a decisive argument. The Scots and the Welsh have a right to govern themselves foolishly if they wish, and if it will do no great harm to their neighbours.

Private and public opinion in England, as distinct from the official view, so far as it can be ascertained does not seem to share this hostility to the principle of home rule. Most of the factors that bedevilled and long delayed the grant of home rule to Ireland do not apply to either Scotland or Wales; and as for those that still exist, the Irish case has taught the English their lesson. Ireland has also proved, in the constitution of Northern Ireland, that it is perfectly possible to devise a system that provides substantial home rule without disrupting the basic structure of the United Kingdom. To the proposition that the Scots and the Welsh, if they can prove themselves reasonably united in the demand, should have home rule on the Northern Ireland pattern, there would probably be an overwhelming majority of assent among the English public.

The essential proviso, of course, is that the transfer of powers should not be such as to endanger the safety of the realm, to weaken it in its external relationships or to undermine its wealth or welfare. All these, however, are safeguarded under the constitution of Northern Ireland, where the writ of the United Kingdom still

runs in matters of foreign affairs, defence, foreign trade, taxation, finance and currency, the Post Office, civil aviation and the like. It does not follow that the Northern Ireland solution could be applied without amendment to the cases of Scotland and Wales. The leaders of the Scottish Convention have made it clear that they want more fiscal autonomy than Northern Ireland has. Their proposal is that Scotland should keep all taxes raised within its borders except customs and excise. This certainly goes too far; there is not a federal government in the world that has found it possible to get on without direct taxation. But it might be that some arrangement could be made that would leave rather more freedom of action to Edinburgh than is now left to Belfast.

Another difficulty, and possibly a more intractable one, would arise out of the nationalisation of industry, which was hardly a serious question in 1921 when Northern Ireland was constituted. To treat Great Britain as three separate areas for nationalisation purposes would obviously curtail the economies of large-scale organisation and centralised administration which are part of the putative purpose of nationalisation. It would be extremely awkward if the government of Wales were to adopt the National Coal Board's policy and sell its anthracite to England at a higher price than it charged its own consumers. Yet at the same time it is centralisation of decision in the nationalised industries which has largely contributed to the rising desire for autonomy and no solution which left in London the absolute control of whole industries would satisfy opinion in Scotland or Wales.

This discussion has bracketed together the questions of home rule for Scotland and for Wales. This is not to imply that the two questions can in fact be treated alike. On almost every score Scotland has a claim to more home rule than Wales. Scotland is a richer country with a more balanced economy and it has much better prospects of becoming a viable economic unit than has Wales. Scotland has reasonably good internal rail and road communications whereas direct communication between North and South Wales is notoriously difficult.

Scotland has a capital city whereas Wales can find no common centre within its own borders. The framework of Scottish government exists in the departments of the Scottish Office, whereas a Welsh government would have to be created from nothing. Finally, Scotland has its own highly developed legal system. Much wider powers could probably be granted to a Scottish than to a Welsh government.

*

The only sensible course for the English to adopt is to say that if Scotland and Wales really want a Northern Ireland status, plus or minus a little, they should have it. But this is not by any means the same thing as saying that they would be wise to want it. Subject to what Lord Catto's committee may find, it seems overwhelmingly probable that the Scots and the Welsh would be economic losers from any subdivision of the United Kingdom. Individually, anything that put barriers across the road to London would injure the careers of their ambitious sons and daughters. Indeed, there are some who argue that the reserves of talent and ability in Scotland (and even more so in Wales) are too small to enable them to staff legislatures and administrations of their own and still maintain their representation at Westminster. But the English will be very foolish if they try to tell the Scots and the Welsh where their interest lies.

In one sense the contemporary desire for home rule is a protest against the power of any government in a planned economy. Whitehall is as exasperating and callous towards Manchester or Lincolnshire as towards Scotland or Wales. The Scots and the Welsh are merely fortunate enough to possess valid claims to home rule which Cornwall, Gloucestershire or Yorkshire do not. But in an age when the influence of the citizen upon his Government is rapidly diminishing, any attempt to reverse the process deserves the support of the private citizen against his official masters. Who knows, home rule for Scotland and Wales might even encourage someone to demand a little freedom for the patient English.

Leasehold Reform

THE climate of opinion over the respective rights of landlord and tenant has its own slow rhythm of change. A century ago the tenant was expected to be content with what rights he could extract from a landlord in the legal contract called the lease. Today, the tenant expects something more than his contractual rights; he looks for statutory protection as well. It is with this aspect of his position that the Jenkins Committee on Leaseholds, whose final report was published this week (Cmd. 7982) were concerned.

In the broadest sense, the term lease can cover a great many varieties of agreement for the tenancy of real property. But the interest and the problems of the subject arise in connection with the system of long leases, which is almost peculiar to English law, and is much more prevalent in some parts of the country—such as South Wales, Merseyside and London—than in others. To the layman (though the lawyer might demur), leasehold is a system whereby a man may be the builder or owner of a building but not of the land on which it stands. Under a building lease, land will be leased for a long period, usually 99 years, on the condition that any buildings erected on it shall revert to the freeholder at the end of the lease. Anyone who holds a lease at the end of its life may find "his" house taken away from him, or at least he will have to pay heavily for the privilege of retaining it. This consequence was, of course, fully foreseen at the start; but that does not prevent the tenant in occupation, especially when he is a poor and ignorant man, from feeling badly used when the time comes for the lease to fall in. Hence the political importance of the problem.

The Jenkins Committee (of which Lord Uthwatt was chairman until his death) were not called upon to advise whether the system of leasehold should be abolished. Had they been, there is little doubt that they would have reported against any such proposal. The chief defect of the system is that in the last twenty or thirty years of a long lease's life, there is progressively less inducement for either freeholder or tenant to spend money on improvements of the property, or even on necessary repairs. There may be and usually is a legal obligation on the tenant to keep the property "in good and tenantable repair," but he has no interest in performing his covenant and legal obligations are poor substitutes for practical inducements. But in spite of this defect, there can be little doubt that leasehold is a useful form of tenure. In the past, it has enabled development to proceed with a minimum requirement of capital; and its utility in the present age is perhaps best demonstrated by the fact that both the coalition government in 1944 and the Labour government in 1947, in their respective Planning Acts, laid it down that land compulsorily acquired by local authorities should be developed on this system. Leasehold was the basis of development in Letchworth and Welwyn and is to be in each New Town.

*

The practical question, therefore, is not whether leasehold should continue but what can be done to remedy its defects. The questions to which the Jenkins Committee addressed themselves fall under three heads, of which two do not require much discussion.

The first, and the one on which most agreement was reached, relates to the position of the tenant (using that word in its broadest sense) with regard to repairs and improvements he may have made. The Committee recommends no basic change in the existing position that the liabilities of both landlord and tenant with regard to repairs should be regulated by the agreement originally made between them, subject to the statutory liability for repair thrown on the owner of small houses by the Housing Acts of 1936. As for improvements, the Committee would extend to all kinds of tenancies the right of a tenant to be compensated for improvements he has made to the premises (at the moment, only tenants of business premises have a somewhat restricted right to compensation under the Landlord and Tenant Act, 1927). With that recommendation few would disagree. The real controversy starts with the other two questions.

The second question relates to the rights of leaseholders of business premises. A tenant who carries on a business or profession in rented premises may create that real but intangible attribute, goodwill. That goodwill is of obvious value to the tenant and is a strong link between him and a particular site. It may also be of value to the landlord, since, when the tenant's lease ends, he may be able to let the premises more easily or more advantageously to another man in the same trade. Is it right that the tenant should forfeit that goodwill simply because his lease expires? Parliament answered that question in the negative as long ago as 1927. What the Committee had to consider was whether the 1927 Landlord and Tenant Act is adequate. They consider that it is not. It does not cover the professional man, only the trader. It enables the landlord to defeat a claim for the renewal of a lease by an offer of compensation, yet the basis on which that compensation is assessed is not wholly satisfactory. In general, the majority of the Committee would not give the business or professional tenant automatic security of tenure, but they would strengthen his right to demand a renewal at a reasonable rent and leave it to the landlord to establish his case to the contrary. On the other hand they agree that the landlord should be free to regain possession of his property if he wishes himself to occupy it, if he intends to rebuild or if he is prepared to buy out the tenant at a fair compensation. The majority report would also leave the county court as the tribunal for settling rights and claims.

These proposals would probably secure general support if it were not for the curious history of the Committee's own handling of the problem. An interim report, published last year when Lord Uthwatt was still chairman of the committee, made proposals, designed to cover the temporary conditions of a great shortage of business premises, which virtually amounted to giving the tenant an automatic right of renewal. Now the permanent proposals restore some of the landlord's rights, and the Committee's new chairman, Lord Justice Jenkins, takes the unusual course of presenting a criticism of his Committee's interim report. This suggests a change of mind, and the main minority report, signed by two members of the Labour Party, would make the interim proposals permanent. Nevertheless, to those who do not automatically take sides for all tenants against all landlords, the majority report appears to do a balance of justice to both parties.

*

The main clash of opinion comes on the third question. This is the vexed question of whether the residential leaseholder shall have the right to buy the freehold compulsorily (which is known in legal jargon as leasehold enfranchisement) or, failing that, whether he shall have some right to demand a renewal of the lease on expiry. Of the ten members of the Committee, the two Labour dissentients plump for leasehold enfranchisement (perhaps a little illogically, since their proposals would lead, not to public ownership, but

Head Office

ROYAL EXCHANGE
ASSURANCE: INCORPORATED IN 1720

rather to that property-owning democracy so powerfully advocated by Conservatives). Failing this, Mr Hale and Mr Ungoed Thomas join with three of their colleagues (who might be called the Liberal section of the Committee) to advocate giving to the tenant the right of renewal—though at a fair market rental, which in almost every case would be more than he was paying before, and with safeguards for the landlord who wants a property for purposes other than investment. The remaining five members, including the chairman, content themselves with saying that an occupying tenant should have the first refusal of the freehold in cases where the landlord intends to sell, though they are unable to think of any means by which this right of first refusal could be enforced. (It should be added that all three sections of the Committee agree on a minor proposal to extend the protection of the Rent Acts to leasehold properties which, by an anomaly, are now excluded from it.)

There is thus plenty of variety in the counsel that is offered to a Goverment which professes itself anxious to legislate on the subject. It should be noted that none of the three sections of the Committee advises (except for the period during which the Rent Acts are in force) allowing a tenant whose lease expires to go on occupying the house at the same rent—which is the only thing that would satisfy some of the critics of the leasehold system. The minority report, which is the most favourable to the tenant, would involve him in raising a sum of capital to buy the freehold. Nor is there any real reason why the tenant, for all his sense of grievance, should be given any further relief. It is doubtless true that landlords often make a good thing out of reversions. It may even be wrong that they should do so, though the existence of value in the reversion only shows that the landlord has been content in the past with less than the full value of his property. But if anyone else is to share in the profit, why should it be the particular tenant who happens to occupy this particular property and who has already (by definition) enjoyed the privilege of paying less than the full rent for it?

To say this is not to choose between the three differing proposals put forward by the Committee. Many people will feel a great deal of instinctive sympathy with the two dissentients. Land should never have been allowed to become private property, and though that original mistake cannot now justly be remedied by penalising landlords, there is something socially distasteful in pure landlordism, in the ownership of mere space. Many more people would agree with Mr Hale and Mr Ungoed Thomas if it were not for the unctuous assumption of moral superiority over their colleagues that they affect as the sole protectors of the poor. In fact, they seem to be more eager to hurt the landlord than to help the tenant, for most of the poor tenants would strongly dislike a system that compelled them to become capitalists—and capitalist debtors at that. Instinct apart, the best course would seem to be that stated by the middle section of the Committee, that of giving tenants a certain qualified right of renewal, hedged with safeguards for the legitimate interests of the freeholder and against mere speculation in "fag-end" leases. It is this course that the Government will be well advised to adopt.

Bad Weather for Ecosoc

THE Economic and Social Council has started its eleventh session at Geneva at a moment that is not propitious. The booming of the guns in Korea is scarcely the background against which to discuss the creation of full employment by international means or the formulation of an international Covenant of Human Rights that shall be legally binding.

The very unsuitability of the moment of meeting brings to the fore a thought that has been latent for some time past: Is it appropriate that this potentially important body should meet only at two fixed dates per annum? Ought it not, like its companion the Security Council, to be on call when need arises, and to need to meet only when circumstances are such as to promote balanced thinking? There are immense advantages in handling economic as well as political topics through a body that is available week in and week out. As matters stand, sessions of the Economic and Social Council have become, for delegates, a nightmare struggle, twice yearly, with a fifty-point agenda that entails attending meetings all day, with only the night for attempting to master the mountain of documentation that awaits them upon arrival at Lake Success or Geneva. This is not the basis on which work on technical subjects can best be done. As its result, the Council tends simply to go through the motions that are expected of an international meeting with a crowded agenda. These are the mere pushing of this item forward and that item back to other bodies. It enjoys neither the time nor the atmosphere in which to improve the shape of the propositions that come before it. A body that consists of permanent delegations stands a better chance of dealing with first topics first, if only because it can turn to each at a suitable interval after the documentation upon it has become available. If it can choose its moment of meeting, it is more likely to render projects practicable. At the moment, these thoughts are academic and utopian. But if the United Nations survives its present testing time, there is surely a case for giving the world's economic and social problems the same chance of day-to-day handling as is afforded to its political arrangements.

Given the present machinery and the state of war in Korea, this summer's meeting is unlikely to be memorable. The hope that prevailed a few weeks ago that the session would provide the occasion for bringing about China's representation by the Peking Government has been dashed by North Korea's aggression. The Russians, Czechs and Poles, who are the eastern *bloc* members of the Council, are not attending it. Some of the more interesting items on the colossal agenda that faces the remaining fifteen delegates therefore lose much of their point. It is to play Hamlet without the prince, for instance, to inquire into forced labour when the principal offender is not there to brand himself by publicly refusing to let international inquirers in. The International Labour Office and the American Federation of Labour are for valid reasons anxious to conduct the inquiry anyway.

Forced labour apart, the agenda for the next six weeks promises only three developments of real interest. These are the methods by which the Council decides to pursue the report of the five experts whom it commissioned to frame recommendations on "National and International Measures for Full Employment"; the recommendations that it decides to make on the methods of financing economic development in underdeveloped countries; and the future which it proposes for the woolly "First Covenant on Human Rights" that has been forwarded to it, with reservations, by its Human Rights Commission.

The Full Employment Report, which was issued at the beginning of the year, was reviewed at length in *The Economist* of January 28th last. Since then, the states members of the Council have been asked to study the views of the interested non-governmental organisations and the specialised agencies upon it. It was simply a working paper. They are supposed to come to the present meeting primed with their considered views upon it and—if they do not like its proposals—with their own alternatives for solving the problems dealt with. The economists have expressed their view of the way in which the ups and downs of demand can be ironed out. It is now the turn of practical politicians—the representatives of governments with congresses to manage and voters to consider—to say which of such devices they are ready to try upon their touchy constituents.

*

The items which cover help with the economic development of under-developed areas—the topic that is usually labelled "Point Four"—are divided into two sections, one on technical assistance, the other on methods of financing the programme. Technical assistance is already under way. A progress report is to be made. But this will get a powerful fillip from the fact that, of the $35 million that has lately been voted by Congress for Point Four purposes, $20 million is to be administered by United Nations bodies. The pump is therefore primed to an extent that will multiply United Nations activity many times over. It remains to be seen whether the international servants who run the activities will be hedged round with resolutions limiting the ways in which they can spend the money, or whether they can be left some latitude to allocate it as between hiring experts and buying apparatus. The proportion of these two requirements varies so enormously from one underdeveloped country to another that overall resolutions tend to lessen the chances of spending the available money to the best advantage.

The advancement of methods of financing development is a more complicated topic. Some idea of the extent of the funds needed if any mark is to be made on parts of Asia, Africa and Latin America, is given in a survey—"Methods of Financing Economic Development"—which the secretariat produced and submitted to Ecosoc's last session. The present session also has before it a new report of its sub-commission on Economic Development. From these two pieces of work it is clear that, although the obvious needs run into billions of dollars per annum, the flow of funds is sluggish It is retarded from both ends—at the issuing end by such factors as the falling off since 1949 of American overseas private investment and by the competing claims of the military aid programme; and at the receiving end by the failure of under-developed countries to submit projects that are good business propositions. Surprisingly, the sub-commission has changed its mind since last year about the best means of bridging this gap. Then, it was all for the creation of special bodies to administer international financing, and to stimulate local financing of projects; it mentioned the possibility of creating a United Nations Economic Development Administration, and most people expected it to endorse the proposal in the experts' Full Employment Report on the creation of a special department in the International Bank for making general development loans. Now, it rejects all thought of special agencies and of bargain basements where loans can be negotiated on the cheap; it simply exhorts all available agencies to go on as they are doing, working wherever possible, more speedily and more generously. The problem that remains unsolved is how to capture the imagination of the American public and private investor by devising some good label for schemes where the application of normal banking standards becomes difficult, and where there is need for loans that allow of low rates of interest, long maturities and flexible conditions of repayment.

*

The Council's position in regard to human rights is as follows: The United Nations has adopted a universal declaration on the subject, but this merely expresses world aspirations. It is not legally binding. The Council has therefore charged its daughter body, the Human Rights Commission, with drafting a companion document—a covenant having the force of law. Within the Human Rights Commission itself, there are two schools of thought about the nature of this instrument. The one holds that it should be precise and enforceable, and should therefore be confined to points that need only a small and manageable amount of new machinery for proper implementation. The other holds that countries that are backward in the matter of human rights will make more headway if the covenant reaches for the stars right away. The second school has won. A document that is intended to be legally enforceable has therefore been produced by people of whom few are lawyers. The result is a "First Draft Covenant"—more are to follow—which is saddled with reservations from all the more practically minded delegations. It is at some points so imprecise as to drive an international lawyer to distraction. It is to be hoped that the Council, by the time it reaches this item on its agenda, will still have strength to resist the temptation simply to forward this harmless but ineffective piece of work to the Assembly.

The rest of the agenda, though estimable enough, is by comparison minor in its implications. It will absorb the full attention of delegates, but the general public, with the best will in the world, cannot concentrate on Geneva when thoughts are in Korea. How can balanced thought be given to a covenant on human rights at a moment when those rights are being violated at the gun's muzzle? What politician has time for serious effort in the field of full employment at a moment when the way to it is wide open down the road of rearmament? For the time being the atmosphere in the council chamber of peace palaces is one of sad unreality.

NOTES OF THE WEEK

Unity in the House

The House of Commons, by carrying without a division the Government's motion endorsing its action over Korea, has demonstrated to the outside world that the British Government's policy commands the full support of the British people. The only two Labour back benchers, Mr S. O. Davies and Mr Emrys Hughes, who came out against the basis of that policy did not try to force a division ; the other signs of restiveness on the Labour back benches—the only area in which opposition was at all likely to develop—were few. Indeed, one of the most effective speeches of the debate came from Mr Mainwaring, the ex-miner who sits for Rhondda East, who exploded Mr Davies's claim to speak for the workers of this country. The virtual unanimity of the House did not, however, mean that party divisions have been obliterated. Mr Churchill was at some pains in his speech, perhaps with his eye on an election in which defence might be the major issue, to repudiate charges that the Tories favoured war because of their "jungle philosophy"—a phrase recently used by the Labour publicist, Mr Driberg. He also spoke scathingly of Mr Crossman and Mr Strachey as if to indicate that a party which included such men could not be relied on to show complete realism in a dangerous situation. This part of his speech aroused a good deal of anger among the Labour members and might have stung some into forcing a division. But any party tension was dissipated almost completely by Mr Eden who wound up for the Opposition with one of the best speeches of his career, a speech which Mr Morrison rightly praised as admirably reflecting "the temper, spirit and commonsense of the British people." Mr Eden widened the scope of the debate from the immediate situation in Korea to the more momentous question of war and peace on a world scale. Until he spoke there had been a tendency to concentrate too much on the merits and defects of the Korean state and too little on the major issue of whether the action of the United Nations was the best way to halt a major war.

If the debate was valuable in reflecting the popular support for the Government's policy it was less effective in exploring the immediate implications of the Korean war. Mr Churchill developed the policy he has frequently stated in the last two years—that of trying to secure a definite boundary between the blocs while we still have superiority in atomic weapons. He renewed his request for a secret session to discuss defence and Mr Morrison renewed his objections to it. It is difficult, indeed, to see what could be gained by a secret session which could not be achieved by the discussions on defence between the Opposition leaders and the Prime Minister. In the conditions of the world today, only the energies of the Government of the day can ensure that defence is properly organised.

* * *

The Veto *vs.* World Opinion

Controversy rages as to whether the Security Council, when it voted 7 to 1 for the American resolution calling for military sanctions against North Korea, took a decision that was valid in law. The seven votes, naturally enough, did not "include the concurring votes of the permanent members," as is required under Article 27 of the Charter. Because no Russian was there, the Russians and their supporters argue that the vote was illegal. They contend that it received no more than three of the five essential votes, since it also lacked the support of the government that is in control of China.

There are two arguments against the Russian case. The first is that, if precedent counts, neither absence nor abstention from voting constitutes a veto. It did not do so when Russia abstained in 1946 on a vote about the North Persian situation, or when Britain abstained in three votes on Palestine in 1948, or when Russia was absent during the vote upon Kashmir in March of this year. The implication of these events is that vetoing must be an active and not simply a passive process.

The second argument is less precise, and no doubt less pleasing to lawyers. But it weighs equally with the general public—a force worthy of consideration when the issue is that of peace or war. The Security Council, owing to the peculiar circumstances in which the right of veto was born, can work only so long as its members share common peaceful intentions. As soon as a Great Power is involved, directly or indirectly, on one side of a serious dispute the United Nations must either throw in its hand or else work its machinery with a cog missing. It claims to work according to democratic principles ; therefore, when the great fall out, the smaller fry should be entitled to their say. Over Korea, the states members who are not permanent members of the Security Council have shown that their weight is behind those who wish to make the machinery work, even without the concurring vote of Russia. If peace is to have a chance of preservation, the machinery must be made to work in all such circumstances. The price of making it work may well be to divide the world into two camps ; but the common opinion of reasonable men and women is that the camp which observes the Charter and upholds the rule of law is entitled to call itself the United Nations, as against those who challenge its authority and would have it made impotent by standing on the letter of its law.

* * *

More Light on the Schuman Plan

The six Governments involved in the negotiations of the Schuman Plan have now returned to Paris after a week's study of the "working paper" put forward by the French. It is too soon to gauge their separate reactions on the delegation.

They are now clearly in a better position to guess the direction of French thought, which, it must be admitted, is much bolder than either friends or critics of the Plan had first imagined. The essence of the economic proposals is an attempt to find a middle term between the two dead ends which appear to face the European economy. On the one hand stand the supporters of *laisser faire*, who believe that all "artificial obstacles" to free trade must be removed in the interests of competition and efficiency, but who have no answer to the fact that, in the past, the consequences of competition for the less efficient producers have been so drastic that they have resorted to cartels, price fixing, tariffs and every sort of national protection to safeguard themselves against the "benefits" of liberal trade. On the other hand are the new school of national planners who can provide investment schemes and full employment schemes to reach national territory, but who seem unconcerned at the risk that a piling up of unco-ordinated and frequently duplicating national plans can be the end of European efficiency and lead to collapse once American dollars cease to hold up the whole structure.

The Schuman Plan is an attempt to evolve a third possibility. It proposes the return of competitive efficiency by the re-establishment of free trade in coal and steel and by the restoration of the price mechanism. The proposed High Authority will supervise this process of freeing the market. It will also encourage the highest standards of technical efficiency by its powers to lend money for the modernisation of enterprises which are prepared to work with it. Since, however, this restoration of the primacy of cheap and efficient production and of the price mechanism may hit some sections of industry, the High Authority may also provide subsidies and grants for the conversion of backward enterprises or areas to other industrial activities. Thus a course will be plotted midway between the scylla of complete liberalism leading to cartelisation and the charybdis of national planning leading to over-capitalisation and redundancy.

Critics in this country may be inclined to ask again why such a middle way could not be negotiated between governments and it is important that the French attitude should be understood. It is that the divided quarrelsome multi-party assemblies of the Continent are as incompetent to integrate an economy as they are to conduct a campaign and win a battle. Just as detailed decisions on defence and strategy have to be handed over to military authorities, economic policies must be similarly farmed out. The High Authority is thus an attempt to by-pass the deadlock created by the incompetence of governments. The fate of M. Queuille this week certainly suggests that the argument has considerable weight.

* * *

M. Queuille Fails

The hope that the pressure of the international situation would give France a government in record time has unhappily not been fulfilled. The Assembly, it is true, accepted M. Queuille within a week of M. Bidault's departure. But, when the new Prime Minister presented his cabinet to the Assembly, he was defeated by a resounding 334 votes to 221 and immediately resigned what had been an ungrateful task, unwillingly but patriotically undertaken.

The reason for M. Queuille's defeat was his failure to persuade the Socialists to join the coalition, and his consequent attempt to secure the support of other groups in the Assembly by cautiously extending his cabinet towards the right. He called in M. Paul Reynaud to take charge of a new Ministry, set up to deal with French responsibilities in the Far East, and gave the portfolio of Public Administration to M. Paul Giacobbi, a Radical with Gaullist affiliations. The choice of ministers was, perhaps, rather curious. The two issues which chiefly divide and disturb the Socialists are the war in Indo China and the question of Civil Service conditions and salaries. To allot Ministries vitally concerned with both to members of the right wing was bound to upset the Socialists and showed something less than M. Queuille's habitual tact. The Socialists in fact reacted strongly and voted against M. Queuille *en bloc*. They were not, however, alone in their disapprobation. The left wing of the M.R.P. also voted against an arrangement which seemed to them to change the orientation of the Third Force from centre to right of centre.

Since even a tense international situation has not produced unity, the problems which brought down M. Bidault's government will presumably plague all attempts to rebuild the coalition. The Socialists are committed to supporting higher pay for the civil servants, the Radicals to keeping the budgetary deficit within limits. The deadlock on electoral reform is complete. In theory, the Socialists, who have destroyed each cabinet in 1950, should now attempt to form one themselves, but the other parties are probably too exasperated to join them. The most general suggestion is that M. Schuman, with his high international reputation, may be prevailed upon to form a team. In any case, a quick resolution of the cabinet crisis now seems out of the question.

* * *

Labour's Troubled Front

There always seems to be more trouble in summer than in winter. In so far as it is true it is perfectly natural, but the sense of ferment among the trade unions is largely exaggerated by the fact that most of their annual conferences are held between Whitsun and Michaelmas, when wild speeches are made by delegates in place of the rather more discreet pronouncements of their leaders. But this year's conferences are taking place against the background of the break-up of the policy of wage restraint. Last week the TUC announced the abandonment of any further efforts to impose a rigid restraint on wage increases, together with its failure to find any alternative form of wages policy. On Monday Sir Stafford Cripps echoed the statement in rather more elegant lawyer's phraseology, in words that amounted to no more than a pious hope that, if there were going to be wage demands, they would be presented in orderly fashion and in such a way as not to cause inflation. The Treasury has followed Transport House in contracting out of the problem.

While a singularly ill-informed dispute over pensions has created a strike of drivers and firemen on the Western Region of British Railways, the strike of the Smithfield meat transport drivers has spread throughout the week. According to a statement made by the Minister of Labour in the House of Commons this strike seems to have been called on grounds even more frivolous than is usually the case at Smithfield, since it started on the day after the employers had decided to enter into negotiations with the men.

The annual conferences of the National Union of Railwaymen and the National Union of Mineworkers have been taking place this week. Apart from a bad tempered piece of invective from its secretary, Mr Figgins, the decision of the NUR has not been made public, since this union prefers to conduct most of its deliberations behind closed doors. From the tone of the opening speeches, however, it seems likely that the union will return to its claim for an all-round increase. The miners' conference has shown that the rejection of their claim for an increase of 2s. a shift for their 400,000 lowest paid workers has put them in a very ugly temper ; it has already produced a strike in the Scottish coalfields. The conference endorsed the decision of its executive to press for an amendment to the old cost-of-living agreement so that the lower paid workers would benefit most. The negotiations with the National Coal Board, on whether there should be a new sliding scale to replace the one which came to an end in 1947 or whether it should be abandoned in favour of some other system, have dragged on for a long time. It seems certain that whatever section of Labour benefits from a decision to abandon rigid wage restraint, the miners are determined that they have the best claim.

* * *

Featherbed for Fish?

A recipe for a depressed industry is something which the postwar planners have not yet had to devise. The six months' subsidy and the new statutory authority for the white fish industry announced this week are the first moves in this kind of planning. In the last three months this industry, left to its own resources after the removal of price control, has lapsed abruptly into all the familiar difficulties of the thirties—falling demand, idle productive capacity and unemployment. The causes of the industry's chronic ill-health, however, are peculiarly its own. Events have proved that these causes cannot be put right by the industry itself, and the trawler owners by their appeals for government aid have admitted that some control is desirable. The case is even stronger today than when it was made fifteen years ago in the Duncan report for an independent authority to regulate excessive competition, enforce reasonable standards of quality and promote reorganisation and re-equipment on both the catching and marketing sides. Planning is as planning does, however, and it is to be hoped that the Government will make the most of this opportunity to prove that planning can mean reform and not featherbedding.

Meanwhile, the stop-gap subsidy for those landing the more expensive kinds of fish can hardly be called a consumer

subsidy in view of the present low demand for fish at all prices. It is simply a ready expedient for keeping men at the fishing ports off the "dole" until demand revives, as it is hoped, next winter. However, since the £1,700,000 involved is to come out of the food subsidies, whose cutting is already agreed, this step amounts to using the food subsidies as a fund for the promotion of full employment for its own sake. Whatever the claims of the fishing community to emergency relief, this granting of relief out of money voted for an entirely different purpose is a dangerous precedent. Similar emergencies will almost certainly occur in other industries in the future. Will the Government seek to maintain full employment elsewhere by the use of similar expedients? Any pretence by Parliament to keep a watch on the many claims to public money must rapidly become a farce if Mr Attlee follows Humpty Dumpty in saying, in effect "A food subsidy means what I choose it to mean, neither more nor less."

* * *

Standing Closer

In a short but constructive debate, the House of Lords discussed this week the proposals for West Indian federation, which were recently put forward by what has come to be known as the Standing Closer Committee under the chairmanship of Sir Hubert Rance. The obstacles to federation, as every speaker emphasised, are formidable: historical, because the territories have different traditions; geographical, because of the long distances between them; political, because of the very different stages they have reached in the road to responsible government; social, because of the different culture of the East Indians from that of the bulk of the population; economic, because of the poverty of some islands and the comparative wealth of Trinidad.

The advantages of federation are, however, no less striking. Not one of the West Indies could hope to support the burdens of Dominion status on its own. Very few can hope to achieve economic and financial stability. A federal West Indian Government should be able to aim at a better balanced economy for the whole area whereas there is always the danger of overlapping and competition between the islands if each tries to diversify its economy at its own sweet will.

It is, however, not so much the pros and cons of federation that need discussing—that was done in the "Standing Closer" report—as "how" and "when." It was Lord Listowel who brought up the question of "when." Premature establishment of federation might be disastrous; but indefinite postponement, while economic and political nationalism in the islands grows apace, might make federation impossible. The question of timing is therefore very delicate, but the balance of advantage seems to lie with sooner rather than later.

"How" is an even more difficult question. How can the great bulk of West Indians be made to want federation? How can their legislatures be persuaded to make the necessary sacrifices of sovereignty? One thing is certain. The suspicion might be provoked from some of the remarks in this week's debate that the present bias towards federation among West Indian leaders has been occasioned by the wish to have a stronger hand in negotiations with the British Government—especially on sugar contracts. If this sort of motive predominates in the standing closer movement, federation is doomed to failure. It is to be hoped that the discussions in the islands' legislatures will reveal a more statesmanlike view.

Bonn Neglects Berlin

Western Berlin continues to be held with vigour by the Allies, and with the very minimum of grudging assistance from its fellow Germans in the Federal Republic. Professsor Reuter, the Oberbuergermeister of this island of freedom in the centre of Soviet territory, has had to report that the budget shows a deficit of DM 650 million. Every month he has to beg Bonn to provide money enough to carry on in the still hard-pressed city. Dr. Adenauer's Government feels itself better occupied in demanding further concessions for itself from the British and Americans—notably a reduction in occupation costs. The business world of western Germany thinks of nothing but maintaining its own high level of profits while Berlin's industries operate at a fraction of their capacity, not only because of the loss of eastern markets but also because west German firms dislike the risk attached to orders placed in the city. The Christian-Democrat party in Bonn also has doubts about the political wisdom of aiding a Social-Democrat stronghold. The mass of the west German public is indifferent to Berlin's plight.

The *Magistrat* is not blameless. It can justly be accused of inefficiency and of spending too much on unproductive works, which only temporarily relieve the city's unemployed. Nevertheless, it has done nothing to justify the fears of socialisation with which business men excuse their wholesale removal of plant from Berlin. American funds are doing much to restore the Berlin works that were stripped by the Russians in 1945, and to make the western part of the city capable of competing in outside markets. As it is, the great electrical industry, which used to employ a third of Berlin's labour force and to provide no less than half of all Germany's exports in this branch, is not working to capacity, owing to lack of orders. Some orders have been turned away owing to inability to produce to specification. American aid should improve this situation, but, temporarily at least, the unemployed will not be helped by increased efficiency in the factories. Markets remain the crux of the problem, and it is here that the indifference of the Federal Republic plays such a deplorable part. Given the will, it should be possible to organise a sales campaign for goods (notably clothing in which Berlin specialises) "Made in Berlin," imported with a Bonn Government guarantee.

Before the air lift it could be argued that Berlin, like Korea, was practically untenable and strategically of comparative unimportance. Nevertheless, since the west won this contest with the Russians, it cannot now renounce its gain. The people of Berlin have always stood out by reason of their courage, irony and sharp sense of realities, and they form a leaven which should prove valuable for the future of Germany. There can, moreover, be no doubt that the western city provides a useful display window through which the inhabitants of the Sovietised surrounding territory can peer at an astonishing spectacle of freedom and comparative plenty, in which even the unemployed share. The Russians have shown that they realise the value of the city. They lost the contest of 1948-49 with the Allies. The challenge now remains to be taken up by Bonn.

* * *

The Legal Status of Formosa

President Truman's decision to afford American naval protection to Formosa against Communist invasion from the Chinese mainland arose out of the military aggression of the Korean Communists in the sense that that aggression sharply revealed the serious character of the Communist strategic threat in the Far East and provided ground for precautionary measures not confined to Korea. On the other hand, nothing new had happened with regard to Formosa itself to alter a situation that had endured for several months without any American intervention. It was known that differences of opinion existed in the highest military and political quarters on the expediency of American action to save Formosa, and it was generally believed that the policy group in favour of letting events take their course had prevailed over the advocates of intervention.

The question of expediency, however, was always quite distinct from the question of legal justification, and it is the latter which needs to be stressed when Russia and Communist China charge the United States with "aggression" against China. The legal basis for action with regard to Formosa, as distinct from any military action which the United States might have taken to intervene in the civil war in China itself, is that Formosa is not at present juridically Chinese territory. It is Chinese-occupied Japanese territory, having been ceded to Japan in 1895, and so it remains until it is formally retroceded to China by a peace treaty. It is true that at the Cairo Conference during the Pacific War Britain and the United States promised that Formosa would be restored to China by the terms of a victorious peace with Japan, but the transfer is not legally accomplished until there is a peace treaty. In any case, the Chinese Communist party, having proclaimed treaties made with foreign powers by the "traitor" Chiang Kai-shek to be null and void, can hardly with consistency invoke in its own favour the agreement made with Chiang at Cairo.

It is, of course, a decisive argument on a longer view that Formosa formerly belonged to China and that the great majority of its population is Chinese-speaking; for this reason Chinese tend to regard all discussion of its present legal status as mere quibbling. But the Formosans did nothing to liberate themselves from Japanese rule, nor could Chinese troops have ever landed on the island after Japan's surrender without being conveyed there by American shipping and air transport. President Truman and his advisers do not see any reason in international law requiring them to allow a territory of potentially considerable strategic importance, which is not yet legally a part of China and which American arms alone took from Japan, to pass under the control of an actively hostile Chinese Government in a period of dangerous armed conflict in the Far East.

* * *

Doctors and Drugs

Further protests have been raised by general practitioners about their capitation fee. Delegates from local medical committees decided at a private conference last week that if it became clear that there was no prospect of a satisfactory settlement with the Ministry of Health, steps would be taken to advise general practitioners to leave the health service. This sounds drastic enough, but in fact there will be no hasty action. It appears that a conference will be called in December, 1950, if a settlement has not been reached by then, and after that three months' notice of the termination of contracts will have to be given.

Nevertheless, the doctors' warnings should not be lightly dismissed. In comparing their claim for higher pay with those of other workers, one has to remember that they entered the health service before they had agreed what their remuneration should be. They had agreed in substance to the Spens Committee's recommendations, but these were based on the 1939 value of money, and the British Medical Association has never accepted the Government's decision to add only 20 per cent to net incomes in respect of the rise in the cost of living since then.

It is true that no supplementary estimates for the health service are to be allowed this year. But additional spending on one branch of the health service is possible provided that economies can be made in others. It is unlikely that cuts in dentists', chemists' and opticians' fees will produce in the current year nearly enough saving to meet the general practitioners' claim. But in drawing up next year's budget for the health service, Mr Bevan should reduce the allocations to other branches in favour of the general practitioners. They have so far come off badly by comparison with other practitioners in the service, and it is time the balance was redressed.

Mr Bevan evidently hopes to make some economies in the pharmaceutical service by eliminating the unnecessary prescribing of proprietary drugs. Last week a committee of the Central Health Service Council published a second interim report on this subject. In brief, it recommends that proprietary drugs, of proved value, for which there is no standard equivalent, should be freely prescribable, and that other proprietaries, of proved value but for which there is an equally good standard equivalent, should be prescribable provided that they are not advertised direct to the public and provided that there is some control over their price. It is this group of proprietary drugs which the Ministry of Health is now again asking doctors to refrain from prescribing in favour of the standard equivalent. Part of the trouble, however, is that the proprietary name is so much quicker for a doctor to write and remember than the formula in the British Pharmacopœia. In any case, substantial savings in the pharmaceutical service would be more quickly effected by an absolute reduction in prescribing than by eliminating unnecessary proprietary drugs. And the best way to achieve this would be to require the patient to pay a small charge.

* * *

Quality in Education

The question of quality provides the most interesting section of the Ministry of Education's Annual Report for 1949. A chapter on this subject is an innovation, and diffident though its conclusions may be, the Minister of Education is to be congratulated on making an attempt to expand the annual account of his stewardship to include some references to one of its most important aspects. The chapter is devoted mainly to extracts from inspectors' reports: there are few objective tests on standards which can be applied over the country as a whole and these reports can only be taken as samples. Yet the pictures they give confirm the general impression that although the standard of attainment in the three Rs has still not recovered from the jolt administered by the war, the time, money and attention which is being expended on the primary and secondary modern schools as the result of the 1944 Education Act have started a chain of events within them and a scale of expenditure on them which are likely to have important consequences. In spite of shortages there has been a real advance in many areas.

On the other hand the secondary grammar schools have done little more than stand still. Expenditure per pupil has risen but only because, as the Red Queen found, it is necessary to spend more to keep in the same place. Since the relative claims of secondary modern schools and of grammar schools are confounded by partisanship it would be difficult for a Minister of Education to state the case for the grammar schools in explicit terms. He has, however, gone some way to recognise the problem of quality by saying:

> Changes in methods of selection for entry, the imminence of drastic changes in the external examination system and other less definable factors have tended . . . to produce a feeling of uncertainty among many teachers who are anxious to ensure that the highest possible standards of intellectual attainment are safeguarded.

* * *

France and the Liberalisation of Trade

Only a short time ago France's balance of payments was the despair of its Marshall Plan associates, who feared that much of the benefit of American aid would be swallowed up by the inflated French appetite for goods. Within the past year, however, France has swung around and is rapidly

The Economists' Bookshop Ltd.

caters for specialists and students in
Economics and the Political and Social Sciences
11-12 Clement's Inn Passage, Aldwych, W.C.2.
West End Branch: 30A Bury Street, St. James's

becoming one of Europe's creditors: in 1949 the French dollar deficit was still high at $857 million, but there was a surplus with the rest of the world of $151 million which has continued to grow in the current year.

Paradoxically, this achievement has brought forth not congratulations but a new crop of complaints from some of its partners. They feel that in the process of improving its balance of payments, France is making too little progress in lifting import restrictions and is buying less than it should from its neighbours. This unwillingness to reduce import barriers is reflected in substantial mark and sterling balances and also in the failure to use up the "drawing rights" (grants) awarded to France under the European payments scheme.

For the fiscal year which ended June 30th, France was entitled to drawing rights amounting to $236,500,000. These were available for the purchase of goods from the other Marshall nations, particularly from the United Kingdom, Western Germany, Belgium and Italy. To date, France has used less than 30 per cent of these grants.

Three reasons for this abstinence are advanced by French spokesmen. First is the improved state of payments with western Europe. Second, it is argued that it would be unwise to import from Europe on a scale that could not be maintained when the support of Marshall aid is withdrawn. Increased imports through the use of drawing rights might put some French industries out of business and force the country to rely on foreign products for which it could not pay after 1952. The third is a political objection—that the grant-aided imports that are available from France's neighbours are of a kind whose appearance would infuriate politically important sections of the French electorate—e.g., peasants, who might lose profits, and workers, who might lose jobs.

This timidity is all the more unfortunate at the present time when the Marshall Plan makes it possible for the French government to finance domestic reconstruction and investment out of funds acquired by selling these gift imports. The French Treasury is chronically short of francs and has been relying heavily on the franc "counterpart" of these grants for investment purposes. By forgoing the grants, France is, in fact, sacrificing what could have been a useful start on its belated housing programme or an increase in defence forces.

Observers on this side of the Channel, where full employment as a political end is a constant preoccupation, are in no position to scoff at French fears of unemployment brought on through trade liberalisation. All the same it is difficult to forget that, for over a generation, the French have shown themselves to be among the most implacable protectionists in Europe. As long as their statesmen adhere to this policy, French declarations in favour of customs unions and international pools will not carry so much conviction as they should.

* * *

India's Role in Asia

Delhi, unlike Cairo, has now pledged itself to back the United Nations Security Council on the Korean issue. The Indian and Egyptian delegates did not vote when the Security Council unanimously condemned the Communist aggression, because they were without instructions. This decision, while at present specifically and deliberately declared not to "involve any modification" of India's foreign policy, gives free Asia a lead from its greatest non-Communist power.

Neither the complex motives for Delhi's action, however, nor some of the remarks made by Mr Nehru, the Indian Prime Minister, during his recent South East Asian tour, permit the hope that India will make any early change in its general attitude of neutrality between the Communist and anti-Communist powers. India backed the Security Council partly because it felt that its own case in Kashmir would be weakened if it failed to condemn an aggressor. It is not following up its condemnation, like some other Commonwealth members, by sending physical aid to the Americans. The Indian lead therefore remains a limited one.

Mr. Nehru has repeatedly denied that his country seeks to give a lead at all. It is his view that Asian countries, including his own, are too weak to go to war. The only way for them to beat Communism is to provide enough food and clothing for their people, whose hunger is more important to them than the slogans of democratic freedom. "It is fantastic nonsense for anyone to think of India marching as a crusader round the world," he said in Singapore. But it is nevertheless true that many people in Asia look to India for guidance and that some of its leaders would like to give it. Mr Nehru was naturally in a difficult position during his visit to Malaya. While he condemned the Communists as roundly as his government does inside India, he could hardly give the British colonial administration unqualified support after his own people's struggle for independence. Nothing, however, would remain of all that Mr Nehru and modern India stand for, if the Communists spilled down from the northern mountains into the sub-continent. And it is a pity that those powerful forces in the Indian cabinet, which already favour a more outspoken anti-Communist foreign policy, do not assert themselves more vigorously. If they did, they would be helping to keep the world at peace.

Hyde Park and Hypochondria

People very anxious about their health generally become diseased. So our sanitary publicists have written so much about the health of the metropolis that they have all become hypochondriacs. They prate like most ill-informed anatomists about the viscera and the glands, and are quite sure that the metropolis will fall into a consumption by its lungs being stopped up. The breathing organs are their tenderest solicitude, and they dilate with diseased pleasure on the overwhelming dangers incurred by not having great breathing places and copious supplies of pure water. Just now, the proposal of the Commissioners of the Exhibition of 1851 to erect a temporary building in Hyde Park has roused into activity all their morbid apprehensions, and they labour zealously to make all the Londoners as uneasy and wretched as themselves. Hyde Park contains 387 acres; it is proposed to take about 20 acres, or something less than the 19th part of it, on which to erect a temporary building for the exhibition, and all our sanitary hypochondriacs rush at once into print to protest against "the inoculating with disease one of the lungs of the metropolis. . . ." In 1851, London will be more splendid than when visited by the sovereigns after their triumphs over Bonaparte, or at the magnificent coronation of her Majesty. From all parts of the world people of fortune will bring their tributes to our industry, and enrich our people. Such plethora of wealth is a source of dreadful alarm to uneasy people and dyspeptics, and they will on no account allow twenty acres of Hyde Park, close to Kensington, to be appropriated to the purpose. We invite all the world to contribute to our enjoyment, our instruction, and our aggrandisement, and our idle and our apprehensive gentlemen are filling the country with terror at appropriating twenty acres out of the 1,568 acres of park about the metropolis to the purposes of the exhibition. If the cavils do not proceed from disease they are very paltry.

The Economist
July 6, 1850

A figure too round to remember

You can print in words, thus: *One million pounds sterling.*

Or you can *figure* it out: £1,000,000.

Or you can use the economists' compromise: £1m.

But why harp on a million? Because it is one of those too-round-to-remember figures we want you somehow to keep in mind. A million sterling is what Associated Electrical Industries spend every year on experiment and research. And another round figure, in thousands, this time . . . 2,000 men and women devote themselves in the laboratories of the A.E.I. companies to probing into the secrets of nature, seeking continually to improve the making and using of electricity. For Associated Electrical Industries are not content to rest on 50 years' experience: they look for new designs, new worlds to conquer. And this Million (or £1,000,000 or £1m.) is their yearly investment in the scientific possibilities of tomorrow.

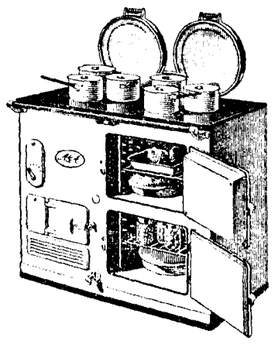
WHAT DOES IT ADD UP TO?

Amount spent on research every year	£1,000,000
Area occupied by research (sq. ft.)	600,000
Research staff	2,000
Designers	3,000
Output per year	£50,000,000
Exports per year	£15,000,000

COMPANIES OF THE A.E.I. GROUP
The British Thomson-Houston Co. Ltd.
Metropolitan-Vickers Electrical Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Newton Victor Ltd.
Premier Electric Heaters Ltd.

It all adds up to AEI

Associated Electrical Industries

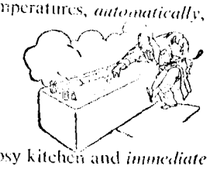


ONLY AGA

Regd. Trade Mark

Gives you all these NINE advantages in ONE combined cooker and water heater

1. Burns *unrationed* coke and thus serves you independently and at full efficiency every day and at all times.



2. Fuel consumption *guaranteed* not to exceed 3½ tons a year; costs less than £4 . 7 . 6 a quarter for all your cooking and bath water, or less than 1/- a day.

3. The largest true boiling and simmering plates of any cooker on the market. Two enormous ovens (one roasting : one simmering).

4. Thermostatically controlled to maintain hotplates and ovens at the required cooking temperatures, *automatically*, without knobs or switches.

5. Gives you 3 *piping hot baths* a day and lashings of washing-up water all day long.

6. Stays in all night to give you a cosy kitchen and *immediate service* from first thing in the morning till last thing at night.

7. The shiny, vitreous, enamelled surfaces are cleaned in a moment with a damp cloth. *No moving parts to remove and scrub.* No flames to blacken utensils. No smoke or fumes. Nothing to burn out. Absolutely *safe*.

8. Every Aga is *guaranteed for 10 years*. In fact the Aga, with its massive chrome-steel fire-unit, lasts a lifetime.

9. Available on *Hire Purchase* over periods of up to 5 years but, by its saving of fuel, in most households it creates its own instalments.

Send to-day for free, 26-page "Saga of the Aga", fully illustrated in colour, dealing with all Aga models and including kitchen designs by a leading expert. Write to: Aga Heat Ltd., 34/4 Orchard House, Orchard Street, London, W.1. *(Proprietors: Allied Ironfounders Ltd.)*

2/6d. A DAY BUYS THE AGA AND PAYS FOR ITS FUEL

every morning at 11.50 to **Milan and Rome**

Every morning at 11.50 Alitalia aircraft leave London airport, fly direct to Milan and Rome. At Milan you have good connections for Venice the Dolomites, Rapallo, San Remo and the Lakes.

FLY luxuriously in *4-engined* aircraft. Aboard you are served Italian wines and food free of charge; you enjoy the natural, lively welcome of the most hospitable airline in the world.

Return fares: LONDON - MILAN £47.16.0. LONDON - ROME £57.12.0. (*Special 23-day excursion to Rome £50*). Book now at any travel agent; or at Dorland Hall, Regent St. London, S.W.1. (WHItehall 9288 or GERrard 9833 ext. 322)

Letters to the Editor

Korea and the Charter

Sir,—In "Notes of the Week" for July 1st there appear, under the heading "The Charter in Action," the following two sentences:—

> "The Security Council put to the test over Korea has this week worked as it was designed to work. After years of service, chiefly as a propaganda platform, it has risen to an emergency. . . ."

No one will deny the accuracy of the first sentence. It is most heartening to see the Security Council "work as it was designed to work." But the impression conveyed, at least to me, by the second sentence that this is the first such occasion, is somewhat unfair. The Security Council, in the course of its short life of just over four years, has previously worked in a number of cases as it was designed to work. Its resolutions in the cases of Soviet troops in Iran and of British and French troops in Syria and the Lebanon brought concrete results. These troops were removed and with them a potential source of hostilities was overcome. Its cease-fire orders in Indonesia, in Kashmir and in Palestine all achieved the positive and immediate result of bringing fighting to a halt. Surely never before in the history of international relations had such a resounding moral victory been won? Were these not examples of moral sanctions? Yet your Note claims that the

> "Council has no previous experience of applying sanctions other than those of publicity and remonstrance."

It is perfectly true that the Security Council has been used for propaganda purposes and that the Council chamber has often been filled with hot air, as I can personally testify. The culprits have generally been the USSR and its associated satellites. Nor have they confined their propaganda efforts to the Security Council but have used their membership of all United Nations' organs for this purpose. Yet, despite this evil practice, the Council has been able to progress and successfully to achieve concrete results. The hot air has been displaced by the cool breeze of reason and sanity and by the intention of the majority to fulfil the purpose for which the Security Council was designed.

The sanctions adopted in the case of Korea, on the Secretary General's initiative, were the most significant step forward which the United Nations has ever taken. It is important to remember that this was not the first.—Yours faithfully,

JOHN A. KEYSER

London

The Wafd Replies

Sir,—May I, as a constant reader of your paper and a member of the Wafdist Organisation, be permitted to make a few comments upon the article published in your issue of June 24th, in which you describe the recent promulgation of the decrees affecting a number of appointed senators belonging to the minority parties as "an act of political racketeering"?

Such Egyptians as have always looked upon *The Economist* as a sober and reliable publication deeply regret that you have deemed fit to interfere in a strictly internal matter upon which, from the necessarily meagre information at your disposal, you are not able to pronounce a sound verdict.

You further assert that the new senatorial appointments hardly encourage the belief that they are intended to safeguard the interests of the "man in the street." Nothing can be further from the truth. The object of having a certain proportion of the members of the Upper House appointed is to ensure the representation of all classes of the population.

Nor can a charge of departing from democratic principles be levelled against the Wafd who, during their comparatively short tenure of office, have actually promulgated such legislation as ensures labour welfare, free education and social security, the latter Bill, without precedent or parallel in the whole East, being a bold attempt to raise the standard of living.—Yours faithfully,

Alexandria AHMED SHAFFEI

Administrative Tribunals

Sir,—In a reference to administrative tribunals, you remark that the attitude still prevails that it is the convenience of Government departments which has priority. I have tended to take a more charitable view, but a recent personal experience of the working of one of them unfortunately lends support to this attitude.

The tribunal was one attached to the Ministry of National Insurance, and the relevant facts are these. I was insured under the old health insurance scheme until January, 1947, when my salary passed the £420 maximum; I re-entered insurance under the new scheme in July, 1948. In January, 1950, I was ill, applied for benefit, and was refused on the ground that the "Contribution Year" regulating benefit for that month was July, 1947-July, 1948, during which period I had paid no contributions. Now, under the National Insurance Act, a "Contribution Year" regulates benefit for a "Benefit Year" beginning 5 months after the contribution year ends, so that the maximum period that should elapse, after entry into the scheme, before benefits are payable, is 17 months. My sickness fell in the 19th month after my re-entry. The reason for this anomaly is as follows. Under the old scheme, the approved societies all collected the contribution cards at the beginning of July each year; now that the administration has been centralised, the Ministry has found it convenient to stagger the collection over the year. As I fell into Group C, the date of the exchange of my card was put back to September, and the first contribution card covered 61 weeks; by ill-chance, my sickness occurred just in the period that was squeezed out by this alteration.

This is a simple administrative anomaly. I therefore launched an appeal on the ground that mine was a case in which a "suitable modification," in accordance with the regulations, should be made, and in due course I appeared before the tribunal. This body quickly decided that the case was one of dispute as to whether the contribution conditions had been satisfied, and should accordingly be referred to the Minister for decision. This done, they proceeded to explain that the Minister would turn down the appeal (which he has done) and sought to convince me that this was the proper course.

From a cloud of general arguments, there emerged two clear points. The first was agreement that, had the luck of the draw given me an A or a B suffix, I would have been entitled to benefit, and that the provision in the regulations is designed to deal with anomalies of this type. The second point, however, was that the provision is only applied in the case of persons who entered insurance for the first time in July, 1948. In answer to my inquiry as to why persons previously insured should be discriminated against, the answer was given that if the picture is looked at as a whole, they are not; if, for instance, I had failed to recover, my widow (if I had a widow) would be much better placed than a widow of someone who had entered insurance for the first time in 1948. In fact, what we lose on the roundabouts, we gain on the swings.

I have since received a letter from the Ministry repeating most of these arguments, though they are quite unconvincing and would not in any case answer the main point. This is quite simply that the Ministry has staggered the collection of cards to suit its own convenience, and has an obligation to see that no part of the insured population suffers from this action. This it has failed to do. What one expects of the tribunal to which one appeals is simply that, if it cannot give a verdict in one's favour, it will comment on the matter in such a way as to lead the Ministry to alter its regulations. Instead, the tribunal that heard my case behaved entirely as a public relations department of the Ministry. Not content with this, it went on to suggest that I might pay voluntary contributions for the period when I was not insured, and that a payment of only £5 or £6 in this way would entitle me to my 26s. benefit.—Yours faithfully,

A. H. BIRCH

Books and Publications

Roosevelt's Mephisto

I Was There. By Admiral William D. Leahy. *Gollancz.* 542 pages. 25s.

At Yalta, on a prandial occasion, Admiral Leahy was toasted by Mr Molotov, he tells us, as "the permanent member of all international conferences." That gives the measure of his important role as Chief of Staff to the President from the summer of 1942, when his mission to Vichy ended, to the Potsdam Conference, continuing in this unique position until March, 1949. He was present at all the Allies' political and war councils of 1943-44 — Washington, Quebec, Cairo, Teheran, Quebec again—and attended, at his chief's request, all the political meetings at Yalta. A full account of what went on behind the scenes, based on the author's day-to-day jottings and evidently filled out by careful reference to the documents, ought to have yielded a really important book of memoirs. That it has not done so can be attributed not merely to the fact that others have stolen his thunder but chiefly to the tough-grained, not to say unpleasing, personality of the man himself. The contrast, for example, of the Admiral's pride and prejudice with Robert Sherwood's presentation of the Hopkins papers is glaring.

His pride is a naive old-fashioned patriotism. One hundred per cent Americanism is for him the highest criterion. This is how he pays tribute to his two Chiefs:—"Both will, in my opinion, be recorded in history as having been completely devoted to America." The war was fought and won by that superb strategist, the President, and the Joint Chiefs of Staff, almost he seems to say, in despite of the nations that were America's allies. Naturally, we hear, in the final pages, of the "dramatic and expensive *American* airlift." His prejudice extends from the normal restricted professional angle of vision of an old sea-dog—he was suitably shocked by Mr Truman's decision to use the atomic bomb—to a "psychopathic dislike of England" (the phrase he applies to Darlan) which may, of course, derive from Irish ancestry. Time and again he seems to have been conducting a private war against the British.

There is a great deal in his memoirs about high strategy, especially in the Pacific area which, obviously, interests him more than decadent Europe. With his fixation about British imperialist designs he attributes Mr Churchill's views, when they differed from his own, to the idea that Britain must have exclusive control of the Mediterranean and sees the British leader concerned more with Britain's peace aims than with defeating the enemy. And he paints a picture of Stalin and Roosevelt "getting along fine" by mutual accommodation at Yalta until the "negotiations" with General Wolff for a military surrender in Italy, authorised by Field Marshal Alexander, revived the Russians' suspicion that the Allies were intent on making a separate peace with Germany. That the Russians had their own plans for the post-war world never seems to have crossed his simple mind.

For the Vichy mission Admiral Leahy had no particular qualifications. His French was rudimentary, his knowledge of French politics almost nil, and tact was certainly not his strong point. But he could, it was hoped, get the confidence of Pétain and Darlan, and, within its limits, his mission was a success. The fact that Mr Churchill also kept the line open to the Marshal, through the Canadian Minister to Vichy, is never even mentioned, nor is there any appreciation of the big risks involved in the American policy towards Vichy. Instead, the reader is treated to all manner of contemptuous references to de Gaulle, who figures as the catspaw of Britain.

While much of what the Admiral tells us cannot fail to be interesting—not for nothing was he appointed by the President to be his "watch-dog"—this "former naval person" was about as suited to the complexity and subtleties of international politics as Mr Anthony Eden would be to the simple blatancies of an American football game. One feels that Mr Roosevelt, with uncanny self-knowledge and a certain impish delight, must have chosen Leahy deliberately as a foil to his own generous idealism, to play Mephisto to his Faust.

Encyclopaedic Economics

Principles of Political Economy. By Carroll R. Daugherty and Marion R. Daugherty. *Houghton Mifflin.* 1125 pages. Two volumes. $8.00.

This compendious work might well be sub-titled "what every young economist should know." Its 1,125 double-columned pages contain a comprehensive exposition of modern economic theory in all its ramifications, lucidly written and incorporating all the tools in the economist's box except mathematics. The central concern is with economic welfare; the exposition proceeds by the construction of hypothetical economic systems. Successive sections deal with the isolated frontier household, barter, pure competition, monopolistic competition, oligopoly, monopoly, and authoritarian economics; these models reappear in a section on multi-national systems. In each section the argument moves from partial to general equilibrium, and thence to dynamic problems. At each stage the foundation is laid for later analysis: the basic national income concepts, for example, emerge in the chapters on the frontier household. At each stage, too, the tools and the schools are fitted neatly into place; perhaps the neatest trick is a synthesis of liquidity preference and loanable funds theories of interest.

Once developed, the theoretical technique is applied to an analysis of the American, Russian, and British economies and the structure of world trade. Here the treatment is slightly uneven. The chapter on Britain for example errs in both fact and emphasis; it is nevertheless an interesting if somewhat patronising attempt to evaluate Labour's achievements in terms of the concepts of welfare economics.

All in all, this is one of the best textbooks to appear in recent years. It has its faults: there are technical errors in analysis, notably in international trade theory; undue reliance is placed on Professor Lerner's rather tarnished Rule; the authors incline towards collegiate slang and the coinage of unlovely neologisms; and in the background is a none-too-subtle faith in the superiority of the American way of life—Republican version. But the solid merits of clear style, deft technique and logical argument compensate for such minor blemishes. The only really dismaying feature is the length. No one who has access to a good library could honestly be advised to read it through; and since it will tend to be used as a reference book rather than as a text, it is regrettable that the authors have followed current fashion in omitting any bibliography of their sources.

The Finnish Spirit

Finland: The Adventures of a Small Power. By Hugh Shearman. Published under the Auspices of the London Institute of World Affairs. *Stevens and Sons.* 114 pages. 10s. 6d.

Mr Shearman has produced a well balanced, lucid and remarkably full account of the development of the Finnish nation. This he traces from its earliest obscure origins through the period of Swedish or Russian domination to the present day. The greater part of the book is rightly devoted to the last fifty years or so, the time of Finland's travail, birth and growth as a nation. The account of the restless last decades of the Grand Duchy of Finland is particularly good. It shows how well developed already were the dominant themes of Finnish politics—the determination to achieve, and maintain, political independence, and the struggle against hardship and poverty—so liable to be transmuted in times of crisis to a conflict between classes or between town and country.

This latter motif, if somewhat weaker, is more pervasive than the resolve to resist the encroachments of Russian power. It explains to a large extent the

no late nights...

Some thoughts on choosing an advertising agency

An early (novelist's) conception of an advertising agency was that of a one-man band run by a "card"—a forceful character who thought of the ideas, the slogans and even did the sketches—all by himself.

A later (film) notion was of a cocktail party kind—bright young writing men and clever girl artists; contact men, entertainment, good shows, late nights....

Some of us sigh for the times we never had, but a real life visit to a first-class advertising agency today reveals a group of specialists experienced in many fields. You see a close-knit organisation with well-planned methods of operation, marshalling trade facts, examining competitive trends, analysing clients' problems; with the ideas-men holding a watching brief until everyone agrees what the idea should be about.

Only then, when the message *behind* the advertisements has passed the test of many minds, are writers and artists left to interpret it in terms of interest to the public—to dramatise, to make memorable, striking. It is quite remarkable what they can do, for instance, with a simple trade message like "look for the name Morley".

The choice of an advertising agency is a matter that calls for a thorough assessment of the resources of the agency under examination—the extent of its services, its experience, its talents, its people. *We of the Pritchard, Wood organisation invite such examination and suggest, as an interim measure, that those interested may care to write for a copy of our new prospectus entitled "Choosing an Advertising Agency", which tells more about our outlook and the way we work.*

It took 157 years

For seven generations Newton Chambers have been making tanks and vessels of all shapes and sizes in their Thorncliffe works. It was therefore a natural development that they should have been among the first to introduce plastic lined tanks which were acid-proof, solvent-proof, and resistant to nearly all chemicals. In this and in many other projects, the experience of 157 years, flourishing within the stable Thorncliffe community, enables Newton Chambers to produce goods of an unremitting high quality.

Newton Chambers

& COMPANY LIMITED OF THORNCLIFFE, SHEFFIELD

IRONFOUNDERS · ENGINEERS · CHEMICAL MANUFACTURERS

dour obstinacy of Finnish politicians who, feeling that they cannot afford a compromise, withstand each other manfully until the sudden realisation of the need to withstand a greater external threat brings them together for a while.

After reading Mr Shearman's account of conditions in Finland a generation or so ago, one is less surprised at this attitude. The Finnish attitude towards the belligerents in the two World Wars also becomes more comprehensible after a perusal of this book, which does not, however, bring out adequately the enormous cost to Finland of the second war. Nor for that matter does Mr Shearman mention the potent psychological effect of reparations payments which, as every Finn knows only too well, afford to Russia legal means of exercising illegal political pressure. Indeed it is almost certainly this knowledge which has called forth the remarkable efforts whereby reparations have so far been punctually paid. In this and other respects the last few pages of the book—together with the two quite inadequate maps reprinted from another work—are the weakest parts of an excellent whole.

A Dreary Catalogue

The American People and Foreign Policy. By Gabriel A. Almond. *Harcourt Brace, New York.* 269 pages. $3.75.

"When we examine the current scholarly output of political science," says Mr Almond, "the shortcomings of at least this sector of the academic elite become disturbingly clear." These shortcomings include a distressing addiction to "historical and descriptive" treatments and a woeful neglect of "basic social, psychological and economic factors"—at least in the field of international relations. Any reader who has bruised his perceptions upon the 250 odd pages of Mr Almond's own contribution to this field will have no difficulty in extending the catalogue still further. Here we have a book emanating from a distinguished American university, and dealing with a theme of central importance. True, it is a topic which has attracted many pens and perhaps it is too much to hope that the Yale Institute of International Studies would have anything to say on it which had not already been said before. Perhaps, therefore, the author is to be forgiven the chapter in which he collects indiscriminately the assessments of the American character made by observers from Tocqueville to Gorer, and feeds them into a kind of socio-psychological totalisator designed to give the odds on American public opinion. A similar indulgence may perhaps extend to the dreary analyses of public opinion polls from 1935 to the present day, based on the assumption that all such findings, whether conducted for their news value or on a serious academic basis, can be regarded as equally reliable and informative.

But when the author leaves these well-worn pavements to blaze a trail of his own, judgment and meaning alike disappear in a jungle of lush, super-tropical jargon which defies the hardest pruning knife. "Opinions must be placed in their subjective matrices of values and basic attitudes if we are to gain an impression of their stability, ramifications and possible future development." "At the level of basic attitudes there is largely an unconscious consensus of feelings with regard to values and of reactions regarded as suitable in response to certain political cues." Is this kind of cuttle-fish effluvium the word-magic that is going to revivify the study of society and inspire the "policy-making elite" of America? It costs, on good paper between dove-grey boards, three dollars and seventy-five cents.

Shorter Notices

Readings in the Theory of International Trade. American Economic Association Series. *Allen and Unwin.* 675 pages. 30s.

This fourth volume in the Blakiston Series of Republished Articles on Economics, published in America last year, has already been warmly welcomed by serious students and teachers in this country. The policy of thus "bringing together, field by field"—to quote the preface—key texts which would otherwise be difficult or impossible of access to the reader is obviously a good one; coupled with a comprehensive and systematic article bibliography, the papers here reproduced provide an indispensable survey of modern theory from 1923 ("The Theory of International Values Re-examined," by Frank D. Graham) to 1947. Empirical and factual articles are excluded, as are those of special and narrowly delimited subject matter. This high level of abstraction does not exclude an often uncanny relevance to stop press actuality; Mr J. J. Polak, analysing in 1943 the "Balance of Payments Problems of Countries Reconstructing with the Help of Foreign Loans" appears to have had a prophetic telescope trained on the Europe of 1950; and much the same may be said of the article on "International Relations between State-Controlled National Economies," by Professor Jacob Viner, first published in 1944.

Social History and Literature. By R. H. Tawney. Published for the National Book League by *Cambridge University Press.* 39 pages. 2s. 6d.

The annual lecture of The National Book League, which has been delivered since its inception by Lord Samuel, Sir Richard Livingstone, Earl Russell, Mr G. M. Trevelyan and the Poet Laureate, is becoming an impressive addition to the intellectual calendar. Mr R. H. Tawney's lecture for 1949 raises the standard even higher, as well as providing a rostrum for one whose voice is heard nowadays only too rarely. His exquisite tracery of thought on the relation of literature to the social environment which produces it is, as one would expect, grounded in examples from the Elizabethan age. The lecture is as entertaining to read as it must have been hard to follow when delivered, since a Jamesian arrangement of subordinate clauses is shot through with a tracery of tantalising but obscure quotations. For the reader with leisure and intellectual vitality—that paragon at whom the enthusiastic reviewer sets his cap—who is seeking for a new field of pleasure and excitement, Mr Tawney has provided a set of guideposts leading down enticing but well-metalled roads.

Etudes sur la banlieue de Paris. *Armand Colin, Paris.* 175 pages. 350 fr.

These "methodological essays" published by the *Foundation Nationale des Sciences Politiques* consist of studies of the Paris suburbs by M. Pierre George, M. Maurice Agulhon, M. L. A. Lavandeira, M. H. D. Elhai and Madame R. Schaeffer. The four specialised studies are, respectively, on political opinion in the Commune of Bobigny between 1850 and 1914; on the phenomenon of "commuting" by workers between their home town of St. Maur-des-Fossés and other communes in the Paris area; on life in tenements built by the government at Aubervilliers, and on the living conditions of the employees of a factory at Montrouge. These studies are preceded by an essay by M. Pierre George on the subjects of suburbs in general. M. George, who is Professor of Human Geography at the Sorbonne gives in his preface a most interesting sketch of the impetus of Parisian development whereby financial and industrial concentration brought into being a new administrative class which occupied the centre of the city and drove the truly productive elements into the suburbs.

The kind of sociological study which this book contains is well suited to the French temperament which is perhaps most sympathetic and human when in a state of intellectual detachment. Thus the French *enquête* about particular human conditions has never the stodginess and pomposity of similar investigations undertaken in certain other countries. The Parisian *banlieue* with its sharply differing local characteristics provides, moreover, a rich and fascinating field.

The Journal of Criminal Science. Volume 2. Edited by L. Radzinowicz and J. W. C. Turner. *Macmillan.* 217 pages. 18s.

The second volume of this excellent series, which is being published under the aegis of the Department of Criminal Science at Cambridge, is a collection of essays on different aspects of the Criminal Justice Act of 1948. The essays are authoritative and describe the many changes which the Act has introduced, especially in the treatment of offenders. Miss Margery Fry, for instance, sets out the few differences which the Act has made to the Borstal system and criticises the many weaknesses which remain. Dr Max Grünhut clears up the confusion which still exists between "correctional training," which is a form of Borstal sentence for offenders over the age of 21, and "preventive detention," which is a sentence which can only be given to persistent offenders over the age of 30 and which is primarily designed for the protection of society. Sir Norwood East examines the changes which the Act has introduced in assessing the mental condition of accused persons and in the treatment of abnormal prisoners. There is also an entertaining article by Chief Superintendent Cherril of New Scotland Yard on how the law now stands with regard to the taking and recording of finger-prints.

All in all, this volume is a useful contribution to criminology. Like its predecessor, it concentrates too much perhaps on the prisoner and not enough on crime in general. The behaviour of criminals and the effect the new Act is having on their activities is at least as important a subject as the treatment of prisoners. An examination, say, of crimes of violence should merit a high place on the editors' list of subjects for their next volume

AMERICAN SURVEY

Strange Bedfellows

(From Our American Staff)

THE last Sunday and Monday in June were uneasy days in Washington. Everyone recognised that a warning from the Security Council was a necessary preliminary to any action, but there was a fear that the action, when it came, might take the form of "all aid short of help" accompanied by the explanation that South Korea was, as it was known to be, outside the American defence line. Mr Truman's temporising statement on Monday increased the unease; phrases like "our concern over lawless action" and "our sympathy and support for the people of Korea" had a too-familiar ring. "Thus the pattern appeared to be," wrote the *New York Times*, "to avoid any semblance of direct military intervention . . . ." That evening Mr Elmer Davis said in his broadcast that "all of us who are old enough to remember twelve or fifteen years back feel tonight as if we were hearing a familiar piece of music played by a new orchestra, under a new conductor, but with the same interpretation. . . . So here it begins again; the old game . . . as Hitler used to play it."

"Forward"

Herblock in the *Washington Post*

Then on Tuesday morning word spread that the President would make an important announcement shortly after noon, and in a few minutes the waiting room at the White House was filled with reporters; many of them, grown cynical after their experiences in London, Paris, Berlin and Rome a dozen years ago, refused to believe a democracy was capable of acting before it was too late. But when the statement came the old pattern had been broken; Mr Truman was not going to be a Chamberlain. "Never before," Mr Joseph Harsch said in the *Christian Science Monitor*, "have I felt such a sense of relief and unity pass through this city. . . . I have never seen such a large part of Washington so nearly satisfied with a decision of the government." In the next two days it became clear that the sense of unity was not confined to Washington; it covered the country.

One of the most interesting by-products of the crisis has been, as the *Washington Post* pointed out, "a general exchange of bedfellows all over the place." Into the larger bed, where the President's supporters lie, hastened, of course, such people as Mr Dewey, who telegraphed his whole-hearted agreement, Mr Herbert Hoover, who lectured his party on the need for unity of purpose and action, and those Republicans in Congress who understood what he was talking about. More surprising, Mr Henry Wallace was seen at least fingering the sheets. The Korean incident has come as a godsend to some left-wing idealists, who had been imprisoned in their pasts and who at last saw a way of escape, and to others who had been edging their way through the door opened by Marshal Tito and were now able to come out into the daylight.

But it is the opposition bedfellows who are more interesting. Mr Marcantonio, the fellow-travelling Representative from New York City, thinks that the President has "usurped the powers of Congress by declaring war without its consent" and so does the *Chicago Tribune*, which says that Mr Truman's statement was an "illegal declaration of war." Applying the principle of guilt by association, as the *Washington Post* remarked, one might refer to the *Tribune* as "the prairie edition of *Pravda*." But the attitude of the Far Right, which has been deserted by the Scripps-Howard and Hearst papers and even by Mr Fulton Lewis, its most dependable radio voice, and of the Far Left, deprived of Mr Wallace's leadership, would hardly matter if they were not supported in the Senate by certain prominent Republicans.

A small group, of which Senators Taft, Wherry and Millikin were the most prominent, took it upon themselves to perform the functions undertaken during the Hitler period by Laval, Flandin and Georges Bonnet. They gave formal support to the President's position while industriously trying to undermine the foundations on which that position was built. On Monday—while Mr Truman, alone as only the President of the United States can be, was making the hardest decision of his life—Senator Millikin came out of a meeting of the Republican Policy Committee to announce that the United States had "perhaps a moral commitment to help the Koreans help themselves, to wit, with supplies"; but that the committee was "unanimous that the incident should not be used as a provocation for war." Twenty-eight of the forty-two Republican Senators were at the meeting and Mr Millikin's announcement can hardly have helped the President. Mr Truman must have felt better, however, when Senator Margaret Chase Smith, who had attended the meeting, showed something less than unanimity by announcing

that "now is the time for the United States to stand up against the Communist aggression that threatens the peace of the world."

It remained for Senator Taft, who has been engaged for some time in dispelling the rumours of his ability and intellectual honesty, to provide two supreme examples of the purely destructive attitude of the right wing of the Republican Party, though he was obviously trying, in his usual half-hearted way, to be less negative than in the past. "I shall discuss," he said, "the question of whether the President is usurping his powers. . . . My own opinion is that he is doing so; that there is no legal authority for what he has done," echoing *Pravda*, the *Chicago Tribune* and Representative Marcantonio. Then the Senator announced his support of what others recognised as the most courageous action by a democratic leader within memory, in the most discouraging words he could find. "It seems to me that the time had to come when we would give definite notice to the Communists that a move beyond a declared line would result in war. . . . It seems to me that the new policy was adopted at an unfortunate time. . . . I believe the general principle of the policy is right. . . . I feel that we must back up our troops with unstinted support. . . . Whether the President chose the right time for his new policy, or the right place . . . his action unquestionably has brought about a *de facto* war. . . . He has brought that war about without consulting Congress."

*

And then, in an effort to help his President in a crisis, Mr Taft added, in the face of all the known facts, that "any Secretary of State who has been so reversed by his superiors . . . had better resign and let someone else administer the programme to which he was, and perhaps still is, so violently opposed." Two days later Senator Wherry also demanded Mr Acheson's resignation. Senator McCarthy's monologue on the subject, of course, continued, but he is one of the pleasant casualties of the Korean war that, as Mr James Reston pointed out in the *New York Times*, "has finally overwhelmed the atmosphere of McCarthyism which has pervaded this city for months."

The performance of such important Republicans in this crisis is tragic, both for the party, which wants one day to win another election, and for the country, which desperately needs the two party system in working order again. It is hardly likely that their antics will compare favourably in the public mind with the dignity and courage of Mr Truman. But they may, with their perverted logic, manage to conceal the Secretary of State's part in the week-end's decisions. It was Mr Acheson and the State Department who maintained from the beginning that the fall of Korea would begin a series of disasters from which recovery would be difficult, and who pressed the political reasons for giving help in the face of clear military reasons—and an earlier decision by the President and the National Security Council—against involvement in such unsuitable territory. If the unfortunate Russians have been accepting all the McCarthy accusations as true and basing their policy on them, they must be bitterly disappointed at being so betrayed by their imaginary friends in the American Administration.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

American Notes

Congress Thinks of Holidays

The Korean outbreak fell upon Congress like an epidemic on a school that is counting the days until the holidays. The two parties had just agreed that they ought to be able to finish all essential business and go home to their election campaigns by July 31st. Whether or not this programme will be upset depends upon the seriousness of the Korean disease and the extent of the infection. So far the Administration has given no indication that it will ask Congress to authorise either new treatment or further preventive measures. It does not even seem inclined to seize this opportunity of pushing through the long-talked-of War Powers Bill, the stand-by legislation for emergency use that would give the President authority to mobilise the country's economy.

Indeed, the immediate effect of the Korean crisis has been to quicken the Congressional schedule. As did the Bill prolonging selective service, the Mutual Defence Assistance Bill sped, with a minimum of opposition, through a Senate glad of this opportunity of showing its confidence in the President. The Bill is now waiting for the House to return from its Fourth of July recess. The Korean invasion may actually kill the Tax Bill, on which the Senate Ways and Means Committee is now hard at work. It is being suggested that the reductions in excise taxes approved by the House may seem unrealistic by the time the Senate itself debates the Bill, if in the interval increased expenditure on defence has become inevitable.

The omnibus Appropriations Bill should reach the Senate floor next week. Once it and the Tax Bill are disposed of, Congress has little left to do, although it may hesitate to adjourn unless the international situation is clearer. Senator Mundt is insisting that the present emergency is making passage of his communist control Bill essential, although it was not included in the list of "must" legislation, earlier agreed between the party leaders. Nor was statehood for Hawaii and Alaska, but completion of the final stage of this Bill might be an encouraging gesture to these two areas on which so much responsibility rests during any Far Eastern hostilities. Another attempt to set up a Fair Employment Practices Commission is also likely, but there is no more hope that it will be successful than there was that Congress would approve other Fair Deal proposals, such as health insurance and a new system of farm subsidies, long ago abandoned for this session.

Both Houses have granted more generous insurance benefits to old people and an agreed Bill on this subject is sure to come out of conference. Rent controls have been extended until the end of the year and government ownership of synthetic rubber plants for two years. The Commodity Credit Corporation has been given its $2 billion in additional lending authority and a satisfactory Act for the admission of displaced persons to the United States has at last been signed. In fact, Congress has lately been earning its holiday.

Mission to Manila

The Philippine Republic has the North Koreans to thank for part of the present which President Truman gave it on the fourth anniversary of its independence—the strengthening of American forces in the islands and the acceleration of military assistance to the Philippine Government, an acceleration which applies also to Indo-China. This was a comforting gift, but the rest of the present was less reassuring. Nor was it a surprise package. The American mission, led by Mr Daniel Bell, which is to survey the Philippine economic situation, had been expected since the beginning of the year, but had been delayed apparently by the reluctance of the Philippine President to accept a mission with only American members. The United States Government, however, considered, and its view has prevailed, that Filipino members could hardly be expected to agree to a frank report on a situation arising, to an extent that the mission itself will have to decide, out of Philippine incompetence and dishonesty.

The shortcomings of their President and his government have often been pointed out by Filipinos, although they have resented criticism from America. But when the Philippine Republic opened up shop in 1946, the United States gave it not only independence but financial backing which, if carefully husbanded, should have been adequate to establish the islands on a sound business footing. Instead, bad management has brought them near to bankruptcy. Budget deficits are growing—revenue next year is likely to cover only half of estimated expenditure; slowness in rebuilding the country's basic industries and the squandering of dollars on luxury imports have completely unbalanced foreign trade.

It is true that efforts to remedy some of these defects have recently been made and that the long-drawn-out Huk revolt has been a drain on the country's resources. But the drain need not have been so serious if the Philippine constabulary had dealt with the revolt more satisfactorily. Now that the Army has taken over, the Huks are growing weaker, although they seem to be concentrating ominously in the

north of Luzon. There, it is thought, may be the stepping stone for the next advance of the Chinese Communists, should they succeed in taking Formosa. The Huks are led by Communists, but the movement is primarily a peasant revolt and much of the responsibility for it lies on the government's failure to carry out promised land reforms.

The Philippines may be the show window of democracy in the Far East, but today the window shows only that, there as elsewhere, democracy needs an efficient government and a healthy economy, as well as independence, if it is to attract the customers away from Communism. Many Filipinos, however, feel that they themselves need not bother to improve their country's display, since the United States dare not allow it to put up the shutters. Quite apart from the bad advertisement for democracy, the islands are vital to America's Pacific defences. The Bell mission is to recommend in the first instance ways in which the Philippine Government may help itself, but the terms of reference also include recommendations on ways in which the United States might be helpful.

Lilienthal's Vacant Chair

The search for a new chairman of the Atomic Energy Commission, which has presumably been going on since Mr Lilienthal resigned in February, will not be made easier by the refusal of the Senate Atomic Energy Committee to approve a new term for Mr Sumner Pike, the acting chairman and only survivor of the original Commission. A Maine Republican, but not so rock-ribbed as his native State, Mr Pike's "New Dealish" tendencies have ruffled the conservatives, and Senator Hickenlooper, whom Mr Pike antagonised last year by defending Mr Lilienthal, has accused the acting chairman, on the air, of insufficient enthusiasm for the hydrogen bomb. Mr Pike denies, with an emphasis some might consider excessive, that he allowed moral considerations to influence his advice to the President.

The AEC, below strength for the past five months, may now be reduced to three of its five members if the Senate does not reverse the committee. But if poor pay and Congressional criticism have thinned the ranks of those who must make the momentous decisions, the rapid rate of turnover in AEC membership has increased the number of those free to discuss, with authority, the issues involved. The Commission is expected soon to ask for an additional $300 million to speed work on the H-bomb and other atomic weapons; already it has cancelled one project involving industrial power from the atom, in order to release scientists to work on the H-bomb and on an atomic motor for submarines, the first application of atomic energy likely to be realised.

In May, however, Dr Robert Bacher, a former member of the Commission, and an outstanding atomic scientist, pointed out that every hydrogen bomb eventually produced would eat up substantial quantities of fissionable material otherwise available for industrial development or atomic bombs; from a military view-point, the latter may prove a more effective use of scarce resources than the hydrogen bomb. He called for the release of essential background information to enable the public to understand the issues involved.

*

Mr Lilienthal is equally critical of the policy of "security through silence" and argues that government monopoly of atomic research will mean exclusive concentration upon military uses. He urges that this paralysis of the atom's better half be avoided by allowing private industry to participate independently in atomic developments in non-military fields. (At present corporations and laboratories act purely as the Commission's agents.) Another expert, Dr Thomas, has submitted a detailed plan under which uranium would be lent to private corporations, who would use it to produce power and would return to the government the accompanying plutonium, isotopes, and other by-products. The weight of most comment is to the effect that, even if it were possible to separate the military and industrial uses of atomic energy, the practical production of atomic power is still so remote, save for military uses, in which cost is a minor consideration, that industry would be unlikely to invest $50 million or so in a nuclear reactor. Nor is it certain that military research is always an enemy of progress in the peaceful application of atomic energy. There is a good prospect, if Congress is not stampeded by the Korean conflict, that the Commission will soon release to the public some of the wartime atomic secrets that the Russians, by now, may be presumed to have discovered or borrowed. Such a step would only be educational; it would not make the participation of industry possible. The Commission is still extremely sensitive about postwar developments; 3,000 copies of the *Scientific American* had recently to be destroyed simply because non-secret facts about the hydrogen bomb were discussed by a Commission consultant.

Padlocking the Ivory Tower

Although few Americans contend any longer that Communists should be allowed to teach in the publicly-supported schools of a democracy, the problem of how to expel them without shaking the academic ivory tower to its foundations is far from solved. The University of California has been rent for months by a proposal of the Regents to impose a special teachers' oath. New York's Feinberg law, which proposes to safeguard the State and its children by legalising the doctrine of guilt by association, is distasteful to many Americans and has yet to be ruled constitutional. Without waiting for a final determination, the New York Superintendent of Schools has suspended eight instructors for conduct "unbecoming a teacher." In seven of the cases, this consisted of refusing to answer when asked if they had ever been members of the Communist Party. In the eighth, and real test case, there is an additional charge of party membership. The Communist Party is still legal in the United States, and it has yet to be judicially determined whether membership is cause for dismissal from a public teaching post protected by tenure rights.

The University of California, with its eight campuses, is the largest in the world, and one of America's outstanding institutions of higher learning. The struggle between the Regents, reflecting the legislature's demand for political purity, and the faculty, resisting in the name of academic freedom and personal liberty, has been watched with concern; the Californian model might appeal to other legislatures holding the academic purse-strings. The faculty objections were that California's teachers already take an oath of allegiance, and that a second implied that professors were a particularly unreliable group; that the oath would be ineffective in sifting out Communists, who would sign willingly; and that it was the beginning of political regimentation for teachers. Governor Warren, also opposing the oath, pointed out that it would carry no perjury penalties as it was not state-authorised. The faculty, not used to a short rein, threatened to walk out when the Regents arrogantly announced that those who had not signed by April 30th would lose their jobs.

To avert this, a compromise was arranged under which each of the 9,000 teaching and non teaching employees was to sign a letter, as a condition of employment, stating he was not a Communist. One hundred and fifty-seven who have failed to return the letter, none of them teachers, have received notices of dismissal. Seventy-three who have refused to sign for reasons of conscience have been given a clean bill of health by a review board. The Regents have postponed for a month the problem of this embarrassing minority which includes men cleared for atomic research, the modern medal of political reliability. It is to be feared that the price of this rather empty victory will be paid, not in California, but in state universities whose professors lack the national reputation and confidence to resist political pressure.

* * *

Shorter Note

The emphasis which his campaign put upon racial questions explains the unexpected defeat that the conservative Mr Willis Smith has inflicted upon Senator Frank Graham, in the North Carolina run-off for the Democratic nomination for Senator. Even the liberal Mr Graham's opposition to the Fair Employment Practices Bill did not save him from a defeat which is a serious blow to Mr Truman. For Mr Smith is certain of election and, apart from the difference on Negro questions his views are indistinguishable from those of the Republican opposition.

THE WORLD OVERSEAS

Italy in Europe

(From Our Rome Correspondent)

ITALY'S presence at the conference on M. Schuman's proposals has been compared by journalists to the part of a witness at a wedding, modest but not useless. In fact, Italy's prime interest in coal and steel is that it should receive them as cheaply as possible. Home sources supply only about 10 per cent of coal needs and the steel industry, which depends traditionally on imports of scrap, produces less than the national requirements. Italy's quick decision to join the pool has been blamed by the left who, in language not unlike that of British spokesmen, have complained that its practical workings are still quite inscrutable. But Count Sforza's move was made not on economic calculations but in pursuance of a political trend. There would have to be something afoot particularly alarming for Italian interests—as, for example, if it were proposed to include Italy's hydro-electric production in a pool administered by a cold-blooded international authority—to moderate the eagerness of the Italian Government to get in quick under the double incentive of improving Italy's eligibility for international co-operation (it is still, by Soviet insistence, excluded from Uno), and of pursuing the European idea.

Italy's west European policy is assailed only by those on the extreme left, who regard the present Italian political structure as a "restoration" (1815 style), with the Atlantic-OEEC set-up as a Holy Alliance against "progressive democracy," and by those on the extreme right who, in the back of their minds (not very far back) cherish schemes of a Hitler-Mussolinian new order to redeem the world again from Bolshevism and Anglo-Saxon-Hebraic capitalism. A west Europe policy, whether it talks of minerals or of spiritual values, signifies for the Communists just American imperialism. The other extremists, monarchists, Fascists, and other *nostalgici*, progressively pooling their homesicknesses in the nationalist fever that now rages horribly among the university and secondary school youth, also cry out against the De Gasperi-Sforza policy; but Britain, not America, is their special bugbear, and a Europe forming itself without Britain, but with the inclusion of a right wing Germany (and, who knows, Spain?) would begin to look pleasant in their eyes.

Resistance to Emigration

The meeting of the extremes in their contempt for the policy of the parliamentary Republic is well illustrated by their attitude towards emigration. This question which, in view of the 400,000 annual increase of population, is naturally a burning one for the government, pursued through difficulties and disappointments by the dispatch of missions of inquiry to South America and by negotiations with potential receiving countries. (Italy has, in fact, disposed of 130,000 persons by net emigration in the past year, but will go to the impending Geneva Conference with a powerful plea for more substantial outlets.) Such schemes are blasphemy to the Communists. The theory that it costs a given dose of investment to put a man into productive employment, and that the sum is not available in Italy from savings or prospective foreign loans, is regarded by them as valid only for capitalist Italy. Communist Italy, enriched by the elimination of competitive waste and of resultant social indisciplines, would, it is suggested, find ample means to reclaim its own internal deserts. The notion of an emigration outside the sphere of Italian sovereignty is likewise repugnant to the right wing (though the question is not prominently treated in their press). In the view of this group of movements it is monstrous "involution" of history that North Africa should not be available for the overspill of the Italian population carrying with it Italian sovereignty.

Interest in the Forces

Slated by both extreme wings, with the left proposing the alternative pattern of an eastward-tilted "neutrality," while the right calls up spirits from the troubled waters of the future, the foreign policy of the Italian Parliamentary Republic is, with one notable exception, no more than an elaboration of a determination to make the most of its club membership in western enterprises. There is nothing to distract Italy from single-minded attention to making the best of Marshall aid while it is on, and of any other American investment plan, under Point 4 or otherwise, when it is off.

The needs of defence, as well as those of opulence, are pursued along the channels of the same system, for the immediate postwar mood of hankering for a disarmed neutrality has quite faded away. A great parade of the services on Republic Day in Rome recently produced a fine display of smart young manhood, but brought no really modern weapons before the eyes of the public; nor did the air force put into the skies on that day the handful of British model jet planes which are its sole up-to-date equipment. The Italian chiefs of staff and the Defence Minister himself are now, however, familiar figures in Washington and at other sources of military supplies. They express themselves as satisfied that personnel is as free from weakening political infections as could be hoped in troubled times. Foreign observers give good marks for the use that has been made of the scarce materials which Atlantic Pact supplies are now gently augmenting. It may be noticed that Minister Pacciardi, himself a particularly conspicuous veteran anti-Fascist partisan, has proffered—evidently in the interests of military morale—a scheme to readmit veterans of the rebel (Mussolinian) Italian Army to pension rights for their previous service in the royal army.

The one exception to this single-minded policy is the Adriatic problem. The ascription of a profound historical and cultural meaning to the preservation of Italy's position at the north head of the Adriatic carries with it an altogether deeper emotion than that which was roused thirty years ago by the "drama" of Fiume, let alone the heady "passions" for such "unredeemed" lands as Corsica, or Malta. There is no question here of an Italian territorial claim upon which moderate men would be readier to compromise than extremists. It is true that Trieste has for some generations been the breeding place of an immodest and unseemly Italian contempt for the Slavs, and that the flag-wagging magnates of Trieste are an embarrassment to Rome. None the less, the sense that Balkan uncouthness must at

some point be withstood and rolled back by a society based upon Italian civilisation is common to all Italians, and the Venetian styled cathedrals, piazzas, and palaces of the small towns in "Zone B" are felt to mark the last line of such a defence. That Zara, Fiume, Parenzo, Rovigno and Pola should have been submerged in Slavdom is felt as more than bitter; but that Italianism should be in the course of being bounced and bullied out of the small cities of Zone B is regarded by all Italy as monstrous. Even the Italian Communists, in the days when their Trieste brethren did full homage to Tito, made efforts to gain guarantees for the Italian "character" not only of Trieste and its close surroundings but of the Istrian cities. The torments in which these places are now living, both those in Zone B and those annexed outright to Jugoslavia are encouraging normally sober Italians to con over the military equation that may exist in the Adriatic a few years hence.

Relations with Tito

Neither in the Italian circles of Trieste—except of course among the Communists, for whom this is dogma—nor seemingly in Allied military circles, is it accepted that there is any good prospect of Tito's Jugoslavia becoming part of the west. Non-Communist Trieste maintain, it is true, that Tito draws his prestige largely from real or anticipated American economic relief. They argue that, were he told by President Truman to behave himself, Zone B could at once breathe again and might even be evacuated. Trieste Italians of all political shades are united in believing that Trieste constitutes an indispensable Anglo-American base, and is thus assured of a long western occupation. The belief does not appear to be shared at all by the representatives of the west on the spot, who conceive their task as one of leaving behind them a reasonably tidy and clear situation a short time hence.

Only a Rome-Belgrade agreement could produce such a situation, and it may be remembered that a hard boiled agreement reached by Mussolini and Pasic in 1925, after an equally tormented period (in which, however, the local Slavs had then been the sufferers), settled affairs in the Julian March for a decade. The 1948 Tripartite Declaration on Trieste, too often misdescribed as a "pledge" to give the whole zone to Italy, is best regarded as a strengthening of Italy's arm for such a bargain.

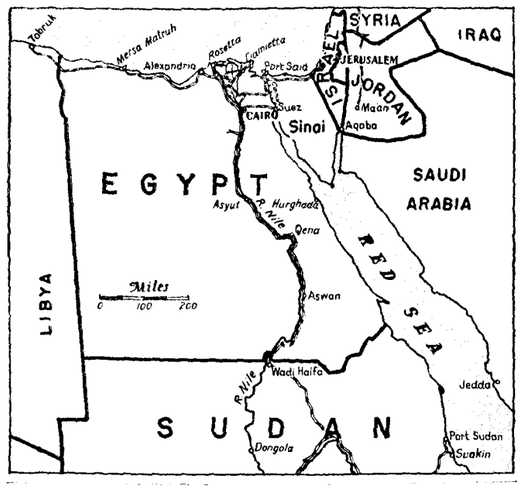
The drift of Italian policy, five years after the end of the war, is towards participation in a technocratic but socially traditional Europe, relieved by Christian Social stirrings. The trend is neither towards popular fronts of any description, nor towards the social democracy of which Britain in 1945 offered the model to a respectable cohort of Italian admirers. Italian politics have now taken the only shape that seems possible between the retreating tide of Communism on one side and the frothy but dangerous swirls of *nostalgismo* on the other. The British model is out of fashion, and so is Britain. The longdrawn and somewhat sullen British occupation of the African colonies; the contrast of British reticence with the easy going American and French readiness to treat the war as if it had never been; and a certain satisfaction, in Italy, at seeing the "five meals a day nation" go austere, tempered by suspicion that this is a hypocritical mask, have left the British almost without an overt friend or admirer in political Italy. The indictments of Italy's conduct in 1943-44 contained in Lord Alexander's dispatches, which are now being published, have brought a climax to British unpopularity which may lead to silence; for it is boring to be always baiting the same John Bull.

The kindest things currently said in Italy about England are to the effect that it is a lost leader in Europe. This should not be taken too tragically. The sense of historical process and of its wavelike movements is very strong among cultivated Italians; and it may be permitted to recall that, a hundred years ago, Italian patriots thirsting for Italian Unity often accused slow moving Piedmont of blocking the path; but it was necessary, for Italian union, that Piedmont should view the national aspiration first with stolid scepticism, then with stolid faith.

Defenders of the Middle East—III

Egypt

[BY A CORRESPONDENT]



On paper the Egyptian army is a force to be taken into serious consideration as a bulwark of Middle East defence. Unfortunately its efficiency is seriously impaired by its subservience to political factors and personalities; its utility in any general regional scheme is nullified by its overweening contempt of the other Middle Eastern forces; and its value as a potential partner in any western scheme is greatly reduced by a xenophobia which makes it utterly unreliable. This xenophobia is directed mainly against the British.

Basically, the Egyptian Army has been built up not so much for the defence of Egypt as for the bolstering of Egyptian prestige and pride, and its senior officers are appointed on the basis of their political leanings rather than on their military qualities. Many good officers have been dismissed (and were for a time imprisoned), the seniors for becoming too popular and the juniors for being too independent. It is not liked by a number of politicians and economists because it is far too costly (it absorbs nearly one-third of the budget); and it is a double-edged weapon—a cause for some disquiet.

The Army's Record

It must be emphasised, however, that could it be divorced from the baneful influence of politicians, and could it have, as many of its more intelligent officers would wish, closer contact with the British Army, the Egyptian Army could be a good one. It suffers from the severe handicap that is common to all Middle Eastern armies but Jordan's Arab Legion and the Sudan Defence Force: it has no practical experience of modern warfare. On the other hand, in defensive roles it gave good service during the 1939-1945 war (particularly in anti-aircraft and anti-submarine defence), and its record during the Palestine war was by no means as poor as it appeared, as there were extenuating circumstances for some of its defeats. During the 1939-1945 war there were neither sufficient British instructors available nor space or facilities for training, which virtually came to an end; and the British Mission departed soon after the end of the war. By the time the Palestine Mandate occurred the Egyptian Army in equipment, training and even morale was probably at its lowest ebb. The then Chiefs of Staff, and indeed the Prime Minister (Nokrashy Pasha), were aware of this disadvantage and opposed sending the army into Palestine; but they were overruled by the Palace. The King was singularly ill-advised and, it appears, badly misinformed by the men around him. Once the army was inside Palestine the British rendered Egypt a further disservice when, at the instance of the United Nations, they placed an embargo upon the despatch of arms and ammunition, thus leaving the Egyptian Army not only without those modern weapons which, under the terms of the Anglo-Egyptian Treaty they believed they had a right to expect, but also without effective ammunition for the few pieces of artillery they possessed. Egypt was indeed forced to the expedient of trying to manufacture fuses for 25 pounders in a garage just outside Cairo; it did not make so bad a job of it.

At the time of the Palestine war the Egyptian Army numbered between 25,000 and 30,000 badly trained and poorly equipped men. It was entirely lacking in armour; it had not a single tank and its transport was obsolete British Army material, not particularly well serviced or maintained. Its losses were fairly heavy. After the end of the Palestine fighting, large-scale reorganisation was immediately put in hand, and now the deserts around Heliopolis and Almaza are a hive of activity. At first nothing ambitious was possible as the arms embargo was still in force. Training, therefore, consisted of basic drilling and unarmed courses and lectures. But the size of the army was gradually increased to around 80,000 men and these are slowly being equipped with modern weapons of British manufacture. During the arms embargo much money was spent on purchasing miscellaneous equipment from various countries, principally Italy; but this has all proved almost entirely useless. Egypt's original plans were too grandiose and too expensive; they called for two armoured divisions and a total army of 125,000 men. So far only two or three brigades are fully armoured. Egypt possesses 100 Sherman tanks, 100 Sherman tanks without guns for training purposes, and is buying Centurions—the latest and largest British tank which cost £50,000 apiece. The target is now an army of 100,000 and this will probably be reached within three years, during which it is planned

to spend £E150 million on the defence services. Factories for the manufacture of small arms and ammunition ("in case Britain lets us down again") have been erected; although there is difficulty in obtaining raw materials, these are already in very small production. The Royal Egyptian Air Force is also being extended and here, as was to be expected, the emphasis is now on jets, of which only the first few of a consignment that is said to be going to number 100 have so far been delivered. At present only a few Egyptian pilots are able to fly these high-speed aircraft and a number of British pilots (in civilian clothes) are doing the job—although this fact is most carefully concealed from the Egyptian public. The Navy, too, has been increased by the purchase of two old British destroyers, some frigates and some miscellaneous craft, but it is still small.

Inadequate Officer Training

The Egyptian has long had the reputation of being a good but uninspired fighting man—provided that he is well led. But while there has undoubtedly been considerable improvement in the general standard of Egyptian officers, it is doubtful whether their training, received now almost entirely inside Egypt and supervised by other Egyptians, is good enough to turn out the right type of officer to lead a fighting army. Certainly their General Staff, from which one officer a year is sent to Camberley for a short course, would be quite unable to direct serious operations. The remedy of integrated training with British forces could be effected were it not for political difficulties. It would undoubtedly be welcomed by far more Egyptian officers than any Egyptian can publicly admit; it is worth noting that combined Anglo-Egyptian manœuvres held some months ago in the Canal Zone were highly successful. Already there is little doubt that the Egyptian Army is capable of taking over the defence of the Suez Canal, but it must be remembered not only that the Canal has entirely lost its value in time of war but that the British base in the Canal Zone is not there for the purpose of guarding the Canal; it is an indispensable bastion of defence over a very much larger area.

Relations with the British

How does the Egyptian Army fit into that picture? On its own, not at all: it is a misfit. In conjunction with a British or Allied army, reasonably well, but with one vitally important reservation. In the matter of security it would be impossible to place any reliance upon Egyptians. Their security machinery is modelled on the British; but, although thorough, it is completely ineffective. Many of them, whether from dislike of the British or of the west generally, or from mistaken notions of nationalism, or from ordinary corruption, cannot be trusted. The last war, during which Cabinet Ministers conveyed Allied military secrets to the Italians, shows how high this untrustworthiness goes. On a lower level, executive rank in any branches of the security administration has provided admirable opportunities for working off old grudges; for instance, many harmless Jews and alleged Communists have wantonly been placed behind barbed wire. Certainly the Egyptian official's job is not easy; it is well known, for example, that Israeli officers have entered Egypt on their ex-passports, some of them British—backed by their respective Embassies or Legations—for visits that Egypt naturally sees as espionage. In short, the new Egyptian Army will be the most powerful force in the Middle East—except for the Israeli Army—but its utility to anybody but its own country depends on a change of heart amongst all Egyptians who matter. Relations between the British Army and the Palace are easier today than possibly ever before, but those with the Government are disappointing. There is still a large section of the more educated community which is fundamentally and bitterly anti-British. The Egyptian Press is venomously so and misrepresents every British action. Yet Egypt's, and the Egyptian Army's, place in the world at large, and even in so small a sector of it as the Middle East, depends upon a realisation that there *are* other countries in the world than Egypt and other, and greater causes than Egyptian nationalism.

For Cultural Freedom

[FROM A CORRESPONDENT]

The British press paid scant attention to the Congress of Cultural Freedom that met in Berlin last week. Yet the meeting was an event of considerable significance; it marked or, at least, reflected a turning point of the western counter-attack in the "cold war."

The delegates included some of the best known writers and political thinkers in Europe and America; Silone, Jules Romain, André Philip, David Roussaye, Carlo Schmidt, Jakob Altmayer, Eugen Cogon, Haakon Lie, de Rougemont, James Burnham, Sidney Hook, Irving Brown, and James Farrell, to name only a few of the hundred and more who took part. The British delegation consisted of Herbert Read, Arthur Koestler, Hugh Trevor Roper and A. J. Ayer on the literary side; Harold Davies, Labour, and Christopher Hollis and

Julian Amery, both Conservatives, on the political. Ernst Reuter, once a leader of the German Communist party and now the Social Democrat Burgomaster of Berlin, was host to the Congress. The appointment, as secretary-general, of Melvin Lasky, the editor of Berlin's American-owned review *Der Monat,* suggested United States sponsorship.

To hold a Congress of Freedom in Berlin was, in itself, a gesture of defiance. The delegates, however, assembled in no defiant mood. Most of them were of the left ; some had only recently broken with the Communists ; and many were attracted to the fashionable conception of neutrality in the "cold war." One of them, Professor Thirring, had even come prepared to read a paper condemning American "atomic diplomacy." The first reports, moreover, of the Communist attack on Korea had only increased the general sense of insecurity and impotence.

These things raised grave doubts about the outcome of the Congress, doubts which the opening sessions did little to dispel. Many lengthy papers were read. Some were eloquent and interesting ; but it was not far wrong to summarise them —as did one commentator—as "Hot air in the Cold War." Then, on the Tuesday evening, came the news that the United States would implement the resolution of the Security Council and defend South Korea against aggression.

Europe's New Conflict

To some the news brought relief that Korea would not be another Munich. In others, especially those on the left, it revived the old faith in collective security. In others still it aroused only fear of war. But the fortune of the Congress was made. The real issue before the delegates had been crystallised. They could not ignore Korea ; they would have to take position for the American initiative or against it. The first straw in the wind was an announcement that Thirring would not deliver his attack on the United States after all.

Total Tyranny or Relative Freedom

The session of Wednesday afternoon opened in a charged atmosphere. Arthur Koestler read a paper which formed the centre of the debate. A few brief quotations will show its tendency.

> The antinomies, "Socialism and Capitalism," "Left and Right," have today become virtually empty of meaning. . . .
>
> Socialists have always . . . preached internationalism. . . . Yet the victory of British Socialism has not abolished British isolationism but has, on the contrary, strengthened it. . . .
>
> The alternative is no longer nationalisation or private economy in the abstract ; the real problem is to find the proper balance of state ownership, control, planning and free enterprise. And the search for this . . . is not an abstract but an empirical pursuit. . . .
>
> While the majority of Europeans is still hypnotised by the anachronistic battle cries of . . Capitalism and Socialism, history has moved on to a new alternative, a new conflict . . . total tyranny against relative freedom.

Most continental Social Democrats still regard themselves as Marxists ; and Koestler's suggestion that the meaning of Marxism had withered away aroused a wave of instinctive opposition. There was an element of resentment too—resentment that they should be taught this lesson by an ex-Communist. Koestler's attack, moreover, on the British Labour party stirred a latent sense of Socialist solidarity. Haakon Lie, André Philip and others rose to defend the orthodox Socialist position and to make the most of their differences with the parties of the right. Nor were matters improved by a brilliant but provocative speech by Franz Borkenau — like Koestler, an ex-Communist — hailing America's atomic supremacy. It seemed, for a moment, as if the rights and wrongs of Koestler's argument would be obscured by the emotions which it had aroused.

This crisis in the session coincided with the arrival of some of the British delegates, who had been kept back in London by the debate on the Schuman plan. Julian Amery tried to explain that, despite sharp differences over the Schuman plan, both parties in Britain supported the movement for European unity. He also stressed British solidarity with the American initiative in Korea and denounced the idea that there could be neutrality in the conflict between east and west. None of this was directly relevant to the academic argument under discussion, but it helped to bring the delegates back to a sense of reality. That a British Conservative should stress British unity on foreign policy calmed the resentment aroused by Koestler's attacks on the Labour party. The debate now continued in a calmer mood ; and, by the end of the evening, it seemed clear that the Congress had more or less accepted Koestler's conclusions.

No Support for Neutrality

This impression was confirmed next day by the final resolution issued by the Congress. It contained three declarations of major importance. First, that there could be no compromise between totalitarianism and freedom. This was a plain rejection of any form of collaboration or united front with Communism. Second, that the practical pursuit of totalitarian policies was intolerable. This was a return to Robespierre's slogan "no freedom for the enemies of freedom" and implied support for legislation directed against Communist activity. An attempt to go still further and outlaw totalitarian ideas, as distinct from action, was wisely and successfully resisted by the British delegation. Last, and most important of all, was a plain declaration that there could be no neutrality in the conflict between Communism and western principles.

The congress concluded its labours by electing a permanent committee. Its members are to meet in Paris in the autumn to plan the next step in what is envisaged as the west's reply to the Communist Peace Campaign.

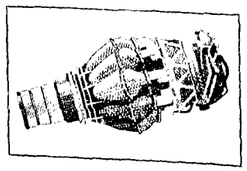
Inert Gases

Over 99% of the air we breathe is a mixture of oxygen and nitrogen. The remaining 1% contains, in addition to the carbon dioxide which we breathe out, no less than five other gases. Though these were not discovered until recently, as long ago as 1785 the English chemist Henry Cavendish noticed that a fraction of the air differed from both oxygen and nitrogen. This observation was confirmed more than a century later when an English physicist, Lord Rayleigh, discovered that nitrogen extracted from the air was heavier than nitrogen obtained from ammonia. Working together in 1894 Lord Rayleigh and Sir William Ramsay found that the difference was due to a gas which later they named argon—a Greek word meaning lazy—because of its reluctance to combine with any other chemical substance. In the following year Ramsay discovered another gas by heating the mineral cleveite. He proved that this was helium, an element which in 1868 Lockyer had observed in the sun. Shortly after Ramsay's discovery it was confirmed that helium existed in the earth's atmosphere also. Finally in 1898 Ramsay and his colleague Travers fractionating liquid air discovered three other gases which they named krypton, xenon and neon. Called the "inert" gases because of their characteristic chemical laziness, these elements have many practical uses today.

Helium is used in airships and in deep diving apparatus. Argon, a filling for incandescent electric bulbs, is now used in certain welding processes. Krypton and xenon are used in photographic flash lamps, and neon, together with certain of the other inert gases, in the brilliant electric signs that bear its name.

ICI

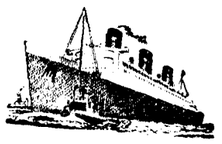
HOW MUCH DO YOU KNOW?

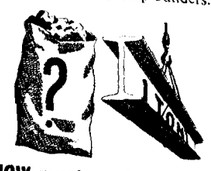


What is the plate a plate-layer lays?

EARLY railway tracks were made with flanged metal plates. The men who did the work were called "plate-layers", and the name has stuck although steel development has revolutionized our methods of railroad construction.

WHY does Britain lead with jets?





A jet engine works essentially by sucking in air at the front, compressing it, compressing it still further by burning it, and then forcing it out at the other end. British scientists and steelmakers gave reality to the inventor's dream. They made the first steel in the world that could stand up to heavy stress at over 1,000 Fahrenheit — red heat. Every year steel firms individually and through their research association are spending over £2,000,000 on research.

WHY are ships made of steel?

Because steel is strong. It is so strong in fact that if the *Queen Mary* could be reduced to ten feet long her hull plates would be thinner than the paper on which this is printed. The first steel ship to cross the Atlantic was Clyde built, and the low price of British ship plates helps us to remain the world's leading ship-builders.

HOW much coal to make a ton of steel?

Between the wars the coal needed to make a ton of finished steel was reduced from over 60 cwt. to 41 cwt. It is now down to 37 cwt. Development and research by the steel industry enabled us to make nearly 700,000 tons more steel in 1949 with less coal than in 1948.

THE BUSINESS WORLD

The Coal Board's Profits

THE Nottinghamshire miners' secretary, who accused the National Coal Board this week of "making too much profit," was in one way attacking the principle of *national management of the coal mining industry*. If in the days before nationalisation (said Mr Herbert Booth at the mineworkers' annual conference) the miners had learnt that their leaders were letting the owners make 15s. profit on every miner's shift "they would have hanged every leader there was." It is true that the board is making a handsome profit (9s. 5½d. a ton in the last quarter of 1949) on Nottinghamshire coal; this is the most profitable of the British coalfields. In other fields the board is still accepting severe losses—in Northumberland 1s. 1d. a ton in the same quarter, in Cumberland 7s. 3d. a ton, in the small field of Bristol and Somerset 16s. a ton. The good pits are paying to keep the bad pits in business, and the report for 1949* makes it sufficiently clear that the schemes of reorganisation and development have still a long way to go before production is entirely concentrated in pits that can pay their way. In 1949 "the profitable collieries made a total profit of £50 million while others incurred losses totalling £20 million."

On balance, however, the board did make a handsome profit last year. Its collieries, having some 5,000,000 tons more coal to sell than in 1948, earned £481,208,246 in pithead proceeds; this was an increase of nearly £20 million on the preceding year, and the total of colliery costs, at £451,789,914, was only £5,600,000 up. Thus the operating profit of the board's collieries amounted to £29,400,000, and the figures for various ancillary activities brought the operating profits for the year to £31,136,700. After providing for compensation for loss of office (£800,000) and setting aside £4,000,000 for the supplementary scheme for workmen's compensation and £3,500,000 for taxation, the board was able to pay the interest and interim income due to the Ministry of Fuel and Power and still show a surplus of £9,466,813 on the year.

*

The need for such a surplus goes back to the first unhappy year of the board's life, when it made a loss of more than £23 million, most of which was still outstanding at the beginning of 1949:

> The surplus of £9,500,000 on the year's operations in 1949 has been used to reduce the deficit of £21.8 million with which the board began the year. The board's object is before the end of 1950 to make good the remaining £12.3 million of their deficit and then to start building up a reserve against more difficult times.

The programme seems, then, to envisage a series of stiff annual profits to strengthen the board's position when "more difficult times" arrive. There are, however, snags in such a programme. Will the mineworkers exercise patience and restraint while the board makes a series of stiff profits? It needs to be remembered that the profits will have to come mainly from a few successful areas, where (Mr Booth's remarks about hanging suggest) forbearance may not prove to be unlimited.

But there is another snag. The board was able to sell its coal for export last year at prices about £1 a ton higher, on the average, than the prices ruling in the British home market. Since exports and foreign bunkers amounted to 19,245,000 tons, it is easy to see that without this bonus, and assuming an unchanged home price level, a fairly heavy deficit would have taken the place of last year's surplus. The board has so far been successful in defending its price policy against European and American attacks, but the attacks have been determined and in a certain way sincere, and there is little doubt that they will continue. The issue of dual price policies has been a diplomatic liability to Britain in the past year; whether the liability is worth bearing for the sake of £15 million a year in hard cash is a matter of opinion. The board maintains that it could have got still higher prices for its exports, but that the risks of loss of goodwill would have made it a mistake to do so.

Thus it concedes that intangible factors do set a limit to the policy of making the foreigner pay. Further, the international market will not always be so favourable, and the board in its cautious estimate of its own financial position shows some awareness of this fact.

*

The whole question is a difficult one; no clear and obvious line of conduct stands out. As the board points out, its export prices, though higher than British home prices, were competitive in relation to the prices charged by other suppliers, and indeed the scarcities that still existed would have enabled it to charge more. Further, the effort to expand coal output tends to raise costs:

> To maintain a sufficient production to supply the demands of home users and still export a large tonnage of coal the board had to resort to extensive overtime working in the pits and many old and inefficient pits where costs are high were kept in operation.

The flaw in this argument is that the export trade—though it is certainly of benefit to Europe—is not undertaken out of pure benevolence; the export connection is a trading asset that the board presumably wants to build up and foster against the day when the home market may not be able to take its entire output. The prices now charged may, in the given circumstances, be right or wrong. What can hardly be questioned, however, is that the board needs to be in a position to reduce its export prices as competition becomes sharper in the European coal trade.

Is the board in such a position today? Various passages in the report suggest that it may not be. It has the 1947 deficit to wipe off; to provide against bad years of the future, it feels obliged to set about forming

* *National Coal Board: Annual Report and Statement of Accounts* for the year ended December 31, 1949. H.M.S.O. 7s.

a nest-egg as soon as this is accomplished. These obligations arise from the clause in the Act that lays down that policy shall be directed to securing that revenue shall cover outgoings "on an average of good and bad years." Reasonable as the principle is, it can perhaps be doubted whether its authors foresaw the situation that forced the board in 1947 to incur a huge deficit in its first year by pursuing the goal of higher output at any cost. Even had this been foreseen, who would then have supposed that the deficit would have been made in effect a charge on the export trade alone? But even today the cost of supplying home requirements is not being fully met by home earnings.

*

To suggest that the board is unaware of its dilemma would be unfair. Its prosperity is precarious and its freedom of movement is limited. Its one hope of gaining real freedom of movement lies in a reduction of the costs of producing coal. Clearly the scope for reducing costs is limited by the obligation that still lies on the board to expand output at the same time; and the report for 1949 is in substance an account of the efforts made to move in both these directions at once. In the event the board achieved an increase in output of 5,000,000 tons—enough to prevent any critical shortage, but less than had been hoped and much less than could have been sold. At the same time it managed to bring costs down by an average of slightly over 6d. a ton—the first reduction since before the war. The report shows how the increase in output was reached:

	Million tons of output
Greater output per man shift at coal face	+6.7
Increased number of face workers ...	+2.3
Fewer working days	−2.2
Less regular attendance	−1.8
Net increase in output	+5.0

The industry lost, on balance, 17,400 men during the year; but it succeeded in increasing the proportion of face workers, and over the year more men were at work at the face than in 1948.

Indeed, while the board has to admit the failure of its efforts to maintain (or even to stem the decline of) its labour force, it does claim that because of measures to use the labour to better effect "the result was not so damaging to the industry as it might have been." Its immediate problem was, in fact, less the shortage of men than the fact that many men were employed in the wrong part of the colliery (usually, too far from the face) or even in the wrong part of the coalfield; and some, it seems evident, were the wrong men. "The shortage of manpower was no reason for keeping men in the industry who were, for one reason or another, unsatisfactory." Therefore some 8,000 men were dismissed for such faults as persistent bad attendance or undisciplined behaviour; this was 3,100 more than in 1948, and clearly the firmer attitude towards discipline must have contributed to the shrinkage of the labour force. The board insisted on transferring many fit workers from the surface to underground work, and dismissed some who would not go.

In its recruiting it tried to insist on quality—accepting, in the south of England, only 65 per cent of the men who came forward—and this attitude influenced the decision to ask for the removal of the "ring fence." The regulation that prevented the men from leaving the industry "was keeping in the industry some men they did not need and was keeping some good people out." The difficulties that have resulted in part from a tougher labour policy are not trifling, and may still become a serious embarrassment; the wastage of men has gone a long way since the beginning of last year. But without such a policy, either the increase in output or the reduction (slight as it is) in costs would have been impossible; the two could not have been achieved together. Nor, indeed, would the effort to get cleaner coal have had much chance of success. Dirty coal can only partly be dealt with by installing new plant; the remainder of the cure must come from better discipline in the pit.

*

Schemes of technical improvement—sometimes costly schemes—have been known to give disappointing results because the economies in labour that they made possible have not, when it came to the point, been carried out. This report gives a number of instances in which improvements have in fact led to savings of labour, increases in productivity, and reductions in cost. Since a new mine, or even the reconstruction of an old mine, may take something approaching ten years before it begins to yield full results, the improvements that have taken effect so far are mostly of a limited kind. Thus at Markham in the East Midlands division the workings were concentrated and trunk conveyors were installed, and 100 men were released for face work; in one seam an improvement in the roof conditions was followed by an improvement of 4½ cwt. in output per manshift. At Harworth the installation of cutter-loaders, the extension of the trunk conveyors, and a reduction of the number of loading points released about 40 haulage men for the face and enabled OMS to be increased by 3½ cwt. The closing of the Bonds Main Colliery led to a saving of some £100,000 a year, and the consequent transfer of 257 men to more productive pits in the same coalfield led to an estimated gain of 20,000 tons a year in output. At Heworth (East Durham) a modification to a winding engine enabled winding to be concentrated at one shaft, the labour of 41 men to be saved, and OMS to be increased by 2½ cwt. These are random examples.

The industry's progress depends, on one side, on a multitude of relatively small improvements of this kind—and on the skill and resolution with which they are made effective in terms of higher productivity and lower costs. On the other side it will depend on the long-term reconstruction and reorganisation of the coalfields, the main plan for which is believed to be now substantially complete. The success of these two major operations taken together will in the long run determine the scale on which the mining industry in Britain is to survive.

COAL OUTPUT AND COSTS, 1947-49

		Scottish Division	Northern Division	North Eastern Division	North Western Division	East Midlands Division	West Midlands Division	South Western Division	South Eastern Division	Great Britain
Saleable Output (Tons) (Calendar year figures)	1949	23,835,200	39,212,400	42,050,100	14,442,300	39,069,400	18,264,100	24,209,000	1,595,700	202,678,200

Business Notes

Sterling Area's Dollar Surplus

A further and unexpectedly good recovery in the British gold and dollar reserve occurred in the second quarter of this year. During this period the sterling area's net gold and dollar surplus amounted to $180 million compared with a surplus of $40 million in the first quarter and a deficit of $632 million in the second quarter of 1949. Receipts under the European Recovery Programme amounted to $240 million in the second quarter, while $18 million was drawn in the same period on the Canadian credit. These three items make up a total of $438 million which went to strengthen the gold and dollar reserves, carrying their total on June 30th to $2,422 million, a figure that compares with a low point of $1,340 million reached immediately before devaluation. The increase in the gold and dollar reserves has been such as to drain the sterling resources of the Exchange Account, and the Chancellor of the Exchequer announced this week that, in order to replenish these resources, he was issuing a further £300 million to the Account from the Exchequer. This will carry the existing borrowing power of the account to £875 million. At current rates of exchange the gold and dollars in the account amount to £865 million, but since well over half these reserves were acquired in sterling before devaluation at the lower gold price, the available margin of sterling resources is far greater than the £69 million indicated by the difference between these two totals. The unexpended sterling resources are, of course, re-lent to the Treasury against "tap" Treasury bills.

The continued recovery of the reserve and the maintenance of a net dollar surplus by the sterling area for a second consecutive quarter are reassuring and welcome developments. The further the distance from devaluation, the less becomes the effect of the "once-for-all factors" such as the reflux of funds that helped the recovery of the reserve in the immediate post-devaluation period. There may, however, be some elements of impermanence even in the more permanent influences that helped the sterling area to earn a larger dollar surplus last quarter.

The Chancellor pointed out that the chief factor has been the continued high level of demand for sterling area produce in the United States. In that context it should be noted that, accompanying the increase in the reserve, there had been an increase in the United Kingdom's short term liabilities in recent months, particularly to other sterling countries. The rise in raw material prices has greatly benefited dollar earnings, and the cautious Treasury view is to anticipate some reaction in these prices after their recent upward trend. Events in the Far East may, however, provide a new stimulus to the inflation of commodity prices and lead to an expansion in overseas expenditure by the United States that will have a marked effect upon the dollar balance of payments of the sterling area.

* * *

Reduced Dollar Expenditure

The chances of a continued dollar surplus for the sterling area are more assured on the expenditure than on the revenue side of the balance of payments. The outlay on dollar imports by the whole sterling area is now running well below the limits imposed before devaluation.

The effects of devaluation on comparative prices have reinforced the import policies decided in the summer months of 1949, and the proposed 25 per cent cuts have been more than realised. Other factors in the improved situation have been the continued high level of invisible earnings of the United Kingdom, the welcome, though still moderate, increase in direct British exports to the United States and Canada and the larger gold imports from South Africa, in consequence of the new arrangements whereby gold is paid for South African imports of certain categories of essential goods for which universal open licences are issued. Only a fraction of the increase in the gold and dollar reserve in the past quarter has been attributable to a narrowing of the gap between dollars expended by Britain on Marshall aid goods and the subsequent reimbursement of these expenditures by ECA. The hidden reserve represented by this lag amounted to $75 million at the end of March. Towards the end of June it had narrowed to $71 million; in effect, therefore, $4,000,000 was shifted to the visible and declared reserve.

Although the gold and dollar reserve has now recovered beyond the level of $2,241 million at which it stood on the eve of the European Recovery Programme—the oft declared minimum level—the need for its further strengthening is self evident and was again stressed by the Chancellor of the Exchequer on Wednesday. The bulk of the recovery in the reserve since September, 1949, has been due, as the appended table shows, to the receipt of ERP dollars. That is a source of revenue that is dwindling rapidly and will come to an end two years hence. There is, in fact, a danger that, given the way in which these gold and dollar

reserve figures are presented and explained by the responsible Ministers, this source of revenue may be turned off more rapidly than the position warrants. At no point did the Chancellor's statement imply that the receipt of assistance from the United States might in any way have helped the sterling area to achieve its welcome and creditable surplus with the dollar world. The two were kept in watertight compartments and the erroneous impression may thus have been created that the Marshall dollars went straight into the reserves. That is certainly how economy-minded Congressmen will interpret the facts—thereby reaching the unwarrantable conclusion that Britain is no longer in need of any assistance from the United States.

* * *

First Quarter's Surplus

The Exchequer return for the first quarter of the financial year is a notoriously poor guide to the prospect for the full year, but if this reservation is borne in mind, the figures issued at the end of last week can be regarded as reasonably reassuring. Ordinary revenue, at £768.8 million, was £12 million more than in the first quarter of 1949-50, whereas for the full year the Chancellor envisaged a decline of £26 million. On the other hand, ordinary expenditure—expected to rise over the twelve months by nearly £80 million—has in the first quarter contracted by nearly £29 million, to £727.7 million (including £2,500,000 for sinking fund). In consequence, in these three months there has been a net "above-line" surplus of £41 million, whereas in the first quarter of 1949-50 revenue and expenditure were almost exactly balanced (at just under £757 million). It should be noted, however, that the performance of revenue owes a good deal to the three special items—surplus war stores, receipts from trading services and Miscellaneous receipts. The Chancellor envisaged a decline in receipts from these three sources by £15 million in the full year, whereas in the first quarter they have gained nearly £5,500,000. Among the more normal sources of revenue, profits tax and EPT have fallen by £17 million—more than half the decline expected for the twelve months. On the other hand, excise receipts, expected to rise by £6,800,000, have in the first quarter risen by £12 million.

"Below-line" expenditure, taken as a whole, seems to have been reasonably in line with the estimates. Its net amount was £107 million, compared with £170 million in the similar period last year—a difference almost exactly equal to the special non-recurring payment of £62½ million made early last year on account of war damage to public utilities. If this special item is excluded from the reckoning, total "below-line" expenditure was expected to rise in 1950-51 by about £30 million whereas it is so far approximately stable—despite the fact that loans to local authorities (mainly for housing) have already risen by no less than £19 million compared with a budgeted increase of only £7,300,000 for the full year. This increase has so far been offset, however, by the fact that purchases of cotton have required no further net new finance (in the first three months of 1949-50 they required £11½ million) and by a reduction in other war damage payments. The upshot of the quarter's experience was an overall deficit of £66 million, compared with £131 million in the similar period last year.

* * *

Subsidising Film Production

The Government has been under pressure for a long time to subsidise the producers of British films by means of a levy on exhibition, to be accompanied by remission of Entertainments Tax. It has always given sound and intelligible reasons why it would not do such a thing, and the Plant committee supported its attitude with arguments that have not been refuted. Why, then, has the Government changed its mind? It has decided in favour of the levy and the subsidy, while (of course) keeping the remission of taxation to a bare minimum. In doing so it has turned its back on the rational approach to reform of the film trade that was embodied in the Plant report—the approach that seeks to create healthy trading conditions in which film producers might survive by their own exertions.

Mr Harold Wilson outlined the new scheme to the Commons last week. The Treasury has decided to give up some £300,000 in Entertainments Duty on the cheap seats. On the dearer seats the trade is to be permitted to charge an extra penny without incurring heavier duty, and on seats dearer than 3s. 9d. "special provision" will be made. While not all the details have yet been made clear, the calculation is that the exhibitors can by these means increase their total earnings by some £3,000,000 a year if attendances remain constant. Half of this they can keep for themselves; the other half they will be expected to pay through the Customs and Excise authorities into a central pool in the form of a levy of a farthing a seat. Administrators, whose names have yet to be published, will distribute this money to the producers of British films shown during the year, in proportions related for the most part to the box-office earnings of the films.

The decisive event that induced the Government to involve itself in this tangle was, apparently, an expression of willingness by the exhibitors to collect the extra penny from the public in the dearer seats, and to pass some of it on, provided that the tax scales were stretched to permit this to be done. Thus, while the Revenue is to contribute £300,000, the cinema-goer is to contribute an additional £2,700,000. He is, in effect, to pay a second tax levied not by the Government but by the trade. Thus he will be supporting the British film producer whether he goes to see British films or not; in the present situation some three-quarters of the total levy will arise in fact from the showing of American films.

* * *

Film Finance and Policy

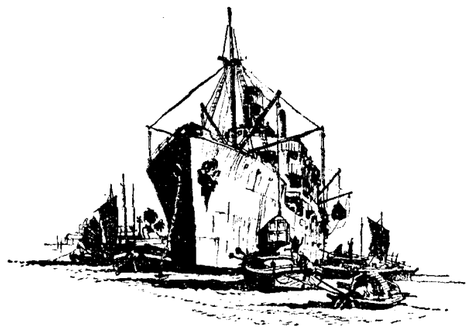
As one slightly soured member of the trade observed, there is only one certainty about collections of money for British film production, and that is that the money will eventually be lost. While the process is going on and devices are being found to make the scheme work the film exhibitors and renters, the producers, the Government, and not a few lawyers will no doubt be busy. But what of the cinema-goer, whose attitude may prove important in the long run? If he does not want to pay the levy, his only remedy will be to stay away from the cinema altogether. Unless he stays away the exhibitor will have no option but to take his penny, because, though the scheme is officially "voluntary," the trade associations have agreed to it and means of enforcement are already being informally discussed. The Government may or may not decide to make the payment of the levy a statutory obligation on the exhibitor; if it does not, powerful means of pressure are still at hand, including perhaps the incorporation in all film hire contracts of an undertaking to pay the levy.

Whatever its final detailed shape, the scheme in the broad outlines explained by Mr Wilson will now inevitably take its place in the custom and practice of the trade, and no doubt—like so many other official money-raising efforts—it will persist long after its original purpose has been frustrated or forgotten. Is it to take the place of a policy for the British film industry? It would seem so. The President of the Board of Trade has spoken more than once of the need for such a policy—"the more fundamental attack which will have to be made on the problems of the industry," as he described it in April. Last week's debates, in which the affairs of the National Film Finance Corporation were reviewed and the Bill to extend the borrowing and lending powers of the corporation was given its second reading, had been widely expected to provide the occasion for a more fundamental statement.

*

Instead, the President contented himself with more expressions of hope that the film industry will yet "float itself off the sandbank on to which it had drifted." The Film Finance Corporation is to help the floating with an additional £1,000,000. As the corporation's work stands at the moment there is no particular justification for refusing this money. But the situation should cause no satisfaction, and it is disturbing to find the complacent assumption persisting that a self-supporting film production is still just around the corner—that a stopgap is all that is needed and, given a little more time and a little more of the taxpayer's money, the industry will right itself. Can this really be taken for granted? Would it not have been better to insist that the definition of the purpose must precede the appropriation of funds instead of being left for later? The prevailing muddle is well enough illustrated by Mr Wilson's description of £1,000,000 as a "small" amount. Common sense would seem to dictate that whether £1,000,000 is a "small" or a "large" sum depends on the use to be made of it and the eventual return that it is reasonable to expect. With no policy evolved, no aims defined, and no return predictable, the scale of loans and subsidies to the film industry has begun to appear unreasonably large.

* * *



EPU—Latest

The meetings of the Ministerial Council of the Organisation for European Economic Co-operation that began in Paris on Thursday should by this week-end have produced final agreement on the European Payments Union. Up to the beginning of this week a number of significant points of detail remained to be cleared by the Joint Trade and Intra-European Payments Committee of OEEC. These outstanding matters included the determination of the rates of interest to be paid to creditors and by debtors of EPU, the rules relating to the termination and liquidation of the Union, the fixing of the unit of account to be used by it, and finally, the manner in which commercial discrimination might be exercised in favour of excessive debtors and against excessive creditors with a view to maintaining that approximate equilibrium in balances of payments without which the EPU would soon be waterlogged and ineffective.

All but the last of these questions were apparently settled satisfactorily before the ministerial meeting. The rates of interest paid to creditors and exacted from debtors of EPU are expected to be moderate and to be levied at the same rates on each side of the account. The unit of account will be equivalent to the US dollar, of the present gold content. In the circumstances it is questionable whether it will be necessary to invent a new name for the unit. The rules

for liquidation of the net debtor or creditor positions outstanding when EPU comes to an end are necessarily complicated. They are likely to be so framed as to make possible an extension of the EPU beyond the Marshall Aid period. The provisions for discrimination have unfortunately proved to be a much more difficult and contentious issue. The British delegates have as usual pleaded for the maximum freedom of action in discriminating against creditors and in favour of debtors of EPU. It may be wondered whether this attitude is mainly an echo of a distant and now anachronistic debtor status. By trying to provide for measures of discrimination against creditors in intra-European payments, Britain may be manufacturing weapons seen to be turned against itself.

* * *

Unilever Points

To outward appearance, the Unilever group had an extremely good year in 1949, for consolidated net profits rose impressively from £10.5 million to £19.6 million. No major part of this increase arises from the inclusion of the net consolidated profits of the undertakings in western Germany and Austria; these account for only £125,000. There are three major factors that affected last year's figures. Devaluation of the pound and the guilder gave rise to exchange surpluses of £5.7 million; these are brought into credit, but taken out to reserves. Secondly, £1.8 million has been transferred from stock reserves to the year's profits; it is evident

that 1949 was an awkward year for the group in the United States where "selling prices had to be reduced more quickly than the raw material cover cost could be adjusted." Last year's transfer from stock reserves "largely covers the 1949 losses" in the United States. Thirdly, tax adjustments relating to earlier years were much smaller—£731,135 against £3,324,442.

No specific reference is made to the results of the Lever Brothers Company in the United States last year. Changes in the top management of that company were made last May. Evidently it had fallen behind in the synthetic detergent business, and its development will "continue to be a charge on our profits this year." A certain caution accompanies the confident references to the changes in the American company's organisation, but it is recorded that "the health of our established brands is sound." In Europe, trade has been freer, and in the Orient (China apart) business has been good although politics have been disturbed.

The Unilever report makes some important points for the attention of stockholders. Finance is becoming tight, and it would become very tight indeed if the group were allowed to complete the process (which has gone a long way in some countries, but has not started in this country) of taking over direct responsibility for stocks of oil seeds. For Limited, this step—if the Government allowed it—could easily absorb £15 million of new finance. The depletion of liquid resources has already reached the point at which the board of Limited must have in mind the eventual possibility of an issue of new capital; NV has already undertaken a major financing operation by the issue of Fl. 75 million 3½ per cent. convertible Notes. Another point of serious consequence is the effect of arbitrary subsidised prices for butter and margarine in this country; sales of margarine reached record levels in the Netherlands, but in this country the ration was not fully taken up towards the end of last year. Reference is made in a subsequent note to the complexities caused by subsidised prices and pooled brands for Unilever's margarine business in the United Kingdom.

* * *

Panama's Merchant Fleet

A remarkable feature in world shipping since the war has been the increase in tonnage registered in Panama, bringing this republic, which in 1939 had an insignificant fleet, into the fourth place—on paper—among the world's maritime nations. Few of these ships ever see Panama, nor do their owners, managers and officers. Many of the ships, particularly the tankers that predominate in the Panamanian registry, belong to United States companies; about one-quarter of the fleets of the American oil companies are registered in Panama. Most of these are well-found and up-to-date vessels, as are the cargo vessels and ore carriers recently built in Great Britain and elsewhere for Panamanian registry; they fully comply with the best national and international standards of safety and strength. On the other hand, nearly half the Panamanian fleet consists of ships that are 25 years old or more, and many would be refused registry in the ports of other countries. It is presumably the existence of such ships that led the international transport workers' federation last year to conduct a vigorous campaign against them, with the threat of a boycott.

As a result of these complaints and of the inability of the Panamanian Government to remedy them, the International Labour Office set up a committee to investigate conditions in Panamanian ships. Although the committee inspected only 30 vessels, it found that Panama had virtually no regulations governing such matters as the international safety at sea and loadline conventions, standards of crew accommodation, or hours of work. Such regulations as existed were frequently unknown to owners and masters. The consular service of Panama was not sufficiently large or experienced to exercise control. Wages were extremely diverse, and in several cases were well below international or good national standards.

The ILO committee did not attempt to establish reasons why so many shipowners registered their ships in Panama, but the international transport workers' federation has suggested that the motives might be to avoid taxation, to evade currency regulations, or to escape the provisions of the international conventions as to safety and standards of accommodation that are commonly accepted by maritime countries. The crux of the matter is that while a large proportion of ships inspected by the ILO committee did maintain adequate standards of safety, this was due mainly to the owners' sense of responsibility, and not to any obligation to or supervision by the Panamanian Government. Unless that government takes adequate measures, there is nothing to prevent unscrupulous shipowners of any nationality from taking advantage of a situation that is as objectionable to the majority of shipowners as it is to seafarers.

Anglo-Iranian Royalties

A striking feature of the full report of Anglo-Iranian for 1949 is its detailed assessment of the burden to be shouldered by the group under the Supplemental Agreement to the company's 1933 Concession Agreement. The new agreement, though signed in Teheran last year, has not yet been ratified by the Majlis, but its ratification (*with retro-active effect*) is expected shortly. The company will then have to pay, as from 1948, 6s. a ton in royalties instead of only 4s. under the 1933 agreement, while a flat rate of 1s. a ton taxation will replace the previous rate of 1s. per ton on the first 6,000,000 tons of oil and 9d. per ton on further amounts. In addition the company will have to pay to the Iranian Government forthwith an amount equal to 20 per cent of its general reserve as at December 31, 1947, and also to pay year by year a similar proportion of its current allocations to general reserve. It retains its obligation, imposed under the 1933 Agreement, to pay the equivalent of 20 per cent of any distribution to ordinary shareholders in excess of £671,250 in any one year. Sir William Fraser, chairman of the company, indicates in the report exactly what these new commitments will, on ratification, have cost the company for the past two years. Whereas the payments under the 1933 Agreement amount to £9,172,245 for 1948 and £13,489,271 for the past year, with the Agreement ratified the corresponding payments will be £18,667,786 and £22,890,261. The company has made full provision for the higher payments in its accounts up to the end of 1949.

With this information it is possible to gauge the trading experience for the past year more precisely. Total revenue of the group, before charging royalties, fell slightly, from the peak figure of £89,133,929 to £88,508,571. Consolidated trading profit after deducting royalties amounted to £63,020,405, compared with £68,384,706 in 1948. These figures emphasise the inadequacy of the preliminary profit statement, which showed that consolidated net profit declined from £24,471,888 to £18,444,209, but gave no indication of how the figure for the latest year was arrived at. The full accounts reveal that it has been struck after providing £24,353,920 (against £17,683,902) for depreciation, oil exploration and survey repairs and after deducting taxation of £22,840,181 compared with £28,310,353 in 1948. Sir William is content to regard 1949 as "a readjustment year" following the "very remarkable year" in 1948, but in fact its results are hardly less impressive. The group's capital expenditure in 1949 has again been on the grand scale, amounting to no less than £56 million. The main items in this bill include the expansion of refinery capacity in this country, the addition of 50 miles of pipe line and extensions to facilities in Iran, the completion of the refinery and construction of the oil and cargo jetty at Mena al Ahmedi in Kuwait, and an increase in tanker tonnage from 1,370,000 d.w. tons to 1,530,000 d.w. tons. The group's liquid funds have been reduced by £20.7 million to £41 million, largely in consequence of this heavy capital programme, which clearly is not at an end. Capital commitments at the end of the year amounted to some £29.3 million.

* * *

Courtaulds' Gilt-Edged

Whatever the feelings of Courtaulds early in the war, when it had to relinquish most of its interest in the American Viscose Corporation to provide the Treasury with dollars, the company has since found the sterling proceeds—held in British Government securities—a most useful source of finance for postwar developments, as its latest report clearly demonstrates. At the end of 1945 its gilt-edged holdings amounted to £39,329,885 (at middle market prices) and in the early postwar phase demands upon them were relatively moderate. Plans for extending activities in this country were slow to mature. It will be recalled, for instance, that the Government's decision to erect a large plant near the company's projected acetate rayon factory in West Cumberland caused a major change of plan, while the other early postwar scheme for the operation of a continuous process for viscose rayon yarn at Carrickfergus is not expected to be in full production until next year. Thus, at end of 1948, despite considerable capital expenditure, the gilt-edged portfolio still stood at about £32 million notwithstanding the intervening slide in gilt-edged prices. Since then, demands on these reserves have been gathering momentum; by March 31, 1950, they were down to £14,897,925 compared with £22,792,748 a year earlier. The process of putting the funds to work is not yet completed, since outstanding capital commitments of the group amounted to £3,250,000 at March 31, 1950, and requirements of working capital are growing continuously. But the company is now beginning to reap the fruits of these programmes. In 1949-50, consolidated trading profit rose from £7,955,804 to £10,232,623, giving rise to group earnings of 37.2 per cent compared with 21.9 per cent. in the previous year.

The chairman, Sir John Hanbury-Williams, makes some interesting comparisons of world consumption of the main textile fibres in the past two years and before the war. The relevant figures are shown below.

WORLD CONSUMPTION OF TEXTILE FIBRES

	1934-1938 Yearly Average		1948		1949	
	Mn. lbs.	%	Mn. lbs.	%	Mn. lbs.	%
Cotton	14,000	78·9	13,400	72·8	13,100	71·7
Wool	2,250	12·6	2,450	13·3	2,350	12·9
Rayon and synthetic fibres	1,390	7·8	2,550	13·7	2,780	15·2
Silk	125	0·7	50	0·2	35	0·2
	17,745	100·0	18,410	100·0	18,265	100·0

These figures show that rayon consumption in 1949 was approximately double the prewar level, whereas wool was only 5 per cent higher and cotton over 6 per cent. lower. Production of rayon in this country has increased by 87 per cent since 1937-39, to 290 million lbs, an achievement for which Courtaulds is chiefly responsible.

Course of Import Prices

Import prices in May rose by only one point, the smallest monthly increase since sterling was devalued last September. The Board of Trade index (1947 = 100) now stands at 132. The cost of imported food, drink and tobacco

IMPORT AND EXPORT PRICES
Board of Trade Indices: 1947 = 100

	1949		1950				
	Sept.	Dec.	Jan.	Feb.	March	April	May
Import Prices:							
Food, drink and tobacco	107	116	118	118	119	122	124
Raw materials	118	130	134	138	143	148	148
Manufactures	105	121	121	123	124	123	124
Total	110	122	124	125	128	131	132
Export Prices:							
Metal goods	114	115	116	117	117	117	117
Textiles	116	115	116	118	119	120	124
Other manufactures	106	106	107	108	109	109	110
Total	113	115	116	116	118	118	119

rose by over 1½ per cent during the month and imported manufactures were also slightly dearer. The raw material component of the index showed no change; the decline in wool prices offset the small increases in other raw materials. Wool is an important item in this component and it may seem strange that its import price should fall in a month when the market price reached a record high level. But imports on Joint Organisation account, which are valued at current market prices, were small during the month, while private imports most probably represented purchases made in February and March when wool prices tended to fall slightly.

Export prices increased by one point to 119 (1947 = 100), mainly because of a sharp rise in prices of textiles; the textile index jumped from 120 to 124. Metal goods remained unchanged, and prices of other manufactures increased slightly. The deterioration in the terms of trade has at least been arrested—though only temporarily, to judge from the course of commodity prices in the past month. As these higher purchase prices are reflected in the import values, the index is likely to rise sharply once more. It is, moreover, at this time of the year that the Ministry of Food re-negotiates many of its contract prices. The new prices might well reflect increases consequent upon devaluation.

Branded Margarine Again?

The campaign to restore proprietary brands of margarine to the British market is gaining momentum. A fortnight ago Mr J. P. van den Bergh raised the point at the annual meeting of Van den Bergh and Jurgens, Ltd., and it has now been seconded in the report of Lever Bros. and Unilever Ltd., the financial details of which are discussed in an earlier note. For some months past the full weekly ration of 4 oz. of margarine has not been taken up by the British public, and margarine production has had to be curtailed despite the improvement in the supply of oils and fats. According to Sir Geoffrey Heyworth, the Unilever chairman, this trend is not any sign of a change in public acceptance of margarine but results from the distorting effects of subsidies. The retail price of butter until last April was 1s. 6d. a lb. and its unsubsidised price was approximately 3s. a lb. The retail price was then raised to 1s. 10d. a lb. and the subsidy at that date was stated to be 1s. a lb. No change was made in the retail price of margarine, which is 10d. a lb.; the unsubsidised price 1s. 2½d. a lb. Butter, it will be seen, is still relatively much cheaper than margarine. Despite the increase in price, it still enjoys a larger subsidy, both actually and proportionately, than margarine. The recent adjustment was clearly in the right direction, but it has so far proved quite inadequate to effect any change in the pattern of demand. Since April there has been no noticeable reduction in the consumption of butter and no apparent increase in the consumption of margarine. It is debatable whether equilibrium between two subsidised commodities that are both complementary and substitutable can be best achieved by fixing the subsidies at the same amount per unit of weight or at the same proportion of the price; but by either test the present retail price of butter is unduly low.

There is no doubt, therefore, that the subsidies are distorting the relative demand for the two commodities; but so, too, is the system of standardisation. "National" margarine is generally regarded as of indifferent quality, and if a higher grade margarine could be marketed at the present retail price—or at least without any marked increase in price—demand would probably expand. Any marked improvement, however, in the present standardised margarine would be difficult to achieve—if only because manufacturers would be unwilling to disclose their trade secrets. This suggests that any real improvement may not be possible unless the proprietary brands are restored. Margarine manufacturers maintain that they could produce a higher grade product from the oils and fats currently available—though not, of course, if they had to sell at the present retail price without the aid of subsidy. The question of shifting the subsidy from a single "national" grade to a number of proprietary grades raises no difficulty in principle, but in practice it would involve some awkward administrative problems—notably that of ensuring that one type of manufacturer was not given an advantage over another. If, for example, the Ministry of Food decided to grant the subsidy by selling its oils and

Nchanga Consolidated Copper Mines Limited

Extracts from the Report of the Directors for the year ended 31st March, 1950

Taxation

The provision for taxation in respect of the year's profits amounting to £834,602 is after taking into account initial allowances on the expenditure during the year on Buildings, Plant and Machinery. These allowances have reduced taxation for the year by approximately £200,000.

Profits

The net profit for the year after providing depreciation but before taxation amounted to £1,531,310 which the Directors propose should be dealt with as follows:—

	£	£
The Balance on Profit and Loss Account for the year ended 31st March, 1950		1,531,310
Taxation on these profits		834,602
		696,708
Provision for taxation in previous years no longer required		188,028
		884,736
Unappropriated profits at 31st March, 1949		1,214,503
Making a total of		2,099,239
Amount appropriated to General Reserve	£1,200,000	
The Directors recommend the payment of a dividend of 20 per cent. on the Ordinary Stock in respect of the year ended 31st March, 1950, which after deduction of Income Tax will amount to	770,000	
		1,970,000
Leaving a balance to be carried forward of		£129,239

COPPER PRODUCTION

During the year 1,282,047 short tons of ore were mined and 1,275,400 short tons were treated in the Concentrator; the grade of ore treated was 4.84 per cent. copper, of which 2.27 per cent. was in the form of Oxide Copper and 2.57 per cent. in the form of Sulphide Copper. The grade of ore milled was higher than for the preceding year, and this, together with an increased tonnage treated, resulted in a 20 per cent. increase in production of copper in concentrates.

The concentrates produced were railed to Nkana for smelting and resulted in a production of 38,761 long tons of copper, compared with 32,877 long tons for the year ended 31st March, 1949. Of the total tonnage of copper produced 2,544 long tons were cast in the form of Anodes which will be required to form part of a stock which will be necessary when Electrolytic Refining commences.

OPERATING AND PROFIT AND LOSS ACCOUNT

Sales and Stocks of Metals

The total tonnage of copper sold during the year was 32,062 long tons of which 62 tons was sold in Concentrates and the remainder as Blister Copper. These compare with total sales of 30,053 long tons last year of which 38 tons was in Concentrates and the balance Blister Copper. The total proceeds from sales amounted to £3,649,930 compared with £3,513,478. The larger proportion of the increased production referred to later in this report was used to build up the stocks of copper which now stand at 13,449 long tons compared with 6,690 long tons and there was also an increase in the stock of copper in concentrates from 7,529 long tons to 10,098 long tons. The total value of these stocks shown in the accounts at cost amounts to £953,915 compared with £621,709. These increases in stocks are, as mentioned by the Deputy Chairman in his speech last year, necessary for the expansion of output which will shortly be achieved when the plant extensions come into operation and also for the build-up of a supply of anodes for the production of Electrolytic Coppex which will be undertaken in the near future for this Company by Rhodesia Copper Refineries, Limited.

EXPANSION OF PRODUCTION

The programme to increase production to 64,000 long tons of copper per annum is proceeding satisfactorily, and this rate of production should be reached by the end of December, 1950, as stated in the Directors' Report for the year ended 31st March, 1949.

COAL SUPPLIES

Coal supplies to the Copperbelt during the year showed a considerable improvement and for the year under review the average monthly tonnage delivered was 38,843 tons, an increase of approximately 1,700 tons per month over the previous year. Since the close of the financial year this improvement has been maintained, the deliveries to the Copperbelt during April and May, 1950, having averaged 46,265 tons per month.

fats to manufacturers at a loss, it would have to ensure the same relationship between its selling prices for the different kinds of vegetable oils and fats as existed in the world market. Such complications afford yet another example of the distortion inevitably created through the incidence of subsidies and specific controls, and illustrate the difficulty of piecemeal relaxations. Many food controls that might otherwise be abolished may have to be retained until the problem of food subsidies is tackled comprehensively.

* * *

Jordan Re-enters Sterling Area

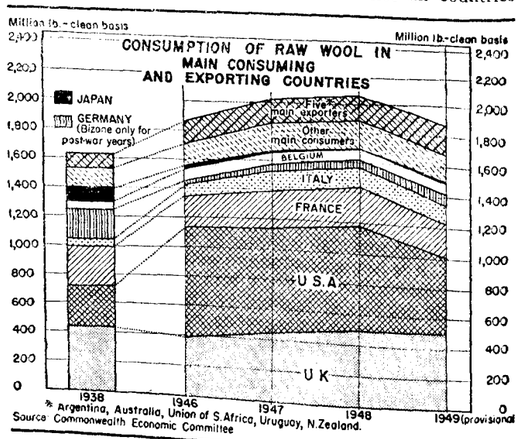
On July 1st, as had been expected, Jordan rejoined the sterling area, and on that day a new Jordan currency, the dinar, was launched. Sterling may now be credited to sterling accounts of Jordan residents without the completion of the sterling transfer form. These moves bring to an end the rather untidy interim arrangements made in February, 1948, when Palestine left the sterling area on the termination of the Mandate. At the time it was felt that the general political upheaval of those days would make effective exchange control impossible, and Jordan, then using the Palestine pound, inevitably had to follow suit. There was never any doubt, however, that Jordan would re-enter the sterling system as soon as preparations for a local currency had been completed. A Jordan Currency Board has now been set up in London and will perform for Jordan alone the functions previously performed by the Palestine Currency Board for the whole area, keeping the dinar at par with sterling. The new notes are in denominations of half a dinar (500 fils) and one, five, ten and fifty dinars. Six denominations of coins range from one fil to 100 fils.

Under Jordan law the new currency has to be backed in full by sterling. At the outset, it will be issued against surrendered Palestine notes, which the Jordan board will then pass to the Palestine Board against payment in sterling. If the two banks concerned in Jordan—the Ottoman Bank and the Arab Bank—do not require dinars for their Palestine notes, they can send them direct to the Palestine board in exchange for blocked sterling. During the first few days of the change-over, the only notes surrendered to the Palestine board for redemption came through these channels. At the outset, the Palestine board had rather over £P 16 million still outstanding, compared with a peak liability of £P 52.6 million in 1947 (this decline, of course, reflected the demonetisation of the notes in Israel). The bulk of the £P 16 million was circulating in Jordan, although the portion in coin still circulates in both countries, despite the gradual introduction of new Israeli coins. The theoretical maximum of dinars 16 million should prove ample for Jordan's currency needs, although it should be noted that Jordan is drawing heavily on its small sterling resources.

* * *

More Synthetic Rubber for USA?

The reports last week-end that the American Government may reopen some of its stand-by plants for synthetic rubber have had no measurable effect on the market. Rubber dealers strongly deny that the present price of natural rubber is maintained by speculation. But they realise that if considerations of national security make a larger supply of rubber necessary in the United States, it would have to come from synthetic production.. The first signs of the expansion in synthetic output were apparent in May when it jumped from 39,425 tons to 42,500 tons, the highest figure since January, 1949. Consumption rose even more sharply from 40,000 tons to 50,000 tons, the highest monthly total since October, 1947.



World production of natural rubber also reached a record level in May when 150,000 tons was produced. This increase was due largely to a continued expansion in shipments from Indonesia. Total exports for the month were estimated at 62,086 tons, which was 2,000 tons more than the previous record attained in April. These heavy shipments were no doubt encouraged by the fact that the export duty on rubber from Indonesia was scheduled to be increased from July 1st. Exports from this source may therefore tend once more to decline. But the record production of natural rubber coincided with a record consumption of 140,000 tons. Stocks in the consuming areas and afloat continued to decline, while stocks in producing areas increased by 17,500 tons. These additional supplies, however, will not be available to consumers for some little time.

The future course of rubber prices is highly problematical. The larger output of natural rubber has done so more, so far, than keep pace with consumption. If a high level of industrial activity persists in the United States, a strong demand is assured. The proposed expansion in synthetic output may take a long time to materialise owing to the shortage of an essential ingredient, styrene. On the other hand, a larger number of synthetic plants in operation would eventually mean a reduction in the stockpile requirements for natural rubber.

* * *

Future of Wool

Wool prices lately have tended to fall from the peaks reached in May, and are now on average between 5 and 10 per cent below them. A readjustment of prices at this late stage in the season was almost inevitable but the wool market has still a firm undertone. Last year wool consumption in the eighteen principal consuming and exporting countries declined by nearly 10 per cent, and the world total was at least five per cent smaller. But not all countries

followed this trend, nor was it uniform throughout the year. The decline was largely concentrated in the first six months, and in the second six months there was some recovery. Despite the overall decline, world consumption was still 15-20 per cent larger than before the war, while the world clip was only about one per cent larger.

The wool market tends nowadays to be dominated by conditions in the United States. Although American wool consumption last year fell by 27 per cent it was still slightly larger than Britain's consumption, and the United States retained its postwar position as the world's largest wool consumer. After Britain, it was the world's largest importer as well. Consumption in France, Italy, Belgium and certain other countries also declined in 1949, but France was the only country of this group with a consumption smaller than prewar. In contrast, consumption in Britain and in the main exporting countries continued to rise. German consumption also increased sharply but was still

less than half its prewar quantity. Japanese consumption was less than one-tenth of prewar.

The recovery in wool consumption that started in the latter half of 1949 has continued this year. Again the lead has been taken by the United States, where in the first two months of 1950 consumption was 10 per cent higher than in the same period of 1949. In Britain, consumption in the first four months of this year has risen even more sharply—by 13 per cent—while that of France, Belgium, the Netherlands, Germany and Austria has also continued to expand. The problem confronting the wool textile industry next season is to secure an adequate supply of raw material. Even a 5 per cent increase in wool production would be inadequate to cover the present rate of consumption now that the wartime stocks of wool are virtually liquidated. The scope for economy lies in a greater use of reprocessed wool and of other fibres. Despite the prospective shortage of wool, much more is being used per unit of wool tissue produced than before the war, when raw wool was relatively plentiful.

* * *

Harvesting Seaweed

Responsibility has been assumed by the Scottish Seaweed Research Association for the mechanical and chemical problems of developing an industry based on north of Scotland seaweed. The association was set up at the beginning of the war by the alginate producers who depend on seaweed as a raw material, but it is now wholly financed out of the Scottish Development Fund. The project is attractive—the alginate industry has expanded fairly rapidly, and the suspending, emulsifying and thickening properties of the alginates give them varied and expanding markets. The largest outlets are in food, paper and pharmaceutical production; in the form of alginate rayon they have a number of specialised applications in textiles. Two other substances obtainable from seaweed, mannitol and laminarin, appear to have applications in the plastics and explosives industries, and a third, fucoidin, has been used in other countries for food and cosmetics and might provide a source of glucose. These three substances have not been used in Britain. After two and a half years' silence the association has announced that mannitol and laminarin should be in pilot plant production when its new laboratories are ready by the end of the summer.

The extraction processes do not appear to present any great difficulties; whether production of these chemicals will be taken up commercially—or indeed whether the alginate industry can continue to expand—depends ultimately on whether regular supplies of seaweed can be guaranteed to the factories in sufficient volume. Even the largest alginate producer, a subsidiary of Albright and Wilson, Ltd., relies on the winds and tides to wash up sufficient supplies of weed to be collected and dried by crofters. Supplies come from Scotland, the Hebrides and even from Ireland. If mechanical methods of harvesting could be developed the association estimated that there are enough weed beds around Scotland to provide one million tons of dried weed a year, the beds being harvested every third year. Seaweed was harvested in Japan by hand before the war, and the same methods are probably still in use; in the United States cutting machines have been successfully developed, but these could not be used on the shorter type of weed found in Scotland. Trials by the association with three different types of equipment have had some limited success, and at least one firm is fitting out a boat for commercial harvesting this summer. Whether this represents the limit of success that can be expected may not be clear for some years. Not only does the type of weed and the coastline itself make harvesting difficult, but the uneven sea bed damages the hooks with which the weed is pulled in. Because of these difficulties, manufacturers are unlikely to start any active research of their own until it is clear whether a greater volume of weed can be harvested by mechanical methods than the tens of thousands of tons at present obtained by extremely primitive means.

Shorter Note

In the article entitled "Competition in Detergents" in last week's issue, the sentence on page 31: "The cost of raw soap can be put at £175-£200 a ton," should have read: "The cost of raw soap can be put at £100 a ton and the equivalent cost of synthetic detergents at £175-£200 a ton."

SECURITY PRICES AND YIELDS

A fuller list containing 366 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Unilever Group; Courtaulds; Anglo-Iranian; Boots Pure Drug; Bleachers Association; Rolls Royce.

THE BURMAH OIL COMPANY, LIMITED

INCREASED SALES OFFSET LOWER PRICES

RESTORATION OF DIVIDEND TO 15 PER CENT

SIR KENNETH HARPER'S REVIEW

The forty-eighth annual general meeting of the members of the Burmah Oil Company, Limited, was held on Tuesday, July 4, 1950, in the Merchants' Hall, 30, George Square, Glasgow.

Sir Kenneth B. Harper, chairman and managing director, who presided, said:—

At the time I wrote my statement the Industrial Court in Burma was still sitting to consider a list of issues concerning retrenchment of surplus employees in both the fields and refinery areas. The Court has now announced its awards, which I regret to say are unsatisfactory, and we have applied for them to be referred to the Supreme Court of Burma. They are accordingly now *sub judice* and it would be improper for me to discuss them here today.

The following statement by the chairman was circulated with the directors' report and accounts:—

The directors have invited Mr W. E. Eadie to join the board and his name will come before the annual general meeting for election. Mr Eadie joined the Burmah Oil Company, Limited as an accountant in 1921 and on the formation of Burmah-Shell Oil Storage and Distributing Company of India, Limited, in 1928 was released to become that company's senior accountant. He rejoined the Burmah Oil Company in 1941 and has been chief accountant since 1948. His knowledge, experience and judgment will be of much value to the board and I have complete confidence in recommending him for election by stockholders. On joining the board, Mr Eadie ceased to be chief accountant and has been succeeded by Mr J. F. Strain.

TRADING RESULTS

The results of 1949 trading, both in indigenous products from Assam Oil Company's resources and in purchased petroleum products, as brought out by the accounts now before you, disclose the group's profit at £5,617,279, after charging expenditure in connection with prospecting and exploration operations in India and Pakistan amounting to £1,402,310. During 1948 conditions in India and Pakistan were such as to call for caution in framing estimates of trading results in these countries and in consequence there is included in the total profit a gross amount of £1,180,000 arising from exceptional credits from Burmah-Shell in respect of that year.

Although, as I indicated in my statement last year, world prices of petroleum products in 1949 were below the average level of 1948, these lower values were compensated for by the increased volume of our sales of imported products in 1949, coupled with an increased return received on sales of Assam Oil Company products following selling price adjustments on devaluation of sterling.

Dividends and interest this year bring in a total of £2,638,117. Assam Oil Company, as you know, became a wholly owned subsidiary in 1948 and our income from that source is taken in as a trading profit.

Total income from all sources amounted to £8,256,204, from which fall to be deducted taxation £5,131,914, depreciation £410.747 and directors' emoluments and auditors' fees, £31,601, leaving £2,681,942 to which is added £514,171 brought forward from 1948, making £3,196,113 as the net amount finally available for disposal.

Many stockholders will recollect that following the bonus issue in 1938 the basic ordinary dividend rate was 5 per cent. interim plus 10 per cent. final to which a cash bonus of 6 per cent. was added for 1938 and 1939. An interim dividend of 5 per cent. was paid for 1941, but by the time the final came to be declared in August, 1942, Burma had been occupied by the Japanese and it was deemed prudent to reduce the final dividend to 7½ per cent. Since then the dividend for the year has remained at the rate of 12½ per cent. The directors consider that restoration to 15 per cent. is now warranted and have recommended that this be done.

Out of the net sum of £3,196,113 available the board have allocated £1,350,000 to general reserve and if their recommendation of a final dividend of 12½ per cent. is approved, net preference and ordinary dividends will absorb £1,298,262, leaving £547,851 to be carried forward, being an increase of £33,680 on the amount brought in.

Turning to the company's balance sheet, you will note it has been possible to finance the operations of the subsidiary companies without making any inroad into liquid resources by further withdrawals from our holding of Government securities. This is due principally to the curtailment of rehabilitation operations in Burma in line with the policy indicated in my statement on 1948 results. Rehabilitation finance in 1949 cost £1,400,000 compared with £3,730,000 in 1948, a reduction of £2,330,000. The greater part of 1949 expenditure will form a claim on His Majesty's Government under their guarantee, to which I refer later.

CONSOLIDATED ACCOUNTS

"Accrued dividends from subsidiaries" at the higher level of £3,241,353 follows on the increase in profits.

In the consolidated balance sheet it is now possible to compare the group's assets and liabilities item by item with the previous year.

"Concessions, oil wells, buildings, etc.," is up £677,647, but £431,250 of this is not new expenditure, being a transfer to this heading of expenditure previously included under "Rehabilitation Suspense Account."

"Investments" at £22,417,361, including British Government securities of £9,817,414, show no material change from 1948.

Under current assets the increase of £711,209 in "stocks of stores and materials" is accounted for partly by continuing payments under contracts placed for plant required under the rehabilitation programme and partly by the additional stores and equipment requirements of Assam Oil Company. "Stocks of oil and products" are up by £880,702. Larger volumes and increased costs arising from devaluation account for this increase.

BURMA

At the time of our annual general meeting last year the position in Burma was that the three British oil companies, responding to a request by the Burmese Prime Minister, had submitted a scheme for completing the reconstruction of the oil industry by which the Union Government would furnish the remaining finance, which the industry itself had decided to stop providing owing to the disturbed state of the country, and the Union Government were engaged in trying to raise the necessary funds. What I was not then permitted to disclose was that in order to assist the Union Government by ensuring them time to negotiate a loan, His Majesty's Government undertook to underwrite any expenditure incurred by us after March 7, 1949 which would be lost if those negotiations were not successful. The negotiations were prolonged and ultimately failed and we shall present our account to H.M. Government as soon as the full amount is known.

Subsequent events belong to 1950 but I feel you would like me to bring the position up to date. The Union Government having failed to raise the money to finance their share of the joint project, that project broke down and we proceeded to discharge the employees who thus became surplus to our reduced operations. The Burmese Government, on the application of the Labour unions, thereupon referred to an industrial court, under the Burma Trade Disputes Act, the questions both of the employer's right to discharge employees in such circumstances and alternatively the terms governing such discharges. The court was appointed on January 11, 1950, but has not yet announced its award, the nature of which will be of great interest not only to us but to all industrial and commercial employers in Burma.

Rehabilitation of plant and facilities on the Burma oilfields, main pipeline and refinery having entirely ceased, the group's operations are now reduced to producing small quantities of crude oil and to selling the products from a primary distillation in such local markets as can be reached in the present disturbed state of communications, while for the accessible markets elsewhere in Burma we are continuing to import products into Rangoon.

It is not yet possible to foretell when or if it will again become feasible to resume our producing and refining operations on the scale formerly contemplated. While the Union Government forces have recently reoccupied several towns which have been in insurgent hands, it is not yet clear whether the insurgents have been defeated or have merely withdrawn to positions elsewhere with their strength not seriously impaired. The greater part of the country through which our main pipeline runs is still outside the Government's control, and repair, much less operation, of the pipeline itself cannot yet be resumed. Without this pipeline there is no means of conveying crude oil to Rangoon in the quantities required for the projected refinery and rebuilding of the refinery would accordingly still be premature. When and if order has again been restored and maintained long enough to give promise of being settled, the directors will assess the economic possibilities of the subsidiary companies resuming operations in the light of the conditions then prevailing and their attractiveness as an investment for your capital.

The suits which the subsidiary companies filed in 1947 against the Union Government for compensation for denying their properties to the enemy on instructions given under the Defence of Burma Act have not yet been heard. A preliminary issue, common to the cases of all claimants, on the point whether the Union Government is liable to pay compensation under that Act, is shortly to come before the court.

I informed you last year that H.M. Government had announced their intention to ask Parliament to make an ex gratia payment to British industrial and commercial interests whose property sustained war damage in Burma, primarily for the purpose of assisting them in overcoming their capital handicaps in the task of rehabilitation. The total grant was £10 million, which it was left to an independent committee to allocate between the interests concerned. The share allocated to your group, which financially speaking was by far the greatest sufferer from the war in Burma, is £4,583,870. That sum has recently been received and will be incorporated in the 1950 accounts. Though welcome, it represents a very small part of the replacement value of what we lost through denial to the country and is far from meeting our subsidiary companies' claims on the Union Government which, as I have stated, continue.

TRADING

In Burma, with large areas of the country under the hand of one or other of the insurgent groups, conditions for trading were abnormal. In January the railway to Mandalay was cut and this main line of communication with important centres in central and northern Burma remained closed throughout the year. For a period of several months the distribution of petroleum products was confined to a relatively small area around Rangoon, to the coastal ports and to small offtake in the Chauk oilfield area. When in July it became possible to resume supplies to Mandalay from Chauk by river, despatches had to be conveyed with military escort when this was available. Overall the volume of supplies which our Burma trading subsidiary has been able to distribute remains below the needs of the country.

A number of our upcountry distributing centres were overrun, fortunately without loss of life, though not without loss of stocks and some destruction of property. Once again members of our staff deserve credit for carrying out their duties so well under difficult circumstances.

It will thus be readily understood that although petroleum supplies were more freely available throughout the world in 1949 the volume of our sales in Burma, far from showing expansion, was appreciably below the 1948 level. Towards the close of the year there were some signs of improvement but the country has received a severe setback in its general economy as the result of the events of 1948/49 and recovery towards fully normal conditions can only be a gradual process.

In India, demand continued in excess of supply, but rationing of both motor spirit and kerosene was on a more liberal scale, and there was a considerable expansion of sales of all main products.

Distribution of Assam Oil Company's products continued without interruption during the year though in the face of an unfortunate worsening of political relations between India and Pakistan. Supplies from Assam refinery normally pass through Pakistan to reach markets in India, and at the close of the year there was a break in political relations which put a sudden stop to all through traffic. Supplies had accordingly to be directed to the newly built Assam rail link and to the river, through traffic on which was fortunately quickly restored.

In Pakistan, as in India, while there was an appreciable increase in the level of sales, distribution and marketing of products were affected by the breakdown in political relations between the two Dominions. East Pakistan is normally supplied with petroleum products partly through our own organisation based on Chittagong and partly through Burmah-Shell based on Calcutta. Towards the end of the year the complete suspension of supplies from Calcutta to Pakistan left Burmah-Shell without their normal means of supplying their adjoining marketing area in East Bengal and a severe strain has been thrown on our Chittagong organisation in endeavouring to supply their needs also.

It is to be hoped that the recent trade agreement between India and Pakistan will be further developed to enable trade between the two countries to flow along fully economic lines of supply.

PROSPECTING

Burma.—I need hardly say that no exploration of any kind was even a remote possibility during the year under review.

India.—The one outside test well in Upper Assam to which I referred last year was completed but without finding any oil. Extension drilling at Digboi has however proved a valuable addition to the productive area there.

Pakistan.—At Chakwal in the Punjab our No. 2 well found production, and development of this small field is proceeding. The more important test well at Lakhra eventually became the deepest well in Asia, but unfortunately found only water and is now being abandoned. On the results in this well we fear that large areas in Sind must now be considered valueless for oil, but we are continuing the search in other parts of Pakistan.

LABOUR

Labour questions continued to provide many anxious problems throughout the year but I am glad to report that relations with our Indian and Pakistani employees remained on the whole excellent, especially when judged against the general background in these two Dominions. There were no strikes in either country, except for a minor affair at an outside test well which was quickly settled, but there have been some dissensions with the unions. In India and to a lesser extent in eastern Pakistan the general trend of awards under the Industrial Disputes Acts, by invariably giving something and usually too much, has encouraged unions not only to be immoderate in their demands but also to discard direct negotiation and rely on the compulsory adjudication provided by the Acts. The practice is not helping the growth of a healthy trades union movement.

I feel, however, I can fairly say that our longstanding policy of good wages and good working and living conditions continues to have its reward. In particular, the company's hospital and schools at Digboi have been highly praised by visiting Indian ministers of government. I must add a word of warning that certain draft legislation now before the Indian Central Assembly is giving employers in India some anxiety. Relations between an employer and his men can be overregulated.

Burma presents, inevitably, a less good picture. The chief event was the discharge of nearly 2,000 men at Yenangyaung oilfield in July, leaving only 100 men to look after our property there and perform other essential duties. At Chauk oilfield and Syriam refinery there were in 1949 no major cuts in the numbers employed, but employees lived under the shadow of them while the events to which I have referred were in progress.

Altogether I am glad to say that relations between the management and employees though severely tested stood the strain well, for which the highest praise is due to your staff, both British and Burmese, and the employees themselves. Unhappily relations with the trades unions are another matter, the unions being largely led by men not in our employment, whose aims are too often mainly political.

TANKERS

Our ships continued to operate satisfactorily during the year and were again free from accident. The nature of their service demands quick turn-round at loading and discharging ports and imposes almost continuous duty on the part of their officers and crews, who continue to maintain the high standard of morale in the fleet.

