"THE ways to enrich are many," wrote Bacon, "and most of them foul." His remark finds point in the career of his contemporary, Arthur Ingram, the most notorious speculator of the early Stuart period. Quick and flexible, plausible and unscrupulous, Ingram, with the mercurial temper of the gambler, fitted the acquisitive temper of the times. His hey-day was the reign of James I, when a peculiarly corrupt political system offered him dazzling opportunities for profits from customs-farms, monopolies and crown lands. As Controller of the Port of London he had government contacts of which he made full use, while the indebtedness of those who indulged in too splendid extravagance in an age of inflation gave him another field of investment. Lionel Cranfield, Ingram's partner in his early career, agreeably expressed the felicitous of this situation when he suggested that they should join "to raise our fortunes by such casualties as this stirring age shall afford."

Professor Tawney has recently written a study of Cranfield based on the Sackville manuscripts; Mr Upton has used the partner collection of Ingram's papers from Temple Newsam. Cranfield moved into politics, but Ingram remained the businessman turned landowner, dabbling in government concessions and supported by patrons at court. He achieved his greatest notoriety in his alum deals. Here Mr Upton's chapter fills a gap in the business history of the time. Ingram surpassed himself in obtaining huge sums from the crown for which he failed to account and in evading

obligations for the alum he failed to produce, running down the plant and oppressing the workmen. Mr Upton valiantly but unconvincingly attempts some defence of Ingram, whom he represents as grappling with a young and struggling industry and whose gains were less than his enemies alleged.

Ingram hardly deserves such charity. Mr Upton rightly remarks that the debtors he destroyed brought their fates upon themselves, but his view that Ingram "was not worse than his contemporaries only far more successful than most" is harsh on others. Mr Upton is a painstaking guide through intricate deals, but time after time he reveals contracts unfulfilled, obligations evaded, lies told and partners and friends deserted. A letter to Cranfield, not quoted by Mr Upton, from one of Ingram's partners is redolent of the distrust he evoked: "I intend not to sup or sip of the cup to make me burn my lips or hazard the distemperature of my estate." Supping with the devil needed a long spoon.

Mr Upton has given us the first clear picture of Ingram's deals. It is a solid, honest and highly competent study, but lacks the dramatic touch which Ingram loved; and, since it oscillates uneasily between criticism and defence, fails to give a definitive appraisal of its subject. It is a book for the specialist. The political background is sketched lightly and not always surely. And it is odd that although the book is sub-titled "a study of the origins of an English landed family," Mr Upton does not mention that from Ingram is descended the present Viscount Halifax. Ingram acquired the manor of Halifax in 1609 and characteristically failed to complete the payments on it.

### Question and Answer

#### The Skills of Interviewing

By Elizabeth Sidney and Margaret Brown.

Tavistock Publications. 408 pages. 35s.

THE general public has become steadily more familiar with "interviewing," through watching television, through ever increasing market research and even through psychotherapy—today more and more people are "interviewed" when they get into some kind of trouble. To the lay person and even to the average executive such interviewing seems a matter of experience and intuition. Social scientists, however, have come to regard interviewing as a scientific tool of research, and by now a highly complex body of theory has been accumulated on the subject. The aim of Mrs Sidney and Mrs Brown—both lecturers in industrial psychology—is to present good interviewing as a skill that can be learned. Their basic argument is that nothing can turn the wrong person into a good interviewer, but that the average person can be helped to conduct his interview more effectively by studying and practising the skills involved.

If you are a big industrial user...

...your electricity can cost you much less!

#### YOUR PROBLEM IS INESCAPABLE...

Heavy peak-load charges have always worried the big industrial user. For, in addition to paying for the units he consumes, he must pay a capital charge which is based on his peak demand—even if this lasts for no more than half an hour in the year!

#### ...BUT YOUR SOLUTION IS SIMPLE...

The Bristol Siddeley 3,000 kW turbo-generator is a reliable power source which radically reduces peak-load charges for a lower capital outlay than any other installation.

Powered by the Bristol Siddeley Proteus gas turbine engine which gives an exceptionally high output for its size, weight and cost, the Bristol Siddeley turbo-generator delivers 3,000 kW within 2 minutes of a cold start. The set, which starts and runs

automatically and entirely unmanned, can be housed in a small building with light foundations. It also has a remarkably low noise level and is very easy to maintain.

#### ...AND THE MONEY YOU SAVE IS CONSIDERABLE

The complete cost of a typical 3,000 kW Bristol Siddeley pocket power station (engine, alternator, switch gear, building and foundations) is £29 per kW—lower than for any other set of comparable power. If, for example, you have an annual peak-load requirement of 200 hours, by using the Bristol Siddeley set you can save £10,000 in one year! And this is after all running and normal amortisation costs have been met.

A Bristol Siddeley 15 MW turbo-generator is now being built, and this first set has been ordered by the Central Electricity Generating Board for service in 1962.

For further information, please write to: Gas Turbine Sales Manager, Power Division, Bristol Siddeley Engines Limited, PO Box 17, Coventry, England.

In any successful interview the interviewer must be clear about what he wants to know, and to get this information must establish the right degree of "rapport." This may seem elementary, but in what is perhaps the most useful part of this book the authors give examples of selection interviews that show clearly just how easy it is even for the confident and experienced interviewer to go astray. The key to good interviewing, they argue, lies in detailed preparation beforehand, combined with some knowledge of what they call the development of personality. On the subject of selection interviews they provide a great deal of technical advice on how to analyse the requirements of the job, how to eliminate the unsuitable candidates by means of well designed application forms, and how best to conduct the interviews themselves.

This is an essentially practical book, and the authors avoid successfully many of the clichés of academic books on industrial problems. They have no desire to turn their interviewers into amateur therapists, and their style is refreshingly free from jargon. A great deal of what they say may appear to be simple common sense and nothing startlingly new is revealed, but it is interesting that the authors found that while many executives questioned agreed with them in principle, in practice they conducted their interviews quite differently—in effect playing them by ear. Of course in a sense this is right: every man has his own style of conducting an interview, or indeed any conversation, and it is useless to pretend that interviewing by textbook rules is always feasible or even desirable. Nevertheless this new book on the subject is full of good ideas that are evidently often overlooked, so that even an experienced administrator might find it very useful reading.

### Gifts of Plate

The English Silver in the Kremlin, 1557-1663

By Charles Oman.

Methuen. 112 pages and 54 plates. 42s.

THIS attractively produced and richly illustrated volume is much more, short though it is, than an expert *catalogue raisonné* of the examples of the English plate in Russia with which it deals. It is

that, but it also sheds interesting light on that enterprising, courageous and rather long-suffering body of men, the merchants of the English Muscovy Company; on their opening of the White Sea trading route to Russia; on the outstanding ability of some of the early English ambassadors to the Russian Tsars—men such as Richard Chancellor, Thomas Randolph, Sir John Merrick and Sir Thomas Smith; and on the ineptitude of the Earl of Carlisle, whose mission in 1663 ends the period of Anglo-Russian relations covered by the book and by the silver which it describes in detail. There is also, as we learn, in Russia much English plate of later periods, purchased in great quantities by the eighteenth century emperors and empresses. But here we are concerned only with Tudor and early Stuart silver, pieces not bought by the Tsars but despatched to them as official gifts in a plate-giving age. Sometimes, it appears, there were none-too-dignified attempts on the part of the Crown to shift the cost of these diplomatic presents on to the Muscovy Company.

Much of the importance of this work lies in the circumstance that the State Armoury Museum of the Kremlin contains "a larger collection of late Tudor and early Stuart silver than can be seen anywhere in England, except when some important exhibition is being staged." This is an interesting fact, and even a surprising one since the work of western goldsmiths, as Mr Oman points out, was not appreciated by the Russians of the Renaissance (other than by the Tsars) any more than examples of their Russo-Byzantine art were then appreciated in the west, where Russian furs proved gifts far more acceptable to the envoys and their staffs than counter-offerings of the local silverware.

Nevertheless, these gifts of plate from the rulers of England to those of Russia, then regarded as the westernmost of the eastern powers rather than as the easternmost of the western ones, "performed quite a distinct function in the negotiations between the two countries." To such an extent was this the case that the Tsar Fedor (Theodore) did not hesitate to return contemptuously, as being "not such as they should be," the presents brought by Giles Fletcher from Queen Elizabeth I. Do we catch here in the voice of Ivan the Terrible's son a preliminary rumble of that of Stalin?

It is encouraging to learn that the authorities of the Kremlin Museum under the Soviet regime were as helpful to Mr Oman as were their predecessors under the Empire in 1880 to Sir Philip Cunliffe Owen, who went to Moscow to make electrotypes of English and Russian plate for the then South Kensington Museum, and in 1909 to Mr. E. A. Jones in connection with his book on "Old English Plate of the Emperor of Russia." It is pleasant to think that the cups, flagons and dishes given by England to Russia three and four centuries ago may still be playing their part today, if in a somewhat different way, in easing relations between the two countries.

### Chairwoman Par Excellence

Lady Denman, GBE, 1884-1954

By Gervas Huxley.

Chatto & Windus. 205 pages. 18s.

FROM an astonishingly long list of public activities, Gertrude Denman will be remembered chiefly for her pioneering encouragement and wise guidance of the Women's Institutes in Britain and for her organisation of the Women's Land Army in both world wars. Mr Gervas Huxley has written of her life with a sincerity that is obviously inspired by affection and respect for his subject. He portrays a woman of warmth and character, sense of humour and humanity, whereas to those who knew her less intimately she presented a somewhat formidable exterior.

Had she not been born into a family that had amassed great wealth, had her mother been less ambitious, who knows whether anything would have been heard of this woman. But the hard Yorkshire streak of dogged determination to use its "brass" to reach a position at the top was strong in her forebears and her mother, Lady Pearson (later Lady Cowdray), was bent on her daughter making a good marriage. Lady Denman's subsequent unhappiness, her rebellion against the fashionable world and the round of social entertaining which she experienced at its fullest as the wife of the Governor-General of Australia, these were the factors which, coupled with an indomitable spirit, drove her to take a strong interest in the well-being of her sex. When, in 1916, at the age of thirty-two she was offered the headship of the Women's Institute movement, then in its infancy, she threw herself wholeheartedly into the difficult task of building it up on Canadian lines. Undoubtedly it is largely as a result of her superb chairmanship for thirty years that the movement has its present strength of nearly 450,000 members. Whatever work she tackled, Lady Denman showed an iron determination to fight with energy and tenacity for what she considered right.

Mr Huxley has a gift for filling in the historical and social background in biography. By no means the least interest in this book is the picture it gives of Edwardian society, the women's suffrage movement, life in Australia immediately before the first world war, troubles over newspaper policy at the time of the Munich crisis (Lady Denman was a director of the Westminster Press) and the fight for education in birth control for the poor (Lady Denman was the first chairman of the Family Planning Association).

First and foremost, the book is a faithful chronicle of fifty years of prodigious service in the field of women's needs and independence, but it has many interesting sidelines. One minor objection, however: a labour of love this may have been, but was it necessary to use the pet name Trudie throughout?

GEORGE WASHINGTON, IN BRONZE, STANDS IN THE MIDST OF BANKS, INSURANCE COMPANIES, INVESTMENT HOUSES—AND IBM ELECTRICS, THE FAVOURITE OF WALL STREET EXECUTIVES.

## Writing history on Wall Street

Wall Street has written its own history of the United States. You'll find it hidden away in old files—a letter on insurance for a trading voyage to China, a request for a bank loan to build a Pittsburgh steel furnace, a note on shares issued to push a railroad over the Rockies.

Many of the Street's treasured records are not only the stuff of history but also handsome specimens of clerly craftsmanship. Wall Streeters learned a long time ago that a business letter, whether it goes just across the street or clear across the world, tells much about the character and standing of the sender.

Meticulous copyists no longer toil to make each line, letter, word, strong yet graceful, but Wall Street still values the appearance of its business papers. In New York's financial district more executive letters are written on IBM Electrics than on any other typewriter.

The IBM Electric's beautiful type faces are the work of master designers. Smooth-flowing electricity produces the sharp, even impression, crisp on the page. The result weds the craftsmanship of the skilled clerk to the speed of the machine.

Wall Street still writes history—much of it on IBM Electrics.

# ROVER

It was born and bred to cross the frontiers of the world, this Rover 3-Litre. It combines the grace and comfort of a town carriage with the dash—and stamina—necessary for long-distance motoring. On the 3-Litre power steering is an optional extra. On all three Rover models—the 80, 100 and 3-Litre—front wheel disc brakes and overdrive are standard equipment.

The '80', £1,396.10.10d. The '100', £1,538.4.2d. The '3-Litre' with conventional gearbox, £1,783.5.10d., with automatic transmission £1,864.0.10d. (Prices include P.T.)

THE ROVER COMPANY LIMITED, SOLIHULL, WARWICKSHIRE. Makers of fine cars and the world famous Land-Rover.

## AMERICAN SURVEY

### Gandhi in Mississippi

SOONER or later every public facility in the southern states of America will be open to use by any citizen irrespective of the colour of his skin. It will be possible for Negroes in the South, as in the North, to use golf courses, libraries and swimming-pools, schools and colleges, as well as all the restaurants and rest-rooms in bus and railway stations—and it will be a crime to prevent them from doing so. Legally, as a result of decisions of the Supreme Court, no state can now impose segregation by law or stratagem in any public facility of any kind: court actions started or to come will apply the law. In their private affairs Americans, in Georgia as in New York, may continue to practise racial discrimination and remain highly compartmented in their present racial, religious and totemistic groups and this may well continue to be a grave national weakness. But in public, at least, there will be no Jim Crows.

The final demolition of the South's customs and "peculiar institutions" may come about sooner rather than later, however, as the result of the bloodied heads and arbitrary arrests in the last three weeks of the "Freedom Riders" on the interstate buses. The practical significance of these events is that they have enabled the Department of Justice to take a long stride forward in requiring the South to respect the equality of civil rights granted in the Constitution as interpreted by the decisions of the Supreme Court. Under the new Administration, the department is seizing this chance with every appearance of alacrity. It claims that the court cases which have arisen from the challenges of the Freedom Riders to the segregation maintained in bus terminals in the South will not only end racial segregation in practice in interstate travel, but will also test the right of states to impose segregation by local law or by police action. With the legal millstones grinding, the department sees no point in provoking southern mobs simply for the sake of defiance. Once the Riders had made their point, the Attorney General, Mr Robert Kennedy, called for a "cooling-off period," though the Department of Justice feels that it is quite another thing for a federal judge in Alabama to issue an injunction against further organised freedom rides.

But only the lawyers see a new Gettysburg being won in the courts. The Negro groups feel that more is at stake than the starting of new lawsuits to enforce rights which they think should be beyond dispute already. Liberals inside the government think that the appeal for a truce was a psychological error; but they attribute it to the Justice Department's loss

of nerve when it had to send in federal marshals to control the mob in Montgomery and had to face the possibility that federal troops might be needed if the marshals were overpowered. Liberal Congressmen, who seek to put through the strengthened civil rights legislation that has no chance of becoming law without President Kennedy's active backing (which has been withheld so far), see half-heartedness in the Attorney General's office and in the White House. Some people talk indeed of promises to go easy made before the election to southern politicians. In the belief that reliance on the law is not enough, Negro leaders have called for more Freedom Riders, and in Mississippi the decision of some 60 men and women, white and coloured, to serve their manifestly unjust prison sentences rather than pay fines for trying to enter a white restaurant is obviously more than a challenge to the state's racial practices.

There are, in fact, two elements in this new wave of protest against racial discrimination in the South. There is the determination—which interests lawyers most—to establish and enforce an existing right. The first team of Freedom Riders, which was stopped by mob violence, demonstrated that desegregated travel (specifically the free use of restaurants and rest-rooms—the American euphemism for lavatories) was not possible in Alabama although they were not interfered with in Georgia or in North or South Carolina. The ensuing wave of Freedom Riders has produced a batch of legal actions of the utmost importance. In the cases which involve both federal and state courts in Alabama, and which are being brought by the Riders against the bus company and the state authorities, the Department of Justice has intervened as a "friend of the court" to ensure that the basic issue, the freedom from arrest for exercising a constitutional right, is not lost in the complexities of a federal legal system. More important are the appeals of a number of Riders in Mississippi against their convictions on charges of causing a breach of the peace—a police pretext for punishing those who defy segregation notices.

These appeals seem certain to go ultimately to the Supreme Court, which has already laid down the principle that "ingenious as well as ingenuous" devices for excluding Negroes from juries, even though they contain no reference to race, are illegal. Furthermore, the Department of Justice has obtained an injunction against the police in Montgomery (though not in Birmingham) ordering them to give equal protection to all travellers. Though this may seem an *ex post facto* move which offers little comfort to those who were battered by the white hoodlums, and no security for those who may face mobs outside Montgomery itself, in fact it serves notice on the police throughout the South not to look the other way when their friends in the mob are out. An injunction restraining the Ku Klux Klan carries a similar warning.

On the immediate issue of desegregated travel, the Department of Justice has taken a short cut by asking the Interstate Commerce Commission to lay

Department of Justice: millstones grinding

down detailed rules against racial segregation in accordance with the Supreme Court's decision of last December. This decision was significant because it ruled that segregation even in privately operated restaurants in terminals used by interstate travellers is illegal; and if this is the ruling on eating-places, clearly it covers every conceivable facility. The ICC is an independent and perhaps rather hidebound regulatory agency, but it is unlikely to refuse this request. The new regulations would make it a criminal offence for interstate bus companies to use segregated facilities and notices would proclaim this. In practice, moreover, it is impracticable to separate the operation of interstate buses from those operating only within states.

THIS is surely an impressive harvest from the rides; but the Riders, and the organisations which back them (principally the Congress of Racial Equality, the National Association for the Advancement of Coloured People and the *ad hoc* committees of Negro pastors among whom Dr Luther King is an acknowledged leader), have far more in view than the provision of new test cases for the courts. They are not merely asserting law. What has thrown American public opinion into an uproar is that the Riders went to Mississippi, notoriously the best-organised police-state in the South, to defy, show up and suffer from the repressive use of law that is designed to make it impossible for Negroes to assert their rights. They have chosen the Gandhian technique of non-violent resistance. This refusal to wait for due process of law, even though the law is the Negroes' ally, springs partly from the heart-breaking slowness of the judicial process, partly from the fact that until recently poor Negroes have shouldered the whole burden—and taken the risks—of initiating legal action.

Whether the moral persuasion used against the conscience of the Anglo-Indian rulers of India can be made effective against the power structures of the southern states may be arguable. The court injunction against further advertised freedom rides shows the difficulty of mounting a big, let alone a mass, movement. But the Negro leaders, and especially Dr King, are reported to be well pleased with the first fruits of their campaign. After the mob violence which forced the Attorney General resolutely to send federal marshals in to restore law and order in Montgomery, Alabama, the State of Mississippi suddenly took precautions for the safety of the American Satyagrahists which fully parallel the care with which the British Raj handled the Mahatma himself. A few months ago few would have predicted anything but a violent reaction. The Riders have demonstrated that the states are no longer prepared to challenge federal authority when it is a question of maintaining law and order. The Negro leaders believe that this muzzling of the mob will in the end have a profound effect on the depressed morale of the Negroes in the South; it is a palpable blow against the time-honoured threat of mob rule.

Whether or not this invasion of Mississippi is quite the historic step that some liberals acclaim it to be, clearly it is a significant one in the unfolding pattern of Negro protest. How far the Negroes can press their campaign of direct action, and how far they must abide by due process of law, supplemented by fresh legislation when the Administration sees its way clear in Congress to push this through, remains to be seen. The Negroes have limited means and the Riders have come from the ranks of the poorer coloured college students (though they include at any rate one white millionaire). But that they have thrust the South again on the defensive, stirred the sluggish northern conscience, and brought pressure on the White House by publicising America's race problem anew throughout the world, is not in doubt. The stage is set for the next act of perhaps the one great human drama which it is wholly in the power of Americans to end.

## Opportunity for Aid

OF all the serious differences in outlook between the American President and the Soviet Premier which Mr Kennedy had to report to the American people last Tuesday, none was more serious than Mr Khrushchev's belief that the world was moving his way inevitably and that "the revolution of rising peoples would eventually be a communist revolution." And the only immediate request that Mr Kennedy made of the American people as a result of his European trip was for their backing for his foreign aid programme, which gives them an opportunity to demonstrate that "economic growth and political democracy can go hand in hand" and that Mr Khrushchev is wrong. Congressional representatives of both parties urged the public to support the President after his speech. Yet at the same time those representatives were attacking his foreign aid programme in the committee hearings on his request for a total of \$4.8 billion for the coming fiscal year, over \$1 billion more than was allowed last year.