By the introduction of a mail advice service, whereby next-of-kin are kept advised of the movements of our ships and officers are enabled to obtain letters from home more frequently, and through increasing the amenities on board, we have been able to give further expression to our constant concern for the welfare of those who serve in our fleet.

THE STAFF

With the suspension of their operations in Burma, our subsidiary companies there have regretfully had to reduce their staffs.

While the whole staff have again served us splendidly, a special word of praise is due to the staff in Burma and particularly at the oilfields and refinery. A heavy responsibility has fallen on our general manager, Mr R. S. Carey and our managers at the oilfields and refinery, Mr C. A. Maxwell-Lefroy and Mr W. T. Watts, and their conduct of our affairs deserves high commendation. I hope I may be allowed to express your appreciation to the staff both at home and overseas.

The report and accounts were unanimously adopted.

The final dividend of 12½ per cent. (2s. 6d. per £1 unit) on the ordinary stock for the year 1949, recommended by the directors, was approved and declared payable on July 14, 1950.

Mr W. E. Eadie, who was recently appointed to the board, and the Right Hon. Baron Bilsland of Kinrara, M.C., D.L., LL.D., the director retiring by rotation, were unanimously re-elected.

PLASTER PRODUCTS (GREENHITHE), LIMITED

MARKED IMPROVEMENT IN TRADING RESULTS

MR. J. P. EVANS'S SPEECH

The thirteenth annual general meeting of Plaster Products (Greenhithe), Limited, was held in London on July 6th.

Mr J. P. Evans (chairman) presided and said: Gentlemen,—As the directors' report is fully informative and the bulk of this information was circulated to every shareholder nearly four weeks ago, there is not very much I can add to the details already in your possession.

The principal changes in the fixed assets have been brought about by the sale of your company's factory at Bridgwater. Current assets and current liabilities both show reductions on the figures of a year ago, and the liquid position has been improved by better trading results. The decreases in bank overdraft and acceptance credits are perhaps worthy of note and these accounts will be repaid out of the proceeds from the sale of the Bridgwater factory.

No decision has yet been made regarding the disposal of the balance of capital available, but one of the facts that must not be lost sight of is that your company has no right to accelerate the redemption of the loan stock until 1953. It must be remembered that the silent plant which is now being stored at Greenhithe could be erected there if the demand justified such a step.

TRIBUTE TO STAFF AND WORKPEOPLE

The trading results show a marked improvement upon those of the preceding year and at this stage I should like to pay tribute to the staff and workpeople who have achieved such figures in the face of fierce and unremitting competition.

Production costs have risen in the present financial year and will rise still more as the progressive effect of higher freights make themselves felt. An increase in the controlled selling price should therefore be granted as speedily as the two reductions in price which immediately followed the temporary fall in the cost of some raw materials during 1949.

Such exports as have taken place were to a large extent pioneer efforts and rising costs will do nothing to help the overseas trade of this company or of the country. On the contrary the extra cost of home-produced materials improves the prospects of the foreign exporter wishing to send his products to this country.

The report and accounts were adopted.

The Board were requested to give consideration to the preparation of a scheme of capital reorganisation.

THE BUTTERLEY COMPANY, LIMITED

ACTIVE DEMAND FOR PRODUCTS

A CAPITAL PROFIT DISTRIBUTION

MR E. FITZWALTER WRIGHT'S ADDRESS

The sixty-third annual general meeting of The Butterley Company, Limited, was held at the registered office of the Company, Butterley Iron Works, near Derby, on June 29th, Mr E. Fitzwalter Wright (chairman of the board of directors) presiding.

The secretary (Mr P. Elliott) read the notice convening the meeting, and the report of the auditors.

The chairman said: Ladies and gentlemen,—There is little change from last year in the form of the accounts before you, except that this year we are able to give you the comparable figures for last year as well. If you will turn to the consolidated profit and loss account you will see that the profit for the year before taxation is down from £346,279 to £245,170. You will also see that our income from what used to be our colliery assets is down from £155,889, which came to us in the form of interim income under the 1946 Act, to £91,930, which came to us in the form of revenue payments under the 1949 Act. The charge for depreciation is raised from £28,344 to £49,312, partly due to the reasons described in Note 4 of the notes to the accounts, and we have provided £6,000 to cover the diminution of value of certain of our quoted investments.

These three items therefore account for almost £91,000 of the reduction of just over £100,000 in the profit for the year. We have been able to take to the credit of profit and loss account profits attributable to prior years, and provisions for certain wartime contingencies which are now happily no longer required, to a total, after tax, of £56,195, giving a profit for the year, after taxation, of £148,123 compared with £171,029 a year ago. To this must be added the balance brought forward from last year of £167,383, giving a total of £315,506, out of which dividends paid or now recommended take £110,687, leaving to be carried forward to next year £204,819.

MAIN LINE WAGONS COMPENSATION

We have received compensation in full in respect of our main line wagons, and a capital profit of £264,036 has accrued to us in respect of this item. It is proposed to distribute £252,000 of this to the shareholders, representing 14 per cent. on the ordinary stock, and we are advised that this payment will not attract either income tax or sur tax. I wish to emphasise that it is most unlikely that a similar payment will be made again.

The issue of £2,000,000 of coal stock, referred to in the directors' report, was made on June 16th. The stock has been realised, and the effect has been to turn a deficiency of current assets of approximately £300,000 into a balance of some £1,700,000. Further sums of cash and issues of stock on account of compensation will continue to be received. The board consider that the time has come for a modification of the capital structure of the company, and therefore have under consideration a scheme to reduce the paid up ordinary stock.

ENGINEERING WORKS ACTIVITIES

Turning now to activities during the year, I am pleased to be able to report that at our engineering works at Butterley and Codnor Park a still further increase in output has been obtained, and sales from these two works reached a record figure of just under £2,000,000. Competition has undoubtedly been more pronounced, a development which we regard as a very healthy one, and we have made reductions in prices of certain foundry products, notably for the motor car industry, as a contribution to the export drive. Nevertheless, our order book is as strong as ever, carrying contracts with delivery dates in some cases more than two years ahead. In particular, the demand for our finished products, such as overhead cranes, and sheet metal machinery, continues to grow, and our crane production last year was almost double that of 1948.

Last year, you will remember, I was able to tell you that we had built nearly 750 railway wagons. This year I am happy to tell you that the figure has increased to over 1,000, chiefly 16 and 21-ton types for the home railways. We are told that the programme of replacing old small-capacity wooden wagons with larger capacity steel ones is to be maintained, and that the number required will be very large. I hope British Railways will take the wagon builders of the country into their confidence, so allowing them to plan ahead with certainty. I have no doubt that if this were done considerable economies in the cost of production could be achieved.

STRONG DEMAND FOR BRICKS

The cut of £200 million in the capital expenditure programme announced by the Government two years ago is now seriously affecting the civil engineering industry, and there is very keen competition for all available work. We are continuing to submit tenders for all suitable contracts, but the profit margin must inevitably be very low.

Demand for bricks, however, continues very strong, and our output figures again show an increase. We have been particularly gratified by the popularity gained by the bricks from our Blaby plant, and arrangements are in hand to double the output from this works. A new kiln and drying shed is being installed, and we hope it will be in production by the end of this year.

THE KELVIN COMPANY

Of our subsidiaries, the Kelvin Company continues to produce very satisfactory profits at the Glasgow works, and the works at Greenford have come through the re-opening troubles well. I am glad to pay a tribute to Mr Harold Jacobsen, director and general manager of the Kelvin Company, to whose energy and ability the success of the undertaking in his charge is so largely due.

In the autumn of last year, we came to the conclusion that an even closer relationship between our works at Butterley and the Ruabon works of Hughes & Lancaster Limited was desirable. Certain changes in the management and organisation were effected. Mr Newman was appointed director and general manager of Hughes and Lancaster Limited, in addition to his duties as general manager here, and Mr Weetman, who for some years has been manager of our machine shop here, was appointed works manager at Ruabon. The results since these appointments were made certainly seem to justify them, and, with the new shop coming into production in the autumn, the prospects are favourable.

NEW MILKING STATIONS

There has, I am afraid, been much irritating delay in the completion of the new milking stations on our farms, to which I referred last year. At the moment, only one is in use, though I hope the other two will be completed in a few weeks' time. We are still threatened with the requisition of a large acreage of land for opencast coal mining, although as a result of energetic representations, in which we were much helped by officials of the Ministry of Agriculture, the area originally contemplated has been somewhat reduced.

Our anxiety on this score is intensified by our experience of other areas in our farms which were requisitioned some years ago and have now been restored. Restoration I fear can only be held to describe the work done to the land, not the effect on the land itself. In the opinion of our experts, it will be a lifetime before the land regains its fertility, and for many years to come it will produce less than a tenth of what it did. Can it really be good economics to inflict such lasting damage for the sake of so small and temporary a reward?

COAL COMPENSATION DELAY

It is now three and a half years since our coal mines were taken over by the National Coal Board, and though we have received quite substantial sums on account of compensation, the final amount is not yet fixed, and if the statutory procedure is followed, it may well be five years before it is. I make no apology, therefore, for repeating the words I spoke to you in 1948. This is what I said: "I do most sincerely hope that certain proposals aimed at shortening and simplifying the procedure at Stage III which will be shortly under consideration by coal owners in our two districts may be sympathetically studied by them, and they may come to the conclusion that in this case rough but speedy justice is preferable to justice possibly more exact but certainly long delayed and very expensive."

At that time our hopes came to nothing, but I am glad to say that at the present moment another effort is being made. As you know, our coal interests are situated in two valuation districts, North Derbyshire and Notts. In North Derbyshire, coal owners representing 85 per cent. of the 1946 output have intimated their support in principle of a scheme for shortening the Stage III procedure, and in Notts, all the colliery companies except one support another scheme on somewhat similar lines. I believe that complete unanimity is essential to the success of these schemes, and I do appeal to those who have not yet agreed to the schemes to reconsider their attitude so that we may all go forward together and put this weary business behind us.

"THROUGH FIVE GENERATIONS"

A book has recently been published entitled "Through Five Generations—The History of The Butterley Company," by R. H. Mottram and Colin Coote. I commend it to you, not only as being eminently readable, but as a real contribution to the history of the Industrial Revolution in general, and the coal mining industry in this country in particular. And, as shareholders, you will, I hope, be not mistaken in deriving from a study of our past a sober confidence in our prospects for the future.

As in the past, so in the future our success must depend on the energy and ability of our officials and workpeople. They do not fail us, and on your behalf I would once more express to them our appreciation and thanks.

I now have pleasure in moving: "That the directors' report and accounts which carry the following recommendations:—

(1) The payment on the 30th June, 1950, to the Ordinary Shareholders of a sum of £252,000 (representing 14 per cent. on the amount of the Ordinary Stock) out of the excess of compensation received over the book value of main line wagons now vested in the National Coal Board, and

(2) the payment on June 30, 1950, of a final dividend on the Ordinary Stock of 6½ per cent., less tax (making 10 per cent., less tax, for the year), which will absorb £64,350 and the carrying forward of the balance of £204,819,

be received, approved and adopted."

The resolution was duly seconded and carried; the retiring directors, Mr M. F. M. Wright and Mr P. N. Wright, were re-elected; the auditors, Messrs Price, Waterhouse and Company, were re-appointed, and the proceedings terminated with a vote of thanks to the chairman.

ROTHMANS LIMITED

(Cigarette Manufacturers)

60TH TRADING YEAR

EFFECTS OF DEVALUATION

The twenty-first annual general meeting of Rothmans Limited, was held on June 29th in London, Mr Sydney Rothman (the chairman) presiding.

The following are extracts from his circulated statement:—

Profits and capital: The profits of the group are £269,000 depreciation absorbs £45,000, taxation £132,000, leaving a disposable profit of £92,000. It is proposed to pay a dividend of 12½ per cent. on the ordinary shares, to transfer £23,000 to reserve for future depreciation, and £37,000 to the general reserve. Total capital reserves and surplus are £911,000.

Jubilee Year: The business was established sixty years ago by the late Mr Louis Rothman, and was incorporated as a public company in 1929. In 1930, the company's capital and reserves were £221,000, the increase to date being £690,000.

Share Bonus: At an extraordinary general meeting shareholders will be invited to pass resolutions authorising the issue of one non-voting ordinary share for every five ordinary shares held, by the capitalisation of £32,000 of the general reserve.

The Year's Trading: The company has been able to sell, without high selling costs, the maximum quantity of its main product—cigarettes. Its principal brands are Rothmans Pall Mall de Luxe, White Horse and Pall Mall Medium. In consequence of government controls, it has suffered a shortage of tobacco and has been obliged to ration its customers at home and abroad. The bulk of the company's present stock of leaf was acquired at predevaluation sterling costs. Selling prices have not been raised at home, and, in effect, manufacturers are selling American tobacco (after manufacture) at less than replacement cost.

Workers and Management: The team spirit has been excellent and I express my thanks to my co-workers for their successful efforts. Mr C. Stanley Gray, has for some years acted as assistant managing director. He has been invited to become one of our joint managing directors and has accepted this position. I congratulate him upon the appointment.

Prospects: Devaluation must result in increased costs of tobacco and other materials. It will be difficult to earn this year the same rate of profit as last year. However, the orders in hand and the business in sight are satisfactory, and one can anticipate that throughout the world smokers will continue to smoke and that your company will secure its share of the trade.

The report was adopted.

TAYLOR WOODROW LIMITED

A YEAR OF STEADY PROGRESS

The annual general meeting of Taylor Woodrow Limited was held on Friday, June 30th, in London. Mr Frank Taylor (chairman) presided, and in his statement previously circulated he said:—

From the sale of certain investment properties we have created a capital reserve account of £42,947. Your directors suggest that the general reserve be increased by a further £35,000 to £150,000. The consolidated balance sheet shows a provision for contingent liabilities on contracts of £200,000, less taxation, leaving £99,000 net. Provision for taxation has been made for the year 1950-51.

Profit for the year before taxation and depreciation is £415,846, plus capital profit of £42,947, making total profit of £458,793, compared with £404,960, plus capital profit of £29,971 in 1948, making £434,931. After depreciation and taxation reserves, directors' fees and remunerations, there remains a balance of £71,628, which, with the balance brought forward from the previous year, £49,070, leaves a total of £120,698. Your board recommend that the dividend be maintained at 20 per cent. for the full year. To maintain our preference dividend of 6 per cent. and an ordinary dividend of 20 per cent. we only require £66,000 gross, or £36,300 net.

ENGLAND:—Our construction company continues to progress and is now well established in the forefront of the industry. Apart from civil engineering works well in hand, which include open-cast coal production work, Air Ministry contracts, construction of power stations, factories and pre-stressed concrete bridges, we have several new projects, including the foundations for a new power station, a very large factory and a contract for the London County Council value approximately £2,500,000.

New plant is being added to the hire fleet and the new plant workshops are complete and occupied. Contracts for reconditioned plant have kept the equipment company busy during the year, and contracts on hand are sufficient to provide work for at least twelve months. Our ballast pits continue to function satisfactorily and two new pits have been completed. The tyre remoulding and distributing organisations are meeting competition, but progress has been made. The plant manufacturing company has made substantial strides and your board have decided to build increased factory facilities. Our joinery company has been engaged in supplying fitments for houses and flats, power stations, gas works and factories, but current building licence restrictions continue to cause a shortage of work, resulting in keen prices. Experimental and development work has been undertaken with plastic material which can be used as an alternative to materials in short supply.

OVERSEAS:—Our associated company, Taylor Woodrow (West Africa) Limited, is now established in Nigeria and the Gold Coast. We have obtained the contract for extensions to the Takoradi Harbour, value approximately £2,500,000. Subsidiary companies in East Africa have carried out extensive contracts, including the Kenya Girls' Boarding School, factories, housing and offices at Magadi, and the Mikindani Pipeline Scheme. We have carried out extensive works in connection with the Overseas Food Corporation's Groundnut Scheme in Tanganyika, but conditions were most unsatisfactory and unbusiness like, and I asked the O.F.C. to release us from our contract. We are in the process of finalising this contract. Following on our experience in prefabricated housing, we have developed other similar structures for tropical countries.

The report and accounts were adopted.

HONGKONG TIN LIMITED

DIVIDEND OF 35 PER CENT.—LOOKING AHEAD

The twenty-first annual general meeting of Hongkong Tin Limited, was held on June 29th at Asia House, Lime Street, E.C.3.

Mr Jack Addinsell, the chairman, said in the course of his statement: As the result of the sale of 930½ tons of tin ore the accounts show a gross profit of £179,375, which is nearly double that of the previous year, the dredge having worked the exceptionally rich ground to which I referred in previous statements. From the gross profit, £10,850 has been written off fixed assets, and United Kingdom taxation requires £136,905. A final dividend of 17½ per cent. makes 35 per cent. for the year, leaving £53,707 to be carried forward. Before arriving at these figures £57,029 was paid to the Malayan government in royalty and tin duty.

Throughout the year the dredge worked towards the northern boundary and, as anticipated, very high values were encountered. The results must be regarded as exceptional. Special arrangements were made to provide suitable conditions and facilitate experiments for the future treatment of rich ground situated below the maximum digging depth of the dredge. The northern limit was reached in February, 1950. The dredge is now turning to the west and south through good but lower grade ground from which satisfactory but variable outputs are to be expected.

Your general managers estimate that within the Sublease Areas there remains a further proved life of 9½ years, subject to the conversion of the treatment plant on the dredge to modern jigs and the installation of special clay treatment plants to permit the recovery of both very fine and exceptionally coarse ore when selected areas are dredged a second time in a different direction.

TELEPHONE MANUFACTURING CO.

HIGHLY SUCCESSFUL TRADING

The twentieth annual general meeting of this company was held on May 3rd in London, Mr Fred T. Jackson, O.B.E., Comp.I.E.E. (the chairman and managing director), presiding.

The following is an extract from his circulated statement for the year ended December 31, 1949:—

The accounts show another highly successful year of trading, and reflect the results of a year of considerable activity. The profit of the parent company amounted to £193,770 as compared with £209,376 for 1948. The group profits amounted to £220,000 as compared with £228,654 for 1948. The turnover fell very little short of the total for 1948, which was a record apart from the war years. The rate of profit has been maintained, although we have had to extend the range of our products to cater for the needs of the export market.

The attention that we pay to efficiency in operation has made these results possible. I do not think we can be accused of exercising other than moderation and restraint in recommending an increase from 6½ per cent. to 7½ per cent. in our final dividend.

Direct exports constituted 30 per cent. of our output, and for the first three months of this year this percentage has increased to 67 per cent.

Our long-term prospects are bright, but the immediate future gives cause for some concern. Keener prices and the increased cost of materials arising from devaluation will affect our figures for the current year. However, our trading results so far are very satisfactory, and I anticipate that the profits will be sufficient to maintain our dividend and have something in hand for general reserve.

The report was adopted.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

IMPORTANCE OF PETROL DE-RATIONING

The annual general meeting of The "Shell" Transport and Trading Company, Limited, was held on June 30th in London.

Sir Frederick Godber, the chairman, said: Gentlemen, I have little to add to my speech circulated with the report, except to say that since my statement was prepared, one matter of very great importance, both to this country and the Commonwealth, and to the oil industry which serves them, has occurred, namely, the de-rationing of petrol.

Although only a short time has elapsed since this took place, it is already possible to see the beneficial effect it has had upon industry generally, and upon the public, and the many other incidental benefits which have emerged.

Notwithstanding the congestion of traffic, it is a pleasant sight for all of us to see happy family parties with their large or small cars enjoying the beauties of the countryside as a result of this relief from prolonged austerity. The psychological effect has been immense.

LONG-TERM PLANNING

So far as the oil industry is concerned, de-rationing of course followed naturally from the efforts of the oil companies to provide ample supplies of petroleum products from their great new refineries which have been constructed in this country and elsewhere. I would like to emphasise that it is not some fortuitous chance that has produced this happy state of affairs, but rather the long-term planning by all the units of the oil industry.

As we anticipated, the industry has taken the release from this particular control in its stride. There have been no embarrassments and we now look forward to the day when the remaining controls are removed.

One other matter to which I should like to refer that has occurred since the publication of my statement is the very great honour of Knighthood which His Majesty the King has conferred upon one of our managing directors, Mr George Legh-Jones. I am sure you will desire to add your congratulations to those of the board and, whilst it is primarily a well-deserved reward of Mr Legh-Jones's ability and attainments, we may perhaps as a group accept some of the reflected glory in that we may consider it as recognition also of the group's contribution to the national well-being.

The chairman then moved the adoption of the report and accounts and the payment of a final dividend of 1s. per share or £1 stock unit, free of income tax, on the ordinary capital.

Sir Robert Waley Cohen, KBE, seconded the resolution and it was carried unanimously.

Sir Richard Hopkins proposed a vote of thanks to the chairman and directors and also to the staff of the group for their services during the past year. Stockholders all agreed that this was a very prosperous and a very great undertaking and that prosperity in an organisation of this kind comes from wise and experienced direction by the directors at the top; competent and imaginative management on the part of the general managers and those associated with them, and loyal and conscientious efficiency and industry on the part of the great numbers of people who served them in various places.

The vote was unanimously accorded and the chairman's acknowledgment concluded the proceedings.

ANGLO-IRANIAN OIL COMPANY, LIMITED

TERMS OF AGREEMENT WITH IRANIAN GOVERNMENT

The forty-first annual general meeting of the Anglo-Iranian Oil Company, Limited, will be held on July 25th at Britannic House, Finsbury Circus, London, E.C.2.

The following are extracts from the statement of the chairman, Sir William Fraser, C.B.E., circulated with the report and accounts for the year ended December 31, 1949:—

Our accounts for 1949 have been prepared on the same basis and in the same form as for the previous year, and comparative figures have been shown.

The Group trading profit is £38,666,485, compared with last year's figure of £50,700,804. This is arrived at after making provision for depreciation on fixed assets, oil exploration interests and survey repairs aggregating £24,353,930, the corresponding figure for 1948 being £17,683,502.

In conformity with the dividend limitation policy recommended by His Majesty's Government, your directors have again decided to recommend a final dividend of 25 per cent., less income tax, on the ordinary stock, making 30 per cent. for the year. You may remember that last year I stated that the payment of a larger dividend would have been warranted. A similar conclusion would, I think, again be warranted in respect of the results for 1949.

Capital expenditure of the Group in 1949 was approximately £55,750,000, and the excess of this amount over the £35,353,920 retained in the business is reflected in the reduction of liquid assets less liabilities.

The decrease in our profits, despite the considerable increase in our total sales, reflects the rising tendency of costs and the lower prices of products as compared with the previous year. During 1949 the growth of total world demand for oil products slackened, a reduction in the expansion rate in the United States more than offsetting an increase in the rest of the world; at the same time the successful efforts made in 1948 by all sections of the industry to expand supply facilities were becoming increasingly effective. 1948, which twelve months ago I called a very remarkable year, was thus followed by what might best be described as a readjustment year in 1949, for at present it appears that total world demand is again moving upwards.

DISCUSSIONS WITH THE IRANIAN GOVERNMENT

In my statement to stockholders last year I referred to the discussions which had been taking place between the Imperial Iranian Government and the company on matters connected with our concession agreement in Iran, and briefly described the main subjects discussed.

Later at our annual general meeting on July 26, 1949, I was able to announce that, on July 17th, a supplemental agreement to the company's 1933 concession agreement had been signed in Teheran on behalf of the Iranian Government and the company.

In accordance with Iranian law, the agreement was thereupon submitted in the form of a Bill to the Majlis for ratification. No finality had been reached before the period of office of that Majlis terminated shortly afterwards, on July 28th, and it is understood that the Bill will be presented to the new Majlis which has now reassembled. In the meantime, the company's payments continue to be made on the basis of the 1933 concession agreement.

After ratification of the supplemental agreement the company will, in accordance with the details set out, pay to the Government £5,090,909 in respect of the amount standing at general reserve at December 31, 1947, together with the additional sums made necessary under the various headings of the new agreement on account of 1948 and 1949. The payments for these two years, on the basis of the 1933 agreement, amount in total to £9,172,245 and £13,489,271 respectively. With the agreement ratified the corresponding payments would be £18,667,786 and £22,890,261. Full provision up to the end of 1949 has been made in the accounts for the extra payments which would become payable under the supplemental agreement.

DISTRIBUTION AND SALES

Our sales of refined products and crude oil in 1949 amounted to a net total of 30,560,000 tons, some 4,000,000 tons more than in 1948. All refined products and crude oil contributed to this increase, which was also well spread over our various markets.

World market prices, as measured by the customary index of quotations in the U.S. Gulf of Mexico, receded during 1949 from the levels attained in 1948 in the case of all products except aviation spirit. For motor spirit the decrease was only slight, but quotations for fuel oils and middle distillates continued the sharp downward trend referred to in last year's report; fuel oil quotations were substantially reduced during the early months of the year, although from June onwards there was a partial recovery. Oil is a commodity of international trade and, as consumption requirements can only be met by drawing on production from both sterling and dollar sources, it has a common basis of valuation independent of the currency classification of its source. In consequence, the changes in currency values last autumn, which did not affect the dollar value of oil products, resulted in higher prices expressed in sterling.

In the United Kingdom, our largest market, motor-spirit rationing continued throughout 1949, but was terminated at the end of May, 1950, following the offer of certain American companies to provide a part of the necessary additional supplies against payment in sterling. This welcome development depended also on the ability of ourselves and other sterling suppliers to meet the greater part of the additional demand expected, and the increased supplies forthcoming from our Abadan and Llandarcy refineries were an important factor. The sale of motor-spirit under brand names remains in abeyance, and the need for maximum quantity precludes the introduction at present of higher standards of quality. In the case of kerosene it has been possible to reintroduce a premium grade, which our marketing associates Shell-Mex and B.P. Limited recommenced selling towards the end of 1949.

RESEARCH

The company's research organisation, in this country and overseas, continues its intensive support of our current operations and their future development. We, with other leaders in many branches of British industry and commerce, can take legitimate pride in the vigour with which, in close association with the universities and other learned institutions, experience is combined with experiment in practical and scientific research for the general betterment of mankind.

The scale and diversity of our operations require an exceptionally wide range of effort, skill and management, and the company's personnel is efficient and well-balanced in all these respects. I am sure that you will join the board in thanking all employees at home, afloat and overseas for good work well done.

BRITISH SOUTH AFRICA COMPANY

LARGER INCOME AND DIVIDEND

The annual meeting of The British South Africa Company was held on June 29th in London.

Sir Dougal O. Malcolm, K.C.M.G., the President, in the course of his speech, said: We present our report and accounts for the year ended September 30, 1949, another very good year, as I think you will agree; better even than last year, good as that was.

Our profit for the year at £1,458,778 exceeds the previous year's profit by £64,000 odd. We recommend a dividend for the year under review of 33⅓ per cent., that is to say, 5s. a share less income tax at 9s. in the £, to absorb £1,204,569, as against 26⅔ per cent., or 4s. per share, absorbing £963,655 the year before. This will still leave us a carry forward increased by £254,209 to £1,841,028.

WONDERFUL MINING RESULTS

The remarkable prosperity of our company in these latter years, and I hope that you will agree with me in thinking that it is remarkable, is, of course, due in very great measure to the wonderful results obtained by the Northern Rhodesian Mining Industry, in particular the copper mining industry, whence we benefit so greatly both as very large shareholders, directly and indirectly, in the mining companies, and as recipients under our agreements with them, by which they receive their *mining rights* from us, of royalties, which vary with their output and with the price of copper and other minerals.

During our year under review the sterling equivalent of the New York price for electrolytic copper averaged £117 per ton. During the year now current it has so far averaged £151 and is now at the extremely high figure of £180, so that for our year now current I think I am justified in anticipating that our mineral revenue will not be materially less than it was for our year under review.

THE AGREEMENT

The reception accorded to our circular regarding the agreement with the Government justified, I think, the belief that the conclusion at which we arrived met with general acceptance. Of course the agreement involves substantial sacrifice on our side; but it does make the position as it stands, in the light of the agreement, safe for thirty-seven years. I am satisfied that the other parties to the agreement will live up to it.

I am satisfied that there is no intention on the part of the Leader of the Elected Members of the Northern Rhodesian Legislative Council, who is a man of his word, or of his colleagues, from whom came the initiative which led to the negotiation of the agreement, to go back upon it in any way.

More than that, Clauses 10 and 11, the last two clauses of the formal agreement, implementing No. 2 (e) of the Heads of Agreement secure, so far as is humanly possible, that any future government which may be set up in Northern Rhodesia in place of the present Crown Protectorate administration will be bound by it. This is a very important element in the security which the agreement affords to our position for the thirty-seven years from the beginning of our financial year now current.

In submitting the formal agreement for the approval of the extraordinary meeting, which is to be held in a few minutes, your board is entirely confident that it will be recommending what is in your best interests.

The report was adopted and the agreement with the Government was approved.

RHODESIA BROKEN HILL DEVELOPMENT COMPANY, LIMITED

SATISFACTORY OPERATIONS

The fortieth annual general meeting of the Rhodesia Broken Hill Development Company, Limited, will be held at the Chartered Insurance Institute, 20, Aldermanbury, London, E.C., on July 25th.

The following is an extract from the report of the directors to be submitted to the meeting:—

The profit for the year after charging all costs and expenses was £2,248,424.

The directors recommend the payment of a dividend of 40 per cent., less income tax, in respect of the year ended December 31, 1949.

CAPITAL EXTENSIONS

Lead Smelter Plant.—The chairman referred in his statement last year to certain additions and improvements to the lead smelter plant which were being undertaken with a view to obtaining a better recovery from the ore mined. Since that time, as the result of further investigations and large-scale tests, the consulting engineers have recommended additions and improvements to the plant extensions as originally designed, so that a still higher output of lead will be obtained from a smaller tonnage of ore mined. Partly as the result of these additions and partly of additional costs of plant ordered abroad, arising from the devaluation of the £, the estimated cost is now £514,000. It is expected that the new plant will be in operation by the middle of 1951. This matter is referred to in more detail in the chairman's statement accompanying this report.

Zinc Plant Extensions.—In his statement last year the chairman stated that consideration was being given to an extension of the zinc plant, but that a final decision could not be made until definite conclusions had been reached on the problems of water supply and electrical power. The consulting engineers now consider that adequate water and electric power will be available for a 25 per cent. extension to the zinc tankhouse. The board has approved this extension, which is estimated to cost £100,000, and it is hoped that it will be completed by June, 1952.

Davis Shaft.—In order to mine ore from the lower levels, the consulting engineers have recommended that the Davis shaft should be deepened and a second pump station installed at about 500 feet below the present one. This project, which is estimated to cost £110,000, has been approved by the board, and work has already commenced.

CHAIRMAN'S STATEMENT

The following is an extract from the statement by the chairman (Mr S. S. Taylor, C.M.G., D.S.O.), which has been circulated with the report and accounts:—

Our operations since the beginning of 1950 have continued very satisfactorily. The total production for the five months to the end of May, 1950, was:—

	Long tons
Zinc	9,390
Lead	5,800

CITY OF LONDON REAL PROPERTY

RESTRICTIONS ON REBUILDING

The eighty-sixth annual general meeting of the City of London Real Property Company, Limited, was held on July 3rd in London, Mr Edmund Howard, F.S.I. (chairman and managing director), presiding.

The Chairman, in the course of his speech, said:

Gross rents and net service charges amounted to £1,009,302, and the balance remaining after deducting the usual outgoings amounted to £670,467, an increase of £67,695 over last year. The directors recommend a dividend of 5 per cent. on the ordinary stock, an increase of ½ per cent. on last year.

During the past few years progress has been made in the complete redecoration and modernisation of all our properties, and by the end of the year it is anticipated that this work will have been completed.

The present position with regard to office accommodation is extremely critical. If we received permission to re-develop all our vacant sites on important centres in the City we could then accommodate only about one-third of the applicants.

During the year the company has taken a lease from the Fishmongers' and Cloth-workers' Companies of the large site situated between Lime Street and Billiter Street, and plans were prepared which have received Town Planning approval. I was approached by the chairman of the Committee of Lloyd's as to the granting of an under-lease to them for the whole of our term in respect of the portion of this site lying north of Fenchurch Avenue.

Negotiations have resulted in an understanding whereby this under-lease will be granted.

The report was adopted.

CENTRAL AND DISTRICT PROPERTIES, LIMITED

DIVIDEND OF 15 PER CENT

The annual general meeting of Central and District Properties, Limited, was held in London on June 30, 1950.

Mr A. W. Bourner, the chairman, said in the course of his speech: I have pleasure in presiding at this sixteenth annual general meeting, as after a lapse of fourteen years it has become possible to pay a dividend to the holders of the ordinary shares.

Once again I am able to report to you an increase in the profit of the parent company as compared with the previous year.

With regard to the subsidiary companies, as compared with the previous year, there is an increase in the profit before the charge for taxation and the reserve for amortisation of £1,549.

Your directors have pleasure in recommending the payment of a final dividend of 10 per cent., making, with the interim dividend of 5 per cent., a total of 15 per cent.

During the year under review two of your company's properties have been sold. One of these sales resulted in a surplus over the book value; the other, a building site which your directors hoped at some time to develop, was compulsorily acquired by the local corporation, and, despite prolonged negotiations by expert valuers, resulted in compensation being paid at £4,567 less than the actual book value.

There is a definite proposal to acquire from the company a property which if accepted by your directors will show a surplus of approximately 50 per cent. over the book value, namely, a surplus of about £20,000.

Provided no unforeseen circumstances arise nor new legislation of a nature adverse to your interests is passed, we can, I think, look forward to a more stable future for your company.

The report and accounts were adopted.

Statistical Summary

EXCHEQUER RETURNS

For the 6 days ended June 30, 1950, total ordinary revenue was £52,759,000 against ordinary expenditure of £49,954,000 and issues to sinking funds £10,000. Thus, including sinking fund allocations of £2,524,000 the surplus accrued since April 1st is £41,021,000 compared with £4,315,000 for the corresponding period a year ago.

Indian Summer

THE quarterly figures of the state of Britain's reserves of gold and dollars were released last week shortly before *The Economist* went to press and were commented on in a Business Note. The figures were surprisingly good and served to remove any lingering doubts there may be that the devaluation of sterling last autumn has successfully accomplished its immediate purpose—though it is as well to bear in mind that the really startling transformation has been in the position of the rest of the sterling area rather than in that of the United Kingdom.

The dollar figures are not the only good ones that are now appearing. Indeed, it would not be much of an exaggeration to say that the economic news is uniformly good these days. So much is this so that it has become the fashion to poke fun at all those who do not believe that everything in the garden is lovely. Economists are getting used to being asked what has happened to their crisis.

All this is very natural, and supporters of the Government's economic policies, who have had to swallow a number of disappointments since 1945, should not be grudged their present enjoyments. But it is also perhaps worth keeping a clear head. The basic economic argument in this country in the past three years has not been over whether conditions are good or bad. It is true that politicians of the opposition are compelled (as politicians of every opposition have always been compelled and always will be) to magnify every defect. But even they do not seriously deny that for the great majority of the people (exception always being made for pensioners, landlords and others with fixed incomes) the times are good. Certainly no attempt has ever been made in these columns to question that fact; rather the complaint has been that people are far too comfortable to inquire into the soundness of the policies pursued.

The argument is not whether or not times are good, but whether they can stay so. It is related that when Napoleon was crowning himself Emperor of the French amid every outward and visible sign of success and stability, there was one figure who remained unimpressed. Madame Mère (which was the only title ever accepted by the Emperor's mother) was heard to say over and over again, with her Corsican accent and her Corsican shrewdness, *pourvou que ça doure*, "so long as it lasts." It is as well that somebody should always be ready to make the same proviso.

What are the odds that the present good times will continue indefinitely? The fact that they have lasted as long as they have is, admittedly, a rebuff to the economic prophets; but when they have admitted it, they can legitimately point out that it is not due to any policies pursued in this country—not even to devaluation—nearly as much as it is due to the phenomenally long continuance of the postwar boom throughout the world. If that goes on for ever, then full employment in Britain is secure; if not, not. "The world" in this context very largely means the United States. Opinion in America,

even among economists, is confident abo[illegible]ness conditions, but not even the most confide[illegible] envisages a future without any fluctua[illegible] consists in believing that future fluctuations wi[illegible] the flow of dollar income by only some 10 or 15 per cent [illegible] instead of the more than 50 per cent of 1929-33. It is surely the height of foolishness to suppose that not even this will happen sometime in the next few years—always supposing (as every rational economic argument must suppose) that major warfare is avoided.

The case of the critics is that the British economy, owing to such familiar things as high costs, crushing taxation and the paralysis of all the normal adjusting mechanisms, is in no fit shape to face even such a moderate "recession" in world trade. That case may be good or bad; but it is no sort of answer to it to point to the undeniable fact that times are good now. The contention is that what is now happening is the Indian summer of the long postwar inflation; and to warnings that no preparation has been made for the winter, it is simply irrelevant to point out that the sun is still shining. The alternation of good and bad times is neither as regular nor as certain as the precession of the equinoxes; but the only possible assumption for the prudent man to make is that it has not now, without visible cause, been wholly arrested.

It is, of course, just conceivable that the British Government has up its sleeve really effective measures for insulating this country against the effect of any change in external circumstances; but it is not very likely. In the first place, how can a trading economy such as the British insulate itself? And, secondly, there is no sign at all that the Government has any novel or original plans for buttressing wavering employment figures. The [illegible] case, that of the fishing industry, has [illegible] recently and the expedient appl[illegible] of a subsidy. Full employment [illegible] cannot be [illegible] anybody subsidising [illegible] policies, turn out, on examination, to be ca[illegible] an inflation going. This would be a sound p[illegible] if, under the cover of the continued inflation, other means were being used to move resources of men and capital into employments where there is a real and continuing demand for their products. Permanent inflation by itself is a recipe for permanent full employment only if it can be assumed that people will be willing indefinitely to go on paying high prices for things that are not what they really want. Yet there is no indication that the British, or any other government, has a better

The present public attitude, especially on the left, towards the possibility of any return, however moderate, of trade depression and unemployment is that it is unthinkable. That means that it is not being thought about. If there were any real sign that the rulers of the country knew what they would do when the first frosts of winter come, one could rejoice with them in their present prosperity without any foreboding. But since the present state of affairs is so much more the result of circumstances external to Britain than of good husbandry at home, the wise man will continue to expect trouble when the run of the luck turns, and to insist that policy is not sound until it begins to make some preparation against this inevitable day.

Under Which Flag?

ON July 7th—not quite a fortnight after the aggression in Korea—the Security Council of the United Nations passed a resolution providing for the unified command of the forces placed at its disposal. The resolution also authorised the use by that command of a United Nations flag in the course of operations. The Russians have, of course, protested at the illegality of both measures; but forty-six out of fifty-nine states members support them. Both the symbol and the mechanism of collective action are therefore in use after only a trifling delay. Yet murmurs of criticism are to be heard. "If only there had been an international force, much grave anxiety would have been saved. . . ."

Have such suggestions any substance? Could an international force have been deployed in Korea effectively and immediately after the Security Council had named the aggressor? The whole idea of an international force of decisive strength and ubiquity is so attractive to the imagination that it tends to give rise to muddled thinking. In particular, its advocates draw too little distinction between the two types of force of which the Security Council could dispose—the one, a constabulary capable of ensuring that peaceful settlements under chapter VI of the Charter are observed, the other an army, navy and air force in battle dress taking action under Chapter VII—the Chapter on action in case of aggression—and armed with weapons powerful enough to strike fear into a military aggressor.

Mr Trygve Lie must shoulder some of the blame for the confusion in the public mind; for he has not, in his speeches to the general public, continuously made the distinction clear. It is fatally easy to win a round of applause for such phrases as "We must put teeth into the Charter." In a speech at Harvard, where he received an honorary degree in June, 1948, he proclaimed that "the Security Council must have a force to back up its decisions." This was the phrase that caught the headlines. Only some of those who heard him, or read the full text of what he said, noticed that he later added that he had in mind only:

> a small guard force as distinct from a striking force. I cannot think of a single case that has been dealt with so far in which a large force would have been needed, provided that a small United Nations guard force of some kind had been available at the proper time.

By the following Assembly he had specified the kind. Count Bernadotte had been murdered, and Dr Bunche, Bernadotte's successor in Palestine, was asking for guards for the Truce Commission. At the 1948 Assembly, Mr Lie tabled his plan for the immediate establishment of a United Nations Guard 800 strong. But the Russians objected: they regarded such a force as a tool in the hands of the western majority and labelled it an attempt to violate the Charter. Mr Lie silently trimmed his sails to the wind. A year later, all that was proposed was a "field service" of 300 men, plus a "field reserve panel" of 500 observers to be called upon when need arose. The duties of the field service were to supply transport for United Nations Missions and to look after their communications, lives and property. This mild proposition secured the approval of the 1949 Assembly by 38 votes

to 5, with 8 abstentions. On March 1st of this year, therefore, there came into being the United Nations Field Service. But neither in name nor in nature is it a force. It is an administrative unit within Mr Lie's Department of Administration and Finance. It has none of the qualities of the international constabularies which supervised one or two of the plebiscites conducted by the victors of World War I in 1920-1—or by the League High Commission in 1935 in the Saar. Yet Mr Lie's public, having heard nothing to the contrary, goes on thinking in terms of his Harvard outlook.

Such thinking has no relation to the international situation as it is. The lesson of the aggression habit is that it takes a tank to catch a tank. Effective military power nowadays hangs upon vast supplies of heavy arms and equipment. The point to thrash out with the advocates of an international force waiting in leash, at the right spot, to pounce upon an aggressor is whether a permanent international service of the necessary strength can be organised, or whether the best that can be done is that the Security Council should call on national units when need arises.

The obvious advantages of a permanent service force lie in standardisation of training, pay, equipment, weapons and the like. Familar arguments against it are that it would be difficult to recruit because of the need for striking a balance between nationalities and ideologies, and that its morale—or, rather, its pugnacity—would tend to be inferior to that of a national army fighting in a popular, if wicked, cause. Both these difficulties can be mastered: international recruitment for the secretariat has in fact been organised and, with modern weapons, professional pride tends to replace pugnacity as a fighting quality. But there are other insurmountable arguments against a permanent international force and, of these, the chief is the question: Where would it buy its weapons? It must be big and strong enough to engender fear of reprisal. How is it, then, to have certain access to heavy armaments and to the staggering industrial machine behind the guns that is nowadays the condition of effective military strength? The world's manufacture of heavy armaments is concentrated in the hands of three or four states. If these are arming simultaneously—and divided into two camps—what are they going to sell to the Security Council, exclusive models, or duplicates of their own latest and secret equipment? Nations loaded down with their own immense bills for armaments would be quite unable to contribute to a permanent central pool on the only scale that would be effective in a heavily armed world. In short, the creation of an international striking force of a size to meet the Council's need is not possible except in a world that has become trustful enough to hand over a proportion of each nation's private provision against attack; that is, in a world of Governments that have accepted disarmament, and so closed the present gap between a striking force and a constabulary.

It is said that an international force, in the event of aggression, could be on the spot more quickly than a national contingent. On what spot? And from what bases would it arrive? Its bases could not be scattered over the globe. The nearest might be far from the scene of action. An international force cannot get its tanks to the scene of an aggression more quickly than ships can steam and men can load, unload and mount its heavy equipment.

A force composed of national units under international authority may be a *pis aller*, but at least it is practicable. It is not a new idea. It was advanced from the United States in 1904 when, at the instance of Theodore Roosevelt, Congress passed a resolution that advocated "constituting the combined navies of the world into an international force for preserving the peace"—an idea that obtained support in Britain but was pooh-poohed by the Kaiser. It was the conception behind Wilson's "organised major force of mankind," and again behind the Tardieu Plan presented by the French to the Disarmament Conference in 1932. Of course the arrangement has drawbacks, and causes quarrels and jealousies. When the mission is being conducted in the name of an international, peace-preserving body, the problems that beset any team of wartime allies seem to multiply. Mutual good will is frustrated by differences in language, organisation, equipment, rations and scales of pay. But the proposals of the pre-war era failed for more fundamental reasons: because of the absence of some Great Powers from the organisation, and because the concept of the complete equality and collective responsibility of all nations seemed to reduce the readiness of Governments to co-operate when it came to the point of actually applying sanctions. Over the years, articles 10 and 16 of the League Covenant became blunt instruments. The Manchuria incident dispelled the illusion that taking "common action" was easy. The Abyssinian crisis shattered it.

The situation now is different, because the United Nations Organisation is universal and because power is concentrated in a few hands—and its Charter admits this fact. Provided that any two of the biggest three will furnish the Security Council with a striking force, other members will co-operate and collective action follows. That is the lesson of Korea.

General MacArthur's force, with its 49 backers and its United Nations flag, therefore possesses several valuable qualities. Its composition is the best attainable in the circumstances. It has reached the site of aggression at least as quickly as could any permanent international service force. Above all, it represents, both in composition and in the spirit in which it has been despatched, an immense advance upon any other measure ever taken by an international organisation to stop an armed aggressor.

It is possible to argue, as the Russians are vigorously arguing, that any such despatch of force by the Security Council requires seven affirmative votes, including the votes of the permanent members, and that the resolution which authorised the unified command and flag obtained neither the one nor even the other—since the seventh affirmative voter did not represent the people of China. But the Charter—indeed the whole concept of the United Nations—does not provide for a case in which one of the permanent five actively helps the aggressor. In such a case, if the letter of the Charter prevents the Council from working, the world divides into two rival alliances. The alternative—which has only to be mentioned to be dismissed—is that whenever the permanent members fall out the United Nations abandons its functions.

The MacArthur force deserves the flag it is authorised to fly. It has the support even of nations which belong to neither the eastern nor the western bloc, notably of India, Pakistan and Burma. It has been neither tardy, nor grudging in sacrifice. And these are causes for thankfulness and satisfaction.

Currency Realism

THE mechanism of the new European Payments Union is described in an article that begins on page 130. The details are complex; they will prove to be of importance to professionals in all forms of international exchange, and of interest to the large body of currency amateurs; but there is no doubt that they will also prove to be caviare for the general. Nevertheless, the birth of this new scheme should not be allowed to pass without a comment of a general nature, for underneath all the technicalities it embodies a development of thought on these matters which is both encouraging and of general importance. This is the first major scheme since the war, in the field of international commerce and finance, that has been designed for the world as it is and not for the world as it should be. That is a great advance.

Hitherto, the various international plans that have been made for the reconstruction of the world's commercial and financial systems have been dominated by the twin principles of multilateral convertibility and of non-discrimination. In the reconstructed postwar world, all currencies were to be convertible on demand (at least for current payments) into all other currencies. If it were necessary to permit any deviations from this principle—that is, if countries found it indispensably necessary to retain exchange control—then at least the principle of non-discrimination was to apply—that is, it was not to be made any easier to exchange Currency A for Currency B than to exchange it for Currency C. The same principle of non-discrimination was to apply to restrictions on trade, as distinct from payments. If countries felt compelled to cut down their imports, they must cut down from all their suppliers equally. These are the principles that underlay the work of the Bretton Woods Conference and are enshrined in the statutes of the International Monetary Fund. They were made an integral part of the Anglo-American Loan Agreement of 1945. With a cloud of qualifications they are the substance of the Charter—as yet unratified—of the International Trade Organisation.

Any reasonably competent third-year student of economics can demonstrate with triumphant theoretical finality that any international trading system which has the peace and the welfare of mankind at heart must be based upon these principles of multilateral convertibility and non-discrimination. No sensible person would dispute that they represent polysyllabic perfection. They have only one defect: in the world as it is, they will not work. In the years when they held undisputed sway *The Economist* got into a great deal of trouble with all men of good will for insisting on this inconvenient but (as it seemed to us) inescapable fact. We could explain that we had no desire to start trade wars in every direction at once or to discriminate for the sake of discrimination; we could plead for an attempt to make currencies convertible within as wide an area as possible instead of within an area so wide as to be impossible; we could play the sesquipedalian game by suggesting that trade should be multilateral but not omnilateral; we could urge that the attainable good is better than the unattainable perfect—but all to no purpose. The men of principle shook their heads over the sad fact that the world's oldest free trade journal had sold out to the Schachtians. It is pleasant to observe that they have changed their minds.

For the European Payments Union is based upon discrimination and upon far less than universal convertibility of currencies. Under it, European currencies are to be freely convertible into each other but not—except in part and with some delay—into the dollar. The European countries will find it easier, with the assistance of the EPU, to buy from and sell to each other than to trade with the United States. These currency arrangements are to be followed up by a measure of trade liberalisation—that is, of the relaxation of import quotas—which will, again, not be extended to the "hard" currency countries of the western hemisphere.

*

Stated as bluntly as that, the EPU might appear to be an act hostile to the United States. Yet the great triumph that has been achieved is that EPU is being born with the blessing, almost at the instance and certainly with the effective help, of the United States Government—or at least of a majority of its agencies. Here is a revolution of thought, indeed. It results from the inexorable pressure of the facts. The famine of dollars is a fact. If the European countries are to get on, after the demise of the Marshall Plan, without free gifts of dollars, they must very seriously cut down their dollar expenditures; and if in so doing they are to avoid discrimination, they must treat their imports from all other sources with equal severity. If all currencies are to be convertible by those who hold them into dollars, then every country must take care that nobody holds a single unit of its currency more than he needs. In short, these sacred principles, when combined with the fact of a dollar shortage, become instruments not of expansion but of the most cruel compression of all trade. It has taken five postwar years for this truth, which should have been obvious, to prevail, and for the Americans to realise that if other countries, all equally short of dollars, make such arrangements as they can to foster their mutual non-dollar trade, no trade is being taken away from Americans that they could possibly enjoy.

The impression should not be given that it is only American obtuseness that has caused delay. On the contrary, one of the most extraordinary phenomena of the whole process has been the way in which the British Government, which should in its own interests have been the most enthusiastic and persistent supporter of all schemes for the maximum of free exchange in a limited area, has had, until very recent months, to be pushed towards EPU by the Americans. If there has been a mistaken clinging to the false appearance of self-interest on the one side, there has been a blind ignoring of obvious self-interest on the other.

The five years' wait has been worth while if it has enabled the sacred principles to be set aside with consent and with safeguards against abuse. Those who, like this journal, have always urged that trade must be discriminatory if it is to expand have never wanted discrimination *ad lib.*; the argument has always been that the nations, in their postwar economic reconstruction should seek to agree on what degree of discrimination is permissible in what circumstances. This, in effect, is what EPU does. So long as the dollar shortage persists, the rules of EPU regulate the degree in which member countries can discriminate against the dollar; and if the shortage is relieved, the provisions for payment in gold (which is nowadays a synonym for conversion into dollars) can be tightened up.

It remains to be seen whether EPU will work well or ill; what has been said here implies no judgment on this. But nothing that happens hereafter can take away its importance as the first major instance in which the nations, in their postwar economic reconstruction (exception being always made for rescue operations such as the Marshall Plan), have based themselves upon the real facts of the world as it is. Is it too late to write some retrospective realism into the statutes of the International Monetary Fund itself?

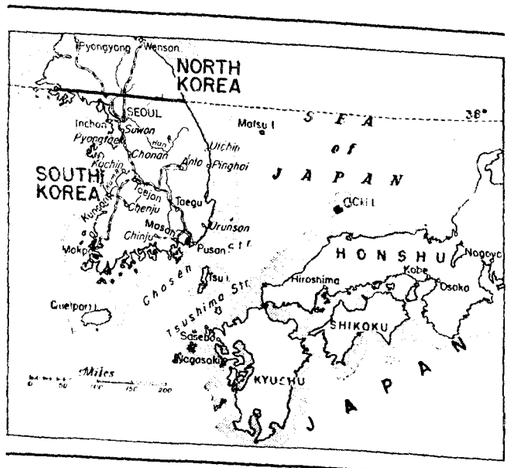
Taxes and Korea

THE dangers from Korea have this week turned towards the public gaze a facet of Britain's finances that so far has been watched only by the few. On the third reading of the Finance Bill the Opposition urged the point that the present burden of taxation is so heavy as to leave hardly any scope for fiscal manoeuvre in an emergency. There is no considerable reserve of taxable capacity. The Chancellor of the Exchequer denied this, just as Mr. Gaitskell recently denied the parallel charge that the Government's financial policy is gravely impairing the supply and quality of the nation's savings. These were matters of moment even before the Korean war gave them a sharper urgency. It is not a little disquieting to find ministers supposing that they can be dismissed by glib negations unsupported by any arguments that deserve to be taken seriously.

The Chancellor did admit last Monday, as he has done before, that so far as peacetime is concerned Britain has come "very near the limit of direct taxation on incomes." But he went on, with no apparent consistency, to affirm—

> but that does not mean, of course, that we have reached the limit of taxability. There is indirect taxation; there are death duties; and many other ways by which taxes can be raised. . . . We have indeed reduced taxation on incomes by £650 million since 1945. So, obviously, there is a reserve which could be tapped if it became necessary.

But it is not obvious; nor is the basis of the Chancellor's figuring, which he did not explain. Fortunately, there is no need to try to follow the Treasury arithmetic, for the argument itself is almost wholly beside the point. No one would dispute the possibility of imposing higher taxes and collecting an even larger total revenue. But the time has long passed when the sole apparent object of collecting a given tax revenue was to enable the Government to pay its bills. The very fact that the Chancellor is budgeting for a true surplus is an admission of the wider purpose—the purpose, repeatedly expounded by Sir Stafford Cripps himself, of enabling the fully-employed national economy to meet the clamant demands upon its resources without increasing the tempo of inflation. The inflationary pressures will mount, bringing a new threat of rising costs to Britain's balance of external payments, unless at current price levels the flow of private savings, plus the budget surplus, is sufficient to finance the nation's large outlays on maintaining and creating capital assets. If defence expenditures precipitated by the Korean affair encroach to any great extent upon the budget surplus, it is doubtful whether, in present conditions, an increased inflationary pressure can be avoided.



In judging whether the limit of taxable capacity has been reached, the question to be asked, therefore, is not whether it is possible for the Government to collect additional revenue, but whether the addition can achieve the wider purpose for which it would be exacted. If increased taxation diminishes the flow of new savings out of income, it is to that extent self-defeating. The fact that certain taxes have been reduced since 1945 is no guide whatever to the possibility of achieving a genuine net gain by raising them towards their wartime level. During the war, the volume of private savings was determined much more by the stringency of physical controls, by the wide gaps in supplies of goods and by the general circumstances of life under fire than by the positive willingness of the public to save. It is, therefore, absurd to suppose that in present conditions any large increase in taxation towards wartime rates could be accompanied by comparable abstentions from spending. Such abstentions as were made would, moreover, certainly have their biggest impact on the most highly-taxed commodities—notably beer and tobacco. These tendencies, indeed, are showing themselves even now in many directions. If this argument is true of the general run of taxes, such as those on income and indirect taxation, it applies even more directly to special forms of taxation. Very naïvely, Sir Stafford instanced death duties as a source of reserve capacity; but these are met almost wholly out of capital, since the securities that are sold to pay them must be bought and financed out of other people's savings. Similarly with profits taxation: an increase here is most unlikely to be financed, except to a fractional extent, by cuts in dividends; it will merely reduce the level of company savings. In neither case will there be any net gain at all.

The conclusion surely is plain. Since the Government evidently has no intention of increasing its fiscal latitude by cutting down civil expenditure, rising defence expenditure is likely to mean rising inflationary pressure. Unless and until Britain reverts to a war footing, with all the paraphernalia of detailed controls, there will be little if any apparent reserve of taxable capacity in the true sense. And if and when that time comes, the fiscal instrument, so over-worked already, will not be the cutting edge. Almost the whole job of shifting productive resources from serving civil consumption to making war material will have to be done by the Government's dragooning of the national economy. In the last war, the weapon of tax increases did an important part of the work. But now even Sir Stafford's £650 million of supposed "reserve" of taxes would be a puny proportionate addition, by the standards of war requirements, to the prewar yield of taxation. It is a disquieting prospect—and not least for those who believe that the individual citizen has a right to freedom, and that he cannot be personally free unless he is also free to control the spending of his income.

NOTES OF THE WEEK

Buying Time in Korea

It is now clear that the Communist invasion of South Korea has behind it a weight of armour and of fire power that the defenders, caught unawares, cannot yet match. In spite of their superiority in the air, they lack the necessary weapons on the ground to check the invaders' persistent tank attacks, and have been compelled to retreat from Seoul to the outskirts of Taejon in a fortnight of bitter and unbroken fighting. In one sense, this delaying action represents a considerable military achievement. The North Koreans would have swallowed an unaided South in a few days, and the Americans, hurriedly assembled from the garrison in Japan, and thrown into the front line, apparently without adequate weapons, have contrived "to buy time by giving space" and to offer the hope of building up a bridgehead that can be held—as Salerno and Anzio were held. But the race is not yet won, and the Communists with fifteen divisions and not less than a hundred tanks still in the field have striking local superiority. General Bradley has said that the situation is "very serious and it would be a disservice to our people to give them any other impression."

It is when news is bad that tempers are frayed and allies fall out. There have been uncomfortable signs in the last week of angry American reactions to the "criticism" of America's military performance that is reported to have appeared in other countries, particularly in Britain. This reaction is very wide of the mark. There has been nothing but admiration in Britain for the boldness of the President's move and nothing but understanding for the intense difficulty of mounting an effective defence at a moment's notice and some 5,000 miles from the home base. Moreover, such criticisms as have appeared in Britain are almost entirely based on the reports of American correspondents. But American criticism is, perhaps, not so wide of the mark when it questions the British decision to commit no land forces to Korea. It is impossible for the layman to speak with authority on such an issue, but the existence of a garrison of 40,000 regular soldiers in Hongkong, relatively within reach of the Korean battlefront, is bound to raise questions which should be conclusively answered in the interests of Allied understanding. One would have thought that Anglo-American military relations and consultation were by now such that joint—rather than unilateral—decision and announcement would have been possible.

The "Peace" Campaign in Trouble

If the western allies are disheartened by events in Asia, they can take some comfort from the likelihood that the Communists, too, have some grounds for discouragement. For them Korea is simply an incident in their worldwide pressure on the free nations, and it is very likely that the local effects of the invasion are less significant to them than the repercussions of the attack in the world at large. There they have been conducting for months a frenzied "peace" campaign, denouncing the west as aggressors, imperialists and warmongers, and calling upon the peoples to thwart their rulers' "plans for war." Moscow radio daily issues instructions of the "correct" attitude to be adopted. Here is an example written by Mr Sobolev of *Pravda*:—

> I vote against war—and this is not merely a matter of words. It means that I shall do my utmost to prevent war. I shall stop the trains; I shall refuse to unload the ships carrying war-materials; I shall not supply fuel for the planes; I shall seize the arms of the mercenaries; I shall not allow my son or my husband to go to war; I shall deprive the Ministers of food, drink, telephones, transport and coal. Let those who are dragging us into war do the fighting themselves.

Korea has now been made a test case of this "peace" campaign. The Russians accuse the Americans of aggression and call upon the workers to respond with resistance and sabotage. In fact, however, the response has been almost nil. The Communist Party of Italy has managed no more than a symbolic hour's stoppage. France is calm. In Britain, strikes have occurred only where normal wage grievances already threatened trouble. Agitation in Germany has been a fiasco. If this is the "rallying of the peoples" to the peace campaign, it is clear that the Russians have a long way to go either to convince the workers that the western powers are aggressors or that active sabotage on the Russian side is the way to "peace."

* * *

Hors de Combat

It is more than unfortunate that British foreign policy should be conducted from a sick-bed when the international situation is so tense and the co-ordination of American and British policies so vitally necessary. No doubt Mr Bevin sees all the right papers, has the right minutes written, can shape policy by his grasp of essentials. But there are two things he cannot do which need doing at this juncture: the first is to see that his colleagues of the Cabinet really understand the kind of world that British policy has to work in and reconsider their policies as a result; the second is to ensure that will power as well as intelligence goes into those day to day decisions in the Foreign Office that make policy.

It is true that Mr Bevin may be back at his desk in three or four weeks. But he then proposes to attend the Council of Europe in Strasbourg and the General Assembly at Lake Success. These are duties that a less conscientious Minister would unhesitatingly delegate. Foreign policy in the Cabinet and western defence demand his undivided attention for many months ahead.

* * *

Railway Wages

The threat of a road haulage strike in Greater London, precipitated by the dispute among the Smithfield drivers, has almost subsided. Mr Deakin, the secretary of the Transport and General Workers' Union, has succeeded in assuring the drivers that the union will not neglect their interests, and thus once again this mammoth union has managed to preserve at least the appearance of unity. If the trouble with the transport union is that it covers too many trades and industries for its leaders to keep effective contact with the men, the difficulty on the railways is precisely the opposite—one industry is covered by three unions with conflicting interests. After more than a year of negotiations, threats, and unrest, the National Union of Railwaymen decided last week to accept the Railway Executive's offer of an increased wage of 3s. 6d. a week for the lowest grades. It has thus accepted an offer originally made over a year ago which it turned down with scorn at the time. In the meanwhile it has seen its successive claims for £1, 10s. and 7s. 6d. rejected by the executive or by the arbitration tribunals, and Mr Figgins, the union's secretary, obviously feels that he must get some immediate advance if he is to save his face with his union.

But the matter is not as simple as that. The two smaller railway unions, the Railway Clerks' Association and the Associated Society of Locomotive Engineers and Firemen, have claims of their own and will not associate themselves with the NUR's acceptance of the Railway Executive's offer. The RCA in particular will not permit those few of its men who are affected to accept the increase. Thus the whole matter is to be again referred to the national reference tribunal, and in the meantime nobody will receive the extra money since the Railway Executive rightly refuses to give the increase only to members of a particular union. The railways, like the engineering industry or the printing trades, illustrate the chaos of inter-union rivalries which makes it virtually impossible to arrive at any rational wage structure. This is a question of which Parliament will one day be forced to take notice.

But the case of the railways also brings up again the unresolved problem of control over the nationalised industries. The railways are running at a substantial loss at present, and the Railway Executive in offering an increase even of 3s. 6d. a week is in fact making an offer of money which it has not got and which must be found by the taxpayer. Since the negotiations with the unions have taken place behind closed doors the taxpayer or his representative has had no opportunity to decide whether that is the way in which he wishes his money laid out. An increase of wages for the lower paid railwaymen must at present lead either to further operating losses or to increased fares, and it is fairly certain that the taxpayer would have considerable reluctance about this step if he were consulted. A solvent nationalised industry is obviously at liberty to pay what wages it likes, but an insolvent one is in effect a bankrupt in the custody of the nation, and it is time that the distinction was recognised.

* * *

Mr Strachey

Mr Strachey's defence, in a debate in the House of Commons on Tuesday, of his now famous speech at Colchester, seems to have satisfied the Prime Minister and the majority of the Labour Members, although it has satisfied no one else. He explained to the House, as he had previously explained to the Prime Minister, that his use of the word "plot" was applied not to the Schuman Plan but to the actions of the Tories. Whatever might have been in the text of the notes issued beforehand for the guidance of the press, he had, he said, in delivering his speech, interpolated sufficient sentences to make it clear that the Tories and not the French and German Governments were the plotters, although he regretted the tone of his expressions about the Schuman Plan. In view of this explanation it is worth setting out the press report of the disputed passage, as supplied to the newspapers by the Press Association whose reporter had attended Mr Strachey's meeting.

> Is it not obvious that the real purpose of this plan was to put up a barrier against the control of the basic industries of Europe by the European people? After all, gradually and with difficulty, but nevertheless surely, the people of Europe and of Britain are getting hold of economic power. . . We shall get more and more of these schemes, no doubt, which under the guise of internationalism, are designed to prevent the people really controlling their economic system. Well, Labour had only, of course, to expose this plot in order to defeat it. Labour triumphed in the debates and divisions on this issue last week. Even some of the Tories wavered a bit when they saw what it really was.

If the nation is to accept Mr Strachey's explanation it must rely on his word against that of the reporter who, after checking Mr Strachey's notes against what he actually said, prepared this dispatch—that is the word of an interested party against that of a person wholly disinterested in the content of the speech but whose job depended on preparing an absolutely accurate report of it. This is not the first time that Mr Strachey has been involved in a wrangle over the exact form of one of his public utterances; it happened when as Minister of Food he was defending the conduct of the groundnut scheme.

But quite apart from the disputed sentence, Mr Strachey, by using opprobrious language about the Schuman Plan, has in fact attacked the policy of his colleagues, and has therefore denied the principle of collective responsibility which is essential to the maintenance of Cabinet Government. Irrespective of whom it was who was accused of perpetrating a "plot," the whole tenor of his speech has seriously jeopardised the relations of all his colleagues with the governments of Europe. It would seem that loyalty alone should make him wish to resign. The fantastic extravagance of his language in this speech shows that behind the façade of the responsible administrator there lurks the wildest kind of irresponsible political agitator. If Mr Strachey really believes the nonsense to which he has given utterance, it is doubtful whether he has the necessary qualifications to be the head of any department of state.

* * *

The Defence of Germany

Judgment of international affairs can easily be distorted by analogies rashly drawn; but that fact will not deter Germans from arguing that Korea has been the scene of rehearsals of several events that have happened, or might in future happen, in the two Germanies. The argument will have very different impacts on their respective politicians. Walter Ulbricht, the Communist Deputy Premier in the east, already smells blood and victory for his "National Front." This organisation is to direct a "resistance movement against the rule of the American governors" which will rally "all patriotic Germans"—a clear threat of force to be used by Communist Germans and their allies against the rest. The Ulbricht junta are doubtless encouraged by the fact that there has been no reply from Moscow to western inquiries about the highly trained *Bereitschaften*—or Communist SS—that they have at their disposal, and that Mr Gromyko has now provided them with a classic exposition of why neither Uno nor the Great Powers are entitled to intervene in a "civil war" that is likely to be won by the Communist "liberators."

At the other end of Germany Dr Adenauer is in an embarrassing position. The eastern junta has claimed the leadership of German patriotism. He will increasingly be asked by political opponents and allies what assurances he can offer for the security of western Germany. He will find it increasingly difficult to explain why the German Government that is taking part in the conference on the Schuman proposals and in the Council of Europe cannot be covered by the Atlantic Pact. There is even the possibility that nationalist extremists, Communists and advocates of neutrality will combine to spread the idea that the presence of American troops in Germany is a source of danger and not of safety.

The whole problem is beset with political and military difficulties. The provisional solution that would produce the greatest effect on morale—not only in Germany but throughout free Europe—would be for the Americans, British and French each to double the number of their divisions stationed in Germany, or close at hand. If that cannot be done, then there is something fundamentally wrong with the Atlantic Pact and Western Union planning of which so much has been heard.

* * *

Ulbricht's Promises to Moscow

The treaties concluded last month between the German "People's Republic" and Poland, Czechoslavakia and Hungary have now been dutifully ratified by the Pieck parliament in Berlin. Speeches made by the Christian-Democrat "Foreign Minister," Herr Dertinger, on this occasion show clearly the significance of the agreements that Russia's German satellites have signed. They were, it appears, intended to implement the Warsaw Agreement of June, 1948, by which Mr Molotov secured the approval of the suspicious Poles and Czechs to his plan for incorporating Soviet Germany into the political, economic and strategic bloc ruled from Moscow. The price paid for Polish and Czech agreement to accept the Germans into their fold, and to support Soviet propaganda for a withdrawal of the occupation forces, was a declaration by Mr Molotov to the effect that the Oder-Neisse line was a permanent "frontier of peace." Now that frontier is formally acknowledged in the People's Republic's treaty with Warsaw. In the same way, Herr Ulbricht, the Soviet citizen who rules eastern Germany, has renounced in Prague all claims to the return of Germans to the Sudetenland.

No renunciations were involved in the treaty with Hungary, and *Volksdeutsche* expelled from that country are said to be returning. But it provided, like those signed in Warsaw and Prague, for greatly increased trade and ideological collaboration with eastern Germany. Even more plainly than the other agreements, however, it stressed that the main purpose of all three is to prepare the way for a military alliance such as binds the Soviet Union to its other satellites. The Poles, Czechs and Hungarians have now been assured that eastern Germany will not again be their enemy; while the Soviet Germans themselves have been informed by Herr Dertinger and President Pieck that their leaders

> have been called upon to affirm on behalf of the entire nation that, in the event of war, the German people will fight by the side of the USSR and the camp of peace.

West German statesmen have naturally repudiated with indignation the right of Herr Ulbricht to sign away the Oder-Neisse line and to pledge the whole of Germany to fight for Russia. Their feelings have found expression in the expulsion from the Christian-Democratic Party of Herr Gereke, the Minister of Agriculture for Lower Saxony, who, on his own responsibility, discussed with the "traitor" Ulbricht the idea of selling to eastern Germany Lower Saxony's huge stocks of unsold tinned foods.

* * *

Juggling with Defence Estimates

The much publicised statement that the United States is spending more than 76 per cent of its budget "for war purposes," whereas the comparable Soviet expenditure is only 18.5 per cent of the budget should not be allowed to pass unchallenged. If, in each case, the official term of military—or national defence—expenditure is accepted at its face value, then American expenditure, as estimated at the beginning of this year, is $13,148 million out of a total of $43,397 million (30.4 per cent), and Soviet expenditure is $19,850 million out of a total of $106,975 million (18.5 per cent). But the Soviet Finance Minister is not content to take at their face value terms used in the capitalist world, and he reaches his conclusions about the American budget by a curious calculation. He appears to have added together the sums allotted by the Americans to national defence ($13,148 million), to international affairs, which includes Marshall aid ($5,964 million), to veterans' services and benefits ($6,905 million) and to interest on the national debt ($5,725 million). This produces a total of $31,742 million, which indeed is 76 per cent of total expenditure—but by pure propagandist juggling.

It is not possible to apply with any confidence Mr Zverev's technique to his own budget figures. But it would surely be not unfair to add to the admitted Soviet defence expenditure of $19,850 million some proportion at least of the following inadequately labelled items: capital investment of $33,400 million, $1,400 million for scientific research and $3,475 million for administration. If that could be done with a full knowledge of the facts—on the scale, say, that facts are made available to committees of Congress—then the results would be quite startling.

It is by attemping such a calculation that experts in the American Industrial College of the Armed Forces have reached the conclusion that the true Soviet annual defence expenditure is not $19 billion but $45 billion. It is based, *inter alia*, on information that in the Soviet Union aircraft construction is provided for under industrial production, new armament industries under capital investment and atomic research under education. (In the United States this item is covered by the title "natural resources" to which $1,845 million are allotted.) There is no means available to the layman of judging the worth of this conclusion; but if Mr Zverev insists on playing tricks with American figures he can hardly object to some intelligent speculation about the adequacy of his own bald estimates.

The County Plan in Danger

There is a serious danger that the County of London plan will suffer the fate of death by a thousand cuts. The LCC already has 165,000 families on its waiting list. If its redevelopment and slum clearance plans are carried out, this list will be further swollen. But where are all these displaced families to go? The LCC has accepted the principle that it should stop housing operations in the Green Belt after the completion of its present schemes. It has amended the original County plan along egalitarian lines, so as to bring down densities in the poorer areas and raise them in the leafier districts—to the detriment of places like Blackheath and Hampstead—but few open sites remain even in the pleasanter parts of the county.

The theoretical solution to the problem is that there should be a large-scale movement out of London to the new towns and other towns at a distance. But it has become clear that the present policy of dispersal will not work. A prime reason is economic exigency. The Board of Trade is not prepared to help squeeze industry out of London, or to ensure that the new towns draw their industry from congested inner areas. Where houses or factories are left vacant, there is little to stop them being reoccupied by migrants from other parts of the country. There is no effective co-ordination between "evacuation" areas and "reception" areas. Moreover, the whole programme is bedevilled by financial considerations. Towns intended for expansion are reluctant or unable to afford the capital outlay. The LCC, for its part, would be faced with a heavier debt burden as its population fell—a consideration which may temper its enthusiasm for its own plan.

The LCC is understandably alarmed that it may eventually be forced to modify its schemes and raise density standards. This would without doubt be a social tragedy. It is therefore up to the Government to reach a clear decision whether the social and strategic advantages of dispersal from London are worth the cost. If they are, then it must not only force the authorities concerned to march in step, but it must also face the probable need for new planning legislation: the present powers, wide as they are, are shown by experience to be vexatious without being effective. If dispersal is not worth the cost, it should stop trifling with a policy which is achieving at great labour and expense very little that would not come about by natural processes. Indeed, Government efforts are cancelling themselves out. What is the point, for instance, of giving the LCC such a high subsidy for flats that it shows a profit in building them at the same time as it is urged to decentralise?

Advising Mr Bevan

The Central Health Services Council, which is constituted under the National Health Service Act, has published its first report covering the period July 5, 1948, to December 31, 1949. In addition to the central council itself, there are a number of standing advisory committees, consisting partly of members of the council and partly of other persons appointed by the Minister of Health; these are chosen, after consultation with representative organisations, because of their experience in the committees' different fields of activity. The functions of both the central council and the committees are to consider any matter relative to the health services referred to them by the Minister, and also to study any matter to which the council thinks the attention of the Minister should be called.

In his comments on this first report, Mr Bevan states that in the period covered by it he remitted some thirty separate questions to the council and committees, while they themselves, on their own initiative, have taken up more than a dozen other matters. That the council is an important body, with considerable influence on policy, can be seen from the account of its work provided in its report. For instance, in the early days of the health service, Mr Bevan refused to agree that general practitioners should treat private patients at health centres set up under the Act. On the advice of the central council, which pointed out that the maintenance of separate surgeries for a handful of private patients would be undesirable, permission for their doctors to treat them at health centres—on certain conditions—was written into the National Health Service (Amendment) Act of 1949. Advice was also asked on the question of wasteful prescribing. The standing medical and pharmaceutical advisory committees set up a joint subcommittee with their Scottish counterparts, which has reported on what preparations are foods rather than drugs and should not, therefore, be prescribable under the health service. Further, a joint committee of the central council itself and the Scottish council has considered, and is still considering, to what extent proprietary drugs should be prescribable under the health service.

Many of the questions considered by the council and the standing committees in the first eighteen months were, like prescribing, concerned with problems that were bound to arise on the introduction of the health service. But they are also paying attention to long-term matters of policy. The report refers to the difficulties which arise from the administration of the service through three separate agencies—the hospital authorities, the local health authorities, and the executive councils for the general medical and dental services. It was recently announced that a committee of the central council has been set up to consider how co-operation between these three branches can best be achieved.

Care of the Tuberculous

In one respect, some criticism of the advisory machinery provided by the Central Health Services Council seems justifiable. Its members, and those of the standing committees, being men and women who are busy in other spheres, some time is bound to elapse before they can consider a problem, formulate their advice on it and forward it to the Minister of Health. An example of this delay is the new measures announced this week for finding hospital beds for the tuberculous. The long wait, now up to nine months, before a tuberculous person can obtain admission to a sanatorium has been given publicity for some years—long before the introduction of the health service. The dangers of this situation have also been emphasised, time and again. But the standing tuberculous advisory committee has only recently submitted its advice to the Minister on what should be done about it. It held only four meetings in 1949, compared with the nine meetings held by the dental advisory committee.

Yet the proposed solution to the shortage of beds was put to the advisory committee last year, and it is difficult to see why the committee has been so long in making up its mind. The solution is that until more accommodation can be provided in sanatoria, beds should be made available in suitable general hospitals for tuberculous patients needing institutional treatment. Some hospitals have already allocated a proportion of their beds for this purpose, but it is only now, after the advisory committee has made up its mind, that Mr Bevan is asking all hospital boards to make a similar provision, and for many of the 10,000 patients waiting for beds, and the unknown number infected by them, the decision will come too late. It is impossible not to contrast this dilatoriness with the energetic action taken to deal with the poliomyelitis epidemic in 1947.

Even now, the measures announced by Mr Bevan are not complete. The London County Council recently drew attention to the fact that the hospital boards disclaim responsibility for the open—that is, infectious—tuberculous persons who cannot benefit from institutional treatment. There are some 160 of these persons known to be living in common lodging houses in London, but the council's proposal to build a night sanatorium and workshops for such cases has been turned down by the Ministry of Health. The project would have been expensive in itself. But when will the Ministry grant the prevention of tuberculosis the priority it deserves?

M. Pleven's Success

By a majority of 373 to 185, M. Pleven has been accepted as Prime Minister of France. The basis of his coalition is the return of the Socialists to responsibility, and one of his most effective pleas for support in the Chamber was based on the success of the coalition in the past and the folly of squabbling now, when growing prosperity had come to crown its earlier efforts. This general appeal, however, would probably have been ineffective if M. Pleven had not succeeded in finding a compromise with Socialist difficulties before he submitted himself to the Chamber's approval. The way was paved for him by M. Guy Mollet, the secretary of the Socialist party, who consulted with the other groups and worked out the terms upon which the Socialists would be prepared to return to the coalition they left in February.

M. Pleven took up these tentative proposals, agreed to increase the salaries for civil servants, provided the weight of the extra expenditure was mainly borne by next year's budget, guaranteed to introduce a minimum wage before September and to secure "full employment without inflation." Other matters of dispute—above all, the electoral law—have been shelved for the time being, and until the autumn at least, France seems assured of the only govern-

ment that has any hope of more than a few weeks' existence —a coalition of the three centre parties, leaning neither to right nor to left.

Marshall Aid for Colonies

The Economic Co-operation Administration (ECA) has made available under the Marshall Plan some $4,000,000 to assist in the development of the overseas territories of the west European nations. By far the largest proportion of the dollars is to be spent on building roads, lack of which has been the greatest single obstacle to increased production of food and raw materials in the colonies.

Britain is to receive as a grant about $1,000,000 for road development in Northern Rhodesia, the Gold Coast, Nigeria, Sierra Leone, Nyasaland, North Borneo and Sarawak. Belgium has been given a loan of $1,768,000 to help finance a large road-building project in the Belgian Congo. Another $1,236,000 is being granted to France to assist the expansion of roads in French West Africa, Equatorial Africa and the Cameroons.

This $4,000,000 is only a small fraction of the $20 million which ECA, nearly a year ago, set aside from Marshall Plan funds for development projects in the overseas territories. It was the view of American officials that such investment should receive a high priority, partly because it reinforced the US Administration's Point Four programme of aid to underdeveloped areas, and also because it might help to restore the triangular pattern of world trade that prevailed before the war.

At first glance it appears strange that it should have taken so long to find ways of using one-fifth of the dollar allocation made available. The most important explanation is that dollars represent only a small part of the funds involved in any one project. This is so largely because Marshall dollars are intended for purchasing only those goods which cannot be bought in Europe and, as economic recovery has progressed, Europe's output of goods has expanded.

Quite apart from this formal restriction on dollar purchases, there has also been some reluctance among the European nations to admit American capital into Africa, even where it is given as a grant. The reluctance springs from a number of sources: long-standing traditions of exclusiveness and a horror of the paper work inevitably involved in the maintenance of accounts which would satisfy Congress. Even more important than these factors is the fear of the colonial authorities that any large-scale investment programme might bring with it inflation and consequent social unrest. It has been estimated that for every Marshall dollar invested in these development schemes, the local authorities would have to put up the equivalent of at least $15 in their own currencies. In the particular instance of the road-building programme, the contribution of the colonial powers is far higher; they plan over a period of years to furnish sterling and franc investments equivalent to $200 million, as compared with ECA aid of $4,000,000.

For all these reasons it will be remarkable if investment projects in the overseas territories absorb as much as $10 million of the original dollar allocation.

Sidky Pasha

The death of Ismail Sidky Pasha removes a most salutary influence from the somewhat turgid and confused field of Egyptian politics. Sidky Pasha was far more of a statesman than a politician, and there were far too few Egyptians ready to follow his intelligent and refreshing lead. His was the traditional lone voice—small, quiet, ironical. He was increasingly ready, in his later years, to criticise pungently the more crashing of his follow-countrymen's follies. From the beginning, he firmly opposed Egyptian participation in the "Palestine affair"; he was the first—and unpopular—advocate of recognition of Israel and the conclusion of a peace treaty. Almost invariably his view was the one that would have brought most political benefit to Egypt; basically, however, it was always that of a financier and an economist.

Once independence had been won, he became one of a minority that recognised that safety for small countries depends upon the friendship of a big power, and that Britain was Egypt's natural friend and ally. The draft treaty he worked out in 1946 with Mr Bevin was rejected by Egypt, but it was a reasonable and sensible arrangement and it is not easy to see how it can be improved upon. It is, indeed, one of the tragedies of Egypt that men like Sidky—and there are a few more—have no following and little honour in their country. In his own homeland, although he had twice been Prime Minister, he was neither popular nor widely known; nor were his opinions (much sought by the press) ever acted upon. To achieve popular support an Egyptian politician has only to be a demagogue, inciting the masses against something or making wild promises about something else. As it is only the politicians with such support who, in the normal run of affairs, are able to influence their country's policy, the erratic and witless course Egypt has pursued in recent years becomes understandable. An excellent memorial to Sidky Pasha would be the publication by the Egyptian Government, for use in universities and higher schools (and also Parliament), of a selection of the elder statesman's speeches and articles on home and foreign policy.

Political Wisdom

Indeed, it may well be questioned whether the consistency so much lauded and desiderated in public men be not, as the word is ordinarily used, a defect rather than a virtue. If indeed a man could start on his course endowed with mature and perfect wisdom, possessed of a gift of forecast almost amounting to the primeval power of prophecy, he might be consistent without danger. But such Godlike capacity is not lavished on common mortals: scarce one in the course of centuries can boast of such endowments. With the mass even of the most honest and highly-gifted statesmen, political wisdom is the slow growth of years, the product of long experience, of wide and patient observation, of experiments tried and failed in, of blunders made, recognised, and profited by. Altered times, new circumstances, past errors, teach their own lessons. Political convulsions bring to light new dangers, and explode old theories; recluse philosophers investigate and perfect subtle sciences which overturn many venerable notions and time-honoured prejudices; and the minister must hasten to learn all that new discoveries can teach him, however they may shatter the antiquated knowledge of the past. How can a man be deemed fit to guide the fortunes of an empire whose mind is not always open to hail any new light which can enlarge his conceptions or modify his doctrines? Yet how can anyone, who keeps his mind thus conscientiously alive and open, dare to hope that he can escape having change after change, correction after correction, forced upon him? . . . We consider that there are far clearer duties in a statesman than unswerving adherence either to a party or a creed —viz., the utmost diligence and open-mindedness in forming his views; the greatest caution in announcing or acting upon them till satisfied of their soundness; and the utmost candour in abandoning them when argument or experience has proved them to be erroneous.

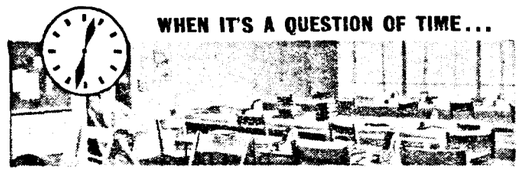
EXPERIENCED TRAVELLERS FLY BRITISH

It is significant that most people in this country who travel by air prefer to fly British. A natural pride in a British concern is of course one reason. But airways cannot depend on patriotism alone. The more definite reasons that have impressed themselves on experienced travellers are the comprehensive schedules on routes all over the world, the all-round efficiency, the courtesy, the thoroughness —and, perhaps above all, that sense of complete confidence that is felt by everyone in the presence of British Airmanship.

BRITISH OVERSEAS AIRWAYS CORPORATION AND BRITISH EUROPEAN AIRWAYS
offer services to and from nearly 70 countries

DO STOKERS TALK T.I.?



Certainly. Ships may have TI in any part of them, from much of the superstructure down to the decorative fittings, from engine room to funnel and mast. . . TI tubes, cylinders, cables, furniture, lighting, paint . . . fabricated steel and aluminium alloys . . . only a deaf-and-dumb seafaring man could escape the subject altogether. Sailors don't often hail TI by name, of course, but they do know a bridge from a bulkhead, a deckhouse from a lifeboat, a hatch cover from a gangway or a davit . . .

All of which are TI topics.

The letters TI mean Tube Investments Limited, of The Adelphi, London, W.C.2 (Trafalgar 5633). They also stand for the thirty producing companies of the co-ordinated TI group, makers of precision tubes, of bicycles and components, of wrought aluminium alloys, electrical appliances, pressure vessels, paints, road signs, metal furniture . . . and essential mechanical parts for a thousand and one things which everybody uses.

AT TODAY'S WAGES?

THE OLD-FASHIONED WAY to do figuring work is plain drudgery. And what's more — *it costs too much!* Today, business and Government offices all over the world do figuring the Burroughs way instead. . . .

It's easy to see why, when you realize how little Burroughs machines cost per day — and compare how much they *save* per day.

Every kind of routine figuring is easier; it's accurate, and — above all — it's fast. And with vital figure facts kept up-to-the-minute, you are able to *plan ahead* more profitably, too. Burroughs can show you the methods and machines that are just right for your own problems; because only Burroughs makes machines for every figuring, accounting and statistical need, and only Burroughs can keep them running their best. *Call the nearest office today!*

Wherever there's business there's

BURROUGHS ADDING MACHINE LTD., AVON HOUSE, 356-366 OXFORD STREET, LONDON, W.1. *Factories:* NOTTINGHAM (ENGLAND), STRATHLEVEN (SCOTLAND)

Highland Development

The Scottish office, stung perhaps by a continuous barrage of criticism in Parliament and in the Scottish press about its slow rate of progress in bolstering up the economy of the Highlands, has issued a White Paper* to explain the basis of its policy. In the last 80 years the population of the Highlands has declined by 75,000, despite a natural increase of births over deaths of over 100,000. Government after government have tinkered with the problem of arresting this decline, but only lately with the demand for increased home food production, the necessity for afforestation, and the development of hydro-electric power has it been possible to justify the application of large amounts of public money on capital development. The White Paper divides the activities of the Government under four heads. There is the provision and expansion of the basic services, including the social services. There is a reasonably good record of new housing in the seven crofting counties, and the scheme initiated fifteen years ago for improving certain essential roads out of the taxpayers' money, which in normal areas would be borne on the rates, is being continued at a much higher cost. The second main task is to develop the basic industries, agriculture, forestry, fishing and tourism. It is hard to believe in view of the general state of the market for fish that it is worth concentrating much effort on fishing. The third line of development is to exploit the natural resources of the Highlands, which have an especial importance, since they often provide a subsidiary occupation to crofting: it is hoped that it will be possible to develop the use of peat for generating electricity. Finally, there is the encouragement to be given to manufacturing industries, especially in the Highland Development Area near Inverness.

The White Paper suggests that a sensible programme of public development is in progress to provide the framework within which the economy of the Highlands can continue to exist. The White Paper naturally neither raises nor answers the question of whether all these scattered developments, undertaken by the departments of the Scottish Office, by local authorities, by public corporations and private companies, receive the necessary co-ordination to prevent waste and overlapping. Nor is there much sign of originality and adaptability in the design of the various schemes—civil aviation is a case in point. But the Highlands can no longer claim to be neglected.

* A Programme for Highland Development (Cmd. 7976).

Shorter Notes

The $20 million now available to the United Nations for technical assistance to underdeveloped countries was referred to in last week's leading article on Ecosoc, but was wrongly arrived at. It is not dependent upon this year's American appropriation for Point Four purposes, the present state of which is described in a Note on page 123. It consists of the contributions of fifty states, already in hand, the largest of which is $12.5 million from the United States and the smallest $2,500 from Luxemburg. The United Kingdom and French contributions are $2,128,000 and $1,207,500 respectively. There are no contributions from the Soviet bloc.

*

The herring industry is predominantly a small man's business, an affair of owner-skippers and share-men. The annual report of the Herring Industry Board for 1949-50 (Cmd. 7975) covers a season of disastrously poor catches and even poorer markets, and makes, therefore, gloomy reading. Last summer barely one-third of some export contracts could be fulfilled because of shortage of fish, while successful landings from the arduous winter fishings found markets flooded with fine Dutch and Norwegian herrings. Yet to reduce these hit-and-miss activities to some sort of order the board has only powers of persuasion to employ on several thousand independent fishermen, scattered throughout a dozen ports. Its plea for more authority and for a more generous loan for its trading operations is certainly based on a strong case.

Letters to the Editor

Portugal and Beira

SIR,—As a regular reader of *The Economist*, I was surprised to read the article entitled "Agreement on Beira," which appeared in the issue of June 27th.

I fail to understand the reference to a "pyrrhic victory for the Portuguese." It seems to me that there can be neither victory nor defeat when two countries sign a Convention among themselves for the protection of their interests and to ensure their mutual co-operation. The recent Convention regarding the Port of Beira is as advantageous to Portugal as it is to Britain, and this has been acknowledged by the respective governments. And it is only when international conventions establish, as does this one, a just balance between the interests of the contracting parties that they can be effective. The Convention implies the recognition that the Port of Beira really needs capital development, but such development was not possible in the absence of a guarantee that the port would be made use of by its hinterland and would always be protected from unfavourable discrimination.

It seems that the article casts doubt on the capacity or the intention of Portugal to carry out the necessary improvements. I am happy, therefore, to be able to inform you that orders for equipment for the Beira Railway have already been placed for the amounts set out below:

	£
Orders placed in Belgium.	844,720
Orders placed in the United Kingdom and in the Union of South Africa ...	1,391,304
Orders placed in Germany.	621,118

In addition, there has already been adjudicated to the Anglo-Dutch Engineering and Harbour Company the construction of a new quay for the shipment of ores.

Thus it will be seen that Portugal has not, in the few weeks since the signing of the Convention, been neglecting the development of the Port of Beira.—Yours faithfully, R. ENNES ULRICH,
Ambassador
Portuguese Embassy, London

Home Rule for Great Britain

SIR,—In your article on Home Rule for Wales and Scotland in your issue of July 8th, you say that "this is the very thing which the officials of Whitehall have persuaded generations of politicians to oppose." Some forty years ago I heard Whitehall officials prove by arguments which seemed unanswerable that the thing was impossible. Ten years later I saw the officials achieve the impossible by transferring many of their functions to Northern Ireland, and nearly all of them to the Irish Free State, under the direction of Mr. Winston Churchill.

My own primary interest in this settlement was to secure home rule for Great Britain. One trembles to think what would have happened after the world war if a large body of Irish members had remained to dislocate and paralyse the business at Westminster.

It is not in question that the government of Northern Ireland since 1921 has done work in the six counties, especially in the fields of agriculture and education, which Whitehall had failed to do. I agree with your suggestion that Ulster is the model which Wales and Scotland would be wise to follow. Wales might need more powers than were given to Ulster and Scotland still more. The powers already given to Ulster might also be increased at the same time.

I once had the privilege of serving under Lord Welby when he was Chairman of the London County Council. As head of the Treasury he had seen

mere of the working of government in Whitehall than any man alive. He once said to me,

> It is the greatest mistake to suppose that a central government increases its power by centralisation. The great problem in Whitehall is always to find time to do what no one but the central government can do. The central government should, therefore, devolve on provincial authorities everything which provincial governments can do, even though they might not be able to do it quite as well as the central government. That is the real way in which it can increase its own power. The *onus probandi* should always be laid on the advocates of centralisation

If Welby's policy were applied the British Government would have time to attend to foreign affairs, which involve the issues of peace and war. Since 1945 the volume of business concentrated in Whitehall has come near to killing the strongest Foreign Secretary who has ever filled that office. Officials in Whitehall would do well to consider the advice of one brilliant head of the civil service, who was not only a competent official but also a statesman.—Yours faithfully,

LIONEL CURTIS

All Souls College, Oxford

Uno and Korea

SIR,—In your issue of July 1st, you write at some length on the assumption that the Security Council of Uno has established on some reliable evidence that North Korea had committed an act of aggression. I had hoped that a journal of your reputation—whatever lesser journals might do—would have checked up on the "evidence."

Had you done so, you would of course have been led to the report of the UN Commission on Korea, which the resolution of the Council expressly cites as its evidence. And, when you looked at that report, you would have found that it merely repeated the assertion of the South Korean government that North Korea had attacked—an assertion they would be sure to make, whatever the facts—without itself either confirming or even investigating it. The report begins, frankly enough, with the words:—"Government of Korea states," and its authors commit themselves to no assertion of fact whatever.

The Security Council has thus—illegally, of course, but that is another matter—started thousands of people off on the road to death, and perhaps precipitated a third world war, on "evidence" on which no reputable solicitor would issue a County Court summons.

—Yours faithfully, D. N. PRITT

4 *Essex Court, Temple, E.C.4*

[If Mr Pritt will not accept the report of a responsible international body on the spot, what evidence will he accept? If the UN Commission, sitting in Seoul within a short distance of the frontier, had had any doubt about the accuracy of the facts stated by the Korean Government they would have said so.—EDITOR.]

The Berlin Congress

SIR,—Your correspondent's admirably fair account of the Berlin Congress for Cultural Freedom does not, I think, fully explain the political issue on which we were divided. May I state this issue as seen by some delegates?

Your correspondent implies that there was originally a *neutral bloc*; that this *bloc* was converted by Korea and Mr Koestler (after his indiscretions of form had been remedied by Mr Amery); and that the substance of Mr Koestler's second speech was in the end accepted by all. I do not believe there was any such neutral *bloc* or any such conversion. We were almost all united in opposition to communism at the start, though we differed as to policy and the function of the Congress; and this unity and this divergence persisted to the end. Mr Koestler's conclusions, as I understood them, were certainly not generally accepted.

The views expressed by Mr Koestler, Mr Burnham, Professor Hook, Herr Borkenau and other prominent ex-Marxists or ex-communists were, briefly, that all old politics are now useless; that the only present political issue is communism or anti-communism; and that all those who are not communists must therefore unconditionally support those who have the will and means to attack communism. There are no other alternatives. Mr Koestler particularly attacked the Socialist alternative as no better than neutrality.

Many delegates, however (not all Socialists), believed that there both are and ought to be valid alternatives (of which the Socialist alternative is only one); that the best method of constructively opposing communism is to foster or create such alternatives, tackling by liberal methods the problems which communism wrongly claims to have solved; and that unconditional support of existing anti-communist parties or leaders (whatever their other aims or views) is politically unconstructive and intellectually unjustifiable.

In the end Mr Koestler's formula was only accepted after two amendments had denied some of its essential premises. Your correspondent mentions that the British delegation succeeded in killing the clause advocating intellectual intolerance. M. David Rousset deserves some credit for insisting successfully on an express advocacy of new and liberal alternatives. These two amendments are incompatible with the thesis of the ex-communists as understood by us.—Yours faithfully,

H. R. TREVOR-ROPER

Commonsense or Psychology

The Young Lag. A Study in Crime. By Sir Leo Page. *Faber.* 320 pages. 18s.

It is inevitable that this book should be compared with the study in delinquency recently undertaken by Mr D. H. Stott for the Carnegie Trust, which has already been discussed in *The Economist* (May 13th, page 1054). Both works consist largely of a collection of case histories of delinquents. In both the statistical method, normally used in studies of crime and criminals, is rejected. There, however, the similarities end, for the outlook and opinions of Sir Leo Page are so different from Mr Stott's that his book almost seems to have been written as a deliberate criticism of the other.

Mr Stott is a psychologist, and therefore in his study of delinquency he looked for emotional disturbances to explain the abnormal behaviour that showed itself in crime. He claims to have found these emotional disturbances, provoked by faulty family relationships, in every one of his 102 approved school boys. Sir Leo Page characterises conclusions like this as actively mischievous. Indeed, he devotes a whole chapter in his book to an attack on the psychological approach to crime. He allows the psychiatrist a small place in the treatment of a few—a very few—offenders, but the great majority of them he declares to be normal human beings, with the normal weaknesses of human nature, but without the strength of character to resist them.

This attitude is perfectly justifiable. Psychology has yet to prove its case—at least to the layman—and the arrogant assumptions of some of its practitioners, especially in the sphere of delinquency, do not help it. But Sir Leo Page goes much too far to the other extreme. He firmly refuses to go below the surface. For him the main causes of crime are the decline of religious faith and the deterioration of general moral standards. To this Mr Stott would answer that moral standards are the codifying of good human relations, that precept and discipline are effective only when emotional conditions allow them to be accepted—discipline imposed by a parent in whom natural affection for his children is lacking often, he points out, results in the child being brought to court as beyond control.

But there is no need for the reader to champion the cause of psychology to feel dissatisfied with Sir Leo Page's study. He claims that his explanations of the motives of crime are as "plain as a pikestaff," but nowhere does he provide a convincing reason why his young lags, after it has been proved to them in abundant measure that crime does not pay, yet go on committing it. Many of them on leaving approved school and Borstal, and between prisons, found steady well-paid employment, and then threw it up and returned to crime. Does this not point to some motive hidden below the surface? It does not follow that the motive is the same that Mr Stott claims to have found. But it is a remarkable fact that many of Sir Leo's case histories revealed facts indicating the unhappy childhood characteristic of the approved school boys. There are other similarities—a restlessness, which Sir Leo regards as a fault of character and Mr Stott as a symptom of deep-seated *malaise*, and strange lapses of memory.

On one point, however, there will be fairly general agreement with Sir Leo Page, and that is with his criticism of many of the sentences passed on his young criminals—though here he sometimes seems to be being wise after the event. He puts in a strong plea for more knowledge of penology by justices and judges and above all for more information about the offender before sentence is passed. He is also an advocate of the suspended sentence and the indeterminate sentence. In all of this, it may be pointed out, most psychiatrists and psychologists would wholeheartedly agree.

Throughout this book there comes out the detached but nonetheless real sympathy of the author for the criminals he studied. It reveals itself in countless ways—in writing letters, in lending books, in intervening with the prison commissioners, in finding prison visitors, and in keeping in touch with the prisoner after his discharge. Whatever the real causes of crime, the delinquent needs practical help and encouragement if society is to reclaim him. In this Sir Leo Page has set a fine example.

Post-Keynesian Revolution?

Income, Saving, and the Theory of Consumer Behaviour. By James S. Duesenberry. *Harvard University Press* (London: *Geoffrey Cumberlege.*) 124 pages. 16s.

In applying the Keynesian theory to the United States, economists have encountered considerable difficulty in accounting for the facts about saving. While the figures taken over a long period indicate a surprising constancy in the ratio of savings to national income, both budget studies and annual figures show that the savings ratio increases as income rises. This apparent inconsistency has usually been reconciled by postulating an upward trend in the propensity to consume.

Dr Duesenberry disagrees with this explanation. He contends that the satisfaction one gets from consumption depends on what is being consumed by others with whom one comes in contact, so that the proportion of income which an individual saves will depend on his relative position in the income scale rather than on his absolute income. Consequently, given the income-distribution, the aggregate savings ratio will be independent of the level of aggregate income, even though wealthy families consistently save a higher proportion of their income than poor families.

This conclusion, however, only holds when income is steadily rising. When income falls, Dr Duesenberry argues, individuals will have greater difficulty in reducing consumption below the standards enjoyed in the past than they would have in raising those standards; and this asymmetry produces cyclical variations in the savings ratio which are consistent with its longer-run constancy. Thus, all the facts are reconciled in one theory, a theory which the author is finally able to summarise in a simple formula.

Dr Duesenberry carefully and ingeniously tests his own and the rival hypothesis against the restricted range of relevant statistics; the results amply justify his modest confidence in the superiority of his own explanation. Some readers will doubtless be sceptical of his efforts to translate sociology into rigorous economic theory; others may be unconvinced that his formula describes the behaviour of American savings more accurately than its rivals. Nevertheless, he has written one of the most provocative works to appear since Keynes's "General Theory."

Science and Philosophy

The British Journal for the Philosophy of Science. Vol. I. No. I. May 1950. *Nelson.* 7s. 6d. a copy, 30s. per annum.

This volume marks what may well be the advent of a new era in this history of science. As Professor Beth of Amsterdam points out in the second article "Aristotle, inspired by Plato's philosophy, systematically set forth a theory of science, which for centuries to come directed and even dominated scientific and philosophical thought." That domination provoked the revolution of the three golden centuries of scientific enterprise from 1500-1800 A.D. based on observation and experiment in lieu of reading into "nature" the implications of pure theory. That revolution in its turn crystallised into what is now generally recognised to be equally invalid, that is the notion of an external world of which scientific thought is the medium of revelation, albeit expressed in terms of numbers and measurements. It was possible for Galileo to view mathematics as the language in which the great book of nature is written, for Newton to conceive space as the expression of the omnipresence of God. By contrast, the editors of this new journal can state that "Today the position is reversed. . . . The philosophical aspect of science has become obscured; science is no longer primarily a philosophy but an instrument." This they rightly deplore and point out that "there is tending to grow up, in larger and larger numbers, a community [of scientists] into whose hands the reins of civilisation are passing, and in whose minds there is less and less understanding of the motive power which they alone are in a position to control." This indeed is the central dilemma of modern society.

Meanwhile, science is urged to recognise the actual character of its work and achievements and not to resort to outmoded beliefs in scientific theories as revealing the objective nature of an external world. Professor Dingle concludes

> "We are now at a stage when old conceptions in physics have broken down and new ones have taken their place. . . . The older views, within their limited range, were consistent, and the newer ones, within a wider range, may be consistent also. But in the time of transition from one to the other we are prone to entertain both at once, without being aware of the contradiction thus introduced into our thinking."

The British Society for the History of Science represents a growing movement for science to understand its own character and possibilities; within it has been formed the Philosophy of Science Group which includes such men as Professor Dingle of London, Professor Milne of Oxford, Earl Russell, Professor

"Where are you going this summer?"

"Going to my favourite haunt, old boy—the one and only Burgh Island in South Devon. It's the finest place I know for enjoying oneself in luxury at moderate prices. And I hear it's even more comfortable since they made the extensions to the hotel last winter."

"Is the food good?" "Excellent—so is the wine-list, *and* the service. And you'd enjoy the smugglers' inn, the 'Pilchard'. There's tennis on the Island, too, and golf courses on the mainland nearby. Oh, and a first-class resident band for dancing. Yes, Burgh Island Hotel has everything, and the scenery, of course, is superb."

"Sounds just the thing—I'll phone them this evening for reservations."

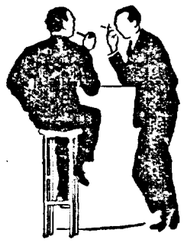
Invisible exports? How do you know?
An invisible expert told me so.

schweppervescence lasts whole the drink through

Schrödinger, Sir Charles Sherrington and Sir Edmund Whittaker. The movement is rapidly extending both in influence and activity and this first number of their journal is to be welcomed as a promise of things to come. Their work may well herald the recall of mankind from the exploitation of science merely for technological progress to the recognition of its latent contributions via experimental philosophy to natural philosophy.

Serfdom for Labour



Soviet Trade Unions. By Isaac Deutscher. *Royal Institute of International Affairs.* 156 pages. 7s. 6d.

To have much painstaking original research shredded down into a simple, palatable study of a big subject is a boon seldom offered to the student of international affairs. Chatham House should encourage more work on such lines, especially in Soviet studies, where the difficulty and need of cool interpretation are so great. It is no discredit to Mr Deutscher's scholarship to say that his journalistic gift is as evident in his treatment of this unpromising subject as it was in his recent study of Stalin. In recording and analysing the crucial features in the Soviet trade unions and defining their place in Soviet labour policy, Mr Deutscher also surveys the extraordinary twists and turns of economic policy in the Union, showing how the personal and doctrinal struggles through which Stalin worked his way to power had their effect on the present limited and subordinate status of the Soviet trade union.

Mr Deutscher is sober but severe in his final judgment: "as the organisation designed to forge the workers' solidarity in their struggle for better working conditions, they (the trade unions) have suffered complete atrophy." The useful welfare duties they still perform are performed as "subsidiaries of the State administration." They play no direct part in the fixing of wages and living conditions; and all local collective agreements are based on central agreements between the ministry responsible for the industry and the central committee of the appropriate trade union. There is, it is true, at the basis of the whole organisation the *fabzavkom*, or factory committee—which in the earliest days of the revolution aspired to independence, in the belief that industrial control would be decentralised—but it is "far closer to the administration and the managements than to the workers." The real master in the factory is the *troika*, the triad of committee chairman, manager and secretary of the party cell. Nonetheless, out of a total union membership of 28½ million (the figure for 1948, compared with 1½ million in 1917) there are more than nine million "activists," voluntarily engaged in part-time work for their unions.

How this evolution occurred is a fascinating story. The explanation is found by the author in the fact that the overriding purpose of Soviet planning was to achieve in a decade a ruthless industrial revolution. When the trade union movement was at its most formative stage there was not sufficient wealth for workers and state to bargain about; at the end of the 'twenties the Russians were still producing only 3-4 million tons of steel and 30 million pairs of shoes for 150 million people. Once the Five Year plans had been started direction of labour was inevitable, and between 1926 and 1939 over 24 million "redundant" people were brought from the villages into the towns. Organised resistance was impossible: "the Soviet trade unions firmly discouraged strikes, and behind the unions stood the political police. Fluidity of labour was the substitute for strikes."

Those who wish to see what really purposive planning can be, should read in this book the totalitarian theory of labour produced by Trotsky 30 years ago to justify his labour armies, which was "exaggerated and brutalised" by Stalin ten years later, and the Draconian labour decree of December 28, 1938. Mr Deutscher has no doubt that such handling of labour is no essential part of planning; indeed, he regards it as "positively incompatible with an orderly planned economy." The message of this book is that the Russian experiment in planned economy was conquered by the tradition of serfdom and not *vice versa*.

AMERICAN SURVEY

United States at Lake Success

(From Our American Staff)

BITTER things have been said in the past, and will undoubtedly be said in the future, about the American tendency to enlist the good offices of the United Nations only when this suits the American book. But in the Korean affair none but the Soviet Union and its satellites say them openly. This time the American action has been wrapped in the very drapings of the sanctuary. Both the State Department and the United Nations have supplied correspondents with a chronology of events as they occurred; the pattern is clear.

As Mr Acheson told the American Newspaper Guild four days later, the cable carrying news of trouble reached the State Department at nine-thirty on Saturday night, June 26th, Washington time. By ten-thirty the Assistant Secretary of State for Far Eastern Affairs (a former liaison officer with the United Nations) was conferring with the Secretary of the Army; by eleven Mr Acheson had discussed the situation on the telephone with the President, who was then in Missouri. Other sources add that Washington called Mr Trygve Lie at three in the morning and found him already aware that a dangerous situation had been created. On the request of the United States for an emergency meeting of the Security Council, members were summoned from Sunday morning breakfast tables and golf links; only Russia, following her pattern of absenteeism, failed to respond. Meanwhile less important routines were also upset: at Lake Success the heating system, turned on to dry undue moisture from the walls, had to be turned off and the cooling system turned on, that diplomatic brains might consult less feverishly.

On Sunday afternoon, within twenty hours of the time the first official word of the invasion was received in Washington, the Security Council had passed its first resolution on the subject; this, framed by the United States, called for an immediate end to the fighting, and for the assistance of all members in restoring the peace. When the President reached Washington by air on Sunday evening, he met representatives of the State and Defence Departments, who laid before him joint recommendations for action under the sanction of a United Nations request. Two weeks later the Security Council, with pledges of support from forty-eight member nations in hand, passed a British-French recommendation that forces and supplies be made available to a unified comn and under the United States, that the United States designate a commander, that the UN flag be used at the "discretion" of the command and that the United States report to the Security Council at intervals.

Critics might murmur that this picture of smooth-geared unity among departments whose internecine quarrels have so recently rent the air, and between nations whose differences of opinion are seldom secret, is so good as to be suspect. Sour speeches by Senators Taft and McCarthy have contributed to this doubt. But the American people as a whole seem to find nothing about it that is strange. The American soldier who, being briefed for action as to his duties under the United Nations, drawled "Do I get a badge?" expressed the general assent. The common interest in the details of collaboration as worked out between the United States and the United Nations is merely that of a people who like to know how things work, and like to see them work well.

*

Whether or not, in this instance, the working well implies the control of the United Nations by the United States is another question. Technically, of course, the relationship prevailing between the two is similar to that with any of the five powers that have permanent seats on the Security Council and hence a somewhat closer responsibility than other member states. The United States is a member of all major committees and commissions; it participates in the work of the specialised agencies; it pays its share of costs, and has its share of nationals in the Secretariat; it is one of forty-seven countries supporting a permanent mission at UN headquarters. The chief function of this mission is officially described as "to assist the President and the Department of State in conducting United States participation in the United Nations." It also serves as the channel through which nations talk to nations about UN affairs, and particularly those considered at New York. Bodies meeting elsewhere have missions separately appointed.

The present head of the mission is the Honourable Warren E. Austin, a solid man more remarkable for presence than for oratory. He is a retired Senator from Vermont. With Mr Austin serve eight deputies assigned to various bodies (two have the rank of Ambassador) and a corps of advisers and assistants, making thirty in all who are listed as members of the delegation. (Britain's list has twelve names, Russia's twenty, China's twenty-three, and there are nine from France.)

The weight of American representation is paralleled by the heavy American contribution in terms of money (some 39 per cent of the total costs are met by the United States) and by the number of Americans employed in the Secretariat. Both these proportions, like American success in competing for UN contracts, arouse complaint on the part of other nations which feel pinched thereby, and vaguely affronted. Behind the official delegation, acting as a bulwark of its position, is the widespread American belief that the United Nations is potentially more important than any one of the actions it has taken. The official attitude is expressed in President Truman's foreword to the State Department's report on American participation in 1949: "Support of the United Nations is and must be Point I of our foreign

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

policy." Next comes the enthusiasm of citizen supporters, many of them women, an emotional attitude which is uncritical, but highly effective both in Washington and at the grass roots. And third is the neutral eye of the man, for example, in the taxi-driver's seat—sceptical, expecting little, but in no way hostile. Threading his taxi past the headquarters building nearing completion in New York this citizen remarks "Wonderful if it works," and "Suppose they'll get it done before a bomb hits it?"

There is little evidence in this that the United Nations is in the pocket of the United States, and much that tends to refute the opposite charge, made at home and abroad during the Greek affair of 1947, that the United States was too prone to disregard its obligations under the Charter and act on its own responsibility. What is certain is that many Americans have so vivid a personal interest in the success of the United Nations that they offer their own volunteer aid. They may not have a clear understanding of its amorphous and overlapping organs, they may grow impatient with its slow ways and cavil at some of its procedures, but they do not seem to find its supra-national character alien or inimical. Almost instinctively they see it in terms of their own form of government, finding an analogy in the relations between Washington and the 48 States. The parallel is far from exact, and it holds dangers, but it does serve to make the new comprehensible in terms of the old. Just as a State has, in effect, its delegation in the Senate, so the nation has its own delegation in the United Nations; that they should haggle with men from Cambodia or the Ukraine is hardly more remarkable than that a Senator from Maine should bargain with a Senator from Louisiana. Every American feels himself a citizen both of his State and of his nation—the peril, or perhaps the hope, is that he will come to assume citizenship in the United Nations, and try to make it, too, in his image.

American Notes

Arms and the Men

Apparently as much to the surprise of the President as of the public, he was obliged to authorise the resumption of conscription almost as soon as Congress had revived the moribund Selective Service Act. It was hoped that the threat of conscription would bring out sufficient volunteers, but the Army, having no illusion about its charms compared with those of the other services, has already asked that 20,000 men be drafted into its ranks at once. They will be taken, to begin with, from the top age group, the 25-year olds. So far, however, the reserve forces have not been called up, although it is hoped that skilled volunteers will come from them. For the moment, it is intended only to enlist the necessary replacements for the men sent to the Korean theatre, not to bring the services up to their authorised strength of 2,005,000 men. The ceiling on defence expenditure, now removed, has limited enlistment to about 1,500,000 men.

At present it is weapons, not men, that seem to be lacking in Korea. The charge that Korea has received practically no aid under the military assistance programme is not difficult to answer; Korea already had arms left behind by the American forces and it has been eligible for aid under the new scheme only for six months. But the charge that Korea is revealing the inadequacy of the entire military assistance programme, in Europe as well as in Asia, carries more weight. The Republican Senator Lodge is asking for an additional $2 billion for the programme this year, but it is not so much a question of whether more money is needed as of whether it is being spent on the right weapons. The free world has been arming against a total war hot all over, while it looks as if it may have to defend itself against a series of minor wars warm only in parts.

Korea is showing that for such wars the latest weapons are not necessarily the best. It is not long-range strategic bombing by B36s that is needed, but air cover for ground troops. Jet fighters seem too fast and too short-ranged for this work, at least as long as they must operate from distant bases in Japan. To the embarrassment of the Air Force, and probably also of the Secretary of Defence, who took its side last year in its civil war against the Navy, aircraft based on naval carriers have come to the rescue of the soldiers in Korea.

* * *

How Much Mobilisation?

The Secretary of Defence has rated economy even higher than he has the Air Force, and so it is especially embarrassing to him personally to have to ask Congress for additional funds. The request may be broken up into small packages, but with more men the armed forces must also have more money, probably about $2 billion more. This is a minimum which may be exceeded if hostilities spread beyond Korea, or if reassessment of the military assistance programme leads to its extension.

This minimum is only a drop in an economic bucket which already contains a national product of over $260 billion a year. But the bucket is full to the brim, and seems almost certain to overflow if more than one or two such drops are added. The steel industry, for example, had until last week's holiday been working above capacity for eleven weeks, although capacity is 20 per cent greater than in 1940. Last month the labour force reached the record total of 64,100,000 as the result of 2,000,000 new entries, chiefly young people leaving school; yet all but 327,000 of these found work and the unemployment figure stood at only 3,384,000. In this situation, any substantial increase in defence expenditure would mean less steel for civilian goods and higher earnings for skilled workers. More money would be chasing fewer goods round the economic bucket, making an inflationary splash in the process that would almost certainly lead to a Presidential demand for credit restrictions and perhaps to one for much stricter controls on civilian consumption.

The bucket is, however, expected to be emptier by the beginning of next year, which is when any defence funds requested now would reach the production line in the form of orders. Indeed, it can be, and is being, argued that such orders would serve to check deflation rather than to spur inflation. But in practice it is Congressional discussions rather than industrial contracts that send consumers to the shops to start the inflationary spiral by trying to beat anticipated shortages. So far there has been less advance buying as a result of the Korean news than might have been expected, but the President's refusal to make announcements beyond the needs of the moment has been largely responsible for this.

Governor Dewey, with less restraint, has called for an all-out effort to enable the United States to outstrip Soviet production of arms. Such an effort would almost certainly mean full industrial mobilisation with many of the controls over materials, prices and so on that Congress granted so reluctantly during the last war and that the voters accepted even more reluctantly. Governor Dewey is not fighting an election next November; the President's party is, yet prominent Democrats are openly supporting Mr Dewey's thesis. But it is the Kremlin, not the President, that will decide how far the United States must mobilise. The last weeks have shown that Mr Truman will not hesitate to demand the necessary sacrifices, if he must, from the American people.

* * *

Omnibus Behind Schedule

Of all the legislation that must be cleared from Congressional desks before adjournment—or such recess as the Korean emergency allows—none is more urgent than the omnibus Appropriation Bill. The government has been living on tick since June 30th, by grace of a resolution that permits spending to continue until the regular appropriations are approved. Hopes that the device of consolidating the bulk of appropriations in a single measure, used this year for the first time, would make it easy to adjust the nation's spending to its income, have been blown sky-high by the Korean outbreak. The deficit in the year just ended totalled only $3.1 billion, $2.4 billion less than the President expected in January, but this was chiefly because of a slow start in spending money.

The new fiscal year begins with abandonment of the President's ceiling of $13 billion on military costs; more money will be needed both for the Pacific expedition and to bring the forces up to strength. The Secretary of Defence would have liked Congress to sign a blank cheque for Korea, but this has been refused, and detailed estimates will have to be presented. A possible vehicle for such a request is the Bill to grant an additional $260 million for work on the hydrogen bomb and other atomic developments, if the Administration can determine, in time, how much more it will need.

The trial run of the omnibus Bill was already in difficulties before Korea. Delay in passing the authorisations for foreign economic and military assistance meant that these controversial items were not considered by the House when it voted on appropriations. They have only caught up with the omnibus in the Senate, and the temper of the House will not be tested until a conference committee of the two bodies reconciles the two versions, now $5 billion or more apart.

The speed with which the Senate Appropriations Committee finally acted to approve a $34 billion expense account (in addition to $6 billion of automatic expenditures) and its firm rejection of all short-sighted economy riders, reflect the atmosphere of emergency. Though the figure approved is $1.5 billion below the President's request, thanks, in part, to a $333 million reduction in foreign aid, military assistance has been allotted the full $1.2 billion.

The Senate Appropriations Committee, however, has not had the time or inclination to realise that, desirable as economy may be, the outbreak of hostilities in the Pacific makes certain non-military appropriations more urgent than ever. Money for the Voice of America and other information activities is reduced just as the need to increase it is becoming apparent. The appropriation for Point Four is cut to a miserable $10 million that will not even cover the US commitment to the United Nations, let alone leave anything for new programmes of American assistance. Funds for present American activities in Latin America are considered separately, so that the final reduction in the appropriation of American funds for Point Four and related activities may be nearer $15 million than $25 million. But it will dismay other contributors to the United Nations scheme, and raise doubts about the constructive spirit in which the United States approaches the long-term problems of the underdeveloped countries. Senator Lehman has introduced an amendment to rescind the cut, a move supported by the President.

* * *

Runaround in Rails

President Truman, handling the striking railway switchmen with unexpected severity, has taken a firm grasp of a much larger nettle, the problem of railway labour disputes in general. It is only two months since a firemen's strike stopped trains for nearly a week on four main railway lines serving the nation's industrial centres. Then the switchmen's strike held up traffic for nearly two weeks on five lines in the middle and far west. Now conductors, trainmen and yardmasters threaten to halt most of the major railways. And in September the chance of the Pullman conductors is

coming. By striking against only a few railway lines at a time and by striking in turns, a combination with infinite possibilities in a country with 150 railway systems and 21 railway unions, labour leaders hoped to give the railway owners a runaround so exhausting that they would lose their will to resist union demands.

The latest twist was the refusal of the switchmen to abandon their strike against the Chicago and Rock Island Railroad when the President's condemnation of their stoppage drove them back to work on the other four railways. Mr Truman has ended this gyration, and perhaps the entire runaround strategy, by using his powers as Commander-in-Chief to seize the Rock Island line and by obtaining a court injunction against the strike ; the men have gone back to work, for the present at least, on the old terms, but with negotiations to be continued. Not only have the switchmen been put in their places, but other railwaymen who are thinking of striking have been warned not to leave theirs.

The widespread restiveness of railway labour springs from rivalry between unions and particularly between the two big groups, the aristocrats who operate the trains and the proletariat who only service them. The traditional wage differentials between the two types of work have been much narrowed in recent years and last autumn the non-operating unions won the forty-hour week, already widespread in industry. This forty-hour week with no loss of earnings is the main issue in the recent and threatened strikes of operating unions. A fact-finding board has recommended such a week, but with wage increases of only 18 cents an hour instead of the 30 cents which, according to union calculations, are necessary if earnings are not to fall below the forty-eight hour level.

This impartial fact-finding board, appointed by the President, was the last stage in the lengthy process of negotiation, mediation and voluntary arbitration established by the Railway Labour Act of 1926. For many years, this special process, justified by the fact that the railways are a public utility, was very effective in damping down railway disputes before they burst into a strike and the Railway Act has been held up as a model to labour legislators. But recently the unions have developed a habit of rejecting even the final fact-finding recommendations. The excuse has usually been that the board has favoured the employers, but the real reason for rejection seems more often to have been the hope, frequently justified, that additional concessions could be obtained by striking. This development has led the railway companies, strongly opposed to compulsory arbitration in the past, to support a Senate Bill that would have the effect of banning railway strikes entirely. Only by restoring the prestige of the Railway Mediation Board can the growing pressure on behalf of this Bill be countered. President Truman made the first move in this direction when he based his denunciation of the switchmen's strike not on the Korean emergency, but on the refusal to abide by the fact-finding board's recommendations.

Shorter Notes

The Atomic Energy Commission is at last being restored to strength ; the Senate, overriding an adverse report from the Joint Congressional Committee on Atomic Energy, has confirmed the nomination of Mr Sumner Pike, the only remaining member of the original Commission, to a new four-year term. Mr Pike had been acting chairman, but Mr Gordon Dean, a lawyer who has been a member of the Commission for about a year, is to be appointed permanent chairman. There is still one vacancy on the Commission. President Truman has now asked Congress for $260 million, in addition to this year's regular atomic appropriation, to be spent on facilities with which, it is thought, hydrogen bombs can be made.

★

The Princeton University Press has begun one of the heaviest editorial tasks in American history, one which will take twenty years, fifty 700-page volumes and $1,000,000. It is the publication of the complete papers of Thomas Jefferson, most of which have never before been printed, to commemorate the two hundredth anniversary of his birth in 1943. The books, the first of which has just appeared, will contain all the state papers of the man who laid a foundation on which the United States as well as the Democratic Party was built, about 18,000 letters from him and 25,000 to him, and his incidental writings on such miscellaneous subjects as food and architecture, words and agriculture, in all of which he took an expert interest. Publication in Britain is being undertaken by the Oxford University Press.

★

After the Texas City disaster three years ago, in which 560 persons were killed when ships being loaded with ammonium nitrate exploded, 273 suits were filed against the federal government. The damages, amounting to $200 million, were the largest ever claimed from it, and a district court, ruling on a test case, has now found the government guilty of negligence. The case will be carried to the Supreme Court if necessary.

★

For over two years Congress has been concerned about the plight of a group of native Americans, the Navajo and Hopi Indians who live in Arizona, New Mexico and Utah. The first legislation passed to help America's own underdeveloped area infringed on Indian rights in various ways and was vetoed by the President. He has now signed a satisfactory Bill, which authorises $25 million for schools and another $63 million for health improvements, roads, irrigation and so on.

We move in next week

Coming to our house warming? We've just bought a house under the "Imperial" Scheme.

Rather, I'd love to come, but what is this scheme you talk about, is it really worth while?

Worth while? It certainly is! Buying a house this way costs less because you get up to 18% income tax rebate on the capital payments in *addition* to the usual relief on the interest.

But what happens if I die before the mortgage is paid off?

Well in that case the entire mortgage would be automatically paid off and the house belongs to your wife and family.

Supposing I can't find a house now that suits me, what then?

The earlier you begin this scheme, the better terms you get, so start saving now while you are still house hunting.

THE WORLD OVERSEAS

Socialism in Burma

(From A Correspondent)

THE Government's relative success against the Communists of central Burma during the last three months may have considerably weakened their appeal in the country as a whole. Indeed, if events in Korea end favourably for the Americans, it is possible that the Rangoon Government's prospects of keeping its own Communists at bay may take a further step forward. The Kremlin has always been at something of a disadvantage in Burma owing to the socialist programme which the Government initiated from the start of independence. By redistributing land, and by taking over the provision of agricultural credit through the nationalised rice marketing trade, the Union Government has tackled the twin evils of the prewar system: land alienation and agricultural indebtedness. The acreage of alienated land had reached over 50 per cent by 1937 ; and in the richest rice-growing districts of the delta it was higher still, absentee landlords owning more than 70 per cent of the cultivated area. More than half was in the hands of Indian moneylenders, the Chettyars, and the total agricultural debt was estimated at one time at Rs. 100 million or about one-third the annual value of the crop during depression.

Although it is easy now to see that agricultural indebtedness was largely occasioned by the repeated world slumps in prices, the Burmese peasants and many of their leaders ascribed their prewar difficulties to the machinations of foreign capital, personified by the Indian moneylender and the European merchant. Dislike and fear of foreign capital had also spread from the moneylender to foreign enterprise in general, especially after the abortive agitation in 1928 against the "Bullinger Pool," a combination of the chief European rice-exporting firms. Much of the support for the Government's chief socialist measures, the nationalisation of the land and of the rice trade, is therefore due to the fact that expropriation meant expulsion of the foreigner.

How Land is Redistributed

In Burma, socialist theory and nationalist feeling have found a common ground for action both in land reform and in the increasing measure of state enterprise. While foreigners may no longer buy land except by special dispensation, land is now being compulsorily acquired by the state—with compensation—and is being redistributed to the peasants. The aim is to provide each cultivator with 12 acres, that is, as much as he can plough with one yoke of oxen. Owners of plots larger than 12 acres are allowed to retain up to 50 acres of their land providing they cultivate it themselves. This redistribution of holdings has robbed the Communists of the support of much of the peasantry, which is loyal to the Union—even if only passively. Since rice-cultivation in Burma involves a great deal of hand labour, for example in transplanting, small units often pay best. The small unit, peasant owned, should now be at least as productive as the old large estates, rack-rented by absentee landlords, many of them foreign.

In trade, state enterprise has been extended in several directions, the most important being the marketing of rice and timber, Burma's two main exports. Agents of the State Agricultural Marketing Board buy the rice, mill it, and sell it abroad. The State Timber Board handles all export sales of teak and other timbers. The Government Extraction Agency, which has for many years been responsible for the working of one particular forest area, has now taken over all the areas worked hitherto by the foreign companies. Full working of these other areas is still impossible owing to disturbed conditions. In the Government view, since the companies' leases had expired during the war, no compensation for loss of extraction rights was necessary.

Two other new state enterprises include the Inland Water Transport Board, which has taken over the river transport monopoly from the British company operating it, and the erection of the first cotton mill which is spinning coarse yarns for internal sale to the handloom weavers of the north.

It is intended to increase the number of Government rice and timber mills. Further nationalisation was projected, for example, of electricity undertakings ; but to any serious student of the country it has been clear for some time that there are many practical difficulties in any further extension of state enterprise. With the complete nationalisation of rice and timber alone the state becomes responsible for the greater part of postwar economic activity in Burma, and this has meant that the country's supply of key executives and technicians is already seriously over taxed. Even before the war there were few technically trained Burmese, partly because the wage competition of trained Indians was acute in all grades. Since education has also been at a standstill since 1942 there is a great deal of leeway to make up.

Need for Private Capital

These difficulties were publicly recognised by the Prime Minister, Thakin Nu, in his Statement of Industrial Policy presented to the Burmese Parliament last September. The pace of economic development can, in fact, be rapidly increased only with foreign assistance, both technical and, in view of the still precarious foreign balances, financial. Rangoon intends to press on with putting several large-scale state schemes up to the International Bank for support ; but it also hopes that private capital will once more take part in the development of the country's economy, in some cases in partnership with the state.

The rate and the character of economic development in Burma will clearly prove important factors in the future of Communism. Since the Burmese Government's postwar policy of land reform has gone a long way towards winning mass support, especially in the villages, the Communists' main hope now rests on whipping up the fear of foreign capital. The Government claims that it is countering this by its offer to take up a majority of the shares in new enterprises, thus retaining at least nominal control. And it is a matter of some surprise in Burma that, in spite of the expression of a new attitude to foreign capital in the Prime Minister's statement of September last year, private capital has been slow to take advantage of investment openings in Burma, partly because of the revolution and partly because of the political uncertainties of the future. This, of course, is Burma's dilemma. But it is also that of the western world, since the real answer to the Communist appeal in the countries of South-east Asia lies in their rapid economic development.

Canada and the Conflict

[FROM OUR OTTAWA CORRESPONDENT]

BY sending three destroyers from Esquimault, the naval base on Vancouver Island, to Pearl Harbour in readiness to support the United Nations forces in Korea, Canada has provided a respectable backing to its support of the United Nations—and of the United States. The government has done enough to offend the irreconcilable isolationists in Quebec, and not enough to satisfy many people in English-speaking Canada. The Conservative press in particular has been saying that this is not enough. Within the government this contribution seems just about right, since from the service point of view it is what can be spared without undue inconvenience.

The RCAF has no heavy bomber squadrons. Its operational fighter squadrons, still equipped with Vampires, number only two, and if they were sent out of the country there would be virtually nothing left to oppose any possible air attack on Canadian territory. However unlikely such an attack may be, there are obvious difficulties in regard to opinion in western and northern Canada—as well as in the United States—in denuding the country of fighter protection.

The same argument applies to the army. The only formation ready for immediate action is a brigade-group of active service troops, the major part of which has completed a full airborne training. This brigade-group, soon to be fully trained in airborne operations, was designed as the front-line defence against any airborne attack on Canada from the north-west. It was also intended to be the only land-force to be kept at home for passive defence in the event of war, in order to free the rest of the Canadian army for use overseas—which hitherto has meant Europe. The rest of the Canadian army was designed as a skeleton of highly trained officers and men around which an expeditionary force could be built from reservists. But it was always contemplated that shipping, and other delays, would inevitably provide a breathing space of three to six months in which this skeleton force could be assembled and filled out. Given three to six months, given the political conditions necessary to calling out the reservists, Canada could mount a respectable, though necessarily small, land force. But these conditions do not appear to apply to the Korean situation, and it is certain that the Government is not at present contemplating any operation on this scale. It does not now—and never has—underestimated the difficulties that the United States or the United Nations will be up against ; but it does not envisage that Canada will take a major part in overcoming them.

Doubts About Formosa

There is no dispute in the Cabinet, and very little in Parliament, about the need for firm action to halt aggression in Korea. In the closing days of the parliamentary session—when the ranks were already thin—the opposition solidly supported the idea of Canadian support to the United Nations forces. Only one member—a dyed-in-the-wool Quebec isolationist, who now calls himself a Liberal—M. Jean-Francois Pouliot denounced the idea of participation. The government was in fact being pressed to move a little faster than it was inclined to.

The government was, however, not reluctant to be pressed provided it could make absolutely clear that it was interested in a Uno police operation: it was not interested in supporting the United States as a major power. Within the government two reservations have been considered to apply to any Canadian contribution to the United Nations force. The first is that Canada will have nothing to do with the so-called barrier around Formosa. This is considered in Ottawa to be purely the concern of the United States. Canada will not support it, and the Canadian Government will do its utmost to ensure that no possible cloak of United Nations respectability is thrown round the operation. The second is a rather smug but entirely natural feeling, that it is the turn of the United States to bear the first brunt. Canada went to war in 1939 twenty-six months earlier than the United States, and there is a strong feeling that there is some justice in the present turn of the wheel of fortune.

Two Kinds of Korean

IT has long been generally known—and the events of the last fortnight have emphasised the fact—that North Korea has received large-scale Russian aid and advice alike in its economic development, in political organisation and administration and, above all, in the training and equipment of its army. What is less widely appreciated is that there exists within the Soviet Union itself a considerable Korean population which has been a useful factor in facilitating the Russian effort to acquire influence in Korea.

These Soviet citizens do not represent any recent emigration from Korea, but are Siberian colonists of long standing. Down to about the middle of the nineteenth century there was no sharp boundary of Korean settlement to the north-east ; the political frontier was supposed to be at the Tumen river, the country to the north being nominally Chinese territory up to the Sea of Okhotsk, but there were very few inhabitants in this remote region, and those mostly belonged to primitive tribes who lived by hunting and fishing. There were, however, some Korean pioneers who, before the coming of the Russians, crossed the Tumen and settled in what is now the hinterland of Vladivostok. After the coast-land between the Tumen and the Amur had been ceded by China to Russia in 1860 and Vladivostok had begun its growth from a cluster of log cabins into a great city, local economic development attracted more migrants from Korea and the Russian authorities did nothing to keep them out. Thus a Korean population of several hundred thousand grew up in the Siberian Maritime Province.

After the Japanese annexation of Korea, the Korean element in Siberia was reinforced by exiles from the home-land and became a potential base for anti-Japanese agitation there, if the Russian authorities should at any time wish to promote such a movement. After the Russian revolution, moreover, the younger generation of Koreans in the Soviet Union were conditioned, by the usual Soviet education and propaganda, to regard the Soviet power as the destined liberator of oppressed peoples and Korea as one of the countries which would thus in due time be emancipated from imperialism. The Soviet Union was for many years very cautious in its dealings with Japan and refrained from any but the most indirect contact with Korean revolutionaries from fear of provoking a war with Japan. The main connections of the Korean militant nationalist movement were with China and, particularly after 1931, with the Chinese anti-Japanese guerillas in Manchuria. The Russians, indeed, not merely avoided being involved in Korean struggles against Japan, but were aroused to extreme alarm by pro-Japanese influences among their own Koreans—which appear to have made some headway during the early thirties, when the Siberian Maritime Province had its full share of the sufferings caused by Stalinist planning.

In the purge panic of 1937 it was decided to remove the Koreans from the frontier region, where they were regarded as unreliable, into the interior of the Soviet Union. They were therefore ruthlessly deported *en masse* and resettled in the Central Asian republics of Uzbekistan and Kazakhstan. This treatment might have been expected to diminish further their Soviet loyalty, but great pains seem to have been taken to counteract its effects by intensive propaganda designed to stimulate their hopes for a future liberation of Korea from the Japanese. Special theatres and films were provided for the Korean areas celebrating Korean partisan

CONTRAST CONTROL FOR THE deaf

is the very latest development in Multitone Hearing Aids. It is incorporated in the SELECTOR — the new and very small pocket instrument. Contrast Control combined with the special construction of the Aid, will, we claim with confidence

Enable the vast majority of people already using Aids to hear better and more comfortably and . . . help those who have so far found the use of Hearing Aids intolerable.

Write or call for a 7 days' free trial and details of this latest Multitone achievement.

YOU NEED THE

MULTO

PORTABLE LIGHTWEIGHT

CALCULATOR

- ADDS
- SUBTRACTS
- MULTIPLIES
- DIVIDES

Cut out figure drudgery with the MULTO. One operator (unskilled) with a MULTO can do the work of five "old method" workers. Saves time, money and labour. The MULTO adds, subtracts, divides and multiplies. Essential for small offices and invaluable as a supplementary calculator in the large office. Takes up no more room than a desk telephone, and a special locking device ensures mechanical safety and fool-proof operation.

We will gladly arrange a demonstration in your own office without obligation.

fights against the Japanese as well as earlier peasant risings against the Korean gentry. Selected Koreans were admitted into the Communist Party, while all qualified members of the community were liable for conscription in the Soviet army, where some of them became officers and even rose to high rank.

When Japan surrendered in 1945 and the Soviet army occupied Korea north of the 38th parallel, trusted Soviet Koreans were of great value to the Soviet state. They spoke both Russian and Korean; they were Soviet citizens and subject to Soviet law and police; but there was no difficulty about providing them with additional Korean citizenship; they had acquired the genuine Soviet mentality from their life within the Union and were free from the spirit of independence which the Russians find so tiresome in the local Communists of satellite states. They included men with administrative and technical training such as Koreans had not been able to acquire under Japanese rule. The political figureheads of North Korea have been native-born, but in the background the "Muscovite" Koreans have had great power and influence, and a part at any rate of the efficiency in aggression which the North Korean state has displayed within five years of its birth must be attributed to their work.

Defenders of the Middle East—IV

Jordan and Its Legion

[FROM OUR SPECIAL CORRESPONDENT]

THE little kingdom of Jordan plays a part in the defence of the Middle East that is disproportionate to its size; it is, with the possible exception of Iraq, the only country in the Middle East that can be considered, both by reason of its military effectiveness and of its loyalty, an integral part of the Middle East defence scheme of the western world. This is due to the Arab Legion, which demonstrates most strikingly what can be achieved by the combination of natural Arab fighting-men and expert British officers. The Arab Legion now numbers not much more than 8,000 well-equipped and fully trained men, but during the Palestine war it reached 12,000. It is not necessary here to dilate upon the excellencies of the well-publicised Legion, but it might be pointed out that its equipment includes such things as field kitchens—not usually thought about by Middle Eastern armies—and first-class ordnance and supply depots. At the moment the British Government, whose grant-in-aid of £3,000,000 a year pays for the Legion, is again keeping it very short of ammunition, particularly for its heavier guns. This seems to be a deliberate insurance that the Legion will not be used by King Abdullah—in one of his more hot-headed moments—for operations against any of his, to him, singularly irritating neighbours, especially Syria.

The Legion has recently acquired an army co-operation squadron of light aircraft which are a local source of pride and pleasure as well as useful for "spotting" over the barren, practically road-less deserts and high rugged mountains of the area. Unlike other Middle Eastern armies, the Legion has also a trained reserve. This is a force of about 4,000 men organised almost on territorial army lines. The regular legionaires are recruited from the desert areas; the reservists are villagers, for they can more easily be called up at short notice. They receive a "retainer" of £2 a year but have to do a fortnight's field training for which they draw ordinary Legion pay. Their uniforms and equipment, including small arms, are retained in Legion depots but are ready for instant issue. There is also a body of irregulars, remnants of the volunteers from Jordan and other Arab countries who fought with the Legion during the Palestine campaign. They have been formed into a rough and ready frontier force to patrol Jordan's boundaries and leave the Legion free for other duties and proper training. On any standards the Legion is a small force, but on the same standards an extremely good one.

The Legion's most important duties today are the maintenance of order and internal security in Arab Palestine; for many months they included the actual civil administration of that area. It is not an easy task. Abdullah's absorption of Arab Palestine has far greater support amongst Palestine Arabs than might have been expected, and his half-Palestinian half-Jordanian Parliament and Council of Ministers are working reasonably well. But there are numbers of Palestinians, understandably embittered and disgruntled at having lost all they possessed, who feel that King Abdullah, by tacitly recognising Israel's existence, has come to terms which can never restore to Palestinians the land and farms, jobs and houses they have lost, and has, therefore, let them down. As, at the same time, enmity towards Abdullah is growing to fever pitch in Egypt, it is not out of the question that use might be made of these Palestinians, accustomed since 1946 to violence as a successful method of settling political or other arguments, as a means of removing a ruler who is determined and strong enough to steer his own course. Were it not for the immunity which his direct descent from the Prophet gives Abdullah amongst devout Moslems, his life could by no means be termed a "good risk"—and many westernised Moslems are no longer devout.

Heir to Abdullah

What would happen to Jordan if Abdullah died—he is not a young man—or were assassinated? The heir to the throne is Prince Talal, of whom not a great deal is generally known, because his father has always short-sightedly kept him so well in the background that no form of public office has been permitted him. Fortunately, Talal is a level-headed man and has derived advantages from a small group of intelligent and far-seeing British friends. Despite many obstacles, not the least of which has been the ill-advised refusal of the British Government to risk Abdullah's displeasure by giving any kind of official recognition to Talal, he is far readier to take over the responsibility of governing Jordan than might have seemed possible. And, despite wretched memories of a most unhappy period at Sandhurst, Talal is fervently pro-British, progressive and, it is felt, capable. Whether he has inherited Abdullah's crafty statecraft or his strength of purpose, only time can show. But there is a reasonable chance that Abdullah's death would not now lead to the collapse of Jordan. Talal is certainly far more progressive than Abdullah and would not therefore impose the irksome restrictions, based upon orthodox Moslem conventions, which now irritate former Palestinians accustomed to British ways.

Financially and economically Abdullah's kingdom is entirely dependent upon the United Kingdom and must remain so for some years to come. Despite excellent plans laid to tide Jordan over the next five years, during which it hopes to complete the integration of its country with Arab Palestine and establish some local industries, there will be need for considerable austerity and most strict control if a sterling "gap" which was nearly £8,000,000 last year is to be reduced to workable proportions.

On balance, however, and despite the violent antagonism of Egypt and Saudi Arabia, there is an essential stability and reliability about this little country which, together with its geographical position, make it of far greater importance to the Arab League, and to the defence of the Middle East, than is the League to Jordan.

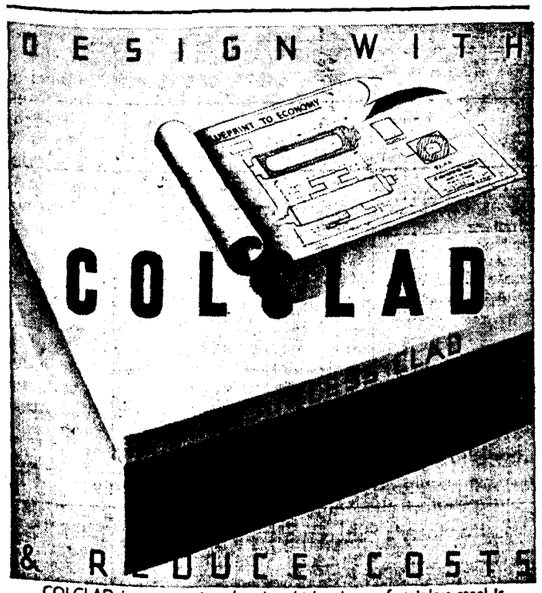
A sensible policy for process steam—No. 14

How are your steam traps chosen?

BY SPIRAX

Choosing a steam trap is not generally a management matter. Yet the virtues and the vices of steam trapping find their way unerringly to the managing director's desk.

It has been shown in these notes that both cost and output of manufacturing operations are irrevocably bound up with the efficiency of heat transfer in the process steam plant.



The role of the steam trapping installation is important. It can, for example, decide whether a machine takes 15 minutes or an hour to come up to temperature; whether the temperature will remain steady or become erratic; whether a process takes 30 minutes or 50 minutes; whether steam consumption is modest or extravagant; whether the percentage of spoilage or rejects is low or high.

In most process steam plant a high standard of output economy begins and ends with the steam trapping installation.

There are, in fact, good reasons for the question which heads these notes.

Correspondence to: **Spirax Manufacturing Co. Ltd.** (Economist Enquiries), Cheltenham, Glos.

COLCLAD is a composite plate in which a layer of stainless steel is bonded to a weldable carbon or low alloy steel. Special methods of manufacture ensure a uniform thickness of cladding. If protection is required on one side only COLCLAD offers equivalent corrosion resistance of solid stainless steel at considerable reduction in price. Easier fabrication and availability of plates in sizes larger than can be obtained in solid stainless steel, reduces production costs.

To assist YOU in adapting COLCLAD to YOUR products our technical staff is at YOUR service.

COLVILLES LTD., 195 WEST GEORGE STREET GLASGOW, C.2

SIMON ENGINEERING GROUP

To keep in the forefront of technical progress has been a basic Simon principle for seventy years. In coal washeries, coke ovens, large water-tube boilers, chemical and gasworks plant, mechanical and pneumatic handling, and the building of granaries and flour mills, Simon engineers have made substantial contributions to modern technology and maintain world-wide contacts. During 1949, in the course of their various duties, twenty-five Simon directors, executives and technicians made seventy visits to twenty countries in both hemispheres and travelled well over a quarter of a million miles. Rolling stones gather no moss but many good ideas.

THE BUSINESS WORLD

Mechanics of EPU

THE best way to grasp the essentials of the European Payments Union agreed in Paris by the OEEC countries last week, and operating retrospectively from July 1st, is to contrast it with the Intra-European Payments Agreement that it is replacing. Both are mechanisms for compensating or clearing the debits and credits arising from current business between member countries of the OEEC group, and both are concerned with the balances of central banks, not with those of individuals. The two successive intra-European payments schemes, however, were integral parts of the system of Marshall Aid and could not have been operated without the grants of ECA dollars made to creditors on condition that they made "contributions" in their own currencies to debtors in the OEEC community. Moreover, these earlier payments schemes were built on the existing bilateral arrangements between the various parties. They called for a monthly offsetting of debit and credit balances arising from bilateral trading, the settlements then being completed—so far as possible—by the use of the contributions and drawing rights. The distinctive weaknesses of these schemes arose from the fact, first, that the amounts of these contributions and rights were fixed before each annual version of the scheme came into operation, and secondly, that the contributions and rights themselves were bilateral—rigidly and exclusively so in the first version of the scheme and as to 75 per cent in the second version that has just terminated. Hence the IEPS served to reinforce the bilateralism of European trade.

Clearing Machinery

The new EPU mechanism marks a revolutionary departure from this principle. Each periodic "compensation" will be fully multilateral and automatic, so that each member country will be concerned only with its credit or debit position *vis-à-vis* the other members of the EPU group as a whole, and not with its several bilateral relationships with those other members. Within the range of EPU payments, which incidentally embraces the non-European monetary areas of the participating countries, there will be complete transferability, at the periodic settlements, of each member's currently accumulated holding of the currency of any other member. It follows that, in formulating its exchange control policy, each participating country will be able to regard the currencies of the other participants as equally "hard" or "soft," so that no justification will remain for discrimination between them in trade or payments. Although EPU will be launched with a certain amount of Marshall Aid assistance, the mechanism that has been devised will, in principle, be capable of operating when that aid is withdrawn.

The Bank for International Settlements in Basle will act as agent for EPU as it did for the Intra-European Payments schemes. During the first six months of the operation of EPU the settlements are to take place every two months; thereafter they will take place monthly. The method of establishing the net debit or credit position of each country at these periodic compensations will follow the lines adopted for the IEPS. At the end of every period the central bank of each member will notify to the agent the balance in the accounts open on its books in the name of the central bank of each of the other members. On the basis of this information, and of the corresponding information supplied for previous periods, the agent will be able to calculate the net deficits or surpluses of each member *vis-à-vis* all the others. These calculations and the resultant book entries will be made on the basis of units of account equal to 0.888671 grammes of fine gold, the equivalent of the present US dollar. The resulting net debits and credits will be entered in the accounts of EPU, and will thus measure at each stage the net cumulative position of each member since the coming into force of EPU on July 1, 1950.

These surpluses and deficits will remain as claims on, or debts due to, the EPU unless and to the extent that they are required to be settled in gold. The extent of the continuing EPU credit and of any associated gold payments is determined by quotas that have been allocated to members on the basis of their aggregate visible and invisible current transactions with other members in 1949. These quotas are as follows:

EPU Quota

Country	Quota (Equivalent in millions of Units of Acct.)	Individual Quotas as percentage of Total Quotas
Austria	70	1·8
Belgium/Luxemburg	360	9·1
Denmark	195	4·9
France	520	13·2
Germany	320	8·1
Greece	45	1·1
Iceland	15	0·4
Italy	205	5·2
Netherlands	330	8·3
Norway	200	5·0
Portugal	70	1·8
Sweden	260	6·6
Switzerland	250	6·3
Turkey	50	1·3
Sterling area (excluding Iceland)	1,060	26·9
	3,950	100·0

If any country's net cumulative position at EPU rose beyond its quota, any excess would at once be dischargeable in full in gold. In other words, apart from certain special provisions explained below, the limit of each country's obligation to lend to the EPU, and of its right to receive credit from it, is set by its quota. If the quota were reached, then at that point the member concerned would have received (or paid) 40 per cent of its EPU surplus (or deficit) in gold; the balance would remain as a credit or debit at the EPU. Below that point, the proportion to be settled in gold is determined by the scale set out in the following table:

Borrowing Rights and Lending Obligations

% of Quota	Debtors		Creditors	
	Use of Credit	Gold Payments	Use of Credit	Gold Receipts
20	20	...	20	...
20	16	4	10	10

The EPU is to pay interest at 2 per cent to creditor countries that have accumulated balances with it. It will charge debtors interest at 2 per cent on all debts outstanding for 12 months or less, at 2¼ per cent on debts outstanding for more than 12 months and up to 24 months, and at 2½ per cent on all debts outstanding for more than 24 months. These provisions for interest payments cannot be regarded as a punitive deterrent to chronic debtors or as a discouragement to the accumulation of excessive balances. In this context it may be recalled that in the original Keynes scheme for a clearing union, interest was to be charged on excessive credit balances, as a penalty for large creditors. There is no echo of this provision in EPU.

Although the credit lines available under the EPU are liberal, and would in themselves postpone gold payments to a fairly distant future, it has been agreed to make gold transfers even more remote by starting the operations of EPU with initial handicaps weighted against prospective creditors and in favour of prospective debtors in intra-European trade. Certain chronic debtor countries will be given a starting credit balance at the EPU, and certain creditor countries will be saddled with a starting debt to the EPU. These initial credit and debit positions will be as follows:

Initial Credit Positions

Country	Amount	Remarks
	(millions of units of account)	
Austria	80	...
Greece	115	...
Iceland	4	Unless other arrangements are made.
Netherlands	30	...
Norway	Between 40 and 70	Part as a loan from EPU.
Turkey	25	As a loan from EPU.
Total	Between 294 and 324	

Initial Debit Positions

Country	Amount	Remarks
Belgium and Luxemburg	...	Half of allotment to Belgium for 1950–51.
Sweden	...	Equal to allotment to Sweden to 1950–51.
UK	150	...
Total	150+? 80	

These arrangements comprise the one important feature that has been taken over from the previous Intra-European Payments Scheme. The initial debit positions will be the equivalent of the contributions that were made by creditors under the IEPS. In so far as they are utilised by the debtors, the creditor countries saddled with initial debits will secure an equivalent amount of "conditional" ECA aid, in US dollars. Conversely, the initial credit positions are the equivalent of drawing rights under the former IEPS. These initial positions will be recorded as debits or credits of the member with EPU and will thus be available as a cushion before the machinery of the quotas comes into play.

To prevent any member's indebtedness to the EPU from being unduly swollen by other members' drafts on accumulated holdings of its currency (for example, the substantial sterling balances held by some of the participating countries) it has been agreed that bilateral agreements shall be concluded for the funding and amortisation of these outstanding debts. If agreement cannot be reached on the terms of amortisation, there may be an appeal to EPU and the matter will then be referred to a special committee. The amounts to be released under these bilateral amortisation agreements will be available for compensation just as though they were current transactions. The British Government, which is the party mainly concerned with this provision, does not intend to negotiate funding agreements of this character. Its representatives announced during the EPU discussions that all sterling balances outstanding on June 30, 1950, might be used by this process to settle net deficits with EPU. If, therefore, Italy—with its estimated £65 million of sterling balances—runs into debit with EPU, it will be able to use that £65 million whether or not it is in debit with the sterling area. Given the size of sterling balances held by other member countries, this gesture by Britain might at first sight seem quixotically generous. The risk of gold loss from this particular arrangement has, however, been entirely obliterated by a special agreement under which the Economic Co-operation Administration has underwritten all gold losses that Britain may suffer as the result of such utilisation of accumulated resources by other members.

The Role of Marshall Dollars

The special arrangement by which ECA underwrites this risk of gold losses by Britain indicates one of the two channels through which ECA dollars will feed the EPU machinery. The first of these is the initial working capital of between $350 and $400 million that is being made available by ECA in the form of free dollars. These dollars will be available to bridge any gap that may arise between gold payments due from EPU to creditor countries and the gold payments due to EPU from debtors. There are two reasons why such a gap may occur—first, because the credits may be concentrated in one or two countries while the debits are spread over a large number of debtors; and, secondly, because (as a glance at Table II will reveal) the relation of gold payments to utilisation of credit is not the same for debtors as for creditors. In addition to providing this working capital fund, ECA will hold an "administrative assistance fund," which will be available to help any member that finds itself running into deficit with EPU at a rate and in circumstances that threaten that member's gold reserves.

A considerable part of the lengthy discussions that preceded the EPU agreement was devoted to the special position of sterling and to the need to safeguard the sterling mechanism in the transaction of international trade. Various solutions were propounded for this problem, including first the British suggestion of a special membership for Britain, then the plan for giving creditors of EPU the option to hold in sterling such part of their credit as had been earned in sterling. The final agreement is modelled on this second proposal, which has been adapted to all currencies of members of EPU. All participating countries will have the right to enter into

bilateral agreements with other participants whereby one partner or both will agree to give the other "a determined volume of credit" in certain conditions. If one of them is or becomes a creditor with EPU, that member may give credit to its partner instead of to EPU. This bilateral credit must be limited to the amount of the surplus with the partner (unless a lower limit is set by the bilateral agreement) and must also be within the credit line available to the debtor under his EPU quota.

Thus, the so-called "sterling option" has not only been generalised, but has also lost most of its substance—because of the rules set out for the liquidation of EPU after its minimum two-year life. When EPU has run its course it is provided that all balances of national currencies accumulated in accordance with this misnamed "option" shall be swept into the general pool for liquidation, being exchanged for EPU units. The EPU holdings of national currencies will then be distributed to creditors in proportion to their quotas. The resultant holdings of creditors will thereafter be repaid in accordance with bilateral agreements between each pair of countries concerned, or, failing such agreement, will be repayable in the currency of the creditor over a period of three years, meanwhile bearing interest at 2¾ per cent. By this provision for sweeping the bilateral credits into the general pool, it is hoped to ensure that member countries cannot so ordain their trade as to concentrate their surpluses into comparatively strong currencies such as Swiss francs and thus to leave others to hold the mixed bag of less desirable currencies that might otherwise comprise the main assets of EPU before the final distribution.

Whether surpluses are held by creditors in EPU units or in national currencies will be immaterial in the calculation of the cumulative debit or credit positions of members and, therefore, in fixing the point at which gold payments have to be made or received. The net position of each participating country will include not merely its credit or debit balance at EPU, but the amount it may hold or owe in the currencies of participating countries by reason of bilateral agreements.

The formation of EPU and the opportunity given to creditors to arrange to hold their surpluses (within certain limits) in particular national currencies, will call for a general reconsideration of the whole structure of bilateral agreements on the basis of which Britain and the sterling area conduct their transactions with the non-sterling world. The gold clause included in certain agreements—that with Belgium for example—will probably have to be dropped, since henceforth any member's obligation to pay gold in consequence of its transactions with participating countries will be an obligation to pay the EPU. Since many agreements may need to be renegotiated, it may be asked whether there is any longer any justification for Britain's practice of negotiating for different kinds of bilateral payments arrangements with different OEEC countries. Since the sterling area's transactions with these countries will be settled multilaterally, there is no point in having, say, the Netherlands within the transferable account area and Belgium out of it. The logic of EPU may before long demand a new segregation of non-sterling countries for exchange control purposes—distinguishing European accounts, non-European (and also non-American) accounts, and American accounts.

The EPU mechanism will not do away with the structure of exchange control in the various participating countries. The transferability of the currencies of member countries will not apply to the transactions of individual traders or travellers, but will come into effect only when the central banks of these participants use the EPU machinery to clear their mutual credits and debits. The actual mechanism of exchange control may, of course, be adjusted by the re-negotiation of bilateral payments agreements and by administrative action that will loosen up the controls. But no individual trader will be conscious of any change in payments machinery following the transition from the Intra-European Payments Scheme to the European Payments Union.

Britain's Credit Obligations

Britain's commitments as a potential creditor under EPU will be as follows:

	In million units
Initial debit position (balanced by conditional ECA grants)	150
Gold free credit line	212
Credit *pari-passu* with gold	424
Gold receipts	424
Total Quota	1060

In addition to these potential obligations, there is the provision for using accumulated sterling balances of member countries; these may be estimated at about £150 million. Despite the ECA guarantee against gold losses from the use of such balances, it will be readily apparent that Britain enters these new payment arrangements committed to pull a very full weight.

Commercial Policy

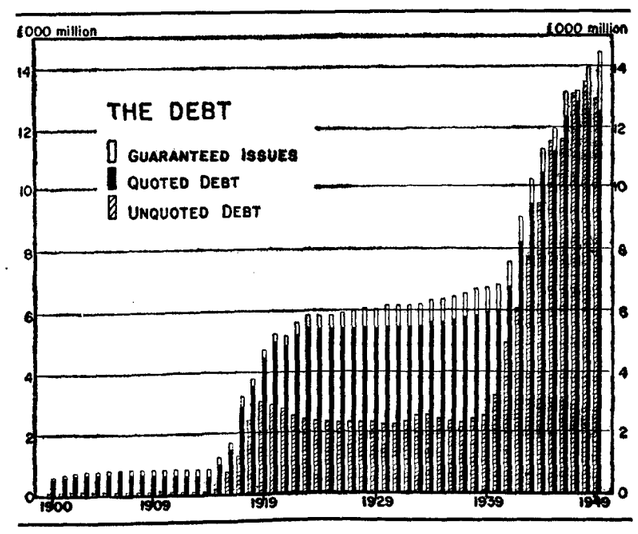
The most visible evidence of the new regime will be seen in the sphere of commercial policy. If the currencies of participants are freely transferable within the EPU group, there can be no justification for discrimination in their mutual commercial relations. Under the EPU agreement, therefore, members have undertaken as from January 1st, 1951, "to avoid any discrimination in respect of imports of any products as between one member and another." For Britain this means that the system of open general licences granted to OEEC countries will no longer exclude Belgium, Switzerland and western Germany. This policy of non-discrimination is also to apply to "invisible" transactions. The EPU agreement provides that as soon as the new system has come into force "no member may delay solely on payments grounds the immediate elimination of all discrimination in the field of invisibles." It will not be long therefore, before all member countries are treated alike in such matters as tourist allocations.

The EPU agreement, however, makes provisions for departure from this rule of non-discrimination by members who run into serious disequilibrium on their balance of payments. If a member "finds itself running into deficit with EPU at a rate and in circumstances which it deems serious in view of the state of its reserves," it may temporarily suspend measures taken by it for the liberalisation of trade and invisible transactions. The member in question is required to do this in such a way as to avoid unnecessary damage to the interests of any particular member, and it must avoid discrimination. The EPU nevertheless may recommend any action that it deems necessary, including a waiver of all rules relating to non-discrimination, against any member who becomes so chronic a creditor as to threaten the reserves of the Union.

Gilt-Edged Chronicle

A FORMER Nonconformist benefactor was known throughout the Methodist connexion as "the anonymous donor." Perhaps it would not be stretching Stock Exchange manners too far to refer, with something of the same kind of personalised anonymity, to "the leading firm of investment brokers" who have introduced, for limited private circulation, the second edition of *British Government Securities in the Twentieth Century*. The authors have been led to suppose, by the interest with which the first edition was received, that "some enlargement of its orginal scope might be acceptable." This is a very modest way of describing a major work of reference of nearly six hundred pages, covering every significant aspect of British Government securities since 1900. The volume sets out the results of painstaking research with great typographical skill; the student of the funds who needs more facts will indeed be hard to satisfy, and nowhere will he find them set out with greater care or authority.

The authors' objective is neatly summarised by a quotation from *Fairman on the Funds*, published in 1824:



> With regard to the contents of the following publication, I have altogether avoided political observations and conjectures, sincerely hoping that virtue and knowledge may ever triumph over vice and ignorance.

The preface does no more than indicate, though with a certain pointed wit, the main signposts down the fifty years. It is, indeed, a far cry to "those distant days before the 1914 war, when London was the money-centre of the world and money was readily forthcoming for every type of enterprise at home and abroad." Today "the whole future of risk capital is in doubt . . . private thrift has become something of a dangerous drug, prescribed in small doses but proscribed in large." The consequence has been a great diminution of private investment and a remarkable increase in the scope of institutional investment. Hence the need for expert study and research in the gilt-edged field:

> The actuarial calculation of yields and the comparison of securities from a multiplicity of angles today form a valuable part of Stock Exchange service in a market in which the turnover last year exceeded four thousand million pounds.

Without any question, this new work is a major contribution towards that service.

The book itself is divided into six distinct sections. The first, simply entitled "The Market," sets out for each year from 1900 to 1949 particulars of all British Government securities (both direct obligations and issues carrying Government guarantee) quoted on the London market, showing the amounts in issue, the terms of repayment, the year's record of prices, and end-year yields. For each year there is also shown a summary of the internal debt and particulars of new Government issues. The second section, "History of the Issues," stretches back to 1694 to trace the growth of the Funded Debt up to 1899; then it sets out in detail the history of every security that has existed during the half-century, whether quoted or unquoted. Section Three presents for each of the fifty years an analysis of the National Debt, with details of changes during the year, and a division of the quoted debt according to the respective lives of individual stocks. Section Four examines the changes in the published holdings of the National Debt Commissioners—that mysterious body which has not sat as a whole since 1860 but which, under the discreet management of the Chancellor of the Exchequer, the Governor and the Deputy Governor of the Bank of England, brings into action at the appropriate time most of the "points" of the public stag. The fifth section presents a miscellany of information about British public finance and the debt service (is there any other place, one wonders, where the whole course of national revenue and expenditure from 1900 to 1949 can be examined in a two-page spread as here?). And finally, "for the convenience of addicts and abstainers alike," a dozen illuminating charts are brought together, of which a selection is reproduced with this article.

Such a bald summary cannot hope to give much impression of the statistical riches which abound in the volume. Here is the record of the repercussions on the public debt and public finance of a half-century of immense change in social, political and economic life. In 1900, quoted securities amounted to £569 million, and the total debt to £639 million—say £15.56 per head. Bank Rate averaged in that year just under 4 per cent, and taxpayers bemoaned a sharp increase from 8d. to 1s. in the £. In 1949, quoted securities had a nominal value of £12,534 million and the total debt and multiplied forty-fold to £25,332 million—nearly £506 per head. Bank Rate had remained immutable for a decade at 2 per cent, while the standard rate of income tax at 9s. was 6d. higher than the level to which it was raised in the first wartime Budget.

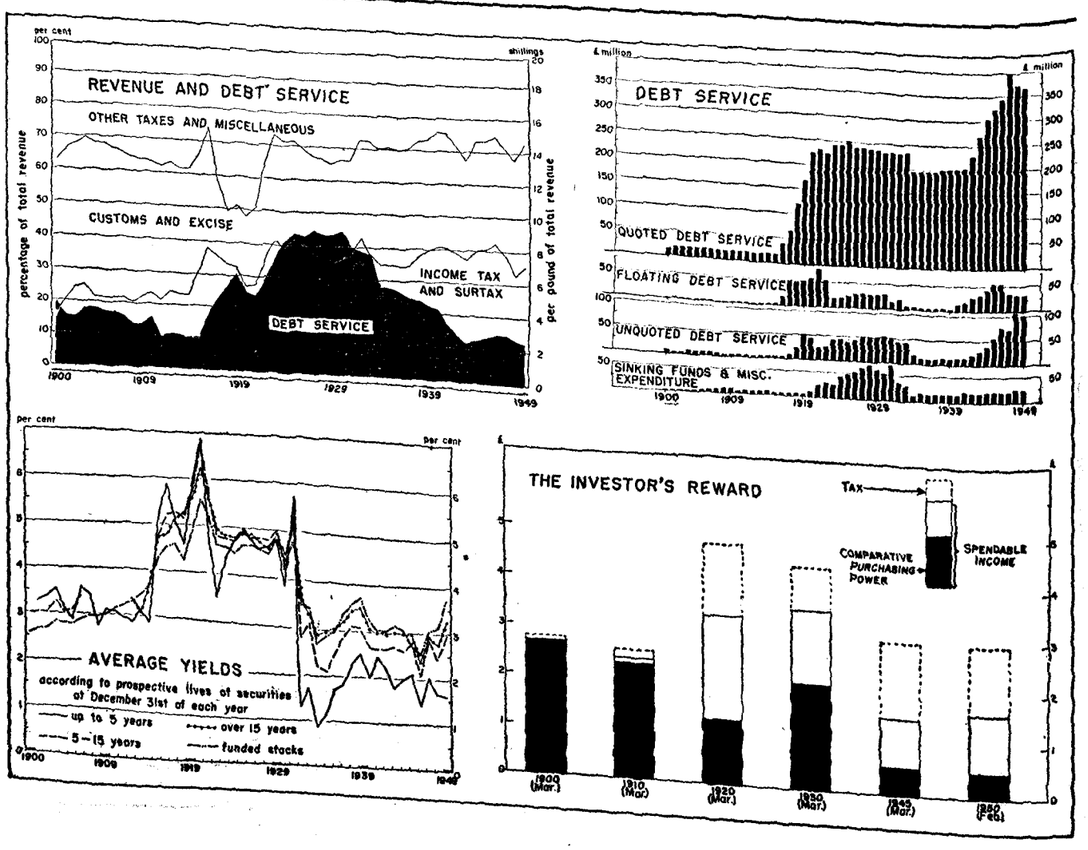
Such random facts paint, in a very slapdash way, the

picture of the new financial orthodoxies that have become the mode in the last generation. A world war would have brought them *into being* in any event, but their seeds were far from dormant in the 'thirties. The private or institutional investor in gilt-edged has only begun to learn the implications of these immense market changes. Modern techniques of official control over the gilt-edged market are as yet but dimly understood, even by those whose business it is to follow them—as closely as is possible from the outside. As the preface observes:

> The growth and application of departmental funds have always been a considerable factor in the market, and today they are probably the most important influence in it.

But any attempt to measure this influence (as, for instance, in the article on the extra budgetary funds that appeared in these columns on June 17th) has to be qualified by so many "ifs" and "buts" that the non-official investor must always feel himself at a disadvantage in a market increasingly dominated by the Chancellor's "creatures." An area of total ignorance extends widely over the Issue Department of the Bank of England and over the Exchange Equalisation Account. The authors of this book readily confess that "only a little light" is shed on official policy and technique by their analysis of the holdings of the National Debt Commissioners, though the bare figures in the first table are a sufficient illustration of their ever-increasing importance.

These changes might be regarded as the flowering of monetary technique in its most modern form, but the preface shows that the roots dig deep into history:



> . . . Departmental subscriptions to new loans, which are sometimes regarded as an essentially modern conception, do in fact constitute an old practice, a clause empowering the Commissioners to subscribe to any future new loan having been introduced, at the suggestion of Charles James Fox, into Pitt's Sinking Fund Act of 1776 which brought the Commission into existence. There is an early example in 1834 of the use of Savings Bank funds to ensure the full performance of a difficult conversion operation.

Such was the puny precursor of the devices that a modern borrower can use to trim the market in his own favour. It is a technique as profound in its financial implications for this century as the discovery of the arts of central banking a hundred years ago.

The selection of charts with this article calls for a brief word. The main chart distinguishes the growth of the quoted debt, the guaranteed issues (much expanded

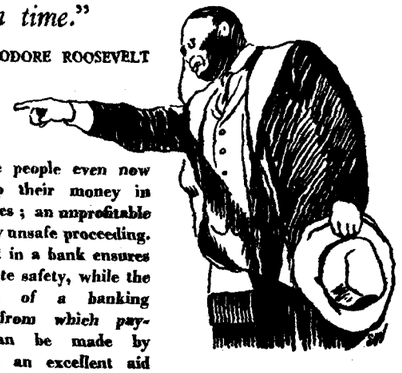
PUBLISHED HOLDINGS OF NATIONAL DEBT COMMISSIONERS

	Mar. 31 1945	Mar. 31 1946	Mar. 31 1947	Mar. 31 1948	Mar. 31 1949
HOLDINGS	£ m.	£ m.	£ m.	£ m.	£ m.
Quoted (direct and guaranteed)	1,550	1,587	1,728	1,923	2,205
Unquoted	1,138	1,547	1,602	1,599	1,622
Total	2,688	3,134	3,330	3,522	3,827
PROPORTION OF TOTAL ISSUES	%	%	%	%	%
Quoted (direct and guaranteed).....	*12·94*	*12·05*	*13·08*	*13·79*	*15·24*
Unquoted	*9·85*	*13·30*	*12·20*	*11·85*	*12·53*
Total	*11·42*	*12·64*	*12·64*	*12·84*	*13·96*

by recent nationalisation policy) and the unquoted debt (which includes Treasury Bills, TDR's, Tax Reserve Certificates and the various popular savings issues). To give precision to the latest year's figures the direct quoted obligations amount to £12,534 million, the guaranteed issues to £1,982 million, while securities not quoted on the London Stock Exchange total £12,892 million. Another chart (not reproduced here) shows the increasing weight of quoted debt represented by securities of shorter life. The present "age composition," compared with 1945, is tabulated below:—

QUOTED SECURITIES ACCORDING TO LIFE
(£ million)

As at March 31	Less than 5 years	5–15 years	15–25 years	Over 25 years	Govt. option to repay
1945	1,672	3,072	1,561	1,523	3,350
1946	1,531	3,498	2,560	1,371	3,409
1947	1,501	2,984	3,103	1,366	3,890
1948	2,023	2,160	3,093	1,361	3,888
1949	2,833	1,615	2,833	1,371	3,887



An alternative title for this table might well be "the tasks of the fifties."

The four charts in the large block compare the revenue and the debt service. The latter is now relatively far lighter in weight than in the twenties. It is sometimes suggested that a rise in interest rates would produce a great and immediate increase in the cost of debt service. The second chart, in conjunction with the table above, suggests that this case is by no means so conclusive as its supporters are inclined to argue. The third chart gives an impression of the movements of average yields on stocks of varying life. Even a regime of strict monetary control, it is clear, does not guarantee uniformity in the relative returns on the different classes. The fourth chart shows that the rentier's real return equivalent to 2.7 per cent in 1900 has now dwindled to a mere 0.5 per cent.

The only invidious aspect of dealing with a book of the dimensions and scope of *British Government Securities in the Twentieth Century* is that any selection from its riches is bound to be scrappy. The work does not aim at any statement of investment principles or doctrine; it is content to establish the facts and to leave readers to their own interpretations. It provides layers of rich material for a dozen separate studies. If the inquirer is in search of the methods by which a popular democracy, burdened by two wars in a single generation, can make its debt burden tolerable, he will find the answers here. If he is interested in the precise techniques by which this has been achieved, he can turn to these pages for statistical corroboration. If he is attracted by nostalgic jobbing backwards (and there are few who are sufficiently strong-minded to resist the pains and pleasures of that much-condemned pastime) he will find these pages as irresistible as those of *Whitaker* or *Wisden*. It is fitting for *The Economist* to return the compliment to "all who study or write about investment and finance," which the authors offer in their dedication, by acknowledging to them its great debt for their contributions to the stuff of investment knowledge.

"Nine-tenths of wisdom is being wise in time."

THEODORE ROOSEVELT

There are people *even now* who keep their money in their houses; an unprofitable and highly unsafe proceeding. To keep it in a bank ensures its complete safety, while the possession of a banking account from which payments can be made by cheque is an excellent aid to the systematic management of your monetary affairs. Accounts can be opened with small sums. Call at the nearest branch of the Bank, where the Manager will be pleased to give full information about the Bank's services.