The main trend of the criticism was outlined by Senator Fulbright, the Democratic chairman of the Foreign Relations Committee and an enlightened friend of foreign aid. Recent events, he said, probably thinking of Laos and Korea, had cast doubts upon the effectiveness of the programme's administration. He hopes, however, that the reorganisation proposed by the President will put fresh life into the programme. This reorganisation is certainly intended to answer this type of criticism and also to spur the countries which receive help to do more for themselves. Wasteful duplication should be avoided and concentrated efforts fostered by putting the main forms of economic aid into one agency and by centralising the various types of aid being given to each country.

But even more important as a preventer of waste and a promoter of efficiency is long-term financing, allowing plans to be made for several years ahead. The Administration wants loans to be authorised—\$7.3 billion worth of them altogether, far more than has ever been asked before—for the next five years with the money being borrowed from the Treasury; this means that the Appropriations Committees would have no chance of cutting the aid down to their size. The loans are to be repaid in dollars, not soft currencies, and nearly all the money will be spent in the United States, which should appeal to Congress. The official witnesses have pointed out that Congress could still supervise foreign development loans, even without annual appropriations, and that a number of other government activities have long been financed by this type of borrowing. But these activities are not controversial; Congress's reluctance to give up its direct control of foreign aid is accentuated by its distrust of the way in which that aid has been handled. The Administration is working hard to convince Senators and Representatives that everything is going to be much better from now on, but it will not be easy to do so.

## Republicans Rebound

REPUBLICANS met last week in Washington and in other cities all over the country to raise funds in a buoyant, aggressive mood. They have had time to get over the shock of losing the Presidency last November and the Kennedy Administration has shed a good deal of its air of shining invulnerability. Texas had just sent to Washington the first Republican Senator ever elected by a popular vote in the South and General Eisenhower, in his first political speech since he left the White House, brought his listeners in Washington to their feet with the most partisan, hard-hitting address he has ever made. With President Kennedy in Europe conferring with President De Gaulle and Mr Khrushchev,

Mr Eisenhower ostentatiously held his hand on the foreign policy of the new Administration. But he dropped a few sharp hints, such as the expectation of the Republicans that they would be consulted before, rather than after, the big decisions—a hint that the President showed he had taken when, on his return, he immediately swept off Mr Dirksen, the Republican leader in the Senate, for private talks.

It was on domestic policy that Mr Eisenhower let fly, with his denunciation of "government by big brother," "immoral deficit spending" and of specific government programmes such as aid for teachers' salaries, more public housing and increased government development of natural resources. The next day Republicans showed how much they relished this fighting line when they chose an aggressive member of the House of Representatives from New York, Mr Miller, as their national chairman in succession to Senator Morton, a mild Kentuckian. Mr Miller was the head of the Republican Congressional Campaign Committee last year and had the satisfaction of seeing his party gain 22 seats in the House even though it lost the Presidency. He hopes to make many more inroads into the Democratic majority in 1962 by concentrating once more on marginal seats where a little extra effort may bring big rewards, by refurbishing the Republican organisation and by encouraging attractive new candidates. If necessary, he may even resign his House seat.

The Republicans themselves recognise only one real risk to their chances: factionalism and particularly the polarisation of party members around the three rivals for the presidential nomination in 1964—Mr Rockefeller on the party's left, Senator Goldwater on the extreme right and Mr Nixon in the middle. Both General Eisenhower and Mr Miller—a professed neutral in this struggle—begged the party to forget about 1964 and concentrate on the congressional and state elections in 1962; a minority party cannot afford the luxury of dissension. Outside observers are not so sure that factionalism is the only danger; they think that the opposition also suffers from a great lack of constructive ideas and sense of purpose. And General Eisenhower, whose mission once was to lead the party into the twentieth century, now seems to have embraced the most barren conservatism.

## Satellite Fever

WHOEVER wins the race to the moon—in which the Russians have a head start—Americans are not neglecting the advantage they enjoy in the task of making space yield more immediate and more tangible benefits to earth-bound human beings. The National Aeronautics and Space Administration has just chosen the Radio Corporation of America to build, for a little over \$3 million, an experimental communications satellite of the "active" variety; that is, unlike the Echo balloon, which simply reflects radio signals, this Relay satellite will carry receiving and transmitting equipment which will make it a much more effective instrument of communication. A system based on such satellites will multiply by many times the telephone channels now available between continents, accommodate the rapidly rising flood of calls and even permit the transmission of television programmes across the oceans. It will have other advantages: it will not be affected by sun-spots and disturbances in the ionosphere as radio com-

munication is today or by the damage to which undersea cables are subject. The capital cost will be great—certainly more than \$200 million—but in the long run it should make communication cheaper.

The system may also be very profitable, which partly explains why private firms are straining so hard to get a foot in this door. The other reason is that only one large commercial system is likely to be needed or financially feasible and the American Telephone and Telegraph Company, the giant firm which provides most of America's domestic and international telephone facilities, once seemed likely to corner it. AT & T stands ready to invest about \$200 million to provide a commercial relay system in about four years. Originally AT & T wanted complete ownership and control of such a system, although it was prepared to lease facilities to others. But to the great comfort of other firms, including those anxious to supply the equipment, the Department of Justice doubts whether the anti-trust laws would permit such domination by one firm and the Federal Communications Commission has suggested that a concerted effort would bring results more quickly.

Thus encouraged, the General Electric Company set up a new subsidiary which it hoped might become the skeleton of such a combine. Late last month GE and its allies suffered a serious setback when the FCC—with the eager approval of AT & T—announced that any such combine should be limited to firms already engaged in the business of international communications; invitations to a meeting called to discuss plans were confined to such companies. At the urging of the Department of Justice the FCC relented and allowed all interested parties to attend, but AT & T has another ace up its sleeve: the relative simplicity of its technical proposals. Those submitted by RCA and GE require the satellites to be placed in precise orbits—something which may remain beyond the ability of American rocketry for several years.

## "Have Ideals, Will Travel"

A DESIRE to go abroad to serve humanity is not sufficient qualification for membership in President Kennedy's Peace Corps. This was brought home to the 3,500 or so people, mostly young, who wrote the entrance examination at the end of May; at centres all over the country for five-and-a-half hours they answered questions to test their verbal capacity, their familiarity with their country's history, their ability to learn languages, their general outlook and their particular knowledge of English, agriculture, health science or mechanics. Another 1,500 who want to be high-school teachers did a special examination this week and a further series will be held in July. While the initial enthusiasm for the Peace Corps was great, particularly in the colleges, the number who actually sat for the examinations was disappointing. But those running the programme are concerned at this point not so much about whether they will get enough volunteers, but about whether they will be the right types. Skilled workmen and teachers are needed most.

The first projects to be approved illustrate why. A team of 28 surveyors, geologists and engineers is to go to Tanganyika to help with road building; another of 64 members to Colombia to encourage handicrafts, rural construction and pig and poultry farming; and a third of 300 to the Philippines to teach science and English, an essential language for technical students there. Other projects all over the world are likely to be agreed shortly; one of the most encouraging aspects has been the welcome given to the Peace Corps by officials in underdeveloped countries. Members will be selected as suitable for specific projects and will serve for two years in return for a basic allowance only. After physical, psychiatric and aptitude tests and personal interviews, as well as the examinations, those accepted will be trained for six months or so, first at a collage in languages and "work

## FRIENDLY QANTAS SERVICE BEGINS WHERE YOU SEE THIS SIGN

## Consult your Qantas Travel Agent for free advice on all overseas air travel

To anyone not used to them, airline timetables look extremely complicated. The man who understands them is your authorised Qantas Travel Agent. Leave the looking-up to him! If you want to get from Calcutta to Bangkok on a Sunday, he'll tell you how. Your Qantas Agent has complete and up-to-date details of Qantas jet flights and connecting services right round the globe. He knows the best route to take and the time of any flight from any part of the world. He'll book your tickets, help with documents, and if you'd like to fly on a 10% deposit with up to two years to pay the balance, he'll arrange that too. Additionally, he'll book your hotel accommodation, sight-seeing tours, or a hire car. Just say "Book me on a Qantas flight" and leave the rest to him.

AUSTRALIA'S INTERNATIONAL AIRLINE

Qantas, in association with Air India and B.O.A.O.

## for an extra measure of pleasure offer your clients HILTON HOTELS in the

All across the United States (and in Mexico and the Caribbean, too) is a wonderful world of Hilton Hotels and Inns. Some are glamorous and world-renowned, some distinctly unusual, yet all hold forth the promise of comfort, courteous service, and just a bit of excitement. The people who serve are sensitive to the special customs and needs of guests, from wherever they may hail. This is our reputation the world over.

In whatever Hilton Hotel your clients may decide to stay, they will enjoy the American friendliness and hospitality—a hallmark of the Hilton name that has made it so justly popular. For reservations, communicate with any Hilton Hotel or the London Office, 17-19 Cockspur Street, telephone Whitehall 3061. May we hear from you soon?

skills," then at a camp where they will experience some of the discomforts which they will find on the job itself. During this time as many as fifty per cent are likely to be eliminated. Officials are not requiring any form of loyalty oath, but the Federal Bureau of Investigation will be keeping an eye on candidates. Nor is any training being given in anti-communist propaganda, although right-wing student groups have been pressing for it.

Congress, however, may insist on something of this kind when it gets round to setting up the Corps on a permanent basis. The President has asked for \$40 million to send 500 to 1,000 volunteers overseas this year and another 2,700 during 1962. Instead of being included in the new foreign aid agency, as was at first suggested to avoid overlapping, the Peace Corps is to be a separate body, although under the State Department. Its sponsors believe that this will make it more effective, but there is argument about this within the Administration as well as outside. There are also those who think that this type of work should be left to the private missionary and educational organisations which are already doing it and that the Peace Corps will only attract frustrating criticism at home and abroad as a result of being part of the government. Its officials, however, are well prepared for criticism and for attack.

## Cows, Corn and Cholesterol

FROM A SPECIAL CORRESPONDENT

WHEN last November the American Heart Association recommended that Americans reduce their weight, eat less fat and substitute "poly-unsaturated for saturated fats," it also said that "there is yet no final proof that heart attacks or strokes will be prevented by such measures." But the message, anticipated by discussion in both scientific and popular journals, was clear: animal fat, including such long-loved delicacies as cream, butter and dripping, seemed to be potentially dangerous to health while vegetable oils, including cotton, maize and soya oil, and fish fat, were beneficial. Given today's incidence of deaths from heart diseases and the degree of profitable hypochondria in the United States, such statements do not go unheeded and this one set off a double battle: the old fight between butter and margarine was intensified and an intra-margarine fight between the relative merits of various ingredients and processes was begun.

The butter-margarine fight has been waged in the United States for most of this century. First introduced as a cheap substitute for butter, scorned by cooks with ample budgets and excoriated by the powerful dairy industry, margarine made its way slowly but surely into the ranks of big business, while the use of butter declined in spite of a steady attempt by the dairy industry to convince Americans that there was something almost immoral about the laboratories' less expensive imitation of a classic food. Margarine

could, in many states, be sold only when white, looking like lard, so that housewives had to add yellow colouring before their families would eat it. Repeated protests finally pushed down that hurdle, but the stigma of supposed inferiority still remained. Now the scientists may change all this. They have added new dignity to margarine by classifying it as a health food and new barriers to butter by saying that it is possibly dangerous to people with weak hearts and therefore, by extension, to the entire adult population.

If the margarine-butter fight has taken on new dimensions, the intra-margarine fight has grown more bitter as a result of the medical theories. Margarine has been made out of various vegetable oils—soybean, cottonseed, maize, peanut, coconut—and with them at times lard and beef fat. Cottonseed oil was the major ingredient just after the war, but soybean has now far surpassed it; in 1960 it constituted over 80 per cent of all fats and oils used in making margarine. But analysis seems now to indicate that of these vegetable oils it is maize (called by Americans corn oil) which is medically preferable. Yet in 1960 only 50 million pounds of corn oil was used in margarine, compared with 1,105 million pounds of soybean oil. The implications for the corn oil industry are so obvious that the shares of one company making the product have doubled in price since the Heart Association's pronouncement.

The proclaimed advantage of corn oil is that it contains the highest percentage of linoleate, a key element in the present theories about heart trouble and its treatment. But corn oil is a liquid which, if subjected to the usual processes of solidification needed to make it into a table spread, somehow loses the linoleate; yet this is believed to be not only healthy in itself, but actually active in melting out the cholesterol which is thought to clog human arteries when too much animal fat is eaten. But now two competing manufacturers claim that their technicians have discovered how corn oil can be turned into a solid spread for bread without destroying the vital linoleate. Both have put their margarines on the retail market and they are set to fight each other in the courts over the patents involved. Meanwhile their advertising departments are having difficulties in explaining the virtues of the complicated scientific claims of their products to the buying public; tricky under any circumstances, this is rendered more difficult by the fact that since 1959 they have been forbidden by the federal Pure Food and Drugs Administration to use the dread but vital word "cholesterol" in advertisements.

## State Goes Banking

FROM A CORRESPONDENT IN NORTH DAKOTA

IN its effort to encourage industrial development, America's most rural state is finding it a distinct advantage to be in the banking business. Most states promote business development and many have laws permitting cities to build plants so as to induce out-of-state firms to move in. But North Dakota has, in addition, its own source of funds in its Bank of North Dakota—the only state-owned bank in the country and, with \$120 million in resources, the largest one between Minneapolis and the Pacific coast (a stretch of 1,500 miles). By deciding in 1959 to buy \$1 million of revenue bonds issued by the City of Williston the bank helped to attract a plant which exploits the enormous resources of salt discovered while drilling for oil in the area. Once the salt has been mined, the caverns which have been formed will be used to store liquid gas. The bank has also helped to finance a meat-packing plant and others which, it is hoped, will win a share of the expanding market for processed potatoes. The bank was also ready to participate in a nitrogen fertiliser plant that would have made the first major industrial use of the billions of tons of lignite that underlie this wheat-growing state. But this project was postponed.

## Static Steel

NEW YORK

THE immediate prospects for the steel industry have brightened visibly. Gains in production in eleven successive weeks have raised output to 70 per cent of capacity (a level that the industry regards as "normal") and the steel companies feel able to talk again of higher prices—to the concern of the government. Even so, developments in the last few years have raised questions about the basic health of the American industry which accounts for a third of world capacity.

In the first place, the annual output of steel has remained more or less static (at around 100 million tons) for the last five years while the economy has continued to grow. Secondly, the potential productiveness of the industry has expanded rapidly—by 50 per cent in the last ten years—and the companies have therefore been able to meet the demands of the market with a large part of their facilities lying unused. And finally, this basic industry is liable to come to a prolonged standstill every two or three years when its contracts with the trade union come up for their periodic re-negotiation.

Generally speaking (and in spite of a great deal of protest about the squeeze on profits) the steel companies seem to take a fairly optimistic view of their longer-term prospects. They attribute much of the apparent stagnation in demand over the last five years to a number of "special factors." Steel users do not now maintain as large stocks as they did a few years back when deliveries were less prompt, and in any case some steel users are not doing particularly well either; the motor-car industry, for instance, has not yet had another year to match 1955. The American consumer is blamed for this; while he has been spending more each year he has been paying for medical care, education and travel instead of buying new cars and washing machines. But the steel-makers take heart in the reflection that the babies of the post-war "bulge" will soon be setting up house.

The companies are not particularly worried that the facilities for making steel exceed the demand for it. Many industries operate quite happily at substantially below their theoretical limits but this fact attracts little attention because, outside steel, production is not measured as a percentage of capacity. The steel industry tried earlier this year (not for the first time) to discourage the use of this gloomy yardstick, but the habit persists among commentators. Moreover, recently the emphasis has been on the introduction of new cost-saving techniques rather than on the construction of new plants. Most companies now claim that they can satisfy themselves and their shareholders with an operating rate of around 60 per cent and, as the industry's modernisation programme nears completion, the break-even point will fall lower.

A controversial question, particularly between the companies and the steelworkers'

union, is the extent to which pricing policies in the industry have encouraged the use of other products. Steel prices, which were held at an artificially low level during the war, have increased far more sharply since 1947 than have those of competing materials. The result has certainly been some displacement of steel. The greatest threat has come in the construction industry, where reinforced concrete is proving both cheaper and easier to handle than steel in the building of bridges, overpasses and (more recently) commercial structures. Motor manufacturers have as yet found no real substitute for steel but they contrive to use a good deal less of it in each car. Aluminium has invaded the large market for "tin" cans, and plastics are being used extensively for children's toys and for a wide range of household goods where steel once served. Foreign trade is another sensitive area. The steel companies are concerned about the opportunities they are losing in Europe's lush markets because their prices are out of line. Instead of showing a significant export surplus, as in the past, America's foreign trade in steel products is now roughly in balance.

IN the arguments over steel's pricing policies the companies blame the union for saddling them with constantly rising labour costs; the union blames the companies for unwarranted price increases that have reduced the market for steel products; and successive Administrations have been inclined to blame both parties for keeping the wheels of the postwar inflation well-greased. Overshadowing all the disputes between union and management is the fact that the industry's need for production workers has been falling despite a 50 per cent increase in the output of steel since 1947. The union today is more concerned with protecting jobs than it is with increasing wages—hence the epic struggle over work rules which featured so prominently in the 1959 strike.

The crux is a clause, known as 2b, which has appeared in all steel contracts since 1947; this provides that employers may make changes in, say, the size of a work crew, in the scheduling of work and so on only when new types of machinery have been installed or if the changes are agreeable to both management and labour. In 1959 the companies made a major but unsuccessful effort to challenge this stipulation, and the issue was referred instead to a committee representing both sides; about one year and thirteen meetings later the only progress that this committee could report was a decision not to appoint a neutral chairman as originally planned.

An important issue that is involved in the clause 2b dispute is the question of incentive payments, which are governed by local work rules. The question is important because two out of three steel workers receive incentive payments in addition to their basic hourly wage—a state of affairs which is unusual in American industry but which appears to be popular with both parties. The rigidity in the system of incentive payments has naturally produced some strange anomalies in the wage structure—a fact that bothers some companies a good deal more than others.

The tussle to modernise the system of wage payments in the steel industry has had a long and stormy history. Between 1945 and 1947 the United States Steel Corporation, which is usually the pace-setter in all negotiations with the union, worked out a new wage structure so far as the basic hourly wage was concerned—one that divided steelworkers into some thirty grades. These schedules were later accepted by the industry as a whole, although they added to the wage bill, on the understanding that a rationalisation of incentive payments (on which the companies expected to make some offsetting savings) would follow immediately. In spite of endless negotiation, this has not been achieved on an industry-wide basis, but recently two companies—Bethlehem Steel and Jones & Laughlin—have worked out with the union new principles based not on how much a man should produce in a day but on how much a particular machine should produce.

The issue now has a good deal more emotional than economic significance. A study by the Department of Labour took the view in January that employers exaggerated the possible gains, and the union the losses, that would follow the elimination of the offending clause. Certainly many industries envy the steel companies the freedom of movement that they already have. Moreover, the issue is to some extent of declining importance. In the newer plants, work rules and incentive payments give rise to few problems. In any event, the Department of Labour felt able to conclude that clause 2b "does not protect widespread inefficiency because such inefficiency does not exist."

Continued from page 1114

The bank's willingness to purchase such industrial development bonds is an extension of its long-standing policy of buying—in competition with private investment houses—the obligations of the cities and villages in the state. During the agricultural distress of the nineteen-thirties, when less than half the taxes could be collected in areas hard-hit by drought, the bank lent money to cities to help them to maintain public services. Since 1945 it has lent them more than \$125 million for improving their streets, sewers, water supplies and so on. North Dakota's towns are small—there are only fifteen with populations of over 2,500 and the largest has 47,000 people—and they find it expensive to borrow. The bank's successful effort to reduce the interest they must pay is regarded as its most significant contribution to the state.

It was the credit needs of the farmer, however, that the bank was originally set up to serve. It was organised by the Non-partisan League, the last major protest movement of American farmers, which won control of the state in 1919. The league saw the bank as the key part of a semi-socialist programme and it was authorised to make loans secured by first mortgages on real property or by warehouse receipts for farm commodities. Otherwise, it was not to lend to individuals. In practice, the bank has realised neither the aims of its founders nor the fears of its enemies. Its farm loan programme was abandoned amid the foreclosures of the nineteen-thirties and its agricultural lending is now confined to schemes guaranteed by the federal government. It never became "a system of state credit," mobilising the assets of the whole state into one large central bank. Instead, by 1932 most of the state's major private banks had become affiliated

with one or another of the private banking "groups" with headquarters in Minneapolis in the next state, Minnesota.

The Bank of North Dakota has never used its authority to open branches. It accepts, but does not solicit, deposits. Its policy has been to follow the market in setting interest rates. Against its \$106 million of deposits at the end of 1960 (three-fourths of which represented public funds) it held some \$80 million in marketable government securities and some \$30 million of state and municipal obligations. Almost every year it earns as much as the state's original investment of \$2 million in it.

Since 1958, however, the bank has come under increasing criticism from North Dakota's resurgent Democratic party, which has inherited the traditions of the Nonpartisan League and whose leaders feel that the bank should be lending more boldly to meet the farmers' insatiable demand for credit. Mr William Guy, who recently became the first Democrat to be elected Governor of North Dakota since 1952, told the Legislature last winter that "with less than four per cent of its resources used in support of agricultural credit," the bank "is not serving agricultural development in the manner for which it was founded." Republican legislators turned down his proposal to let the bank guarantee loans to help young farmers get started, but Mr Guy has vowed that at least lending under the federal guarantee programmes will be increased. Although responsibility for the bank's day-to-day operations has been delegated to the manager, whom Republican Governors regarded as a sound banker, final control over personnel and policy rests with the three-man Industrial Commission, of which Mr Guy is chairman.

#### SUBSCRIPTIONS TO THE ECONOMIST

Annual Postal Subscription by ordinary mail £4.10; overseas £5

By air see below

Subscriptions to many countries can be sent either by direct second-class airmail or in bulk by air freight for onward posting from central distribution points. Airmail is invariably more expensive but usually quicker by about 24/48 hours. Where only one service is shown this is because the alternative is either not available or not recommended.

### Lone Ranger in Los Angeles

CALIFORNIAN politicians, famous for crossing party lines, surpassed themselves in last week's "nonpartisan" mayoral election in Los Angeles. The victor was Mr Sam Yorty, once a left-wing member of the State Legislature and later of the United States Congress; still a Democrat he supported the Republican presidential candidate, Mr Nixon, last November and in retaliation last week the party organisation in the city supported his opponent, the incumbent Mayor, Mr Norris Poulson, once a Republican Congressman, Mr Yorty, a vigorous 51-year-old with a good television appearance, had no official help and was opposed by the local newspapers. But he won the votes of various minority groups—aided by a riot involving Negroes and policemen the day before the poll—and of the many people who were tired of the ageing Mr Poulson. He had been in office eight years, during which he had given Los Angeles a new civic centre and a leading baseball team and had stood up to Mr Khrushchev when the latter visited the city in 1959. Mr Yorty contended that Mr Poulson was the creature of big business and was himself accused of being a tool of the criminal underworld. There were no real issues in the election and less than 50 per cent of the voters went to the poll.

What Mr Yorty does when he takes office on July 1st will be interesting enough; he has promised to begin by shaking up the entire police force. What he does in next year's election will be even more interesting. His disillusionment with the Californian Democratic party dates from 1956, when he lost the senatorial nomination. There are those who think that he will try for that again in 1962 or that he may even challenge Governor Brown, one of his favourite enemies, for his office; alternatively Mr Yorty may support the Republican nominee, especially if he should be Mr Nixon. As long as Mr Yorty has control of the third largest city in the country, in the second largest state and one which is only marginally Democratic and with a divided Democratic party, this political maverick cannot be ignored.

THE OLD WORLD  
MADE HERCULES...

TODAY  
HERCULES IS HELPING  
TO BUILD THE  
NEW WORLD

"Vanquish or be Vanquished". That was the uncompromising law of the mythical world wherein Hercules of old was nurtured. . . . Triumphant then, Hercules will boast that he is no less triumphant to-day. But now his labours bend towards more sophisticated ends. Man's transportation, for example. The Mares of Diomedes have given way to the train, the car, the aeroplane. And by developing skills in industrial chemistry, Hercules has laboured to some purpose here. Hercules industrial chemicals make compositions tailor-made for transport—lacquers flame-proof or lustrous or low-temperature-resistant, tenacious adhesives, defiant anti-corrosives, new and revolutionary lubricants. . . . To-day if it's in transport, Hercules is there, in such guises as Ethyl Cellulose, Celloyl, Pamak, Vinsol, Hercosflex and Hercolube. Might they meet your needs?

HERCULES POWDER COMPANY LIMITED

ONE GREAT CUMBERLAND PLACE, LONDON, W.1. Telephone: AMBassador 7768

In the first year of insuring their export business a firm of marine machinery manufacturers shipped goods to the value of £12,000. In nine years this figure had reached over £1,000,000.

An exporter of textile machinery who first insured with ECGD four years ago increased his exports from £2.8 millions in 1957/58 to over £4 millions in the following year. He is now insuring business worth over £6 millions per annum.

Export credit insurance not only protects exporters from loss—at premium rates lower than ever before. Every ECGD policyholder benefits from ECGD's up-to-the-minute files on over 140,000 overseas buyers and unrivalled economic intelligence on each overseas market: the insured exporter can thus offer competitive credit to new buyers in new markets. An ECGD policy assigned to his bank may prove the key to export credit financing. No matter what or where you export, ECGD insurance can help you in more ways than you realise. Write or ring your local ECGD man now.

## THE WORLD OVERSEAS

### Waiting Game in Berlin

FROM OUR BONN CORRESPONDENT

**A**LTHOUGH Herr Ulbricht's stalinist heart is sick with hope deferred, it seems that the communist central planners have effectively counselled him to wait a while longer for the prize of a German peace treaty and a neutralised west Berlin. Yet probably not very much longer; for they must know that, if it is not soon to be desperately short of crew, Herr Ulbricht's ship of state cannot wait for what party believers consider to be the unalterably rising communist tide.

The prize was held out for all the world to see as long ago as November, 1958. While he has since been kept kicking his heels, Herr Ulbricht has been perforce studying the weekly reports of his ministry of the interior on the number of persons fleeing from east Germany, most of them through the west Berlin escape hatch. To him and the state planning commission these returns have become almost as disquieting as were the figures of torpedoed shipping to British officials during the gravest months of the war. During last week alone, for instance, 4,389 more persons turned their backs for good on the Democratic Republic; of these 672 were under the age of 24. The week before that, there were 4,169. The sad, unceasing exodus obviously not only invalidates Herr Ulbricht's claim to speak for his inarticulate subjects but is also slowly undermining the Democratic Republic's economic and social foundations. East Germany's population, now scarcely over 17 million, has declined by over two and a half million since 1949. There are not nearly enough people to do the work in hand, let alone what is projected. There is a shortage of doctors and schoolteachers. The troubled state planning commission appealed last month to workers of 65 and over not to retire, promising both wages and old age pension to those who would carry on. Signs have since appeared in many east Berlin shop and office windows offering "light work for old-age pensioners."

How long can Herr Ulbricht afford to wait? Professional western interpreters of the meagre auguries culled from recent pronouncements in Moscow, Vienna, and Berlin are in general agreement that the communists are not planning to bring the German issue to a head before November. For Mr Khrushchev, that would come fittingly after the personal and political ratifications of the Soviet Union's Communist party congress. For Herr Ulbricht, it would be conveniently after the Federal Republic's general elections. In a much-publicised interview with the party organ, *Neues Deutschland*, a surprisingly courteous Ulbricht has acknowledged that the west German leaders can scarcely be expected to recommend negotiations with the Democratic Republic in the middle of an election campaign, and has indicated that he is ready to wait until there is a newly elected government in Bonn to consider negotiating a peace treaty that would acknowledge the separate existence of the Federal and the Democratic Republics.

Mr Khrushchev and Herr Ulbricht seem really to believe there is some hope that before the year is out the west German government will be encouraged by the pressure of events, and by the counsel of its allies, to enter at last into such negotiations. And it looks as though Herr Ulbricht has been persuaded that consequently his wisest course for the time being would be to try to promote confidence in the communist plan for a Free City of West

Berlin—for the amiable caging of a sort of civic white elephant, regrettably doomed in the nature of things to eventual extinction, but surviving meanwhile unmolested and unmolested in the surrounding red plain.

To switch to official party metaphor, the communist cure for the "west Berlin abscess" was until 1958 either a voluntary total capitulation by the West, or some rough and ready surgery that might set up mortal complications elsewhere. (The surgeons jabbed away from time to time to test the patient's sensitivity.) Today it is seen that these are unnecessarily crude and troublesome alternatives; that, given the survival of the Democratic Republic, the abscess can probably be drained away over a period of special nursing in which west Berlin would continue to indulge in a few harmless western liberties, yet would cease to be the exclusive *protégé* of the Federal Republic and its allies. But, to obtain acceptance, such an arrangement must be made to look feasible. Accordingly, the Soviet news agency, *Tass*, which, if it wanted to, could cover west Berlin quite adequately from its present east Berlin headquarters has newly opened an office in west Berlin; and the Russians are trying to open a virtually superfluous trade mission in west Berlin that would deal directly with the local authorities, superseding the present practice of dealing with west Berlin through the Soviet embassy in east Berlin and the Bonn government.

**I**t is through the long-term effects of a series of peaceful penetrations such as these that the communists now seem to see their cleverest way of eventually winning the whole of the former German capital. President Kennedy told the press in Paris that neither General de Gaulle nor he "would feel it appropriate to have our statutory rights in Berlin changed by force or the threat of force." Force is not going to be used. East Germany's dependence on west Germany for certain important special steels has not been lessened by the new trade agreement, signed last month, which provides the Democratic Republic with a Soviet credit of 2,000 million east marks between now and 1965. Interzonal trade and communications between west Germany and Berlin are not going to be lightly severed. Indeed, in his interview with *Neues Deutschland*, which the east German foreign ministry is quoting as holy canon, Herr Ulbricht also made much of the possibility of these communications being guaranteed by treaty. "All that needs to be done," he said, "is to define by treaty with the Democratic Republic the necessary legal basis for using the routes by air, water and land as far as they touch the territory of the German Democratic Republic."

To put it gently, the Democratic Republic has come to stay for quite a long time. The rest of the communist block will see to that, whatever "little local difficulties" Herr Ulbricht may have. If Mr Khrushchev is disappointed in his expectation that the West will be ready by the end of the year to enter into some kind of negotiations for recognising eastern Germany, it seems most likely that he himself will wait no longer. He will invite such countries of the eastern block as are concerned to sign a separate peace treaty with the Democratic Republic; and west Berlin will be jeopardised anew. In the meantime, we shall see every peaceable

device being employed to strengthen the Democratic Republic's position, and to weaken west Berlin's. Last month the Russians refused to continue to negotiate a cultural agreement with west Germany that would have included west Berlin. The east Germans contrived to elevate their trade mission in Damascus into a consulate. The eastern block boycotted the international water supply conference in west Berlin because it was held under the patronage of President Lübke of Federal Germany. So it will go on. It is tiring for the west, and for conscientious statesmen poses a terrible moral dilemma. Gestures, such as the sending of the British Minister of Defence to attend the Queen's birthday parade in Berlin, will not resolve it.

## The Awakening Saudis

FROM A SPECIAL CORRESPONDENT

"WE are driving western influence out of here," an Egyptian journalist boasted in Jiddah. But in fact, the wind of change that is blowing through the Arabian desert is essentially a western wind. The political and social debates being conducted in an exotic setting of palaces, perfumed concubines and pampered slaves fall upon the western ear with a staggering familiarity. It was a wealthy merchant, wearing gold-threaded black silk and sipping Coca-Cola, who passionately argued that princes tend to be parasites and religion to be the opium of the people. The cooler economic jargon employed by Saudi Arabia's administrators and planners turns out to be cosily familiar: the minister of finance, Amir Talal, is plainly a Keynesian.

Change has not been exactly snail-like in Saudi Arabia in the last couple of decades. On the contrary, ever since the oil wealth flooded and cracked wide open the foundations of an ancient way of life, the pace has been furious. Air-conditioned and neon-lit palaces took the place of skin tents lit by tallow with the ease and celerity traditionally associated with the genie out of Aladdin's lamp. And the Saudis showed themselves impressively adaptable. It is with considerable sangfroid that they have swapped their camels for Cadillacs.

The trouble is that the changes have been uneven. Convoys regularly cross the desert, also criss-crossed by wide, smooth, arrow-straight roads, but the methods of farming are as they were thousands of years ago. The sons of slaves sit in school beside the king's sons, and a former finance minister is the son of a freed slave, but slavery still exists. Death for adultery is now so repugnant that Saudi courts, like 19th century English juries with sheep-stealers, refuse to find guilt; but hysterical women who volunteer confessions of adultery may still be stoned. Everyone gets free medical care; but thrice-convicted thieves still have their anasthetised right hands chopped off in public, before they get theirs.

Nobody now openly opposes reform, save Wahabi religious fanatics whom almost everyone dislikes. The reality of the wind of change is accepted on all sides, and is welcomed by many. The burning argument is not whether there ought to be reform, but how much reform may endanger the House of Saud, and how much is needed to ensure its safety and Saudi Arabia's welfare? The problem here is not the king, an amiable and well-meaning monarch more akin to Charles II than Charles I, but the vast progeny of princes. They were created out of dynastic and tribal considerations rather than uxoriousness, the idea being to have as many blood ties as possible between the Throne and every important family. But now there are about a thousand of them, all busily reproducing themselves.

Few have been properly educated, or allowed to work. All draw literally princely incomes. They spend a lot of their time and money abroad, on the sort of life that Saudi Arabia, wrapped in a black shroud of grim Wahabi puritanism, fails altogether to provide. Now an increasing number of young Saudis (taught in schools where three out of five teachers are emancipated Egyptians) also want to live as if Saudi Arabia were in the twentieth century and not the tenth. They want to see girls, go to cinemas, listen to music, and perhaps even to drink something stronger than non-alcoholic beer. And they complain, with mounting dissatisfaction, that the numerous princes are getting far too big a share of the national income.

The awakening Saudis' other objects of grievance are, as might be expected, foreigners. There are about 50,000 Egyptians in Saudi Arabia, and they have acted as carriers of change and new ideas. But, despite the journalist's claim about driving out western influence, it isn't at all sure that it won't be the Egyptians who are driven out. The Saudi press talks, bluntly enough, about "foreigners who are hypocrites, humbugs and frauds, having come here to get as much money as they can." The Egyptians frankly admit they are well paid and also admit that the Saudis resent them. It should be added in fairness that the Egyptian teachers and technicians fully earn their salaries, and have done Saudi Arabia immense good.

The Americans are less ubiquitous or even visible than the Egyptians, for they live for the most part in their Dhahran oil compound, which resembles a Californian suburban real estate development area. The Saudi employees of the Arabian American Oil Company are not only well-treated and well-paid but are fairly rapidly replacing Americans in the superior jobs. But not very far from the California-type housing there is a "tin village" where Saudis who work for Saudi contractors live in abject poverty and degradation. The contrast is painful and striking. Here too the wind of change is blowing: Sheikh Tariki, the minister of petroleum and minerals, is thinking of turning the oil wealth that flows from a production of one-and-a-quarter million barrels a day into fertilisers and petrochemicals.

And some at least of the princes may find a solution for themselves by going into business. Some have already done so, but in a negative sort of way, by acquiring land and buildings in Riyadh (as well as apartment buildings in Beirut). But the more adventurous are beginning to think in brisker terms than being merely rentiers and landlords. One son of King Saud is financially interested in oil refining, another is reported to be gambling with soap, a third is interested in cement. The future clash may be between this sort of blue-blooded Samuel Smilesism, and the obvious, though nascent, socialism of the younger planners. Meanwhile, the king is turning his palaces into schools and hospitals,

Keynesians in the palace

The end crowns the work

## MAN-EATER AT LARGE!

There he is, prowling the promenade deck with a gleam in his eye. F. J. Smith, Esq., world sales director on his annual sales tour.

But whatever became of the frown that scourged the secretaries' room? Whither the scowl that flailed a hundred salesmen? Can this tanned, jaunty, relaxed figure be the irritable, overworked Mr. Smith who left Tilbury two weeks ago?

Mrs. Smith knows it is. But she herself can hardly believe it. She's thanking their lucky stars that Mr. Smith decided to sail to America via Sydney (and a lot of other

delectable ports of call). And that he decided to take her with him. And that they went by P & O - Orient Lines.

This trip is taking years off them both... making them feel better than they've done for ages. Wonderful food, impeccable, friendly service, the sheer joy of being able to rest and relax... with all these things to enjoy and look forward to the workaday world seems very far away.

Mr. Smith's off to take a swim. (At eleven o'clock on a Monday morning!) How about that for a happy hunting ground?

The world's largest passenger line

and, in the "King Saud's Sons' Institute," in Riyadh, young princes and commoners, sharing the same classrooms, are learning that "manners make the man," "the end crowns the work," and, perhaps most significant of all, that "by educating our Saudi girls, we shall have educated wives, instead of ignorant wives."

## Israeli Counterpoint

BY OUR SPECIAL CORRESPONDENT

THE very fleeting visitor to Israel never gets far behind the hospitable face of this single-minded, assertive and accomplished little land. But he does catch echoes of a counterpoint in not a few Israeli minds to the single-mindedness, the patriotic assertiveness and the justified sense of swift and strenuous achievement during the past thirteen years.

The most striking feature now is the historic Eichmann trial, to which your correspondent could not go but which all visitors are invited to attend, with a traumatic visit to a museum where the full horrors of Nazi persecution are pictorially displayed. Israelis will not dispute the justice or the equity or the necessity of this (as all visitors agree) coldly and completely judicial process. But there is a low hum of questioning about what the effects of this grim demonstration may be, not upon the world outside, but upon the politics and the psychology of Israel and the Israelis themselves.

The leading fact about Israel today is that Israel now exists. It is a fact that has to be accepted equally by the Arabs who lament, and exploit, the lost homelands and by those Jews who bewail the funnelling of Jewry's destiny into an outmoded nationalism. Even more, perhaps, it has still to be accepted by Israel.

"It's no good saying that a solution is impossible," said a sensible and intelligent young Israeli patriot last week, when he heard that Mr Ben-Gurion and President Kennedy had talked in Washington about a scheme to solve the problem of the Arab refugees from Palestine; "we've got to have peace so that we can settle down." This wish to pause, without falling back in the race, to make good what has been so very remarkably done already, without striving too soon for too much more, can be glimpsed among veteran patriots as well as young ones, among professional men as well as ordinary folk.

It is not, though, what responsible Israelis say. Nor is it the policy of Israel. The race for survival must go on. The enemy is at the gates (a chief topic is what Arab intentions in the near future may be, and what measures Israel, with its conscript citizen army at the centre of its educational and social as well as military life, must be ready to take to be safe). The need to rally the people, to keep them moving forward, to raise and meet their aspirations as they are absorbed in the new society: these must determine not only foreign (and defence) policy but economic policy as well.

Good Israeli economists will frankly recognise that, on a strict reckoning, too much may be attempted at once; that too many enterprises may not be properly accounted at all, in terms of cost and yield; that many things are being over-produced and, at the same time, prices are too high; that, with so much reliance still on outside subventions for foreign exchange, more economic criteria and a wind of competition, with more natural exchange rates, would be desirable. In economics, as in attitudes, the tendency in Israel, perhaps understandably, is (in the golfing term) to "press" too hard. But these economists, too, go on to say that in the embattled race to secure and build Israel economic incentives have to give way to national and social ones.

The resemblance is to the new nation states of Asia and, still more, Africa—with the difference that Israel is ahead by the length of its educational provision, equipment and esteem, which are the

brilliant spearhead of its restless and remarkable advance. The young Israeli who said last week that peace with the Arabs was needed, so that Israel could settle down, admitted that Arabs might not want it because the profits of living together would go to skilled Israel. An intellectual and orthodox economist said just the same, pointing out that one would have to go, say, 2,000 miles east of Jerusalem to find a university and students' campus like those there.

The Israeli reply to the other Jews who lament the new nation state of Israel because it is an anachronism in the twentieth century is that Israel now has a mission to give example and aid to the new nation states in Africa and Asia, which at present are, in fact, the century's chief feature. The marriage of "liberation and knowledge," they say, which is going to enable Israel to "transcend the bounds of smallness," is what these others most want.

Must the tension and the race, then, go implacably on? And what will the end of it be, in the face that Israel presents to itself and to the world, in the view that the world will take of Israel, and in the attitudes of Israelis to Israelis? The other side of the siege and survival mentality is a formal framework of required conformity to traditional rules of conduct, which spring from the ways of life and worship that have enabled the community of Jews to preserve its identity through the centuries, but which contrast strikingly with the real, possibly unique, social democracy that is being established in Israel.

Here is another counterpoint. It can be caught in the fact that so many political clashes in Israel have sprung from this conflict between conformity and non-conformity; it is echoed in most private conversations. Any judgment by a visitor would be presumptuous. Where religious orthodoxy springs from the true tenacious belief that has withstood the persecution of ages it is the admirable quality of the Jewish people in an unbelieving world. But it is very hard not to feel that until the conformity that is factitious, as well as the gripping tension, can be relaxed for the sake of freer choices, the land of Israel will not be able to reach its real, bright promise.