Business Notes

Prices and Korea

The Stock Exchange has made the best of the cheerless news from Korea this week—a little firmer one day and not so firm the next. In a quiet market, industrial shares have shown a few small rises—the *Financial Times* industrial share index stood at 112.0 in the middle of the week, compared with 111.1 a week earlier and 114.8 before hostilities began in Korea. The broad effect on gilt-edged has been to raise the yields on "undated" stocks by rather more than a shilling per cent with correspondingly smaller movements in the returns on the dated issues and shorts. Thus Old Consols which were yielding a copper or two more than 3½ per cent on the eve of the Korean war now yield practically 3.6 per cent, while 3 per cent Savings Bonds 1965-75 have fallen from a yield basis of £3 6s. per cent to £3 7s. 2d. per cent.

Perhaps London's evident willingness to await events is more realistic than Wall Street's occasional flurries this week. If the international situation is really grave, it is difficult to rationalise the selling of common stocks which pushed the Dow Jones average down by 5½ points on Wednesday. Indeed, the key to the market situation surely lies in the

Note: Korea was invaded on June 25th.

inflationary implications of the Korean war. The commodity markets have certainly shown a sharper awareness of these factors than have the security markets. It is hardly surprising that rumours of commodity controls in the United States have multiplied in the past week, for the western world has been treated in the space of three weeks to a boom in commodity prices of so far-reaching an order as to suggest that the tepid war had been heated up to boiling point. Rubber, after its recent salutary check, is now at 2s. 5½d.—a record unchallenged since the restriction scheme of the mid-'twenties. Tin, about which recent discussion has turned on the possibility of restriction of supplies, had by Thursday jumped by more than £100 a ton; lead has recovered, and cotton is 2d. a lb. dearer.

Such are the immediate consequences of superimposing a keener demand for rearmament purposes on an already high civil demand for basic raw materials. Here are the proximate consequences of inflation and the one thing that could reverse them would be a sudden outbreak of peace. Whether the commodity markets are safe in regarding this possibility as entirely remote could no doubt be argued. But it is remote enough, and the one certain consequence of Korea—whether the fighting ends quickly or not—is that it will touch off a major demand for rearmament and in all probability sustain high prices for all essential raw materials. In due course, no doubt, these consequences will not be lost on equity investment.

* * *

Mr Menzies' Mission

During the past few days conflicting reports have come from Canberra about the financial implications of Mr Menzies' whirlwind world tour—and, in particular, about the objects of the financial discussions he is expected to hold in London. There seems to be no doubt that he is hoping to negotiate some sort of dollar loan in America; he may even be going to angle for direct participation by American contractors in Australia's development programme. It will be remembered that Australia found some initial difficulty in implementing the 25 per cent cut in dollar imports agreed on at the Commonwealth Finance Ministers' Conference in July, 1949. In November, indeed, the Chifley Government resorted to a draft of $20 million on the International Monetary Fund to enable it to reduce its drawings from the sterling area central pool while still maintaining purchases of dollar capital goods. Since then the Australian investment programme has gone forward at a brisk pace, although some of the most cherished hydro-electric and other schemes have run up against shortages of capital equipment that only America can supply. There is, of course, no binding obligation to prevent Australia from drawing dollars from the sterling area pool to purchase this equipment—the Commonwealth is not (officially, at any rate) restricted to any annual dollar quota. But it is obviously in the interests of all sterling area members, first, that Australia should place as many orders as possible in soft currency rather than hard currency areas; and, secondly, that Mr Menzies should discuss any proposed increase in such drawings or any borrowing projects that involve future dollar commitments with the central banker of the area before his mission to America takes place. This, presumably, is the explanation of the London talks.

Meanwhile, figures issued in Canberra show that a massive increase in Australian imports of vehicles and machinery from the sterling area reduced the Dominion's external surplus on merchandise account from £A120 million in the eleven months to end-May, 1949, to £A80 million in the eleven months to end-May, 1950. Imports from the dollar area were kept well in check—the dollar deficit on trade account declining from $35 million to $30 million in this period. This welcome decline, however, may well have been due as much to the change in the price differential between sterling and dollar goods after sterling's devaluation as to any startling efficacy of Australian import controls. Whatever the way in which the industrial development programme is to be financed, it is to be hoped that the inflationary pressure generated by it, as well as by the high level of export income and by what some quarters still believe to be the undervaluation of the Australian pound will not now lead to a politically irresistible increase in Australian demand for dollar consumer as well as dollar capital goods.

* * *

Six Months' Surplus?

The provisional trade figures for June, which the Chancellor of the Exchequer gave to the House of Commons on Monday evening, are at once encouraging and disquieting. The encouragement lies in the buoyancy of the export drive. The total value of exports for the month reached £175.9 million, compared with £182.7 million in May. June had only 25 working days; thus the daily rate of exports in that month actually exceeded the record level of May. The disquiet rests in the further rise in the cost of imports which reached a new record of £238.6 millions, some £10 million more than in May. Imports normally rise to a peak in June and July, but the record figures for last month obviously owe much to the continued rise in commodity prices.

The excess of imports (valued c.i.f.) over total exports and re-exports (valued f.o.b.) for the first half of the year amounted to £220.5 million. The corresponding figure for the first six months of 1949 was £199.1 million and for the

second six months £230.4 million. If the figures for the first six months of 1950 are adjusted to a common f.o.b. basis (on the lines explained in a Business Note on page 1234 of the issue of June 3rd), a net visible deficit for the period of £70 million would result against a deficit of £57 million for the first half of 1949. The trend in invisible items is much harder to estimate with any certainty. In the first half of 1949 the invisibles yielded a surplus of £42 million, and in the second half £68 million. It is a fair guess that net income from invisibles this year should at least have equalled that of the second half of 1949. If so, Britain's overseas payments for the first half of the year should balance and might even show a small surplus. The "Economic Survey" assumed an overall surplus of £50 million for 1950. This is not yet outside the realms of possibility. But the Government's overseas expenditure may well increase in the coming months, and exports and income from invisibles would then have to expand at a much faster rate than at present if a surplus of this size is to be achieved.

Sterling and Dollar Oil

While the attempt to settle the Anglo-American oil differences in principle as between governments shows every sign of being bogged down, the negotiations with individual companies have been making progress in the last few weeks. The latest step is an agreement, made public this week, between the Arabian American Oil Company and the British Government. "Aramco," a partnership of four major American companies, has in the past sold its oil for dollars only; it has now agreed to take some sterling from the marketing companies which sell its product, and is to be permitted to use that sterling to pay royalties to the Saudi Arabian Government and to meet some other expenses in Arabia. These provisions indicate a potential saving of dollars to Britain, though it cannot be a large saving. More important, they have been taken in the United States to clear the way for the agreement with the Caltex Company which has been under discussion for so long.

Caltex is the foreign marketing organisation of two of the partners in Aramco—California Standard and Texas Oil Company. Thus it is Caltex that markets some 60 per cent of the Arabian American output. Clearly there would not be a great deal of significance in the Aramco agreement if it were not to be followed by a further agreement permitting Caltex to handle sterling more freely than it has so far done. The Caltex negotiations, however, concern the oil of Bahrein, which is in the sterling area, more than they concern the oil of Saudi Arabia, which is not. The Caltex output from Bahrein has not yet been treated as sterling oil. The case is one in which the argument for "sterling" treatment of an American company's output is particularly strong, and it will be surprising if the Caltex agreement is delayed much longer.

The derationing agreement at the end of May was followed quickly by two other agreements with American companies. The first, with Standard Vacuum (a partnership in the Far East of the Jersey Standard and Socony-Vacuum groups) permitted the Indonesian output of Standard Vacuum, so far as it is sold in the sterling area, to be treated as sterling oil. The second concerned the same two companies' share of the output of Iraq Petroleum Company. To the extent that they sell this oil in the sterling area the two companies have agreed to take sterling for it and to make the sales through a joint British subsidiary, still to be formed, which will be subject to British taxation. In return they are permitted to sell some of their Iraq oil for sterling outside the sterling area.

Although the details are complex the general tendency of these agreements is fairly clear. Britain saves dollars. By their agreement to take sterling for certain oil sales in the sterling area, the American companies gain freedom from the British Government's "substitution policy" there and a somewhat greater trading freedom in third countries. One result is that the substitution policy itself is beginning to look a good deal smaller than when it was first announced.

Policy for Ironstone Workings

The contrast between the meticulous and costly restoration of opencast coal sites and the condition in which some of the iron ore workings in the east Midlands have been left has puzzled many people, and few will be sorry that the energetic Minister of Town and Country Planning has decided to produce a policy for the iron ore workings. Dr Dalton visited the ironstone areas soon after his appointment, and (he said in the Commons last week) was "greatly shocked" by what he saw. These are proper feelings. But it is desirable that a policy that is to be put into statutory form—and which can have important industrial repercussions—should be produced in a state of calm rather than a state of shock. The iron and steel industry depends on home-produced ore for about half its production of pig iron, and this dependence is likely to increase in the next year or two. The industry is showing some concern lest the policy to be imposed may upset its production programme.

The Minister's statement of policy last week was more formidable in its language than in its content. "Complete restoration, with replacement of topsoil" is to be the formula for present and future workings, but the exceptions to the formula are so extensive that it may fairly be doubted whether the new order will differ fundamentally from the old. Where the length of face worked is so great that the cost of replacing the topsoil would be "very high," then topsoil may not, after all, have to be replaced. Where restoration to agriculture is "impracticable" the worked land can be afforested, with or without levelling. The producers and landowners will bear three-quarters of the cost, and the Exchequer will bear the rest. This refers to present and future workings, which may well cover 31,500 acres of land in the next century or so. For the past workings that have not yet been restored there is to be a Government effort to bring about levelling and restoration to agriculture, either by the owners or by local authorities with Exchequer help.

To this policy, in the general terms in which it now stands, no very urgent objection need be taken. It is true that there is a somewhat offensive imputation of "past neglect" against the firms concerned, which might not have arisen if they had been as good at public relations as they are at their work. It is also true that the presumption in favour of "levelling" the worked ground turns out to be entirely questionable when the actual ground is seen at close quarters. Experience may, however, supply a corrective—provided that the statutory Order that the Minister has promised is not drawn in a rigid way and does not fail to allow for the possibility that more may yet be learnt about the best treatment for ironstone workings. The matter, in short, needs care rather than haste.

* * *

Strip Mining and Steel Output

Nearly half of the 8,577 acres worked for ironstone in Northamptonshire up to the end of last year has by now been restored to agriculture—though with by no means uniform success. Only 900 acres have been planted with trees. But if the iron ore producers decide the matter, the proportion to be planted with trees will increase very greatly as the depth of the workings and the size of the excavating machines increase. The reasons are to be found partly in the methods of heavy mechanised excavation; to leave the land flat the excavators would require to do their work twice, and thus their output would be cut by half. Another reason lies in the geology of the area: where the excavations

have to dig deeper than about 35 feet they encounter a thick band of limestone lying on top of the ore, and the sites in their final state are strewn with limestone boulders that defy cultivation. To restore sites of this kind fully to a cultivable state would cost, in the iron ore producers' estimate, something like £950 an acre—perhaps twenty times as much as the land, as agricultural land, is worth before mining.

These facts have influenced the producers to adopt their present policy, which is to leave most of the land in the "hill and dale" formation (a somewhat kindly description of the ugly serrated state in which the excavators leave it) and to plant the slopes with trees. Experience in strip mining districts of the United States, and more recently in Northamptonshire itself, has supported this policy by showing that conifers grow better on the slopes of the serrated land than on sites that have been levelled. To level the land may often be worse than useless. Stewarts and Lloyds, who are the biggest ironstone producers in Northamptonshire, have their own forestry department and tree nurseries and have gone a long way towards demonstrating the value of afforesting the "hill and dale." Since much of the ironstone mining in Northamptonshire will eventually have to go underground—and will therefore need timber—the industrial value of these plantations may eventually be high.

*

The expansion of British steel output is continuing; figures released this week show that the crude output was 8,309,000 tons in the first six months of 1950, and this is 351,000 tons more than in the first six months of last year. As the programme stands at present, the expansion will go on until an annual rate of output of some 18,000,000 tons is reached in 1953. This will not happen, however, unless home ore production is expanded; indeed, since supplies of German scrap are expected to fall off, even the present output cannot be maintained without an expansion of pig iron production based partly on greater supplies of home ore. It is an unpleasant fact, therefore, that the steel production programme requires iron ore to be mined in Northamptonshire on a large and increasing scale. Rigid orders to level and restore the sites would reduce the supplies of ore and add greatly to their cost; so it seems doubtful whether, once the probable consequences have been faced, the Government will insist on revolutionary changes.

Record Rise in Tin

Tin has shown a spectacular rise in the past week; on Tuesday it jumped by £16 a ton and on Thursday by as much as £30 a ton. The closing quotation on Thursday was £692¼ a ton, compared with £615½ a week earlier and £591⅛ on the Friday before fighting started in Korea. Prices on the New York market have kept pace, rising from 76⅜ cents a lb. (equivalent to £611 a ton) on June 24th to 87 cents (£696 a ton) last Wednesday. There is as yet no sign that the United States Munitions Board has increased its purchases for the stockpile or that consumption has increased in America, in Britain or on the Continent. Users of tin have in the past tended to hold only minimum working stocks. Now that supplies from the Far East might be affected by any spread of hostilities, there has been a rush to rebuild inventories. The demand has come mainly from European countries.

Will this sharp rise in price be more than temporary? Once stocks have been replenished (and assuming always that supplies from Malaya and Indonesia are uninterrupted) some adjustment in the market might perhaps follow. The Ministry of Supply has done nothing to check the rise by offering metal from stocks. Since the London market was re-opened in November the Ministry has followed a cautious policy in releasing tin, on the ground that as tin is an important dollar earner, a larger dollar income may be secured by sustaining the price. Even in the past week, its offerings on the market, though increased, have not been on a large scale.

Tin has many uses in war, but it is less vital than it was. The development of alternative materials was successful in the last war and new techniques then developed with substitutes have continued since. But tin is still being accumulated by the American stockpile and in recent months the Munitions Board has acquired almost the entire output of the Texas smelter. The Reconstruction Finance Corporation has recently agreed to buy tin concentrates from Bolivia in the current year at 4 cents a lb. below the average price for the month in which delivery is made. The Texas smelter will thus be assured of the major part of its raw material.

Argentina and Meat Supplies

The negotiations between Britain and Argentina on the price of meat for the second year of the five year contract are still dragging on. Meat, of course, is only one item on the agenda; remittances to Britain is the other and the two are inextricably bound together. But despite the length of time which has already elapsed without agreement there are signs that some progress is being made. Recent reports in particular indicate that Argentina is becoming more conciliatory. Shipments of meat are continuing and even in larger quantities than Britain expected; the invoice price is subject to later adjustment. Since home killings in Britain will reach their seasonal peak in the next few months and since the supplies of home produced meat are likely to reach their highest level since the war (judging from the increase this year in the number of cattle over two years old), Britain may find these larger shipments of Argentine meat somewhat embarrassing. In view of this prospect, the British offer to Argentina of £90 a ton against £97 10s. last year seems reasonable.

Britain is likely to be faced in the autumn with a surplus of meat, but the surplus would of course be only seasonal. World production, according to a revised study published a fortnight ago by the Commonwealth Economic Committee,* is still below its prewar level, while exports of meat are still 15 per cent smaller than in 1938. Production in Britain last year was less than three-quarters of its prewar level, while output in most countries of western Europe has yet to recover fully from the effects of the war. But at least there are signs that output is increasing.

World exports of beef in 1949 were about 12½ per cent below their prewar level. Exports from Argentina alone were

"TIME-MASTER has streamlined my day!"

YOUR SECRETARY too will find that the new Dictaphone Time-Master proves a real blessing. It saves so many interruptions, and so much running about.

Time-Master gives her time to become a *real* assistant to you: she can get more done in far less time. She need never be called in from whatever she is doing to take a letter. Dictation interrupted by a caller never wastes her time. Letters and memoranda—there they are, perfectly recorded on Memobelts for her to transcribe when it's most convenient.

PERFECT RECORDING ON THE MEMOBELT

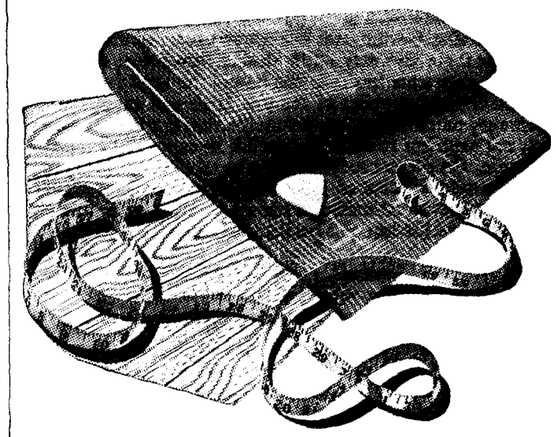
The little plastic Memobelts—each one taking 15 minutes dictation—give crystal-clear recording. They fold flat for filing and can be posted in a standard envelope—up to ten at a time for a 2½d. stamp.

EASY TRANSCRIBING

There are simple controls for volume, tone and speed; a pedal to backspace and repeat dictation as often as required. Backspacing is uniform, measured and instantaneous.

ONLY THE TIME-MASTER OFFERS ALL THIS

1. Streamlined machine, only 4½ ins. high, slightly larger than a letterhead. 2. Uniformly clear recording and reproduction. 3. Uniform backspacing, immediate place finding. 4. Simple automatic operation. 5. Mailable, filable, expendable Memobelts, low-cost plastic medium. 6. Nation-wide service, Dictaphone dependability.



Write for TIME-MASTER literature to Dictaphone Co. Ltd., Dept. O. 107 Kingsway, London, W.C.2.

NICKEL AND CLOTHING

Do you know that nickel plays an important part in the production of our clothing? Take wool, for instance . . . the equipment used on the sheep farms, the plant for producing the yarn, the tanks for dyeing it, the machinery for weaving it into fabrics, even the sewing machines — in all these nickel is present, toughening and strengthening the metals used in their construction, making them staunch against the attacks of wear, corrosion and heat. Thus nickel is contributing to the efficiency of the tools and equipment with which Britain is achieving her recovery.

30 per cent smaller although production was 15 per cent larger than in 1938. Before the war, Argentina accounted for well over half of the world exports of beef and veal. The gap between output and exports has been caused by increased domestic consumption in the postwar years, an increase which the Argentine Government has encouraged. World exports of pigmeat are also very much smaller than before the war; last year they were less than one half of the 1938 figure. On the other hand supplies of mutton, lamb and canned meat were very much larger than before the war, but their increase was not sufficient to offset the decline in exports of beef and pigmeat. On present reckoning it may take at least two years before world exports of meat are large enough to enable Britain to abolish rationing. A change of policy by Argentina, however, could reduce this period appreciably.

Standards of Air worthiness

The Air Registration Board is awaiting confirmation of an agreement with the American Civil Aeronautics Board by which all 1950 certificates of airworthiness issued by the British authority will be accepted by the Americans. The importance of such a step can hardly be exaggerated. Either registering authority has been able hitherto to refuse to approve an aircraft already certified as airworthy by the other, and although the British have accepted the Civil Aeronautics Board's certificates for the American aircraft bought for British airlines, reciprocal treatment by the American authorities was thought unlikely. The present tentative agreement has been reached by technical men on the basis of the technical points which determine the safety of a machine. It needs to be approved by the political authorities in Washington, but the chances of success are thought to be better than those of previous attempts which started on a political instead of a technical level.

On this occasion the political opposition may carry less weight than in the past. The reciprocal recognition of certificates of airworthiness removes one device that could have prevented the purchase of British aircraft for operation by American airlines. But it must now be clear that the American aircraft manufacturers, whatever protection they get, cannot for some years catch up with the British development of gas turbine civil aircraft. In the circumstances the American airlines may need freedom to buy British machines.

Once approved, the agreement will last until February when the standards of the International Civil Aviation Organisation are expected to replace it. The draft standards which were drawn up, largely in accordance with American ideas, have never been accepted. When ICAO meets in Paris soon, the American delegates are expected to accept certain British counter-proposals on climb and performance standards and there seems a good chance that an international standard will be agreed; the British proposals have already been accepted by the other members.

Few British aircraft now holding 1950 certificates of airworthiness have a potential market in America. The Viscount is the only gas turbine aircraft to have a full certificate yet, but the Viscount 700, the production model that is due to make its first flight next month, differs in some respects from the prototype and does not inherit the certificate automatically. The Come has still some tests to complete before it has a full certificate, and the same is true of other gas turbine aircraft. Of the piston-engined aircraft with current certificates, only the smaller ones with no American equivalent are likely to prove popular with American operators. The 12-seat de Havilland Dove has already been the subject of a separate successful negotiation with the Civil Aeronautics Board. Improvements were made in the engine performance to bring it up to American requirements, and the Civil Aeronautics Board was then prepared to accept the British board's assurance that the Dove met American standards. The new agreement would make such formalities unnecessary.

* * *

Producing Polystyrene in Britain

The first of two British plants for the production of the plastic polystyrene—that of Monsanto Chemicals Limited—comes into production in the middle of the month. A smaller plant built by Petrochemicals Limited is expected to start production later in the year. Sales of polystyrene have risen rapidly in the United States since 1945. It is said to have the best insulating properties of any thermo-plastic; it is unaffected by acids, alkalis and most other materials; it moulds accurately, keeps its dimensions, and is lighter than other similar plastics. In the United States, mouldings have been used to replace zinc die castings, aluminium, steel, glass, paper and laminates. Domestic appliance manufacturers take the largest tonnage, but considerable quantities go to the motor, aircraft, radio and electronics industries. It has the militarily useful property of giving a good performance at low temperatures.

Until this month, British supplies have depended on imports of polystyrene by Monsanto from its parent company, which is the largest producer in America. These imports were permitted only on the understanding that 90 per cent of the final products were re-exported. The regulation is now expected to lapse, but until there are British supplies of styrene (which is polymerised to produce the plastic) Monsanto will imports its styrene from the company's Texas plant. These plans were made before the expanded operations of the synthetic rubber plants created an American shortage of styrene, but the tonnage required is a negligible fraction of total American production and is, therefore, expected to be unaffected. The company considers the new British plant to be the finest of its kind in the world, and is unlikely to starve it of materials. The dependence on imported styrene is temporary, but its duration depends on events which are only partly within Monsanto's control. A styrene plant is being built at Grangemouth by Forth Chemicals Limited, a company formed in April by Monsanto and British Petroleum Chemicals Limited. This will provide the Newport polymerising plant with its raw material. Through its connection with British Petroleum Chemicals, which is jointly owned by Distillers and Anglo-Iranian, the styrene plant expects to get the ethylene and benzene needed as raw materials. Both will be produced by the Anglo-Iranian catalytic cracking plant which will be part of the Grangemouth refinery. The Petrochemicals plant will supply materials to those plants in its group which make polystyrene and the styrene co-polymers used in paint manufacture.

ROYAL BANK OF CANADA

DIVIDEND NO. 252

Notice is hereby given that a DIVIDEND of 2½ per cent., being at the rate of 10 per cent. per annum upon the paid-up Capital Stock of the Bank, has been declared for the three months ending August 31, 1950, and will be PAYABLE at the Bank and its branches on and after September 1, 1950, to shareholders of record July 31, 1950.

By Order of the Board, B. Strath, London Manager.

6, Lothbury, London, E.C.2. July 13, 1950.

DOMINION OF CANADA

FOUR PER CENT REGISTERED STOCK, 1953-58

For the purpose of preparing the Interest Warrants due September 1, 1950, the BALANCES will be STRUCK at the close of business on August 1, 1950, after which date the Stock will be transferred ex-dividend.—For the Bank of Montreal, Financial Agents of the Government of Canada in London, A. D. HARPER, Manager, 47 Threadneedle Street, E.C.2. July 1, 1950.

CITY OF JOHANNESBURG 3½% INSCRIBED STOCK 1952

NOTICE is hereby given in order to prepare the Warrants for interest due September 1st next, the BALANCES of the several accounts in the above-mentioned Stock will be struck on the night of August 1st, and that on and after August 2nd, the Stock will be transferable ex dividend.

For Barclays Bank (Dominion, Colonial and Overseas), (Registrar of the above Stock), H. V. Martin, Assistant Manager.

Circus Place, London Wall, E.C.2. July 11, 1950.

UNIVERSITY COLLEGE OF HULL

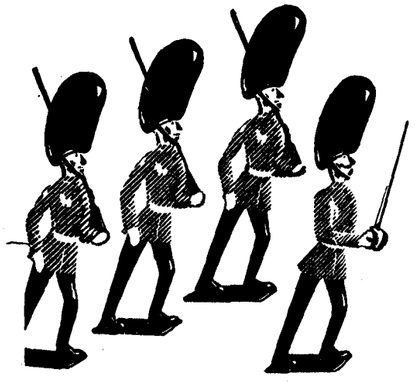
The College proposes to award a Post-Graduate Studentship in the Faculty of Arts for full-time research in Arts, Commerce, Economics or Law. The value of the award is £250 for one academic year, renewable for a second year. Further particulars may be obtained from the Registrar, to whom applications in triplicate should be sent not later than July 31, 1950.

C. MEGGITT, Registrar.

Exchange Account's Profit

The current Exchequer return duly records the issue to the Exchange Equalisation Account of the additional £300 million to which the Chancellor referred in his statement on gold reserves last week. Previous increases in the resources of the account were specifically authorised by statute, by the insertion of clauses in successive Finance Bills in the 'thirties. Under legislation passed at the outbreak of war, however, when the amount issued to the Account stood at £575 million, the Treasury was empowered to sanction further issues without limit and without seeking specific parliamentary approval. Not until last week was there any need to utilise these powers, so that the latest increase brings the total issues to the Account up to £875 million. The purpose of this increase is quite clear. It results from the substantial recovery in Britain's gold holding and from the steep increase in the cost of buying gold with depreciated sterling. After the resultant depletion of the Fund's sterling assets, it had little or no resources available for making any further purchases.

The operation has, however, caused some mystification—on the grounds that the sterling worth of the holding of gold and dollars at June 30th last, calculated at the current exchange rate, was £865 million—or only £10 million (not £69 million, as was inadvertently stated in these columns last week) below the new total of sterling issues to the Account. This does not mean, however, that virtually the whole of the additional £300 million of sterling was already bespoken. Roughly 55 per cent of the present gold holding was acquired at dates prior to devaluation, and since Britain "scraped the barrel" in the early years of the war, it can reasonably be presumed that the whole of this proportion was bought when sterling stood at $4 to the £. If the remaining 45 per cent is priced at the current rate of $2.80, the aggregate cost of the total holding would be about £720 million.



Even this calculation, however, does not quite dispose of the mystery, because it indicates that at June 30th the sterling cost of the holding was already roughly £145 million in excess of the total sterling resources that had then been issued to the Account. It is just conceivable—though rather improbable—that the authorities had been anticipating the issue of additional sterling, and had found some internal accounting device for providing the funds in the meantime. A much more probable explanation, however, is that the whole of the difference between the former borrowing powers and the actual cost of the gold represents additional sterling resources accruing to the Account, not through issues from the Exchequer, but from dealing profits on gold and exchange in earlier periods. In particular, the depreciation of sterling in 1939 meant that the Account secured considerable profits when its gold holdings were resold in the early phase of the war. This explanation seems to be confirmed by the fact that this week's increase in the total of outstanding Treasury bills occurred almost wholly in the internal portion of "tap" bills, indicating that the Exchange Account had not already encroached upon the additional £300 million for gold purchases—and perhaps even had some residue of its earlier resources still in hand.

* * *

Agreement on West Indian Sugar

At long last, agreement has been reached between Britain and the West Indian sugar producers on the terms of a five-year contract for the period opening in 1953. The negotiations started in November. In January Britain offered to buy 640,000 tons of sugar a year (out of total exports from

'Lead' exclaimed my Uncle Toby, 'Lead, Tristram, is the general metal in which they fashion the soldiery—and the officers also. Where, pray, would your fortifications be, or the cannon-balls, or the Barricados were it not for Lead?—'tis a prodigious metal' (here my Uncle blew his nose) . . . Tristram Shandy, Chapter 96

UNCLE TOBY'S REGIMENT OF LEAD

Since Uncle Toby's time, Lead has been on the march . . . Special Lead Alloy is supplied for the manufacture of toy soldiers (a useful dollar earning export) but Lead in many forms is needed for a wide variety of industries earning hard currency, from cables to batteries, pottery, glass . . . even television sets.

Associated Lead are experts in the manufacture of Lead Compounds and Lead Alloys.

ASSOCIATED LEAD MANUFACTURERS LIMITED

Ibex House, Minories E.C.3 LONDON

Crescent House, NEWCASTLE

the West Indies of 900,000 tons) at prices "which would assure reasonable remuneration to efficient producers." This offer formed part of a general agreement with Commonwealth producers, and the West Indian delegation alone raised objection, demanding that Britain should contract to buy 725,000 tons a year instead of 640,000 tons.

The negotiations were based on the assumption that Britain's unrestricted requirements for sugar would be 2,550,000 tons a year, and this total was divided among the various suppliers. To increase the West Indian share of the British market would have meant a corresponding reduction in supplies from other sources. Other Commonwealth producers were not willing to have their "allocations" reduced, and the proposed "quotas" allotted to Cuba and the Dominican Republic had already been cut to a minimum.

The new compromise has taken the form of an undertaking by Britain to make a special examination of the position in 1953, the first year of the new contract. If British consumption proves to be higher than the basic estimate, the guaranteed quantities will be increased in proportion. To quote from the joint statement: "For example, if consumption proved to be 5 per cent above the estimate, the offer would be to increase the guaranteed quantities by at least 5 per cent." The intention of the British Government is that, once sugar rationing ends, a period of six months should be allowed for sugar consumption to settle down, after which a review of the guaranteed quantities from Commonwealth producers would be undertaken.

This solution to a somewhat bitter controversy seems reasonable enough. The West Indies put in a strong plea for special treatment because of their peculiar social problems. But the Ministry of Food had to consider other producers within the Commonwealth and outside, particularly in view of the possibility of a new international sugar agreement. At the meeting of the International Sugar Council a fortnight ago, supplies of sugar for the "free market" for the crop year ending August 31, 1950, were estimated at 5,090,000 tons, against estimated requirements of 4,600,000 tons. There was little prospect of this surplus being reduced. The council thereupon adopted the special committee's report which suggested that a marketing scheme for sugar should be prepared to stabilise prices between agreed upper and lower limits—following, presumably, the pattern of the 1937 agreement. The report has now gone to the governments of member countries for consideration.

* * *

Soap *Versus* Soapless Detergents

The Ministry of Food hinted some time ago that soap might be derationed. The date has now been announced—September 10th. The Ministry will retain control over the supplies of oils and fats, and the maximum price schedules will continue. In these circumstances it seems that de-rationing is a strictly limited measure. Coupons will be abolished. But trading freedom for soap manufacturers will not be achieved until they can procure their own supplies of raw materials at or below prices ruling in the world market.

The Minister of Food in his annoucement this week, said nothing about the allocation of supplies of oils and fats to different manufacturers. Will they be able to bid against one another for particular vegetable oils which are not plentiful? Or will raw materials continue to be allocated in proportions related to a datum year? The latter method seems to be the most likely, but to the extent that it assures to inefficient producers a certain output it may prevent the consumer from getting all that he wants of the brands that he prefers.

Derationing of soap will test the contention that soapless detergents have made headway in recent years largely because soap has been rationed. Since the soap ration has not been fully taken up for some months past, the distribution of demand between soap and soapless detergents may not be materially altered after September 10th. The quality of soap has improved noticeably in recent months and if manufacturers are able to obtain the materials they require this improvement—an important element in the competitive strength of soap—will no doubt continue. Soapless detergents are dearer than soap but they have advantages in hard water areas and in certain industrial uses. They are, however, limited in quality and output in Britain by a shortage of certain raw materials, and until these limitations are overcome it may prove necessary to reduce the selling prices of soapless detergents in order to hold their present market.

COMPANY MEETINGS

WIGGINS, TEAPE & CO. (1919)

DIFFICULT TRADING CONDITIONS

DEMAND NOW IMPROVING

MR L. W. FARROW'S STATEMENT

The thirty-first annual general meeting of Wiggins, Teape and Company (1919), Limited, was held on July 6th at Winchester House, Old Broad Street, London, E.C., Mr L. W. Farrow, C.B.E. (chairman of the company), presiding.

The secretary (Mr W. Barnes) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1949, and was taken as read:—

Trading conditions during the year 1949 proved to be the most difficult since the beginning of the late war. These unsatisfactory conditions applied to the higher-grade papers throughout the industry and there were a number of factors which caused them. I referred to some of them in my statement submitted to the last annual general meeting. The more important were:—

(*a*) The licensing system which controlled the distribution of paper was, with few exceptions, discontinued;

(*b*) The price of the principal raw material used by the paper trade, namely, wood pulp, continued to fall throughout the year; and

(*c*) Three successive reductions were made in the maximum prices of paper controlled by the Board of Trade.

PAPER STOCKS

Prior to the cessation of licensing, stocks of paper had been built up by consumers and merchants, and with the cessation of licensing and the price reductions stockists naturally took the opportunity of working down their stocks. This process resulted, of course, in a much reduced demand for fresh supplies of paper. Your Board, however, kept your company's mills running full time until the month of July, when, owing to an accumulation of stocks, certain of the mills had to be put on short time. In addition, the St. Neots, Basted and Annandale mills were closed. The St. Neots mill had been closed formerly in the year 1931, but was reopened in the year 1940 when we were compelled to close our Dover mill owing to the bombardment of that town. The Annandale mill was scheduled to be closed just before the outbreak of war, but with the much increased demand for paper during the war period the decision to close the mill was postponed. During the last two years the Basted mill was largely engaged in the manufacture of abnormal orders for speciality papers for foreign countries, and with no fresh orders forthcoming it was decided also to close that mill. The two latter mills are the smallest in the group.

I referred last year to the difficulties in the export markets due to import restrictions. During the year 1949 these import restrictions were intensified and several of our traditional and important markets were entirely closed to us, although we held very large orders from our customers in those markets.

Our merchanting business, both at home and abroad, also suffered from the unsatisfactory trade conditions to which I have referred.

Towards the end of the year, with stocks reduced, conditions became more satisfactory and by the end of the year all our mills, with the exception of those that had been closed, were running full time.

DEMAND FOR SPECIALISED PAPERS

The demand for our specialised papers such as photographic base, greaseproof paper, machine accounting card, etc., was not, I am glad to say, affected by the conditions referred to above, but the Board of Trade controlled maximum prices for these papers at an unremunerative level.

In my last statement, I referred to the refusal by the Board of Trade to take into account, when fixing maximum prices, the increase in wages negotiated with the unions in the year 1948. I regret to say that the Board of Trade have not yet been persuaded to reverse their decision.

Owing to an increase in the production of our lower-grade papers, the output of our mills in 1949, notwithstanding the reduction in the production of high-grade papers, showed an increase of 2 per cent. on the peak year of 1948, but the sales of our own productions were lower by 1 per cent. In addition, there was a substantial reduction in the turnover of our merchanted papers.

I usually refer to our subsidiary, Pirie Appleton and Company, Limited, and was able to report last year a record turnover. The envelope and manufactured stationery trade during 1949 throughout the country unfortunately followed the same trend as that which was experienced generally in the paper trade, and the turnover of our subsidiary company showed a substantial reduction compared with the two previous record years. Production commenced at the two new Pirie Appleton factories in the Union of South Africa towards the end of last year, and your Board consider that these units will, in due course, prove of value to Pirie Appleton and Company, Limited. I am glad to report that the principal subsidiary company of that company—namely, A. Armstrong and Company, Limited, of Dublin—had a successful year's trading.

PROGRESS OF NEW PROJECTS

I will now deal with the progress of the three new projects:—

(1) The alterations to the buildings at our Chartham mill and the installation of new plant and machinery specially designed for making natural tracing paper, were completed during the year and the machine was started up in the month of September. Manufacture of natural tracing paper is entirely new to our group and, in fact, to this country. While obtaining experience of and making adjustments to the machine, lower-grade papers had to be manufactured. In order to supply our customers' needs following the dismantling of the old machine, the tracing paper we had been supplying for some years had to be manufactured at other of our mills. All this proved a costly matter, with the result that a loss of £67,032 was incurred. The loss, being of an exceptional nature, has been provided for by a transfer from contingencies reserve. I am glad to say that we have largely overcome the initial difficulties and the product now being made at Chartham mill is being sold not only in this country, but in the world markets.

(2) The new mill at Wooburn Green for the manufacture of photographic base paper was completed early this year and is now engaged in producing photographic base paper fully up to standard.

(3) The new mill in South Wales for the manufacture of tissue paper is nearing completion and your Board hope that manufacture will commence on the first of the three machines in July, followed by the other two machines in August and September, respectively. The output from the mill has been sold for several months ahead in anticipation of production.

REPAIRS AND RENEWALS

During the year 1949, we continued to carry out certain repairs and renewals to our mills and other properties which had, of necessity, been postponed during the war period. The total cost of repairs and renewals for 1949 amounted to the substantial figure of £618,457. During the war period, we built up reserves to meet these deferred repairs and those executed during 1949 have been charged against that reserve. You will remember that in the years 1946, 1947 and 1948 the deferred repairs executed were charged against the revenue account. No final agreement has been reached with the Inland Revenue with regard to the allowance to be made against excess profits in respect of the expenditure to which I have referred, and as deferred repairs are still being executed it will be some time before a final settlement can be made. It is interesting to record that during the years 1946 to 1949, inclusive, the sum of £2,104,584 has been spent on repairs and renewals, being an average of £526,146 per annum, compared with £140,753 average expenditure during the immediate prewar years.

During the year 1949, your Board decided that it was in the interests of the group to manufacture high-grade papers in the Union of South Africa. Negotiations were concluded with South African Pulp and Paper Industries, Limited, for an interest in that company so that arrangements could be made for the manufacture at their mill of your group's papers for the South African market. Your company subscribed for 320,000 shares of 10s. each at the price of 25s. per share. On the other hand, South African Pulp and Paper Industries, Limited, undertook to acquire one of your group's paper machines. The machine has been dismantled and is being rebuilt, reconditioned and extended in the engineering shops at our Stoneywood mill. We anticipate that it will be re-erected at Johannesburg by the beginning of 1951. The machine will be capable of producing most of the papers which have been made by the group and hitherto exported to the Union of South Africa. It is satisfactory to note that the shares in South African Pulp and Paper Industries, Limited, now stand on the Johannesburg Stock Exchange at the price of 46s. per share.

MILL FOR AUSTRALIA

During the past year, we have been investigating the possibility of establishing a mill in Australia. A site has been acquired and consideration is being given to the designs of buildings and machinery.

As from April 1, 1950, the paper mills in this country, for the first time since the beginning of the late war, have been free to purchase their requirements of chemical wood pulp, although the consumption of wood pulp is still controlled. The maximum prices fixed by the Board of Trade have been freed from control for a limited number of types of paper.

THE ACCOUNTS

With regard to the accounts, changes in the capital structure have occurred during the year by the issue of the balance of the debentures and the capitalisation of reserves which are referred to in the directors' report. Reference is also made therein to certain withdrawals from reserves created in past years to meet contingencies and changes in paper prices and stock values. I would also mention that the discount on the issued debentures and the expenses in connection with the bonus share issue and debenture issue have been charged to the contingencies reserve. In past years, in calculating the provisions for income tax on the profits of the year, credit was taken for the income tax recoverable in respect of debenture interest payable in the year of assessment. Your directors have now eliminated this credit by making a further provision of £16,504 out of the contingencies reserve.

The particulars of fixed assets, etc., and details of capital and revenue reserves, are set out in schedules 1 and 2, respectively.

TRADING PROFIT AND ALLOCATIONS

The consolidated trading profits of the group for 1949, before deducting the expenses enumerated, show a decrease of £831,642. After allowing for repairs and renewals (other than deferred repairs), pensions, interest on loans, amounts set aside for obsolescence and renewals and increases in specific reserves, the profits before taxation amounted to £323,079, compared with £1,019,668. Adding thereto investment income and withdrawals from specific revenue reserves (referred to in the directors' report), and deducting taxation, dividends of subsidiaries applicable to outside shareholders and profits retained in subsidiary companies, etc., the profit of Wiggins, Teape and Company (1919), Limited, amounts to £300,886, compared with £408,568.

It will be seen that your directors are recommending a final dividend of 2¾ per cent, free of tax, making, with the interim dividend, a total of 3¾ per cent., free of tax, on the ordinary stock for the year 1949, which, taking into account the bonus issue of shares, is at the same rate as was paid for the year 1948. After transferring to contingencies reserve the sum of £35,000, the carry-forward is higher at £62,196 by £1,342.

TURNOVER AND COST ITEMS

I give below a table showing the relationship of the various items of cost, reserves and dividend to £1 of turnover for 1949:—

	£	s.	d.
1. Raw materials, purchases and stores		13	4
2. Wages, salaries, pensions and social services		3	10
3. Fuel and electric power		1	0
4. Rent, rates and expenses			7¼
5. Carriage			4¼
		19	2
6. Direct taxation			4
7. Amounts set aside for obsolescence and renewals and reserves	d. 3¾		
Less: Withdrawals from reserves	3¼		
			½
8. Net payments to debenture and stock holders			5½
		1	0

The cost of the new mills and extensions has turned out to be a good deal in excess of estimates, in addition to which our interest in the South African Pulp and Paper Industries, Limited, has necessitated the provision of £400,000. The group at December 31, 1949, still had commitments of £1,075,000 in respect of new mills, extensions and foreign properties. Provision has also had to be made for the financing of stocks of wood pulp and esparto grass, which since 1939 had been provided entirely by the Government. Arrangements have been made in the current year as a temporary measure to meet these financial requirements by loans from our bankers and the establishment of acceptance credits.

CURRENT YEAR'S PROSPECTS

With regard to the prospects for the current year, I am glad to say that the improvement in the paper trade, which began towards the end of last year, has since been fully maintained. Not only have all the operating mills in the group been working full time, and, in some cases overtime, but our order books are so full as to cause us some embarrassment. In addition, the demand from the export markets has considerably improved, and in some of the countries where licences to import were unobtainable, they are now being granted. The position at the new mill at Chartham has improved, the new Wooburn Green mill is in full operation and the new mill in South Wales will be in operation during the latter part of the year. Should the present satisfactory trade conditions continue, the profits for the current year should be fully up to those the group was earning prior to the year 1949. The maximum prices of controlled paper have been increased by the Board of Trade and the prices of "free" paper have also been advanced, owing to the increases in the cost of production due to the rise in the price of raw materials, including wood pulp and esparto, following the effects of devaluation.

It is my pleasant duty once again to thank our employees, both at home and abroad, for their loyal work and co-operation during the past year.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring director, Mr J. R. Illingworth, was re-elected; and the remuneration of the auditors, Messrs Price, Waterhouse and Company, and Messrs Wade, Harrison and Company, having been fixed, the proceedings terminated.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

IMPROVING OUTLOOK

The annual general meeting of this company will be held in London on July 27.

The following is an extract from the statement by the chairman, Mr H. J. Welch, circulated with the report and accounts.

Our gross income of the past year was £102,076, equal to earnings of 4.1 per cent on the issued capital. After deduction of administrative expenses and taxation the net income amounted to £52,688 compared with £56,651 in the preceding year. The directors propose maintaining the dividend at 5 per cent. for 1949, carrying forward £119,008 into the current year and leaving the dividend equalisation reserve of £50,000 intact.

At the end of the year the surplus of current assets over liabilities and provisions, including the proposed dividend, was £23,699; addition of investments at cost £3,114,693, gives an assets total of £3,138,392, covering issued stock of £2,469,384 and the reserves and surplus of £669,008.

As to the prospects for the current year, a welcome return of several rubber-producing companies to the dividend-paying list has been made in recent months, and prices recently and now ruling for rubber and tea point to a welcome further expansion. The full benefit of the recent rise in prices will not be realised by the Trust during 1950, but so far gross dividends received by the Trust for its holdings in tea and rubber companies amount to over 50 per cent above those received for the same period in 1949. It therefore at present appears that the results for this year will be more satisfactory than those of 1949.

AMALGAMATED METAL CORPORATION LIMITED

MR WALTER GARDNER'S STATEMENT

The twenty-first annual general meeting of Amalgamated Metal Corporation Limited will be held at Princes House, 93, Gresham Street, E.C., on August 9th.

The following is an extract from the statement by the chairman:

The profit for the year before taxation has increased from £456,336 to £698,857, but, as United Kingdom taxation has increased from £243,440 to £403,438, the net profit is only increased from £212,896 to £295,419. After paying the increased dividend the balance of undistributed profit for the year is £111,877, compared with £41,766 for 1948.

After a break of nearly eight years the London Metal Exchange was re-opened on November 15, 1949, for dealing in tin. We welcome even this limited return to a free market.

Our organisation is widespread. Through the British Metal Corporation and Henry Gardner and Company it is represented in Australia (Sydney and Perth), in Canada by the British Metal Corporation (Canada) Limited, and Drew Brown Limited (Montreal and Toronto), in South Africa (Johannesburg), India (Calcutta and Bombay), in Malaya by Sandilands, Buttery and Company Limited (Singapore, Penang, Kuala Lumpur), and in Cyprus. The group trades in and markets non-ferrous metals and minerals, rubber and many kinds of produce, timber and other materials. It provides coal-washing plant, ventilation plant and other specialist engineering and metallurgical equipment. It is engaged in a general import and export business and furnishes allied shipping, insurance, secretarial, financial, technical and statistical services. The various branches and associates show satisfactory progress though, naturally, for the most part, it is gradual.

The rubber business of Henry Gardner and Company has continued to be active and satisfactory during the past year.

NEW ACQUISITIONS

During the year the British Metal Corporation acquired the entire share capital of Brandhurst Company Limited, whose main business consists of agencies for the sale of cobalt, radium and chemicals.

Our associated company in Australia, the British Metal Corporation (Australia) Proprietary, Limited, has also expanded its business in the following directions. It has purchased the entire share capital of a company in Sydney named Goodall and Company, whose business consists, amongst other things, of the distribution in Australia of timber-working machinery and machine tools. This distribution covers both goods fabricated in Australia itself and also imported goods. We hope that, through this investment, we may be able to take part, through the distribution of capital goods, in the increasing industrialisation of Australia. Our Australian associated company has also acquired the business of G. N. Thorp and Company, who are engaged in a general import and export business.

Finally, our friends, Consolidated Tin Smelters, and the British Metal Corporation (Australia), have recently purchased outright the business of Sydney Smelting Company, one of the two tin smelters in Australia.

During the year Government control of hardwoods ceased, except in the case of a few special types. This development has increased the turnover of our two timber companies, Forest Hardwoods Limited and Richard H. Keeping Limited.

I am glad to report that the large Huntington Heberlein plant installed for the Consolidated Mining and Smelting Company of Canada by the Sink and Float Corporation of New York came into operation in May, 1949, and is successfully treating up to 10,000 tons daily.

LAPORTE CHEMICALS LIMITED

WIDER RANGE OF MANUFACTURING INTEREST

LARGER SALES TURNOVER BUT PROFIT MARGIN LOWER

MR L. P. O'BRIEN'S REVIEW OF GROUP'S ACTIVITIES

The forty-third annual general meeting of Laporte Chemicals Limited was held on July 10th at Luton.

Mr L. P. O'Brien, the chairman, presided, and in the course of his speech, said:—

The consolidated profit, at £533,644, is up by £38,011, as compared with 12 months ago, but this year we bring in for the first time £39,459 from Hunt Brothers (Castleford) Limited, representing nine months' profits to March 31, 1950. Hunt's accounts cover a 15-month period from January 1, 1949, but as the actual date of acquisition was July 5, 1949, an amount representing six months' pre-acquisition profit has been treated as a capital item and credited to goodwill in the consolidated balance sheet.

Without this addition to our group figures, our profit on a comparable basis with last year would show a decrease of £1,448, which is not unsatisfactory in view of the changes in world trade conditions which have been experienced.

You have heard so much from others about the disappearance of the sellers' market in favour of the buyers' market that I need only confirm that the easy selling days for chemicals are finished in the export markets, and as good as over in the home market. We maintained belief during the past 11 years that one day sterner competitive conditions would prevail and, as we shaped our policy accordingly, we face the future with confidence that our employees will continue to be gainfully employed in producing essential products which are well-nigh indispensable to modern standards of living, backed as they are by good processes and modernised plants.

During recent years we have increased our research staff to cope with the wider programme of investigatory work undertaken by the company. This policy already has been amply justified by the results, and now, as the laboratories built in 1936 are quite inadequate to house the increased number of scientific research workers employed and to be employed over the next few years, we are engaged in building at Luton, at an estimated cost of £50,000, additional laboratory accommodation, also a new experimental plant house where we shall develop new processes and methods before embarking on large-scale production.

Twelve months ago we retained undistributed profits in the group of £115,992. In spite of this reinvestment and those of previous years, we have just held our previous profit level, but not our former profit margin on the increased sales turnover, nor our former rate of profit on the increased total capital invested.

SATISFACTORY TRADING OF HOME COMPANIES

With minor exceptions the home companies showed satisfactory trading profits, and we were particularly gratified that our new subsidiary—Hunt Brothers (Castleford) Limited—came well up to expectations. John Nicholson and Sons Limited, as usual since they joined us, kept well abreast with other companies in the group.

National Titanium Pigments Limited was able to increase output and sales of titanium oxide and titanium pigments; consequently, this subsidiary made a satisfactory profit without increasing selling prices last year. N.T.P. is not likely to expand the present rate of production from the existing plant at Luton, but as the home and overseas demand for this product is increasing and we believe that we can obtain a justifiable share of the future estimated market, N.T.P. is now engaged in building a new, bigger and better designed plant to be known as Battery Works, Stallingborough, North Lincolnshire, which will cost about £1,500,000 over the next few years.

The new N.T.P. site of about 60 acres is on the south bank of the River Humber, between Immingham and Grimsby. We plan to build a jetty at which essential imports of raw materials from overseas can be received in barges loaded ex ships from adjacent ports; also, water-borne coal from Yorkshire coalfields. Rail facilities exist within a short distance of the site, from which an extension can be made into the works. We are advised there is a good labour market to be drawn on from Grimsby, which needs other than the traditional outlet for the knowledge and skill of its menfolk.

The world production of titanium oxide has steadily increased over the last 25 years. The product continues to find uses in new fields of application and N.T.P. feels confident in opening out in a bigger way and of ability to keep abreast in the forward march, both scientifically and economically.

The results of our Australian subsidiary company were adversely affected by the disastrous general strike which occurred in Australia in June, 1949. The current financial year of this subsidiary commenced on July 1, 1949, and as resumption of work did not occur until some weeks after that date, their results will again be affected by short production. Meanwhile, that company has increased and improved its plant and processes.

SELLING PRICES AND PRODUCTION COSTS

Much of the business of the parent company is concerned with the manufacture and sale of hydrogen peroxide, and you may be interested to learn that we have not increased the selling price of this product for over two and a-half years. In the meantime, raw material, electric power, fuel prices, wages, holiday costs, salaries, packages, freight costs, and expenses have increased substantially over that period, but by applying the greater knowledge gained from our researches and investing in improved plant, and on the basis of making and selling more hydrogen peroxide from the Luton plant than ever before, we have held our costs down in spite of the higher amortisation charges we must make on the more costly replacement plant which we have installed, thereby achieving a good trading result without the need to ask our customers to pay higher prices.

New hydrogen peroxide plant purchased by additional capital subscribed two years ago is now coming into successful operation, and the sale of the output will provide a further support to our policy of keeping prices of our hydrogen peroxide and peroxygen compounds down as low as possible.

Unfortunately, we could not repeat that performance so far as prices of some other of our products were concerned—notably, the barium compounds, sulphuric acid, sodium sulphide, and detergents—but we have pursued a moderate price policy.

The buildings, plant, and equipment of the companies in the group have been maintained in a good state of repair, and, in addition, £95,925 has been set aside to meet depreciation of fixed assets.

The report and accounts were adopted, dividends were approved, and the retiring directors were re-elected.

RICHARD THOMAS & BALDWINS LIMITED

ANOTHER GOOD YEAR

The annual general meeting of Richard Thomas & Baldwins Limited will be held on August 3rd in London.

The following is an extract from the circulated statement of the chairman and joint managing director, Mr E. H. Lever:—

The company has had another good year both in respect of output and of trading. The balance of the trading accounts of the group at £6,514,211 shows an increase of £183,000. Extraneous and non-recurring profits were lower by £108,000 but on the other hand larger profits were made on realisation of stocks, following price increases, the improvement in results from this cause being £400,000 against £185,000 in the previous year.

Once again our group bears a heavy charge for United Kingdom taxation, the figure this year being as high as £3,289,000. At a time when so much money is required for modernisation and development this drain on our cash resources is a serious matter.

Although a Government Committee has been set up to report on taxation, its recommendations can, at best, only affect the incidence of this burden and I feel that we can expect little real relief until Government expenditure is drastically reduced. The Profits Tax is a heavy impost and that it should be levied on undistributed profits in these times, as well as on distributed profits, seems inequitable.

The dividend recommended, with the interim dividend already paid, makes 15 per cent. for the year, less income tax. This is the same rate as for the three previous years and is the maximum payable under the provisions of the Iron and Steel Act. It may interest you to know that the 15 per cent. dividend expressed as a percentage of equity capital employed in the Parent Company is 7.75 per cent.

IMPROVEMENT AND MAINTENANCE

We have proceeded steadily with our schemes of modernisation and reorganisation and repairs and maintenance deferred during the war years are being gradually overtaken. During the year our expenditure on Capital Account amounted to approximately £1,750,000.

The effect of the general rise in transport charges which operated as from May 15, 1950, will be to increase the manufacturing cost of finished steel by 10s. a ton. So far as the Steel Industry is concerned it has been decided not to pass on this additional cost to customers by way of an increase in prices.

It is now over three and a half years since our collieries vested in the National Coal Board. Judging by the leisurely pace at which matters are proceeding, it threatens to be several more years before the individual collieries receive the compensation due to them. I am glad to tell you, however, that we are taking active steps to bring about a more rapid settlement.

The Iron and Steel Bill became an Act in November, 1949. The vesting sections of the Act come into operation at the earliest on January 1, 1951, and at the latest on December 31, 1951, unless the Government recognise at this late hour the folly of taking over an industry which is serving the country efficiently and well. In the interests of our workpeople, our customers and stockholders and the country generally, it is my hope that the vesting sections of the Act will never become operative.

I am confident, that, left free from state interference, the iron and steel industry in general, and your company in particular, will continue to prosper.

SPEAR & JACKSON, LIMITED

INCREASED TURNOVER

MR A. K. WILSON'S STATEMENT

The forty-fifth annual general meeting of Spear & Jackson, Limited, was held on July 7th at the staff dining-room, Aetna Works, Savile Street East, Sheffield, Mr D. J. Haggie, the deputy-chairman and managing director, presiding in the absence of the chairman and managing director, Mr A. K. Wilson.

The following is an extract from Mr A. K. Wilson's circulated statement:—

REVIEW OF THE PAST YEAR'S WORKING

The year 1949 has been a memorable one in that, in spite of a falling off in the lumber trade and a consequent fall in the turnover of our Canadian and American subsidiaries, the turnover of the Group as a whole has again exceeded £1,000,000. In spite of difficulties encountered, the turnover of the parent company shows an increase of £100,000 over that of 1948. Research is constantly going on and improvements in methods of production and in the company's products are being sought. By close co-operation with our agents all over the world our products have been kept prominently before our customers overseas, and in spite of difficulties arising from import restrictions, quotas and the like, a large export trade has been maintained. The demand of the home market for our goods has continued as great as ever.

In the latter part of the year, the devaluation of the pound brought substantial orders and very many inquiries from overseas buyers. Whilst every effort is made to absorb new business, the needs and requirements of our old and valued customers are not neglected. Conversely, devaluation has materially affected the costs of production of certain of our products.

THE PROFIT AND LOSS ACCOUNT

Available profits total £126,965, compared with £81,055 for 1948. The appropriation to general reserve, £15,000, is the same as last year, and the sum of £10,000, as against £25,000, is placed to the special reserve against increase in cost of replacement of fixed assets. In addition to the foregoing, appropriations have been made to the following reserves for specific purposes:—

(i) Deferred taxation reserve—benefit from initial allowances—£10,000.

(ii) Stock reserve—£40,000. To minimise any unexpected fall in the level of prices.

(iii) Amount appropriated for the purpose of writing down the value of the investment in associated company—£10,000

DIVIDENDS

The dividend on the preference shares for the year has been paid, requiring a net sum of £2,200. The directors recommend a dividend on the ordinary shares for the year of 15 per cent. (the same as last year), which will absorb a net sum of £13,612.

Balance to be carried forward.—After giving effect to the foregoing appropriations and recommendations, the sum of £26,153 (as against £25,243 at December 31, 1948) remains to be carried forward to next year.

BALANCE SHEETS

In the balance sheet of Spear & Jackson, Limited, it will be noted that current assets at £639,222 compare with £528,546 at December 31, 1948. The liabilities side shows deferred liabilities at £98,205, compared with £85,246 last year, and current liabilities £254,359, compared with £243,025. Included under these headings you will find the reserves for taxation, as follows:—

(*a*) Under deferred liabilities: the reserve for income tax on the profits of the year, which is not due for payment until January 1, 1951, £57,000.

(*b*) Under current liabilities: the reserves against outstanding tax liabilities on the profits of prior years, £111,845, and also the estimated liability to profits tax on the profits of the year, £23,000.

During the past year a number of outstanding matters affecting excess profits tax liabilities have been cleared up, but there are still one or two items of major importance remaining to be settled. Adequate provision against any liability on these items is included in the provision of £111,845 mentioned above. The excess of current assets over current and deferred liabilities at December 31, 1949, is £286,658, compared with £200,275 at December 31, 1948. The consolidated balance sheet shows the position of the Group as a whole.

PENSION SCHEME

The inauguration of a pension scheme for the staff and executive directors of the company has been under consideration for some time and the directors now consider that such a scheme should be started. It will therefore be my pleasure to propose a resolution at the annual general meeting that the directors be authorised to negotiate and carry into effect a scheme on such terms and conditions as they deem appropriate.

GENERAL

During the year under review increasing difficulties have been encountered in the export trade. Many countries have imposed import restrictions under which only certain goods may be imported into their territories, and these must be within the validity of import licences granted for a specific value. This has necessitated very careful supervision of production. In spite of these restrictions and the dearth of shipping space an increased export business has been achieved.

Scarcity of labour still continues to be a source of worry and a limiting factor in production. In particular, the saw trade is short of young men to take up the trade.

FUTURE PROSPECTS

Under prevailing conditions of world trade and increasing competition, it is obviously impossible to make long-term forecasts. However, on the evidence of the first three months of the current year our prospects remain good. Turnover so far has been at least equal to that of 1949, and we look forward to another satisfactory year.

In conclusion, I would like to pay high tribute to the company's management, staff and employees, to whose co-operation is attributable the very high standard of output which has been achieved.

The report and accounts were unanimously adopted.

THE METAL BOX COMPANY LIMITED

The twenty-ninth annual general meeting of The Metal Box Company Limited, was held in London on July 13th. The accounts showed a profit for the year of £820,976 after taxation, against £655,372 the previous year.

The Ordinary Dividend was maintained at 20 per cent.

The Capital and Revenue Reserves as shown by the Consolidated Balance Sheet total £6,390,246 against £5,843,466.

The following are extracts from the review by the chairman, Sir Robert Barlow, which accompanied the statement of accounts:—

The profit this year is the largest the Company has earned. The increase arises (*a*) from the greater amount of business done, which has risen to over £26,000,000 or £4,236,000 more than last year (*b*) from the benefits now accruing from the expenditure of £5,259,000 on buildings and machinery over the last five years and (*c*) from the greater activities overseas.

There is so much ill-informed talk nowadays about profits that it is worth while to spare a moment to think about them. The profits of The Metal Box Company have increased steadily over the years. They have done so because the business itself has grown. The profits would not have become bigger unless the business had. But it is just as true that the business would not have grown bigger unless the profits had.

As I have said, we have spent £5,259,000 in five years on buildings and machinery. Where did this money come from? £2,293,000 of it was from profits earned and retained in the business. And £2,966,000 was fresh capital invested in the Company by the public of the United Kingdom, India and South Africa.

During the same five years we have paid stockholders £1,254,000 as dividends on their investment, and paid the State £3,454,000 as taxation.

The rate of profit which, before taxation, is 7 per cent. on the business done in the United Kingdom, is certainly not exorbitant.

We have endeavoured to maintain good wages and good conditions of employment and believe it to be our first duty.

For the sixth year I have to report that the shortage of tinplate remains as a grave handicap to the Companys activities at home and overseas—and therefore to its customers. Every major wartime restriction on its usage inevitably remains until this shortage is overcome.

Despite statements to the contrary in various quarters, I see no early prospect of any alleviation. Indeed, owing to the increase of world demand, the shortage is becoming more acute—for production in this country is still only 70 per cent of prewar. This brings about very real harm to the canning industry at home and consequently to agriculture.

It is imperative both that production should be increased and that the significance of the injury to the home trade should be appreciated by those responsible for allocations for export.

The report and accounts were adopted. Complete copies are available on request from the secretary, the Metal Box Company Limited, The Langham, Portland Place, London, W.1.

At an extraordinary general meeting held at the conclusion of the annual meeting new articles of association were adopted and resolutions were passed increasing the authorised capital of the Company to £6,700,000 and applying the sum of £1,806,385 from the Premiums on Shares Account in paying up in full 1,806,385 ordinary shares of £1 each to be allotted as fully paid bonus shares to Ordinary Stockholders.

ROYTON TEXTILE CORPORATION LIMITED

SATISFACTORY PROGRESS SINCE FORMATION

CHAIRMAN'S REVIEW

The first annual general meeting of Royton Textile Corporation Limited, was held on July 12, 1950, at the offices of the Corporation, Vine Mill, Royton, Lancs. Colonel J. B. Gartside, D.S.O., M.C., T.D., D.L., J.P., chairman, presided, and in his review which was circulated with the report and accounts said:

The accounts submitted give the result of nine months' trading of the Corporation ended March 31, 1950. It will be appreciated they represent the initial period since our inception.

SOUND FINANCIAL STRUCTURE

I think you will agree, after careful study of the accounts, that the Corporation, by the manner of our formation and acquisition of the properties has been well conceived, and is already established on a sound financial structure, having in the first trading period dealt with the formation expenses, £6,196, and a very considerable balancing charge of £75,000. We are indebted to our professional advisers for their able guidance and advice in the formation of the Corporation.

The accounts as submitted are presented in a simple form, can be considered satisfactory, and I think with the notes thereon require no further comment from me.

The Corporation has been accepted by the Board of Trade as eligible for the re-equipment grant under the Cotton Spinning (Re-equipment Subsidy) Act, 1948. Since our incorporation some £70,000 has been expended in re-equipment, in addition to £124,000 spent in the mills since 1945 prior to their acquisition.

NEW MACHINERY

Contracts have been placed for further conversions and new machinery amounting to approximately £250,000. A major portion of this total expenditure will rank for the Government subsidy.

This expenditure was necessary, and is justified if we are to progress; it will result in a material increase in production of cotton yarns in more varied forms and packages to meet the demand of manufacturers.

Sandy No. 1 Mill has been scrapped, but its production capacity has been replaced by the installation of additional new plant at Sandy No. 2 Mill.

Production during the period shows a satisfactory increase over that of the transferor companies in the same period in the previous year. The labour force has been augmented and production per operative is higher.

GOOD DEMAND FOR PRODUCTS

The products of the Corporation are giving satisfaction, and are in good demand over a well-spread field of manufacture for both home and export markets. Our order book is considerable, and we have reason (apart from political and international potentialities) to face the immediate future with confidence.

The Corporation is in its infancy, and has the lusty desire of all healthy infants to develop, progress and ever seek new fields for its activities, for the betterment of the trade and in its own and the national interest.

TRIBUTE TO EMPLOYEES

I wish to tender on my own behalf and on behalf of all our shareholders our deep appreciation of the splendid and loyal service of the management, staff and employees in the mills of the Corporation since our inception, a most difficult time for all concerned, which has contributed materially to the progress achieved, and to pay tribute to that singleness of purpose which has been so apparent throughout and is so essential to success.

The report and accounts for the nine-month period ended March 31, 1950, were adopted.

A final dividend of 6 per cent. on the 5s. shares was declared, making 10 per cent. for the period, equal to 13⅓ per cent. per annum, less income tax.

Colonel J. B. Gartside and Mr. William M. Holden were re-elected directors.

THE GOLDEN HOPE RUBBER ESTATE LIMITED

The annual general meeting of The Golden Hope Rubber Estate Limited, will be held on July 31, 1950, in London. The following is an abstract of the address of the Chairman, Sir Eric Macfadyen, circulated with the report and accounts:

From the trading and profit and loss account you will see that the output of rubber accounted for is 5,691,807 lb., compared with 5,815,507 lb. last year. The season was not a particularly good one for crop. The net proceeds at £285,328 were, however, better by a matter of £10 in spite of the slightly lower output. The cost of production was £188,157, against £205,278, being some ½d. per lb. cheaper, in spite of the lower crop—a reduction in cost per pound highly creditable to the management in these days. The net profit for the year, after charging £41,243 for taxation in the United Kingdom and Malaya, amounts to £47,210. We have made allocations of £22,022 to cultivation and replacement reserve (partly to offset this year's expenditure of £12,022 charged to that reserve), and of £1,585 to rehabilitation reserve. We also write off £6,560, representing the book cost of approximately 200 acres cut out under the Japanese and which has not been replaced. If you approve the proposed 10 per cent. dividend, we shall carry forward £25,836, against £22,717 brought in.

Our net planted acreage is now 9,747 acres —made up of 6,318 acres of rubber planted in 1927 and earlier, 3,349 acres planted since that year with selections, and 80 acres of oil palms.

THE RUBBER MARKET

Even at the peak of the recent rise in prices, at which no great quantity of rubber was marketed, as producers had been selling forward without reserve on the rising market, rubber was still below its prewar value in relation to commodity markets generally. At prices ranging between 1s. 6d. and 2s. landed London, the East would be prosperous and rubber should be attractive to the user.

COMMODITIES AND THE BALANCE OF TRADE

The importance of rubber in the general economic set-up is now better appreciated in governmental circles. The man in the street, however, is little aware how largely the sterling problem is a problem of overseas trade.

Rubber.—There appears to be every prospect that US absorption of natural rubber may reach 1,500 million lb. this year: if stockpiling calls for another 150 million, imports will amount to, say, 1,650 million lb. If the same proportion of US imports as last year is taken from the British East that will amount to about 825 million lb. On the assumption that these realise an average of only 21 cents (in May the price touched 34 cents) this would represent, say, $173 million.

Tin.—Of tin, in concentrates and metal, the US is unlikely to require to import less than 220 million lb. in 1950. If it takes 110 million lb. from the sterling area, at a price of 75 cents, that will represent $82.5 million.

Cocoa.—A considered estimate of US requirements of cocoa from the sterling area indicates an import of not less than 330 million lb., probably of about $75 million value.

Wool.—Wool was worth to the sterling area some $110 million last year. In 1950 Dominion exports to US may approach 190 million lb. and may fetch about $1 a pound. At say, $180 million, the contribution from this source may this year surpass that of rubber.

Rubber, tin, cocoa and wool by themselves —without reckoning other valuable commodities—may thus be expected to contribute over $500 million to the sterling dollar equation.

Home industries are making a valiant and successful endeavour to improve their exports to the US—the leading items being textiles, spirits, automobiles, machinery, pottery and glass, etc. To all of these devaluation has so far on balance been of assistance. The $200 million or so they realised between them in 1949 may be substantially improved upon in 1950. Taking a sanguine view let us put the value at $250 million. The comparison then between overseas and home is of the order of two to one.

In these days when perforce we must all of us be statisticians and economists I think it is of some importance that this aspect of the make-up of our precarious trade balance should be more widely understood.

TIMOTHY WHITES AND TAYLORS, LIMITED

BUSINESSES WELL MAINTAINED

The 21st ordinary general meeting of Timothy Whites and Taylors, Limited, was held on July 13th in London, Mr Louis Nicholas, J.P., F.C.A., (chairman) presiding.

The following is an extract from the statement by the chairman for the year ended December 31, 1949:

The businesses of the company and its subsidiaries for the year taken as a group, have been well maintained. On the chemists side of our retail businesses there has been an increase in the general trade.

In the household and hardware side there has been a slight fall in turnover, while our wholesale subsidiary and our manufacturing subsidiary have continued to face constantly increasing competition.

The trading profits and sundry income of the company and its subsidiaries for the year were £1,153,711 as compared with £1,183,519. This latter figure covered 53 weeks of trading as against 52 weeks for the year under review.

The net profits, including the dividends received from subsidiaries, were £335,668. This sum has been dealt with, £150,000 being carried to general reserve and the dividend on the ordinary shares maintained at 32½ per cent.

Since January 1, 1950, sales show a small decrease as compared with the corresponding period of last year. Since May 1st last, the percentage allowed to be added by the chemists to the cost of goods supplied by them for National Health prescriptions has been halved. This reduction is being resisted by chemists and the dispute has been referred to arbitration.

The report was adopted.

JEREMIAH AMBLER & SONS LIMITED

(Worsted and Mohair Spinners)

RECORD RESULTS

MAJOR EDWARD BEDDINGTON-BEHRENS' STATEMENT

The fifty-seventh annual general meeting of Jeremiah Ambler and Sons Limited, was held on July 7th, in London, Major E. Beddington - Behrens, the chairman, presiding.

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended December 31, 1949, and was taken as read:—

I am again in a happy position, for the sixth year running of my chairmanship, of being able to present shareholders with record results. Profits for the year ending December 31, 1949, after all provisions, except taxation, were £217,868 compared with £198,219 for the previous year. Our turnover increased by 6 per cent., due mainly to increased production from our new mill at Carrickfergus near Belfast. This increased production was obtained with approximately the same labour force as was employed the previous year. The carry forward on profit and loss account is increased from £138,484 to £217,489. This amount is equal to over 7 years' preference and ordinary dividends at the present rates (£30,271). Our liquid position remains satisfactory, current assets of £1,082,141 (including cash and tax reserve certificates of £240,482) exceeding current liabilities of £325,295 by £756,846. During the year we have authorised the issue of £300,000 4½ per cent. debentures of which £150,000 have been issued to finance the re-equipment programme of the group, and as the re-equipment proceeds further issues will be made as required.

A "RESTRAINED" DIVIDEND DISTRIBUTION

As you will see in the summary at the back of the balance sheet, over the last six years the company has distributed £107,161 in dividends on ordinary shares compared with earnings of £854,797 and payments of £505,770 in taxation. In other words, over this period shareholders have received dividends of approximately 12 per cent. of earnings and paid out 59 per cent. of earnings in taxation. Your directors have therefore considered a way of giving some additional distribution to shareholders requiring the minimum depletion of the company's assets, and consequently recommend in addition to the ordinary dividend of 14 per cent. as paid in previous years a bonus of approximately 2½ per cent. in ordinary shares by capitalising the small amount of £7,244 out of the large reserves accumulated. This amount equals exactly one £1 bonus share for every £38 of stock held, and would only involve an increase of £558 in net dividend for a full year at the present rate. Provided no unforeseen adverse circumstances affect your company in future years, your board will endeavour to maintain this small bonus distribution in future, and for that reason are asking you to pass resolutions to increase the ordinary share capital. The dividend of 14 per cent. on the ordinary share capital represents approximately 1¾ per cent. gross on the estimated capital employed in the business and compares with earnings of 73 per cent. This still represents a very "restrained" distribution.

A YEAR OF HIGH ACTIVITY

The period under review was one of high activity in the worsted spinning industry, in common with all other branches of the wool textile industry. We therefore experienced a steady demand for all qualities of our production, our customers feeling it essential to cover their requirements far ahead.

The labour supply remained difficult throughout the year, and at the beginning of the year the machinery in operation was with difficulty maintained at high activity. The location of Midland Mills in the centre of the city made the labour problem more difficult than at other units, and in the earlier part of the year a considerable amount of machinery remained inactive. This, I am glad to say, has now been corrected, partly by obtaining more hands from a distance and partly as the result of internal reorganisation, considerable machinery redeployment and new equipment. This latter together with the institution of an incentive bonus produced higher pay packets within the general wage agreement framework. Reconstruction of the canteen at Midland Mills was finally completed and has proved very satisfactory.

In equipment, the large - scale programme at Britannia Mills of Christopher Waud and Company continued, with the receipt of much of the new equipment long on order. This together with the reconstructed buildings, is making this unit a very efficient concern. You will see from the accounts that there still remains on order with manufacturers an additional amount of machinery to the value of £100,950. This will be installed during the current year at Britannia and Midland Mills. For new equipment very long delivery dates are still required by machinery manufacturers who through Government direction are giving quick delivery for export which unfortunately speeds the modernisation of equipment of our foreign competitors.

SUCCESS OF TWO-SHIFT SCHEME

As I stated in the last two years, production costs are higher than previously and still rising, thus narrowing the margin of profit which can only be maintained by increased production and increased efficiency. Our Ulster subsidiary, with its good activity, made a substantial contribution to the Group's turnover. Shareholders will remember, as I have previously mentioned, we put into practice there our experiment in two-shift operation in worsted spinning. This routine is now satisfactorily accepted and I am glad to record greatly increased production, assisted by the incentive bonus instituted some twelve months ago.

Broadly speaking, it may be expected that the U.S.A. will continue to have the largest influence on our trading fortunes. The ebb and flow of their buying from the rest of the world must continue directly and indirectly to affect the buying of customers from a firm like ours. Despite gloomy forebodings, I anticipate no recession during the coming year in the U.S.A. Our own production is fully sold forward to the end of the year. I am therefore confident of again being able to present you with satisfactory results next year.

In conclusion, I wish to express my appreciation of the great help which your deputy chairman, Lord Barnby, has given to the business. His unique experience of the wool textile industry has been of the utmost value. I also wish to congratulate your managing director, Mr John S. Ambler, and Mr Little, Mr Seager, Mr Hindle and Mr Crowther, directors of the subsidiary companies, as well as the staff and workpeople of the whole group, upon the excellent results achieved.

The report and accounts were unanimously adopted.

HOVIS LIMITED

STEADILY RISING SALES

The fifty-second ordinary general meeting and the adjourned fifty-first ordinary general meeting of Hovis Limited was held on July 7th in London.

Mr J. F. Morton, the chairman, in the course of his statement, said: The accounts are in respect of the year ended March 31, 1949.

Hovis sales were fully maintained during the year and, in spite of difficulties, they are now showing a steady and most promising increase.

I am sure you will pleased with the strength of the group revealed in the consolidated balance-sheet.

The consolidated profit and loss account shows that the profit earned by the group amounted to £428,647, as against £407,698. Taxation has absorbed £220,035, and the net profit remaining amounted to £204,087, as against £176,593 for 1947-48. The brake which taxation applies to development and progress is unquestionably of grave import.

Those of your subsidiary companies which are excluded from control have made marked progress through the year. Vitovis Limited has established itself as a national supplier of the highest grade animal feeding-stuffs. The motor engineering and bodybuilding activities of Locomotors Limited have been extended with excellent results.

Since the date of the accounts a subsidiary company has been formed in the United States—Hovis (America) Inc. It is a most difficult matter to establish a market in the United States, and much has yet to be accomplished before it can be said that a satisfactory business has been created. The national need for dollars in itself will ensure our utmost endeavours in this respect.

The report was adopted.

LUNUVA (CEYLON) TEA AND RUBBER

CRUSHING TAXATION

The forty-third annual general meeting of The Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held on July 13th in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from his address circulated on June 6th

The profit for the year shows a substantial improvement over that for the previous year. Expenditure on maintenance of the estates at a high standard has been continued and their equipment has been improved and extended. The final dividend is again 10 per cent., making 15 per cent. for the year.

As was mentioned in my address last year, expenditure is being limited to such extent as is possible, consistent with the maintenance of our valuable properties at their optimum level of economic efficiency. The Governments of the United Kingdom and Ceylon take between them, and expend for their own purposes, far too large a proportion of the earnings of industry, which is thus deprived of the means to maintain that efficiency and extension of its activities on the results of which the Governments themselves depend.

Some attention has been directed recently in the press to the decision of a British firm of contractors not to undertake a large contract for the Government in Ceylon on account of the incidence of the crushing double taxation. This was followed by the announcement that the Government of Ceylon were sending a leading taxation official by air to London. We may perhaps now hope that the desultory and leisurely discussions regarding a double taxation convention between the United Kingdom and Ceylon which have been proceeding for some years past will fructify in the near future.

The report was adopted.

MIDDLE WITWATERSRAND (WESTERN AREAS) LIMITED

REVENUE MORE THAN TREBLED

POSITION OF VARIOUS INTERESTS

The seventeenth annual general meeting of Middle Witwatersrand (Western Areas) Limited, was held in the board room, Anglo-vaal House, Johannesburg, on June 29th.

Mr B. L. Bernstein, who presided said, in the course of his speech:—

The revenue for the year was £239,596 as compared with the previous year's figure of £77,542, the major portion of the increase being due to the net profit on the realisation of portion of the company's share investments.

The balance from the previous year of £83,026 added to the net profit for the year £176,615, plus the transfers of £958,750 from share premium account and £3,225 from reserve for contingencies account, made available a total of £1,221,616. £1,000,000 was transferred to general reserve and an amount of £221,608 was carried forward on appropriation account.

At the date of the balance-sheet the book value of investments, excluding shares held in subsidiary companies, was £484,126. The market value of the quoted investments was £1,407,550. Unquoted investments, consisting mainly of our interest in Kennecott-Anglovaal Exploration Company, Limited, at cost, totalled £75,550.

Today the company has approximately £650,000 cash working capital, which sum is adequate to cover the contemplated expenditure on the several operations being conducted by the company.

O.F.S. INTERESTS

Virginia Orange Free State Gold Mining Company, Limited, which was formed to work 5,355 claims in the Virginia area has a debenture capital of £2,000,000, all of which has been issued and a registered capital of £2,562,500, of which £2,250,000 has been issued and £312,500 is held in reserve to meet the conversion rights attaching to the £2,000,000 First Mortgage debentures.

After providing for participants and the offer of 3,777,200 units of stock to shareholders, this company was left with approximately 600,000 units of stock in the Virginia company.

Merriespruit Flotation. Shareholders have already been advised in the Press of the application for a second mining lease to cover approximately 5,830 claims, and the flotation of the Merriespruit (O.F.S.) Gold Mining Company, Limited, which will take over such lease when it has been granted. The financing of the Merriespruit company will closely follow the pattern of the Virginia company. The capital of the Merriespruit company will consist of £2,000,000 in First Mortgage debentures carrying interest at the rate of 3 per cent per annum, commencing only from the date of production, and £2,562,500 in units of stock. The Kennecott Copper Corporation will subscribe firm for £500,000 of the debentures and underwrite the balance of £1,500,000. The debenture stockholders will have the right to convert a quarter of their holding, for a period of five years, into Ordinary units of stock at a premium of 60 per cent. Of the share capital £562,500 will be subscribed firm by the Kennecott Copper Corporation, £500,000 will be subscribed by the vendors from the cash vendor consideration received by them, and £1,187,500 will be subscribed by your company and its participants. The balance of £312,500 will be in reserve to meet the conversion rights of the debenture stockholders. It is expected that, after satisfying all sub-participants, your company will be left with approximately 56 per cent. of the £2,250,000 Ordinary share capital and an offer of units of stock and debentures in the Merriespruit (Orange Free State) Gold Mining Company, Limited, will be made to shareholders in due course.

Virginia Mine. On June 28, 1950, No. 1 Shaft had reached a depth of 935 feet, and No. 2 Shaft, a depth of 725 feet. It is estimated that reef will be intersected in No. 1 Shaft at a depth of 3,750 feet, and at a depth of 3,100 feet in No. 2 Shaft.

Merriespruit Mine. Arrangements are in hand for commencing operations at the Merriespruit Mine, and shaft sinking will commence in the near future. Full advantage will be taken of the organisation and equipment available at the Virginia Mine for the conjoint development of the two mines.

Van Den Heever's Rust Area. Drilling to date has proved the existence of payable Basal Reef in this area, and boreholes VDH1. TV.2, and K.1 have indicated the presence of an additional occurrence of highly payable upper reefs, extending over a distance of some 14,000 feet in a zone above the Basal Reef horizon.

Drilling is in progress to enable an assessment to be made of the potential ore resources of this upper horizon, and is designed to gain further knowledge of the lateral extent of the upper reef occurrences.

Your company now owns the entire mineral rights of the farm Van den Heever's Rust.

Gelukspan and Zomersveld. Since the close of the financial year, your company has exercised its option to purchase the mineral rights of the farms Zomersveld No. 395, and Gelukspan No. 394. These farms form portion of a block of ground which is the subject of an agreement between your company and New Consolidated Goldfields Limited, for the exploration of a joint mining area.

STILFONTEIN-HARTEBEESTFONTEIN AREA

At the Stilfontein Gold Mining Company, two vertical shafts are being sunk, and good progress is being made with the equipment of the mine.

Intensive drilling, to the south, in the remaining area beyond the boundaries of the Stilfontein Gold Mining Company, is being continued. At present six boreholes are in progress, and the results up to date provide encouragement for the prospects of the establishment of at least one additional mine in this area.

Five boreholes, in which the Vaal Reef was intersected, all disclosed payable values at workable depths. It is encouraging that these boreholes cover a stretch of approximately five miles, southwards from the boundary of the Stilfontein gold mine.

OTHER INTERESTS

At New Klerksdorp Gold Estates, Limited, in which your company retains the controlling interest, the tonnage crushed for the year amounted to 94,500 tons, and the working profit was £15,384, equal to 3s. 3.1d. per ton.

The payable ore reserve as at December 31, 1949, was estimated to amount to 686,000 tons, having an average value of 2.65 dwt. over a stoping width of 74.8 in.

For the first five months of the current financial year 43,200 tons have been crushed, the working profit for this period being £11,644.

The present crushing rate is about 9,000 tons per month.

Your company has acquired an option to purchase a portion of the Klerksdorp Town Lands, approximately 4,556 morgen in extent, and prospecting work has been commenced.

Since the close of the financial year Mr H. F. Oppenheimer resigned from the board. We desire to express our appreciation of the valuable services rendered to the company by Mr Oppenheimer during his tenure of office.

THE PROBLEM OF FINANCE

Before concluding I wish to refer briefly to the problem of financing mines in the Orange Free State with particular reference to our two mines in the Sand River area. As you are aware, we have adopted the Virginia pattern of capitalisation for the Merriespruit mine. The salient feature of this capitalisation is that more than half the funds required to bring the mine to production is provided by a debenture issue, thereby enhancing the value of the share capital. The effect of this is to keep within reasonable limits the amount to be raised from shareholders by way of share capital, a feature which we consider of importance in the light of existing financial conditions. The policy of capitalising Virginia and Merriespruit in this manner arises from two maior considerations

In the first place we are in this manner able to ensure at the very outset the capital funds required to bring our mine to production without having to resort to further capital issues and having to rely on time being propitious at some future date for a successful offer of rights to shareholders. In the second place we have considered it important to raise as much as possible of the capital funds required from sources outside the sterling area whose funds would not otherwise be available for South African investments. The effect of this is not only to relieve existing financial markets of the need to provide considerable capital sums, but also to provide hard currency for the South African economy. These factors have influenced us in departing from what might be termed the traditional pattern of financing gold mines and we believe this policy to be in the best interests of shareholders.

WALKER CAIN LIMITED

STRONG POSITION

The twenty-eighth ordinary annual general meeting of Walker Cain Limited was held on July 11th in London, The Rt. Hon. Lord Brocket (the chairman) presiding.

The chairman, in the course of his speech, said:

No doubt you will have studied the accounts very carefully, and in doing so will have noticed a certain disparity in the figures of the profit and loss accounts when compared with those of the period ended March 31, 1949. The corresponding figures shown represent trading periods of 21 months for 11 subsidiary companies, two subsidiaries 19 months, our principal subsidiary, Peter Walker (Warrington) Limited, 18 months, and of this company, 15 months.

In my remarks last year I referred to the reduction in the Beer Duty made in April 1949, and its effect on future [illegible]

fact that we had to bear 3s. per barrel, and said that this and the rising cost of materials and all other expenses made the outlook less promising. That has proved to be the position, coupled with a general decline in output over the whole country. Admittedly beer is too dear, and the duty should be further reduced to enable it to be sold at a price commensurate with the available spending power. Whilst we are disappointed that there was no relief in duty in the last budget, we at least gained partially one of our objectives—an improvement in the quality. All our beers are now increased three degrees in gravity, which brings us halfway towards our prewar strength. Though it is too early to say what the effect will be on output, the improved strength is much appreciated by our customers.

If you will refer to the consolidated profit and loss account you will see the net profit is £567,365, after all charges, including taxation, and a further provision of £44,000 for deferred repairs. With the balances brought forward from last year, we have available £1,063,819. The total dividend for the year is 16 per cent.—a reduction of 2 per cent. on the average yearly rate we paid for the 15 months to March 31, 1949. When we take into account the recession in trade and the large increases in the cost of materials, duty and other expenses, and in particular those occasioned by the introduction of the Catering Wages Act, I am sure you will be entirely satisfied with the results of the year's working. The consolidated balance-sheet reveals a strong liquid position.

The report was adopted.

J. LYONS AND COMPANY LIMITED

The fifty-sixth annual general meeting of J. Lyons and Company Limited was held on July 11th in London, Mr Harry Salmon presiding.

The following are extracts from the chairman's statement circulated with the report.

The differences revealed by the comparison of this year's figures with those of last year are not in any way abnormal in present circumstances. The figures show that the company had need of further capital, and we obtained, towards the close of the year, the sanction of the Capital Issues Committee for an issue of £1,000,000 in debenture stock. By the end of the year, negotiations were concluded for placing this with a consortium of insurance companies, and the issue has since then been completed in the form of debenture stock secured by a charge on our premises at Cadby Hall. The stock bears interest at 4 per cent. and is redeemable by half-yearly payments of capital and interest combined over a period of 25 years.

The net profit for the year is £578,063 which shows an increase of £11,729 over last year's figure of £566,234. Dividends on preference and preferred ordinary stocks for the year have absorbed £270,578. We are recommending the payment of final dividends on the ordinary, "A" ordinary and proportional profit capital at the same rates as last year, which, with the interim dividends paid in December last, will take £229,714. Out of the amount brought forward in the profit and loss account at the beginning of the year, we have transferred £250,000 to reserve for contingencies. The unallocated balance of the net profit is £77,771 and the total amount now carried forward in the profit and loss account is £80,299.

During the year two new ordinary directors have been appointed: Mr Douglas Gluckstein and Mr Kenneth Gluckstein. They, like all of us, have been brought up in the business and by their experience, gained in a long apprenticeship, and their ability and zeal in the company's interest, have earned their seats on the board.

The costs and charges which industry has to bear are still rising. The increased petrol tax and the new railway freight charges which have recently been imposed will, together, add well over £100,000 a year to the direct cost of distributing our products; and this is apart from the increase they must cause in the cost of the commodities and the equipment we buy. It is, to say the least, surprising that these extra charges should be imposed on industry at a time when those who impose them are constantly saying that distribution costs are already too high.

We endeavour to work for a profit and we make no apology for it; if we did not succeed in that endeavour we should have to go out of business. The present level of taxation makes it almost impossible to provide for replacement of capital, and this must, in the long run, not only prevent expansion but interfere with current production.

Indirect taxation accounts for about one-half of the total taxation of the country, and most of this, in one form or another, enters into the prices charged to the customer. An example of this is purchase tax, recently further extended so as to embrace commercial vehicles. Hitherto, this tax, in theory at least, has been levied on consumer goods; but, as it is charged on many of the items of equipment we need, we, in fact, have to pay it on the tools of our trade. It already adds very substantially each year to the cost of capital items, and it will now add still more, all of which must be reflected in the prices at which we sell our products. It cannot be questioned that the high level of Government expenditure makes a high level of taxation inevitable; the obvious remedy which we hope will soon find acceptance, and which must be applied, is to reduce expenditure to a level the country can afford.

As an illustration of the effect of the continuing rise in costs, I may mention that, since the end of the war, approximately one-third of our plant and machinery has been replaced at a cost averaging over two-and-a-half times the prewar figure. The comparative figures given in the balance sheet show how great is the increase in the amount of capital required in the business as a result of high costs and high taxation. This year fixed assets are up by nearly £640,000; stock is up by over £570,000, sundry debtors by about £413,000, while cash resources, including tax reserve certificates, are £650,000 down. Against this there is an increase in sundry creditors of over £700,000. You will see from the note appearing in the accounts that, in addition, we have entered into contracts for capital expenditure amounting to £1,104,000. The policy of conserving our resources, which we have always followed, has enabled us to provide very substantial sums for our capital requirements, but if the rise in costs does not soon stop, and if there is not soon some reduction in the level of taxation, that must become increasingly difficult.

During the year, we have succeeded, in general, in maintaining the volume of business both at home and abroad where we have earned much needed dollars for the country. In consequence, we have been able to produce results which we think you will agree are satisfactory. Their achievement has meant a year of hard effort on the part of all our staff, and I should like to thank them on your behalf and ours for their loyal and efficient service.

Addressing the meeting the chairman said:

I do not think I need add very much to the statement which accompanied the accounts.

Since the last annual meeting some of the restrictions which have hampered us for so long have been removed, including that which limited meal prices and the number of courses which could be served in catering establishments. We always held the view that the effect of this restriction would be far different from its intention, and it is interesting to note that at the Trocadero, the removal of it has meant that, while 15 per cent. of our customers are spending more than previously, 20 per cent. are spending less. The greater freedom of choice which we can now give has been welcomed both by our home customers and those from overseas.

Unfortunately, there has not yet been any realistic modification of the Wages Regulations which are so unsuitable for a trade such as catering. They can be said to be crippling it, at a time when it should be encouraged because of its importance in the expansion of the tourist trade which is so valuable to the country's economy. This is, we hope, slowly coming to be recognised, for a commission is now enquiring into the operation and effect of the regulations, and before long some at least of the necessary changes may be made.

One of the greatest difficulties we still have to meet arises from the continuance of the system of bulk buying—a system which certainly cannot be justified on economic or commercial grounds. It is responsible for the poor quality of so much of the raw material we are able to obtain, because it leads to bulk allocations which preclude the use of our full skill and experience in buying. Liberty of choice and the stimulus of competition should be restored to the commercial buyer for he knows the varying tastes and needs of the public and will provide for them. That would give the public the opportunity, of which it has been deprived for too long, of choosing the quality and type of food it wants. It is certain that the opportunity would be welcomed.

For such relief as we have had we are thankful; though we feel that the policy is too timid and the process too slow. We hope that this small beginning will soon lead to the complete freedom which alone can give full scope to initiative and enterprise.

The report and accounts were adopted.

HUDSON'S BAY COMPANY

SIR PATRICK ASHLEY COOPER'S REVIEW

The 281st General Court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held on July 7th in London, Sir Patrick Ashley Cooper, the Governor, who presided.

The following is an extract from his circulated statement: In most fields of economic activity, Canada's prosperity reached new and previously unequalled heights in 1949. It is generally felt in Canada that the post-war boom has ended, and that a period of readjustment, from which more difficult trading conditions may result, lies ahead. With the prospect of Marshall aid coming to an end in 1952, the question of a solution to Canada's balance of payments problems becomes increasingly urgent.

The Hudson's Bay Company was formed originally to trade in furs but, from the outset, this object implied, in addition to the marketing of the furs, the rendering of a service to the community from which they were obtained. It is from the development of this service that your company has grown and, in some places, with the expansion into towns and great cities of what were once mere trading posts, the original object has long since receded and its place been taken by the provision of a great store such as that at Winnipeg.

The marketing of the fur collection is the responsibility of the fur sales department. We continue to have great faith in the ability of London, our oldest outlet, reopened in 1946, to retain and improve its international position as a fur market. Fur prices are, of course, liable to fluctuate widely and suddenly, and 1949 was on the whole a year of heavy declines.

The report was adopted.

Statistical Summary

EXCHEQUER RETURNS

For the 8 days ended July 8, 1950, total ordinary revenue was £52,631,000 against ordinary expenditure of £46,976,000 and issues to sinking funds £624,000. Thus, including sinking fund allocations of £3,148,000 the surplus accrued since April 1st is £46,053,000 compared with £1,767,000 for the corresponding period a year ago.

OUR APPOINTMENTS BUREAU WELCOMES ENQUIRIES

from Professional Men, Directors and Higher Executives who have vacancies for secretaries with a University standard of training. For interview by Employers, students are selected from among those who have completed their course with the full London College Diploma. In accordance with our established custom, no fees are charged for this service. Please write or telephone to:—

THE APPOINTMENTS DIRECTOR,
THE LONDON COLLEGE OF SECRETARIES
170, Queen's Gate, London, S.W.7. KENsington 3228.

SWINTON CONSERVATIVE COLLEGE

A seven weeks' Residential Course will commence on October 18, 1950. The normal week-end Courses will continue to be held during this period.

The syllabus will consist of those subjects which are necessary for an understanding of current political questions and will include Economics; Social, Economic and Political History; the Constitution; Political Thought; Empire Development and Problems; and World Affairs.

In addition to lectures, including special lectures, the work will take the form of directed reading and individual supervision.

Applications for enrolment and further particulars may be obtained from the Bursar, Swinton Conservative College, Masham, near Ripon, Yorkshire. Telephone Masham 230.

HOW does a large, modern advertising agency function? If considering advertising, you are cordially invited to have a "look around", our building and see how it's done!—Samson Clark and Co., Ltd., 57/61, Mortimer Street, London, W.1. Museum 8050.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. (Econ.) Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities. Study for the degree is open to all without University residence. You may prepare at home under the experienced guidance of Wolsey Hall tutors. Fees are reasonable, and may be paid by instalments, if desired.

Prospectus from the Director of Studies, Department P17, **WOLSEY HALL, OXFORD**

AGGREGATE ASSETS at 31st March 1949 £96 642 721

Priorities for Containment

THE news from the Korean front is [illegible]. Although a handful of American soldiers have continued to fight with air support but without adequate artillery or anti-tank weapons, to slow down the Communist armoured columns, the retreat has continued. The Communists are now across the Kum River and are threatening the American advance positions at Taejon. There appears to be confidence in both Tokyo and Washington that a sufficient bridgehead can be maintained to make the mounting of a counter-offensive possible, but the margin is narrow between the time needed to bring in men and material and the space that can still be safely "sold" to secure it.

Yet in spite of the bad news, the Korean incident cannot be called discouraging in the wider context of western policy. On the contrary, it seems that the Soviet leaders have succeeded once again in doing the one thing necessary to ensure the defeat of their own tactics of infiltration and disintegration. Just as the Prague coup ensured the passage of Marshall aid, the Korean aggression can turn the policy of containment from a diplomatist's blueprint into cold military reality. The truth is that, for the last year, the foreign policy and the defensive strategy of the western world have become increasingly out of step. As Mr Menzies put it in his speech on Tuesday night:

> It is all too true that from time to time we have a foreign policy of one kind and a defence policy of another, forgetting that a powerful foreign policy begets obligations and that a realistic defence policy makes you fit to perform them.

Such has been the weakness of western policy. In diplomacy, there is general agreement that a stop must be put to Communist expansion. In defence, however, the conclusion appears to have been that the west can have as much military strength as it can "afford," whether or not that level bears any relation to the strength needed to keep Communism in check. Korea has shattered these pretensions. The western powers cannot live any longer in a cloud-cuckoo land of containment without weapons and defence by instalments.

In view of all the wild talk and the public alarm, it is important to emphasise that the Communist aggression on Korea in no way invalidates the policy that the western nations have been pursuing. On the contrary, that policy is confirmed, and its chances of success—that is, of avoiding the third world war—have been greatly enhanced. The attack on Korea was a tactical surprise, but it was exactly the sort of thing that the policy of containment expected to have to face; it was always clear that the Russians would probe into every weak spot in the long line between the Communist and the free worlds. But, on the other hand, the net effect of Korea is to remove two of the basic doubts about western policy. To those who wondered whether the United States really would come to the assistance of any victim of aggression, the answer is now on the record. And the other great question-mark, whether the west had enough organised force to remove any possibility of a quick victory for Communist aggression, is also, by all apparent signs, to be removed.

It is natural that news stories of tanks advancing and pictures of refugees should cause alarm and foreboding and a wave of gloomy conviction that another world war is imminent and inevitable. But on a cool analysis, the fact that the Korean incident has happened increases the chances of avoiding a world-wide war. A month ago there were two main reasons for fearing that total war might break out. The first was madness in the Kremlin and that still remains. The second was miscalculation in the Kremlin, and the chances of that are surely now greatly reduced. For the west the lesson is not to change policy, but to pursue the former policy with more vigour —and with more confidence that it will succeed in preventing war.

Another of the false first impressions of the Korean fighting that needs correcting is that the Far East is the main seat of danger. There may be other aggressions on the borders of China—or, indeed, in the Middle East. But the place where the issue will be determined—whether it be by cold war or by hot—is in Europe. It is here that the two systems lie close together and where mortal blows can be exchanged. It is here that no space can be sold even for precious time. So long as there is any risk of a rapid Russian occupation of the western continent, western diplomacy is hampered from one end of the world to the other. The very first priority of a policy of peace through strength is to create an international army in being in Europe strong enough to deter aggression. The second priority is to have similar forces within reach of the other weak spots in the chain. The third is to create a mobile reserve of the free nations, which could be rapidly moved wherever it was needed. The fourth is to have the plans, the designs and the orders ready, so that, if it is necessary, industry can be very rapidly mobilised. The fifth is to make sure that the allied countries are working to an agreed and understood programme. If all these things can be done, there will be no world war. These necessities were apparent before the Korean incident. They are, in fact, inherent in any idea of containment. What Korea has done is to throw a blinding light on the gap between western needs and western performance. What it may and should do is to give the impetus necessary to persuade democratic governments that defence must be accepted on such a scale in times, if not of peace, at least of non-war.

★

The programme is a formidable one. The urgency of it cannot be over-emphasised. But the magnitude necessary can easily be exaggerated. Over and over again it must be repeated that the job is not to fight and win a war—when the sky is the limit—but to prevent one—in which time is of the essence. "Too little and too late" is perhaps dangerously familiar; there is a risk now of planning to produce too much too late. Enormous programmes take longer to set on foot than more moderate ones; to make the plans too big might provide very little more protection in the next three vital years—and far more than will be needed thereafter. The task is to catch up with a Soviet and Soviet-controlled armament programme which is several years ahead of the west in time, but almost certainly not very large in total size, relatively to the resources of the western countries. It is a contest in time, not in amount, and the vital question to ask of western rearmament plans is not "how much?" but "when?"

If this argument is accepted, it has certain quite clear consequences for British defence policy. The first task is to mould the 360,000-odd men in the British army into a larger number of front-line mobile formations than has hitherto been achieved. At the same time the argument that the gravity of the situation makes it necessary to increase the period of national service in Britain should be resisted. Conscription is designed to create large reserves over a long period, so that a trained army can be quickly mobilised in the event of total war. To call up more conscripts now would merely complicate the problems of the regular army without, at least for a time, materially adding to its fighting power. On the other hand, if the Korea aggression is the precursor of further local acts of aggression, the necessity to maintain a policy of "defence by riposte" may make it necessary to call up some of the existing army and air force reserves.

If mobile front-line forces are to have their full effect, a radical transformation is needed in their equipment and fire power. The spectacle of American troops in Korea without adequate tanks or anti-tank guns and without the right kind of air support would, in view of recent propaganda about advances in technological magic, be ludicrous if it were not so tragic. But it is only a practical illustration of the dilemma between long-term and short-term preparedness. The pace of technical advance in the design of both weapons and aircraft is now so rapid that it is tempting to keep on improving prototypes rather than plunge into mass production. The fighting in Korea shows how essential it is to have up-to-date weapons actually in the hands of trained troops.

In choice of weapons, two lessons are suggested by Korea. The first is greatly to increase the fire power of both artillery and infantry. Too large a part of the British army is still using weapons which were only just adequate in 1945. The improved weapons must now speedily move from the drawing board or out of stock and into the hands of those who may have to fire them. The best designs that exist today should be put into production; there will be time to improve on them later. The second urgent need is for the creation of strong tactical air forces to support the mobile formations of the Army. It is obvious that, so far as Britain is concerned, the requirements of air defence at home and the needs of Western Union make heavy calls on the production of fighters. This production may therefore have to be greatly expanded, and the programme for the production of medium bombers and fighter bombers accelerated by a year or more. It is upon weapons which will contribute to the strengthening of defence against local aggression that all energies should be concentrated in this period not of war but of containment.

If these are the present necessities of realistic defence —and it is difficult to see how the western world can do with less—it is clear that more money must be spent upon armaments. Of all expenditure this is the type most likely to compete immediately with civilian requirements. To secure the weapons it may be necessary to reduce sharply the number of new cars, refrigerators, television sets and household fittings made available to the public. President Truman is ready to face both necessities—the provision of finance and the curtailing of civilian economy. He has proposed increased expenditure of the order of $10 billion and has asked to divert materials to war purposes, to expand taxes, to limit credit and to cut back unessential expenditure and production. He has, in fact, moved with as much courage and spirit on the home front as in his original determination to resist aggression. The British community both here and in the Commonwealth must be prepared for an equivalent effort, and must be ready to confront the consequences. They cannot be other than sombre, for if room has to be made in a fully stretched economy for several hundreds of millions more of defence expenditure, then some other form of expenditure—governmental or private—will have to be reduced. This presents an awkward choice; but the one unforgivable thing would be to allow it to be decided by the blind lottery of inflation.

★

A decision reached among the most effective military partners of the western world to put their defences into effective order would be a great deal gained, but it would not be everything. The struggle against Communism is not a fight that each nation can carry out separately. The principle of a fusing of command and of resources has been accepted and the framework of co-ordination exists —in the Atlantic Council, in Western Union, in the defence arrangements of the Commonwealth. The habit of co-operation has, one may hope, also survived from the last war to make effective the efforts of such organisations as the Standing Group of the United States, Britain and France, which co-ordinates the military activities of the three nations from Washington. There is, therefore, no need at this stage to elaborate more machinery for producing a single western effort. What appears necessary is to make urgent and decisive use of the machinery that is already there. To the uninformed public, for instance, it seems curious that the defence problems of Korea, Hongkong, Indo-China and Malaya—all of them different facets of the same reality of Communist pressure—should still apparently be dealt with piecemeal by separate ministries of defence. It may be, for instance, that it is better to send marines from California to Pusan and leave units of the British regular army in Hongkong. The logistics of the situation may demand such an arrangement. Yet the evidence that is available suggests that the decision was not reached on a combined basis and that the really lavish machinery of western military co-ordination was simply ignored.

The issue is, in fact, political, not military. If at this stage and with Korea to spur them on, the governments of the west decide to pool their resources, to make their plans jointly, to revive the partnership of the last war, and to subordinate everything to an effective policy of containment, the resources and the machinery for such an effort exist. But resources and machinery cannot of themselves dictate policy. They can be used or not as the governments decide. The supreme need is for a quality of statesmanship in all the western nations equal to the courage that Mr Truman and Mr Acheson have already shown, so that the free world may derive the utmost benefit from the impetus towards unity and strength that the Communist aggression in Korea has given them.

Hindu and Moslem

IT is now just over three months since Mr Liaquat Ali Khan accepted Mr Nehru's invitation to come to Delhi and attempt a settlement of the communal problem in Bengal. The Delhi Agreement on Minorities which the two Prime Ministers drew up in April has been working better than some pessimists had feared it might. Indeed, many people in both Pakistan and India have been pleasantly surprised. To have expected complete harmony would, in the circumstances, have been naive; but the Agreement removed the immediate danger of war, and that in itself was a very considerable success. At the moment, in fact, the two countries are perhaps further from coming to blows than at any time since partition in 1947; in March, as Mr Nehru admitted, they were "on the brink" of open war. There remain, however, several fundamental questions for India and Pakistan to settle if they are to live out the future in friendship, and if, as they should, they are to present a co-ordinated front to the pressures of Communism. Besides the minorities, there are still the serious disputes over refugee property, over devaluation and trade, over the canal waters of the Punjab—and, of course, over Kashmir. Events in Korea have drawn public statements from both Prime Ministers that they must sink their differences. And they are due to meet again this week in order to do so.

It was disappointing that, at the time the Minorities Agreement was negotiated, so little came of the intimate and friendly exchange of views on Kashmir and other problems, or of the trade talks subsequently held in Karachi. It has been even more disappointing since that, in spite of a relaxation of the barriers to trade, the limited barter agreement which did come out of the Karachi talks has not been fully implemented. Little more than a third of the jute contracted for has reached the Indian mills, and by no means all the jute purchased before the breakdown in Bengal trade has been released. Attempts to extend materially the present restricted scope of Indo-Pakistani trade have also so far failed—as they are bound to do until the exchange rate difficulty is settled. It is true that certain valuable goods traffic in fruit, fish and vegetables for Calcutta has restarted; but what is needed is to get vital commerce moving again in coal, raw cotton, textiles and wheat—as well as in jute.

Meanwhile, the Bengal Minorities Agreement continues to operate, its machinery now at last fully in being. And, although the first impetus has been exhausted, it is to be hoped that the Agreement will long remain in force; if it lapsed at this stage the results would be disastrous. By the end of its first and most crucial two months, from mid-April to mid-June, the Agreement had succeeded in completely stopping the net flow of Hindus from East (Pakistani) to West (Indian) Bengal. The flow of Moslems in the reverse direction was not stopped, but it was very considerably reduced. To judge by Pakistani statistics, whereas in the second half of April, 104,825 Hindus moved out of Pakistan, 65,257 came in, leaving a net exodus of 39,568; in the first half of June, 83,762 Hindus left and 84,999 came in, making a net intake of 1,237. Figures for Moslem movement (in Bengal only) showed that in the first equivalent period 34,967 entered Pakistan and 5,370 left, giving a net intake of 29,597, while in the second period, 30,676 entered and 20,356 left, making a net intake of 10,320—or only

a third of what it had been. Since then, there has been a slight though not important setback in these trends.

Even if the Agreement is a long way from having persuaded more than a small proportion of the refugees to return to their homes, part of its success can nevertheless be measured in the number of Hindus and Moslems moving against their respective refugee currents. Most of these people undoubtedly consist of former refugees who have gone back temporarily to try to salvage some of their property, a question on which the Agreement has obtained a considerable, if no more than local, success. Part of the provision in the Minorities Agreement applying to Bengal is that "rights of ownership in, or occupancy of, the immovable property of a migrant shall not be disturbed. If, during his absence, such property is occupied by another person, it shall be returned to him, provided that he comes back by the 31st December, 1950." It is usually the man with lost property who remains bitter and spreads the most bitterness in his new home. On the whole the property of the Hindus has amounted to more than that of the Moslems, many of whom are labourers. And the Pakistan Government is to be congratulated on having done what it can through trust committees to restore Hindu middle-class property without attempting to bargain about the Moslem position in West Bengal.

On the Indian side, in spite of the best intentions, the situation has caused some anxiety in Delhi owing to the intransigent attitude of opinion in West Bengal. When Mr Nehru originally staked his political future on achieving a settlement with Pakistan over the minorities, there were at first many in India who doubted the possibility of any success. But by the time the two Bengali ministers, Mr Mookerjee and Mr Neogy, came to press their resignations from the cabinet, it was they and not Mr Nehru who were flying in the face of public opinion in India as a whole. There can now be no doubt that the leading Indian ministers have acted loyally and courageously in the cause of peace.

West Bengal stands out as the main source of danger to the Agreement. Even now, the tone of its press—apart from *The Statesman*—is ugly and bitter, in spite of warnings from Delhi, of promises of good behaviour by the Calcutta editors, and of the efforts of the Joint Indo-Pakistan newspaper editors conference. Bengal used to be the leading and ruling province of nineteenth-century viceregal India. Today, West Bengal is an unhappy rump of former greatness over which the central government in Delhi naturally hesitates to attempt too tight a control. Unfortunately, this hesitation, based though it partly is on regard for the constitution, could yet mean that mischief makers in West Bengal might once more bring all India to the brink of the abyss. The truth is that many West Bengalis do not want the Agreement to work; they talk less of war than they did, but they do not know what they want instead, except perhaps to see the rest of India suffer for Bengal's misery. They are not even in a mood to accept a new lead. Desperately overcrowded—2 million Hindus have come and little over 1 million Moslems have left since January—cynical, hot tempered, arrogant, disliked by others and in despair, West Bengal has so far seen the Agreement work in spite of itself.

Elsewhere, although much calmer and more realistic, the general run of public opinion in both Pakistan and India is still distrustful of the other. In India, there is a deep-rooted conviction that Pakistan never keeps its word; hitches in the present Agreement are quoted as further proof. In Pakistan plenty of people are waiting to see whether the Hindu Mahasabha will succeed in swinging Congress against the cabinet and Mr Nehru's policy; they are almost certainly waiting in vain—although Mr Nehru could not lightly face the resignations of another two key Ministers. On the other hand, visits of public men to opposite sides have unquestionably improved the atmosphere in both countries and restored perspective. Law and order have been reasserted and, while there are still minor incidents, robberies and murders, there is little talk at present of "barbarism and atrocities" and no major riots.

*

The present moment is one of renewed opportunity. Both Mr Nehru and Mr Liaquat Ali Khan have been abroad during the past few weeks, and have been able, as Mr Nehru has said himself, to see their own problems from the outside. Everyone interested in drawing Pakistan and India together will expect them, in their present meeting, to take up where they left off at the beginning of the hot weather. The Minorities Agreement, like a monsoon, has broken some of the tension which had been built up. But it is by no means enough, even in its own sphere. If nothing further is done to help the minorities to live where they are, they will move. And although machinery now exists to help them to do so, their movement will still cause endless misery and stir up much dangerous resentment. They ought to be given enough reason to stay where they are.

Perhaps India and Pakistan, like oil and water, will never really mix. There is, however, a new feeling in India that, if they cannot act as brothers, then they should handle their common relationship like two unrelated states whose fundamental interests move together. If they could forget the family feud, they might come to a working arrangement as strangers. In Pakistan likewise, the acute trouble in Bengal has produced a new understanding of the risks and horrors of fratricidal war. The good will generated by the Minorities Agreement is already evaporating nevertheless, and if the two countries are not to drift back into a state verging on hostilities a new catalyst must be found, and quickly. This might be an external force like the danger in Korea; or, more likely, the success of Sir Owen Dixon's negotiations on Kashmir during the next few weeks. It might even be Pakistan's acceptance of a new rate for its rupee next month on the advice of the International Monetary Fund. But, whatever it is, neither side can afford to fail to find it.

Kashmir is still perhaps the biggest single issue dividing India and Pakistan, and a satisfactory settlement there would have an electrifying effect. Yet, although a severe test of statesmanship, at the ministerial level, it is not so urgent as the problem of the minorities; nor does it affect the everyday life of the man in the street. A week-end of rioting could still put hundreds of thousands of hapless human beings to flight again with incalculable results. If last April's work is to run no risk of being undone, Mr Nehru and Mr Liaquat Ali Khan, together with their ministers and officials, must renew contact successfully. The generation which once worked together under the British—and fought together against them—probably has a better chance of reaching a settlement than has the next. Time is not necessarily on the side of peace.

Savile Row

SAVILE ROW is an uninteresting little street sandwiched between Bond Street and Regent Street. "Savile Row" is a description recognised all over the world as applying to men's clothes that not only contain good materials and workmanship, but contain also some special virtue, some air of distinction and dignity which stamps the work of London's first-rate tailors. The heirs to this tradition are a mere handful of firms, fifty at most, and none of them is very big. But this small aristocracy of craftsmanship wields an influence out of all proportion to its size; the standards it sets and the demand it creates at home keep alive all the retail bespoke tailors' shops up and down the country, while its prestige value abroad enables British tailors exporting goods of every type and quality to bask in its reflected glory.

Only a few of the first-class tailors are now in Savile Row itself, for, when the name of this little street became a household word for fine tailoring, cloth merchants, appreciating its publicity value, began to push the tailors out. The tailoring firms, who have no more liking for high rents than they have for publicity, continue to flourish quietly in the old Georgian houses of the surrounding streets, aloof and non-committal behind their discreet name-boards and screened windows. Rarely does the name of the firm give a clue to the name of the tailor inside, and when it does it is likely to be a generation removed, for new establishments are rare. More commonly, the firm's name is the only relic of a man who built up a business on strapped trousers and frocked coats and sold it to the present proprietor's father. In spite of a strong tendency towards succession among tailors, as among customers, the tendency to conserve old names for old businesses is even stronger.

The chief stock-in-trade of a good-class tailor is his connection with several hundred customers, not necessarily in London or even in England, who will seek him out from time to time to renew their wardrobes, occasionally introduce acquaintances to his shop, and in due course bring their sons in to be dressed. The essence of his service is to be permanently and dependably the same—available year in and year out to produce good clothes with the minimum of trouble. Any change which disturbs this comfortable continuity is unwelcome and the old name is at one with the solid furniture and formal avoidance of display in assuring the customer that his tailor is a reliable institution—yesterday, today and for ever.

*

But if this trade is, as it claims, an institution with traditions and standards to consider as well as narrowly commercial advantages, it will have to take confidence to plan for its future craftsmen. Almost the whole of a well-made suit is sewn by hand, by journeymen tailors sitting cross-legged on the "board" or table, and all master tailors and cutters learn their trade by being apprenticed to an experienced tailor and watching him mould garments by alternate pressing and stitching to an outline which he holds in his mind's eye. "Rock of eye" is the tailor's name for this sense of good line, and all successful tailors must cultivate it by a laborious apprenticeship. Fully trained tailors specialise in cutting if they have a preference for the "front of the shop" and a weekly wage, or if they have a family business to inherit. Otherwise they become journeymen tailors, of whom the majority are "outworkers" renting a room or a single "sitting" in a side street of Mayfair or Soho and taking work from two or three firms. Only the most skilful tailors get work from the best firms that pay the highest prices, but these can at present earn up to fifteen pounds a week on a full week's work. Others, with less skill in coats, specialise on trousers and waistcoats, which they make up with a small team of helpers, and if they can get a plentiful supply of good-class work, they earn almost as much as coatmakers.

The history of outworking, and of the London Time Log on which its piece-rates are based, is long and stormy. The system worked successfully in the past because tailors were plentiful, their work was cheap, and their tools were few and simple; so long as seasonal rushes of work could be obtained satisfactorily from outworkers, it did not pay master tailors to house and supervise more than skeleton staffs in expensive Mayfair premises. Moreover, before the first war the market for

working tailors was constantly replenished by the immigration of Irish and continental craftsmen and of Swedish tailors anxious to learn London styling ; underemployment, bad conditions and poor earnings persisted long after free immigration ended. At the present time a fair proportion of London's finest craftsmen are these same immigrants, or their sons.

The trade union cry of " workshop accommodation and direct employment " for the whole tailoring trade has never received whole-hearted support from the most successful journeymen with good connections ; a substantial minority, especially when work is plentiful, enjoy their independence, go racing one day and work into the small hours the next, and discount bad working conditions because they have never known any others. But a move to end outworking is now apparent among the master tailors themselves. In the last few years good craftsmen have become so scarce that firms have begun to take workrooms and offer good conditions and constant employment. But, as in so many skilled trades, it is difficult to attract a sufficient number of apprentices. Much of the work is still done in conditions which seem shabby and cramped compared with those of a modern factory, and the long ill-paid apprenticeship and the need for night school lessons are further deterrents. Unless training and recruitment are taken in hand with more imagination and foresight as investments for the future, the genius of Savile Row tailoring will flag just when it needs to put its best foot forward in search of new markets.

*

Almost for the first time the best tailors are having to concern themselves about customers. These are still plentiful, but the proportion of English clients is falling steadily. These have always been, in the main, people with taste as well as means, for neither a West End address nor a high price is an infallible proof of good tailoring. Indeed, one of the curious facts about the leading London tailors is that their suits sold before the war at 14 or 15 guineas when 12 or even 13 guineas was a common price for a suit of markedly inferior cut and quality. The corresponding price today is 35-40 guineas (of which a fifth is purchase tax), but several times as many tailors, with no pretensions to being in the top rank, find customers at 30-35 guineas—a puzzling contrast, this, with the steep prices women pay for the big names of *haute couture*.

There are in theory many potential new customers for the first-class tailor—people who would be better dressed in the long run if they would substitute two good suits for three mediocre ones. But since few laymen can judge clothes objectively—or at least have confidence in their ability to do so—old habits prevail, while the man with half a mind for a Savile Row suit must often be deterred by the lack of introductions to these exclusive-looking houses. The problem of how to widen their clientele without losing dignity is one that most good tailors cannot bear to consider, let alone to solve. Meanwhile, the order-books are kept full by greatly increased foreign custom. Some firms are making more suits for the United States than for England ; some have particular connections with European capitals ; some specialise in riding habits for customers all over the world. Customers in Europe and America are measured and fitted by a firm's traveller who may make one or even two visits a year to cities where the firm has customers. Final adjustments in the United States are usually made by English tailors employed there for the purpose. European countries have customs agreements enabling coats without their top collars to be taken in and out duty free for fitting. No first-class tailor, however, needs many fittings. Other foreign customers are those visiting or passing through London, for whom prodigies of speed are now performed to enable them to take the goods home under the Personal Export Scheme, and who often repeat orders by post for years afterwards from remote parts of the world. " Send me another dark blue suit. I am two inches fatter round the waist " is the kind of order that causes many misgivings in London, but is always met ; the paper patterns, which are never destroyed, are disinterred from the storeroom ; often some *aide-mémoire* is referred to ; and the cutter goes to work to interpret what those extra " two inches round the waist " really mean in terms of the man he remembers.

*

Competent estimates agree that something over one-third of the total product of the first-class London tailor is exported—far more than before the war. Does the future of this trade lie in exports ? The master tailors themselves are emphatically convinced that it does not ; they regard the fall in the home market as disastrous and the boom in exports as a temporary makeweight. They blame purchase tax for the ruin of their English custom and pin their faith to a return to prewar conditions when it is removed. But this somewhat facile diagnosis ignores more fundamental factors—the lower real incomes of the upper classes as a whole and the changing social pattern which results in so many of the postwar rich having no tradition of dressing well. Purchase tax now makes a 32 guinea suit cost 40 guineas and no doubt its removal would help to sell some more suits, but it is hard to believe that between these prices the elasticity of demand of existing customers can be very great. On the other hand, the possibility of building up a successful export trade without a basis in a sound home market is not yet seriously considered ; the dangers of a slump in the United States, of tariff barriers and quotas suddenly cutting off some patiently cultivated market, of costs at home and price levels abroad moving unfavourably against each other, are all grave drawbacks to such a proposal.

The hand tailoring industry is an interesting case-study precisely because it is in many ways typical of the situation in so many of the British luxury trades, each complaining bitterly about an impoverished home market, each unwilling to accept the fact that its future bread and butter must largely come from exports. The habit of mind which has long regarded exports as an " overspill " from production for the home market dies hard. Although in the last few years the proportion of this overspill has grown considerably, owing to a seller's market abroad, yet as that seller's market returns to normal the pressure to remove purchase tax and free the home market increases. The desire is understandable to relinquish risky, newly won contacts abroad and to turn comfortably back to a predominantly British custom. But it seems more than likely, that for Savile Row at least, the home market as it was known before the war would be found—even without purchase tax—to have shrunk to an uncomfortably small size.

NOTES OF THE WEEK

Diplomatic Blackmail

Pandit Nehru, in his evident and admirable desire for peace in Asia, has contrived to confuse two issues—the Communist attack upon South Korea on the one hand and, on the other, the impasse in the Security Council produced by the Soviet Government's refusal to appear there unless the Peking Government is admitted as the representative of China. In his letter to Mr Stalin on July 13th Mr Nehru proposed that a " speedy, peaceful settlement " of the Korean issue could be achieved by bringing Communist China into the Security Council and then, either inside or outside the Council, settling the Korean issue by agreement between the powers. The plain inference of his proposal was that the Russians should " buy " China's place in the United Nations by calling off an aggression which they had certainly armed and, in all probability, instigated.

Mr Stalin's response to this suggestion of a dubious political deal was, in effect, to accept the offer of Communist China's admission while making no commitment about ending aggression in Korea. The " Korean question," he said, should be referred to the Security Council " with the obligatory participation of the representatives of the five Great Powers, including the People's Government of China." For the rest, he was silent. Having published the correspondence—without asking permission—to the embarrassment of the Indian Government, he has allowed Pandit Nehru's initiative to make its own impact on the troubled mind and conscience of the world.

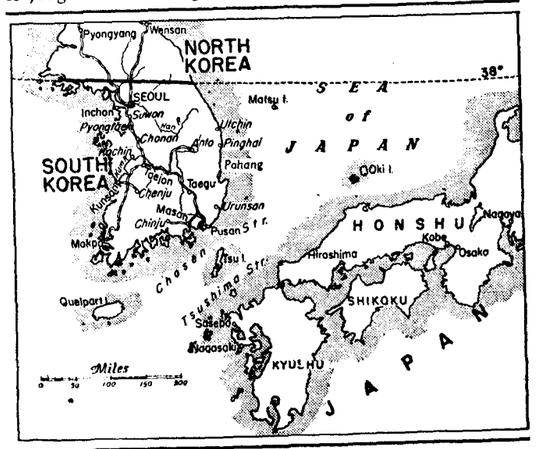
It is important that the confusion created by the Indian attempt at mediation should be quickly dispelled. The British Government has long held that it is vital for the functioning of the United Nations to secure the admission of Communist China. But this issue has absolutely nothing to do with the Korean incident, in which North Korea attacked its southern neighbour in open aggression and then disregarded the Security Council's call for a cease fire and a withdrawal of forces. This, and this only, is the issue at present before the United Nations, and one kind of intervention only is called for from the Russians—to compel their puppets to withdraw to the 38th parallel which they should never have crossed. If, as a result of encouraging what they call " civil war," the Russians can secure political advantages in other totally unrelated fields, the invitation to use the pressure of force will be overwhelming. The question, " What will you give me if I stop twisting your arm ? " has a place in the vocabulary of thugs, but not in the proceedings of the United Nations.

* * *

China and the Council

It is doubly unfortunate that the issue of China's representation on the Security Council should have become linked in any way with the Korean incident. Whereas the western world has succeeded in reaching an admirable and unforced unanimity on the issue of North Korea's aggression, there is not—and, indeed, cannot be—the same certainty on the question of China's place in the United Nations. In the first place, the British and American governments have not seen eye to eye upon the issue. In the second, the claim of Peking to speak for China is widely accepted as being more reasonable than that of the Nationalists.

It is therefore important to remember at this juncture that, if the Soviet Union had pursued other tactics, Communist China would almost certainly have been a member of the Security Council by now. When the vote on Chinese representation was taken on January 13th, three nations—the USSR, India and Jugoslavia—voted for the Peking Government, six nations—the United States, France, Nationalist China, Egypt, Ecuador and Cuba voted against and two—Britain and Norway—abstained. The instant Soviet reaction was not a friendly canvass of other members to induce a change of view but a total boycott. The Russian delegates walked out and have not returned since.



It was left to the British—the " capitalist hyenas "—to undertake the diplomacy which the Russians scorned. The British delegation set to work to convince the other members that the change was desirable. Any hopes of convincing France were, however, undone by Russia's entirely gratuitous recognition of the Ho Chi-minh regime in Indo-China. Any softening of American opinion was similarly discouraged by Communist seizures of American consular property in China. Nevertheless, the British could feel that progress had been made during the early summer and a position was reached in which the Americans allowed it to be known that they would not use their veto to keep Communist China out of the Security Council if a majority was secured for the motion.

The British effort was, naturally, totally undone by Communist aggression in Korea ; and the unbridled Russian attacks on Mr Trygve Lie will not make it easier for the process in due course to be resumed.

* * *

The Two Bridgeheads

The general military picture in Korea has not changed decisively in the last week and the retreat of the United Nations forces has continued. Two events of the campaign, however, deserve comment. One is the first sign of strategic mobility and counter-attack on the American side. A strong force has been landed from the sea—unopposed—and secured a bridgehead at the small port of Pohang on the east coast. What effect this initiative through a small port of limited capacity may have on the campaign is difficult to judge. But it is significant that the Korean Communists

were unable to call on naval forces or air power to harry an operation of this kind. Indeed, reports suggest that the Communist air forces are suffering heavy losses in the air and on the ground ; if these are accurate, it will be interesting to see whether reserves of pilots and machines will be made available from outside Northern Korea.

The other factor is not so favourable to the defending side. Within the whole southern bridgehead, stretching from Taejon and Pohang in the north down to the southern coast, there are many reports of serious activity among the Com-

manist guerrillas. Ever since the beginning of the campaign, North Koreans, disguised as refugees, have passed through the lines and attacked the defenders from the rear. The latest reports, however, speak of guerrilla attacks launched far behind the line. The impossibility of distinguishing one kind of Korean from another makes it exceedingly difficult to deal with this new menace, an important part of "civil war" tactics.

* * *

Defence and Debate

The Government has wisely acceded to the demand for a debate on defence before the House rises for the summer recess at the end of next week. The session will not be the secret one for which Mr Churchill and some Tory members have pressed, which in the interests of security as well as publicity is just as well. The press is not under the same restraints as in wartime to refrain from publishing any information which its political correspondents might glean, and the discretion of some members might prove to be less than absolute. It is doubtful, however, how much the Government will be prepared to tell the country in open debate about the state of Britain's defences at home and abroad. It has hitherto had a bad record for unnecessary secrecy and vagueness on this subject; but if it wishes to strengthen the nerves and heighten the response of the British public, a fairly frank picture must be presented, not only of the external dangers but of the gaps and deficiencies in the defence system itself.

Whatever line the Government takes next week, a proper debate will be an improvement on the method which has been practised during the past ten days by Tory back benchers of cross-questioning Ministers at question time about separate aspects of the defence system. Ministers have been frequently hampered in their replies, particularly to supplementary questions, by their anxiety to keep within the limits of security. The outcome of the questioning must have been to add a good deal to public concern and very little to public knowledge. Indeed Mr Churchill's angry remark on Wednesday to Mr Shinwell that the country has been "shamefully let down" could much better have been reserved until the Minister was in a position to make a proper reply.

The Conservatives are clearly determined to press the defence issue with all their strength, partly from a desire to ensure that all possible precautions are in fact being taken, and partly because they believe, and are trying to make the country believe too, that a Conservative Government is the only possible custodian of the defences in a time of crisis. There can be no doubt that they plan to make it a major issue at the general election, whenever it is held. The Korean crisis appears likely to have the effect of delaying rather than accelerating an election.

Meanwhile on the Labour back benches a handful of the survivors of the foreign policy "rebels" have come forward with a motion in which emphasis is placed on the need for mediation and the cessation of hostilities in Korea. No mention is made of a Communist withdrawal to the 38th parallel as a condition of mediation, but stress is laid on the need for a United States withdrawal from Formosa and of the admission of Communist China to the Security Council. It is one of those shrewdly drawn motions which, taken bit by bit, might be called unexceptionable, but which in timing and in emphasis, and in particular in the absence of any reference to the withdrawal of the North Korean forces, amount in fact to a criticism of the Government's policy. Mr Attlee certainly found it sufficiently exasperating to ask the members concerned to withdraw it; but a number of them, including Mr Driberg, who is a member of the Labour Party Executive, have held to their position. In many ways a forthright opposition to the Government's policy would be healthier than this type of sniping from behind cover.

Untried Weapons

Mr Hugh Gaitskell's statement on British employment policy, at the plenary session of the Economic and Social Council, marks—to a reasonably optimistic eye—a certain advance in realism. Mr Gaitskell recognised, even if only by implication, that none of the measures in the armoury of full employment policy is relevant to an unemployment problem arising from a decline in overseas demand and a corresponding incapacity to import, which is more than the British Government spokesmen have generally been willing to admit hitherto. Moreover, his prefatory warning against complacency referred not merely to balance-of-payments difficulties but to the older and deeper-rooted problem of the home-produced depression.

But complacency need not, as has been too often demonstrated in other spheres, consist only in an unfounded belief that one will not have to use one's weapons, but in an unfounded confidence in their efficacy when used. Mr Gaitskell listed some of the anti-depression devices ready to the Government's hand: tax remissions, reductions in social insurance contributions, the liquidation of postwar credits, on the consumption side, and on the investment side an expansion of the housing programme and of other public works. On these two comments need to be made. In the first place, a mere decline from "brimful employment"—98.4 per cent at work, as at present—to the "full employment" of 97 per cent envisaged, for example, in Lord Beveridge's "Full Employment in a Free Society," would probably, in the present state of public opinion, result in political pressure on the government to bring the entire battery at once to bear, restoring and enhancing the inflationary pressure which has bedevilled the British economy for the last five years. It is notoriously unwise to use sledgehammers to crack nuts, particularly when, as in this case, the nut is better left uncracked.

Secondly, and more importantly, there is as yet no experimental proof that the various devices listed by Mr Gaitskell will in fact suffice to ensure permanent full employment, even in a closed economy. All of them, in greater or less degree, are devices to keep the inflation going and to create enough artificial demand to employ the nation's resources in those places and occupations where they happen to be. In short, they are devices to make the pattern of demand conform to the existing pattern of supply. This can, no doubt, be done for quite a time, but only at the cost of transferring a few more initiatives from private hands to those of the state and adding a few more subsidies to the taxpayer's burden.

One can say with reasonable certainty that it should be possible to flatten out somewhat the curves of depression and to avoid the enormous positive mistakes that turned depression into catastrophe twenty years ago. But it is difficult to believe that a full employment policy can be permanently efficacious unless it includes some provisions for shifting resources from where they are less to where they are more in real demand—and it is provisions of this sort that are still conspicuously lacking. Until there has been much more thought on these lines it would be unwise to regard the untried weapons of the Keynesian armoury as a fairy-tale sword and buckler whose owner has only to put them on to vanquish whatever dragons may lie in his path.

* * *

The Indifferent Steward

The British Government, in its capacity as a planning agency and as the arbiter of the import and export programme, has shown itself to be an extremely indifferent guardian of the interests of the press and of a public which buys more newspapers per head of population than any other nation. At the beginning of 1950 the government decided that it was not possible to allocate dollars to buy Canadian

newsprint (despite the fact that it had managed to do so in the previous three years and despite the fact that the balance of payments between Canada and the sterling area was nearing equilibrium). On this basis the Newsprint Supply Company calculated that it was possible to permit seven-page papers (that is, an alternation of six and eight pages for the penny nationals) over the period of the election and six-page papers after July 2nd, since it could partially counterbalance the loss of Canadian supplies by purchase elsewhere and by increased home production. In the House of Commons last week Mr Harold Wilson implied that the newspapers had been carelessly over-optimistic. But according to a detailed statement issued on Monday by the Newsprint Supply Company it appears that the government itself was largely responsible for the sudden deterioration in supplies by making an equally optimistic deal to increase exports of British newsprint to Australia (where the newspapers are already back to prewar sizes). The problem was, however, accentuated by a sudden drying up of the other non-Canadian sources of newsprint, owing to increased American demand. The stocks in Britain now stand at only a little above half what is considered to be the safe level and there is no certainty that six-page papers can be maintained.

Faced with the prospect of an imminent newsprint famine the Board of Trade on May 9th relented to the extent of permitting 25,000 tons from Canada (or 50 per cent of the previous level of imports) for the second half of 1950, but by then the Canadian mills were sold out and no more than 10,000 tons could be secured. Moreover the Canadian mills reasonably insisted that if they were going to do business with Britain again they must know the total tonnage that Britain was prepared to import in 1951, which in any case could not, under existing contracts, exceed 75,000 tons. The government was at first only prepared to authorise the purchase of half this amount for the first half next year. However, it has belatedly realised that next year's production must depend on the level of timber fellings during this summer and autumn. After much friction it has therefore authorised the purchase of 75,000 tons for 1951.

*

The record of the Board of Trade on newsprint in the past few years makes it very difficult to acquit the government of the charge that it has either been inspired by gross malice towards the press or else that it has shown extraordinary incompetence. As Mr Wilson has himself admitted, the demands of the press on newsprint make it essential to have a steady and regular supply, whereas the government's handling of the Canadian contracts has shown that it regards newsprint as an item which can be juggled with at will. The government has constantly expressed its concern about the standards of the press, but there are quite enough ex-journalists in its counsels for it to be well aware that standards cannot be maintained and raised if it is impossible to train and deploy a constant stream of new recruits—recruits who are once again being reluctantly turned away from the doors of every newspaper office in the country. Once again, it is precisely in foresight and planning, in the ability to make a programme and stick to it, that the controlled economy seems to fall most sadly behind private enterprise.

* * *

The Menzies Mission

The goodwill and understanding that have characterised Mr Menzies's visit to London have quickly driven to ground rumours circulating beforehand of political misunderstandings between Liberal Australia and Labour Britain, and of clashes over increased Australian demands for dollars from the sterling pool. The Korean war may be partly responsible. If Communist pressure is to increase in Asia, Australia is an indispensable base for the free world and a natural link between the United States and British strength in Europe and Africa. Much of the impetus behind Australia's enormous immigration programme springs from the determination to provide Australia with the population and the economic strength to deter aggression. The capital needs which this programme entails—of which housing is only the most pressing example—go beyond the capacity of the sterling area. The hydro-electric schemes, in particular, require dollar imports. There is thus every reason, from the point of view of Commonwealth defence, for London to welcome and agree with plans for Australian expansion, even at a certain extra dollar cost.

But the success achieved by Mr Menzies also turns on the reasonableness of his case. It is true that Australia is technically a dollar "user," but this is in large measure because many raw materials—minerals, wool, meat—which could be sold for dollars are in fact supplied in return for sterling and the dollar problem of the sterling area as a whole is eased in this way. The result has been a steady growth in Australia's sterling balances which are now in the neighbourhood of £400 million.

* * *

Observers in Trouble Spots

Three lessons about the technique of "civil war" are now being learnt by those whose business it is to estimate future developments in the international field. The first is that if a personality or organ of the Cominform accuses the British and Americans of planning aggression in an area, the chances are that plans for "civil war" to break out in that area are well advanced. The second is that the measures taken to build up public opinion in the Communist sphere are an important source of intelligence about future intentions. It is curious, for example, that the persistent East European propaganda accusing the west of preparing an atomic war is never used to encourage air raid precautions or civil defence in the countries where the war fear is whipped up. The third lesson is that an international team of observers at the trouble spot can play a most important role both in checking aggressive acts and in guiding public opinion about the situation in which they take place.

The United Nations Special Commission in the Balkans has this week very properly drawn the attention of the Secretary General to the trend of Communist propaganda against Greece and Jugoslavia. They have singled out in particular an outrageous article in the Cominform journal by Zachariades, the Greek Communist leader. This contains allegations that a "Belgrade-Athens axis" for aggression is being formed and that Jugoslavia is being supplied with large quantities of American arms. It contains material, too, that would be understood by every Communist to be an order to begin extensive sabotage in both countries.

The Secretary General would do a great service if he were to propose to Uno members that commissions of international observers, like that which is still watching the frontiers in Greece, should be placed in all areas where the technique of "civil war" and aggression by proxy is likely to occur. The list of areas is easily drawn up. With such teams out in the field, and with the international press in close touch with them, the United Nations could wield the weapon of publicity that has proved so effective in the last month. If Mr Trygve Lie feels that he cannot sponsor such a proposal, it could perhaps be made the business of one of the "middle powers."

Town *versus* Country in Federal Germany

The attempt made by Dr Adenauer and his Minister of Economics, Dr Erhard, to carry out their long-heralded intention to abolish the subsidy on bread grain and fertilisers as from July 1st has brought about a crisis inside the Bonn

coalition. What is more, it threatens to disturb that peace in the labour world that has been so remarkable a feature of postwar Germany. The government has been attacked from two fronts: from a farm bloc that is exerting more and more pressure for protection, and from a trade union federation that is also trying to determine the course of German economic life in its own interests. As a result, the *Bundestag* voted last week for the subsidies to be retained in defiance of the government. Trade union anger had been roused by the action of the bakers who, ignoring the price control, immediately raised the price of bread to retain their profit margin. The bakers themselves had to face an increase of 22 per cent in the crop of wheat, and of 17 per cent for rye.

The rights and wrongs of the case are comparatively easy to assess. Dr Adenauer has handled the matter ineptly, but has the best economic arguments on his side; for the objections to removal of the bread grain subsidy are fundamentally due to the Germans' illusion that they can avoid the impoverishment caused by the war, and have every right to live better than ever. Its maintenance has roused the indignation of the American authorities who, in every country receiving Marshall aid, object to subsidies and deficit financing. They point out that 70 per cent of the bread the German public now eats is made of white flour—largely from imported, subsidised, dollar wheat—whereas before the war more than half the bread eaten in Germany was rye. Public protests, led by the trade union federation, have now been roused by the suggestion that a cheap, mixed loaf might now be substituted for white bread. To a country that lived for decades on hidden inflation, followed by American aid, it means little when the Finance Minister points out that, however much he would like to subsidise the loaf, the money is not there to do it.

Dr Erhard can justly claim that, under the policy of freedom from controls at home and liberalised trade abroad, the cost of living has dropped very considerably. In March, when the cost of living index was 174, the index of hourly wages and salaries showed a rise to 155. Since March, the cost of living has dropped to 157 (1938 = 100). The prospect of a further fall, however, is now endangered. Hopes of a drop in American food prices are now certain to be dashed; and, at home, Dr Erhard is faced with growing opposition from the organised farm bloc. This has now presented a demand that the price of fertilisers shall be maintained, that imports of fruit and vegetables shall be prohibited, and the import of all other foods greatly reduced. In the latest trade negotiations with eastern Europe, Frankfurt has been forced by the farmers to refuse the full quantities of pork and other foodstuffs offered by the Poles and Bulgarians. It would be dangerous if this attitude were allowed to dictate Bonn's policy and two irreconcilable fronts were formed in town and countryside.

Another Colonial Constitution

The negotiations that have preceded the introduction of a new constitution for Sierra Leone have followed the same lines as the discussions over Nigeria's proposed new constitution. The inevitable consequence of the artificial boundaries of the African colonies is that they comprise races of very different outlook and culture and at very different stages of development. Now that the colonies are attaining a considerable measure of responsible government, the more backward elements in them are alarmed lest they should be swamped by the more vigorous advanced elements. They therefore rely on their greater numbers to preserve their influence, while the more progressive minority retorts by claiming at least equal representation on the basis of quality.

In Nigeria, the comparatively backward Moslem north is claiming half the seats in the proposed new central legislature, on the basis of its large population. In Sierra Leone, whose present constitution dates from 1924, the "colony"—which means Freetown and its neighbourhood—objected to the proposal to give the "protectorate"—which means the rest of the country—twice as many seats in the revised legislative council as were to be allotted to itself. It claimed equal representation, in spite of its far smaller population, because of its undoubtedly more advanced state. The controversy has still not been settled, and proposals for a joint committee of both parties to discuss it amicably came to nothing. The Governor and the Secretary of State have therefore decided to impose the constitution in the hope that the differences may fade away once it is in force. A literacy qualification for membership of the Legislative Council may dispel some of the "colony's" fears, for it should lead to more educated members to represent the protectorate, which otherwise might be exclusively represented by the chiefs. It would certainly be foolish for the colony not to attempt to make the new constitution work, for in effect it brings Sierra Leone into line with the other West African colonies. It will have an unofficial majority in its Legislative Council, and, through the participation of four of these unofficial members in the Executive Council, a direct say in all major matters of policy.

The reference section of the Colonial Office's information department is to be congratulated on producing "Notes on Colonial Constitutional Changes 1940-50," which is an excellent summary of the new constitutions and their background. It is to be hoped that the section will keep it as up to date as possible.

The Future of Groundnuts

The British taxpayer, who has advanced some £35 million to the East African groundnut scheme, will not derive much comfort from Mr Webb's speech in this week's debate on the Overseas Food Corporation. Once again the harvest of groundnuts—in so far as any have been planted—has not been up to expectations, and the yields of sunflower, both at Kongwa and Urambo, have been very disappointing. Once again land clearing operations are falling behind the estimates. In fact, the only heartening conclusion to be draw from Mr Webb's survey, which he emphasised was an interim report, is that it was honest. The days of false estimates and of hiding the facts are evidently over.

But the future of the groundnut scheme is still uncertain. The shift of emphasis from its importance in the production of fats to its importance in colonial development was very apparent in this week's debate, and the Opposition once more put forward a plea that in consequence responsibility for the scheme should be transferred from the Ministry of Food to the Colonial Office. *The Economist* has always taken the view that the Colonial Office ought to have been in charge of the scheme from the outset. But it ought to be pointed out that in itself a transfer would solve nothing. All the colonial development by-products of the scheme which were enumerated in the debate—the health service, the schools, the training schemes, the transport facilities—cannot be maintained without a sound economic basis. If that basis cannot be provided by the production of groundnuts or sunflowers, what is to take its place? Neither the change in the membership of the board of the Overseas Food Corporation nor, if it takes place, a transfer of departmental responsibility should be used as an excuse for refusing to tackle this crucial question.

* * *

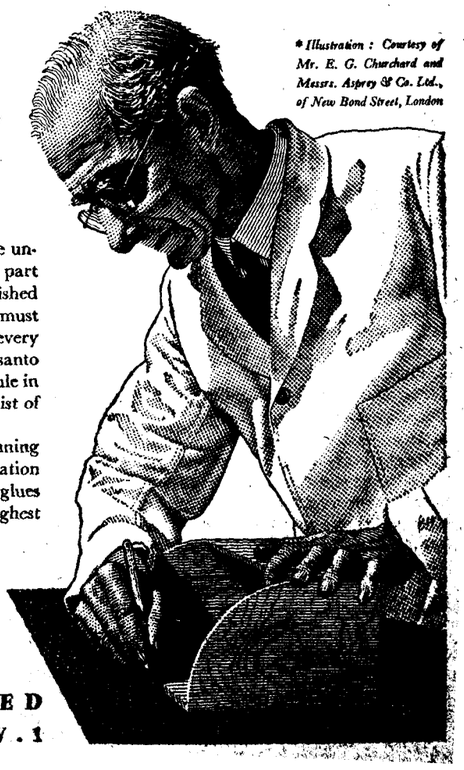
The Status of South-West Africa

The International Court of Justice, to which the United Nations had referred the South African Government's proposal to incorporate South-West Africa as part of the Union, gave its advisory opinion last week. It reached four main conclusions. First, by a majority of eight votes to six, it decided that the Charter of the United Nations imposes no obligation on the Union Government to place the territory under trusteeship. Secondly, it decided unanimously that the territory is still under mandate, and thirdly, by twelve votes to two, that the Union is still bound by the obligations imposed by the mandate, in particular the obligation to submit reports on its administration of the territory. Fourthly, the court decided, also unanimously, that the Union cannot modify the status of South-West Africa without the consent of the United Nations.

The Union Government had already declared that it was not bound by the opinion of the international court. If it therefore ignores the court's findings and persists in flouting the wishes of the United Nations, what happens next—and in particular what should be the attitude of Great Britain? It did not associate itself with the General Assembly in condemning the Union for refusing to submit reports to the Trusteeship Council, because the legal position was not then clear. Now that the international court has given its opinion, this equivocal attitude can hardly be maintained much longer. Whatever the exact legal status of South-West Africa, and whatever the validity of the United Nations' assumption of the supervisory functions of the League of Nations, it is quite clear that the Union Government has no authority in the territory except that which derives from the mandate. It would be quite indefensible therefore for South Africa to invoke the mandate in order to justify the incorporation of South-West Africa and at the same time to disregard the obligations of the mandate by refusing to submit reports.

If Dr Malan follows this course, and is in consequence stigmatised as an aggressor by the United Nations, Great Britain will be in an unenviable position. But both on moral grounds, and in its own interests in Africa, it cannot associate itself with a country whose native policy has become a symbol of oppression. If Dr Malan forces the matter to an issue—and it is to be hoped that he will not—the British Government must not hesitate in taking its stand against him.

* * *



Educational Politics

In the debate on education in the House of Commons last Monday, the Opposition attacked and Mr Tomlinson defended the minimum age limit of 16 at which children may sit for the new General Certificate of Education. The most serious aspect of this controversy has been the unwillingness of the Minister to produce at any time a considered and convincing defence of his policy. There are, indeed, certain advantages which may be reaped from the imposition of a minimum age limit. But the opponents of the age limit, who include many distinguished and experienced educationists, have given their opinion that the damage to the level of scholarship in the schools will be much greater than the uncertain advantages to general education. Mr. Tomlinson has never attempted to answer this view and he failed to do so in this week's debate. The schools are now in process of adjusting their syllabus to the new examination and to the age limit. It may well be that the effects will be less evil than some people suppose. But the fact remains that a decision was made for the wrong reasons. By administrative act the Minister has broken into the schools' most sacred ark—their independence from interference in academic matters—and he should be prepared to defend his action more convincingly.

The truth is that the reasons for instituting the age limit were political, not educational. The age limit of 16 was fixed in order to rule out from taking the examination all children at secondary modern schools who leave at 15, and thus to avoid any invidious comparisons between their attainments and those of grammar school children. But

Whenever Export figures are quoted there comes the accustomed reference to 'expert British Craftsmanship'. But . . . have you ever stopped to ask yourself . . .

"Who are Britain's Craftsmen?"

* *Illustration: Courtesy of Mr. E. G. Churchard and Messrs. Asprey & Co. Ltd., of New Bond Street, London*

*Introducing Edgar George Churchard. Over sixty years a craftsman in leather goods, and for many years senior foreman and cutter for a department making the highest quality fitted cases, wallets, handbags and travel goods. These exclusive products help to place Leather Goods high on the Export List.**

But . . . does craftsmanship mean only hand-craftsmanship? The fine grade leather from which these goods are fashioned . . . the special glues used to bond leather to frame . . . are themselves produced by craftsmanship, although one may be unable to spotlight one man or one part of the process. And if the finished article is to be a masterpiece must there not be craftsmanship at every stage of its production? Monsanto think so, and they follow this rule in making chemicals for a long list of British industries.

Monsanto chemicals for tanning play a vital part in the preparation of fine leathers. Monsanto glues assist in turning them into highest quality leather goods.

Monsanto make over 200 chemicals for use in industry. Of widely varying application, they all conform to the highest standards of craftsmanship in chemical manufacture.

MONSANTO CHEMICALS LIMITED
8, Waterloo Place, London, S.W.1

whatever satisfaction the original decision may have given to the National Union of Teachers, it must have suffered a severe reverse when Mr Tomlinson stated on Monday that he hoped that the secondary modern schools would in future tempt their pupils to stay on to 16 and to take papers in the General Certificate of Education in subjects never dreamed of in the old school certificate. He has thus broken down the artificial defence set up by the 16-year age limit to protect the reputation of the secondary modern schools before it has even been tested.

Red Teachers

In the same debate Mr Brooke and Mr G. Thomas raised the question of the policy to be adopted towards Communist teachers. This is a question of which more is likely to be heard in the future and it deserves a thorough airing in public debate. Hitherto most local authorities have turned a blind eye on the Communist affiliations of their teachers provided their school work was unaffected. But as the true character of Communism becomes more widely recognised this attitude becomes harder and harder to maintain. Mr Brooke and Mr Thomas cited Communist influence among the teachers in training colleges. It is probably as strong in the schools themselves. In making appointments what policy should local authorities adopt?

There can be no doubt that the influence of Communist teachers over their pupils can be very powerful. Except in the secret recesses of Government, from which they are already barred, there are few places where Communists can achieve a greater and more enduring effect, and most parents would strongly resent putting their children within this circle of influence, if they were aware of the facts. Yet for a local authority or any other employer to take account of political sympathies in deciding on a candidate's fitness for a job is deeply repugnant to most English people, and could lead to great abuse of power. The problem seems as difficult to solve as all the other problems raised by the existence in a democratic society of a body of men and women who are prepared to use the facilities which it offers in order to achieve its overthrow.

* * *

Perón's Inflation

The unprecedented prospect that Uruguay may supply Britain with half as much meat as Argentina in the next twelve months should provide plenty of food for thought in Buenos Aires. While Argentina's current exportable surplus is partly reduced by the severe drought of last December and January, the long-term causes go deeper; they are to be sought in the wasteful and uneconomic policy of self-sufficiency which President Perón has pursued ever since he came to power. One of its results has been an intense inflation, which, at the end of the fourth year of Perón's presidency, is now the outstanding feature of Argentine internal economy.

Sporadic efforts by Señor Miranda's successors to stem the rising tide have proved singularly ineffective. In particular, attempts to limit government spending, the main factor in the problem, have been frustrated again and again by arguments of political expediency. A tentative effort last year, for instance, to cut expenditure on the armed forces was very quickly dropped.

In May this year currency circulation had risen to 10,379 million pesos, or more than two and a half times the figure at the end of 1946. Deposits held by banks for the account of the Central Bank were nearly twice those of 1946, at 21,084 million; while bank loans and advances rediscounted by the Central Bank rose to 18,502 million, or nearly five times the 1946 figure. Measures taken last year to restrict bank credits have merely proved inflationary, since they have been applied to private industry only and have resulted in a switch of funds from industrial production to government enterprises. Conservative private estimates of the rise in the cost of living now suggest that with 1939 as 100, the equivalent in January, 1950, was 374, compared with 292 in 1949, 222 in 1948 and 151 in 1946. The figure today is probably over 400.

It is true that the Argentine worker, compared with the middle class, is better off than ever before. But this improvement has been achieved by wage increases which have so far just kept a jump ahead of the inflation—a process which cannot be kept up indefinitely if Argentine exports are to pay their way. Already many essential consumer goods are growing scarcer and, with the virtual absence of imported non-essentials, more and more expensive. If now, in order to reverse engines and send men back to the land from which they should never have been lured away, extensive government credits are going to be handed out to the farmers under Perón's "new economic policy," then the inflation will certainly grow worse.

Shorter Note

In an action in the King's Bench Division last week it was held that the Statutory Order made by the Minister of Labour under the Wage Councils Act, 1945, dealing with holidays with pay in the wholesale mantle and costume trade was not *ultra vires*, although it did in effect impose some retrospective liability on an employer to make holiday with pay allowances based on periods of individual employment extending back over a period before the Order came into force.

Preserving the Aristocracy

There are . . . amongst us not a small number of socialists, communists, quasi philanthropists, and persons whose lives are passed in devising schemes for promoting the public welfare, who practically believe that some kind of legislation can alter the great natural relations which exist between man and the external world, and they continually demand changes in the law to make all men equally respectable, comfortable, and happy. They are instructed that legislation keeps up the aristocracy, and they in turn require that the democracy shall be sustained. . . . Though great industry and great talents and moral worth all conspire to establish and maintain the superiority of individuals or of classes, and so create something corresponding to an aristocracy in every society —such an aristocracy being as marked and distinct in republican America as in monarchical England—yet it is perfectly plain that without wealth there can be no aristocracy. An aristocracy supplicating for employment or begging for bread is a moral contradiction. Unless Parliament can find means to keep the aristocracy relatively wealthy, or proceed on the plan of paying, pensioning and feeding it as it feeds the army and navy, it is beyond the power of Parliament to preserve the aristocracy. . . . It may select a House of Lords from the natural aristocracy of society, placing in it those who are most eminent in learning, in theology, in law, in arms, in politics, in science, in trade—and those who have acquired or possess great property; but it cannot, merely by its will, insure for a House of Lords either respect or power—and if wealth be fast accumulating beyond the House of Lords—if public opinion become somewhat hostile to the sort of learning and talents and heroism heretofore honoured by elevation to the peerage, its fiat cannot preserve for such an assembly the power it may have had in the constitution.

Canada wants you on the spot!

CANADIANS are waiting to get you on the spot—*in person, in Canada*. They want to buy *your* goods—and now is your golden opportunity to capture orders in this valuable hard-currency market!

Lose no time. Fly to Canada yourself by Trans-Canada Air Lines, the most frequent direct service. T.C.A. link you with *every* important Canadian and U.S. city, and there are also frequent connections with all major U.S. airlines.

In the Heart of Canada's Market!

Just step aboard one of the famous North Star pressurised Skyliners at London or at Prestwick. You'll thoroughly enjoy the swift, smooth, luxurious flight. Less than a day later, you'll be right in the heart of Canada's market—and within easy reach of the U.S. market, too. Remember, also, you save valuable dollars by booking T.C.A. right through to your final destination.

Fast T.C.A. services leave Britain for Canada daily. Let T.C.A. take you there—and *you* will take the orders!

WING YOUR WAY IN A SKYLINER!

T.C.A. North Star Skyliners give you not only the *most frequent* direct service to Canada—but swift, smooth, *luxurious* travel. You'll thoroughly enjoy every minute of your trip—especially the roomy, comfortable cabins and the wonderful, piping-hot meals!

And, on arrival, the services of *all* T.C.A. offices in Canada are at your disposal—throughout your stay.

TRANS-CANADA *Air Lines*

Books and Publications

Groundwork for Victory

The Second World War: Vol. III. The Grand Alliance. By Winston S. Churchill, O.M. *Cassell.* 818 pages. 25s.

The year 1939 was the crisis of peace, 1940 the crisis of defensive war; 1941, in comparison, was an indecisive year. And yet, if indecisive, how crowded it was with events! It began with victory in East Africa and the great crisis in the Balkans and Middle East—the arrival of Rommel in Libya, the German invasion of Yugoslavia and Greece, the disastrous loss of Crete, the revolt of Rashid Ali in Iraq, the Anglo-French war in Syria, the Anglo-Russian occupation of Persia. The summer saw the German attack on Russia; the winter the Japanese attack on America. All the time there were feverish and spectacular comings and goings, diplomacy and manœuvre: Hitler pushing Franco, Mr Churchill pushing the Jugoslavs and Turks, Hess dropping out of the sky in Scotland, Matsuoka gyrating round Europe, and Prime Minister and President secretly meeting on the Atlantic sea.

By the end of the year, though the military frontiers had not been decisively altered—Germany and Britain had both consolidated their position in the areas under their control—the immediate position for Britain was worse than ever. The Germans were deep in Russia, the Japanese supreme in the Pacific, Rommel invincible in Africa. A series of colossal naval disasters had destroyed or immobilised, in a few weeks, more than a third of the British battleships and battle-cruisers and the entire American Pacific Fleet. But potentially and politically Britain had won, through its perseverance, through Hitler's blunders and Mr Churchill's patient diplomacy, a guarantee of ultimate though still remote victory. It was no longer isolated: it was the centre of a great coalition of powers, a new Grand Alliance.

All the stages of this great change are illuminated by Mr Churchill's new and copiously documented volume. On the outbreak of the Russian war he has interesting observations, generally of a dry character, and his account of the Japanese attack adds little to the Hopkins papers. Most interesting is the controversial question of the Balkan campaign. Mr Churchill's policy was clear. The western flank of Egypt, up to El Agheila, must at all costs be secured: there was no question of sacrificing this to any other need, however urgent. A mass of manœuvre must be concentrated in Egypt, to enable intervention in Greece if desired; and successful intervention in Greece was dependent on a Balkan coalition of Turkey, Jugoslavia and Greece. In fact, the Balkan coalition crumbled in the making; the prospect of positive success disappeared; and there remained a question of the relative disadvantage of leaving Greece to its fate when half-committed or of continuing to share its misfortune. The latter policy was accepted. It delayed the German attack on Russia by five weeks, but its real justification lay not in this uncalculated result but in the world of intangibles where certainty is impossible, even after the fact. The loss of Crete and of El Agheila was in an entirely different category. Crete was in fact a Pyrrhic victory for the Germans: their seaborne invasion was a total failure and their ultimate success ruined their only airborne division. El Agheila was an unqualified British defeat, largely owing to General Wavell's miscalculation of Rommel's armoured strength and capacity.

The whole question of Mr Churchill's relations with the late Lord Wavell is most interesting, and the evidence, being contemporary documents, seems conclusive. Wavell seems to have been consistently wrong: he refused to believe in an imminent German attack on Greece and doubted the prospect of an attack on Crete. He immobilised troops in Kenya and protested that an East African campaign before the rains was impossible; when overruled he found victory easy. He completely miscalculated Rommel's strength and so lost the vital Western flank. Mr. Churchill's treatment of Lord Wavell in this narrative is always generous, but the documents support the view on which he ultimately relieved him of his command —that he was "tired out."

Mr Churchill was never tired out. Once again the most astonishing feature in this history is his gigantic range, his incredible vitality, intervening everywhere with an amazing grasp of strategic detail, explaining to this Admiral, correcting that General, overruling now the timidity of the Admiralty, now the strategic views of the CIGS, and (in the cold afterlight one must agree) substantially correct. It is no doubt with some complacency that he reprints so many documents proving his correctness; but they are documents, and who else could have done so? If this volume is less eloquent than its predecessors in style, in content it is, if possible, even more convincing. The documents speak, and proclaim him the greatest of war ministers, more effectively than the pompous titles so authoritatively claimed by "the greatest war-lord of all times" or "Generalissimo" Stalin.

Precision and Vagueness

A Critique of Welfare Economics. By I. M. D. Little. *Oxford University Press.* 275 pages. 18s.

To find an analogy to Mr Little's book one must, perhaps, go back to De Quincey's attempt to restate the doctrine of Ricardo in the light of those concepts and subtle distinctions which he had learned as a student of philosophy. Mr Little, however, is likely to have a greater impact and a wider influence than De Quincey did. The economists who followed the latter for long remained primarily interested in the practical aspects of their science; today, with the great growth of academic economics, professionals on both sides of the Atlantic are pouring forth publications on the foundations and presuppositions of economic theory. At the philosophic level, Mr Little puts most contemporary economic writing on this topic in the shade. He is equipped with the tools of modern Oxford philosophy, now undergoing a notable renaissance, and he knows how to use them.

If the reader expects great precision in Mr Little's definitions and statements of postulate he will be disappointed. Mr Little is indeed capable of great precision when dealing with a purely economic point (for example, with indifference curves or as he prefers to call them "behaviour lines"), but in the realm of philosophical presuppositions he is doubtful and tentative. This does not mean woolliness of thought. Extreme accuracy of thought demands perfect adjustment to its subject matter; the subject matter here being human nature, what can be said is inevitably infected with vagueness and uncertainty. (All this will come as a great shock to economists striving after precise statements; they will have to take the shock or be quite outclassed.) For instance, Mr Little has no difficulty in demolishing the supposedly fundamental distinction between the "scientific and objective" character of the data desirable from the observed "marked behaviour" of an individual and the vaguer, "unscientific," inter-personal comparison of satisfactions, which provides the intellectual justification for equalitarianism. He certainly raises this subject on to a new plane of accurate thinking—though one where few laymen will try to follow him.

In the first half of the book Mr Little is dealing mainly with presuppositions, in the second half with constructive economic doctrine. The latter is less satisfactory. He argues that the effects in income distribution of any economic change should always be given great weight when the merits of that change are being assessed. It is doubtful whether the general effect of such repeated weighings would be good; in the long run, changes in income distribution move either way and are apt (though not certain) to cancel out, while improvements in production are cumulative. Mr Little's logic need not be criticised; what seems wrong is his judgment of the quantitative importance of the productive and redistributive effects of new measures.

Mr Little seems to take more pleasure in his destructive work than in his constructive proposals. There is a danger here; the habit of mind that finds more pleasure in destruction in the purely intellectual sphere may be symptomatic of a society that lacks the vital instincts of self-preservation. This book establishes him as a thinker of the first flight and a fine economic theorist. Readers will wait with interest to see what he can do when he turns his attention to the more central parts of economics.

Irish Studies

Ireland: its Physical, Historical, Social and Economic Geography. By T. W. Freeman. *Methuen.* 555 pages. 32s. 6d.

Mr Freeman's book is the first comprehensive geography of Ireland that has ever appeared. To say that it fills a long-felt want would be a severe understatement. It contains a great deal of knowledge never before gathered together in a convenient form, and will prove an invaluable text book and reference book for all students of Irish affairs. The illustrations, maps and bibliographies are all excellent. The island is treated as a unit, as is proper in view of its sea-bound individuality. Its present division into two political units is regarded as of less permanent importance than its natural division into twelve regions well marked by their distinctive physical and agricultural features. This is not to say that the problems created by political partition are overlooked or evaded. On the contrary, Mr Freeman draws attention to the fact that the divergent economic policies and alignments of Eire and Northern Ireland may render their political union more difficult the longer it is delayed.

The economic history of Ireland is of fascinating interest, if for no other reason because of the fall that has taken place in the population during the last hundred years. The great famine of 1845 constituted a crisis in Irish affairs of the same magnitude as the industrial revolution in Great Britain. The effects of the famine began to wear themselves out in about fifty years. The year 1891, when the tide of emigration began to diminish and the Congested Districts Board was established, marked a secondary turning point, after which Irish economic trends began to show a slight improvement. Except in a few years, however, the population has continued to decline.

Mr Freeman demonstrates how emigration has been directed more and more away from the United States and towards Great Britain. The recent British policy of full employment has relied on abundant supplies of labour to fill the vacancies caused by military service and emigration to Commonwealth countries. These supplies have been partly drawn from Ireland, which has become "a reservoir of workers on which Britain may draw more or less at will." Mr Freeman thinks that emigration from the rural areas has gone too far. It has resulted in a shortage of labour which is preventing the intensification of agriculture. "Never," he remarks, "has so much land been farmed by so few." He suggests that steps may have to be taken later to limit emigration in future. It will be interesting to see whether this opinion will be shared by the Irish Commission on Emigration, the publication of whose report is expected soon.

The Population of Ireland 1750-1845. By K. H. Connell. *Oxford University Press.* 293 pages. 18s.

Students of demographic history have found many interesting problems in connection with the great increase in the Irish population in the sixty years before the Famine. According to the most generally accepted estimates, the population increased between 1779 and 1841 by 172 per cent as compared with 88 per cent in England and Wales. Mr Connell discusses these estimates, which are derived from the hearth-money returns. In the light of what can be learnt about the number of houses in Ireland and the average number of people in each house, he reaches the conclusion that the actual population in the eighteenth century was greater than the traditional estimates and that the increase in the early nineteenth century was less than that generally accepted heretofore. But he is satisfied that the rate of growth accelerated considerably after 1780. The population of Ireland increased by 17 per cent in each decade from 1780 to 1821 in spite of considerable emigration. Between 1821 and 1845 the increase continued, until it was checked by the appalling catastrophe of the famine of 1845.

W. H. SMITH & SON POSTAL LIBRARY SERVICE

There is no evidence of any general prolongation of life during the period. The increase in the population was caused, therefore, by an increase in fertility which, in turn, was caused by earlier marriage. Mr Connell finds evidence of "both the desire and the opportunity to conceive almost as many children as it was possible for the mother to bear." The desire for large families was based on the value of juvenile labour and the attractions of early marriage in conditions when food and housing were cheap. The potato and the hut constructed of mud and sods were both conducive to large families. After 1780 this desire became easier to gratify. The potato became, to an even greater extent than earlier, the universal diet of the working classes, the increase in arable farming led to subdivision and the supply of land was increased by reclamation. The rate of increase was highest in the localities where the highest mortality prevailed. The earlier age of death of the parents made marriage easier for their children, and the ravages of infantile mortality made a larger number of births desirable. There was thus a grim correlation between mortality and fertility in the poorest areas, which were doomed to suffer most in the famine years. Mr Connell's book is at the same time a valuable addition to Irish economic history and a fascinating account of Malthusian problems in the age of Malthus.

Shorter Notices

How States are Governed. By Ernest F. Row. *Pitman.* 101 pages. 7s. 6d.

This little book is, despite its expense, of considerable value. It is the third edition of a work first published in 1935 and now revised to cover the changes in constitutional structure and development which have occurred since then. Mr Row writes with a dual aim. He provides a simple primer to enable the intelligent newspaper reader to follow the jargon of political and constitutional ideas, both in Britain and abroad. In the second place, the book is intended as an introduction for senior schoolboys to the study of political science. There is no subtlety in Mr Row's analyses of constitutions and their effect upon political development but he uses clear and simple language and concentrates upon essentials in describing the different types of modern state and constitution, the meaning of sovereignty, representation, the rule of law, second chambers, federal government—in short the basic arithmetic of political science.

Labor Dictionary. By Paul Hubert Casselman. *Philosophical Library, New York.* 554 pages. $7.50.

Professor Casselman has dedicated his concise compendium of labour information to the attainment of industrial peace, but it might as happily have been dedicated to that of international understanding. For the language of American trade union controversy confounds the foreigner's confusion over the issues involved. This dictionary is a useful chart to the colourful phrases in the American labour glossary. "Red tape" seems to mean the same in all English-speaking countries, but what about "blue-sky bargaining" and "yellow-dog contracts?" The latter is said to be the equivalent of "signing the document" in Britain, a term not much more enlightening to the average British reader. But in the 2,461 entries such a reader will find explanations of the various alphabets and Acts which are required knowledge for any explorer of American trade union terminology. The meaning of such terms as "therblig," perhaps not quite so essential, are also given as clearly as the subject (time and motion study) permits. It is another sign of the times that "industrial music" is given more lines than "Samuel Gompers," the father of American trade unionism. The Boake recommended to the brewer; they include "bandle-stiffs," "bellunks," "boondoggling" and "bourbon" (which in this context is neither whisky nor a dynasty).

Day of Judgment. By David Cushman Coyle. *Harper and Brothers, New York.* 205 pages. $3.00 (London, *Hamish Hamilton.* 21s.)

"The day of judgment," says Mr Coyle, "is the time when mankind . . . comes face to face with science." That is the publicist speaking and it is the publicist who must be called to account for the flamboyancy and superficial political theorising of this book. But flamboyant generalisations and stimulating superficiality make easy reading and Mr Coyle is writing for people who will not read anything difficult, for those Americans "who trust too much to luck." Mr Coyle, an engineer and economist as well as a publicist, puts at least one foot to the ground in the chapters dealing with production, agricultural and industrial. But it is hardly possible for an author to come down to earth for long if he has only 200 pages of well leaded type in which to discuss western civilisation, the meaning of freedom, the limits of the material world, democracy and destiny.

"Gold for Europe," by Hjalmar Schacht published by Duckworth at 7s. 6d. was reviewed in *The Economist* of December 3, 1949, when it appeared in German, published by Otto Meissner, under the title of "Mehr Geld, Mehr Kapital, Mehr Arbeit."

Letters to the Editor

Reconstruction in Greece

Sir,—I have read with interest the article by an Athens correspondent in your issue of June 17th. First as Chairman of the Reconstruction Committee and later as Prime Minister, I have been intimately concerned with the matters discussed. I hope, therefore, that you will allow me a few lines to dispel certain persistent misconceptions.

It is now agreed that Greece cannot hope to reach economic equilibrium by concentrating merely on the development of agriculture. The cultivable area is so limited that Greece will always have to import foodstuffs: for 1950, the domestic wheat crop is estimated at about 800,000 tons, leaving about 500,000 tons to be imported. The cost of food imports is likely to remain at around $100 million annually. There are, however, a number of items to the credit of Greek agriculture:

(1) Cotton output is now 15,000 tons annually, and can be expanded further;

(2) Currant exports are today worth roughly $6.5 million per annum, in the face of severe competition;

(3) Tobacco, until recently the major export, provides a livelihood for some 900,000 persons. The prewar exports of 48,000 tons annually—of which 20,000 tons to Germany—were worth about $93 million. Now, however, Virginia is displacing Oriental tobacco in Germany, and Greek exports are down to 28,000 tons annually.

(4) Domestic production of vegetables and fruit is adequate for home needs.

The food yield per acre can be substantially increased by developing intensive cultivation and the agricultural processing industries. Further improvement along these lines cannot, however, lead to a solution of the country's two major problems: food production will not expand as rapidly as the already excessive population; nor can additional agricultural output correct the present unbalance of the whole economy. Only by eliminating the "structural deficit," created by the general unsoundness of the economy, shall we be able to offer productive employment to all, whether in the countryside or in the towns. This major change can only be achieved by industrialisation.

Greece's natural resources, if properly exploited, should prove adequate to sustain a rising level of production. Certain basic industries must, however, first be created. Chief of these are:

1. Iron and steel. Both British and German experts consider that there is sufficient iron ore in Greece to justify the construction of a blast furnace. The necessary plant for steel-making will be available from reparations, so that only comparatively small amounts of American aid would be needed. Even the planned initial output of 125,000 tons would reduce the deficit by $10 million annually for steel and $26 million for secondary metal goods.

2. Bauxite. Bauxite, now exported raw, could be processed and shipped as alumina.

3. Magnesite. Greece has large deposits of good quality magnesite, eminently suitable for the production of magnesium, which is in short supply elsewhere.

4. Soda and nitrates. Domestic production from local raw materials should save $22 million annually in foreign exchange.

5. Oil. Refineries could be erected in Greece with Marshall Aid funds, as they have been in other small countries. Greece's geographical position should enable it to obtain crude oil $4 to $5 per ton cheaper than other European countries.

These basic industries alone are expected to provide openings for an additional 120,000 workers, mostly in new industrial centres away from the capital. There is, however, very little spare capital in Greece and only the re-modelling of the economy on sounder lines will make more available. Industrialisation is essential to give Greece financial independence and a stable currency, and so enable it to become a productive member of the European community. Otherwise, American aid may not lead to the desired results.—Yours faithfully,

ALEX DIOMEDE,
Formerly Prime Minister and Chairman, Reconstruction Board, Greek Government.
11 rue Barbet de Jouy, Paris VIIe
Paris

Juggling With Defence Budgets

Sir,—Comparison of the arms expenditure of the USA and the USSR based on the proportions of the national budget devoted to military purposes is even more misleading than your Note of last week demonstrates. In addition to the considerations you raise, it is also important to remember that a much higher percentage of the Russian national income is included in the budget than is the case in America. Further, the US Federal budget is distinct from expenditure by each of the forty-eight separate States, and one would therefore expect the Federal budget to be devoted almost entirely to military expenditure, foreign aid and domestic conservation and assistance programmes.