## Bechuanas in Limbo

FROM A SPECIAL CORRESPONDENT

SOUTH AFRICA'S withdrawal from the Commonwealth fills the broad skies of Bechuanaland with several important questions. Despite the "standstill" agreement which gives a year's grace for South Africa to work out the details of its new relationship with the Commonwealth and with the adjoining British territories, some matters need swift settlement with this northernmost of the three High Commission countries.

Chief of these is the setting up of a new capital. By little more than an historical accident 66 years ago, when Southern Bechuanaland became part of Cape Colony, the present capital of Bechuanaland Protectorate is squarely inside the Union, enclosed in "the imperial reserve" at Mafeking. South Africa has welcomed the trade this arrangement has brought, but can hardly now tolerate such an anomaly. Similarly, Britain cannot long continue to base the protectorate's administration inside a country that has left the

## CAN BRITISH CARS TAKE IT?

## Can British cars take Australian bushwhacking?

### ASK PRESSED STEEL

Can our cars take it in the rougher parts of the world, or are they only at home at home? We can answer for the British cars we know, because we make their bodies.

They are put through tests at MIRA. Tests as violent as those given to armoured fighting vehicles. They are bounced violently over corrugated tracks (washboard surfaces which form in hot climates). Trowned over a thousand miles of potholed pavé (copied from Belgium's worst). Take a flight over pitching tracks.

Are left in dust tunnels to test the sealing. Driven through water. Drummed through noise, resonance and corrosion tests. Are baked in intense heat, then frozen for two days in temperatures down to  $-60^{\circ}\text{C}$ , and are expected to start within 30 seconds.

The cars tested like this are normal British cars, with normal Pressed Steel bodies.

PRESSED STEEL COMPANY LIMITED Car Body Division: Cowley, Oxford; Swindon, Wilts; Theale, Berks.

## We're in farming right up to our necks

Just because we're an oil company, please don't think we only live amongst traffic lights, cars, machinery and oil wells, and never get a whiff of the old farmyard. In fact we get whiffs of it all over the world. Look at our record.

We protect the crops in the fields with pesticides, fungicides and weed-killers. We make fertilisers to make them grow better. We look after fruits and vegetables in orchards and market gardens. We make fuel and lubricants for every piece of machinery on the land. We supply kerosine, fuel oil and liquid gas to help run the farmer's house. And bitumen for

roads, rafters and fencing posts. We do this all over the world, on farms, plantations and haciendas.

How do we know so much about the land? Because we have laboratories, experimental farms, and agronomists who keep up with the tricks of all the known pests, and marry our products to the latest farm machinery. That's why farmers trust us and the things we make. And they really do trust us. In the more lonely parts of the world, a farmer will save up his thorniest problem for the moment when his local Shell man comes driving towards him across the plain.

YOU CAN BE SURE OF

Commonwealth on racial grounds, even though the removal of the capital will cost (according to a range of estimates) anything from £1 million to £4 million.

The hesitation about where the new capital should be sited illustrates the problems facing Bechuanaland and hints at the expense of overcoming them. Either Lobatsi or Gaberones would be conveniently central. But the scarcity of water in the area has so far prevented any attention being given to the country's economically most important institution, the Lobatsi abbatoir. The choice of Francistown on the eastern border would seem better. Francistown has a good airport, is near Bulawayo, and is the main trading centre. The drawback seems to be that it is inside the Tati concession, a strip of two million acres which Lobengula ceded in perpetuity to an exploration company, and which was later taken over by two Johannesburg financiers, the Glazer brothers. Although the Tati company, in expectation of good business, has offered the protectorate government as much free land as it might want in Francistown for a new capital, the government is being very cautious about committing itself into the hands of a chartered company that enjoys almost unlimited powers in its tiny domain. The only logical conclusion may be for the British Government to buy out the Tati company—and, presumably, the sooner the cheaper.

Another issue of importance to be settled is the collection of customs, now performed for the protectorate by South Africa. This year the customs and excise estimates account for nearly a quarter of the country's tiny revenue of £1,480,000. It seems faintly improper that this arrangement should continue, even on an

agency basis. The South African rand is official currency, and there is little reason why it cannot remain so, especially since, in this easy-going country, Rhodesian money is also universally accepted. Perhaps these changes, however, will persuade Britain to take a

thorough look at the Bechuanaland economy. It would not be before time. Little has resulted from the economic survey mission led by the American Professor Chandler Morse in 1959. Cattle exports, after two years of drought and disease, have dropped alarmingly from a 1958 figure of £1,900,000, and the position of the country's only real industry has worsened further with the Katanga and Rhodesian Copperbelt markets dwindling because of uncertainty in the Congo and the decision to give copper miners money instead of meat rations. The measure of the country's poverty is shown by the size of the British grant in aid this year to balance the territorial budget of £2,400,000: the British grant has to provide almost 40 per cent of the revenue.

Bechuanas indicate two possible ways out of their troubles. Those with a kinship to Mr Micawber expect the geologists of the Rhodesian Selection Trust to run into the dusty streets of Francistown with shouts of "Eureka." This American-British copper company has a ten-year concession over 40,000 square miles of the Bamangwato reserve; and through a subsidiary company it is prospecting for a range of minerals as well as separately exploring salt and coal deposits. Although geologists have been at work for eighteen months, they are more concerned with a thorough investigation than with trying to achieve quick results; and if good news is to come at all from this quarter, it is unlikely to come soon.

The other group, which includes Seretse Khama, realistically

says: "We must work with what we know we have." Their development plans are concentrated on improving cattle production and encouraging agriculture. The problem, as always, is the scarcity of water. The government is spending a comparatively large amount on underground water development. A Francistown land agent is only one of many who insist that parts of this huge country have plenty of water, but, because it usually arrives torrentially, it is allowed to flood away to the Indian Ocean. They suggest that a subsidy scheme to assist farmers to build many small conservation dams would bring excellent dividends.

Seretse Khama, after years of semi-retirement when he renounced the Bamangwato chieftainship, has returned to the leadership with spirit. After his uncle Tshekedi's death he became tribal secretary and proved an efficient executive. Last month, in a series of pyramidal elections from democratic area meetings, he gained most votes of the ten Africans chosen for the new Legislative Council. He is almost certain to be one of the two Africans appointed to the Executive Council. Constitutionally, Bechuanaland is pursuing a curious course, with a large unofficial legislative majority of ten Africans and ten Europeans precluding any system of ministerial responsibility. But a most hopeful sign is the way Seretse Khama and another uncle, Rasebolai Kgumane, who has been the tribal authority during the suspension of the chieftainship, deplore tribalism and speak of the national unity of the protectorate's 350,000 people. During the four-year life of this constitution, long steps may be taken towards that goal through the legislative council, and a system of direct elections and ministerial responsibility may be introduced. But until these steps are matched by some economic advance, no one is prepared to talk much about Bechuanaland's independence.

## Australia and the Common Market

FROM OUR CORRESPONDENT IN CANBERRA

AUSTRALIA'S attitude towards the common market and Britain's entry into it was summed up by Mr Menzies in a report to Parliament on April 11th:

So far from complaining about the six-power treaty we have seen in it great political as well as economic value. But we believe that some wider association which would include Great Britain is desirable if western European unity is to be achieved and maintained.

Mr Menzies went on to say that Australia had its special interests to protect and would expect the fullest consultation before Britain entered into negotiations that might lead to an offer, or even to an agreement in principle; and by that he meant consultation while ideas were being formulated, not after they were fixed.

The assurances Mr Menzies asked for were readily given by the British Government and are being faithfully observed. The permanent secretary to the Australian department of trade will soon arrive in London for talks about the common market, and it is rumoured that Britain's Secretary of State for Commonwealth Relations, Mr Duncan Sandys, will visit the Antipodes in person. On the face of it, this would suggest a favourable atmosphere for discussion, but appearances could be deceptive.

The clash of economic interests is well known, at least in general terms. Australia's main export, wool, which still brings in about 40 per cent of total export earnings, would not be hit if Britain (the largest wool-buyer after Japan) joined the Six, since wool would not in any case be subject to duty. Exports other than wool, however, amount to about £A160 million to Britain and a further £A60 million to the Six—a big slice out of total exports of about £A920 million a year. Of these, wheat, meat and dairy produce,

## brake at the burnt

Already it is possible to drive your car up to certain banks and transact your business without leaving your seat. You have no problem of where to park. Nor are you faced by a long wait at a busy counter. You simply brake at what the underworld calls a 'burnt' and the rest of us term a window.

No ordinary window, this, but a Chubb Bank Window Counter. You press a bell, and a Teller appears behind bullet-resisting glass. You converse with him by means of a two-way intercom. A drawer carries your cheque in, your cash out.

Attention to detail makes the Chubb Bank Window Counter extremely convenient. But then Chubb know very well that in security matters, every detail counts. They also know that security equipment must not only resist the burglar: it must also be thoroughly practical in everyday use. That is why Chubb is the name to choose when security matters to you.

Write for details to: Chubb & Son's Lock and Safe Company Limited,  
14-22 Tottenham Street, Tottenham Court Road, London, W.1.

Chubb counter the crime wave

if denied free entry, would face grave difficulties. As a consumer one might not grieve too much over the fate of the dairy industry, which maintains its exports only by over-charging the home market; but the government can hardly sign its death warrant.

Australia can be relied upon to drive as good a bargain as possible by making the most of such difficulties. It is, however, prepared to pay a price for the political unity of Europe and for the continued prosperity of its largest market. Precisely what its maximum price would be has yet to be determined, and the final word will probably rest with Mr John McEwen, the powerful minister for trade and leader of the Country party. In view of this probability, more than usual interest attached to a lecture given last week by Sir John Crawford who used to be head of Mr McEwen's department and who recently accepted a chair at the Australian National University. He observed gloomily that Australian willingness to negotiate had always been predicated on some agricultural concessions by the European countries, but that these were not in sight. In discussing what Australia would do if Britain had to enter the common market at the expense of Commonwealth interests, he suggested that "it need not be assumed that Britain would in turn lose her preferences. Australia must hesitate to reward an uncompromising Europe in this way." Sir John also spoke of the technical problems of abolishing preferences—whether to do so by raising the tariff against Britain or by lowering the most favoured nation rate.

Apart from differences arising from the conflict of interests, there are other less easily definable possibilities of friction in the Anglo-Australian discussions that will soon take place. Relations between the two governments have been somewhat strained since the Commonwealth prime ministers' conference. There are those in Canberra who feel that the British Government, not excluding Mr Sandys, is so preoccupied with the new members of the Commonwealth that it has forgotten the faithful white Dominions; and that in striving so single-mindedly to build the multi-racial association it may lose what was best in the old Commonwealth. If it lessens that preoccupation, Britain's entry into the common market might have some attraction. On the other hand, if Britain shows anything but the most extreme reluctance to sacrifice Commonwealth interests, the impression of neglect and indifference will be confirmed. There are certainly some fences to be repaired. One must hope that Mr Sandys, if he comes, will have deft enough hands for the task.

## Burma's Maid-of-all-Work

BY A CORRESPONDENT

THE field of action of the new Burma Economic Development Corporation, which held its inaugural meeting at the end of April, is virtually limitless. Its *raison d'être*, like that of the Defence Services Institute which it is to supersede, is to fill the gap in Burma's economic life left by the squeezing out of foreign enterprise and the inexperience of the Burmese themselves. The change-over of the two organisations is, in some respects, merely nominal. The DSI, which expanded under General Ne Win's regime from an organisation performing roughly the same functions as the British Naafi into an economic ginger-group with a network of commercial subsidiaries, was bound to be cut down when civil government was resumed last year under U Nu. While the military regime carried out some necessary reforms, its blunt methods, often arrogantly enforced by junior officers in the provinces, caused widespread resentment. Since the recent purge among brigadiers and colonels—a very gentlemanly affair, the principal weapon being transfer to an embassy overseas—the army as a whole seems as anxious to get back to its proper duties as the population is anxious to see that it does so.

Nevertheless, army participation in economic affairs is still necessary, since the army is the only organised and energetic body capable of playing long-stop to the efforts of civilian business men. Seventeen of DSI's subsidiary companies have been transferred to the BEDC. The corporation's board consists of seven members of whom one, the chairman, is also president of the Defence Services Institute, two are closely connected with the institute, and a fourth is the secretary for defence.

The corporation's immediate concern will be with trade. The first step in the post-independence policy of excluding foreigners from Burma's import trade was to set up "joint venture corporations" of the government and private business men. A year ago, the government set out to transfer the agencies of foreign companies to Burmese hands. This "Burmanisation" of agencies would, if carried through, thrust on to the shoulders of the Burmese business man a heavy volume and complexity of work. It is here that the corporation could come in useful. For what in practice has happened is that, first, the decree intended to implement Burmanisation was so loosely worded that it has small effect; second, and more important, the corporation apparently intends to continue the DSI's policy of taking over foreign trading houses as subsidiaries, including some of the largest British houses, complete with their agencies.

ALTHOUGH Burmanisation is the liveliest issue in Burma's trade, it is not the most important. Most of Burma's imports, like its exports, are controlled by the government. Either they are bought by government organisations, or the choice of supplier is dictated by national trading agreements. The vital question, therefore, is whether the BEDC will intervene in Burma's trade pattern. So far, the pattern has largely been bilateral, and this, in some respects, has been to Burma's disadvantage. The outstanding example has been the reparations agreement with Japan which, until it expires in 1965, will probably mean that Japan continues to displace Britain as Burma's principal supplier. The reparations are paid in goods, which, not surprisingly, are often high in price and sometimes of poor quality. Apart from this, Burma has tended to buy from those countries to which it can sell. The crux of Burma's economic problem remains the recovery of its agricultural and mineral production from wartime devastation, postwar insurgency and post-independence mismanagement, and the diversification of its agricultural production. Burma's precarious balance of payments position leads to an annual fearful search for outlets for its rice crop, with the natural result that in recent years the government has favoured large, simple bilateral deals.

Burma was thoroughly disillusioned with the barter deals of the mid-fifties with the Communist countries. These certainly got rid of the rice but brought a high proportion of poor or unsuitable products in return. Yet, despite this disillusion, the fundamental problems remain and were the main reason behind the barter deal concluded with China in February.

It remains to be seen whether the BEDC will delve into these problems. The army was believed to be suspicious of the Chinese loan. The difficulty is that the directors of the corporation are as inexperienced as most other Burmese in economic and technical affairs. The DSI's answer was to seek the co-operation of foreigners, principally of Israelis. It may be that the new corporation will seek co-operation from similar sources or even from the old trading houses now under its control.

Apart from improving and diversifying its agriculture, Burma is attempting to diversify its whole economy by encouraging manufacturing industry. Because of the lack of a managerial class, and because of its own socialist theories, the government after independence pursued a policy of state enterprise. However, since most

of the government factories proved inefficient, the policy has been abandoned. The DSI launched into the industrial field in co-operation with foreign interests and it is possible that the corporation will continue this course. Apparently the government would like to see the foreign merchant houses withdraw from trading and move into industry, but the majority of them would probably prefer to get out altogether. The government is also inviting over-

seas manufacturers to come in under the Investment Act of 1959, which offers attractive privileges. If investors are put off by the uncertain atmosphere of the country and, in particular, the unsettled status of the foreign trading houses, the corporation may move in, either in collaboration with foreign interests or with the help of foreign aid. The BEDC is in fact a potential maid-of-all-work in Burma's economy.

## Africans on the Move

FROM OUR WANDERING CORRESPONDENT IN AFRICA

As nomadic as any other African tribe, black politicians give ample positive expression to the African personality by flying to Europe and America. Black South Africans look for solidarity in Dar-es-Salaam, Accra, Cairo, London and New York: their leaders are not so easy to find. Nairobi is the last place to look for Mr Tom Mboya of the Kenya African National Union. After the elections, when Kenya was providing plenty of work for its politicians, the presidents and general secretaries of both nationalist parties led full delegations off to Cairo. Mr Mboya and Mr Ngala (of the Kenya African Democratic Union) popped back to Nairobi long enough to discard their sports shirts and put on lounge suits, and then they were off to London, where the Colonial Secretary, Mr Macleod, got back there from Africa just in time to meet them. Mr Mboya is still frequently out of Kenya.

In Nyasaland nothing more serious looms ahead than a general election which will give the colony its first African government. Dr Banda's absence at the beginning of April was, in the circumstances, not a calamity. But in Southern Rhodesia, where things are not decided, the National Democratic Party leader, Mr Nkomo, was missed; so was Mr T. G. Silundika, the general secretary, who went to Indonesia and other places. Mr Nkomo and Dr Banda were joined in New York by Mr Kaunda of Northern Rhodesia: that colony's new constitution is in debate, and one would think that the leader of its strongest black party could hardly be spared.

The first purpose of an African jaunt abroad is the collection of money for party funds. Moral support, or United Nations sympathy, may be gathered on the way. On longer absences political training may also be acquired. Visits to the Colonial Office are proving more useful than dinners with Labour MPs, but either is a legitimate excuse for a trip. The men who stay behind secretly suspect that the real attraction is the glamour of being fêted in foreign capitals. For some, this is quite a relief from the daily routine of an "agitator" in a dusty little town. Black South Africans are often genuine

refugees from unpleasantness. Others are sent off so that they may trumpet down the walls of Dr Verwoerd's Jericho from outside. The complaint all over Africa is that too many non-politicians are leaving the Union in expectation of a free living. Worse, it is charged that not enough good men are staying behind to do the job from within.

In Dar-es-Salaam about thirty South Africans form a small colony in the town's African quarter. Mostly they are bored, and worse fed than at home. Many men whose fame preceded them have stopped over at Dar (some in ministers' houses) on their way to Accra and beyond. Mr Philip Kgosana, of the post-Sharpeville march on Capetown, was one. Others are unknowns and some, it is whispered, are chancers. All are looked after by Mr Nyerere's Tanganyika African National Union, which finds the task expensive. The representative in Dar-es-Salaam of South Africa's banned African National Congress is Mr James Hadebe, whose task is to do his best for his charges, and also to run the local office of the South African United Front (leading the trumpeters).

But not even Mr Hadebe can find work for all the new arrivals, especially at a time when there is much unemployment in Tanganyika. The more fortunate refugees travel by somehow getting to one of the protectorates (Bechuanaland, Basutoland, or Swaziland) and taking special aircraft from there. Others wander, as anonymous migrant Africans, across the long land route. Some, who left the Union at the time of the emergency a year ago, are still arriving in Tanganyika.

One attraction is a belief that scholarships await all exiles: several hopeful young men have arrived in Dar-es-Salaam to ask about entrance to overseas universities. Not all of them have the necessary qualifications; in any event, scholarships are rare. But it is difficult, and it would

be politically embarrassing, to turn anyone back.

In Nyasaland, and in the Rhodesias, the refugees rarely stay long; the federation is still under a government that could be hostile to them. In Northern Rhodesia the United National Independence Party has, privately, complained to the South African United Front about the number of men who are not genuine refugees who turn up in the colony, expecting money and help from Unip. An arrangement has been negotiated whereby the United Front screens people in the protectorates before they leave.

In Lusaka, Unip officials say that the South African police has sent one or two of its own men through, disguised as refugees, in the hope of learning more about the several "escape routes" used. Men suspected of being police agents have been turned back. In some parts of Northern Rhodesia suspicion of refugees has risen to the point where new arrivals are closely watched for their first week. One or two have had their clothing and belongings searched. Most of them pass this test, however, and are sent on to Tanganyika.

The most damaging quarrel between the South African organisations and nationalist parties in the rest of Africa is about tactics: time and again refugees are asked why they are not at home, resisting or sitting in gaol. Some, of course, are sent out for specific purposes by either the banned African National Congress or the banned Pan Africanist Congress in South Africa. Even these find discussions about South Africa, where "one man one vote" is not around the corner, embarrassing. Few, however, are going back.

## SAFETY IN OUR TIME

On the low road, the high sea or anywhere in Upper or lower Space, life or death relies on electricity. In fact, there is just a faint line between sheer enjoyment and madness. But in our time sheer enjoyment is taken for granted.

No solid citizen in his right mind anywhere would drive at night without lights... any more than a ship's captain or the pilot of a jet.

We take electricity as part of our heritage, in such forms as light, heat and power, all vital factors of our better living.

Hitachi, Ltd. is a leading force in the development of electricity in the Far East, manufacturers of everything electric and electronic from gigantic generators to tiny tubes and transistors. These Hitachi products, now world-renowned, are contributing to today's modern, better, and safer living.

But Hitachi's research scientists, never satisfied, are daily engaged in all-out efforts to enlarge the usefulness of electricity, to make tomorrow's living better than that of today.

*MONSANTO PUTS CREATIVE CHEMISTRY TO WORK*

# Monsanto and the Instant Rescue Boat

When Britain's newest passenger ship wants to put a man ashore or send her doctor to a passing tramp steamer, the call is for the "instant" rescue boat. "Instant" because it is specially designed for the job—with a hull of glass-fibre and polyester resin. "Instant" because it is ever-ready for duty at sea. And "instant" because it can be launched in an instant.

Monsanto plays its part by supplying phthalic and maleic anhydrides—raw materials for polyester resin.

The hull of the rescue boat scorns maintenance, shrugs off the menace of salt-water corrosion, and is not to the taste of deadly marine-borers. It is oblivious of time, tide, wind and weather . . . and the only painting it needs is for cosmetic effect.

And so, the reinforced-plastics rescue boat, light and as tough as they come, is available at a moment's notice. To answer man-overboard calls . . . to take crews on shore leave . . . always ready for any emergency.

Here is another example of how Monsanto puts creative chemistry to work—and brings a better future closer.

*If you, as a manufacturer, are interested in chemicals or plastics, it will pay you to get in touch with Monsanto.*

**MONSANTO CHEMICALS LIMITED**  
970 Monsanto House  
Victoria Street, London, S.W.1  
and at Royal Exchange, Manchester 2

In association with: Monsanto Chemical Company, St. Louis, U.S.A.; Monsanto Canada Limited, Montreal; Monsanto Chemicals (Australia) Ltd., Melbourne; Monsanto Chemicals of India Private Ltd., Bombay. Representatives in the world's principal cities.

This Johan Polak painting shows one of the two first-ever reinforced-plastics rescue boats in action. Made by Viking Marine, it is part of the equipment of the S.S. Canberra, whose 22 lifeboats are also made from polyester resin and glass-fibre.

## The Silences of Mr Kennedy

FROM OUR SPECIAL CORRESPONDENT

MR KENNEDY never said it. Whether he was ever tempted to, out of passing sympathy for the guarded, official faces struggling with inner wishfulness and anxieties, may be doubted. But not a word passed his lips in London to reassure his audience that 1961 was still 1941, that the mystical association, impervious to time or reason of state, persisted into another presidency. He had arrived, as he found it necessary to repeat, to attend his godchild's christening and to tell Mr Macmillan what had passed in Paris and Vienna. The warming words, the predictable Eisenhower sentiment, were not to be. This was astutely, and not unkindly, done. For a tensed and tired man (as he looked on Sunday evening) the silences of Mr Kennedy were sagacious and firm.

The message was not unexpected: so far as it has been understood it has been taken with a good grace. Indeed, Mr Kennedy departed to heartfelt sighs of gratitude from pro-Europeans that, however unsuccessful he may have been in persuading General de Gaulle to give Britain an easy passage into the Treaty of Rome, he had done nothing to justify British dilatoriness in trying to get in. This political preoccupation with the European debate had appeared, in fact, to be sustaining a massive British indifference to the Vienna meeting throughout the preceding week. And this, in turn, was reflected in the British press's own safe preoccupation with Mrs Kennedy's patronage of the House of Givenchy and the comings and goings of Parisian coiffeurs. It came as news to the public that Berlin looked like blowing up into a crisis again. All late-developing fears on this score were, however, extinguished by Eurovision's comforting spectacle on Saturday night of the Kennedys and Khrushchevs in neighbourly attendance at the musical *conversazione* at the palace of Schönbrunn. The Black and White Minstrel Show had nothing on this.

UNTIL late on Sunday evening London even appeared unaware of the Kennedys' approaching descent. On a clammy and unfervent afternoon 3,000 nuclear disarmers gathered in Trafalgar Square to embrace other American visitors en route from San Francisco to (they hope) Moscow: some of these later trailed out westward towards the airport. They were more or less prepared. But the Sunday papers printed no street maps of the Kennedys' route to the Radziwill home in Buckingham Place: even the published hour of their arrival turned out, because of delays in Vienna, to be wrong. The 250,000 people that gathered along the pavements from Hammersmith inwards were uninvited and (judged by the pace set by the motorcade) largely unexpected.

It was not the tumultuous reception that had greeted Mr Eisenhower in 1959. But the mattresses of Hammersmith are stuffed with life savings put by to purchase a home and a plot in Kerry or Wicklow, and the London Irish streamed from the Broadway to the Garryowen club on Sunday night conscious of a duty decently done. The next day the crowds were heavy round the Radziwill home and Admiralty House, but only moderate elsewhere. In Grosvenor Square this disturbed one crew-cut onlooker. His companion was only partially reassuring: "It isn't a world meeting here. He's just called in to see whether he can depend on everybody."

Mr Kennedy could, as it turned out, depend on Mr Macmillan to keep mum in the House of Commons about all that had transpired in the three hours and twenty minutes of "very serious, very friendly" talking at Admiralty House. (The more nationalistic observers promptly calculated that, since there was no need for translation, this was in effect a longer discussion than anything held with General de Gaulle. So much, they concluded prematurely, for the wooing of Paris.) The presidential departure for Buckingham Palace that evening was the occasion for more demonstrations of enthusiasm and an obliging kerbside interview on television. But there was no balcony appearance at the Palace, a matter seemingly of some regret to American officials in London. Such affairs are apparently reserved, with the ceremonial fireworks, for state visits alone.

Mr Macmillan (like Mr Khrushchev in Vienna) certainly made no bones at the airport about his expectations of a helpful, lengthy visit in the near future. Mr Macmillan's speech there, brief but necessitating much turning over of pages, was at once breezy and imploring, itself appearing as a curious reflection of British uncertainty in the face of an altered Anglo-American relationship. It is not yet clear how this will settle down in popular estimation. Mr Kennedy arrived in a London that is aware of changes, conscious of the need to explain itself better (hence, in part, Lord Home's transatlantic journey this month) and, above all, anxious not to displease. This may be why Mr Watkinson evidently thought it desirable last week to add a British nuclear voice to the chorus warning Mr Khrushchev against any hasty move on Berlin. There is inevitably a feeling that the personal associations of the war are ending, and that new ones need to be built up. So Mr Ormsby-Gore, who possesses the necessary foundations of personal friendship, is being despatched to Washington. The British performance this week has not been very confident; but the experience of the Kennedy visit should be a salutary one.

... For London, Conundrums

## Kirk Unmilitant

FROM A CORRESPONDENT IN GLASGOW

THE Church of Scotland, with 1,300,000 full members and many adherents among the nation's 3,500,000 adult population took some 25 major policy decisions during its annual General Assembly which ended in Edinburgh last week, and demonstrated in the process that it has virility yet. The doubt seems to be whether it has enough to hold what membership it has without embarking on the redemption of the million or more adult Scots whose background is Presbyterian but who nowadays do not go to church at all.

Such backsliding is by no means peculiar to Scotland. But it is a problem that causes acute concern to the auld kirk, which even today enjoys a mass support that makes it more truly representative of national life than most churches. This year's assembly, rich as ever in austere ceremonial, was attended by about 1,400 commissioners (ministers and elders equally apportioned) who were delegated from 66 home presbyteries and a handful overseas. The commissioners, over the eight-day sessions, debated kirk and state in that disputatiously democratic way the Scots have and, in the continuing absence since 1707 of a Scottish legislature, repeated their partially justifiable claim to speak on all matters in the name of Scotland.

BUT the Church of Scotland, strongly evangelical in religion and stubborn in defence of its hard-won freedom within the Reformation, can be highly conservative in other ways. This may be understandable in a body old enough to welcome the Queen last October to its fourth centenary celebrations, but many of its critics decry the kirk's canny tendencies in handling most of the major issues of the day. It may well explain why large numbers of the backsliders do in fact backslide, and it is one reason why the church's claim to speak for a nation with radical traditions deserves to be treated with some reserve.

The assembly has been less fiery than most in recent years, in spite of the urgency of international problems such as Central and South Africa and the Polaris missile or domestic issues like Scottish home rule, Sunday drinking and the churches' modern quest for unity. The assembly at the finish called out most boldly for the third year running on Central Africa (where the kirk has an historic commitment which it feels deeply) and urged the whites in the Federation of Rhodesia and Nyasaland to go more than halfway with emergent Africa to make possible a model association of races on the continent. This decision, like others from Edinburgh in the past which have sustained African nationalism, owed almost everything to the Very Rev. Dr George F. MacLeod, an outstanding radical who can sometimes carry the assembly farther perhaps than it means to go.

Some Scots cynically believe that the church responds best when its own interests are intimately involved or when it is pre-

Dr MacLeod: the radical cal-

sed with a moral challenge so precise that individual members cannot evade it. Central Africa may illustrate the point, for the assembly over three years has shown great willingness to accept the testimony of its Nyasaland missionaries and to fight vigorously for African political rights in an area which its missionaries understand. The kirk apparently felt compelled to demonstrate positive leadership and did it to an exceptional degree; the question of whether a dogmatic approach made for good or bad leadership was exactly what divided the assembly so bitterly during each of the Central Africa debates.

All this partisanship was in sharp contrast to the kirk's more characteristic preference not to take sides on the equally

political question of the Polaris missile base at Holy Loch. Polaris was not debated as such: the assembly accepted a recommendation that Polaris represented a breathing space in which to press for multilateral disarmament. But the issue crept in again on the heels of a unilateralist motion which sought to pledge the kirk totally to pacifism. The motion was roundly defeated, and Dr MacLeod failed further to have a special committee appointed to examine the relative merits of Christian pacifism and the doctrine of the just war. But the kirk's conscience was nevertheless pricked, and as a direct result the assembly instructed its premier committee to prepare for next year a full report on peace and war.

Just what will finally emerge on peace and war is anybody's guess. It may be that an electrifying call in Christian terms would fail to revolutionise international relations, but it might rekindle interest among some, at least, of the kirk's missing million. The verdict, however, is likely to cause less excitement among churchmen themselves than a proposal that the Moderator pay a courtesy call on the Pope when in Rome next year on other business. The kirk remains ultra-suspicious of all traffic with Rome even in its current ecumenical enthusiasm, and with the real possibility of opposition arising within the presbyteries it is far from certain that any such meeting will take place. This, in fact, is the sort of theological issue about which the Church of Scotland can always be trusted to take the firm line that its critics complain is lacking on all but the odd and memorable occasion like Central Africa.

## City and Suburban

FROM A CORRESPONDENT

"GIVE me your tired... your huddled masses yearning to breathe free." The words (from the pedestal of the Statue of Liberty) appear also on a small plaque in a modern office building in Croydon. In flowery terms they describe the offer that Croydon and other London suburbs are making to office workers in the jungles of the City and the West End.

Several firms have already accepted. Whether their reaction to the change is favourable or adverse seems to depend on how well they planned their move, where they are situated and how important they regard the social life of the City. The experience of one of them, the Land Division of Lloyd's Register of Shipping, will serve to show how some of the worst pitfalls of dispersing can be avoided. The office moved to Croydon in June, 1959. It now occupies three floors in a large block built speculatively by the Norwich Union.

The preparations for the move took a year to complete. Croydon was chosen for several reasons. It was near the geo-

graphical centre of the area in which key personnel lived, so that only ten employees out of 65 or 70 felt compelled to move. (The firm paid for this.) The remainder of the staff, consisting of about 30 secretarial and clerical workers, was systematically recruited (whenever a vacancy occurred during the preparatory year) from south London.

Another reason why Croydon was chosen was the frequent 17-minute train service to and from London Bridge. This suited clients visiting the office and messengers travelling to the firm's other departments in Fenchurch Street. Communication by telephone is also straightforward. Unlike some suburban exchanges such as Epsom, CROYDON may be dialled directly from London without an area prefix and without the help of an operator. The expansion of the subscriber trunk dialling system will eventually extend this service (and the metropolitan rate of 2d. for three minutes) to exchanges as far away as Horsham, but it will involve longer dialling codes.

Unlike Surbiton, Croydon retains some local character. On Tuesdays there is a street market with barrows and boisterous costermongers. It also offers office workers a flourish of shops. Typists can choose from several department stores. An office on the Great West Road or Purley Way may be more accessible to executive cars but to secretaries it is a shopping desert to be avoided if possible.

Parking for 11,000 cars within a quarter-mile radius of the town centre is planned by Croydon county borough. Although parking is admitted to be "a hell of a problem," at the rate of 1s. for four hours it is also cheap. New office developers are now required to provide one parking place per thousand square feet of office space, but Lloyd's Register occupies three floors in a recent building and is allocated only three car berths.

On average, people at Lloyd's Register and other Croydon offices seem to travel 35 minutes to work. Croydon is, of course, equally approachable by train from East Grinstead and Victoria. It is also the centre of a network of country buses. Much more difficult is getting to it from Watford, which involves a journey both into and out of London. Equally awkward, unless done by car, is a trip across the suburbs and across the radial pattern of London communications from a place like Hounslow. Clearly, therefore, an office in the suburbs

does control the domicile of its staff more than a City one.

The Croydon restaurants are adequate for everyday meals and modest entertaining; more may spring up as the offices now building are completed. The lack of anything comparable to City luncheon clubs is, however, bewailed by senior and more old-fashioned businessmen.

Rent per square foot for suburban office space can be 15s., 12s. 6d. or less. Many tenants seem to pay about half of what they were previously paying in the City. The buildings they occupy are generally more modern and correspondingly warmer, lighter and cleaner. By paying about three-quarters of their former rent companies can both save money and expand office space. This has a good effect on staff morale. "When I worked in the City," said a telephonist who enjoyed a view towards Selsdon Wood, "you'd have thought I was the crown jewels from the vault I was in."

THE experience of Lloyd's Register and other Croydon firms applies exclusively to offices near the middle of suburban towns. Sites on arterial roads are different. Transport to and from them tends to be by

Yearning to breathe free...

car or bus alone. A lack of shops and restaurants may make it necessary for staff canteens to be provided. The remoteness of banks means that money has to be carried long distances.

Suburban town centres, on the other hand, seem practical and pleasant places to work in. Time may even give them an seem a bit raw but time may give them an atmosphere and associations of their own to set beside those of Threadneedle Street and Bread Lane.

Wales there are five towns with a population of over half a million, while more than half the total population and about two-thirds of the urban population are aggregated in 184 urban local authority areas of 50,000 or more. The concentration is even more intense than these figures suggest since more than one-third of the total population live in the six major conurbations.

AMONG these preliminary findings, perhaps the one that will be most talked about is that women still outnumber men: to every 1,000 men in England and Wales there are 1,066 women. This predominance of females is no longer true at the marrying ages, but, because women live longer than men, they are still in the majority. But not everywhere: in the mainly agricultural areas there are more men. Thus a county analysis shows that, in England and Wales, Rutland has the lowest proportion of women, their ratio to men being 0.913, and Huntingdonshire comes next with 0.944. At the other end of the scale, Sussex has the biggest concentration of women: in the eastern part of the county they outnumber men in the ratio of 1.252.

One further set of facts deserves mention. There are now 14,702,823 private households and 14,647,922 private dwellings in England and Wales; ten years ago the corresponding figures were 13,117,868 and 12,079,712. From having over a million more families than houses, the excess has been reduced to little more than 50,000.

## Snapshot of the British

LESS than seven weeks after the taking of the sixteenth census on April 23rd, well within the target time, the preliminary figures have been published of total and district populations. There are no startling findings: indeed, on first glance, the census seems to tally so well with expectations as to make it seem almost unnecessary.

According to the count, the population of the United Kingdom on April 23rd was 52,675,094; the Registrar Generals had estimated that on June 30th last year it was 52,383,000 and, on recent rates of growth, their predictions for this year could not have differed much from the actual count. However, area by area, the estimates cannot be expected to be quite so good; to begin with, the population of Scotland is now discovered to be about 45,000 less than had been expected.

The shifts in the population over the decade between the two censuses have been well documented: the drift away from Scotland (about half of Scotland's loss of some 250,000 by migration was to other parts of the United Kingdom, mainly England, and about half overseas); the falling population in London but the big growth in the surrounding counties and the south-east; the movement of dormitory areas farther away from the centre of the conurbations; the filling up of south-coast resorts by the swelling army of retired people. All these

developments may be familiar. But how well known is the actual snapshot of the British people which the census provides?

How many of its citizens, for instance, could put in order the ten largest cities in Great Britain? Or say to what extent the population of England and Wales is concentrated in urban areas? The two accompanying tables show that in England and

| URBAN DWELLERS (England and Wales) |              |                                   |
|------------------------------------|--------------|-----------------------------------|
| Population of Urban Areas          | No. of Areas | Total Population 1961 (Thousands) |
| Less than 5,000 .....              | 172          | 560                               |
| 5,000-10,000 ..                    | 163          | 1,188                             |
| 10,000-20,000 ..                   | 215          | 3,156                             |
| 20,000-30,000 ..                   | 109          | 2,702                             |
| 30,000-50,000 ..                   | 122          | 4,673                             |
| 50,000-100,000 ..                  | 117          | 7,921                             |

# BRITISH OXYGEN ARE PROPANE EXPERTS

The use of bulk propane is backed by the huge resources of British Oxygen. In practical terms, this means the free installation of bulk storage tanks: regular servicing of these installations and reliable delivery of BOC propane by tanker and in cylinders. British Oxygen experts estimate your propane needs—supply you with equipment—advise you on the advantages of using this resourceful fuel. Propane. Bought from British Oxygen.

Two of Canada's chartered banks—The Canadian Bank of Commerce and the Imperial Bank of Canada have come together under one roof.

The amalgamation became effective with the formal approval of the Governor-in-Council; previously the agreement had received the enthusiastic acceptance of shareholders of both banks.

The name is new: Canadian Imperial Bank of Commerce. But the amalgamation it represents is a bringing together of two long-established banking traditions.

With more than 1,240 branches across Canada, at certain points in the U.S.A., in the Caribbean area and in London, Canadian Imperial Bank of Commerce has the largest branch network of any Canadian bank and is admirably equipped to help you with your business in Canada or abroad.

## Equities Remeasured

A PERKIER mood has returned to the ordinary share market after last week's sharp tumble. Those of the "equities at all cost" school are shrugging off this setback, arguing from past experience that it was bound to be short lived, and rejoicing in this week's successive recoveries. This is too simple a view. Between the end of 1960 and the middle of May, ordinary share prices, measured by *The Economist* indicator, rose 20 per cent; even after this week's recovery they show a fall of nearly 4 per cent since mid-May. The big rise in the first 4½ months of this year occurred against an improbable background—stationary production, some degree of cost inflation, and some shrinking of profit margins. It seemed as if buyers could wait no longer, having waited most of 1960 for growth to be resumed, though there was little evidence of growth in the economy itself. The issue that the ordinary share market has to decide is a fundamental one: Is the latest setback a first move in correcting an unjustifiably rapid advance in the first months of this year? Or is it a pause for breath in a new long term rise, with all the factors responsible for the standstill in 1960 completely worked out? The answers to these questions will determine whether the *Financial Times* index is bound for 400, or whether it comes back to the 300-320 range.

Yet these questions involve few genuinely new considerations. There were enough warnings about growth and profit margins long before the chairmen of ICI and Vickers added their weight to the evidence. They rest on the same points of caution that investment comment in these columns, and the investment policy of many of the institutions, have had in mind for several months. Essentially they involve the same forces that checked the market in 1960 and they can be summarised in the statement that Britain has not learned how to grow without inflation or how to solve its external problem. The dividend increases of the first four months of this year were generally no better than the share prices of early 1960 had already anticipated (and some were less good). Wall Street was

a help until it, too, got stuck at a peak that looks forward a long way towards the fruits of economic recovery. In both markets, short-term speculation has taken a big hand—in the buying of every insecure share labelled "electronics" in the American market, and in some hectic chasing of brewery, bank and property shares in London. And there has been so much alleged "anticipation" of the trustee investment bill that one wonders if most of the trustees in this country have been indulging in *ultra vires* gun jumping. If, when the act is eventually passed, trustees find themselves able to face the heavy loss of present income and to buy extensively into ordinary shares, they will help further to widen the yield gap, and that fact would not be lost on the institutions whose investment policy has already been significantly adjusted to fit the present gap.

WHAT is the lesson of 1960 for the ordinary share investor? Surely that if the magic of growth is still elusive and the brakes have to be firmly applied after only a brief period of expansion, there can be no immediate growth potential for equities either. Nor are equities a very satisfactory answer to re-emerging inflationary pressures so long as British governments are ready, in the defence of their reserve currency, to check domestic spending. Competitive forces have increased in both home and export markets; and if Britain moves into Europe they will not be lessened even though the opportunities for trade are widened. The only difference in the last few weeks is that industry has begun publicly

to advertise some of these difficulties. Its cost inflation is at work, with wages up and salaries up even more. But industry as a whole cannot nowadays rely on automatically reimbursing itself, as it did for so long after the war, by raising prices. Price increases by the brewers, the bakers and the cigarette makers have caught the headlines, and conceivably they will affect future wage claims. But many important sectors of

industry outside the consumer field are selling less than they could and their productivity suffers from less than optimum use of their invested and employed resources. The result is a nasty squeezing of margins.