That the United States spends more of its budget on war preparations than the USSR is therefore irrelevant in estimating the comparative expenditure of each country. The truth would seem to be that the Americans are spending more in terms of actual money, but that the Russians lay out a higher proportion of their total national income.—Yours faithfully, HARVEY R. COLE
44 Avenue Road, London, N.W.8

Financing the Hospitals

Sir,—There has been so much confused thinking both with regard to the financing of, and the delegation of responsibilities in, the hospital service, that it is especially important that influential journals should show true appreciation of the facts, and perhaps I may be allowed to make some comment on your article. With the Chancellor's announcement of a ceiling for the health services and the Minister's consequential instructions to the authorities concerned, the spending madness which has been a feature of the hospital service since the Appointed Day was in fair way of being cured and some sense can now be made of the financial arrangements made and the administrative framework set up by the Minister under the National Health Service Act.

It is insufficiently appreciated that the ceiling announced is primarily in respect of the financial year 1950-51 and is considerably in excess of the approved expenditure for 1949-50. It therefore represents a state of development, in the hospital service at least, which has not yet been reached, while of course not allowing all the improvements that hospital authorities sincerely desire. This being so, it is difficult to conceive how a regional hospital board having been granted the finance to carry on the existing service, with the addition of an amount sufficient only for part of the developments envisaged by its own planning proposals and those desired by its hospital management committees, can proceed to choose from these developments without requiring from hospital management committees a detailed estimate of the cost of running the existing service and the cost of each new development proposed.

It is hardly consistent to belabour a system which is alleged to provide "an incentive to extravagance" and at the same time criticise those essential functions of it which serve both as a curb on the over-estimating from which extravagance apparently stems and as a channel for the effective deployment of the total amount allocated to the service. Until services are adequate universally within a region, or for that matter throughout the country, the Minister and the regional hospital boards can hardly avoid some detailed consideration of hospital budgets, else the financial resources available will not be used to advantage and the priority of new schemes will not be related to needs. In this way, schemes to provide additional tuberculosis beds will not depend on "chance savings" for implementation but will be given the precedence they deserve in relation to the other needs *of the region* and ultimately *of the country*.

Under present conditions therefore the case for more power to be given to hospital management committees to spend up to their "grants" as they think fit, so far from being "unanswerable" has not even been made, since if committees are socially conscious of the fact that they are part of a national service and wish to co-operate in it, theoretically any economies they make on existing services should be willingly made available for financing essential development elsewhere.

In the same way with the introduction of an upper expenditure limit for the health service it may be that the present system of budgeting is not so impracticable after all, especially since the granting of block allocations to regions has made for a degree of flexibility in finance which in practice, with good will and endeavour, should resolve most of the difficulties encountered hitherto.—Yours faithfully, GORDON MCLACHLAN
14 Airlie Gardens, W.8

Sir,—The national health service now faces a critical phase by reason of its tremendous cost. Much is due to increased expenditure on salaries and increased commodity prices. Far too little is due to extension or improvement of the hospitals. They are faced with two dangers in particular. One is the indiscriminate application of percentage cuts. The other is the curtailment of progress by the dominance of financial stringency over all other considerations—particularly dangerous is this in the case of hospitals, since progress, especially through medical research, is the essence of their vitality.

What then can be done? I suggest, first, the overhaul of the new administrative system. Over-centralisation of hospital administration does not effect economy. It is decentralisation, *not* further centralised control, that is required. The total amount to be expended on the service—based on local estimates of requirement—must, of course, be determined by Parliament; but greater, not less, flexibility is needed in the final breakdown into the global sums for the maintenance and improvement of the local hospital services. And over the spending of their allotted sums the hospital management committee should have complete freedom, coupled with the right to spend at their own discretion any moneys saved by prudent administration and economy.

My second suggestion devolves from the first. If the management of the hospital services is centred where it belongs—in the locality served—there could be a great resurgence of local public interest in the hospitals and their needs. Proof of this is already to be found in the fact that several hundred thousand people—dubious at first whether they might be intruding or whether their gifts of service or money might be welcomed—have voluntarily organised themselves into Leagues of Hospital Friends in support of their local hospital or hospitals. In addition to providing all kinds of amenities for the patients and staff, some of these bodies have raised considerable sums of money for some special and urgently needed object connected with their local hospital service; and in at least one case medical research has also been generously supported.

If the people are encouraged personally to serve and take an interest in their hospitals, some at least of the present difficulties can be overcome.—Yours faithfully, J. P. WETENHALL,
Chairman, National League of Hospital Friends
12 Whitehall, S.W.1

Harvesting Seaweed

SIR,—It is desirable to correct two errors of fact in the note on "Harvesting Seaweed" on page 97 of *The Economist* of July 8th. You say that the Scottish Seaweed Research Association is wholly financed out of the Scottish Development Fund, but since there are a number of private and corporate subscribers to the Association it would be more accurate to say "largely financed."

Your note states that the "largest alginate producer" is a subsidiary of Messrs Albright & Wilson; in fact this company, which is the largest alginate producer in the world outside the United States, is not a subsidiary of Messrs Albright & Wilson or any other company.—Yours faithfully,

A. H. STEWART, Secretary
ALGINATE INDUSTRIES LIMITED
4 Moorgate, E.C.2

AMERICAN SURVEY

The First Casualties

(From Our American Staff)

FLATULENT over-confidence, not truth, was the first casualty of the Korean war. A few hours before the news of the invasion reached Washington, the Secretary of Defence had returned from a visit to the Far East announcing that "We've got all the facts." A week or two earlier Brigadier General Roberts, the head of the military mission training the South Korean army, had boasted that it was the best fighting force in Asia and able to lick three times its number of North Koreans. Tanks, he added, were no menace in such difficult country. As for tanks, the Secretary of the Army had said on June 6th, at the time when the Pentagon was singing the praises of its new weapons, that "It may well be that tank warfare as we have known it will soon be obsolete."

It was not long before all these statements were made to look ridiculous. But there was a short period, in the early days of the fighting and before the experienced war reporters began to arrive in Korea, when the Defence Department's pre-war optimism was being echoed in the news from the front. It was assumed, as a matter of course, that the first few American troops to arrive in the line would at once turn the tide. And this illusion was heightened by stories of officers saying grimly that "We are not going any further back. We are going to the 38th parallel." A few days later a number of miles further south, they were shouting "This is where we stop. From now on we go north," before retreating again. Such exhortations may be good for the morale of troops, but they mislead the public at home. It was not long, however, before the correspondents, the military authorities and Congress began to admit the full weakness of the American position. (The admission came more quickly and was more forthright than in London during the Norwegian campaign of 1940.) The war was hardly two weeks old before the possibility of being driven off the mainland was being soberly discussed. And by that time the value of the delaying actions of the small American contingent was beginning to be understood.

The United States now finds itself in a situation with which other countries are only too familiar: that of beginning a war without preparation and being forced to buy time as best it can. It is fighting with battalions on a peacetime establishment and with experience only of occupation duties, with weapons exploited during the last war and with generals who may well be past their best. The plans for the expansion of the armed forces will provide the manpower and equipment at a pace which, if precedent is any guide, will astonish the world. There remains the problem of leadership. Curiously, for such a nominally civilian country, the armed services have always been able to remain largely above criticism. The State Department is everybody's whipping boy. The generals, at least in Congressional eyes, can do no wrong. And therefore every action which is approved is attributed to the military, and every unpopular one to the State Department.

Soon after the war started the weekly magazine *U.S. News* published its version of what happened during the first two days. "General Douglas MacArthur," it says, "called the turn in US policy calling for a showdown . . . insisted that there should be no new retreat. . . . State Department officials were expressing the view that Southern Korea would have to be crossed off as expendable. . . . Mr Acheson was quick to agree on the need for a showdown with Communism in Asia when all the cards were on the table and when General MacArthur outlined the action needed." In this way myths are created that pervert the truth. It was Mr Acheson who insisted on action. General MacArthur, whose intelligence had left him in complete ignorance of the North Korean preparations, continued to oppose the idea of intervention until the moment when he was ordered to use his air force and fleet.

*

Indeed, the mystique that surrounds General MacArthur is one of the complicating factors in this situation. A man who has been out of his own country for more than ten years and has steadily refused to return even for a visit would seem an unlikely national hero. But he has become, by an accident of history, a symbol of bipartisanship in military affairs. The incidence of left-wing generals in the United States Army is not high—their political views usually run parallel to those of French generals under the Third Republic—but only General MacArthur seems to radiate that particular brand of conservatism which reassures Middle Western Republicans. "I have confidence in General MacArthur" was the reason given by Senator Wherry for his support of the President's decision to commit ground troops. Since nothing in the General's public statements suggests that he agrees with the isolationist philosophy of the Senator and his friends, it can only be assumed that he has given private proof of his belief in the principles of the *Chicago Tribune*—which supports him with fervour. If so, it is a malicious trick of fate that he should be the first man to command forces of the United Nations and to fly the United Nations flag.

During the five years of his reign in Japan he has, whatever the state of training of the troops under his command or the efficiency of his staff, kept his relations with visiting Congressmen well up to scratch. And, since he is more articulate than most generals, his visitors have come away with oracular statements on which many an anti-Administration speech in the Senate and House has been based. But, although General MacArthur has long been recognised as an oracle, the Delphic quality of his utterances have sometimes been overlooked. His ability to tell his callers exactly what they wanted to hear has, in the past, led to the spectacle of different visitors returning to expound different gospels. Senators Smith and Knowland came back at Christmastime, for instance, convinced that he believed that American troops should occupy Formosa, while the Joint Chiefs of Staff had a different impression.

It may have been that the visits of the Secretary of Defence and General Bradley and of Mr Dulles were timed to coincide in the hope that two government departments, at least, would hear the same story. What they heard together about such matters as the Japanese peace treaty is now unimportant because the Korean war began two days after the representatives of the Defence Department left. Mr Dulles stayed nearly a week longer and must have garnered some of the post-invasion words of wisdom but, since the General is notoriously laconic on the telecommunications system, the Chiefs of Staff of the Army and Air Force found it necessary to fly out to Tokyo to see and hear for themselves and make their own estimate of future requirements. So far the Defence Department has been able to meet—or, rather, to promise to meet, since delivery is difficult—all General MacArthur's demands for men and equipment. Whether enough will arrive in time for a successful defence of the beachhead round Pusan must depend on the continued success of the delaying action.

The plans for the expansion of the armed forces which the President announced on Wednesday are based on the present estimate of what will be needed to get back to the 38th parallel, to fill the gaps left by troops which have gone to Korea and to provide a similar force ready to cope with further satellite excursions—all without weakening the present "mobilisation base" in the United States. They are an impressive climax to the developments of American policy over the last three weeks and a tribute to the courage of the Administration. In the first few days North Korean strength was badly under-rated; it is now believed that it has been fully assessed and that this expansion will do the job. But should Chinese Communist troops be committed some time in the future, new estimates and further expansion would become necessary. The President has not hesitated yet and there is no reason to think that he will in the future. He is himself taking the advice which he so often gives to young Congressmen—"Have confidence in the American people."

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Crops at Midsummer

[FROM OUR AMERICAN STAFF]

COMING just as the news from Korea was reminding people of their wartime ration books, the Department of Agriculture's July crop report has attracted exceptional interest. It is a satisfactory report, showing that America is producing food at a rate 20 per cent greater than in 1941. It gives the President plentiful evidence for declaring that food rationing is not contemplated, that hoarding of food is very foolish and that profiteers are to blame for recent increases in food costs. Stock market prices fell sharply when the cold war developed a hot spot in Korea, but commodity prices rose with the international temperature. The Administration's Brannan plan, which would put farm price supports on a new and allegedly more satisfactory basis, has suddenly ceased to look like an issue on which to fight the November elections. Concern at the prospect of a drop in farm income for the third year in succession has changed to concern over the capacity of American agriculture to supply the food and fibre needed for the coming period of partial mobilisation.

The crop reporters think there is no doubt that it can. While efforts to deal with surpluses of maize, wheat, cotton and other products have succeeded in reducing both the acreage planted with these crops and the total acreage put to agricultural use, overall farm output in 1950 will be larger than in any year before 1942, and probably larger than in five out of the eight fat years since then. Total production of all crops, as forecast on July 1st, will amount to 124 per cent of the 1923-32 average, compared with 132 per cent in 1949, and 138 per cent in the peak year of 1948.

The 52 principal crops are being produced on 339 million acres, less than in any year since 1941. Government restrictions on acreages are not the only reason for this. Unfavourable weather caused the abandonment of a good deal of winter wheat and interfered with the spring sowing of small grains. But much of the initial loss has now been made up and, except for the wheat area, the nation-wide map of crop prospects shows few poor, and no very poor, patches. Acreage restrictions on surplus crops mean that substitutes are planted; many farmers have chosen such soil-improving crops as soya beans, or have turned to hay and pasture, to the long-term advantage of the land.

JULY CROP REPORT

Crop		Output			Acreage (million acres)		
	Million Units	1950 Estimated	1949	1939-48 Average	1950*	1949	1939-48 Average
Wheat	bushels	957	1,146	1,031	61	77	60
Maize	"	3,176	3,378	2,901	85	87	88
Oats	"	1,395	1,323	1,274	43	41	39
Soya beans	"	285†	222	154	15	11	12
Potatoes	"	390	402	435	1·8	1·9	2·7
Hay	tons	103	99	100	76	73	74
Cotton	bales	10	16	11	19	28	22

* Acreage actually harvested will be less in some cases. † Unofficial estimate.

Soya-bean plantings are up by 28 per cent, and grain sorghums by 34 per cent; less land has been planted with maize than in any year since 1894, but the maize carry-over, at 1,058 million bushels, is heavy; hay is in good supply. As a result there is a near-record amount of feed available for each animal unit. Milk production for the first half of 1950 was nearly up to the record made in the corresponding months of 1945, and average daily output per cow, at 19.71 pounds for the country as a whole and over 23 pounds for the chief dairy regions, was at an all-time high that reflects careful culling of herds. Egg production was also at a peak during the first half of the year, 6 per cent above last year and 12 per cent above the ten-year average, with a new June record of 1,615 eggs from each hundred layers. The results of this abundance are reflected in the scarcity of young chickens on farms, 16 per cent less than the average.

Because of the late spring, deciduous fruits and market garden crops for commercial processing are below the average, by 4 per cent and 11 per cent respectively. The plague of potatoes, however, seems likely to continue as a demonstration of how acreage reductions can be offset by more intensive cultivation. But in general the crop report contains good news for the Commodity Credit Corporation, which has to deal with surpluses. This year's attempt to relate supply more closely to effective demand seems to have had some success. Indeed, as it has turned out, it has perhaps been too successful in the cases of wheat and cotton.

The total wheat crop is less than the billion bushels which have been exceeded in each of the last six years. Bad weather in the winter and spring has meant that the acreage harvested will be well below the 72.8 million acres which could have been planted to wheat under the acreage restriction scheme. However, there will still be a carry-over of about 500 million bushels and, before the Korean outbreak, the Department of Agriculture had been expected to cut wheat acreage in 1951 down to 65 million or even less. Now it has announced that permitted acreage next year will be the same as it was this, that is, about 20 per cent above the acreage that is actually being harvested.

Cotton has been planted on 31.3 per cent fewer acres this year than last; domestic consumption and normal exports will together almost certainly use all the crop and may make calls upon the anticipated carry-over of about 7,000,000 bales. Heavy demands for cotton uniforms and other equipment needed by troops in the Far East might make even that carry-over look small. One aspect of the cotton report will be seized upon by those who insist that the United States will never rely on international trade to the same extent as the creditor nations of the nineteenth century: the acreage planted with the long-staple cotton that used to come almost entirely from Egypt has jumped in one year from 5,600 to 110,500 acres, a twenty-fold increase.

All of this has made it possible to raise estimates of cash receipts from farm marketings in 1950; they have been revised upward from $25 to $26 billion, compared with $27.5 billion in 1949, and estimates of net realised income have gone up from $11.6 to $12.5 billion, as against $13.6 billion last year. In contrast with the talk of allocations for steel, and other possible restrictions on industry, the food situation is clearly not tight enough to call for general controls. Conscription will make farmers worry about their labour supply and the possibility of limitations on purchases of new machinery may spur those who have been waiting to buy it until prices came down. The frozen food locker business, which has had a slight slump, is likely to pick up. But by and large, farmers have had time, and money, to replenish their equipment, and farmers' wives to remodel their kitchens, since durable goods again became available. The nation's agricultural plant is in good shape.

American Notes

America on Guard

President Truman's message to Congress accepts the Korean aggression as a full scale challenge to the United Nations, which must be met by building up a nucleus of strength in the United States, to be deployed wherever it is needed to guard the peace. He is asking Congress for $10 billion, nearly double the highest advance estimate, in new defence appropriations (he had already budgeted for $13 billion) to meet the world situation as well as the Korean; more money will also be needed for the Mutual Defence Assistance Programme. The Korean incident seems to have justified those who have long been arguing that excessive economy has endangered the security of the United States and of the free world. They put the responsibility for this excess squarely on the present Secretary of Defence, Mr Louis Johnson. Even more unexpectedly, considering his office, he also seems to be the leader of the group within the Administration which is supposed to have been pressing for a limited answer to the Korean challenge, contending that anything approaching full-scale mobilisation will frighten the Kremlin into starting a preventive world war.

According to the alternative and more plausible view, it is cold calculation, not fright, that explains all Russian moves, and the Kremlin can be deterred only if it is made clear that the United States is putting its full economic strength behind its moral support for the free world. The chief advocates of this view are, it is understood, the Secretary of State and Mr Averell Harriman, who has already taken up his new duties as the President's special adviser. They know from wartime experience how much it takes to counter aggression; so does Mr Truman, who made his name as chairman of the committee investigating the national defence programme in the last war. It is not surprising that the President has taken the courageous course and has decided that the United States must be ready to answer any challenge.

Congress is already hastening to give Mr Truman what he wants; the House has completed action on this year's military assistance legislation since the President sent his message, and has authorised the full sum of $1,222,500,000. It is unlikely to be more than a few days before the statutory limits on the armed forces of 2,005,000 men are raised. In addition to permitting the use of conscription, Mr Truman has also told the Secretary of Defence that he may call into service the National Guard and as many of the reserve forces as may be needed. Procurement and delivery of aircraft and other supplies have been stepped up.

* * *

Strains on the Economy

The President is confident that the national economy, stronger than ever before, can stand the strain involved by this partial mobilisation, but he does not deny that there are weak points that must be buttressed. From now on military procurement will be growing faster than industrial output can hope to do, at least until the effects are felt of the production loans that the President recommends as a means of increasing supplies of essentials. If this means, as it seems to mean, an expansion of industrial facilities under government auspices in peacetime, or rather pseudo-peacetime, it may prove to be the most controversial of the President's requests.

He also asked for power to establish priorities and allocate supplies, to limit the use of materials for non-essential purposes and to prevent hoarding. Many industrialists would perhaps prefer voluntary allocations, which were used during the postwar period of shortages, but the Administration is unlikely to think these adequate in present circumstances. Steel will probably be the first material affected, with non-ferrous metals and rubber coming soon after, and limitations are expected on the output of such things as automobiles and television sets which compete directly with military requirements for tanks and electrical equipment. The reimposition of controls on consumer (instalment) credit, recently rising to a disquieting degree, will do much to reduce the civilian demand for durable goods, while the curtailment of government loans for housing, just put into effect, will also mean less competition for scarce materials and skilled labour. Other government programmes are to be modified for the same reason. The Defence Production Act of 1950, which was at once sent to Congress, contains provisions for curbs on commodity and real estate credit, as well as for the other economic controls already mentioned.

Restrictions on credit expansion are a safeguard against inflation, but an increase in taxation is the President's chief insurance against that disease. He hopes that the heavier taxation, which he is to request shortly, will make price controls and rationing unnecessary, but promises that he will not hesitate to recommend such drastic measures if he must; at the moment, only panic buying and hoarding could bring these controls down on businessmen's heads. Congress had already abandoned its tax reduction Bill for this session, but it will hardly be as enthusiastic about the President's request for increased taxes as about his other proposals.

McCarthy on the Shelf

The Korean outbreak threw a clean cloth of patriotic unity over the political dinner table and put a number of new recipes on the menu. But even before that there was a growing revulsion, in Washington if not throughout the country, against Senator McCarthy's mess of Communist accusations, as indigestible as it was highly-spiced. Between now and next November, the Republicans should have little difficulty in collecting ingredients in the Far East for more palatable dishes to set before the electorate. For this reason most of them will probably leave the McCarthy concoction on the shelf, although they are unlikely to allow it to be thrown in the dustbin, as is proposed in the report of the Democratic majority on the special subcommittee that investigated the Senator's charges of Communist infiltration in the government. The full Senate Foreign Relations Committee has unanimously consented to the closing of the inquiry.

One of the Republican members of the subcommittee, Senator Lodge, who never found Mr McCarthy's recipe to his taste, agrees with the majority that none of the charges has been proved. But he thinks that the attempt to get to the bottom of them has been superficial and inadequate, a criticism that has often been heard during the investigation. The other minority member, Senator Hickenlooper, who has swallowed the McCarthy invention whole, has not troubled to put his views in writing, but he will certainly explain them during his election campaign. The majority report breaks with the tradition of senatorial courtesy as sharply as did Senator McCarthy's accusations. They are condemned as "a fraud and a hoax," and as "the most nefarious campaign of half-truths and untruth in the history of this republic," where for the first time the "totalitarian technique of the big lie" has been seriously tried.

Senator McCarthy, in his answer to the report, toed the fascist line even more obviously, for he now accuses these "most loyal stooges of the Kremlin" of giving "a clean bill of health to Stalin's fifth column in this country." According to him, that fifth column infiltrated the State Department by means of 81 unnamed and of nine named, and much more important, individuals, including Mr Philip Jessup, the State Department's Ambassador-at-Large, and Dr Owen Lattimore, the Far Eastern expert. The subcommittee found that the facts failed completely to establish these irresponsible accusations, and the State Department's loyalty board has again, for the sixth time, cleared Mr John Service, another of Mr McCarthy's victims. The majority report declared this board to be fully competent, but suggested that, at "this critical juncture of our international relations," the government's whole loyalty programme should be surveyed by an independent commission. Similar proposals had already been made, both in the press and in Congress (by Senator Lodge amongst others), as the best way of clearing out the McCarthy poison.

Roll Back the Pork Barrel

The advocates of Federal economy have not thrown in their hand, despite the heavy costs of the Korean war that will have to be met. Indeed, the thirty Republicans and five Democrats who demand a flat 10 per cent cut in all spending, save for a few items such as defence and veterans' benefits, argue that a dose of austerity will strengthen the economy to bear its new war loads. The fact that the austerity would be shared by the Economic Co-operation Administration, which has already suffered a 10 per cent cut, is no deterrent, indeed it is a positive advantage, to many sponsors of the Bridges-Byrd amendment. Others, however, recognise that if the cut, that parallels the $600 million slash approved by the House, is to survive, ECA may have to join the elect and exempt.

Senator Douglas, who has set himself to show that a liberal

All banks are members of the Federal Deposit Insurance Corporation

need not be a wastrel, believes $1 billion might be saved, but not by a flat reduction in the prudent and essential, as well as the extravagant and unnecessary, spending of the government. He opposes, for example, the low postal rates for magazines and newspapers, which contribute to the postal deficit, and are, in effect, a subsidy. But discriminating cuts require, beside time and patience to wade through accounts and hearings, a rare political courage. How unattractive they are to Congressmen was shown in May when Senator Douglas's assault on the rivers and harbours Bill was repulsed at all points.

The rivers and harbours Bill is traditionally known as the pork barrel, for it enables Congressmen to "bring home the bacon" in the form of federal funds for pet local projects. Politically, it is almost untouchable, for its benefits reach into every State in the Union; a Congressman who wants $114,000 for dikes and channels desired by 125 fishermen in Grand Marais Harbour, Minnesota, cannot afford to be too critical about his colleague's anxiety to divert a river from a Louisiana graveyard. More substantial items are the ambitious river basin schemes, that may out-run the available water. In Senator Douglas's view, the pork barrel will be eliminated only when private individuals and corporations are required to pay, say, half the costs incurred on their behalf. But no such step was taken this year; Congress added 156 projects, conservatively estimated to cost $1.6 billion, to its shelf of approved public works, though Senator Douglas urged that half the cost was pure waste, and the President, in signing the authorisation Bill, noted that it would take eighteen years to complete all the rivers and harbours work Congress has authorised. The President was also extremely critical of the piecemeal approach to resource development, and particularly of the favour shown projects of the Army Engineers, some of which were authorised although related, and more urgent, work of the Bureau of Reclamation was turned down.

The House evoked some gasps of admiration when it cut some $200 million from the funds for the Army's civil functions in May. This is the chief, though not the only, vehicle of pork barrel appropriations. The Senate Appropriations Committee, however, raised the figure to $762 million; even if the Bridges-Byrd amendment is accepted, a 10 per cent cut will not reduce it to the $600 million approved by the House. Even the lower amount is three times what the Engineers were accustomed to receive four or five years ago. The economisers can hardly expect to be taken seriously unless they are willing to roll the pork barrel out of sight for the duration of the Russian challenge.

* * *

Hoover Prescriptions

One of the Congressional excuses for turning down unpopular government reorganisation plans is that President Truman has tampered with the bi-partisan prescriptions handed in by the Hoover Commission. The blame, however, does not always lie with the President. The reorganisation of the Treasury failed because it followed the Hoover prescription too closely; the new version submitted is expected to succeed because it abandoned the aim of subordinating the Controller of the Currency to the Secretary of the Treasury. On the other hand, no public objection was raised, though some private doubts were expressed, over the plan to give the chairman of the National Security Resources Board full authority over the preparation of mobilisation schemes.

On the question of creating a Department of Welfare, however, principle has been sacrificed in vain. The House, which gave an unfavourable verdict on a reorganisation plan for the first time, overwhelmingly rejected the proposal to elevate the Federal Security Agency into a department whose administrator should have Cabinet status. The plan was turned down by the Senate last year; to sweeten the dose this time, the President abandoned the ideal of a clear line of authority and promised Congress that the Commissioner of Education and the Surgeon-General would continue to exercise all their present statutory authority and responsibility. Even this concession, however, failed to persuade the House to swallow the possibility that Mr Ewing, the Federal Security Administrator, might become the first Secretary of Health, Education and Welfare—a ponderous title that in itself was a surrender to critics of the welfare state. Mr Ewing, it was feared, even by normally staunch supporters of the Administration, might use his new post to advance the cause of compulsory health insurance, the threat of "socialised medicine" that makes insomniacs of most doctors and dentists. Welfare activities should long ago have received departmental status; this overdue reform has been postponed, even though the Senate would still have had the power to reject Mr Ewing as Secretary.

The Reconstruction Finance Corporation, the 18-year-old lending agency, has, on the other hand, been reprieved—though not for good behaviour. The Senate investigating committee looking into its lending policy would like to put off any question of transferring the RFC, now an independent agency, to the supervision of the Department of Commerce, until it decides whether the RFC should exist at all, now the emergency that created it has vanished. But the President wants to use it again in the new emergency that has arisen.

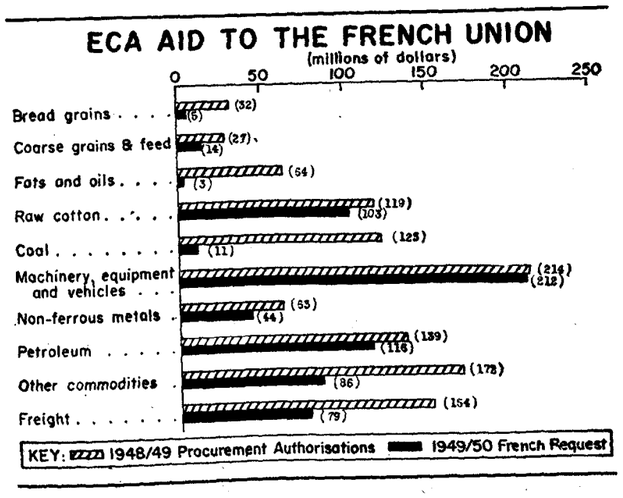
Of a number of unsavoury loans being exposed to the light, none is more extraordinary than one of nearly $1,000,000 to a hotel in Reno, Nevada, a large proportion of whose income is derived from a flourishing gambling casino. Gambling is legal in Nevada, but this hardly makes the loan conform to the condition that it must be in the public interest. Hard pressed by Senators Fulbright and Douglas, an RFC official suggested that Reno had other industries, divorce, for example, and that accommodation was needed for its clients. In the view of Senator Douglas, however, this is carrying the welfare state too far; and that may well be the verdict on the RFC's lending operations in times of prosperity. None of these individual reforms is, however, nearly as important or far-reaching as the overhaul of Federal accounting and budgetary policies that it is hoped may yet cap this session's contributions to the modernisation of the executive.

Shorter Notes

The Administration has admitted defeat in its fight for a Fair Employment Practices Commission, for this session of Congress. The final attempt to bring the measure before the Senate was foiled last week, as had been expected, when the motion for closure of debate, to prevent unlimited discussion and to avoid a filibuster, failed to obtain the necessary two-thirds majority. Both parties will now take this well-worn issue to the electorate, particularly to the Negro voters; each will claim that the measure failed because it lacked sufficient support from the other side. The Republicans will point to the 27 Democrats who voted against the motion, and Democrats, in the North at least, will claim that, if the Republicans had been as strongly behind the measure as they say they are, it would have been carried.

*

The biggest non-military airlift on record recently brought over 5,000 Puerto Ricans to Michigan in a week. They were needed urgently to thin sugar beets. Later they will pick pickles, beans and cherries and will end this agricultural cycle in October by harvesting the beets. By then it is expected that they will be longing for the warmth of their islands; but no one can be sure, since this is the first time Puerto Rican labourers have come to Michigan. As American citizens, they are free to stay if they wish.



THE WORLD OVERSEAS

What Marshall Aid Has Done for France

(From Our Paris Correspondent)

DURING 1948-1949, the first year of the Economic Recovery Programme, France received nearly a billion dollars' worth of Marshall aid; in 1949-1950 it received $700 million. For the current fiscal year about $500 million are expected as France's share in American foreign aid, and for the concluding year (1951-1952) France will need some $350 million, according to an estimate of Mr Barry Bingham, chief of the ECA mission to France. Between April, 1948, when ECA proper began, and February, 1950, direct grants had amounted to $1,674 million. An idea of the immensity of this flow of materials into France can be gained from the table that accompanies this article.

France's economic position after the war was desperate in two respects. There was a huge shortage of food and raw materials, and equipment was depleted to such an extent that France could no longer be called an industrial power. During the first year of Marshall aid, vast imports of cereals, fats and coal restored energy to the country. After this primary phase of recovery, dollar funds went increasingly to purchase equipment and machinery for industry and agriculture, the import of raw materials being mainly restricted to cotton, petroleum and non-ferrous metals. A position has therefore now been reached in which the bulk of ECA aid goes straight to the account of M. Monnet's plan of modernisation and equipment with which organisation ECA officials are in continuous touch.

The vital and continuing importance of Marshall aid to France lies, therefore, in its support of the French investment programme. To this end France has been allotted during the first two years of aid no less than $264,900,000 worth of machinery, or a quarter of all the exports of machinery to all ERP nations during that period. What this has meant to France is not difficult to imagine. For the Monnet plan has had to make up not only for war-depletion but also for pre-war failure to invest. (In 1938, France's gross investment was less than two thirds of the 1929 figure. Consequently, it is only in 1950 that France's production has been able to approach the level of 1929.)

Transformation in Three Years

As well as using the direct shipments from abroad the French Government has made large investments in its own budget. In 1950, investment under all heads amounted to 38 per cent of the budget or some 870 billion francs. Of this sum counterpart funds represented 250 billion francs of receipts. Counterpart funds (the deposits of local currency in a blocked account made by each ERP country, commensurately with the dollar cost of the grant aid received) have played a very big role in the French investment programme, not least because this money can only be used for ends approved by ECA. No manœuvring of parliamentarians can budge these gratuitous funds one inch.

An example of a major permanent contribution to France's wealth made by counterpart funds is the development of electrical energy. The lack of electrical power had been for long one of France's gravest industrial deficiencies. It is now calculated that, owing to the recent construction of barrages, this industry will show by 1952 a 100 per cent increase over prewar level. Up till the end of 1949, 124 billion francs of counterpart funds had been allotted to nationalised electricity and over 76 billion francs to the state railways. In all, 443 billion francs of counterpart funds had been applied to the French economy by April 1, 1950, a sum exceeding this year's very large military expenditure.

A situation has now been reached in which France can cover with exports 82 per cent of its imports and in which it is a European creditor. It has, indeed, been estimated that France will still need an annual grant of $150 million after the end of Marshall aid. But what a transformation of the payments deficit of 1947!

During the last two years and a bit, the United States has literally led France out of the valley of the shadow of death. This fact is, however, so far removed from the normal French interpretation of the event that it is perhaps worth while to consider the procedure of Marshall aid as it affects the relations between French and American officials.

The Economic Co-operation Authority is a new type of governmental agency and its missions are a new kind of national mission. If the Americans are in some ways the Romans of the 20th century, and as restlessly energetic as their forerunners of the ancient world, they have nevertheless developed a novel technique of influence which owes little to dogmatic dictatorial methods. That an all-powerful country should consider it best, morally and materially, in no way to restrict the political liberty of its lesser associates is, it seems, a notion all but incomprehensible to some peoples that view public generosity with a mixture of incredulity and contempt. So it often is in France, where a jaded opinion prefers to listen to the far-off cries of Communist-hunting

senators, or to the local reverberations of *l'Affaire Coca-Cola*, than to the quiet admonitions of American official representatives. Paris, which contains not only the special mission to France but also the office of the special representative for all Europe, now Mr Milton Katz, is in fact the headquarters of some hundreds of economic physicians devotedly nursing their patient Europe towards an undated but undoubted recovery.

A sudden visitor from Tibet would, however, hardly think so, reading in the newspapers of the extreme left about dollar imperialism and in those of the neutralitarian middle about "mediating between the blocs." The absurdly meagre recognition of American aid and the vague anti-Americanism so prevalent in the French intellectual bourgeoisie are partly due to resentment at events of the last decade and to a natural cultural prejudice. (French patriotism, when not military, is cultural rather than political.) But French public ignorance of the actual nature of Franco-American relations is due, in particular, to the weakness of the central government, which is by nature incapable of forming or focusing opinion. The absence in France of public opinion, in the Anglo-Saxon sense of the term, was, however, quickly appreciated by the ECA which, with a remarkable versatility, abandoned the broad effects and addressed themselves to concrete problems in the company of competent Frenchmen (of which there has never been and never will be any lack). The information services have for their part proceeded to do valuable work in the dissemination of technical information in publications and by exhibitions of American machinery. ECA had for instance a stand at the International Fair at Lyons in April. This individual approach is probably more effective than poster propaganda.

Faced, then, with France's grave political dissensions, ECA officials were compelled to choose their French associates from the ranks of civil servants rather than of politicians. There has, therefore, grown up during the last two or three years a kind of consortium, consisting principally of the ECA, the Monnet plan, the Bank of France and the Ministry of Finance. M. Petsche, who has the splendid qualification of being a non-party minister in a coalition government, is, accompanied by his Secretary of State, the link between this consortium and the National Assembly. (M. Petsche sees as much of the one and as little of the other as possible.) What is the role of the ECA within this association?

No Dictation by ECA

It is a Communist theme-song that the ECA in general uses American economic power to impose its will on French statesmen and officials and, in particular, rules France by attaching strings to the liberation of counterpart funds indispensable to the balancing of the French budget. ECA does not, however, dictate French fiscal and investment policy. It has no wish to, when there is no lack of French experts who know French needs much better than it. Rather is it the business of ECA to support the French economic directorate's financial policy against the onslaughts of the politicians. For the position of MM. Petsche, Monnet, Baumgartner (governor of the Bank of France) and other prominent officials is clearly precarious. Their policy is exposed to all the dangers emerging from a groggy coalition and from an assembly that has, at least theoretically, the power to tear a budget to shreds. It is in this connection that the counterpart funds are dangled like a carrot in front of the deputies' noses. For instance, the budget, as everyone knows, can't be balanced without them, if the investment programme stands. And the investment programme must stand, otherwise no counterpart funds. So no one objects to the investment programme.

In practice neither ECA nor the French experts can, with a weak government in office, press their general economic policy to a point at which it becomes highly offensive to a particular section of the community. Thus trade is *not* drastically liberalised in order, as the American and French economists would wish, to increase turnover and productivity. (France's decision to waive the bulk of the drawing-rights awarded to it in the Payments and Compensations Agreement of last September; together with its failure to spend its 100 million sterling balance are evidence enough of a policy directly opposed to the wishes of the American administration.) Similarly fiscal reforms are *not* thrust down the throats of recalcitrant farmers and shopkeepers in order to make taxation fairer. Mr Barry Bingham has, indeed, spoken repeatedly of the necessity of reforming the tax structure which, in his opinion, shows a too high proportion of indirect taxes—68 per cent of the tax-revenue. This suggestion was on the whole well received in the French press and it is very likely that the next budget will in fact contain heavier direct taxes. Mr Bingham's comments were, however, simply in the nature of advice. Nor is the ruinous regime of the nationalised industries abolished in order to save subsidies. None of these things has happened for the good reason that they have been hitherto politically impossible.

Investment Without Tears

On the other hand, were French democracy liquidated after the fashion of Roumanian democracy, the recovery programme would certainly be much less gradual and much less expensive to the United States. This type of political precedure is not, however, in tune with the philosophy of the "dollar imperialists," who, if they have to choose between freedom and efficiency, in fact sacrifice efficiency. Thus the policy of France's economic directors and of the ECA can only be to pursue the recovery programme as fast as the internal conflict of interests permits.

The function of ECA, therefore, has been silently to inject sustenance into the French economy, in the hope that one day the patient may sit up and feel better. Then, it is expected, the warring members of his other self, the body politic, will function more harmoniously with a strengthened constitution. There is a chance that this forecast will prove accurate. For the horse is drinking even if he doesn't know it. Never, at any rate, has one nation been so strongly buttressed by another. The principal effort which is now justly demanded of the French is that their entrepreneurs should make a real effort to increase productivity. For, if the last two years of "investment-without-tears" have seen an initiative largely of American and French officials, the time has now come, especially in the matter of dollar-exports (which might perhaps be trebled) for the industrialists to make a real national effort.

Tito's Defences

[BY A CORRESPONDENT]

WHATEVER foreign observers may think or say, the Jugoslavs themselves are confident of their ability to deal with their neighbours of the Cominform if they should attempt to start a "civil war" on Korean lines. That is to say, they have full confidence in the morale and fighting ability of their national forces; but they cannot guarantee that the course of events would run in their favour if the Soviet Government has taken as much trouble over the equipment and training of Hungarian and Bulgarian troops as it has obviously taken over the North Koreans.

Except on the seaward flank and on the frontier with a still suspicious Greece, Jugoslavia is encompassed by countries whose governments are hostile both in word and deed, maintaining persistent and abusive propaganda and a total economic blockade. To the north-east and east lie Communist Hungary, Roumania and Bulgaria, and to the north is the Russian-occupied zone of Austria. Wedged into the south-west corner of its territory is a hostile Albania, kept alive only by sea-borne supplies from the Soviet Union.

How these frontiers could be defended against military attack would depend on its nature and direction. If it came over the mountainous frontiers—from Albania, or from Bulgaria into Jugoslav Macedonia, the Jugoslavs would be fighting their own kind of guerrilla warfare with the full support of the local population. If it came from the north or east the position would be more dangerous. Here the land is flat and, with the exception of a short stretch of the River Drava south of Lake Balaton and of the Danube at the Iron Gates, there are no natural obstacles to invasion. If the attack were made by infantry of the neighbouring states, not stiffened by heavy equipment, there is no doubt that the Jugoslav army could hold its own.

Infantry of the Ex-Enemies

According to the peace treaties, the three ex-enemy states are supposed to have limited their armies to 65,000 men in the case of Hungary, to 55,000 in the case of Bulgaria, and to 120,000 in the case of Roumania. Although it cannot be assumed that these limits have been observed, there is no reason to believe that these forces are of the calibre of Jugoslav troops. Nor is there any reliable evidence—in spite of numerous reports recently put about

—that the Russians have been putting forces into these countries that might be used for an attack on Jugoslavia. The Soviet Government is known to have two divisions in its zone of Austria, two in Hungary, two in Roumania and nothing more, apparently, than a military mission in Bulgaria. These numbers are substantially the same as they have had for the past two years.

Marshal Tito to-day has an army—regulars and conscripts—of 375,000 men, which divides into 250,000 men in the armed forces, 75,000 highly trained security troops (KNOJ), and 50,000 militiamen. These forces are quickly available for action; it is almost certain that, if it were necessary, between 800,000 and a million men could be mobilised. This was the strength of Tito's army at the end of the war, at which time the Jugoslavs regarded themselves as the chief exponents of guerrilla tactics. This tradition has been maintained in post-war military training; indeed, the Jugoslav determination that it should be maintained was one of the main causes of differences with Soviet military experts, even before the quarrel with the Cominform came to a head two years ago.

Danger of Armoured Attack

It is possible—indeed likely—that Soviet equipment has been made available to the armies of the Cominform countries; if so, the threat to the Jugoslavs may be graver than they think, for their armaments position is not strong. By the end of the war they had accumulated a miscellaneous collection of British, American, German, Italian and Russian weapons. To these were added military supplies—some of them heavy arms—to the value of $72 million, imported from the Soviet Union between 1947 and 1948. The present Jugoslav tank strength is believed to be about 500, of which probably not more than half are really serviceable. In the May Day display in Belgrade this year a few tanks were on show, and they were modelled on the Russian T.34. It is unlikely that Jugoslav factories are at present turning out new tanks in any numbers or can now re-track or repair the Russian tanks which they acquired at the end of the war. On the other hand, it is known that a considerable industrial effort is going into armaments. In short, all the evidence suggests that an armoured attack through the northern plains could not be repelled if it were delivered in strength and in the near future.

The Jugoslav air force consists of some 10,000 men with a few hundred fighters and fighter bombers of the Stormovik type. Shortly before the invasion of Korea Marshal Tito stated that he had neither asked for nor received any arms from the United States or Britain. It is possible that what has happened in Korea may make the Jugoslav leaders reconsider their attitude, and they may now be less anxious to get permission to manufacture jet fighters under licence than to buy them ready-made.

Defenders of the Middle East—V

Iraq and its Army

[FROM OUR SPECIAL CORRESPONDENT]

OF the Middle Eastern countries proper, including those which are members of the Arab League and omitting those on the outer fringes of a badly-defined region, Iraq is strategically by far the most vulnerable. Egypt may provide the only adequate facilities for a base, but Iraq is in the

front line, just behind and beneath the American-supported "roof" in Turkey and Persia. Egypt may possess the area's best ports, airfields and communications generally; but Iraq has the oil-fields and refineries that are an obvious and early target in a world war. Furthermore it covers the direct and immensely vulnerable route to the equally important oil regions of the Persian Gulf. Its powers of defence are therefore a matter of vital concern to the west.

Links With Britain

Against aggression from outside Iraq has virtually no defence. Unless credits and equipment are supplied by an ally or protecting power, the size and general efficiency of any small country's armed forces must depend, in the last resort, on the state of its economy and its natural resources. Iraq is an extremely poor country (despite its great potentialities) and in no condition to maintain a large and properly equipped army. It is tied technically to Britain by the still current treaty signed in 1930; the revised Treaty of Portsmouth, negotiated in 1948, was never ratified. The British Military Mission was withdrawn in 1948 and Britain has no say in the organisation or training of the Iraqi Army; it also makes no contribution to its equipment, except so far as this is of standard British Army pattern sold to the Iraqi Government through normal commercial channels.

The armed forces of Iraq have been built up solely for purposes of internal security; they are large and good enough to enable Iraq at least to hold its own against aggression by any of the other Arab countries or against a rising by the turbulent Kurdish minority; but they could not withstand an attack by a large Power. They could not even fulfil the important role of "holding," or even seriously delaying, a Russian advance through the northern mountains for sufficient time to allow an airborne army to be flown in from, say, Egypt's Canal Zone. The Iraqi Army is a little under 30,000 strong. It is composed of three not quite complete divisions. The first division is stationed in the hilly country to the north of Iraq and is essentially equipped and trained for mountain warfare; its main task is to keep watch over the Kurds and prevent any trouble from that quarter. The second division is based in the plains between Baghdad and Basra. Both are fitted out as a balanced force of all arms, mainly with reasonably modern British small arms and automatic weapons. The remaining third is split up into small units which are scattered all over the country. Some are artillery, others are mechanised—and these are the elite of the army. But the Iraqi Army has no tanks and, indeed, no armour at all. It suffers from a lack of what might be termed "realistic" training and the men have learned to use their arms mostly in barrack squares.

It is generally believed that the four or five brigades of Iraqi troops sent into Palestine were a complete failure. That is not actually the case. Owing to political differences within the Arab League and the abysmal failure of what passed on the Arab side for a higher command, the Iraqi troops did hardly any fighting at all. Their appearance, indeed, was the most workmanlike and soldierly among all the Arab units, with the possible exception of the Arab Legion. During the months they were either inside Palestine or in camp in Jordan their morale was at its lowest ebb; this was due first, to the failure of their generals and politicians to provide them with any fighting and the consequent opportunity for loot, and secondly to the fact they received no pay, owing to a more than usually acute economic crisis in Baghdad. That has now been rectified and, within the strict limits of Iraq's slender resources, the army is being reorganised and re-equipped. In the budget for 1949 a sum of £6,250,000 out of a total expenditure of £26 million has been allocated to the defence forces. That, however, does not go very far towards providing modern armour—with tanks at £50,000 each.

For its size, and taking into consideration the limited scale of its armaments, the Iraqi Army is reasonably good. The scheme of basic training introduced by the British Military Mission, although not being fully continued by an Iraqi training staff, was sound and practical. The Iraqi is a good fighting-man. Although he has no experience of modern warfare, there have been plenty of clashes with the Kurds to give him at least a minor "battle inoculation," and to ensure that selected units would form a valuable auxiliary to an allied army going into action in the foothills of the Taurus Mountains. But, as in almost all the Middle East, xenophobia is rampant and there would only be very few Iraqi officers who would welcome a return of a British Mission; not many more are in favour of an alliance with Syria.

In fact—and it is a most curious fact—the tide of opinion in the army today flows towards participation in the Arab League's collective security pact under the leadership of Egypt, however much that might be opposed by the country's political leaders. This trend is probably due to inadequate and second-hand knowledge of the Egyptian Army, and it might well be dissipated by the constant irritations that such co-operation would produce. It does, however, add to the difficulties in the path of a government which has, as nearly as possible, broken with Egypt. The Iraqi is extremely independent, and Egypt's clumsy attempts to dominate the Arab League and domineer over its members have nowhere been more strongly opposed than in Iraq. There, in particular, King Farouk's efforts to prevent a Iraqi-Syrian union aroused widespread resentment—even amongst Iraqis who did not particularly favour union.

Were time not short it would be possible to view the situation in Iraq with greater equanimity. For the country's economic prospects are definitely improving, and its resources in oil, in agricultural products and, above all, in good water supplies and much cultivable land, are greater than those of almost any other country in the Middle East. But as a defender of the Middle East today, in a few months or even in one or two years, Iraq must be written down as a negligible force, unless Britain or the western powers in general are prepared to foot the bill and provide the arms.

'Monastral' Blue

'Monastral' Fast Blue B is the most brilliant of all blue organic pigments. Though one of the major chemical achievements of recent years, the observations that led to its discovery were accidental. In 1928, chemists at an I.C.I. works in Scotland noticed a blue impurity in some phthalimide, a chemical used in making dyestuffs. The origin of this impurity was found to be a crack in the lining of an iron vessel in which the phthalimide was being mixed, and investigation showed that reaction between the chemical and the iron was producing a blue substance.

This chance defect stimulated the curiosity of the chemists. By a fascinating and classical piece of organic chemical research, they established that the impurity belonged to an entirely new class of compounds—the phthalocyanines—whose structure resembles chlorophyll, the green pigment of plants, and haemin, the red colouring matter in blood. The blue substance was in fact, iron phthalocyanine. Phthalocyanine derivatives were then made from a great variety of metals, and, after hundreds of tests, copper phthalocyanine was shown to have great possibilities for commercial purposes.

Efforts to produce a suitable physical form of the new pigment succeeded in 1936, and today 'Monastral' Fast Blue B is widely used to colour plastics, paints, paper and printing inks. It is the first new blue paint in the artists' paint box for a hundred years.

every morning at 11.50
to **Milan and Rome**

Every morning at 11.50 Alitalia aircraft leave London airport, fly direct to Milan and Rome. At Milan you have good connections for Venice, the Dolomites, Rapallo, San Remo and the Lakes.

FLY luxuriously in *4-engined* aircraft. Aboard you are served Italian wines and food free of charge; you enjoy the natural, lively welcome of the most hospitable airline in the world.

Return fares: LONDON - MILAN £47.16.0. LONDON - ROME £57.12.0. (*Special 23-day excursion to Rome £50*). Book now at any travel agent; or at Dorland Hall, Regent St. London, S.W.1. (WHitehall 9288 or GERrard 9833 ext. 322)

A FREELY MARKETABLE INVESTMENT IN A TRUST SPREAD OVER THE SHARES OF THE LEADING 30 BRITISH INSURANCE COMPANIES

INSURANCE-UNITS

AT THE PRESENT TIME, these Trust Units are particularly suitable for those who seek a stable income combined with good prospects of capital appreciation.

"Ploughing Back"

The insurance companies, whose shares constitute Insurance-Units, have a common policy of maintaining a wide margin between what they earn and what they pay out in dividends. This "ploughing back" should indicate further dividend increases when existing dividend limitation comes to an end.

Advantages of £ Devaluation

These companies receive a large part of their premium income in $. They also have very big $ investments. Devaluation of the £ means therefore greater £ income from $ sources and a considerable increase in the £ value of their $ investments.

Easy Purchase of Units

Though "Insurance-Units" gives a spread over the shares of the 30 leading British insurance companies, the investor can purchase Units for as small a sum as £10.

Ask any Stockbroker or Bank for full details.

Offer Price 17th July 21 9/xd. Commencing yield (conservatively calculated on net cost, including commission and 2% Stamp Duty) £3/9 3%.

TRUSTEES: WILLIAMS DEACON'S BANK LTD.
MANAGERS: BANK INSURANCE TRUST CORP. LTD.
30, CORNHILL, LONDON, E.C.3

TO ALL CONCERNED WITH PRODUCTIVITY

The specialist team from Britain, which recently toured the factories of the United States, has brought back to British industry a Prescription for Prosperity. "Better materials handling", says their report, "offers a greater opportunity to cut production costs and increase productivity than any other single factor".

Of the fork truck in particular, the report says, "Here is a device of such importance that it warrants detailed study by all concerned with increasing productivity".

Here now—made in Coventry—is the Coventry Climax fork truck—ready, now, to take over a hundred-and-one jobs of handling all along the production-distribution line. It lifts, carries, stacks and loads almost anything, up to 6,000 lbs. at a time. It is mobile, powerful, dexterous, versatile. It is a hoist, a truck, a loco and a "conveyor belt." It is a whole handling system in one.

There are Coventry Climax Models, Diesel or Petrol driven, to suit almost every need and circumstance. They range from a new TSM 1500 lb. model specially designed for work in small spaces, to the heavy-duty FTF series lifting 4000, 5000 or 6000 lbs. in a single load.

COVENTRY CLIMAX *fork lift trucks*

For details of the trucks best suited to your needs, write to Dept. 52
COVENTRY CLIMAX ENGINES LTD., WIDDRINGTON ROAD WORKS, COVENTRY

THE BUSINESS WORLD

The Schuman Union

GREAT initial momentum has been given to the Schuman Plan by its presentation to the world as a grand design for the harmony and unity of Europe. The more passionate advocacy of the plan and the more intractable suspicions of it have centred in its central political proposal: the supra-national authority responsible to an assembly of parliamentarians. The sun-drenched political vistas opened up have caught the imagination of many Europeans, and it is not unfair to say that the pooling of sovereignty is being treated in some ways as an end in itself rather than as a means to serve specific industrial and trading purposes.

Not only, in consequence, have the industrial and trading purposes of the plan slipped away out of the public eye, but for practical purposes they have yet to be formulated in any specific manner. In the talks now going on in Paris among the six countries (of which Britain is not one) represented there*, the main task has so far been to prepare the broad juristic and political outlines of a treaty. Working parties have been set up to deal with matters of production, price policy, investment, and trade, but it seems unlikely that they can achieve much more at this stage than a preliminary view of the ground. Later, when the basic treaty has been drawn up and, perhaps, subscribed to by the member countries, the main burden will pass to the technicians.

Source: *European Steel Trends in the Setting of the World Market.*

By what method and with what purpose will the new authority seek to influence the volume of production of coal and steel, the viability of existing plants and the location of new projects? How will access on equal terms to the raw materials of iron and steelmaking be secured? What, indeed, are "equal terms" for this purpose? A homogeneous price policy is one of the declared intentions, but on what principles will such a policy be formulated? Will it be designed to give free play to the advantages of economic location, or to neutralise them? Price policy may prove to be the crucial point of the plan if, as seems likely, the authority is to pursue its production and investment policies by economic means rather than by decree.

It is too soon to expect precise answers from Paris to questions of this kind. Before the answers are found, important differences of interest and intention between the participating countries will need to be reconciled, and this will take time; there seems no doubt that the differences will survive the initial act of signing a treaty. A glance over the field of European heavy industry will bring out some issues that are certain to arise.

Interdependence in Europe

No European country is independent for its supplies of the raw materials of steelmaking. This has not prevented the countries of Europe from seeking the qualified (and in some ways illusory) self-sufficiency that comes from the possession of a complete national iron and steel industry, and, indeed, the tendency to build such industries has been very marked since the war. But in the economics of a heavy industry, the prices of materials and the costs of their transport tend to play a decisive part; on these the viability of the industry may depend. The movement of coal, coke, iron ore and scrap across frontiers and over long distances is, therefore, bound to be a major preoccupation of the countries joining in the Schuman Plan when they come to details.

The nature of this interdependence among the European countries was set out in some detail in an article in the *Statistical Bulletin* of the British Iron and Steel Federation for May. Germany, the largest European producer of iron and steel before the war, has built its iron and steel industry on the abundant supplies of good coking coal in the Ruhr. German reserves of coking coal form the greater part of the known reserves of Europe. The decline in output from the Ruhr mines since the war has limited and hampered steel production not only in Germany but also in France, Belgium and Luxemburg; and this limitation is only now beginning to disappear.

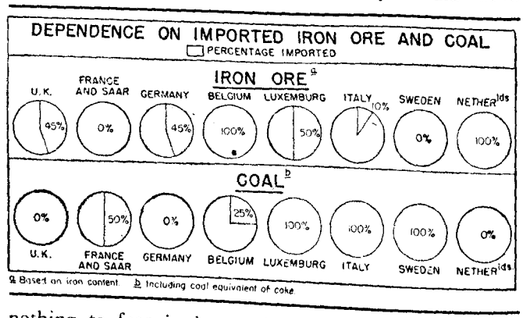
The German steel industry is not, however, and has never been independent of foreign sources of iron ore. "Even when Lorraine was a part of Germany," says the *Bulletin*, "the Ruhr plants drew the bulk of their supplies from Sweden," and before the last war more than two-thirds of their supplies of ore were imported. Since the war, because of shortages of foreign exchange and pressure from the occupying Powers, exertions have been made to increase the supplies of low-grade ore from the Salzgitter-Peine fields in Lower Saxony, but these ores are suited only to the basic Bessemer process, which accounts for only half the German steel production in normal times; they will not serve the open hearth process. Germany imported some 4.3 million metric tons

* France, W. Germany, Belgium, Netherlands, Luxemburg, Italy.

of ore last year—3.2 million of this from Sweden—and German requirements are growing. German purchases of Swedish ore will tend to increase.

Britain, similarly, has built its iron and steel industry on indigenous deposits of coking coal ; home ores meet less than half the industry's iron requirements, and the richer ores have to be imported. Sweden was last year the most important supplier, with North Africa second. In addition, Britain imports substantial quantities of steel scrap.

Belgium and Luxemburg have been important buyers of Swedish ore since the war. The Belgian steel industry was based on coal deposits in the Charleroi and Liége districts, and, although it supplements its coal and coke supplies with imports from Germany, the Belgian reserves of coking coal are by no means worked out. But Belgium is poor in ore deposits, and has, in the past, obtained most of its ore from the Lorraine field or from the extension of that field into Luxemburg. It is the postwar shortage of coke that has obliged the Belgian industry, in search of fuel economy, to turn to Sweden for supplies of rich ore. The situation of the Luxemburg steel industry is different again. The Lorraine ore field extends into Luxemburg ; the industry was built on these deposits and depends on foreign coalfields—primarily on the Ruhr—for its coke. Lately this industry also has been supplementing its local ore production with imports of high-grade ore from Sweden as well as of minette from France.



Italy, which is proposing to increase its output of crude steel from about 2,000,000 tons to 3,000,000 tons in 1953, is dependent on imports partly for its supplies of ore and scrap and entirely for its supplies of coking coal. The imported scrap requirements amount already to about 750,000 tons a year ; the coal is bought from Germany, Poland, Britain and, at present, the United States. Hydro-electric plants supply a large part of the power needed, and the Italian industry tends to specialise on open-hearth and electric processes.

Sweden has virtually no coal resources, but the richest iron ore resources of Europe and some of the richest in the world. A modest but technically resourceful steel industry has been built up in Sweden on the rich indigenous ore together with British and Polish coal, German coke, and some imports of steel scrap. On present plans Swedish output of crude steel is to be increased from 1,100,000 tons last year to about 2,000,000 tons in 1953. But it is as the supplier of the highest-grade iron ore that Sweden plays its special and vital part in the European steel industry. Before the war, 70 per cent of the Swedish exports of iron ore went to Germany, and Britain took about 15 per cent. But the demands for Swedish ore have multiplied since the war ; as has been seen, the producers of western Europe are now more dependent on Swedish ore than ever before, and the great expansion of steel output in the United States has sent American buyers into the Swedish market. Thus the falling-off in German demand has been more than replaced by rising demand from many other quarters, and competition for Swedish ore has become very keen.

The French Disadvantage

France is now in the middle of a great expansion of its steel industry, which may not (as things now appear) reach the heights once envisaged in the Monnet Plan, but which is still planned to reach a crude steel capacity, for France and the Saar together, of 14.8 million metric tons a year by 1953. French iron ore resources, mainly in Lorraine, are great enough to supply this capacity, though they will in practice be supplemented by North African ores. The Lorraine ores are fairly low in iron content (between 24 and 41 per cent), but in quantity should be adequate to supply most of the needs of Belgium and Luxemburg as well as France and the Saar once the present pressure to use rich ore, arising from the scarcity and high price of good metallurgical coke, is removed. It is in coal supplies that the French are at a decisive disadvantage. France has to import more than half her metallurgical fuel, and there is no reason as yet to suppose that the French experiments in the blending of coking with non-coking coal will greatly lessen this dependence.

France, in the struggle to overcome this disadvantage, has made great efforts to expand the production of the French coal mines and cokeries. While these efforts have not been ineffective, and French coal output is now greater than before the war, they have been costly ; the mining labour force has had to be greatly increased, output per manshift has not regained the prewar level, and mines are being worked that are uneconomic by general European standards. French coal costs are, therefore, high. This is the real significance of the sustained diplomatic effort by France against the prevailing high level of prices in the European international trade in coal. The president of the French steel federation said in a recent speech that the French steel industry would have

nothing to fear in international competition provided only that it could obtain coal on the same terms as foreign steel producers. This may be so ; but what does "on the same terms" mean ? France itself is a high-cost coal producer and will continue to be so unless the volume of French coal production can be reduced and the pits rationalised at the same time.

What is "Equalisation"?

The choice at present offered to the French steel industry is, in effect, between expensive foreign coal and home-produced coal that is even more expensive. In the hope of putting this right the French government has been concentrating on the foreign front, where it has been conducting an offensive against the dual price systems. It scored an apparent success last week, when on French pressure the Ruhr Authority ordered that the price differential between German coal exported and German coal sold on the home market should be reduced by 20 per cent. But, as the Germans have been quick to point out, this does not necessarily mean that France will get Ruhr coal any cheaper. Even if it does—even if, as may well happen before very long, Ruhr coal is supplied to France at the same pithead price as to German consumers—the consequent improvement in total

French costs will be small in comparison with the continued burden of rail charges and the high costs of French coal. The Düsseldorf *Handelsblatt* made the following calculation. Ruhr coke is sold for export at DM.46 at the cokery. Assume that it is reduced to DM.42, the price at the cokery to German consumers. It will still have to bear rail freight charges that may amount to DM.20 by the time it reaches its destination in Lorraine, so that the delivered price will be equal to DM.62. But if the French user takes French coke instead he will have to pay a price equal to DM.57.60 at the French cokery, and to this may be added freights of (say) DM.15, giving a delivered price of more than DM.72.

It is unlikely that the French government will want to go on paying subsidies for ever to offset these price differences or that, if it did, such devices would fit easily into the framework of the Schuman Plan. But the questions that arise go far beyond the immediate state of the coal export market. "Equalisation of prices" and the creation of homogeneous conditions for the supply of materials and the marketing of products have figures largely as general ideas in the early stages of discussion of the Schuman Plan, but the vital questions are undecided. There is a manifest French interest in favour of some form of price equalisation for coal that would wipe out, economically, the distance between the Lorraine steelworks and the coal of the Ruhr. But even such a scheme, if the Germans ever accepted it, would leave the French coal industry facing serious difficulties ; no equalisation scheme could make French coal cheap at its present volume and efficiency of production. There may, therefore, be some pressure for high selling prices for iron and steel products, in order to permit the high costs of unfavourably located works to be absorbed ; and such pressure may arise in other countries as well as in France.

Price policy leads by a direct route to investment policy. Steel industries have always been preoccupied with the fluctuations of demand and of prices, and every steel industry in the world would like to see prices stabilised at a level that will ensure a good return for its investments. But is the price level to be fixed so high as to ensure a return on bad investments as well as on good ? The coal and steel authority, when it is established, may or may not include the formal approval or disapproval of major investment projects but this is in a certain way irrelevant. Influence on the future pattern of investment will in any case be exerted through the conditions that are established for the supply of coal, coke, ore and scrap to the various partners, and through regulation of the prices of iron and steel products.

German Aspirations

This survey leaves deliberately out of account the political attractions of the Schuman Plan, though these are clearly very great and may well, for a time, outweigh the economic difficulties that have been discussed. Industrially, it is reasonably clear what one of the major partners, France, hopes to gain from the proposed union. From within the six-country area France can hope to get on improved terms an assured supply of the raw materials (coal and coke) in which the French iron and steel industry is mainly deficient. What can Germany expect in return ? The German deficiency is in iron ore, and this the area—even assuming the further development of the North African fields—cannot fully supply unless Sweden is induced to join. So far Sweden, like Britain, has remained outside. In this respect Germany has less to gain than France from the union. But the primary German objective in heavy industrial matters is "equality of rights"—release, that is, from the surviving provisions of the level of industry plan ; and, once this freedom is obtained, the German industry will seek to expand its capacity to between 14 and 15 million tons and to improve its efficiency at the same time. This target was mentioned at a recent shareholders' meeting

of Hoesch A.G. at Dortmund, and on the same occasion the chairman of the company mentioned another form of freedom, release from some of the consequences of the decartelisation laws, as a desirable object. German heavy industry has based its efficiency in the past on the close integration of coal, iron and steel production and processing, and will no doubt seek to return to its technical tradition.

These will be substantial gains, and the Germans will no doubt consider them to be worth some sacrifices. But the gains would be meaningless unless the German industry is to use them to expand its capacity and improve its competitive power. The rigours of competition may prove, therefore, to have been merely postponed for the members of the union who are technically and economically the weaker.

Divergent Interests

In the development of the heavy industries of Europe certain main lines of division of interest between countries are not difficult to discern. There is a clear division between the coal exporting countries and the countries that are net importers of coal ; this is momentarily alive in the controversy about dual price systems, though its importance and its permanence can easily be exaggerated. Another division, less easy to define but in the long run more vital, separates the countries that are industrially well placed—and which, through access to materials and command of large steel-consuming markets, can maintain their iron and steel industries at a profit in competitive conditions—from those that are building up heavy industries against the handicaps of geography. Each of these divisions of interest cuts across the group that has joined together to work out the Schuman Plan, and separates its members. The one conspicuous interest that the members of the group have in common in this matter is also a common interest of all the countries of Europe: the need to co-ordinate their economic growth and combat the industrial Balkanisation that has gained so much ground in Europe in the last forty years.

Technique of Stockpiling

THE hostilities in Korea have provoked some sharp increases in commodity prices and promoted much discussion of the possible further stiffening of the inflationary impetus that American demand is imparting to world markets. Even before this week's Presidential message to Congress, it was being assumed that purchases for the American "stockpiles" would be accelerated; this chiefly explains why the impact of the Korean war upon commodities has been most noticeably felt by tin and rubber. The behaviour of tin has been extraordinary. Before the fighting started, tin was selling at £591 a ton; by the end of last week it had risen to £720. There was a sharp fall last Monday of more than £30, and the mid-week quotation was £681. Rubber has held and added to its gains; it has jumped from 1s. 11d. a lb. to a new record of 2s. 6¼d. These are two spectacular examples. If purchases for the American stockpile are to be increased in the next few months, many other commodities are likely to be affected—among them, copper, zinc and sisal. At this stage it is naturally impossible to make dependable forecasts; no one can yet guess how rapidly the massive expansion now projected for the American defence programme will develop. Moreover, the operations of the Munitions Board (which governs the transactions of the stockpiles) are necessarily secret. The aim of this article is simply to explain the background and mechanics of American stockpiling—and to draw a few tentative conclusions about its effects.

The postwar stockpiling operations of the United States Government are conducted under the authority of the Strategic and Critical Materials Act of 1946. A stockpiling programme had in fact been authorised by Congress before the last war—by the Act of 1939—but the quantities of materials accumulated by the time the United States was involved in the war were totally inadequate to meet the high level of industrial output that had to be sustained. The bitter experience of 1942-43—when the swift advance of the Japanese armies in South-east Asia cut off the allied powers from their traditional sources of many vital raw materials—made it abundantly clear that a reserve of strategic materials should be created as a safeguard against the possibility of another war. The Act of 1946 instructed the appropriate authorities "to decrease and prevent wherever possible a dangerous and costly dependence of the United States upon foreign nations" for supplies of strategic and critical materials in time of a national emergency. The Act itself laid down no detailed objectives; nor did it list the materials to be stocked. It merely stated that the materials must be essential for the common defence (essential, that is, either to industry or to the armed forces), inadequately supplied in the United States, and capable of being stored. Three departments are primarily responsible for stockpiling. The National Security Resources Board co-ordinates the separate policies and programmes. The executive authority for stockpiling is vested in the Munitions Board which formulates and follows up the agreed programmes and maintains a balanced supply of the various materials. The procurement of supplies is carried out for the Munitions Board by the Federal Supply Service, formerly known as the Bureau of Federal Supply. Many other agencies and departments, such as the Economic Co-operation Administration, the Commodity Credit Corporation and the Departments of Commerce and Agriculture, assist in procurement of supplies.

The ultimate objectives of the physical size and composition of the stockpile have never been disclosed. The broad aim is to accumulate a stock of critical materials sufficient to bridge the gap between wartime requirements in the United States and supplies likely to be available in wartime. But within this wide framework much depends on the kind of war that is being envisaged and its possible duration. It is not surprising therefore that emphasis on particular commodities is constantly changing. The original intention was to accumulate 69 materials (from agar to zircon) within five years. Crocidolite asbestos and aluminium have since been added to the list—the latter being the first processed material to be included—and the operations of the stockpile have been extended to 8 years. The Munitions Board has emphasised in its six-monthly reports to Congress that technological developments, changes in production and consumption, problems of transport and general economic and political considerations continually call for flexibility in procurement policy. During the past financial year, for example, the programmes for eleven commodities (including rubber, tin, sisal and manilla hemp) have been revised.

Source: Munitions Board's Stockpile Report to Congress, January 23, 1950.

★

The speed at which the stockpile buys depends on the amount of funds appropriated each year by Congress, and on the state of the markets for individual commodities. At one time, it was laid down that stockpile purchases should be made only when supplies of particular commodities were greater than industry currently needed; the intention was to get the American economy back to a peacetime production without official competition for its scarcer materials. Oddly enough, the only period when such surpluses arose was between March and July of last year, and that was the very period in which no purchases could be made for the stockpile—because the Munitions Board had exhausted its funds.

Congress provides authority for stockpiling operations in three different phases. The first step is the appropriation of cash to enable the Munitions Board to buy spot supplies. In 1949-50 some $275 million was thus appropriated, making a total for the four years of $740 million. A second method is to authorise contract commitments against future appropriations; by this method, actual purchases can be spread over periods longer than a year, thus reducing their immediate impact on market prices. The allocation for such authorisations for 1949-50 was originally $250 million but this sum was later cut to $150 million; the total for the four years is $795 million. Thirdly, it is necessary to appropriate cash to liquidate earlier authorisations that fall due in a given financial year. So far, $325 million of contracts have been liquidated and $470 million are outstanding. Congressional control of the purse strings tends to accentuate the effect of stockpile purchases on the different markets. For three months last autumn, for example, it was impossible to place new contracts because Congress proposed to reduce its authorisation of funds, by an unspecified amount. When purchases were eventually resumed, they coincided with an expanded commercial demand. Again, when the funds are made available, they are usually spent within a relatively short period, and no more purchases can be made until the funds are replenished. The appropriations up to the end of June, 1950, are shown in the accompanying table. For the year ending next June, the Munitions Board has asked for $640 million cash appropriation and $100 million contract authorisation; this provision is still before Congress, but after last week's Presidential message, it appears certain that a revised request will be made.

In addition to the funds specifically authorised by Congress, ECA "counterpart funds" may also be used (up to a limit of 5 per cent) for procuring supplies for the stockpile and also for assisting the establishment and expansion of sources of supply outside the United States. But the quantities of materials purchased through ECA are relatively small. In all, up to the end of June, 1950, they amounted to $75-85 million, compared with a total cash appropriation made direct to the Munitions Board of over $1,000 million.

The only limit that has been set for the stockpile is the rather illogical fixing of the total commitment at $3,773 million. By the end of 1949, materials costing $1,149 million were already in stock and further deliveries valued at $406 million were expected before the end of June, 1950. Thus the stockpile has already cost over 40 per cent of its total budget and the further contracts for later delivery, valued at $473 million, will raise the total well over the halfway mark. The lack of logic does not rest in the absolute size of these value figures but in their irrelevance as a guide to the sufficiency of materials purchased—which is the objective that the stockpile is supposed to pursue. Commodity prices have risen considerably since the Act of 1946 was passed, and have thus reduced the real volume of materials purchasable for a given outlay. Details of the stockpiling operations are secret, but rough estimates can be made from published data. These suggest that in the four years, 1946 to 1949, nearly 450,000 tons of natural rubber have been acquired for the stockpile and more than 85,000 tons of tin. It is also estimated that last year some 200,000 tons of copper, 130,000 tons of lead and 80,000 tons of zinc were acquired. Zinc, manganese and copper are probably the materials in which the Munitions Board will be particularly interested in the future. It was disclosed last month that purchases of lead would be "substantially reduced," but those of zinc would be maintained.

★

Stockpile purchases, however, have been no more than marginal in relation to American commercial demand. In 1948, for example, at the height of the American postwar boom, the United States consumed about two-thirds of the world's output of copper, 40 per cent of the lead, nearly half the zinc and tin, about 45 per cent of all natural rubber and virtually all the synthetic rubber, nearly half the world's output of rayon, and about one-third each of the world's cotton and wool. American commercial demand is the major factor in determining commodity prices. Purchases for the stockpile may cause periodical fluctuations in the prices of commodities—particularly when they are superimposed on a high commercial demand—but they are unlikely in themselves to sustain the commodity markets for any length of time. A significant hint was given in the Munitions Board's report to Congress last January. After stating that the total cost of stockpiling was rising substantially, the report declared that "redoubled emphasis should be placed on other devices to strengthen the strategic materials position of the United States. Remarkable achievements in efficient use of materials were scored by Germany during world war II." The lesson from experience in the last war was the need to conserve scrap metal and to design equipment using the minimum of strategic materials as well as to produce synthetic substitutes. This would suggest some greater leaning of American policy towards self-sufficiency—stopping far short, of course, of the extremes to which Germany pursued such a policy before the war. The Munitions Board has already taken steps to standardise military equipment and to develop substitutes for certain critical materials. In addition it has suggested that national research programmes should give more attention to the development of techniques to enable less accessible domestic ores to be used commercially.

There has been much argument since the fighting started in Korea on the effect of stockpiling operations on primary commodity prices. When stockpiling coincides with a high level of commercial demand, prices are bound to rise and in circumstances such as those of the present time, where there is little or no scope for a rapid expansion in the output of these commodities, the rise in prices may be embarrassing. The notion that stockpiling operations might become a stabilising factor in the commodity markets has disappeared. They represent part of the military pre-emption that was evident in the world's commodity markets long before the invasion of Southern Korea. Those who look to such stockpiling purchases for a permanent prop to the commodity markets should remind themselves of the new aims of the Munitions Board and of the amount of money already spent on the programme. It is the level of world demand, rather than the particular form taken by a limited proportion of American purchases, that will determine the main trend of prices.

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area— and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

Business Notes

Markets and the Truman Message

President Truman's dramatic message to Congress on Wednesday has made a profound impression in the City, where the general response to it was one of astonishment at the size of the dollar appropriations for which the President is asking, at the breadth of the whole programme, and at his determination to take—though not necessarily to use—wide powers of physical and financial control. At the moment of going to press, although these and many other aspects were being actively discussed, it was clear that in the Stock Exchange and commodity markets even the first impact of the news had not exhausted itself. Everyone realises that, psychologically, a new impetus has been given to the forces of inflation; but the extent to which these forces are strengthened by rising real demands will depend not only upon the pace at which the American defence programme is implemented but upon how far the additional pressure is held in check by firm counter-measures. The first impression is that, for some time to come, monetary restraints and increases in taxation will be more important than physical controls and specific directives. Nor is it yet possible to guess how soon Britain's share in the plans for defence will add its own quota to the rising pressure of demand—but when that happens, it is likely that the physical restraints will be more important than the fiscal.

In these circumstances, when many people are wondering whether, and, if so, to what extent, their economic judgments need to be reorientated, the behaviour of the financial markets is not any reliable signpost. In the Stock Exchange this week the volume of business has been small and price movements narrow, while the price of tin, which made such a rapid advance last week, reacted sharply on Monday and has been irregular since. Both gilt-edged and industrial equities were firm on the eve of the Presidential message—partly in sympathy with the recovery on Wall Street and partly in response to the new American landing in Korea. This firmness, on the day of America's response to the Nehru initiative, is in significant and heartening contrast to the market's habits in the prewar days of appeasement. After the news of Mr Truman's proposals, the rally gained momentum—but it was still of moderate dimensions. The industrial share index of the *Financial Times*, which on Monday and Tuesday remained unchanged at the low point of 110.6 reached last Friday, advanced to 111.3, compared with 114.8 on the eve of the attack on Korea. The pattern of gilt-edged prices has developed rather on the same lines. At one time the price of 2½ per cent Consols had declined by as much as 2¾ points to 68¼ from its ex dividend price on June 23rd, but by the close on Thursday 1¼ points of this loss had been regained. The movement of 3½ per cent War Loan, in which a fairly big speculative position had been built up prior to Korea, was if anything more pronounced. On July 4th it had fallen a full 3 points to 91⅞ from its pre-Korean level, but has since risen 1⅝ points from its low point.

Light on EPU

This week's House of Commons debate on the European Payments Union scarcely succeeded in lighting up the darker recesses of this scheme. This is hardly surprising, given the complexities of the subject—with which most of the speakers were unfamiliar. Mr Gaitskell, though he had little stimulus from the opposition, succeeded in conveying both an admirably balanced description of the scheme and some information additional to that which could be obtained from the printed documents. It is clear from his speech that the British Government visualises the useful expectation of life of EPU as extending well beyond the remaining span of Marshall Aid. It is hoped that, as long as the world cannot attain complete and free convertibility of currencies, EPU will go on and will provide for Europe and its related monetary areas the advantages that come from a multilateral system of payments even when that multilateral system fails to be omnilateral.

For Britain one of the most important features of the new system is the guarantee against any gold lost through the use of accumulated sterling balances by member countries that happen to be in deficit with EPU. Mr Gaitskell confirmed that there was such a guarantee, that it was contained in correspondence between himself and the United States special representative with OEEC and that the terms of the agreement will be published as soon as permission has been received from the United States. Information about the size of these balances, which Mr Oliver Lyttelton said was as difficult to obtain from the Treasury as "pulling the back teeth out of a mule," was again refused by Mr Gaitskell —on the usual argument that the balances were somebody else's property to which the customary secrecy between banker and customer applied. He confirmed, however, that the four main European holders of sterling balances are Italy, France, Sweden and Portugal, and that the total European balances are roughly £200 million.

The balances held on French account are in fact being held in anticipation of repayment of the French government's funded debt of £110 million debt to the British Government—more than twice the existing French balance. The amount owing to Italy is under discussion at the moment. On the other side of the account the debt owing to Britain by Denmark has been funded and will be amortised over a period of ten years. Mr Gaitskell gave it as his opinion that Britain would be unlikely to gain or lose gold as a result of EPU. It is anticipated that the sterling area will be roughly in balance with Europe and that any swings in the payments will remain well within the margin of Britain's initial debit position (duly covered by conditional ECA grants) and of the gold-free portion of the credit lines available under the EPU quota.

The first major criticism made from the Opposition side was Mr Oliver Lyttelton's plea for making sterling an increasingly scarce currency and his fear that EPU might have the reverse effect. But the scarcity or abundance of sterling will depend on the degree of domestic inflation, on the release of sterling balances and, last but not least, on the way in which the balance of payments of the sterling area is affected by events over which Britain may have little immediate control—the repercussions of the Korean war and of American rearmament, for example. Again, Mr David Eccles claimed that an expansion of intra-European trade would, unless accompanied by higher production, be positively detrimental to Europe's endeavours to bridge the dollar gap. This seems too gloomy and negative a view. The unified market in Europe and the greater scope given for effective competition should be conducive to higher efficiency and lower costs and provide the basis for a more promising attack on what remains of the dollar problem.

* * *

Liberalisation of Trade

Within fifteen days of the signing of the EPU agreement (which is expected to take place towards the end of August), the participants have undertaken to liberalise 60 per cent of their imports on private account. The signatories also under-

take that as from January 1, 1951, they will avoid any discrimination in respect of imports of any products as between one member and another. All existing measures of discrimination based solely on payments difficulties, such as the exclusion of Belgium, by a number of European countries, from the advantages of the measures of liberalisation of trade already instituted under OEEC, will thus come to an end. This principle of non-discrimination will also apply to invisible transactions. In conformity with this, Britain has already announced that the previous limitation of British tourist expenditure in Belgium to a prescribed total has come to an end and that visitors to Belgium will be subject only to the individual quota that applies to visitors to other European countries. The same concessions will be made to British tourists' expenditure in Switzerland as soon as that country has produced the necessary Parliamentary sanction of its promised adherence to EPU. Mr Gaitskell, however, suggested that this rule of non-discrimination to invisible items did not mean that the special facilities given to British tourists to the Scandinavian countries would be extended to other members of EPU. The Scandinavian position, he said, was a special case and that fact had always been made clear to the council of OEEC.

If a member of EPU finds that it is running seriously into deficit, it will discuss its problems with OEEC, and may go back on previous liberalisation measures and reinstitute quantitative restrictions on imports. These measures must, however, be applied without any discrimination unless the Council, in very special cases, authorises a departure from this rule. This it may do, both to help debtors and to restrain excessive creditors. It may authorise members to import products from extreme debtors on more liberal terms than from others. It may also authorise members to discriminate against a particular member that is incurring so heavy a surplus with EPU as to endanger the reserves of the Union. The objective of the EPU rules on commercial policy is twofold. First, the rules are intended to expand trade within Europe on a basis of non-discrimination. That is part of the basic philosophy of EPU and of the retreat from the principle of bilateralism. Secondly, exceptions to the rules for liberalisation of trade are provided; discrimination may be applied if its purpose is to maintain that approximate equilibrium in intra-European balances of payments without which EPU, or any similar organism, would soon find itself waterlogged and ineffective.

Dutch Buyer's Strike

The latest difficulty to arise from the British price policy for coal exports has confronted the National Coal Board rather suddenly; it has arisen in the Netherlands, where the government has decided to stop the import in the current quarter of certain qualities of coal obtained from Britain. The Netherlands has lately been a good customer for British coal, and took 903,000 tons last year. These imports are controlled by licensing, and the Netherlands government subsidises the imported coal to the extent necessary to bring its price down to the domestic price level. The Dutch have decided that for certain qualities of imported coal the gap that has to be covered by subsidy is unreasonably large, and these are the qualities the import of which has been stopped. They are by no means all—as might perhaps have been expected—the best or most costly qualities; among them are some inferior coals, cheap by comparison with other grades of imported coal but dear by the side of comparable qualities on the Dutch market. In the recent experience of Britain and other exporting countries these inferior grades of coal have been the hardest to dispose of, even at fairly low prices.

Discussions between the National Coal Board and the Netherlands government have been hurriedly arranged and are to start in London soon; no doubt the board will try to persuade the Dutch to restore the missing licences, and the Dutch will ask the board to change its price policy. There have been protests before from several countries, but these did not lead to any great change, presumably because the European market had not yet approached a state of glut. Has such a state been reached now? It seems doubtful, unless in a limited range of inferior qualities. But if not, why have the Dutch chosen this moment to make their protest?

The question would be easier to answer if it were known how the Dutch decision will affect imports of coal from other sources than Britain. The Netherlands imported 912,000 tons of coal from Poland last year and 1,613,000 tons from western Germany. Both these supplying countries pursue differential price policies. But the International Ruhr Authority issued a direction last week that the difference between the home and export prices of German coal was to be reduced forthwith by 20 per cent. Britain abstained from voting when this decision was taken, and the Germans have shown that they do not relish it; there is great reluctance in Germany to raise the inland price, and the mining undertakings declare that they cannot support the loss of income that would come from a reduction of export prices. It is still unknown, therefore, which of the price levels will have to give; the German government may produce a subsidy to resolve the dilemma. No doubt the Dutch, before delivering their blow, made some calculation of the probable course of Ruhr export prices, but they must still be uncertain how the calculation will work out.

* * *

The Caltex Agreement

With the Caltex agreement, announced this week, one more piece is fitted into the jig-saw of arrangements by which the government is arriving at a *modus vivendi* with the American oil companies. Granted the assumptions on which the government's overseas economic relations are conducted, the agreement represents a substantial success. The Caltex group sells some 3,000,000 tons of oil products a year in the sterling area. This oil is refined at Bahrein, in the sterling area, where the Caltex group has a refinery; the crude oil comes partly from Bahrein itself and partly from Saudi Arabia. Bahrein crude, though it has been treated hitherto as dollar oil because of its American ownership, has the highest "sterling content" of any dollar oil; but Saudi Arabian crude has a dollar content of 100 per cent. The first step to bring about the Caltex agreement was, therefore, the arrangement with Arabian American Oil Company that was discussed in these columns last week, permitting Caltex to pay for Arabian crude oil partly in sterling and permitting the Arabian American company to use the sterling so obtained to meet some of its costs in Arabia.

The Caltex products refined at Bahrein are sold for the most part in overseas countries of the Commonwealth. They will now be treated as sterling oil in all those countries that draw upon the sterling area pool of dollars. The company handling this trade, Caltex (U.K.) Ltd., will be treated in all respects as a British company, drawing on the sterling area dollar pool for its operating needs, and transferring only its profits (after British taxation) to the United States. It will be exempt from the British "substitution" policy. In return, the company agrees to various steps directed towards increasing the proportion of its sterling costs and decreasing the proportion of its dollar costs; these will include, besides the arrangement already mentioned with Arabian American Oil Company, the building of tankers in Britain.

While it will need perhaps two years for these dollar-saving measures to take full effect, the result will be (it is estimated) a saving by 1952 of between $30 million and $40 million a year to the sterling area dollar pool. By removing Caltex from the ambit of the substitution policy, it will reduce by 1,000,000 tons a year the extent to which the

We've solved some problems in our time!

In 1942, peak period of Hitler's submarine campaign, came a request for batteries to operate wireless transmitters in the ships' boats of the Merchant Navy. Batteries that could be relied upon to give immediate service when needed, even if they had been standing by unused for as long as two years.

¶That was a problem. No such battery existed. Normally a filled battery progressively loses its power when idle and needs periodic recharging; an unfilled battery needs a lengthy first charge before it can be used.

¶Our answer was to produce the Exide self-priming battery. Its plates were *dry* charged, and sealed in a compartment separated by a thin diaphragm from another compartment containing acid. When the diaphragm was pierced with a punch attached to the battery, the acid ran on to the plates, and within a few minutes the battery was working at full strength—even after 2 years or more of inactivity.

¶Thousands of these batteries were supplied; and many a seaman owed his life to them.

¶We have been solving battery problems for over 50 years. Wherever batteries are used today you will find Chloride, Exide and Exide-Ironclad batteries giving good service in jobs for which they were specifically designed at a user's request. Our battery research and development organisation, the largest and best equipped in this country is now, as ever, at industry's service—ready at any time to tackle another problem.

EXIDE WORKS · CLIFTON JUNCTION · NEAR MANCHESTER

British Government may require sterling oil to displace dollar oil in the markets of Britain and the Commonwealth.

Thus the impact of the substitution policy—already reduced by 500,000 tons a year by last month's agreement with Standard Vacuum—is now limited to 2,500,000 tons a year falling almost exclusively on the trade of one American group, Jersey Standard. This group will have its new British refinery in operation at Fawley by the end of next year, and this, together with the arrangements it has made for the supply of sterling crude, will enable it then to make out a strong case for the treatment of Standard products also as "sterling" oil. It remains to be seen whether special arrangements will be made for the interim period; if they are, then the substitution policy in oil will virtually have ceased to exist.

* * *

Trends in Bank Deposits

Net bank deposits rose in the six weeks to end-June by £91 million, their largest rise since last December. This, however, is a slightly smaller movement than occurred in either 1949 or 1948 and need not, therefore, be regarded as an indication that a new phase of credit expansion is beginning. The risk of such a development is, however, greater now than at any time since the major phase of expansion came to an end two years ago. This risk arises not only from the probability of increased expenditure on defence, but also from the fact that the disturbance of investment markets has checked in mid-course the official operations in the gilt-edged market that would otherwise have rounded off the recent cash-and-conversion offer. For some time past, the dominant characteristic of the banking scene has been the fact that governmental repayments of indebtedness to the banks have been more than sufficient to offset the additional credit made available by bank advances. In the twelve months to end-June last, this excess of governmental repayments was sufficient to permit a decline in net deposits by £47 million, to £5,740 million, in contrast with an increase of £51 million in the preceding twelve months. During the first half of 1950, moreover, the improvement on the previous year's experience has been equally marked, despite a sharp acceleration in demands for advances. In this half-year net bank deposits dropped by £224 million, or by nearly £100 million more than in the first half of 1949. Yet the growth of bank advances in these six months steepened to £125 million, compared with £70 million. Now, it seems, the chances of avoiding a new upturn in the volume of deposits depend very largely upon whether the pressure upon the banks for advances will begin to relax. During May and June there was, it is true, a marked reduction in the rate of net new lendings, but this appears to have been wholly due to repayments effected out of the application moneys and first call on the new BEA loan. Apart from this, the pressure still seems to be appreciably greater than at this date last year, and it is perhaps not likely to subside significantly unless and until the new capital market is able to absorb a large volume of funding issues.

Meanwhile, thanks to the past year's vigorous switching by the Treasury from Treasury deposit receipts to Treasury bills, the big rise in advances has not impaired the technical flexibility of the banking position. Although the ratio of advances to deposits has risen in the twelve months from 24 to 27½ per cent, the combined ratio of the banks' bills and call money—the most flexible of all their earning assets—has risen from 21 per cent to the unprecedented level of 31½ per cent. This improvement has been brought about by the very large reduction in bank holdings of TDRs, which at end-June stood at only £297 million, compared with £1,142 million in June, 1949, and as much as £1,994 million at the peak touched in mid-1945.

Rising Output in the Motor Industry

The output of passenger cars in the first six months of the year has been consistently higher than in 1949, and by the end of June it had reached an annual rate of 510,000 cars. The original estimate put forward at the beginning of the year was only 450,000 cars; this was based on tonnage of sheet steel which it was then thought would be available to the industry. Complete production figures for the first half of the year are not yet ready, but the total is likely to be between 254,000 and 255,000 cars. Total exports during the period were 175,407, valued at £54,575,054. The Ministry of Supply at the beginning of the year laid down a figure of 110,000 cars for the home market in 1950. Less than half this number had been delivered by the end of June.

Each of the big manufacturers reports higher production and export figures for cars and commercial vehicles in the first half of the year. The Ford Motor Company had the largest output. Production totalled 100,890 cars and commercial vehicles, 82,900 of which were exported. In the same period the Austin Motor Company produced 81,972 vehicles and exported 64,440 of them. Nuffield exports were 51,500 units, those of Vauxhall Motors were 32,633 out of a total output of 46,148. Exports of the Standard Motor Company during the same period were 23,362 vehicles, nearly all passenger cars. Standard's production figures for the six months are not available but production has now recovered to 500 units a day.

Canada is rapidly overtaking Australia as the leading export market for the British motor industry. In June 6,774 cars were sent to Canada compared with 5,749 to Australia. During the first six months however, Australia has taken 46,701 cars as against Canada's 38,670. Sales in the United States have recovered somewhat, but the industry does not expect to find a market there for more than 40,000 cars a year and even this seems optimistic, since exports in the six months have amounted to no more than 6,005 cars.

These figures, while they are encouraging, need cautious interpretation. Production at home is not expected to continue expanding at the same rate as it has in the first half of the year. The industry considers that it should be possible to find enough sheet steel to raise the production rate by another 10,000 cars, but expansion beyond that figure is unlikely this year. There is little possibility now of getting from the United States any more sheet steel or slab for rolling into sheet. The American motor industry is itself finding difficulty in getting enough steel for the increases in output that it had planned. The American Ford Motor Company has already announced that it will work a shorter week than it intended because of inadequate supplies.

The rising trend in exports is also likely to be checked and may even for a time be reversed. The second half of the year is not usually a time when cars are bought, so during this period deliveries to the home market may be made up. The Standard Motor Company's decision to allocate first deliveries of its new Triumph to the home market will increase the total number of cars quite considerably. The decision is obviously a wise one, until some experience is gained at home there are serious risks involved in selling a new model abroad. The new Ford is the only other new model expected this year.

Patons & Baldwins Capital Needs

Patons & Baldwins are to follow up the issues of new preference and ordinary capital (which brought in approximately £5,900,000 in 1949) by an issue of £3,000,000 4 per cent debenture stock 1960-75 at 98 per cent. Cash applications for the new stock must be made by July 28, 1950, together with a first payment of £25. The balance of the issue price is due on allotment. Up to £500,000 of the new issue will be used to redeem the outstanding existing 4 per

Total 1948 U.K. exports to the territory were £5,416,000.
These included :

CHEMICALS	£474,000
COTTON PIECE GOODS	£695,000
IRON & STEEL MANUFACTURES ...	£539,000
MACHINERY	£682,000
VEHICLES	£605,000
REFINED SUGAR ...	£422,000

The table shows some of the goods that the Anglo-Egyptian Sudan bought from Britain in 1948. There is a market, too, for many other British products.

Write for our new booklet 'Overseas Markets'.

It contains detailed trade tables for the Anglo-Egyptian Sudan and other territories where the Bank has branches.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

GB4906. E.

cent debenture stock. The remaining proceeds will go towards the repayment of bank loans and acceptance credits. The accounts for the year to April 29, 1950, show that such financing had risen from £857,002 to £2,536,571, partially offset by a rise of nearly £400,000 in cash balances to £695,803. The vice-chairman declares in his statement that "while no forecasts can be made as to the future trend of raw material prices, it is apparent that the company has become short of adequate working capital to finance the current and expected level of output."

The jump in short term borrowing in the past year has been occasioned primarily by the rise in the cost of raw wool to record prices. The balance sheet reveals that the value of stocks had increased from £8,148,294 to £10,401,527 by April 29, 1950. But it is also to be noted that debtors required nearly £450,000 of additional finance in 1949-50. Meanwhile, capital expenditure of the new Darlington factory has continued. Expenditure, at cost, on the new plant up to April 29, 1950, amounted to £10,432,228, of which £1,798,599 was spent in the past year. An additional outlay of about £1,650,000 will be required to finish it. Mr Philip A. Wright reports that most of the sections of the factory came into operation in the course of the year. The factory has been processing raw wool through all stages to finished yarn since January, while its output was 40 per cent higher than in 1948-49.

Patons & Baldwins face several awkward problems as their postwar expansion programme nears completion. Not least of these are the "growing consumer resistance to higher prices," the risk of a fall in wool values and the provision of extra working capital to finance a high level of production. Yet it is satisfactory that demand continues to exceed the company's capacity to meet it, even with the assistance of additional supplies from the new factory. The rise from £1,756,527 to £2,455,159 in the trading surplus of the past year is impressive, and provides particular justification for the big additions to outside capital of recent years. The latest debenture issue conceivably may not represent the end of this process. The trust deed securing the new debentures also authorises the issue of an additional £3,000,000 debenture stock ranking *pari passu*, if it should be needed at some future time.

New Heavy Tractor

Vickers-Armstrongs Ltd. have completed a year's trials with the prototype of a heavy industrial tractor, production of which will start at the beginning of 1952. It is powered by a 180 h.p. diesel engine, one of three standard diesels made by Rolls-Royce. Tractors of this size have limited agricultural uses in some areas, but their primary purpose is for heavy industrial duties such as earth moving and pipe laying. This will be for a time the heaviest tractor built in the world, although there are reports that Allis-Chalmers plan to produce one with an engine of more than 200 h.p. An output of 500 tractors a year is planned.

Tractors of this class have so far been built only in the United States, and American exports of them are considerable. Annual production is about 15,000 a year. Since 1947 Britain has spent $5,250,000 on imports of these tractors. Vickers have been working for three years on the project and during that time have, with Rolls-Royce, spent £1,000,000 on development. A number of "pre-production" models will be built for various firms in the next 18 months for testing in use. It is essential that any snags that might arise in operation be removed before the tractor goes into full production, because it is intended to send most of the output abroad. The home demand for equipment of this weight is limited. Development work has been facilitated by the fact that a standard and well-tried engine is being used. Rolls-Royce diesels have been developed from the range of petrol engines first built for tanks; parts for the three engines are largely standardised. Vickers have decided to distribute the tractor through the firm that has been handling most of the heavy tractor imports from America. This firm, Jack Olding and Company, is now giving up its American agency, presumably on the assumption that imports to this country will cease when the home-built tractor becomes available. Abroad, however, the tractor will be selling in direct competition with American-built tractors in a necessarily limited market. Demand in the postwar years was large because of the amount of reconstruction and rebuilding to be done. The market may not now be of the same size, and in the light of this possibility the rate of production planned is perhaps less modest than it might seem in comparison with past American sales.

SECURITY PRICES AND YIELDS

A fuller list containing 366 securities appears weekly in the *Records and Statistics* Supplement. Notes on the following company reports appear in the Supplement: Patons & Baldwins; British Match Corporation; Lewis Berger.

The Subscription Lists will open and close on Wednesday, 26th July, 1950, for the

ISSUE AT PAR OF

£500,000 4½ per cent. First Mortgage Debenture Stock, 1960/80.

The Prospectus states, inter alia:

1. **BUSINESS.**—The Company manufactures ladies' and children's knitted outerwear, handknitting and rug wools and children's woven outerwear. These products, many of which are sold under nationally advertised trade names, including "BAIRNS-WEAR," "TIROLA," "FEMINA" and "LA LAINE," have achieved a high reputation for quality at competitive prices.

2. **DEVELOPMENT PROGRAMME.**—To provide additional facilities for increased output of ladies' and children's knitted outerwear the Company has agreed to lease a factory now being built at Armagh, Northern Ireland. This factory should be in full production by the end of 1951. To produce additional handknitting wools, the Company has acquired a freehold site at Worksop, Nottinghamshire, on which a new spinning mill is being erected. It is hoped that this mill will be in full production by the end of 1952.

Preliminary constructional work at Worksop, begun in 1948, involved a cost of approximately £85,000; a balance of about £8,500 still remains to be paid. Including this balance, the cost of completing the mill and equipping both it and the factory at Armagh (now estimated at £605,000 in all), plus £125,000 additional working capital, will amount in total to about £730,000, of which £137,972 was provided by the issue of Preference and Ordinary Shares in October, 1949. Of the balance, £479,000 will be provided by the net proceeds of the present issue of Debenture Stock and the Directors consider that the existing resources of the Company will be ample to provide the remaining £113,000.

3. **CAPITAL AND INTEREST COVER.**—Net tangible assets of the Company, including the estimated net proceeds of the £500,000 4½ per cent. Debenture Stock, as stated in the Auditors' Report, amount to £1,415,179, which is equivalent to more than 2¾ times the amount of the Stock including the maximum premium payable on repayment.

The profits of the Company, subject only to taxation, for the financial year ended 18th December, 1949, amounted to £207,291, which is equivalent to more than nine times the gross interest (£22,500) annually payable on the Stock.

BANK OF BRITISH WEST AFRICA LIMITED

ECONOMIC AND FINANCIAL CONDITIONS IN WEST AFRICA

SIR FRANCIS BEANE'S STATEMENT

The annual general meeting of the Bank of British West Africa Limited was held at the office of the company, 37, Gracechurch Street, London, E.C.3, on July 12th, Sir Francis Beane (the chairman) presiding.

The secretary (Mr S. J. Andrews) read the notice convening the meeting and the report of the auditors.

The following is an extract from the chairman's statement which was circulated with the report and accounts.

Turning to the balance sheet and profit and loss accounts, I am pleased to place before you figures and results which I hope will be regarded as satisfactory.

BALANCE SHEET ITEMS

Capital remains unchanged at £1,200,000. A sum of £50,000 has been taken from profits and added to the reserve fund, making a total of £950,000. A further £50,000 has been added to contingencies account.

Current, deposit and other accounts at £44,628,715 show an increase of £6,568,530 over the previous year.

Liabilities on acceptances, confirmed credits and other engagements on behalf of customers at £5,306,265 have decreased by £1,410,836.

On the assets side, our cash holdings at £8,030,734 are higher by £230,254, while call and short money at £16,425,000 are up by £2,625,000. At first glance these figures may, perhaps, suggest unnecessary liquidity, but it must be remembered that the bank operates in a sphere which deals in high-priced raw products, and it is essential, therefore, to have ample cash resources available to meet the recurring and increasing needs of agricultural seasons.

There is little change in the level of investments at £11,490,942.

Loans, advances, overdraft and other accounts at £7,847,095 continue their upward tendency due to heavier demands made upon us by customers requiring finance, and are higher by £3,357,936.

Premises and furniture stand in the books at £110,839.

THE DIVIDEND

Your directors, after careful consideration of the profit and loss figures, recommend the payment of a final dividend of 4½ per cent. which, with the interim dividend of 2½ per cent. paid in December, 1949, will make a total of 7 per cent. for the full year.

CONDITIONS IN WEST AFRICA

During the past year West Africa has been passing through a period of development and activity, and there are clear indications that the importance of its natural and agricultural resources is recognised. In many directions the necessary steps are being taken to extend these resources for the benefit of its population and the satisfaction of overseas demands. In this respect it would appear that, to enable West Africa to achieve her aims, three main requirements must be kept in view: capital, technical and managerial skill and, most important, increased efforts by all concerned.

So far, there are few signs that West Africans have money available in the form of capital for investment purposes and it is clear that the country will have to look outside its own resources for the financial requirements necessary for its development. Skilled personnel and much equipment are needed if the four Colonies are to justify themselves, and it must be a matter of self-interest that each of them should create conditions which will attract a steady flow of capital from overseas. An essential condition for this is political stability throughout West Africa.

BOOM PERIOD PASSING

With its agricultural crops and mineral wealth West Africa occupies an important sphere in the world today, and it ranks high among the dollar earning countries. There are, however, indications that the period of rising prices is coming to an end, and improved methods and increasing energy are necessary now that greater competition is in evidence from producing areas in other countries.

Expressions of opinion to this effect have been made in many quarters, and recent speeches by Colonial governors have emphasised that the "boom" phase is passing.

Foresight is being displayed in each of the four Colonies for the safeguarding of the future and, although their financial positions are sound, a watchful eye will have to be kept on expenditure which has risen to an unprecedented level due to the years of artificial prosperity created both during and since the war. Any important fall in revenue due to reduction in world prices will, in the absence of further sources of taxation, lead to a curtailment of desirable development schemes.

INFLATION PROBLEM

Inflation undoubtedly exists and if the general situation is not to get out of hand, careful supervision will be necessary to ensure that the cost of living is kept at an economic level.

West African exports place large sums of money in the hands of the community each year. Much of this money has hitherto been spent freely on high-priced luxury and domestic merchandise, especially during periods when such goods have been in short supply. The past year has seen a complete change of conditions and, with few exceptions, notably waxed prints, sugar, etc., markets are now heavily loaded with practically everything to satisfy local demands. Surplus stocks exist in some areas and there have been instances of price cutting below production costs. This, however, is not general, as replacement values are still on the upward trend, apart from certain lines coming from Japan and Italy.

Many schemes of development are now in progress.

After dealing at length with conditions in Nigeria, the Gold Coast, Sierra Leone and Gambia, the statement continues:—

THE FUTURE

In the uncertain conditions prevailing today, I am sure you will not expect me to venture upon any definite forecast, but I have great faith in the future of West Africa with which your bank's fortunes are bound up. Our business is sound and increasing as are our resources and our ability to meet such demands as are likely to be made upon us, and I therefore think that we may look forward to the future with feelings of confidence and security.

The report and accounts were adopted.

THE BRITISH SHAREHOLDERS TRUST LIMITED

MR B. H. BINDER'S SPEECH

The twenty-eighth annual general meeting of the British Shareholders Trust Limited was held on July 11th in London.

Mr B. H. Binder, F.C.A. (the chairman), presided and in the course of his speech said: Our gross profit for the year amounted to £79,705 and, after meeting expenses, the net profit, subject to taxation, was £53,633. After providing for taxation based on the profits for the year the available balance was £30,360, which is about £10,600 less than the comparative figure of the previous year.

This reduction in profit, which arises from the lower revenue from placings and profits on realisation of securities, is not surprising in view of the generally unsettled conditions during the past twelve months, which were caused by a number of factors, including the devaluation of sterling last September and the general political uncertainties both before and after the general election.

A sum of £3,000 has been allocated to the staff pension fund and the directors recommend the payment of a final dividend of 4½ per cent. and a bonus of 2½ per cent., both less income tax, making a total distribution for the year of 10 per cent., a rate which will have been maintained for the four years ended March 31st last. Although this involves a reduction of over £2,000 in the carry forward, there still remains the substantial credit balance of £84,052 on the profit and loss account. This amount added to our various reserve accounts and issued capital makes a total amount invested in the company's business of over £1,000,000.

I wish to emphasise that the issues and placings sponsored by the British Shareholders Trust Limited bear little relation to the number of proposals submitted to us, only a small proportion of which satisfy our standards and see the light of day. They are submitted to a very careful sifting. I am sure you will all agree that the issues and placings of securities of various kinds which we have sponsored make a very satisfactory showing, and we and our clients also can be satisfied that the list of them clearly indicates that our policy has been fully justified by the test of time.

THE SUBSIDIARY COMPANY

The accounts for the year to March 31, 1950, of our subsidiary company, the Record Electrical Company, Limited, show an improvement over the previous year. The turnover increased, the liquid position improved, and the profits, before taxation, increased from £12,900 to £19,500. The dividend of 40 per cent. on the ordinary shares which we have received in respect of the year to March 31, 1950, is double the dividend which we received last year.

You will appreciate that a business such as ours is particularly susceptible to the effects of national and international uncertainties with which we are now faced and that, in existing circumstances, it is not possible for me to give you any reliable indication of future prospects.

In spite of these uncertainties and difficulties we must continue to carry on our work and duties as normally as possible in the expectation that steadiness of purpose in our daily tasks will, as in the past, assist us to overcome present difficulties. This is the line which your board and your staff will follow and hope to be able to submit to you next year results as good as conditions will allow.

The report and accounts were unanimously adopted.

ROLLS-ROYCE, LIMITED

ANOTHER YEAR'S SUCCESSFUL TRADING

INCREASED AERO ACTIVITY

The forty-third annual general meeting of Rolls-Royce, Limited, was held on July 19th at the Midland Hotel, Derby.

Lord Hives, managing director, who presided, expressed regret on behalf of all the shareholders at the absence of the chairman, Mr E. C. Eric Smith, due to illness, and said they would all wish him a speedy recovery.

The following is an extract from the chairman's statement circulated with the report and accounts for the year ended December 31, 1949:—

The motor-car division has suffered from the various restrictions to which I have referred previously. Devaluation produced an increase in the export orders, but to some extent this advantage was offset by the steady increase which had been occurring before and have continued since devaluation in the prices of many of the materials which we use.

Commercial and economic restrictions have not prevented us, however, from doing everything in our power to enhance the reputation already earned for our present range of Silver Wraith, Silver Dawn and Mark VI Bentley cars. The recent reduction in the purchase tax mitigates one of the big handicaps under which we have been operating, and will be of material assistance to us in making plans to meet the needs of both the home and overseas markets.

The Ministry of Supply has now specified our "B" range of engines for certain of their new combat vehicles. The motor-car division, on whom the task of producing these engines will fall, is busily engaged on the necessary organisation.

AERO DIVISION

The Aero Division has experienced a further increase in activity, the outstanding feature of which has been the volume of business in overseas markets.

Technical Progress.—In the civil field there has been a steady development of the Merlin installations, of which British Overseas Airways Corporation and Trans-Canada Air Lines now have substantial numbers in operation. Success in this field is measured by reliability and economy, and the achievement of these goals in the high performance engine requires unremitting effort on the part of design and development staff.

There has been steady development in the Dart gas turbine propeller engine, and the power rating of the engine specified for the Vickers "Viscount" shows a substantial increase since the prototype first flew. The reception which has been given to this particular aeroplane by the various air lines throughout Europe, including Scandinavia, confirms the opinions which we had already formed regarding the high standard of passenger comfort made possible by the use of the gas turbine engine.

MILITARY DEVELOPMENTS

In the military field the outstanding event has been the performance of the Avon engine in the "Canberra" light bomber, designed and manufactured by English Electric Co., Ltd. There is no doubt that more will be heard of this particular aircraft and engine combination as it finds its way into service beside the Meteor aircraft which, with our Derwent engine, continues to serve not only the Royal Air Force but also Western Union Powers and other allies in ever-increasing numbers.

The complex nature of the new family of engines of which the Avon is the forerunner places a high premium on fundamental research and design facilities, and it continues to be your company's policy to foster and strengthen these particular activities in parallel with the subsequent development work which follows the prototype stage. The rate of technical development has, until recently, presented problems to the production departments, but the last year has seen substantial progress in this field also. There is still scope for further ingenuity if the production costs of the engines of the future are to stand comparison with those of the established piston engines.

Our Glasgow factory has been maintained at a satisfactory level of activity. Particular attention continues to be given to the organisation of the speedy overhaul of piston engines, as this is an essential part of the service which must be offered to our many customers throughout the world.

OVERSEAS DEVELOPMENTS

Last year I referred to our collaboration with Messrs Pratt and Whitney, and this has continued most satisfactorily. The engines which Pratt and Whitney have developed from Rolls-Royce designs are already giving a good account of themselves in the Grumman "Panther" operated by the U.S. Navy.

Nearer home, we continue to make a practical contribution to Western Union resources, and Belgium and France have both made progress in the local manufacture of our engines.

Your managing director has recently returned from an extended tour through the Middle East to Australia, where you company has now established a very happy relationship with Commonwealth Aircraft Corporation, who have been nominated by the Australian Government to manufacture certain of our products under licence. The small investment which we made in this company a year ago is already showing a satisfactory return.

SUBSIDIARY AND ASSOCIATED COMPANIES

Our subsidiary and associated companies have traded successfully. Park Ward and Company, Limited, has had further successes with its special coachwork at exhibitions both at home and abroad, but is still faced with the difficulty of maintaining an economic output of bodies of the high quality associated with the company's products. This position is shared by others engaged in similar work, and must continue to be a source of anxiety.

Our Canadian company, whose results are, of course, affected by devaluation, continues to give practical effect to our policy of backing up overseas sales with technical service.

Rotol, Limited, in which we are jointly interested with the Bristol Aeroplane Company, Limited, has added to its activities by acquiring a 50 per cent. interest in British Messier, Limited, who are engaged on the development of under-carriages and hydraulic systems for aircraft.

Renfrew Foundries, Limited, have been kept busy during the year, and their position shows still further improvement.

In once again recommending the payment of a dividend at the same rate as last year, your directors have had regard to the present national position and to the future requirements of your company. The knowledge and experience which is continually being accumulated by our technicians can only be turned to good account where the resources for the continued development of both existing and new products are available, and your board feels that this demand can best be met by a further increase in the balance of undistributed profits.

The report was adopted.

SALTS (SALTAIRE) LIMITED

SALES AND EXPORTS RECORDS

SIR FRANK B. SANDERSON'S STATEMENT

The twenty-seventh annual general meeting of Salts (Saltaire) Limited was held, on July 19th, at the registered offices of the company in Saltaire, Yorkshire. Sir Frank B. Sanderson, Bt., the chairman, presided.

The secretary, Mr Selwyn B. Brearley, having read the notice convening the meeting and the auditors' report to the members, the chairman, in the course of his speech, said:

The year under review has been one of marked increase in our production and continued progress and expansion. Sales of the group have reached a total value which creates a record in the history of the company.

Profit on trading of the group, before charging depreciation of fixed assets of £82,561 and auditors' remuneration of £1,579, amounts to £1,073,898. After making provision for these items there remains a profit on trading of £989,758.

After adding income from trade investments, £9,830 and providing taxation, £499,410, there remains an available profit amounting to £500,178. To the amount of £500,178 must be added taxation overprovided in prior years amounting to £14,100 and £198,797 being amount brought forward making a total of £713,075.

DIVIDENDS

The chairman, having referred to various appropriations, continued:—There remains an amount of £227,950 now available for distribution. The board recommend the payment of the following dividends. A final dividend of 3½ per cent. on the 7 per cent. non-cumulative preference shares, making with the interim dividend, 7 per cent. for the year, which will absorb £11,550. A dividend on the preferred ordinary shares of 1s. 3d. a share, absorbing £41,250; and a dividend on the ordinary shares of 6d. a share which will absorb £24,750. Deducting these appropriations from the profits available for distribution, there remains a balance of £150,400, which it is proposed to carry forward.

EXPORT MARKETS

We have materially increased our export trade and continue to give our closest attention to the development and increase of export markets. The total value during the year under review establishes a record. We, like other industries, are seriously handicapped by import restrictions in many countries, and we look to the Government to do everything possible with foreign countries to ensure a more free importation of textiles, of which there still remains a scarcity in many markets of the world.

FUTURE PROSPECTS

With the prospect of another general election at home, and as the industry is confronted with a number of problems in respect of the development of the export trade and the higher price of wool, it would be unwise to prophesy in regard to the future. Happily, I am in a position to state that output in our mills is being fully maintained, and we continue to take all possible measures to avoid any repercussions from a fall in wool prices. Your company has never been in so strong a position as it is today to meet any contingency which may arise. Without undue optimism it is, I think, to be expected that your company will be able to give a good account of itself at the next annual meeting.

The report and accounts were unanimously adopted.

BOOTS PURE DRUG COMPANY, LIMITED

RECORD SALES

LORD TRENT'S SPEECH

The sixty-second annual general meeting of Boots Pure Drug Company, Limited, was held at Nottingham on July 20th, Lord Trent presiding. Points in his speech were:

Net profit of the company was £720,378 as against £627,662.

With taxation on the scale it had been for several years, and costs three times prewar, it was no longer possible to finance renewals and expansion wholly out of profits. Shareholders had therefore been asked to subscribe for more capital. The total amount received was £2,240,000, of which £1,280,000 was credited in the accounts for the year ended March 31st.

Sales beat all previous records, and 33 million prescriptions were dispensed. At March 31st £700,000 was owed the company on behalf of the Ministry of Health, owing to the Pricing Bureaux being many months behind.

Salaries and wages absorbed 4s. 11½d. out of every pound of turnover against 4s. 8d. in the previous year.

The new Airdrie factory was turning out a constantly increasing tonnage.

It was hoped to commence production in the autumn on the first half of the rebuilt printing works.

Work had started on modernising and extending the main Nottingham powerhouse.

Plans were being prepared for a Research Institute on the Beeston site.

New products placed on the market as a result of the research department's work under Sir Jack Drummond included:

Turk-e-san, a drug for treating blackhead in turkeys;

Cornox, a selective weed-killer;

Epitone, a new tonic.

Sales through the farms and gardens department showed an increase of over 26 per cent.

EXPORTS

Exports increased by more than 17 per cent., but much money must be spent on publicity in foreign markets before sales are profit-bearing.

It was neither desirable nor economical, in his view, to advertise or market the same medical product under one name at home and another name abroad. So in spite of recent statements in high quarters on the subject of branded proprietaries, the company was continuing to export most of its medical products under a trade name (to which is added the official designation).

PRICES

Distributors were not to blame for high prices. No successful retailer liked high prices. Producers and distributors alike wanted the maximum volume of trade.

The manufacturer was dependent on the retailer for moving the goods that he produced. If the retailer was unsuccessful, unemployment followed at the manufacturer's end. Public demand followed best value at low prices

Present position of retail prices was not promising. All the influences at work made for inflation. If rates are put up as a result of revaluation, further price rises can hardly be avoided.

As to prospects, all the factors within the company's control were favourable, but the same could not be said for the circumstances that were outside its control. There, all is instability.

The report was adopted.

BRITISH EMPIRE TRUST

IMPROVED VALUE OF HOLDINGS

The forty-eighth annual general meeting of The British Empire Trust Company Limited was held in London on July 17th.

Mr E. Ronald Crammond (chairman), who presided, said that the practice of revaluing the investments as at the close of each year and bringing in to the profit and loss account the unrealised appreciation or depreciation had been discontinued. The gross earnings for the year amounted to £80,448, and after expenses and taxation the available balance was £46,163. The total available for appropriation, including the amount brought forward (£59,043), was £108,661. Dividends at the same rates as for the previous year absorbed £29,987, leaving a balance of £78,674, being an increase of £19,631 on the balance brought in.

Continuing, he said:

The market, or estimated value of the investments held by the company and its subsidiaries at April 30, 1950, exceeded the book value by £97,732, showing an improvement of nearly £74,000 on the year.

In view of the development of events, your directors feel that their policy of retaining a high percentage of Government securities in the company's portfolio continues to be desirable. At the date of the balance-sheet 48 per cent. of the total investments comprised securities or obligations of the Government of Great Britain, the Dominions or other States of the Commonwealth, and a further 6 per cent. is represented by the securities of British or Commonwealth municipalities. You may be sure that we are giving the closest attention to the affairs of your company, and if by good fortune peace and settled trading conditions should be realised, your company is in a position to turn such events to advantage.

The sterling appreciation on our American and Canadian investments, following the devaluation of the pound, accounted, mainly, for the improvement in the value of the company's investments.

As to the outlook, we are living in times of great difficulty and uncertainty, and while I think we have good reason to expect that our investment income will be maintained, it has to be borne in mind that this country's commitments, in so far as they relate to the cost of defence, may have to be increased considerably.

In this respect, with a Budget already swollen to a dangerous extent, the country is ill-placed to meet the heavy outlay which would be involved. However, it has been apparent for some time that at some stage a halt must be called to aggressors. The first step in this direction has been taken, and we must hope that the outcome will be a speedy recovery of settled conditions in which all of us can pursue our lawful occasions free from the fear which now grips the world.

The report was adopted.

SMITH'S POTATO CRISPS (1929) LIMITED

SIR HERBERT MORGAN'S SPEECH

The 21st ordinary general meeting of Smith's Potato Crisps (1929) Limited, was held on July 10th in London.

Sir Herbert E. Morgan, K.B.E. (the chairman) said that the net profit of the company amounted to £88,703 as against £81,236, while the group net profit amounted to £97,767 as against £91,116. That showed steady progress; the business was travelling on the even keel it had for the past 21 years. The directors recommended the usual final dividend of 20 per cent., with a cash bonus of 5 per cent., with the interim dividend, making a total of 32½ per cent.

The demand for Smith's Potato Crisps was insistent and continued to increase unabated. It was their great regret that a serious limitation on supplies of some of the materials they regarded as essential to the quality of the product made it impossible to meet that demand under present conditions. They steadfastly refused inferior substitutes. Under no circumstances would they forsake quality for quantity. Quality was the keystone upon which the unique business had been built and so would it always be maintained. Nevertheless, they as a company naturally looked forward to the day, not too distant, they hoped, when they could supply everybody's requirements.

Touching upon some of the reasons for the popularity of their Crisps, the chairman said that Smith's Potato Crisps could be eaten hot or cold and served with any meal, saving trouble and labour to the housewife, a factor of great importance in these days of shortage of domestic help.

Their business for the present year was going very much as usual. Their order book was full and flowing over.

The report was adopted.

MILFORD STEAM TRAWLING COMPANY

FISHING INDUSTRY'S PROBLEMS

The annual general meeting of the Milford Steam Trawling Company, Limited, was held on July 12th in London.

Mr J. M. Whittington (the chairman) presided, and in the course of his speech said: The incidence following the decontrol of fish was not the cause of the industry's troubles, which go far deeper, but it undoubtedly accentuated them, and so shook the confidence of every member of the trade, from fishermen to fishmonger, that now they have become profoundly pessimistic and unwilling to contemplate any risk or expansion of business, but rather to limit their commitments in every direction. This loss of confidence pushed the industry over from its precarious balance into depression.

The present price of fish is not generally remunerative to producers, but the price to the housewife has reached the highest point at which it can be sold in competition with meat, eggs and suchlike subsidised foods. It is therefore suggested that the cost of production should be lowered. But here there is a difficulty in defining cost of production. Fishing is not like a manufacturing process because the amount of fish produced by a voyage is not under the control of the owner, whereas the expenses are practically fixed. The cost of production per pound of fish is therefore largely dependent on the quantity of fish caught per day. Last week the Prime Minister announced the attitude of the Government to the industry's problems. A body is to be set up to reorganise, control and develop the industry. Its powers, duties and constitution are apparently to be left to the members designate to decide. These members will be independent of the industry, and will, therefore, have to master their subject first. Legislation will also be required, and therefore the new body cannot function until 1951 at earliest. Indeterminate action of this kind was just what I feared. However, it would be uncharitable not to wish the best of luck to any person willing to stake his reputation on solving a problem which has so far baffled the Government which appoints him and the industry which he is to control.

In the meantime a subsidy is to be paid out of the general food subsidies to certain producers. We shall be concerned with the provision which will apparently underwrite the proceeds of voyages up to a maximum of £12 a day in certain cases for ships under 140 feet. I have no information as to the methods of applying the subsidy.

The report and accounts were unanimously adopted.

HENRY HOPE AND SONS, LIMITED

(Makers of Metal Windows, Casements, etc.)

INCREASED SALES AND PROFIT

IMPROVED DELIVERIES

MR H. DONALD HOPE'S SPEECH

The fifty-second annual general meeting of Henry Hope and Sons, Limited, was held on July 19th at Halford Works, Smethwick, Mr H. Donald Hope, the chairman, presiding.

The secretary, Mr A. E. Hobson, having read the notice convening the meeting,

The chairman said: Gentlemen,—When I met you last year I did not expect that we should make an increased profit; there were signs at that time of the sellers' market being on the wane, and with the building restrictions in this country I think many people looked forward to a reduced demand.

The decline of the sellers' market has in a way improved business conditions, because we are now able to give deliveries of most of our goods in reasonable time, whereas at the height of the sellers' market, delivery promises had become ridiculous and it was not uncommon for some commodities in the building trade to be so scarce as to put them outside common use.

The detailed information demanded by the latest Act in Company Law is fully set out in the report which we circulated to shareholders three weeks ago, but there are some items which call for comment.

PROFIT

First of these is the consolidated profit, which amounts to £415,499 after taxes are paid, against £357,628 last year. This increased profit has arisen from several factors, of which the first and most important is increased sales. Other factors are the increased dividends from our subsidiary and associated companies abroad. Our principal subsidiary in the United States has contributed very handsomely to our consolidated profit, and the devaluation of the pound has provided a fortuitous extra profit for this year.

Last I will modestly put the fruit of good management and excellent staff work at home and abroad. The name of Hope's for metal windows, roof glazing and kindred products stands high throughout the world.

THE DIVIDEND

The next item is the dividend, and your board has decided to recommend to you the payment of a dividend of 12½ per cent. on the ordinary stock, which is the same as last year, and as you have probably noticed in some of the newspaper comments, this is covered 14 times after payment of the preference dividend, but is under 2 per cent. on the total capital employed.

The next item is the reduction of £40,000 in trade investments. This is accounted for by the sale of our share in the Scottish Metal Window Company to the Crittall Manufacturing Company, Limited.

Careful estimates were made from official data when the Scottish company was planned at the invitation of H.M. Government to establish a window factory in a development area in Scotland. Unfortunately, the building of houses in Scotland lagged far behind the official programme and this Scottish factory has only been kept reasonably employed by diverting orders to it which should have been made at Braintree or Smethwick.

The Crittall Company now has complete ownership and I hope H.M. Government will realise there is an obligation to provide sufficient work in Scotland to fully employ it, although it has been built and financed without Government aid.

While I am on the subject of associated companies, it is appropriate for me to tell you that a new factory has been opened under the Crittall-Hope Metal Window Company, Limited, at Port Elizabeth, South Africa. This factory is now operating and provides hot dip galvanised windows primarily for the coastal regions where corrosion must be provided against.

NEW GALVANISING PLANT

During the year your company has perfected a fully mechanised and in many ways original hot dip galvanising plant at Wednesbury. An expert who visited this plant only a month ago wrote to us that, in his opinion, it was the best galvanising plant for its purpose in the world. We are so satisfied with the result of its operations that we are now putting down a duplicate plant of the same design.

We started hot dip galvanising at Wednesbury in 1937 and since the end of the war we have galvanised the whole of our output of steel windows and other products. I think it is a reasonable supposition that this has not only met with the entire approval of our customers throughout the world, but that the increased earnings may in some measure be attributed to this policy. Hot dip galvanising costs a little more than other so-called "rust proofing" systems, but the fact remains that it holds the confidence of architects, engineers and contractors wherever steel windows are used.

IMPORTANT CONTRACTS

We have carried out many important contracts during the year and among these one of the most notable was for eleven new schools for the London County Council. Others worth mentioning are the new great power stations at Birmingham, Croydon, Ipswich, Nottingham, Birkenhead, Newport, Johannesburg and Calcutta. Each of these is an example of window construction on most modern lines with opening portions electrically controlled. We are also engaged on making windows for the extension to the Bank of England, Princes Street, London, E.C.2.

We have once again taken active steps to maintain and expand our export trade, and senior members of your staff have travelled widely during the year.

Looking backwards through the records of our annual meetings since the conclusion of the war, you will remember that year after year we were short of steel and that our output was restricted by the amount of steel we could persuade the Ministry to allocate to us. The control of steel sections and with it the system of allocation was abolished on May 27, 1950, and we can now look forward to purchasing steel in accordance with our own requirements.

HOPE'S HEATING AND ENGINEERING

Hope's Heating and Engineering Limited, with their branch offices in London, Leeds, Hull and Cardiff, have done an increased business and have carried out successfully some very important contracts for the Air Ministry, Ministry of Works, The British Electricity Authority and education authorities. Large industrial installations have been made for many leading manufacturers including the Ford Motor Company, Morris Motors Limited, and the Wales and Avonmouth Industrial Estates.

PATENT ROOF GLAZING

Among the factors which have contributed to the continued success of your company in a very important degree is the patent glazing department; they have made considerable technical developments in the last two or three years and their lead-clothed glazing bar (notwithstanding the price of lead) continues to hold the confidence of many of our most important customers. Our aluminium glazing bar is a reliable alternative for those who prefer aluminium and who wish to take advantage of the present lower price.

There is not the slightest doubt that the present exorbitant prices of lead, zinc and copper have contributed to the use of aluminium.

CHANGES ON THE BOARD

Since the publication of our last report, Colonel A. A. Trowell and Admiral J. H. Godfrey have resigned. Mr H. D. Smith, who I informed you last year had been appointed by the directors, has taken his seat, and we have filled the remaining vacancy by inviting Mr George Watson, who has been our works manager for nine years.

THANKS TO STAFF

In conclusion I should like to pay a tribute to our staff and workpeople who contributed so largely to the year's result. Individually and collectively the staff has done remarkable work and you will appreciate the necessity for this when you consider that during this trading period we have carried out more than 14,000 separate contracts for over 6,000 different customers ranging in value from a few shillings to over £70,000.

The report and accounts were adopted; the proposed dividends were approved; the retiring directors, Mr H. D. Smith and Mr G. Watson, were re-elected, and the directors were authorised to fix the remuneration of the auditors, Messrs. Aston Wilde and Company.

LONSDALE INVESTMENT TRUST

MR T. L. McC. LONSDALE'S STATEMENT

The third annual general meeting of Lonsdale Investment Trust, Limited, was held on July 19th at the offices of Robert Benson, Lonsdale and Company, Limited, 22, Old Broad Street, London, E.C., Mr T. L. McC. Lonsdale (chairman of the company) presiding.

The secretary (Mr C. W. Quennell) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which had been circulated with the report and accounts for the year ended February 28, 1950, and was taken as read:—

The gross revenue of the Trust, including the unchanged dividend received from Robert Benson, Lonsdale and Company, Limited, amounted to £158,020 against £156,892 last year. The net profit after payment of expenses, debenture interest and taxation amounted to £78,427 compared with £78,097 a year ago. After bringing in an overprovision for tax in respect of previous years, paying the preference dividend and maintaining the dividend of 10 per cent. on the ordinary stock, the carry forward is increased by £4,083.

According to present estimates the revenue from our general investments for the year

ending February 28, 1951, should be not less than that for the year under review.

You will observe that during the year there has been an increase, based upon valuation, in the Trust's investments in the U.S.A. and the British Commonwealth, and a corresponding decrease in Great Britain. Valuation figures are not always a dependable guide to the movement of investments, but in this case they do reflect the changes which have been made. So far the Trust has neither received nor taken into account any sums in respect of double tax relief on U.S.A. investments.

SUCCESSFUL ISSUES

During the year Robert Benson, Lonsdale and Company, Limited, have again sponsored a number of successful issues. The incidence of taxation, which restricts the accumulation of adequate reserves of capital, and the enhanced level of prices which makes capital investment, whether in stocks or in plant, so much more expensive, make it difficult for industrial companies to find the money they require from their own resources, and tend to force them to seek fresh capital from the market. These conditions are reflected by the increasing number of applications for fresh capital which are now being submitted to the company. The company has also turned its attention towards the financing of the development of industrial and raw material resources within the Empire, for which a very real demand exists, and during the past twelve months three such issues have been made and others are under consideration. Whether or not this prospective business materialises, however, is to a great extent dependent on market conditions which, in these days, are impossible to forecast.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

PURNELL AND SONS, LIMITED

SATISFACTORY RESULTS

The sixteenth ordinary general meeting of Purnell and Sons, Limited, was held on July 14th in London, Mr W. Harvey (chairman and managing director) presiding.

The following is an extract from his circulated statement:—

Once again, it is a pleasure to be in the position to submit to you accounts which, having regard to the general trading conditions throughout the country, cannot, I believe, be considered other than satisfactory.

FACTORS AFFECTING PROFIT

Naturally you will be interested in the reasons for the decrease in the net profit, as compared with the preceding year. During the year under review there have been wage increases and the cost of materials has also risen, and having regard to the position of the industry generally, your directors deemed it inadvisable to pass on to the customer the whole of these increased costs. In addition, in furtherance of the policy of the company, the quality of the goods produced has been improved without correspondingly increasing prices, with the result that turnover has been largely maintained and the goodwill of the customer further consolidated.

Although, no doubt, you have seen from other company reports the harsh effect of taxation on industry, I should be failing in my duty if I did not draw your attention to the factor that out of a profit of £571,950 no less a sum than £331,147 has had to be provided for taxation on profits, leaving the shareholders—who provide all the capital and take all the risks—with 8s. 5d. in the pound of profit earned; one also has to remember that possibly many of these shareholders have to meet surtax on the dividends they receive.

The proposed final dividend, if approved, will make the total distribution to the ordinary shareholders a slightly increased percentage over the distribution for 1948 on the old capital.

The consolidated balance sheet shows that the current assets exceed the current liabilities by just over £200,000.

The Inland Revenue Authorities have now discharged practically the whole of the excess profits tax, post war refund, against current tax liabilities and consequently the item which appeared on the asset side of the balance sheet in 1948 has disappeared and the provision for taxation accordingly reduced. In order that the figures shall be more easily comparable, the 1948 figures have been similarly amended.

WORKS IN FULL PRODUCTION

It is encouraging to be able to report that the company's works are in full production and that although faced with keener competition and the desire of your directors to give the customer good value for money, I see no reason to doubt that the present year's results will again be satisfactory.

I should like, in no formal manner but with real sincerity, to pay tribute to my colleagues on the board, all of whom give their full time to the service of the company, and also to express my very hearty thanks to the staff and workpeople whose wholehearted support make possible the satisfactory results shown by the accounts.

The report was adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS LIMITED

DIVIDEND 4%

The forty-second annual general meeting of The United Serdang (Sumatra) Rubber Plantations Limited was held on June 19th. Mr H. Eric Miller, the chairman, presided.

After dealing with the domestic affairs of the company, with especial reference to the drastic effect of the new Indonesian exchange and monetary regulations, the chairman said:—

The United Serdang Company and others in the "H. and C." group have a very large stake in Indonesia, and it is up to us to co-operate, so far as lies in our power, with those new leaders of Indonesia who have the best interests of their country and people at heart.

The problems facing the new rulers of Indonesia will tax their capacity to the utmost. The first essential is that they should restore and maintain law and order with a firm hand, but that is not easy in their widespread archipelago, where racial feelings have run high in each island from time immemorial. A major development in the political field is the recent move towards the establishment of a unitary state quite different from the proposed Federation on which the Round Table Conference had reached agreement. Discussions towards unification are now in progress, but the complications are such that it is not possible to forecast the outcome.

EVENTS IN KOREA

Events in Korea are having their repercussions further afield and are liable to stimulate communist activities everywhere. Until the political and economic conditions in Indonesia justify our taking a reasonably confident view of the future, we cannot attempt to frame any long-term policy, but will continue to make the best of things as they are.

Washington advices indicate that the Reconstruction Finance Corporation is raising the output of the synthetic plants at present in operation to the limit of their capacity and is to reopen idle plants capable of producing an additional 75,000 tons of G.R.S. and 13,000 tons of Butyl yearly, but it will be some months before the additional supplies are forthcoming. Output will then be running at the rate of 500,000/550,000 tons of G.R.S. and 75,000 tons of Butyl.

U.S.A. CONSUMPTION

This step up in synthetic output, according to the *Wall Street Journal*, is intended in the first place to enable the Munitions Board to buy more natural rubber for their stockpile. When the Study Group met early in May this year, U.S.A. consumption in 1950 was estimated at 600,000 tons of natural and 425,000 tons of synthetic, together 1,025,000 tons, but demand for tyres is so insistent that actual consumption may well be 100,000/125,000 tons higher. Demand in the rest of the world is likewise strong.

There is an acute shortage of nearby rubber and there is likely to be a ready market for all shipments as they come forward. The discount at which forward positions are quoted, as compared with nearby rubber, is, however, an indication that the present spot price is considered to be too high, and not in the best interests of the industry. The price of many strategic materials has risen lately and however much we dislike violent fluctuations I am afraid they will have to be faced so long as abnormal tension continues.

The report was adopted, and the dividend of 4 per cent. was approved.

W. AND J. GLOSSOP, LIMITED

SATISFACTORY RESULTS

The fifteenth annual general meeting of W. and J. Glossop, Limited, was held in London on July 19th, Mr Henry Stephenson, the chairman, presiding.

The chairman, in the course of his speech, said:—

Your board consider the year's results satisfactory, taking into consideration the restrictions which have been imposed—and are still maintained—on road expenditure. Turnover is much the same as last year, but keener competition and rising costs have caused a reduction in trading profits to £45,332 2s. 4d., as compared with £65,042 2s. last year. We are, however, able to recommend a final dividend of 15 per cent. (less tax) on the ordinary shares—making a total of 25 per cent. for the year, and a final dividend of 15 per cent. (less tax) on the employees' shares, which is the same as last year.

We continue to preserve and extend our plant and organisation so as to be in a position to cope with the increased business we ultimately expect, though such increased business has not materialised so far. The Government's economic policy has not favoured our operations and although increasingly vast sums are being collected from road users, there appears to be continued reluctance to allow road schemes to be developed on the scale required. Whilst I hesitate to forecast future results, and the immediate outlook is far from encouraging, I can only express my belief that circumstances will ultimately prevail which will compel a much greater expenditure on the road systems of this country, and when that time comes, we intend to take our full part.

The report was unanimously adopted.

Orders and copy for the insertion of Company Meeting reports must reach this office not later than Wednesday of each week and should be addressed to:—

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 15, 1950, total ordinary revenue was £50,902,000 against ordinary expenditure of £55,895,000 and issues to sinking funds £510,000. Thus, including sinking fund allocations of £3,658,000 the surplus accrued since April 1st is £40,550,000 compared with a deficit of £27,291,000 for the corresponding period a year ago.

HOW MUCH SHOULD YOUR ADVERTISING COST?

The answer *can* be given by a professional organisation. It is a measure of costs and possibilities: an equation between capital, profit and potential market, short term and long term. Thirty years of planned advertising have produced the evidence on which to base *your* successful campaign. If you would like to know how we can help you, write for the pamphlet, "How much should your advertising cost?"

ROBERT BRANDON AND PARTNERS, LTD.,

Advertising and Public Relations,

45, Dover Street, London, W.1. REGent 0301/2.

UNIVERSITY OF ABERDEEN

DEPARTMENT OF POLITICAL ECONOMY

Applications are invited for a Research Fellowship in Economics. Salary £500 per annum with F.S.S.U. Applications to be lodged by July 31, 1950. Particulars and form of application may be obtained from the undersigned.

The University, Aberdeen. H. J. Butchart, Secretary.

SOUTHERN DIVISION—BRITISH ELECTRICITY AUTHORITY

PRINCIPAL ASSISTANT

DIVISIONAL SECRETARY'S DEPARTMENT

Applications are invited for a position on the staff of the Divisional Secretary dealing with managerial and organisational problems arising within the Division.

Candidates must have had a sound general education and preference will be given to applicants in possession of a recognised professional qualification. Experience of the organisation of a large industrial concern will be an advantage.

The commencing salary will depend on the qualifications and experience of the applicant, and will be within the range £705—£900 per annum. Alternatively a man with the necessary basic training and little experience in this type of post would be considered at a salary in the next lower grade—£630—£705.

The post is superannuable and subject to a medical examination.

Forms of application may be obtained from the undersigned, and should be returned not later than August 31, 1950.

British Electricity House, High Street, Portsmouth. P. D. A. OLIVER, Divisional Secretary.

DO YOU SELL RETAIL?

Opportunity sought by young man aged 34, B.Com., with thorough training in Retail Management and Control. Not content with present salary of £1,200, is willing to be paid by results. Resident London.—Box 450.

INDUSTRIES—SOUTH AFRICA. South African Finance, Shipping, Insurance Organisation, established fifty years, invites correspondence with Industrialists and others desirous extending operations South Africa. Complete facilities available for Handling, Storage in Bonded or Duty paid Warehouses, Depot Stock Holding and Distribution, Railway Sidings, Scales and Collections. Own offices and facilities at all ports and principal centres. Substantial Property and Real Estate Owners, extensive U.K. interests, undoubted in all respects. South African Director now visiting U.K., available interviews with view co-operation and participation. Absolute discretion assured.—Write Box M 869, Willings, 362, Gray's Inn Road, London, W.C.1.

NORANDA MINES LIMITED

PICCADILLY CIRCUS BRANCH, 16/18 PICCADILLY, W.

ASHANTI GOLDFIELDS CORPORATION LIMITED

NOTICE IS HEREBY GIVEN that an Interim Dividend (No. 108) of 25 per cent has this day been declared on the issued Capital of the Corporation in respect of the year ending September 30, 1950. This Dividend is payable, less Income Tax at 9s. in the £, on and after October 20, 1950, to all Stockholders on the Registers on August 31, 1950.

THE TRANSFER BOOKS will be closed from September 1 to 7, 1950, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,

E. W. MORGAN, Secretary.

Registered address: 10, Old Jewry, London, E.C.2. July 18, 1950.

BIBIANI (1927) LIMITED

NOTICE IS HEREBY GIVEN that an Interim Dividend (No. 25) of 10 per cent has this day been DECLARED on the issued Capital of the Company in respect of the year ending September 30, 1950. This Dividend is payable, less Income Tax at 9s. in the £, on and after October 20, 1950, to all Stockholders on the Registers on August 31, 1950.

THE TRANSFER BOOKS will be closed from September 1 to 7, 1950, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,

E. W. MORGAN, Secretary.

Registered address: 10, Old Jewry, London, E.C.2. July 18, 1950.

FAR EASTERN AFFAIRS

The shifting of the international centre of gravity from Europe to the Far East demands the urgent attention of every responsible organisation in Britain. Is your company or association in a position correctly and objectively to follow and interpret events and trends in this evolutionary part of the world? If not, there is something radically wrong with your political intelligence and economic research services.

For expert advice and assistance from an internationally recognised specialist on current Far Eastern Affairs, based on 16 years' first-hand experience at all levels, with wide and influential contacts, write Box 403.

DIRECTOR-GENERAL Manager (43), engineering background and unbroken record of success, now earning £3,500 p.a. and resident in the North, being influenced by domestic circumstances, seeks an appointment in the Southern half of England. Wide experience in administration, home and export commerce, and finance (including company formation) could be free in 3-6 months. Implicit confidence will be observed.—Box 475.

MARKETING executive required by leading advertising agency. The post will involve direct contact with clients who include some of the largest producers of consumer goods for the home market. The man we need must be capable of analysing their sales problems and interpreting them in terms of merchandising and promotional policy. His experience should include selling or sales promotion and he should have some training in economics and statistics. Write giving details of experience and qualifications to Box 472.

POWERS SAMAS 21 Column installation for sale. Almost new. Tabulator, Sorter and two automatic punches.—Box 466.

The Cost of Defence

THE statement on the Government's defence plans made to the House of Commons by the Minister of Defence on Wednesday had none of the drama and contained none of the arrestingly large round figures of Mr Truman's message to Congress of the week before. It was enough, however, to make it clear that there is to be a sharp increase in the burdens that defence lays upon the British people. The sum of £100 million that was mentioned by Mr Shinwell was described as "no more than a small part of the cost which would be involved fully to equip our forces to fight" and it is clear that this is only a beginning.

The contrast between $10 billion in America and £100 million in Britain is bound to attract comment. There is, of course, no reason why the speed and grandeur of the American reaction to the Communist aggression in Korea should not be used as a spur to keep British defence preparations up to the mark; on the contrary, it will do nothing but good. Nevertheless, a simple comparison of global sums of money, one of them more than thirty times the size of the other, may give a wholly misleading impression of the real facts. To form a fair judgment, it is necessary to know not merely the size of the increase, but where the starting point is, and to be able to relate both figures to the relative means of the countries being compared. The recent annual report of the Bank for International Settlements contains a useful table of defence expenditures in 1949 or 1949-50—that is, before the Korean incident—expressed as percentages of national income, from which the following figures are taken.

	%		%
United Kingdom	7·4	Sweden	3·6
Netherlands	6·1	Canada	3·0
United States	5·9	Switzerland	2·7
Turkey	5·8	Belgium	2·5
France	5·0	Norway	2·5
Italy	3·8	Denmark	1·9

The addition of $10 billion a year to the defence expenditure of the United States will bring the percentage to almost exactly 10 per cent. The British figure is certainly going to rise to over 9 per cent, and these statistical comparisons are not accurate enough to be pressed to within a closer margin than 1 per cent. For all practical purposes it is true to say that the British defence effort, which ever since the end of the war has been the highest, relative to the national resources, of any of the free nations, will stand comparison, as measured by expenditure, even with the newly proposed scale of American preparations. Where the principle of equal sacrifice requires much greater efforts is among those members of the Atlantic community other than the United States and the United Kingdom. That everybody deeply deplores the tragic need for heavier spending on armaments ought to go entirely without saying. But if any of the free nations are tempted to argue that they cannot afford to spend more, they

might be reminded that the Soviet Union, a much poorer country per head, manages, according to Mr Shinwell, to spend at least 13 per cent of its national income on armaments. If there is anything that the free nations cannot afford it is that their response should fall dangerously short of the challenge.

*

It would be wrong to say that Britain is now about to return to a war economy, since it has never properly emerged from the economy of the last war. Moreover, the extent of what is contemplated—at least for the present—should not be exaggerated. An additional slice of the national income amounting to something between 1 and 3 per cent of the total is to be devoted to the purposes of national defence ; by 1943, as compared with 1938, resources equal (in real terms) to some 56 per cent of the prewar gross national product were transferred from peacetime pursuits to defence. The shift that is now in prospect is thus a relatively small one. But it undoubtedly marks a reversal of the trend ; the economy which has with such painful slowness been working its way out of the wood will now have to turn round and retrace some, if only a few, of its steps.

It might have been supposed that, with such a gigantic object-lesson in the realities of war economics so recently to hand, the public mind would be clear on what is involved. But it is apparently not so, and the present moment, when the need for increased defence expenditure is for the first time officially confirmed, is not too soon to begin re-stating some of the basic principles that were grasped only with such pain ten years ago.

The first and most obvious essential is to insist that if more of the national resources are to be used for defence, fewer will have to be used for something else. The only circumstances in which this would not be true would be if the total available resources were about to be increased. It is true, as the Prime Minister said on Wednesday, that "the most satisfactory and the least painful method of tackling the new problems presented to us is by a more rapid increase of productivity." But the following sentences showed how little hopes he had of this happening. There is no very apparent reason why the Korean affair should have any favourable effect upon productivity, unless and until there is a willingness to relax the normal labour practices insisted upon by the trade unions ; indeed, if there is a general return to the allocation of raw materials, some part of the progress made in the last few years may be lost. It thus approaches very closely to absolute truth to say that if more is to be spent on defence, less will have to be spent on other things. This should, in fact, be obvious. But there is a noticeable tendency to qualify the principle. People tend to say "if inflation is to be avoided, other things must be cut down." But inflation is not an alternative to the necessity for cutting down ; it is one method, and a particularly blind, haphazard, inequitable and damaging method, of accomplishing the cutting down. With or without inflation, if the British people are to devote more of their resources to defence, they will have to devote less to their private consumption or to Government activities of a non-defence character or to capital outlays From that choice there is no possibility of escape whatsoever.

The next question is obviously to ask what, then, should be cut down. Economic reasoning supplies no absolute answer to this question. But common sense gives a very clear indication. Out of every pound of the British people's private income in 1938, something like 14s. 9d. was spent as its owners wished ; only the remaining 5s. 3d. was spent for the people by the central and local governments. Today the figures are about 11s. 4d. and 8s. 8d., and much of the 11s. 4d., though it comes out of private pockets, can hardly be said, in this land of licences and permits, to be "freely" spent.

If the British people were asked whether they would prefer that the additional 3d. to 6d. in the pound that rearmament involves should come out of their reduced free spending money, or be met by a reduction of some of the other ways in which the state already spends their money for them, can there be any possible doubt of the answer ? To cut the other expenditures of the Government is, admittedly, a painful matter for politicians to contemplate. But if they do not do so, then the increased cost of defence will have to be found by squeezing individual family budgets, which is certainly no less painful. It is all very well to use high-sounding phrases such as "guarding the work of social and economic reconstruction that has been undertaken" ; but what that means in fact is that the state should spend even more of the public's money for it. It is virtually certain that this is not what the citizens of this country, those who vote Labour as well as those who vote Conservative and Liberal, wish their representatives to do in their name. The increased defence expenditure must be met by economies in other forms of state spending.

*

The phrase just quoted was taken from the speech made at Enfield by Mr John Strachey last Sunday. (That is to say, the phrase was taken from the report of the speech, and from the absence of complaint it is perhaps legitimate to conclude that on this occasion the press had the good fortune to report him correctly.) Mr Strachey, of course, has his own way out of the dilemma of private *versus* public spending. He is reported to have said that any additional defence expenditure which became necessary would have to be undertaken

> very differently from the way it has been undertaken in the past. . . . It has often been the case that when heavier defence expenditure has been necessary, almost the entire burden has fallen on the people of this country. That is not necessary. It is perfectly possible that that burden should be spread justly among all the classes of this country and that the well-to-do classes should pay their full proportion and share in any burden that has to be undertaken.

These sentences, it will be noticed, are very craftily worded. Mr Strachey might claim that by "the past" be meant the War of Jenkins's Ear, and that when he said "almost the entire burden" fell on "the people of this country" he merely meant to assert that it did not fall on the people of Patagonia. But what any reasonable man would understand him to be suggesting—and the suggestion that he unquestionably meant to convey—was that in the war of 1939-45, too much of the burden was put upon "the people"—that is, the organised wage-earners—and too little on the well-to-do.

This suggestion is flatly contradictory to the well known facts. Indeed, so flat is the contradiction and so easily verifiable are the facts, that Mr Strachey must either be too stupid or else too utterly careless of the truth to be deserving of public office. All the relevant facts about what happened in the last war and the situation it has left behind it can be seen very clearly in the annual

White Papers on the national income, from which the following figures are derived:—

	1938	1944	1949
Wages, after deduction of direct taxes (£ million)	1,682	2,589	3,916
Do. at 1938 prices (£ million)	1,682	1,714	2,152
Do. expressed as 1938 = 100	100	102	128
All other private incomes after deduction of direct taxes (£ million)	2,906	4,298	5,198
Do. at 1938 prices (£ million)	2,906	2,846	2,856
Do. expressed as 1938 = 100	100	98	98½

There is not the slightest evidence here of "almost the entire burden" falling on wages. Indeed, the figures could be much more easily used to prove that virtually none of the economic burden fell on wages and that the whole lot was borne by others than those for whom Mr Strachey speaks. This may have been the right thing to do ; it was certainly accepted at the time without much protest even from those who were its victims. But it is monstrous that the record should be falsified for the purpose of engendering bitterness between the classes and encouraging the wage-earners to believe that they can be patriotic at somebody else's expense. In fact, Mr Strachey's forecast of the future is likely to be very nearly as mendacious as his account of the past. The cost of any additional defence expenditure—and all the more of any future war—is bound to fall very largely on what he calls "the people," if only because the combined effect of what was done in the two previous wars has been to leave them with such a large slice of the taxable income of the country.

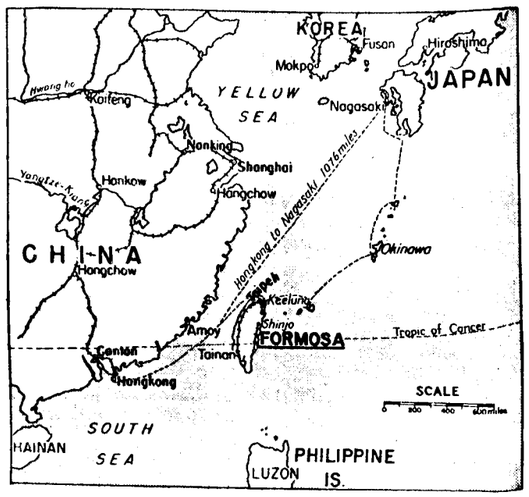
The "well-to-do" will certainly be called upon, by whatever party has the responsibility, to bear at least their fair share of any new burdens. If Mr Strachey and his friends succeed in putting even more of the burden on them than last time, and even less upon "the people," the inevitable effect will be to reduce all incomes to the proletarian level. If this is the Socialist intention, Mr Strachey has, perhaps, done a service by giving the game away so clearly. If so, the majority of the nation which has never voted Labour will know what value to attach to the appeals for national service and national unity that the Secretary of State for War will doubtless soon be issuing.

Fuss about Formosa

FROM time to time public discussion of British foreign policy is thrown into confusion and uncertainty by the intervention of the clever Dicks. When the international situation is dangerous they can be counted on to increase the danger by asking whether risks are really necessary ; when it is intricate they will oversimplify the issues with a pretentious logic of the either-or variety ; when it is unpredictable they will state as certainties what are at best future possibilities. It is the application to foreign policy of the technique of the columnist, which solves the problems of the Foreign Secretary and the Chiefs of Staff in the course of a paragraph. If there can be a passing suggestion that the Americans are arrogant or dangerous allies, or that the British are no longer masters of their own actions, so much bigger is the splash made, so much livelier the controversy provoked, abroad as well as at home.

The question of Formosa has provided this week a choice example of this technique. It has been argued in the letter columns of *The Times* that Britain is in no way associated with President Truman's warning that the American fleet will oppose the invasion of Formosa by the Chinese Communists ; that the Chinese Communists will regard the intervention as aggression by the Americans ; that this would bring the Russians in on the Chinese side ; and that a major war would then ensue. Two questions are then asked: Have the British Government "told the United States unequivocally" that they would stay out of this major war ? If not, and if they intend to help the Americans, will they please inform the British people of their intention ?

In this argument there is not only confusion of issues but also omission of facts that are essential to any fair estimate of probabilities. The first is that the published text of the treaty of military alliance, signed between the Russians and the Peking Govenment in February, makes it clear that it comes into action only in the event of "one of the agreeing parties being subjected to attack by Japan or any state allied to Japan." This treaty, like those signed with the east European satellites, is designed to leave the Soviet Government free to avoid all overt military action in support of an ally that gets embroiled with the west in the cold war. There is no real threat to Soviet interests in the American defence of Formosa ; if the Russians can stand aside while the Americans land armoured forces in Korea, they can do just the same while American warships and aircraft try to stop the invasion of Formosa. It is Mao Tse-tung, not Stalin, who is committed to the success of this operation.



The second fact of importance is that the Chinese Communist attack on Formosa would be, both in fact, and in legal theory an attempt to decide by force what should be decided by international agreement. It is true that the restoration of Japanese-occupied Formosa to China was promised to Chiang Kai-shek in Cairo in 1943, but only as part of the peace settlement with Japan. As the Peking Government has declared null and void all arrangements made with foreign powers by the "traitor" Chiang, it can hardly invoke in one case principles it spurns in others. The American Seventh Fleet has, in short, been carrying out a thoroughly respectable police operation off Formosa ; admittedly, it is intervention in the Chinese civil war, but its purpose is to localise the battle now raging in Korea. Before the British public is asked to decide for or against the American action on a basis of incomplete facts it should be reminded of exactly what President Truman said on June 27th.

> It (Communism) has defied the orders of the Security Council of the United Nations to preserve international peace and security. In these circumstances the occupation of Formosa by Communist forces would be a direct threat to the security of the Pacific area and to United States forces performing their lawful and necessary functions in that area.
>
> Accordingly I have ordered the Seventh Fleet to prevent any attack on Formosa. As a corollary of this action I am calling on the Chinese Government of Formosa to cease all air and sea operations against the mainland. The Seventh Fleet will see that this is done. The determination of the future status of Formosa must await the restoration of security in the Pacific, a peace settlement with Japan or consideration by the United Nations.

The purpose of the American intervention could not be stated more clearly and simply. It is true that the British Government, having recognised the Chinese Communists, is left in an embarrassing position. But its action in according recognition was a mistake when it was taken ; and has become more mistaken since. It would be foolish in the extreme to cover up one blunder by making a bigger one.

It is at this point that the confusion of issues in the controversy that has started becomes clear. The question of supporting American action to protect Formosa against Chinese Communist invasion is one thing—and no question of active support appears to have arisen. The question of whether the Americans should be left to face the consequences of their action alone is another. If it is argued that they are running the risk of world war by persisting in their Formosa policy, the answer is that there is no need for world war unless the Russians want it. They are no more obliged to assist in the conquest of Formosa than the Americans are bound to hand it over. If, on the other hand, the Russians decided to come openly to the assistance of the Chinese Communists, it would be because they were ready to see the conflict that they allowed to begin in Korea spread everywhere. In that case there should be no doubt whatsoever of the British attitude, or, indeed, of that of all the members of the United Nations.

To ask at this moment that the British Government should define exactly where they agree and where they disagree with the Americans over a situation that may not arise, and the exact nature of which must be unpredictable, is to behave irresponsibly. The Russians are confronted in Korea with a situation probably quite different from the one they expected to exist a month after the Northern Communists attacked. It is probable that neither they nor the Chinese Communists have made up their minds about the next step ; indeed, their propaganda is virtually silent on the subject of Formosa. If anything could encourage them to make up their minds to take all the risks and extend the area of war in Asia it would be a public display of divided views and irresolute will in this country and the United States. The voice of appeasement that is being heard is coming from a quarter where it is an article of faith that nothing the capitalist Americans do can be wholly right ; the fact that they unhesitatingly shouldered so large a share of the burden of opposing armed aggression, while other members of the United Nations counted their money and their men, is resented instead of being applauded and supported. Some excuse must be found for quibbling and fault-finding. So Formosa becomes important. It is not a

problem of world politics so much as of psychology in Bloomsbury.

The British people cannot enjoy at one and the same time the benefits of collective security afforded by American power and the luxury of picking and choosing between the issues that arise in the cold war. If peace is indivisible, so must be the policy of resistance to aggression.

Local Government Efficiency

(By a Correspondent)

THE Local Government Manpower Committee announced in the final paragraph of their first report that they intended to "consider the methods of procedure and organisation for handling the various services at the Local Authority end" and for this purpose a Sub-Committee of the Local Authority Associations has been set up "to investigate, within the framework of the existing law, the procedure for the delegation of powers from County Councils to District Councils and other bodies."

It is not clear from this statement whether the whole procedure whereby local authorities conduct their affairs will be reviewed, or merely that part of their procedure which deals with the delegation from larger to smaller units of administration ; if the latter is the sole subject of investigation, it is unlikely that the sub-committee's researches will yield very profitable results. Fortunately, there is some evidence that more will be attempted. Civil servants, having listened to the laments of the local authorities and accepted with tolerable grace their suggestions for improving the central government, have now informed the local representatives where they think their own administration could do with a "shot in the arm." In a document, so confidential that many hundreds of copies have already been reproduced, they have drawn the attention of the city and county fathers to the beams which affect their vision. These include charges of insufficient delegation by councils to committees, or by committees to officials ; of councils and committees dealing with too much detail ; of excessive departmentalisation, overlapping and duplication of work; and that local government procedure suffers, among other things, from an insufficient distinction between the statement of policy, and its application to individual cases. They state also that efficient and economical executive action requires that someone be available to

give a decision on a point on which someone is urgently waiting for a decision, whereas the machinery of local government is almost deliberately designed to function in direct opposition to this thesis.

These last suggestions are of considerably more importance than the first. The roots of the matter lie much deeper than the question of delegation, which is less concerned with administrative economy than with the constant struggle for power—the same struggle which frequently drives local councillors and their officials to deplore the encroachment of Whitehall and makes the civil servant at the centre justify his centralisation by such euphemisms as "master plans," "financial control" and "national patterns." The tension which exists, sometimes called a "partnership in the common effort," between central and local authorities is, however, potentially benevolent in that it restrains either side from inflicting unbridled tyranny, whether petty or majestic, on the suffering taxpayer whose delight it is to pay the salaries of both participants in this contest of gods and men.

*

The study of delegation may, or may not, result in administrative economy. A more fruitful field for examination is the procedural methods by which local government services are administered. These methods have frequently been decided either on the assumption that democracy means the detailed control of everything that happens in its name, or on the basis that no one person, be he elected or official, shall have open authority to make responsible decisions *de jure* however much he may enjoy this privilege *de facto*. Consider the average procedure of a county council or county borough at the present time. It may well be spending about £8,000,000 a year and employ six or seven thousand persons. It may be responsible for the education of 75,000 children, the maintenance of several hundred miles of roads, the administration of justice, many public health functions, town planning and possibly housing. It may be undertaking capital projects of an annual value of several million pounds. The day-to-day running of this considerable concern is in the hands of an archaic combination of paid servants and groups of amateur enthusiasts elected by the local inhabitants. It is not always realised that the multitudinous decisions to be made, from the repair of a burst pipe to the expenditure of £250,000 on a new school, are controlled by almost the same procedure. A committee of one sort or another has the facts placed before them, frequently in print, and the tempo of their decision is determined by the pressure of the agenda and the need to be home for lunch.

The members of a public authority may between them spend literally thousands of hours a year sitting round tables and lifting their hands in approval or negation, while a senior official may well attend over 100 meetings a year in order to explain, cajole, flatter or threaten his employers to do what, in a comparable industry, would be done on the sole decision of a personnel manager, or even a works foreman. This identification of democratic responsibility with the exact control of expenditure impedes the machinery of government and makes it wasteful and expensive. Decisions pile up against a dam and are not made until the flood waters are released and, even then, nothing happens at once because too many decisions have been made on one occasion and it will take time to carry them out. The only efficient method of committee control would be for the members to sit in relays from 9.0 a.m. to 6.0 p.m. for five days a week receiving a continuous series of reports on everything from the lay-out of a village green to the purchase of a stair carpet for a Children's Home. As fast as they made their decisions, they could then be put into effect.

Unfortunately, this partiality for financial control has resulted in an exact reversal of the theoretical relationship which should exist between the elected members and their paid staff. Theoretically, the committee decide on the policy and the officers carry it out ; in practice, the major decisions of policy are initiated by the officers and the members dabble in the administration in so far as they can understand it. This understanding is frequently limited to matters which cost, in money, the sort of sum that the member has handled either in his own private life or in the businesses with which he has been associated. Scores of examples could be quoted by any local government officer of occasions when committees have spent a great deal of time debating items costing between £50 and £100 but have passed without comment projects involving five or six figures.

It is, of course, unfair to compare government with large scale business or industry, because government, however inept, is trying to make democracy function as well as run an efficient service. Any business, however, which grew from a concern spending £100,000 to £10 million a year, would alter its organisation and method, but there has been virtually no comparable alteration in the practices of local authorities, although their expenditure has grown in a similar proportion.

In the recent debate in the House of Commons on the attempts by Luton and Ilford to secure county borough status, it was alleged that local government was becoming increasingly inept, because the whole structure needed reform. But local government difficulties are not primarily those of function or area ; they are those of the machinery by which they discharge their duties. The recent introduction of the equalisation grant has done much to enable the poorer authorities to provide the financial resources necessary to discharge their duties, but it will need more than an alteration in fiscal policy, or the work of a Boundary Commission, to make them alter their outmoded administrative methods—methods which are as common in a large prosperous all-purpose authority as they are in the smallest of rural district councils. It would be much better to try to make the existing system work efficiently rather than to tear the whole structure to bits and to recreate a new pattern of local government performing its functions in the same elephantine way.

*

The main object of local government is to enable the local people to feel a sense of responsibility for the administration of their local services, to administer those services efficiently in the light of local knowledge and to enable the local citizen to feel that he can get at those who are making the decisions that affect him personally. None of these objectives is attained by the identification of local responsibility with the detailed control of administrative expenditure by elected representatives, especially when this is at the expense of adequate consideration being given to the policy that produces the administrative action.

Although the cries of dissent and indignation already

echo in the writer's ears, it is suggested that local government might well adapt its procedure more closely to that of the central government. On the assumption that the full council meets monthly, bi-monthly, or even quarterly, one full session should be devoted to each of the major services administered, much in the same way that Parliament deals with these services at the time of the annual estimates. On such an occasion, the whole policy of the authority should be debated and on this, as at the other meetings, time should be given for any questions to be asked on any matter or decision on which executive action has been taken. It should be redundant to add that proper notice of these questions will produce a more coherent answer. Broadly the same procedure should be followed by the main committees, which should devote their regular meetings to the discussion of particularly important aspects of their work with, again, adequate opportunity to ventilate complaints and grievances. Subject to the general decisions of policy laid down by the full council or its committees, the job of day-to-day administration should be left to the technical experts and administrators appointed for the task, subject to the approval, in certain circumstances, of the chairman or a small executive committee of the main body.

These chairmen, whose technical function is only to preside, but who might usefully, in their own way, play something of the part that a Minister does in Parliament, should be openly recognised as responsible for major administrative decisions within an accepted policy. They would answer for their respective departments at full meetings of the council and, by meeting together, would constitute something in the nature of a cabinet. This would have the additional advantage of ensuring that at least a small group of the more responsible elected members knew what was being planned on a wider front than their own particular concern, and would prevent blind competition among the various services for the inevitably restricted amount of money or materials available. To alter the analogy, they would become, so to speak, the directors of the firm. The officers would represent the top technicians employed by the undertaking, and responsible, in the first place, to the directors. The full council would represent a rather more active body of shareholders than is usually found at company meetings.

This is only the roughest outline of an attempted solution, but some solution will have to be found whereby the adequate democratic control of policy can be reconciled with the need for efficient administration. What is needed is not so much to alter the design of the bodywork of the administrative vehicle as to increase the power output of its engine. At present it fires on woefully few of its cylinders.

Apartheid in Practice

THE Group Areas Bill, which was passed by both Houses of the South African Parliament at the end of last month, is the most important development in South African politics since the South Africa Act of 1909. It is a long and extremely complicated piece of legislation which will provide a headache—and a source of income for lawyers—for many years. It is Dr Malan's attempt to solve the racial problems which have defeated all his predecessors ; it is the embodiment of his controversial policy of *apartheid* ; it is the bogey whose growth most Africans and some Europeans in the rest of Africa have watched with fear and suspicion.

Shorn of its details, the Bill divides the population of the country into four main racial groups: Europeans, Natives or Bantu, Asiatics and Coloureds. Each group is to be allotted areas from which the others—with a number of important exceptions—will be excluded. The non-European groups will in time be given a measure of autonomy, but there is no question of their participation in the central parliament or in the central government.

It is not the purpose of this article to repeat the arguments against the principle of the Bill but to examine what its effect is likely to be in practice. The Nationalist Government claims for it, apart from anything else, that it is the only practical solution which any South African government has so far put forward for South Africa's racial problems. It is indeed true that no other South African government has succeeded in this sphere of domestic politics, but a closer examination of the Bill makes it difficult to substantiate the claim of practicability.

Past schemes for the segregation of the different races in South Africa have been stillborn chiefly because of economic reasons. All four of the main racial groups are interdependent for their livelihood ; the economic forces which bring non-Europeans into European areas or which encourage Europeans to seek markets among the non-Europeans are well-nigh irresistible. The Bantu and the Coloureds in particular depend almost entirely on the Europeans for employment and for the tiny proportion of the national wealth they enjoy —the native reserves are a standing monument to the failure of their inhabitants to be even self-supporting, much less to develop an expanding economy. For their part, the Europeans have obtained a source of cheap labour upon which their economic strength depends. The gold mines, for example, mining low grade ore, would be far less profitable and possibly even uneconomic were it not for the comparative cheapness of native labour. Total segregation, therefore, would mean an intolerable burden on the European population, misery and a much greater degree of poverty for the non-Europeans, and the probable collapse of the economy of the country.

The claim of the Nationalist Government for the practicability of its solution rests chiefly on the clear recognition in the Group Areas Bill that total segregation is impossible. There is no question of Europeans being deprived of non-European labour. Provided they are employees of Europeans, non-Europeans may occupy (but not own) premises in a European area. Similarly, Europeans may trade (and own property) in non-European areas on the grounds that non-Europeans will probably lack the necessary capital for trading and for buying property. There is no doubt that these provisions coincide with the economic realities of race relations in South Africa—with the exception of the Indians whose capitalists and traders are apparently to be driven in upon themselves and so, very likely, out of business. The exempting provisions are probably essential if the Bill is to work at all, but they would seem to invalidate the fundamental conception of *apartheid*.

What is likely to happen in practice ? In Natal, the Indians are already effectively confined and cannot own or occupy further property in European areas, but they may well be driven out of some of their present properties. Their numbers are also steadily increasing. They will have nowhere else to go unless the Government makes special provision for them, which can only be done at the expense of one or other of the remaining racial groups. On the Rand, the gold laws have kept the Indians in fairly compact groups, but Africans and Coloureds occupy congested areas around which new European districts have grown up. The thousands of non-Europeans in these areas will presumably be moved elsewhere. In the Cape, there are mixed areas where Europeans, Natives, Coloureds and Indians live closely together. Again, if such areas are unmixed, where will those who have been ejected go and how will they live when they get there ?

*

Dr Donges, the Minister of the Interior, who was responsible for seeing the Bill through Parliament, has suggested that about 20 per cent of existing properties will be affected by ejections and forced sales. If, as promised, the process is extended over a long period, a state of uncertainty will reign. The Bill provides, on paper, for the removal of groups from one area to another and for the legal procedures for the forced sale of properties, but there is no indication in it of how the enormous administrative and other problems involved in such removals are to be met.

The most serious defect of all in the Bill is the refusal of the Government to accept responsibility for finding alternative accommodation for those who have been ejected from a proclaimed area. Dr Donges said that the existence or absence of alternative accommodation for ejected persons would be a material factor which would be considered before an area was proclaimed for any particular group, but this is a far from adequate guarantee that those who are ejected will be properly cared for. Moreover, no financial compensation will be paid to anyone who suffers loss as a result of the Bill. Thus, if, for example, it is decided to remove a hundred thousand non-Europeans from the Johannesburg townships —a decision which may already have been made—either new homes will have to be provided for the non-Europeans, at a cost which the Johannesburg Council cannot easily afford, or more "shanty towns" will be erected on the open veld, which means more crime and disease. Even the Nationalists might baulk at such a prospect.

It would, however, be contrary to the character of the Nationalists to abandon a policy to which they are so firmly committed. Their desire for *apartheid*, like their wish to become a republic, is inspired by a genuine belief that it is the best thing for the country in the long run. Furthermore, there are a large number of South Africans who do not support the Nationalist party but who nevertheless believe that *apartheid* is the only satisfactory solution of the racial problem—and not only that of white against black but also of white against white. It may be that, with such support behind him, Dr Malan will decide to ride roughshod over the economic obstacles in his path and damn the cost so long as some degree of segregation is obtained. But he cannot properly claim that the Group Areas Bill is any more workable than previous schemes for segregation.

NOTES OF THE WEEK

Manny, Get Your Gun

The speech by Mr Emanuel Shinwell, the Minister of Defence, at the opening of Wednesday's debate represents a great advance, both in clarity and candour, on previous government statements on defence. He gave the figures of Russian military strength, which should convince even the most optimistic ostrich that adequate defence forces are now the highest priority for the western nations. He announced that the United Kingdom will make ready a self-contained military formation, presumably a brigade or divisional group, for the Korean theatre, and that measures to improve the production and modernisation of weapons would be accelerated at the cost of an additional £100 million to the annual defence budget. The decision to lend a hand in Korea has given great satisfaction in the United States, although the British force will achieve little practical improvement in redressing the grave shortage of American infantry in Korea if the time needed for assembly and dispatch is to be as long as Mr Shinwell's statements implied. The decision to speed up production of new material and the reconditioning of stocks is also very much to be welcomed. The emphasis is to be on increasing the reserve of fighter aircraft—an obvious necessity in view of the extremely limited number of new first line aircraft. But it will be possible to breathe more easily only when the accelerated production programme has resulted in a greatly increased number of fighters, fighter bombers and centurion tanks actually in the hands of operational units.

On the wider issues of defence both Mr Shinwell and the Prime Minister showed that the spirit of Micawberism still lingers. Mr Shinwell admitted that

> the forces at present available, or in sight, fall a long way short of requirements estimated even on the most conservative basis.

Recruiting for the army and air force is causing grave concern, the stocks of reserve equipment are unbalanced, the new measures for production and re-equipment are no more than a fraction of what is required. But the present Ministers have been in office for five years and one does not have to approve of Mr Churchill's sour attitude in the debate to demand that they give more adequate reasons for having produced defence forces that are not only inadequate—a common failing in democratic nations—but also of the wrong size and shape. The truth is, of course, that the Government, while by no means neglecting the problem of defence, have since the war chosen the easy course of basing their policy upon the hope that there would be a long breathing space before military forces need be actively deployed again. Now that that assumption has been exploded, an apprehensive Cabinet is attempting to warn the nation without losing too much face. History would suggest that nothing less than complete candour will make the nation come to the rescue of the Government.

* * *

Working the Atlantic Pact

"Tangible results" by September are what is asked of the Atlantic Council Deputies who have been meeting in London this week. Those two words clearly mean now some-

thing very different from what they meant in May, when it was agreed to appoint deputies who would ensure that all the plans and commitments of the Atlantic Pact governments were co-ordinated and their work made effective. If it was fairly clear then that the interlocking military and supply organisations of the Atlantic Pact and Brussels Pact were cumbrous and inefficient it should be crystal clear now. And if there was urgency then about seeing that plans became reality, the urgency is now redoubled.

It is said that the deputies will have been chiefly concerned with problems of organisation. If that is so, it is to be hoped that they will have considered three points that cause much concern among their military advisers. The first is that the occupation forces in Germany—which, in fact, defend western Europe—have no clear connection with Lord Montgomery's command and planning headquarters at Fontainebleau. The second is that the head and soul of Atlantic defence is in the standing group of American, British and French officers in Washington, while supply and finance are dealt with in London. The third is that the planning of defence in western Europe, which is clearly one theatre, is split up among three regional planning groups in which too many governments and interests have their say. Such an organisation could not possibly function efficiently for three days of hostilities ; and the test of efficiency is the only one that should be applied in the present situation. It is to be hoped, too, that the American chairman, Mr Spofford, and his colleagues will be given real power by their governments to get things done quickly.

* * *

Civil Defence and the Bomb

Since 1946 the Civil Defence Department of the Home Office—much reduced in funds and staff—has been conducting in Japan and Germany studies of the effects of heavy air attack, whether by atomic or "conventional" bombs. While very much the same people who said in 1938 that there was no defence for the civilian against German bombing have been saying that nothing can be done against atom bombs, scientists and officials have been collecting evidence that shows that this is not true. A body of administrative and technical evidence has been built up, out of which has emerged a civil defence doctrine comprehensive enough to justify the formation of a civil defence staff college. Some of what has been taught and discussed there has now been simply and clearly summarised under the title "Atomic Warfare. Volume II of the Manual of Basic Training in Civil Defence."

A third of the 40 pages of text consists of frightening but highly instructive photographs of what the bomb did to buildings in Nagasaki and Hiroshima, and there is an appendix which might be entitled "atomic physics without tears." The purpose of this, as indeed of the whole pamphlet, is to enable the civil defence volunteer to understand and speak with authority and confidence about a subject on which popular comment is either defeatist or melodramatic. Its lesson is quite clear: atomic bombing will cause serious casualties and damage, but both can be substantially reduced by organised preparation, shelter and training. The main problems presented by the atomic bomb are not new—blast, fire, rescue work, evacuation ; against the new factors of heat flash, and the effects of delayed or immediate radioactivity, research has produced detection apparatus, equipment and principles of medical treatment which are described in detail.

This pamphlet says little that is convincing about the effects of bombs—more powerful, presumably, than those dropped in Japan—on the working life of an industrial centre or of the immense problems of clearance and restoration that would follow ; that is presumably subject for another publication. But it does provide the kind of facts and argument which should convince the ordinary citizen that civil defence training is worth having. It is encouraging to note that the rate of recruitment to the Civil Defence Corps has now risen to 2,300 a month, as against a rate of 1,500 at the beginning of the year.

* * *

Narrow Margin in Korea

The news from Korea continues to be disturbing. The Americans are being steadily pressed back by numerically superior infantry in country where heavy equipment and aircraft seem to be able to do little to redress the balance of numbers. As British forces learnt in Malaya, modern western armies with all the paraphernalia of complicated supply organisations and using tactics learnt on Salisbury Plain or at West Point are no match against steady infiltration in unfriendly country. The situation may improve once the Americans can fight in open country again, but they clearly need large reinforcements of infantry if they are to be able to hold their ground, let alone start pushing the North Koreans back to the 38th parallel.

Unfortunately, it seems unlikely that the help which has been promised from other countries will reach Korea in time to affect the situation in the immediate critical period. Other means of strengthening the American position will have to be found. The possibilities of naval and air support have not yet been exhausted. The carriers operating off the coast should now be able to find far more targets than hitherto and to exploit their great mobility more fully. The North Korean troops are apparently living off the country they have overrun ; their supplies of food are scarce and every air attack on those supplies will weaken their ability to fight. There may be other similar weaknesses which General MacArthur can probe and thus make it easier for his infantrymen to hold up the North Korean advance. The fact remains, however, that the Americans are still fighting a delaying action, and the need for more troops, well but lightly armed, must be met with the greatest possible speed if the final defence zone round Pusan is to be held and expanded.

* * *

More Light on the Schuman Plan

Some of the original vagueness of detail about the Schuman plan for pooling coal and steel in western Europe is gradually lifting. In his statement before the National Assembly on Tuesday, the French Foreign Minister, M. Schuman, added two new pieces of information which help to fill in the general outline.

Alongside the high authority there is to be ranged a committee of ministers from the six participating countries. The two bodies are to hold periodic joint meetings and, although the powers and tasks of the new committee were not defined by M. Schuman, it can be assumed that the ministers will concern themselves with ensuring that the high authority works over a much wider range than the interests of the coal and steel industries.

A second new feature of the plan, implicit in M. Schuman's speech, is that the high authority will conduct its operations through "natural" local units of the coal and steel industry ; in some cases these units may stretch across national boundaries, and in others a number of such units may exist within the borders of one nation. The assumption in the past has been that the high authority would deal with national groups. This decentralised form of organisation would serve many useful purposes. It might make internationalism a reality at the base of the pyramid as well as at the top ; it might also be a useful weapon for breaking up the cartels both of the Ruhr and the French steel industry.

M. Schuman expressed his regret at the absence of Britain from the councils of the six governments ; but he is still showing little readiness to alter the structure of the plan sufficiently to meet the criticisms of the British Government. British reluctance to enter the organisation will only start to yield if the high authority is unambiguously subordinated to governments. That may never happen ; but since Britain and five of the Schuman plan countries are members of the Atlantic pact, it is likely that, at least where defence is concerned, there will, in fact, be very close association between the coal and steel industries of Britain and those of the Six.

* * *

Back to Strasbourg

The portents are that British foreign policy may have another rough passage during the meeting of the Council of Europe that begins next week at Strasbourg. With Dr Dalton in charge of the British delegation and with Mr Bevin disinclined to pursue the discussion of the Schuman Plan in an atmosphere where generalisations flourish both before and after lunch, it is important that the British should make one or two contributions that are imaginative as well as solid.

There are two ideas that suggest themselves: the first is that the meeting of minds—which is still the most valuable feature of the Strasbourg occasion—should produce some practical schemes for getting young Germans in large numbers to work, travel and study in western Europe. Someone has to take the initiative in this vital matter, and the Council of Europe is in a good position to do so. The second is that delegates should face quite honestly the need to explain to voters what it is they are trying to do, and what would be the consequences to the mass of working people of the various economic projects that will be discussed during August. There is this to be said for the Labour Party pamphlet on "European Unity" that it did break away from the political and intellectual dishonesty that has marked too much of the discussion elsewhere.

This year's Assembly will be epoch-making if for only one reason—the reappearance of a German delegation in the public proceedings of a European body. The attitude and activity of these eighteen representatives of the Bonn Parliament will be watched with the greatest interest. It will be most unfortunate if this opportunity for reconciliation is spoiled by demonstrations of self-pity and propagandist zeal such as Germans abroad are prone to indulge in. But other delegates will do well to remember that these Germans will also be watching carefully to see how the democracy of the west works in practice, and whether they are taking part in what is really a going concern. This Strasbourg session must be much more businesslike and realistic than the first if it is to hold people's respect and attention.

* * *

Labour's Agenda

The preliminary agenda for the Labour Party's conference in October, which has been published this week, contains as large a number of fiery resolutions as in previous years. It is to be hoped that the general run of Labour supporters have a more percipient view of national and international affairs than the small minority in the constituency associations and trades unions on whom the framing of such resolutions usually devolves. Most of the forty-three resolutions on wages, prices and profits demand action from the Government to penalise profits, to redistribute the national income further in favour of the workers, and to reduce prices by legislative action, and in addition there are fourteen resolutions urging the Government to adopt a more socialist policy. There are twenty-seven resolutions on foreign affairs, most of which demand an end to the cold war and collaboration or agreement with the Soviet Union. These resolutions, like those on economic policy, are merely a way of expressing resentment against the cold hard world of reality.

It is interesting to observe that the more fire-eating and the more unreal resolutions come from constituency associations, not from trades unions, and more often from suburban and residential than from industrial areas. Indeed the only resolution drawing attention to the precarious basis of Britain's economic recovery comes from the National Union of General and Municipal Workers. This division underlines a tendency which has been discernible at Labour Party conferences, that the Left wing of the Labour Party derives the impetus for its criticism of the party executive and of the Government from enthusiasts in the constituencies, many of whom, from their geographic locus, cannot be working class. The majority of the trades unions by contrast are content with very little general criticism of the Labour Government's policy both at home and abroad. What effect these resolutions will have upon the future of Labour policy it is difficult to tell—five years in office have made the party executive much less sensitive to pressure from below. But one thing is quite certain, that if the executive heeds the voice of the left wing of the Labour Party and decides on a policy of "more socialism," it may get an impressive demonstration of enthusiasm at its conference in October, but it will not get the votes of the majority of the electorate when the election comes.

* * *

Colonial Week

This is the time of year when colonial affairs are thrust upon the public's attention. The annual debate in the House of Commons on the colonies in general, which took place on July 12th, has been followed by a much more concentrated, and therefore more valuable, debate in the House of Lords this week on the economic development of Africa. In addition, there has been published within the last week the annual report of the Colonial Development Corporation, the annual return of schemes made under the Colonial Development and Welfare Acts and a Colonial Office report (Cmd. 7987) on East and Central Africa in the last five years, 1945-50.

Yet, in spite of all the talk and documentation on the colonies, the basic question of the future of British colonial policy remains unanswered. It has become a truism to say that the grant of responsible government must be accompanied by economic progress if it is to be well founded. Nevertheless new constitutions, each carrying the colony concerned farther along the road from dependence to independence, are being granted all over the colonial empire—at the beginning of this week the Windward Islands, a fortnight ago Sierra Leone. Economic development has obviously not proceeded at anything like the same pace. It is quite true that the amount of capital investment that has taken place in the colonies in recent years is far greater than is perhaps generally realised. In the House of Lords debate, Lord Hall pointed out that, at the present rate of expenditure, the £120 million granted under the Colonial Development and Welfare Act of 1945 will have been exhausted by the end of 1954. The ten-year development and welfare plans approved for the African dependencies will cost, in all, about £135 million. Actual investment in Africa from all sources, public and private, was estimated by Lord Rennell as £120 million in the last five years—including the £35 million sunk in the East African groundnut scheme. But, in spite of this investment, the African dependencies—and most of the other colonies—are still economically very backward. They may be financially sounder because they are still enjoying high prices for colonial produce, but in most cases their productivity is as low as ever.

The fact has to be faced that political changes are far outstripping economic progress—inevitably so, because, as the groundnut scheme has proved, colonial economic devel-

opment cannot be rushed. What, therefore, is to happen? Are we, in a few years' time, to be faced with self-governing colonies, which have neither the resources nor the leaders to assure their economic and financial stability? Exactly how far is the present policy of constitutional reform intended to go? This is the uncertainty which Government spokesmen in colonial debates have still not resolved.

* * *

The Nigerian Constitution

There are several points of importance about the proposals for Nigeria's new constitution, the background of which was described in an article in *The Economist* of December 3, 1949 (page 1242). First is the care that has been taken in associating the people of Nigeria with the framing of the proposals. The initiative for constitutional reform came from the Governor, but the whole procedure of discussion and consultation, from the villages upwards to the provinces and regions and finally to a general conference, whose members were elected by the regional conferences, was designed to forestall any suggestion that the constitution was being "imposed" by an alien government.

The second interesting feature is the considerable amount of autonomy to be given to the regions. Regional legislatures were established under the Richards constitution of 1947. Now there are to be regional executive councils as well, consisting partly of official members but with a majority of Nigerian ministers drawn from the regional legislatures, which themselves will be more representative and have more powers. But it is not intended by this emphasis on regional autonomy to encourage Nigeria to break into three separate parts. On the contrary, it is also proposed that the central legislature should continue to legislate "for the peace, order and good government of Nigeria"—in the words of the Secretary of State's dispatch—without restriction. It follows that to begin with there will be considerable overlapping between the functions of the central and regional legislatures, and it is to be expected that the parcelling out of these functions will be a main issue of any future constitutional reform. In addition to the legislature, there will also be established at the centre a Council of Ministers, to take the place of the existing Executive Council. It will consist of the Governor as President, six official members, and twelve Nigerians, who will be Ministers, nine of them with portfolio. The Council's functions will be to formulate policy and direct executive action.

A third point of importance is the attitude of the largely Moslem North to the composition of the central legislature. It is claiming half the seats on the basis of its size and population, a claim which is being contested by the Eastern and Western Provinces. The compromise that has been put forward is that the legislature should consist of two chambers, in one of which—the upper House—the provinces should be equally represented, the composition of the other being based on population. The different provinces have still to agree on this proposal—which in itself will create further problems—and the publication of the Secretary of State's dispatch, to the effect that the British Government agrees to the proposed constitution, is intended to stimulate agreement. The decision, therefore, now rests with the Nigerian people.

* * *

Titoism in the Ruhr

The German Communists in the eyes of the Kremlin are still very strictly on probation. The third congress of the Socialist Unity Party (SED) held in Berlin last weekend laid bare the extent to which they have so far failed to reach the standard set by their taskmasters. Max Reimann, the leader of the western Communists, had to repent publicly for the failure of his KPD in the Federal Republic. He has failed to win the Social Democrat workers for a united party; the Communist vote was halved in the recent Rhine-Ruhr elections, and only 2,000,000 signatures were secured to the "peace" appeal—a figure which compares with 17 million, or over 90 per cent of the total population, who are said to have signed in Soviet Germany. Wilhelm Pieck, likewise, had to promise in the presence of Suslov, the Cominform leader from Moscow,

> to drive out of the ranks of the KPD the agents of imperialism, to remove from the leading posts in the Party the opportunists and pessimists who lack fighting spirit and confidence. . . . Ruthless struggle against Trotskyite and Titoist elements inside the KPD and the Socialist Unity Party is one of our most important tasks.

The need for this new purge was underlined by the fact that, simultaneously, there was being held in the Ruhr a Titoist conference of Communists expelled from the Party for lack of subservience to Moscow. The Germans, unreliable even in the days of the prewar Comintern, have thus become the first Communists outside Jugoslavia to form an organisation that is independent of Moscow. Even in Russian-occupied Germany the Socialist Unity Party has not yet won the right to call itself a "party of the new type"—a term which is applied by Moscow to the parties which rule the satellite states on Bolshevik revolutionary principles. German national characteristics and the legacy of the Nazis are retarding the development of older workers into reliable allies of Russia; success with the young is another matter. Pieck was forced to admit that the SED has not secured sufficient backing in the zone from the industrial workers, who should form a majority in any Communist organisation. The trade unionists show true German readiness to work themselves to the bone, but lack political zeal.

* * *

Korean Technique for Germany

In other respects, the SED congress was extremely disquieting. Korea has been made by the Kremlin into a turning-point for the German Communists, who are now presented with "the absolute necessity" of forcing the withdrawal of the western occupation forces. If this could be achieved, then, obviously, events would be made to take the same course as in Korea. The Premier, Grotewohl, has now called for civil disobedience in the Federal Republic and in western Berlin. To this demand he has attempted to give a "legal" basis by declaring that the continued presence of the western forces is a breach of the Potsdam Agreement, and constitutes "American intervention"—an ominous phrase which recalls Moscow's version of the Korean conflict.

In spite of the nonsense talked by Communists about "misery" in western Germany as the "result" of Marshall Aid, it was admitted at the Congress by one of the leading Party organisers, Dahlem, that they were faced by an "enormous task" in making the western Germans realise the "danger" from America and the "true friendship of the USSR." Nevertheless, President Pieck made the confident forecast that "there will certainly be an eruption in the west, though perhaps not immediately." In the meantime, the Communists must redouble their efforts to bring it about.

* * *

It seems advisable to state, in response to a number of enquiries, that the Editor of *The Economist* has no connection, and has never had any, with the British Peace Committee or kindred bodies. It is a matter of mortification to him that an unfortunate similarity of names should mislead anyone into thinking him capable of lending his support to activities which he regards as transparent devices of Soviet imperialism.

New Soviet Air Commander

The fact that control of the Soviet Air Force has changed hands at some time during the last year should not be allowed to pass without comment. Marshal of the Air Force Konstantin Vershinin, who had been Commander-in-Chief since 1946, has been displaced by his deputy, a notoriously pushful and politically minded character, whose experience has been mainly in the Far East—Colonel General Pavel Zhigarev. The fact that this most unpopular officer should have attained such a rank shows how few have been left to choose from by recent purges in the higher ranks of the armed forces.

Zhigarev is 50 years old and is considered by his fellow officers to have only mediocre military talents. He was deeply implicated in the Tukhachevsky plot against the regime in 1937, but decided to turn traitor after having covered his tracks with remarkable skill. Since then he has been regarded by the Party as one of the most efficient snoopers in the Soviet Air Force, and has been responsible for the downfall of a number of senior officers. Marshal Vershinin appears to have been his latest victim. It is impossible to judge what political or military significance the appointment may have; but it is another reminder of the type of man who can get into the top posts of the Soviet Union.

* * *

Jekyll and Hyde Marketing

The innocuous-sounding Tomato and Cucumber Marketing Scheme had a rough passage from Labour backbenchers in the Commons last week, and it was not only the representatives of the Co-operative movement who feared the effect on the interests of consumers of setting up a producer-controlled board with wide powers. The Minister of Agriculture's plea that his party had always been in favour of "orderly marketing" rang somewhat hollow. The Wool Marketing Scheme was approved at the same time, and other marketing schemes, promoted by the National Farmers' Union, will follow. One for peas is at present under public examination, and a much more ambitious scheme for the marketing of fat stock (a guaranteed commodity) is a possibility.

It is true that the marketing of horticultural products in Britain presents a wasteful and chaotic spectacle. The 80,000 growers send haphazardly all over the country, while the combination of a large number of distributors with a small number of main markets increases costs. Covent Garden is an expensive bottleneck from which no less than 40 per cent of produce is consigned again to other markets. The result is that gluts and shortages occur concurrently in different areas, and that consumers may be faced with high prices at the same time as growers are denied a market. The case for any type of marketing organisation which would reduce the costs of distribution is therefore very strong.

But will the proposed Tomato and Cucumber Marketing Board help towards this objective? It is purely a producers' board, and as such will not interfere (nor should it) with "the normal channels of distribution." It may do good work in improving methods of grading and packing, and in organising market intelligence. But its main function is likely to be that of a producers' pressure group, endeavouring—through the manipulation of supplies and prices, and by bringing influence to bear on the regulation of imports—to secure better terms for the grower. It is true that the Minister is to appoint a small minority of the members of the board (most of whom are elected by the producers) and that he has strong reserve powers to protect the public interest. But the Minister in this case means the Minister of Agriculture—and no one who holds that office is likely to give his first thoughts to the welfare of consumers.

* * *

Rent Rebates Analysed

The high cost of housing has recently produced a crop of suggestions on how to overcome or counteract the economic and social difficulties which follow from it. Rent rebates are one of the counteracting methods and there can be no group of people more competent to discuss it than the Society of Housing Managers. This they have done in an excellent pamphlet,* which is as lucid as it is brief. Unfortunately, with a timorousness unworthy of the successors of Octavia Hill, they have avoided any final conclusion about whether rent rebates should be more widely applied.

Until the society sent out a questionnaire in 1949 no information about rent rebate schemes more recent than 1939 was available. Of the 1,470 local housing authorities approached by the society 971 replied. Of these only 78 were applying a proper rebate scheme, 72 gave rebates in cases of special hardship without a sound scheme, 52 had abandoned schemes, and only six had new schemes under consideration. These figures show that rent rebates are not popular with housing authorities.

Over the last eleven years the purpose of rent rebates has changed. In the past they were used to help the "submerged" families. Rebates were paid mainly to the unemployed, the sick and the aged. Now the National Assistance Board will pay for these classes any rent which it considers reasonable; old-age pensions are more generous; unemployment is low. Instead of protecting families suffering from great hardship rent rebates are required mainly to bolster normal families in the lower wage groups against the effects of a period of very high building costs. The fact that many council tenants can now afford the economic rents of council houses increases the case for attaching the subsidy to the occupants rather than to the houses.

On the assumption that the present housing policy will continue, there are great attractions in extending the system of rent rebates in order to share out the housing subsidies according to need. But the analysis of existing schemes which the pamphlet contains shows how complicated and difficult the schemes are to apply. A great deal of effort is wasted in making the schemes too perfect: equity is achieved at too high a cost and at the sacrifice of the tenant's co-operation. Yet certain schemes have been found to be workable and could be more widely applied. In the absence of other changes in housing policy rent rebates are a partial remedy, and the pamphlet well deserves to be studied by all those who would apply it.

* * *

Foreign Capital for Southern Asia

The recent foundation of a Philippine Association by businessmen of all nationalities in the Republic has drawn attention to the country's urgent need for capital investment from abroad. Since the war the Philippines have had more of a spending spree, and have run through more United States dollars with less to show for them, than any other territory of the same size. Today the Philippines lie within the belt of Pacific countries over which the mantle of protection against the Communists is being firmly cast by their former ruler, the United States. But they also belong to the fringe of South East Asia where Communist tactics of infiltration are being vigorously pursued, and not

* Rent Rebates. A review. April, 1950. 1s.

without success. Already the problem of raising economic standards by capital development is, therefore, being keenly studied.

The rich flow of American subsidies to the Philippines, in the form of extensive payments for war damages and other claims, will come to an end next year. When it does the Philippines will almost certainly face an acute shortage of foreign exchange unless immediate measures are taken to readjust the adverse balance of trade. Yet the problem itself is—or rather ought to be—almost absurd. Speaking last month, one of the founders of the Philippine Association, Mr Gerald Wilkinson, claimed that "the natural resources of the Philippine Republic are far richer and more varied than the United Kingdom's," while the population is very much smaller. Addressing a mixed audience of Filipino officials and foreign and Filipino businessmen, Mr Wilkinson then put his finger on the great weakness in any scheme for attracting foreign capital, namely

> fear of the unknown intentions of each of us toward the other: fear in the minds of some legislators and some domestic interests that foreign capital may deprive, rather than enrich, the Filipino people: fear by our foreign businessmen that there is a rising intent to legislate them out of business and to expropriate by law a growing portion of their activities for transfer to others.

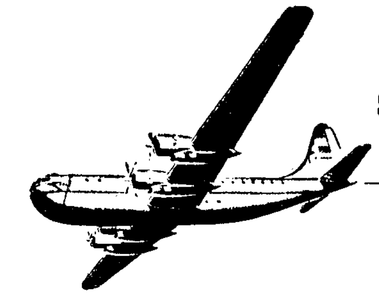
Mr Wilkinson went on to point out that Britain has for centuries profited from the entry of skilled foreigners. He also showed by means of an actual example how a foreign investment, which may cost 250,000 pesos a year in foreign exchange for the repatriation of interest, pumps from eight to twelve times that sum into local circulation as payment for labour and raw materials, to subcontractors and, not least, to the local government in taxation. Both the advice given and the complaints made by Mr Wilkinson apply generally to every under-developed country in southern Asia.

* * *

Mr Mackenzie King

With the death of Mr Mackenzie King all but one of the great figures who created the present pattern of Commonwealth relations have passed from the scene. His attitude to the Commonwealth, his insistence on the integrity of Dominion sovereignty at the expense of the unity and cohesion of the Commonwealth as a whole aroused from time to time criticism and not a little resentment both in Britain and in the other dominions. But in fact since nationalism is a force that can only be ridden not curbed, Mr King may be judged a more percipient statesman than his critics have allowed for. In any case the idea of the loosely associated Commonwealth of white nations to which the statute of Westminster gave expression can be seen in retrospect to have been in part founded on a contemporary illusion shared by almost every statesman about the growing safety and sanity of the international order. The necessity for all free nations to co-ordinate their actions and merge their right of independent action in higher forms of association has been made painfully clear in the last few years, and Canada has been as quick to recognise this as any other nation.

Mr Mackenzie King's most outstanding achievements were threefold. In the first place, he carried on and strengthened the work of his master, Wilfrid Laurier, in achieving the highest degree of national unity which is possible in a country of many diverse races and in which the aspirations of the two main groups, the English Canadians and the French Canadians, are rarely in harmony. By infinite patience, by adroit political manœuvring, by never imposing a strain which the unity of the Canadian people would be unable to bear, he preserved and greatly strengthened Canada's internal cohesion. Those people in Britain and the rest of the world who were maddened by his capacity for evasion and double talk, and those among his countrymen who chafed beneath his inability or unwillingness to give expression to the heroic and adventurous character of the Canadian people, were inclined to forget the intractable material with which he had to work. If government is the art of the possible, Mr King must be considered a great artist. His second great achievement was to create and wield a first class government machine. He was almost continuously concerned with the business of government, first as a civil servant and then as a politician, for nearly fifty years and few political leaders—not even Mr Churchill—have had such mastery of the relation between policy and administration. Finally, by making the United States, and in particular President Roosevelt, aware of the existence and potentialities of Canada, he did a great deal to explode the myth, so strongly entrenched in American minds, that the Commonwealth was a trick of British diplomacy which the United States must do its best to unmask.



Shorter Note

The High Court has held that the trade description "vinegar" properly applies only to vinegar produced by the double fermentation of malt, wines, cider or spirits. It cannot be applied to other liquids such as those produced by a solution of acetic acid and caramel and known as "non-brewed vinegars," despite the wide sale of these liquids and despite the fact that the term "non-brewed vinegar" has been used by the Ministry of Food as an official description of these liquids. It therefore upheld a conviction imposed on a manufacturer of such liquids for selling them under a false trade description contrary to the Merchandise Marks Acts.

Death of the President

Late accounts have brought the unexpected intelligence of the death of General Taylor, the President of the United States. We had received no previous intimation of his being unwell, and his sudden decease, at the comparatively early age of 64, is ascribed to cholera and political chagrin. The first cause is ample of itself, when the disease gets hold of a veteran whose constitution had probably been damaged, or at least hardly used, in backwood clearances and Indian warfare, and the second might well have existed without preying much on the mind of a man accustomed to contention. . . . He is the second President who within the short period of eight years has died in office, subjecting the constitution of the States to the severest test of its efficiency likely to be encountered in the ordinary run of human affairs. The result amply justifies the sagacity of its founders. As Vice-President Tyler succeeded to General Harrison, and carried on the Government with ease and security till the period of electing another President, so Mr. Millard Fillmore, recently Vice-President, has succeeded to General Taylor, and will hold the Presidency till the time comes for another election. With quite as little or perhaps less disturbance than takes place on the death of a monarch leaving behind him a successor ready to take his place, the vacant Presidency is occupied in the States; and with a change of Ministers, made necessary by the discredit into which the Cabinet has fallen, the affairs of Government will go on much the same as before. Where a wisely devised system makes the Government correspond to the nation or identical with it, and where the people at large take part in administering its affairs, the death of an individual, however influential, is of comparatively little consequence. The system depends on no one man; the ever living and slow changing nation carries on the government as it carries forward its own continued existence, and policy only changes as parties change or as the nation itself changes.

Letters to the Editor

South-West Africa

SIR,—In your Note of July 22nd on the subject of "The Status of South-West Africa" you indicate that the exact legal status of this territory is not easy to define. The point is of interest because it might very well arise again in connection with other territories that were placed under mandate in the first world war. What actually happened was that Germany under Article 119 of the Peace Treaty renounced all her rights and titles over her overseas possessions in favour of the Principal Allied and Associated Powers—not, it should be noted, to the League of Nations. The Principal Allied and Associated Powers consisted of the United States of America, the British Empire, France, Italy and Japan. The sovereignty, therefore, of these territories was presumably vested in these powers. So far as I am aware it was never transferred to the League of Nations, nor does there appear to be any evidence that it was transferred in respect of each particular territory to the mandatory power. It therefore seems that it is still vested in those powers jointly, unless the late world war is regarded as having any effect on the participation of Italy and Japan.

Further than this, the mandate was not drawn up by the League of Nations, but by the individual mandatory powers and submitted for approval. The treaty did not confer on the League of Nations any other right than that of receiving an annual report in reference to each particular territory. A permanent Commission received and examined the reports, but the League apparently, however much it might have disapproved of any report, had no power whatever to do anything about it.

The Trusteeship Council of the United Nations, on the other hand, has very considerable powers, but the United Nations Charter, as confirmed by the finding of the International Court of Justice, constitutes the handing over of such territories to the Trusteeship Council as an entirely voluntary action. As this has not been done in the case of South-West Africa, it is possible for the United Nations to claim that as the successors to the League they have the right to receive the report, but beyond this they can apparently make no claim whatever. Legally speaking it would seem that the territory is the joint possession of the United States of America, the British Empire and France.

Yours faithfully, W. A. WELLS

Financing the Hospitals

SIR,—May I comment on the "spending madness" and "over-estimating" to which Mr McLachlan refers in his letter of July 22nd? The combination of war and the impending health service, with the possible anticipation of rebuilding, meant that many hospitals had had very little spent on their development in recent years. Many of the hospitals taken over by the state needed a great deal spent on essential improvements. Shortage of steel, timber and other materials prevent major structural alterations and what has been spent has been the minimum necessary for amenity and efficiency. The bulk of the "spending madness," as reflected in the budgets, has been due to the increase in salaries and cost of maintenance.

It is indeed likely that hospitals have over-estimated their requirements. Over-budgeting automatically accompanies a fear of Ministerial cuts, which might endanger the level of service to the public. Again, with no contingency fund, over-budgeting is almost inevitable. A petrol pump at my hospital failed, after many years of service, but its demise had not been anticipated in the budget and it could be replaced only at the cost of some other item. Obviously, officers in future will be encouraged to ask for the replacement of machinery unnecessarily soon. The necessity of budgeting in great detail a year ahead also encourages over-estimating. Hospitals, unlike schools or post-offices, are constantly faced with changing expenditure due to medical research. It is quite impossible to anticipate these changes a year ahead and this must encourage over-budgeting.

I feel the present financial arrangements are fundamentally unsound and the modification of the system might well effect a substantial saving without loss of efficiency. Mr Wetenhall comes to the crux of the problem. Greater flexibility is needed for hospital management committees. Detailed budgeting of small items is quite unnecessary and could be met from a general improvement and contingency fund. The present system means that items of expenditure tend to be judged primarily on whether or not they have been budgeted and only secondarily on their intrinsic merits.

The present financial arrangements may be administratively tidy but they have effectively removed the stimulus to economy. The financial system must be such as to encourage the hospital management committee to economise, who, in turn, will stimulate their staff. Economy is an attitude of mind and, in practice, a painful discipline which needs constant stimulus and incentive, and some local benefit must be allowed to accrue from the hard work involved.

Yours faithfully, F. AVERY JONES
43 *Cleveland Square, W.2*

West African Press

SIR,—It would appear from a recent debate that the Home Government do not sufficiently appreciate the harm done by the daily outpourings of a large section of the West African press. The constant misrepresentation, slanders and impertinent sedition which characterise a large proportion of the press in the Gold Coast and Nigeria are matters of very profound concern. Towards the end of last year, one Gold Coast broadsheet used the term "The Son of Man" as a reference to its own political leader, and prayer forms have been adapted to glorify the same politician and his dogma.

These scurrilous publications are practically alone in the field, there being hardly any moderate press. Further, the African has an immense respect for education and all its fruits, and the printed word enjoys an unquestioned authority. Perhaps this last statement has to be qualified as Government releases are automatically assumed to be wrong by a large proportion of the people. The technical poverty of the papers is also important. Frequently there is no connection between headlines and text; articles are freely adapted from other newspapers, and too often the text bears no relation to the true context.

It is true that repressive measures are repugnant, but some action is required. Apart from the obvious course of more libel and sedition actions, a vigorous campaign of denials and official statements correcting false accounts in the local press might be considered in preference to ignoring the falsehoods and insults appearing daily.

Something could be done, also, to eject from the precincts of public buildings those of the official letter writers who seem to spend most of their time in reading these broadsheets—for a fee—to their illiterate brethren. Surely there is no need to give such people shelter at the taxpayer's expense?

It is sad indeed that such measures should be advocated, but until the African press can learn the difference between liberty and licence, it is necessary for Government to protect itself and the law-abiding majority against the constant stream of foul abuse which forms the only substance of so many broadsheets and other publications in West Africa today.—Yours faithfully,

HUGH ROM

Attack on Queen Victoria

SIR,—If *The Economist* were *The New Yorker* we should all know what happened to the person "who turns out to be a Mr Pate." Is there any record of his raising a large family in Australia, or of his being hanged? The suspense is terrible since all that one can safely assume is that he did not resume being a lieutenant in the 10th Hussars.

Yours faithfully, J. A. MACLEOD
British Embassy, Bogota, Colombia

[In case there are other readers in a similar suspense, may we say that it was reported in *The Economist* of July 13, 1850, that Mr Pate was sentenced to be transported for seven years. He escaped whipping on account of his family. The trial is of interest because the McNaghten Rules, then seven years old, were cited. It was held that though Mr Pate "had been out of his mind for a considerable time," he yet knew that he was doing wrong and so remained accountable and punishable.—EDITOR.]

Books and Publications

Notes for a Sermon

War or Peace. By John Foster Dulles. *New York: Macmillan. London: Harrap.* 274 pages. $2.50 or 15s.

Mr Dulles has written a book that is useful and important without being good. It is important because the author has been close to the heart of American foreign policy planning, knows the reasoning as well as the motives behind it, and might one day be a Republican Secretary of State. It is useful because it will give the British reader the kind of picture of American effort as a Great Power since the war which his newspapers have been either unwilling or unable to provide; it will also tell him much more pungently than his own statesmen have yet done the dangers of the world we live in.

The book is not good because the principle of arrangement changes from chapter to chapter: now it is chronological, now dictated by the author's train of thought, now by the scheme of four parts. This is quite simply a brief presentation of "the enemy"; an excellent survey of "the policies we have"; a frank and quite modest attempt to add up the "five year score"; and nearly a hundred pages—fifty too many—about what still needs to be done. The style sometimes reminds one of notes for a sermon, and has none of the fluency and felicity of phrase that distinguish Mr Acheson's speeches. Some of it is clearly intended for those sections of the American public who do not like paragraphs more than seven lines long.

In one respect, however, Mr Dulles has done an outstanding service for all those people outside the United States who care to read him. He gives—perhaps unconsciously—a faithful reflection of the mind of the American public man shouldering his world responsibilities with a curious combination of tough realism and genuine aspiration towards a better world—a world which will be in many important respects just what an American likes to think the United States is at its best. Communists call this imperialism but the word is completely misleading. There is a final chapter on "Our Spiritual Need" which is really eloquent in its protest against the materialism not only of the Communists but also of many of their principal opponents.

For the historian of the postwar years there is nothing new of importance in Mr Dulles's account of events; but this book does give as handy a summary as has yet appeared of the acts of Soviet policy, both in conference and outside, that convinced American statesmen by the end of 1946 that co-operation with Moscow was impossible. As they are here presented, in series, they make the perversity of Soviet policy in killing American isolationism and giving the Western World something to marvel at. It is as baffling as Stalin's refusal to believe in 1941 that he was going to be attacked by the Germans. If Mr Dulles, and others who think like him, see the world too much in terms of gigantic Communist conspiracy, it is the fault of the Russians not of the Americans.

Romance and Figures

Chance and Choice, by Cardpack and Chessboard, Vol. I. By Lancelot Hogben, FRS. *Max Parrish.* 417 pages. 50s.

Teachers of statistical method are faced with a major dilemma. If they try to avoid the mathematical and philosophical theory of the subject, their students are liable to emerge from their courses with a knowledge of the rules of the game but no genuine understanding of the circumstances in which it is safe to apply them. If the mathematics and philosophical discussion are given full play, the students are liable not to emerge at all. It is very hard to find a middle way, and harder still to write a book about it, if only because students of statistical method vary so much in the amount of mathematics they can command. The problem is enhanced for economists, as compared for example with chemists or biologists, by the fact that they often come to their studies with no previous mathematical training. Indeed they come with an understandable distrust of the power of mathematics to produce any results in their subject which are not attainable more simply by non-mathematical arguments.

In this book Professor Hogben applies his unique expository gifts to the problem of instructing the student of statistics and probability to understand How To Do It and Why To Do It, without requiring more than goodwill and application on the mathematical side. It is not a statistical version of "Mathematics for the Million" but a serious textbook whose object is to enable the reader to use statistical methods for himself, not merely to understand broadly what happens when other people use them. This first volume deals mainly with large-sample theory. A second volume on small samples and the refinements of logical inference in probability is promised later.

The book opens with an introductory chapter on the algebra required to deal with probability and some approximative formulæ for the sums which arise. Chapter 2 develops the theory of choice with the aid of illustrations drawn from packs of cards and other apparatus of simple games. Here and throughout the book is lavishly illustrated with diagrams, often in two colours, Professor Hogben being a confirmed believer in the pictorial method of presentation. With the elementary laws of chance established the author goes on to discuss the testing of hypotheses, significance and confidence, and the recognition of significant differences between classes. Chapters 8 and 9 develop the theory of correlation, association and concomitant variation generally; and the book concludes with a review of sampling systems. There are many examples and exercises, an indispensable adjunct to any statistical textbook. The author's object has been to make each volume complete in itself and it might have been an advantage to provide this volume with an index.

Professor Hogben can invest even the binomial theorem with an atmosphere of subdued excitement, and the freshness and originality of his treatment, though it will arouse opposition among the orthodox, evinces the enthusiasm he himself feels for his subject.

The Fourth Republic

The Reshaping of French Democracy. By Gordon Wright. *Methuen.* 297 pages. 15s.

Mr Wright, who is now Professor of History at the Oregon University, has written an excellent narrative of political events in France from the Liberation to the launching of the Fourth Republic in October, 1946. His book besides providing the general information necessary to an understanding of this confused period is much enlivened by the comments of an eye-witness since Mr Wright spent two years as Secretary at the United States Embassy in Paris.

Mr Wright appreciates the divergencies in France's political philosophy which have hitherto prevented the modernising of her institutions. Thus his account of the search for a new system of government undertaken by the very different resistance elements within and outside France during the war is especially interesting. General de Gaulle, the central figure in this formative period, far from appearing as a clerico-corporatist of the Pétain type, is revealed as an uncertain groper after new political forms. For the Nietzchean side of his character (Mr Wright quotes from the General's prewar writings) is undeniably balanced by a juridical scrupulousness usually foreign to dictators.

Monarchy and "fascism" being ruled out for different reasons, the republican debate turned upon whether to introduce a kind of presidential democracy with the executive strengthened in relation to the legislature or to revive the older "conventional" republic in which government would be carried out by the Assembly itself through its steering committees, no independent executive at all being permitted. The Communists, having waited until 1944 to declare their position, flatly rejected the former solution and pronounced for the latter, which they evidently regarded as the most suitable method of transforming bourgeois democracy into the Soviet system. In the event, as the world knows, France received a constitution giving as little promise of cabinet stability as that of the Third Republic. The change has been in the personnel not in the practice—if the emasculation of the Senate be excepted.

Mr Wright's survey of the period is naturally confined to the political manœuvrings in Paris. He fails to stress the importance of provincial government and, above all, of the prefectural system. For, in a sense, parliamentary disunity is normal in France and to hope to change it decisively by governmental device was probably, and may still be, a vain aspiration. But the relatively smooth functioning of the municipal and departmental councils under the authoritative eye of the prefect has in fact been an important contributory factor to French recovery. In all probability, French democracy cannot be really reshaped until the Third Republican parties lose their following. General de Gaulle himself seems to have realised this after his fruitless experiences in constitution making. His negative achievement may be measured by the fact that the Communists did not gain control of any key ministry after the liberation. The years to come will show whether he or any other leader will be capable of establishing a majority party of the centre. Then only will come the time for further tinkering with the constitution.

Second Thoughts

Betrayal in India. By D. F. Karaka. *Gollancz.* 253 pages. 12s. 6d.

Mr Karaka has written an entertaining book. Whether he has proved his theme—that Congress has let the new India down—is another matter. For Mr Karaka writes so well and mostly so reasonably that he sometimes spoils his own case by bringing in petty instances of the kind of local bribery, inefficiency and abuse of power which would occur under any new regime. Nor is it ever very clear—and here Mr Karaka is in the difficulty that the whole Indian electorate will be in next year—just what party the author would like to see replace the Congress party.

But, these questions apart, Mr Karaka has given a thoughtful and sensitive account of the development of India since just before partition, against the background of his own impressions at the time. Educated at Oxford—where he was the first Indian to be President of the Union—he has produced a sober challenge to many accepted ideas. Whether they agree with it or not, his book should inform as well as interest all who follow India's affairs.

The Compleat Small Farmer

Farmer's Progress. By George Henderson. *Faber and Faber.* 230 pages. 10s. 6d.

Mr George Henderson's first book "The Farming Ladder" was more than a success story. It showed the impact that intelligence and the ability to work long hours can make on an industry now generally considered to require, in addition to such qualities, ever increasing quantities of capital and technical training, since Mr Henderson started without capital or technical training in any appreciable quantities.

"Farming Progress" is, as its subtitle indicates, "A guide to farming" and this time Mr Henderson sets about his task on a wider basis than his own experience. It has many of the qualities of the earlier book and is full of sound common sense on farming methods, on farm management generally, and on taking a farm. But when Mr Henderson gets away from the firm ground of his own considerable achievements he is inclined to be provocative and often gets into deep controversial waters. In his statements on the agricultural policies of both the major political parties, the Agriculture Act, and the National Agricultural Advisory Service he is outspokenly critical. He has hard things to say about economists, but no harder than the things he reserves for some of his fellow farmers. In spite of such irritations this is a book that should be read by both economists and farmers, quite apart from any desire to improve their knowledge of the technicalities of husbandry, for Mr Henderson's book is an outstanding example of the small farmer's approach to life and work.

That such views and methods of work can survive and succeed in as highly an industrialised a country as Great Britain is surely not without significance. The qualities of the peasant mentality, love of the soil, tenacity, frugal independence and a capacity for hard work are likely to be ignored in a highly developed and complex civilisation. But for the world at large it is probably still true to say in the words of Dr Venn, "The intimate character of man's association with the land cannot be better illustrated than by saying that the 'typical' human being is the peasant farmer." Western civilisation neglects this fact at its peril. It is in such a context that this book might well be read by those who have no intention of farming themselves.

Principles or Sense

Large-Scale Organisation. Edited by G. E. Milward for the Institute of Public Administration. *Macdonald and Evans.* 230 pages. 16s.

This series of thirteen papers must have been appallingly difficult to edit; they are certainly difficult to review. In the introductory essay Mr J. R. Simpson, the Director of Organisation and Methods at the Treasury, asks all the questions which a study of the day-to-day organisation and management of large industrial undertakings and public services might be expected to answer; these questions range over the usual topics of the seat and nature of control, the desirable extent of decentralisation, the composition of the controlling group and so on. There follow descriptions of the organisational system of four public departments (the Ministry of National Insurance, the Post Office, the LCC and the Board of Inland Revenue), two nationalised bodies (the Bank of England and the Transport Commission) and three giant private enterprises (Unilever, ICI and the Midland Bank). All of these are written by high officials of the bodies concerned and most of them are frankly factual business memoranda with organisational charts attached. In the final essay, Sir Charles Renold (chairman of the Institute of Management) tries to sum up the series and records as his "chief impression" that "very little in the way of general principles has emerged." The bald truth is that once a body has grown too large for one chief executive to be the centre of all decisions (as all the bodies here reviewed have done) the extent to which initiative and responsibility can or should be diffused down the line depends on too many widely differing "determinant considerations" (to use Sir Charles Renold's term) for any comparison of different systems of large-scale organisation to yield much fruit. There is no exact science of public administration; there is simply a general need for good administration.

On international finance they all listen to

HJALMAR SCHACHT

GOLD FOR EUROPE

is his new book outlining a plan for the rehabilitation of German (and so European) finances with American assistance. AMERICAN SURVEY

The New Commitment

(From Our American Staff)

THE commitment which President Truman proposed to the American people ten days ago was a long-term one. The share of the national resources it is proposed to allocate to defence cannot be delivered without curbing civilian demand. To clear a right of way for the new arms programme, without undue inflation, will mean accepting a degree of economic control for a long time to come. Both the President's Message to Congress and his broadcast to the people set forth in some detail the record of events in Korea, emphasising that the use of American troops there was to carry out a United Nations police action. Both suggested that the Korean invasion may well have revealed the pattern of the future:

> The attack upon Korea makes it plain beyond all doubt that the international Communist movement is prepared to use armed invasion to conquer independent nations. We must therefore recognise the possibility that armed aggression may take place in other areas.

Both emphasised that there is a limit to the number of little fires that can be lit without causing a world conflagration:

> Those who have it in their power to unleash or withhold acts of armed aggression must realise that new recourse to aggression in the world today might well strain to the breaking point the fabric of world peace.

In other words, the President told the American people that the least the United States must do is to make ready to counter Communist outbreaks in a number of widely-scattered trouble spots. Vastly more than that may be required to assure American security. To an unprecedented extent, the President's listeners agreed with him. In the months before America's entry into the two world wars, emotion choked every argument; those who held that American interests were not involved were a determined group that could not be said, with any certainty, to be only a minority. Until after the sinking of the *Lusitania* in the one case, until the attack on Pearl Harbour in the other, there were two sides to the issue, both deeply felt. This time, there is a minimum of emotion; no one argues that the United States could have ignored the challenge.

The Republicans, whose bipartisanship has hitherto stopped at the international date line, have now no real choice: they can side with the Communists or with the Democrats. They cannot complain of the decision to undertake the war; they are reduced to criticism of the conduct of hostilities. And even here their freedom is limited. The ability of the North Koreans to launch a surprise attack, and the poverty of American equipment during the first phase of the fighting, would normally afford tempting targets; but shafts directed toward them risk piercing the aura around General MacArthur.

And in respect to the measures of preparedness Mr Truman proposes, the Republicans are no better off for an issue. In this campaign year it might be dangerous to invite charges of supporting a policy of too little and too late. The resentment expressed in the cloakrooms against Mr Johnson, the Secretary of Defence, as the man whose economy knife cut away the muscle as well as the fat of the forces, would have the ring of a good issue, if the ring were not muffled by echoes of economy-minded Republican votes. The tally on the $1.2 billion Military Aid Bill, passed by the House two hours after delivery of the President's Message, with Mr Marcantonio as the sole dissenter, measured the initial unanimity of response. Last year the corresponding Bill had 122 opponents.

So, though Senator Taft affirmed that the controls requested go "far beyond any necessity we know of at the moment," and Senator Wherry declared that the President's programme "would nationalise the economy," the Defence Production Bill of 1950 was immediately introduced, and hearings begun both on the economic controls recommended by the President, and on an authorisation to increase the size of the armed forces.

*

The reaction of the business community to most of the President's programme, including credit controls, has been outspoken and favourable, though the Chamber of Commerce holds that no new tax legislation should be introduced until the shape of things is clearer. In respect to allocations, Senator Taft's eagerness to avoid controls runs counter to the wishes of major industries; the producers of steel and other basic metals are far from eager to have to discriminate on a voluntary basis among their would-be customers. Equally satisfactory is the response of the group of nine labour leaders, appointed to represent the various segments of the trade union movement, who met Mr Symington, the chairman of the National Security Resources Board, on July 11th. The main concern of this group is that labour should have a voice in the planning of production, dealing with general policy. In the last war, it was restricted to an advisory role on labour matters. Had the nomination of Mr Symington's former colleague, Mr Robert J. Smith of Texas, to be the vice-chairman of the NSRB not been far advanced, a vigorous effort would have been made to secure that post for labour. A second major concern of the trade unions is that any steps toward a wage freeze, a no-strike pledge, or direction of labour (much more likely in an economy adding war production to very high-level employment than in an economy with slack as in 1940) shall be accompanied by effective controls of profits and prices.

Among the general public, the first reaction has been to accept the new way of life as inevitable and then go out and buy whatever seemed hardest to do without last time; a car,

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

a set of tyres, a sack of sugar, a supply of sheets, or a pair of nylons. Against the abundant figures of the mid-year crop report that came out just as this spree was getting started, the public's determination to "stock up before the hoarders get it" appeared misguided; in his fireside chat, Mr Truman's reproof was expressed in the homely words that every American child has heard from his grandmother: "Perfectly ridiculous!"

Mr Brannan, the Secretary of Agriculture, has reminded the Chairman of the House and Senate Agricultural Committees that he holds, without power of disposing of them, supplies of perishable commodities purchased under the farm price support programme amounting to one pound of butter, two and a half pounds of dried milk, and two dozen eggs for every man, woman and child in the country. Hearings are now going on to determine what to do with them. Price rises in the basic commodities, such as cotton, are being slowed down by the withdrawal of the supplies placed under government loan by farmers last year (of about 3,000,000 bales under loan, more than 2,000,000 have been redeemed) and by reductions in the stocks from the 1948 harvest to which the Commodity Credit Corporation holds title.

Since a boom was already under way before the present buying wave started in both agricultural and industrial commodities, the inflationary danger is recognised to be real. Whether it can be kept within bounds without far-reaching controls will probably depend on how much further prices are pushed up before the powers requested by the President are granted.

Solid as is the support of the new commitment the United States has undertaken, there are new elements in it that cause uneasiness. European states are accustomed, as the United States is not, to living within reach of powerful potential enemies and to the dispatching of military forces to fight in far parts of the world. Among these nations, Britain knows what it is to stand alone. A further anxiety is the fear of the unknown that accompanies the knowledge of the atom bomb. This is shared now by all countries, but felt most keenly in the place of the bomb's origin. But these are part of the new conditions of American life. The preparations set in motion in the last fortnight are not preparations for meeting a temporary emergency. They are preparations for lifting the national defence effort up on to a plateau, which will serve as a long-term foundation for American security.

American Notes

Men for the Arms

The omnibus appropriations Bill will be a double-decker by the time it returns to the House, if it is held up in the Senate until the President's latest request for $10,517 million can be added to the $13,294 million already allowed by the Senate Appropriations Committee for defence next year. The House itself was slightly less generous, but that was before Korea and now, if it takes the advice of Mr Vinson, the chairman of its Armed Services Committee, it will force more upon the President than he has asked for. But it is doubtful if he could spend more in the next few months. It takes time to place contracts and expand facilities, even though some at least of the preliminary plans are probably already made, since it is reported that a substantial expansion of the forces had been intended next year, in preparation for the anticipated crisis in 1952.

The present request contains $2.6 billion for the Navy, $3 billion for the Army and $4.5 billion for the Air Force. Broken down into items, the largest sum is again for flying, $3.3 billion for aircraft, with $2.5 billion for maintenance of plants and facilities, and $2.6 billion for guns, electronic equipment and the tanks which Korea has shown to be so desperately needed. Requirements for Korea are, of course, to be given urgent priority, but the estimates also provide for "an early, but orderly, build-up" of the forces to "a state of readiness designed to deter further acts of aggression." Why they are not already in such a state, after having nearly $50 billion spent on them in the last four years, is a question that is engaging the critical attention both of Congress and the press.

Except in the case of the Navy which, according to Mr Vinson, will be able to send 48 more ships to sea, including nine aircraft carriers, two cruisers and 32 destroyers, no details are yet available of what the new appropriation will mean in terms of arms. In terms of men, it will mean an addition of 600,000 to the total of 1,506,000 originally planned by the forces for the 1951 fiscal year. The Navy proposes to raise its strength to 579,000 officers and men from 375,000, the Marine Corps to 109,000, the Air Force to over 500,000 and the Army to about 830,000 from 592,000. Marine Reserves have all been ordered to report and the other services are expected to follow suit before long, although so far they have only called up selected individuals from their Reserves. The Army, however, has summoned a number of specialised units of the National Guard and will probably ask for more conscripts as soon as the selective service system has delivered the first batch in September. In Washington civil service hiring rules have been suspended in order to allow the defence agencies to rebuild their civilian staffs, and there is talk of a six-day week for federal employees.

It is the electronics engineers, the maintenance men and others with special skills that the services require urgently and these are the men that industry too must have if it is to increase its output of aircraft, tanks and guns. Few, if any,

skilled workers are to be found amongst the 3,300,000 unemployed and already there are manpower shortages in Detroit. The Department of Labour is conducting a sample survey in various centres to find out how many men would be taken away from essential defence industries by full mobilisation of the Reserves.

Hobson's Choice on Taxes?

When the President and Senator Taft sing a duet on the immediate need to increase taxes, it is hard for Congress to turn a deaf ear, though the committees that write the tax Bills have done their best. The President, stung, perhaps, by the cynical assumption that the Democrats would postpone the reckoning until after the elections, has asked, as an interim measure, that an additional $5 billion in revenue be raised by increasing taxes on the 1950 income of corporations, and by lifting the withholding tax on individual incomes from 15 per cent to 18 per cent, beginning with income received in October. This would sweep most of the Republican tax relief measure of 1948 into the discard, along with this year's House-passed Bill, whose skeleton, it is suggested, would make a handy peg on which to hang the new levies.

The tax request is only a first instalment on the new level of defence spending; the Secretary of the Treasury has promised that a more "comprehensive" measure will be submitted in about three weeks. But the interim increases would offset most of the new defence spending that can be done this year, while permitting more leisurely consideration of the long-term changes in the tax structure that may be needed when a prospective deficit of over $5 billion is compounded by rearmament. Among these may be the revival of the excess profits tax so popular with labour.

If Congress complies, it will not be because it loves financial prudence so much as that it detests controls even more. Both the President and Senator Taft have underlined the unpleasant choice. The alternative to a tax increase large enough to offset the new inflationary forces that will be generated is the proliferation of controls, perhaps to the retail level. The Republicans are already complaining that the powers of allocation and requisition in the Defence Production Bill constitute a blanket grant of authority and go beyond the powers granted during the war.

Though compulsory powers are requested in the Bill, a trial may first be made of the system of voluntary allocations used after the war. This guaranteed a limited supply of steel to essential users such as freight car builders, who may again be found near the top of the queue. Mr Sawyer, the Secretary of Commerce, whose department formerly administered this machinery, with the aid of advice from the steel industry, has named tin, aluminium, copper, and steel as today's most serious bottlenecks.

The trouble in steel is not that it is scarce, but that the appetite of the durable goods industries is insatiable. The capacity of the steel mills passed the 100 million ton mark on July 1st; in 1944 about 50 million tons of a then production of 89 million tons was enough to support the peak of the war effort. The industry is now turning out about 13 million tons more than the rest of the world—including Russia—did in 1949. Yet even before the new military inquiries began, Detroit was pinched, and cutting back production, for lack of steel and non-ferrous metals, while Europe was being combed for scrap. Convinced that its crowded order books are no temporary phenomenon, the industry determined, even before Korea, to add another 3,600,000 tons to its capacity by 1952, in addition to a 2,000,000-ton expansion already scheduled. This may checkmate the Administration planners who believe that an industry running at or over its theoretical capacity is underequipped to sustain an expanding economy and should be helped to grow by the government, whether it likes it or not. The industry would, however, not be averse to government aid to speed-up the extraction of iron ore from low-grade reserves. The depletion of domestic ore reserves might be the industry's Achilles heel if war cut off its supplies from new finds overseas.

* * *

Three's Competition; Two's Some

Trans World Airlines may have a more impressive name than Pan American Airways, but it carries less weight in international aviation and apparently also in the White House. That at least is how Washington explains the President's second thoughts on whether PAA should be allowed to buy American Overseas Airlines. The Civil Aeronautics Board, after eighteen months' consideration and against the advice of its special investigator, refused its permission; Mr Truman first accepted this refusal and then unexpectedly ordered the board to give its approval at once. Its chairman, Mr Joseph O'Connell, resigned rather than do so and both TWA and other aviation interests are contesting the legality of the President's interference, so far without success.

The board originally objected to the merger because it would tend towards monopoly, since it would leave only two instead of three United States airlines regularly crossing the north Atlantic; even now Pan American has not got its ointment without a fly. To ensure competition in flights to the principal traffic points in Europe, Mr Truman insisted that both remaining American airlines be authorised to serve all the major centres. PAA is therefore losing the exclusive rights in London and Frankfurt which it had hoped to buy with AOA, but it will be able to fly to Paris and Rome, hitherto a monopoly guarded so jealously by TWA that not even the claims of Holy Year pilgrims could break it. To TWA the new arrangement seems not a fair exchange, but robbery by a rival that it has little hope of defeating in open competition.

TWA's despondency is explained by Pan American's size —"not a business but an empire"—and ruthlessness. Already PAA carries 38 per cent of America's transatlantic air traffic, which is in its turn 70 per cent of all such traffic, and it will have 67 per cent if it can hold on to all of AOA's share. Pan American's directors must think it can or they would hardly have paid the record sum of $17,450,000 for an unprofitable undertaking which American Airlines, the majority shareholder in AOA, was anxious to get rid of. TWA's financial position is said to be little stronger and its apprehensions are perhaps sharpened by chagrin that it did not get the first offer from PAA. In spite of the great expansion in air travel, America's transatlantic airlines have become increasingly dependent on government support in the form of airmail subsidies. One of Pan American's chief arguments for the merger was that it would save the country $9,000,000 a year in airmail payments. Although this argument is not entirely convincing, the President cannot be blamed for trying to have economy and competition, too.

By making the attempt, however, he may also have made the choice he refused to make in 1945, when Mr Trippe of PAA tried to convince him that only a single airline, the "chosen instrument" of the government, could compete successfully with subsidised foreign companies in overseas operations. The franchises then granted to the American transatlantic carriers come up for review in 1952; by then, if TWA is justified in its fear that it cannot survive the concentrated competition of PAA, Pan American Airlines may become the chosen instrument by default, a possibility which its directors are unlikely to have overlooked.

* * *

Contempt of Congress

The Un-American Activities Committee of the House has raised to fifty-seven the number of contempt citations it wants the House to approve—a bumper crop compared with thirty authorised between 1940 and 1947. Most of these baulky witnesses refused to answer when asked if they were, or ever had been, members of the Communist Party. They took refuge in the Fifth Amendment, which says that no man shall be compelled to testify against himself. The futility of seeking shelter under the constitutional guarantee of free speech has been demonstrated in the case of the ten Hollywood writers, whose conviction has been upheld and has led to $1,000 fines and a year in jail—the maximum sentence. (Some legislators would like to see these penalties increased to enforce respect for Congress.) Serving shorter terms are the members of the Joint Anti-Fascist Refugee Committee, who nearly four years ago defied the House Un-American Activities Committee.

Three prosecutions are also being sought in the Senate, one against Mr Philip Jaffe, the former editor of *Amerasia*. The counsel of the Tydings sub-committee feels that if Mr Jaffe can plead self-incrimination with impunity, all obstinate witnesses will follow suit and the whole investigative function of Congress may be frustrated. A statute adopted in 1862 provided that no testimony given in committee by a witness might be used against him in court, but this has been whittled away and in the past committees have been reluctant to press for answers.

The right, as well as the left, is in hot water. Contempt proceedings are threatened by Mr Buchanan, chairman of the House lobby inquiry, against the heads of two right-wing organisations that attempt to influence public opinion: Dr Rumely of the Committee for Constitutional Government and Mr Joseph Kamp of the Constitutional Education League. These are only two of a number of conservative "front" groups with high-sounding names; the committee contends that they evaded the necessity of reporting contributions of over $500 by recording them as purchases of anti-Fair Deal books and literature. Mr Kamp is already in jail for contempt of Congress perpetrated in 1944; he and Dr Rumely refuse to reveal the names of their "customers" or open their books to the committee.

There is thus no lack of test cases to determine whether a Congressional committee can force a witness to incriminate himself, and whether he is to be the sole judge of incrimination. One problem is whether the right to get all the facts is worth the risk that guilty parties, by making an open breast, may put themselves beyond the reach of the law. Another is whether, under the present system of investigation, partisan committees can be trusted not to abuse any new powers they are given. Senators Ives and Thomas believe that the right to force a witness to incriminate himself should be reserved to a bipartisan commission, and that full immunity from subsequent prosecution should be guaranteed.

* * *

Pandora's Box Stays Shut

The House of Representatives has decided that, where electoral reform is concerned, the devil it knows is preferable to the one it does not. It has refused to follow the Senate in approving a resolution designed to secure the consent of three-fourths of the States to the abolition of the electoral college and the present system of awarding the whole electoral vote of a State to the winning candidate, however narrow his margin of victory. The Lodge-Gossett resolution would have apportioned the electoral vote in each State among the candidates, according to the number of votes each polled. Its sponsors believed it would avoid the risk of a deadlock or of a minority President and would help to break the unhealthy monopoly hold of the Democrats in the South and the Republicans in certain northern States.

In the Senate, both parties seemed dazzled by the votes they might gain under such a change, though Senator Taft steadfastly maintained that the Republicans would lose more in the north and west than they could hope to pick up below the Mason-Dixon line. In the House, however, Mr Martin, the Republican leader, maintained that the resolution was a political Pandora's box, and that opening it would encourage the growth of splinter groups and wreck the two-party system. He gained a number of unusual allies when liberal Republicans and Democrats became convinced that the chief beneficiary of the change would be the conservative South, whose solidarity would increase its influence in Democratic counsels. Minority pressure groups, such as the Negroes, also realised that they would lose the power they now have to tip the balance in populous States, and joined with the Congress of Industrial Organisations and certain conservative groups to persuade the House to keep this Pandora's box shut, at least for the present.

Defenders of the Middle East—VI.

Saudi Arabia and the Yemen

(From Our Special Correspondent)

WITH the discussion of Iraq's armed forces consideration of the potential defenders of the Middle East really comes to an end. Israel, presumably the strongest single force in the area, is outside the orbit of a correspondent who is identified with the Arabs. The Sudan Defence Force which, on past performance and on present showing, is quite the best "army" in the Middle East—granted that the Sudan, on strategic if not geographical grounds, can be considered part of that region—is still virtually a unit of the British Army and is thus still removed from the vagaries and uncertainties common to the others. There remains only Arabia proper—Saudi Arabia and the Yemen.

These two mediaeval countries are full members of the Arab League, but they are as far removed in outlook, state of modernisation, and ordinary twentieth century facilities from, say, Egypt, as Egypt is from the United States. Neither of them can be said to possess armies in the modern sense of the word. The Yemen, in fact, must be left outside any calculations, not only because it is an almost unknown country implacably hostile to the slightest European penetration, remote, unchanging and unexplored, but also because it is the fixed policy of its rulers to keep it so. It has what has been admirably and tersely described as a "barefooted army" of, it is believed, some 20,000 men. Many of them, however, are virtually slaves—feudal retainers of the royal family and the other chiefs—and although most of them are reputed to be armed with rifles, mostly of pre-1914 Turkish pattern, they would have neither the will nor the facilities—other than their own bare feet—to move far from the confines of their immediate mud-walled villages, many of which are hidden away in the impenetrable mountains which gird the poverty-stricken country. When, in the interests of Arab unity, a small token force of these hirsute warriors appeared in Palestine, they were looked upon by their allies as objects of curiosity, dangerous to approach, frightening in appearance, but hardly to be taken seriously as an effective contribution to the prosecution of the Holy War. On the other hand, the exploits of Yemenite Jews, both during the pre-independence days of terrorist attacks upon the British administration and as soldiers of the Israeli Army show that the Yemenis are brave, ruthless and dangerous. If the Yemen is ever modernised—although the world will have changed very considerably by then—the Yemenis might become a force of some importance.

Saudi Arabia is slightly different, for, although much of the country and much of what goes on inside it is still unknown, the foreign exploitation of its immensely rich oil-fields has brought it into contact with the Western world. As long ago as 1937, King Ibn Saoud, inspired probably by jealousy of his old enemy King Abdullah, whose British-formed Arab Legion was already attracting attention, decided that he, too, would have a modern army. He already had a considerable force of extremely fierce Bedouin fighters of the traditional "desert warrior" type—more than adequate for the joint purposes of maintaining internal security and subduing, if necessary, tribal risings or attacks from the Yemen—but he decided to issue a decree for the setting up of a Ministry of Defence with foreign advisers and assistance.

The outbreak of war interrupted these plans, and it was not until 1947 that a British Military Mission arrived in Jedda. The Mission's brief was to train a mechanised force of 10,000 men on the lines of the Transjordan Frontier Force and the Arab Legion, and far better progress than at first seemed possible has been made. The Mission, under an excellent British brigadier with long experience of the Arab peoples, faced and overcame the usual difficulties of Arab procrastination, changeability, failure to implement undertakings, provide funds, facilities, and so on, but the greater difficulty of obtaining British-made equipment took longer to surmount. Now, after three years' hard work, a surprisingly efficient little force has been established, with desert Arabs who had never previously seen a piece of machinery more intricate than a penknife revealing the same aptitude as their brothers in Jordan for using and maintaining armoured cars and automatic weapons.

The maximum contribution that Saudi Arabia will be able to make to Middle East defence, however, would probably be only to the extent of guarding pipe-lines and oil installations, for there are two serious obstacles to any expansion. The first is the virtual impossibility of obtaining proper officers. The Mission is purely advisory, and foreigners are not accepted in either administrative or operational capacities in the Saudi Arabian Army—they are not even allowed to travel outside the strictly limited areas open to Europeans.

A few Saudi Arabians have been sent to England, to Sandhurst and other training centres and have done well; but nepotism is the rule, and it must be remembered that King Ibn Saoud has an unusual number of descendants, any of whom appear to have first pick of any jobs that are going, including commissions in the army, despite their lack of qualifications. It is also difficult to instil reasonable notions of discipline.

The second obstacle is more important and—unless recent developments in the Far East have induced a change of mind—was far less likely ever to be overcome. It is an unfortunate and unhappy factor in the situation in Saudi Arabia that Anglo-American economic rivalry, so pronounced in the oil business in the Middle East, Arabia and the Persian Gulf, has managed to influence both political relations and defence considerations. It is highly unlikely that Washington subscribes to the views of the oilmen, but one hears on all sides, in the fantastic, artificial American oil town of Dhahran, violently anti-British sentiments, including active resentment and jealousy that it is the British and not the Americans who are training the Saudi Arabian army and providing the equipment—especially as it is the Americans who maintain the huge air base and are training Saudi Arabians to fill minor posts in it. These views, freely passed on to the Saudi Arabians, neither facilitate the work of the Mission nor increase the efficiency of what might otherwise be an excellent little army.

(*Concluded*)

Political Deadlock in Australia

[FROM OUR MELBOURNE CORRESPONDENT]

MR R. G. MENZIES, the Prime Minister, has been in office in Australia since December, when the Liberal and Country Parties were decisively returned on a policy "to arrest the drive towards a Socialist State in Australia." They were elected on specific pledges to outlaw the Communist Party, to restore the Commonwealth Bank board of directors, to abolish petrol rationing, and to provide 5s. a week endowment for the first child of every family. In addition the parties gave broader pledges "to cut living costs and improve industrial relations." The adjournment last month of the first session of the new Commonwealth Parliament affords a useful opportunity to estimate what progress Mr Menzies has made.

Soon after taking office, the Government honoured its promise to abolish petrol rationing and when Parliament met in February the Prime Minister introduced legislation to outlaw the Communists and restore the Commonwealth Bank board of directors (abolished in 1945 by Mr Chifley) in place of a governor responsible to the Treasurer of the day.

In these two measures the Government met serious opposition in the Senate, in which the Labour Opposition commands a majority. When Parliament adjourned for three months in June, both these measures were tightly deadlocked in the Senate, with Labour refusing to give way on clauses in the anti-Communist Bill affecting onus of proof and trial by jury of a person declared a Communist, and showing equal obduracy on the Bill to restore the Bank board.

Brick Wall in Senate

The Commonwealth Parliament has in fact become unworkable, with the Senate presenting a brick wall to legislation which the Government regards as vital. Before Mr Menzies left on his present overseas tour, he made it patently clear that if the Labour-dominated Senate persisted in its refusal to pass the anti-Communist Bill when it was presented a second time after the prescribed interval of three months, he would exercise his constitutional right and ask the Governor-General for a dissolution of both Houses of Parliament. This is drastic procedure, for normally one-half of the Senate offers itself for election every three years. A double dissolution has taken place only once in Australia—at the time of the great split on the issue of conscription in the 1914-18 war. Mr Menzies says he will seek a double dissolution if the present impasse continues so as to give the people themselves the opportunity of deciding the issues of Communism and defence which, he says, are interlocked.

Banking is the other issue on which Labour is prepared to make a stand. In Labour eyes, restoration of the Commonwealth Bank board is almost an act of high treason, for it would sweep away the very pivot of Labour technique of controlling the whole economic system. For this reason, Mr Chifley's declaration that Labour would oppose every clause designed to establish a new Commonwealth Bank board is no idle threat. It means that, even if Labour should compromise on the Communist issue, it would fight to the death on the banking issue. The Bill was described by Mr Chifley as "a pay-off and a camouflage to meet the demands of the private banking interests behind the Government."

This, then, is the political impasse in which the Menzies Government finds itself seven months after taking office. In the meantime, economic events are not standing still, and there has been this year a progressive fall in the purchasing power of the Australian £1 as living costs rise at a disquieting rate. The official cost of living index now stands at 73.5 per cent above its prewar figure, which means that the Australian £1 today is worth only 11s. 6d. compared with 1939, and there are still no signs of any check in the upward movement of prices. In Australia, rises in the cost of living are automatically followed by a compensating rise in the basic wage. The effect on production costs is immediate and widespread.

Inflation and Revaluation

The Government, rightly or wrongly, links the great inflationary pressures in Australia with the fact that production is so unsatisfactory. This, in turn, is attributable, it says, to the crippling effect upon industry of the Communists. It seems inescapable, however, that the great tide of inflation has sprung basically from the unprecedentedly high incomes which Australia has been enjoying in the last two or three years from her primary exports. Compared with prewar, Australia is now receiving five and a half times more for its wool (the largest export), nearly four and a half times more for its wheat, and more than four times more for its base metals. These fantastically high prices have generated a great secondary inflation in Australia, expanding purchasing power to a point at which current demand is satisfied neither by imports nor domestic production. The result is seen in soaring prices and costs, threatening the stability of the whole economy.

Before Parliament adjourned, the Federal Cabinet sat several days considering means of dealing with the present inflationary situation. Revaluation of the Australian £1 closer to parity with sterling was discussed as one means of putting some brake on inflationary forces, but there were also impressive political reasons why the farmers' incomes should not be arbitrarily interfered with, and the Cabinet disbanded with the country feeling that the exchange rate was safe—for a while at least. Sir Douglas Copland, Vice-Chancellor of the Australian National University, who is Australia's leading economist, has expressed himself strongly against any appreciation of the Australian £1. Relief to the cost of living by appreciation of the currency to parity with sterling would not, he says, amount to more than 5 per cent over a period of many months. Sir Douglas Copland continues:

> Appreciation by itself will not stop inflation, the control of which would demand a wide range of measures such as

higher interest rates, restricted bank advances, reduced investment, public and private, lower government expenditure and other such discouragement to increases in costs and incomes. There are strong signs that the era is now passing in which high export incomes provide the main impetus to inflation, and that the driving force henceforth is likely to be the heavy investment programme associated with the immigration scheme.

The crux of the Government's proposed measures to meet the inflation threat in Australia is seen in the final sentence of Sir Douglas Copland's statement quoted above. It is seen in the mission of Mr Menzies to London and New York to advance Australia's claims for more dollars. The Government appears to take the view that little can be done to check the present inflationary pressures by monetary methods alone, and it realises that no significant increase in output of manufactured goods can be obtained from Australian factories. It is aware of the tremendous demands for capital equipment associated with the heavy investment programme now being pursued for national development, and is therefore seeking means to obtain it from the United States, the one country to which it is able to turn.

Australia's London funds are bulging at more than £A500 million compared with a mere £A34 million before the war, but these will do little to obtain capital goods and raw materials urgently needed to develop the country and provide a counter for galloping inflation. It is possible that Australia in the year ending June 30th last lived within its dollar earnings, taking gold sales and invisibles into account, but this has been achieved only by reducing imports from the United States to a mere trickle of their former flow. The Government appears to be trying to reduce inflationary pressures by making a bold bid for more capital goods and equipment from overseas to bridge the gap between supply and demand. This explains the nexus between Mr Menzies's present mission overseas and the domestic political situation which demands immediate anti-inflation action once the impasse in Parliament is resolved.

Brazil's Presidential Campaign

[BY A CORRESPONDENT]

DR GETULIO VARGAS has accepted nomination by the *Partido Trabalhista Brasileiro* (PTB), his so-called Brazilian Labour Party, to run for President in October. In its simplest terms, his move challenges the representative system which supplanted his personal rule. He has never hidden his contempt for it. The Senate (of which he is a member) has seen almost nothing of him, and in an outburst against "the old Liberal democracy" which might have come from his near neighbour, President Perón, his only comment on President Dutra, who won the Presidency as his official candidate, was his advice to the Labour Party to support him "in order to avoid anarchy." It is between Dr Vargas and the forces which believe in representative government that the issue rests at the coming elections, and his challenge finds them divided against themselves.

In fact, they were never united. After his overthrow in 1945, Dr Vargas counselled his followers to vote for General Dutra, whose victory he openly, and reasonably, interpreted as a sign of his own strength. Once installed, however, President Dutra tried to stiffen the democratic front by working for agreement between his *Partido Social Democrático* (PSD) and the *Uniao Democratica Nacional* (UDN), which had begun the movement that expelled President Vargas. Both groups subscribed to a Constitution intended, in the words of its preamble, "to organise a democratic regime." By definition, both had turned their backs on the methods of Dr Vargas. Now they face him separately. The bond of their common purpose had been frayed by his henchmen entrenched in President Dutra's party. It was discarded altogether a few months ago when, after fruitless efforts to agree on a joint ticket for the Presidency, the UDN adopted Brigadier Eduardo Gomes (whom General Dutra defeated at the 1945 election). Thereupon the PSD chose as candidate Sr Cristiano Machado, an obscure politician from Minas Geraes.

The move played into Dr Vargas's hands, if only by splitting the allegiance of Minas Geraes, the second most important state in the country. Reputedly anti-Vargas, it could no longer be counted solidly pro-Gomes with a native candidate in the field. State loyalties notoriously conflict with those to the national parties, and in other important states their influence is an even greater hurdle for the liberal group represented by Brigadier Gomes. It is commonly reckoned that the Presidency must go to any candidate who can carry Sao Paulo, Minas Geraes, and Rio Grande do Sul—three states known in electioneering jargon as "the vital triangle" and containing 4,000,000 of the almost 9,000,000 voters now inscribed throughout Brazil. However Minas Geraes may vote, the facts are that Dr Vargas is a native of Rio Grande do Sul, and that in Sao Paulo—the greatest political stronghold of all, with 1,700,000 voters—he has enlisted the most adroitly controlled political machine in the country.

Vargas and the Under-Privileged

Its boss is Sr Ademar de Barros, the State Governor, who has publicly pledged its support, and is accompanying Dr Vargas on part of his campaigning tour. A few months ago the Governor's followers were busily persuading the country that he himself was their choice for President. They are now said to regard him as Dr Vargas's heir apparent in the event of a Vargas victory. The Communists are also likely to find themselves in the Vargas camp. Since their party is illegal, they cannot present a candidate of their own, and if proof were wanted that no concessions are to be expected from Brigadier Gomes in return for Communist votes, it lies in the strong support pledged to him by the Church. The Vargas platform, on the other hand, is an obvious rallying point for Communists, since a Vargas victory could be relied upon to discomfit the United States.

If his name goes before the voters, those would be Dr Vargas's weapons. Whether or not his opponents close their ranks by producing a single ticket (as some anti-Vargas groups are still urging), most Brazilians recognise that he holds a strong hand. Basically, his appeal is to the under-privileged, who now wield a large and possibly decisive proportion of the country's votes. "The father of the poor," as he has styled himself, made labour laws which gave them a new sense of their importance (however much they may have frustrated employers), and no political group has since dared to question these laws. This side of his record largely explains why he is fiercely defended by some of his countrymen, although he is branded as a dictator by many others who believe that Brazil has outgrown paternal government and can support an orthodox democratic system.

It had long been apparent that Dr Vargas, the most controversial figure in Brazilian politics, was preparing a new bid for power and would stand for election if the political climate proved favourable. Remaining aloof from party politics, he had yet retained control of the Labour Party which was planned in his Labour Ministry before his deposition and later recognised as a national party with the right to nominate a Presidential candidate. The slogan "He will come back," plastered on walls throughout the country, was the only advertisement of cells carefully nursed by his intimates and friends among working-class voters. These shrewd activities were punctuated by messages from "the hermit of Sao Borja" (his southern retreat) calculated to raise his prestige with every rise in the cost of living. Dr Vargas has used as a stick to beat his successors the progressive inflation which they blame on the excesses of his regime.

Reactions to his challenge could only be measured with the announcement of his candidacy. So far, they are not such as to discourage him. The two other candidates have both condemned a move (said to have been instigated by one of President Dutra's closest advisers) to ask the Electoral Court to disqualify Dr Vargas as a Presidential candidate on the ground that he failed (as a Senator) to sign the present Constitution. As for the Army, which enforced his resignation in 1945, and which has once more been pledged by its leaders to uphold free elections, it is profoundly significant that a pro-Vargas General was recently elected President of the *Club Militar* in Rio de Janeiro—the centre of military opinion. The signs are thus that Dr Vargas will go before the country in October. Some opponents believe that, should the international situation worsen, his expected bid for Communist votes would discredit him at the polls, but this view perhaps underrates his consummate demagogy. Meanwhile, the newness has worn off the crusade of the genuine Liberals who lost the last election to forces strongly influenced by Dr Vargas. This time they face Dr Vargas himself.

Parallel with Perón

The result will be of much more than local interest, for the parallel between the Vargas strategy and that which brought President Perón to power in Argentina is no coincidence. That Brazilians regard Perón as a pupil of Vargas is a reminder that political oppression of the kind adopted in Argentina once marked the Vargas regime in Brazil. Anyone who has more than a casual acquaintance with the two strongest countries in South America is aware, not only that intense nationalism exists on both sides of their common border, but that the politics of each is *sui generis*. Nevertheless, their political development since the war has followed opposing trends, and this could no longer be said should Dr Vargas emulate his pupil by riding back to power on the shoulders of the mob. Brazil will not begin or end on election day, as a Rio de Janeiro newspaper comments, but a Vargas victory might well duplicate in Brazil the dangerous stresses and strains that confront President Perón in Argentina. It might even bring similar developments in Brazil's foreign policy.

New Zealand's Defence Policy

[FROM OUR NEW ZEALAND CORRESPONDENT]

THREE recent events have caused New Zealand to face the realities of Commonwealth defence. These are: the beginning of compulsory military training in May (the first draft of 18-year-olds are now near the end of their first 14 weeks' course); the visit, late in June, of the Chief of the Imperial General Staff, Field-Marshal Slim; the Korean War, with New Zealand's immediate endorsement of the action taken by the United Nations and its despatch of two frigates to the Far East on July 3rd.

Against the background of these events it is pertinent to examine the pattern of New Zealand's defence policy, especially in its broader Commonwealth aspects. The Governor-General's speech at the opening of the first session of the new Parliament on June 28th stated: "In the widespread uncertainty characterising the international scene, my Ministers are glad to recognise in the group comprising the British Commonwealth a firm nucleus of strength and integrity of purpose."

What is New Zealand contributing to this "firm nucleus"? Its immediate responsibilities are very limited. Nevertheless, it has a deep concern for the security of the Commonwealth as a whole and, particularly, of the United Kingdom as the heart of the Commonwealth. New Zealand's acknowledgment of its position in the Commonwealth is well expressed by the decision to establish a system of compulsory military training, which is the only means by which New Zealand can ensure, in the event of war, that it will be reasonably equipped to make an early and effective contribution to the security of Commonwealth interests.

The Danger of Air Attack

Because of the differing responsibilities of the members of the Commonwealth, and the nature of their defence problems, it is difficult to make a satisfactory comparison of the defence burdens they are each carrying. New Zealanders realise that United Kingdom defence expenditure is currently, about £780 million a year, or about £15 10s. a head. When their compulsory military training scheme is fully operative, and when the three Services have been developed in accordance with current plans, the cost will be about £17 million a year, or £9 10s. a head.

Although the proportionate cost to New Zealand will be less than in the United Kingdom, New Zealand's forces will, for this expenditure, be organised with a view to giving the maximum possible assistance in war to the Commonwealth and its allies. The point is also made in New Zealand that the United Kingdom must spend many millions of pounds on defence preparations to offset the threat of decisive air attack. Further, the United Kingdom is vitally dependent on the security of sea communications, particularly in the North Atlantic, where enemy action would doubtless be most intense. New Zealand, because of its more isolated position, does not consider itself to be similarly threatened. Therefore, because of these accidents of geography, New Zealand preparations for self-defence are far less costly than those of the United Kingdom.

Numerous developments can be mentioned to give practical proof of New Zealand's concern for the defence of Commonwealth interests as well as its own. For instance, New Zealand has continued to accept certain responsibilities for the defence of Fiji and is giving other forms of assistance to certain British Commonwealth territories in the South Pacific. When the crisis in Hongkong developed last year, the New Zealand Government offered a flight of Dakota aircraft which were based on Singapore and operated in support of the British forces in Hongkong. In more recent months these aircraft have been engaged in supporting United Kingdom forces in anti-bandit operations in Malaya. Continued assistance to the United Kingdom authorities in the Pacific has also been given by the Royal New Zealand Air Force flying-boat squadron stationed in Fiji, and by ships of the Royal New Zealand Navy during their annual Islands cruise. Transport crews were also sent from the RNZAF to take part in the Berlin airlift.

New Zealand is also accepting increasing responsibilities in other fields of defence effort. It has undertaken research in certain scientific projects suggested after consultation in the Commonwealth Scientific Advisory Committee. These will be of value not only to New Zealand but also to the United Kingdom and other Commonwealth countries. Certain responsibilities have also been accepted in the field of intelligence. In both these fields New Zealand's activities are necessarily limited, not so much by the amount of money it is willing to spend on them, but rather by its available resources.

Your correspondent understands from a reliable source that the New Zealand Government is considering the presentation to Parliament of a statement on defence policy, generally similar in scope to the White Paper on Defence which is presented annually in the House of Commons. This statement would probably review the general considerations on which New Zealand's policy is based and would, in addition, give some detailed information about the strength of the Services.

SIMON ENGINEERING GROUP

The Simon organisation has been export-minded for more than half-a-century, and since 1945 Simon machinery, plant and technical services have been sold in forty countries. Power stations in Abadan and Australia : coke ovens in eight countries from Finland to South Africa : sulphuric acid plants in Europe, the Middle East and the Indies : grain elevators for the Argentine Government : flour mills in a score of countries from Norway to North and South America : heavy gears for French and Swedish steelworks and South African and Mexican cement mills : these are examples of post-war export contracts undertaken by Simon-Carves, Henry Simon, Simon Handling Engineers and Turbine Gears.

Stand design and construction comes naturally to

OLYMPIA

It is logical that the home of so many famous exhibitions should house a department which creates and builds hundreds of stands a year. They are produced by Olympia's own designers and craftsmen—for exhibitions all over the country or on the Continent. This service is, we believe, second to none. Not least amongst its features is that wise planning makes prices decidedly competitive.

A sensible policy for process steam—No. 15

Better steam trapping, better output economy

BY SPIRAX

A fortnight ago we said that in most process steam plants a high standard of output economy begins and ends with the steam trapping installation.

Most steam traps will work if the conditions are within their range of pressure and discharge capacity. But the function of a good steam trapping installation is not merely that it shall work, but that it shall get the greatest efficiency and output from the plant it is controlling.

A first consideration is that the steam trap should be of the correct *type* for the conditions of the particular process or equipment. Secondly, it should be installed in such a position that it can work at full efficiency (an elementary precaution so often overlooked, with costly results). To protect the valve from pipe scale, there should be a strainer in front of the trap. To keep visual check on its operation there should be a sight glass at the outlet.

Those prosaic details are fundamental to the output economy of process steam plant.

THE BUSINESS WORLD

Productivity and Labour

THE only defect in Mr Gaitskell's review of the progress of industrial production and new capital investment on Tuesday was in its timing. Productivity is rising ; the question is whether it is rising fast enough to meet the additional burdens on defence that were disclosed on Wednesday in Parliament. There are difficulties in measuring physical production accurately ; but the official index shows a rise of 9 per cent in the first five months of this year, compared with the same period of 1949, and such a result is not repugnant to ordinary observation. Total output is rising, and at a moderately increasing rate ; productivity, as defined by the official figures (the qualification should always be made), is increasing, not quite so fast because the labour force itself is expanding, but at a rate approaching 6 per cent compared with 3½ per cent assumed in the "Economic Survey." These are the fruits of an economy working at high pressure, and now enjoying the first benefits of the postwar industrial investment programme. There is room enough for argument whether industry has obtained a big enough share in the capital programmes of recent years, and whether there has not been excessive emphasis on certain primary industries under the Government's more or less direct control.

With all necessary qualifications, however, the rise in output and productivity in the main sectors of British industry is encouraging. In truth, it is no more than the country needs at this moment of high political and economic strain. At a rough calculation, the additional output this year may be worth some £250 million. This is the sum which was reported some weeks ago to be "on offer" to the unions in relief of the wages freeze. How it will in fact be shared between wages (that is, on consumption), exports (to meet the higher cost of imports since devaluation) new investment and finally new defence expenditure is not easy to determine from the Government's statement on Wednesday. Once again, the British economy finds itself working more or less full out, but with nothing to spare because new burdens have overtaken the rise in output.

★

It is still necessary, therefore, to look deeply at the causes of increased productivity in the last year or two, and to assess the chances of much more rapid progress in the future. The British economy is still at the stage where ideas about productivity are much more common than their application. This is not entirely a matter for criticism ; it is barely two years since the formation of the Anglo-American Council on Productivity was greeted with no small suspicion in certain trade union quarters. In that time, a series of reports on American industrial practice has been published (this week produces another example dealing with pressed metal industries) all of them interesting and some of them excellent in their exposition of the sources of high productivity in the United States. It is, indeed, principally the success of this venture in comparative industrial study that has led the Committee on Industrial Productivity (set up in 1948 under the chairmanship of Sir Henry Tizard) to write its own obituary notice in a report submitted to, and accepted by, the Lord President this week. Twenty-four productivity teams made up of representatives of management and labour and seeing American industry at first hand are bound to make an important contribution to the discussion of ideas about productivity.

The reports already published have become almost repetitive in their appraisal of American industrial achievements. The American worker is served with a more ample supply of power ; his task is lightened by power tools and lifting devices ; he takes particular pride in new machinery, and adapts himself quickly to new arrangements on the shop floor ; he is often, by craft standards, unskilled, but is able to make the most of his productive effort because of the skill of production engineers. All these technical factors, together with the competitive instincts of all ranks of American society, are the things that strike the British seeker for the secret of America's industrial superiority. Among the many common features in these productivity team reports, it is perhaps the emphasis on human attitudes towards work and standards of living that is most impressive. Given all the technical advantages of superior equipment and more power, it is still these attitudes that count most. This is a point properly recognised in the swansong of the Committee on Industrial Productivity*.

> We doubt whether the importance of the human side of the problem has even yet been given sufficient recognition. Technical improvements cannot achieve their full effect if the necessary human relations are lacking. . . . In any "real life" situation in industry, human and technological factors tend to react so decisively on each other as to call for joint consideration.

Human factors are by no means the sole interest of the trade unions, but they colour much union thinking on productivity. If it is true that "stability" has been achieved in economic affairs and the secrets of full employment policy have been mastered, how can the British trade unions address themselves to the task of increasing productivity ? In an illuminating report and series of recommendations†, a team of British trade union officials who visited the United States at the end of last year offer their conclusions on the role of American unions in increasing industrial productivity. They pose the problem squarely enough ; it is

> to find ways and means of increasing productivity—a problem concerned mainly with industrial policy and action as distinct from the political pressure to achieve full employment and economic stability.

They are convinced that some American unions do make

* Second Report of the Committee on Industrial Productivity. Cmd. 7991. HMSO. 4d.

† Trade Unions and Productivity. TUC. 2s. 6d.

a valuable contribution towards higher productivity. The wide differences in unionism in the two countries have to be recognised at the outset. The industry-wide wage contract is rare in the United States, and the contract between a union and a single company is common. There is closer contact between American union "locals" and the plants they serve. Sometimes the plant pays union representatives to handle union business on the spot; there are 263 representatives of the United Automobile Workers attached to the sixteen branches of the Ford plants, paid by the Ford company to look after the interests of 11,000 union members. The American unions purport to refuse to accept time study, job evaluation and other techniques of "scientific management" (always referred to in quotation marks in this report) but, in fact, they are accepted as at least a first guide to the measurement of work, and are frequently cross-checked by union technicians in testing the contentions put forward by management. On this the report concludes:

> Sooner or later, unions will, we think, have to accept work standards in spite of their present determination not to do so. . . . Eventually management and unions will adjust time study ratings and the "reasonable day's work" until they produce nearly similar results. . . . A particular feature about the concept of a "reasonable day's work" is that it precludes opposition to new production techniques. Changes in production methods are not used as an excuse for presenting wage claims. Operatives, though working differently, will work no harder than previously.

This is a judgment about the prospects before American trade unions. It follows directly that wage claims will be based on a due share of profits and increased productivity, and not on the physical character of a particular job. The object is to establish a norm of reasonable effort, and then to break down the production process so that the norm is not exceeded. (At the Unilever meeting this week, Sir Geoffrey Heyworth disclosed that the adoption of such standards in the Unilever organisation has raised "normal" productivity by 30 per cent.) The American unions are not proximately concerned about higher productivity; that is the function of management, and if union policy makes labour dear, then employers are stimulated towards greater efficiency. This is perhaps a slightly romanticised view, as are the examples of improved efficiency forced upon incompetent managements by energetic union officials. But there is an element of truth in it, and there is no doubt about the American worker's sense of pride and fulfilment in using modern machinery.

There is a paradox in American systems of payment. Hourly wage rates are generally preferred to piece rates and incentive schemes; only 30 per cent of the operatives in manufacturing industries are on piece work or incentive systems. This may contain a lesson for British industrial relations, for in recent years it has been commonly assumed that incentive payment schemes are all that is necessary to solve the trick of higher productivity. The report suggests that three factors account for the unions' preference for time rates; their suspicions about allocation of work; their willingness to work to a pace set by the speed of machinery or assembly lines; and their unwillingness to let employers "shift their business risks on to their employees." Of these three factors, the second is almost certainly the most important, and it is the American worker's willingness to change his task and accept new production methods that makes it so.

What lessons are to be learned from American trade union experience? Home after its journey, the team is quick to underline the differences, as it sees them, in the circumstances of trade unionism in the two countries. There is a rather sententious reference to the responsibilities that the British trade union movement has adopted in the policy of wage restraint. "Nor is there full employment, as we understand the phrase, in the United States"—surely a perplexing conclusion. American industry is not under the same pressure as British industry to keep prices down—though it oddly succeeds better than we do. There are criticisms of the past unwillingness of British management to cultivate efficiency and to provide enough mechanical power, and they have force. And it is hard to resist the conclusion that, given full employment (particularly "full employment as we understand the phrase"), industry-wide wage increases would not necessarily lead to greater mechanisation and higher productivity. But the final conclusions are sensible and enlightened. First, unions must accept responsibilities as well as claiming their rights; they must be prepared to co-operate with managements that are trying in a reasonable way to use modern production techniques. If unions are willing to co-operate in incentive schemes and specific work loads, they have a right to see that work loads are reasonable and that incentives have a proper chance to operate; they must, therefore, be able to demonstrate by acceptable principles of production engineering any deficiencies of factory organisation and production methods. And finally a more positive approach to problems of redundancy is needed:

> A rising standard of living can only be achieved by increasing productivity obtained from labour-saving machinery and technical processes and working skill. Redundancy, therefore, is inevitable unless increased production enables immediate reabsorption; but redundancy is not unemployment where full employment exists. Considerable emphasis is placed upon labour mobility and flexibility because it is becoming increasingly recognised that full employment means that there are more jobs than workers, rather than providing the redundant with jobs at the same trade and wage rates in the same locality. There are limits, in effect, to the distribution of industry based only on local social need.

Such ideas are not new; but it is nevertheless astonishing that they are now being put forward by trade unionists for the sober consideration of their colleagues. The real weakness on the trade union side—a weakness that has hampered the fruitfulness of joint consultation—is the lack of expert knowledge of production problems, as distinct from process problems. "We are not unaware" says the report in a concluding statement, "of the financial implications to unions of these recommendations." Expert technical knowledge is expensive, and the advantages of such a service to the trade unions will seem remote, even though they may be considerable. The matter now rests with the unions and the TUC. Experience has not encouraged the belief that the trade union movement has a policy for higher productivity or is anxiously preparing to develop one. The human attitudes of the unions are still conditioned by suspicion and inertia; it is not management alone that is to blame. But here is a fair challenge, not from Government, management, or economists, but from fellow trade unionists. It is surely too important for the unions and Transport House to ignore.

Radio-Isotopes in Industry

IMMEDIATE industrial benefits are not to be expected from the atomic energy programme. It may well take ten years to work out the problems of appiying atomic energy in commercial power plants. But from the two main lines of research—arms and power production—one important by-product is already emerging. This is the production of radio-active materials in the larger of the atomic piles at Harwell. These materials are tools for laboratory research, but they also have interesting industrial applications—not, indeed, in the direction of revolutionary changes in manufacturing technique, but rather in the improved accuracy and efficiency of certain familiar industrial processes. The development of these materials has not gone very far, for the producing pile itself came into operation only fifteen months ago; not until the past few months have these new radio-active materials been available in any quantity.

A radio-active isotope can be very roughly defined as a particular form of an element—say carbon—that is unstable and gives off particles as it returns to a stable condition. It continues to be radio-active until it has become stable; the process may take a few seconds or millions of years. Such radio-active isotopes are produced incidentally in the process of generating atomic energy. Minute quantities of such materials will emit radiations sufficiently strong to be detected by measuring instruments even when they are greatly diluted with stable forms of the same element. If the proportion of radio-active to stable material is known, these materials can be used to analyse many physical, chemical and biological processes. Knowledge so gained is bound eventually to advance the techniques of industry and medicine in fundamental ways, though it is impossible at this early stage to guess where it may lead. Experience is scanty; highly trained physicists are needed to evolve techniques, and hazards to health can arise if radio-active materials are accumulated in any quantity. For the present, the use of radio-active materials is unpractical in a number of industrial processes in which they would be valuable in theory.

Certain broad lines of development are, however, already becoming clear. The "tracer" technique of the laboratories is being successfully applied to check the efficiency of individual machines and processes. Here are some examples. The addition of small amounts of radio-active gas in the atmosphere showed up without much difficulty defects in the ventilation of an asbestos plant. Unnecessary losses of material have similarly been traced in spray-drying towers. Tests in the textile industry have included the addition of radio-active material to the oils that are used to coat nylon and rayon fibres during production. In this process, the density of the oil coating and the evenness of its spread are both important. The radiation from isotopes added to the oil measures both conditions by the marks it makes on a photographic film; on the evidence so obtained the plant can be re-set if necessary. Photographic film can often be of service when a measurement of thickness or penetration is required. In calculating the penetration of lime into leather to see if the lime-coating stage of tanning could be safely omitted, successive layers of leather were shaved off and the degree of blackening on the film at each stage showed how much of the radio-active material—and so how much lime—had penetrated to a given depth. The same technique can be used to measure the penetration of a coating on metal.

*

Whether such methods of production control are adopted depends on alternative forms of control that may exist. Often there is no alternative; tracer methods sometimes make possible the identification of the presence and concentration of a material where chemical and physical methods fail. Thus in the case of oil coating on fibres, measurement can show the amount of oil used on so many yards of yarn, but it will not establish the thickness of the coating nor its evenness. In other cases, the new techniques are much faster than existing methods. For instance, the primary purpose of lubricating oils is to reduce wear, and oil companies perform interminable tests on machinery under different working conditions and with different oils. The Shell Research Centre recently sent a pair of wire-drawing dies to Harwell, and had them irradiated in the pile. When the wire was drawn through the dies, the amount of radio-activity present in the coating oils on the drawn wire gave an accurate measure of the wear on the die. The drawing of 200

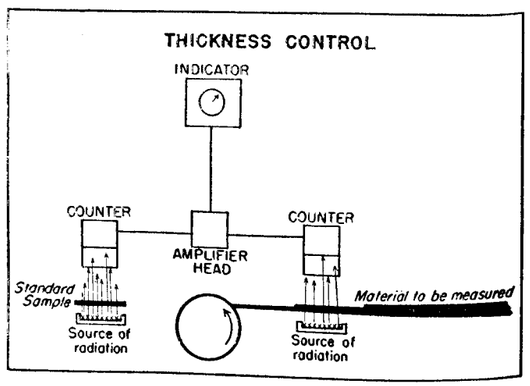
yards of wire gave a conclusive result; under normal conditions, such a result could have been obtained only by operating a plant for a year. Similar methods have been used to measure wear on bearings. Whether they can be extended to measure engine wear remains to be seen. If the test time for each oil formula could be reduced from the present average of twenty days' continuous running, a developed lubricant could be marketed sooner, and at much lower cost for research. But in these, as in many other applications, there are real practical difficulties in carrying out the research although in theory the application may be simple.



*

Radio-isotopes can be used under certain conditions for process control. Fractional amounts of radio-active sulphur and phosphorus added to a steel melt give a radiation strong enough to be detected in the furnace. When the counter no longer signals the presence of the radiation, it can be assumed that no sulphur or phosphorus remains in the furnace. The presence and final removal of carbon can be detected in the same way, by using a carbon isotope. It is possible to treat sulphur in the course of rayon processing in the same way. This particular kind of use is limited by the necessity of making sure that the radio-isotope is entirely removed during the course of the process. If there were any radio-active residues in the final product, however slight, the total amount of radiation that might be emitted in a machine shop or in storage and transport would be too high to be desirable. This point emphasises the main risk of using radio-isotopes as "tracers." The risk can always be met by shielding, but the cost and inconvenience of protection soon becomes so great that they outweigh the advantages of using isotopes. Most isotopes emit harmless radiation and where some local risk is involved, the particular section of the plant can be easily screened. The serious health hazard is not an occasional over-dose of radiation, but that some particle of radio-active material might be inhaled or ingested. As long as such a particle is inside the body, the tissues will be directly exposed to continuous radiation.

When the control system does not depend on the mixing of radio-isotopes with the process materials, the precautions are quite simple. For example, a gauge is now being sold which measures the thickness of sheet materials. The principle on which it works is to compare the degree of radiation that will penetrate a sheet of standard thickness with the radiation that passes through the sheet material being produced. The counter will show whether more or less than the standard amount of radiation is coming through—in other words, whether the sheet is thinner or thicker than it ought to be. It is possible to calibrate the rolling machines to the counter so that they correct themselves automatically. The radiation method easily gives accuracy of control to within 1 per cent over the thickness of sheet materials, and this is invaluable for types of sheeting which cannot be measured by contact methods without injury to the surface. It is estimated that £10,000 of material can be saved a month in the large scale production of plastic sheeting against a capital outlay of £200 on the gauge. By a similar method the filling of cartons can be controlled by placing a source of radiation on one side of a moving belt of cartons and a counter on the other. The radiation does not penetrate the full cartons but passes through any unfilled sections to the detector. Another application in the iron and steel industry—and one of more immediate importance than that already mentioned—enables the iron and steel producer to keep himself informed of the state of wear of his furnace linings. In the lining of some of the new blast furnaces a plug of radio-active material has been incorporated for this purpose.

In another field radio-isotopes are expected to have far-reaching effects. In certain industrial processes—for instance in the reeling of paper in paper mills—there is a serious danger of electro-static charges getting out of hand and causing a threat of fire or serious explosions, and the methods of eliminating "static" that depend on high voltage charges are not considered wholly reliable. Radiation from a radio-active source can ionise the air and thus remove any "static" as soon as it forms. An entire room or an area round a machine can be ionised according to the way in which the "static" builds up. When this ionising technique is fully developed, it should be possible to drop some of the present precautions: it may, for example, be possible to run rollers at a higher speed.

A number of relatively limited uses has been developed to meet individual problems not likely to occur generally in industry. As knowledge of the properties of radio-isotopes spreads, such specialised applications are bound to increase. They provide, for example, a method of gauging levels inside sealed containers or fractionating columns, of tracing different oils through pipe lines or locating stoppages in them. Some laboratory results suggest that radiation might eventually be used to induce certain chemical reactions but this, if feasible, is a distant prospect.

*

Although the use of radio-isotopes is not widespread, their applications in this country seem to be as advanced as in the United States. One reason for this favourable comparison is that American firms have to publish results of their use within six months, and thus present their competitors with any advantage they may have gained. British firms can keep their results secret if they wish. Even so, unfamiliarity with nuclear physics, on which the techniques are based, would appear to be holding back many firms that have pioneered more complex fields of chemical research. A physics division in a large industrial plant is still a novelty. To staff it adequately a first-class nuclear physicist—a rarity—two well-qualified assistants and laboratory staff are needed. Few firms have made appointments on such a scale. Research budgets are already high, and it is not easy to persuade boards of directors to increase them, particularly as it appears from the broad field of applications described that radio-isotopes do not usually confer upon a firm an appreciable technical lead over its competitors.

*

Present conditions—the high cost of research in an unfamiliar field, with prospects of only moderate reward—suggest that development may best be left to specialists working as consultants. The isotope division at Harwell, which is responsible for the production and handling of the materials, has done much to provide such a service. But a strong and respected body of opinion considers that work on the relatively "frivolous" problems of industry wastes the talents of men of the calibre needed to solve more fundamental problems in the application of nuclear physics. Harwell has great difficulty in finding skilled physicists at salaries considerably below those offered by the Universities or by industry; hence there may be a real problem in the practical application of isotopes through sheer shortage of technicians. The isotope division at Harwell has been supplying free advice to any firm, and charging on the basis of time taken for any experiments carried out on the firm's behalf. Although many firms seem to baulk at paying £50 to £100 for experiments—even with a good prospect of success—the arrears of work are so large that no new work is being taken on until the old is cleared. The formation in March of a private consultant firm, Isotope Developments Ltd., will expand these services for industry; in addition this new company manufactures and instals the necessary equipment. It is hoped that Isotope Developments, which has been financed by seven large firms, will be able to deal with most of the research and inquiries that do not need daily access to the atomic pile.

Certain general techniques for using radio-isotopes have now been evolved. The next step is to establish the production problems that are open to solution by these methods, and to bring them to the notice of the plant engineers and the physicists. Valuable work has been done at Harwell for firms that have gone to the isotope division without a very clear idea of what they wanted, but such direct simplicity may not suggest itself to others. The Harwell exhibit at the British Industries Fair proved an excellent method of public education but it cost the disruption of routine work at Harwell to arrange and staff the stand. Next Easter, the isotope division hopes to start training courses of 6-8 weeks in the handling and use of radio-active materials for technicians. These will be held outside the boundaries of the main plant; thus some of the security regulations need not be enforced and pupils can be accepted from all over the world. This promises to be one of the most effective methods for overcoming the prevailing ignorance of nuclear physics among engineers and chemists in industry. It should make the introduction of radio-isotope techniques less of a leap in the dark.

FINANCE AND OVERSEAS TRADE

The financial arrangements involved in trading with countries overseas can present many complications. The Three Banks Group has wide experience of this aspect of modern Banking practice, and with many important contacts overseas is particularly well placed to handle such problems and tender advice based on accurate knowledge of local conditions. The need for increased exports is leading to considerable expansion of the Group's activities in this direction.

ROYAL BANK OF SCOTLAND
Founded 1727 Edinburgh, London & Branches
GLYN, MILLS & CO.
Founded 1753 London
WILLIAMS DEACON'S BANK LIMITED
Founded 1771 Manchester, London and Branches

THE THREE BANKS

INDUSTRIAL AND COMMERCIAL
I.C.F.C.
FINANCE CORPORATION LTD.

I.C.F.C. was set up in 1945 by the English and Scottish Banks, with resources of £45,000,000, to supplement existing facilities by providing an accessible source of share capital and long term funds for well conducted businesses of small or medium size. It applies to all proposals the usual canons of sound finance and is not averse from supplying risk capital. I.C.F.C. so far has made available over £19,000,000 for British Industry, divided among more than 290 concerns of many kinds.

Full particulars of the facilities offered may be obtained from the General Manager,

7, Drapers Gardens, E.C.2.

Business Notes

Warm War and Markets

While Mr Shinwell was describing the make-up of the first instalment of £100 million to be added to the bill for defence, rubber was shooting up to over 3s. a pound and tin established a new peak at £732 a ton. These movements owed rather more to events abroad than to events at home. Singapore's excited response to the suggestion that the American Government would step in to make pre-emptive purchases of rubber was not matched in London, where the possibilities of a bulk contract and a ceiling price were recognised. Nor was the continued boom in the prices of primary commodities accompanied by any particular reawakening of interest in equities. The shadow cast at the week-end by Mr Strachey's remarkable "warning" that the burden of increased defence expenditure should be spread "fairly among all the classes of the country and that the well-to-do classes pay their full proportion . . . very differently from the way it has been undertaken in the past" hung heavily over all sections of the market.

The burden—or the first dose of it—is a good deal less burdensome than many people had expected. Of the projected £100 million, only part is likely to be spent in the current financial year. Increased productivity (always assuming that there is no increase in consumption and that civil capital expenditure is kept within the projected bounds) may be able to furnish a sizable part of the required resources. From Mr Shinwell's outline, it seems possible to infer that, at this stage, the enlargement of defence requirements will not result in any form of extreme competition for resources now fully committed to home and export requirements. The aircraft industries (whose position is described in a succeeding note) can take up a fair amount of slack after the cuts in orders made only a few months ago. Specialised equipment and weapons might be more difficult to provide without impairing civil output of certain ranges of engineering and electrical production, and any major expansion of military transport would be quickly reflected in car supplies to the home market. The shipbuilding industry will not, it seems, be called upon for any great effort of new naval construction, but the fitting out of ships with improved armament and technical equipment will occupy marine engineers and fitters.

But all this is a very conjectural estimate of the consequences of the first stage of the job that has to be done. The new weapons to which Mr Shinwell referred are in the research and development stage; when they begin to flow in quantity they will entail a much heavier bill than that presented to the nation this week. To suppose that this bill can be met solely by relying on increased productivity (with all other commitments for consumption, exports, industrial capital investment and the Government's social programmes unchanged) would indeed be fanciful. Investors therefore have the awkward problem of guessing the future course of the Government's financial policy. Mr Strachey's implicit suggestion of a capital levy is a piece of masterly economic irrelevance—though that, unfortunately, does not put it entirely out of court. Obviously the precarious balance of inflationary forces and disinflationary policy is going to be rudely disturbed before very long. And despite the Chancellor's claims to the contrary, there is no margin of taxable capacity that can be tapped without causing further inflationary pressure or producing political difficulty from a large section of the Government's own supporters. Direct physical controls and heightened inflation may well be livelier possibilities than a studied attempt to disinflate the economy to a sufficient extent to accommodate the new defence needs. This phase of the warm war may not be allowed greatly to disturb the gilt-edged market; but for equities the possibilities of taxation and industrial changes caused by the defence programme are likely to dominate market conditions for many months.

* * *

Aircraft Production and Orders

The international crisis has removed the threat of economy cuts from the aircraft industry, and the more rapid placing of orders can be expected. In particular the provision of reserve fighter aircraft will be (the Minister of Defence said on Wednesday) "one of the biggest items in the additional £100,000,000." But the timing and placing of orders depends on the rate of progress which individual firms can make with the aircraft which they have under development. De Havilland will for some time be fully occupied with building the engine and airframe for the Venom fighter which is now replacing the company's Vampire. The main concern of the Hawker Siddeley group continues to be the Meteor fighter in its various forms. The Meteor is primarily a product of Gloster Aircraft but another member of the group, Armstrong-Whitworth, has developed and is building the night fighter version. Hawker Aircraft has developed from the turbo-jet Sea Hawk the supersonic fighter known as the P.1052. This is purely a development aircraft not likely to be put into production. It has been used to provide data for a more advanced design, the P.1081, which has only recently made its first flight and is intended to serve as the prototype of a production model once its flight trials have been completed.

Vickers is in a similar position. The company is building a new trainer for the RAF and completing the reduced order for the Valetta transport. The turbo-jet Attacker is in production for the Navy and from this aircraft has been developed the supersonic Supermarine 510. Whether the 510 will prove, like the Hawker P.1052, to be merely a stepping-stone to further development or whether it will go into production in its present form is not yet clear. Both de Havilland and Avro have had misfortunes with the flying-wing type of aircraft, but experimental work on designs of this kind is likely to continue.

New types are being developed for production by a number of firms which have not been visibly active in recent months. Deck landing trials have recently been made by three anti-submarine aircraft built by Westland, Fairey Aviation and Blackburn and General Aircraft. This latter firm also made the first flight of its big military freighter a few weeks ago. Fairey Aviation still have in production their piston-engined Firefly; their new anti-submarine aircraft has Armstrong-Siddeley's double Mamba engine. Developments by Armstrong-Siddeley, particularly in turbo-prop engines, have been a feature of the past year. Development by Bristol Aeroplane of similar big turbo-prop engines has been slower, and after developing the turbo-prop Dart, Rolls-Royce have concentrated wholly on turbo-jet engines. The Westland anti-submarine aircraft also uses an Armstrong-Siddeley engine.

The most serious gaps in production and development are in bombers and long range fighters. Gas turbine engines with their high fuel consumption, have tended drastically to reduce the effective range of aircraft. Disposable fuel tanks increase range but curb performance. The fighter developed by Avro Canada is the only long range jet fighter in the world about which any information is available. There is the same gap in bomber production. Development of gas turbine bombers has been slow. The English Electric Canberra is not expected to have a great range, but no piston-engined bomber can now fly (as they once could) above the operating ceiling of modern jet fighters.

Electricity in The Commons

Interest is bound to be aroused by the remarks of the Minister of Fuel and Power in the Commons on Tuesday about the "constant, urgent drive" that is required (and, he implied, that is going on) for the better spreading of the electricity load over night and day. Mr. Noel-Baker said that "the best brains of the industry" had been devoted for many years to this problem of the peak. These brains had induced industry to carry out certain processes at night by the offer of cheaper current. Experiments were taking place with "a storage fire or radiator" to replace some of the electric fires that add 10 per cent to the load on a cold morning. Electric battery vehicles were another possible way of giving a big night load. The Minister added an unexpected note of congratulation:

> I am glad that the authority are constantly putting more resources into research, especially research into storage batteries, on which I believe an intensive effort is required, and into other storage and control devices which might give real results in relation to the problem of evening out the load.

*

This pat on the back may well have come as a pleasant surprise to the British Electricity Authority, which, if it has really been pursuing any systematic inquiries along these lines, has been extremely modest about mentioning them. The last annual report gave some particulars of the authority's research activities on such matters as the life of insulators and the corrosion of transformers and transmission lines. But the list of these activities, though admirable in many ways, contained very little suggestion of anything designed to even out the load. The exception is a survey of the characteristics of traction batteries, which appears to be based on observation of the authority's own fleet of 350 battery-driven vehicles in action. But this is a small and well-trodden corner of a large field. What other forms of storage—whether of water-power, current, or heat—are being studied? On what contol devices designed to even out the load is work going on, and what is the nature of the work? It is not only surprising to hear of these activities from the Minister when the authority has been silent about them; it is also surprising that they need to be made the object of technical research at this stage at all. Plenty of devices for storage and control are known to exist, and it had been supposed that the outstanding questions concerned their commercial application and not their technical character.

It would be useful to know more about all this. Or was Mr. Noel-Baker adopting a tactful method of suggesting to the BEA the directions in which it might with advantage turn its energies?

* * *

The Super-Grid

The British electricity grid, most of which was constructed between 15 and 20 years ago, transmits current at 132,000 volts. This was not a remarkably high voltage even when the grid was constructed, and as the supply of electric power has grown the need for a more powerful grid has become apparent. Clearly, also, a policy of national integration of power supply—one of the policies that the British Electricity Authority was created to carry out—is likely to call for the bulk transmission of power over distances on an increasing scale. For these reasons the authority's decision to start now on the building of a new grid for the transmission of power at 275/300 kilo-volts is not likely, perhaps, to be questioned in spite of the many other pressing demands on the authority's resources. The first pylon on the first stretch of the new grid has now been erected; this stretch of line will connect Staythorpe, on the Trent, with Sheffield, and will take two years to complete. An experimental stretch, half a mile long, has already been built at the BEA research station at Leatherhead, so that the problems of maintaining the line and of loss of power can be studied. The project was first evolved by one of the authority's predecessors, the Central Electricity Board.

Electric power engineers have been greatly preoccupied in recent years with extra-high voltage transmission, and a number of countries have gone much further in this field than Britain has gone. In Germany the Rheinisch-Westfälische Elektrizitätswerke began in 1923 the construction of a long-distance transmission system designed to carry power at 400 kV between the Lower Rhine and the Austrian hydro-electric stations. This company's line from Bludenz (Vorarlberg) to Brauweiler, near Cologne, was built to carry 400 kV, though it has not yet been used for more than 220 kV. The completion of the project, and its possible extension into a European grid, have been actively canvassed in the last year or two. A line to be operated eventually at 380/400 kV has been completed in France, and similar lines are under construction in Sweden; one of these will carry hydro-electric power at 380 kV over a distance of 600 miles from the north of Sweden to the neighbourhood of Stockholm. In the United States the line from Boulder Dam to Los Angeles works at 287 kV, but American plans for more powerful lines are well advanced.

Britain, though less concerned than most countries with the transmission of power over great distances, has to watch carefully for the moment when it becomes cheaper to transmit electric power than to transport coal. This change may well revolutionise location policy for power stations in Britain; the Minister of Fuel and Power suggested in the Commons debate on Tuesday that more power stations might soon be located at pitheads to serve relatively distant consumers. The significance of the new grid is itself more limited. When it is complete (though this may not be for ten years or even more) it will form a bulk transmission system stretching from the London area to central Scotland. The first stretch of some 40 miles will carry power to Sheffield from the big new station at Staythorpe. A second new station is also to be built at Staythorpe, giving a combined capacity there of 720 megawatts, and the line to Sheffield will be extended to Tees and Tyneside, districts in urgent need of more ample power supplies.

* * *

Italy's Sterling Balances

At its latest meeting, the Anglo-Italian Economic Committee discussed the problem of Italian sterling balances in the light of the European Payments Union arrangements. In the communique issued after the conclusion of the talks, no detailed information was given of the arrangements that are to be made for the utilisation and funding of these balances. It can be disclosed, however, that the agreement provides for the separation of the existing balances (which amount to about £70 million) into two parts. In the first place, £20 million is to be made available for current use.

GILLETT BROTHERS
DISCOUNT COMPANY, LIMITED.
Capital and Reserves
£1,750,000
TOTAL ASSETS EXCEED £70,000,000
ESTABLISHED 1867
52, CORNHILL, LONDON, E.C.3

It will be open to Italy to draw on its balances to this amount over the next two years in order to complete its compensations under EPU or to meet a direct deficit in the balance of payments between Italy and the sterling area; an important point to note is that Italy will have the right to use this £20 million even though it is in credit with EPU as a whole. The remaining £50 million of Italian balances are being set aside to finance long-term capital projects involving the use of machinery imported from the sterling countries. This arrangement is a pendant to a programme of industrial expansion recently launched in Italy with government support.

When EPU was being negotiated the British Government stated that any sterling balances held by other participants, whether funded or not, would be available to meet any deficit incurred by these holders with EPU as a whole. This promise remains applicable to the whole £70 million of Italy's sterling balances. If, however, such use of sterling balances results in gold losses to Great Britain, the indemnity given to Great Britain by the Economic Co-operation Administration will immediately come into play. Agreements remain to be negotiated for dealing with Portuguese and Swedish sterling balances and it would cause no surprise if these were to follow the lines of the arrangements made with Italy; the Portuguese, indeed, already have the greater part of their sterling funds earmarked for capital expenditure by an agreement negotiated with Britain four years ago.

At last week's meeting, the Italian and British representatives also decided to renew their current payments agreement until September 30th next. This short extension is intended to give both parties a little more time in which to assess the full effects of EPU and to ascertain how the detailed EPU convention emerges from the process of codification which it is now receiving at the hands of the lawyers. This extension of the Anglo-Italian payments agreement is not to be taken to mean that in, their renegotiated forms, the British payments agreements with members of EPU will still incorporate clauses providing for unlimited extensions of credit as in the case of the present agreement with Italy.

* * *

Prescription for South Africa

When Dr de Kock, the Governor of the Reserve Bank of South Africa, addressed its annual meeting in 1949, the Union's foreign exchange reserve was dwindling dangerously towards vanishing point. When he addressed the annual meeting last week, the reserve had risen to £147 million—a level at which it should be well able to withstand any immediate demands for foreign currency made upon it. The main influences behind this recovery have been the rise in the sterling price of gold consequent upon devaluation and the imposition by South Africa of swingeing import restrictions last year.

The main burden of Dr de Kock's address, however, was that this welcome rise in exchange reserves must not delude the Union into supposing that it can now throw its bonnet over the windmill. South Africa, he pointed out, was still a developing country—and one whose development very largely depended on an inflow of foreign capital and technical knowledge. About the capital needs of the new mining ventures, it is true, Dr de Kock seemed surprisingly optimistic. These ventures, he said, had already succeeded in securing the whole or most of the capital they required to reach the production stage and, if new capital were still needed thereafter, he believed they would be able to finance expansion largely out of profits. Industrial expansion, however, also largely depended on an inflow of foreign capital; now that the United Kingdom could not provide as much as it used to do, the Union would have to adopt new methods of raising capital in the United States and Switzerland. The main prerequisites for attracting foreign investors were to assure them that the Union would be able to meet any demands made on it for foreign currency during the next few years and to prevent inflationary pressures from hoisting internal costs to a burdensome level. His prescription was therefore that imports and inflationary spending must still be kept on a tight leash.

* * *

Trade in the Second Quarter

The final figures for overseas trade in June fill in the details of the picture sketched here when the provisional figures were announced a fortnight ago. The rise of nearly £10 million (to £238½ million) in the value of imports during the month seems to have been due to an all-round increase in volume as well as in prices; value figures for imports of food, drink and tobacco, of raw materials and of manufactured goods all reached new postwar records. In the first six months of the year, however (during which the average monthly value of imports was just over £213 million compared with a monthly average of just over £189 million in 1949), the most significant influence driving import expenditure upwards has plainly been that of rising raw material prices; the average monthly value of raw material imports rose by fully 22 per cent over the monthly average for 1949. As already announced the daily rate of exports in

UNITED KINGDOM EXPORTS TO NORTH AMERICA
(Millions of U.S. Dollars. Quarterly figures)

	1948	1949				1950	
	iv	i	ii	iii	iv	i	ii
United States	22·5	21·7	15·4	16·1	13·7	18·8	20·3
Canada	27·9	25·7	24·5	25·2	20·0	23·9	28·6
Total	50·4	47·9	39·9	40·3	33·7	42·7	48·9

June was slightly above the record level established in May; detailed figures now show that exports of vehicles, agricultural tractors, new ships and paint continued to run at high levels, but the volume of machinery exports declined and textiles (other than artificial silk products) still seem to be failing.

In the highly competitive North American markets the dollar value of British exports last quarter was higher than for any comparable period since 1948; the dollar value of exports to the United States itself, however, had still not quite restored itself to the level attained before the pre-devaluation recession. In June itself, exports to Canada receded slightly from the record level established in May; the amount of vehicles, iron and steel manufactures and coal shipped to this market continued to be promisingly high. Exports to the United States in June also fell by £200,000 (to £3,000,000) below the level reached in May. Some £1,600,000 of this £8,000,000 was accounted for by increased sales of spirits and some £900,000 by increased exports of woollen and worsted goods; these were offset, however, by smaller exports of pottery, machinery and cotton-goods.

* * *

Check to Cotton Exports

The cotton trade figures reveal a disturbing contrast between the industry's rising volume of production and its flagging export performance. Yarn and cloth production in April reached their highest levels since the war, and this performance was surpassed in May; although the holiday season has interfered with output since then, the general level of production is still running well above that of last year. Thus the total output of single yarns (including waste and mixture yarns) in the first 26 weeks of 1950 amounted

to 525 million lb., compared with 489 million lb. in the corresponding period of last year. In weaving there were 18,000 more looms running on cotton and rayon fabrics in the first quarter of this year than in the first quarter of 1949; and the May figures showed a further intensification of activity. Cotton, rayon and mixture cloth output in the four weeks ended May 27th was 230.19 million yards, compared with 212.32 million yards in the comparable four weeks of 1949; both were holiday-free periods. About 6,700 more weavers were at work than a year earlier; the cotton industry's recruitment has continued to go well.

This expansion has brought one substantial advantage: it has enabled the industry to carry on with reduced imports of foreign (and particularly Japanese) unbleached grey cloth. Thus its cloth exports are no doubt tending to be, to an increasing extent, goods wholly manufactured in Britain rather than goods finished in Britain but spun and woven abroad. But this seems to be almost the only crumb of comfort. Measured by value, exports of cotton yarns and manufactures were £73.4 million in the first six months of 1950 compared with £84.3 million in the first half of 1949.

BRITISH EXPORTS OF WOVEN COTTON PIECE GOODS
(Thousand Sq. Yds.)

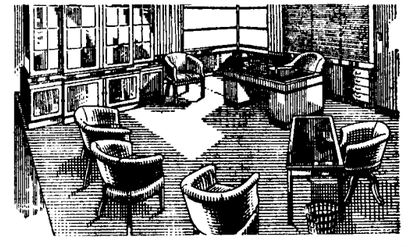
	Six Months ended June 30,		
	1948	1949	1950
TOTAL	337,551	473,364	393,135
Exports to:—			
British West Africa	53,713	75,884	73,226
South Africa	27,995	54,503	26,342
India	9,704	37,399	3,816
Pakistan	2,019	37,588	31,718
Australia	39,962	60,919	54,964
New Zealand	12,812	20,634	24,969
Canada	12,645	19,237	9,969
U.S.A.	5,943	3,329	4,792

Source: Trade and Navigation Accounts of the United Kingdom.

The monthly average in the second quarter (£11.9 million) was appreciably less than in the first quarter (£12.5 million), and in the two quarters taken together the monthly average was 8 per cent less than in the full year 1949. The bulk of this decline can be attributed to a falling-off in the trade in piece goods, as the accompanying table shows; no doubt, in the markets of Africa and Asia, Japanese and Indian competition are playing a big part.

The question will naturally be asked whether the situation described will bring about an improvement in the supply of cotton goods to the home market. This should in logic be so. But in fact, the existence of quantities of frustrated exports does not in the ordinary way add to the utility supplies on which most people depend. It adds to the pressure of non-utility goods on the market, but purchase tax restrains the sale of these goods. It may be doubted whether the disproportion between utility and non-utility supplies, of which the President of the Board of Trade was complaining in the spring, has yet been reduced. Until decisions are taken for the overhaul of the utility scheme, the tendency may be the other way. But the committee that is studying the utility scheme is unlikely to complete its work for some months to come.

* * *



Globe Telegraph Questions

The scheme submitted to stockholders of Globe Telegraph and Trust has the double object of reshaping the company's capital structure and sharing out part of the proceeds of compensation from the company's big holding in Cable and Wireless (Holding). Holders of the existing £1,811,270 6 per cent cumulative preference stock are offered an equal amount of 4 per cent debenture stock together with an option to receive either 10s. ordinary stock, or alternatively a further 10s. 4 per cent debenture stock plus a cash payment of 2s. 6d. for each £1 unit of preference stock held. The new debenture is to be redeemable in 30 years with an option to repay after 25 years. Ordinary stockholders would retain their existing stock—of which £2,354,000 is in issue—but would get an additional 10s. ordinary stock plus 10s. 4 per cent debenture stock and a cash payment of 4s.

By substituting a debenture for its 6 per cent preference capital, Globe Telegraph would make a saving in profits tax and also divest itself of all uncertainty about the rights of the preference capital in the event of liquidation. Admittedly, the scheme gives no hint that liquidation is contemplated, but it may be supposed that the board attaches importance to this aspect of the scheme. Globe Telegraph preference stock has been assumed to be *pari passu* with the ordinary stock for repayment of capital and remaining assets. But the legal rights are not explicit, and the judgments in the colliery company cases in the House of Lords last year have thrown the position of preference holders as a class into the melting pot. The directors of Globe Telegraph have taken legal opinion on the effect of these judgments and have been impressed by the serious doubts cast on the rights of the preference stock in the event of winding up. Hence the directors' proposal to eliminate the stock and with it any uncertainty.

The best commentary on the value of the scheme to preference stockholders is the reaction of the Stock Exchange. The ordinary stock was marked down 5s. to 42s. at one time on Wednesday, though some of this loss was recovered later. The preference held its ground at around 30s. 9d. Ordinary stockholders may well ask whether the swap of debentures for preference together with trimmings worth 50 per cent or more of its face value is necessary. A winding up is not contemplated. Is it necessary therefore to make an offer to preference stockholders that seems to admit that in the event of winding up, they might enforce their presumed rights?

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.

Your enquiries for floor-coverings, and for any assistance are cordially invited.

CATESBYS LIMITED

Tea Auctions Again

No details are yet available of the arrangements that are being made to fit the operation of the London Tea Market into the straitjacket of rationing, price control and subsidies, which, Mr Webb has announced, it is to wear "for some time" after it reopens next April. Apart from the problem of applying the subsidy over a wider spread of graded teas, however, these arrangements are likely to present mainly administrative problems. Even before the war, auction buyers manœuvred under a retail price ceiling—a ceiling fixed not by the Ministry of Food (as it will be under price control) but by the big tea firms who did not allow their retail prices to fluctuate in line with purely day-to-day movements on the market. One of the main problems confronting the market at its opening may, indeed, be that set by the low level of stocks, consequent upon the reduced quantities of tea that India and Ceylon have allowed to be sent to this country. The Minister of Food revealed on Wednesday that bulk buying will continue as close to April, 1951, as necessary and that the Government's stocks would then be made available and sold at the auctions.

Although much may happen in the Far East between now and next April, there will be general satisfaction that the Government has made up its mind to bring bulk purchase of tea to an end. The existing system has done a great deal of harm. It has encouraged the growth of new markets in Calcutta and Colombo (despite the lack of suitable storage) and marketing skills in London have been allowed to rust. Good quality teas have often been shipped to other markets while the dregs of the crop have too frequently come to this country. The Ministry has not noticeably had the best of successive bargaining bouts with India and Ceylon; the recent news that Ceylon is to increase its revenue export duty on tea from 38 to 53 cents per pound serves as a reminder of the fact that independent governments in tea-producing countries now increasingly tend to interpose themselves between producers and their chosen markets. When the London market reopens in April, it will plainly have a rougher road to travel than it did in 1949; and it will have no simple task to restore its prewar skill, financial resources, and commercial eminence.

London Fares

The Transport Tribunal sat again on Wednesday this week to consider amendments to the London Passenger Charges Scheme. The original scheme was submitted in February by the London Transport Commission and the Commission hoped to have it in operation by October 1st. In a full year, and assuming no changes in prices, the scheme was expected to produce £82½ million of revenue. During the recent hearings there was much discussion of the equitable share that the London area should contribute to the revenues of the Commission. The latter has to consider itself as one undertaking and it was not denied that the London scheme was an interim scheme subject to possible amendment when country-wide charges schemes come under consideration. But these lie two years off, and in the meantime the Transport Tribunal has shown itself reluctant to accept proposals that might be criticised on the ground that London was paying too much.

The Commission's estimate of the fair contribution from London (which can only be assessed on a series of arbitrary hypotheses) was £82½ million, and the scheme itself aimed at just over £80 million. Some critics suggested that a fair figure would be as low as £75 million and the Tribunal admitted part of their contention by putting London's "reasonable contribution" at £79 million and asking the Commission to amend the scheme in such a way as to relieve the early morning fare payers of £1,000,000. It was this part of the scheme that was expected to encounter the stiffest opposition; it proposed radical increases in workmen's fares and the Tribunal has concluded that it would have dealt more hardly with that section of the travelling public than with others. The revised early morning fare scales submitted by the Commission would reduce the estimated revenue by £923,000; they have meant some departure from the system of a consistent rate per mile on which the Commission had modelled its first proposals. But a sacrifice in methodological perfection is less important than the public demonstration of responsible and judicial supervision of proposed charging schemes. This first case under the full provisions of the 1947 Act has demonstrated the value of the Transport Tribunal as a watchdog concerned with the public interest. It is a real pity that transport is the only nationalised industry for which such supervision has been provided.

Australia's Dollars

Mr Menzies' financial discussions in London appear to have passed smoothly and profitably; there is little doubt that in the course of his talks with the Chancellor of the Exchequer he was given an abundance of good advice. The fact that he may not have been entirely convinced seems to be implied in Mr Menzies' description of his talks with Sir Stafford Cripps and officials of the Treasury as "extremely interesting." It is stressed by all concerned that these were not negotiations, but discussions of long-term projects. Mr Menzies advanced his long-term plans for large-scale immigration—schemes which necessitate the doubling of the rate of housebuilding and a corresponding stepping up of a large part of the capital investment programme in Australia. The programme will require additional dollar expenditure, part of which, it is hoped, will be financed by a loan from the Export/Import Bank loan which Mr Menzies is to negotiate in the United States. On these matters of economic development and capital expansion, the burden of British advice to Australia will probably have been to go slow and not to bite off too much at once—advice given with the fresh and painful experience of the East African Groundnuts Scheme in the minds of those who were imparting it. It would be disquieting if Australia's development programme were to be accelerated just at the moment when the cost of such a programme is likely to be going up.

Brighter Shipbuilding Outlook

The quarterly merchant shipbuilding statistics compiled by Lloyd's Register of Shipping are the most reliable and comprehensive published, and it is disappointing that, five years after the end of the war, there should still be gaps in the world picture of shipbuilding which they present. No doubt the absence of information from Russia has to be accepted. Poland has now joined China in withholding facilities from Lloyd's Register. These two are not important shipbuilding countries. But Germany, another absentee, is important, and German shipbuilding activity is increasing. The absence of figures for these countries has to be borne in mind when considering the Lloyd's Register totals of shipbuilding abroad in the second quarter of 1950. At the end of the quarter the tonnage under construction abroad was 2,612,730 tons gross; this is 176,725 tons less than three months previously. A decline in the United States from 441,640 tons to 326,034 tons is the largest factor in this change.

Building in Great Britain and Northern Ireland has, in contrast, increased by 41,972 tons to 1,937,191 tons gross. In the last quarter 345,614 tons were completed and 372,433 tons begun. Launchings in the same period amounted to 484,873 tons gross; this is much more than the 204,440 tons of the previous quarter. Work is now passing more speedily through the shipyards, and output for 1950 seems likely to exceed that for 1949. The prospects of speedier delivery may be expected to attract new orders, and already the orders placed for new tonnage this year considerably exceed the total for the whole of last year. The greatest demand is still for tankers, of which no fewer than 988,787 tons gross are now being built. This is almost exactly half of the total tanker tonnage under construction in the world, which in turn is 41.3 per cent of all tonnage under construction. The accent on tanker tonnage presents difficulties for some shipyards, particularly the smaller ones, which require a steadier flow of orders for dry-cargo tonnage than they are getting. Orders continue to come in from abroad, and more tanker orders are expected to result from the recent Caltex oil agreement. Export tonnage at present under construction in British yards amounts to 738,265 tons, or 38.1 per cent of the total. It includes 325,020 tons for Norway, 81,683 tons for Argentina and much the same figure for Commonwealth countries. In all 20 foreign countries are represented in the yards, and a recent order from Turkey will raise the number to twenty-one.

Cuba Sells Silver for Gold

The Cuban government recently decided to sell the 80 million silver pesos backing Cuba's currency circulation and to use the proceeds to purchase gold bullion. The shipments of silver coin are already on the way from Cuba to the New York Federal Reserve Bank. Reports from Havana have suggested that the silver bullion received from the melting of these coins will be sold in the market. If true, these reports may help to explain the surprising stability of the price of silver since the beginning of the Korean war—a stability which has been maintained while the price of virtually every other metal, precious and base, has been rising. It seems unlikely, however, that the silver in question will reach the open market. Since the Cubans intend to obtain gold bullion with the proceeds, the transaction is more likely to be a simple exchange with the US Treasury.

While the market price of silver remains exceptionally steady, the free price of gold has continued to rise very slowly and has this week climbed beyond $38 per ounce; this compares with the recent low of about $36. The response of the gold price to events in the Far East would have been far more spectacular had the Chinese mainland remained a wide open market for gold, as it was before the Communist invasion rolled over the country. There have, however, been interesting hints of a renewal of Chinese demand for gold for hoarding purposes; this reputed renewal is small as yet, but it is significant in the light of the harsh retribution that meets those who are found out.

Bank Agency Charges

From the beginning of next month the two largest clearing banks, the Midland and Barclays Bank, are to levy charges for any "agency" services that they undertake for customers of other banks—and to pay reciprocally for any agency services rendered by other banks. Hitherto, under an agreement reached as long ago as 1924, British banks have undertaken these services for each other for nothing. Since 1924, of course, the amount of such agency work has greatly increased; for one thing, the local branches of nation-wide businesses often pay in their receipts through banks that derive no benefit from their custom—since the head office of the business concerned often holds its account with a bank of which there is no local branch. Moreover, the cost of passing such receipts through the clearing has increased in recent years and there are many who have long believed that the mounting pressure of costs must eventually drive the banks towards the principle of levying more specific charges for services to their own customers.

Atomic Energy Establishment

WINDSCALE WORKS

Here on the actual site of one of the firm's large war-time contracts, two high chimneys tower above the squat bulk of the atomic piles. It would seem more than a coincidence that this present day contract is being carried out almost within sight of James Laing's first historic contract in the hills of Cumberland over 100 years ago. Between 1848 and 1950, the contrast is complete.

ANOTHER TUBE GONE

Sudden calls to replace or repair burnt-out boiler tubes are not uncommon, and one of the causes can be scale deposited in the boiler from the water. The modern way of avoiding scale formation in industrial boilers is by conditioning the boiler water with Calgon (sodium metaphosphate) one of Albright & Wilson's phosphates. Calgon not only prevents the formation of scale in boilers but will keep feed pipes and valves clear as well. It will in fact all be clear to you if you care to consult Albright & Wilson's Technical Service Department.

49 PARK LANE · LONDON: W.1 Tel: GRO. 1311. Works: Oldbury & Widnes

VAW65A

Despite these considerations, the majority of the clearing banks are opposed to the move now to be made by the Midland and Barclays. They argue that most banks give nearly as much as they receive under the present agency arrangement. It is contended that, if all agency services now mutually and gratuitously rendered were to be paid for, some net receipts would doubtless accrue to the bigger banks—but these receipts might be too small to justify the extra work that careful recording of each agency transaction would entail. Some of the banks opposed to the new proposal have recently written to some at least of their customers who use the agency services of the Midland and Barclays, pointing out that a charge is now to be imposed and giving the address of any local bank that still intends to do agency work for nothing. Whether the bank paying the charge will pass it on, wholly or partially, to the customer, in the form of an increase in the general service charge for the account, will apparently depend upon the circumstances of each case.

Shorter Notes

A Note in last week's issue stated incorrectly that expenditure at cost on Paton and Baldwin's new Darlington factory up to April 29, 1950, amounted to £10,432,228. As the accompanying extract (with the figures adjusted to the nearest £000) from the company's balance sheet shows, this figure represents the cost of all fixed assets of the company before depreciation. The amount spent to the date of the latest balance sheet on fixed assets at the Darlington factory is £5,925,562, before deducting depreciation provisions.

PATON AND BALDWINS FIXED ASSETS

	1949 Comparative figures			1950

★

Coal output last week was 3,881,600 tons, a little lower than the week before. Holidays caused an estimated loss of 463,000 tons during the week and these losses can be expected to continue until the end of the holiday season. In the week ending July 15th there was a further net loss of 200 men, bringing the numbers on the colliery books down to 697,600 compared with 721,300 at the same time last year. The rate of decline in manpower appears to be slowing down, and with the end of the school year and the subsequent recruitment of juveniles it may for a time be reversed. Total output in the first 29 weeks of the year was 121,981,400 tons, compared with 120,565,800 in the same number of weeks last year.

★

A further discussion took place this week between British Government and American film trade representatives on the revision of the Anglo-American films agreement. The American film producers are urging a return to "normal trade relationships" and the unrestricted convertibility of their earnings in view of the improvement in the British balance of payments.

★

The Seattle City authorities have invited tenders for six single-phase transformers; this contract may have a value of about $1,200,000. After discussions in Washington, the authorities recently withdrew a proposed ordinance which would have facilitated the rejection of foreign tenders, however low, for city contracts.

SECURITY PRICES AND YIELDS

COMPANY MEETINGS

THE STANDARD BANK OF SOUTH AFRICA LIMITED

CONDITIONS IN THE UNION

THE EARL OF ATHLONE'S REVIEW

The one hundred and thirty-seventh ordinary general meeting (being the annual general meeting for the year 1950) of The Standard Bank of South Africa Limited was held on July 26th in London.

The Rt. Hon. the Earl of Athlone, K.G., the chairman, presided.

The following is an extract from his circulated statement:—

In developing areas such as the Union of South Africa and Southern Rhodesia there must come periods of adjustment and consolidation. The year covered by the accounts now presented is one such period, when efforts directed towards the balancing of oversea payments became a major consideration. The effects of the measures taken towards this end are reflected in the changes appearing in our balance sheet.

You will observe from the profit and loss account that after providing for taxation and after an appropriation to the credit of reserve for contingencies out of which any diminution of assets has been provided for, but before making an allocation towards writing down premises and to the officers pension fund, the profit amounted to £760,692. This compares with £715,834 for the previous year. After adding £192,832 brought forward from 1949 we have a sum of £953,524 for disposal. Out of this an interim dividend at the rate of 7s. per share (amounting to £175,000 gross, and, after deduction of income tax, £96,250) was paid in January last. From the balance of £857,274 remaining, the same appropriation as last year—viz., £150,000—is made to bank premises. It is also recommended that an allocation of £350,000 be made to the officers pension fund, and that a final dividend of 9s. per share, together with a bonus of 4s. per share, be paid, leaving a sum of £178,524 to be carried forward. The dividend and bonus to shareholders, now proposed, will take £325,000, and after deduction of income tax appear as £123,750 and £55,000 net respectively in the accounts. The final distribution recommended together with the interim dividend already paid will amount to 20s. per share—that is, the same sum per share as was paid last year.

We have continued to increase the number of our branches, and expenditure in connection with this and the provision for their maintenance continues at a high level.

ECONOMIC SITUATION

In reviewing the economic situation of the Union of South Africa it should be borne in mind that it is still a country in the course of development, and the changes from time to time in its external trading position must be considered against this background. At the present time the situation is very sensitive to change because of the scale of development in progress and the degree to which this must be sustained by new investment from oversea.

Trading activity in the Union contracted in the past year. Employment has been generally steady, and the demand for essentials has remained constant, but the influence of price levels has been such that the market for luxury goods has been selective.

The increase in the sterling price of gold, which followed devaluation by the United Kingdom and most of the countries associated with the sterling area, completely changed conditions for the gold mining industry. The increased price of the metal solved the mines' most pressing difficulty—namely, the narrowing margin between revenue and costs. It enabled mines on the point of ceasing operations to remain in production, and, by rendering payable the mining of an inferior grade of ore, has prolonged the life of the others.

The improvement in the situation was followed by a renewal of demands, which had been held in abeyance, for improved wages and conditions of employment and further increases in working costs are expected in the general rise in the prices of stores and materials used by the mines. The benefit to the industry arising from devaluation was shown by the increase in the sum distributed in mining dividends for 1949. Operations were also assisted by improved deliveries of equipment and stores and by a large increase of the native labour force. Prospecting and development have been well maintained, especially in the Orange Free State where work is in progress on 10 mines.

For a great part of the year sales of diamonds were strongly affected by currency difficulties and the general expectation of devaluation but, after that event, markets quickly recovered and the value of sales for the Union was maintained.

RHODESIA

Trade in Southern Rhodesia was active during 1949 and, as stocks were varied and plentiful, commercial concerns generally experienced favourable conditions. The demand for necessities remains steady, but merchants have found that consumers are becoming selective and less inclined to buy luxury goods. The growing use of credit facilities is an indication that there may possibly be some difficulty in maintaining the high turnovers of the past few years. The good crop prospects for the coming season, and the continuance of the flow of immigrants, both European and native, into the Colony will, on the other hand, stimulate trade.

Mineral production last year reached a record total value, due mainly to the high current prices for asbestos and chrome, and, since the devaluation of sterling, the greater price for gold. The increase in the volume of base metals exported is a welcome feature.

In Northern Rhodesia activity in all sections of trade was well maintained and business conditions were generally satisfactory although there were signs of a greater use of credit facilities. The prosperity of the territory is closely tied to the market for its mineral output and the demand for this remains firm at favourable prices.

OTHER COUNTRIES

The general level of business in Nyasaland in 1949 was satisfactory and compared favourably with the previous year, the present high price of tobacco acting as a stimulus to trade.

Internal trading conditions in South-west Africa were buoyant, closely reflecting the level of farming prosperity in the territory.

During 1949 the rainfall in Kenya was much below normal and in some parts severe drought conditions were experienced. In spite of the adverse weather conditions in the early part of the planting season, the harvest of cereals improved over the previous year.

The report and accounts were adopted.

THE BRITON FERRY STEEL COMPANY LIMITED

ALL-TIME RECORD OUTPUT

The sixty-second annual general meeting of the Briton Ferry Steel Company Limited, was held on July 27th at Briton Ferry, Neath, Glamorgan, Colonel J. M. Bevan, M.C. (chairman and managing director) presiding.

The following are extracts from the chairman's circulated statement:—

The group net profit amounting to £477,138 has been materially assisted by the profits earned by our subsidiaries, and, in total, compares favourably with last year.

After making provision for taxation of £280,009 and deducting the amount of £27,715 attributable to outside shareholders, the profit for the year remaining within the group is £169,414.

I must repeat my previous statements that the take-over prices for the stocks of this company, under the terms of the Iron and Steel Act, are altogether inadequate, and add that apart from this injustice, it is to be hoped that wiser counsels may yet prevail and the iron and steel industry be permitted to carry on under private enterprise, which gives scope for individualism and is the only sure road to efficiency.

PRODUCTION AND DEMAND

The output of the steel industry of the country has now very largely caught up with the demand, but we are still very dependent on the importation of foreign scrap, which particularly applies to open hearth steel works similar to ours operating without blast furnaces. The increased output has, however, made it possible for the importation of finished and semi-finished steel to be largely curtailed, and it is to be hoped that shortly the country will become self-sufficient so that we shall be able to return to more normal trade conditions.

Our own steel works continued in full production throughout the year and established further all-time record outputs. This also applies to our re-rolling works, with the exception of our tinplate mills, where we are restricted to less than three quarters of our capacity on account of a severe shortage of labour. This handicap is common to all pack mills in the trade, with the result that the output of Welsh tinplates is considerably less than the potential demand, which remains at a very high level.

I consider there is justification for thinking that the annual demand for Welsh tinplates may well stand in the neighbourhood of 800,000 tons for many years and may increase to as much as one million tons per annum, provided we continue to foster our export trade which is normally responsible for about half our output.

Present plans provide for the future production of about 500,000 tons annually by the continuous strip method, from which it will be seen that there is a considerable balance, amounting to between 300,000 and 500,000 tons per annum, remaining for the existing pack mills. This is about equivalent to the present day output from these mills, from which it would appear that all the pack mills in operation today are likely to be needed for some years longer than was at one time contemplated. This is surely a very reassuring picture, providing as it does ample security to all engaged in the tinplate industry of regular employment for many years.

We are today converting about two-fifths of our steel output into sheets and tinplates in our own mills, but we are continuing to develop our production of ordinary and special quality billets, thus building up a satisfactory market in this direction for the future.

The report was adopted.

LEVER BROTHERS & UNILEVER LIMITED

PROBLEM OF PRODUCTIVITY

EXPERT STUDY AN AID TO EFFICIENCY

OBJECT TO IMPROVE METHODS AND WORKING CONDITIONS

BASIS OF NORMAL WORKING AND INCENTIVE SCHEMES

SIR GEOFFREY HEYWORTH'S SPEECH

The Annual General Meeting of the Members of Lever Brothers & Unilever Limited was held on July 27th at the Hall of the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.2. Sir Geoffrey Heyworth presided.

Addressing the Meeting, the Chairman said:—

My Lords, Ladies and Gentlemen,—It has been my custom at these meetings to discuss a subject which is related to our business, but at the same time is of general interest. This year I shall describe our experience in tackling the problem of productivity.

The problem faces every industry in some form or other, but to a great extent special considerations apply to each industry. The under-lying principles have been the subject of discussion and study for many years past. Little that is new in theory can be profitably added today. The main contribution that can now be made is rather in the direction of the confirmation of those principles in the light of the practical working experience of recent years. I will therefore confine myself to telling you of what we have done in Unilever and the conclusions we have reached from the point of view of those industries with which we are concerned. I must leave it to those who are familiar with other industries to decide if and how far our experience can assist them in dealing with the problem of productivity in their particular sphere.

I have chosen the subject firstly because of its importance as a basic problem upon the solution of which an industry's ability to survive under modern conditions depends; and secondly because the work we have done since the war has reached a stage when we can begin to look back, observe progress and draw conclusions as to the principles to be applied and the best methods to pursue.

In what follows I use the term "productivity" in the sense of physical volume, not value of product, and I relate it to the number of man-hours worked. In relating it to man-hours I do not suggest that low productivity is necessarily the fault of the worker, the result of insufficient effort or skill, nor on the other hand that an increase in productivity is necessarily due to the worker, to increased effort or skill on his part. It is necessary for purposes of comparison to relate the number of units of output to some common factor, and man-hours is the simplest. It also has the advantage of directing attention to the importance and possibility of economising labour at a time when some industries are obstructed in their efforts to satisfy their markets by difficulty in securing labour.

CHANGE IN EMPLOYMENT SITUATION

It is perhaps necessary at this point to make clear that improving productivity per man-hour is not the only way of reducing cost. It may not offer as great an opportunity as other approaches. In the industries in which we are mainly engaged—seed-crushing, margarine manufacture and soap-making—the labour element is small in relation to the final cost, a much larger element of cost being the raw materials. It is therefore only natural that the production manager's first thoughts go to ensuring the most economical use of his raw materials.

This aspect of production which we call "technical efficiency" has been and continues to be the subject of unremitting study, both in the factories and in the research departments. Very considerable progress has been achieved and to that extent the scope for further improvement may be diminished, but we expect nevertheless to see further worthwhile economies in this field in the course of time.

Perhaps the main incentive for increased emphasis on the study of improvement in productivity comes from the change in the employment situation. Between the wars when there was serious unemployment in almost all industrialised countries there was a natural reluctance to make changes, the first effect of which was to reduce the numbers employed. Now conditions are very different—these often make it difficult to maintain a working force adequate to cope with an increasing demand for our products. Even if the labour force is adequate, the prospect of getting more output without increasing numbers has a strong appeal to production managers. From the worker's point of view the climate is also favourable—the emphasis having shifted from ensuring a job to a desire for a higher standard of living.

THE APPROACH TO THE PROBLEM

All factories throughout the organisation are expected to accept that expert study of labour productivity is necessary as an aid to efficiency which can be used for the benefit of the business. It is just as much the concern of those that are thought to be efficient as those that may be thought to be less so. Moreover, it is recognised that the benefits that accrue through it will redound to the credit of the management, and the fact that they do accrue is not regarded as a criticism of past performance. The full benefits will not be forthcoming without the help of experts and therefore a pool of specially trained personnel has been created centrally.

We have at the present time fourteen production study engineers based on London and Rotterdam. This personnel is available to work out programmes for production studies with managements, and agree plans with them for subsequent implementation by them. These experts have no stereotyped scheme to offer. There are certain principles that have to be observed if the plan is to be effective, but each plan is determined by the physical and human conditions of the individual factory units.

These study engineers are also concerned with the training within the individual factories of experts whose duty it is to operate the plans after they have been accepted. It takes from two to three years to train a study engineer, i.e., a man who initiates productivity studies, and about twelve months to train one of the plant men who can take responsibility for the running of a plan in operation. In the last four years thirty-nine plant experts have been trained.

When the decision has been taken to initiate a study in a factory, the first step is to explain its objects to all concerned—management and workers—and to secure their effective co-operation. It is explained that the object is to improve methods so as to make working conditions easier—at the same time bringing about a reduction of cost; that in practice no worker loses his employment by reason of it—any redundancies being taken care of by reduction of intake of new workers; that the object is to achieve more effective use of the same amount of effort that is presently being expended rather than to demand a greater expenditure of effort. Further that the correct assessment of a normal day's work will provide the basis for considering the introduction of an incentive scheme of wage payment. Exactly what the study will involve is made clear to everybody, and that it can only be effective if all carry on in their normal way while it is being made. The results that can be expected are largely determined by the thoroughness with which the objectives are understood by the management and workers.

STUDIES AND PLANS

Production studies which lead to the final plan can best be discussed in the following sequence:—

(i) lay-out and equipment;
(ii) organisation of work;
(iii) human factors.

I propose to say a word about each in turn. The studies on which these observations are based in the main relate to the United Kingdom and the Continent and the period since 1945. Here the effort has been on a co-ordinated and organised basis, gradually expanding as more trained personnel became available and as we grew more sure of the lines on which we were working. Before the war attention to productivity was more spasmodic—at any rate in our European factories. In the United States work in this field has received more continuous attention. As soon as more trained personnel are available it is the intention to extend the studies to all our overseas operations.

LAY-OUT AND EQUIPMENT

The difficulty with lay-out is that in an existing factory it is not easy to make a fresh start. In our organisation for instance the design of some factories is somewhat unsatisfactory, usually because during the earliest phases of their history they developed in a rather haphazard manner, and extensions therefore had to be made which had not been foreseen and for which a suitable space had not been provided in the initial plan. Ultimately this lack of logic works out in high cost—particularly of internal transport. It is our experience that even in a poorly designed factory methodical planning can quite often greatly improve the flow of production, and thus increase efficiency. Sometimes a certain amount of building is necessary for this purpose.

Even more important than design and lay-out is the quality of the equipment. In our organisation we have plants of various degrees of modernity, and this gives us an opportunity to see how much difference equipment can make. The number of man-hours required for a certain process with modern or with obsolete machinery is not the *only* measure of efficiency. The higher cost of equipment too has to be considered. In most cases, however, this increase in cost is more than compensated by the savings in handling-cost, especially when cost of power, space, etc., is taken into consideration. A few comparisons show the importance of first-class machinery for the efficiency of labour. In one of our factories the manufacturing and packing of soap powder requires 8 man-hours per ton. In another factory where production is in comparable units, but the mechanisation is higher, the corresponding figure is only 4.2 man-hours per ton. In a factory where we pack by hand, manufacturing and packing of household soap tablets require 23.5 man-hours per ton, whereas in another factory where a modern packing machine is in operation, the labour cost of this product has been reduced to 8.1 man-hours per ton.

Similar differences exist in our margarine factories. The average standard for factories, operating the old batch process, is about 9 man-hours per ton of packed margarine. By applying a continuous method the standard can be brought down to 6½ man-hours per ton, and by further mechanisation of packing even to 5 man-hours per ton.

ORGANISATION OF WORK

A logical lay-out and modern equipment do not by themselves guarantee the highest degree of efficiency. It is also necessary to concentrate on the organisation of work down to the movements of the individual worker. We have been soap makers and margarine makers for a few generations, but it is remarkable that men who have grown up in a particular job find it difficult to detach themselves sufficiently to obtain a fresh outlook. Quite often a trained observer can suggest more effective means of using time and energy, not only because of his specialised technique of observation and analysis, but also on the principle of a new light on an old subject.

One of the main reasons for loss of time and energy is the lack of standardisation of products. Changing over from one size or weight to another causes considerable losses. Conveyor-belts have to be stopped and machines reset every time, and during re-setting not only the productivity of the machine, but also that of the operator is nil. Here we have a problem that calls for a great nicety of judgment—the striking of a balance between the consumer's demand for variety and operational efficiency. The consumer is interested in operational efficiency because it is one of the determinants of the selling price. We therefore plan to produce as many products as possible by continuous runs, and where this is not possible to limit production to runs of a certain minimum length. Moreover, in countries where we have more than one factory, we are able to increase the degree of standardisation by concentrating particular types of runs in certain factories.

The interruption caused by re-setting is only one form of irregularity of flow, which is one of the greatest sources of waste. In fact, at the very outset of a study we often discover that a lot of time is spent waiting for the next job. This was most obvious when raw materials were in short supply and arrived at the factory in irregular quantities. One example will illustrate the point. During the year 1948 in one factory labour cost per 100 units of production of one item varied from 4s. to 13s., mainly in accordance with the volume of production in different weeks. It is not always possible to avoid hold-ups in the delivery of raw materials. There is, however, no reason why workers engaged for instance in cleaning drums or repairings bags, should waste time in waiting for the next lot. Elimination of waiting time has often helped to increase performance by as much as 30 per cent. Apart from external influences it is in most cases possible to secure a continuous flow by simple means, once the matter is given systematic attention.

Surprising though it may seem, it is often more difficult to discover where exactly bottlenecks in the plant lie. Sometimes they are almost unnoticeable, and yet they have a decisive influence on output. This was evident during the war when in one of the occupied countries the manager of a soap factory slightly reduced the speed of the packing machines. His aim was to practise a mild form of sabotage, but he was able to find an excuse in the inferior quality of wartime packing material. This appeared to be a very small matter, but in fact it reduced the production of the whole factory by 10 per cent. Now this was a bottleneck of which the manager was very well aware, but there are many factories in which bottlenecks are only discovered by study. This must be done by close co-operation of the expert with the factory management.

THE WORKERS' PERFORMANCE

It has been well known that workers, even when they have done a certain job for a number of years, make unnecessary movements and thereby waste energy. By motion study it is possible to show how the same job can be done with less effort if things are arranged in a slightly different way. If and when after such re-arrangements the worker's performance is increased, it is not because he is being driven, but because he has been helped to use his energy to better effect. Work study in a department where labour is chiefly manual has much greater effect than in a department which has already been mechanised; because the machine in itself compels a certain amount of purposely organised effort. Still, even in mechanised departments savings are possible. This was demonstrated by a study of mechanical packing in one of our soap factories, which resulted in an increase in productivity of 20 per cent.

On the whole, our experience is that even without incentives, by just studying the methods of work and improving them, we have been able to establish a level of productivity which we will call the new "normal"—30 per cent. above the previously existing level. To reach this level no extra effort by the worker was called for. It was solely a matter of eliminating waste and improving conditions. It should be emphasised that the "normal" is determined by the results of the studies and is then explained and accepted by the management and the workers concerned. This brings me to the last and most important point in the sequence—the human factor.

HUMAN FACTORS

When referring to the rather low standards of individual performance which have been typical of the post-war situation in most countries, some critics have assumed that this is all due to lack of effort on the part of the workers. Of course, wartime circumstances have to a certain extent affected the workers' effort. In occupied countries most people had adopted a go-slow attitude for patriotic reasons. It is not surprising that after a period of passive resistance, frequently combined with undernourishment, the return to pre-war performance took some time. In other countries active warfare had demanded the utmost energy of all during a number of years, and a certain reaction was bound to set in. I think that these difficulties have been overcome by now and that wherever individual performance is inadequate it is wise to look at the methods of supervision in some detail. Day to day proccdure, and the level of understanding on the part of supervisors may vary considerably. In our experience a good manager's efforts to increase efficiency, after mutual consultation, are hardly ever frustrated by resistance from the workers. Neither workers nor office personnel like to work long hours, but *whilst they are on the job*, they are generally willing to work. In our organisation we are always in a position to compare conditions in different countries, and it is remarkable—perhaps to many this may be unexpected—that in our experience of European countries we have not found any important differences between the workers of various nationalities as far as willingness to work and potential performance are concerned. Generally speaking, there are two motives for workers to accept production study, namely that it saves energy and that it brings in extra money.

It follows that the worker must be guaranteed that his wage will be maintained even if the amount of physical effort required is less than was necessary before the improvements were introduced.

The acceptance by all concerned of these work tasks is vital and can only be achieved by explaining in detail to everybody exactly how the measurement of them has been arrived at. To achieve this it may be necessary to hold classes of selected key workers to explain the various measurement techniques. No trouble is too much to take to ensure full understanding. When the production is organised on the new basis, everybody should feel that the work has been made more attractive with a saving of physical effort.

"NORMAL" PRODUCTION AND INCENTIVE SCHEMES

The time taken to complete a production study in a factory to the point of establishing the new "normal" varies in accordance with the complexity of the operations to be studied, the amount of time that the management can spare from day to day operation, and the degree of confidence that exists between the management and the workers; but in no instance can it be done quickly. In a medium sized factory, say one employing 500 workers, a minimum of 12 months is required. At least half this time is devoted to establishing basic understanding of the methods to be used and the objectives that are sought to be achieved.

A production study can stop at the stage where work tasks have been set in relation to the improvements in lay-out, equipment and organisation, and in many cases it does. This "normal" can also form the starting point for a soundly based incentive scheme, acceptable to both workers and management.

From 1945 to date production studies have been initiated in 82 factories throughout the United Kingdom and the Continent. In 39 of these the study has not yet been carried beyond the establishment of the "normal"; in the remainder, incentive schemes have been introduced. Proportionately, the number of incentive schemes introduced is much less in the U.K. than in the other countries. This is due to the fact that we started rather later to build up the necessary expert personnel. On the other hand in some Continental countries there has been a more positive pressure from the worker for the introduction of incentive schemes as a means of bringing his wage packet up to an adequate level, direct wage increases unaccompanied by increased productivity being in many instances prohibited by decree.

The introduction of an incentive scheme once the "normal" has been established is relatively simple since the measurements on which the incentive is to be based have been already established and the method of recording set up. As a rule, a few weeks suffice. The principle is that the worker receives the full benefit of the reduction in labour cost per unit resulting from output in excess of the "normal." The company benefits by the reduction in the overhead element in the cost arising from the higher output. The company bears the additional cost of the clerical expense necessary for the recording. In the main, incentive schemes result in increases in output and workers' earnings of about 20 per cent.

Generally speaking, incentive schemes are based on groups of workers rather than individuals. The groups should be small enough to keep every member informed and interested.

A FAIR TECHNIQUE

I shall not dwell upon the details of our incentive schemes because they vary with the character of the work. The point I want to emphasise is how essential it is for the workers to understand the technique of the system and to accept it whole-heartedly as being

cur. The same point has already been made in relation to the establishment of the "normal." The operation of the incentive schemes requires the continuous attention of management. In the course of time as conditions change it is necessary to alter the "normal," and this must receive close attention. The change can be in either direction. For instance, if sub-standard material has for some reason to be handled the operator must not be penalised and so the "normal" has to be reduced. On the other hand, if better machinery is installed, the "normal" will have to be increased. It is extremely important that nothing be done to undermine the workers' confidence in the real aims of the incentive plan. Much of the disinclination of workers to accept incentive schemes has been caused by fear that the rates may be cut as higher performance is achieved. For this reason we do not alter the "normal" unless some change in the equipment of the unit or in the character of the material makes it necessary. Technical improvements increase the output per man without any extra effort from the worker, and it is not reasonable that gains thus obtained should go to the worker in the form of bonuses.

It is generally desirable that incentive schemes should be introduced to cover as large a proportion as possible of the workers engaged in a unit at the same time. This is desirable operationally, otherwise the harmony between the outputs of related departments would be disturbed. Moreover, it is not desirable to give the opportunity to one particular group of workers to enhance their earnings unless similar opportunities can be given to the others.

This raises a further point—namely, that there are some operations in a factory which do not lend themselves readily to inclusion in incentive schemes based on the output of the operators immediately concerned—maintenance workers being a good example. The difficulty with these non-standard work tasks is to measure them satisfactorily and to record them without excessive cost.

Speaking generally, we believe that an incentive scheme should not be introduced unless 50 per cent. of the workers can be brought within it. For it to have the best chance of success, we believe that it should comprise 75 per cent. Whatever percentage of workers can be included, the problem of what to do about those not covered by an incentive scheme must be faced. There are various alternative methods of increasing their earnings. The method selected should obviously provide for their earnings to increase, but not out of proportion to the earnings of those covered directly by the incentive scheme.

The main points which I have indicated as having been brought out by our experience so far, are:—

(i) Production studies cannot be done quickly, for it is essential that they should be thorough. The methods to be used and the objectives sought must be made clear to, and accepted by, management and worker. This demands a great deal of patience.

(ii) Production studies require specially trained personnel. Once a plan has been introduced a specialist must be appointed to each unit management.

(iii) Above all, the first priority must be given to the maintenance of complete confidence between management and workers, without which satisfactory results cannot be maintained.

CONCLUSION

And now in conclusion, some remarks about Productivity in general. From time to time figures of productivity of individual industries are published—in particular making comparisons between one country and another. Operating as we do in a large number of countries it can be rightly assumed that we are well placed to provide data of this kind for the industries in which we are engaged, but in fact such figures—although no doubt of general interest to the economist—have little direct usefulness for the industrialist. His task is to produce at the lowest cost units of output which are saleable.

Theoretically, we could increase our productivity in England and Holland if we adopted the larger units of sale that are prevalent in the United States. To give one example—the average unit of sale to the consumer of the leading brand of packaged soaps in the U.S. is 23 ozs. per packet; whereas in England it is 7 ozs.; and in Holland it is 9 ozs.

In all cases the packing operation is done by machinery, the output of which is determined not by the weight of the throughput, but by the number of units that have to be produced. It is therefore not practicable to obtain the same productivity per ton of output in England and Holland as in the United States until the standard of living rises to a point which permits the consumer to buy in larger units.

Again as we have already pointed out the degree of mechanisation has a large influence on productivity, but the practical limit of mechanisation is determined by the all-in cost. So it follows that the greatest opportunity to mechanise effectively exists in countries where the general wage level is highest. It is a fact that the wage level is higher in the U.S.A. than in England and Holland.

For these reasons—and there are others—productivity figures by themselves are not a true criterion for measuring efficiency between one country and another. We do believe that it is valuable to study the methods by which high productivity is obtained in different countries and then to see how far they can be applied elsewhere under differing conditions, and that is what we are attempting to do. By so doing, we shall in due course of time make a contribution towards raising the standard of living in all the countries in which we operate.

The chairman concluded by moving the adoption of the report and accounts.

Sir Herbert Davis, C.B.E., vice-chairman, seconded the resolution and it was carried unanimously.

The proposed dividends of 10 per cent. on the ordinary stock and 6 per cent. on the deferred stock payable on August 4, 1950, were approved, the retiring directors (except Mr H. H. Bagnall who had reached retiring age and did not seek re-appointment) were reappointed and the remuneration of the auditors, Messrs. Cooper Brothers & Co. and Messrs. Price Waterhouse & Co., who had been re-appointed under the provisions of the Companies Act, 1948, was fixed.

LEVER BROTHERS & UNILEVER N.V.

The annual general meeting of the members of Lever Brothers and Unilever N.V. was held yesterday at Museumpark, Rotterdam. Mr P. Rykens presided and made a speech in similar terms to that delivered by Sir Geoffrey Heyworth at the annual meeting of Lever Brothers & Unilever Limited, reported above.

The report and accounts for the year 1949 were adopted. The proposed dividend of 8.9 per cent. (being the equivalent of the dividend for the same year to be paid by Lever Brothers & Unilever Limited, to its ordinary stockholders calculated in accordance with the provisions of the equalisation agreement and converted at a rate of exchange of Fl.10.64 to the £ sterling) was approved, the retiring directors (except Mr H. H. Bagnall) were re-appointed and the auditors, Messrs. Price Waterhouse & Co. and Messrs. Cooper Brothers & Co., were re-appointed.

CONSTRUCTORS, LIMITED

PROFIT IMPROVEMENT MAINTAINED

MR H. J. FINER'S STATEMENT

The twenty-eighth annual general meeting of Constructors, Limited, was held at Nickel Works, Tyburn Road, Erdington, Birmingham, on July 20th, Mr H. J. Finer (chairman and joint managing director) presiding. The secretary (Mr J. A. Pinches) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to December 31, 1949:

Ladies and Gentlemen,—It would be appropriate, I think, to commence my address this year by reminding shareholders that the company was converted into a public company on October 27, 1949, and that the Stock Exchange has granted permission for dealings in, and for quotation for, the 150 000 preference shares now issued. Your directors felt that the profits of the group had now reached a level which necessitated an increase in the permanent capital of the company and the £110,000 raised during the year by the preference share issue has been utilised in the repayment of the advances from the group's bankers, which, at December 31, 1948, amounted to £102,953.

There is, consequently, a material change in the "liquid" position of the group and reference to the consolidated balance-sheet shows that current assets exceed current liabilities by some £230,000. The directors regard this margin as being quite ample to provide adequate working capital and normal plant replacements, having regard to rising costs of production and price levels generally.

TRADING RESULTS

In the press notice published in October, 1949, reference was made under the heading "future prospects" to the fact that "profits earned in the current year to date exceed those earned in the same period last year." I am pleased to report that the improvement over last year was maintained. If you turn to the consolidated profit and loss account you will see that the balance from trading account increased to £168,586 from £143,193 last year. After deducting depreciation and amounts written off patents and transferring £6,000 to plant replacement reserve—a total of £21,760 as against £6,782 in the previous year, and after allowing for directors' emoluments and other charges, including profits tax, the profit for the year before income-tax is £101,603.

I do not think it is necessary to refer again to all the appropriations of profit, which are shown clearly in the directors' report, but I should, perhaps, explain the transfer of £1,000 to the pension scheme reserve. When the company's superannuation scheme was inaugurated some years ago the directors thought it prudent to place sums to reserve and at the same time invest like amounts in government securities, to ensure that the annual premiums could be duly paid should the company experience less profitable trading. Although the profits earned in recent years may suggest that this reserve may not be necessary, it is the intention of the directors to protect the employees' pensions by adding to this reserve from time to time.

DIVIDEND AND RESERVES

Regarding the distribution to shareholders, the preference dividends have, of course, been paid during the year. An interim dividend of 10 per cent., less income-tax, has been paid on the ordinary shares and the board recommends a final dividend on the ordinary shares at the same rate. This leaves a balance on the group profit and loss account of £67,246 compared with the balance from last account, after crediting a surplus taxation reserve of £1,624, of £40,165.

The group's reserves now amount to £147,459, and I would remind shareholders that in the press notice it was pointed out that the directors may, if they think fit, propose a capitalisation of reserves and the issue of bonus shares. At the appropriate time the directors will consider the advisability of such an issue to bring the company's issued capital more into line with the actual capital employed in the business.

It would be unwise in these difficult times to make any forecast as to the future, but I can say, as far as the current year is concerned, that progress to date has been maintained.

I should like to conclude with a vote of thanks to our directors, staff and employees in which, I am sure, you will all be pleased to join.

The report and accounts were adopted; the proposed dividends were approved; the retiring director, Mr J. A. Pinches, was re-elected, and the remuneration of the auditors, Messrs Thomson McLintock and Company, was fixed.

NCHANGA CONSOLIDATED COPPER MINES

EXPANDING PRODUCTION

The thirteenth annual ordinary general meeting of Nchanga Consolidated Copper Mines Limited was held on July 26th, in London.

In the course of his speech, Mr S. S. Taylor, C.M.G., D.S.O., Deputy Chairman, who presided, said:—

I would like to make a few comments on the directors' report and accounts, and in the first place I will deal with the matter of our expanding production.

The programme adopted was as follows:—

We would raise production to a figure of 64,000 long tons of copper per annum and we would also undertake shaft sinking and development with a view to a still larger production. The 64,000 long ton programme was initiated and has proceeded, although as has been reported to you from time to time various delays have occurred in delivery of plant and machinery, while there have been substantial increases in the cost of plant, machinery and labour. I informed you last year that the total cost of the programme, including various items of plant, machinery and housing which had been added to the first scheme, was estimated at £4,087,000 Since then there have been further increases in cost and our latest estimate is £4,500,000. The time of completion is approaching, and I have no reason to believe that there will be any further increase in the figure I have mentioned.

FURTHER CAPITAL EXPENDITURE

We have had to provide for further capital expenditure over and above the actual cost of our extension programme. We have purchased £250,000 ordinary stock in Rhodesia Copper Refineries Limited; we have provided additional stocks of copper in connection with the increased production programme requiring £475,000, and our share of expenditure on the electric power interconnection scheme amounts to £180,000. These extra items of capital expenditure make a total of about £900,000, which, added to the cost of the extension programme, gives us a figure of £5,400,000. The amount of new capital raised in 1946 was £4,100,000, leaving a balance to be provided of £1,300,000. Last year I informed you that our capital commitments would require us to use a substantial amount of the profits which the company had made. It was for that reason that we did not recommend to you the payment of a dividend for that year, but the £1,300,000 to be provided is covered by our revenue reserves.