In very few industries—almost none since 1952—has there been any purposeful attempt to get costs down. This is not a matter for which industry should bear all the blame—Government and trade union policies should carry a large part of it too. The moral for the ordinary share investor is that foreign competition is already stronger—with the ending of trade discrimination from 1959 and with the formation of EFTA—and will become stronger still when tariff cuts emerge from GATT and Britain gets economically involved in Europe. This involvement of equities in international economics is also sharply brought out by their reaction to pressure on sterling—if the early months of 1961 were in some sense an exception to this principle, that is ground for regarding the rise in ordinary shares at that time with a certain suspicion. It is not that the equity market is currently anticipating exchange depreciation (that indeed would be a classical argument for putting shares up) so much as measures to avert it, such as the Chancellor using his 10 per cent indirect taxing power. In itself, this need not be so terrible for ordinary shares; but the point is that unless the Government changes its mind radically, it will not allow internal demand to go rip and force up ordinary share prices along with everything else.

As soon as uncertainties arise about the future course of equity dividends, fixed interest stocks grow relatively in attraction. Ever since the yield lines crossed in the summer of 1959 to show a reverse gap, equities have been sensitive on this point. Fears about sterling have again depressed the gilt-edged market, driving Old Consols down to 40 and pushing up yields to record heights. Given even a small change in the market's mood, present returns on gilt-edged stocks would become strongly competitive with equities. It is repeatedly said that gilt-edged are friendless. War Loan certainly is just now. But there were friends enough to buy £640 million of gilt-edged between April and December last year, after allow-

ing for bank sales. This huge volume of buying, disguised (or in part encouraged?) by falling prices is portentous; if demand were to continue at anything like the 1960 rate, gilt-edged would surely make progress unless the authorities were prepared to squeeze bank liquidity still further. The Chancellor and his Financial Secretary have come close to advertising this possibility and, clouded though it is by sterling, there may still be a better chance of gain than risk of loss in gilt-edged and in the meantime a high income. At some stage, perhaps reasonably soon, gilt-edged may come to be regarded as eligible investments—as in some degree they already have done in the calculations of at least some institutional investors. But everything hangs on a successful defence of sterling.

UNLESS that defence fails, will it be reasonable to expect the ordinary share market to break through its mid-May peak in the next few months? Will investors come back to a market where they can average 4½ per cent twice covered on a mixed portfolio of equities (with many shares well below the average), but can get nearly 2 per cent more on a 15-year stock? Many of the factors that made for caution and selection last year are equally present now, and they apply, moreover, to a much higher level of prices. At this stage, it is hard to imagine rises in profits, or in dividends, matching those recorded in respect of last year. It may be that current earnings will not force many reductions in dividends, but they may not afford more than modest increases either—which may be disappointing for some shares looking a long way ahead. It looks, indeed, as if the market is destined to fluctuate between narrow limits for the next few months—say, between 320 and 350 for the *Financial Times* index. Below the 320 mark, equities could be said to be cheap in comparison with the end-1960 level of just over 300, since earnings and dividends are higher.

It is, indeed, easier to find groups that look fully valued rather than underpriced. For the best quality in insurance shares, a price is now demanded that will take years to justify.

common stocks would no doubt be strengthened if the administration succeeded in persuading the Federal Reserve not to reverse its present easy money policy. But investors have their doubts whether long-term rates can be stopped from rising as recovery in the economy progresses.

Within present policy, in any case, both the Federal Reserve and the administration aim to keep short-term interest rates up. This week, for example, the Treasury embarked on a new course, offering 1.8 billion dollars in a "strip" of bills that run from 50 to 150 days, with portions maturing in each of eighteen successive weeks. In effect, the Treasury has added 100 million dollars to its regular weekly bill auction but instead of selling them each week has offered them in a package for the entire period. The market looks upon the idea with favour and appreciates the good average yield it can secure. The Federal Reserve, too, welcomes the moderate increase in short term rates.

volume of trading has declined quite sharply and interest is now focused on seasoned issues which offer reasonable values both in terms of prospective earnings and yields. Blue-chips, however, are not in great demand, for earnings reported by the big companies are not very impressive as a whole, and buyers are showing rather more interest in second rank stocks which can be acquired at higher yields than their big brothers.

With the Dow Jones industrial average just above the 700 mark, compared with 565 when the bull market got under way in November, many investors think that the summer rally, if it comes, is likely to be of fairly modest proportions. But there is no doubt that investors, private and institutional funds alike, have money available; if profits improve there could be a new upsurge in buying and the appetite for

The same is true of the steamily growing but expensively fashionable shares in electronics. Breweries and banks after their fine fling are respectively on the 4 per cent and 3 per cent yield marks, prompting the ugly suspicion that one can sometimes pay too much even for the best. The biggest cement company, APC, offers 2½ per cent (though handsomely covered) and its lusty rival, Rugby, yields 1 per cent less (with good cover too); could one justifiably go much further than this in investing in the building boom? When one turns to the top division—ICI, Metal Box, or Guest, Keen, say—modest yields which would certainly be justified by the assured prospect of growth are qualified by recent warnings about costs and the pace of future expansion. This does not mean that excellence has suddenly become unesteemed; but any purchase even of the best is taking for granted prospects of growth about which the leaders of a number of important industrial groups feel less certain than they did.

Unfortunately, the converse of this argument is not automatically true either. Do good yields and good cover on steel shares adequately justify the industry's patchy outlook

on the short view and its concern with expensive expansion on the longer view? They may for the courageous. In oil, the yields have a mouth-watering quality until one remembers first, that a gross fund gets not a penny of tax back, because Shell and BP (and Burmah almost) have a nil net UK rate, and therefore buys them, if at all, on a net yield basis; and secondly, that five years may easily be the minimum time for the industry to get back to more stable market conditions, if indeed it ever can. The dilemma that the top quality in equities has an exiguous yield and that elsewhere a reasonable level of current income usually has some snags attached to it is not new. But at this time, current income is talking more loudly than it did, because there appear to be a few snags about low "growth yields" too. On any significant reaction in the equity market the buyers will come in. If the investor were to wait for that, and meantime to confine his specific attention to equities with solid earnings cover and proven record in growth and dividends, he should not go far wrong. He may indeed see some of the recent fashionable favourites at lower levels before being tempted to buy.

## Building Societies in Business

CROMWELL's major-generals often talked politics in the guise of theology and for a few days this year it looked as if some members of the building society movement were taking a leaf from their scripture in talking of interest rates in terms of tax. The increase in profits tax from 12½ to 15 per cent was the immediate signal for a number of quite bellicose statements that if the tax burden were to become heavier interest rates would have to go up. But the societies knew that the profits tax increase added only 3d. to the total tax payable on each £100 borrowed and lent, and they could easily make the guess that the composite rate of income tax paid on shares and deposits this year will not rise very much above the 5s. 4d. in the £ paid in 1960. The extra pennies in tax are unwelcome as they reduce the already slender margins available for reserve appropriations; but in themselves they were not sufficient cause for an increase in interest rates. The fuss, in fact, was an attempt yet again to persuade the Chancellor to exempt building society surpluses from profits tax.

At the time, however, it drew attention from the lively debate whether, for reasons other than tax, interest rates ought to go up. This debate is now resolved. The Building Societies Association recommends that the net rate on shares should go up from 3½ to 3¾ per cent on October 1st and that the mortgage rate should go up from 6 to 6½ per cent, for new borrowers immediately and for existing borrowers after October 1st. The decision to defer increasing the share rate until the autumn suggests a close debate—a compromise between the views of some big societies that investment rates would eventually have to be put up, though not yet, and those of many small societies pressing for an immediate increase. Some of the latter will probably jump the gun. The important point is not the timing of the change but that big and small societies alike have at last recognised the necessity for an

increase. The grounds are set out in the association's official statement:

During the last few months there has been not only a slowing-down in the amount of savings placed with the building societies but also a tendency for withdrawals to increase and it has now become clear that the present rate of interest on shares is no longer sufficiently attractive to the public. Nor does there seem to be any sign of an improvement in the situation in the near future. In addition, societies are faced with increased taxation and higher management expenses.

In other words, it was lack of resources, not tax or management expenses, that goaded the societies forward—except possibly the Halifax, which remains outside the association and whose directors have decided to defer any decision on rates.

The incidental widening of the gap between borrowing and lending rates will help societies that need to bolster their reserve ratios as a condition of participating in the Government's house purchase scheme and of securing trustee status. This is shown in the following table:

|                                             | Old rates<br>£ s. d. | New rates<br>£ s. d. |
|---------------------------------------------|----------------------|----------------------|
| Share rate .....                            | 3 10 0               | 3 15 0               |
| Composite rate of tax at 5s. 4d. in £ ..... | 1 5 5                | 1 7 3                |
| Income tax on surplus at 7s. 9d. in £ ..... | 5 3                  | 6 6                  |
| Profits tax on surplus at 15 per cent ..... | 2 1                  | 2 6                  |
| Management expenses .....                   | 11 0                 | 11 0                 |
| Reserve margin .....                        | 6 3                  | 7 9                  |
| Mortgage rate .....                         | 6 0 0                | 6 10 0               |

This table is based on the assumption that all money is lent out on mortgage; on the more realistic view that about 15 per cent of shares and deposits is kept in liquid form the reserve margin improves by only 6d., from 4s. 11d. to 5s. 5d. per £100 borrowed. Another effect is less welcome to the societies anxious to expand their mortgage business: as rates move up it becomes increasingly difficult for a society to allow

## Wall Street Waits at the Peak

A correspondent cables:

WALL STREET is in a cautiously expectant mood, looking hopefully for signs of the traditional summer rally. Much of the recent buying has been stimulated by the administration's plans to increase spending and President Kennedy's European trip has done nothing to upset the conviction that business is recovering smartly and that a boom with inflationary overtones may be in prospect. But investors have already discounted a substantial upturn and they are no longer willing to make purchases solely on the basis of hope; they want concrete evidence that corporate earnings are improving.

This more sober attitude is partly the result of a spate of warnings about speculation, particularly in new issues and in shares in companies in technological fields. The

old borrowers to extend the period of repayment so as to leave their monthly outgoings, covering both interest and repayment, unchanged. When the mortgage rate goes up to 6½ per cent, the societies will have to consider with care individual cases where, say, the mortgage was first taken out at 4 per cent.

ARGUMENTS about the effect of an increase in rates on old borrowers have been constantly used by those resisting any change. But since the average life of a mortgage is only eight years, the number originally granted at low rates has steadily diminished. At the same time, greater weight has been put behind the counter-argument that obligations to the past should not be put above the need to try to meet the rising demand for new mortgages. This is the essence of the debate between the old and new schools of thought among the building societies. The traditionalists look back to the 1930's when the societies competed hard to lend money and are content with a slow and steady rate of expansion—even with rationing of advances rather than raising rates. The modernists argue that there is no fear of the demand for mortgages drying up and that the task in the 1960's is to attract sufficient new savings to satisfy it.

On this occasion the new school has prevailed, not least because recent history has borne out its arguments. Last year the societies advanced nearly £560 million on mortgage, more than ever before. Of this, about £40 million represented money channelled through the societies by the Government on loans on older properties. But in order to repeat their 1959 achievement of lending nearly £520 million from their own resources the societies had to rely first on repayments (nearly £470 million, higher than ever before) and secondly on a

† Approximate figures. \* At book values.

deliberate policy of cutting down their cash and investments. As the table above shows, average liquidity (taking investments at book values) was reduced last year from 16.2 to 15.3 per cent. The fact that last year's investment rates were wrong is easily demonstrated: the inflow of new savings of about £585 million was £15 million less than in 1959, while withdrawals at £470 million were about £50 million more. The societies brought this upon themselves by reluctant and inadequate increases in their own investment rates when the general level of interest rates was actively on the move. Two reductions in Bank rate gave some temporary fillip to the inflow at the turn of the year, but this Spring, especially in May, the societies faced another reduction in new savings and a big increase in withdrawals.

Remedial action had clearly become necessary, but not until

the Provincial announced that it was putting up its rates was resistance overcome. Yorkshire is a key area where such national societies as the Halifax, Leeds, Permanent and the Provincial are based, with a good number of local societies as neighbours. The thrifty Yorkshireman seems to keep a closer eye on competing rates of interest than his southern cousin and the Provincial's action made it clear that the smaller societies in Yorkshire would soon have to follow; this tipped the scale in the council chamber of the association.

In the end sentiment ("We run a public service") had to bow to hard facts ("Where do we get the money?"). This latest increase may suggest some shift in thinking about the future by members of the movement. Rapid changes in building society rates are undesirable for many reasons, not least because of their effect on administrative costs. But for some years friendly critics of the movement (including this newspaper) have noted that when the societies have been slow to adjust their rates to accord with the general level of interest rates, they have suffered sharp reductions in the net inflow of investment money. These critics have urged the societies not to rely so directly on the rationing of advances, but to let the price of money do most of this job for them. The latest increase has come at a time when rates on competing investments—for example, national savings and bank deposits—have not risen, which implies that some societies at least now look with more favour on the argument that a higher rate on shares would bring in more money to satisfy the demand for mortgages and higher rates for borrowers would at the same time dampen the demand (and even have some effect on the more absurd prices that some houses have been fetching). If the societies want to expand, the logic of using interest rates ought to be compelling.

The question is not whether the latest increase is justified, but whether it is enough. Already it is said that the increase to 3½ per cent may check withdrawals, but that it may not lead to any increase in new savings. That would lead on to the argument whether 4 per cent on shares and 7 per cent on mortgages would be more appropriate. Some of the smaller societies will have to pay and charge such rates. Would it have been better to take the jump at once instead of running the risk of having to put rates up to these levels in a year's time? Barring any likelihood of the general level of interest rates falling sharply this year, these lines of thought may attract increasing support.

## BUSINESS NOTES

### THE EXCHANGES

#### Challenge for Basle

PRESSURE on sterling has intensified this week. On Thursday the rate dropped below \$2.79, a new low point since 1957. Sterling was being sold by all centres and the only buyer was the Bank of England. At the same time as foreign funds are being withdrawn from London, commercial demand for dollars from the tobacco companies and others is coming forward early in the season. The summer strain is on.

The market is alive with rumours. At the "Forex" meeting of foreign exchange dealers in Lucerne last weekend, every kind of story was going the rounds—the exchange margins were about to be widened, the Swiss, the French and the Italians were going to revalue after all, the mark was to be revalued again, the mark was about to be set free to float, America was not going to get to the moon at \$35 an ounce. . . . Rumours in this size and number, possibly, are less menacing than one persistent and more probable story. But the disturbing factor, more than any particular rumour, is still the shock to confidence in the status quo administered by the indecisive 5 per cent revaluations of the mark and guilder in early March. From now until the meeting of the International Monetary Fund in Vienna in mid-September, there will be many operators who will believe nothing and try to provide for everything before each weekend.

If speculation of this magnitude were to persist, one might indeed agree that a modest range of exchange rate fluctuation would lead to less disruption. The trouble is that, especially if wider margins were conceded under pressure, it might be equally difficult to persuade the markets that the particular range chosen was itself the definitive one, and that further pressure would not be met by a further widening of margins. It is this consideration that for many years past has turned the scales against the strong technical argument for

more flexible exchange rates. If the exchange authorities feel that this consideration is still paramount, they are surely in a position to hold their stand. In no speculative crisis of the past have they had the benefit of a Basle Agreement, of an international support fund.

But if this weapon against the speculators is to be effective, it must surely be wielded more openly. If the central bankers know what they intend to do and are prepared to proclaim it, the speculators will quickly recognise the true balance of power—as they did in their ignominious collapse in face of Mr Kennedy's few words of affirmation about defending the dollar soon after he assumed office. If, on the other hand, the central bankers lie low and are seen privately to be shaking their heads, they might encounter the worst of both worlds—putting up a heap of money under the Basle facilities and seeing no result for it. The annual meeting of the Bank for International Settlements this weekend which is being attended by Mr Per Jacobsson of the International Monetary Fund, provides the obvious opportunity to set doubts at rest.

The extent of the actual strain on the London reserves is still successfully being kept from public view. The published gold reserves fell by £16 million in May, compared with £26 million in April and £62 million in March. The figures mean nothing. In May the Exchange Account received part of the foreign exchange proceeds of the IMF loan to Australia, of which £51 million was in currencies other than sterling. This support permitted a "modest repayment" to central banks under the Basle arrangements. Presumably more will be drawn this month.

South Africa, meanwhile, appears to have enjoyed some respite. In the week covering the inauguration of the republic on May 31st its official reserves rose by £2½ million, after falling continuously since March.

### FUEL

#### The Fight Is On

NOW that the Gas Council has at last put in its formal application to the Minister of Power to be allowed to import methane from Algeria, the argument between the council and the Coal Board over new sources of supply for Britain's town gas has reached a decisive stage. Mr Wood has to choose, or patch up a mutually satisfactory compromise, between two nation-

alised industries for which he is the responsible minister—between gas, some of whose leaders would like to shake themselves free of virtually complete dependence on coal, and coal, which equally understandably does not relish the prospect of losing any more of a market which still accounts for an eighth of its total sales.

The scheme submitted by the Gas Coun-

cil—a few days after it signed a provisional agreement with the French producers in the Sahara and with Conch International Methane, which would transport the methane, liquefied, in refrigerated tankers—would displace about 4½ million tons of coal a year from gas manufacture. Two tankers of 11,000 tons capacity would carry about 700,000 tons of liquid methane in a year, or roughly 350 million therms, equivalent to 10-15 per cent of this country's total requirements of town gas. After re-forming into town gas on arrival here, the council says, it would be piped to seven of the twelve area gas boards. The cif price of the methane, it is believed, would be about 6½d. a therm. This would put the cost of town gas derived from it, after re-forming, at perhaps 8½d. a therm—as against a shilling or more from the best of the new coal carbonisation plants.

But the argument between the two industries ranges more widely than a straightforward price comparison. Most of the issues were discussed in two Business Notes in *The Economist* of May 27, 1961 (which inadvertently described the Filson committee on coal derivatives as the Robson committee). Last week the chairman of the Coal Board again repeated his belief that enrichment of lean gas made from large-scale Lurgi plants would produce town gas cheaper than town gas from reformed methane, the difference would probably be less than a penny a therm. Detailed design and cost studies of Lurgi plants of a specified size and on specified sites should be ready in a few months. Much as the Gas Council would like an early decision on its application, it hardly seems likely that the Minister of Power will want to make up his mind before the results of these studies become available.

#### Coal Still in Transition

PRESUMABLY one of the considerations that will bear with Mr Wood, the Minister of Power, in deciding upon the Gas Council's application to import methane is the present state of the coal industry. It is still pulling out from the collapse of coal sales two years ago and it is still only part way through its accelerated programme of mechanisation. Measured by the Coal Board's own objectives, which are re-stated as an introduction to its report for 1960, its performance last year could perhaps be accepted as successful. The board's aim was to bring coal output below sales to reduce the large amount of coal held in stock without causing any "substantial measure of hardship" to miners and without vitiating its hopes for higher efficiency. This it can reasonably claim to have done. Whereas total sales rose from 194 million tons to 202½ million tons, output was cut

from 206 million tons to 193½ million tons. Stocks accordingly fell by 6½ million tons to 29 million tons. Forty-four pits were closed or were merged but only 250 of the miners in them remained out of work at the year's end—though 93,000 miners retired or left of their own accord during the year and the board took on (or could get) only 42,000 to replace them. The gain in efficiency since the breakaway from the persistently static level of 24-25 cwt a man shift prior to 1958 was, meanwhile, fully sustained. Output per man shift for face workers rose by a full hundredweight in 1960 to 27.9 cwt a shift.

But this is not the shortest path for returning to profitability. Output was pruned in the board's unprofitable and profitable divisions alike—only three divisions, the north-east, the east and the west midlands, stayed in the black last year, before interest charges. Indeed, before coal prices were raised last September, the board had piled up a total loss of £26 million. With higher prices and some accounting transfers in the last three months, the total loss for the year was cut down to £21 million, nearly £3 million less than in 1959. (About £12½ million of that loss represented the cost of carrying unsold stocks which had cost £27 million in 1959.) With another year of holding output below sales, perhaps 190 million tons against 200 million tons, thus clearing out another 10 million tons from stock, and a full year of the increased prices, the board hopes this year to cut its loss in half—to about £10 million—and to break about even in 1962. It hopes, too, to raise productivity among face workers to 29 cwt a shift this year, and still further next.

Until coal has emerged from its latest financial morass, and as long as it is expected to run economic and social objectives in tandem, the industry might reasonably expect its protection to remain unviolated either by imports of methane or by imports of American coal. But mounting pressure for these cheaper sources of fuel may not be irresistible.