In the directors' report it is stated that the rate of production of 64,000 long tons of copper should be reached by the end of December this year. You will have seen from the directors' reports that the production each year has increased gradually from 22,138 long tons in the year ended March 31, 1947, to 38,761 long tons in the year under review. Since the end of the financial year production has increased monthly; for the three months ended June 30, 1950, production amounted to 13,545 long tons. It is worthy of note that the production for June itself was 5,324 long tons, which, on a yearly basis is almost equivalent to 64,000 long tons. None of this production is in the form of electrolytic copper as the Leach Plant at Nchanga is not yet complete, nor are the extensions to the Electrolytic Refinery, belonging to Rhodesia Copper Refineries Limited, which are being made to deal with part of the production of this company. The extensions to the refinery, however, are expected to be complete by the end of this year, though the coming into operation of the Leach Plant may be slightly delayed beyond that date, owing to power shortage.

That completes my remarks on the 64,000 long ton programme and the provision for its finance.

MINING PROGRAMME

I will now deal with the question of still larger output of copper, which was envisaged in 1946. At that time it was thought that the final plans of plant construction and decisions as to what capital expenditure would be required would not be made until the 64,000 long tons plant had been running for some time. Since then our views have changed somewhat. It is in the interest of the country that the fullest possible production of copper should be provided by the British Empire, and it is also to the interests of the company that the potentialities of our great mining property should be exploited to the full. As I have said, there have been considerable delays in the completion of the extension to 64,000 long tons, and we have at present at the mine a large construction labour force which would take some time to re-assemble if it was once disbanded. We have gained considerable information, which will enable our consulting engineers to plan our mining programme. For all these reasons your directors have decided to proceed with the next stage forthwith. We are planning for a production of 108,000 long tons of copper per annum. The estimated cost of the increase is £5,700,000. In due course information will be given to you as to how it is proposed to finance this programme, but I may say that the present intention of your board is to obtain the main portion of the required funds by way of loan. We expect to complete this programme by the end of 1952, and we also expect that nearly the whole of the total production will be in the form of electrolytic copper.

We are still under contract to sell the major part of our output for the calendar year 1950 to the Ministry of Supply.

The dividend of 20 per cent. was approved and the report adopted

EX-LANDS NIGERIA LIMITED

INCREASED TIN REVENUE

The thirty-eighth annual general meeting of Ex-Lands Nigeria Limited, was held on July 26th in London. Maj.-Gen. W. W. Richards, C.B., C.B.E., M.C., the chairman, presiding.

The following is an extract from the circulated statement of the chairman:

The declared output from our mines for 1949 was 725 tons of tin concentrates. This compares with 755 tons of tin produced during the previous year. In his report the manager gives the F.O.R. cost per ton as £151. After some final necessary adjustments the actual cost per ton figure was £151,339. By far the largest proportion of the expenditure per ton of tin mined is for native wages and amenities.

Further drilling was carried out and the result of the year's work has been to increase the proved reserves by 48 tons after taking into account the 725 tons mined. The reserves at December 31, 1949, were 4,582 tons contained in 11,122,700 cubic yards, giving an average value of 0.92lb. per cubic yard.

Tin revenue, £304,760, was up on last year by some £16,948, although the tin produced was less by 30 tons. After making provision for the distribution of 30 per cent. dividend for the year, the credit balance carried forward on profit and loss account is increased from £25,136 to £40,255.

Up to May 31st this year, 345 tons of tin have been produced compared with 350 tons mined during the same period last year. The decrease is due almost entirely to shortage of water. Generally speaking, the labour position is satisfactory, and we can look forward to the future.

The report was adopted.

CHAMBERS WHARF AND COLD STORES LIMITED

SATISFACTORY PROFIT

The twenty-third annual general meeting of this company was held on July 24th in London, Mr Charles Goldrei (chairman and managing director) presiding.

The following is an extract from the statement by the chairman for the period ended March 31, 1950:—

The accounts for the 53 weeks under review disclose a trading profit (after providing for payment to the Ministry of Food Cold Storage Control of the excess over the maximum allowed to be retained by the company) of £159,627. This is considered satisfactory.

Your directors have transferred to general reserve £7,500, to staff pensions and benevolent account £5,000, to contingencies reserve £20,000, and they recommend a final dividend of 22½ per cent.

In December, 1949, the company purchased additional land and buildings adjoining their riverside premises and on March, 31, 1950, they also acquired the lease of St. Saviour's Wharf, Mill Street, Dockhead, which is nearby. These acquisitions have increased the company's storage capacity by some 10,000 tons of warehousing accommodation.

Your company has played its part in the campaign against the nationalisation of cold stores. We, in company with the industry, consider in the national interest that private enterprise is in a better position to keep the industry on a competitive and therefore efficient basis than any nationalised concern.

The report was adopted.

At a subsequent extraordinary general meeting resolutions to sanction the capitalisation of £42,707 5s. of the undivided profits and to alter the articles of association were approved.

WALSALL CONDUITS, LIMITED

FURTHER RE-EQUIPMENT AND EXPANSION

The fourteenth annual general meeting of Walsall Conduits, Limited, was held on July 25th at Grand Hotel, Birmingham, Mr Albert E. Read (chairman) presiding.

The following is the chairman's statement circulated with the report and accounts:

It will be seen from the consolidated profit and loss account that the combined net profit of the parent company and its subsidiaries after making full provisions, including taxation on the basis of the legal liability to December 31st amounts to £147,581, as compared with £178,041 for the previous year. In making comparison with the previous year's results I would remind you that the profits of the company's principal subsidiary covered a period of 16 months from September 1, 1947 to December 31, 1948. Before providing for taxation the net profits earned by the parent company exceeded those of the previous year by approximately £11,000, but in the case of the subsidiary A. G. Hackney and Company, Limited, the net trading profit for the year 1949 amounted to £31,688, compared with £64,059 for the period of 16 months ended December 31, 1948. This fall in the profit was largely due to increased costs of both labour and materials and there was also some falling off in the demand for the type of porcelain products of the subsidiary, but steps are being taken to extend the range of its productions and I am hopeful that improved results will be obtained.

In my statement a year ago I referred to rising costs of production and shortage of labour and limited floor space. These conditions continue to apply but not, I am happy to say, to quite the same extent

FACTORY EXTENSIONS

The new tube mill is now in full production and working smoothly and well. New pickling and enamelling plants are in course of being installed and it is anticipated these will be completed by the end of the present year and will provide facilities for a substantial increase in tube output. Since 1945 approximately £100,000 has been expended from the company's liquid resources on capital re-equipment and expansion. The continually increasing demand for our products will necessitate further extensions in every department apart from the tube mills, the extensions to which are now nearing completion. The company's business is very complex, embodying grey, malleable iron and non-ferrous foundries, steel tube mills, galvanising, pressing and engineering shops, all of which are equipped with modern plant and machinery necessary for the production in the most economical way of a vast assortment of articles from the smallest pressing to the larger types of industrial equipment.

Prior to the war it was possible, and was the policy of your directors, to retain sufficient liquid resources to meet the cost of new plant and for development purposes. Today, however, the cost of such capital outlay is anything up to 400 per cent. higher than in prewar years and taxation now absorbs the liquid resources which formerly would have been set aside for such purposes. The maintenance of full employment is worthy of our greatest efforts but expansion of production and full employment must go hand in hand. This cannot be maintained indefinitely if the liquid resources of industry continue to be appropriated by the State in the form of excessive and penal taxation.

I am pleased to be able to state that production and sales so far this year show an increase of approximately 10 per cent. over the corresponding period of last year. These results have not been easily achieved; they are the result of experience and hard work and your directors thank and congratulate the management, staff and all the company's employees for their loyalty and support throughout the year.

The report was adopted.

WHITEHEAD IRON AND STEEL COMPANY, LIMITED

LARGER TRADING PROFIT

MR G. H. LATHAM'S STATEMENT

The forty-third annual general meeting of The Whitehead Iron and Steel Company, Limited, was held on July 25th at Newport, Mon, Mr G. H. Latham, LL.D., J.P., the chairman and managing director, presiding.

The following is an extract from his statement circulated with the report and accounts:

The trading profit for the year to March 31st last amounted to £762,706, an increase of £111,403 compared with the previous year. The profit before charging tax amounts to £766,356. Of this sum, considerably more than half, viz. £398,750, goes in taxation, leaving a net profit of £367,606, from which provision for a dividend and the replacement and modernisation of the plant must be made. The total amount distributed in dividend, namely £129,332 (net), represents 35 per cent. of the net profit, so that 65 per cent. (£238,274) is retained in the business.

CRIPPLING TAXATION

Taxation is crippling industry. The more modern the works the higher is the cost of maintenance and replacement, and the exaction of a sum which is more than half the profit is a short-sighted policy. We shall soon need all the competitive power we can command, and it behoves us to keep our plant in first-class order. Taxation as it stands today makes this extremely difficult, if not impossible.

After adding to the net profit (£367,606) the amount brought forward (£70,550), the total amount available is ... £438,156

Deducting:		
Interim dividend (12½ per cent.) paid ...	£53,883	
Final dividend proposed (17½ per cent.) ...	75,444	
Transfer to General Reserve recommended	225,000	
		354,332
There will be carried forward to next year		£83,824

The book value of the net assets now stands at £3,105,603, compared with £2,826,849 as at March 31, 1949, and the General Reserve will stand at £1,625,000 if the transfer now recommended is adopted.

SUBSIDIARY COMPANIES

Whitehead Hill and Company, Limited: The demand for our wire products fell off during the year, but the market is now showing distinct signs of recovery. The previous shortage of wire rods has entirely disappeared and the continuity of supplies has been safeguarded.

Brick Works: At the Llandowlais Brickworks we are producing some of the best bricks in the country and we have no difficulty in disposing of all our output for a long time ahead.

W. A. Baker and Company, Limited: Our modern Engineering Shops are fully equipped to undertake a wide range of engineering products. An agreement with a well-known U.S.A. manufacturer of paper-making machinery has proved to be very successful, and finished machines are being shipped to hard currency areas, thus making a valuable contribution to the export drive.

We have had an extremely difficult year in starting up the new Mechanised Foundry with untrained labour. The mass production of castings necessitated the finding of consumers in entirely new markets, which has thrown an extra burden on our Pattern Shops. It will be appreciated, therefore, that these factors have militated against my return, by way of profit, on the substantial holding of the parent company.

The company has an excellent reputation for ornamental structural work in wrought iron, steel, bronze, etc., and have recently executed important contracts for large ornamental gates, etc.

Godins, "The Rollers of Steel Sections" Limited: This modern factory is well equipped with rolling facilities for the manufacture of Cold Formed Sections in steel and non-ferrous alloys such as aluminium, duralumin, as well as stainless steel. A year ago there was a pronounced recession in the demand, but business is now much improved.

Courtybella Works: During the year the whole of our Hot Rolling Continuous Mills were in full operation, and the output exceeded the highest "peak" output previously achieved in the history of the company. The works are still contributing very substantially to the export market.

We have progressively re-designed and rebuilt our re-heating furnaces; and the electrical drives of all hot rolling mills have been modernised. The whole of the works at Courtybella are consequently in an excellent state of efficiency so that we are able to meet any competition in the manufacture of the products in which we are interested.

Cold Rolling Department: During the first three months of the year the demand for cold rolled material fell appreciably, but in the last six months the demand revived and the present position of our order book is healthier than it has ever been. Full-time working is assured for a very long period, and the excellent finish and quality of our steel ensures your company getting its full share of both the home and export market. It is interesting to note that our output in the year 1937-38, which was a "peak" production period throughout the steel industry, was more than doubled last year, so that you have every reason to be proud of the cold rolling mills now installed.

BRIGHT PROSPECTS

I am confident that the future prospects of the company are bright, and if the politicians will allow us to get on with the job without the atmosphere of uncertainty, we are quite able to contribute our full share to the record outputs which are being achieved by the steel industry as a whole.

In conclusion, I am happy to pay tribute to all employees, both of The Whitehead Iron and Steel Company, Limited, and its subsidiary companies. I cannot speak too highly of their enthusiasm and co-operation. During the year we have again been entirely free from labour troubles. Every man has worked well, with that loyal team spirit which is such a marked feature throughout the whole of the steel industry.

The report was adopted.

TRUST HOUSES LIMITED

INCREASED TRADE

The forty-seventh annual general meeting of Trust Houses Limited was held on July 24th in London.

Captain A. R. S. Nutting, O.B.E., M.C., the chairman, in the course of his speech, said: Our profit for the year shows an increase as compared with last year. This result will, I hope, be thought satisfactory. It reflects the first full year's trading of Brown's Hotel and of the Cairn Hydro at Harrogate, which was re-opened, after Government occupation, in May of last year. It reflects also—and this I think is the gratifying thing—a steady if unspectacular improvement in the volume of our trade in apartments and food in the majority of our houses.

It may be interesting here to look back and compare the company's business today with what it was for 1939, the year before the war. For the purpose of the comparison I must of course exclude Brown's Hotel and also the business of our associated company, the Surrey Trust. In 1939 the number of sleeper nights recorded was just over 1,000,000. In the year just completed, in approximately the same number of houses, it was 1,500,000. In 1939 the number of meals we served was about 5,000,000; last year it was just on 8,000,000.

COST OF IMPROVEMENT TO PROPERTIES

I draw your attention to the very large sum of money that we have had to spend on repairs and maintenance of our houses—no less a sum than £530,000. In addition, we have spent £62,500 on improvements. It is in total a very considerable figure and the present bright and cheerful condition of our houses after the dreary war and postwar years has, I am sure, a good deal to do with the maintenance of the volume of our trade.

Nevertheless, it is an alarming figure, for it reflects the sharp rise in costs and the effect of purchase tax. When we have caught up with postponed expenditure our charge in the profit and loss account under this head will be a very heavy one. It is worth noting that out of our very heavy spending last year on furniture and equipment 12½ per cent. went to the Treasury as purchase tax. The concession announced by the President of the Board of Trade the other day would help a few establishments, including, I hope, some of ours, but at the risk of seeming ungrateful I am bound to say that we should have much preferred a measure of relief in which all hotels and inns could participate.

CATERING BUSINESS

During the last year a lot has been said in many quarters about English hotels, not by any means all of it favourable. It seems to me that these comments have not made enough allowance for the industry's difficulties in the postwar years and for the effect of food rationing on hotel catering. It is apparently thought that catering establishments are better off than the housewife, but that is far from being the case.

You may expect me to say something about the effect of the removal of the restrictions on meals—that is, both the 5s. limit of price and the limit to three courses. Our figures do not show any real increase in spending per head. The customer is delighted to have a little more freedom of choice, but on average he does not want to pay any more. It is your company's policy to continue to offer a reasonable meal at a moderate price.

As to the prospects of business this summer, they appear to be reasonably good, provided world conditions do not deteriorate.

The report and accounts were adopted.

THE TRUSTEES CORPORATION, LIMITED

12 PER CENT. DISTRIBUTION MAINTAINED

The sixty-second annual general meeting of The Trustees Corporation, Limited, was held in London on July 26.

Mr L. A. Stride, the chairman, in the course of his speech, said: Once more we come before you with results which are satisfactory. At £282,359, gross revenue from interest and dividends for the year to May 31st last showed an increase of £19,383 compared with the previous year. In the year under review certain unusual factors led to the appreciable increase now apparent including devaluation last September. Even in a full year, however, devaluation will have relatively small effect upon our total revenue.

For the year now current, on the basis of careful estimates, we foresee no likelihood of a further increase in income from investments anything like comparable with that of last year. At home and abroad grave uncertainties prevail and we therefore are convinced that in accordance with past policy a cautious outlook is still clearly called for.

I give it as my conviction that at home on the part of the community as a whole there is no true comprehension of the continuing seriousness of this country's financial and economic situation. As was recently said in the House of Commons, there is still grave risk that the so-called "Welfare State" may ultimately prove to be the "Farewell State." For our own part, beset with the doubts and difficulties both at home and abroad which spring from political considerations quite outside our powers, we shall continue to manage your affairs with prudence and to the best of our abilities.

The report was adopted.

FORSTER'S GLASS COMPANY LIMITED

RECORD SALES

The thirty-first annual general meeting of Forster's Glass Company Limited, was held on July 21st in London, Major A. C. Bonsor presiding in the unavoidable abscence of the chairman (Colonel C. E. Ponsonby, T.D., D.L.). The following is an extract from the circulated statement by the chairman: The profit for the year amounts to £72,405, as against £69,147 last year. Your directors recommend that a dividend of 16¼ per cent. be paid on the ordinary shares.

During the year the volume of production and of sales constituted records in the history of the company. As far as the present year is concerned, the demand for your company's products continues at a satisfactory level.

In common with many other manufacturers we are now passing through a period of very difficult trading conditions. Our selling prices have remained stable since October, 1947, although since that date all costs to us have been steadily increasing.

The continued incidence of heavy costs over the past year and the additional items to be borne this year, left us with no alternative but to apply for an increase in our selling prices. There was every justification for a five per cent. increase, but the authorities concerned were unwilling, in view of the present economic position of the country, to allow us more than two and one-half per cent.

The permitted increase will not balance all our additional costs, and it is obvious that this will have an adverse effect on the company's earnings during the current year. Our plant and machinery is kept in a high state of efficiency and wherever possible new and improved technical equipment and methods are introduced.

The report was adopted.

OHLSSON'S CAPE BREWERIES

A NEW ISSUE

The sixty-first annual general meeting of Ohlsson's Cape Breweries, Limited, was held on July 19th in London.

Mr Geoffrey Dent (the chairman), in the course of his speech, said: The year under review has not been altogether free from difficulties in the conduct of the company's business. The profit on trading and rentals of the company and its subsidiaries for the year, after charging all working and management expenses but before providing for depreciation, amounted to £630,111. It is proposed to pay a final dividend of 17½ per cent. on the ordinary shares less income-tax, making 22½ per cent. for the year.

The trading profits show a decrease of £57,376, but it is satisfactory to record that net profit is only slightly below the figure for 1948-49.

Your board have decided that the time has now arrived when the provision of additional capital is desirable. It is proposed to offer for subscription by the ordinary shareholders 180,000 new shares of £1 each in the proportion of three new shares for every 10 shares held at the close of business on Monday last, July 17th. These shares will be provisionally allotted to the ordinary shareholders at a price of £3 10s. per share, which is approximately 10s. below the present market price of the issued ordinary shares.

The proceeds of the issue, which will amount to approximately £612,000, will be required to finance the company's existing commitments for capital expenditure, including the new Lager Brewery now in course of construction at Cape Town, a new bottling depot in Bulawayo in Southern Rhodesia, and a new depot at East London.

The report was adopted.

SAN FRANCISCO MINES OF MEXICO, LIMITED

The thirty-seventh annual general meeting of the San Francisco Mines of Mexico, Limited, was held on July 25th in London. Mr C. T. Pott, the chairman, presiding.

The following is an extract from the chairman's circulated statement:

The net profit for the year amounted to £628,525, against £503,141 in the previous year. The directors recommend the payment of a dividend of 5s. per unit.

During the year 1948-49 we milled 580,000 tons, against 503,000 tons in the previous year when operations were suspended for two months by a workmen's strike. The average grade of the ore milled was above that of the previous year and nearly equalled the average grade of our ore reserves.

Due to the shortage of underground workers, development on vein was restricted to some 4,000 metres, of which 40 per cent. was payable. Although the meterage developed was smaller and the payability lower than in recent years, the tonnage and the grade of the blocked-out ore reserve was maintained at over 4,000,000 tons averaging about 16 per cent. combined lead and zinc.

The mill and mine are now fully equipped to operate on a scale of 60,000 tons per month, which is 20 per cent. above the previous capacity, but so far there has been insufficient labour to enable the expanded capacity to be fully used. The labour supply, however, is now improving and it is anticipated that the current monthly production rate of 50,000 tons will be brought up gradually to 60,000 tons by the end of 1950, with of course, proportionate effect upon our earnings. Our strong financial position enables us to face the future with confidence.

The report was adopted.

G.R.A. TRUST

MR. F. S. GENTLE ON "GROSSLY UNFAIR" BETTING TAX

The twenty-second annual general meeting of The Greyhound Racing Association Trust, Limited, was held on July 27th in London.

Mr. Francis S. Gentle (chairman and managing director), in the course of his speech, said: The group's trading profit was £412,000, as against £519,000 in the preceding year. The fall in totalisator revenue, which we attribute mainly to the continued effect of the 10 per cent. Pool Betting Duty, was even greater, but we were able to counteract that to some extent by planned savings in operating expenses. Your board recommends maintaining the ordinary dividend at 30 per cent.

We regard the 10 per cent. Pool Betting Duty as a most unjust tax, striking only at on-the-course betting on greyhound racecourses. It seems to us grossly unfair that we should be taxed simply because we are easy to tax, but that seems to be the only reason for this discrimination. In addition, the results show that the rate of tax is much too high. Average attendances at greyhound race meetings at your tracks during the year to March 31, 1950, were less than 2 per cent. down, as compared with the previous year. But the totalisator turnover on average was 16½ per cent. down and the downward tendency still continues. To my mind these figures clearly show that the 10 per cent. tax is "more than the traffic can bear."

As regards the future, I am confident that your company is as well equipped as any to weather any difficulties.

The report was adopted.

WILLIAM HANCOCK AND COMPANY LIMITED

COLONEL J. G. GASKELL'S REVIEW

The sixty-third annual meeting of William Hancock and Company Limited was held on July 25th at Cardiff, Colonel J. G. Gaskell, T.D., D.D., chairman and managing director, presiding.

The following is an extract from the chairman's circulated statement:

The net profit for the year after all charges amounts to £78,474 compared with £86,449 for the previous period of 10 months. This is the more disappointing, because during the year our beer trade increased by 8 per cent., which is exceptional in comparison with brewers' turnover in some other parts of the country.

The profit reduction can be explained by many factors. In the Budget of April, 1949, there was a reduction in duty of 24s. a barrel, but of that 24s. brewers were required to find 3s. and in addition there was a loss incurred on the duty-paid stocks in the brewery. The cost of materials has increased; wages have gone up, and the cost of electricity and fuel was higher.

As a result of the April Budget this year, the gravities of all beers have been increased by three degrees. Whether this increase in gravity is going to produce increased output, I am very doubtful.

Since the devaluation of the pound in September, there have been increases in the cost of heavy fuel oil, petrol and railway freights.

On the brighter side of the picture we have shown an increase in sales, a great achievement which would under more favourable conditions have meant a profit increase.

The long overdue release of petrol from all restrictions will undoubtedly be of benefit to many of our residential hotels.

I am reasonably confident that we can look forward to some relief of the taxation burden in all its forms now borne by the trade and which in turn should increase the spending power of the public.

The report was adopted.

BARRY AND STAINES LINOLEUM, LIMITED

The ordinary general meeting of Barry and Staines Linoleum, Limited, was held on July 27, 1950.

Sir John N. Barran, Bt., the chairman, in the course of his speech, said:—

Both turnover and net profits have expanded. Our Canadian investment has given us the best dividend ever declared so far, and our French Company, despite many difficulties, has had another satisfactory trading year. We have been able to add a greatly increased sum to our contingency reserve. We have depreciated more heavily than last year.

We have restored the dividend on our Ordinary stock to its normal prewar rate. We have increased the rate of the bonus to our employees of all grades.

But we are all conscious that the trade barometer has already fallen. Control has been relaxed with pitiful and grudging slowness. There is no possible justification for the maintenance of price control for our industry.

Purchase tax is quite indefensible today on such goods as our industry offers. Even more indefensible is the seizing by Government of profits not distributed as dividends, but reserved for strengthening capital against the heavy replacement costs of the future.

DIRTY WEATHER AHEAD

Hampered as we still are by these conditions, we cannot count on the results of 1949 being repeated in 1950. What steps are we taking to prepare for the dirty weather into which our ship may well run? We are pressing forward with every fruitful plan of renewal, extensions and invention at our command. Scientific and chemical analysis, research and trials are hard at work. Our warehouses are derequisitioned and now re-opened; our travelling staffs are active again.

We are more than ever convinced that the spirit of co-operation, and a growing sense in the mind of the rank and file of British workers, of the dignity of individual labour and the share of individual responsibility, however modest, for the common result, are among the true main-springs in securing for productivity its full meaning and value. Self-reliance not subsidies, competition not cushions, should be the national watchword.

The report and accounts were unanimously adopted.

WHITEHALL ELECTRIC INVESTMENTS LIMITED

The twenty-eighth annual general meeting of Whitehall Electric Investments Limited, was held on July 20th at Winchester House, London, E.C.

The following is a summary of the report for the year ended December 31, 1949:

The consolidated gross income amounts to £145,425.

The valuation of the assets, excluding the London premium on U.S. investments, is as follows:

$6 preferred stock of American and Foreign Power	£1,317,915
Other investments at market prices	2,020,956
Unquoted investments	609,005
Gilt-edged investments and net floating assets	560,111
	£4,507,987
Deduct minority interest	185,561
Leaving attributable to the company, excluding any valuation of Athens	£4,322,426

The scheme of arrangement, which was approved by shareholders at meetings held on August 10, 1949, received the sanction and confirmation of the Court and became effective on November 11, 1949.

No dividend was received during the year on the $6 preferred stock of American and Foreign Power. In view of the rising dollar price of the shares and the advantageous rate of exchange, opportunity is being taken to reduce this investment.

The Greek civil war has been brought to a successful conclusion by the Government forces. The U.S. authorities have declared their intention to go forward with plans for the reconstruction and industrialisation of the country; but they have made the continuance of American aid dependent on the adoption by the Greek Government of administrative and fiscal reforms.

The Athens electricity company has pressed forward with extensions to its generating capacity and reinforcement of its distribution system; and, as a result of the $6 million loan granted under E.C.A. auspices, it has been enabled to place orders for further equipment to meet its immediate needs.

The transport undertaking suffered from increased competition by private buses, but some improvement in revenues has resulted from increases in fares.

The devaluation of the drachma in September, 1949 seriously affected the earnings of both companies, as they are wholly dependent on their drachma earnings to meet the cost of imported materials and to provide for amortisation and loan service in sterling or dollars. It has not yet been practicable to adjust tariffs to meet the consequent loss.

The report and accounts were adopted and the retiring directors re-elected.

MARTINS (DYERS & CLEANERS) LIMITED, Apperley Bridge, near Bradford, wish to appoint a Chartered Accountant to act as deputy to the company secretary. Applicants should be 28-35 years and with keen interest in industrial accountancy. The position involves considerable responsibility and carries very favourable prospects.—Write, stating age and details of education and experience, including service record, if any, and stating salary required, to Personnel Manager.

A PHARMACEUTICAL HOUSE of repute with offices in the London area wishes to appoint a person to be solely responsible for the purchasing of raw materials. Only candidates with experience and proved ability in purchasing chemicals will be considered. Salary is commensurate with high responsibility involved. The company's present employees have been notified of this vacancy.—Box 468.

REES JEFFREYS Studentship in Transport will be offered by the London School of Economics and Political Science (University of London) for award in October, 1950. The value of the Studentship is £200, tenable for one year.

The Studentship is not confined to University graduates, but is open to any person who has been engaged in the administration of transport, including road transport, or in the production of transport equipment or facilities.

Application forms, which must be returned by August 31, 1950, may be obtained from the Registrar, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2.

WANTED Qualified Accountant Secretary; salary four figures if suitable. Only personnel with highest references need apply.—Write Box I.Y.H., c/o 95, Bishopsgate, E.C.2.

FOR SALE.—Economist, Mar., 1949-Mar., 1950. Offers.—Box 481.

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 22, 1950, total ordinary revenue was £48,524,000 against ordinary expenditure of £49,641,000 and issues to sinking funds £46,000. Thus, including sinking fund allocations of £3,698,000, the surplus accrued since April 1st is £39,393,000 compared with a deficit of £11,533,000 for the corresponding period a year ago.

Applications are invited for appointment as Organising Tutor on the staff of the Department of Extra-Mural Studies, to take up duties in October, 1950.

Salary in the scale £540, rising by annual increments of £30 to £750 p.a., with prospects of promotion to a higher grade. Expatriation allowance for staff of non-tropical domicile is either £150, £200 or £250 p.a., according to salary. Point of entry in salary scale according to qualifications and experience. Superannuation on F.S.S.U. basis. Part furnished residential accommodation at not more than 10 per cent. of salary. Passages paid for members of staff and wives on appointment and on leave.

Applications (six copies) with the names of three referees should be sent to the Secretary, Inter-University Council for Higher Education in the Colonies, 1 Gordon Square, London, W.C.1, from whom further particulars may be obtained. Closing date August 18, 1950.

MARTINS (DYERS AND CLEANERS) LIMITED, of Apperley Bridge, Nr. Bradford, invite applications for the position of Personnel Officer. Commencing salary offered from £450-£600 according to qualifications and ability. Applicants must possess Diploma in Social Studies or equivalent or higher qualification and must have had two years' post-graduate experience of work in this field or similar.—Write stating age and full details of education, qualifications and experience, to Personnel Manager.

EXPERIENCED Cost-Accountant, Statistician (H, Polish), seeks an interesting and profitable field of activity. Fifteen years' experience in industry: Iron and Steel, Textile, Pulp and Paper, Leather and Shoe Factories. Comprehensive experience of standard and actual costing, modern organisation, budgetary control, statistics. Able to prepare confidential reports. Knowledge of English, German, French, Turkish. Sound background (B.Sc.Econ). Preferably abroad. Suggestions, advice, offers welcome.—Box 479.

BANKERS

We specialise in all financial transactions with The Netherlands

54, 55 & 56, Threadneedle Street, London, E.C.2

OUR APPOINTMENTS BUREAU WELCOMES ENQUIRIES

from Professional Men, Directors and Higher Executives who have vacancies for secretaries with a University standard of training. For interview by Employers, students are selected from among those who have completed their course with the full London College Diploma. In accordance with our established custom, no fees are charged for this service. Please write or telephone to:—

THE APPOINTMENTS DIRECTOR,

THE LONDON COLLEGE OF SECRETARIES

179, Queen's Gate, London, S.W.7. KENsington 3228.

SWINTON CONSERVATIVE COLLEGE

A seven weeks Residential Course will commence on October 18, 1950. The normal week-end Courses will continue to be held during this period.

The syllabus will consist of those subjects which are necessary for an understanding of current political questions and will include Economics; Social, Economic and Political History; the Constitution; Political Thought; Empire Development and Problems; and World Affairs.

In addition to lectures, including special lectures, the work will take the form of directed reading and individual supervision.

Applications for enrolment and further particulars may be obtained from the Bursar, Swinton Conservative College, Masham, near Ripon, Yorkshire. Telephone Masham 230.

INVESTMENT—SOUTH AFRICA. South African Finance, Insurance Organisation established fifty years, invites correspondence with Investors desirous extending operations South Africa, particularly Industrial, Property, Real Estate and Financial; no Stock Exchange or speculative business. Advertisers, are substantial Property owners, have extensive U.K. interests, in all respects undoubted. South African Director now visiting U.K. available interviews with view co-operation and participation. Absolute discretion assured.—Write Box N.870, Willings, 362, Gray's Inn Road, London, W.C.1.

IS national advertising "expensive"? It should not be, however much one spends—£1,000 or £100,000 a year—it can be a sound investment in prosperity. But it must be *good* advertising!—Consult Samson Clark's, 57/61, Mortimer Street, W.1. Museum 5050.

MARRIED WOMAN (26), honours M.A. in Economics and Mathematics, university teaching experience, also some administration, seeks employment in Edinburgh from October, 1950.—Box 467.

A Tithe for Safety

THE British public can consider itself fortunate that the sudden return of Mr Bevin from Eastbourne to Westminster last Thursday enabled the Government to defeat the Opposition's demand for a secret session of the House of Commons on defence. If Mr Churchill had had his way the public's desire to know the truth about British defence might have been frustrated. As it turned out, Mr Shinwell's review of Russia's military strength, combined with Mr Churchill's sombre estimates of the weakness of the western powers, has given the same kind of shock to public opinion as was given by the revelation of Britain's military weakness at the time of Munich. The facts which the Government have for so long refused to reveal are now in *Hansard*. Russia is maintaining an active army of 175 divisions of which one-third are mechanised and tank divisions with at least 25,000 tanks. This force is backed up by 19,000 aircraft, including modern jet bombers and fighters, and in addition Russia has a strong force of submarines. While pursuing "war by proxy" in the east at a minimum cost in terms of Russian formations and equipment, the Kremlin could assemble from this total an army to hurl against the West which could be met by a force no larger than the twelve divisions and four to six thousand aircraft which Mr Churchill and M. Reynaud have estimated as the maximum effective first-line strength of Western Europe—an estimate from which Mr Shinwell did not dissent. Apart from the American lead in the manufacture of atomic bombs, a weapon whose effect upon the strategic course of a war with Russia is quite unknown, the West is as inferior in front-line strength in relation to Russia as it was in 1939 in relation to Germany. The British public at last knows the grim truth.

It is very difficult indeed to imagine what Mr Churchill thought he could secure by a secret session that would have been of equal value to the effect upon public opinion of the speech he made in public. Whether or not the Government have been right hitherto in supposing that public opinion is opposed to more drastic measures of defence, there can be no question that they are wrong now. Indeed, a situation has been created that is almost comically like that of the Chamberlain period of the late thirties. The more the Government try to reassure the public that nothing will be done to disturb "business as usual," the more the public is alarmed.

It is true that the Government are not quite so immobile as the first provisional figure of an extra £100 million suggested. It was always fairly obvious that that figure was the barest beginning, and the new Memorandum which is published as we go to press contains much larger figures. Over a period of three years, it is now proposed to spend £3,400 million, of which by far the greatest part will be found at home, although the United States is asked to assist with dollar grants. The pre-Korea rate of expenditure was £780 million a year, so that the increase is to be of the average order of £353 million a year. In short (as was assumed in these columns last week) the proportion of

the British national income to be spent on defence is to go up from about 8 per cent to about 10 per cent, or roughly the same proportion as the Americans are proposing for themselves—a tithe for safety.

This begins to sound as if the Government meant business. And yet it is difficult to feel wholly reassured. A large part of the memorandum is devoted to arguing that the new plans are "the largest programme practicable within the period envisaged and without restoring the direction of labour" and other aspects of a war economy, or without disturbing "the continuance of economic recovery." These rotund generalities do not set any absolute limits. Whether or not a given increase in defence expenditure would require the direction of labour depends entirely upon whether or not any other form of expenditure is to be cut. It would seem, therefore, that the Government's order of argument is first to decide that nothing that is now going on is to be stopped, then to calculate how much more can be squeezed out of the economy by higher productivity or otherwise; and finally to declare that this is the maximum that can be afforded. This, surely, is the wrong way round. In no single phrase of the memorandum is there, even by implication, any assurance that what is planned will be enough to do the job. A sum of £3,400 million sounds very large. But, averaged over three years, it is an increase of less than half over present expenditure. Some undisclosed part of the increase, moreover, will go in higher rates of pay for the existing forces which, necessary though they are, do not represent a real increase in the volume of defence. If the present rate of expenditure has left the West so defenceless, will some 40 per cent more be enough to create the minimum of effective defence?

Yet this is not the main ground for dissatisfaction. The planned ultimate scale of the West's defence programme is not nearly as important as the speed with which it is to move. To preserve the peace, enormous forces later on are much less needed than an effective minimum immediately. The overriding and obvious necessity at this moment is not to mortgage a large further slice of the national output to defence, but to put as sharp a cutting edge as possible, as quickly as possible, on the 10 per cent or thereabouts already committed. But speed is another matter on which the memorandum says next to nothing, and the Prime Minister's remark in last week's debate that

> it is unlikely that the increase in the actual outlay on defence during the next few months will be so large in relation to the national budget as to require special new counter-inflationary measures to be put into operation during that period

sounds very much like an intimation that it will be quite a time before any of the new money is spent—and before the new programme will have any effect on the defences of the country. The note of complacency, the insistence on orderly procedures, are ominously reminiscent of 1939-40. No disturbance that is caused, and no money that is spent, in saving a month or two, will be one-hundredth part as upsetting or as costly as failure to be in time.

There is another dangerous delusion of which the British Government cannot fairly be accused, though it seems to be very widespread elsewhere in Europe. This is the delusion that America will provide arms for all. The Korean war has exposed the fact that the American forces are suffering from the same defects as the British and European and to bring paper formations up to a standard of warlike efficiency, it will obviously be necessary for some time to come to devote almost all the increased American production of weapons and aircraft to the United States forces themselves. The most that can probably be spared for the British and European defence forces is second-hand equipment. But if the fighting in Korea shows that semi-obsolete American equipment is not good enough to stop the forces of a Russian satellite, by how much the less would it be effective against aggression by Russian armies and air forces themselves? American rifles and steel helmets may be of some use to an army like the French, which has had to build from the ground up, but a gift of Sherman tanks or Boston bombers will not bring the forces in Western Europe or the Middle East up to anything like the necessary pitch of effectiveness. American help is, indeed, an essential part of any consistent attempt by the western nations to put themselves into an effective posture of defence. But the British Government's memorandum is realistic when it speaks of "materials, machine tools, components and balancing items from the United States itself" and "dollars which can be spent in any part of the world." The major part of the job will necessarily have to be done at home.

★

There is almost no sector of the British system of defences which does not need considerable strengthening. The air defences of Great Britain, the mobile defence of Western Europe, the defence of the Middle East, the creation of a mobile reserve to resist aggression wherever it may next occur in the Far East, all these can present cogent claims to be given first priority. But to try to do everything at once would be self-defeating. It is necessary to establish a rough-and-ready system of priorities which can be explained to the public, to industry and to the services so that a steady and demonstrable improvement in the strength of defences can begin.

It is not within the knowledge of the layman to say exactly what these priorities should be. But the most important of them is clearly recognised in the memorandum: important though men may be, "the most urgent need is to increase the production of defence equipment." There are large potential reserves of trained men, and even if there were not, both the world wars have shown that large numbers of men can be trained quickly. But there are very few weapons, apart from small arms, which can move from the drawing board to the fighting services in under three years. This does not, of course, mean that the question of manpower can be ignored. The need for more formations of trained and equipped men is now no longer a theoretical possibility, but a pressing reality. It may even be necessary to increase the period of compulsory military service. But that would be a *pis aller*, and the public would be right to resist it until a real attempt has been made to make regular recruitment definitely attractive. Ministers are examining the question of service pay; it is to be hoped that, for once, the Treasury will not persuade them to be niggardly. No one can be sure that really attractive rates of pay will do the trick; but it is very unlikely indeed that the trick can be done without them.

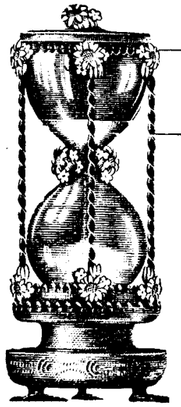
The main emphasis, however, must be on material and not on men. Within this main priority, there is of course need for sub-priorities. Here the layman is very quickly out of his depth. But there are two principles that he can the more properly insist upon because the experts are prone to ignore them. The first is that an expanded defence programme must emphatically not be an opportunity for every branch of the three services to get a little of what it wants. The test of the Ministry of Defence lies in what it can keep out of the programme; every additional penny provided for heavy bombers or for anything naval that does not fight submarines should be regarded with the utmost suspicion.

The second principle is that there must be no perfectionism leading to delays in design. What is needed is weapons in a hurry, and they can be too good as well as too many if making them so involves delay. The sound line is obviously that of reinforcing success. For the first time in its history, the British Army has, in the Centurion, an all-purpose tank which will stand comparison with any others, and the British aircraft industry has at least two first-class types of jet fighter. What is needed now is a steadily expanding production programme of these and other successful types so that the maximum number of field formations can be equipped, not with a perfect weapon but with the most serviceable modern weapon available. Second to this requirement is the need to bring forward as speedily as possible the actual production of the major defensive weapons, those of pure defence like the anti-submarine craft and aircraft or the anti-tank gun, and those of offensive defence like the rocket bomber.

It would be wrong ever to write on these matters without expressing the disgust that every peace-loving man and woman must feel when faced with the necessity of turning once again to the ways of war, barely five years since the end of the bloodletting. Memories inevitably go back to the rearmament programmes of twelve and fourteen years ago, and it is only natural to ask oneself whether there can be a different outcome this time. The similarities are depressing. But there are also decisive differences, the chief of which is that the overwhelming strength of the United States is, this time, included in the mobilisation. There is a very real basis for believing that, this time, "defence" need not become a mere mealy-mouthed euphemism for war, and that war preparations can be the most effective expression of the will for peace.

Schuman Plan Progress

FIVE of the six governments discussing the Schuman plan in Paris are signatories of the Atlantic Pact and the defence of the sixth—western Germany—is obviously one of the western allies' first preoccupations. Nevertheless, it does not seem that the change in climate brought about by the Korean war has yet had much effect upon the discussion of the plan. The emphasis in the free world at large may have switched from economic recovery to military preparedness; it is possible that, in the short run, the most likely prospect will be steel shortages, not the feared steel surplus; but, so far at least, these changes have not been registered in the Paris talks.



The reason is not any remoteness or withdrawal of the negotiations from practical reality. The negotiating governments have not built a cloud cuckooland and withdrawn into it. The change in emphasis brought about by the Korean war affects primarily the economic aspects of the plan. The political need to create a more united Europe has certainly not changed—unless to become more urgent—and it is upon the political side of the proposals that the emphasis of the negotiations has so far been placed. The prime movers in Paris—the French and German delegations—frankly recognise that the political aim of unity overrides all others. They are reinforced in their conviction by the evident support and approval of the United States. In their speeches to the Assembly last week, M. Pleven, M. Schuman and the socialist leader, M. André Philip, went out of their way to underline the need for political union in Europe and their hope that the Schuman plan would prove a stepping stone towards it. The worsening of the international scene and the greater risks to which Germany is apparently exposed have, therefore, become added arguments for carrying through the Schuman plan.

The political emphasis has ensured that the examination of the economic aspects of the plan is only just beginning to be undertaken by the technical experts assembled in Paris. So far, the negotiations have turned upon the political issue of the machinery by which the plan will be administered. It will be recalled that the original French plan would have given virtually all executive power to the High Authority but proposed that it should be flanked by two other organisations—an assembly composed of deputies chosen from the various national parliaments which would meet once a year to receive reports from the High Authority and could by a vote of no-confidence secure its resignation; and a semi-judicial body, a court of arbitration, to which governments and individual interests differing from the High Authority could take their complaints. These two subsidiary bodies have been retained in the discussions, and the most important modification introduced into the French draft—largely on the insistence of the Benelux countries—is to set up a new body, a Council of Ministers (probably composed of finance and economic Ministers) which will work side by side with the High Authority and carry the responsibility for the wider political issues which the working of the plan is bound to throw up.

This move clearly restores a measure of governmental control. The whole point of the High Authority was that its members should be men of international standing and technical competence, who would not consider themselves to be the representatives of the governments. A Council of Ministers can only be a body representing separate national interests. But the difference that this change may make to the working of the scheme cannot be known until two things are made clear. The first is the methods of reaching decisions in the Council of Ministers. The second is the division of function between the two bodies. The procedures for voting in the Council have not yet been decided. There appears to be general agreement that the unanimity rule—which gives each separate government what is in effect a power of veto—would defeat the purposes of the plan; the most canvassed procedure is that decisions should require a majority of three-quarters. On the other hand, some delegates have been particularly anxious to include effective safeguards for local interests. One suggestion is that a government should be allowed to veto any proposal which affects its own country and no other. Such a concession may be necessary. Equally, however,

it could defeat any attempt to secure rationalisation by closing down inefficient local industries. It is perhaps to some extent with this difficulty in mind that the delegates are examining the possibility of creating regional industrial groupings which cross national frontiers and in which adjustments would not necessarily be at the expense of only one participating nation. The difficulty here is that while it is true that to respect national frontiers may not provide the most efficient and suitable location of industry, it does not always follow that the opposite policy—to create groupings which always cross national frontiers—will automatically fare better. There appears, for instance, to be no way of dividing the industrial complex of the Ruhr which does not involve a loss of efficiency.

The demarcation of powers between the High Authority and the Council of Ministers has been very fully discussed and a provisional division suggested, but it is difficult to believe that there will not be a good deal of alteration and modification before the final pattern is determined. Broadly speaking, the present idea is to hand over to the High Authority the technical problems raised by the industries themselves while the wider political and economic repercussions of the pooling of coal and steel will be the responsibility of the Council of Ministers. But the technical problem that is not susceptible of raising wider repercussions hardly exists, and *a priori*, a division on these lines suggests that, however much the Council and the High Authority are designed to be partners of equal standing, the practical working of the scheme may tend to give the dominant influence to the Council.

From the Hour-glass to "TIM" . . .

The earliest use of the Hour Glass may have been to time the Philippics of Demosthenes. But the Managers of the Sun Fire Office were amongst the first to use this device in affairs of business. During their meetings in the days of Queen Anne, an Hour Glass on the Board Room table limited their expenditure of that precious asset—TIME.

THE HOUR GLASS has given place to the electric clock—visual or telephonic—but the Sun Insurance Office has never ceased to offer the essentials of Insurance—security and service—even more important to-day than in 1710.

SUN INSURANCE OFFICE LTD · FOUNDED 1710 ·

The Centuries-old Sign of Public Service

Head Office: 63, Threadneedle Street, E.C.2
Branches and Agencies throughout the World

The key to the High Authority's effectiveness in producing a rationalisation of European coal and steel lies, naturally, in the extent to which it would be permitted to influence prices and the policy that it then pursued. If prices were maintained at a level permitting the most inefficient producers to remain in business, then the Schuman Plan would bring no gain in more efficient output or in cheaper coal and steel for the consumer. The decision has apparently been taken to leave the fixing of prices to the proposed regions. The producers and consumers in each region will agree on a "fair" price and this price will then be submitted to the High Authority for its approval, rejection or modification. The Authority will also have the task of co-ordinating the price proposals of the different regions. This procedure clearly leaves loopholes for the maintenance of high prices and its corollary, the fixing of production quotas for the various producers. Inevitably, the tendency of the industrial advisers, consultants and representatives is to slip back into this familiar pattern of the cartel. But governments, which are trying to transcend the notion of guaranteed markets and prices, have allies in the steel consuming industries. In France, they have been at the mercy of a particularly close and restrictive cartel, the *Comptoir des Produits Sidérurgiques*, and support M. Monnet and M. Schuman in their attempt to break the local French cartel by international means.

Provided the price policy of the High Authority tends in the direction of renewed competition, its next important function will be to set up and administer the temporary fund designed to succour those producers who are in danger of being squeezed out by competitive pressure. Where producing units are clearly uncompetitive, the fund is to arrange the provision of capital for starting up alternative employments and for retraining the workers. Where only equipment and methods are out of date, the fund is to have the task of providing the funds for modernisation. The policy is apparently to finance the fund out of a levy upon the more efficient producers. Only in its working will it be seen whether the fund is a genuinely dynamic force or degenerates into an agency of subsidisation for sub-standard enterprises.

Another vital function of the Authority, and one which the French have stressed from the outset, is to be a source of fresh capital for European coal and steel. Many industrialists, particularly in Germany, have great hopes of considerable American investment. It is believed that the prestige and the guarantees the High Authority can offer will attract American capital and that the fresh investment can then be made in the best interests of the entire European industry. Many of the delegates also wish it to be laid down that all investment in the heavy industry by other governments, even within their own territories, shall use the channel of the High Authority. Investment by national governments has in the last five years been to some extent responsible for the threat of overlapping and redundancy in the European steel industry. National programmes are often determined by politics and prestige more than by economic considerations, and if the High Authority were to become the sole channel, this type of uneconomic over-investment could be checked. No decision has been reached in the Paris negotiations on the question of private investment. Even if it is not formally controlled, it will inevitably be very considerably guided by the surveys and the information services of the High Authority.

These, then, are the main functions of the High Authority that have emerged so far in the discussions. But the effectiveness of most of them would turn upon the use the Council of Ministers were prepared to make of the powers conferred on them. Indeed, the whole Schuman Plan turns upon the willingness or unwillingness of the Governments to abolish all tariffs, quotas and restrictions of every sort on the free movement of European coal and steel and to create a completely open intra-European market for these commodities. This, after all, is the essence of the plan and it is surely significant that once this fundamental decision has been taken, its manner of implementation and the review of its consequences in the economy at large are all apparently to be the responsibility of the Council of Ministers—a governmental or at least a semi-governmental body.

The delegates have also recognised that another condition of free competition and a free market—comparable standards of wages for the workers involved—also involves political decisions and economic repercussions that go far beyond the limits of the two basic industries. A rise in the wages of coal miners and steel workers in certain countries must have its effect upon the wage level in other industries, some of which will undoubtedly tend to rise in order to preserve existing differentials. Here, too, the issues appear to go beyond the competence of the High Authority and may be handed on to the Council of Ministers.

It should perhaps be added that, although such a development has not yet been discussed in Paris, the military demands of Western Europe are bound to become another responsibility of the Council of Ministers. To discuss rearmament without including the role of heavy industry is indeed to play Hamlet without the Prince. The issue cannot be determined by the High Authority and will inevitably fall to the lot of the political Council. It is at this point, incidentally, that certain delegations see the best hope of quietly associating Britain with the Schuman Plan. To accept a joint armament programme without a joint planning of industrial resources would seem to be lacking in realism. It is, therefore, by this practical side door that the Europeans hope to see Britain enter the Plan.

This, then, is the general picture that has so far emerged from the Paris talks. It will be seen that the issues raised have been largely political and in so far as questions have been decided, virtually every decision has been taken on political grounds. The delegations are now at work on the technical and economic implications of a free market for European coal and steel, but the hidden reefs and obstacles have barely risen above the tide of debate. That they exist is not in question. But it can be said with some certainty at this stage that they will not be permitted to stand in the way of the completion, in some shape or other, of the proposed merger. What they can do, however, is very considerably to modify its scope and effectiveness. These possibilities will be examined in a further article.

Income Tax Reform

WHEN the British cease to grumble at the income tax, they will have no pleasures left. There were no reports of dancing in the streets after the Prime Minister's announcement ten days ago that a Royal Commission is to be appointed to inquire into "the whole of the present system of taxation of profits and income, with particular reference to the taxation of business profits and the taxation of salaries and wages." The British art of governing by Royal Commission is deliberative rather than speedy, and a full-scale examination of the income tax is about the toughest job that any Royal Commission could undertake. There are many admirable qualities about the British tax code. It tries, more than any other system, to treat taxpayers equitably according to their circumstances, and it succeeds—at a price. This price is incredible technical complexity, which only expert tax practitioners can hope to unravel. In 1927, it was hoped to cut through this jungle. A Committee was appointed with the double assignment of codifying and simplifying the tax law. It was nine years labouring at this impossible task and produced in the end a report characterised by a former Commissioner of Inland Revenue as "one of the worst reports ever to come from so many competent individuals."

A wide inquiry into the effects of all taxes on income (largely wages and salaries and business profits) is certainly overdue. The last Royal Commission was in 1920; it produced a few reforms but was also responsible for two errors of judgment. A modern tax reformer always has to work under the restraint of a qualifying term of reference which duly appeared in Mr Attlee's statement—"keeping in mind the need for maintaining the revenue." Modern governments may not always in future take it upon themselves to spend over two-fifths of the nation's income; but they are unlikely, whatever their political colour, to spend very much less unless the nation decides in favour of major changes in social policy. Until that happens, tax reform can only mean making the incidence of high taxation as equitable and economically tolerable as possible, with little prospect of major relief.

Much has been made since the war of the disincentive effects of PAYE. It is said to dissuade wage earners from putting out greater effort or working longer hours because, after a given point varying according to the size of individual incomes and families, the tax collected from an extra pound of wages increases sharply. Similarly, the professional man is reputed to look twice at extra work which may, if he already earns £3,000 a year gross, leave only three-eighths of his extra income after he has paid income tax and surtax on it. No doubt such considerations do affect the decisions of workers who are near the margin between lower and higher tax rates. No doubt, too, it would be possible to exaggerate these effects. But PAYE (which is levied on all wage and salary incomes above the exemption limits) is due for review. It has been running for six years, to the inestimable convenience of the revenue. It has secured the current taxation of nearly three-quarters of all personal incomes, and produces a third of the total income tax assessed under all schedules.

The tax authorities are not likely to let go such a rich discovery. Yet, apart from its administrative ease and certainly of collection, PAYE invites some questions. In 1948, there were 8,650,000 incomes in the range

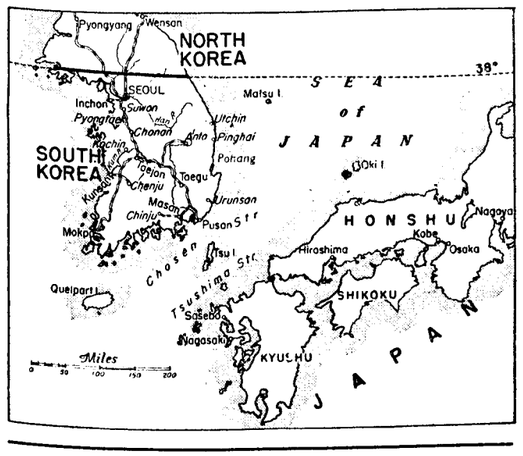
between £250 and £499. This is by far the biggest block of personal incomes in the taxable range; it accounted for £2,929 million out of a total of £8,541 million, and it can be regarded for practical purposes as comprising the bulk of wage incomes subject to PAYE. Whatever may be said about the disincentive effects of PAYE on marginal earnings, the fact is that only 5.4 per cent of this total block of income was taken in taxes, compared with 14.7 per cent. of the next block (£500 to £999) and 25.6 per cent for the £1000 to £1999 block. The £250-£499 block has quadrupled in numbers and total gross income between 1938 and 1948; many in this group pay no tax, or very little, because their allowances offset any liability, and those who pay tend to think in terms of "take home" wages and to dissociate them from gross wages from which PAYE has been deducted. The social and economic implications of this attitude of mind will provide a rich field for study by the Royal Commission.

★

As for the disincentive effects of moving upwards through the reduced rate areas—when a man finds himself paying, say, 6s. instead of 3s. on his next pound of taxable income—there are two changes that might be considered. The first is to base PAYE deductions on the previous year's assessed income; this would mean a more or less equal weekly deduction, irrespective of the size of the week's income, but it is open to all the old objections to assessment in arrear. The second is the set of proposals (and the variations on them) devised by Lady Rhys-Williams, and first described in these columns at the end of 1943. This scheme aims at a "private income" for all to be paid by the state, in combination with a flat rate income tax to be paid to the state from all wages and salaries without exemption limit. This amounts to social insurance and PAYE rolled into one, financed by a simple wages tax (for that is what the proposed flat rate of 6s. 8d. amounts to). There is no straining after pure equity in this scheme; it pursues the other alternative of simplicity. One of the obvious psychological difficulties is the proposal to deduct 6s. 8d. in the £ on all incomes (offset, of course, by "private incomes" amounting in the case of a married couple with two children to £2 17s. a week); such an effective rate does not apply at present to a taxpayer with wife and two children until his income exceeds £2,500. If simplicity were to become the keynote of the British income tax, equity would have to be rough. A certain roughness can be admitted so long as the effective rate of tax is low. But would the proposed rate be low enough? It is certainly to be hoped that the Royal Commission's terms of reference will be wide enough to consider and pronounce upon this scheme and its possible variants; it has many attractions and presents as many difficulties.

The Prime Minister's statement described the supply of new capital to industry as a matter of "vital importance." High taxation and a satisfactory flow of personal savings are incompatible; the supply of new capital has beyond question been critically impaired. There are, too, all the problems of defining what "profits" really are. Most economists would argue (though many accountants would deny) that a "profit" cannot truly be said to have been "earned" until full provision has been made to replace capital—both fixed assets and working capital—used up in the business. Here again there may be a conflict between what is equitable and what is practicable; but it is urgently necessary to stop the erosion of real capital that has been caused by the high taxation of "profits" which are really capital in another accounting dress. The Tucker Committee has spent the best part of a year taking evidence on the computation of business profits for income tax purposes, and its report is expected before the end of the year. This is apparently "to be taken into consideration" by the Royal Commission—which hardly suggests that urgent action is contemplated. Some industrialists are content to suppose that the doubling of the initial allowances in last year's Budget meets these points. If it does, it is only because those who hold this view turn a blind eye to the future; the 40 per cent (like the 20 per cent before) represents only an acceleration of wear-and-tear allowances and the Chancellor himself has recognised that the doubling is only an expedient to assist industry with ready finance to meet the higher cost of replacing assets instead of having to wait—in the now familiar phrase, the initial allowances represent "an interest-free loan."

An article in *The Economist* of May 20th examined the main points submitted in evidence to the Tucker Committee, and there is probably no need to rehearse them again. Its public proceedings, conducted with a certain friendly informality, underlined the great difficulties of tackling even one branch of the income tax. A full-scale inquiry will almost certainly have to cover afresh a good deal of the ground about the proper definition of business profits. In addition, it will have to examine the Profits Tax and test the contentions of those (*The Economist* among them) who hold that a special additional tax on distributed profits, on top of income tax and surtax, is unjust and a tax on undistributed profits positively iniquitous. And it will presumably have to consider the taxation of income from the ownership of land, houses and buildings under Schedule A, now based on imputed annual values dating back to 1936 which are economically irrelevant to present day conditions, and are in process of revision. Its terms of reference should certainly be wide enough to pay particular attention to the tax difficulties of private companies and firms which are "director-controlled"; these concerns experience the worst impact of income tax, surtax and death duties as personal liabilities of their directors and are all too often unable to make satisfactory provision for the sustenance of their own trading capital. The problem here is to find a way of strengthening the contribution of small businesses to the nation's output without opening the door to tax avoidance.



All these are complex and controversial matters. Equity is a fundamental quality of the British taxation system; to weaken it would be controversial, and to strengthen it would introduce still greater complexity. But after a certain point is reached, the refinement of equity can cost more than it is worth; it leads to fantastic tangles that can be unravelled only by highly qualified tax officials and professional advisers and yet bring in only a small return to the revenue. The easiest way of cutting out this waste and releasing energies for more productive purposes is to reduce the total tax demands of the Government. But that is a matter of policy that far transcends even the reform of the income tax. The Royal Commission will have to consider the facts of the British fiscal burden as they are, and make suggestions for the disposition of that burden in the least damaging way. They are likely to be long over their labours.

NOTES OF THE WEEK

Critical Stage in Korea

The race against time in Korea has become critical. The United Nations' forces have been thrust back virtually to their last defence line and for a time it seemed that the North Koreans by a quick thrust down the west coast had been able to pierce even this final ring. A Communist spearhead was reported at Masan, within 30 miles of Pusan, the essential American supply base, and was checked only after bloody fighting in the region of Chinju.

This ominous situation, which is in curious contrast with the optimistic releases coming from General MacArthur's headquarters in Tokyo, is relieved by one thing only—the arrival of greater American reinforcements, including the first units of the Marines. It remains to be seen whether this addition of tough, determined manpower can make good

the still dangerous disparity between the numbers engaged on each side. But it is already clear that the Americans have lost none of their capacity for tremendously speedy and successful improvisation. Writing in 1941 Mr Churchill had occasion to question a statement by the Chiefs of Staff:

> that one division could not be transferred from Great Britain to Ireland in less than eleven days, no matter how great the emergency nor how careful the previous preparations.

Yet the Americans have managed, in not much more than three weeks, to establish a supply line across the Pacific ocean. The Russians would be well advised to consider the implications of such imposing logistics.

★ ★ ★

Mr Malik Comes Back

An end has been put to the United Nations "crowded hour of glorious life," during which nearly fifty nations rallied under its leadership to the condemnation of an invader and the United Nations flag waved over forces put into the field for the one aim of checking aggression. No more quick and decisive action need be expected from the Security Council. Soviet Russia has returned and taken its seat.

The return of Mr Malik to assume the office of president for the month of August is the Kremlin's tacit admission of a major blunder. By absenting itself, the Soviet Union permitted the free world to use the machinery of the United Nations to express its common purpose. No Soviet veto checked the condemnation of the North Korean aggression or the subsequent endorsement of American action in support of the South. As a result, Russia lost some of the initiative in a vital field—propaganda to world opinion.

To repair this error was no doubt the first object of Mr Malik's return. But almost as strong a Soviet motive must have been to continue the process of confusing and confounding the issue of Korea with that of the representation of China on the Security Council. The attempt made by Pandit Nehru to persuade the Soviet Government to cooperate through the Security Council in a peaceful settlement for Korea, provided Communist China were admitted to the Council, served notice on the Kremlin of a lively division of opinion in the free world, and Mr Malik's first action on opening the August session of the Security Council was to declare that as president, he did not accept the credentials of the Nationalist Chinese representative. He was immediately defeated on a point of procedure by eight votes to three, both the United States and British delegates pointing out that the credentials of a Council member could not be determined by the fiat of the president. Yet the Russians may well have felt that the manœuvre succeeded, since India, the chief independent spokesman of Asia in the Council, voted with Mr Malik.

The Security Council will now become a weary scene of futile dispute. Its brief spurt of action and effectiveness is at an end. Now it reverts to its old function—that of acting very largely as a forum for Soviet propaganda. For this reason, however, the free nations would do well to consider carefully their policy for the political representation of the Chinese people. The Russians are on strong ground in the eyes of Asia when they claim that the Nationalist representative, Dr Tsiang, represents nothing, and accuse the United States of supporting forces which have been driven, for very weakness and corruption, out of their own land. The issue must, no doubt, wait until the Korean incident has been settled. But the present position is an anomaly benefiting only Russia and should be brought to an end with all speed.

★ ★ ★

Moscow's Dream War

Seen through the eyes of Tass and Radio Moscow, the Korean conflict is a model war between the toiling masses and the capitalist-imperialists, conducted in a Marxist-Leninist-Stalinist dream world. Moscow has a ready-made theory of how wars start and what happens thereafter, and if the facts do not conform to the theory, all the worse for the facts.

The Korean war, according to Moscow propaganda, began because the American imperialists had decided the moment had come to pass from active preparation for war against the peoples striving for liberation, to acts of open aggression. Why had the capitalist-imperialists taken this step? Because, as every student of Marx-Lenin-Stalin knows, the United States, like every capitalist country, was sunk deep in economic distress, the toiling masses were restive under a constantly sinking standard of living, and unemployment had soared to staggering totals. Capitalist contradictions between the Americans and British were acute, as each fought for the other's markets. North Korea was needed by the Americans as a market for their surplus consumer goods, and was marked down for exploitation of its resources of raw materials, such as iron ore and graphite. The reason why the Washington beasts launched their cannibalistic aggression was thus as clear as Marxist mud.

The subsequent course of events has naturally followed the

Kremlin's pattern of wars as they should be. America's action has been met by a mighty movement of the masses the world over, thundering the people's demand for an unconditional end to American intervention in Korea. The wrath of the peoples, secure in the knowledge that behind them stands the great bulwark of peace, the Soviet Union, is hurled at the warmongers. The answer from the ruling classes is savage terrorism directed against the "Partisans of Peace."

In all this, the United Nations has created a discordant note. Moscow was clearly nonplussed by the swift and unexpected support given to the United States. It was, of course, "illegal," according to Russian accounts, but nevertheless it fitted extremely awkwardly into the Marxist picture. In the third week of the war, however, Moscow rallied. No less than twenty nations had refused to send troops to aid America. The United States, owing to the vast movement of the masses, stood isolated. No nation dared raise a finger in its aid for fear of their fury. After an embarrassed pause, Moscow gave the news that Britain had, after all, undertaken to send troops to Korea, under the "greatest pressure" and because the Americans were "ingloriously retreating."

As the war entered its fifth week, the Russian people were told that the Americans, who had counted on a quick victory to crown their aggression, were now faced with the prospect of a long, protracted campaign. But the main lesson to be drawn from the first month's fighting was that even an aggressor armed to the teeth was powerless against a united people. This week, the Moscow propagandists, reeling slightly, have had to announce, after a pause to rewrite their directives, that the Soviet Union was back at the Security Council. Once more, Stalin's work for peace was applauded, they said, by the toiling masses of the world.

How much, one wonders, does Stalin believe of all this stuff and nonsense? The question is extremely important, for on his assessment of the support of the public abroad may depend his decision whether or not to risk a general war.

* * *

New Problems for the Atlantic Powers

In the last six weeks something of a revolution has taken place in the relations between the members of the Atlantic community, and so far they are clearly very far from realising all its implications. The fears and worries with which Europe has lived for four years—fear of an American recession, fear of a general fall in employment, fear, above all, of the dollar gap—have now been very largely banished. There will be no American recession with $23 billion of armament expenditure added to an economy already operating very nearly at capacity. Nor will unemployment worry nations straining everything to rearm in record time. Inflation, not deflation, is the future enemy. And President Truman and Congress between them have exorcised the spectre of a dollar shortage for some time to come. The 1950-51 allocation of Marshall Aid—just under $3 billion—is likely to pass through Congress substantially uncut. The $1.2 billion already authorised for military assistance to Europe will probably be appropriated speedily. In addition the President has also asked for $4 billion, of which the major part would be spent in Europe. All in all, some $7 or 8 billion may be finding their way across the Atlantic in the next twelve months.

If old problems have vanished, new and intractable difficulties have taken their place. How is the need for further European recovery to be balanced against the urgent need for arms? The Foreign Ministers of the Western Union powers, meeting at the Hague this week, have agreed that defence must, where necessary, be the first priority, but what, in fact, does such a decision entail? And where does the distinction lie? For instance, improvements to ports, to transport, to power plants or steel mills can perfectly well be regarded as contributions to defence or to recovery. In which case, would it not be more sensible to extend the authority of ECA over both the Marshall Plan and the Military Aid Programme? Or should ECA and OEEC together become the War Resources Board of the Atlantic Council?

One thing seems clear—that unless the armaments needed for defence can be secured by increased output, some economic advantages must be curtailed. For this reason, the difficulty of securing "equality of sacrifice" has come to the fore in recent weeks. The French have proposed a common fund for defence into which each nation would, presumably, contribute a percentage of its national income. The French are also reported to be speaking of a "pool of manpower," which would entail the use of more British and American divisions in Europe. All these preoccupations remain to be clarified, but the main issue is already clear—that effective defence is possible only in a pooled and unified Atlantic effort.

A Sop for Merseyside

When Mr Harold Wilson seized the occasion of the opening of a new carbon-black plant on Merseyside to announce a "special relaxation" of the capital investment restrictions for the benefit of new enterprises in the Development Areas—Merseyside in particular—and other favoured localities he provided one more straw to show in what direction an ill wind is blowing. There are, of course, circumstances in which the policy of "taking the work to the workers" rather than shifting the workers, or leaving them to shift themselves, to the work is as economically unexceptionable as it is humanly desirable. Since, however, the measures by which it is put into effect almost by definition involve placing enterprises in situations less favourable, less conducive to low costs, and therefore less competitive, than those which would spontaneously have been chosen, the burden of proof that these circumstances exist should always rest squarely on the proposers of that policy.

To enforce high-cost production is already bad; to divert capital resources from the production of the more essential to that of the less essential (not, be it noted, by the despised criteria of the market, but by those of the planners themselves) is worse. That is what Mr Wilson's "relaxation" amounts to; "within the total investment resources available to the community" enterprises which do not satisfy the strict dollar-earning or dollar-saving criteria may go forward if they satisfy certain other criteria relating to employment. By inference, other enterprises, which do satisfy the "dollar" criteria, must, since total investment remains limited, be held back.

It would take a very desperate employment situation, the situation of a Jarrow or a Rhondda Valley fifteen years ago, to justify such a paradox. There is little evidence of such a situation on Merseyside or elsewhere. The shipyards are as busy as they have ever been; the coalfields are clamouring for any miners made redundant by the closing of worked-out pits; the steel and tinplate industries need suffer no lack of work through reorganisation; and while there is an undeniable unemployment problem around the Liverpool docks, many enterprises within a ten or fifteen-mile radius are short of workers. In such circumstances to issue an open invitation to would-be producers of the relatively unimportant to come forward and receive the Board of Trade's blessing is to push further than ever the principle that labour's privilege of immobility should be regarded as more important than either the higher standards which accompany lower costs or the considerations of solvency embodied in the "dollar" criteria. No version of full employment policy could in the long run be more thoroughly self-defeating.

A National Wage Board?

A recent Fabian pamphlet, "A Policy For Wages," by Mr Allen Flanders, raises a number of interesting questions. It tackles a question which every prewar Socialist writer, and far too many postwar ones, have shirked; how, under full employment, "can the public interest in the outcome of collective bargaining be made effective without destroying the voluntary system or weakening the trade unions?" Mr Flanders is ruthless with existing half-answers. "*Laisser faire*," he says, "cannot be abandoned in other vital sections of our economic life and retained on the wages front." The argument cannot be sidetracked by reference to excessive profits; these can be dealt with otherwise than by wage increases, and the problem would remain if they did not exist. Nor is that problem a merely temporary matter of balance-of-payments difficulties; were these overcome, the wrong wage policy would re-create them, and its disastrous internal implications would in any case remain. To assign a proportion of the national income to wages in general and entrust the TUC with its distribution between industries, as suggested by the "Keep Left" group, would fatally impair both the TUC's independence and its relation with its membership; "objective" determination of wage rates by "job evaluation" would be incompatible with union freedom even were it practically possible; arbitration through anything like the existing machinery would be hopelessly piecemeal.

Here is a salutary clearance of rubble which is long overdue. Mr Flanders's own proposal is for a National Wages Board to "supervise" (a term which may mean much or little) both the decisions of statutory wage-fixing bodies and voluntary collective agreements, to act as the final arbitration authority, and to inquire into reform of the existing wage structure. Its objectives shou'd comprise the avoidance of inflation and deflation in so far as wage movements affect these, a simpler, more rational wage structure, the establishment of a national minimum, and (cautiously) the use of wage rates to implement the manpower budget. There are holes in this proposal. It leaves the right to strike in the air—though this may well be the only place for it; one of the proposed objectives, the national minimum, is an economic monstrosity; and it does nothing to remove the fundamental inflationary drive of over-full employment. One may indeed say that nothing short of complete regimentation could permanently curb the pressures generated by employment at today's levels in today's context of immobility and rigidity; but any excess of jobs over job-seekers—and no full employment policy can either promise an exact balance or, without self-contradiction, acquiesce in deficiency—will generate pressures of some force, and it is possible that Mr Flanders's proposal might be able to deal with them. Thus the very indefiniteness of the board's powers and relationship to existing machinery is in its favour. An authority resting on confidence, gaining strength from experience, persuading rather than coercing, is well in the democratic tradition—and is more likely to focus responsible judgments and to isolate irresponsibility than any economic Star Chamber. In this field it is important, probably essential, that initiative should come from the Left. It will be interesting to observe the impact of Mr Flanders's proposals on Socialist thought.

* * *

Scientific Employment

The third report of the Advisory Council on Scientific Policy (Cmd. 7992) confirms the findings of the Ministry of Labour that, except in chemistry and chemical engineering, the output of qualified scientists and technologists from the universities is near to meeting the demand, and that in some branches of scientific employment there is likely to be a temporary surplus. In spite of this the council maintains its original view that whatever temporary maladjustments there may be the long-term interests of British industry demand that there should be an expanding supply of university-trained men and women in industry, both for research and for administration. The long-term wisdom of the council and the short-term demands of industry might have produced an uncomfortable hiatus during which many young people encouraged by their universities to be scientists would find it hard to get a job. However, it now seems likely that the needs of even a modest measure of rearmament and increased defence preparations will come to the rescue of the scientists. If the development of certain weapons, for instance, heavy anti-aircraft guns and their very elaborate control systems, continues at its present rate there will be an acute demand for electronic and electrical engineers both to make and to fire them. Fortunately for the nation the universities are now producing twice as many applied scientists as in 1939.

On the much-disputed subject of higher technological education the council has now ventured a slightly more positive opinion. In its report last year it gave only the most lukewarm support to the concept of independent colleges of advanced technology "as a long-term policy." After a year of public discussion ending with a conference arranged jointly with the Royal Society, they are now prepared to say:

> We therefore think that as soon as the resources, material and human, can be employed without detriment to the work in applied science which the Universities are now doing, it would be prudent to establish one or more colleges of applied science, with suitable governing bodies of their own, but fitted into the university system.

This is the sort of sentence which both parties to the argument can quote to their own advantage. It does, however, indicate a slight hardening of opinion within the council on Scientific Policy and since it is an influential body, it is possible that after the usual interval during which Whitehall slowly masticates and digests a new idea some action on technological colleges will be forthcoming.

* * *

King Leopold Retires

Ever since King Leopold and his advisers chose to interpret a 57 per cent majority in the referendum on the King's position and a 48 per cent Christian-Socialist majority in the recent election as an invitation to the King to return to Brussels, it could be foreseen that his resumption of his royal prerogatives would be the signal for grave disturbances. Beneath the calm of Belgian politics lie genuine cleavages—between Catholic and rationalist, between working class and conservative, between Fleming and Walloon. The King's policy, his choice of advisers, his reliance on a single party were all calculated to exacerbate these latent differences. So much any unbiased witness could have foretold. What is surprising is the strength of the reaction.

From the first demonstration which brought the opponents of the King, headed by M. Spaak, to the gates of Laaken ten days ago, a rising tide of violent opposition threatened to sweep Belgium into civil war. The Government forbade meetings, recalled troops from occupation duty in Germany, barricaded the streets and used truncheons and mock bombs to disperse demonstrators. The attempt was useless. Strikes spread in Antwerp and Brussels. In the violently hostile industrialised regions of Wallonia, there was virtually a general strike. Crowds ignored the decrees prohibiting public meetings and in demonstrations at the week-end three men were shot dead by the police. By this time, the workers in Wallonia had organised a general march on Brussels and there were growing undercurrents of Walloon separatism and republicanism—fostered by the Communists—in the angry protest of the masses.

By Sunday, two things had become apparent—that only the King's disappearance would restore peace to the divided country and only his rapid disappearance would prevent the situation getting out of the control not only of the Government—so much had already occurred—but of the Socialists

themselves, who, while leading the opposition, were attempting to keep it in order and out of the hands of the Communists. It was probably this realisation that brought the Catholics, the Liberals and the Socialists together in an attempt to persuade the King to agree to an abdication. The negotiations were long and acrimonious, but a compromise was at last reached in the small hours of Monday morning as the first of the Walloon demonstrators marched into the city. The King agreed to cede his powers to his son, Prince Baudouin, immediately and to abdicate in September, 1951, when the Prince comes of age. In return the Socialists consented to abandon the demand for immediate abdication and for Leopold's immediate departure from the country. They also had to accept a clause making abdication in 1951 conditional upon the achievement "of the promised reconciliation round the person" of Prince Baudouin.

The Communists attempted to denounce these terms as a "betrayal," but after a difficult meeting, M. Spaak succeeded in persuading the crowds massed in Brussels that immediate abdication as opposed to deferred abdication was not worth the spending of blood and of lives and that the essence of their demands had been achieved. With that, the danger of civil war receded and there is now a reasonable chance of restoring Belgium's impaired peace and unity.

* * *

Japan and the Korean War

The American military expedition to Korea was originally undertaken with forces drawn from the occupation army in Japan and, though reinforcements are now arriving in Korea direct from the United States, Japan remains the forward base of operations for both the Americans and any other United Nations contingents participating in the campaign. The political situation within Japan itself has thus become of even greater importance than it was before the outbreak of the Korean war. The attitude of the Japanese people and their political leaders must be regarded as one of the key factors in Far Eastern affairs, even though Japan is at present disarmed and subjected to (a now substantially reduced) American military occupation.

The Japanese Communist party has been virtually outlawed since the purging of its leaders which was decreed under the terms of the original occupation directive excluding anti-democratic politicians from public life. The purged leaders, however, have disappeared and gone underground, so that a campaign of violent revolutionary activity may break out at any time, including attacks on American supply bases and occupation troops in Japan. The question is how much sympathy the Communists may be able to gain among those Japanese, who are not Communists in the strict sense of the word, by their pose of representing Japanese patriotism and the cause of national independence against an American domination. It is the Americans and not the Russians who have been occupying and controlling Japan since September, 1945, and docile as the Japanese have outwardly been under the benign rule of General MacArthur, there have been many signs in recent months that their national pride has now recovered from the demoralisation of defeat and will not be content with anything less than a restoration of national sovereignty. To this new unrest have now been added two other potent factors—first, the desire of Japanese industrialists for re-entry into the Chinese market, which Peking has been using as a political lever to embarrass the American authorities in Japan and Mr Yoshida's Cabinet; and, second, the reverses suffered by American arms in Korea, which, as long as they last, cannot but create doubt of the power of America either to coerce or to protect Japan.

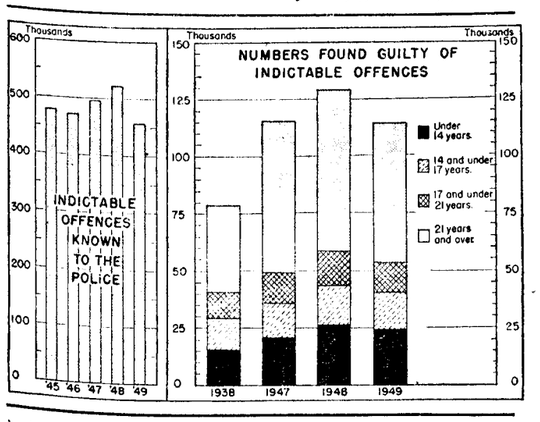
Most serious of all is the attraction of Communist promises of a re-militarisation of Japan for ex-officers of the Japanese army. No prospect of a rebirth of the Japanese army has so far been held out from the American side, but a former Japanese general and other officers who joined the Communists after the war are reported to be serving with the North Koreans, and it is understood that a Communist Japan would, like East Germany, be allowed by Russia to build up its own armed forces. It is probably in order to counteract this propaganda that the Prime Minister, Mr Yoshida, who is certainly anti-Communist and anxious to co-operate with the western democracies, has now made a speech opposing the idea of ceding bases in Japan to any foreign power in the prospective peace treaty, while at the same time insisting that Japan's security must be provided for. The implication, though not directly stated, is clearly that Japan must be enabled to defend itself by its own strength.

* * *

China Helps Viet Minh

Reports from Indo-China suggest that the Chinese Communists are now training Viet Namese in camps across the border north of Laokay—a situation that ominously recalls the guerrilla training camps set up in Bulgaria and Jugoslavia during the Greek civil war. The situation in fact is not entirely dissimilar, in that the rebel Communist movement in Indo-China certainly relies for its hopes of victory on aid in one form or another from neighbouring Communist territory. This aid is now arriving in the shape of arms and equipment, particularly much needed mortars and light artillery—though the Chinese still cannot spare any aircraft. In Indo-China, however, as formerly in Greece, the Communist forces must now face the certainty of a growing volume of American aid to the government forces. An official mission under Major-General Erskine and Mr Melby of the State Department has arrived in Indo-China and presages the speedy arrival of the promised aid, which will probably be expanded as a result of President Truman's increased arms programme.

Nor is the increased strength of the government forces only a matter of military equipment. Some indication of the degree of success lately achieved by the Bao Dai regime in rallying Viet Namese opinion against the Communists has been given by recent Viet Minh radio broadcasts. These bitterly complain that Bao Dai's followers "are transforming the Franco-Viet Namese war into a civil war"—it used to be readily branded simply as a national revolt against the French.



It looks at present, therefore, as if another Viet Minh guerrilla offensive is the most that may be expected for the moment; an invasion by the Chinese does not yet appear to be an immediate threat, and, in spite of the camps above Laokay, the French chances of making military progress during the next few weeks are quite good. A very great deal, however, still depends on the quality as well as the independence of the Bao Dai government. Progress has been made, but Indo-China has still to solve the two main problems that confront every non-Communist regime in Asia —how to fortify opinion against the fear that, by invasion or by infiltration, the Communists will win in any case. The second is how to accept and use foreign assistance without laying the government open to the charge of being a "toady of Wall Street."

* * *

Measuring Crime

The Criminal Statistics for 1949 for England and Wales (Cmd. 7993) which were published last week show a welcome decrease in the volume of crime from the peak year of 1948. The total number of indictable offences known to the police declined from 522,684 in 1948 to 459,869 in 1949, the lowest number since the war. The number of juvenile offenders found guilty of indictable offences has also decreased, the largest decrease being in the number of those between the ages of 17 and 21. The number of boys under 14 found guilty is still very high—21 per cent of the total of all guilty persons—but even this figure is an encouraging decline from that of 1948.

In other respects, however, the statistics are disturbing. Offences against the person, with the exception of murder, are steadily increasing. There were 17,250 crimes in this category in 1949 as compared with 16,105 in 1948 and an average of 7,200 in the four years before the war. The largest percentage increase has been in unnatural offences—there were more than twice as many in 1949 as in 1948—and

in indecent assaults. The number of murders declined from 147 in 1948 to 119 in 1949; seven murders remained unsolved at the end of the year. The number of suicides increased slightly: 4,653 (2,998 men and 1,655 women) in 1949 as compared with 4,604 (2,900 men and 1,704 women) in 1948. It is interesting to note that by far the largest proportion of suicides—nearly half the total—are committed by people over the age of 60.

A useful supplement to the statistics shows the distribution of crime throughout all police districts in England and Wales and particularly the distribution of juvenile delinquents. The tables are of special value to organisations which are trying to deal with the problem of juvenile delinquency on a national scale. The Home Office is to be congratulated for its enterprise in producing them, though the tables would have been even more useful if it had been possible to compare, district by district, the number of offenders in each age group with the total number of persons in that age group. If such a comparison were available, it would then be possible to make a rough assessment of the criminal tendency of children in any particular district.

* * *

Cruelty in the Home

A joint circular to local authorities from the Home Office, the Ministry of Education and the Ministry of Health deals with a subject that has agitated public opinion ever since the Curtis Committee reported in 1946. That committee was concerned with the 200,000 or so children deprived of a normal home life. It did not, however, cover those children still in their own homes but living nevertheless in conditions of squalor, neglect or cruelty. Towards the end of last year, the House of Commons passed a resolution asking for an inquiry into these cases. It was refused by the Home Secretary mainly on the ground that a working party was already looking into the extent to which the existing machinery for helping the children concerned was being used. The new circular to local authorities is the result of the working party's findings.

It has always been held, officially and unofficially, that children should not be removed from their parents except as a last resort. All the substitute homes that come within the province of the children's committees of the local authorities are rightly regarded very much as a desperate remedy, and if the right action could be taken in time the need for them would dwindle. To find the right action is, however, not so easy. The circular suggests, in brief, that there should be more co-ordination between the statutory and voluntary services. This should be achieved by the appointment of an officer to whom all known cases of child neglect and ill-treatment should be reported and who would arrange for regular meetings of the voluntary and statutory services at which the cases, and the needs of the families concerned, should be considered and the best way of helping them decided on.

Co-operation of this sort should eliminate the duplication of visits paid to unsatisfactory families by a bevy of officials and voluntary workers—a duplication that often goads the parents to fury or obstructive resentment. The cases of pure neglect should, in particular, become more tractable. (The provision of home helps may be expensive, but it is far cheaper than the cost of maintaining a child in a children's home.) It is the cases of cruelty, particularly of mental cruelty, that are so difficult to treat. What can official or voluntary action do to help the unloved, unwanted child in an otherwise respectable home or to prevent parental quarrelling? It is these cases, so often ending up in the juvenile courts, that seem designed to defeat the most intricate machinery for child care.

The Covenant in the Motor Trade

At the end of June motor traders generally were startled by a High Court decision in the case of *Monkland v. Jack Barclay, Ltd.* In May, 1946, Mr Monkland ordered two cars and settled down to wait for his turn to receive delivery. In August, 1946, the British Motor Traders Association devised its present scheme under which any retail buyer of a new car must covenant not to sell it during the twelve months following its delivery. Mr Monkland was informed of this change of circumstance but declined to enter into any such covenant, on the ground that no such scheme had been in force when he ordered his cars. One car, a Rolls-Royce, was delivered to him free of covenant in February, 1948. That he immediately sold and realised a profit of £1,150. The other car ordered was a Bentley; a week or so before the Rolls-Royce was delivered Bentley Motors themselves removed Mr Monkland's name from their list of waiting customers and the car that might have been allocated to his order was delivered to someone else. Learning of this, Mr Monkland sued the trader with whom he had placed his orders and recovered £1,500 damages for failure to deliver a Bentley car at a time when it was obvious that one had been available for someone in his degree of priority as a buyer.

As a result of this decision, the position of the motor trader seemed suddenly to have become most awkward. If a trader delivered a car to a customer without requiring the standard covenant against a re-sale, the Motor Traders Association would be free to place him on its "stop list" and all supplies, not only of new cars but also of spare parts, would at once cease. On the other hand, apparently any customer who had placed an order before the covenant scheme was announced was free to decline to give such a covenant and, if he were then refused delivery of a car, could recover damages for his lost profit on re-sale. To clear the position, another firm of motor traders sued the Motor Traders Association for a declaration that the covenant scheme was

unenforceable, since it compelled motor traders to break existing contracts. The first hearing resulted in a dismissal of the claim. By arrangement an appeal to the Court of Appeal was expedited and the Court of Appeal gave judgment last week, which has confirmed the original decision. The court has held that the covenant scheme is not against public policy, that it is enforceable against the motor trader and that he must, in consequence, face the risk of actions for damages by customers who claim delivery of cars free from covenant.

The outlook for the motor trader is not, however, quite so black as it looks. First, no customer who placed an order after August, 1946, when the covenant scheme was announced, can have much hope of establishing that he did not know he would have to sign a covenant when he was offered delivery of his new car. Second, the Court of Appeal took the view that the circumstances in Mr Monkland's case were very special and prevented its general application, and that a dealer still has some discretion as to how he allocates amongst his customers such cars as he receives from the manufacturers. There is also the practical consideration that the vast majority of those who have ordered cars, and waited years for delivery, have every intention of using those cars themselves and are therefore prepared to accept a twelve-month restriction on their right to sell them.

Shorter Notes

The Medical Act, which received the Royal Assent before Parliament adjourned last week, has three main purposes. First, it gives effect to one of the recommendations of the Goodenough Committee on medical schools, which reported in 1944, by providing that after qualifying a medical student must have a period of service in a hospital or similar institution before being placed on the medical register and allowed to take up independent practice. It is to be hoped that, as a corollary to this obligatory internship, the General Medical Council will do something towards pruning and revising the whole medical curriculum before the obligation comes into force. The other main proposals concern the council itself. Its constitution is to be altered, to allow a greater representation by election from the medical profession. Secondly, its disciplinary machinery is to be altered, and doctors, whose names are erased from the register, are to be allowed to appeal to the judicial committee of the Privy Council.

*

Parents who send their children on their own initiative as fee-payers to private and independent schools must now abandon the hope of grants. It had been hoped that local authorities might be allowed to make grants equivalent to the cost of educating these children in state schools, but Mr Tomlinson destroyed their hopes on July 21st. In answer to a Parliamentary question he stated that he could not sanction flat-rate grants based on the assumed cost of tuition in a maintained day school. Those who claimed that they were doing a service in relieving the congestion in maintained schools are thus defeated.

*

It is something of a portent that the International Co-operative Alliance should have decided to launch a quarterly magazine, soon, it is hoped, to become a monthly, devoted entirely to the protection of the consumer against monopoly and monopolistic agreements. The first number of this review, entitled *Cartel*,* contains an excellent survey of "Cartels in Retrospect and Prospect," a pertinent critique of the Monopolies and Restrictive Practices (Inquiry and Control) Act and of the Monopolies Commission which it set up; an article on international commodity agreements and another, cautious but not carping, on the Schuman plan; together with briefer material on current clashes in various parts of the world between monopolistic organisations and the law or the co-operative movement. Well written, well produced, and remarkably objective, this little periodical is doing an important educational job—though the somewhat dreary connotations of the word "educational" should not be inferred. In Britain the educational aspect of the co-operative movement has become entirely secondary. Elsewhere it has fortunately kept an importance of which *Cartel* is a welcome reminder.

*

Last week the High Court refused to make an order requiring the chairman of convocation of London University to call a meeting of convocation to consider the refusal of a university school to renew the appointment of one of its lecturers. The reason for the court's refusal was that the proper body to require, or not, the summoning of convocation was the Visitor of the University, in the case of London His Majesty in Council, and that the court would not interfere with a matter domestic to the University where there was a domestic remedy available to any member aggrieved. The case arose from the decision of the School of Slavonic and East European Studies not to re-appoint a Mr. A. Rothstein to his lecturership.

* *Cartel:* obtainable from International Co-operative Alliance (Publications Department), 14, Great Smith Street, S.W.1. 10s. net per annum.

Schleswig-Holstein

There has been a great battle in Schleswig, and future historians will speak of a "famous victory." . . . The prosperity that Schleswig-Holstein has enjoyed from a long peace is now at an end; its harvests are beaten down, its pleasant dwellings made desolate, the country devastated, and the people slaughtered, for a name or a theory. Claims there are on one side to new privileges or larger liberties, and on the other claims of old and hereditary sovereignty, which makes little account of the people; but on neither side is there great and substantial wrong or denied rights, on neither side are the duties of sovereign and subject neglected; but a shadowy claim on one side of almost valueless independence, and on the other of nominal sovereignty, suffice, under misdirected zeal or erroneous opinions, to expose the people to all the ravages of war. That this is the ultimate consequence of the ferment in the German mind of foolish theories, and probably of those notions of a great empire and of political unity which have been fostered by writers both in Germany and in other countries, we do not suppose, but we hope it is the last battle which will spring from such chimeras. . . . The Schleswigers require to be united with Germany, as is Holstein; the Danes require Schleswig to remain united with Denmark, as it has been for some hundred years; but these conflicting claims of the people and their Sovereign might surely have been settled without appealing to the sword. All the Powers of Europe have, in fact, interfered to settle the dispute, and, much to the disgrace of diplomacy, have rather exasperated than reconciled the parties. . . . The result is a bloody battle, in which it is said not less than ten thousand human beings have been killed or wounded, and Schleswig seems likely to remain in connection with Denmark, as it was before the two years' dispute had begun and the battle had been fought. . . . Liberty cannot now be won by a hired military force, nor can the affections of a people and the secure possession of a country be obtained by an army. Some other means must in the end be found of settling the dispute between the Schleswig-Holsteiners and the Danish Government than the sword, and it would be better to employ them before than after using it.

Bowater mark...

BOWATERS reproduce here a newly registered trade mark. The arrow stands for precision, purposefulness, and integrity; the wings for drive, impetus, and service; the water for the covering of distances — symbols which represent correctly the aims and policies of the world-wide Bowater Organisation.

BY entries made in the Trade Marks Register, the subsidiary companies of the Organisation in this country which sell the production of the Bowater paper and board mills, either in original or converted form, have been recorded as Registered Users of the mark.

BESIDES being used to identify goods manufactured by or for its registered proprietors, the mark will be seen on the properties and equipment of the Bowater Organisation, and will be used as an advertising symbol.

Letters to the Editor

Fuss About Formosa

Sir,—Your article on Formosa completely ignores the strongest argument against the American decision to support Chiang Kai-shek, namely, the effect on public opinion. In the last resort the strength of any government or political movement depends on the willingness of people to support it. It is completely unrealistic to reckon up the strength of opposing positions while forgetting that international politics differs from chess in the ability of the pawns to change their colour.

The Kuomintang in Formosa has an even worse record of oppression and corruption than it ever had in China. It has antagonised even conservative Chinese opinion by the blockade and its air-raids on Chinese cities. The decision to support Chiang Kai-shek must, therefore, greatly increase the popular support that the Chinese Government could obtain for the most extreme anti-American and pro-Russian policies. In the areas of the world where Russia and the West are competing for support, this decision must seem to many people to support the thesis of Russian propaganda that the West's claims to stand for democracy are hypocritical.

To oppose totalitarianism by supporting democracy is a policy which, though difficult, does lead in the direction of a stable peace. To oppose left-wing totalitarianism by supporting right-wing police states which have not got even the active minority support that can make Communist or Fascist police states comparatively efficient is an expedient quite as futile and dangerous as any appeasement policy. If the United States considers that strategic necessity compels it to secure Formosa against Communist occupation, steps should at least be taken to replace the Kuomintang administration by one which can make some claims to govern in the interests of the people of Formosa.—Yours faithfully,

MICHAEL LINDSAY

The Berlin Congress

Sir,—May I, as General-Secretary of the Berlin Congress for Cultural Freedom, make a few comments on the remarks of Mr H. R. Trevor-Roper, who attempted to correct the fair and balanced article of your correspondent. Mr Trevor-Roper is apparently under the impression that a group of "ex-communists" argued and debated at the Congress as a fixed and determined fraction. His account of both who these "ex-communists" were and what points of views they represented is inaccurate. He begins by lumping Koestler, Burnham, Hook, Borkenau, and some unnamed others into one camp. This is a convenient fiction created for polemical purposes. There were, in fact, among the former Communists present in the Congress (a small minority, by the way) men and women who today hold the most divergent opinions.

The summary of opinions which this group is alleged to have held is, I am afraid, little short of absurd in its oversimplification. "That all old politics are now useless." The most that anybody ever tried to argue was that *some* fundamental aspects of "old politics" are today useless. "That the only present political issue is Communism or anti-Communism." The most that anybody ever tried to argue was that this issue was one of the, or perhaps *the*, most important one facing the world today. "That all those who are not Communists must therefore unconditionally support those who have the will and means to attack Communism." I doubt whether this could be substantiated. All of us present at the Congress were "not Communists"; all of us had the will, and as writers all of us had the means to attack Communism, and all of us did by agreeing to the various resolutions and the final manifesto. Unconditional support was a notion foreign to the whole tenor of the Congress; and the very idea of ever abandoning democratic checks and controls, and the right of criticism, is explicitly rejected in Point 7 of the Manifesto. "Koestler particularly attacked the Socialist alternative as no better than neutrality." This is a misrepresentation. What Mr Koestler had said was that the apparent policy of the present British government in maintaining a certain aloofness from continental affairs was contributing to a situation of West-European weakness and even despair in which the neutrality idea could flourish. And what is that programme that the ex-Communists will have nothing of? "Tackling by liberal methods the problems which Communism wrongly claims to have solved." Is Mr Trevor-Roper truly under the impression that Burnham would be against slum-clearance in Harlem, or that Koestler would reject raising the salaries of the railroad workers in France?

I want especially to correct the false impression that "the British delegation succeeded *in killing* the clause advocating intellectual intolerance." There was no such clause in any Congress document. There was an awkward phrase to the effect that "totalitarian ideologies which deny spiritual freedom do not enjoy the right to citizenship in the free Republic of the Spirit." But there was general agreement on its withdrawal because of its stylistic imprecision. The implication that thereby book-burnings were prevented in London, Paris, and New York, is a product only of Mr Trevor-Roper's somewhat melodramatic imagination. There was a democratic unity achieved at the Berlin Congress. This unity comprised two main groups, one group putting the emphasis on militant resistance against the threats from the East, the other group putting emphasis on enterprising reconstruction of the West. Somewhere in this international unity there is place for all the democratic elements, whether of the "left" or the "right."—Yours faithfully,

MELVIN J. LASKY, General-Secretary,
Congress for Cultural Freedom
Berlin

Methods in Research

Sir,—In your review of Sir Leo Page's book "The Young Lag" and in your earlier comment on my own "Delinquency and Human Nature," there might seem to some readers to be a suggestion that since our studies were not primarily *statistical* our conclusions were lacking in validity. Statistical techniques, however, do not form a method of science in themselves; they are not alternative but complementary to other techniques of investigation, and in fact are only one of those which the scientific method embraces. The important thing, without which years of research may be irrelevant, is to know at which point in the development of any branch of knowledge one should utilise the one technique or the other.

There is a contemporary tendency to regard "the statistical method," and above all the control-group technique, as the only method. The result is that investigations are planned on statistical lines before the essential relationships and processes have been studied. The prerequisite of any planned testing of hypotheses is a phase of observations that will suggest which are to be tested. A failure to do this means that the investigator accepts, implicitly or explicitly, the traditional hypotheses, and only looks for the facts which are relevant to them. He thus ignores data which earlier investigators, because they were inconvenient for their hypotheses, also disregarded. His whole approach, in short, rules out the possibility of new discovery or of new synthesis. Nor can a new hypothesis be produced by an examination of statistical results alone, for a hypothesis is a description of a complex of relations, and its medium is that of concept and not of number.

I was careful to point out that my study consisted in an exploration of those relations in the mental sphere which might account, among other things, for the hitherto unexplained irrationality of delinquency. In other words my task was the framing of new hypotheses. I further show in detail, first, that if I had adopted the traditional control-group technique without a feasible hypothesis to test, many of the really significant factors would have lain undetected; secondly, how most of the statistical studies of the inheritance of insanity had been a waste of time because the investigators had failed to take account of the possibility of "environmental transmission," i.e., failed to observe what the children of unbalanced parents might have to put up with

May I further point out that I define my factors and give them quantitative assessment. In other words, I was in the position of a laboratory worker intent upon finding out what actually happens, but also making my observations in a form which the statistician can handle.—Yours faithfully,

D. H. STOTT

Books and Publications

The Bear and the Orient

The Rise of Russia in Asia. By David J. Dallin. *Hollis and Carter.* 293 pages. 18s.

The English edition of the first of Mr Dallin's two books on Russia's Far Eastern Policy (the second dealing with the period since 1931 has already appeared) comes at a moment which could hardly be more opportune. It is half a century since Korea was last a storm-centre of world politics; and it is well worth being reminded of the occasion. But the book does more than give its readers a chance of drawing parallels of lesser or greater accuracy and relevance. With its companion volume, it forms the only continuous narrative available in English of the whole story of Russia's Far Eastern activities from the beginning until almost the eve of the present conflict; and although these books are by no means faultless, they are certainly indispensable.

At first sight the present work divides sharply into two parts. The first, which carries the narrative down to the Russian Revolution, is fairly straightforward diplomatic history for which much first-hand material exists in the published archives of the Tsarist and other governments. The second part dealing with the very complicated relations between Russia and her far eastern neighbours from the Revolution until the Japanese invasion of Manchuria is of course based on materials that are far less complete. Only the United States among the great powers has published much relevant official material; and on the Russian side, Mr Dallin is obliged to rely rather heavily on such sources as the memoirs of the ex-Soviet diplomat Bessedovsky and on his own ability to interpret the Soviet press. This does not, however, mean as is sometimes assumed, that the historian of these transactions has an insurmountable obstacle before him. What Mr Dallin has to say not only on the relations of the Governments concerned, but also on the relations between the Communists and the Kuomintang, is likely to stand up to most tests.

Mr Dallin is too shrewd to accept the view that the obvious recurrence of certain geographical and strategic patterns means that the present Russian policy can simply be regarded as having taken up the task where it had been abandoned in 1905. Communism in Asia has provided a new source of expansionist energy; and the elimination of Japan has given Russia an opportunity that is unique.

> Thus an ideological inclination combined with the opportunity of the present merges into the most formidable drive in Russia's Far Eastern history.

In a passage written over a year ago when opinion was less concerned with these things than it is now (and when Mr Dallin was perhaps not altogether without some propagandist purpose) he declares that

> history also shows a way out of desperate situations. There is the lesson both of Russia's campaigns early in this century, and of Japan's bid for power in the thirties. The progressive isolations of each of these powers is the first consequence; the coalition of their adversaries is the second; and finally, if nothing else is capable of stopping their relentless dynamism, an armed conflict ensues, in which the challenger invariably loses to the converging forces of the world.

This is pretty cold comfort. But quite apart from its implications for policy, it is a view that explains some of the weaknesses of the book. For having admitted the importance of the Russian ideology, Mr Dallin nowhere really analyses either it, or the inner nature of the Russian expansionism that preceded it, or, most important of all, the transformation that has been going on in the Asiatic world itself. The standpoint is still too close to that of the diplomatic historian proper.

One more specific point must be made. Mr Dallin in analysing Dr Sun Yat-sen's outlook on world politics and especially his antagonism to Great Britain, mentions that "the great port of Hongkong, in the vicinity of Sun's Canton had been taken over by the British." Mr Dallin cannot but know that Hongkong became a great port from having been a barren islet precisely because it had been taken over by the British. If Great Britain were to abandon it, its fate would be like Shanghai's. And to find someone who was certainly at one time looked upon with favour in the State Department repeating this anti-imperialist cliché without a blush, helps one to understand how difficult is the struggle to find a common basis for British and American action in Asia. If President Roosevelt had not importuned the British Government in and out of season to "return" Hongkong to the Chinese, it might have been easier to spare troops from its garrison now to assist the hard pressed Americans in Korea.

From Utopia to Stalin

Studies in Revolution. By E. H. Carr. *Macmillan.* 227 pages. 9s. 6d.

Professor Carr is a specialist in the history of European revolutionary political thought since the end of the period of Napoleon, and the little book of essays which he has now published begins with Saint-Simon and closes with Stalin. He would have done well to specify "socialist revolution," for he ignores the original French Revolution completely, and calls Saint-Simon "the precursor," though after all Rousseau and Marat were considered rather subversive in their day. The list of personalities who get one or more essays apiece from Professor Carr's pen comprises three Frenchmen (Saint-Simon, Proudhon and Sorel), two Germans (Marx and Lassalle) and four Russians (Herzen, Plekhanov, Lenin and Stalin), but the only Englishman is Mr Gallacher, who seems somewhat of a lightweight in such company.

Professor Carr is particularly fascinated by the Russian revolutionary thinkers, and their attraction for the *connoisseur* of revolutions is indeed due not only to the world-shaking effects of the Russian Revolution in our time, for, in the author's words, "Russian nineteenth-century thought revolves unceasingly round the central idea of revolution"—a statement which could not be made about any other European country in that age. But the very backwardness of Russian society which caused Russian intellectuals to believe that no real progress was possible except through a violent catastrophe also made it inevitable that the revolution, when it came, should lead to a totalitarian regime. Professor Carr justly refers to "the lack of any foundation in Russian thought and tradition which could have carried the elaborate and delicate structure of liberal democracy" and to the impossibility after 1917 of "creating in terms of men and women that basis of democratic administration on which socialism of the kind contemplated in the Marxist tradition could alone rest."

In his last essay Professor Carr clearly recognises the nationalism as well as the despotism in which the Russian Revolution has issued, and it is therefore the more surprising that all he has to say about Russia's recent international behaviour is that "Soviet nationalism since the war has taken some forms which Western observers have thought sinister." Having explained so well why Stalin's Russia is as it is, it is certainly odd that he seems to ignore the threat of its great military power to the rest of the world. But it may be that he averts his gaze from this aspect of his subject in order to preserve the state of mind with which he habitually studies it. Just as a zoologist may observe snakes in a cage with a detached scientific curiosity tinged with mild enthusiasm, but will be liable to quite other emotions if he sees that a cobra has got out of the cage and is wriggling towards him, so Professor Carr enjoys the sight of his revolutionary specimens at a safe distance, but cannot take pleasure in the prospect of their closer proximity. Despite all his sympathy for revolutions, he is not enough of a Stalinist to be considered a good "life" under a possible interrogation by the M.V.D.

The Course of Orthodoxy

The United States and the Restoration of World Trade. By William Adams Brown, Jr. *Washington: The Brookings Institution. London: Faber and Faber.* 572 pages. $5 or 36s.

The Brown family has United States commercial policy firmly in its beneficent grip. Mr Winthrop Brown is Chief of the Division of Commercial Policy at the State Department. He will

soon be leading the American delegation that will arrive here for the Torquay meeting of signatories of the General Agreement on Tariffs and Trade. His brother, William Adams Brown, the author of this book, is the chronicler and philosopher of the great crusade for the liberation of world trade—a crusade in which the United States have played so leading a part—though, where deeds are concerned, one which still falls short of what might have been hoped. This book is the work of the chronicler rather than that of the prophet. It traces the historical background of the International Trade Organisation Charter and of the General Agreement. It delves back into the fundamentals of United States foreign trade policy and views with an obviously approving eye the various steps taken by the United States during the war, first through the Atlantic Charter, then through Lend-Lease agreements, and later in the course of the Anglo-American Loan negotiations, to set up an international code of commercial behaviour, comparable with the code of monetary behaviour enshrined in the Bretton Woods agreements.

This account, supplemented by the texts of all the essential documents, is an invaluable book of reference with which to follow the coming Torquay negotiations. The pedant looking for flaws in this monumental factual presentation would find a psychologically significant one in Mr Brown's suggestion that by the Anglo-American Financial Agreement of 1945 "the United Kingdom undertook to discontinue within one year the operation of the sterling area dollar pool." There was no such undertaking, but merely a clause that "sterling receipts from current transactions of all sterling area countries will be freely available for current transactions in any currency area, with the result that any discrimination arising from the so-called sterling area dollar pool will be entirely removed." The continuation of dollar pooling arrangements was due, not as Mr Brown suggests, to the inability to maintain sterling convertibility, but to the perpetuation of banking arrangements which have their roots in the commercial and financial evolution of the Commonwealth over more than a century and which functioned when sterling was a fully convertible currency, just as much as they did when it ceased to be convertible.

Larousse and the World

Atlas International Larousse. Edited by Professor Jean Chardonnet. *Paris: Librairie Larousse. London: Harrap.* £7 7s.

Any production of Librairie Larousse is received with respect in Britain, as well as in France. One knows in advance that it will provide a huge volume of information in a conveniently condensed form and in this respect the "Atlas International Larousse" is in the true tradition of this famous publishing house. The atlas is arranged in three sections: first, a section containing physical and political maps; then a series of maps giving economic data; and finally, a statistical section. Between each double-page map are two pages of text giving data on the countries shown on the neighbouring maps.

In his preface, M. André Siegfried succinctly states the familiar case against the use of Mercator's projection. It therefore comes as a surprise to find how widespread is the use in the atlas of the projection condemned in the preface. The maps themselves are well drawn; particularly successful are certain maps on projections centred on the Poles, and it is the editor's hope that these will correct distorted views derived from the many maps on Mercator. In an attempt to give this atlas an international character three languages (French, English, and Spanish) are used for text, keys, and the principal geographical names. This has had certain unhappy results: not only is all information given three times, but on almost every opening, from the title pages onwards, there are misspellings, and also mistranslations that tend to shake the user's faith in the atlas. A serious fault is that some of the keys to conventional signs are quite unintelligible without a knowledge of French; and in one instance one-twentieth in French becomes twenty per cent when translated into English. It seems strange that no English-speaking person was employed to approve the translations on the map pages and on some of the text pages between them.

The editor has avoided the temptation to overload the maps with quantitative economic information and for the most part has concerned himself with giving the nature of the economic activity in each area. In order to do this several ingenious devices have been worked out and the facts are shown on the maps close beside the country to which they refer. Some of the trade information is seriously out-of-date—for most of the North-West European maps it is for 1938, but postwar information is given for other areas. There is a series of industrial maps that should prove interesting, notably those covering Russia's industrial regions. Figures supporting and amplifying the maps are given in the statistical section at the back. This section contains tables grouped by subjects and by countries. The countries appear in alphabetical order according to their names in the national language of each country. From this arrangement some results emerge that will be strange equally to French, English, or Spanish eyes; although Suomi and Misr may be familiar, and Nihon and 'Arabiye-es-Saudiye may be identifiable, FNRJ and Suriyeh may well perplex all save stamp collectors. And does not B'lgaria savour of pedantry? The explanation that these unfamiliar forms accord with the nomenclature adopted by the Universal Postal Union does not seem to justify their use in an atlas.

But although there are certain weaknesses in this ambitious production, the most important fact is that here is a postwar atlas, containing an enormous volume of fairly up-to-date economic and political information, shown on maps of reasonable size and scale. The Larousse organisation has set itself a difficult task and it has had a very considerable measure of success.

The Constitution for Beginners

An Anatomy of American Politics, Innovation versus Conservatism. By Arthur Bernon Tourtellot. *Bobbs-Merrill, New York.* 349 pages. $3.00.

When a book on the political institutions of the United States opens with a narrative of mammalian evolution and traces the psychological processes of primitive man in language hardly less fanciful than that of John Locke describing the state of nature, alarm and despondency are healthy and natural reactions. But it would be a pity if Mr

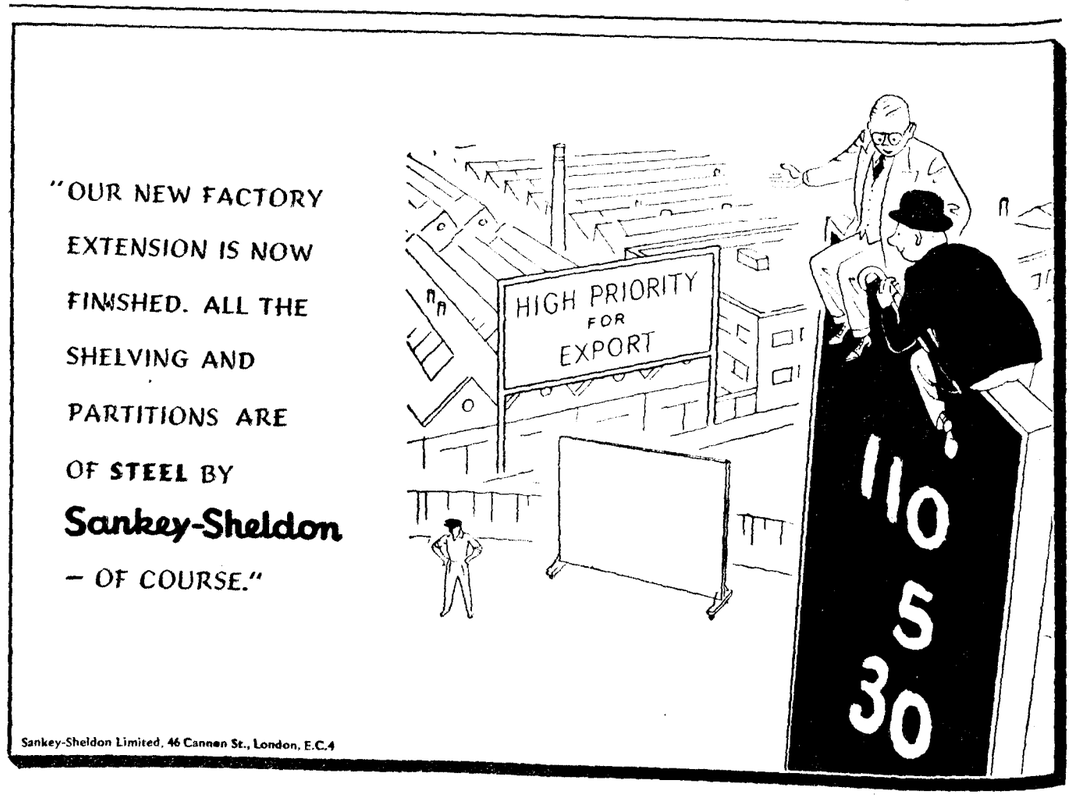
SCHWEPPIGRAM No 25

His boisterous family shouting with glee,
Paterfamilias sits by the sea,
And he sighs, as he watches them bob up and down,
For the peace and the quiet of his office in town.

schweppervescence lasts the whole drink through

Jacqmar
Fine Fabrics
16 Grosvenor Street, London W.1

Tourtellot's book were to be judged by this initial sample. In Chapter two there begins a discussion of the American Presidency which owes nothing to Charles Darwin, H. G. Wells or the Smithsonian Institute, and which is in fact an excellent, straight-forward, shrewd and well-balanced analysis that sets the key for the remainder of the book. Successive chapters on the Congress, the Supreme Court, the parties and the electoral system constitute a description of the nature of the federal government, in practice as well as in theory, which deserves high praise. It has all the indispensable virtues of accuracy, clarity and fairness, plus an additional merit not always found in books of this kind—it is infused throughout with a feeling for the practical, even harsh realities of politics. The book is clearly intended for the reader who has not previously made any serious study of the workings of the American Constitution. It eschews the footnote, presumably on the same principle as commercial air-lines avoid parachutes, for fear they should alarm the traveller. However, this timidity has fortunately not prevented Mr Tourtellot from tackling difficult topics in the text, or from appending a very sensible and up-to-date bibliography. His chapter on the Supreme Court, for instance—an institution which has sometimes baffled even Americans, once they have substituted curiosity for adoration—unravels with great ease and clarity many of the tangled skeins which constitutional tortuosity has created. It is as sensible a brief account as is anywhere to be found.



The only reservation that one feels obliged to make in recommending Mr Tourtellot's book to an English public is that having been written as an introduction for the American reader, its presuppositions, both as to knowledge and to ignorance, are American rather than British. An English beginner must, therefore, expect occasional mystification when confronted with what every American schoolboy knows, while at the same time finding, here and there, explanations of topics with which he is already pretty well familiar. But these are no more than minor inconveniences, which any intelligent reader, who wants to get a good, up-to-date and fair-minded description of American politics, would be well advised to tolerate. Mr Tourtellot has done a good job.

The Unthinking Reed

Somewhere South of Suez. By Douglas Reed. *Jonathan Cape.* 428 pages. 12s. 6d.

When Mr Reed confines himself to describing his travels, he is entertaining and informative. He has an observant eye, a ready pen and a nice wit. But when he branches off into political philosophy and his own curious interpretation of modern history, he reveals a mind more muddled than most and a blind disdain of relevant facts. Zionism, according to Mr Reed, is the driving force behind world events and the architect of the "Grand Design of the Twentieth Century." Mr Churchill, Mr Roosevelt, Mr Truman, General Smuts, Hitler and Stalin are all apparently puppets of the Zionist movement, shaping their policies and fighting their wars all fundamentally on behalf of the Zionist cause. He quotes a speech of Lord Melchett's in 1928: "Do you really in your hearts believe that we have been led back to Israel by nothing but a fluke?" and with this rhetorical question as a theme, he goes on to demonstrate by an ingenious distortion of historical facts how the statesmen of the world have at least played into the hands of the Jews if they were not actually controlled by them.

It seems to be an occupational disease of itinerant journalists to break out from time to time with some naive theory about the forces which shape international events and which in their saner moments they would blush to recall. But rarely has any of them ever produced such sweeping nonsense as this. Fortunately for the patience of his readers, Mr Reed has kept most of his political theorising to his last few chapters; the first two-thirds of the book are comparatively free from such blemishes and afford a most enjoyable and illuminating account of the South African scene. It is a pity for the sake both of Mr Reed's health and of his reputation that he broke his back during his travels and was forced to spend a year on a balcony in Durban where, he says, most of his theories were developed.

AMERICAN SURVEY

Men Behind Mobilisation

(From Our American Staff)

THE United States starts its latest mobilisation with a governmental machine far stronger and better co-ordinated than in any previous time of crisis. The general shape of the machine was outlined by the National Security Act of 1947, and much of it has been in working order for nearly three years, even if it has not always worked as well as was hoped. The Act established the National Security Council to advise the President on the integration of domestic, foreign and military policies related to national security and to assess the objectives, commitments, and risks of the United States in relation to actual and potential military power.

Besides the President, the members of the Council are the Vice-President, the Secretaries of State and Defence, the Chairman of the National Security Resources Board, and such other departmental Secretaries and Board Chairmen as the President may invite. This June it was further strengthened by the appointment of Mr Averell Harriman as a Special Assistant to help the President to handle foreign affairs. The National Security Act also provided for unification of the armed forces, and for the permanent organisation of the Joint Chiefs of Staff, the Munitions Board and the Research and Development Board. On the civilian side, it created the National Security Resources Board, to advise the President on programmes for industrial and civilian mobilisation.

The greatest difference between this permanent structure and those specially designed for previous crises is the absence of a temporary agency, manned by top industrialists, to speed industrial production. Mr Bernard Baruch, America's "mobiliser emeritus," urged that such an agency be set up at once, when he testified last week at Congressional hearings on the Defence Production Act; this Act would confer on the President the limited powers he thinks necessary to ensure that the shift from civilian to defence production is made in a satisfactory manner, without inflation. Mr Baruch's demand for full economic mobilisation had an immediate and wide impact on members of the Administration as well as on Congress. It has made it difficult for the President to maintain his stand, based on experience gained during his Congressional investigations in the last war, in favour of leaving the regular government departments to administer the new Act.

In the past, when mobilisation machinery had to be improvised with the outbreak of war, a temporary agency seemed the best way of meeting urgent needs, and also of prevailing upon captains of industry to come to Washington to serve under generals of bureaucracy. "Give them their own outfit," it was felt, "and they will come." And while the captains assembled under their own banner, the generals could look on with only a twinge of regret at lost opportunities: "Give them their own outfit," the generals could say, "and they will come to us—to find their way around government." Furthermore, those with long memories could reflect that, at the end of a war, it is not disadvantageous for the agencies of government that have done all the unpopular things, from quotas for industry to rations for individuals, to fold their tents and vanish with their bad marks as well as their good. Now, however, the fiction of three months' leave, which last time drew executives out of industry and into the War Production Board, is too obvious to be effective when a long effort is in prospect; the men who staff the present mobilisation agencies must accept their posts as primary and lasting jobs.

★

The final power of decision rests, of course, with the President—and it is a power that is being used. He is the focal point of all policy proposals, of all the integrated advice. His recommendations to the nation, his executive orders, his requests to Congress, are the combined outcome of the thinking of his subordinates as well as his own. But in the end, it is the President as Chief Executive, Commander-in-Chief, and head of the Democratic Party, who decides. It is he who must choose when policies prepared in the National Security Council are diverse or contradictory.

In the Council, political and diplomatic considerations are presented by the Secretary of State. Tall, lithe, with photogenic hands and a lawyer's manner of presenting a convincing brief, Mr Acheson has steadily been able to make his voice carry above Senator McCarthy's hisses. He comes to the Council backed by the advice of a policy planning staff headed by Mr Paul Nitze; this advice has included the ideas of Mr George Kennan, until he resigned in the unfounded hope of taking a year's leave, and been complemented by those of Mr Charles Bohlen.

Much more unified military advice than has ever before been available to a President can now be brought to the Council by the Secretary of Defence, responsible for all three services. Mr Louis Johnson, bald and affable, with experience both in business and the American Legion, was fund-raiser extraordinary in the Democratic campaign of 1948, and fund-cutter extraordinary in the defence economy campaign of 1949; in mid-1950 he is a more amenable man. It may be that thanks for the quick military reaction to the Korean outbreak are owing to the men actively in charge of the various services, rather than to Mr Johnson. But it is certain that under Mr Johnson a great deal of unification has been accomplished.

Some of it may be credited to Admiral Forrest Sherman, who succeeded Admiral Denfeld on the Joint Chiefs of Staff last year and who, with General Loren Norstad of the Air

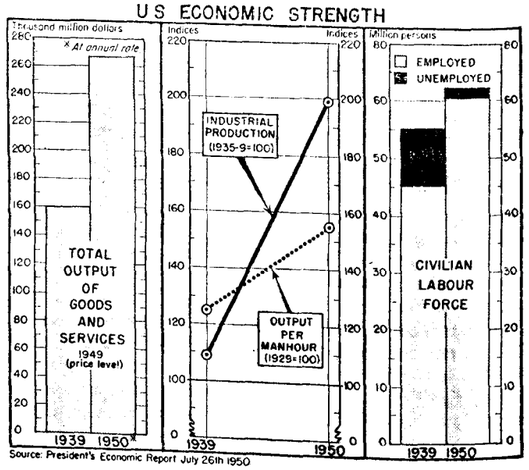
"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our American Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Force, was one of the original architects of unification: his capacity to take and express an overall view was proved at his first meeting with the Joint Chiefs. In the Navy-Air Force squabble that preceded Admiral Sherman's appointment, it was not General Vandenberg, who looks like a military tailor's ideal, but Mr Stuart Symington, then the Air Force's civilian Secretary, who performed the more spectacular dive-bombing feats. General Collins, who made his name as a combat officer, is still identifiable as an Army man. The main burden of military briefing of the President, the Cabinet, and the Congress is borne by the Joint Chiefs' chairman, General Bradley, whose home-spun integrity gives him the standing of a man as well as a strategist, and spreads his influence outside military circles; when he testifies before congressional committees the impression grows that a citizen as well as a strategist is talking.

*

The unified military advice given to Mr Johnson by the Joint Chiefs is now to be paralleled by unified geo-political advice given him by the Joint Secretaries, the newly formed organisation of the civilian heads of the three services. While the Secretary of the Navy, Mr Matthews, has not had previous Washington experience, Mr Pace, the Secretary of the Army, was Director of the Budget before he came to the military establishment; Mr Finletter, the Secretary of the Air Force, has a background of service as wartime special assistant to the Secretary of State, as head of the Economic Co-operation Administration's London mission, and as chairman of one of the independent committees that has declared a seventy-group Air Force to be essential. Both of these men have good reason to be aware of the inter-relationships between military and civilian programmes and of the importance of giving consideration to the views of non-military agencies in defence planning. With their new assistant, Mr Edward T. Dickinson, Jun., just transferred from ECA, as an emissary to other agencies and foreign governments, the Joint Secretaries expect potential differences to be handled informally without reaching the stage of interdepartmental clash. The preparation of the $10.4 billion request for new defence funds, submitted to Congress following the President's message, gave this new organisation an exceptional opportunity of demonstrating its "jointness," both in relating the total sum to the whole economy, and in allocating the individual sums among the respective services.

Mr Symington, having disappeared from the Defence Establishment, reappears as Chairman of the National Security Resources Board wearing a strictly civilian hat, though his air force background has accompanied him in his public relations man, Mr Leo, and his vice chairman, Mr Robert J. Smith of Texas, wartime airman and prewar airlines executive. No lover of half measures, the red-haired Mr Symington has made up for the long period of headlessness which the Board underwent before his appointment. Even before the Korean crisis, the new chairman was emphasising the necessity of planning for the long, as well as the short, term; now he is taking his cue from Mr Baruch and insisting that his Board's responsibility for wartime economic planning means that it, and not the government departments, must also be responsible for the administration of the new controls, in principle if not in detail.



Among these varied and spirited personalities, the President's new special assistant, Mr Harriman, will have full opportunity to exercise his powers as negotiator and conciliator. Mr Harriman is at his best in a small organisation; his habit of quiet and ubiquitous consultations in advance will leave its anonymous mark on future decisions of the National Security Council.

American Notes

Business Unusual

The President's mid-year economic report needed almost complete rewriting after the Korean outbreak, but the final verdict remained the same. The remarkable growth of the American economy since 1939, and even since the war, its remarkable recovery from last summer's recession, had made it strong enough to scale new economic heights—an increase of 5 per cent in industrial output by the end of the year, for example. Before Korea the American standard of living would have benefited; now the defence of the free world will. Of course, said Mr Truman, business could not go on as usual, but the only unusual powers he wanted were those contained in the Defence Production Bill, which would permit the allocation of scarce materials, the limitation of civilian output, curbs on credit and loans to encourage defence production.

These powers would be adequate to prevent inflation, in Mr Truman's opinion, provided that the armament programme was put on a "pay-as-you-go" basis by increased taxation, and that the public made the necessary adjustments to the emergency voluntarily, especially by refraining from hoarding and panic buying. But when the President spoke, the commodity price index, rising for some months, had jumped 13 per cent since the Korean invasion and retail sales were running 46 per cent above the previous year (when admittedly they had been below average). This was a psychological inflation, before new defence orders had given any real excuse for price rises, and as such, it may check itself.

Nevertheless Mr Truman must have begun to share the doubts of some of his advisers whether the limited controls in the Bill would provide a lid heavy enough to hold down the rising indices. The point has already been reached where the increase in the cost of living is threatening to bring demands for higher wages, the whip that spins the inflationary top. The President's message contained an outspoken reminder that labour could not be excused from the restraints that were being asked of the rest of the community but, as the election draws near, the temptation to find such an excuse will be great.

The temptation could be removed by imposing price controls and this is the gift that Republicans have been offering to the President. They included wage controls and rationing powers in the package, wrapped it in the protests against price increases which every Congressman was

receiving from his constituents, and fastened it with Mr Baruch's appeal to Congress for full wartime controls even though the country was not yet at war. The parcel looked so much like what the voters wanted that even some left-wing Democrats forgot that those who bear gifts are to be feared. Not so the President, who knew that inside the wrapping was a Pandora's box full of unpopularity. Wage controls would undoubtedly weaken labour's enthusiasm for the defence effort, price controls would have the same effect on business. When forced upon an Administration that had made no preparation for them, there would inevitably be both inequity and inefficiency and even consumers would find controls much less soothing in practice than in theory.

But a refusal to accept the Republican gift could be sold to the electorate as a refusal to check price increases. The Democrats, once they realised the dilemma, hastily found a less irritating filling for the box—stand-by instead of mandatory powers to control prices, wages and consumer goods—that can be taken out on short notice should the need arise, as many believe it will. These powers the President has agreed to accept. Indeed, he may have refrained from asking for them in the first place only because he wished to avoid the delay and controversy that they have caused in the past. In consequence of the Republicans' political chicanery, the Defence Production Bill, which they originally criticised for giving the President excessive powers (Senator Taft still does), is likely in the end to give him powers which even he thinks excessive.

* * *

For the Common Defence

To enable the free nations of the world to make their maximum contribution to the common defence in the shortest possible time, President Truman has asked Congress to appropriate an additional $4 billion for military assistance to foreign nations. The Atlantic Treaty countries will get $3.5 billion, nearly $200 million goes to Greece, Turkey and Iran and the rest to South-east Asia and the Philippines. The request is part not only of the Mutual Defence Assistance Programme, for which $1.2 billion has already been authorised for the current fiscal year, but also of the new American defence programme. Appropriations for all three are apparently to be included in one Bill. The provision of funds is urgent, since the bulk of the money is to be used for procuring military equipment that takes many months to produce.

The President emphasised that American aid will supplement, not take the place of, the efforts that the Atlantic Treaty countries are making, out of their own resources, to increase both their armed forces and their production of defence equipment. This is an assurance that Congress will hardly be willing to take on trust, especially when the United States is already devoting a painfully large part of its own resources to the common defence. The dispatch of foreign troops to Korea is one form of concrete evidence that other nations are thinking of the common security as well as their own. Another would be satisfactory answers to the American request for details of possible military contributions to the collective cause.

The main purpose of the $4 billion is to enable advantage to be taken of foreign manpower and productive capacity by supplying equipment and materials so that these resources can be used to the full. The necessary defence articles are to be obtained wherever they can be produced most quickly, cheaply and efficiently—and that will not always be in the United States. This is a new departure, although authorised under the original MDAP legislation, and it might seem to be a substitute for economic aid, an idea which was perhaps encouraged by suggestions from officials of the Economic Co-operation Administration that counterpart funds might be used for military purposes. But these officials, of course, agree with Mr Truman that increased defence production abroad only makes Marshall aid more necessary

The Senate, accepting this view, not only rejected Senator Kem's perennial attempt to slash ECA appropriations to the bone, but also restored the much less drastic cut which its Appropriations Committee had made. Economic assistance may, however, still be pared by 10 per cent, along with funds for other purposes, before this appropriation Bill goes to the White House. But the loan of $100 million which the Senate has presented to Spain, undesirable as it may be in many ways, is an addition to, not a subtraction from, ECA funds.

* * *

America Goes Suburban

The preliminary results of the census taken last April gave the continental United States a total population of 150,520,198. The number of Americans has doubled in the last fifty years and has gone up by nearly 19 million in the last decade, in spite of an almost entire absence of immigration. The coincidence of births postponed from the depressed 'thirties and borrowed from the uncertain 'fifties is the usual explanation for the prolific 'forties, but it begins to look as if the long-term trend was changing as well. Ten years ago the demographers plotted population peaks of around 160 million for about 1980, but even before the census the accuracy of their sights was more than doubtful. However, the present prospect of 200 million Americans by, if not before, the year 2000 encourages the economists in their conviction that there are no foreseeable limits to the possible expansion of the American economy.

In the past ten years America has been growing from the centre outwards, from the centre of the country out to its coasts, from the centres of the cities out to their suburbs. It is Florida and, as was expected, the States west of the Rockies that show the great gains. One-fifth of the increase for the entire country was in California and the five States that have actually lost inhabitants — Arkansas, Oklahoma, Mississippi, Nebraska and North Dakota—are all rural and

CENTRAL HANOVER UNION BANK AND TRUST COMPANY

NEW YORK . . . 70 Broadway

(with one exception) all in the central farm belt. Country folk who find jobs in industry, as so many have done, feel at home in suburban districts. So do families with small children—the under-ten age group has increased far more than any other—especially when wages are high and cars are obtainable. And on the outskirts of towns land has been available for the new building developments that have solved the postwar housing problem. As a result, it is in suburban, not rural or urban, districts that the sensational increases in population have taken place.

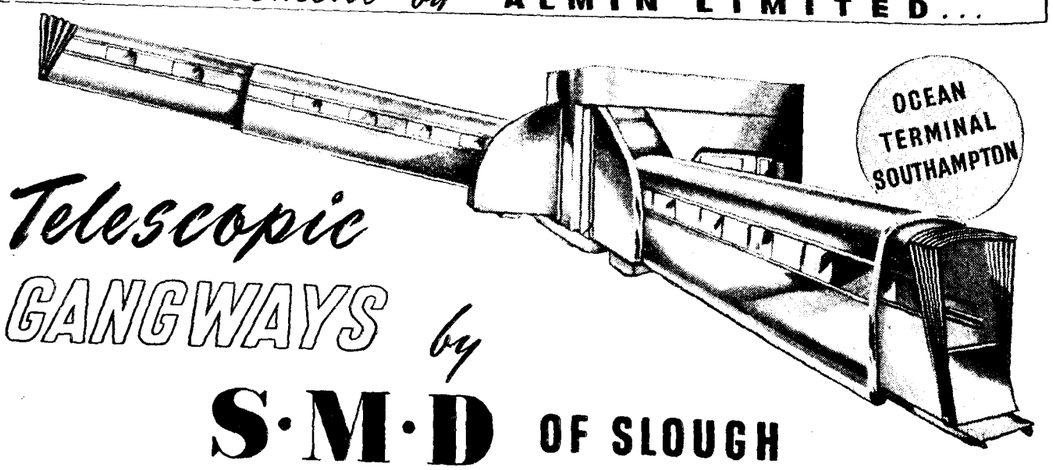
There are now 106 cities with more than 100,000 residents: most of them seem disgruntled at the results of what it is often suggested was an inefficient census, because it found them smaller than had the estimates of boards of health and utility companies. A census which went on for two weeks, and longer in some places, can hardly be entirely accurate, but enumerators, paid seven cents a head, must have been anxious to collect as many scalps as possible on their schedules. One New York City official even surveyed supposedly uninhabited islands by helicopter, looking for heads to be counted, and in Washington, D.C., a recount did not bring the city much nearer to the size which a decade of overcrowding had led it to expect. It still has under 800,000 residents, and New York City is still under 8,000,000. But when the dormitories of Maryland and Virginia are included, the Washington area as a whole has 1,452,000 inhabitants, 50 per cent more than in 1940. And while the five city boroughs of New York have grown by only 5 per cent, on near-by Long Island such commuters' paradises as Nassau and Suffolk Counties jumped by 64 and 38 per cent respectively.

Shorter Notes

The Dow-Jones index of commodity futures, nearly 17 years old, has been revised; it now contains 12 commodities instead of 11, as silk, in which there has been no futures trading since 1941, has been replaced by cottonseed oil and wool. The other commodities are wheat, maize, oats, rye, cotton, coffee, sugar, cocoa, rubber and hides. There has also been a change in the method of calculation in order to counteract the distorting effect on the old index of farm price supports. In addition there is now a new index of spot prices, calculated on the same commodities as the futures index.

★

One of the most unfortunate aspects of racial discrimination has always been that in the nation's capital all the nation's citizens do not have equal rights. A test case was recently brought, after a restaurant had refused to serve Negro customers, in an attempt to revive statutes outlawing such discrimination, passed nearly eighty years ago and long since forgotten. The judge however ruled that they had been repealed, by implication, by the Act of 1878 which set up a new system of government for the District of Columbia.



★

Anti-submarine sound generators and other electrical devices are coming to the rescue of the trout in the Great Lakes. They are being killed off by sea-lampreys, but it is hoped that the parasites can be destroyed in electric fields which the fish instinctively avoid.

★

All export licences covering shipments to the mainland of China have been revoked, as part of the attempt to keep strategic exports from finding their way to North Korea. Controls have also been put on shipments of oil-producing and refining equipment to Latin America, in order to ensure that it is not re-exported to the Soviet Union. These steps have been taken under the Export Control Act, valid until July, 1951. The Act will also make it possible to limit exports of any commodities in which shortages may develop as a result of the defence programme.

Announcement by ALMIN LIMITED...

Telescopic GANGWAYS by S·M·D OF SLOUGH

Our illustration depicts one of the Three Pairs of Power Operated Telescopic Gangways which are the outstanding feature of the new Ocean Terminal at Southampton. Constructed in aluminium alloy throughout, each unit can be traversed, slewed, luffed, extended to 75 ft. and telescoped. We believe it can fairly be said that this is the most interesting engineering structure in aluminium alloy ever attempted; and we are glad that it is our construction company, Messrs. Structural & Mechanical Development Engineers Ltd. of Slough—Pioneers in this Field—who have been entrusted with the manufacture.

THE WORLD OVERSEAS

Russia's German Base

THE Soviet zone of Germany is the one Communist dominated country in Europe that cannot present a façade to the outside world or keep its citizens in complete ignorance of conditions in the west. Nothing can prevent a constant stream of refugees from escaping over the frontier. It is a one-way stream. Germans are usually not given an inter-zonal pass by the Russian authorities if they have near relatives in the west; no such precautions need to be taken at Bonn. The western business men who find that their opposite numbers in the Soviet republic can be bribed for a pound of butter have no need of statistics to convince them that food is scarce in the east. A factory manager who has secured a valuable machine from Saxony at the price of three radio sets has a very adequate picture of the state of the consumer goods industry under President Pieck. Nor is there any sign that the western German workers do not realise that their standard of living is higher than it is in the Soviet republic. With diminishing exceptions, western Germans react to the statement, "I live in the Soviet zone," with an indifferent "Bad luck."

Russian Norms

It would be wrong to maintain, however, that no progress has been made in the Soviet zone. Production has undoubtedly increased. According to Herr Ulbricht's statement at the Socialist Unity Party congress two weeks ago, overall industrial production has reached the target of 81 per cent of 1936 output, set by the two-year plan, and will be over one hundred per cent of 1936 by the end of the year. This means that the east is some six months behind the west. Ulbricht admitted that the vitally important steel and hard coal industries were still lagging behind.

The key to the increases achieved lies in the system of piece rates based on the Russian "norms" which Marshal Sokolovsky introduced two years ago. Only a small proportion of factories have as yet followed his instructions, and the figure of 85 per cent will not be reached, it is estimated, until the end of the five-year plan. Nevertheless, the system has already brought an improvement in quantity. The poor quality of eastern German goods is, however, a constant source of agitation to the Communist authorities, who are under pressure to deliver first-class machinery as reparations to Russia. "Quality Brigades" consisting of workmen pledged to high standards made their appearance in the factories some time ago, together with the production "Brigades," which are a common feature of Soviet economic policy. In future, the Soviet title of "Hero of Labour" will be awarded to model workmen.

Shortage of Skilled Labour

Low productivity, however, remains an outstanding characteristic of the Soviet zone economy. The five-year plan assumes that it must, and can, be raised by no less than 60 per cent. Otherwise, even by working two or three shifts, the ambitious target of double the 1936 industrial output cannot be reached. Wages, it may be noted, will increase by only 16.8 per cent; the German must produce more for less, and, said Herr Ulbricht, the trades unions must undergo "a thorough change." In the steel industry, despite the importance attached to it, there are works in which twice the number of workmen are needed to produce half the prewar output. This situation is largely due to the extreme scarcity of machines for saving labour, which is in turn due to Russian thoroughness in stripping plants for reparations.

Under these circumstances, it is not surprising that there is a shortage of skilled labour which will greatly increase with the new plan. No less than 890,000 more workers must enter industry, building and transport by 1955. The Soviet zone authorities, intent on the future, are making greater efforts than their western counterparts to train unskilled youths and women. The five-year plan calls for the training of over 900,000, 40 per cent of whom are to be women, and a large, but unspecified number, landless peasants. For the first time in German history, women are to be made to undertake heavy work in mines and foundries. Opposition to this move to bring the Germans down to the Russian level is bound to be strong. Even at the height of Dr Goebbels' "total war," women were not employed on a scale in any way approaching that of Britain, not to mention Soviet Russia. One reason why they are now being roped in is that the Soviet authorities need more male labour for the uranium mines, which have already drained off a considerable army of miners.

The Worker's Lot

Miners are henceforth to be attracted by a new system of wages, announced at the SED Congress by Herr Ulbricht. In future, rewards will not only increase with performance, but the basic wage will be higher in those industries to which the plan attaches the greatest importance. All forms of mining and heavy engineering will lead the way. How miserably low the scale of wages is may be seen from the fact that the average miner's wage in the Soviet zone is at present only 1.5 eastern marks per hour. The value placed by the Berlin free market on the eastern mark before the recent reduction in prices for unrationed goods was one-sixth of the western D-mark. This value reflected its relative purchasing power. The Soviet zone workman receives wages pegged at the pre-war level, and rations of food and clothing—which vary greatly according to the value placed by the state on his type of work—also at low pegged prices. Though the heavy workers and professional men's food rations are adequate, those of workers in the lower categories and of the unemployed are not. Even the heavy worker is pitiably short of clothing and all other consumer goods. The locomotive driver who was chosen to drive the train-load of "presents" to Stalin for his birthday was obliged to borrow 200 marks from his trade union to buy—according to the Communist newspaper which published the story—a "second and third shirt." Anything to supplement the rations must be bought in the stores of the so-called state *Handelsorganisation* (HO). Prices in these shops have been successively reduced, partly as pre-election propaganda, and partly because they must be brought to the level of the prices of rations before rationing can be abolished. They are still exorbitant. A miner would still have to work five hours to earn enough to buy a pound of margarine. It is indeed hard to understand how Moscow can declare that "the German Democratic Republic

points the way to liberation for the west from the regime of hunger and misery."

The development of agricultural production has apparently been a disappointment. Last year it was proclaimed that rationing of all foods except meat and fats would be abolished after this year's harvest—that is, before the elections on October 15th. All that Herr Ulbricht could promise at the SED Congress, however, was an immediate increase in the meat and fats ration that would see the beginning of a free market. The needs of the peasants are neglected in favour of industry. The result is an increasing number of deserted holdings. The conditions which many new settlers must face are still impossible. Shortages of everything the peasant needs still persist, while delivery quotas have been raised. This situation might theoretically improve with collective farming, but—doubtless because of the bad impression collectivisation would make in the west—the Communists are going very slow in this field, and have ordered lower delivery quotas for the "medium" peasants owning 25 to 35 acres. The Five-Year Plan calls for an increase of 25 per cent in yields per hectare.

Shortage of Steel

Some food deliveries have been received from the Soviet Union, and much more is expected from the latest trade treaties with eastern Europe. Trade exchanges with Poland are to be 60 per cent higher this year than last, with Czechoslovakia 80 per cent higher, and with Hungary 70 per cent greater than was originally estimated for 1950. The obstacle to this development is that the Soviet zone is committed to provide deliveries of industrial goods that have been increased to the same degree. To fulfil these obligations, it needs Ruhr steel. Although intense efforts are being made to render the zone self-sufficient by 1956—Herr Ulbricht announced that another new works to produce 400,000 tons of steel a year would be erected on the Oder—products of the Ruhr are still required. Before the war two million tons of steel went from the Ruhr to eastern Germany, and the great expansion of heavy industry that is now planned will demand much more than that. Production in the machinery industry is to increase by 121 per cent, that of the electrical industry by 96 per cent, and of the precision instrument and optical industries by 139 per cent over 1950. These figures make it plain that the standard of living of the Soviet Germans is not intended to improve very much. Everything has been geared to Soviet requirements. Apart from obligations under trade treaties, the People's Republic still has to deliver reparations valued, at pre-war rates, at $3,171 million; and, despite the flourish made when twenty-three enterprises were recently returned to the eastern German economy, the great majority of key firms are still Soviet companies.

Moscow's Ambitions

The Soviet zone, in general, does not constitute an attraction for the western Germans. Nevertheless, Moscow conceives it primarily as a base for the acquisition of the remaining two-thirds of Germany with its 50 million inhabitants and a steel capacity of more than three-quarters that of the Soviet Union itself. Moscow's hopes appear senseless, unless they are of a long-term nature. The National Front, which was formed to win western Germans by an appeal to nationalism, is greatly handicapped by the fact that the Pieck Government has accepted the hated Oder-Neisse frontier. It has also to follow Moscow's uncompromising dictates and make the western Germans not only hate the Americans, but swear love and boundless devotion to Stalin. As the SED Congress stressed, it is not enough to concentrate on Sovietisation of the east, and gain a paltry two million signatures to the "peace" appeal in the west; henceforth, Communists must realise that the whole *raison d'etre* of the People's Republic is to gain the west, by fair means or foul.

Pandit Nehru's Foreign Policy

[FROM OUR CALCUTTA CORRESPONDENT]

INDIA'S foreign policy has lately had to face some delicate situations: notably the Prime Minister's tour in Indonesia and Malaya, and the decision over Korea at the Security Council. In handling them Pandit Nehru is uniquely fortunate. From Shyam Prasad Mookerjee of the Mahasabha, on the right, to Jayaprakash Narain of the Socialists, on the left, nobody criticises his foreign policy. Some, notably Sardar Patel, would like a more definite alignment with the Anglo-American bloc; only a few Communists want a more Russophile policy. No newspaper ever criticises the Foreign Ministry even in the restrained and tender tones with which *The Economist* disposes of Mr Bevin; the abuse which is the daily food of the State Department is simply inconceivable in India.

This lack of opposition suits Nehru's impulsive temperament; he has neither to define his terms nor to control his extemporisations. Nobody minds his proclaiming neutrality as the key to his policy because everybody knows that what he really means is independence. There can be no neutrality for India. In most of its states the Communist party has been banned, and Communist terrorism in Hyderabad and Madras is being met with the full force of army and police. Itself a free democracy, India's sympathies must, in any conflict between freedom and totalitarianism, necessarily be on the side of freedom. But India has obtained control of its foreign policy too recently to be willing to surrender any inch of its right to decide for itself when freedom is threatened. And India does not always arrive at the same conclusions as the west. The possibility of a direct Russian attack is completely discounted, and Nehru is confident that he can deal with his Communists, whether Russia supports them or no. A third bloc would only make Russia a more dangerous neighbour.

Views on Imperialism

Moreover, viewed from Delhi, the fervour of the west's belief in freedom and democracy is less evident than it appears in London. For Indians freedom means the end of colonial imperialism, democracy means votes for negroes, too. Britain proved its *bona fides* in 1947; therefore the Indian press has shown full understanding in the Malayan imbroglio; the lapse over the Seretse Khama farce has not been played up; even in East Africa, where Indian interests are directly involved, Indian public opinion has been patient with Britain's difficulties. But the other western countries find no such understanding; French clinging to power in Indo-China is seen as a threat to Asia's freedom. That Dr Hatta is now so weak that he has perpetually to perform a tight-rope act over chaos is blamed on Dutch failure to accept Indonesian independence early enough. Even Italy's intrigues to recover its colonies are quoted as evidence that the imperialist leopard has not changed his spots. Indian faith in the American way of life cannot be complete until that way is open to the negro; every fissure in the Mason-Dixon line strengthens the cause of democracy. Sometimes, also, India suspects America of being less interested in the cold war against Russia than in the dollar curtain against sterling; and India is vitally interested in sterling—the currency of its foreign balances and

of most of its foreign trade. And India, occasionally, has a horrid suspicion that the gift of Filipino independence was a Trojan horse whose true contents are the privileges given to American business and the American armed forces.

India finds an outlook truly similar to its own only in the Commonwealth; and the Commonwealth in India still means Britain. Canada is too remote, South Africa stands for all that India holds evil; only with Australia is it gradually building up a new and independent relation. Commonwealth methods suit India very well; India likes the informality, the round table atmosphere, the feeling of being an equal among equals. It realises that the Commonwealth as a body, however loosely connected, carries more weight in the world than any one of its members. Membership has indeed ceased to be a political issue: even the Socialists have nearly dropped it. Moreover, for Britain itself, Indians still have a quite unique feeling. The habit of blaming it for all India's ills is dying with astonishing speed, although many speakers may still give it the parting salute of a cliché or two. To the educated Indian, the Briton is not a "foreigner" like the American or the Russian, and the effect of this on foreign policy is strengthened by the fact that India and England get their foreign news from the same sources. The press of both countries uses *Reuter's*, which now has Mahatma Gandhi's son on its board, and the *Statesman* and the *Times of India*—two of India's biggest papers—use the foreign service of *The Times* and the *Manchester Guardian* respectively. This climate of opinion suits Nehru's own ideas exactly. Economically, he may be at one end of the Liberal tradition and Churchill at the other; but, on the great issues, the distance between them is no greater than the length of their old school tie.

Champion of Backward Peoples

It is the Commonwealth bond also which lies behind Nehru's insistence that the problem of Asian defence is not military, but economic. Russia cannot attack India without starting a world war, and no Indian believes that a world war would start with an attack through the Kyber. Admittedly Nehru is the major heir to the white man's burden of keeping the peace in the Indian Ocean. But, with the liabilities he has also inherited the assets; every stable state in the area, with the doubtful exception of Indonesia is a fellow member of the Commonwealth. Naturally Indian opinion looks sceptically on proposals for a Pacific pact; India's non-Commonwealth neighbours, with their more than Balkan instability and their somewhat Chiang-like democracy, can contribute nothing to India's safety. Delhi will do nothing to impair such stability as its neighbours may have; rebels, from the Karens to Ho Chi-minh, get no support and the loan to Burma went through Parliament unopposed. Only in Indonesia, with whom Indian relations are very close, does Indian opinion see a real ally. India considers that one of its main contributions to the democratic cause is the moral authority it has gained amongst backward peoples as the champion of their freedom and equality; this good will is too valuable an asset to be written off for some such temporary advantage in the cold war as the recognition of Bao Dai.

Channels for American Aid

Nobody knows better than Nehru that the new national governments of Asia have to give their people the three musts—food, clothing, housing—if freedom is to survive. India has always been poor, but now it has a new revolutionary consciousness of its poverty. Alas, any quick change needs capital; and, as the Indian proverb says: "Father will not work, and Mother will not let us beg!" A democracy cannot create saving by terror as the Communists do; and Indians are nervous of the Americans. They have not yet acquired the European equanimity about strings and senators, and they find it tiresome to keep on having to explain that Marwari speculators are not just brown Mr Hoffmans. But, whether for loans or gifts—and loans would do—the United States is the only available source of aid today. The sterling releases have been of vital importance, and the few millions which have been invested from outside since the war have come from Britain; but Britain can do no more, as India understands. So it looks around for a buffer through which it can deal with the Americans—even bearing gifts—as an equal. Once it thought of Uno, but realisation has dawned that, however useful Uno may be for the assertion of human rights, it has little or no money. Now hope is therefore focused on the Spender plan. The Commonwealth would be the ideal buffer, and face would be saved in benefiting from a Commonwealth plan. For India, after all, is a senior partner.

Economic Development in Ceylon

[FROM A CORRESPONDENT RECENTLY IN COLOMBO]

CEYLON is divided by a mountain backbone into two well-defined regions known as the wet and dry zones. The wet zone in the west gets the full force of the south-west monsoons which the mountains deny to the further side: the north-east monsoon, however, gives to that region a rainfall of 65 inches which, because most of it is received in the late autumn, is insufficient without storage for agriculture. The dry zone covers most of the island. The greater part of it, in remote times highly cultivated as is evidenced by the ruins of towns, villages, reservoirs and canal systems, is now smothered with dense forest.

The geography of the island—Ceylon is roughly half the area of Britain—determines its economic life. In the centre of the wet zone are the tea, rubber and coconut plantations which provide the bulk of its exports. The dry zone, which

THE BRITISH METAL CORPORATION LTD.

is associated with

The British Metal Corporation (Australia) Pty. Limited, Sydney and Perth; The British Metal Corporation (Canada) Limited, Montreal; The British Metal Corporation (India) Limited, Calcutta and Bombay; The British Metal Corporation (South Africa) (Proprietary) Limited, Johannesburg; C. Tennant, Sons & Co., of New York, New York: Vivian, Younger & Bond Limited, London.

and with the organisation of

Henry Gardner & Co. Limited, London, Canada, Cyprus and Malaya.

The Group trades in and markets non-ferrous metals and minerals, many kinds of produce, timber and other materials; it provides coal-washing plant, ventilation plant and other specialist engineering and metallurgical equipment; and it furnishes allied shipping, insurance, secretarial, financial, technical and statistical services.

in past ages grew all the food required in Ceylon, now barely provides one third: the rest has to be imported and paid for by the proceeds from the wet zone. No coal, oil or minerals of any consequence are found in the country. The lack of these essentials has militated against industrial development and, apart from the plantations, there is no industry organised on modern lines. The result is that the economy of the island is unbalanced, not to say precarious, depending as it does on the price of rubber, tea and coconut products in the world markets.

The obvious remedy is to recover from the forest in the dry zone the two million acres estimated to be available and restore them to agriculture. Till recently virulent malaria deterred pioneer efforts; today DDT has met the menace and made life in the forest possible.

No Communal Troubles

The population of the island now exceeds seven million people of whom four and a half million are Sinhalese Buddhists. Unlike India there is no communal trouble: Buddhism is tolerant; Muslims, Christians and Hindus live peacably with the dominant element. Nearly twenty years ago the Ceylonese were given a popular constitution based on universal suffrage, from which they derived valuable experience in self government. In 1946 this system gave place to responsible government with foreign relations and

defence reserved, and two years ago the country acquired full Dominion status; the reservations disappeared. Universal suffrage is the basis of the new constitution; and the legislature is bi-cameral.

The country has put into power a strong Union party government composed mainly of Sinhalese. The prime minister, Mr Senanayake, is an elder statesman of character, ability and integrity. He has wisely included in his cabinet a minister from the Tamil Hindu party next in importance to the Union party. The opposition is leftist, mainly Communist. The Communists, numerically weak, are split into factions and the movement is not regarded as dangerous although it causes some anxiety. It derives its support mainly from the intelligentsia of the towns.

Mr Senanayake and his colleagues place economic development in the forefront of their policy. The future of their country, perhaps indeed its independence, depends largely on whether it can make itself self-supporting in food; this can only be done by recovering from the forest the vast areas of land it denies to the plough, and the Government is determined to bring this about.

A six-year plan for clearing the forest has been elaborated. Put into force two years ago it only aims at getting ready for agriculture 131,137 acres out of the two millions involved by 1953. About 34,000 acres have so far been cleared. A dam is also being constructed by an American firm on the Gal Oya river in the southern area of the dry zone to irrigate 150,000 acres. It is to cost several millions sterling. The scheme includes a hydro-electric installation.

Electrification Plans

The six-year plan covers projects for the development of industry. This part of it, because of the absence of coal, depends for its implementation on the production of electricity on a large scale. The idea is to set up a grid over the whole island, so as to electrify every village and town. The first stage of a big scheme known as the Laxapana project is nearing completion; it is hoped that 20,000 kW will be brought to Colombo before the end of the year. In its further stages in the next four or five years, the output of Laxapana may reach 100,000 kW; this, with a contribution from Gal Oya, should meet the requirements of industry for a considerable period. There are many other schemes, recently surveyed by American engineers, which could be developed when more power is wanted. It is estimated that tea and rubber estates would take 70,000 kW if current could be delivered as cheaply as is produced by oil-driven privately owned plants. The industrial target is of moderate dimensions. It is hoped to produce 7,500 tons of steel by 1952 and 3,000 tons of paper about the same time, also cement and plywood, the plywood to be used for tea-chests. Little cotton is grown at present; as land becomes available it is planned to produce enough in five years to make possible the manufacture of much of the clothing wanted in the country.

The success of the economic policy of the Ceylonese Government naturally depends to a great extent on its financial position. Fortunately, the war has left no deep scars on the economic life of the country. British war finance did indeed bring on inflation but against this Ceylon has to its credit large sterling balances in London. Assets are officially estimated to exceed liabilities by £2,500,000. Public debt equals roughly a year's revenue (about £39 million). Unlike India and Pakistan, the charges for defence in Ceylon are less than 2 per cent of the revenue. Social service, education, public health, food subsidies and so on, absorb about £17 million of the revenue: expenditure from loans is estimated at £10 million, of which £5,000,000 go to economic development and about the same to social and public utility services. The average income is computed to be about £20 per head, the highest in Asia next to that of Japan.

Problem of Food Supplies

These statistics suggest that from the point of view of public finance the prospects for the economic development of the island are distinctly favourable, provided only that the plantation industries, which contribute 90 per cent of the state income, continue to flourish. For that there is no guarantee. To make the position secure the first essential is to ensure that the country is self-supporting in food.

The problem is urgent. Left to itself it is doubtful whether Ceylon could overcome the jungle in a generation. Some help from the outside world is therefore essential. Ceylon is one of the most important strategic centres of the Commonwealth, and it is obviously in Commonwealth interests that everything possible should be done to ensure its economic security. Not the least advantage of a prosperous Ceylon would be as an outpost against the spread of Communism in South-East Asia. It would be a proper object for the type of aid mooted at the recent Commonwealth conference at Sydney.

It took 157 years

It was a natural sequence of events that a progressive company whose interests from its earliest days included coal mining, should have been among the first to realise the importance of coal distillation. The firm of Newton Chambers was nearly a hundred years old when its scientists recognised the germicidal properties of certain coal oils and introduced Izal Germicide, later to be followed by many other important products in the Izal range. Today, Izal products span the globe, backed by industrial experience acquired over 157 years.

THE

'BANK-INSURANCE' GROUP OF TRUSTS

British banks and insurance companies conform to the Three Golden Rules for investors: ONE—They provide essential services to trade and industry. TWO—They are managed with skill and prudence. THREE—They allocate a large part of profits to reserves.

A most convenient and economical method of obtaining a freely marketable investment in these high-grade equities is by a purchase of Units in the 'Bank-Insurance' Group of Trusts. Apply through any Stockbroker or Bank for leaflets, prices and dividend rates.

Bank-Units: *29½% of the Trust Fund is spread over the $ shares of the 7 big Canadian Banks; 24% is in other Dominion & Colonial Banks and 41% in Home Banks and Discount Companies.*
Offer Price, 3rd Aug. 21/11 x.d. Yield £3/12/4%†*

Insurance-Units: *A spread over the shares of 30 British Insurance Companies; a considerable part of their premium income is earned in $ and the sterling value of their very large $ investments will greatly increase as a result of the devaluation of the £.*
Offer Price, 3rd Aug. 21/8½. Yield £3/9/6%†

Bank-Insurance Units: *37% of the Fund is spread over British Insurance Companies; 15% over $ shares of Canadian Banks; 14½% in other Dominion, Colonial & O'seas Banks and 28% in Home Banks and Discount Companies.*
Offer Price, 3rd Aug. 21/0½. Yield £3/11/8%†*

** Subject to reduced rate of tax, allowing for D.I.T. relief.*
† The yield is conservatively calculated on net cost which includes commission and 2% Government Stamp Duty.

Invested funds of these 3 Trusts exceed £15,000,000

The Consumer's Interest

"IF we do create these big public monopolies, it is right and proper that the consumer should be given new safeguards." The Member of Parliament who made this plea in the recent Commons debate on the affairs of the nationalised electricity supply industry was a Labour Member, not an opponent but a partisan of public ownership. The more critical of the partisans have begun, in the light of experience, to discard the assumption that public ownership means public service immediately and at all points. Some such assumption does appear to have underlain the nationalising Acts of the last Parliament, with their glib injunctions to the new authorities to pursue policies designed to serve "the public interest in all respects." No policy can pursue the public interest in all respects at once ; at best it can strike the happiest balance between conflicting considerations. There has become apparent in the minds of critics, including socialist critics, a realisation that the consumer's interest may need more specific protection.

The nationalising Acts of 1947-49 did, it is true, make various gestures of recognition to the user's point of view. But the bodies they set up in token of such recognition have tended to be, for the most part, either amateur bodies uncertain of their standing, or mere appendages pliable in the hands of authority. At least one consumers' council has openly fallen into the sophistry of speaking of the consumer's "best interests," which means not what the consumer wants, but what is thought by his betters to be good for him ; and, indeed, there is plenty of evidence that this subtle and elusive conception is tending to prevail. That public boards, and even Ministers, should override particular interests in favour of the public good is entirely proper. But it is equally proper that before and after they make their overriding decisions the particular interests concerned should be enabled to voice their points of view effectively. This, if anything, is what the idea of consumer representation means. It implies that the consumers' councils and similar bodies are not the consumer's mentor but his mouthpiece and his watchdog. But what has happened since the nationalised boards were set up has been—whether from weaknesses and vagueness in the Acts, or from the nature of the administrative steps taken to implement them—entirely different.

★

The two Coal Consumers' Councils, industrial and domestic, have brought resentment upon themselves less by their actions or their failures to act than by the studied manner in which they have appeared to range themselves, in their rare public utterances, with the National Coal Board and the Ministry of Fuel and Power in a close circle from which the general public is firmly excluded. It is hard to know how far this attitude characterises the councils' private dealings with authority ; but certainly it is the apparent attitude, and it is certainly ill-judged. These two bodies were established under the Coal Industry Nationalisation Act ; their members were to be appointed by the Minister after he had consulted representative bodies, and they were to be appointed "to represent" consumers of coal. They were charged with the duties of considering "any matter . . . which is the subject of a representation made to them by consumers," or which in their view needed consideration, and where action seemed requisite they were to notify their conclusions to the Minister. They were also to consider and report on matters that the Minister might refer to them. The Minister might give directions to the Coal Board after hearing what the councils had to say.

These were not remarkably strong provisions. All the same, the Act does suggest what the councils were intended to do, and from their own reports it would be hard to conclude that their practice has realised the intention. In its third annual report last month the Industrial Coal Consumers' Council did, it is true, "think it fair to comment that too much dirt is still being raised and that this adds to the consumers' fuel costs." It "regretted" that the drive for more output had not gone better ; it had "welcomed" the improvement last autumn and had since been "disappointed that the rate of increase has not been maintained." It "fears" that it may be some years before output is really adequate, and in the light of this fact shows some impatience with carping consumers who will not accept the inevitable:

> Consumers take the view that it should be the aim of the National Coal Board to produce coal in the quantities and grades required to enable industry to secure the best results. It seems to us reasonable to suggest, however, that as the scarcity of special qualities is likely to continue for some time, all consumers should endeavour, in their own interest, to adjust their operations so as to introduce a greater flexibility in the demands for particular grades.

This is, indeed, "reasonable to suggest," but the National Coal Board and the Ministry are quite able to make such suggestions for themselves. Individual firms have to weigh such factors against other relevant factors and make their own decisions as to what is best for their own interests. But where can the idea have originated that it is the task of the consumers' council to indoctrinate consumers on such subjects ?

The council was intended to listen to representations from consumers and suggest action to the Minister, but it seems to have neatly reversed the procedure. This is not to say that the council is a useless body. Some of its talks with the Board and the Ministry on pricing systems, calorific values, fuel efficiency, and other technical matters have probably been valuable. But in the council's life of three years it has never received any serious volume of representations from consumers. Why is this ? Is it, as the report suggests, "because consumers recognised that in present circumstances the National Coal Board cannot do all that they would like to do to meet consumers' wishes" ? Or is it because of a feeling that representations would be a waste of time ?

The domestic coal consumers' council goes further and reproves some of those optimists (only about thirty in number) who in the past year have turned to it with their complaints. This council regards itself as a "long stop" to deal with major differences after the normal procedure has been exhausted. No doubt it is, in fact, neither equipped nor organised to handle multitudes of individual complaints. But in a seller's market and a rationed economy it is not a complete answer to tell the complainant "to seek redress from his merchant" ; the council would, therefore, have been well advised to place less reliance on this argument, and to have avoided the appearance of treating complaints as merely tiresome. If the official system (for however good reasons) does not work, then authority can act as its own apologist, and the consumer's representative ought to be the last person to come to the rescue. What seems to have happened, however, is that the councils allowed themselves to be over-impressed at the start with the idea of harmony at the top, and that they have allowed "fairness" to the authorities to become an overriding preoccupation. The domestic council now declares itself "most anxious" to avoid creating "the impression that the Council, or the merchants, or the National Coal Board, can provide a remedy for the inferior quality of some of the coal that has to be supplied." The industrial council has always taken the view that it "could best serve the interests of consumers not by captious criticism of the National Coal Board, but by collaborating as knowledgeable consumers." Before these attitudes become enshrined in the constitution it ought to be asked whether there is not a useful purpose to be served by captious critics. The merits of local representation might also be considered. The Act permitted regional coal consumers' councils to be set up, but the two national councils have opposed any such step.

★

Perhaps the coal consumers' councils are a lost cause. If so, they should be a warning for the consumers of iron and steel, to whom under the Iron and Steel Act, if and when it comes to be implemented, not dissimilar representation is assigned. The Iron and Steel Consumers' Council will similarly be appointed by the Minister after consultation (some of his consultations may be with "organisations representing workers," though the Act does not say which groups of workers are meant). They are to consider "matters relating to the interests of consumers" and notify their conclusions to the Iron and Steel Corporation ; they can make representations to the Minister of Supply. The Corporation will pay their allowances and the salaries of their staff, and will provide them with "such office accommodation as appears to the Corporation to be requisite . . . or as may be directed by the Minister." These arrangements do not promise any great degree of independence.

It is true that the Iron and Steel Consumers' Council is empowered to appoint its own officers, while (by contrast) the "clerks, officers and staff" of the coal consumers' councils are supplied by the Minister. But the experience of another group of bodies that is in some ways similar, the Consultative Councils set up under the Electricity Act, has shown that this concession can mean less in practice than might appear. The Electricity Act provided for a consultative council in each of the fourteen supply areas—one, that is, attached to each Area Electricity Board. The members of these councils were to be representative of local authorities and of industry, agriculture, and other consumers' interests. They were to consider representations from consumers or would-be consumers in their area, or other matters affecting the distribution of electricity, including tariffs, and report their conclusions to the Area Board. They were also to report on matters referred to them by the Board. They have a right to be informed of the area board's "general plans and arrangements." After due consultation with the area board and the central authority, they can address representations to the Minister. The chairman of a consultative council is *ex officio* a member of the area board and in this latter capacity is paid a salary.

The appearance of strength in these arrangements is proving to be deceptive ; and if in fact the electricity consultative councils have not shown the obsequiousness of some other bodies, the cause seems to lie in their regional character—which puts the members in direct touch with responsible local feeling—rather than in any of the other safeguards in the Act. This may dispose them towards independence ; but the independence is proving hard to maintain, and in at least one area a serious struggle is going on. It is illuminating to see how the provisions of the Act work out in practice. The chairman's status as an *ex-officio* member of the area board may have been designed to give the consultative council a direct voice in the board's deliberations, but in practice it has the converse effect: it gives to the area board, the electricity supply authority, the dominant voice in the meetings of the consultative council. The council is empowered under the Act to appoint its own officers subject only to "the approval of the Minister as to numbers." But in practice, in each area, an official of the area board was seconded for service with the consultative council. Thus not only the chairman's salary but the secretary's future career and prospects of promotion are bound up not with the consultative council but with the supply authority, and at least one secretary of a council has been sharply reminded of the implications of this fact for him. The members other than the chairman are voluntary and unpaid, giving to the work such time as they can spare ; their offices are usually in the area board's offices, and their collective identity is inextricably confused in the public eye with the identity of the supply authority itself.

Suggestions to reform these arrangements were made in the Commons debate on electricity supply last week by Mrs Barbara Castle, the Labour member whose view was quoted at the opening of this article. Mrs Castle suggested that the press should be admitted to meetings of the consultative councils, that their finance and accommodation should come from the Minister's vote and not from the authority whose affairs they exist to overlook, and that their chairman should not be a board member, "a man of divided loyalties." These are sensible suggestions. It is probably too early to assume that this particular struggle has been lost. Many members of consultative councils have become disillusioned, and some have resigned ; other resignations are likely unless the independence of the councils can receive unexpected support from London. The fault is only partly in the weakness of the Act ; more influential is the official failure to understand what consumer representation is for. Because the purpose is misinterpreted—being assumed to be the provision of the public corporations with a free public relations machine—then independence

is squeezed out. But in this case it has perhaps not yet gone so far that it cannot be undone.

Transport, alone among the nationalised industries, is provided with a machine of independent supervision possessing indefeasible statutory powers. The Transport Tribunal does not, of course, "represent" the users of transport. It has, however, a decided authority in matters of charges, and its existence obliges the British Transport Commission and its subordinate bodies to submit themselves to public accountability in a searching form. No other of the national corporations has to undergo any similar test, and spokesmen of the Transport Commission have shown some resentment, which can readily be understood, at having been singled out through an historical accident for this treatment. It is a curious feature of the Transport Act that, side by side with the independent supervision of a Tribunal, a system of consultative committees was set up on lines not unlike the arrangements for "advisory" consumer representation in the other nationalised industries. The comparative performances of the two systems have provided the contrast from which lessons may perhaps be drawn for the future. Consumer representation without teeth has yet to show how it can be effective.

Profit Inflation Again?

IT would seem from the latest quarterly figures that industrial profits are again rising. The check to industry's earning power that was apparent twelve months ago has disappeared; rising prices since devaluation, the American boom and the comparative stability of wage costs per unit of industry's expanding output are in combination producing a resumption of the earlier advance that characterised 1948. At this, no doubt, there will be indignant cries that social justice is being outraged. It is desirable, however, to look more closely at the extent and nature of the increase before jumping to hasty conclusions that profits are already showing an unjustified inflation. It is the more necessary to do so because of the new demands for rearmament that are likely before long to be imposed on a British economy already at full stretch.

If the observer is content to base his arguments on the total income of the 917 companies whose reports were received last quarter, he will discover an increase of 5 per cent, from £485 million to £510 million. In terms of trading profits (that is, excluding investment income and other non-trading items) the increase was 6 per cent, from £433 million to £459 million. This rise is slightly lower than the 6½ per cent increase recorded by 559 companies in the first quarter of the year, and it has been produced by a highly representative group of industrial companies. But there are some oddities in the best sample of companies; if the trading profits of tobacco companies are left out of the reckoning (they are dominated by British-American Tobacco whose earnings arise overseas and whose accounts showed a large special credit after devaluation) together with those of plantation and finance companies, the residue of predominantly British industrial trading profits shows an increase of about 4½ per cent from £389 million to £407 million. This does not seem an excessive participation by capital and management in the fruits of economic expansion and industrial improvement during the past year.

The "average financial year" in which these trading profits were earned ended early last January. They reflect, therefore, the conditions of 1949, before the further rises in the costs of imported raw materials occurred; these seem bound to affect profit margins in at least some lines of production, but all past experience shows that profits as a whole are highly responsive to rising prices. Present indications—a high level of output, increasing productivity, rising exports, inflationary pressure in the United States, and rising rearmament demands at home—all these factors point in the direction of a further increase in profits during 1950. Some increase in profit incomes was obviously necessary to fill the gap of savings that was apparent to any casual reader of the "Economic Survey." It seems quite possible that this gap will be closed. Once again, a profits inflation promises to provide the "savings" that individuals (including the Government) are not prepared to find in sufficient volume to finance new capital formation.

There is, however, a new competitor for such "savings"—namely, the ordinary shareholder. The force of dividend "limitation," like that of the wages "freeze," has given way to "moderation and restraint." There is certainly nothing immoderate about the increase from £50.8 million to £51.9 million in ordinary dividends declared during the past quarter; there was, in fact, an increase in the issued ordinary capital of these 917 companies from £668 million to £703 million, and the average rate of ordinary dividend before deducting tax actually fell from 13.8 per cent to 13.5 per cent. But this is the first increase in ordinary dividend payments of any perceptible size since the early days of 1948. For every ten company chairmen who criticise dividend limitation but explain that, limitation or no limitation, the dividend cannot be raised, there is perhaps one who is now prepared to assert the right of ordinary shareholders to receive some modest increase. The amounts involved are small and no one could claim (except perhaps those who lodge resolutions to be put to the Trades Union Congress demanding the right to inspect companies' books to see where the swag is stowed away) that they make a pennyworth of difference to the risk of inflation.

Obviously, the great majority of industrial concerns will be chary about dividend increases, even though profits are rising and the force of voluntary limitation is less strong than it was. The table opposite shows where the profit goes. Total income is up by £25 million. Of this nearly £11 million has been set aside for depreciation, £6,000,000 to extra tax provision, £2,750,000 for contingencies, and £3,000,000 more added to undistributed profits. The pattern is too well known to require elaborate comment. The great majority of companies today rely upon surplus earnings to fortify their strained financial resources. Out of total incomes of £510 million, the latest group of companies have provided £200 million for taxation and £76 million for depreciation. The exact significance of these two items is affected by the treatment of initial allowances in company accounts—a matter on which professional accountants have different views and practices. But apart from that complication, it is the obvious fact that the tax collector habitually takes about two-fifths of total profits, and he would take much more if the initial allowances were curtailed or reduced.

The analysis of profits earned by industrial groups shows that it is easy, in talking of "profits," to overlook the considerable differences in the performance of particular industries. It is no surprise that breweries again lost ground last quarter—twenty-five companies in this group suffered a severe fall of total income from £16 million to £12.4 million, and showed corresponding reductions in tax charges and reserve provisions. There was "less money about," according to popular belief, but this was belied by the stability and indeed occasional expansion of earnings in the other consumption trades. The capital industries, as might be expected, continued to thrive, but the results of the general industries group were patchy: chemicals and paint reflected the lower profits of ICI and keener competition in paint; electrical manufacturers were very busy last year but their profits increased only modestly; and there are clear suggestions of heightened competition in the stable income figures (and lower equity earnings) for the newspaper and printing and the miscellaneous manufacturing groups.

In some branches of industry, it is less easy than it was to earn profits. And although industry as a whole may seem to be faring well enough on paper, this does not mean that it can satisfy its urgent capital requirements and pay appreciably higher dividends. Shareholders may sometimes get tired of chairmen who hurl defiant criticism at dividend limitation and then leave their dividends unchanged. But the compelling need for more finance as the prices of new plant and of raw materials continue to rise cannot be gainsaid. If, as seems possible, the trend of industrial profits is again set for a rise, this overriding fact will still be true. There are some companies that could find a little more, and others that positively should do so; but for the great majority of companies, under existing conditions, it is likely to be a matter once again of jam tomorrow for the equity shareholder.

Business Notes

Poised for Advance?

The market's reaction to the Korean news prompts the question how it might have fared if the political weather had been calm. This week, a steady strengthening of spirits and prices has taken place. Gilt-edged stocks, and particularly the "shorts," have enjoyed steady support, providing an auspicious background for the issue of just over £2,000,000 of 3½ per cent Sierra Leone stock 1968-70 at 99½. For the market to have kept and indeed to improve its position to permit the resumption of trustee borrowing within six weeks of the start of fighting in Korea is no small achievement. It is not, indeed, being put to any major test, for the public offering in this case is limited to £1,600,000; but this is of less consequence than the noticeable stiffening of the terms compared with the Uganda issue, which was offered at 98 last April. On the eve of the Sierra Leone issue, the Uganda stock stood at 101¾, thus attracting, even after allowing for accrued interest, favourable attention to the terms of the Sierra Leone issue. The investment market has shown its firmness in the recent successes of the Patons and Baldwins and Manfield debenture issues. To these there has been added this week a comparative rarity—a major placing. This consists of £1,000,000 of Tees Conservancy Commissioners 3¾ per cent stock, redeemable in 1990, which Messrs Pember and Boyle have acquired at 98; dealings started on the basis of 99 and the price has since risen to 99½.

If there have been few excitements in the industrial market, prices have certainly been firm. The *Financial Times* index of industrials has improved further to 111.4 compared with 114.8 before the Korean fighting started. There has been some nibbling interest in steel shares, based on the argument that, given war or nationalisation, present prices are too low. No major buying of equities has yet become apparent on the inflationary implications of rearmament, here and in America; but the market gives the impression that it is poised to respond significantly to any increase of buying based on such calculations. Even in Kaffirs, there has been sunshine this week. It is probably safe to discount the stories of large scale American buying that were in circulation; in fact London seemed to be quite as active as the Cape—certainly in the shares of developing mines where a technical recovery was easier to contrive since dealers' books were bare.

Investors, in short, have not committed themselves about the major issues of peace or war, or about the repercussions on the British economy of a stiff dose of rearmament. But their behaviour in the past two weeks reflects few fears and suggests a certain underlying strength.

Integration of Freight Services

The statement of policy on the integration of freight services by road and rail, issued by the British Transport Commission last week, contains few surprises. The considerations it lists about the prospective role of each of the two forms of service are familiar, and were always presumed to be in mind when nationalisation was being discussed. It is something to have them explicitly stated, but they cannot be said to carry the problems of integration—which have to be solved in hard, practical terms—very much nearer solution. Integration, it is intended, will leave the trader free to choose the transport service he prefers—provided that regular services of different kinds are running between the same points. But freedom of choice depends intimately on charges and conditions of carriage; and these will not be framed and put to critical test for two years or more.

Integration of freight services rests on the principle that both forms are complementary and not rival. The circumstances in which each is specially suitable and efficient are set down—rail transport is specially suitable for trainload or trunk haul traffic, for example, while road transport is best used for local work or for more extended services up to the distance at which the economy in tractive effort by using rail for the trunk portion of the conveyance is greater than the economy from avoiding extra handling on and off rail, saving on packing, lower pilferage and shorter time. It was indeed such presumptions as these that gave transport nationalisation its technical attraction—that integration might provide a unit of transport suitable for each type of need at the least real cost. Yet the first specific proposal in the statement suggests that theoretical functionalism has been at work too, for it is proposed to put all the collection and delivery services now operated by the railway executive under the charge of the road haulage executive. In other words, it is proposed to pursue the "compartmentalising" process which has hived off former railway services such as docks and hotels from the railway executive but has not resulted, as far as one can see, in any reduction of costs. Divided and confused responsibility are obvious risks in such a proposal; it is fortunate that the proposal would take so long to bring into effect, at least in the larger centres, that there will be good time for reflection.

The concentration of long distance and wagon load traffic on rail and of cross country, feeder and distributing services on the roads will take time. One of the main problems in such changes is to gain the support of the operating staff for them. The commission seek to minimise hardships resulting from the innumerable and inevitable changes in existing arrangements; they promise elasticity, careful regard to staff interests, sympathetic handling and reinstatement of staff that may be displaced from existing jobs. There will also be awkward pay problems, for some downgrading is inevitable and the unions will certainly not relish changes affecting pay, seniority and privileges. It may be doubted whether these knotty difficulties will be unravelled, as the commission hope, by the angelic forbearance of give and take.

Dollars for Film Production?

The agreement "in principle" announced this week between the Board of Trade and the American motion picture industry contains at least one highly questionable feature, which makes it necessary to ask what was the Government's purpose in the first place in restricting the amount of dollars that the American film producers can take out of Britain. The Government has always protested that its purpose was solely and exclusively to limit the country's dollar expenditure on films. But the new arrangements, if the Board of Trade has described them accurately, serve a quite different intention.

While the details are still to be worked out by technical representatives of both sides, the new arrangements are briefly these. The amount that can be remitted without conditions from the American film companies' earnings in Britain remains unchanged at $17 million a year. From October 1st, however, for a period of twelve months an end will be made of the additional "pool" of dollars which the American companies have been dividing up among themselves—an amount equivalent to the net earnings of British films in the United States—and a new "bonus scheme" will take its place. The new scheme is an improvement in so far as—by relating the extra drawing rights of each American company to its efforts in marketing British films in the United States—it replaces a pooled bonus by a direct individual incentive to each company. But the American companies can also qualify for the new bonus in another way, by spending their "frozen" sterling on film production in Britain. In proportion as they do this the amount of dollars they are entitled to remit will be increased. There is no question here of earning or saving dollars for Britain: for every £1 spent on film production in Britain by an American company from sterling funds which the Government has declared that it cannot afford to convert, an amount (still unspecified) of dollars will be released from the sterling area dollar pool.

Thus, in effect, the Board of Trade has agreed after all to spend extra dollars, in return for the creation of employment in British film studios. It will be interesting to see how many dollars it considers £1 of employment in British studios to be worth. This is the second instance in a week in which the Board of Trade has twisted to an entirely different purpose a set of restrictions that had been introduced originally to meet the dollar crisis. Mr Wilson's decision to relax the dollar-saving and dollar-earning criteria for new industrial projects, provided that the projects are located in areas chosen by the Board of Trade, is discussed on page 256. The new films agreement resembles that decision in a manner that can hardly be accidental. Dollars are still officially "scarce" for the ordinary purposes of trade and industry. Are they ceasing to be scarce where there is a pet government idea to be served?

* * *

Cotton Prices and Utility

No intermission is yet in sight of the steady upward pressure on the prices of utility cotton goods. The major increase in cloth prices which was conceded by the Board of Trade in March—and which reflected the rise in raw cotton prices in the three months or so following devaluation—has only in recent weeks begun to be reflected in higher permitted prices for utility garments in the shops. A further general increase, this time of about 5 per cent, in utility cotton cloth and household textiles was announced on Monday. This arises from a recommendation of the Cotton Utility Scheme Committee, which the Board of Trade decided to accept; the announcement describes it as "an interim measure to facilitate the placing of orders following the issue of yarn licences" in the new period that has just begun. It was intended, in short, to meet some of the trade's immediate grievances and improve the atmosphere while the utility committee went on with its deliberations.

But in the month or so that has elapsed since the increase was conceived, the conditions of trade have once more changed; raw cotton prices, with other commodity prices, have risen sharply following the outbreak of the war in Korea. The price of American "middling," which was 34.79 cents a lb. on July 1st, was 39.10 cents a lb. on August 1st. Thus, while converters have gained a temporary advantage and will be able to sell at a better profit the goods that they now have on their hands, the advantage will be temporary and limited; any general benefit that it was intended to have for the trade has been neutralised. The slight fall that has taken place in cotton prices since then has not materially changed the position.

*

Thus the second major price increase in six months has still done no more than keep pace with the rise in the price of raw cotton. This fact can only underline for the cotton utility committee the drawbacks arising from the rigidity of the scheme. The committee, which represents the trade as well as the Government, was appointed in April to make a general review of the scheme. On the trade side, the demand for radical changes—in fact, for demolition of large parts of the existing structure—was being widely voiced at the time. But it may be that the worsening of international relations since then has put demolition out of the question, for the time being at least. In that case the committee's task must be to devise ways of making the scheme more flexible, particularly in its price structure. The present system of fixed maximum prices based on rigid specifications might, for instance, be replaced by some kind of sliding scale which would move with the movements of the price of raw cotton. Such an arrangement would not be easy to devise. But it is true that the committee, by bringing about a better atmosphere, has improved the chances of getting at least a provisional solution later this year.

* * *

Building Societies' Income Tax

The Chancellor of the Exchequer has decided to give a greater measure of permanence to the present arrangements, which are subject to review from year to year, under which Building Societies pay income tax on behalf of their shareholders and depositors at a composite rate. In answer to a question in the House of Commons at the end of last week, he stated that the present arrangement for the payment of income tax by building societies at a composite rate is to continue beyond April, 1952, when it would otherwise be due for review. As a first step, Sir Stafford Cripps intends to authorise prolongation of the present arrangement up to April, 1957, subject to the necessary provision in next year's Finance Bill. This decision has been greeted with natural satisfaction by building society managements and investors.

But Sir Stafford has linked this proposal with another to "regularise" the existing anomaly whereby surtax is calculated on the actual amount of interest and dividends received by surtax payers on their deposits and shares in building societies. It is his intention that liability to surtax will in future be assessed on "the amount actually received by surtax payers from their investment plus income tax." This is as far as his statement goes; it leaves unanswered whether the amount actually received will be grossed up at the composite rate of income tax paid by the building societies (at present 5s. 2d.) or at the standard rate of 9s. in the £, or the "appropriate rate" applicable to the surtax payer.

These distinctions are clearly important for surtax payers and they may affect the societies themselves. The mounting total of building societies funds in recent years to the record level of £1,057 million at the end of 1949 owes not a little to the obvious attractions to surtax payers of investment in the societies. The concession now under fire has certainly added to the relative inducements for surtax payers of building society investment *vis-à-vis* say, investment through the Stock Exchanges. It remains to be seen whether the levelling down of the net yield to surtax payers will set any considerable volume of the vast funds of the building societies on the march. The societies are naturally reticent to express any firm opinions at this stage before the Chancellor's intentions are given specific form, but the general view is that any large outflow of funds is unlikely. Some surtax payers, however, have funds invested with a large number of societies up to the limits they are prepared to receive. If big withdrawals have to be faced, the question of liquidity would assume more importance than many societies have lately been disposed to concede. The average ratio of liquid to total assets for the movement at the end of 1949 was roughly 16 per cent; a few showed a ratio well above the average, but others were more content with 10 per cent or less. The impact of any new disposition of surtax payers' funds would be felt most heavily where liquidity ratios are low. It might, if it went to extremes, also call in question some of the more speculative types of mortgage business undertaken by certain societies in recent years.

* * *

Bank of England Report

The Bank of England report for the year ended February 28, 1950, follows ploddingly in the steps of its predecessors

—it is handsomely printed but totally lacking in comment, new information or prose worthy of the paper and the type in which it is presented. In its references to movements in the bank return items, there is a warning to allow for the increase in the Treasury's special account (the counterpart fund) when comparing the latest figures with those in the previous report. In the comments on the floating debt there is mention of the running down of Treasury deposit receipts, but no explanation of the monetary policy that led to their gradual conversion into Treasury bills. A review of the clearing bank figures evokes the guess that the rise in advances may have been connected with the increase in prices since devaluation and with the difficulty of raising industrial capital by public issues. On devaluation itself the Bank of England is virtually silent. It was "the outstanding financial event of the year"—and it produced a new sterling dollar rate of £1=2.80 US dollars. That is all. The Bank's report used to be first in the field with figures measuring the use of sterling through automatic and administrative transferability but even this tit-bit is now snatched in advance by eager politicians when the figures tell a tale that rebounds to their credit. The figures, however, will bear repetition. The amount transferred within the transferable account area and through the special administrative facilities available at the Bank of England were as follows:

	1948	1949
	£ Million	
Automatic facilities	88	144
Administrative facilities	152	124
	240	268

These figures exclude all transfers to and from American account countries. In addition, during 1949 merchanting transactions and payments under the coffee and rubber schemes amounted to another £37 million. These figures speak well for the performance of sterling in a particularly difficult and checkered year. The report includes a useful summary of the payments and financial agreements negotiated during the twelve months. But by comparison with central bank reports in countries of more modest financial importance than that of Britain, the report is inadequate, pedestrian and unworthy of the world's oldest central bank.

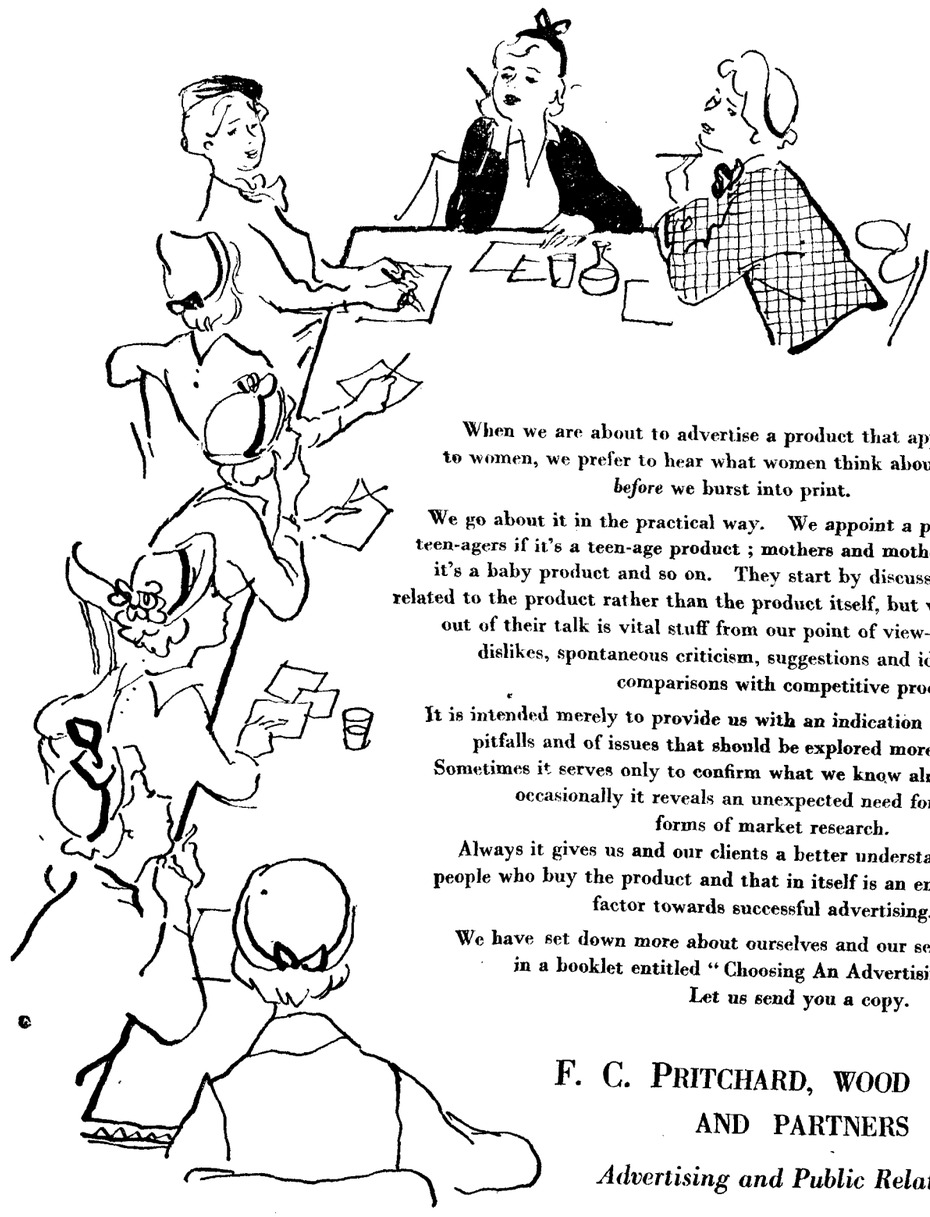
* * *

Dilemma About Counterpart Funds

The change in key of American assistance to Europe from the reconstruction motif to rearmament is under way. This week, while President Truman has put the impressive figure of $4 billion to the prospective total of American military aid to other countries, the United States Senate has been valiantly reinstating the amount which had previously been cut from the ECA appropriation by the House of Representatives. As things now stand, ECA appropriations seem unlikely to be substantially affected by the spectacular stepping up of military aid. It has, however, been stated from ECA quarters, both in Washington and Paris, that the emphasis in the use of counterpart funds should be changed from reconstruction to rearmament. The text of the Foreign Assistance Act is deemed to be elastic enough to allow such diversion of these funds. ECA has estimated that on June 30th outstanding balances in national European currencies accumulated as a result of the sale of Marshall Aid goods amounted to the equivalent of over $2,000 million of which some $500 million had been specifically earmarked and released for reconstruction projects. Of the balance of $1,500 million, the largest single item was the sterling counterpart fund maintained in the Treasury Special Account at the Bank of England. This balance has risen to the figure of £246,518,530 recorded in this week's Bank return.

The steady increase of this item, which for many weeks has distended the Bank return, reflects differences of views between the British government and ECA regarding the ultimate utilisation of these funds. The Americans would like to see some more specific "tag" attached to their use. The British spokesmen point out that, in accordance with existing Exchequer practice, any surplus of funds in government accounts, whether they derive from the sale of Marshall Aid goods or from any other direction, are automatically used in the repayment of debt. In order to satisfy the American authorities that ECA counterpart funds were so used, the device was invented of creating a special form of government debt which was cancelled when formal ECA sanction to the use of counterpart funds for debt redemption was obtained. To go through the fictional motions of applying these funds to "finance" an addition to existing capital expenditures would be inflationary unless corresponding cuts were made in other parts of the capital programme.

It would, of course, be easy enough to label part of the planned capital programme as being backed and made possible by Marshall Aid counterpart funds. It would be a piece of sentimentality that would do no great harm and might do some good. The counterpart funds, of course, do not in themselves supply any new finance at all for the realisation of capital or rearmament projects. They are an accounting siding into which figures are shunted in and then shunted out. But to pretend that the counterpart funds could play a real purpose would presumably satisfy American susceptibilities; need it offend the purists at the Treasury who had already shown their readiness to admit the subterfuge of creating special pieces of paper representing national debt, which ostensibly were cancelled by the use of counterpart funds? The British official attitude remains unaffected by the suggestion that these counterpart funds should now be devoted to rearmament purposes. For the time being the finance of rearmament in Great Britain remains within the bounds of approximately balanced current revenue and expenditure. As long as that is the situation, the sterling that is realised from Marshall dollars, whether ECA wishes it or not, must automatically be used in the redemption of debt, or at least in preventing borrowing which, but for these new sterling receipts, would have been necessary. And when an expanded programme is seen to be necessary, it will have to be financed at the expense of other domestic expenditures or exports if inflation is to be avoided.



* * *

Banking Trends—Real and Apparent

At first sight the clearing banks' statement for July seems to provide evidence of a startling change in the trend of bank advances. In the first nineteen days of July the apparent level of bank advances declined by no less than £66.8 million; the last eight of these monthly statements had all shown rises in bank advances, the net increase between mid-October and end-June amounting to over £182 million. The real reversal of trend, however, is not as marked as these figures suggest. For one thing, the second £35 million call on last May's Electricity Loan was made in the period covered by this statement; the BEA undoubtedly used the greater part of these funds to repay outstanding bank advances. For another, the clearing banks' statement for July habitually shows an apparent "fall" in bank advances as a result of the customary decrease in inter-branch transit items after the end of the half-year. Only one bank—Lloyds—lists these items separately; the others include them among their advances. Lloyds' return shows a fall of over £6,000,000 in "items in transit." If the other clearing banks experienced a similar fall and hid it (as they would do) in their advances item, then this accounting oddity and the BEA repayments between them may explain away the greater part of the apparent £66.8 million fall in advances. Nevertheless, careful analysis suggests that the curve of bank advances has flattened out and even turned slightly downward over the past two months.

women matter . . .

even when they natter

When we are about to advertise a product that appeals to women, we prefer to hear what women think about it *before* we burst into print.

We go about it in the practical way. We appoint a panel—of teen-agers if it's a teen-age product; mothers and mothers-to-be if it's a baby product and so on. They start by discussing activities related to the product rather than the product itself, but what comes out of their talk is vital stuff from our point of view—likes and dislikes, spontaneous criticism, suggestions and ideas and comparisons with competitive products.

It is intended merely to provide us with an indication of possible pitfalls and of issues that should be explored more thoroughly. Sometimes it serves only to confirm what we know already, but occasionally it reveals an unexpected need for deeper forms of market research.

Always it gives us and our clients a better understanding of the people who buy the product and that in itself is an encouraging factor towards successful advertising.

We have set down more about ourselves and our services in a booklet entitled "Choosing An Advertising Agency." Let us send you a copy.

(opposite Australia House)

Paid for in Dollars

Rubber and tin from the East are two of our major dollar earners —there are many others in this area—and the Chartered Bank's wide network of Branches assists British business men in expanding this valuable potential and also earns dollars for Britain in the form of invisible exports. Eastern merchants and prospective traders are cordially invited to discuss their plans with the Managers of any of our offices in this country, and we shall have pleasure in placing our comprehensive Eastern banking service at their disposal.

The Bank's branch system, under British management directed from London, serves

INDIA · PAKISTAN · CEYLON · BURMA · SINGAPORE AND FEDERATION OF MALAYA · NORTH BORNEO AND SARAWAK · UNITED STATES OF INDONESIA INDO-CHINA · THAILAND · THE PHILIPPINE REPUBLIC HONGKONG · CHINA · JAPAN

For nearly 90 years the

BANK OF LONDON & SOUTH AMERICA LTD

has been serving the merchants who trade between Britain and Latin America. Its unique position as a British Bank in Latin America enables it to offer every form of international banking service and commercial information through its 64 branches in:

Argentina	Brazil	Chile
Colombia	Ecuador	Guatemala
Nicaragua	Paraguay	Peru
El Salvador	Uruguay	Venezuela
Portugal	Spain	Paris

and its Agency in New York

Head Office:
6, 7 and 8 Tokenhouse Yard, London, E.C.2

Bradford: 19 Sunbridge Road

Manchester: 36 Charlotte Street

From the point of view of monetary stability this check may have come just in time. The clearing banks' statement shows that Government indebtedness to the banks (as indicated by bank holdings of money market assets and Treasury deposit receipts) increased by nearly £100 million in the nineteen days covered; holdings of Treasury deposit receipts, in fact, increased for the first time this year. In addition an increase of £18.8 million in bank cash set free an equivalent volume of central bank finance for the Government. Even allowing for the fact that some of the "departments" may have been switching out of floating debt to take up new BEA stock, it is difficult to see what has caused this sudden increase in Government demands upon the banks. The effect of these demands has been to send the recorded level of "net" deposits up by nearly £44 million. This figure is struck after allowing for the decrease in inter-bank transit items but before allowing for the decrease in inter-branch transit items (the extent of which is discussed above); the true increase in "net" deposits may well have been £70 million or more.

Flexibility in the South African Agreement

After a lightning three weeks' tour of the European continent (during which he has discussed a loan in Switzerland and a trade agreement with Germany), Mr Eric Louw, the South African Minister for Economic Affairs, has been back in London this week to resume his discussions with the British Treasury and Board of Trade. He has now returned to Pretoria with an agreed (but unpublished) list of the commodities on South Africa's import programme for 1951, which will be designated as "essential" within the terms of the Havenga-Cripps agreement.

The main feature of this agreement, it will be remembered, is that South Africa pays in gold for all its "essential" imports; if these "essential" commodities can be supplied in open competition by sterling area or other soft currency countries then the gold in question finds its way into the vaults of the Bank of England (against sales of sterling or the required soft currency). In order to maintain "flexibility" in this rather makeshift agreement, neither South Africa nor Britain has ever revealed exactly what commodities are included in the Union's "essential" list. There is, unfortunately, a widespread suspicion abroad that this secrecy is in fact maintained so that South Africa can inject a little anglophile discrimination into what is supposed to be a non-discriminatory agreement. Some European countries also believe that the list is not published so that they themselves need never know—and therefore in theory never grieve about—the amount of gold they are involuntarily contributing to the sterling area central pool by selling essential goods to South Africa.

Despite these rumblings of discontent on the Continent there is no doubt that Britain itself is well satisfied with the working of the agreement so far. In the first six months of 1950 South Africa is unofficially reported to have contributed £50 million of gold to the sterling area central pool—considerably more than was originally expected. South Africa, for its part, has given voice to some discontent about the relatively small inflow of genuine investment capital into the Union this year and about Britain's tendency to ration supplies to the Union of certain scarce British exports not paid for in gold; it is possible however that the private tenor of Mr Louw's complaints on this latter score has not been as bitter as one of his political speeches in South Africa once suggested. The time has come, however, when both countries should face the reasons for the agreement's success. Britain and South Africa have had a reasonably happy honeymoon in the past six months because it has been almost immaterial to South Africa in this period whether it has paid out gold or whether it has paid out sterling at the current rate of exchange. If sterling should again become much less desirable to South Africa than dollars, then the vaunted flexibility to which this unhealthy secrecy gives rise is likely to generate in both countries a great deal of ill feeling and pother.

Richard Crittall Judgment

Judgment was delivered this week in the Richard Crittall case. The principal defendant, A. E. P. Hinds, former managing director of Richard Crittall & Co., engineers, was found guilty on twelve counts including inducing people to subscribe for shares in the company by reckless misleading statements and forecasts in the prospectus. Another former chairman of the company, J. L. Musgrave, was found guilty on three counts of making misleading forecasts and not guilty on three other charges of making misleading statements. Mr K. F. Steven, partner in a firm of chartered accountants which certified the profits figures, was found not guilty on charges of recklessly making misleading statements. Hinds was sentenced to three years imprisonment and Musgrave to a heavy fine with the alternative of imprisonment if not paid within three months.

The case arose from the prospectus published by the company in December, 1947, in connection with the issue of 450,000 5 per cent. cumulative £1 preference shares. The prospectus included an estimate that the company's profits for the year ending December 31, 1947, would be in the region of £100,000 whereas an actual loss of some £600,000 was incurred. Mr Justice Humphrey's observations on the responsibility of auditors will no doubt receive very careful consideration by the profession and by the Companies Department of the Board of Trade. It deserves quotation in full:

> I think it calls for consideration by the authorities whether this system of appointing a firm as auditors is a satisfactory one. The law used to be different. An auditor at one time had to be the person signing the document and had to accept a personal responsibility. Now the practice is that a firm which may consist of nine or ten partners can act as auditors. It may be that this case has shown that this is not very satisfactory because one does not get what everybody desires —the personal assurance of the individual expert that a matter is right.

Although Mr Steven signed the offending statement, it was his partner who had made tests and satisfied himself of its accuracy.

Plentiful but Dear Wheat

This year's wheat harvest in Europe should exceed the average and yields may be larger than in 1949, despite the damage caused by July's heavy storms. Harvest estimates for the sixteen wheat producers of western Europe are provisionally put at 1,022 million bushels compared with 974 million bushels last year and 995 million bushels before the war. Production in the United K[ingdom], we[st]ern Germany, Portugal and Belgium is well ab[ove] [la]st [yea]rs. France, however, will have a much smalle[r] [har]vest even than its 1935-39 average. This is a [ser]ious check to France's resumption [of] wh[eat] [ex]ports, since is no information about wheat crops in the [U.S.S.R.]. But the weather has, on the whole, been fav[ourable] [for] substantial harvest[s] [are] therefore expected. Ac[cording to] *Marshall's Corn Trade News*, imports of whe[at] into Europe during the [next] twelve months may [be] 400 million bushels [be]low the annual import before the war.

The American crop is [est]imated at about 950 million bushels, against 1,140 million bushels last year, but this fall is cushioned by a rise in carry-over stocks at the end of the season from 293 to 450 million bushels, and available supplies in the new season will be little smaller than in 1949-50. The

area under wheat in Canada declined slightly from 27½ million acres to 27 million acres, but the outturn is expected to reach 400 million bushels compared with 367 million bushels in 1949.

These preliminary estimates suggest that the supply of wheat in the new season should be more than adequate to meet importers' requirements, even after allowing for the lowering of the extraction rate in Britain (the largest importer) from 85 to 80 per cent. The chance that "international agreement" wheat might be sold below the maximum price of $1.80 a bushel would on the face of it seem distinctly favourable. But during last season, the first covered by the agreement, sales of wheat by the United States fell short of the quota by 30 per cent. Importers are required to take up the full quota only when the price is at the minimum. This did not happen last season; the United States Government was content to hold larger stocks in an effort to keep the price at the maximum, and no doubt other exporters followed the same policy. Wheat is only likely to fall to the minimum price under the agreement when exporters' stocks reach burdensome proportions; that may not happen for two or three years, and world politics may cause a revision of ideas about what is "burdensome." Despite the larger harvest in western Europe, $1.80 a bushel seems likely to set a standard for wheat prices during the coming twelve months.

Korea and Sugar

The Korean fighting has quickly converted the prospective surplus of sugar in the world market into a shortage, for it has prompted the American housewife to buy on a panic scale. American consumption of sugar last year amounted to 6,700,000 tons and consumption this year was expected by the US Department of Agriculture to run at roughly the same level. But the sudden increase in American consumers' demand during the past month first made the Department raise the import quota by 310,000 tons, and later to arrange to buy 549,000 tons from the Cuban surplus. The department has started negotiations to buy 225,000 tons of sugar from Puerto Rico, the Virgin Islands and Hawaii. Total purchases this year by the United States will thus amount to 7,800,000 tons, or 1,100,000 tons more than in 1949.

The effect of these recent American purchases on the world market has been to absorb the surplus on the "free" market, put at 490,000 tons by the International Sugar Council only a month ago, and to reduce reserve stocks in exporting countries to the barest levels. These quantities however, are not being consumed; they represent a transfer of stocks from producers to consumers. The American Government has said that the additional purchases were being made to ensure an adequate supply for the domestic market; if American retail demand does not absorb these additional quantities, the American Government stands willing to resell the surplus to other countries at the price it paid. But at present other countries are eagerly trying to build up their stocks, and little or no sugar is available. Britain's requirements to the end of the year are believed to be more or less fully covered.

On any view of the prospects, the sugar market is in for difficulties next year. If the crisis spreads, the demand will be impossible to satisfy. If the Korean affair is localised and the threat of general war subsides, American buying will be seriously curtailed as housewives use up their hoarded stocks. Cuban production is expected to reach almost record proportions; the provisional estimate is put at 5,850,000 tons, some 400,000 tons larger than this year. If the political situation were to improve, the world might well be faced with a burdensome surplus of sugar.

More Synthetic Rubber

The American Government's decision last week-end to increase the output of synthetic rubber by a further 100,000 tons came as no surprise to the rubber market. The spot price for natural rubber in London hovered around 3s. a lb. for the first part of the week but by Thursday it had spurted again to 3s. 9d. The relatively wide discount on future dealings suggests that the market does not expect the present high price to continue indefinitely. American synthetic production has increased steadily since the beginning of the year: January output totalled 27,800 tons and by June production had reached 41,500 tons, representing an annual rate of almost 500,000 tons. On July 7th the Reconstruction Finance Corporation ordered the reopening of plants with a capacity of 88,000 tons a year; this with the new extension of output should raise annual production of synthetic rubber to about 675,000 tons. This rate of output is not likely to be reached before the beginning of December. It still leaves a margin of total capacity in hand, for the plants owned by the American Government are capable of producing 875,000 tons a year.

Meanwhile, pressure on natural rubber continues, despite the considerable expansion in output this year. Production in Malaya in the first half of the year was virtually unchanged at 325,800 tons, compared with the corresponding period of 1949. But apparent production in Indonesia has increased strikingly, even allowing for the appearance in the current output figures of rubber previously produced and hoarded.

AMERICAN CONSUMPTION OF NATURAL AND SYNTHETIC RUBBER
(Tons)

	Jan.	Feb.	Mar.	April	May	June	Jan.-June
Natural rubber:—							
1949	*50,041*	*46,126*	*52,908*	*47,692*	*45,966*	*46,945*	*289,678*
1950	59,992	56,580	60,859	57,816	63,641	62,546	361,434
Synthetic rubber:—							
1949	*37,085*	*34,889*	*39,041*	*36,529*	*35,528*	*37,211*	*220,283*
1950	33,966	31,860	37,647	38,037	46,369	48,246	236,125
TOTAL							
1949	*87,126*	*81,015*	*91,949*	*84,221*	*81,494*	*84,156*	*509,961*
1950	93,958	88,440	98,506	95,853	110,010	110,792	597,559

Source: Secretariat of the Rubber Study Group.

Output for the January-June period totalled 293,700 tons, of which 207,600 tons came from smallholders, whereas production in the first half of 1949 (of estates and smallholders together) amounted to only 190,400 tons. Stocks of rubber previously kept off the market by smallholders must by now be almost liquidated, though some margin of stocks is no doubt retained by the estates. If the present level of production is maintained, Indonesian output for the year might well exceed the estimate of 520,000 tons made by the Rubber

Achievements of an Industry

Genius for invention is inherent in the British people. In a previous series of announcements — "Ancestors of an Industry" — I.C.I. told the story of Britain's scientific pioneers from A.D.1144. The present series is designed to describe some recent British chemical achievements, many of which have been the genesis of new products and processes which have given fresh vigour to the nation's industry.

Such achievements have been sometimes the brilliant discoveries of inspired individuals, but are more often the work of teams of research chemists co-operating on a given task and working to a set plan. The announcements in this series are proof — if proof were needed — that the British spirit of initiative and enterprise is still alive.

ICI

Study Group last March—a figure which then seemed distinctly optimistic. At this stage, only tentative forecasts can be made of world production in 1950 ; present trends suggest a total in the region of 1,625,000 tons against 1,487,500 tons in 1949.

The big question mark about rubber in recent months has now become an exclamation mark. American consumption in the first half of 1950 totalled 361,400 tons against 289,700 tons for the first half of 1949. Synthetic consumption which declined towards the end of 1949 has increased very rapidly in the past three months ; the total for January to June was 236,100 tons against 220,300 tons for the first six months of 1949. These figures suggest that total American consumption of rubber in 1950 may exceed 1,200,000 tons, of which 650,000 tons might be met by natural rubber. If American consumption were sustained at this level next year, the use of natural and synthetic rubber might be reversed, with natural rubber accounting for only 550,000 tons of the total.

The new American rearmament programme, superimposed on an already high level of industrial activity, demands an expansion of synthetic production in the United States. But it will raise problems for natural rubber at a later stage when the normal commercial demand for rubber manufactures or the military programme is curtailed. It may be much more difficult to scale down synthetic production next time when American demand for rubber begins to decline ; if so natural rubber will feel the effect very sharply, since production will be at a very high level.

* * *

American Inquiry for British Tankers

Tenders for the construction of several large tankers are being invited from British shipbuilders by the Standard Oil Company (New Jersey) through its United Kingdom affiliate, the Anglo-American Oil Company. Such an inquiry has been expected since the company's agreement with the British Government which preceded the derationing of petrol ; the Jersey Standard group agreed to take sterling in payment for the additional requirement of oil products. It was announced at the time that the sterling receipts thus obtained by Standard Oil would be used for the purchase of British materials and equipment, and that these would include tankers. The Anglo-American Oil Company already has a considerable tanker fleet operating under the British flag ; its ocean-going vessels are managed by the Esso Transportation Co., Ltd., Anglo-American has not built any such vessels since the war. Tankers have been built in the United States, however, for the parent company, whose fleet is managed by the Esso Shipping Company.

It is understood that the new tankers to be built in Britain will be modifications of the more recent types built in the States, and will have a deadweight tonnage of 26,650 tons (about 17,800 tons gross). There are already several British tankers of 28,000 tons deadweight under construction, and the first of four ordered by the Shell group, the *Velutina*, has just entered service. The new Esso tankers, however, are to have a designed speed of 17 knots, compared with the *Velutina's* normal speed of 15 knots. It is expected that the Esso tankers, when they come into service, will be used to carry crude oil from the Middle East to the new refinery at Fawley, which is designed to produce 5½ million tons of petroleum products a year. The size of these tankers limits the number of shipyards that can tender for them, and for the moment there is no shortage of work of this kind. In consequence Standard's decision to build in Britain will not come as a relief to those British yards that have received no contracts for twelve months or more. British shipbuilding costs are less than half those of American yards.

* * *

France Revalues its Gold

Under an agreement between the Bank of France and the French Treasury the French gold stock is henceforth to be entered in the Bank's books at the gold price derived from the current exchange rate of Francs 349.6 to the dollar ; hitherto the stock has been valued at the 1945 rate of Francs 119 to the dollar. The result of this simple and overdue accounting reform has been that the value of the stock on the Bank's books has leaped by Frs. 126,000 million to about Frs. 180,000 million—the wholly illusory "profit" of Frs. 126,000 million accruing to the Treasury. If the Treasury used this "profit" to meet its current expenditure or to increase the investment programme, it would of course be generating inflationary pressure just as much as if it deliberately resorted to a larger Budget deficit or to the printing press. Fortunately M. Petsche has turned his back on this expedient. In part the Treasury's "profit" will be used to buy back Treasury bonds from the Bank ; to the extent that the "profit" is used in this way all that will happen is that as one item in the Bank's list of assets (gold) goes up, another (Treasury bonds) will go down. In part, too, the "profit" will be used to buy gold from the Bank with which the Treasury will repay before term certain loans from a group of American banks to the French Government. It is perhaps misleading to say that the revaluation operation has made this repayment of loans possible. The improvement in France's balance of payments has made repayment desirable and the accounting change in the make-up of the Bank's weekly statement of assets is a separate issue of no real significance.

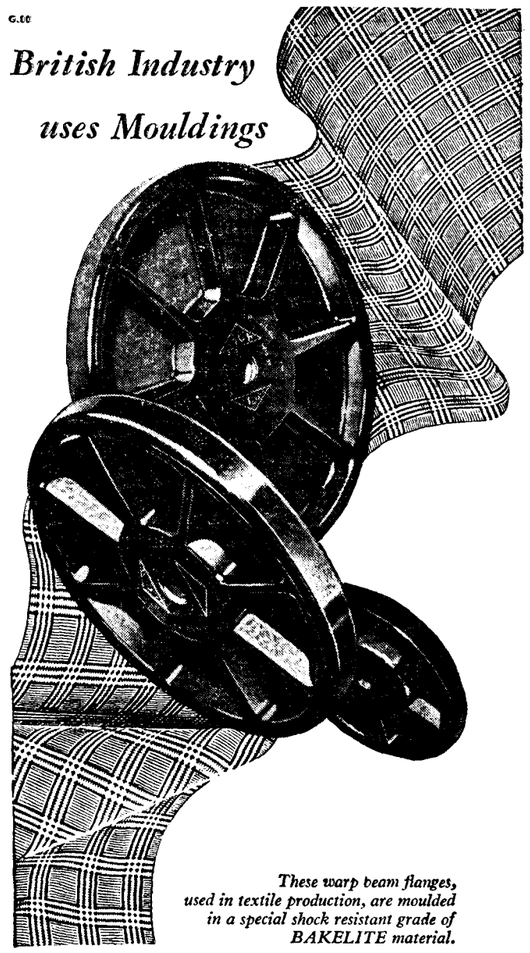
General Electric

Although the increase in the trading profit of the General Electric group from £4,996,454 to £6,021,980 in the year to March 31, 1950, is partly attributable to rising turnover, the report also connects it with the completion of remunerative contracts taken in previous years. There were also signs of more difficult trading conditions—higher turnover was accompanied by lower profit margins while new orders were on a somewhat reduced scale in the current year. In particular, production difficulties have arisen in certain GEC factories which have felt the scaling down of orders for the building industry. These circumstances raise the possibility that profits for the current year may be lower. But good progress is reported in the export field and substantial economies may well result from the completion of extensions to the heavy electrical and mechanical engineering works and re-equipment elsewhere.

A striking improvement in the group's liquid position has been secured by the issue of £8,000,000 3½ per cent unsecured loan stock 1954-59. The group's bank overdraft has been cut from £7,373,166 to £13,669, while cash has increased from £1,108,269 to £4,102,870. Part of this improvement is derived from the big surplus of group earnings which amounted to 61.4 per cent compared with 56.7 per cent of the parent company's ordinary capital in 1948-49 and covered the maintained ordinary dividend of 17½ per cent over 3½ times. But the continued demand for finance is marked by the absorption of £539,000 (after depreciation) by fixed assets and a further £444,000 by trading items during the year.

Shorter Notes



German exporters to the dollar area may in future retain 20 per cent of the proceeds of their dollar sales, to be used to pay for business journeys or to import goods for which foreign exchange would not normally be provided. German exporters had at one time asked for a 50 per cent bonus. The concession has been granted against stiff opposition from the German banking authorities, who may well be justified in their fear that it will lead to a free market in bonus dollars.

*

A scheme is to be proposed for the repayment of the £1,000,000 4½ per cent preference capital of Silver Line. The original proposals have been revised in the light of observations made by the joint special committee of the British Insurance Association Investment Protection Committee and the Association of Investment Trusts. The final scheme provides for either repayment in cash at a premium of 1s. per £1 stock unit plus all arrears of dividend or 16s. in cash per £1 stock unit plus all arrears of dividend plus one 10s. ordinary stock unit for every £2 preference stock held.

G.00

British Industry uses Mouldings

These warp beam flanges, used in textile production, are moulded in a special shock resistant grade of BAKELITE material.

—in BAKELITE Material to be sure

Textile Manufacturers know how to profit by the serviceable qualities of BAKELITE Plastics—do you? Take these strong warp beam flanges, for example; they can be dropped on a concrete floor without being damaged. Intricate shapes present no difficulty, either, with mouldings. Simple or complex, they can be turned out to fine limits quicker and cheaper. BAKELITE materials can satisfy industry's most exacting demands—for production components or finished products. Why not go into the details with the BAKELITE Technical Staff?

COMPANY MEETINGS

BRITISH PLASTER BOARD, LIMITED

YEAR OF STEADY PROGRESS

DIVIDEND MAINTAINED

LORD BELPER ON THE OUTLOOK

The thirty-third annual general meeting of The British Plaster Board, Limited, was held on July 27th at 20, St. James's Square, London, S.W., the Rt. Hon. Lord Belper, P.C., D.L., J.P., the chairman, presiding.

The secretary, Mr Robert G. Forsyth, read the notice convening the meeting and Mr J. G. Hurst, of Messrs. Bretherton, Hurst & Co., read the report of the auditors.

The following is the chairman's statement circulated with the report and accounts:—

As you will have observed from the balance-sheet and accounts, the activities of your company during the year to March 31, 1950, have yielded steady progress and, whilst I need to draw your attention to a number of matters, there is nothing of a particularly exceptional nature.

Board of directors—We have recently invited Mr L. K. Reid to join our board of directors, and you will be asked to confirm his appointment presently. Mr Reid, who is a joint managing director of D. Anderson & Son, Limited, has a wide knowledge of the needs of the building industry and his presence at our meetings will be of considerable value.

BALANCE SHEET

If you will refer to the consolidated balance-sheet, to which this statement is attached, you will see that the increases in the authorised and issued capital duly reflect the decision made last year to bring the share capital of the company a little more into line with the real value of the assets.

I advised you in my previous statement that steps were being taken to have a revaluation of the fixed assets by professional firms, in order to have corroborative evidence of the values involved in terms of the post-war pound. Our instructions emphasised that the valuations were to be on a conservative basis. In spite of this, figures totalling over £6,000,000 were established in respect of the fixed assets which appear in the consolidated balance-sheet at £2,171,493. In addition, there are the considerable net liquid assets amounting to £2,238,727, and a substantial value for goodwill to be taken into account, as well as the investments in our associated companies. So you will see that your shares are well covered.

SALE OF THREE BUSINESSES

We have disposed of three small businesses during the year, that is to say, the businesses carried on by Henry Wilkinson, Limited,—the paper company—and by Raynal Manufacturing Company, Limited, and Dunelt Cycle Company, Limited—cycle manufacturers.

In pre-war days the bulk of our sales of plaster board was of a type for which the product of our paper factory could be used, but this is no longer the case, and your directors thought it best to take a good opportunity to sell the business.

The Raynal Manufacturing Company, Limited, and Dunelt Cycle Company, Limited, were acquired with the enlarged premises bought a few years ago for our expanding stampings business; the vendors making it a condition for the sale of the premises that we should also acquire these two companies. Continuous developments in stampings have made it necessary to utilise the space occupied by these cycle companies, thereby necessitating the sale of the latter.

The profit on sale of capital assets—£36,755—which you will have noticed in the consolidated profit and loss account, includes the profit realised on the sale of the fixed assets of the companies named.

A SOUTH AFRICAN MERGER

At the beginning of this year, the capital of our associate company in South Africa was increased and we subscribed for £80,000 of the new shares. Towards the end of our financial year, negotiations were concluded whereby the whole of the share capital of the main competitor of our associate company was acquired by the latter for shares and cash. Loans amounting to £140,000 were required to finance the arrangement and provide necessary working capital. £90,000 of this loan has been advanced by The British Plaster Board, Limited, as shown in the balance sheet.

As the result of the merger, various buildings and other fixed assets will no longer be required, and it is hoped that their liquidation will provide sufficient money to pay off the loans. There will be ample productive capacity to serve the needs of the whole of the Union of South Africa and adjacent territories, with a margin for further expansion, and your directors are of the opinion that our associate company's prospects in the Union are greatly enhanced by the arrangement.

FRENCH INTEREST

An agreement has been reached with Societe Anonyme Placoplatre, a company which has recently introduced the manufacture of plaster boards into France, whereby, in return for services to be rendered, your company have the option to take up a substantial interest in the French concern. This company has the support of two of the most influential gypsum concerns in France, and your directors consider it would be of advantage to secure a stake in this development of the French gypsum industry.

CAPITAL EXPENDITURE

The contracts for future capital expenditure outstanding at March 31, 1950, amounting in total to £90,510, are small in comparison with the much larger sums involved over the past few years, and are made up of a considerable number of minor, but necessary, improvements to the various units.

PROFIT AND LOSS ACCOUNT

The aggregate turnover for the year was slightly larger than for the previous year, and the company's mines, mills and factories are running on a reasonable output basis. In the plaster board industry the closure of two factories—one being our own Wallasey factory, as I mentioned last July—has left the industry sufficiently near to maximum capacity for satisfactory operation, while plans are ready for a substantial increase in output if required.

The trading profit for the year under review at £1,155,456 is slightly larger than for the previous year. This improved result has been achieved after writing off a larger sum than heretofore for depreciation; the comparative figures being £285,593 for this year, as against £209,032 for the previous year. Unfortunately, yet heavier tax absorbs a still larger proportion of your Group's profits, the necessary provision for profits tax being increased by approximately £15,000, while provision for income tax and also for relief in respect of initial allowances together require an additional £66,000. I have coupled the relief in respect of initial allowances with ordinary income tax in my remarks because, after all, it is only a deferment of the payment of the tax which eventually has to be met in any case, and thus, for a concern which is adequately financed, is of no assistance at all, except in so far as the money represented thereby can be invested and earn a little interest—which again is subject to tax in its turn. The result of the additional demands by the Exchequer is to leave some £42,000 less for appropriation than was the case a year ago.

DIVIDEND 16⅔ PER CENT.

Your directors have placed £100,000 to General Reserve and recommend the payment of a final dividend of 10 per cent. which, with the interim dividend of 6⅔ per cent., makes a total for the year of 16⅔ per cent. The latter, after making adjustment for the recent 50 per cent. capital increase, is therefore equivalent to the dividend paid for many years. We are conscious that the continuance of this policy means, in effect, a progressive reduction in the real value being paid to the shareholders, as the purchasing power of the pound falls and taxation on each pound received by shareholders continues to be so high. You will understand that we feel our hands are tied in this because of requests made to industrialists by spokesmen of the Government, but, at the same time, I must point out our view that such a response cannot be expected indefinitely.

EXPORTS

Considerable attention is being paid to the export markets and I am pleased to be able to tell you that we are achieving satisfactory expansion, both in total value and in the number of countries served.

PERSONNEL RELATIONS

We are much indebted to all grades of employees for the results achieved. Personnel relations continue to be excellent throughout the Group, and I am glad to inform you that we have maintained a cordial association with the trade unions with which we are connected.

THE FUTURE

Every effort is being made by continued research work in all branches of the company's activities to improve and enlarge the range of the company's products.

For the immediate future, we are having to face large extra costs on raw materials such as paper and paper bags, and, particularly, on transport of materials into our factories and the finished products going out, as well as on other less important items.

There are, however, encouraging signs of a general improvement in the industries served by our various units. In the building industry, being the most important to your Group, the indications of increasing freedom of action—recommended so strongly in the reports of the Building Industry Working Party and the Productivity Team—are particularly welcome and, subject to avoiding a disastrous timber shortage, such freeing of the industry should rapidly lead to more and cheaper houses and thus, so far as we are concerned, to a greater demand for the products of your Group of companies.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring directors, Lord Belper, Mr T. S. Durham, Mr H. Leigh Newton, Mr L. K. Reid and Mr J. F. Strable, were re-elected and the remuneration of the auditors, Messrs. Bretherton, Hurst and Company, was fixed.

GOODLASS WALL AND LEAD INDUSTRIES, LIMITED

STRONG LIQUID POSITION

MR. H. S. TASKER'S STATEMENT

The nineteenth annual general meeting of Goodlass Wall and Lead Industries, Limited, was held on July 27th at Winchester House, Old Broad Street, London, E.C., Mr H. S. Tasker (chairman of the company) presiding.

The following is an extract from his circulated statement:—

Although there are no particularly unusual features which require comment, I should like to draw attention to several items in the consolidated balance sheet. There has been substantial expenditure during the year on land, buildings and plant, the increase in the value of these items amounting to £579,000. There is no large single item to refer to, but during the year the new paint factory at Speke, near Liverpool, was completed, as also was the central block of offices, laboratories, canteens, etc., in our Millwall works. Substantial progress was made with similar staff accommodation at the antimony works on the Tyne. These last two items represent important steps in our policy of improvement in the working conditions of our staffs and work people at the factories. Similar improvements are either in hand or proposed at other centres. The war interrupted progress in these developments, which we regard as essential, particularly in old-established factories. The immediate return cannot easily be estimated, but these provisions are nevertheless essential features in an efficient organisation and are greatly appreciated by our employees. Further expenditure was incurred in enlarging the manufacturing facilities at the paint factories in Bombay and Melbourne, and substantial progress was made during the year in the erection of our new factory for the production of lead products and pigments in Durban.

There is a small decrease of £5,502 in shares in subsidiaries which have not been consolidated. This is explained by the sale of a small overseas subsidiary at a satisfactory figure which entailed a profit on its book value, which has been transferred direct to capital reserve.

The increase in the value of our trade investments is mainly accounted for by the subscription of further Ordinary capital in British Titan Products Company, Limited, and by further investments in existing companies in Australia and South Africa.

Our liquid position remains strong. Our cash resources appear to us to be adequate for the remainder of our development programme which is at present foreseen, and there remains a balance which is available for other promising developments that may come to our notice.

PRICE FLUCTUATIONS

Trading throughout the year was considerably affected by the wide and somewhat arbitrary fluctuations in the prices of the metals in which we are interested, giving rise to heavy demands at some periods and to equally heavy pressure on our ability to absorb supplies of raw materials in other periods.

In the case of lead, the price fell from £123 0s. 0d. per ton on January 1st to £75 10s. 0d. on July 12th, and during the large part of this period the price in this country was maintained by the Ministry of Supply at a level substantially above that ruling in other markets, which no doubt helped that Government Department in its capacity as a bulk trader, but which was by no means helpful to those manufacturers of lead products who were attempting to maintain their goodwill in world markets. On July 12th this policy was abandoned, and since then the price maintained by the Ministry of Supply has closely followed the ruling price in America. This price, of course, is quoted in dollars, and when devaluation took place, the Minister took for himself full advantage of the situation and raised the price from £87 5s. 0d. on September 21st, to £122 0s. 0d. This price afterwards fell to £97 0s. 0d. at the end of the year.

Since September 21st, the equivalent sterling price has been calculated on the basis of the devalued pound, so that so far as our main raw material is concerned devaluation has brought no assistance to the manufacturers and would-be exporters of lead products. As a matter of fact, the official UK price has been and now is in excess of that prevailing on the Continent. In spite of this, it is satisfactory to note that, during the year, our rate of export was maintained, although the tonnage was smaller than could have been reached in more favourable circumstances. This result was only obtained through excellent work on the part of our export staff.

In reviewing the work of our manufacturing departments at home, it may be noted that our metal smelting, refining and alloying departments have had a particularly successful year. In metal and pigment manufacture we again did well but evidence is increasing of the effect of the continued high price of lead (six times prewar) on the consumption of white lead now that increased supplies of titanium oxide are becoming available. Although the volume of trade in prewar years may not easily be reached again, the inherent qualities of this pigment will ensure its continued use for a long time to come. Antimony metal and compounds have again done well.

MANUFACTURING ACTIVITIES

As you already are aware, the major part of our manufacturing activities was consolidated at the beginning of 1949 for trading purposes under Associated Lead Manufacturers, Limited. The commercial organisation is based on three centres—namely, London, Chester and Newcastle-on-Tyne. I am glad to say, after 18 months under the new organisation, that it has proved efficient and economical in practice, and I believe that it distributes with better service to our customers our various old-established brands, as "Associated Lead Products."

Our relations with our work-people are good and we are continuing to develop in our factories incentive schemes by which production per man-hour is increased in such a manner that our men receive benefits closely related to improved productivity.

TRADING RESULTS OF PAINT GROUP

The trading results on the paint side of our group have shown some reduction in total. Competitive conditions in this country are increasing, but with the completion of our new factory at Speke and following on this the concentration of manufacture there from our older factories in the Liverpool area, we are well placed to meet any competition.

Considerable attention has been given to our interests overseas. In India these include lead products and alloys, zinc products and paint. Although during the past few years these companies have enjoyed profitable trading, conditions in India are making this increasingly difficult and the attitude of labour in particular is not encouraging to enterprise. Hitherto we have pursued a progressive course in that country, and we hope that we shall not be forced by this less favourable trend to adopt a more cautious policy. We take rather a different view as to future prospects in Australia, where we are encouraging our subsidiary companies in schemes of energetic expansion. Our associated company in Eire continues to increase its business successfully, and in South Africa our new paint company has made good progress. Our other main undertaking overseas is Goodlass Wall y Cia. (Argentina) Ltda. The inflationary conditions in that country are reflected in our subsidiary's accounts, and the financial results in Argentine currency are satisfactory.

Our interest in British Titan Products Company, Limited, has increased and is now very substantial. The new Grimsby plant of that company began production early in 1949 and has more than fulfilled expectations. The capacity of this factory is now to be doubled although it will take two years before the additional supplies reach the market. We are providing in our forward estimates for the further finance that will be required in this field.

Your Board has given the most anxious consideration to the question of this year's rate of dividend, and only after careful discussion has it decided to adhere to the same rate of dividend distribution as before, even although earnings in recent years would justify some increase. We disagree in principle both with the limitation of dividends for risk-taking capital and with the limitation of reward to the more industrious or more capable worker. Nevertheless, owing to excessive and often extravagant expenditure by the Government, the danger of further inflation is still with us. That is why we have decided once more to support the policy of restraint.

The report was unanimously adopted.

MARLU GOLD MINING AREAS, LIMITED

The fifteenth annual general meeting of Marlu Gold Mining Areas, Limited, was held on August 1st, in London.

Maj.-Gen. W. W. Richards, C.B., C.B.E., M.C., chairman of the company, presided.

The following is an extract from his circulated statement:—

The tonnage mined and treated during the year shows an increase of 91,400 tons over the previous year's results. Working costs per ton showed a reduction of approximately 3s. 6d. per ton compared with 1948, due mainly to the increased tonnage; similarly, the amount of gold recovery of 42,832 ozs. was 12,262 ozs. higher.

The item "Prospecting and development" in the balance sheet is up on last year by some £25,000—approximately half of this expenditure was incurred in the reopening and testing the sulphide-underground section of the Bogosu mine.

In the profit and loss account it will be seen that the West African expenditure was some £23,000 higher than the previous year, but against this, revenue from gold won was £118,000 higher than that received in 1948. The net result of the year's working is the small balance of £12,045 on the wrong side.

Since the close of the financial year under review—that is, from October 1, 1949, to May 31, 1950—we have treated 316,180 tons of ore for a yield of 32,731 ozs. of gold and a net mine profit of £142,537. This compares with 267,980 tons, yielding 29,122 ozs. for a mine profit of £29,305 for the corresponding period of the previous year.

On the question of labour there are many opportunities for employment open to the African today, and there is competition for his services.

The report was adopted.

FOY, MORGAN AND COMPANY, LIMITED

(Timber Agents and Brokers)

A YEAR OF FRUSTRATION

SIR GERALD LENANTON'S STATEMENT

The fifteenth annual general meeting of Foy, Morgan and Company, Limited, was held on July 31st at the offices of the company, 16, Eastcheap, London, E.C., Sir Gerald Lenanton (chairman of the company) presiding.

The following is the chairman's statement which had been circulated with the report and accounts and was taken as read:—

The net trading profit of your company, after due allowance for taxation, for the year ended December 31st last is £55,219, compared with £56,412 in the preceding year. Dividends have already been paid on the preference and ordinary shares amounting to £11,818, leaving an available balance of £43,401, to which has to be added the balance of £54,997 brought forward from the 1948 accounts. From this sum it is proposed to transfer £11,250 to pensions account, £10,000 to the first preference dividend reserve fund, and £5,000 to the preference share redemption fund, leaving a carry forward of £72,148—an increase of £17,151 over the 1948 figure.

ADDITIONAL DIRECTORS

The increase in the number of directors mentioned in my statement last year has been effected. Messrs I. R. Lundborg, R. V. Cooper, N. E. Graydon, A. J. S. Waterman, L. Hartley Sharpe and E. A. Cremer joined the board of your company on August 1, 1949, and we shall ask you to confirm their appointment. They are all men of experience and standing in the timber trade, and I regard their election to the board as an important addition of strength to the company. I very much regret to tell you that Mr Marcus Beresford has been obliged, for reasons of ill health, to resign his position as a director of your company. The good wishes of all his colleagues go with him in his retirement.

During the year under review the balance of the £100,000 seven per cent. second preference shares were redeemed in accordance with your company's articles of association and in their place were issued £50,000 five per cent. second redeemable preference shares, and the remaining £50,000 will be issued during the current year.

The style of your subsidiary company in South Africa has been changed to Foy, Morgan, Africa (Pty.), Limited, and has incorporated the business of Frank Siebert (Pty.), Limited, the two directors of that company, Messrs F. Siebert and R. B. Laburn, joining the board of the South African company—Mr Siebert as managing director. The business is being expanded and an office in Cape Town has been opened.

PROSPECTS FOR 1950

The year 1949 has been one of frustration, and I regret that the prospects for 1950 do not confirm the hopes expressed last year. Though the importation of hardwood and wallboard is now largely, and plywood partially, free of Governmental control, the Board of Trade still acts as sole buyer of softwood. The effect of this policy on the current year's imports is likely to be disappointing, for it is doubtful whether the total quantity of softwood which can now be purchased for import before the end of the shipping season will be sufficient economically to fulfil the minimum requirements of the country for housebuilding and other essential needs—at least from those exporting countries best qualified by long experience to cater for this market. It is hoped that when the Board of Trade decides to allow individual companies to resume purchase of softwood and plywood abroad sufficient notice of the effective date will be given to the trade. Over-hasty abandonment of control might cause as great a dislocation of supply as over-protracted maintenance of the present purchasing arrangements.

Your directors have taken steps to prepare the company to meet the new situation which will arise when control of softwood buying comes to an end. The selling staff has been largely augmented, and connections with shippers abroad have been maintained by personal visits of your directors and staff. They look forward to the day when freer trading is allowed.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring directors, Mr I. R. Lundborg, Mr R. V. Cooper, Mr N. E. Graydon, Mr A. J. S. Waterman, Mr L. Hartley Sharpe, and Mr E. A. Cremer, were re-elected and the remuneration of the auditors, Messrs Hope Agar and Company, having been fixed, the proceedings terminated.

WILSON BROTHERS, LIMITED

FURTHER PROGRESS

The third annual general meeting of Wilson Bros., Limited, was held on August 1st in London, Mr Harry Wilson (chairman and joint managing director) presiding.

The following is an extract from his circulated statement:

I am happy to be able to report that your company has made further progress with results which are satisfactory.

The profit for the year under review, before taxation, was £110,698, as against £106,755 for the previous year.

Of the profit of £110,698 provision for taxation absorbs £62,655, leaving, with the balance of £12,258 brought forward, the sum of £60,301 available for appropriation.

A final dividend of 27½ per cent. is proposed which, together with the interim dividend already paid, will absorb £24,750 and leave £18,551 to be carried forward.

You will recall that, following the annual general meeting last year, the capital of the company was increased to £100,000 by a bonus issue of £50,000. The total dividend of 45 per cent. for the year under review is equivalent to a dividend of 90 per cent. on the capital before it was increased, as compared with the dividend of 85 per cent. which was actually paid last year.

The new factory covering 16,000 square feet, adjoining the old premises situated at 78-80, Great Eastern Street, is now working to full capacity and has enabled your company to increase the output of merchandise in all departments.

It must be appreciated that the heightened competition encountered in the greeting card industry since the removal of paper control in February, 1949, has necessitated an increased turnover with smaller profit margins in order that the company's profits might be maintained. Nevertheless, your directors are pleased to report a substantial increase in the sales of your company's publications and at the same time an encouraging increase in profits.

Your company's export trade is quite satisfactory, and as the result of the facilities afforded by the new factory, your directors are planning an intensified drive to promote increased shipments of greeting cards to overseas markets.

The current year has opened satisfactorily and orders in hand justify your directors' confidence that, save for unforeseen contingencies, the present year's trading will be equally successful.

The report was adopted.

GROSVENOR HOUSE (PARK LANE) LIMITED

DIVIDEND 6 PER CENT.

The twenty-second annual general meeting of Grosvenor House (Park Lane) Limited was held on July 28th at Grosvenor House, Park Lane, London, W., Major G. C. S. Black, C.I.E., M.V.O., O.B.E., the deputy chairman, presiding.

The following is an extract from his circulated statement for the year to March 31, 1950:

The consolidated profit, after charging debenture stock interest, amortisation and directors' emoluments, amounted to £168,436.

Pursuant to the articles of association, a transfer to special reserve of £5,626 has been made; and the provision for maintenance has been increased by £15,000. It is proposed to increase the general reserve by £10,000.

Provision has also been made for the "writing off" of £5,400, being the goodwill of a subsidiary company. After providing for taxation and bringing in the balance from the previous year, the amount available is £100,971. The board has pleasure in recommending the payment of a final dividend of 3½ per cent., less tax, on the ordinary stock, making 6 per cent in all for the year.

It has been the practice in recent years for the directors to declare an interim dividend in January and to recommend a final dividend at the annual general meeting. Your directors consider it prudent in future years to discontinue this practice and to recommend dividends at the end of the financial year when the profits of the year have been ascertained. It should not be assumed that this presupposes any change in the dividend which we hope will be earned and distributed for the current year.

I regret to record that costs in all departments continue to rise. While turnover records are broken, and may be broken again in future, net earnings do not keep pace with turnover.

Notwithstanding difficulties, we pursued the policy established in 1936—unfortunately interrupted by the war years—of maintaining our furnishings and equipment at the highest possible level, with the object of satisfying the most exacting client and of doing so with the utmost efficiency.

THE GREAT ROOM

The Great Room is now in service again, not only for exhibitions, but also, for the first time since the war, for dinners, dances and receptions. The room is the largest ballroom in any hotel in Europe, and can cater in comfort for more than the 1,500 guests whom the authorities permit us to accommodate in it at any one time.

The Great Room has also been successfully let for exhibitions, such as the Sunday Times Book Exhibition and the International Stamp Exhibition, as well as for purely trade exhibitions. This use may well have to be restricted as the demand for it as a ballroom and social centre expands.

I am pleased to be able to state that your company has to the maximum possible extent assisted the nation's effort to close the dollar gap. It is interesting to observe that the number of our visitors from overseas in 1949-50 was 2½ times as great, and the number from the U.S.A. 3½ times as great, as in 1947-48.

With loyal and attentive staff, the willing and cheerful personal service, which is the greatest asset of any good hotel, and for which we are now happily well known, can be maintained. Grosvenor House will maintain it. As sales conditions tend to return to normal, we face the future with the knowledge that the goodwill and prestige of Grosvenor House, both at home and abroad, continue to grow.

The report was adopted.

BRITISH GLUES AND CHEMICALS, LIMITED

MR ROGER DUNCALFE'S REVIEW OF SUCCESSFUL YEAR

The directors' report and accounts of British Glues and Chemicals, Limited, for the year ended April 30, 1950, were issued to stockholders on July 31st.

In his circulated review, the chairman, Mr Roger Duncalfe, said that the consolidated profit, after full taxation provision, was £261,685 (against £106,418). With amounts brought in, the total available for appropriation was £352,230 (£222,488).

Appropriations were: £40,000 further contribution for back service liability under the group's pension schemes; £18,000 to replacement reserve (making it £80,000); £51,000 to reserve for tax deferred by initial allowances; and £150,000 to general reserve (making it £300,000).

Mr Duncalfe emphasised the directors' view that it was in the best interests of stockholders to strengthen the company's reserves rather than to make an increased distribution this year, particularly in view of the proposal for £50,000 bonus issue.

Dealing with the consolidated balance sheet, Mr Duncalfe explained that consolidation at the current rates of exchange of all assets and liabilities of the North American subsidiaries had resulted in an increase of £26,496 in capital reserve, which now stood at £57,574. Fixed assets, at £1,029,703, had increased by £29,204; and new capital expenditure schemes in progress totalled £60,000. Current assets had further increased during the year by approximately £340,000, and now exceeded current liabilities by approximately £730,000

PRODUCTION AND SALE

Mr Duncalfe continued:—

A feature of the year has been a substantial increase in production of gelatines, glues, greases and cattle feeding stuffs, including mineral supplements, with a corresponding increase in turnover.

Our technical department has been particularly successful in translating our development department's new processes into full scale works production; we now produce in five U.K. factories a far greater tonnage of gelatine and glue than we did in seven factories pre-war. Research and development work has had our unremitting attention in all divisions of the group; the need for it is obvious, the cost is substantial; the benefits of our sustained endeavour are beyond doubt and are expressed in our results.

In our gelatine division the most noteworthy features are the expanded production and sale of high-grade technical gelatine for specialised industrial uses, and the encouraging development of export business. Our Murray division increased its business in casein plastics and essential oils. Although our soap division had to face keen competition, personality soap continued in public favour. Production by the Croid division of a new veneering glue, possessing a number of advantages over synthetic adhesives, has met with considerable success. Our Calfos product to remedy calcium and phosphorous deficiency has been well received in North America and has proved a useful dollar earner.

PERSONNEL

The appointment to the board of Mr C. G. Smith, B.A., and Mr D. N. Walton, A.C.A., will, I believe, commend itself to stockholders. Mr Smith has been in the service of the company since 1936 and has been for some years in charge of our gelatine division. Mr Walton, as a non-executive director, brings to bear on our problems his specialised professional experience.

The profit for the year is the result of a great co-ordinated effort on the part of all workers in the group, powerfully led by your managing director, Mr Harold J. Cotes. On your behalf I extend to them all sincere thanks for their endeavours. The total contribution by the company to the pension funds over the past three years, amounting to approximately £140,000, is a practical expression of our appreciation.

A BONUS ISSUE

The company's revenue reserves and surplus today total some £620,000 over and above our issued capital of £700,000. Your directors feel it is time for the first step to bring the issued capital into closer relationship with the capital employed. We therefore propose to issue a bonus to ordinary stockholders' £50,000 ordinary stock (two 4s. units for every seven units held).

It would be unwise for stockholders to expect a continuance of profit on the scale of the year under review. Although, as I have said, it was a year of difficult trading conditions, there were certain favourable winds which may not last. The year was one in which we achieved a substantial reduction in works costs, and it did not suffer the full impact of the rise in those costs outside our control which occurred in the later months of the year. This rise has continued and may not yet have reached its peak. We gained, in the last six months of the year, certain important benefits from devaluation—adverse effects are apt to become apparent later. Competition is becoming keener. We are fortunate to have had a good trading period in which to rehabilitate and improve our works and to pay the heavy cost involved. Your company is in a sound position to face the future. The first three months of the new year have given us an encouraging start; international conditions may move against us, but the year's trading should, in my view, yield a reasonable profit.

BATANG CONSOLIDATED RUBBER ESTATES, LIMITED

IMPORTANCE OF REPLANTING

The thirtieth annual general meeting of Batang Rubber Estates, Limited, was held in London on August 3rd, Mr E. G. Estall (chairman) presiding.

The chairman, in the course of his speech, said that the estimated crop for the year to March 31, 1950, was 1,046,000 lb., the shortage being mainly due to the unsettled conditions caused by bandit activities. The "all-in" cost was 8.62d. per lb. and replanting costing 1.12d. per lb. A year ago the low price of rubber was causing concern being near to the cost of production. Consequently when the price did eventually rise to over 1s. a lb. the directors considered it prudent to sell forward part of the crop and thus ensure production expenses for 1950.

A large proportion of the mature area was old rubber and unless this was replanted with the best high-yielding material the company could not hold its own in the future. For the current year they were replanting 213 acres. Much had been said about the advisability or otherwise of replanting. He and his colleagues were in agreement that it was imperative to continue replanting. He believed the whole industry was solidly behind a gradual replanting programme, as this was the only way in which they could ultimately compete with synthetic. He did not think a defeatist attitude would solve shareholders' problems. On the contrary, it was just playing into the Communists' hands.

The report was unanimously adopted and the recommended dividend of 7½ per cent. was approved.

SILVER LINE, LIMITED

PREFERENCE CAPITAL REPAYMENT

The twenty-fourth annual general meeting of Silver Line, Limited, will be held in London on September 1st.

The following is an extract from the statement of the chairman, Mr Henry Barraclough, circulated with the report and accounts for 1949:

The difficulties reported to you in my last statement continued during the early part of 1949, but showed some promise of being mitigated by the steps taken to improve the position. A recession, however, occurred in the second half of the year, and whilst this was to some extent arrested by the effects of the devaluation of sterling, this occurred too late in the year to make any material difference to the year's results.

The operating profit for the year was £85,987, as compared with £18,905 in 1948. Our Canadian subsidiary showed a trading profit of $28,056.77, as compared with a loss of $358,596.35 in 1948.

Since I took office as chairman in 1948 and later as managing director in 1949, there have been considerable changes in the company's operations. It was inevitable that post-war conditions throughout the world should lead to close examination of and variations in our trade routes. We have withdrawn from trades that held out no immediate hope of becoming remunerative, and have found it necessary to reduce the size of our fleet of cargo-liners to conform to our reduced requirements. Additionally, we have come to the conclusion that our almost entire dependence upon dollar trades for our revenue places the company in a position that is too vulnerable to the impact of forces and events outside our own control. Our policy now is not to confine ourselves to cargo-liner business and we are therefore passing through a transitional period from which we expect to emerge with a mixed fleet engaged in more diversified trading.

As part of this policy we have placed orders for two motor tankers, each of 16,500 tons deadweight, for delivery in December, 1951, and November, 1952.

CAPITAL POSITION

As I informed you last year, we disposed of two new cargo-liners then building, and in furtherance of our present policy of reducing our unprofitable cargo-liner services, we have recently sold the two other cargo-liners now under construction. This latter sale puts us in the position of being able to approach the preference shareholders with the proposal that the preference capital should be repaid on terms which I will later set out, and which I feel confident will be regarded as equitable. We feel that a shipping company such as ours should not have any preference capital, but that the capital should consist entirely of ordinary shares, held by those who know well that they must, over a period, take the lean years as well as the good.

The proposal which is to be made to the preference shareholders will, in effect, mean that they will receive a return of the price of 21s. per share paid at the time of the issue, plus all arrears of dividend down to the time of repayment. We have, however, had indications from some of the larger holders that if this proposed repayment is made they would wish to take an interest in the ordinary stock of the company.

By way of addendum it is stated that the scheme will provide, at preference stockholders' option, for either (*a*) repayment in cash at a premium of 1s. per £1 stock, plus all arrears of dividend, or (*b*) 16s. in cash per £1 stock, plus all arrears of dividend, plus one 10s. ordinary stock unit for every £2 preference stock now held.

PARKLAND MANUFACTURING COMPANY

A MOST SUCCESSFUL YEAR

The forty-seventh annual general meeting of the Parkland Manufacturing Company, Limited, was held on July 28th at the Midland Hotel, Bradford, Mr Jonas Hanson (chairman and managing director) presiding.

The secretary (Mr R. Richmond Mann, C.A.) read the notice convening the meeting and the report of the auditors.

The following is an extract from the chairman's statement: The accounts show that your company has had a most successful year. During the year the new weaving plant in our main mill at Greengates has settled down to something like full production, and as a result there has been a remarkable expansion in our turnover.

PROFITS

Our profits, therefore, showed a substantial increase over the previous year. In the parent company the net profit before taxation was £314,375, compared with £201,521 for the previous year. For the group as a whole the net profit, before taxation, for the year to February 28, 1950, was £374,223, against £281,297 in the previous accounts, when the periods covered were a year for the parent company and 14 months for each of the subsidiaries.

The surplus remaining for the group, after deducting taxation, is £174,194, against £138,910 for the previous periods to February 28, 1949.

The reserves now total £591,532 made up of capital reserves £96,224, and revenue reserves and balance on profit and loss account £495,308. With the issued capital of £470,000 the total capital employed in the group is £1,061,532.

Since the date of the balance sheet, the authorised capital of the company has been increased by the creation of 1,500,000 ordinary shares of 5s. each. In April last, £44,000 of the above-mentioned reserves were capitalised, and in satisfaction thereof 176,000 ordinary shares of 5s. each in the capital of your company were issued, credited as fully paid, to the ordinary shareholders in the proportion of one new ordinary share for every five ordinary shares held.

On the assets side you will have seen that the total written down value of the fixed assets was £282,889 at February 28, 1950. This figure includes additions during the year which cost £73,025.

The current assets are shown at £1,013,752, against current liabilities of £235,510, which are thus covered nearly five times.

Stocks on hand are shown at £559,592, against £559,671. During the year we have been able to eliminate the bottleneck in burling and mending. This has enabled us to reduce very considerably the number of pieces carried in stock and, of course, we now give quicker delivery to our customers.

In the home market a heavy purchase tax is added to the price of all higher quality cloths which do not come within the permitted ceiling prices for utility cloths. On top of the high cost of wool the tax makes high grade non-utility cloth very difficult to sell in this country. Thus, a manufacturer has to plan his production in two ways; for the home trade he must concentrate, as far as possible, on the modestly priced utility cloths, but for the export trade a better quality cloth at a rather higher price is called for. Our principal difficulty, therefore, is the need to produce different kinds of cloths for the home and export markets. I believe we are well fitted to overcome all the difficulties which lie ahead and to obtain our share of the available business in home and export markets.

The report and accounts were unanimously adopted.

At a subsequent extraordinary general meeting of the company, new articles of association were approved.

JOHN BROWN AND COMPANY, LIMITED

SHIPBUILDING PROBLEMS

The eighty-sixth annual general meeting of John Brown and Company, Limited, was held on July 28th in London.

The Rt. Hon. Lord Aberconway, C.B.E., LL.D. (the chairman) said that the balance added to the credit of the profit and loss account as a result of the year's working was £515,256, an increase over the previous year of some £7,000. That modest increase was, however, after providing for profits tax and income tax to the extent of £547,280 as compared with £177,259 for the preceding year. They proposed a final dividend on the ordinary stock of 11d. per unit, free of income tax, which, with the 4d. per unit already paid would maintain the dividend at the same rate as last year.

During the past few months, the shipbuilding industry had been passing through a critical period. For some time very few orders had been placed because shipowners were rightly perturbed by uncertainty about the price they would ultimately have to pay for the vessel they wanted. The shipbuilder was equally uncertain about the cost to him of the materials and labour he would have to use.

SUBSIDISED COMPETITION

The merchant shipping of Great Britain was now, even more than before the war, exposed to competition from ships subsidised both in first cost and in running expenses. Great Britain was most vitally dependent upon the existence of a vigorous merchant navy, and our economy could not be maintained unless we hold a large and he might even say a predominant part of the international carrying trade. If they were to keep that leading position the ships which were its instruments must be the best of their kind.

They as shipbuilders realised how important it was that large and costly vessels should get into service as quickly as possible. They had made it their policy to maintain exactly and, if at all possible, to anticipate their contract dates for the delivery of new ships. They looked upon that policy and its effective fulfilment as perhaps the most important element in the goodwill of their clients.

EXTENSION OF ACTIVITIES

As indicated last year, they were seeking to extend their activities into other engineering fields. Notably they had been accepted by the British Electricity Authority as contractors for steam power plant which the country required to meet the ever increasing demand for electric power. Their experimental work with gas turbines suitable either for land or marine use continued actively.

With the help of Costain-John Brown Limited, they were investigating schemes for the construction of oil refinery plant, a branch of engineering in which they considered there was a substantial future. The work that they were doing in the manufacture of water turbines for hydro-electric schemes both for Great Britain and for foreign countries was both substantial and continuous.

Such projects would add to the work that could be taken at Firth Brown's and Markham's and in certain of their shops at Clydebank. The main addition to the work undertaken at Clydebank was, however, being placed in an additional works being built at Whitecrook on vacant land acquired a short time ago. It would thus be seen that the company was employed in a much broader range of activities than used to be the case.

The report was adopted.

ELLAMS DUPLICATOR COMPANY, LIMITED

The annual general meeting of Ellams Duplicator Company, Limited, was held on July 31st in London, Mr Frederick Ellam the chairman, presiding.

The following is an extract from his circulated statement:—

You will have noticed the increase in the ordinary share capital, which you will remember was agreed last year. The capital was increased by £75,000 by transferring this amount from our reserves and making a bonus issue to the ordinary shareholders on the basis of two new 1s. shares for each 1s. share held.

Trading conditions during the year were rather more difficult, chiefly because of restrictions in certain export markets, which is reflected in a somewhat smaller profit. The position has latterly improved, but having regard to present prevailing circumstances, your board do not feel that the time is opportune to recommend an increased dividend.

The supply of raw materials also presented difficulties from time to time and resulted in some reduction in output. Furthermore, the cost of certain raw materials, partly as the result of devaluation of sterling, has advanced considerably. Every effort is being made to offset this tendency of rising costs while maintaining the high standard of quality upon which the good name of your company has been built, by introducing wherever possible improved methods of production, and the process of installation of new and up-to-date plant and equipment is continuous.

Trading conditions during the first six months of the current year can be considered satisfactory, and orders in hand are being maintained at the normal level.

Report and accounts were adopted.

NOTICES

IMPORTANT GROUP, having several foreign branches and subsidiaries, requires qualified Accountant, thoroughly conversant with Foreign, Dominion and U.K. taxation law and practice. Applicant should be prepared to travel if necessary. Write, giving details of qualifications and experience, to Box 476.

FORMER Assistant in large house of general merchants, importers and managing agents in India, desires similar position, or in Hong Kong or Malaya. Age 37. Excellent references. Returned to England for family reasons.—Box 480.

THE CHARTERED INSTITUTE OF SECRETARIES.—Directors requiring the services of CHARTERED SECRETARIES to fill with the Secretary of the Institute, 16, George Street, Mansion House, E.C.4.

FIRST-CLASS Hons. B.Com. (Lond.), knowledge commerce and distribution, experience in economic and statistical research, capable writer, ex-editor trade journal, initiative and imagination, organising ability, 31, invites offers around £1,500 p.a.—Box 477.

Statistical Summary

EXCHEQUER RETURNS

For the week ended July 29, 1950, total ordinary revenue was £74,789,000, against ordinary expenditure of £38,608,000 and issues to sinking funds £100,000. Thus, including sinking fund allocations of £5,798,000, the surplus accrued since April 1st is £131,535,000 compared with £68,084,000 for the corresponding period a year ago.

HIS MAJESTY'S COLONIAL SERVICE—NIGERIA

A vacancy exists for a Statistician in the Department of Agriculture on the staff of the Oil Palm Research Station at Benin, Nigeria. Duties will be to assist in planning and interpreting field experiment and progeny trials in connection with the Oil Palm Research programme and to organise the recording and treatment of routine statistical data.

The appointment will be on three years' probation for permanent and pensionable employment. Salary scale, including pensionable expatriation pay, is £660 per annum to £1,300, with an efficiency bar at £860 and a promotion step at £1,140. War service and professional experience will determine the point of entry into the scale. In addition, a temporary cost of living allowance is payable. Where Government quarters are provided a sum varying from £60 to £90 a year is deducted for rent. Free passages are provided for the officer, his wife and up to two young children on first appointment and on leave. Income tax is at local rates, which are very much lower than those in the United Kingdom. The tour of service is 18-24 months. Leave on full salary is granted at the rate of seven days for each completed month of resident service.

Candidate must be under 40 and must possess a good Honours degree in an appropriate subject, preferably statistics or mathematics with statistics. Practical experience in design of experiment work is desirable. Forms of application can be obtained from the Director of Recruitment (Colonial Service), Colonial Office, Sanctuary Buildings, Gt. Smith Street, London, S.W.1, to whom completed applications should be submitted within two weeks of the appearance of this advertisement.

NUFFIELD FOUNDATION

The Nuffield Foundation has a vacancy for an Assistant Secretary. He must be a university graduate (in any faculty) with a good academic record, of proved administrative ability in responsible posts and having the capacity to consider novel proposals imaginatively and practically. Preferably he should be aged between 35 and 40 years.

The commencing salary will be £1,500 a year, with superannuation and child allowances.

Anyone wishing to be considered for this post should write to the Secretary, Nuffield Foundation, 12, Mecklenburgh Square, London, W.C.1, stating age and full details of qualifications and experience and the names of three referees.

L. FARRER-BROWN, Secretary.

SENIOR Official required by the International Tin Study Group (an intergovernmental organisation in The Hague). Qualifications include some administrative or parallel experience, interest in international aspect of economic problems, and good knowledge of English and French (latter essential). Duties will comprise general supervision of organising and administrative work of the Group, ability to undertake enquiries into the tin industry, working with committees, etc. Minimum age 28 years. Salary about 8,500 Netherlands guilders (currently about £800) per annum. Contributory pension scheme. Apply in English or French before August 15th with full details of age, education, languages, experience, special qualifications, date at which appointment could be taken up, references, etc., to the Secretary, International Tin Study Group, 7, Carel van Bylandtlaan, The Hague, Holland.

FOR SALE, "Records and Statistics," Nos. 1-158 and "The Economist," Jan. 18, 1947—May 27, 1950.—Offers Box 478.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): fees are reasonable, and may be paid by instalments, if desired.

Mr Malik's Manœuvres

TEN days of Mr Malik's performance as President of the Security Council have been quite enough to show the world the purpose of his return. North Korea's unprovoked attack on South Korea united the free nations in an all but universal condemnation of the Soviet puppet and of its powerful backer. The original resolution in the Security Council condemning North Korea and calling on the United Nations to assist South Korea has since been accepted by 53 of the 59 member nations and the unanimity of opinion cuts across every division which normally prevents the crystallisation of what can reasonably be called "world opinion." Great states and small, eastern states and western states, Asian states and American states, Arab states and Israel—all have joined in the denunciation of aggression and in the determination to check it at its source. Thus the Soviet Union, in the full spate of its peace campaign and of its efforts to fix responsibility for "atomic aggression" on the United States, has suddenly found the tide reversed and the charge of encouraging aggression pinned upon it by a unanimous world.

The chief purpose of Mr Malik's return to the forum of the Security Council has been to put an end as speedily as possible to this unanimity of world opinion and to drive back the wedges which tend to hold the nations apart. There is little point in dwelling on the sophistries by which he has sought to prove that the war in Korea is a civil war and that the only aggression that has taken place has been the intervention of a foreign power in the shape of the United States. This "upside down talk" has not for one moment convinced the United Nations, which was itself responsible for establishing the South Korea Government as a legal government, whose own Commission on the spot confirmed the fact of the attack on June 25th and whose flag now flies over the American forces desperately seeking to retain a foothold in South Korea. In all the votes on the issue of Korea itself, Mr Malik has had the Council almost solidly against him.

From the very first day of his Presidency, however, the Russian delegate has used more effective tactics for confusing the issue and destroying the unanimity of opinion in the free world. He has sought to shift the debate from the issue of Korea, upon which there is unity of outlook among the free nations, to others upon which there is not. It may, indeed, have been Pandit Nehru's well-intentioned efforts to call in Stalin as a peacemaker that first suggested a possible policy to the Kremlin. It will be recalled that Mr Nehru proposed a settlement of the Korean issue through the Security Council, strengthened by the prior admission of Communist China. The Soviet Government was thus reminded that almost every issue concerning Mao Tse-tung's regime could be made an apple of discord among the free nations. In particular, Asian opinion could be inflamed and played off against Atlantic opinion and the old overtones of western imperialism and Asian independence reintroduced. The Security Council itself was divided on the question whether Communist

representatives should oust the Nationalist delegate. Opinion generally was uncertain about the exact status of Formosa and the legitimacy or otherwise of Chinese Communist claims to it. Here, clearly, were troubled waters for the Soviet hook. Mr Malik settled down to some very intensive fishing.

The aim of his speeches, his accusations, his innuendoes and violent tirades has been to convince the outside world that Korea is a subordinate issue in a general American "attack" upon the Far East. The proof he offers is the refusal of the United States to admit the Chinese Communists to the Security Council, its backing of Dr Tsiang, the Nationalist representative, and its "active military support" for the "corrupt regime" of Chiang Kai-shek in Formosa. In the last week, General MacArthur's somewhat flamboyant visit to Formosa, the even more flamboyant press releases issued by Chiang Kai-shek and the revival of Nationalist bombing of "invasion barges" have been woven into the fabric of Soviet propaganda. Again and again, Mr Malik has thrust the issue of the Korean fighting to one side and brought up instead the question of the rights and the representation of the Chinese Communists. And it must be admitted that his efforts to put an end to unanimity have not been entirely unsuccessful. Both Britain and India have voted in the last week for the admission of Communist China and America against it, and doubts and uncertainties about developments in Formosa have been voiced not only in India but in Australia and even the United States. What was clear on August 1st—the fact of North Korean aggression—has been slightly muddied. So much must be conceded to Russian tactics.

*

The immediate aim of the free nations should therefore be to buttress their unanimity at the points where it is endangered. In the specifically Korean issue there can, of course, be no wavering in the admirably unanimous view that the only acceptable end to the incident would be a withdrawal by the Communists behind the 38th parallel of latitude. This insistence will be the firmer if a similar unanimity can be achieved on the other two points, on the representation of China in the Security Council and on the status of Formosa. This should not be an impossible task, as the real divergences are by no means as great as they appear.

The arguments for the admission of Communist China to the Security Council which the British and Indian Governments have for some time been pressing upon the other members of the Council are, firstly, that it is really absurd to go on recognising Chiang Kai-shek's nominee as the representative of the people of a China from which he has been expelled, and secondly that to bring Mao Tse-tung out of his lonely *tête-à-tête* with the Kremlin and into the open forum of the nations cannot, at least, do any harm. It is true that the Chinese representative is equipped with a veto, which might be useful to the Russians if they chose to walk out once again. But it can be taken for granted, after the brief demonstration of what the Security Council can do in the absence of a Communist veto, that by one means or another, the veto will now be a permanency in any case. The Security Council cannot hope to be more than a talking-place, and there might be some virtue in having the Chinese Communists there to talk to. In any case, the alternative, that Chiang Kai-shek should continue to be treated as a Great Power, is getting more ridiculous every day.

Nor is the American opposition absolute. The State Department has declared that it will not interpose its veto against the wish of the majority. Indeed, if it had not been for the aggression in Korea, Communist China would probably by now be seated in the Security Council. There would certainly be no harm in letting Peking know that it is the action in Korea that has postponed the matter. The hesitations of the State Department were very largely due to domestic American politics—to the fear that Senator McCarthy and the China Lobby would proclaim a vote for the admission of Mao Tse-tung as proof of the assertion that the State Department's policies are dictated by disguised Communists in its midst. The transformed political situation in Washington should by now have at least diminished this obstacle. In any case, a positive American vote would not be needed, provided there were a change of attitude among the other members of the Security Council who have hitherto voted with the United States. What is needed is to let it be known that, at the proper time, Communist China will be seated at the Security Council. Agreement will, of course, be needed on what the proper time is. Sir Gladwyn Jebb has rightly been insisting that there is no connection between the matter of Communist China's admission and North Korea's aggression—or at least not enough connection to justify the bargaining of one against the other. But it would certainly be very odd to admit one Communist regime in the Far East to the Security Council while another was still openly defying its authority and warring against its troops. However this may be, the essential first step is to see whether the free nations cannot agree on what should be done, so that Mr Malik can no longer make them vote in different camps.

*

The question of Formosa, at first sight, seems more intractable, since the verbal disagreements are more embittered. To listen to some of the British left-wing criticisms of American action, one could easily be forgiven for supposing that the American Seventh Fleet is a greater menace to world peace than all the tanks and bombers of the Russians. And it must also be candidly said that General MacArthur's visit, or the interpretation that he has allowed the Chinese Nationalists to put upon it, is calculated to put the very worst face possible upon American policy.

But in reality, the breach over Formosa between the more sober elements in the free nations, and between their governments, is not nearly as wide as it seems; it is largely a matter of emphasis. The United States did suddenly reverse its policy on June 27th by deciding to prevent a Communist invasion of Formosa. But this was a temporary expedient dictated by obvious strategy. It would clearly be lunacy, at a time when Communist aggression was loose in the Far East and the United States was preparing to repel it, to allow Communist forces to occupy a valuable strategic island. Only the most foolish of the critics attempt to suggest that the American action was wrong or unnecessary in the context in which it was taken.

What has excited criticism, outside the ranks of the extremists, is the insufficient care that the Americans have taken to explain that their change of policy was no more than a temporary expedient dictated by strategy, that it does not imply any going back, as a matter of permanent policy, on the Cairo undertaking that Formosa should eventually be Chinese, and that it certainly does not betoken any willingness to support Chiang Kai-shek in his dreams of reconquering the mainland. It should not surely be difficult to achieve a statement of policy to which all could subscribe. There seem to be four essential points. First, Formosa is at present in international law Japanese territory and cannot become anything else except by international treaty. Secondly, the free nations might reaffirm their declaration that when the time comes to draw up such a treaty they will support the retrocession of Formosa to China, which will imply their recognition as rightful rulers of Formosa of whatever is at that time the *de jure* government of China. But, thirdly, the time for peace making clearly cannot come so long as aggression is rampant in the Far East. And, fourthly, in the meantime, it would be both wrong and dangerous to permit any change in the status of the island to be made by force of arms. The working out of such a joint policy, which might even achieve the agreement of Pandit Nehru, is an urgent matter, since Mr Malik must not be left a day longer than is necessary in the position of compelling the free nations to take different sides.

In all these matters, it is essential not to lose sight of the main issue. There is only one possibility of world-wide total war breaking out, and that is if the Kremlin wishes it. It is most unlikely that the decision to be taken in Moscow will be swayed one way or the other by anything that the western nations do, or do not do, to Mao Tse-tung. On the other hand, it is highly likely to be swayed by the degree of unity and resolution in the free world. In Washington no less than in London—indeed, in Washington even more than in London—it should be realised that, at this moment, the need for unity is paramount.

Partition for Kashmir?

LAST month's official negotiations in Delhi for a settlement of the Kashmir dispute were completely unsuccessful. They represented the first formal attack on the problem by Sir Owen Dixon, the new United Nations representative, and they followed his stay of several weeks in Kashmir to study the situation at first hand. Fortunately for the peace of Asia, Sir Owen is still travelling between Delhi and Karachi, and the two Prime Ministers and their closest advisers, resuming the series of meetings begun over the Minorities Agreement in April, are to meet again soon, probably during September.

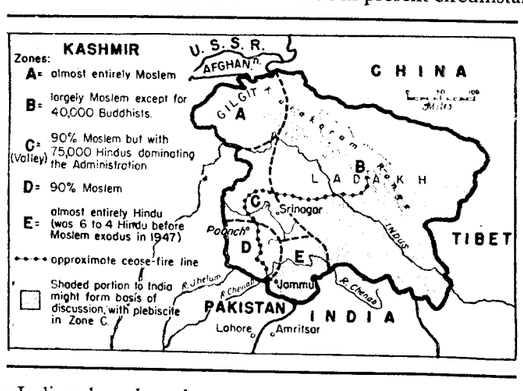
This dispute is the poisoned well from which infection has spread to every other point of contact between the two countries. If it is not cleared soon, the poison will become so virulent that there will be small hope for any lasting agreement on Kashmir or on any other topics under dispute. It is little short of three years since October, 1947, when open fighting began in Kashmir and the Maharajah decided to accede to India. Pathan tribesmen from the North-west Frontier had already entered Kashmir through Pakistan territory, and a Moslem "provisional Republican government"—in so-called Azad Kashmir—had been established. Indian troops were then flown in to support the Kashmir state forces and the Maharajah accepted a new government under the pro-Indian Moslem leader, Sheikh Mohammad Abdullah. Fighting went on for several months. In January, 1948, on India's initiative, the Security Council sent a Commission to investigate the situation, subsequently arming it with instructions to restore peace and arrange for a plebiscite—objectives to which both India and Pakistan subscribed in principle. On January 1, 1949, a cease-fire was achieved, and it is now over a year since the cease-fire line was formally marked out and accepted by both sides. But no progress whatever has proved possible in organising a plebiscite.

The main stumbling block has been the Indian view that, since the Security Council demands the demilitarisation of Kashmir before a plebiscite is held, Pakistan's troops should start their withdrawal first and the Azad Kashmir forces should be disbanded. This Pakistan has refused to do, both on principle and in the fear that India would not follow suit. On the other hand, Delhi has protested, not without justification, that since Pakistan was the original aggressor in allowing and later helping the so-called Azad Kashmir forces to assemble, Pakistan clearly ought to make the first move in withdrawing.

During the long months of complex deadlock, outside opinion has tended to go against India. In an exceedingly delicate situation such as this, bordering on war, it would seem no more than reasonable to expect military withdrawals to be simultaneous. India has also received a lion's share of the blame for the lack of a settlement because it has in effect held the initiative, because it occupies the more important parts of Kashmir, and because, being more powerful than Pakistan, it runs less risk. These criticisms of Indian tactics have been made on the supposition that both India and Pakistan accept the holding of a general plebiscite throughout Kashmir as a fair means of decision. What now makes the Indian position even less tenable is the fact that, in last month's talks at Delhi, Mr Nehru apparently stiffened his terms and, by demanding the submission of northern Kashmir to Sheikh Abdullah's government before a plebiscite could be held, sought to impose conditions Pakistan must certainly reject. The conclusion is being drawn in Karachi that India no longer accepts the idea of a general plebiscite in Kashmir.

*

There are, however, several important things to be said in defence of the Indian position. Kashmir has become a question of fundamental prestige to both sides; yet it is clear that if the fate of every part of the state is to be decided by a single universal plebiscite, Kashmir will go to Pakistan, because it has a large Moslem majority. This is a risk no government in Delhi is prepared to accept after all that has already happened. Not the least of its reasons is that parts of the Jammu district, always predominantly Hindu, have been made completely Hindu by the flight of the Moslem minority; there would be communal rioting in India on a very serious scale if these Hindus were simply turned over to Pakistan, most of them probably themselves becoming refugees as a result. This might undo the whole effect of the recent Minorities Agreement on Bengal.



The broader facts of India's attitude are also apt to be lost to sight. For India, Kashmir is a test case. The Indians have always felt that partition of the sub-continent was a concession wrung from them at the last moment as the price of independence by the rocklike insistence of Mohammad Ali Jinnah ; they never really expected it to happen. When it did, India, which still contains well over four-fifths of the sub-continent's population, was faced with an irritating and, as it felt, dangerous, situation. Pakistan has not only received the areas producing the two most important raw materials, jute and cotton, but also holds the only two frontiers across which the sub-continent could conceivably be attacked, in the east and in the famous north-west. British military thinking in India used to be dominated by the North-west Frontier, and, rightly or wrongly, the new India is still deeply influenced by this climate of thought in which its staff officers were brought up. Yet one of Pakistan's first acts was to let raiding tribesmen go marauding into Kashmir. Quite apart from Mr Nehru's own ancestry in Kashmir and the fact that the legal ruler of Kashmir, the Maharajah—whatever his personal faults—did legitimately accede to India, the stubborn Indian claim to Kashmir springs in part from the undeniable fact that Pakistan stirred up the inflammable issue of the North-west Frontier within two months of its independence in 1947.

★

Today the truth seems to be that, as in Palestine under the Mandate, no solution is possible for Kashmir other than some form of partition. If this is the case, then it is the attitude of Pakistan, as the more opposed of the two to partition, that becomes crucial. At the next meeting between Mr Liaquat Ali Khan and Mr Nehru partition is, nevertheless, almost certain to be the key issue. The Indians have been known for some time to be ready to consider partition. They might suggest that Jammu and Ladakh should be allotted to India and that a plebiscite should decide the issue in the valley of Kashmir only—presumably they would insist on keeping Sheikh Abdullah's government in power during the process. The rest of Kashmir would go to Pakistan. Opinion in Pakistan, however, has hitherto been adamant against any partition. If in Delhi the Kashmir question represents an issue of principle, in Karachi it looks like a matter of life and death ; any powerful enemy installed in Kashmir could dominate western Pakistan militarily and would have control of the waters of the Chenab on which Pakistani agriculture depends. The Jhelum could also be diverted, but at greater cost to the hostile power. In Kashmir, too, Pakistan sees at stake the whole principle of Moslem unity—to which it owes its own existence—and regards the Indian attitude as proof that many Indians still seek to do away with Pakistan altogether.

In spite of all these arguments, however, partition now represents the best means by which Pakistan can secure what it most needs and wants—namely, in Kashmir, a large accession of power and territory on its own frontiers, and, in general, peace with India. It has become a question of sacrificing part of the object in order to obtain what matters most. This reality is not entirely unrecognised among Pakistani statesmen. The two most vital aspects of the question, therefore, are on what line a partition should be made and the means by which Mr Liaquat Ali Khan and his ministers can persuade their people to accept it. The problem of precisely where partition should occur in Kashmir is closely affected by the distribution of Moslems and Hindus, by the present realities of the military positions, by the amount that either side could yield without drawing a devastating fire from public opinion, and by the grim repercussions which a false decision would have in creating another distressing and dangerous movement of refugees. On this basis Gilgit must inevitably go to Pakistan, some part of Ladakh and the now overwhelmingly Hindu parts of Jammu to India. The next step would be to make a provisional division of the rest of the territory along the cease-fire line, and then to hold a plebiscite for the Valley of Kashmir only. There would remain the area of Poonch and the rest of Jammu ; Pakistan certainly demands the whole, but it would probably accept a frontier on the Chenab.

So much for the line itself. It represents the maximum which in present circumstances each side can be expected to concede to the other, but as a basis for a full settlement, the fixing of a line is insufficient. In some areas, a temporary United Nations administration might make it possible to hold a plebiscite without a prior withdrawal of troops ; it might also help both sides to reconcile themselves to the verdict. The agreement on partition should be combined with at least provisional settlements of other points in dispute between India and Pakistan. Such a framework would enable concessions to be made in Kashmir in return for counter-concessions elsewhere by the other side. It ought to be the prelude to an Indo-Pakistan mutual defence pact. Only thus can the "frontier question" be exorcised.

★

The net result of some such settlement as this would be that India would surrender territory it at present occupies while Pakistan would give up its present claims to the whole of Kashmir. Neither Mr Nehru nor Mr Liaquat Ali Khan, if they came to such an arrangement, would find it easy to secure ratification. Nor should any outsider underrate the sacrifices involved. There is far too much readiness to feel that India and Pakistan ought simply to have their heads knocked together. But if there is to be an end to the friction generated between the two Dominions, a solution for Kashmir must be found. Neither side can achieve its full aim by peaceful means Both will use force to repel any attempt at a violent settlement. For both, therefore, the only solution appears to be an "equality of discontent" and this at least a solution based on partition seems to offer.

Boutique Fantasque

IN various recent articles, it has been argued in these pages that the present prosperity of the British economy is not the presage of a new millennium nor solely the result of the wisdom and endeavour of the British people or their government, but that it is in fact merely an extension of the postwar boom throughout the world, and is dependent for its continuance upon the economic weather abroad. The toy industry is certainly a miniature case in point. At the moment it is on the crest of the wave, producing toys of better quality and more variety and earning more by exporting them than any country has ever done before, but behind this achievement lie artificial conditions of international trade which throw a more sombre light upon the future.

Germany was the first country to make toys commercially in the nineteenth century and its toy industry dominated the international market until 1939. The history of British toy making is the history of the attempt to wrest this leading position from Germany, and the issue is still by no means decided. At least some of the credit for Germany's long pre-eminence as the world's toy maker must no doubt be given to the peculiar genius of the Teutonic character for fantasy and *Gemütlichkeit*. But from the first the industry was highly organised. In the wooded hills of Saxony and Bavaria, cottage workers made wooden toys on water-driven lathes, while whole villages specialised in narrow lines, some in animal figures, some in musical toys, some in doll's furniture or buildings or even in those cumbersome pencil boxes so dear to the hearts of many generations of children. Wooden dolls in one district soon gave way to the stuffed bodies, papier maché limbs and bisque or pot faces, which became standard characteristics for so many years. Here again villages tended to specialise in various ranges of quality, while factories grew up to make such parts as wigs, eyes and shoes. Stuffed animals were a German speciality in the eighties, and it was the heirs of Siegfried who first produced the immortal teddy-bear. This extraordinary specialised and localised organisation has persisted in German toy manufacture up to the present day, and has resulted in an unchallenged cheapness and efficiency.

There were, it is true, some toys produced in most countries even before the first world war. Admirers of Axel Munthe will remember his essay about France avenging Sedan on her nursery floors, where the dainty Parisienne dolls drove out the clumsier German *Gretchen*. On the other hand English doll makers "would not spoil a good doll with an English head" and so imported heads from Hamburg. Heavy wheel toys were not at that time worth long transport, and both Britain and the United States developed these as a light engineering product. In one toy only was Germany outdone. Lead soldiers were produced in London in the nineties, after much experiment, in a hollow casting, lighter and cheaper than the solid German originals. Only after overcoming great prejudice could their formations invade the British market (six cavalry or ten infantry for a shilling), but having done so they defeated their German opponents everywhere, even in Germany itself. They continue to do so even at the present time, their descendants having now multiplied into hundreds of regiments, corps and posses—though probably today's keenest collectors of these miniature works of art are the children in middle age who have outgrown the temptation to melt them down in the kitchen stove.

The years 1914-18 ended Germany's virtual monopoly of the international toy trade. American and Japanese manufacturers fell heirs to the huge market of the United States, and in 1922 the raising of the United States tariff on toys to 70 per cent caused temporary havoc in the reviving German industry. America has been self sufficient ever since in all but the cheapest comic novelties from Japan and Germany—Christmas decorations, trumpets, rattles and puzzles—and a handful of high-quality German and British specialities. High prices, however, have largely kept American toys out of world markets.

16286

Britain after the first war imposed a tariff of five per cent, later to become the twenty-five per cent in force today, and aided by a little national prejudice began to develop its own toy industry. British manufacturers gradually captured the British market. Only 30 per cent of home consumption was British-made in 1922, about forty per cent in 1933 and over sixty per cent in 1938. Japan secured a foothold in the British market during the first world war and steadily enlarged it. If a celluloid aeroplane was marketed at sixpence the Japanese would copy it for another wholesaler to sell at threepence, and when the price of the original was halved would offer it to a third merchant for twopence, by which time the first maker would abandon that line for something fresh. Sometimes German firms tried to prosecute British importers of toys that infringed international patents, but so transitory is the market for a celluloid aeroplane or a clockwork mouse that the profit was reaped and the line played out before the slow processes of law could be mobilised. The Act of 1933 compelling foreign toys to be marked with their country of origin was an attempt—not very successful—to hamper Japanese competition by drawing public attention to it.

This unscrupulous stealing of ideas was not peculiar to Japan. Its manufacturers stole most thoroughly, but it has always been a trade practice, particularly in the cheaper mechanical and clockwork lines known as "novelties," in which English firms today are still copying the latest German ideas. A two-shilling tin monkey which turns somersaults may need from two to three thousand pounds' worth of machinery to produce it ; it may have one crowded hour of glorious life in a single Christmas season and then be finished, a few survivors of the brief fashion languishing in dusty corners of the suburban stationer's window. Moreover as soon as it appears it will probably be copied (if it is any good)—perhaps at a lower retail price. The only way to make it profitable, therefore, is to sell it widely and quickly ; and the common procedure is for merchants, agents with wide selling contacts, or representatives of chain stores, to place a substantial order at the outset, partially to finance the tooling, and then to reap a sufficient profit from exclusive rights to an agreed output. On the other

Xm356,M43LC
M43.159

hand, models, whether of famous engines, of cars or of the homely steam roller, are built with expensive accuracy; their trade names are generally household words, and once in production they stay for many years.

In 1945 British toymakers faced a market starved of toys of all kinds, and the trade was a paradise for mushroom firms making shoddy toys and evading price control. In the last two years, however, the poorest toys have been ousted, and at the same time the industry has expanded at a rate which, even allowing for greatly increased prices, is still impressive. There were 200 exhibitors at the 1950 annual trade fair; the majority are small firms which concentrate on particular lines—rubber toys, soft toys or a host of other specialisings—while a handful of engineering firms, whales among the minnows, produce trademarked mechanical and big wheel toys. It is said that about 20,000 people are employed in toymaking, but the industry is too varied to be defined exactly; perambulators and bicycles are made for young and old, rubber, celluloid or plush toys are often sidelines in firms making other goods in those materials, while a host of carnival and fancy goods begs the question of what constitutes a toy.

GROWTH OF BRITISH TOY PRODUCTION (£ million)

	Year 1938	Year 1949
Total Output	3.4 (aprox.)	21.3
Exports	0.4	4.0
Imports	1.7	0.5

Since the South African market was closed in 1948 Australia and Canada have been the main export markets for British toys. The United States market for them is still negligible—it was worth only £165,880 worth in 1949; this is due not only to the 70 per cent tariff, but to the ban on the promotion of foreign toys through trade papers and toy fairs which the American toy manufacturers have enforced. As competitors in world markets, on the other hand, American manufacturers are hampered by the dollar shortage. Germany's wooden toy districts and part of its doll-making district are now behind the iron curtain, but its metal and mechanical toys are already fiercely competitive—both in price and in imaginativeness—with those of Britain wherever they are allowed to be sold. Italy and France are making a bid for Germany's old export markets in dolls, while Sweden and Holland are doing the same thing in respect of wooden toys, in which they have the advantage of plentiful supplies of good material.

BRITISH TOY EXPORTS: YEAR ENDED APRIL, 1950

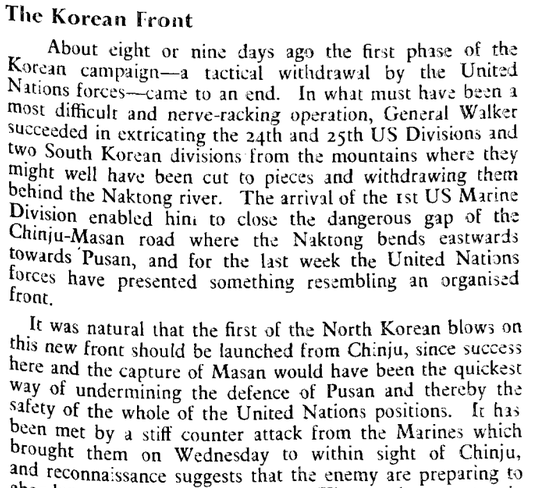
	£000		*Exports as % of*
	Exported	*Total Output*	*Total Output*
Dolls	296	1,221	24
Soft toys other than dolls	152	740	21
Wooden Toys	107	1,443	7
Metal Toys	2,167	10,186	21
Plastic Toys	625	2,262	28
All others	698	5,500	13
Total, all toys	4,045	21,352	19

It is not a welcome thought to British toy makers that their oldest competitors were beaten not at toy making but at war, and that both old and new competitors are being held at bay only as an incidental effect of political decisions and the general difficulties of world trade. The British home market is protected not only by a tariff but much more effectively by the system of import quotas which admit no American or Japanese toys, and hitherto very few from Germany or Belgium. The new European payments agreement, however, will mean that those two countries will soon be free to put their good, cheap mechanical toys on the British market, while in any move to free international trade by a lowering of tariffs, British toymakers fear that their small industry may well be used as a bargaining counter when bigger issues are at stake.

★

Whether, given a fair field and no favour, British toys could hold their own against European and eventually against Japanese competition is not easy to guess. But one feature of the toys now on sale in the shops stands out clearly. In the name of "quality" toys are becoming progressively more elaborate and correspondingly expensive year by year, while the really cheap toys—the "penny bazaar" items of the prewar years—seem to have gone for good. Purchase tax at 33⅓ per cent certainly exaggerates this impression, but even when this is discounted, the tendency to persuade customers to pay bigger prices for extra trimmings is unmistakable. There are certainly some toys—mainly models for older children—where the price of each individual toy is unavoidably high and the quality argument has undeniable force. But for the toys of children under ten, this light-hearted assumption that "nothing is too good for the kiddies" and that "people don't mind how much they spend if the toy is worth it" is surely a foolish optimism stimulated by years of shortages.

There is, too, a great deal of muddled thinking about what "quality" means in toys. The demand for toys is unique in that it is indirect, that is, toys are made not to appeal to children but to their elders and betters, and the snob value of showy toys has always been a hard commercial fact. But it is possible that parents are changing their ideas faster than the trade realises. Walking crocodiles and drinking ducks, which hold a child's attention for ten minutes, are not real playthings, because they call for no imaginative effort on the child's part; clockwork models that form no part of a larger project are wasted in all their elaborate verisimilitude on the child of eight or nine and the parent has only to buy one of them to realise the fact. The needs of younger children are not so much for elaborate miniatures of the real world but for the basic materials of their own active play and when this is realised "quality" should come to mean something very different. Durable washable dolls, whose limbs can be replaced and whose clothes will survive endless undressing, are in real demand; yet the "quality" dolls are neither durable nor always mendable. A car or a tractor which shatters into brittle fragments in its first week in the nursery will command less support both from parents and from children than a simple arrangement of cotton reels. Similarly, simple constructional toys badly need research into more ingenious designs, and into lighter materials for larger sizes. There are in fact endless unsatisfied real needs in children's toys. If British manufacturers do not pay careful attention to the developments of the understanding of children's minds and habits, and at the same time yoke the element of fantasy and imagination which is inseparable from good toy making to the new materials and processes available to them, it seems more than probable that some foreign competitor will again take the lead both in foreign, and it may be even in domestic, markets.



NOTES OF THE WEEK

The Korean Front

About eight or nine days ago the first phase of the Korean campaign—a tactical withdrawal by the United Nations forces—came to an end. In what must have been a most difficult and nerve-racking operation, General Walker succeeded in extricating the 24th and 25th US Divisions and two South Korean divisions from the mountains where they might well have been cut to pieces and withdrawing them behind the Naktong river. The arrival of the 1st US Marine Division enabled him to close the dangerous gap of the Chinju-Masan road where the Naktong bends eastwards towards Pusan, and for the last week the United Nations forces have presented something resembling an organised front.

It was natural that the first of the North Korean blows on this new front should be launched from Chinju, since success here and the capture of Masan would have been the quickest way of undermining the defence of Pusan and thereby the safety of the whole of the United Nations positions. It has been met by a stiff counter attack from the Marines which brought them on Wednesday to within sight of Chinju, and reconnaissance suggests that the enemy are preparing to abandon pressure on this sector. The southern sector is not, however, the only—perhaps now not even the main—danger point. To roll up the United States front it is obviously necessary for the North Koreans to bestride the complex of roads which centre on Taegu, and they appear to be attempting this by means of two thrusts over the Naktong to the north and south of it, in the vicinity of Waegwan and in the bend of the river opposite Changnyong. Both these bridgeheads have so far been contained, but if there is real weight behind the attacks they present a very ugly threat. The northern bridgehead is opposite the junction of the 1st Cavalry Division and a Korean division, and the southern one faces the 24th US Division, which is not only holding a very wide front but is extremely exhausted.

The Nangtok river runs apparently in a fairly shallow bed, and without some time in which to prepare defence positions it seems doubtful whether it really provides an effective obstacle. But it is at least an obstacle of some

kind whereas the three South Korean divisions holding the northern section of the front do not seem to rest on any kind of natural defence line. There is already a report of a Communist thrust of about a brigade strength through the 3rd South Korean division to within ten miles of Pohang. It is clear that the main weight of the enemy force is concentrated on the American sector, and it is also clear that the mere pace of advance coupled with American air attacks has considerably reduced their striking power in any sector. But there is no part of the front which can as yet be regarded as firmly held.

★

This is no reason for gloom. As the accompanying map shows the United Nations forces are still in possession of a very large area. It can in fact be argued that the area over which General Walker has attempted to stabilise the front is too large and may have to be contracted to the line Taegu-Pohang. There is a definite limit to the frontage which infantry, however well equipped, can hold at night and in the face of an enemy skilled in infiltration. The pronouncements of armchair critics are rightly spurned by generals trying to fight a battle, but what the civilian can reasonably demand is that military and political considerations should not become confused. It is no longer possible to expect that the United Nations forces should deny South Korean territory to the North Koreans: that has been tried and has failed. The essential task now is a purely military one, to entrench the United Nations forces behind the strongest possible defence line—and the superimposing of the Tobruk perimeter on the map shows how a small area can be made impregnable by minefields under much more unfavourable circumstances—until reinforcements of men and material can arrive from the rest of the United Nations and an offensive can be launched. The fact that there are no fresh formations which can arrive—except for one further US Marine Division—from the United States or from anywhere else for some weeks makes it essential that the perimeter should be based on the most realistic assessment of what the forces already in Korea can reasonably be expected to defend.

★ ★ ★

Reshaping the Services

The various pronouncements and actions of the British Government during the past fortnight have succeeded in making the public realise what it has been told often enough by everyone except the Government, that despite the large number of men in uniform Britain has virtually no reserve of first-line formations in any of the three services. To bring the Far Eastern Fleet up to battle pitch, and to scrape together a modest force in Britain for despatch to the United Nations forces in Korea, it has been necessary to call up part of the Fleet Reserve and the Regular Army Reserve, and to open recruiting for army volunteers on a special eighteen months basis of service. As an emergency measure the decision to create a special class of recruiting is sensible; it would be a mistake to deplete the whole of the reserve since its primary function is to provide the men to staff new formations and training centres in the event of total mobilisation. But such emergency measures reveal the crucial weakness of British defence policy—the static system upon which, owing to conscription and the failure of regular recruiting, it is based.

There can no longer be any question about the two chief priorities for the framers of the manpower policy of the services. The first is to raise the proportion of regulars in the Army and the RAF in order to create a reserve, not of men but of trained mobile formations. It is possible that the Government will manage to get through the present emergency by means of special measures, but it will be absurd, and in the end self-defeating, if every fresh outbreak of trouble has to be met by special appeals. Increased regular recruiting is a long-term policy and at long last the Government has decided to use the inducement of increased pay on

which an announcement is shortly to be made (Mr Shinwell in a speech claimed this as a measure of forethought on the part of the Government, but in fact it is the course that has been urged upon him for many months by the Opposition, by his own back benchers and by the press). It is to be hoped that since a higher rate of pay will in any case form only a fraction of the bill for increased defence, the increases will be sufficiently spectacular to make a strong impression on the minds of possible recruits and that they will not be confined, as in the past, to a casuistical juggling of allowances and tax concessions.

The second and equally urgent task is to undertake a drastic refashioning of the military machine in order to reduce the non-essential manpower in the services and to increase the first-line strength. The pruning of the "tail" in order to sharpen the "teeth" of the forces was a subject on which Mr Churchill continually hammered the Chiefs of Staff—without very much effect—during the last war. Whether some radical reorganisation of the system of supply and maintenance would not reduce the number of men employed on third and fourth-line duties is a highly technical question, but there are few signs that it has even been seriously considered. What is certain is that at the present moment neither the RAF nor the Army can afford to employ a single man on welfare, education or administrative duties who is capable of taking his place in a first-line formation.

* * *

France's Share

The Atlantic Pact Powers are making, one by one, their replies to the United States Government's inquiry on the extent and form of their defence expenditure. The British estimates were published last week. Belgium has announced increases of £35 million. The interest of the French reply lies not so much in the estimates it gives but in the light it throws upon French strategic thinking. Actual French expenditure will be increased to a figure of 2,000,000 million francs (£2,000 million) over the next three years and the first purpose of this new level of costs will be to enable the army to equip 15 new divisions. The French, however, do not wish this concentration upon the expansion of the army to be interpreted as readiness on their part to provide the bulk of the Atlantic Union army. The memorandum says bluntly:

> It is necessary for the United States and Britain to share in defence by stationing a sufficient number of divisions on the Continent.

The British document pointed out that the effort of rearmament could not be carried out without considerable American financial assistance. The French take the thought further and demand not only financial fusion but a complete pooling of manpower and resources.

There will be every sympathy in Britain and the United States with France's insistence upon a joint effort and common sacrifice. Now that the French proposals bring Frances's own defence contribution up to the level of its Anglo-Saxon partners—roughly ten per cent of the national income—there will be all the more readiness to listen to France's plea for greater pooling in other fields of defence. Nevertheless, in a long effort of containment, it would be impossible to reach anything like parity in the provision of ground forces for the simple reason that the area to be defended lies in the homeland of France or in closely contiguous western Germany. Garrisoning duties become far more onerous and costly when 3,000 miles of ocean, not a short train ride, separate the soldier from his home.

Controversies at Strasbourg

The Council of Europe has opened in an atmosphere of hot controversy and the issue—federalism versus national sovereignty—is likely to run like a clue through the labyrinth of procedural and legal and constitutional debates. M. Spaak, re-elected Chairman in spite of a Dutch protest at his handling of the Belgian royal question, fired the first broadside in a strong attack upon the Committee of Ministers who, he complained, were reducing the powers of the Council to a point at which it might as well go home. Three issues are in dispute. The first is the unwillingness of the Ministers to agree to set up special ministerial portfolios for European affairs in each national government. The second concerns the question of unanimity in Ministerial decisions. The third point, which cuts most deeply towards the bone of national sovereignty, is the proposal that Ministers shall be compelled to submit resolutions passed by the Assembly to the various parliaments for discussion even if the Committee of Ministers have not approved them. These issues, unimportant though they may seem, are being magnified by the strength of federal sentiment behind them. The initiative, in fact, lies with those who wish to see sovereign political powers conferred as soon as possible upon the Council.

In this heady atmosphere, the advocates of functional association have some difficulty in putting their case with the effectiveness it deserves. In the field of defence, for instance, which in 1950 has been thrown open to the Assembly's discussion, there is unanimous agreement upon the collective approach. No state claims total sovereignty in defence and it was British representatives—Mr Callaghan and Mr Edelman—who made the strongest appeals for European military unity. Unfortunately, the British have lost the opportunity of taking a lead in another functional field—that of European heavy industry. M. Schuman will present his Plan to the Assembly but the Labour representatives are debarred from supporting it and the Conservative counter-proposals are not calculated to appease the French and their more ardent federalist supporters.

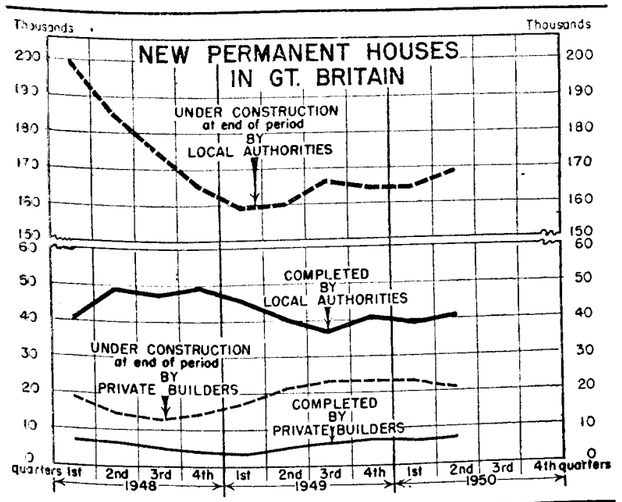
* * *

Counter-Schuman ?

The resolutions which have been tabled in Strasbourg by the British conservatives are largely the work of Mr David Eccles and has been signed by the seven British Conservative representatives taking part at Strasbourg (excluding Mr Churchill), by Lord Layton, by Mr Ohlin of Sweden and by Mr Smitt-Ingebretsen of Norway.

The proposals accept the chief objectives of the Schuman plan—the political need to reconcile France and Germany and the economic desirability of developing the coal and steel industries in common and of moving towards a free market in these products. But here much of the resemblance ends. Where the Conservative plan departs most radically from the French is in suggesting that the authority to be set up for coal and steel should be appointed by, and subordinate to, a ministerial committee. This committee would be set up by those members of the council of ministers of the Council of Europe who decided to sign a treaty linking their coal and steel industries. The core of the French scheme, as it is now evolving in the Paris discussions, is that the authority should possess independent powers of its own in certain important fields.

A big difference also exists in the proposed make-up of the authority. The French want it to consist of independent experts, while the Conservative plan calls for a body composed of representatives of employers, trade unions and consumers presided over by an independent chairman. Moreover, under the Conservative scheme, each government would have during the first five years what amounts to a veto over any decisions taken by the authority that might injure its "basic economic, social or strategic policy." A member could also withdraw from the committee and the authority by giving twelve months' notice or be expelled by a two-thirds vote.



Other features of the Conservative plan include the development of a common export policy for markets outside Europe and the supervision by the authority of a common price policy for coal and steel which will aim at charging the same prices at the pit-head or ex-works to all buyers. Such a price policy, however, should result in a levelling up of wages rather than any lowering of living standards. The Conservative scheme follows the French plan in permitting the authority to impose a levy on industries which benefit from rationalisation in order to assist those who may suffer. It is clear also that the authority would be given some say in matters of production and investment plans.

The Conservatives are undoubtedly sincere in their efforts to find a constructive method of associating Britain with the Schuman plan and they have made a genuine effort to conciliate the different views of the parties within their own country. But it is already plain from the French reaction that this particular effort is not likely to be generally acceptable on the Continent. It offers very few concessions to the French desire for pooling sovereignties, nor does it shed any light on the economic policies that could be pursued by an authority, whatever its powers.

* * *

Houses and Rearmament

The housing returns for the second quarter of 1950* show that for the last eighteen months the output of houses has stabilised at an annual rate of about 200,000, and that the number under construction has risen by only about 6 per cent over the same period. This stability should have removed the obstructions to higher productivity and the speedier completion of houses which resulted from the earlier fluctuations in housing policy, but the signs of improvement in productivity are as yet hard to discern.

While it may seem absurd to go on building new houses when the possibility that they may all be knocked flat again can no longer be excluded, it is obvious that a programme of 200,000 houses a year is about the minimum to which the government will permit the housing programme to fall in conditions short of actual war. The rearmament programme is unlikely seriously to infringe on the raw materials or the labour needed for house building, at least for some time to come. On the other hand, an extensive programme of factory building or conversion, or of defensive works, would undoubtedly compete directly with the more marginal forms of construction, such as schools and offices. Even so, the amount of unused camp and factory space in the country suggests that the dislocation of building for civil purposes would be nothing like as severe as in the early years of the last war.

*Cmd. 7998 and 7999.

The housing returns also give figures of the numbers of houses being built in the new towns. They are not encouraging and underline the concern expressed by the London County Council last week in a report on the movements of population to new and expanded towns. Building sites within the LCC area are nearly exhausted, and it is expected that the natural increase of population, excluding immigration, will by 1962 bring the population of inner London to 340,000 over the desirable figure of 3,160,000. Middlesex is another of the authorities which is overcrowded, and is anxious to disgorge 200,000 persons. The new and expanded towns were intended to take this overspill population, but so far, in all the new towns together, there are only 1,368 houses under construction and a mere 263 completed. At this rate of building the new towns will provide no solution either to the problem of overcrowding or to that of strategic dispersal.

Chips off the Block

Mr Raymond Blackburn, the Labour member for Northfield, has announced his decision to leave the Labour party and to sit as an Independent, since in his view the gravity of the international situation necessitates a coalition under Mr Churchill. While resignation from one of the two main parties who could form a coalition may seem an odd way of promoting one, it is certain that if any member was likely to adopt this kind of tactics it would be Mr Blackburn, for his political career which began in 1945 has followed a curiously quixotic course. At times it has seemed that only his greater dislike of the Conservatives has restrained him from expressing his contempt for his own party. Whether a coalition is a practicable possibility or not, it is certain that Mr Blackburn's views are not shared by many of his colleagues on the Labour back benches. His resignation will reduce the government's majority over all others from four to three. Although his right to sit in the present Parliament cannot be challenged, it is likely that he will be under the very strongest pressure to present himself for re-election. A by-election in a marginal constituency at this stage would be most interesting in showing whether the government is gaining or losing support as a result of the new defence programme.

There has also been a minor disturbance on the other side of the massive mountain of the Labour party. Mr Ellis Smith and Mr Fenner Brockway, two back benchers of the left, have resigned from an organisation known as the Socialist Fellowship since they felt unable to sign a resolution demanding the end of colonial rule and condemning the action of the United States and Britain in Korea. Mr Ellis Smith was one of the guiding spirits in founding the Fellowship last year, and it showed initially a certain amount of promise, not as an organisation that would either talk sense or influence the mass of the Labour party, but as a forum for idealists in the party. It now appears, like so many other idealist organisations, to have been captured by emissaries from the Communist party, and Mr Smith and Mr Brockway not anxious presumably to go the way of Mr Zilliacus or Mr Solley, have withdrawn just in time.

* * *

Mr Lie Speaks Out

Mr Trygve Lie, who has sometimes in the past tried too hard to appease all comers, has now begun to speak as the Secretary-General of a world organisation should speak:

authoritatively and with decision. He will not hesitate, he said at a press conference this week, to call a special meeting of the Assembly at twenty-four hours' notice should a new emergency or a new aggression occur. He is of opinion that he is in a position to set aside the rule prescribing longer notice. The difference between tackling an emergency in the Assembly and doing so in the Security Council is that whereas in the latter a great power can use the veto to give covert support to an aggressor, in the former all decisions of substance are taken upon a two-thirds majority vote.

The same new note of confidence and determination—determination provoked by Russia, confidence imparted by the backing of the United States—is noteworthy in the presentation of Mr Lie's Annual Report on the work of the United Nations from July 1949 to June 1950. Since the month during which this was printed—July, 1950—was one in which ink, however new and damp, was out of date before it reached the eye, the most interesting part of his report is its covering document, which is dated August 2nd. Here Mr Lie sets out a few basic facts about the state of the world which, although they are obvious, are expressed with a vigour and candour that is rare in international documents. "Collective security as it is envisaged in the Charter," says Mr Lie, "cannot be created until an end is put to the conflicts for power and position resulting from the defeat of Germany and Japan." To restore the task of peacemaking to perspective and effectiveness, a new effort has to be made to get the policy-makers of the Big Five once more to meet round a table and thereafter to meet periodically. Regional alternatives to collective security are at best interim measures. Nevertheless, Mr Lie had been going to add at the Mansion House on July 3rd, and in fact said at Lake Success last Monday, that pending the establishment of collective security under the Charter, "members should look to their own defence and form such bilateral and multilateral associations as would in their opinion strengthen their security."

Unhappily for Mr Lie—and for the world—the issues upon which disagreement between the great powers has so far proved radical make up the entire agenda of any possible Five Power meeting, and to call them the Ten Point Twenty Year Peace Programme does not make them any less intractable. Moreover, as Mr Lie is the first to admit, a settlement in Korea takes precedence over any such programme. For without that, the Security Council has been flouted, and his whole Organisation undone.

Indeed, in the light of Korea, the list of achievements set out in the Secretary-General's report seems very small. Some of them, however, are genuine achievements; others are not. Among the first must be classed the part played by Uno in the creation of the United States of Indonesia, in keeping the Kashmir dispute from flaring into war, in launching a $20 million programme of technical assistance to under-developed areas. Among the latter must be ranked the decision to make Libya independent in two years, the total failure to agree over Eritrea and the drafting of a Covenant of Human Rights which few lawyers think operable. It remains to be seen what the Organisation can do to implement the advisory opinion of the International Court of Justice reaffirming the principle of international responsibility for South West Africa.

In running expenses paid out of members' contributions, the United Nations costs the world under $50 million a year. Total expenses for 1950 were approved at $49,641,773 and for 1951 are estimated at $45,450,800. At this rate, the cost is approximately one-tenth of that paid annually by the United States Government to run the Department of State and its representation abroad. Even though Uno's works have not everywhere captured the public imagination, it must be acknowledged to be worth its weight in dollars. A world-wide forum would be worth preserving even at a higher cost, provided that the price paid were not that of Russian dictation.

Trouble in Denmark

The Social Democrat minority government in Denmark which, under Mr Hedtoft, has held office since November, 1947, resigned on Wednesday morning. New elections will be held on September 5th and meanwhile Mr Hedtoft carries on. His resignation follows the introduction at an emergency session of the Rigsdag of measures designed to deal with two major problems—defence and an unsatisfactory balance of payments. It was the country's economic position which caused the extraordinary session to be called. Denmark has consistently shown a deficiency in its foreign payments. Devaluation has helped little and certainly less than expected. The entry into operation of the European Payments Union at the beginning of August seemed likely to aggravate this state of affairs (which a very high standard of living at home does not help to improve). When, however, parliament met it also had to study Denmark's reply to the American request for information on possible increases in its defence preparations. They involve an additional expenditure of 350 million kroner a year—about 3.6 per cent of the Danish national income. This is not an impressive figure when set against the efforts of other countries and the need for the complete re-equipment of the Danish forces, but extra money has nevertheless to be raised and special defence taxes were therefore proposed. These involve a special tax on incomes over 10,000 kroner (about £500), heavier taxes on petrol, motor cars, tobacco, wines and so forth. Behind the taxes lay the further aim of diverting consumption from goods which involve expenditure of foreign currencies to those which do not.

There was general acceptance of the need for this extra though unwelcome expenditure, but the nature of the government's proposals was not acceptable. As Mr Hedtoft remarked in announcing his government's resignation, it was the form rather than the contents of these new measures which caused the dispute. In general the opposition maintains that the incidence of these new burdens falls unfairly and to some extent favours the Social Democrat supporters. Although the government has resigned there is little doubt that the money for its new proposals will eventually be forthcoming, but it will not be raised in the form originally proposed. The exact form will be decided by the new government which is to be elected in September.

More Health Service Economies

Further small economies have been made in the health service. In themselves they amount to very little, but they are significant as showing the stricter attitude of the Ministry of Health towards abuses of the service of public and practitioners alike. Hospital staffs have been asked to economise in the use of drugs and dressings and X-rays. General practitioners themselves have now been given guidance through a committee of the Central Health Services Council on what constitutes a toilet preparation rather than a drug and should not therefore be prescribed under the health service.

Another abuse is to be stopped by the introduction of a means test before patients' travelling expenses to hospitals are paid for them. Patients whose condition prevents them from using public transport will still be carried free of charge by ambulance or by the hospital car service if it is authorised by a doctor. Other people have hitherto had their public transport fares—and sometimes even their taxi fares—reimbursed if their journey to hospital exceeded a certain distance or had to be undertaken frequently. From September 1, however, their fares will be paid only if the Assistance Board is satisfied that they would otherwise suffer financial hardship. Taxi fares will no longer be paid.

A more far-reaching attempt to control expenditure on the health service is the introduction from April 1st of this year of a uniform costing system throughout the hospital service. This is not intended to be the advanced costing system that will probably be required eventually if true comparisons of costs between the different departments of hospitals and between similar types of hospital are to be made possible. At present, research into advanced costing is being undertaken in certain hospitals. But additional staff would be needed for such a system to be generally applied, and the Ministry of Health's proposals are in essence an elaboration of the original system of classifying expenditure under various heads of account; notional allowances are, however, to be made to eliminate the distorting influence of out-patients and of vacant beds. These cost statements are to be submitted annually by management committees to their regional boards and a summary is to be submitted by the boards to the Ministry. Apparently, however, the individual statements are not to be published either locally or in a return to Parliament. Yet it would be a most effective stimulus to hospital administrators to keep a close watch on expenditure if they knew that comparisons could be drawn between the costs of their group of hospitals and those of another. Publication of their accounts as soon as they are compiled ought to be encouraged, not suppressed.

Filipino Troops for Korea

The Republic of the Philippines has now, after some initial hesitation, followed the example of Turkey and Siam by promising a military contingent for service with the United Nations forces in Korea. It would indeed have been remarkable if a country linked to America by special strategic and economic ties were to have stayed out of the conflict after President Truman had coupled his declaration on Korea with an assurance of increased American aid and support for the Philippines. But it was somewhat awkward for the republic to be called on for troops to fight against Communist aggression in Korea, because the Philippine army has for some time had its hands full with fighting against Communist guerrilla revolt at home, and the critical state of the Republic's finances makes the expense of a foreign expedition a serious matter even if American financial aid is to be increased.

The budgetary troubles of the Philippines and their unfavourable balance of trade (which springs from the failure to restore export production since the war) could probably be overcome by American capital investment and by improved administration. In their desire not to encroach on the sovereignty ceded to the republic in 1946, the Americans have been reluctant to apply pressure for a reform of the improvident and extravagant habits of the Philippine Government, but recently they have been more inclined to review Philippine expenditure of dollar aid and an American mission under Mr Daniel Bell is now visiting the islands and studying their economic situation. More intractable is the problem of how to induce a Philippine Government closely connected with a powerful landowning class to adopt measures of agrarian reform sufficient to detach peasant support from the dangerous rebel movement of the Huks. The leader of this revolt, known as the Huk Supremo, is a Communist, and Russian eulogies of his fight against "American imperialism and its puppets" show that high hopes are reposed in him by Moscow. In the mountains and forests of northern Luzon the Huks have so far defied the efforts of Government troops to suppress them, and in the Philippines, as elsewhere in the east, there have been signs of a belief that Russia is invincible and that it is politically wise to reinsure with Russia's *protégés*.

One of the reasons for President Truman's decision to protect Formosa against a Chinese Communist invasion may well have been a warning of the disastrous moral effect which the fall of neighbouring Formosa would have in the Philippines, combined with the fact that geographically it would be a half-way station for supplies from China to the Huks on the mountainous northern and eastern coasts of Luzon. The American naval protection of Formosa will be indirectly of great advantage to the Philippines, but it should be accompanied by firm, friendly advice to the Philippine Government to adopt speedily internal reforms which are long overdue.

* * *

The Churches under Communist Attack

Throughout eastern Europe the Communist attacks on the Christian churches continue to be pressed with unrelenting vigour and to provide convincing evidence of the impossibility of any real compromise between Christianity and Communism. The last representative of the Vatican amongst the Soviet satellites, the Papal Nuncio in Bucharest, was expelled at the beginning of July for alleged espionage. In Czechoslovakia a steady stream of propaganda seeks to divide the parish clergy from the Catholic bishops; and Archbishop Beran remains a prisoner in his palace while rumours of his forthcoming public trial circulate with increasing persistence.

In Hungary negotiations between representatives of the Government and the Catholic Church have been going on intermittently since the end of June. The Government would probably like them to lead to an agreement similar to the one signed by the Polish Government and episcopate last April. This agreement, which was never approved by the Vatican, placed the Catholic Church in Poland completely under the thumb of the Communist state. The Church, for instance, can carry on its charitable activities and religious teaching—but only "within the existing laws." But even after this surrender the Polish bishops have not been left in peace. Their reluctance to sign the Stockholm "peace appeal" unleashed a violent and widespread propaganda attack which finally led them to give way.

But the virulence of a recent press attack on certain of the Hungarian bishops indicates that the Hungarian Government will not get an agreement on the Polish model. It is more probable that a schismatic pro-Communist Catholic organisation will be formed on the lines of the Czech Catholic Action. Last week a conference of Catholic priests and monks (organised, no doubt, to put pressure on the recalcitrant bishops) expressed their ardent desire for a successful conclusion to the present negotiations between the bishops and their government as well as their loyalty to the "people's democratic state" of Hungary.

*

It is more than likely that the churches in Soviet Germany will also be subjected to increasing attacks. Ideological reasons apart, the east German Communist leaders are anxious to raise their stock in the Kremlin, which still seems to be uncomfortably low. For months past both Cardinal Preysing, the Roman Catholic bishop of Berlin, and Dr Dibelius, the Evangelical bishop, have made repeated and quite fruitless attempts to stop the constant anti-Christian propaganda, not only in the press but in the schools as well. The refusal of most of the clergy to have anything to do with the Communist-dominated National Front has released a furious flood of disapproval culminating in a violent personal attack on Dr Dibelius by Herr Grotewohl at the recent SED congress. But the Protestant Church has countered this attack by asserting its complete confidence in Dr Dibelius, and both Protestants and Catholics have boldly joined in condemning the attempt—in the words of the Catholic statement—to make them "join committees and campaigns which use the name of peace but serve political purposes."

Spain Still Waits

Last week the United States Senate voted $100 million for military aid to Spain, tying this contribution into the new military aid programme for Europe. Some gesture of this kind has now become an annual affair, and has its origins as much in internal American politics as in any clear desire to help General Franco. As on previous occasions the new aid has been opposed by the State Department; it has got no further than the Senate vote. Questioned on American policy to Spain, Mr Acheson later indicated that "our basic objective with regard to Spain is its inclusion in the West European community, but it seems unlikely that Spain will be accepted by a majority of its neighbours unless and until there is a perceptible evolution towards democracy within Spain."

This wise definition may not preclude the United States from voting for a return of ambassadors to Madrid when the question of Spain again comes up in the United Nations Assembly, as it is expected to do this autumn. In last year's vote, those who wished to restore diplomatic representation to Spain were only just defeated; now they may probably squeeze their resolution through. There is no reason to cavil with this decision if it is reached, since the inconvenience and ineffectiveness of removing the ambassadors has become apparent to all during the last four years.

It should not, however, be assumed that such a step is a prelude to any closer association of Spain with the Atlantic community. It is true that as the issues between Communist imperialism and western civilisation become deeper and clearer, there is everything to be said for bringing the Spanish people back into normal relationship with the western community. But nothing has happened during the past twelve months to diminish the force of the old argument that this cannot be done while General Franco's present regime remains in power. His name, if closely associated with the Atlantic Pact or Marshall aid, would still be a liability. Spanish association with other western powers must cause a dangerous dismay to all those members of the Left in Europe whose contribution to the fight against Communism remains exceedingly valuable. And, if this risk is to be forced on an unwilling Europe for military reasons, fear that the Pyrenees and not the Rhine or Elbe will, after all, be the basic western defence line will undermine the moral effect of the Atlantic Pact.

* * *

"Enemies of the People" in Hungary

No political fallacy of recent times has been harder to eradicate or more disastrous in its consequences than the conviction of so many European socialist and trade-union leaders that it is possible to co-operate politically with Communists in power without total submission to them. In the long list of pro-Communist collaborators since the war, which includes the names of Fierlinger, Grotewohl, Cyrankiewicz, Szakasits and Nenni, there have doubtless been some who were "cryptos," that is to say, persons of genuine Communist conviction who would have openly joined the Communist party, but accepted the orders of the Communist leadership that they should remain in their Socialist party and disrupt it from within. But a much greater number have been men who under the influence of slogans of "working-class unity" or "anti-fascism" have suffered from the delusion that they can form a coalition with Communists and still retain their political independence, as if under parliamentary rule. But in every case where governmental power has been obtained by the Communists, such leaders have in the end either submitted absolutely to Communist dictation or been eliminated from political life, with or without imprisonment in addition.

In Hungary it is now the turn of the trade unions to be subjected to the purgative zeal of the Communists and their henchmen, and there has been a wave of persecution directed against "right-wing Social Democrats and enemies of the people," who are charged with encouraging opposition among the workers to the new production norms decreed by the government with effect from July 31st. The government's aim is to increase production by setting higher norms in industries where workers "through lack of effort" have not achieved what is regarded as satisfactory output. The Hungarian radio explains that the decree is not aimed at lowering wages and that, "if there is a fall in wages, it will be temporary only." It seems, however, that not all Hungarian workers are enthusiastic about this measure, for although the press has declared that "the wish of the workers expressed in thousands of letters and speeches has now been realised," the wicked right-wing Social Democrats are accused of trying to "loosen" the norms by "playing upon the views of the more backward elements in the working class."

In other words, there are still Hungarian workers who cling to the old-fashioned idea that one of the functions of a trade union is to protect its members against wage-cuts and have not yet grasped the principle that under a Communist regime a trade union is primarily an instrument for getting more work for less pay whenever the government requires it. Such a misapprehension of the nature of the workers' state—which the propaganda of the Communists themselves before they obtain power never does anything to remove—obviously cannot be allowed to continue, and "every honest worker" is ordered to stand on guard against "any attempt made by the enemy to prevent the correct working of the new decree." Meanwhile police arrests continue to reduce the number of former Hungarian Socialists who have retained minds and wills of their own.

Science and the Community

The men of science have met this year at Edinburgh under the presidency of Sir David Brewster. He opened the proceedings on Wednesday week by an admirable discourse, which requires only to be read to be generally admired. Our space and our peculiar pursuits forbid us to give even the briefest abstract of its contents, or to take much notice of the proceedings of the Association; but Sir David refers to one subject, which our especial vocation will not allow us to pass by in silence. He proposes to take science into the pay of the State, as is done in France, and so provide by regulations for the advancement of knowledge. . . . On such a question we cannot concede that scientific men are the most impartial or the most correct judges. It is, indeed, generally, if tacitly, assumed that individuals of a particular class or calling—farmers, bankers, shipowners, etc.—because they necessarily know their own business better than other men, know also what legislation is most appropriate for it. The assumption might be correct if the action of the State, when evoked, could be limited to the business to which the law nominally applies. But this is impossible; and the interests of all classes are so linked in one with another that every law, though called a Corn-law, a Bank Regulating Act, or a Factory Act, affects, in some way or another, the whole community. . . . Because laws and regulations affect interests beyond their nominal boundaries, the particular class whose objects they are intended to serve are perhaps the very last class which should be consulted. . . . Agriculturists, in demanding or supporting a corn-law, see only the increased price they anticipate for their produce; and philosophers, in demanding the patronage and protection of the State, think chiefly of the advancement and glory of science, which they presume will be the consequence.

Relations

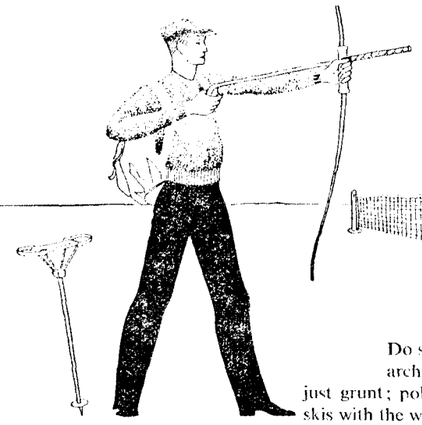
"PUBLIC" AND PRIVATE

MONTHS AGO we invited you to "Meet the Family". By now you are on terms with the family name — Associated Electrical Industries or **A.E.I.** to family friends. But each member carries a proud name of its own — "B.T.H.", "Metrovick" and the others listed below.

Family feeling is not made by formula. It is made by behaviour. **A.E.I.** is a happy family. A family has relations. We have heard perhaps too much of "public" relations. **A.E.I.** cultivates *private* relations as well — confidence and continuity in management, in the works, in the sales force, in research. As for public relations, it has had its ticket written by an unknown reader of these advertisements. Let him speak *for* himself, *about* us, *to* you.

Let not your self-esteem deny
The debt you owe the A.E.I.
Nor speak with emphasis undue
Of what the A.E.I.O.U.

Thank you, Sir!



WHAT DOES IT ADD UP TO?

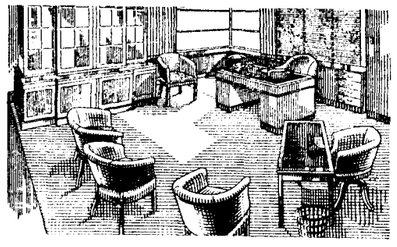
Annual output	**£50,000,000**
Amount spent on research every year	**£1,000,000**
Square feet occupied by research	**600,000**
Men and women in largest factory	**18,000**
Men and women in smallest factory	**100**
Total number of employees	**53,000**

It all adds up to **AEI**

Associated Electrical Industries

The British Thomson-Houston Co. Ltd.
Metropolitan-Vickers Electrical Co. Ltd.
The Edison Swan Electric Co. Ltd.
Ferguson Pailin Ltd.
The Hotpoint Electric Appliance Co. Ltd.
International Refrigerator Co. Ltd.
Premier Electric Heaters Ltd.
Newton Victor Ltd.

DO SPORTSMEN TALK T.I.?



Do sportsmen talk? Fishermen are silent till the King's Arms open; archers and golfers frown at so much as a hiccup; javelin-throwers just grunt; pole-vaulters gasp; motor-racers mutter; and you can't chat on skis with the wind in your teeth. On the other hand, squash and tennis players often keep up a stream of encouraging noises; the brotherhood of the rucksack greet Wordsworth's daffodils; small-boat specialists use terrible nautical words; while shooting-stick sitters are natural natterers.

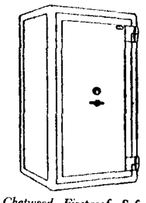
Have we lost track of T.I.? Not on your life. *Every single sport mentioned here owes some of its keenest equipment to T.I. enterprise.*

The letters T.I. stand for Tube Investments Ltd., of The Adelphi, London, W.C.2 (Trafalgar 5633). They also stand for the thirty producing companies of the T.I. Group, whose specialist skills are co-ordinated in the general field of light engineering.

THE SURNAME OF A THOUSAND THINGS

Reflection

Your Board Room or Office is a reflection of your efficiency and should be a forceful part of the business of selling, whether it be sales or services. You will find this efficiency in Catesby Office Furnishings and we offer you our full experience and tradition of service. We invite your enquiries for a single item or complete new office to our Director of Contracts.



Your enquiries for floor-coverings, and for any assistance are cordially invited.

CATESBYS
LIMITED

64/67 TOTTENHAM COURT ROAD
LONDON, W.1

Our only address. Telephone: Museum 7777

Did you know that 43% of Firms who lose their records by fire never re-open?

The Chatwood Fireproof Safe Cabinet is available in 4 sizes with many types of internal fittings to choose from.

Records of customers, records of sales – these are the life-blood of any business, and no Insurance Company can compensate for their loss. Complete burglar-proof protection may not be necessary, but a Chatwood Fireproof Safe Cabinet will give your records protection against fire *and* petty-pilfering. *For your own peace of mind why not write for further particulars.*

CHATWOOD
For protection against fire and thief

THE CHATWOOD SAFE & ENGINEERING COMPANY LIMITED, SHREWSBURY

Letters to the Editor

School Leaving Age

Sir,—In your leading article, The Cost of Defence, of July 29th, you point out that the Government obviously do not believe that any probable increase in productivity can provide the additional needs of defence and you rightly say, "The next question is obviously to ask what, then, should be cut down?" I would reply, the school leaving age. I suggest that to do so would make a large positive and negative contribution to meeting our economic difficulties with a minimum of social inconvenience and perhaps with definite educational benefit.

The easiest way to increase production would be to increase the labour force. But since the British population of working age is stable, any of the needed increases in our armed forces can only mean a reduction in the number of those in industry. Faced at this moment with the need for greatly increased production and a danger of reduced manpower in industry, it would therefore be peculiarly opportune at this moment to double the juvenile recruits to industry. That would be a positive contribution to our economic problem.

At the present time much labour and material is being used to provide the additional school places required to deal with the coming "bulge" in the school population. The wartime and postwar increase in the birthrate reached its peak in 1947 and the fall since then has been so rapid and so steady as to suggest a return to the prewar level or, for reasons I need not elaborate, to one lower still. It is therefore extravagance to provide places which will not be needed after the "bulge" has passed. To reduce the demands made upon the building industry by education would be a valuable negative contribution to our problem.

The desperate efforts now being made to increase the teaching staffs to cope with the "bulge" can only add to the difficulties of the forces and industry in finding the right type of men and women for their key positions. If a return to the old school leaving age were made, any additional recruitment to the teaching profession would enable something to be done to reduce the size of classes.

I fear that the Government will resist this proposal because it might appear to be going back upon a policy already adopted. The argument will also be used that if a reform is once abandoned, it can never be restored. Such an argument is akin to that used when the change was made in 1946: "If you do not do it now, you will never do it." It is obviously not true to say that because a good deed is not done at the wrong time, it will not be done at the right time. We have unfortunately to face new difficulties and some steps must be taken to divert our resources to defence if we are not to suffer the worse evils of inflation. —Yours faithfully, HUGH MOLSON

The House of Commons

Western Policy

Sir,—Without question, the swift and determined intervention of the United States, with the support of the majority of the United Nations, is immensely encouraging, for, without it, all nations would sooner or later come under Communist control. But there is a grave danger that American intervention may play into Soviet hands, partly because the United States has not yet worked out a clear Asian policy, and partly because the leaders of policy and opinion seem to draw too mechanical comparisons between Fascist aggression in prewar Europe and Communist aggression in postwar Asia. To come to the aid of Abyssinia, Spain, or Czechoslovakia would have meant not only a warning to would-be aggressors, but also support for peoples and governments which had overwhelming or substantial popular support. In Europe today, Communism can only succeed by force. The majority of the people, including the organised working class, oppose it because they have much to lose and nothing to gain by it. But in Asia, Communism is still able to enlist the formidable twin forces of nationalism and social discontent. In China, Korea, and Indo-China, the Communists fight with national armies, supported only by Russian weapons, advice, and instructors. But the western powers must largely fight the battle of the governments which they support, and they are compelled to do so under the most unfavourable geographical and strategic conditions. It would be a tragedy if emergency deflected the western democracies from a calm policy, conscious of the limitations of western power, and guided by a clear scale of priorities.

I submit that such a policy must face the abandonment of all those parts and governments of Asia where the western powers would have to bear the whole burden of intervention, and defend governments which would have the double stigma of being identified with foreign intervention and social reaction. Surely the preservation of non-Communist Europe must still be the first priority, and its defence implies that of the oil centres of the Middle East, and of the Mediterranean. Thanks largely to the wisdom of British policy, the western democracies have at this moment still the friendly though hesitant support of the governments of India, Pakistan, and Indonesia (perhaps also of Burma). All of them have gained their freedom by agreement, and represent progressive non-Communist policies. To keep them on the side of the west is vital. They represent at present the other Asia, that part which has reason to believe in emancipation and progress through collaboration with democracies. This collaboration—as the hesitant policy of India already shows—will be greatly endangered if western policy continues to support discredited regimes. —Yours faithfully, W. FRIEDMANN

Income Tax Reform

Sir,—Nothing ought to be written on the subject of income tax reform without a tribute to the pioneer work of Lady Rhys-Williams, and the author of the article under this title which appeared in your issue of August 5th very properly made reference to her proposals. He might perhaps have gone further and mentioned the report of a committee set up by the Liberal Party which appeared in March of this year and which has the approval of Lady Rhys-Williams.

In this report, entitled "Reform of Income Tax and Social Security Payments," some of the difficulties to which your contributor refers are dealt with, even if they are not solved. Certainly 6s. 8d. is an intimidating rate of tax; but equally it is not easy to see how it can be substantially reduced if the present high level of Government expenditure is to be maintained.

As chairman of the committee which produced the report, I can testify that we attempted almost every conceivable variation between adequate "social security" and the avoidance of an intolerable rate of tax to finance it. We ultimately proposed a flat rate of 5s. on earned income (6s. on unearned) with supplementary taxes on incomes above £600.

Your contributor is of opinion that there is "no straining after pure equity" in Lady Rhys-Williams's scheme, but that it "pursues the other alternative of simplicity." It seems to me that it pursues both aims. Any committee—and the same will be true of the proposed Royal Commission—will be faced with impossible dilemmas: security or incentive; rough justice or equity? Equity (a vague term even in Law) has been long neglected in income tax methods. This fact is one of the first to become glaringly apparent when an attempt is made to "simplify" taxation.

The truth is that the present systems of income tax and social security do not even attempt to secure equity. It is convenient to impose penal taxation on all incomes above the mediocre, but it is not equitable.

There is no end to the difficulties which face the reformer, and among the chief of them is the notion that there is something "natural" about the present formula. A scheme which produces simplicity in collection, abolishes stamped cards and PAYE coding, favours the family man, and still does not depart too strikingly from the accepted formula, is worth attention. Real simplicity and real equity, however, will not come until old notions of "soaking the rich" have been forgotten; and an "incentive" rate of tax will not be achieved while Government demands remain so high and popular thought runs in the channel of "something for nothing."—Yours faithfully,

178, *Cromwell Road.* GUY NAYLOR

Books and Publications

Disarmament Fails

Documents on British Foreign Policy, 1919-1939. Edited by E. L. Woodward and Rohan Butler, assisted by Margaret Lambert. Second Series, Vol. IV, 1932-1933. H.M.S.O. 565 pages. 25s.

This volume, covering the period from June, 1932, to March, 1933, is devoted to the rise of the Nazis to power in Germany and the collapse of the Disarmament Conference into total failure. The third major topic of the time—the development of the Far Eastern crisis—is being reserved for later volumes in the series.

The two chapters on the German domestic crisis contain an almost complete sequence of the telegrams and despatches of the British Ambassador in Berlin, and are therefore a useful record of a rapidly changing situation as it appeared to well-informed observers. But many other informed observers of these events have already given their accounts to the world, and it could not be expected, especially after the Nuremberg Trial, that the material here printed would add anything important to our knowledge of these events. What is more to be regretted is that, on the subject with which this collection of documents should be concerned, on the direct reaction of the British Government to those events, the volume provides no information. Only three telegrams in the two chapters on this subject are not from the British Ambassador; and one of these advises him of the anxiety of British Jews, while the other two are factual reports of interviews with the German Ambassador in London.

This is due partly to the fact that, as in previous volumes, the editors have confined their selection of material to telegrams in and out of the Foreign Office, which must always be largely tactical in importance, and have omitted the Foreign Office minutes and memoranda, in which this sort of reaction would be recorded. But another reason, which would be beyond the editors' control, may be that Government conclusions on such developments are reached belatedly, and that only indirect evidence of the British Government's reaction to the rise of Hitler should therefore be expected within the period with which this volume is concerned.

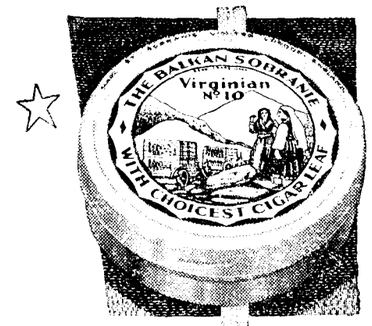
Of this indirect evidence there is an abundance in the four chapters on the Disarmament Conference. In the persistent efforts of the British Government (ending, with this volume, in MacDonald's personal attempt) to keep Germany at the Conference, to bring her back when she had left, and to avert disaster for the Conference when she had returned, the policy of appeasement was taking shape before that debatable policy had acquired its evil but equally debatable reputation. But if a successful Disarmament Conference was clearly regarded as the only antidote to almost certain dangers from Germany under Hitler, and if the British Government was prepared to make desperate sacrifices to that end, it is impossible to believe that this line was adopted without argument or with complete confidence; and, once again, the volume suffers in that it only shows the attempt to execute a policy after its adoption. No light is thrown on the great and perennial debate that must have taken place behind the scenes, both in the Foreign Office itself and—what should be particularly relevant to disarmament—in the Service Departments.

Perhaps the chief importance of the material which the volume does contain is to show that, though the connection between the emergence of Hitler and the failure of the Disarmament Conference is obvious, and though the editors are right to deal with the two subjects in parallel, the connection was not causal. If Hitler killed the Conference in the event, German policy and the French attitude, even before his rise to power, were such as to ensure that the Conference would be abortive. The Far Eastern situation exerted, in any case, as the editors imply, an influence that would have been equally disastrous if the German problem had not loomed so large. The conclusion cannot be avoided that the Conference failed because its underlying assumptions were unreal and its objectives impossible of achievement. It will always remain a matter of opinion, on the other hand, whether this was due to an inherent fallacy in disarmament as a policy, or to the fact that the Conference was premature, or to the fact that the Conference was held too late.

The Occupation Face of Japan

Kakemono: A Sketch-Book of Post-War Japan. By Honor Tracy. *Methuen.* 205 pages. 12s. 6d.

Miss Honor Tracy is a lady of robust prejudices with a gift for extremely amusing, but biting, satire. She spent eight months in Japan in 1948 as a British newspaper correspondent, and inevitably her reminiscences are as much about the American occupation authorities as about the Japanese. It cannot be said that her account of Americans in Japan is a contribution to Anglo-American understanding; she appears to reciprocate the sentiment of an American correspondent who always opened a conversation with her with the words "The British are no damn good." But fundamentally it is clear that Miss Tracy's antipathy is not for Americans as such, but for a military administration living in luxury among a defeated and impoverished people and complacently trying to "democratise" them by arbitrary dictation in every sphere of their national life. If she had been posted in the British zone of Germany instead of in General MacArthur's Japan, her remarkable talent for making great officials look silly would certainly have been exercised at the expense of her own fellow-countrymen.



Unlike most observers who argue the question whether General MacArthur has succeeded or failed in his high task of "democratisation," Miss Tracy regards the purpose itself as absurd. As she has had no experience of militarist Japan and knows the Japanese only as rather miserable under-dogs, she is inclined to underestimate the extent of the evil which it was the original intention of Allied policy to purge. But she is keenly aware of the contradiction involved in the project of imposing democracy on a nation by decrees of a foreign conqueror, and she vividly reveals the absurdities which arise when a national press is ordered to criticise everything freely and then curbed with a drastic censorship as soon as it attempts to exercise its freedom. The Japanese "occupation face" is one of unfailing politeness and flattery, but Miss Tracy's experience led her to the conclusion that the conquered people is not so fascinated by the virtues of western civilisation as it pretends to be. The Americans, she writes, "complain that they never know what is passing in the minds of 'these people,' but 'these people' know exactly what is passing in *their* minds and play up to it in a way that it is a real privilege to watch."

Commonsense Illuminated

Economics of Everyday Life. By Gertrude Williams. *Penguin Books.* 243 pages. 1s. 6d.

This is a book for the armchair, not for the bedside or for the desk, but for somewhere between the two. The author sets out to tell the ordinary intelligent reader who knows nothing about economics "something of the economic issues which lie behind the political problems of the day," and to tell him in the language of every day. It is a measure of her success that she makes the whole subject sound like very little more than applied commonsense, but commonsense applied to familiar situations in a way that picks out a consistent pattern and shows the reader that the "economic aspect" is nothing more abstruse than a methodical selection from facts which, in a muddle-headed way, he knows already.

Each chapter is complete in itself; even "Imports and Exports" or "Price Economy and Planned Economy" have not been burked, but treated on the same basis of simple description as the more straightforward topics like "What is Money?" or the "Structure of Industry." In each case the same care has been taken to point out where the purely economic issues give place to social or political differences of opinion. "This is the choice," each chapter says in effect, "and economics alone cannot

Take the finest leaf from the Golden Belt of Old Virginia and add to it (the touch of genius) a touch of the leaf that has made certain cigars world famous, and you have just the raw materials for this magic blend. Before it is worthy of your favourite briar there is the added touch of blenders whose skill is hereditary, so that finally you can weave your dreams in smoke clouds and see solutions to the insoluble through the smoke rings. For this is a tobacco that is not just a smoke but a way of living, not just another fill but another outlook, not just another brand but a bond that links you and your pipe for ever to the surname Balkan Sobranie.

EXPERIENCED TRAVELLERS FLY BRITISH

It is significant that most people in this country who travel by air prefer to fly British. A natural pride in a British concern is of course one reason. But airways cannot depend on patriotism alone. The more definite reasons that have impressed themselves on experienced travellers are the comprehensive schedules on routes all over the world, the all-round efficiency, the courtesy, the thoroughness—and, perhaps above all, that sense of complete confidence that is felt by everyone in the presence of British Airmanship.

decide the answer." It goes without saying that in a book of this sort the reader must be wooed and not bullied or he will lay it aside for good. If—and it is a big if—it is possible to tempt the intelligent reader to spend several hours reading descriptions of things he already knows presented in a new light, without any prospect of acquiring showy economic jargon, but merely to gain a better understanding of the everyday world, then this is the book to do it—"with learning spread lightly like powder on jam."

Scandinavia

The Democratic Monarchies of Scandinavia. By Ben A. Arneson. *London, Macmillan; New York, Van Nostrand* 294 pages. 22s. 6d. or $3.00.

Addressed primarily to the student of political science, this book, which is one of a series on the governments of Europe, is also very useful for the general reader. For him it will be more a work of reference than of study; and it is surprising that the first edition of the book, brought out in 1939, is so little known. The decade that has supervened has, however, done little to alter the structure of government in the three countries examined—Norway, Sweden and Denmark.

After two succinct introductory chapters on "Land and People" and "Political History," Mr Arneson gets down in a very workmanlike way to describing the parties and elections, the "policy making process," the instrumentalities of administration, the administration of justice, local government, labour relations and social relations. Within these limits it is valuable and unusually informative.

The book's main claim to distinction, however, in its rather specialised field, is its comprehensiveness. It does not, it is true, go very deep or attempt to interpret the facts it records, but it misses little. There are, however, traces of too hasty revision. On page 73, for instance, reference is made to "the present coalition between the Agrarians and the Social Democrats in Sweden"—a statement which, though true in 1938 when the first edition was in preparation, would now indeed be news to the worthy leaders of both these parties who, in 1948, could not agree to join forces again.

The Withdrawn Community

Brotherwoods Utopias; the Sectarian and Owenite Phases of Communitarian Socialism in America: 1663-1829. By Arthur Eugene Bestor, Jr. *Pennsylvania University Press; London, Geoffrey Cumberlege.* 288 pages. $3.50 or 28s.

One of the most persistent ideas attracting zealots to the hinterland of America was that of the "withdrawn community," dedicated to special principles of living. From the Puritan communities until the industrial revolution put an end to the economic possibilities of such a life, "communitarian" experiments were a characteristic feature of American society. Beginning with religious sects the tradition broadened until, with Owen and Fourier, it became largely secular in outlook, concerned to demonstrate through a select example the possibility of a radical reformation of the humdrum world on the principle of co-operative effort.

A new study of these communities has long been needed, and Professor Bestor has done his job with thorough research, real insight and humour. He traces clearly the essential connection between the various manifestations of the communitarian idea, whether religious, as with the Shakers and the Rappites, or secular, as with the Owenites, the Fourierist Phalanxes and Brook Farm. All shared a common impulse as seekers after a true community experience as an antidote both to the atomistic individualism of the young America and to the economic pressures of industrialised Britain. He underlines the importance of European ideas in stimulating these experiments and rightly attributes to Robert Owen the greatest influence in communitarian experiments before 1840. Much of the book is concerned with Owenism and his New Harmony venture. There is a penetrating study of Owen's ideas which corrects convincingly certain misconceptions concerning the nature of Owen's social theory.

By this view, Owen, in his American experiment, was not concerned so much with the economics of socialism as with establishing a co-operative society based upon a controlled environment and a rational education. Indeed, the tragi-comedy of New Harmony's collapse may be ascribed to the cloudiness of Owen's social philosophy and his complete failure to address himself to the economic management of what might, with his capital and managerial skill, have become, like the Shaker villages, a thriving co-operative economy. The author stresses the absence of any dominating strain of real "communism" in any of the experiments; and it is for this reason that he chooses the rather ungainly term of "communitarian" to describe the movement.

Pioneer Thought in Turkey

Foundations of Turkish Nationalism. By Urid Heyd, Ph.D. *Luzac & Co. and the Harvill Press.* 174 pages. 12s. 6d.

Far too little is known, in western Europe and America, of the nature of the Turkish revolution and of the modern Turkish way of life. The average library shelf contains only a few over-dramatised lives of Mustapha Kemal Atatürk. Kemal was unique as a driving force, but not as a thinker. It was Ziya Gökalp, a self-taught philosopher and sociologist from eastern Anatolia, who was the chief writer of the Young Turk Movement, and—in the years just before he died in 1924—an important influence upon the Kemalist revolution. This book, which is subtitled "The Life and Teachings of Ziya Gökalp," should have paid him the compliment of bearing his name on its cover. For his influence on Turkish thought was great; it was even astonishing when viewed in relation to his upbringing. First through poverty, and then through the handling meted out to young freethinkers during the reign of Sultan Abdul Hamid, he was denied a university education. He spent years in exile in his home town. He had no access to books. Scarcely ever could he brush up against a mind of his own calibre.

Although he had no chance to visit Europe, he was much influenced by French thinkers—notably Durkheim and Comte—but could read them only in translation. Yet here was the mind that first applied western sociology to Turkish conditions, and that suggested many of the changes that create the shape of Turkey today. Dr Heyd, who originally wrote this study in Hebrew as a thesis for the University at Jerusalem, has done both the English speaking world and Turkey a service by reproducing it in English.

THE "N.P.I." POLICY

not only creates capital out of income, but at a chosen retirement age the fortunate policyholder can apply this capital to provide an income for the rest of his life, without the anxieties of investment. And for fifteen years this income is tax-free.

AMERICAN SURVEY

Doctors with Nasty Medicine

(From a Washington Correspondent)

PERFORMANCES for which no applause was expected or given have now been concluded on each side of the Atlantic. President Truman and Mr Attlee have explained to their respective audiences why it is going to be necessary to spend a lot more government money precisely at the time when the case for spending a good deal less had been elaborately and convincingly demonstrated.

Whether two months ago Mr Attlee or Mr Truman was under the greater popular pressure to economise may be a matter for argument. Taxpaying Britons could not have required much further evidence to persuade them that they would be better off if the government could be made to cost less. But in Washington the general subject of federal economies had a powerful appeal too. Senator Byrd, proclaiming with holy zeal that deficit spending in time of prosperity was a sin against the light, stirred an uneasiness in many a Puritan American soul. Living within your means, paying your debts, putting a little by for hard times—these were precepts older and easier to understand than were those of the ever-expanding economy, as set forth by the President and his economic experts. For the present at least this mental conflict has been by-passed in America. Deficit spending at a time which everyone can recognise to be an emergency is a different kettle of fish. The moral reservations disappear, and all that is needful is to prove that the money is being spent with the right objectives and in the right way.

Both the President and the Prime Minister have been provided with a case prefabricated by events that have left little room for controversy. In the United States, as in Britain, the public desire to get going—and fast—was at least as evident as the government's. All the same, the two doctors were expected to go through the joyless job of placing on the record the reasons why so much nasty medicine will have to be taken.

★

"The fire that has been started in distant Korea may burn down your house," Mr Attlee said to his British audience. Mr Truman, who is counted a more colourful personality and might have been expected to appeal with more eloquence and fire, has pitched his oratory on the whole in a low key, giving much attention to formal detail.

On the other hand, Mr Truman has contrived to sound more optimistic than Mr Attlee. In his recent Sunday night broadcast, the Prime Minister sadly observed that "it was our hope to build up the strength of the United Nations so as to remove the fear of war from all peoples." There was almost an invitation to brood upon the melancholy record of Russian obstruction and upon the "shadow of fear" which has been cast over the non-Communist world. But in Mr Truman's utterances the United Nations emerges not as the graveyard of hopes, but as something revitalised by the new happenings. He told the Congress that

> if this challenge had not been met squarely the effectiveness of the United Nations would have been all but ended, and the hope of mankind that the United Nations would develop into an instrument of world order would have been shattered.

That calamity did not occur. On the contrary, "vigorous and unhesitating actions" were taken by the United Nations and the United States, and there was "an overwhelming response" throughout the free world. In consequence, "where there had been dismay there is hope; where there had been anxiety there is firm determination."

Mr Attlee's address may well have left the impression that disappointment has numbed the hopes of the British in the United Nations, and that the new sacrifices they are accepting are primarily induced by the belief that their own house is in danger. And that might be an accurate summary of the British mood. It would not be as accurate a summary of the American mood. The American house is perceived to be in danger too, and it could no doubt be shown that the American concern for the United Nations is based upon a calculation that it would best assure peace and prosperity for the United States. But the Americans have also come genuinely to hold the conviction that they will be unable to consolidate peace and prosperity for themselves until a peaceful and prosperous world has been created. There was nothing phony in Mr Truman's emphasis. This *is* what a very high proportion of the Americans consider themselves to be fighting and spending for, and what they have by no means given up hope of getting.