#### INDIA AND PAKISTAN

### First Needs Met

INDIA'S National Development Council last week settled the final details of the third five-year plan. Spending on the plan will be the equivalent of \$25 billion and the Indian planners, as expected, leave a gap of \$5½ billion to be filled from abroad. A few years ago the idea that India's friends should put up over \$1 billion a year would have been greeted with universal scepticism. Yet last week, under a procedure that now tends to be taken for granted, the "Aid to India" consortium of Britain, Canada, France, Japan, West Germany, the United States and the World Bank matched India's request with an offer of \$2½ billion to cover deficits in the first two years of the plan. This week the same club members offered

Pakistan \$550 million for the first two years of its second five-year plan which began last July—\$230 million in the first year (which ends next month) and \$320 million in the second. Pakistan's needs for external aid are proving much higher than expected, following the census of last January; and

| Aid for India (\$ million) |       |            |             |
|----------------------------|-------|------------|-------------|
|                            | Total | First year | Second year |
| United States .....        | 1,045 | 545        | 500         |
| West Germany .....         | 364*  | 225        | 139         |
| United Kingdom .....       | 250   | 182        | 68          |
| Japan .....                | 80    | 28         | 28          |
| Canada .....               | 56    | 50         | 30          |
| France .....               | 30    | 15         | 15          |
| Total less US .....        | 780   | 500        | 280         |
| World Bank .....           | 400   | 250        | 150         |
| Total .....                | 2,225 | 1,295      | 930         |

\* Includes \$75 million to finance expiring short-term credits.

the original estimate of \$1,000 million for the five years is expected to be increased substantially. The amount of aid now offered seems to confirm this.

#### RUSSIAN TRADE

EXHIBITORS who spent £2 million showing their wares at the Moscow trade fair expect to treat the cost as a long-term investment. Though several million pounds worth of goods were sold, and orders for another £10 million worth were placed—with more still under negotiation—the main, but less tangible, value of the fair was the increased awareness of and interest in British goods in Russia. A survey by *Metaworking Production* of firms exhibiting plant and machinery showed that 80 per cent did not expect to get orders immediately. Once the Russians have returned to their factories, the hope is that they will start pressing to buy British goods. And if Russian policy happens to coincide—and this will largely depend on the trade negotiations now in progress—the investment in the exhibition will eventually return, with interest.

Large single orders for complete factories, such as the nylon plant ordered from Vickers and the worsted spinning mills ordered from Platt Brothers, the contracts for synthetic rubber and polypropylene fibre plants that Vickers is now negotiating, are still the backbone of Anglo-Russian trade. Even this kind of business should benefit from the general goodwill towards British products the fair seems to have created. The Russian desire to get all it can buy from the west in those branches of technology in which it is behind shows no sign of abating. This feature of Russian demand for equipment does mean, however, that there are few repeat orders for similar types of plant. The same holds true for such expensive items as computers: some firms which exhibited prototype machines are carefully bringing them home, having refused to sell them.

Agreement on the Indian commitment came after a month's adjournment. The United States offer of \$1,000 million, made at the beginning of May, was contingent on the same amount being provided by other creditors—whose opening offers fell short of this by \$350 million. During the adjournment France became a full member of the consortium, offering \$30 million in aid, and when the meeting reassembled at the end of May, Britain offered an extra \$46 million, Germany an extra \$33 million, and Canada an extra \$20 million. This virtually matched the United States contribution for the first year, but leaves a shortfall of \$220 million for the second. The United States has made it clear that it expects this deficiency to be made up before the club meets again in the autumn. It is to be hoped that by the autumn the other European countries that are running payments surpluses will join in offering India development aid, and that Germany will offer more in the form of aid and long-term loans rather than short-term export credits.

## After the Fair

There may well be a limit on the number of complete plants that Britain can expect to sell to Russia, even though the limit should still be some way off. There are plenty of chemical and fibre processes that the Russians may still want to acquire. Russia's purchases of individual pieces of machinery, also intended to fill gaps in its own production programmes, or to meet needs not large enough to justify Russian production, seem more likely to provide a steady and mutually beneficial trade than the more spectacular orders for whole plants.

### Where West is Best

IN the expansive atmosphere of the fair, Mr Maudling suggested that Britain and Russia have a shot at doubling import quotas for consumer goods in 1962. Existing quotas for the year to June 30th are to be extended to the end of the current year by "increasing" (as the joint communiqué made out) individual quotas by 50 per cent. Mr Maudling's challenge is short of daring. An annual target of £4 million each way has stood for more than a year. Quotas arranged last October fell short of the target by a long chalk: Britain agreed to import twenty categories of Russian consumer goods worth £3.1 million cif, and Russia elected to take a scarcely greater range of Britain's more diverse and attractive exports to the same value. An extension of this trade was to have been discussed before the end of June.

In actual performance, both countries seem to have been even more wide of the mark. Though Russia has scored a resounding success with exports of canned crab-

meat, which after canned salmon is its best seller, and has been permitted to exceed its quota, it has not been possible to persuade British consumers to take up the quantities of other goods specified by the agreement—even vodka does not enjoy the following that it commands in America. In general, Russian consumer goods are practical—often even severely utilitarian. No one suggests that the state factories should give Russian consumer goods all the unnecessary frills for the sake of a few exports, but the incorporation of some relatively inexpensive western styling would help. Unfortunately, Russia does not study the packaging of western toys and perfumery with the same zeal that it tackles the working parts of machinery.

The Board of Trade announced in December that it would issue licences for the import of £2½ million of Russian machinery and equipment, and Russia agreed to take an extra £2 million of industrial materials from Britain. Normally, Russia buys all the capital goods it can afford here—direct exports to Russia reached £37 million last year—and pays with sterling earned from exports of many primary products that are not restricted. Imports from Russia soared to £75 million in 1960, but Russia maintains that the balance is spent on sterling area products. Russia appears to be seeking to expand its traditional trade and wants long-term contracts for commodities whose production could be expanded for the British market. Its exports of consumer goods are sickly, and the offer of Soviet petroleum products—rebuffed by Mr Maudling, but persisted with—is not exactly pouring oil on troubled waters. Mr Maudling has officially taken note of this offer, said to amount to 2 million tons of oil; it is also said that one distributor is prepared to take it.

Negotiations for a full trade treaty with Russia are apparently to be jogged along. Commercial treaties prescribing access to courts, unfair practices and general standards of treatment have been negotiated between Britain and most foreign countries, the earliest being with Sweden in 1654. But not all British exporters wish to exchange the present system of catch-as-catch-can for "most favoured nation," "national" (same rights as Russians) or "absolute" status, under which any arrangements would apply solely to them.

#### HIRE PURCHASE

### Car Sales Boom

TOTAL hire purchase and other instalment debt outstanding rose for the second month in April, following the short decline from July, 1960, to last February. The April rise was of £5 million, to £939 million. As in March, the rise in outstandings owed directly to finance houses was strong enough to offset a continuing fall in debt owed to household goods shops. These shops were expanding their current instalment sales, but evidently repayments have

been still larger.

The finance houses, whose main direct business is in vehicles, showed a fall in new credit extended in April, on account of the early Easter and good March weather. In May, however, car contracts registered with Hire Purchase Information shot up to 99,000, within hailing distance of the level reached in April, 1960, when hire purchase restrictions were reimposed. Now that the press is beginning to talk freely about the likelihood of the Chancellor imposing his 10 per cent surcharge, one wonders how many car dealers are pushing along their customers with helpful reminders that if they wait till next month it may add £15 to the price of a Mini-minor and £36 for a Humber Hawk.

#### MOTORS

### End of a Monopoly

THE Birfield group's long standing monopoly of the manufacture of universal joints and propeller shafts for cars and commercial vehicles in Britain has been broken with seeming ease by Guest Keen and Nettlefolds. GKN's subsidiary, Blade Research and Development, decided to go into production only eighteen months ago. It now claims to supply half the propeller shafts and universal joints used by the British motor industry. Ford is its largest customer; but it also supplies the Rootes group, Standard-Triumph International, Vauxhall and Leyland—all the big firms except British Motor Corporation. Birfield still supplies the special constant-velocity universal joints for the front-wheel drive of the BMC babies. BR and D also makes a constant-velocity joint suitable for front-wheel drive cars. It was designed by the Fighting Vehicle Research and Development Establishment, but it is at present used only in military vehicles.

The speed with which BR and D has been able to seize half the market for propeller shafts suggests that the motor manufacturers readily welcomed the appearance of a competitor for Birfield. None of them likes to be dependent on a single supplier; labour troubles at the Birfield subsidiary, Hardy Spicer, stopped production at several car factories last year. Hardy Spicer also found difficulty in meeting the demands of the industry when production was at the peak. For Guest Keen, the quick success of this new venture must be gratifying: for Birfield it has meant surplus capacity rather than a shortage—and perhaps lower prices as well.

#### OVERSEAS TRADE

### Another Black Spot?

A BOARD OF TRADE survey that sets out to spotlight the undoubted potential of trade with the Middle East has necessarily picked out in much stronger light Britain's indifferent export record in that area. Oil

revenues in these countries are now running at about £500 million a year; in 1960, imports from eleven leading manufacturing countries were not far short of £1,000 million. Between 1958 and 1960, imports from these eleven countries rose by £162 million. Britain, in 1958 still the largest exporter to the area, increased its sales by only £6½ million. It was therefore hustled out of first place by the United States, and run close by the next largest exporter, west Germany.

Demand in the Middle East is naturally concentrated on capital goods essential to the cherished development projects of the various governments. The consumer goods market is—as the Board of Trade admits in studied understatement—"rather price conscious." But the excellent showing of the United States seems to explode one

myth that served to explain Britain's relative failure. German and Japanese exporters were alleged to have learned the secret of not fixing western-style sales itineraries and therefore careering around hoping to snap up business. They were apparently quite happy to drink coffee until business eventually matured.

This trade certainly has its idiosyncrasies, but Britain's poor performance seems part of its general failure to make progress in competitive foreign markets. However, a group of about 50 British firms has formed the Middle East Association which can provide the special conditions conducive to successful trading with these states. The

Association will provide visitors from the Middle East with an information centre divorced from government agencies. It will also be able to look after them privately while they are here, in the collective interest of British exporters.

## VANS

### For Business and Pleasure

THE new Anglia van should improve Ford's competitive position in the market for car-like vans, the fastest-growing section of the commercial vehicle industry. The number of light vans registered for commercial use rose from 14,000 in the first quarter of 1960 to 20,000 in the first quarter of this year—more than the rise in sales of all commercial vehicles. Production of these light vans rose by even more, for a growing number are being registered as cars—by people keener on avoiding purchase tax than the appearance of the vehicles they drive about in, or the speed limits they are expected to observe. British Motor Corporation has recently been outrunning Ford in the light van market. Its output rose from 78,000 in the first 41 weeks of the corporation's 1959-60 financial year, beginning in August, 1959, to nearly 110,000 in the same period of the present accounting year. The new Austin Seven and Mini-minor vans accounted for over 20,000 of this increase. They appear to be especially popular with the van-driving motorist. But many firms using vans for local delivery also buy them—to use as cars at the weekend. All the vans in the BMC range—which share the A-series overhead-valve engine—had the advantage of the old Ford vans, which had the 100 E side-valve engine and rather more utilitarian bodywork.

Ford is clearly aiming its new vans at this competition from BMC. The price of the 5 cwt model—£369 in primer or £379 painted—is fractionally above that of the slightly smaller Austin Seven or Morris Mini-van, which cost £360 painted. That Ford has had to cut its margins pretty drastically so as to compete with BMC is suggested by the fact that the price of its vans is £36 less than that of the equivalent car model, whereas the Mini-van is £10 dearer than the Mini-minor. Ford is clearly not intending to let BMC stay top in a market that it had become accustomed to dominate.

## RIGHTS ISSUES

### Calls for Cash

THERE is no sign of any slackening in the number of companies anxious to raise money in the stock market. This is one reason why the institutions have been disinclined to enter the market recently, as they know that substantial calls will be made on their funds in the next few months. By far

## BUSINESS NOTES

the largest of the recent rights issues comes from Distillers, which is asking for £32 million. This is more than had been expected and the issue on a one for ten basis at 32s. 6d. a share makes the rights worth only about 6d. at the current price of 37s. 3d. As in the big ICI issue, payments will be spread, with the first call of 10s. in July and the second of 22s. 6d. in September. The directors have indicated that profits in the year to March 31st before tax but after minority interests have risen by only 5½ per cent to £33.8 million; this compares with a 21 per cent increase in 1959-60. An earlier statement referred to keener competition and lower profit margins and the directors now say that net profits are unlikely to be more than £500,000 above the 1959-60 figure of £16.9 million, but the forecast final dividend of 8½ per cent will raise the total payment from the equivalent of 12½ to 13½ per cent. At an estimated ex rights price of 37s. the 10s. shares would yield 3.6 per cent.

The proposed rights issue by Hudsons Bay is something of a surprise since the annual meeting of the proprietors less than a month ago revealed nothing about the need for fresh capital. This issue is also on a one for ten basis; the issue price is 130s. so that with the shares at £10½ the rights are worth about 7s. A scrip issue will follow the cash issue. This will also be on a one for ten basis and the price of the shares after both issues should be about £9½; this is still a heavy price and there is no indication that the suggestion made at the meeting that the shares should be split will be implemented. Presumably the current trading dividend of 24 per cent and a tax free payment of 5 per cent from land sales will be maintained on the increased capital. If so, the yield would go up from 3½ to 3½ per cent.

## AIR FREIGHT

### Those Special Cargoes

A REASON why the international airlines took so long to agree on a new scale of freight rates was a basic disagreement on the best way to attract traffic. One group, headed by Pan-American, wanted a simple standard tariff where goods were charged by weight only on a sharply sliding scale designed to encourage big consignments. Others, among them BOAC, believed that the present system of giving preferential tariffs to certain types of commodities would have to be retained otherwise the airlines might lose some of the traffic they had built up so laboriously over the years. BOAC pointed out that under the new general freight charges proposed, some of these specially favoured cargoes would pay more than they do at present, which hardly seemed to make sense.

Most airlines would agree that the system of special rates for special goods has got out of hand—there are more than 70 of them, and by September, they will have been reduced to 26. All that this means, how-

## THE ECONOMIST JUNE 10, 1961

ever, is that the airlines are dropping rates that had failed to attract traffic and retaining those that did. Spare parts for cars, for example, can in future be shipped in relatively small half-ton loads for as little as 4s. 9d. a kilo, where the cheapest rates for big consignments of general cargo is 5s. 2d. For some reason, the most pampered commodity is motor cycles, which can be flown across the Atlantic from next autumn for as little as 4s. 4d. a kilo. Not all commodities come off so well; in some cases it will be cheaper to consolidate shipments into one big general consignment flying at 5s. 2d. a kilo than to send smaller lots at the special commodity rates. But it is not always easy to consolidate mixed shipments—for example, putting food or flowers together with general cargoes—and some airlines think that 40 per cent of air cargo will continue to fly under special commodity rates as against 65 per cent at present. Other airlines, however, take the opposite view, and see the new tariffs as the death knell of the commodity system.

## NYLON 6

### Partners Compete

THE plans that Courtaulds and Imperial Chemical Industries have announced this week to make caprolactam, the raw material for the nylon 6 polymer, will bring the two partners in British Nylon Spinners into direct competition. The type 6 polymer is more suited than type 66—already made in Britain—to make both moulding powder and staple fibres. As a moulding material, it can stand higher temperatures than most plastics and is stronger. It can thus be used to make hot-water pipes and oil-less bearings. As a fibre, it has many industrial uses, for instance ropes and conveyor belting, as well as being suitable for blending with wool in clothes. ICI plans to make nylon 6 polymer from part of the 15,000 tons a year of caprolactam that its new plant at Severnside will be making by 1963. It will sell this polymer to plastics moulders or fibre spinners, just as it now sells nylon 66 polymer to BNS and other firms. Courtaulds, however, has no plans yet to make polymer, though one might expect a textile company to be keen on going right through to production of the fibre. For the moment it says that it will limit itself to making caprolactam, at the rate of 10,000 tons a year, at an unstated time and place. Both companies have bought from European companies the processes they will use to make caprolactam. Courtaulds from Snia Viscosa, its Italian associate; ICI from the Swiss firms Emse Werke A.G. and Inventa A.G.

One clue to the use that Courtaulds may have in mind for its caprolactam is the plan of British Enka to build a plant to make nylon 6 polymer and fibre; it will have to buy in the caprolactam raw material. The amount that it is likely to take is not yet known; the capacity of the plant for fibres has not been announced. But it could be

# If you do world-wide business call on the Hongkong Bank Group

We are an integrated group of British trade banks operating throughout the East and The Middle East and also have offices established in New York, San Francisco, Los Angeles, Paris and Hamburg. We specialise in the financing of foreign trade and in giving a complete world-wide personal banking service through our own branches and through agency arrangements with a network of correspondent banks. Our advice and help could be your surest "passport" to success where overseas banking facilities are concerned.

Group total assets exceed £445 million.

a big customer for either Courtaulds or ICI. The situation might prove more complicated for Courtaulds, however, if ICI were able to offer the nylon 6 polymer at a low enough price to make dubious the economics of building a relatively small polymer plant—such as British Enka plans. It might well decide in this case to buy polymer from ICI and cut out the polymer plant from its plans, leaving Courtaulds without a buyer for its caprolactam—until someone else, or itself, decided to build a nylon 6 plant.

#### SOUTH AFRICA

### Mr Oppenheimer Speaks Out

DISASTER is the word used by Mr Harry Oppenheimer in his speech to the shareholders of Anglo American Corporation to describe South Africa's withdrawal from the Commonwealth. It is the word

#### BUSINESS NOTES

that one expects from a man who is a South African first and the chairman of the biggest finance house in Southern Africa second, and it colours the whole of a statement in which, more forthrightly than ever before, Mr Oppenheimer takes the policies of the South African government to task. The truth is, he says, that "the fundamental principle upon which South African policy is based is morally unacceptable to practically all the nations of the world, European and non-European." He deplores extreme demands from either side, but he adds that, while racial peace needs time, South Africa will not have that time if it persists in a policy that stands condemned on moral grounds. At the moment, the South African government is capable of controlling the situation by force but, Mr Oppenheimer adds:

Perhaps it can be held in this way for a long time, but only at the cost of a perpetuation of racial conflict, which must become progressively more embittered.

#### THE ECONOMIST JUNE 10, 1961

And while this conflict lasts, it will be impossible to restore confidence in the future of the country, and the economy will be threatened with stagnation.

The flight of foreign capital has already slowed down new development, forcing Anglo American and other finance houses to rely almost exclusively on their accumulated resources and loan capital and increasing their difficulties in adequately reimbursing risk capital. It must in the end threaten living standards in a country which is less able than almost any other to afford a slowing-down in the rate of economic growth. Without growth based on foreign capital the development of a multi-racial community is impossible and the "Bantustan" policies of the government are economic nonsense. Confidence will not be restored by economic controls; but these may provide time, Mr Oppenheimer hopes, to tackle the real causes of the difficulties—the social, human and political problems of South Africa. The solution, Mr Oppenheimer insists, depends

first upon the establishment on the personal level of attitudes of respect and affection for people of other races; secondly on the extension of these attitudes on to the level of industrial and other organisations; and, only thirdly, on political policy.

As far as Anglo American is concerned this means the vigorous pursuit of policies to give "adequate increased recognition to higher skills and improving efficiencies amongst its African employees" and to "the abilities, personal needs, inclinations and aspirations of individual Africans."

#### ATOMIC SHIPPING

### A Case for Co-operation?

THIS week the head of OEEC's Nuclear Energy Agency paid a courtesy visit to the head of the Atomic Energy Authority and inevitably the talk came round to atomic shipping. The AEA has given much thought to this and concluded that no good purpose would be served by building a nuclear ship until there were some chance of its being competitive—which, in the Authority's view, could not happen until a new type of reactor had been developed that is efficient in small sizes. Meanwhile, the Minister of Transport invited tenders from industry to build a nuclear tanker and a government decision on whether to go ahead is expected within the next three or four weeks.

OEEC has also made a detailed study of nuclear ships and concluded, like the authority, that there was no early prospect of their being competitive and that the starting point must be improved reactor designs. But unlike the authority, OEEC still thinks that an experimental atomic ship would be worth building. This is not a question of keeping up with the nuclear Joneses. Its experts believe that some data vital to the design of nuclear powered ships

## Money Flowing In

PEOPLE are spending more in the shops, though not quite as much in April as the provisional estimates had suggested. But the final index, after seasonal adjustment, of 115 (1957=100), shows that turnover was as high as it had been in March, about 3 per cent above the average for the previous five months.

For the first time the Board of Trade has provided seasonally adjusted figures for different trades, making it possible to get a better idea of where the extra money has gone. Sales by durable goods shops started to recover last December; by April they were nearly one-quarter above their low point of last November and only 6 per cent below the peak in April last year. On the other hand, clothing and footwear shops, which had benefited not only from reduced spending on durables but also from fine weather in the early spring, felt the draught a little in April, when their rate of turnover fell about 4 per cent.