If Mr Attlee, formerly of Haileybury and University College, Oxford, had said to a British audience: "My one ambition has been to obtain world peace—a peace that will help us all, a peace that will make all the peoples of the world happy," it might have sounded both naïve and egocentric. To an American audience (in Idaho, during the President's cross-country tour last spring) it sounded fine from Mr Truman, formerly of the Independence, Missouri, grade school and high school. But that is largely because the Americans and the British assign different priorities to the qualities they expect to find in their top men.

★

It is true that both Mr Attlee, the believer in socialism, and Mr Truman, the believer in capitalism, hold their jobs mainly because they are good politicians who are recognised to be pursuing the honest aim of improving the lot of the people at large. The President has powers which far exceed those of the Prime Minister, but far more in the way of profundity, dignity and public restraint is expected by the British of Mr Attlee than is expected by the Americans of Mr Truman. It is one of the important ironies that, ever since the makers of the Constitution equipped the American President with powers which set him apart from all others in the land, the American people have demanded that their President should exhibit the character of a plain Joe with as few as possible of either the airs or graces of leadership.

The view of President Truman, his qualities and his decisions, which is taken in Washington is often materially

different from that taken by the people of the towns far away across America. There is little knowledge and less curiosity in the distant places about the day-to-day details of Mr Truman's performance which so excite the capital city. They are much more concerned about the man and his character, as revealed by what are considered to be significant acts. But the distant places and the District of Columbia often have conspicuously different ideas on what are significant acts. Moreover, the distant places sometimes put wholly different interpretations on what the President does, finding good in what Washington considers to be bad, and bad in what Washington considers to be good.

One of the contemporary subjects of such schizophrenic judgment is Mr Truman's policy of awarding posts in his Cabinet or in the foreign service or in vital executive agencies to old friends of his and, having done so, of refusing to dislodge them in the face of almost any sort or degree of criticism. "Government by crony" it is called in Washington, and bitter things are sometimes said about the dead hand of mediocrity. But in the distant places, where character counts for more than efficiency, the known fact that Mr Truman rewards and stands by the friends he can trust is worth a carload of votes.

Mr Truman himself was raised and politically educated in one of the distant places, and he makes few mistakes on this plane. For it is important all the time that he should measure up to the standards of the distant places; and it is never more important—for him, for the United States, and so for its allies and the free United Nations—than at a time when there is nasty medicine to be administered. The roots of Mr Attlee's strength are fed by his restraint and dignity. But in the distant places where Mr Truman's strength abides there is more nourishment in simplicity.

American Notes

Clear and Present Danger

President Truman's message to Congress on the steps needed to preserve America's basic liberties and to protect its internal security was more a warning to Congress that it was endangering the liberties than it was a request for additional powers to safeguard the security. That it is more difficult to do the latter now than in previous times of international tension has been impressed upon the country by the arrests made as the American ramifications of the Fuchs case have been tracked down, by the trials of Communists, and by Congressional inquiries into alleged Communist influences in the Government. Subversive agents today are not aliens, but Americans who put loyalty to their party before allegiance to their country. But last week Judge Learned Hand ably documented the President's belief that even this unfamiliar peril can be met without resort to police state methods and without abrogating the Bill of Rights.

The occasion was the unanimous refusal of a Court of Appeals to reverse the conviction, in New York last October, of the leaders of the American Communist Party for conspiring to advocate the overthrow of the US Government; they can still apply for leave to appeal to the Supreme Court. Judge Hand translated into present day terms Mr Justice Holmes's famous decision that the constitutional guarantee of free speech applies unless the words used form a clear and present danger that Congress has a duty to prevent. In view of the evidence given at the trial and of that supplied by recent international events, Judge Hand held that the probable danger of the Communist conspiracy was as clear and present as it could be, "unless we must wait till the actual eve of hostilities" before dealing with it.

There were other demonstrations last week of the adequacy of the present safeguards against subversion—and of the danger of hysteria. In San Francisco, Mr Harry Bridges, on bail pending his appeal against his conviction for perjuring himself by denying that he was a Communist, was sent to prison for menacing the security of the United States by speeches opposing the Korean war. What is perhaps even more significant is that, partly as a result of Mr Bridges's speeches, several of the branches of his Longshoremen's Union are turning away from the leadership of the union, which has long been regarded as a Communist stronghold. Some of these branches have even joined with other maritime unions and the shipping employers in a plan to keep known Communists off American ships. But a less satisfactory type of voluntary co-operation against Communism has been tried in Birmingham, Alabama, and McKeesport, Pennsylvania, cities where attempts are being made to expel all Communists.

*

This is pure witch-hunting and there are elements of witch-hunting, too, in various Bills now before Congress. Until the President's warning was received, the Senate was for the first time thinking of approving the Mundt-Nixon Bill, which had been before it for many months. It is widely believed that this "Communist control" Bill would not even be able to excuse its attack on civil liberty by its effectiveness. Another Bill, passed by the House and nearly as dangerous, would empower heads of government agencies to dismiss employees considered to be bad security risks because of personal weaknesses, without even the right of appeal allowed in loyalty cases. The President, however, recognised that there was at least something to be said for the House's attempt to deal with deportable aliens whose native countries will not accept them; he recommended a less objectionable version of this Bill. Congress has been so busy concocting its own remedies for the Communist menace that it has not found time to consider certain improvements in the existing espionage laws, which the Administration first asked for at the beginning of 1949. Mr Truman has now asked for them again, for he still believes that they are all that is really necessary to counter the present danger.

* * *

Defence Keeps on Growing

With the President's latest request for an additional appropriation of $1,156,000,000, the amount to be spent on defence purposes in the current fiscal year, without including foreign military aid, has almost doubled in six weeks; it now amounts to $26,722,000,000, nearly two-thirds of the total allowed for all purposes in the original budget for this year. The Senate, using a technique slightly different from that of the House but with much the same effect, has cut an indiscriminate ten per cent from all domestic appropriations, and also from those for Point Four, but not from Marshall Plan funds. Even so, it has only pruned half a billion dollars from its all-embracing Appropriation Bill.

The latest billion for defence is to be spent chiefly on naval aircraft, a tribute to their proven value in the Korean campaign and a consolation prize to the Navy for the Air Force's success in reaching the 70 group star to which it long ago hitched its wagon. Admittedly, it will take the Air Force over two years to achieve its ambition and then it will have only 69 groups officially—but groups are larger today than they were when the star first rose in 1947.

The Army's goal, less spectacular but more urgent in view of the shortage of men for Korea, is to bring its existing ten divisions up to full strength and to add four more. The first is being done by calling up units of the Organised Reserve and about 60,000 individual reservists and by increasing the number of conscripts to 100,000 by the end of October. The second has meant that four divisions and two combat teams of the National Guard, totalling about 43,000 men, have been summoned to active duty. The Guard is organised by States and a partial mobilisation of this kind inevitably bears unfairly on certain sections of the country, a matter about which Congressmen are sure to hear from home. The divisions now called come from New England, Pennsylvania, Oklahoma and California, four well-separated parts of the country. The whole Marine Reserve, of 124,000 men and 2,000 women, is being mobilised. The Navy and the Air Force have so far only called up selected reserve units and individuals. Reservists and Guardsmen are not regarded as civilians and the services are not expected to look very favourably on requests for deferment; lists of essential activities and critical occupations have, however, been issued for guidance.

The way in which the defence programme keeps on growing strengthens the case for giving the President powers to control wages, prices and consumer goods. The most telling argument for this has always been that he would need such powers far sooner than he realised. On the other hand, Congressional wrangling over the form the powers should take has also justified the President's reluctance to ask for them, explained by his fear that such a request would delay the more urgently needed controls over industrial materials and credit. Delay inevitably weakens the effectiveness of such limited checks on inflation, and delay there has been. The House of Representatives, determined to give the President the powers he did not want, got into such confusion over the whole question last week that it went back to the beginning and started work on the Bill all over again. Meanwhile prices have continued to rise. As a result Mr Truman will now probably be glad to have the discretionary authority to set ceilings on prices and wages, which the House has finally given him and which the Senate is also likely to approve.

Pacific Wards

The transfer of the island of Guam, in the western Pacific, from naval to civilian rule was postponed for a month, until August 1st, because of the Korean invasion. The 58,754 inhabitants therefore had to forgo the celebrations planned for July 21st, the anniversary of the island's liberation from the Japanese and the day by which they had also hoped to be liberated from the Navy and to be enjoying a considerable degree of self-government, under the civilian governor appointed last year. The postponement has, however, given the US Congress time to pass an Act giving the Guamanians full American citizenship, a bill of rights and a Congress with power to legislate on domestic affairs. No one appears even to envisage the possibility of future statehood for the island.

Guam has been run by the Navy for 52 years and is politically the most backward of the territories seized from Spain in 1898. The Philippines have achieved independence; recently Puerto Rico, in the less stormy Atlantic, was given the privilege of writing its own constitution, assuming that it provides for a republican form of government, and the right to elect all its own officials. An organic Act, similar to that granted Puerto Rico in 1917, and repealed, in part, by the new Act, was promised to Guam at the time of its annexation. It is hoped that the Department of the Interior, with only civilian responsibilities, and without the Navy's custom of shifting its men every eighteen months, will be able to provide more continuity of policy for Guam and cheaper and more democratic government.

The only outright American possession in the western Pacific today, Guam lies in the midst of the 96 island groups of the Mariana, Caroline, and Marshall Islands over which the United States exercises a strategic trusteeship from the United Nations. This special arrangement with the Security Council permits the islands, formerly fortified by Japan when it was the mandatory power, to be fortified by the United States and to be closed to inspection. In fact, only Eniwetok has been closed, at the time of the atom bomb trials, and a UN mission is just completing a tour of the strategic trusteeships in the western Pacific.

A report on the stewardship of the Navy presented to the United Nations in February showed that about $7,000,000 a year is being spent on the islands, though only $1,400,000 of this is direct aid to the islanders. Great progress is being made in eradicating disease, somewhat less in spreading self-government. The chief criticism of other colonial powers, however, was that the United States was overdoing its good

works and pampering its wards, thus postponing the day when they might, despite their slender resources, be expected to stand on their own feet. On the political side, it is hoped that the transfer of both American Samoa and the trustee islands to civilian rule may be completed by the middle of 1951 and that larger grants of self-government will then be possible.

* * *

Putting the Stockpile First

The Munitions Board prepared its semi-annual progress report on the stockpile of strategic materials before the Korean outbreak, but even so it said that the rate of procurement should be accelerated or completion of an adequate stockpile would be dangerously deferred, until 1956 at least. President Truman has now asked Congress for an additional appropriation of $600 million for the current year, which nearly doubles his original request for this purpose. The value of materials in, or on order for, the stockpile at the end of June was $2,051 million, just over half the present estimated cost of the completed stockpile. The increase from last year's estimated total of $3,400 million is explained by a recent review and consolidation of stockpile objectives. As a result four materials—pepper, rutile, baddeleyite and zircon—have been taken off the list and reserves of another eighteen, including antimony, chromite, lead, mica and quinine, are regarded as adequate or nearly so, for the moment at least.

But the stockpile is far from adequately supplied with such important and expensive items as rubber and tin, copper and zinc. This unsatisfactory situation is partly due to last year's delays in making appropriations, not likely to be repeated this year. More recently industrial demand has been so high that little has been left over for the stockpile, and the Board has been accused of driving up prices by badly-timed purchases. But early in June its chairman pointed out that the national security was more important than market fluctuations and that the needs of the stockpile must come first. If that was so then, it is even more so now. But once the new armament contracts are placed, buyers for the stockpile will be competing not with civilian demand but with military requirements. Then there may well be conflict between the immediate and the long-term safety of

the nation and the time for putting the stockpile first may have passed almost before it has begun.

The ideal solution, of course, is to increase supplies until there is enough for everyone, including civilians, and a certain amount is being done in this way. The Senate is reluctantly preparing to lift the duty on copper reimposed at the beginning of July. Marshall Plan dollars and counterpart funds are already being used both for the purchase of strategic materials and for the development of fresh sources of supply. The new Defence Production Bill permits government loans to producers of scarce materials so that they can expand their output ; it remains to be seen whether this will lay the ghost of the wartime subsidies to marginal mines which has been haunting Congress for many months. The search for satisfactory methods of using the low-grade American manganese has become most urgent now that Russia refuses to export manganese ; the various government research bodies have been giving much attention to this and similar problems and also to experiments with domestic substitutes for strategic materials. Synthetic rubber is the classic success story in the latter field; most of the stand-by capacity has been opened up as an answer to the Korean emergency. If enough benzine is to be found, synthetic rubber output will be running at an annual rate of 675,000 tons by December and more of the imported natural rubber will be going into the stockpile.

Fair Weather at Chicago

The honour of holding the first international trade fair in the United States has been won—or perhaps bought, since it is financed by local business men, not by the government—by Chicago, a traditional setting for exhibitions and conventions. Although a more temperate month than August might have been chosen, there are many reasons why Chicago seems an especially suitable setting for this practical application of the slogan of this year's American World Trade Week—"Buy an Import." The main purpose of the fair is to show Americans how profitable it can be for them as individuals to fill the dollar gap with purchases of foreign goods. That the fair is being held in the supposedly nationalist heart of the isolationist Middle West should demonstrate to doubting Europeans that Americans are ready to practise their new-found faith in the value of a two-way exchange of goods. That it is being held in the commercial heart of the rich farm belt should encourage cautious Europeans to venture into the market that they have been so inclined to neglect for the better-known but better-exploited east coast.

The fair is intended to bring foreign goods to American buyers who hitherto had to go to fairs abroad to find them. For this reason the space allotted to American firms has been limited to one-third of that available. The Economic Co-operation Administration has naturally been grooming its charges for the show ring and the recipients of Marshall aid are doing it credit by putting up a high proportion of the exhibits. There are no exhibitors from behind the iron curtain, but two from its fringe, Finland and Jugoslavia ; the Czech reservation was cancelled by the fair authorities after the closing of the Czech consulates last May. Of the 40 countries represented, France has the biggest display, with the United Kingdom second, despite a slow start, and Western Germany third ; all three ex-enemy countries are taking part.

The Korean war caused a rise in the barometer of anticipated orders at the fair, since American buyers, foreseeing shortages at home, are attaching increased importance to supplies from abroad. The possibilities of importing steel and steel products are said to be arousing special interest, often damped by the high prices being asked. Foreign manufacturers will be in no hurry to adapt themselves to a spell of fair weather in America which looks very temporary, especially when they expect the clouds of the dollar shortage to be dissipated by expanded defence programmes. They would be more inclined to take advantage of the Chicago sunshine if Congress showed any sign of improving the foreign trade climate permanently by acting on the pending Bill for simplifying customs procedures.

Your American banking connection

Trade with the dollar areas frequently may be expedited by the services of a bank such as the Chase which has extensive facilities in the United States and which has valuable correspondent banking relationships in every commercially important center within this area.

Shorter Notes

The two chief rivals in the American trade union movement, the American Federation of Labour and the Congress of Industrial Organisations, have formed a permanent Unity Committee and seem at last to be ready to make a serious approach to reunion. As a first step, they have agreed to work together at the national as well as the local level on political problems ; the next and more difficult step will be to find some method of dealing with jurisdictional disputes between individual unions.

*

The defence programme has done what the Reconstruction Finance Corporation could not do and reopened the famous Waltham Watch Company, in Massachusetts. An Air Force order for 2,700 clocks for aircraft has given the company's trustees and the RFC representatives something more important to do than argue over the disposal of the company's assets, as they have been doing since the plant shut down six months ago.

*

Even before the Korean crisis encouraged hoarding, sugar consumption was running ahead of the advance estimate on which sugar imports are based. Now this year's import quota has been raised by 350,000 short tons, and the government has arranged to buy all the Cuban reserve. This should provide enough for the sweetest tooth and check the panic buying that has cleared retailers' shelves. Average individual consumption of sugar, 90.4 pounds last year, has never climbed back to prewar levels, but nevertheless the present estimate of consumption for 1950 is 7,850,000 tons.

THE WORLD OVERSEAS

War Boom in Japan

(From Our Tokyo Correspondent)

AFTER the first initial shock, Japan is bearing the burden of the Korean war with fortitude and expectancy—sustained and consoled by increased production, rising prices, shrinking stockpiles, greater domestic autonomy and the hope of generous peace treaty concessions to come. There is a buoyant atmosphere in the Diet ; the Prime Minister, Mr Yoshida, looking like an Oriental Mr Pickwick, righteously rebuked militaristic questions about possible Japanese participation or even a specific proposal for Japanese volunteers to fight the Communists, and Ministers generally do not attempt to conceal their satisfaction over the benefits which they believe the war will thrust upon Japan. With the one doubt of possible American non-intervention removed, the Government, sceptical of any early development of the Korean fighting into a world war, are smugly anticipating bigger and better peace treaty rewards from the United States and Britain for continued Japanese democratic loyalty.

Mr Yoshida was privately astonished at the lack of any adverse world reaction—even in Australia—to General MacArthur's sudden order to him to enlist a reserve police force of 75,000 men, which, bland denials notwithstanding, may be the nucleus of the new Japanese standing army. But for the encompassing shadow of the Korean crisis, a storm of denunciation would have followed General MacArthur's order. Today no one appears even to be paying attention to open disclosures that the police force will be led by former Japanese army officers and that such essential prerequisites for normal police work and traffic control as light armoured cars, grenades, aircraft, machine-guns and light mortars are being confidently requested by the Japanese for the new police. For 18 months the Japanese Government, while secretly but vainly pressing for this police increase, had denied strongly and repeatedly that they were seeking any such increase. Yet within two days of General MacArthur's surprise yielding—influenced, of course, by the transfer of United States Occupation forces to Korea—a complete and detailed plan for the organisation and set-up of the new police force was operating, based on the Army's prewar district scheme for the military defence of Japan.

More Dollar Funds Expected

On the economic side, by coincidence, the long-awaited removal of the restriction on the number of Japanese cotton spindles to four million (compared with more than 12 million before the war) was anounced in the first week of the war. This wide-open concession, when even the most optimistic Osaka textile industrialist had expected permission only to operate six or eight million spindles, also passed comparatively unnoticed in the confusion of continuing American withdrawal to stronger positions south of the 38th parallel.

The Stock Exchange has reflected the general financial opinion that American intervention in Korea and participation in the affairs of all non-Communist areas in Asia would mean more dollar funds for the revival of Japanese industry and more orders for Japanese factories. The volume of turnover of shares in both Tokyo and Osaka in the first week of the war set soaring post-war records—3,275,000 a day in Tokyo ; 2,160,000 in Osaka. For the western observer, there was pensive interest in the anticipatory rush for shares in old companies which had been engaged in war production in the past but which are now allegedly broken down into deconcentrated units concentrating only on harmless peacetime production. Long range forecasting by the Japanese Ministry of International Trade and Industry visualised increased demand for heavy materials and supplies for the United States bases in Japan and increased credits for manufactured exports to South-east Asian countries which may later be menaced by the Communists.

Already United States prices are rising for Japanese stockpiles of non-ferrous metals which could not be sold profitably before because of inefficient Japanese production methods and high costs. Tin prices have jumped 30,000 yen to 570,000 yen a ton, and copper and zinc by 5,000 yen to 165,000 yen and 125,000 yen, respectively.

Automobile manufacturers and general construction concerns have also returned eagerly to overtime conditions, if not so eagerly to democratic scales of overtime wages. The Japanese also have high hopes of speeding up the resurgence of the shipbuilding industry and of steadily returning Japanese shipping to the world's trade routes. Already most of Japan's idle shipping has been pressed into wartime convoy service for the United Nations at freightage charges twenty per cent above normal fees, while most dockyards are back to a 12-hour-day seven days a week.

"Japan For The Japanese"

Nor have the Japanese been slow to use the Korean crisis as an opportunity to redouble their efforts for wresting local autonomy from the occupation. The Americans, they argue with democratic bows of unselfish co-operation, should not be tied down by red-tape occupation supervision and routine in democratised Japan when they are faced with a life-and-death challenge on the Asiatic mainland. They should now restore greater flexibility and sturdy American-like independence to Japanese factories (that is, they should relax supervision over Japanese working hours, wages and minimum living standards). They should now place the control and operation of occupation land reform laws in the experienced hands of the Japanese landlords. They should instal as many Japanese members as American members on all occupation boards and committees charged with occupation duties and occupation control (that is, they should officially wind up the occupation).

Supporting this "Japan for the Japanese" campaign, the *Oriental Economist,* an influential and conservative Tokyo periodical, has denounced "undue Japanese submissiveness" to the occupation authorities and has demanded that the government should "resolutely embark upon the necessary steps to restore autonomy in Japanese affairs to the ultimate benefit of the Americans as well as the Japanese." On the human side, there is no doubt that the Japanese people, like most people, do not want war or any part of war. But the government would like a Japanese army again, and knows that many occupation military advisers privately endorse the vigorous public pleas by General Robert Eichelberger,

General MacArthur's former deputy, now in the United States, for the creation of a new, lightly armed Japanese defence force. Minority but influential pressure is increasing for the swift mobilisation of five Japanese divisions for the Korean fighting. And only a brave or foolish man would deny that the new-style, democratised, faintly Anglican, vaguely royal Hirohito could summon a holy crusade against the red devils at the drop of an imperial rescript.

The Soviet Budget Estimates for 1950

[BY A CORRESPONDENT]

THE dearth of Soviet statistical data makes the study of the Soviet budget an interesting though not wholly satisfying task. Once a year the Soviet Government reveals in figures its past and future economic policy, but, true to its methods, this picture is far from complete and lucid. This year's report of the Finance Minister, A. G. Zverev (*Pravda*, June 14, 1950), is no exception to the rule that Soviet budget figures conceal as much as they reveal. Yet much can be deduced by studying the items mentioned and those omitted.

The budget for 1949, endorsed by the June session of the recently elected Supreme Soviet, and the estimates for 1950 present the following picture:

	1949		1950	
	Million Roubles	Percentage of Total	Million Roubles	Percentage of Total
Income :—				
Turnover tax	?	ca.66·0	239,000	55·2
Profit tax	?		40,000	9·2
Direct taxes	36,400	8·3	36,400	8·4
State loans	22,900	5·2	31,800	7·4
Other revenue	?	20·5	85,800	19·8
TOTAL	437,000	100·0	433,100	100·0

	1949		1950	
	Million Roubles	Percentage of Total	Million Roubles	Percentage of Total
Expenditure :—				
Grants to National Economy	161,900	39·0	164,400	38·4
Social and cultural services	116,000	28·1	120,700	28·2
Defence	79,200	19·2	79,400	18·6
Administration	13,500	3·3	13,900	3·3
Unspecified	41,700	10·4	49,500	11·5
TOTAL	412,300	100·0	427,900	100·0

(11.20 roubles=£1)

The incompleteness of these figures is striking, although it is not a new feature of Soviet budgets. The 1948 budget left undesignated about the same proportion of the total. In the 1950 estimates, the sources of nearly 20 per cent of the revenue is unexplained. There can be no doubt that much of it comes from reparation payments, profits from Soviet-owned and mixed companies in eastern Germany and the satellite states, and foreign trade profits, none of which are so much as mentioned in Mr Zverev's speech. On the expenditure side, 49,500 million roubles (11.5 per cent of the total) are undesignated. Even allowing for 3,500 million roubles as interest on state loans, (which does not seem to be included in any of the items mentioned in the budget), there still remains an undisclosed expenditure of 46,000 million roubles. Mr Zverev made no attempt to explain why the actual budget figures for 1949 were lower than estimated, the revenue by 8,200 million roubles and expenditure by 3,000 million roubles. Neither did he explain why grants to the national economy in 1949 exceeded the estimate by 9,400 million roubles.

The actual expenditure on social and cultural services was about 3,200 million roubles less than the estimate. This was more likely to be due to an administrative failure to make use of all the allotted funds, which is borne out by complaints of the inadequacy of the medical and other services made by some of the deputies, than to the reductions in the prices of consumer goods announced in February, 1949. These are claimed to have constituted a "saving" of 71,000 million roubles in 1949. But this calculation is extremely unrealistic since it assumes that people would have bought as much at the old prices as they did at the new. Wholesale prices and transport costs, on the other hand, rose at the beginning of 1949 owing to the withdrawal of government subsidies from industry. But the effects of this withdrawal seem to have been overcome by the beginning of this year, when wholesale prices and transport costs began to fall.

The 1950 revenue is expected to be 4,000 million roubles lower than in 1949. This may be partly due to the very substantial price reductions of consumer goods decreed last March. These, which ranged from 15 to 30 per cent and are said to present a "gain" for the population of 110,000 million roubles, must inevitably lead to a loss of turnover tax. But this loss may to a certain extent be compensated by an increased volume of trade. The drastic fall in the budget surplus is one of the most interesting features of the 1950 budget. It will amount to only 5,200 million roubles as compared with 24,700 million in 1949, 39,600 million in 1948 and 24,700 million in 1947. It is possible that the large surpluses of the past few years have been used for some hidden purpose which now either no longer exists or is being financed under some other heading. But a much more likely explanation is that it has been used to strengthen the rouble and as a precaution against possible inflationary tendencies. This explanation is confirmed by the fact that the surplus reached a peak of nearly 40,000 million roubles in 1948 after the currency reform of December, 1947. The significance of the decline in the surplus may therefore lie in the belief of the Soviet planners that the danger of inflation is very much reduced.

Expenditure will go up by 15,600 million roubles compared with 1949; in particular, grants to the national economy by 2,500 million roubles; social and cultural services by 4,700 million roubles; defence by 200 million and administration by 400 million. Considering the lower wholesale and retail prices, the real increase in each case will be even higher than indicated by the increased budget allocation. It is interesting to note that no explanation was given of the use to be made of 7,800 million roubles of the increase in expenditure.

PERCENTAGE COMPARISON OF APPROPRIATIONS IN 1949 AND 1950 BUDGETS (In Percentages)

	1949	1950	
Total expenditure	100·0	100·0	
Grants to national economy	39·0	38·4	
Industry	not known		51·8
Agriculture and forestry			22·3
Transport and communications			9·1
Trade			5·6
Unspecified			11·2
Social and cultural services	28·1	28·2	
Education			49·3
Health and physical training			18·2
Family allowances			3·3
Social security			18·6
Unspecified			10·6
Defence	19·2	18·6	
Administration	3·3	3·3	
Unspecified	10·4	11·5	

On the whole, the appropriations for 1950 show practically no change compared with those for 1949, except for a slight decrease in the share of the national economy and defence and an almost corresponding increase in the share of unspecified items. It is interesting to note that both items for which detailed allocation figures are given, contain some unspecified expenditure: 11.2 per cent in the case of grants to the national economy, and 10.6 per cent in the case of social and cultural services. Mr Zverev mentioned that under the latter heading 5,600 million roubles have been allocated to "the development of science" (to which purpose a further 1,500 million roubles will be made available from industrial organisation). These sums are probably designed for research in the field of preventive medicine, protection of labour, etc. But that still leaves about 5 per cent unaccounted for. As to the undesignated 11.2 per cent of the national economy grants, is one justified in speculating that these constitute an additional defence expenditure?

Industry will receive 85,300 million roubles, that is, just over half of the total grants to the national economy, to which will be added 25,300 million roubles provided by the industrial enterprises from their own resources. Budgetary appropriations for capital investment in all branches of the national economy are estimated at 106,500 million roubles, to be supplemented by contributions from enterprises and institutions themselves to the value of 29,100 million roubles.

The total amount of profits of enterprises and various other economic organisations for 1950 is estimated at 70,700 million roubles; this is three times more than in 1940. Out of this amount the state will take 39,800 million roubles, thus leaving 56.3 per cent of the profits in the hands of the enterprises themselves for local investment. In 1949 the enterprises' share was 48.7 per cent. This is a reversal of the former economic policy of the Government, when the lion's share of profits was directed into a pool and distributed centrally; it is consistent with the present policy of running enterprises not on subsidies but, without exception, on the principle of making them pay their own way. Hence the constant drive to lower production costs.

Italy's Fifth Column—

[FROM OUR ROME CORRESPONDENT]

SIGNOR TOGLIATTI'S personal publication *Rinascita* recently indulged in an ill-natured reminiscence of the events of Spring 1944, when Signor Togliatti, arriving from Moscow, joined Badoglio's All-Party Government at Salerno. It described how the Allied Commission at Salerno was all over him when his arrival was found not to have given the dreaded signal for a Communist uprising against Marshal Badoglio. It is quite true that the adroit, humorous, and cultivated Togliatti at once stopped the sizzle of petty indisciplines which had been the outward manifestation of local Communism in hungry wrecked Naples before he arrived. Out for bigger things than ovations in the Piazza, Togliatti quickly made himself useful to the western Allies, as a steadying factor in Italian affairs. The result was that Togliatti and his party remained in all Governments until 1947, leaving Nenni's Socialists to throw ultra-democratic tantrums on questions of the monarchy, Allied interference, and Vatican influence. With Allied blessings, the Italian General Confederation of Labour was rebuilt—before the war finished—by a deal between the Communist, Socialist and Christian Democratic parties, under triumvirates in which the Communist gracefully took the role of Augustus. In the first postwar general elections (1946) the Communists took 4.3 million votes, slightly more than half the Christian Democrat vote, and a little less than that of the still united Socialist Party, which was bound to them by a Pact of Collaboration. Subsequent municipal elections showed the Communists to be making progress while Christian Democracy receded. The position of the Communists as the third of the three "mass" parties, with a powerful hold upon one of the others, and a recognised dominance in the central and the chief single trade unions, and, above all, among the still powerful freemasonry of the guerrilla veterans, seemed to ensure their indispensibility as a component in any future Italian Government. Their language and behaviour was that of key men in the present, and, by virtue of a loudly asserted moral, intellectual and organisational superiority, heirs apparent, with early expectations of succession, to the official national leadership.

But early in 1947 Signor De Gasperi, pleading the need for a united government to cope with financial crisis and inflation, resigned. Pulling together the passive support of various small Right-Wing groups, he dared to form a government without Togliatti, who was obediently followed into the wilderness by Nenni. (Nenni's party had meanwhile suffered the defection of the Saragattians.) The general elections of 1948 were to have had the character of condoning punishment for this flouting of the representatives of "the immense majority of the advanced parts of the Italian people," whose support the Communists claim. But, as is well known, —thanks to the Italians' awareness of their dependence upon America, and the Church's influence—the Communists, together with Nenni's shrunken following, gained only 8,000,000 votes, a third of the total, and left Sr De Gasperi more than ever master of Parliament.

The political struggle of 1948-50 has raged, spluttered or fumed around the attempt of Signor De Gasperi's team to limit the freedom and authority of the defeated Communists to the exercise of criticism in Parliament and the press. Togliatti does not despise this function of Opposition. He himself, and also Pietro Nenni, are excellent parliamentary orators, the former far more trenchant and witty, the latter more fluent and engaging than any government spokesman. This activity is not politically wasted. The professional classes of Italy are highly susceptible to argumentative and

sentimental elegance. Moreover, they have recently emerged from a twenty-years' surfeit of clownish inelegance, and the Opposition terminology of progress and peace has still the sweetness of lately forbidden things. What the Government says, especially in moments of stress, inevitably echoes to some extent what other governments have said—and for twenty years the Government was Mussolini's, so that Signor De Gasperi (or Scelba) runs greater risks of appearing to reincarnate the Duce than does Togliatti—at present.

But if Togliatti does not despise the function of Opposition, which means giving expression to what a large fraction of the nation thinks, his essential business as Communist leader is, on the contrary, to speak for and to command "the immense majority of the advanced part of the Italian people," that is to say, a movement which regards itself as a unique élite from whom the Italian people are predestined to obtain guidance towards a coherent future "while the existing order of Society is visibly cracking up on every side." The atmosphere of the higher Communist society in the great cities, where parliamentarians, novelists and professors assemble for mutual comfort, is one of intense excitement (climaxes and catastrophes—it is continually recalled—have been scientifically foretold, and while one must manfully carry on in the provisional world around, one must always be attuned to the greater vocations ahead). It must be remembered that nearly all the leading Italian Communists have either served long prison sentences or have lived for years in exile. It is perhaps the fact that he has known only the milder sufferings of exile (a dozen years or so, mostly in Moscow) that fits Togliatti for his task of representing the party to the insensitive outside world. Of the younger prominent Communists, most have known the hazards and agonies of active participation in the Civil War of 1943-45. It is symbolic, and also important, that the bible of Italian Communism, in the higher ranges, is the noble and harrowing prison diary of Antonio Gramsci, the frail and heroic first secretary of the party—in the main a tragic meditation on ethics and human destiny.

They are people who have found no peace, and would suspect and despise any peace which came "through the usual channels."

Three Shields and a Dragon

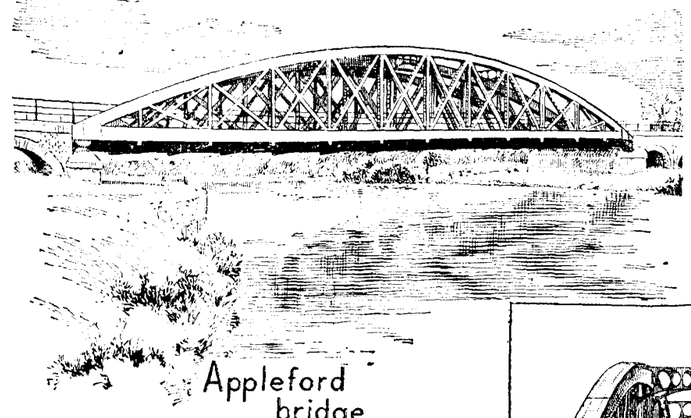
[BY A CORRESPONDENT]

THE Scandinavian Airlines System (SAS) is sometimes held up as a working model of the sort of international air transport company which, on a larger scale, is envisaged as the eventual solution of the problem of German civil aviation. If, it is argued, the Germans are not given sole and complete control of the air lines which, sooner or later, they will run again, the threat that they will be able, should they so desire, to misuse them by secretly building another *Luftwaffe* will be removed. The announcement at the end of May that the eastern zone was likely to be allowed its air lines has made consideration of this problem more urgent. It is not proposed to discuss it here but merely to give an account of the development of SAS and to draw attention to some of the difficulties it faces in its international adventure.

As at present constituted the Scandinavian airlines system is a company, incorporated in Sweden, which conducts the overseas operations of the three national airlines of Norway, Sweden and Denmark. These are, respectively, *Det Norske Luftfartselskap* (DNL), AB Aerotransport (ABA), and *Det Danske Luftfartselskap* (DDL). SAS began operations in August, 1946, and in May, 1948, took over all the scheduled international traffic of the Scandinavian companies except for one Norwegian line. This is Braathen's South American and Far East Airtransport run by Braathen's shipping firm and encouragingly abbreviated to SAFE.

The aim of SAS is to achieve a more rational utilisation of the joint fleet of the three countries, amounting now to over 70 aircraft, than would result from competition. Its operations are accordingly conducted on an agreed traffic plan under which Sweden gets three-sevenths of the traffic and Norway and Denmark two-sevenths each. Profits and losses are divided in similar proportions.

So much for the theory of the organisation. In practice co-operation has not been as smooth or successful as expected. Norway has consistently expressed dissatisfaction at the arrangements. Denmark and Sweden have retorted by pointing out that the existence of the private Norwegian company which operates abroad with government permission went against the spirit and detracted from the earnings of the joint enterprise. (Last year SAFE carried 7,312 passengers compared with DNL's 115,282.) Each country put in a strong bid for its own chief airport being the main trans-Atlantic terminal of SAS. Between Norway, which pressed the claims of Sola, near Stavanger, and Sweden, intent on building a great new airfield north of Stockholm, to be known as "Stockholm-Attunda" there has been considerable friction. Meanwhile, the Danes at Kastrup, Copenhagen's airport, handle nearly as much traffic as the other countries together.

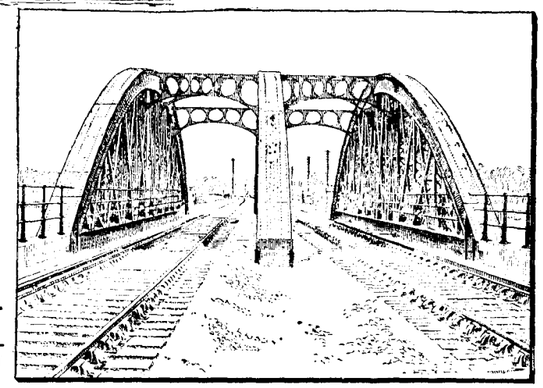


Copenhagen Talks on Airlines

These cumulative disagreements reached a head last summer. In August a committee was set up to advise on the reorganisation of SAS. Its report, which was discussed in Oslo in January, stressed the many advantages accruing from co-operation and put forward various suggestions for improving it. In particular it recommended that SAS should be reorganised to form one company with a single balance-sheet (thus avoiding, in this case, triple taxation), a single management and a single managing director instead of a tripartite concern handling the foreign business of three separate companies, each of which is taxed and each of which has its own management. In this way economies were expected amounting to about £875,000 a year.

A sub-committee was appointed to consider these proposals or to suggest alternatives and, at the beginning of May, a conference was held in Copenhagen attended by the Finance Ministers and Ministers of Transport of the three countries. Apparently they reached no decision. And there appears to have been considerable disagreement between the Norwegians on the one hand and the Swedes and Danes on the other. Discussions continue behind the scenes, although the only indication of how they are going is to be had from the announcement at the end of July that a meeting of Ministers due shortly to settle the reorganisation of SAS had been postponed until the autumn.

How much of this is applicable to any West European international air company? Very little, it seems; and the experience of SAS does not augur well for co-operation at this stage of a fiercely competitive industry. The greater resources and traffic potential of, say, Great Britain, France and Germany would make disagreement on the major terminals unlikely, since, unlike the members of SAS, each country could easily maintain several. But the competing interests of their aircraft industries might cause much more friction. This is a factor which does not affect SAS, which uses either American or British machines, although the new Swedish SAAB "Scandia" is on order. But Sweden alone of the three countries builds aircraft so there is no cause for internal dispute on that ground. Constitutionally, the company might have had an easier passage if there had been a greater delegation of national sovereignty in the beginning. But if that had been pressed, SAS would probably not have existed at all. This, however, is the crux of the present protracted negotiations. Meanwhile, the silver aircraft fly on bearing the three shields of Norway, Sweden and Denmark and the Viking dragon as their crest.



BRIDGES *by* BUTTERLEY

Appleford bridge.

Built in 1928 at Appleford near Oxford to carry the G.W. Railway main line over the River Thames.

We undertake the design, construction and erection of road, rail and other bridges, either by riveted or welded fabrication. The modern methods we employ are backed by our wide experience of bridge building—stretching back for over a century and a half.

Overseas agents: Messrs Cecil Tress & Co. Ltd., Africa House, Kingsway, London, W.C.2

A sensible policy for process steam—No. 16

The Steam Circulation System

BY SPIRAX

This week's notes are intended particularly for those readers who have an interest in process steam equipment such as platen presses, textile tentering machines, tray-type drying stoves, and others in which the cross-sectional area of each steam space is little greater than that of its steam inlet.

As you have read, heat transfer from process steam can be vastly improved by reducing the thickness and the resistance of the stagnant films of air and water at the heating surfaces.

In certain kinds of plant, such as those mentioned, something more can be done.

By accelerating greatly the velocity of the steam over the whole of the condensing surfaces, the *character* of the residue of the stagnant films is changed from streamline flow to turbulent flow. The effect is to "scour" the filmed surfaces, to an extent that the heat can even more swiftly penetrate to the process.

That, very briefly, is the function of the steam circulation system and some notable results are being achieved.

Economics of Rearmament

I.—Measuring the Burden

SECOND thoughts on the Government's memorandum on defence, released just as last week's issue of *The Economist* went to press, suggest that it is even more difficult than was apparent at first glance to make sure estimates of its economic implications. Not unnaturally, there was a tendency to assume at the outset that the memorandum reflected a rapidly devised programme for spending a total of £3,400 million over three years. But now it is clear that no such programme yet exists. The memorandum is simply a statement of what the Government is "in principle" prepared to do—on certain conditions—and the £3,400 million is an "upper limit." The limit itself has been set by the Government's estimate that any bigger programme would rule out a continuance of economic recovery (which the United States recognises as necessary for the achievement of "security" in its widest sense) and would require direction of labour and requisitioning of factories (which the Government is not prepared to reintroduce) or would involve creation of new capacity ("which could not have rapid results"). Within the limit thus determined, the extent of the programme is stated to depend upon the extent of American assistance, in the form of materials, plant and free dollars; and the pace of the programme will be strongly influenced by the speed with which this aid is given.

It will be seen that, at least in the short run, this condition introduces a second and lower limit. The American Government will doubtless speedily promise liberal aid. But, as in 1940-41, Britain is not the only applicant, and the supplies that are sought—such as specialised machine tools—will inevitably be those in keenest demand. Unless the American Government rapidly restricts civil industry much more drastically than Britain is at present intending to do, it seems clear that for some time to come the flow of material aid to Britain will be conditioned by sheer physical shortages. If, therefore, the Government's insistence upon the crucial role of American aid had to be taken quite literally, this might mean that Britain's defence expansion would proceed very slowly indeed. In practice, however, there is little doubt that the Government will rely upon America's promise rather than upon the actual flow of supplies, and will put in hand whatever programme of defence production can be reconciled with the general domestic conditions it has laid down. Moreover, if the international situation deteriorates further, these conditions would obviously be modified or abandoned.

These many imponderables show how shaky is the foundation for assessing at this stage the nature and extent of the burden Britain will have to bear. It can be argued, at one extreme, that the overriding conditions and physical shortages and the inevitable time-lag between planning and production will so restrict the programme in the early phase that the burden will not become perceptible, except for its pressure at isolated points, for perhaps twelve months to come. At the other extreme, it is being contended that there is at present an appreciable slack in the production potential of Government factories and contractors already engaged on munitions work, and that considerable resources would be absorbed if output were stepped up for equipment that is already in production there. The deadweight of such outlays would be felt quickly, and the burden would be further increased if American deliveries of key items of equipment formed the basis, as they might well do, for much larger schemes of plant extension here—for example in the ordnance factories formerly engaged on civil production. On this argument, the dislocating effects of the expansion might conceivably be greater in its first year than in the second or third.

It is quite certain, however, that so long as the Government keeps within the terms of its memorandum, even the most determined effort will not raise expenditure in the fiscal year 1951-52—which is apparently regarded as the first year of the programme—to the average maximum contemplated for the three years. In 1949-50 the actual expenditure on defence was £759.9 million, and in the last budget the estimate for 1950-51 was £780.8 million—an increase of £21 million without counting £9,500,000 to be specifically borrowed for expenditure on married quarters. Hence the average annual outlay contemplated at the upper limit over the three years to March, 1954, represents an increase of £373 million (or 49 per cent) over 1949-50 and one of £353 million (45 per cent) over the basic estimate for 1950-51.

*

The burden that the programme may involve at the limit can be appraised in two ways—first by considering it in terms of finance and relating it to the national resources as a whole, and, secondly, by trying to assess the manpower it would absorb and to estimate its impact upon the industries most directly concerned. From both points of view, and especially from the first, much depends upon the extent of consequential American aid. But even if the aid—in supplies and free dollars—were to approach one half of the gross outlay, it would be foolish to suppose that Britain can rearm without tears. That was possible in the early stages of the rearmament effort of the thirties, because there was then a large pool of idle resources that could be tapped. Now, however, as the Government memorandum points out, Britain's economy is "fully stretched." The only way in which the total output can be expanded without measures of special mobilisation of manpower is by increasing the

average output of workers already in employment—through increased efficiency and/or by longer hours of work. Unless additional output obtained in this way is at least equal to the net additional burden of defence, there must inevitably be some contraction in the investment programme or in civil consumption or a return to an "overall" deficit on the balance of external payments—and probably a combination of losses under all three heads. Indeed, for these losses to be avoidable, the gain in total production would have to be much larger than the increase in the deadweight of defence, because of the wastage that inevitably arises where the industrial and export pattern is changing, and because of the impossibility—in the absence of more stringent physical controls and powers of labour direction—of shifting resources rapidly from one industry or area to another.

*

Since the Government will presumably avoid the deliberately inflationary process of bidding for industrial capacity in competition with civil demands, the pace and scale of the programme will apparently depend mainly upon the volume of work that can be set going in its own factories or by amicable agreement with contractors. But although the Government declines to adopt wartime powers, it is apparent that some resources will be released by "physical" measures—notably, no doubt, by specific cuts in the investment programme and in releases for civil use of Government imports of materials. These, indeed, are almost the only methods available for the diversion of resources—unless the Government deliberately sacrifices the export drive and drops its propaganda pressure upon the reluctant exporters. Subject only to the cuts that may thus be imposed upon investment at home and abroad, every increase in defence outlay that is not specifically covered by additional output at the points where the burden presses is likely to add to the tempo of inflation. This would be true even of such part of the outlays as were "covered" by the receipt of free dollars—if these dollars were added to the reserves instead of being expended in additional imports so as to cause a deficit in the "overall" balance of payments.

Much has been made in some quarters of the importance of avoiding the "mistakes" made in the past ten years, by using stern fiscal devices to enforce economy in civil outlays and thus to divert resources to defence in a non-inflationary way. The argument here is in principle unassailable, and the counsel would be wise counsel if the level of taxation were not already at or beyond the peacetime maximum for disinflationary budgeting. But in fact, though the tax collections might be increased if tax rates were raised or new imposts devised, there is no doubt that a large part of the disinflationary force of this increase would be at once neutralised by countervailing drafts upon private savings. The hard fact is that defence on a "business-as-usual" footing means defence-by-inflation. Paradoxically, that is one argument for the Government's apparent opinion that no emergency budget would be needed this year. Such a budget could not serve its full purpose unless the Government were prepared to admit that an emergency has arisen—and were prepared, in consequence, either to cut its own civil expenditures and/or to enforce and exploit economy in private expenditures by recourse to mobilisation measures of control and direction.

II.—Is Productivity Enough?

To prove that the measure of rearmament that is needful can be provided entirely out of prospective increases in productivity during the next three years would entail an exercise in the higher logistics. It is possible to be sceptical about this point and to concede at the same time that it is a convenient assumption for the Government to make. The notion of foregoing what is just around the corner has been a convenient way of presenting "sacrifices" to the country on earlier occasions, though it has not avoided the need for real sacrifices later. Whether the precedents of innocuous capital "cuts" followed eventually by devaluation will be repeated in the changing phases of rearmament cannot be foreseen; but the possibility is real enough to make any discussion of "painless" rearmament through increased productivity highly conjectural.

In the first five months of this year, the physical output of industry seems to have increased by about nine per cent compared with the corresponding period of 1949; discounting this increase for the rise in the labour force, it would seem—with perhaps greater reservations—that productivity in industry was increasing at a rate of about 6 per cent in the first part of this year compared with twelve months earlier. The "Economic Survey" in its projection of the division of the national income had assumed an increase for the whole of 1950 of 3½ per cent. Therefore, so far as the figures go, they suggest a potential increase, beyond the forecast already made for this year, of 2½ per cent, which in money terms would be worth about £250 million.

This calculation in itself has no immediate relevance to the rearmament programme outlined last week; the only thing quite certain about that programme is that it cannot get under way in the current calendar year, and the Government does not claim that it will. To examine the contention that room can be found for the rearmament programme, on top of all the existing and prospective claims upon the national output for consumption, new investment, other Government expenditure, and exports, involves making guesses about the future course of industrial productivity during the next three years. Industrial output is worth about £6,000 million a year. If productivity were in fact to increase regularly at 6 per cent per annum in each of the next three years, and if all other demands on the national income remained unchanged, there might be output worth £360 million to spare for defence in Year I and nearly £1,200 million in Year III. That a considerable increase could be secured from existing resources of plant and manpower can hardly be denied; if half the precepts contained in the reports of the productivity teams that have lately visited the United States could be applied overnight, astounding results could be produced. But that would still leave unanswered the question whether the required increase in productivity specifically to furnish new means of defence was in fact likely to emerge in the right places. Admittedly, any general increase in productivity would assist, for even where it occurred in civil industries, it could in theory release resources for use on defence work without impairing

civil output. But the frictions that impede such shifts of resources have not been eased by the experience of brimful employment in recent years. It would certainly be safer, at this stage, to concentrate attention on those industries most proximately concerned with rearmament.

*

The table that follows gives a necessarily sketchy picture of the course of productivity in certain industries since the second quarter of 1948. The method adopted takes the percentage movement in the two indices of production (the official interim index and the London and Cambridge index) between the second quarter of 1948 and the first quarter of this year, and then discounts this percentage change in output by the change in employment since June, 1948, in the industries shown. Owing to the alteration in the method of computing employment that took place in the middle of 1948, it is impossible to go back beyond that date; to do so would in any case risk adding to the already considerable statistical hazards of computing changes in productivity in this way. The official interim index for all industries suggests an increase in productivity between the second quarter of 1948 and the first quarter of this year of 12 per cent—say 7 per cent per annum. The "A" index of the London and Cambridge Economic Service, on a working day basis, suggests an increase of 9 per cent, or 5¼ per cent per annum. The two results are close enough to postulate a recent increase of 6 per cent. But there is a marked difference between this result for the increase in productivity of industry as a whole, and the achievements of particular sectors:—

ROUGH PRODUCTIVITY ESTIMATES
FIRST QUARTER 1950, COMPARED WITH SECOND QUARTER, 1948

	Production (Apr.–June 1948 = 100)	Employment (June 1948 = 100)	Percentage Increase in Productivity during Period
Based on official interim index:—			
All industries	114·8	102·6	12
Metal manufacture: ferrous	110·1	101·8	8
Engineering, shipbuilding and electrical goods	106·4	99·6	7
Vehicles	137·9	103·5	33
Other metal goods	110·8	99·6	11
Precision instruments	153·6	106·5	44
Chemicals and allied trades	111·8	105·7	6
Food, drink and tobacco	108·3	104·3	4
Building and contracting	100·0	98·3	2
Textiles	120·5	108·1	11
Based on London and Cambridge Index:—			
Index "A" (per working day)	112·2	103·1	9
Metal production	109·6	100·8	9
Shipbuilding and repairing	82·1	89·8	— 9
Motors, cycles and aircraft	145·3	106·8	36
Chemicals and allied trades	115·5	105·7	9
Food, drink and tobacco	101·0	104·3	— 3
Building, building materials and furniture ("B" index)	100·0	100·1	...
Textiles	116·2	108·1	7

With the exception of two cases, all the separate estimates for particular industries comprised in the official index show an increase in productivity during the period which is below the average. The two exceptions are so brilliant—vehicles with an increase of 33 per cent and precision instruments with an increase of 44 per cent—that it is obviously necessary to treat their performance as a special case. The same irregularity of pattern is shown in the estimates based on the London and Cambridge index in the second section of the table; the figures generally are lower, and they indicate, indeed, one or two industries where falls in productivity may have occurred. The precise changes shown by the figures are not primarily important; the significant thing that they reveal is that any calculation that suggests that rearmament can be provided out of accruing productivity must take into account the fact that the accrual is not evenly spread among industries.

The case of vehicles suggests an obvious note of caution. By either basis of calculation, the increase in productivity in this industry (or complex of industries) has been proceeding in recent periods at a rate of about 20 per cent per annum. An increase of this kind cannot be the result of some sudden change in technique or some sudden access of productive energy on the part of the labour force. The industry is as conscious as most industries of the need for higher productivity; that it has so far excelled the rest is due largely to the fact that in the past year or so it has seen the fruition of its post-war reconversion and has been confronted with the need to make few major changes of design. The new models today are substantially the same cars as in 1948, and there are more of them; high productivity has been achieved by producing many more of the same things, getting the most from existing plant and labour resources but not having markedly to change them or increase them. The achievement recalls Mr Churchill's wartime dictum about munitions: "In the first year, none; in the second year, a trickle; in the third year, a flood." High productivity means in this case exploiting to the full productive arrangements that are already geared to high output. To change the character of the output would obviously affect, perhaps in considerable degree and for a considerable period, the productivity increases that have been scored in the last year or two.

It happens that vehicle production would be one of the industries principally affected by large-scale rearmament needs; it is here that major dislocation would be quickly felt, and there is no evidence in the productivity achievements of the majority of other industries (even of the other metal using industries) that their progress would be sufficient to release resources that could be quickly spared to ease the dislocation at its worst points. Until the rearmament programme is known in much fuller detail, it will, of course, be impossible to measure the impact of such dislocation. But it may be noted that deliveries of passenger and commercial motors (for home and export) were worth about £275 million last year. If the average increase in defence expenditure to be provided out of home resources is put at £200 million a year for the next three years, the impact on the vehicle industry could be considerable. It would obviously be prudent, therefore, not to count on the maintenance of the recent average increase in productivity in the first stages of the rearmament programme—not, that is, if the programme itself has teeth in it. According to forecast, the programme does not seem large by comparison with the output that can eventually be made to meet it; but it has to be absorbed by an economy already fully occupied, and unwilling, under its Government's guidance, to make any noticeable change in the present disposition of its national income. It is the more probable, therefore, that the intrusion of defence orders at specific points in industry—together with the effects of formal or informal controls over their output—may have fairly severe repercussions for a time on their productivity. If this is so, it enhances the argument that the inflationary risks of the programme, as it is at present conceived, are likely to be more directly felt in the early years than in the later years.

III.—Manpower at Stretch

WESTERN EUROPE is not without a reserve of unemployed labour, but this reserve is relatively small; most of it is in Italy and Germany, and hardly any is in Britain. The total of unemployed in Britain on June 12th was 282,000—only about 1.4 per cent of the total of insured workers. The figure includes casual workers who happened to be out of work on that day, and the official analysis shows that less than half of the total had been unemployed for more than eight weeks. Thus, while a remnant of the "hard core" of the prewar unemployment problem still lingers in what were once the depressed areas, the British total of unemployed today is for the most part a reflection of the number of workers who at any given moment are in transition between one job and another. Even viewed in this way it is an extremely small total suggesting great steadiness and continuity in the pattern of production, and if there is in fact to be any widespread shift from civil to military production, the disturbance would be more likely in the short term to lead to an increase than a decrease in unemployment.

Once the needs of recruitment for the forces are faced it seems likely that the Government's problem will not be to increase the industrial labour force but to prevent it from shrinking. But it is becoming apparent that the demand on the labour force, in terms of physical product required, will be greater than ever before. The brunt of this increased demand is to fall on the metal-using industries, the principal suppliers of equipment to the forces. These industries are the suppliers of new plant for industry in general. They have also been in recent years one of the most successful groups of industries in the export drive. It seems clear that something will have to go, and the Government appears to be faced with a painful choice between allowing exports to fall off and causing the expansion and re-equipment of industry to be slowed down. The Government's memorandum to the United States government last week indicated that exports were likely to suffer.

But it would be too optimistic to suppose that the supply of new capital equipment to industry will not suffer as well; the question is how far it is to suffer and whether a new period of technological stagnation, the second in fifteen years, can be avoided. Clearly it will not be avoided unless the output per man-year of the existing labour force in the engineering industries can be increased quickly. This is a first condition. But the engineering industries will also need to recruit new manpower, and since they cannot draw this manpower from any reserve of unemployed they will have to draw it from other industries if they can.

For some years the Government's manpower policy has been concentrated, though without any great positive effect, on strengthening certain industries that were held to be "essential" on a set of criteria that may now have to be changed. Textiles, pottery, and certain others were put high on the list in 1948 on the ground that they were able to contribute largely to the export drive while making only slight demands on the scarce supplies of steel. Coal mining was made the subject of an ambitious recruiting programme which, in the event, failed even to prevent a decline in the mining labour force; and the improvement in coal output has been achieved not by recruiting more miners but by raising output per man-shift. Agriculture has suffered a slight loss in manpower since 1948 in spite of official campaigning. Only in the textile industries have the Government's attempts to influence the movement of labour shown any marked success.

"Essential" is a movable concept, and no doubt the mark of priority will soon be shifted to other industries. But it seems necessary to consider whether means can

DISTRIBUTION OF MANPOWER IN GREAT BRITAIN 1948-50
Thousands

	Mid-1948	End-1948	End-1949	End-May 1950

Source: *Ministry of Labour Gazette*

be found of making the priorities more effective in the future than they have been in the past. Very full employment will no doubt continue as a powerful factor inhibiting any deliberate attempt to change the distribution of manpower. So will the housing shortage. The third powerful influence tending to keep manpower immobile has been the attempt to prevent any movement of wages. Long before the outbreak of war in Korea it was becoming apparent that the "freeze" of wages could not much longer be maintained. The arguments for attempting to form a wages policy, of a positive and not merely a repressive kind, may soon be compelling.

IV.—Export Policy Now

THE metal-using industries have, broadly speaking, made the greatest strides towards higher productivity; they are also the biggest contributors towards the export effort; and they will be among the first to feel the consequences of rearmament. It would be easy to argue that American assistance towards rearmament, coupled with some reduction in unrequited exports (either in redemption of wartime loans or in new overseas investment) and with some greater willingness on the part of the overseas sterling area to build up its sterling balances may, in combination, reduce the strain on Britain's balance of payments to reasonable—indeed comfortable—proportions. But this would be a short-sighted view. For a variety of reasons, the continuation of the maximum export effort that is compatible with effective rearmament is the only safe course to adopt.

To relax the export drive would make rearmament easier industrially—and also financially, so long as overseas creditors could be found to assume the burden of the British balance of payments on our behalf. But there are commitments to overseas countries for the supply of goods to relieve their own economic and political pressures, and these commitments cannot be tossed overboard. Secondly, the British balance of payments, after four years of painful effort and generous American assistance, seems to have been roughly balanced in the first half of this year; that is an achievement that only folly would throw away. Thirdly, the demand for sterling area primary products in the United States has outstripped all records, and has come close to solving the British dollar problem; it remains a primary obligation on the British economy to give sterling area countries overseas good value for the gold and dollars they are earning. Fourthly, although America's own preoccupations with defence mean some slackening of its own export effort and hence the possibility of greater opportunities for exporters in other countries, Britain's own responsibilities for paying for the increased cost of imports (partly the consequence of devaluation and partly the consequence of the American boom) are very great; the increase in import costs will be of the order of £300 million this year, so that more than half of the value of the expected increase in productivity must be earmarked to meet the deterioration in the terms of trade, and the prospective fall in Marshall aid.

To secure the necessary contraction in home supplies and shift output towards exports and defence would entail policies far more draconian than the Government is prepared to contemplate at this stage. There are some industries—the motor industry happens to be one—where a system of more or less informal control has been built up. But this appears to rest on allocations of sheet steel (which should be less scarce in a year's time) and on dubious threats (in the past) of nationalisation. It is not a very satisfactory permanent system, and it has already cut down home supplies of passenger cars at least to meagre proportions. Most of the metal using industries work under similar compulsions or keep a sharp watch for official nods and winks. The following table shows the production record of certain of these industries and the proportion stated to be for export. In 1949, for instance, two-thirds of the number of passenger cars produced and over half their value were earmarked for export; for commercial motors the figures were about one-half and one-third respectively. Nearly two-fifths of the tractors and agricultural machinery, between a third and a quarter of the turbo-alternators, three-fifths of the internal combustion engines and more than a third of the machine tools were produced for export:—

TOTAL PRODUCTION AND EXPORT PRODUCTION OF CERTAIN ENGINEERING PRODUCTS

	Total Production			Production for Export		
	1947	1948	1949	1947	1948	1949
Passenger cars and chassis (no. per month)	23,917	27,376	34,358	12,914	19,350	22,683
Do. deliveries (£'000 per month)	7,756	9,385	12,059	3,367	5,272	6,441
Commercial motors (no. per month)	12,889	14,169	18,031	4,200	6,983	8,898
Do. deliveries (£'000 per month)	7,279	9,125	10,613	1,902	3,460	3,795
Agricultural tractors (no. per month)	4,800	9,800	7,500	1,500	6,100	4,700
Agricultural machinery (£ mn. per year)	42·7	69·2	63·9	9·0	28·2	26·1
Turbo-alternators ('000 kW per month)	86·3	112·0	165·0	38·6	39·0	47·8
Internal combustion engines (£'000 per month)	1,702	2,256	2,787	780	1,078	1,546
Machine tools (£'000 per month)	2,127	2,591	2,968	870	940	1,168

Source: *Monthly Digest of Statistics.*

To cut any of these leading lines of metal exports would be misguided. The home market can in some cases take further cuts—for example in passenger cars. But where home civilian supplies are already severely controlled and new demands for rearmament are particularly urgent, there may be no recourse from at least attempting to switch the export effort from the present concentration on metal products to "soft goods." It would be sanguine, of course, to expect a great deal from such a policy; it has been tried before, in the hope of assisting the urgent demand for new investment in plant at home, and it was not very successful. And it is obviously in conflict with the recent trend in exports, as the following table shows:—

CHANGE IN VALUE OF UK EXPORTS
January–May, 1950 compared with year 1949

	Per cent
Iron and steel and manufactures	+17
Machinery	+11
Vehicles, locomotives, ships and aircraft	+30
Woollen and worsted yarns and manufactures	+19
Cotton yarn and manufactures	− 8

To make the necessary partial shift from exports of metal products to textiles depends, of course, on something more than the necessary changes of demand in the home market. It depends even more directly on the willingness of the overseas buyer to take fewer engineering products and more textiles and that he may not be willing to do unless there are changes in relative prices of an order that seems quite inconceivable. Greater home demand for textiles is likely in any case to accompany the

inflation of domestic incomes. Export policy thus presents all the elements of uneasy compromise. If a big fall in exports of metal products is to be avoided, greater resort to physical controls and all the familiar forms of velvet glove suasion is likely to be needed to ensure that the cuts fall at home and not on exports. That involves some form of rationing, at least to the extent of some crude list of priorities to be administered by the industries concerned. Beyond this it is difficult to see how any large slice of the output of the metal-using industries can be diverted to rearmament without causing serious difficulties in exports as well as in home supplies.

Yet it is imperative that the export effort should be maintained. The efforts of this country to secure a balance in its overseas payments must not be squandered even at this critical phase in world affairs. They themselves represent a crisis partially surmounted, and all the experience of war itself—as manifested in the Lend-Lease Export White Paper and the shackles of Clause 9 of the American Loan Agreement—shows how dangerous it would be to impair the export effort now. No doubt, these questions may soon be raised again, perhaps in disagreeable form, from across the Atlantic. The best way of resisting them, in the interests of world recovery and political stability—to say nothing of eventual British economic independence itself—is to maintain as far as maybe the export obligations that Britain has assumed and to do nothing to impair them except under the direst necessity.

V.—Mechanisation—A Case Study

THE motor industry is bound soon to be affected by a change in Army mechanisation. Ever since what has become known as the "B" range of engines was developed, it was known that complete re-mechanisation was inevitable; the only question has been when sanction would be given for the expenditure it would involve. The range consists of three petrol engines of four, six and eight cylinders respectively. Between them they represent a range from 75 to 160 brake horse power; they provide a power unit for every type of army vehicle likely to be required. The military value of these engines lies not so much in their performance as in their construction. The bore and stroke are the same for all three and except for those few components (23 out of the 207 parts in each engine) whose dimensions are dictated absolutely by the size of the engine, all the parts are common to all three engines. A fourth engine has been developed from this range to serve in a cross-country jeep-type vehicle but because its dimensions are unusual it contains a larger number of non-standard components.

The idea of producing a standardised range of engines for all types of vehicles originated with Rolls-Royce Ltd. nearly twelve years ago when the firm's engineers were appalled at the military supply problem created by using as many as 27 different types of engines in one division. The range was evolved from the standard 40/50 Rolls engine, simplified, lightened and strengthened to fit military requirements and given a long life between overhauls. By the time the engines were developed, which was not until 1945, the War Office was in no position to order the change-over of vehicles to the new range, particularly since standardisation would pay dividends only when adopted throughout the Army. For a considerable time past, these engines have been fully approved and tested by the Ministry of Supply and the Army, and matters have rested there. Rolls-Royce have installed them in fire engines and they would have obvious advantages for owners of large civil fleets of vehicles (the Overseas Food Corporation might be an example) since they not only reduce the number of spares carried but eliminate the confusion among semi-skilled mechanics that arises in finding the right component for a specific engine. Since the Ministry of Supply has adopted the engines as its standard specification for military vehicles, it is almost certain that the expansion and re-equipment of the army will inevitably start off this delayed change-over to the "B" range of engines. There are indications that the preliminary moves are already being made. The sooner the change is completed the more rapidly will the advantages of rationalisation be felt. This would best be attained by dividing the orders among a few firms who could tool up for really long runs; if, as seems likely, orders are distributed over the entire motor industry, it will produce the maximum of inconvenience and the minimum of production economies.

Should an emergency arise, production would, however, be suitably dispersed, and in any case the motor industry will gain valuable experience in production of the engines. Since most of the big motor manufacturers are expanding their capacity, and since those who are not have surplus capacity, this might not prevent them from maintaining exports for a time, but it is certain at least to prevent any increase in the home market allocation that might otherwise have been expected. Further expansion of passenger car output beyond present levels is unlikely since there is no prospect of a large increase in sheet steel supplies until the Margam plant starts production in the second half of next year.

The commercial vehicle section of the motor industry may find the military programme to its advantage. The manufacturers of commercial vehicles have not been finding it easy to meet the Government's very ambitious export requirements, and they have not only been subjected to an additional tax but have also been virtually forbidden to supply more than a limited number of commercial vehicles to the home market. There has been some concern in the motor industry that this policy would lead to a cut back in production which would inevitably raise production costs and make exports even more difficult. Re-mechanisation of the army might remove part of this fear.

The motor industry made both tanks and guns in the last war, but it is not likely to be asked to do so at the moment. The Centurion tank, which was designed by Vickers towards the end of the war, has been in production ever since both by Vickers and by the Ministry of Supply agents. The older Comet tank is in production. Both of these, and indeed the majority of British tanks, use the Meteor engine, which is really a modification of the Rolls-Royce Merlin aero engine. It may not be necessary to make any arrangements for increasing tank production other than increasing the orders now in the hands of the established producers.

FINANCE AND OVERSEAS TRADE

The financial arrangements involved in trading with countries overseas can present many complications. The Three Banks Group has wide experience of this aspect of modern Banking practice, and with many important contacts overseas is particularly well placed to handle such problems and tender advice based on accurate knowledge of local conditions. The need for increased exports is leading to considerable expansion of the Group's activities in this direction.

Business Notes

Steel and Defence

Despite holidays, steel output in July has continued to break records; output last month was at an annual rate of 14,366,000 tons, compared with 12,697,000 tons in July last year. Those who survey a dark scene for encouraging portents may note that the previous record for July stood at 13,145,000 tons—in July, 1940, when Britain stood alone. Clearly the steel target of 15½ million tons of raw steel is likely to be surpassed this year quite comfortably; it is significant that although the increase in the annual rate of production in the first half of this year was 722,000 tons, the July increase is well over twice that rate. New capacity is showing its paces, and there is no reason to apprehend any shortage of steel sufficient to impair the progress of the defence plans. Indeed, the steel industry's own planning has for several months past been contemplating an expansion of total capacity to between 17 and 18 million tons, by the retention of certain units of older plant; this is likely to be achieved in time to meet the later stages of the rearmament programme.

Certain shortages, of course, persist. Sheet and tinplate are particular examples, and here no major relief is to be expected until, in the second half of next year, the hot strip mill at Margam begins to turn out sheet in increasing quantities and the finishing plant at Trostre adds its large quota of cold finished sheet and tinplate to supplement the output of the hard-pressed old style mills. The new melting shop at Margam is based on an annual output of 1,500,000 tons of ingots a year, of which somewhat over 1,000,000 tons will feed the continuous strip mill. Eventually, therefore, some 20,000 tons of rolled strip, sheet and plate are expected to swell the present weekly output, which has this year been running at about 46,500 tons a week, compared with about 43,000 tons a week in 1937. These products, and a few others of less conspicuous importance such as boiler tubes, are the only instances of present shortages, and these can be expected to rectify themselves before rearmament demand becomes acute. That demand in itself might be considerable in the case of sheets, but on the assumption that the pattern of rearmament demand is not violently different from that of the last war, there should be adequate supplies of finished steel to meet it without jeopardising supplies for exports and capital construction at home. There is, too, plenty of capacity for making alloy steel and armour.

A hot war, of course, could change this broad picture overnight. Already there are certain signs of difficulty. German reports have recently been referring to "the last quota" of German scrap shipments to Britain, now under negotiation in London; the British steel industry obviously cannot rely beyond this year on the maintenance of the recent level of German scrap supplies. Competition for iron ore is increasing, both on the part of the German steel industry (now producing at a faster rate than the 11.1 million tons prescribed by the Allied authorities) and on the part of American buyers. Some relief is likely to be afforded by renewed British purchases of Newfoundland ore, now permitted by the Treasury, and supplies from French sources should be maintained. Other stresses are also appearing. Apart from the special American purchase of steel pipe from Stewarts and Lloyds which will absorb over £2,000,000 of "gasoline sterling," direct American buying of European steel is becoming active.

Squeeze in Base Metals

The Government broker delivered what at first sight appears to be a lethal blow to the tin market on Thursday. After the morning session he intimated that the market could no longer rely on cash sales by the Ministry of Supply—in other words supplies of tin to the market were no longer assured. The Ministry is still the only large holder of tin in this country, and its offerings in the past had been somewhat limited. Government stocks which at the beginning of the year totalled 14,682 tons had declined to 11,600 tons by the end of June. The Ministry apparently feels that it should hold a stock of 10,000 tons as a strategic reserve—at least until the situation in the Far East improves. Such a quantity represents no more than six months' supply at the present rate of consumption. Consumers' stocks have increased slightly during the first half of the year from 1,376 tons to 1,629 tons, but they are still less than a month's supply. If supplies are not forthcoming from the Ministry's stocks, the market will to all intents and purposes cease to operate, since it will take many months for production to expand sufficiently to increase the current supplies coming to the market. Discussions between brokers and the Ministry about the future course of action were proceeding as this issue went to press. On Thursday afternoon a nominal price of £780 a ton—an all-time peak—was quoted but there were no sellers.

Tin and zinc are the only two non-ferrous metals of which stocks in Britain have declined during the first half of 1950. They are also the only metals of which the rate of consumption during this period was substantially higher than for 1949. Copper consumption fell very sharply last year and has again declined this year, while lead consumption has shown little change compared with twelve months ago. Production of copper, lead and tin in Commonwealth countries has continued to expand while the output of zinc has remained at the same level as in 1949. As far as Britain at least is concerned, any increase in consumption of copper and lead for specific rearmament purposes could go some distance without necessitating any corresponding reduction in present commercial demand. Tin consumption could also increase somewhat, whereas zinc consumption is already at a very high level and imports this year have tended to decline.

CONSUMPTION AND STOCKS OF BASE METALS IN THE UNITED KINGDOM

(Consumption, monthly averages; Stocks as at end of period)

	Copper		Lead		Zinc		Tin	
	Cons'n	*Stocks*	Cons'n	*Stocks*	Cons'n	*Stocks*	Cons'n	*Stocks*
	Tons	*Tons*	Tons	*Tons*	Tons	*Tons*	Tons	*Tons*
1946	27,117	*123,066*	16,126	*20,835*	18,008	*40,739*	2,154	*11,462*
1947	29,177	*92,338*	14,820	*36,605*	18,601	*32,084*	2,282	*9,204*
1948	29,753	*110,231*	15,662	*17,070*	18,605	*46,709*	2,103	*12,817*
1949	26,561	*120,721*	15,083	*48,875*	16,558	*61,570*	1,755	*16,058*
1950 (first half)	26,202	*125,196*	13,100	*67,857*	19,718	*52,722*	1,925	*13,229*

In the United States the squeeze in all base metals has been much more pronounced, and particularly for copper and zinc. Copper consumption in the first half of the year averaged 105,000 tons a month, rising from 92,000 tons in February to 120,000 tons in May and June. Available supplies have been estimated at 113,000 tons a month, of which 81,000 tons came from domestic production. Zinc consumption has averaged 64,000 tons a month during this period while the stockpile is estimated to have taken a further 14,000 tons a month. Domestic production provided 68,000 tons a month and imports 10,000 tons. Clearly, any increased demand for either of these two metals for the American rearmament programme is likely to involve some curtailment of commercial consumption. Even the demand for lead has tended to recover in the past few weeks and much of the stock accumulated during the first part of the year has already been sold.

Delays to the Viscount

Last week British European Airways signed an order with Vickers-Armstrongs Limited for 28 turbo-prop Viscount aircraft. This order was first promised four years ago and later countermanded. Negotiations were reopened last August and have taken twelve months to complete. No aircraft will be delivered before the end of 1952, and none can be in service before 1953. Had it not been for these delays they would have been in service next year, and would have given the British corporation a lead over its competitors in comfort, economic operation, low maintenance costs and prestige which it would be hard to exaggerate. The de Havilland Comet, which must have seemed a more uncertain proposition when it was ordered in its early development stages, will be in service next year.

Vickers have been criticised in some quarters for postponing tooling-up until the order was signed, and attempts may well be made to blame them for late delivery. But tooling-up involves a very large capital commitment, and as an adjunct to production orders have to be placed with innumerable companies making accessories. No firm could be expected to take such a risk, and in fact the wisdom of the delay is proved by the small size of the order. Last August it was announced that the Ministry of Supply would place an order for 40 aircraft for the two corporations. The final order is for 28, and the British Overseas Airways Corporation, which was to have used the Viscount on its dollar earning routes in the West Indies, is understood to have "deferred" the placing of its order, presumably feeling that its Vikings have some years of useful life ahead of them.

A spirit of caution which may be admirable has dictated the airline policy in circumstances in which a more adventurous spirit might have won a big prize in economies and in the attraction of custom. It has also involved the fairly costly modernising of the corporation's old Dakotas to improve their standard of comfort until the Viscounts replace them. The first Dakota made its first flight 20 years ago. The prototype Viscount, now carrying passengers, was considered technically perfect but operationally uneconomic. The production version, the 700, due to make its first flight shortly, has nearly twice the payload. The 701, the version ordered by BEA, contains further innovations dictated by the corporation. No order was signed until it was certain that these alterations would give the aircraft the performance demanded by the corporation's engineers. As customers they have obviously the right to demand this, but the vicissitudes of many aircraft, notably the Airspeed Ambassador which is still not in service, have arisen in attempting to meet a customer's requirements against the original judgment of the manufacturer's designers.

There has also been some stiff price bargaining; it is unlikely that BEA have agreed to pay the £170,000 which is the price estimate given for the Viscount. But weighing all this against what was at stake, should it not have been possible for both parties to agree to the early signature of a contract containing penalty clauses? Such contracts are not unknown in the aircraft industry although they are unpopular and admittedly in this case they would have been further complicated by the need to bring in Rolls-Royce, the engine makers.

* * *

Rubber Makes its own Rules

The demand for rubber last week continued very strong and the price, in consequence, again soared. It rose by 5d. in a day to 4s. 2d. a lb.; the total rise for the week was 1s. 2d. This week there has been an easier tendency. The spot price in London, which closed at 4s 1d. a lb. on Tuesday, fell to 3s. 9d. by Thursday evening, while quotations for forward delivery declined even more sharply. Three months ago discussion was centred on whether two shillings a pound would be the likely level of the market during the coming months. Now the question is whether four shillings can be maintained until the expansion in American synthetic production curbs the demand for natural rubber. The pressure is still on spot or near future supplies and, so long as consumption in the United States remains at its present high level, there is little reason to suppose that demand will slacken appreciably within the next month or so. British consumption is also at a higher level than a year ago.

One thing at least is certain. The recent trend in the rubber market has defied all statistical computation. In the first half of 1949 world production of natural rubber totalled 697,500 tons and consumption 732,500 tons. During this period the London price averaged 11 1/16d. a lb. This year, world production in the first six months amounted to 822,500 tons and consumption to 792,500 tons yet the price in the London market has averaged 1s. 7 5/16d. a lb. If these figures give any rational explanation of the market, the inference is clearly that supplies have been hoarded either by governments or by individuals and that these quantities are not included in the published figures. Purchases for the American stockpile, for example, are rightly excluded from American consumption figures. But such purchases during the first half of this year have been of the order of 30,000 tons compared with 40,000 tons in the corresponding period of 1949. Again world stocks of natural rubber this year have declined by only 10,000 tons. Twelve months ago, the decline was nearly ten times that amount. The boom in rubber has been proceeding for nearly five months; hence this discrepancy in the official statistics and the market behaviour cannot be explained by any temporary hold-up in shipments. Perhaps a more intelligent appreciation of the situation will be possible at the end of the year when the expanded output of synthetic rubber will at least take care of the most urgent demand for current supplies.

* * *

Changes in Cotton

The rather frequent and marked changes in the price of American cotton during recent weeks has forced the Raw Cotton Commission to amend its method of announcing its price changes. Instead of notifying buying brokers individually, details of alterations to its selling rates will in future be posted on the Liverpool and Manchester exchanges and, when possible, published in the daily press. The Commission has also had to curtail its facilities for providing cover for new business. In the past it has been possible to get cover up to 7 p.m. on weekdays; the closing time has now been brought forward to 4 p.m.

The curtailment of these facilities is undoubtedly a retrograde step, and spinners who require cover for individual overnight offers of yarn to overseas buyers will be particularly affected. But in a market where price movements even within a day could be considerable, the Commission presumably had no alternative. Clearly it must be in a position to alter its selling prices overnight and not have to let a day elapse before announcing the new prices, otherwise spinners could anticipate such changes to their own advantage. The same reason applies to the reduction of the hours of business for obtaining cover. Any sudden change in the American market during the day could be hedged by spinners requesting cover from the Commission that same evening.

The American cotton market has certainly been erratic during the past six weeks. On the Friday before the outbreak of hostilities in Korea the New York spot price was 34.58 cents a lb. By July 27th it had reached a peak of 39.95 cents a lb., but subsequently fell back to 38.17 cents a lb. The publication last Tuesday of the first official estimate of the new American crop, which was smaller than had been expected, caused a recovery, and by Wednesday the New York spot price had risen to 39.35 cents a lb. Movements

of this order are likely to continue until the world situation becomes much clearer. At least the rise in the price of cotton caused many American growers to market the supplies which they had previously put into Government loan. Last season's loan rate was fixed at 29.43 cents a lb. and the market was recently a full 10 cents above it. The basic loan rate for the new season will be 29.45 cents, but the market price is likely to remain quite appreciably higher. The American harvest is officially estimated at 10,308,000 bales, compared with 16,127,000 bales a year ago. Thus, despite the larger carry-over (7,000,000 bales against 5,000,000 bales), total available supplies of American grown cotton this season will be some 4,000,900 bales less than in 1949-50.

* * *

Sterling Release to Pakistan

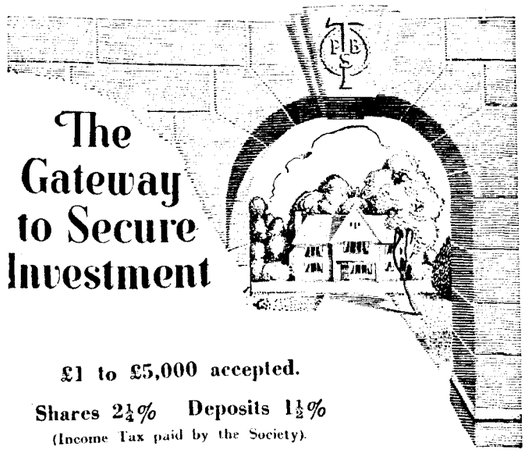
This time last year, when the overseas sterling area was running a large payments deficit with the outside world, the British Government was justifiably criticised for allowing what seemed to be incongruously generous releases from the blocked sterling balances of the Asian Dominions. At that time India was allotted releases of £50 million for each of the years 1949-50 and 1950-51 and Pakistan was allowed a release of £17 million (including £5,000,000 for refugees) for 1949-50. Owing to the improvement in its balance of payments India has apparently managed to keep within the terms of that agreement; it will not be necessary to make any sterling release to it for 1950-51 above the £50 million already agreed (in fact if the post-devaluation improvement in the Reserve Bank's published sterling assets is maintained India should not have to draw even that amount). Experience with Pakistan, however, has been less satisfactory. That dominion has apparently been allowed releases of £31 million (instead of the £17 million originally agreed) in 1949-50. For the year to June, 1951, under an agreement announced last week, its permitted release will be £15 million plus not more than £2,500,000 "for the purpose of meeting exceptional requirements up to September 30, 1950, arising from the present state of trade and payments with India." Moreover, if the trade deadlock with India still persists at the end of September, the Pakistan negotiators can apparently come back to London and ask for more.

Pakistan's overdrawing of £14 million from its blocked balance last year is officially explained as being due to the fact that it was not able to earn unblocked sterling from India during the year, owing to the trade dispute. There has always been a certain amount of British sympathy for Pakistan about this; whatever the rights and wrongs of the dispute, there is no doubt that the deadlock has hit the smaller Dominion hard in its trade account. But it is worth pointing out that last year's Indo-Pakistan Payments Agreement (now moribund) suggested that Pakistan could earn a maximum of only £15 million of free sterling from India—and that after giving a credit to India to cover the first £10 million or so of any bilateral deficit. It is impossible therefore to avoid the suspicion that a disproportionate part of the burden incurred in other people's quarrels is being shifted on Britain's (or rather on the rest of the sterling area's) back. The latest Anglo-Pakistan agreement does, however, contain the apparently optimistic provision that if Pakistan should earn any sterling from India as a result of transactions covered by the Indo-Pakistan Agreement of August, 1949, then Pakistan will pay the greater part of such sterling back into its blocked account.

* * *

Argentine Stalemate

The Anglo-Argentine financial and commercial negotiations in Buenos Aires have bogged down to a complete standstill. The members of the British team have left the Argentine capital to take a well-deserved rest and the British Ambassador has returned home on leave. Amid this somnolence and inactivity intriguing rumours have been circulating in the City that financial relations between the two countries are about to undergo a considerable improvement and, in particular, that financial remittances to this country, of which there is now a backlog of well over £10 million, are to be worked off. These rumours have as their basis some vaguely optimistic remarks made by a high Argentine official at a recent private function in London. They have no other substance. It is true that three weeks ago a representative of the Argentine Ministry of Transport arrived in London to discuss some long-overdue payments owing to British railway wagon builders and other suppliers of equipment. This emissary has been profuse with his promises but as yet does not appear to have settled any of the outstanding bills.



The position, in fact, justifies none of the current of optimism that has been flowing through interested quarters in the City in the last few days. On the contrary, the prospects of a satisfactory Anglo-Argentine agreement have recently deteriorated on a number of counts. The first of these is that Argentine authorities appear to be banking heavily on the outbreak of a Third World War. They are therefore prepared to sit tight on what they have to sell. This reasoning no doubt explains the recent decision to suspend meat shipments to Britain. The converse of this reasoning is that Argentina is now stockpiling oil and other essential commodities, the scarcities of which are still one of the more unpleasant memories Argentina inherited from World War II. A third factor in the situation is that Argentina has now very little external purchasing power. The last harvest was bad and very few surpluses are being carried forward. Finally, relations with the United States are still in the honeymoon period following the latest reconciliation and the seal of an Export-Import Bank loan that was placed upon it. In that mood Argentina is unlikely to go out of its way to reconcile its differences with Britain. In the background the wrangle concerning the amount due (or not due) to Argentina on the exchange guarantee covering sterling accumulations at the time of the devaluation of sterling remains unsettled. The arithmetic seems to make it clear that Argentina had no net sterling balance to which the revaluation clause might apply. But the position appears quite different in Argentine eyes, which see only the credit items in the position and conveniently ignore all the sterling debts that were overdue and unpaid at that time. All things considered, the British negotiators would appear to have been well advised to break off their labours and to recover their strength for the next round.

Firmer Freight Rates

A notable feature of the tramp shipping freight market in recent weeks has been the reluctance of charterers to arrange fixtures at the rates for which shipowners are beginning to hold out; and owners who have not hitherto been taking too firm a stand against the demands of charterers are now feeling more confident in waiting for better rates and conditions. The result is that while the volume of fixtures on a voyage basis has not been greater than is normal at this season, fixtures have generally been made at slightly enhanced rates. There is evidence also of fair inquiry for the time chartering of vessels for varying periods, and owners undoubtedly feel that the tone of the market is firmer than it was this time last year, although the general level of freights is lower. As the accompanying graph of the freight index of the Chamber of Shipping of the United Kingdom shows, there has been less fluctuation in freight rates so far this year, although the general level is considerably lower than in previous years. The index for May last was 71.4, compared with 99.7 in May, 1949; but by June it had strengthened to 71.7, compared with a drop of 13 points in the same period last year. The index is based on tramp fixtures in sterling reported during the month.

The stronger attitude of the freight market cannot be attributed to any single factor. The lack of coal cargoes has contributed to the hardening of some rates, particularly in the Mediterranean trades, while the paucity of bulk grain shipments from the Plate to U.K.-Continent has led to unprecedented high rates for the few outward cargoes of coal to that destination. But the Korean war, with its possible effect on the demand for tramp tonnage, may well be the most potent factor influencing the market at the moment. The US Military Sea Transportation Service has already asked

for offers of about 20 fast ships to make September readiness on the North Pacific coast. Its intention is apparently to take American ships first, where possible, even to the extent of preferring slow American ships to faster foreign ones; American maritime policy shows no new access of vision. Meanwhile about 70 ships have been withdrawn from the American strategic reserve fleet of war-built standard ships, mainly of the Liberty type, which are surplus to normal commercial requirements. The withdrawal of these ships from reserve will help to dilute the demand for international

chartering, although the transfer of American-operated ships to the Korean supply lines will increase the opportunities of foreign ships in other trades. There is already a considerably increased demand in the North Pacific trades as a result of the diversion of American ships to the Far East. There are well over 2,000 ships laid up in American waters, but their "reactivation" takes a good deal of time. The procedure is to hand them to American shipowners as agents until ready for service, then to bareboat-charter them and take them on time charter to the Transportation Service.

* * *

Rearmament and Clothing Fibres

The proposed increase of 600,000 men in the American armed forces will certainly expand the demand for uniform cloth and other textile products. Neither the cotton nor the wool textile industries in the United States are working at full capacity and it would no doubt be technically possible to meet the new military requirements without seriously curtailing normal output. It will be much more difficult, however, to ensure adequate supplies of raw materials. World stocks of cotton on July 31st, the close of the 1949-50 season, are estimated by the International Cotton Advisory Committee at 17 million bales; this represents seven months' consumption at the current level, the same as a normal prewar stock. Some 5,000,000 bales of this total consist of US Government loan cotton and 2,000,000 bales of US "free" cotton; thus 7,000,000 bales would be available for American industry. But other cotton consuming countries might well be faced with a shortage. The American crop now being harvested is expected to be 6,000,000 bales smaller and although output in India, Pakistan and Egypt will be larger, the world crop is expected to decline by at least 2,000,000 bales, to 29 million bales. Any increase in consumption during the coming season can only be met from stocks.

Wool supplies are seriously short. World production in 1950-51 might increase by three per cent to, say, 3,950 million lb. (greasy basis) and if total consumption remained at 4,350 million lb., end-of-season stocks would be reduced below 1,000 million lb. This represents less than three months' supply. Demand is being reduced to the available supply by market forces; last month, wool prices exceeded the all-time record reached in May. If the military requirements for wool cloth in the United States are at all large, some system of allocating raw wool among American manufacturers seems inevitable, and the curtailment of production of peacetime goods would surely follow. That might have its compensations if it led to wider opportunities in the American market for British and European exports.

Rayon and other artificial fibres could no doubt mitigate to some extent the shortage in wool and cotton. The American Government has experimented with uniforms made from synthetic fibres, and is apparently satisfied with the results. Rayon can also be used in mixtures with the other fibres. World production of continuous filament yarn and staple fibre in 1949 was estimated by *Rayon Organon* at 2,690 million lb. while productive capacity existing at the end of 1950 was forecast at 4,033 million lb. Thus there would seem to be a large surplus of capacity to bridge the gap left by the other fibres. But this capacity is concentrated in western Germany, Italy and Japan; to utilise it, these industries would first have to be restored to their prewar level. That would immediately involve the further problem of securing an adequate supply of cellulose, particularly as the supply of cotton linters will decline during the coming season, owing to the smaller world cotton crop.

* * *

"Tanks" Scheme

First reactions to the capital reorganisation proposals put forward by the board of Tanganyika Concessions have been generally favourable. The scheme arises primarily from the intended transfer of the company's domicile to Southern Rhodesia, a proposal to which stockholders are also asked to agree. This move would substantially ease the company's tax liability, in particular its liability for United Kingdom profits tax, though it would make institutional holders of "Tanks" stock liable for profits tax on dividends received. While a reduced tax burden on the company would bring advantages even to the institutional holder of "Tanks" ordinary stock (and would anyhow be of advantage to private holders), the benefits to be expected by institutional holders of "Tanks" preference stock (and such holdings are very large) would be confined to improving the earnings cover on the preference dividend to the extent that the tax load is lightened.

Hence, the immediate purpose of the scheme is to make removal to Southern Rhodesia financially attractive to both classes of stockholders. Preference stockholders are offered a stake in the "Tanks" equity; each £1 of existing preference stock (which at present is receiving a 10 per cent dividend consisting of a cumulative 4 per cent dividend, a non-cumulative 2 per cent payment and a payment of a further 4 per cent ranking *pari passu* with the ordinary stock) is to be exchanged for one 8 per cent cumulative redeemable 16s. preference share and one 6s. ordinary share. The cumulative element in the preference dividend would thus be increased and an equity stake provided. What is more, the new preference shares will be redeemable on six months' notice at 32s.

Branches & Agencies throughout the World.

Given the present ordinary dividend of 10 per cent, the return to preference holders under the scheme would be lowered in effect from 10 per cent to 9.4 per cent, but it is a fair presumption that part of the saving in taxation would be distributed by way of a higher ordinary dividend. An increase from 10 per cent to 12 per cent would in fact make preference holders better off for the exchange. The Board puts a capital value of 38s. 3d. on the stocks now offered in exchange for each £1 nominal of existing preference stock. This is made up of 23s. 3d. for the 16s. preference shares (assuming a 5½ per cent yield basis) and of 15s. for the 6s. ordinary unit taking the current price of 25s. for the 10s. ordinary units. The existing preference stock is currently quoted at 34s. 3d. The scheme of arrangement would change the issued capital from £2,305,783 in preference stock and £3,139,678 in ordinary stock to £1,844,627 in 16s. preference shares and £3,831,412 in 10s. ordinary stock units.

Shorter Notes

The increase in exports of vehicles of all types in the first half of the year led to a proportionate increase in the export of tyres. More than 3,000,000 tyres were included in vehicle exports and a little less than that figure were exported directly. The value of the direct tyre exports was £7,625,826, compared with £6,394,138 in the same period last year. The total number of tyres exported was 6,106,713, compared with 5,770,225 in the first half of 1949.

*

The United States has purchased 34,000 troy oz. of platinum from the British Government for its strategic stockpile. The purchase was made under the Economic Co-operation agreement, and payment was made in sterling from the counterpart funds. Previously rubber, industrial diamonds and sisal have been bought for the stockpile through ECA channels. The quantity of platinum still held by the British Government is not known, but it is believed to be considerable.

*

Under the Wool Textile Industry (Export Promotion Levy) Order, which came into force on July 31st, a levy estimated to produce between £100,000 and £120,000 a year is imposed on the industry to finance export promotion activities to be carried on by the National Wool Textile Export Corporation. Manufacturers and traders in the materials of the wool textile industry are required to register with the Board of Trade, which will collect the levy to be passed on to the corporation.

*

The New Zealand House of Representatives is now considering The Reserve Bank (Amendment) Bill, which seeks to switch control of the policy of the New Zealand Reserve Bank from the Finance Minister to an independent Governor and Board; the nature and objects of this Bill were discussed on page 335 of *The Economist* of February 11th last.

*

The free market in foreign currencies started as an experiment by the Spanish authorities for an initial period of two months is proving unexciting. There is nothing particularly "free" about the market; in effect it means a partial devaluation of the peseta. Invisible sterling earnings can be converted at pesetas 110.30 to the £ or pesetas 39.40 to the $, compared with peseta rates previously ranging from 45 to 70 to the £ and from 16 to 39 to the $. Tourists are the main beneficiaries. The sterling-dollar cross rate is maintained at parity.

'I've made a wise move'

'I want my dependants to have lasting security, so I've appointed the 'General' in my will, to act as my trustees. Why? Mainly because they have all the necessary qualifications and ability to look after my estate. Their service is continuous—over many generations if necessary—and my dependants will benefit from the 'General's' wide experience of investment and financial administration.'

Peace of mind costs very little

The cost of expert trusteeship through the 'General' Executor and Trustee Department is small. The benefits may make all the difference to the well-being of your dependants. Find out more about this way to ensure permanent, reliable administration.

COMPANY MEETINGS

TUNNEL PORTLAND CEMENT COMPANY

DELIVERIES AGAIN A RECORD

EXPORT TARGET REACHED

MR N. M. JENSEN'S STATEMENT

The thirty-ninth annual general meeting of The Tunnel Portland Cement Company, Limited, will be held on September 11th at 105 Piccadilly, London, W.1.

The following is the review by the chairman and managing director, Mr N. M. Jensen, which has been circulated with the report and accounts:—

PROFIT AND LOSS ACCOUNT

The profit on trading for the past year amounts to £882,894, and compares with £835,543 for the previous year; and dividends and interest have risen from £198,561 to £206,613. Depreciation has increased from £64,705 to £97,775. This is accounted for partly by the additional plant installed at our West Thurrock works, but it is mainly due to the fact that our new works at Padeswood in North Wales came into operation during the financial year.

Although the profit is higher, the income-tax figure of £230,178 is well below that of last year. The reason for this is that we have the benefit of initial allowances on the substantial addition to our plant and equipment. The similar benefit which we had last year was dealt with by a transfer to special depreciation reserve. The initial allowance is, of course, only in advance on the wear and tear allowance, which is reduced correspondingly, and, in the long run, there is no additional advantage. Your directors have, therefore, come to the conclusion that the right way to deal with the matter is to have an income-tax equalisation reserve, which will be credited with the difference when the depreciation charge in the accounts is below the wear and tear allowance including initial allowance taken up in the income-tax computation and debited with such difference when it is the other way round. This will have the effect of bringing the amount set aside for tax into line with the profits earned year by year.

RESERVES

You will find that a total of £200,000 has been placed to the credit of income-tax equalisation reserve, of which £120,000 is in respect of the year to March 31, 1950, and £80,000 in respect of previous years.

As replacement cost is at present approximately three times the cost of our prewar plant, your directors have considered the question of building up a replacement reserve, but they came to the conclusion that this vexed question is, for the time being, best dealt with through transfers to general reserve. You will notice that the sum of £545,035 has been appropriated to general reserve, and this, together with the transfer of the special depreciation reserve, builds up the general reserve to a total of £1,250,000.

After making these substantial appropriations and providing for the dividends on the two classes of preference shares and the interim and proposed final dividends on the "A" ordinary shares and "B" ordinary stock, there remains a balance of £577,616 to be carried forward.

BALANCE SHEET

Since the date of the balance sheet, the authorised capital has been increased to £4,200,000 by the creation of 600,000 new "A" ordinary shares of 10s. each and 1,400,000 new "B" ordinary shares of 10s. each, and the bonus share issue, to which I will refer later, brought the issued capital up to £3,643,660.

I have already mentioned the adjustment to some of the reserves. In connection with the bonus issue, a sum of £1,221,830 has been transferred from share premium account which now stands at £951,538. Expenditure on our new works at Padeswood, North Wales, and on new plant for our West Thurrock works accounts for most of the amount of £899,049 which has been added to property, plant and equipment. Helwan Portland Cement Company and Ribblesdale Cement Limited have again increased their capitals, and we took up the proportions to which we were entitled. These represent the main items in the increase of £154,624 in trade investments. Cash at bankers and in hand stand at £973,397, or £1,229,787 less than last year. This is mainly accounted for by the increase in fixed assets which I have referred to, together with the increase in trade investments. We have furthermore invested £101,502 in Government securities and £83,200 in additional tax reserve certificates.

DEMAND FOR CEMENT

During the year under review the totals of the home and export deliveries of British cement were even greater than the previous year's record results. The Government, in consultation with the industry, set a high export target, which was achieved, and it is gratifying to note that all but a small fraction of cement exports are direct dollar or hard currency earners or savers. Though there are indications that export demand may slacken, this has not yet happened and the limiting factor on exports has been the steadily increasing demand at home.

EXTENSION OF PRODUCTIVE CAPACITY

Your new works at Padeswood came into operation with the first unit in December last, and the second unit was started in April. This is the first new cement works to commence production in this country since before the war. Lack of suitable labour has so far prevented us reaching the measure of output which we shall ultimately obtain.

At West Thurrock, new grinding plant and packing plant has been put into operation. This, together with the kiln installed last year, has replaced less efficient plant and also increased our total capacity by approximately 50,000 tons per annum. Work on the extension of the Pitstone works is proceeding, and it is hoped that the extensions of the Clitheroe works of Ribblesdale Cement, Limited (of which your company holds half the shares), will be in operation by the end of the year. Altogether it is estimated that your company's share of new extensions will, when completed, amount to 470,000 tons per annum, and this constitutes a generous contribution to the efforts of the whole cement industry to meet the increasing demand in the home market and, at the same time, maintain the present level of export.

TOWN AND COUNTRY PLANNING

In my review last year I said that there were indications that the amount of compensation for loss of development rights in our quarries would be approximately equivalent to the development charge we should have to pay. Negotiations on this complicated matter have continued, and although an official announcement has not yet been published, it is now quite clear that the company will not suffer the grave hardship which was feared when the development charge was introduced.

SCHEME FOR SEGREGATION OF ASSETS

At the class meetings and the extraordinary general meeting held on July 7, 1950, the resolutions required to effect the increase of capital of this company and the issue of bonus shares were duly passed, and such bonus shares were consequently allotted to the ordinary share and stockholders.

As explained in our circular dated June 12, 1950, these transactions were intended to be the first step in a scheme, of which an outline was given, for segregating the overseas assets of this company, and it was stated that details would be sent with the notices of the further meetings which would have to be held in order to complete the scheme.

An unforeseen difficulty has now arisen. A group of shareholders representing more than 35 per cent. of each class of the preference capital informed us that certain aspects of the scheme did not appeal to them. The matter was fully discussed, and on the part of the company it had to be admitted that one point of criticism had some substance, namely, that the segregation of the assets would deprive the preference shareholders of the advantage which they now hold of the trading profits and income from overseas investments being pooled. Your directors were anxious, as far as possible, to meet the preference shareholders on this point and, subject to the necessary alteration to the company's memorandum and articles of association being approved, they offered that your company should guarantee for a period of 15 years the payment of the preference dividends by the investment company on the understanding that the guarantee would automatically cease in the event of the business of the cement company being nationalised. The group of shareholders did not accept this, but made their support of the scheme conditional upon the guarantee being permanent and continuing notwithstanding nationalisation. Your directors considered that this condition was unacceptable.

The object of the scheme was to protect, as far as possible, the rights of all the shareholders and stockholders in the event of nationalisation and to continue such rights so far as the segregated assets are concerned. Accordingly in the opinion of your directors, the dividend rights of the preference shareholders of the investment company should, after nationalisation, be dependent solely on the segregated assets. Furthermore, the burden of such a continuing guarantee would, in the event of nationalisation, fall on the nationalised assets of your company, possibly giving rise to difficulties in any resulting liquidation and to a reduction in the value of the rights of the holders of the ordinary capital.

Your directors do not desire to proceed with a scheme which is unacceptable to a large group of the shareholders and which, in view of the necessity of obtaining the consent of each class of preference shareholders at separate meetings, could not be carried through successfully. They have therefore reluctantly come to the conclusion that further prosecution of the scheme is impracticable.

OVERSEAS INTERESTS

As you are aware, our chief overseas interests are in Egypt and in the U.S.A. I am happy to say that the Helwan Portland Cement Company has had another successful year. The extensions to which I referred last year are well under way and a new works, the Alexandria Portland Cement Company, in which the Helwan Company holds a substantial interest, commenced production in May last. The National Portland Cement Company in the U.S.A. has also had a successful year.

Finally, on behalf of your board, I would like once more to thank our staff and workpeople for the very efficient and loyal manner in which they have carried out their duties.

PYE, LIMITED

RECORD RESULTS

MR C. O. STANLEY ON THE GROUP'S EXPANSION

The twenty-first annual general meeting of Pye, Limited, was held on August 4th in London.

Mr C. O. Stanley, C.B.E. (the chairman), who presided, said: Ladies and gentlemen,—The accounts and directors' report have been published in a detailed and illustrated form and have been in your hands for several weeks, so that it is not necessary for me to add very much today.

The year 1947-48 was a record—the year 1948-49 was again a record—and now 1949-50 far surpasses every previous year with a trading profit of nearly half a million pounds! This is an indication of the way in which the Pye group of companies has expanded. You must also remember that this has been achieved whilst vigorously pursuing a policy of reducing prices to the consumer.

Since our annual report was circulated it has become clear that a company like ours will have to make considerable sacrifices in changing part of the production of both laboratories and factories over to work of a military character. We know we will have the support of all our shareholders when we tell you that we are prepared to make any sacrifice in shouldering our part of the responsibility in the National effort.

It is now clear that the reference we made in our annual report to the purchase tax on radiogramophones has proved only too true, and we would again ask the Chancellor to review this tax if he wants us to keep up our export business.

PROFIT-SHARING SCHEME

With regard to our profit-sharing scheme, we announced at its inception that it was experimental, and this year one of the flaws in the scheme has come to light. It was our intention that the same amount of money represented by an increase in the deferred dividend should be paid as a profit-sharing bonus to our employees. This year the number of our employees has gone up considerably, so that if the profit sharing had been on the same basis as last year the individual employee would have received less while the shareholder would have received the same amount of money. Quite obviously, if the number of our employees goes up each year and we continue the old basis, then we might arrive at a point where the amount that goes to each individual employee is infinitesimal compared with the amount that employee received in the first year. This was never the intention of the scheme, and for that reason we altered it this year. Your directors will review the whole situation to take care of this difficulty in the future.

The report and accounts were adopted.

W. J. BUSH AND COMPANY, LIMITED

LARGER SALES AND PROFITS

The fifty-third annual general meeting of W. J. Bush and Co., Limited, was held in London on August 4th, Dr. P. C. C. Isherwood, O.B.E., PhD., F.R.I.C. (chairman and managing director), presiding.

The directors' report, which was submitted to the meeting, showed that the net profit for the year amounted to £209,559, and that after adding to this the sum of £286,161, being the amount brought forward from the previous year, and deducting the amount required for dividends on the Preference shares, there remained a balance of £481,970. Out of this sum it was proposed to pay a final dividend of 8 per cent. on the ordinary shares, making 12 per cent. for the year, and also a bonus of 1s. per share on the ordinary shares.

CHAIRMAN'S REVIEW

The following is the chairman's circulated statement:—

The accounts now submitted show that the profit for the year, after deducting taxation, amounted to £209,559 as against £172,624, an increase of £36,935. The higher figure arises as a result of a substantial increase in sales which was partially attributable to devaluation in the last quarter of the year. It must be borne in mind, however, that replacement of stocks in the current year is involving the company in higher costs.

For many years the Australian market has been operated through local branches of the London company, but as from January 1, 1949, the business has been transferred to a wholly owned subsidiary incorporated in Australia. The transfer of the net assets to the new company has correspondingly reduced the net assets of the holding company, and these figures are not, therefore, comparable with 1948, except in the consolidated balance-sheet, where they are included in both years.

As I indicated in my statement last year, the accounts under review reflect the redemption of the four per cent. first mortgage debenture stock.

In view of the enhanced costs of replacement of plant and buildings, your directors have considered it advisable to increase the reserve against these items by £50,000. A further amount of £50,000 has been placed to general reserve, bringing it up to £350,000.

EVER-GROWING COMPETITION

In face of the ever-growing competition from abroad, it is vitally necessary to equip our factories with the most modern plant available. Owing to the somewhat long delay in delivery, this means careful and far-sighted planning and this aspect of the business is very much to the fore in our deliberations.

In spite of the difficulties due to import restrictions in several important overseas markets, I am pleased to report that during the year under review the company's export business was again on a higher level than the previous year. The directors continue to give the closest attention to the extension of exports and members of the Board have paid visits abroad to assess at first hand the possibility of further expansion of this important section of the business.

Your directors consider that the accounts justify an increased distribution and recommend the payment of a bonus of 1s. per share, as against 6d last year.

Finally, I wish again to pay tribute and to declare publicly the directors' sincere appreciation of the loyal contribution to these results by our efficient staff both at home and overseas.

The report and accounts were adopted.

AMALGAMATED DENTAL COMPANY, LIMITED

FURTHER IMPROVEMENT

The 45th annual general meeting of the Amalgamated Dental Company, Limited, was held on August 4th in London, Mr E. Russell Polden (the chairman) presiding.

The following are extracts from the chairman's circulated statement and speech at the meeting:

The further improved position, both in regard to the stability of the company and the increase in profits, is due to the continued expansion of trading at home and abroad. Undoubtedly the company's export business could be greater were it not restricted by the fact that many countries are not in a position, through lack of currency facilities or other economic reasons, to grant import licences.

As regards future home trade, judging from what one reads in the Press and from our own experience, I can fairly assert that dental treatment has by no means reached "saturation point" in meeting the requirements of the community.

Referring to the results of the year's trading, it will be seen that the group has produced total profits before taxation of £753,331 compared with £478,075 in 1948. It will be observed that a considerable proportion of the profits of the subsidiary companies making up the group have been retained in these companies in the interest of building up the financial structure of the group.

In reviewing these accounts, I know full well that members will bear in mind that the satisfactory results shown could not have been attained without the whole-hearted and loyal co-operation given by the management, staff and operatives engaged in the service of the company, its subsidiaries and associates.

The report was adopted.

BRITISH MATCH CORPORATION, LIMITED

TAXATION HANDICAPS

The twenty-third annual general meeting of the British Match Corporation, Limited, was held on August 9th in London, Mr Arthur Hacking, O.B.E., the chairman, presiding.

The following is an extract from his circulated statement:—

From the directors' report it will be seen that although the Control of Distribution of Matches ended on August 2, 1949, the Control of Prices Order dated July 29, 1949, is still effective.

For the current year our difficulties in regard to timber supplies are likely to be greater than ever. We have, as yet, no idea what our allocation of dollars for purchases in Canada will be for the year 1951 and, until we have that information, it is impossible for us to take any effective steps in regard to supplies from Canada. We are obtaining certain supplies of round timber from Finland, but the Baltic States, where we obtained supplies between the two great wars, are under the domination of the USSR and we have not been able to obtain supplies from that source.

Your board has been able to recommend the same dividend and bonus as last year, adding approximately £3,600 to the carry-forward.

Our gross consolidated profit of £2,075,297 is reduced to £1,729,483 after making provision for directors' remuneration, audit fees, depreciation and bank interest. The tax relative to £1,741,983 is no less than £999,925! What a dreadful handicap in running a business and endeavouring to expand!

The report was adopted.

STEEL BROTHERS AND COMPANY, LIMITED

(East India and General Merchants, Rice and Flour Millers, Saw Millers, Cotton Pressers, Ginners and Spinners, Rubber Planters and General Agents.)

A SATISFACTORY RESULT DESPITE DIFFICULTIES

MR J. K. MICHIE'S STATEMENT

The fifty-ninth ordinary general meeting of Steel Brothers and Company, Limited, was held on August 4th in London, Mr J. K. Michie (chairman and managing director) presiding.

The following is the chairman's statement, which had been circulated with the report and accounts for the year ended December 31, 1949, and was taken as read:—

The physical difficulties confronting us in closing and concentrating accounts from so many countries have again resulted in our presenting the balance sheet and profit and loss later than we had hoped.

PROFITS AND ALLOCATIONS

In my last year's statement I forecast a recession in our profits which has in fact happened, the figure for the year before tax deductions being £563,841, against £600,952 in 1948, an amount of £28,174, included in the profit and loss account, being in fact provisions made ex previous profits not now required. In the circumstances I hope this result will be regarded as satisfactory.

As you will see, no less than £350,000 has been set aside to meet taxation, while £141,365 has been applied to depreciation of our fixed assets and our investments and to writing off advances.

As from December 31, 1949, a superannuation fund was put into operation in anticipation of which, as you will remember, the sum of £100,000 was set aside ex 1948 profits.

This reserve was a "gross" figure and as under the scheme eventually adopted by us it was not permissible to use this reserve free of British income taxes, we have had to appropriate half of it as the company's contribution to the scheme for 1949. To compensate for this we have increased our tax reservation by a similar amount, so ensuring that the sum of £50,000 carried forward as a reserve against pension liabilities will be tax free, and so in fact worth £100,000 (at present rates of taxation) should the need arise to use it.

BURMA WAR DAMAGE PAYMENTS

Last year I reported the appointment by H's Majesty's Government of an independent committee to apportion among United Kingdom business interests who had sustained war damage in Burma the sum of £10,000,000 granted as an ex gratia payment of limited amount to assist them in overcoming their capital handicaps.

This committee performed its complex and difficult task with admirable and businesslike celerity and made its allocation of all but a small percentage of the sum available in January of this year. The amounts so far received by your company on its own behalf, on behalf of fully owned subsidiaries, and on behalf of subsidiaries which were indebted to us was £753,230. While wholly inadequate as a replacement of our lost capital, this nevertheless is a welcome contribution to that end.

EFFECT ON BALANCE SHEET

In consultation with our auditors it has been decided to revise our balance sheet to incorporate these sums and so present to stockholders a fair and up-to-date picture of our affairs. So all amounts in the fixed assets representing items totally destroyed have been written off and values of investments have been written down to quoted or estimated values. All fixed assets are again shown under one heading. This spring cleaning enables us to present a balance sheet in normal form and to advise you that your investments in the aggregate now stand in the books at a fair value.

The position of the claims of our subsidiary companies for war damage under the heading of "Denial" remains little changed, as no test case has yet been heard in the Burmese courts.

One welcome effect of the receipt of our share of the ex gratia payment from His Majesty's Government has been its incidence on our cash position. At December 31st last our net overdraft had reached the considerable total of £1,406,292—again partly due to advances made as buying agents for Governments. At date of writing there is actually an overhead credit balance, but that is a position we do not expect to maintain.

CONDITIONS IN BURMA

I now comment on developments and conditions in our various spheres of action.

Burma.—As anticipated, opportunities for doing our traditional business in Burma were distinctly fewer in 1949. We worked no rice mills and owing to the nationalisation of our teak forest concessions and the lack of logs from other sources in Rangoon and Moulmein our timber mills at these ports were closed down and are now costing us a considerable sum for care and maintenance. When it became obvious beyond all question that there was no further employment for them we discharged all redundant workmen at our Rangoon mill, paying to those concerned the amounts at their credit in our provident fund and to all one month's salary. Since then a reference has been made by the labour union concerned to an industrial court set up by the Burmese Government under the Trade Disputes Act and an award has been made against us which would involve us in a substantial additional payment. We are taking the steps open to us to protect ourselves against this award, so the case is subjudice. I will therefore make no comment except to quote the following from the award:—

"So long as there is no social security scheme in the country and private industry exists the employers must within reasonable limits shoulder the responsibility for relief in cases of involuntary unemployment."

This is a new and interesting concept of social and industrial justice, even when qualified by what the Court terms "reasonable limits."

EFFECT OF IMPORT LICENCES

The necessary austerity measures taken by the Government of Burma to reduce imports coupled with its system of issuing import licences has militated against our trading activities; nevertheless we succeeded in achieving a fair turnover and results were not unsatisfactory.

More recently the Government has made fair headway against the dissident elements in the country, and we are hopeful that conditions will gradually improve. Should the area under "law and order" gradually be extended, production of rice, timber, etc., would concurrently expand and the economic life of the country would then revive. It is for this we must hope not merely in self-interest but for the sake of the country.

During the current year after a lapse of eight years we have again been able to share in a comparatively small way in the rice export trade both as agents for certain Colonial Governments and as shippers. We hope that a larger crop this year will assist Burma rice to regain its previous place in the markets of the world and that we shall be allowed the opportunity to assist in marketing it to the best advantage of the producer.

BURMA CEMENT COMPANY

At the time of writing the works of the Burma Cement Company, Ltd., at Thayetmyo, which we manage and in which we have a considerable stake, are still in the hands of insurgents, while the oil industry in which we are largely interested is operating on very modest lines. We must hope that Government will soon regain control of the riverine areas in which these industries operate and then be able to address themselves to the practical side of their declared wish to encourage friendly foreign enterprise to assist in the economic rehabilitation of the country.

Strand Hotels, Limited, Rangoon.—This company has had its first full year and the result achieved in face of many difficulties was satisfactory. Equally so have been the good reports from guests of the service given in the hotel.

BUSINESS IN INDIA

India.—Our business in India continued on much the same lines and scale as during the previous year although the problems following devaluation have made overseas trading extremely difficult. These conditions cannot but be reflected in this year's trading.

Our work for the Indian Tea Association as their procuring agents for foodstuffs continues and although there have been many difficulties to contend with I trust our efforts on their behalf have been satisfactory to them.

REPERCUSSIONS IN PAKISTAN

Pakistan.—Principally because of the repercussions of the non-devaluation of the Pakistan rupee, but also because of previous overimporting into Chittagong aggravated by congestion in the port and by weather conditions which badly damaged the food crops of East Pakistan and so adversely affected its purchasing power during the normal busy season, trading in this area was steadily and drastically changed from a comparatively simple process to one of great hazards and inescapable losses, and instead of making an expected profit we ended the year with a moderate loss and are thankful to have escaped so lightly.

In West Pakistan naturally there were similar difficulties caused by the exchange situation, but of lesser degree, and results at our Karachi branch were in the circumstances satisfactory. Markets in Pakistan generally have this year been less volatile and though still far from easy—particularly because of the halting way in which, so far, trade is passing between India and Pakistan—prospects are more promising. It is, of course, a mere truism to say that trade in both countries will not prosper as it should until the statesmanlike agreement reached by the two Prime Ministers is put into practical effect.

HONGKONG AND JAPAN

Hongkong.—Trading was maintained at a surprisingly high tempo throughout 1949 and our business was well maintained. Quite recently, however, there was a sudden break in demand and in confidence which might well have come sooner. Recent happenings in Korea are not likely to help Hongkong markets, although trends in that part of the world are quite unpredictable.

Japan.—Our Tokyo office only operated for part of 1949 and as was to be expected did not earn sufficient to cover expenses.

It is now doing a useful business and building up a connection which in due course should show favourable results, although the changes being introduced into the Japanese economy do not make our task easy.

NORTH BORNEO, SIAM AND CEYLON

North Borneo.—After a two years' trial we reluctantly decided to close down our branch at Jesselton and our staff has just been withdrawn. The opportunities for trading are distinctly limited by population and communications and it was felt we could use our staff to better advantage elsewhere. We hope, however, that our withdrawal from Jesselton will not mark the end of our association with this territory.

Siam.—Our interests in Siam fall in two parts—import and export trading and membership of the Siam Rice Agency, Limited.

Trading conditions were extremely difficult, due to overstocking of various lines of goods and to overtrading generally, and this situation has still to be adjusted.

The rice agency company continues to perform a valuable function as agents for certain Commonwealth countries and this year as shippers on their own account. The partial freeing of the Siam rice trade is an encouraging move and should help to get it back towards, if not to, the old basis of standards only on which can an international trade be built up and maintained.

Ceylon.—As I forecast in my last report our subsidiary, E. B. Creasy and Company, Limited, found trading conditions very difficult last year, but they have since improved and 1950 promises much better.

THE MIDDLE EAST

Middle East.—Our own business in this area was well maintained and we have as from April 1, 1949, extended our interests by the purchase of 50 per cent. of the capital of Spinneys (1948) Limited, a company which took over the interests in Cyprus, Lebanon, Syria, Iraq and Kuwait of that old-established business Spinney and Company, Limited. I have recently returned from a comprehensive tour of the Middle East and am quite satisfied with our investment.

This arrangement entails the merging of a large part of our own previous activities in the Arab countries into Spinneys (1948) Limited, but this, with the help of the trained staff we have been able to post to the new company, should result in its more rapid expansion to the mutual benefit.

While circumstances tend to restrict its scope, our business in Israel continues active.

EAST AFRICA

East Africa.—Our associates, Messrs A. Baumann and Company, Limited, who closed their accounts at June 30, 1949, had a satisfactory year.

The timber project in Tanganyika, which I mentioned last year, has now become a company — Steel Brothers (Tanganyika Forests), Limited—registered in Dar-es-Salaam on October 15, 1949, with an authorised capital of £250,000. Our associates in East Africa, Messrs. A. Baumann and Company, Limited, have also participated.

A timber extraction and milling company cannot be established in virgin territory in a few months, but already good progress has been made. The bare essential quarters for staff have been built, water supplies found and piped, roads built and extraction on a considerable scale begun. In fact, small lots of round logs have already been shipped to this country and to Kenya. The milling plant is now on the way and it is hoped to have the first section in operation this year.

Results from this company cannot be expected before 1951-52, but we are satisfied that prospects are reasonably good.

BRITISH GUIANA

British Guiana.—We have now concluded an agreement with the Colonial Development Corporation, whereby we act as managing agents and as selling and purchasing agents for their timber interests in British Guiana which the corporation have acquired and/or negotiated on lease from the local Government.

Carbutt and Company (1928), Limited.—Our wholly owned subsidiary operating rice and barley mills in London and Hull again had a satisfactory year.

Mactaggart and Evans, Limited.—Though gradually increasing its scope and income this company which operates as an industrial and chemical research institute again made a loss. Improvement, however, continues.

THE OUTLOOK

Prospects.—As my foregoing remarks indicate, we cannot expect easy times, and it is difficult to see how in current conditions 1949 results which included certain sums pertaining to previous years can be maintained, but no effort is being spared to consolidate and to widen our interests and what does not fructify this year we hope will benefit us later.

Staff.—Appreciations of staff in annual reports run the risk of becoming stereotyped and this I want to avoid. Nevertheless, without the ability and enthusiasm which have again been evinced by all members of our staff in the parent company, our subsidiaries and associates these results would not have been achieved, and I wish to thank them sincerely.

The report and accounts were unanimously adopted.

The retiring directors, Mr J. K. Michie and Mr P. G. G. Salkeld, C.B.E., were re-elected; and the remuneration of the auditors, Messrs Deloitte Plender Griffiths and Company, having been fixed, the proceedings terminated with votes of thanks to the chairman, directors and staff.

RICHARD THOMAS AND BALDWINS, LIMITED

ANNUAL GENERAL MEETING

The annual general meeting of Richard Thomas and Baldwins, Limited, was held on August 3rd at Grosvenor House, Park Lane, London, W., Mr E. H. Lever, chairman and joint managing director, presiding.

The chairman said that he regretted to have to announce that Sir John James, the deputy chairman, had decided to retire from the board in order to devote more time to the Lancashire Steel Corporation, of which he was chairman. His services to the company had been invaluable.

The chairman then moved the adoption of the report and accounts for the year ended April 1, 1950, and the payment of a final dividend of 10 per cent., less income tax, making 15 per cent. for the year.

Lt.-Colonel J. B. Neilson, C.M.G., D.S.O., C.A., seconded the resolution and it was carried unanimously.

The retiring directors, Mr C. G. Gilbertson, J.P., Mr C. Watts, F.C.A., and Mr H. F. Spencer, were re-elected and, the remuneration of the auditors, Messrs Peat, Marwick, Mitchell and Company, having been duly fixed, the proceedings terminated.

ASSOCIATED BRITISH PICTURE CORPORATION LIMITED

A SUCCESSFUL YEAR

The twenty-third annual general meeting of Associated British Picture Corporation Limited was held on August 3rd in London, Sir Philip Warter (the chairman) presiding.

The following is an extract from his circulated statement:—

The trading profits of the group amount to £2,205,624, against £2,038,762 for the previous year. Of the net profit of the group amounting to £543,622, £11,308 represents profits attributable to outside shareholders of subsidiary companies and the balance applicable to the corporation of £532,314 compares with £450,613 last year. After deducting £24,519 in respect of profits retained by subsidiary companies there remains a balance of £507,795, representing the net profit of the corporation for the year.

Receipts at the box-office have shown a downward trend. The only satisfactory way of arresting the downward trend is by way of better films. Even in the Greater London area, where attendances and receipts are down by a greater percentage than in the rest of the country, the results on the really successful films were satisfactory.

The gross takings of the corporation's cinemas last year amounted to £18,722,253, out of which no less than £6,891,835 was paid in entertainments duty. The report of the committee of inquiry appointed by the Board of Trade made the point that entertainments duty at the existing rates is too great a burden and expressed the view that the Government should bring under review the whole question of entertainments duty.

A REALISTIC QUOTA

I referred last year to the Cinematograph Films Act, 1948, and the order made under that Act providing for 45 per cent. of the first playing time to be devoted to British pictures. Half-way through the year under review this figure was reduced to 40 per cent. In making every effort to comply with the law, we have shown a number of films which, through lack of entertainment value, resulted in substantial losses in the cinemas where they were shown. For the year commencing October 1, 1950, the quota has been fixed at 30 per cent., which is a realistic quota and one which it should be possible to fufil with pictures of reasonable quality.

The Corporation's studios were kept fully employed, and although our film production operations resulted in a loss, I am pleased to say that the position generally shows an improvement. The markets available to British films do not permit a sufficient return on the successful films to offset losses on the inevitable failures. Government finance and quotas are not the answer.

Until the basis of taxation is adjusted in such a way that film production becomes a reasonable commercial risk, your board, although anxious to support the country's production effort to the full, is bound to view the making of pictures with considerable anxiety. The new proposals recently announced by the Chancellor of the Exchequer will afford some measure of relief to the industry and, although we welcome them as a slight recognition of our troubles, the proposals do not provide anything like a satisfactory solution.

Having regard to the difficult conditions the results are excellent. We have many problems to face, but the Corporation is now in a better position than ever before to meet them, and I therefore look to the future with confidence.

The report was adopted.

COLTHROP BOARD AND PAPER MILLS, LIMITED

MR FRANK W. J. SMITH'S SPEECH

The thirty-second annual general meeting of Colthrop Board and Paper Mills, Limited, was held on August 3rd at the registered office of the company, Thatcham, Berkshire, Mr Frank W. J. Smith (chairman and managing director) presiding.

The following is the chairman's statement circulated with the annual report and accounts for the year ended May 31, 1950:

In my statement of last year I pointed out that a certain order by the Paper Control had had a very adverse effect upon the company's results for that year. I am now pleased to say that several orders, and in particular the one preventing the use of our machines to the best advantage, have been rescinded. Although the Paper Control has not been entirely terminated, we now have a greater degree of freedom to conduct our business in our own way than we have had for over ten years.

In addition to this, various improvements and additions to the machinery made since the end of the war, and financed entirely out of profits, have resulted in greater output and in lower working cost.

The combined effect of these factors has been a net profit for the year of £194,707, after deducting all expenses except taxation, compared with £64,435 for last year. This has been the best year the company has ever had both in profit and tonnage of output.

It is unfortunate that the provision for taxation takes £104,315, or 53 per cent. of the profit, but the directors have no hesitation in recommending a dividend on the ordinary shares of 15 per cent., less income tax, being the same dividend as was paid in 1947 and 1948.

RESERVES STRENGTHENED

The directors would have liked to recommend a higher dividend, but owing to commitments upon capital expenditure designed to increase production and effect still greater economy of working, and owing to the present high cost of replacing machinery it is considered wiser to strengthen the reserves.

Accordingly the directors also propose to transfer £20,000 to general reserve, £20,000 to reserve for replacements, £5,000 to reserve for possible future bad debts, to place £5,000 to the credit of our employees' benefit fund, and to carry forward £41,789 or £3,946 more than was brought in.

It would be unwise to attempt to forecast the future in these uncertain times, but the company has a fine plant and a full order book, while the accounts that have been submitted to you show the soundness of the financial position. The plant, machinery and equipment stand in the books at very considerably less than present-day values. Providing we have no governmental interference, we can look forward to the future with confidence.

In conclusion, I wish to pay a tribute to my colleagues on the board and to the staff and to the employees in the mills. Their work throughout the year has effectively combined to produce these very satisfactory results.

CHAIRMAN'S REMARKS

Addressing the meeting, the chairman said: In my statement which was printed with the report, I mentioned that this is the best year the company has ever had, and I explained briefly the reasons for the improvement over the previous year. There is little more that I need say. I might have referred to the strength of the financial position, and in particular I could have pointed to the fact that the current assets amount to £524,000, while the current liabilities and provisions total only £282,000.

Everything is very clearly set out in the accounts. If, however, there are any questions you would like to ask, I shall be very pleased to answer them.

The report and accounts were unanimously adopted, and the dividend and appropriations as recommended were approved.

The retiring director (Mr J. R. Henry) was re-elected, and the fee of the auditors, Messrs Deloitte, Plender, Griffiths and Company, was fixed.

Mr. E. Royden Alltree, in proposing a vote of thanks to the chairman, directors, staff and work-people, said he happened to know a little about the company's class of business, and he knew that the magnificent result of the year represented a great deal of work, a great deal of worry and a great deal of distress of mind. The shortages of raw materials and increases in prices, which had made it very difficult to keep in friendly touch with their customers, had been appalling, and he thought that to produce the best result the company had had in the whole period of its existence was marvellous.

Mr F. E. Armstrong seconded the motion, and it was carried unanimously.

After a brief acknowledgment by the chairman, the proceedings terminated.

W. H. SMITH & SON (HOLDINGS) LIMITED

INCREASED TURNOVER

HON. D. J. SMITH ON RISING COSTS

The first annual general meeting of W. H. Smith and Son (Holdings) Limited was held on August 4th at the Holborn Restaurant, London, W.C.1.

The Hon. D. J. Smith, J.P., the chairman, presided.

The following is an extract from his statement, which was circulated with the report and accounts.

During the year under review, the retail and wholesale sections of W. H. Smith and Son Limited have shown a healthy tendency so far as sales are concerned. This was due in large part to the greater amount of newsprint available for the daily papers and weeklies, periodicals and magazines. More goods were also available on the stationery side of the business, though purchase tax has a very real effect on the sales in this section.

At the same time, costs have risen in all sections and wages particularly show a large increase on the previous year.

RENOVATION OF SHOPS AND BOOKSTALLS

I am pleased to say that several shops have been renovated or refitted and this work is being proceeded with as opportunity and licences permit. At the same time, some old or temporary bookstalls have been replaced with very fine modern structures. The latest of these are at Marylebone and Fenchurch Street stations and are probably the most modern design of bookstall in the world.

If you will now turn to the figures which are set out in the report which you have before you, you will see on pages 14 to 17 the consolidated profit and loss account and the appropriation account of W. H. Smith and Son Limited and its subsidiaries.

As your company acquired the share capital of W. H. Smith and Son Limited on September 1, 1949, the profits of W. H. Smith and Son Limited earned but undistributed before that date are not available to this company for distribution to its members by way of dividends, but recourse may be had to the pre-acquisition profits to defray pre-liminary expenses. Effect has been given to this position in the consolidated profit and loss account of W. H. Smith and Son Limited and its subsidiary companies in the following manner. There have first been shown the trading figures for the entire financial year ended April 1, 1950, with comparable figures for the previous year, so that the position as a whole may be clearly seen in this part of the profit and loss account. The principal change is an increase in the amount provided for depreciation of fixed assets; to some extent this reflects recent capital expenditure, but to a larger degree it is due to an adjustment of the rates of depreciation considered desirable in view of the enormously increased cost of replacement under present conditions.

NET PROFIT

After deduction of taxation the consolidated net profit has been apportioned on a time basis between the pre-acquisition period of five months from April 3, 1949, to September 1, 1949, and the remaining seven months of the financial year to April 1, 1950. For the entire financial year the net profit amounted to £611,028, out of which there have been paid dividends amounting after deduction of income tax to £288,862, including the special dividend of £41,250 paid to your company to defray its preliminary expenses. There has thus been retained by W. H. Smith and Son Limited and its subsidiary companies out of the year's profits a total sum of £322,166, of which £144,590 has been allocated to reserves not available for payment of dividends to members of your company, and £177,576 has been carried forward in respect of the profits for the last seven months of the financial year.

From the consolidated balance-sheet of W. H. Smith and Son Limited, and its subsidiary companies, it will be seen that the accumulated reserves and undistributed profits have been distinguished as between those existing at September 1, 1949, and those which have arisen in respect of the seven months from September 1, 1949, to April 1, 1950. Taking the position as a whole, the total of the share capital and reserves representing the funds employed in the combined businesses amounted at April 1, 1950, to £3,960,590, as compared with £3,622,538 at April 2, 1949, showing an increase during the year of £338,052.

STOCK POSITION

Fixed assets comprising properties, plant, motor vehicles, fittings, fixtures, etc., have increased during the year by £135,955. This is the net amount after deduction of depreciation charges and sales; the total capital expenditure during the year amounted to £273,964. In addition the surplus of current assets over current liabilities and provisions has increased during the year by £174,622. Stocks are less by £194,304, it being our policy to keep stocks as low as possible, but debtors have increased by £264,476 as a result of increased turnover and current trading conditions.

The separate accounts of the Holdings Company show that the income which has been drawn from W. H. Smith and Son Limited has been limited to the amount which is required for payment of dividends and expenses.

I have referred earlier to the staff, but I cannot end this statement without paying a very warm tribute to the staff throughout the country for all that they have done during the past year.

The business of W. H. Smith and Son Limited has now been in existence for more than 150 years and has grown by wise steps during that time. I can assure the Shareholders that the Directors will continue to be on the lookout for such expansion as they consider to be prudent.

The report and accounts were adopted.

Statistical Summary

EXCHEQUER RETURNS

For the week ended August 5, 1950, total ordinary revenue was £89,325,000, against ordinary expenditure of £58,652,000 and issues to sinking funds £480,000. Thus, including sinking fund allocations of £4,278,000, the surplus accrued since April 1st is £105,668,000 compared with £49,585,000 for the corresponding period a year ago.

BANKING BUSINESS OF EVERY KIND TRANSACTED

A correspondence service in Trustee and Executorship is also undertaken in the Bank's "Trustee" Companies in

HONG KONG LONDON SINGAPORE

REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER 1.

ANNUAL INCOME EXCEEDS £18,000,000
ASSETS EXCEED £112,000,000
CLAIMS PAID EXCEED £207,000,000
(1949 Accounts)

PETAUKE CO-OPERATIVE MARKETING UNION LIMITED

Applications for the post of ASSISTANT MANAGER are invited.

1. Duties.—Secretarial and accounting, supervision of Agricultural activities, building construction, carpentry, and vehicle maintenance and deputising for the Manager when necessary.

2. Qualifications.—University degree and/or secretarial and/or accountancy qualifications, versatility and interest in agriculture.

3. Conditions of Employment.—Will be governed by a three year contract. Salary £500-£600 plus bonus according to experience and qualifications, free accommodation and heavy essential furniture, long leave accumulating at the rate of four days per month of service after three years.

4. Applications.—Will be received by the Manager, Petauke Co-operative Marketing Union Limited, Petauke, Northern Rhodesia up to and including August 31, 1950. The successful candidate will be expected to commence duty at the latest by January 1, 1951.

ASSISTANT SECRETARY

The Nuffield Foundation has a vacancy for an Assistant Secretary. He must be a university graduate (in any faculty) with a good academic record, of proved administrative ability in responsible posts and having the capacity to consider novel proposals imaginatively and practically. Preferably he should be aged between 35 and 40 years.

The commencing salary will be £1,500 a year, with superannuation and child allowances.

Anyone wishing to be considered for this post should write to the Secretary, Nuffield Foundation, 12, Mecklenburgh Square, London, W.C.1, stating age and full details of qualifications and experience and the names of three referees.

L. FARRER-BROWN, Secretary.

CREATIVE imagination is the dynamo of the most forceful advertising. It endows the written word with power and persuasion. Samson Clark's produce advertising of such character. *May we do so for you?*—'Phone Museum 5050 for an interview.

URWICK, ORR & PARTNERS seek additional staff for the Accountancy and Administrative Division of their professional work as Consulting Specialists in Organisation and Management. Applicants must satisfy the following requirements:

1. Professional qualification in Accountancy.
2. Some years' responsible executive experience in senior industrial appointments.
3. Knowledge and experience of modern techniques of Cost Control.
4. Sound general education and wide interest in contemporary affairs.

Successful candidates will be trained as Management Consultants at the Company's own Training Centre. Applications should be addressed in WRITING to the Company's Offices, at 7, Park Lane, London, W.1, quoting Reference C.1937.

ADMINISTRATION—Chartered Accountant and A.C.W.A. (42), wishes senior appointment with progressive organisation offering scope and prospects. Extensive experience professional, commercial, trade associations, financial investigations.—Box 471.

COMPUTING and statistical help by experts. Data of all types analysed, with statistical tests if required. LAN 1187.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research, and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall since 1894; fees are reasonable, and may be paid by instalments, if desired.

Prospectus from the Director of Studies, Department P17. WOLSEY HALL, OXFORD

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: EDINBURGH. Branches throughout SCOTLAND.

LONDON OFFICES: 37, Nicholas Lane, E.C.4; and 13/17, Regent Street, Piccadilly Circus, W.1.

Every description of Banking Business undertaken.

GROWN AGENTS FOR THE COLONIES

ACCOUNTANT required by the Government of Nigeria for the Department of Commerce and Industry to carry out duties in connection with the payment of income tax, also checking the assessments and generally assisting the Chief Accountant. Candidates should have had experience in the field of income tax and preferably a year (minimum) of practical experience in the office of a professional accountant. Duties commence at Lagos, Nigeria, but the successful candidate will be required to undertake tours of the Colony and Protectorate. Salary scale £720 x £60 - £900 x £75 - £1,200 per annum. Outfit allowance £100. Free passages for officer, wife and three children under 21. Liberal leave on full salary. Income tax at local rates. Contributory pension scheme. Candidates, who must be between the ages of 25 and 40, should apply by letter, giving full particulars of their experience and qualifications, to the Crown Agents for the Colonies, 4, Millbank, London, S.W.1, quoting M/3. Envelopes should be marked "Application" and not addressed to individuals. Applications will be treated in strict confidence and will be acknowledged. Further particulars will be sent to candidates who do not receive an appointment.

SECRETARY for Trust Company in Nassau, Bahamas. Must be experienced in all branches of trust work. Position is permanent and pensionable. Salary £1,000 per annum. Apply, stating age, experience and qualifications, to Box 1,000, c/o Mercl...

EDITORIAL ASSISTANT required by leading publishing house. Applicants must have excellent knowledge of English and be capable of writing clear, concise abstracts of articles in English and French. Salary £350 to £400 per annum. Write, giving full particulars of education and experience, to Box 1,001, c/o Mercl...

FULL-CHARGE ACCOUNTANT required by Company in Nassau, Bahamas. Must be experienced in all branches of accounting, including costing. Salary £1,000 per annum. Apply, stating age, experience and qualifications, to Box 1,002, c/o Mercl...

THE Civil Service Commissioners invite applications for the appointment of a Senior Principal Scientific Officer to be filled by competitive examination. The appointment will be made in January and will carry a salary of £2,000 per annum. Applications must be received for the receipt of applications closes on December 31st. Further particulars may be obtained from the Secretary, Civil Service Commission, Cornwall House, Stamford Street, London, S.E.1, quoting reference number 1,003.

WORKS MANAGER required by Company in Nassau, Bahamas. Must be experienced in all branches of engineering, including electrical, mechanical and structural. Only those with experience of tropical conditions need apply. The salary will be £1,000 per annum. Apply, stating age, experience and qualifications, to Box 1,004, c/o Mercl...

B.A., A... Cambridge... Apply, stating age, experience and qualifications, to Box 1,005, c/o Mercl...

A European Army?

WHEN Mr Churchill proposed at Strasbourg last Friday that a "European army" should be established, his suggestion was received with eager enthusiasm and the Assembly voted by 85 to 5, with 27 abstentions, that such an army should be set on foot. In spite of this brave reception, it is a little difficult to discover precisely what Mr Churchill and his supporters have in mind. There was clearly no intention of contrasting a European army with an American army and suggesting that Europe could be defended by European means alone—American assistance is universally seen to be essential. Nor does it seem possible that the suggestion envisages the dismemberment of national armies and the setting up of a new single force, clothed in one uniform and staffed by officers chosen indiscriminately from each western European country without reference to language or experience. The appalling confusion such an innovation would bring about would fatally weaken Europe's resistance at a time when it most needs to be coherent and firm. For three years at least—the crucial three years—there would be not a European army but no army at all. This, obviously, cannot have been in Mr Churchill's mind.

Yet there can be no doubt that the Assembly, in its vote, was expressing a deeply felt wish of European opinion. The vote reflects Europe's concern at the weakness and the ineffectiveness of the mutual defence arrangements that have been made so far. With the hot breath of the Russian bear at their back, the delegates looked at their military resources and found them wanting. The demand for a "European army" is a demand that the present shadowy framework of a European defence force should now be filled in with the fighting men, the tanks and aircraft which alone can give it life and substance. The principle of a European army has, after all, been accepted in Western Union. There exists at Fontainebleau a High Command built on completely international lines. It is the "war headquarters" of two potential theatres of war which have been made to overlap—the original Western Union area covering western Europe and the "central European region" of the Atlantic Pact. This supreme command would, in the event of war, have the national military forces of the member states at its disposal. The three services of the five nations would serve under Field-Marshal Montgomery, the land forces of the five nations under General de Lattre de Tassigny. There is thus a "European army" in potential existence such as there has never been in any previous period of peace in Europe. Mr Churchill, in demanding a "European army," was not suggesting that such a framework did not exist but that, so far, it had signally failed to provide an adequate structure of European defence. The need is not to create still another paper organisation—there are too many already—but to breathe life into the embryo that already exists. Fontainebleau should not be superseded; it should be given authority. It should be converted from an idea into an army.

There are three practical things that could be done almost at once. The first is to remove the ambiguity that still hangs over the degree

of American and Canadian participation in the defence of Western Europe—an ambiguity that can only be increased by the unfortunate use of the phrase "European army," however natural it may be in a Strasbourg context. The actual text of the Atlantic Pact lays it down that the United States and Canada shall participate "as convenient" in the strategic planning of the "central European region." They should now become full partners. If this entailed the appointment of an American general to succeed Lord Montgomery, then (without any disrespect to the Field-Marshal) so much the better.

The second thing that could be done now would be to give the joint defence organisation some authority over what is done, or not done, in each of the member countries. There is a tendency at present for decisions to be taken in committee for the execution of which the central organisation has no assurance at all. It is easy for Defence Ministers to meet and agree and make pledges and then return home only to find political pressures and economic exigencies and financial stringencies too much for them. It has been formally agreed that defence is to take precedence over economic policy; but no European country is in fact acting as if it meant it. This is, of course, basically a matter of stirring up public opinion. But a great deal of good could be done if an officer of high rank and personal authority were appointed as Inspector-General, with the right to follow up in each of the participating countries the execution of agreements reached at Fontainebleau or elsewhere. It is not only a question of the munitions of war. Here, indeed, American aid may play a predominant part. The promises that have gone unfulfilled in the past have often concerned aspects of defence which national governments alone can determine. Such, for instance, is the provision of cadres, of NCO's, of facilities and proper support for local training. So frequent have the divergences been between promise and realisation that there is urgent need for the appointment of someone whose task it would be to check performance against promise and keep pressure upon governments whose temptation may still be to default.

The third and the most important thing that can be done is to give the Supreme Commander some troops. This, surely, is what is chiefly meant by the creation of an Atlantic, or European, army. It does not mean that the whole of each national army should be transferred to the authority of Fontainebleau. National governments would insist on continuing to recruit and train and control their armies—and it is right that they should do so. Moreover, most of the governments concerned have military responsibilities outside Europe. The clearest way of envisaging what is required is to say that Shaef should be reconstituted and that each of the governments should place at the disposal of the Supreme Commander, as they then placed under General Eisenhower's command, as many fighting formations as they could. This conception fits in with the eminently reasonable desire of the French Government to see more American and British divisions stationed in Europe. The most urgent need of the moment, indeed, is that the defence forces of the western nations should be regrouped in fighting formations. The demand for a European army, in fact, is a demand that there should be an army in Europe.

Here is an eminently practical, urgent and realistic piece of "closer union in Europe" which raises none of the awkward issues of vested interests that haunt the Schuman Plan and other economic schemes. It is, in essence, simply a proposal to take up the armed co-operation of the free nations at the point where it was dropped in 1945. The European Assembly deserves the fullest support of public opinion in its attempt to put the whole subject on the agenda for immediate action.

The Divorce Laws

THERE are few branches of the law which are in closer contact with the social customs and personal beliefs of the people than divorce. Undoubtedly this is why the divorce laws are under such constant pressure for change. The impetus for change comes from three directions. The first is public opinion itself. Since it is chiefly concerned with broad principles, it is rather a blunt instrument of reform; but it is a powerful one, and has directly inspired at least one Act of Parliament. The second is the departmental committee; over the last two years a number of minor but important changes have been made as a result of the last of such committees, the Denning Committee. The third source of change in the law is the decisions of the courts themselves. More than any other court, the divorce court is constantly reconciling the claims of the individual with the claims of society, a process which inevitably produces change in the law itself. At the moment, there are two fields in which alterations are either being urged or are taking place. The first is a growing public demand for some change in the rights to divorce possessed by couples who are already separated. The second is concerned with cruelty. In the last month or so the courts have been faced with some difficult problems where cruelty is alleged as a ground for the dissolution of a marriage.

Cruelty has always been a ground for some relief in the divorce court. Originally it justified a judicial separation. Since the Marriage Act of 1937 it has been a ground for the dissolution of a marriage. In matrimonial proceedings it was defined by the Court of Appeal, in 1897, as

> conduct of such a character as to have caused danger to life, limb, or health, bodily or mental, or as to give rise to a reasonable apprehension of such danger,

a useful definition, from a public point of view, since it does not tie subsequent judges too rigidly. The problem that has faced the judges recently has been how far the element of intention is necessary.

In the autumn of 1948, a wife went out for an evening leaving her husband in charge of their one child, aged eight. When she returned she found that the husband had strangled the child and had attempted, unsuccessfully, to commit suicide in the gas oven. The husband was tried for murder and found "Guilty but insane," and is now in Broadmoor. The question before the court was whether the wife was entitled to a divorce on the grounds of her husband's cruelty. His acts had been cruel, but had they been intended to be cruel, in the sense that the husband was aware of all their natural consequences? In any case, did that matter? In a second case, heard this summer, a petitioning husband had almost the reverse story to tell the court. His wife showed what was described as a complete disregard for her family. She stayed in bed late, failed to prepare meals, neglected all her normal duties and left the child of the marriage to be cared for either by her husband or her mother. Did her conduct amount to cruelty, when it was so negative that it could hardly be described as having any intention behind it at all? The answer of the court was in the first case to give the wife her divorce and to refuse it to the husband in the second. These judgments were obviously grounded in common sense, but can they be considered logical or consistent?

*

It is easy enough to distinguish the two streams of thought in the minds of the judges. It is clearly not their business to make divorce too easy, or to relax the requirements laid down by Parliament. As Lord Justice Denning said in this second case ". . . if the door of cruelty was opened too wide, we should find ourselves granting divorce for incompatibility of temperament. . . ." Lord Justice Asquith said very much the same thing in an earlier case—

> the husband cannot be absolved from neglect and want of consideration for his wife, but this is a charge which thousands of spouses would proffer against each other with abundant justification but without hope or prospect of receiving legal relief.

On the other hand, to quote the judgment, that of Mr Justice Pearce, in the case of the husband who murdered the child,

> . . . to withdraw from the ambit of legal cruelty conduct that is intolerable but is due to insanity is to make the court powerless to help in cases where help is most needed.

Yet the essence of insanity is lack of intention. The dilemma is increased by the rigid parliamentary definition of the insanity needed to justify a divorce on that ground alone. It must be incurable insanity and the insane spouse must have been under care and treatment for at least the five years preceding the presentation of the divorce petition. The courts are now in the position of having laid it down that a man may be responsible for all his acts, intended or not, in one court, the divorce court, but not in another, the criminal court. Perhaps the courts will only regain their capacity to be logical when they are empowered to dissolve a marriage if the conduct of, or circumstances surrounding, one spouse make it impossible for the other spouse to continue the marriage in more than name.

The same kind of situation is at the root of the agitation for greater freedom of divorce among those who are legally separated. Divorce can be obtained if one spouse deserts the other for three years, but the courts, again logically, have been bound to hold that if the parties are legally separated, either by voluntary agreement or court order, neither can thereafter be said to be deserting the other. But the practical disadvantages of this are considerable. A wife deserted by her husband is usually left without much money. She goes to the public court for a separation order because it normally contains a provision requiring the husband to pay weekly maintenance, and a magistrate's order to pay money is more easily and speedily enforced than one which has only a civil sanction behind it. But once the order is made, the wife can no longer obtain a divorce for desertion. She could in most cases obtain one based on adultery, if she could prove that adultery. It is easy to prove desertion: the evidence of the wife is sufficient. It is far less easy, and far more expensive, to prove adultery. In addition, to complicate the issue, there is that body of spouses, legally separated, who have no intention themselves of marrying again, and every intention of preventing their legal partners from doing anything of the kind.

It is not very satisfactory to find that the divorce court is driven to apparent inconsistency, that it is able to treat insanity that has a "cruel" manifestation as a ground for an immediate divorce, whereas insanity of another kind may leave an equally deserving spouse with five years to wait. It is essential that the community should put up a stiff ring fence to deter the bored, the lazy and the promiscuous from believing that their own lack of discipline is full justification for release from their existing liabilities. This was recognised in the 1937 Act when it was laid down by Parliament that divorce could be granted during the first three years of marriage in only the most exceptional cases. It is arguable that the three-year period is too short. Yet public opinion has gradually come to accept the idea that, if divorce is to be permitted at all, it is better that it should be based on the fact that the marriage has foundered, as established by one or more of a number of legally accepted tests, rather than that a divorce should be regarded as the "right" of the one party who has contrived to appear the more "innocent" or less blameworthy.

If the divorce laws are ever investigated by another

ALLIANCE

Commission, or made the subject of another Parliamentary Bill, it is surely time to consider whether the courts should not be given the right to dissolve a marriage which is beyond doubt at an end as a fact, and yet where the cause of that ending may not fit into any of the categories that parliamentary skill has laid down. The courts, faced with the postwar flood of divorce petitions, have shown themselves capable of defending the public interest in continuing marriages where there is the slightest chance that the marriage can be saved. But, at the moment, they cannot refuse a divorce to a spouse who proves a single act of adultery on the part of the other, while they may not be able to release a spouse married to an insane murderer because he or she may be unable to prove that the insanity is incurable. It is arguable, to say the least, that the institution of marriage would be strengthened, not weakened, by relieving the courts of these absurd restrictions.

The Hotel Industry

THE report of the Catering Wages Commission on its inquiry into the operation of the Catering Wages Act in the hotel industry* is a most disappointing document. It will be recalled that the Commission were asked by the Minister of Labour last December to review the working of the Act "as a matter of urgency." Since the Act is a particular pet of the Ministry of Labour, the request itself could be regarded as an admission that something was badly wrong. The Catering Wages Act has, in fact, turned out to be a prime example of the sort of mess that rigid and unimaginative government intervention can make of an industry.

The Act originated with Mr Bevin, who was anxious to extend the benefits of trade unionism and collective bargaining to what was a largely unorganised trade. The aim was in itself a good one. But the difficulty was —and is—that there are neither trade unions nor employers' organisations that can properly speak for the industry. On the union side, what happened was that three of the general unions made a treaty partitioning the country and started to try to recruit members from the hotel industry—in which they have largely failed. On the employers' side, the representative bodies were very heavily weighted by the big London hotels, whose proprietors knew no more about the conditions of work in the small country inn or the seaside hotel than the unions did. The result of their collaboration—and the report shows that the orders have been, in the main, agreed documents—was a wages code of the most fantastic complexity, intelligible only by trained accountants and appropriate only to large metropolitan hotels which, with their specialised staff and shift-working methods, can be run more or less like industrial factories. It is hardly possible to realise the absurdity of the Wages Orders without reading, in the Appendices to the Commission's report, the 28 pages of complex detail that were actually enforced on the licensed section of the industry and—even more egregious—the 26 pages (including, among other things, definitions of 86 grades of workers, of which some are as exotic as *Chef-Entremetier* and *Commis-Saucier*) that it was solemnly proposed to enforce on the 80,000 or so unlicensed establishments, most of them one-woman boarding houses.

The objection, from the point of view of public policy, to the results of this interference is not that it has raised the earnings of workers in the hotel industry, many of which were unreasonably low. Nor is it any more objectionable in the hotel industry than in any other that wages regulation should have raised the costs, and therefore the level of charges, in the industry. Hotels as a whole have been prosperous enough in these last few years to be able to absorb such part of the added costs as they were unable to pass on to the public. At least for the present there is no need to waste any tears on the hotel proprietor—though the story may be very different if ever the present record volume of business falls off, for the rigidity of costs imposed by the Act, fully as much as their height, may play havoc with an industry which is in any case very susceptible to depression.

The public objection lies far more strongly against the effects of the Act—or rather of the Wages Orders made under it—in lowering the standard of service. If the hours of work exceed 48 a week, or are spread over more than 12 hours in any one day, there are penalties of progessively increasing severity to be paid. The result is that the proprietor of a small hotel where shift working is impossible is almost compelled to limit the service he provides for his guests to the same hours, which may be suitable for a factory but do not fit a residential hotel. This is bad enough; but the height of absurdity in treating a domestic industry as if it were a factory is reached in two other provisions of the existing Order. One of these is the provision that any hotel worker who is asked to work on a Bank Holiday shall be paid double time for the day and in addition given an extra day off, or a day's wages in lieu—in effect triple time. This provision was copied from the wages code for factory canteens, where it is reasonable enough. But many, probably most, hotels and their workers expect to be at their busiest on Bank Holidays. The provision is equivalent to insisting that a night watchman be paid triple time because he has to work at night. The other, and perhaps the most absurd of all the provisions, is that, in fixing wage rates, no account at all is taken of the fact that some hotel workers do, and others do not, receive tips. It should be appreciated that there has been no attempt to abolish or even to discourage the practice of tipping—indeed there would be the most strenuous objection from the workers' side if there were. It is simply that in an excess of sentimentalism the Commission decided to pretend that what manifestly does exist does not. The obvious result is that "front of the house" staff can now make very much better livings that, for example, kitchen staff, who are consequently very difficult to recruit, so that the aspect of British hotel-keeping which needs most encouragement is in fact most prejudiced.

In these circumstances, it was surely the duty of the Commission to go back to the beginning and see the whole subject in perspective. And it is precisely in this respect that their report is most disappointing. It contains a number of useful recommendations—that the industry should be divided, not as between licensed and unlicensed establishments, but as between "large London," "large provincial" and "small establishments wherever situate"; that the Wages Board should be assisted by committees "confined to persons actually and actively engaged in the hotel industry" and not drawn from the representatives of the organised interests who constitute the Board itself; that the "spread-over" should be increased to 14 hours; that the "emergency" provisions (which can result in its costing the employer the best part of a pound to have the front door bell answered late at night) should be reconsidered; that work on a Bank Holiday should be paid at plain time rate; and so forth.

These will all be useful, and will remove some of the more glaring absurdities. But they are relatively trifling. Of fresh thought on the major issue—which is how exploitation of the workers in the industry can be prevented without impeding its smooth working—there is very little sign. Even on the vexed question of tipping, though the Commission come very close indeed to admitting that they were wrong three years ago, they can only recommend that "a joint national committee" (presumably of the same old unrepresentative organisations) should be established to examine it "as a matter of urgency."

Perusal of the report leaves on the mind the depressing reflection that the planned economy is not fitted with a reverse gear. It can make mistakes; it is even prepared to collect and print the evidence to prove that they are mistakes; but there is very little possibility of acknowledging any errors, and virtually none at all of putting them right. What is missing from this report is the moral courage that would be required to admit that the whole scheme of the Catering Wages Act was conceived in a romantic cloud of misinformation and that it needs thinking out again from the start in a spirit of realism.

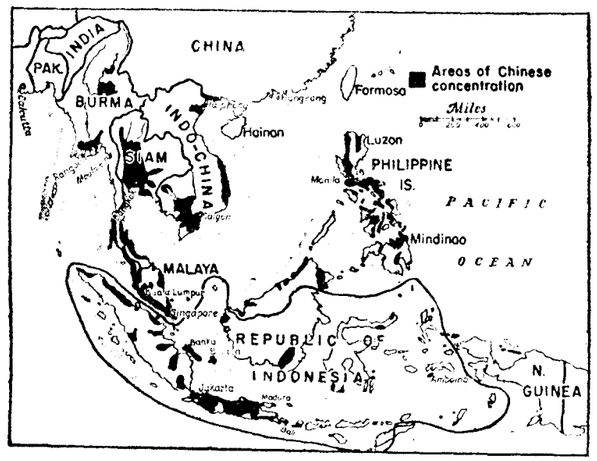
Chinese in South-east Asia

HOW does the new Chinese People's Republic look to the Chinese communities of South-east Asia? The role that it will play in world affairs will very largely depend on whether or not it can enlist them as allies. They are outside the territorial frontiers of China and cannot be directly coerced by the Chinese Communist power as long as its troops do not go beyond those frontiers; they are free to choose how far they will support the revolutionary regime now established in Peking. At first sight, it might seem that their prevailing interests and sentiments would make them in general strongly anti-Communist. They are predominantly bourgeois in social composition. The typical Chinese of South-east Asia is engaged in private business, large or small, and retail shopkeeping is the occupation he has made specially his own. Very few of them are settled on the land—the problem of peasant squatters in Malaya being a special and recent development—and the agrarian reform appeal of the Communists in China therefore hardly applies to them. Even those Chinese of South-east Asia who have remained wage-labourers generally enjoy a higher standard of living than the corresponding grades of workers in China and might be expected to lack enthusiasm for the recent news that textile workers in Shanghai had voluntarily asked the Communist authorities for a reduction of their wages.

But these emigrants may prove to be much more pro-Chinese than anti-Communist. The overseas Chinese have always looked upon China not only as the homeland of their race, but also as the power which should support and protect them in their exile. It is true that their emigration from China has been voluntary, that many of them have found a range of opportunity and have achieved a prosperity which would never have been possible for them in their own country, and that very few of them have shown any inclination to return to it. Their direct practical concern is with the economic and political affairs of the countries wherein they have settled rather than with the national destiny of China. Nevertheless, they retain a sense of separateness from the peoples among whom they live, a sense of being Chinese and therefore, by traditional habit of mind, of being superior to all non-Chinese, particularly to the inhabitants of South-east Asia, most of whom were formerly tributary to the Chinese empire. In two countries the Chinese are so numerous that they constitute a rival nationality—in Malaya, where they number nearly half the total population, and in Siam, where they are about a fifth. Elsewhere they form strong local groups, but are heavily outnumbered by non-Chinese in the population totals; in Indonesia, for example, there are more than a million Chinese but their percentage in the total population is only 2 per cent.

*



The separateness of the Chinese has recently tended to be accentuated rather than to diminish. Chinese families which have been settled in South-east Asia for several generations have indeed in many cases been more or less assimilated to the local population; they have intermarried with the natives and have sometimes even lost the use of the Chinese language. With Chinese emigrants of the first and second generations, not only has the process of assimilation not yet had time to work, but it has been definitely reversed by two factors due to the growth of nationalism of the modern type throughout Asia. On the one hand, the native peoples of South-east Asia have become increasingly conscious of nationality and have in consequence begun to view the unassimilated Chinese as aliens with a new sharpness of definition. On the other hand the Chinese themselves have also become more nationally conscious and for several decades the Chinese national authorities, which formerly took little or no interest in Chinese who had once left the shores of China, have been trying to exercise rights of protection over the overseas Chinese communities. They have persistently maintained the

INDEX

The Index to Volume CLVIII of *The Economist* (Jan.-June, 1950) should by now have been published. The delay, which we regret, is one of the results of the continuing ban on overtime imposed by the London Society of Compositors in May. An announcement will appear as soon as the Index is ready; this is unlikely to be before the end of September.

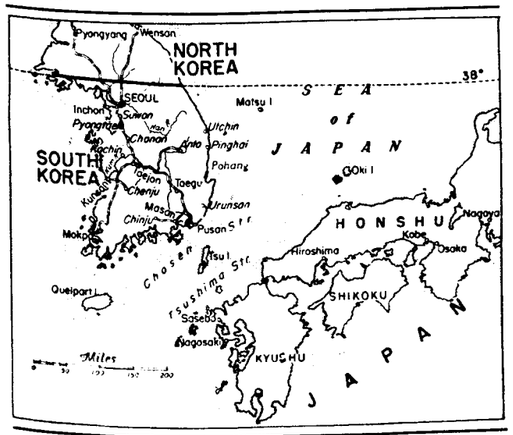
doctrine that persons of Chinese descent born abroad, as well as emigrants born in China, are Chinese citizens, entitled to the good offices of the local Chinese consul—and amenable to his authority.

The Chinese of South-east Asia, finding themselves regarded as subjects by the local governments (whether western colonial or native authorities) and as outsiders by the native inhabitants, have looked more and more to the Chinese consuls and to the power and prestige of the Chinese state to gain or preserve for them the rights and the status to which they aspire. They desire, therefore, that China shall be as strong and independent as possible; for every increase of Chinese national power and prestige strengthens their own position as Chinese, while every weakening or humiliation of China diminishes it. Hence the overseas Chinese have been from the beginning of the century enthusiastic supporters of every political movement which has aimed at the creation of a modernised and efficient unified China and has appeared likely to attain that end. They provided Sun Yat-sen with most of the funds for his revolutionary organisation which grew into the Kuomintang, and in the twenties they continued to back the Kuomintang in its struggle against the North China "war lords." When the Japanese invaded China they boycotted Japanese exports, even though it meant cutting off from Malays, Indonesians or Filipinos the cheap consumers' goods which Chinese traders and shopkeepers had distributed. They looked forward to the emergence of China as a Great Power after the defeat of Japan, a Great Power able not only to strike awe into an independent Siam or Burma, but to be tough with British, Americans, French and Dutch.

By comparison with this dream postwar Kuomintang China was a sorry failure. Plunged in administrative chaos and monetary inflation, it exhibited a humiliating dependence on American aid and was unable to talk to the world in the "high astounding terms" expected of it. A revulsion of feeling against it transferred the allegiance of the younger generation of overseas Chinese more and more to the new rising power of the Communists, which not only displayed a capacity for ruthlessly efficient government, but used a language of bold defiance and invective towards all the nations of the west outside the Soviet *bloc* and towards all the governments under which the overseas Chinese lived. When the Chinese Communists, with complete impunity, bombarded a British warship and held it captive in the Yangtse for many weeks; when the Americans after supporting the Kuomintang and maintaining a military mission and naval base in China abandoned the field to the hostile Communists; when Britain after extending *de jure* recognition to the Peking Government submitted to the indignity of being made to bargain as a suppliant for the precious privilege of being allowed to have diplomatic relations with the celestial empire—then all patriotic Chinese had to admit that here at last was a Chinese government which could put foreigners in their place.

It may be objected that this new Chinese truculence does not apply to Russia, and that the "People's Republic" has defied Washington and London only at the price of a degrading subservience to Moscow. This is perfectly true, but as far as publicity goes it cannot be denied that the Russians have been far more discreet than the Americans were in the period of their influence. In a country where "face" is notoriously of primary importance, Russia has been careful to avoid hurting Chinese pride by any such public statements as the reports made by Generals Marshall and Wedemeyer after their missions to China. Further, it has to be remembered that, wherever Russian domination may have extended in the past or the present, it has never yet reached South-east Asia, and it seems remote and unreal there compared with the recent or contemporary rule of western countries.

There is, moreover, a further reason why Communism makes a strong appeal to overseas Chinese on nationalist grounds. As long as they were organised only in branches of the Kuomintang, a specifically Chinese party, which could never have non-Chinese members, they were cut off from the possibility of leading organised bodies of the non-Chinese peoples. But Communism being theoretically international, Communist parties can be formed in Malaya, Siam or Indonesia, including both Chinese and non-Chinese members. The Chinese can be sure of playing the dominant—or at least a very influential—part in these parties, because of their initiative in them and the prestige of China as the model and promoter of Communism throughout the Far East.



*

Success in this direction is still limited by the suspicion which the native peoples have for organisations run by Chinese; so far in Malaya, for example, Communism has remained essentially a Chinese movement with very few Malay adherents. But under more favourable conditions Communism could be in South-east Asia an effective instrument of Chinese domination without direct affront to local nationalisms. Just as in Europe the international character of Communism has facilitated the national ascendancy of Russia, so in South-east Asia it might be made to serve a new imperial expansion of China.

NOTES OF THE WEEK

Korea and Formosa

Very heavy fighting has continued all through the week along the United Nations' defence line on the Naktong River. The North Koreans have continued to establish bridgeheads across the river and their great superiority in numbers continues to stretch the resources of the American forces almost to breaking point. Nevertheless, the week's fighting has given some further proof of growing American strength and mobility. The counter attack at Chinju has been pressed forward, local initiative has been recovered near Pohang, which was lost to the invaders last week, and the mustering of an enemy attack upon Taegu has been disorganised by the dropping of 1,000 tons of bombs on a concentration of some 40,000 North Korean troops assembled in the neighbourhood of Waegwan. For the first time a note of doubt has crept into Communist exhortations: the North Koreans have been told they must win before the end of August brings further reinforcements to the United Nations.

If the military front shows some signs of growing stability, the diplomatic background to the Korean war remains obscure and indeed disquieting. Mr Harriman's visit to General MacArthur has led to no clarification of the official American attitude towards Chiang Kai-shek. Mr Attlee, in a reply to Mr Fenner Brockway, has bluntly stated that Britain's undertaking to give military assistance does not extend to Formosa. Meanwhile, the fear has grown that the Russians may be able to push Mao Tse-tung into launching his invasion of Formosa. Their hope is that the Americans would then find themselves with two wars on their hands, one within the framework of the United Nations and backed by world opinion and another, in support of Chiang, which would be fought alone. If it is true that blundering American diplomacy bears the major share of blame for permitting such a dangerous situation to arise, it is also true that it is fully as much to Britain's interest as to America's to bring it to an end.

The Real Debate at Strasbourg

A clear geographical division of opinion has now made itself apparent at Strasbourg. On the one hand are the "fringe states" of Europe—Britain and the Scandinavian countries—on the other the continental powers—France, Italy, Germany and the Benelux Union. In all the fringe states, the experience of government in the last thirty years has been reasonably reliable and coherent. Nor have they, with the exception of Norway, suffered deeply and directly from enemy occupation and all the dislocations of administration it brings about. For them, national government is still an orderly process providing the best method of securing democratic control and the representation of interests.

The continental communities have experienced three very different decades. Unstable coalitions, cynical administration, long occupation by the enemy with varying degrees of local collaboration—all these have undermined the authority of government among influential groups of opinion and the desire has grown to escape from "the idiocies of sovereignty" by by-passing government altogether. What seems a safeguard of democracy in Britain or Sweden is a mockery of it to France.

It is this profound division of opinion and indeed of emotion that explains the inability of the British delegation to make contact with the mood of continental Europe. Dr Dalton might in any case prove somewhat unadept at a task demanding tact and the appreciation of atmosphere. But the British Conservatives are in no better case. The French have demonstrated a fierce and angry opposition to the rival version of the Schuman Plan put forward by the Conservative members of the British delegation and denounce it as a "plot" to emasculate the Schuman Plan by removing its essential feature—the by-passing of governmental control. This issue, in fact, has appeared in all the debates, whether they have turned upon the Assembly's relations with its Committee of Ministers, upon the European Army, or the Schuman Plan. The British and Scandinavian delegates have pleaded repeatedly for the responsibility of government, their continental neighbours as resolutely against it. This has become the real deadlock in Europe.

Parliament Recalled

Once again August has proved itself to be a month of crisis. Once again the Prime Minister has proved his infinite capacity for turning crisis into anticlimax. It was argued with some force before the House of Commons adjourned at the end of last month that Parliament ought not to be in recess until October 17th, since the war in Korea was obviously compelling the Government to take big decisions on defence policy. Mr Attlee and Mr Morrison then replied that the Government would certainly recall Parliament if the circumstances demanded it, but the leisurely way in which they have redeemed their promise—with a whole month to elapse between the notice of recall and the assembly of Parliament—destroys any psychological effect the recall might otherwise have had.

It is assumed that Mr Attlee's reasons for refusing to accept the arguments of Mr Churchill and Mr Clement Davies for an earlier recall, pressed in person for an hour and a half on Wednesday, were that the full implications of the new defence programme, and its effects on the country's economy, have not been worked out. There might be some substance in Mr Attlee's view if people could have some confidence that the Government's plans, when completed, would match the situation. But memories of three summers ago, when the Government refused to recall the House of Commons at all, and when the British people, who had been keyed up to expect a plan for economic salvation, were let down with a series of small ineffective measures, are not reassuring. Moreover, a meeting of Parliament before the Government completes its plans might well strengthen its hands, since members would voice the people's anxiety that the action taken should be adequate. Instead, the old temporising Festival-of-Britain mentality—the belief that all is right with the British way of life—seems to be ruling the Government.

The effect on public opinion here can only be to lull it into a false sense of security. In the United States the impression will be given that the British Government still does not fully realise that today speed is the essence of a successful defence policy.

* * *

Higher Civil Servants' Pay

The Government has relented towards its higher civil servants and from October 1st, 1950, they will receive the first instalment of the higher pay they were due to receive in October, 1949, and which was snatched from them a week or two before this date as one of the first fruits of the devaluation crisis. Anyone who knows the burden borne by this small and overworked band of men and women will admit the justice and wisdom of this step. Since 1939 the salaries of the heads of Government departments have risen by only 17 per cent and of their deputies by 14 per cent. In common with other professional workers they have had to meet the higher cost of living; unlike most other workers they have also had to shoulder a far heavier load of responsibility since the role of central government has changed so radically over the past eleven years. To expect so much from these men and women and to give so little in return was patently unfair.

Below are compared the new range of salaries, which were recommended by the Chorley Committee in September, 1948, and the present and prewar rates. The effect will be to increase the top grade by 50 per cent over 1939 and the maximum of the Assistant Secretary grade by 33⅓ per cent.

	1939	*Present*	*New Rates*
	£	£	£
Permanent Secretary	3,000	3,500	4,500
Deputy Secretary	2,200	2,500	3,250
Under Secretary	*	2,000	2,500
Assistant Secretary (maximum of scale)	1,500	1,700	2,000

* No comparable Grade

In theory, at least, it should be possible to implement these increases without stirring up a storm of salary demands outside the Civil Service, since at the time of their acceptance the Government stated that the Chorley recommendations were consistent with the White Paper on Personal Incomes. Inside the Civil Service, however, the decision is likely to have immediate repercussions.

The First Division Association has been fighting a long battle with the Treasury over increases in salaries for the lower ranks of the administrative grade—principals and assistant principals. This ended in stalemate in March of this year when the Civil Service Tribunal refused to deliver judgment in the case put up to them. The decision to increase the salaries of the top grades will certainly stimulate the First Division Association to return to the attack. Other associations representing senior professional civil servants are almost certain to do the same.

Inflation in Europe

One of the tasks of the Organisation for European Economic Co-operation is to survey the internal financial policies of its member states and by analysis, information and encouragement to attempt to guide them towards the financial stability which they have accepted as part of their obligations under the Marshall plan. A first report on Europe's financial stability was issued rather less than a year ago and now a new report has been published surveying conditions in 1949 and early 1950. The period is admittedly a difficult one in which to study financial stability since the major upheaval of general devaluation occurred in the middle of it and the consequences of that change have not yet worked themselves out. Indeed, one of the difficulties that has beset the experts in their examination of each index of internal stability is the impossibility of deciding which phenomenon is responsible for what consequence. As the report remarks, *à propos* the relation between balance of payments and internal financial stability:

> It is difficult to disentangle the effects of each country's internal financial situation on its balance of payments from the effect of the devaluations or of the changes in world and United States demand and prices or of the liberalisation of intra-European trade.

Nevertheless, the report reaches some provisional conclusions. The era of acute inflation has passed, but stability in most states is still precarious. Prices began to fall generally in 1949—on an average by between 2 and 6 per cent. Pressure of demand slackened and although very high rates of investment mentioned throughout Europe—19 per cent of the national income was the average—more goods reached the private market, largely, no doubt, because domestic production increased by about 10 per cent in 1949 and by a somewhat lower percentage in early 1950. Industrial employment was maintained everywhere except in Belgium and it is clear that the report, taking into account this almost universal absence of "slack" in the economies, thinks it only too likely that inflation could return to most countries either as a result of their efforts to maintain investment once Marshall aid has ceased or as a result of greater defence programmes. It is true that devaluation has not been the signal for strong inflationary pressure and post-devaluation prices have risen slowly except in Austria. Yet a general rise had started by the beginning of 1950 and clearly only large increases in productivity and vigorous checks on unnecessary spending can prevent the defence effort from ushering in another inflationary phase.

Protagonists at Geneva

The discussions on full employment have provided the United Nations Economic and Social Council with one of its most lively and profitable sessions. In addition to the government delegations, those who took an active part included representatives from international technical bodies —such as M. Gutt of the International Monetary Fund— and Mr Nicholas Kaldor, who spoke in his private capacity and as a member of the original group of six economists who drafted the Uno report on full employment. It was this report which formed the basis of the discussion at Geneva.