Some of the month-to-month variations in these new indicators may reflect no more than the hazards of seasonal adjustment. Nevertheless the volatile nature of spending on durables and clothing is well estab-

lished. About half the total decline in durable sales last year occurred in the first month after the re-imposition of credit restrictions; and in that month clothing shops benefited to the extent of an extra 5 per cent or so in their sales. But it is the weather as much as anything that seems to determine how well or badly clothes sell in any particular month: the wet weather last November, for instance, took away a lot of custom. And it will probably be the weather this summer that will decide whether the setback in clothing sales in April was more than temporary.

Shops selling durable goods and clothing account for only about a quarter of all retail turnover. What has happened to buying elsewhere? Food shops, taking nearly half the total, have edged up their sales a little. But it is the business of the rest of the shopkeepers, including department stores, which has grown most steadily and their turnover in April was about 6 per cent more than last year. However, prices of most things have risen too. People may be spending about 4 per cent more money in the shops than a year ago; they are getting only about 2 per cent more goods.

## TIME'S ON YOUR SIDE WITH INDUSTRIAL DIAMONDS

Industrial Diamonds in one form or another help to make practically everything from watch cases to washing machines. Only diamond tools can cut, grind or polish with the speed and accuracy needed today.

To find out if diamond abrasives, diamond tools or diamond impregnated wheels can help you in your problem, please get in touch with the Industrial Diamond Information Bureau. This Bureau is backed by the world's largest laboratory devoted to diamond technology - The Diamond Research Laboratory in Johannesburg. For information and advice, without obligation, please write to the address below.

### The Industrial Diamond Information Bureau

2 CHARTERHOUSE STREET (DEPT E), LONDON, E.C.1.

can only be learned by accumulating practical operating experience of at least one nuclear powered vessel under normal commercial conditions. Questions such as fuel handling at sea and in port, size and composition of crew, the difficulty of squeezing round the reactor to maintain the conventional parts of the ship's machinery, stresses put on the reactor in different weather, all need answering before anyone can talk with authority about the practical design and operation of a commercial, nuclear-powered merchantman. Not all the questions are even technical; prospective owners are particularly anxious to know how public opinion would react to the arrival of an atomic powered ship in a densely populated port and, indeed, how many port authorities would allow it to tie up. The only way, OEEC says, is to send a ship and see.

The Ministry of Transport could argue that this is precisely why it originally invited tenders for a 45,000 ton tanker (which OEEC does not think the type of ship most likely to provide the answers). The difference between the two proposals is that one makes sense because its cost can be shared between several countries and the other is a questionable luxury because the whole burden falls on Britain's economy. If OEEC's plan makes headway—and it is still only in the discussion stage with detailed proposals expected in the autumn—would Mr Marples be justified in going it alone? The tender prices he has received, of about £12 million, may be more realistic than the £6 million for which OEEC guesses its ship might be built; and it is difficult to justify any duplication of effort when sums of this size are at stake. Mr Marples would perhaps be accused of breaking faith with industry if he were to back out of the nuclear tanker project at this late stage, but honour would be served by compensating those who have tendered for their costs.

### Binding Cases

Binding cases for THE ECONOMIST are available from EASIBIND LTD. The cases are in stiff, dark blue cloth covers, and are gilt-lettered on the spine; they provide an extremely effective and firm binding and will hold 13 issues of the normal edition together with the quarterly Index, or 26 issues of the air edition with two quarterly Indexes. The year can be stamped on the spine. The cost per case, post free throughout the world, is 12/6. Orders, stating requirements clearly and enclosing a remittance, should be sent, not to THE ECONOMIST, but to—

### CIGARETTES

## A Penny More

THE wave of cigarette and tobacco price increases this week shows that Imperial Tobacco Company is still unchallenged as the tobacco industry's price leader. But none of the cards it has been pulling out of its king-size pack—new brands, new packets, new style advertising—has yet halted, or even, it seems, slowed down, the steady erosion of its dominance over the cigarette market. Six years ago, before supplies of leaf were freed of restriction, the group made nearly four out of every five cigarettes sold in Britain. Today Imps make only just over three of every five. Neither "Strand," with its expensive promotion of smokers' loneliness, nor "Admiral," the king-size cigarette in a black pack—the two new brands the group launched early last year in the cheap and the dear ends respectively of the fast growing filter market—have taken hold. Even "Export Woodbine" appears to have lost ground after initial success.

On the other hand nothing that Gallaher does appears to fail. This company now has almost 30 per cent of the total cigarette market. It is still a long way behind the Imperial Group, but it is way ahead of the rest of the field. "Senior Service" has come right up in the last ten years to the point where it is now locked in a battle royal with "Player's" for the coveted top place among all brands (if "Woodbine," the past leader, has dropped back as much as is reported): at present each has about 21 per cent of the market. In the filter market, which now accounts for 17 per cent of all cigarettes sold, Gallaher bided its time. But "Nelson," its entry in the medium-price section (now 3s. 7d. for twenty) where two-thirds of all filter sales are made, has climbed in not much more than twelve months to third place in that price group, behind "Bachelor" (Imperial) and "Kensitas" (Wix), but ahead of "Bristol" (Imperial). Every eighth filter cigarette now smoked is a "Nelson."

Shifts in smoking habits also have hit Imperial. Novelties like menthol and king-size cigarettes are still marginal sellers, though growing apace—menthol brands were one of the main drives behind the growth of filters in the United States to their present half-share of that market. The move away from the cheaper plain brands, such as "Woodbine" and "Weights," two of Imperial's best sellers, to the equivalent or medium-price filter brands has been substantial. Significantly, Imperial has not raised the prices of these cheaper brands—nor those of "Strand" and "Export Woodbine," which will still sell at 3s. 2d. and 4s. 2d. respectively,

though "Export Woodbine" is to be slightly reduced in thickness.

THE effect of the extra penny on the price of a packet of twenty of most other brands is perhaps less unpredictable. Tobacco manufacturers always talk about diminishing returns when the Chancellor raises the duty, but this point has not been reached yet. Sales increased three per cent by weight during last year as a whole, though the twopence increase in duty in the 1960 Budget has had the customary—and so far always temporary—effect of subsequently damping down the rate of growth. Doubtless smokers will in time take the latest penny increase in their stride as well. For the manufacturers the increase had become essential. Costs have gone up all round, with higher wages, increased mechanisation and greatly increased advertising. But the largest increase has been in leaf costs. In 1956 the average price of American flue-cured tobacco was 51½ cents a lb; in 1960, after four years of steadily advancing prices, it was 9 cents a lb dearer. And British leaf buyers, like buyers in other industries, indulged in a bout of restocking last year. Imports of unmanufactured tobacco rose by 61 million lb to 362 million lb. With imports of American tobacco now no longer subject to any kind of control, British manufacturers stepped up their purchases of Virginian leaf by 37 million to 177 million lb. But America's share of the British market was still held below 50 per cent last year, despite the increased buying.

## PROFITS TAKE A BOW

Bowing is so deep-rooted a form of greeting in Japan that a businessman may find himself bowing during a telephone conversation.

An increasing stream of buyers is being greeted at Mitsubishi Shoji these days. This is because word is getting around of the high profits in trade with Japan. The quality products of this country's industry are finding wider and wider markets.

Many of these products carry the Three Diamonds mark of Mitsubishi companies. There are over a score of them in light and heavy industries, each handling foreign trade transactions through Mitsubishi Shoji, their big general-trading representative.

For 90 years, Mitsubishi Shoji has been showing overseas buyers the profitable way to trade in Japan. Its branches and affiliates are in all the world's trading centers.

### JUTE

#### Down from the Peak

FREE markets can be cruel: famine prices of up to £180 a ton still face manufacturers who must have jute now; for the "haves" who can wait for October shipment when supplies of raw jute will be flowing from the new crop, the price is £50 a ton cheaper. So there are few buyers of raw jute for prompt delivery, and current prices are beginning to cave in as sorely pressed consumers stiffen their resolution now that they know a measure of relief lies only weeks ahead. Pakistan

hopes to get a limited amount of new jute on the market this month. There is obviously no reason why producers should hold back supplies this season. Upcountry growers in Pakistan are said to have much better market information since their villages acquired radio sets and better communications. Chicanery was alleged as prices soared to almost unprecedented levels after last year's partial crop failure. If growers withheld jute then, the price incentive is now pulling powerfully in the other direction. Apart from some cyclone damage that broke some tops when they already stood six feet high and will therefore produce a shorter fibre from affected

plants, this season in Pakistan is highly favourable. The greater acreage under jute should yield 7.4 million bales this year, compared with 5.6 million last season.

Prices of jute goods have never reflected the peak prices of raw jute—the market has never been strong enough for that. They are now falling ahead of the slide in the price of raw jute. Last weekend yarns and cloth were reduced by up to £20 a ton in Dundee; manufacturers hope that the cuts will get business moving again. Jute goods must be cheap and readily available and two crop failures have severely prejudiced them. It may take two good crops to put matters right.

## French Machmanship

THE US Air Force proudly sent its 1,500 mile an hour Hustler bomber to Paris last week; breaking up in mid-air at the climax of an international flying display of more than 100 aircraft, the Hustler demonstrated that even America's huge aircraft industry can stumble. What place can there be, in this supersonic age, for the relatively small aircraft industries of Western Europe and of Britain?

The sad fact is that the kind of commercial success that would have constituted a triumph ten years ago is not enough today to sustain the pace of development required to remain in the front rank. This point is illustrated by the plight of the French aircraft industry. This employs 82,000 people, about a third of those employed in British aircraft plants. It is currently enjoying unprecedented sales; 116 Caravelle airliners have been ordered, far more than the orders for the Comet or Convair medium-range jets. Alouette helicopters have swept the market in 24 countries, and even the British army has bought some "for trial." Small guided French rockets are used by 11 armies, including the American. French jet trainers are standard equipment for Nato. All these contracts have been won in the teeth of British and American competition, with all the more difficulty because these two countries were already well established in world markets.

Yet the French aircraft industry is frankly apprehensive, looking into a future that seems to hold nothing but empty factories. It has only one major new aircraft under development, the Mirage IV

atom bomber designed, like the Hustler, for more than twice the speed of sound. With prototypes now flying, this small bomber could be in service some years before the only British project with a comparable performance, the TRS 2.

But there is nothing to succeed the Caravelle, which will not sell for ever, and will not show a profit until 200 are sold. Various ideas for developing the Caravelle, adapting it for longer or shorter ranges, making it faster, giving it greater capacity or smaller, have been looked at but not found worth the heavy development cost. The French aircraft industry, it seems, must either retire altogether from the international market when the last Caravelle has been built, or move on to the next generation of supersonic aircraft.

THIS is not an easy choice. France has never built what could be called a "North Atlantic aircraft" and has not the capacity to do so, yet it is this route that is most directly involved in supersonic speed. French designers have had to keep their sights low, and the supersonic airliner that they have studied—and have, indeed, got to the point where it is ready to start fabrication—is a supersonic replacement for the Caravelle designed for ranges of less than 2,000 miles. Whether airlines want an airliner of this standard is open to question. Advantages are claimed for it over quite short ranges and those who might be tempted to ridicule it might remember their mistakes about the Caravelle at the start of its career.

Because the Super-Caravelle is small, weighing a bare 70 tons against the 170-ton aircraft proposed for supersonic flying over the North Atlantic, it creates less noise and is far easier to build. Whether the French government will provide funds for its construction is another matter: a decision whether the industry (which is largely nationalised) may go ahead with a prototype is promised for August or September.

If the government rejects the Super-Caravelle, the French industry will have no choice but to fall back on the only market that requires no prohibitive entrance fee, offering those unglamorous workhorses of the air-feeder-line transports, short-range military freighters, "executive" aircraft and tiny machines built for clubs and private owners. The number of types on offer and under development has risen sharply as more and more companies have found that they can no longer compete in the big league. French and German manufacturers are already co-operating on the development of aircraft of this type: the machines are not necessarily small, and they gain considerably from the attention of first-class designers backed by adequate research facilities. But they are all characterised by relatively conservative construction methods and modest development costs.

This tendency is not confined to France; it is being copied more and more in Britain, most recently in the growing number of executive aircraft on offer—the market is not all that rosy but there still seems room in it for more than one manufacturer. This is no longer true of the market for international airliners, and less and less true of military aircraft.

The British aircraft industry has diversified much more than the French; many of the 300,000 workers who the Ministry of Labour lists as employed on building aircraft are in fact making something very different. But what happens to the men who are genuinely building aircraft when present contracts expire? The tendency towards the concentration of production into fewer hands, and those mainly American, cannot be ignored.

### SHORTER NOTES

Last winter the airlines had outstanding success with a special 17-day excursion ticket of £125 return to New York on jets and £114 on propeller aircraft—the first time that air fares had undercut sea fares. The shipping companies now propose winter excursion return fares of their own, from £98 to £105.

The Department of Scientific and Industrial Research is to contribute £77,000 towards a new laboratory for plastics, on the understanding that the industry itself will raise £120,000 a year for the next three years. The rubber industry, which has been spending between £140,000 and £150,000 a year on research, with £37,000 contributed by DSIR, is joining forces with the plastics industry to run the new laboratories.

Mr Butlin's shareholders should now be as happy as his campers: pre-tax profits of Butlin's in 1960 jumped from £1,156,000 to £1,759,000 and the ordinary dividend has been raised from 50 to 80 per cent. There is also to be a one-for-one scrip issue.

Faced with opposition from BEA and BOAC, Cunard-Eagle and British United Airways have mutually agreed on the routes for which each will seek permission from the Air Transport Licensing Board to fly. Mr J. J. Taylor appointed as deputy chairman of the board, has run the Workers' Travel Association for many years and served on the old Air Transport Advisory Council, the precursor of the Licensing Board.

The Independent Television Authority has now completed its network with the appointment of a television company for Wales, the fifteenth to be given a licence by the ITA. Programmes are expected to start at the end of 1962. The ITA's charter expires in 1964.

Horlicks has improved on its earlier bid for Burt Boulton which was resisted by the directors. The new offer of 1½ Horlicks plus 22s. 6d. values the Burt shares at 79s. 6d. against the previous offer of 1¼ shares plus 20s., worth 71s. If the revised bid is successful Horlicks' ordinary capital would be increased by 34 per cent.

Spot tin rose to £880 a ton in London this week. The International Tin Council's buffer stock manager is instructed to sell at this price. The chairman of the ITC has denied that a change in this "ceiling" was discussed at the recent meeting in London.

City Centre Properties and Imperial Tobacco pension fund have formed a new company for the purpose of "co-operating on property development." London Assurance has acquired a substantial interest in the Peachey Group as a result of its purchase together with Mr Eric Miller, the deputy managing director of Peachey, of the 3 million 2s. shares formerly held by the late Mr C. W. Hutley, the former chairman of Peachey.

The volume of leather footwear production in the first quarter of 1961 was 129 (1954=100) compared with 128 in the corresponding three months of 1960. In the December quarter, output was 6 per cent higher than a year ago.

### COMPANY MEETINGS

This week, start on  
Page 1160

dividends and reduces the cover to 1.9 times. The sharp fall in profits, however, more than offset satisfaction with the dividend and the £1 shares fell back on Thursday by 2s. 1½d. to 41s. 3d., to yield 4.8 per cent.

### Metal Box

PRE-PACKAGING of goods before they are displayed on the shelves of the supermarkets and other retail stores has in the past led to a very sharp advance in the sales and trading profits of the Metal Box group. In the last decade the emphasis has been on markets at home but the company has also paid a great deal of attention to building up trade abroad, not so much through exports as through the establishment of local manufacturing facilities. The value of this policy has now been clearly demonstrated, for while domestic sales in 1960 showed their smallest increase for many years, despite the adverse effect of the 1959 printing strike on the previous year's turnover, overseas sales showed by far their biggest increase, rising from £20.7 million to £26.2 million.

The dividend has been maintained at the forecast 12 per cent on the capital as increased by last July's one for ten scrip issue, representing an effective increase of 1.1 per cent; the new shares resulting from the one for six rights issue last December rank for the final of 7 per cent. At the time of this issue, shareholders were warned not to

## COMPANY AFFAIRS

### Courtaulds Profits Slide

WHEN Courtaulds half-yearly figures were announced in November the directors said that profits for the full year might not reach the 1959-60 total of £21 million. In fact, despite higher sales in the year to March 31st, they fell by 11 per cent to £18.7 million; this understates the full setback in profits for as the table shows the previous year's figures did not include any profits from Pinchin Johnson. But its first year in the Courtaulds group has not been a happy one for Pinchin Johnson and its profits were substantially lower following a fall in demand for paint from two of its main customers, the domestic appliance and the motor car industries which were both hit by credit restrictions.

Sales of viscose staple also fell away late in 1960, reflecting presumably a lower demand for tyre cord as a result of the recession in the motor industry. Nor do results from overseas operations give much cause for satisfaction: rising costs and lower prices in export markets have cut margins while

there is as yet no sign of any improvement in trading conditions in North America, where intense competition was cited as the main reason for the disappointing interim results in November.

| Six months ending | Sept. 30, 1959* | Sept. 30, 1960* | Sept. 30, 1960 | Sept. 30, 1961 |
|-------------------|-----------------|-----------------|----------------|----------------|
| Gross profit..... | £'000s 9,154    | £'000s 11,890   | £'000s 9,569   | £'000s 9,128   |
| Tax .....         | 4,036           | 5,141           | 4,199          | 4,036          |
| Net profit .....  | 4,803           | 6,415           | 5,024          | 4,798          |

\*Pinchin Johnson's profits not included

Despite this somewhat sombre picture, relieved only by the news that fibres such as Courtele and Tricel have made further headway, and the not very reassuring statement that the pattern of trading in the current year shows no marked change, the directors have fulfilled the stock market's expectations by rounding up the ordinary dividend from the equivalent of 9½ to 10 per cent. This seemingly small adjustment absorbs however another £711,000 net in

In fact the preliminary statement now shows that profits were lower in the six months to March 31st than in the previous six months and in the case of the home group they were smaller than those earned in the corresponding period of 1959-60. Lower profit margins at home are cited as the reason for this fall. Presumably current profits lie under the same shadow, though eventually the large sums being spent on capital account should lead to some improvement. In the short run the prospects for further expansion would seem to lie much more with the overseas group than in the past but as the table shows, its gross profits have risen by 50 per cent in the last eighteen months and it must at least be questioned whether this rate of expansion can be maintained for long. The shares have risen by 2s. this week. At 89s. 6d. they are still some way below their earlier peak of over 100s. but even so they yield only 2.7 per cent, 2½ times covered.

## Firth Cleveland

Two giants among industrial holding companies, Sears Holdings and Thomas Tilling, have recently presented reports which set out in plenty of detail their activities and a breakdown of profits. This week's report from Firth Cleveland, which has expanded rapidly in the last few years and which cannot be ranked far behind the two giants in the industrial holding world, falls short of these standards. It gives a full list of the companies engaged in such diverse activities as engineering, electronics, steel, lead and the retailing of radios, television sets, other electric appliances and furniture. But it does not break profits down, nor does it show how much the 300 odd shops in the Broadmead electrical retail group, the Solartron Electronic group (in which a 53.3 per cent. interest was acquired) and the Rotherham steel makers, J. J. Habershon, contributed. Their results were consolidated into the accounts for the first time last year and must have made an important contribution to the rise in trading profits from £2.4 million to £3.8 million and in net profits from £1.3 million to £1.7 million. All that the directors indicate is that the contribution from Solartron was negligible though apparently it made some contribution to the rise in turnover from £21½ million to £36 million. It would be interesting to

## COMPANY AFFAIRS

know exactly how far the acquisition of Solartron has been responsible for the fall in the group's profit margin on all sales from 10 to 8½ per cent.

The balance sheet, too, is not without its mysteries. At the beginning of 1960, deferred profits on hire purchase sales according to the chairman, Mr Charles Hayward, amounted to £3½ million. He now says that the debts outstanding on HP contracts are less than they were; the balance sheet shows an increase in this item of £800,000 to £1,900,000, but the figures for 1959 did not include the accounts of Broadmead. Amounts receivable under credit sales, virtually a new item in the accounts, amounted to £700,000 at the end of last year, and these sales together with a rise in the rental business partially offset a fall in HP sales.

In his speech a year ago Mr Hayward spoke of a "redeployment of assets" to finance the £3.9 million in cash needed to meet part of the payments for Broadmead and Solartron, but it is not clear from the latest accounts how far the redeployment has gone. Fixed assets have more than doubled to £6.4 million. Bank overdrafts stood at £1.8 million at the end of the year; capital commitments amounted to £713,000; and, in addition, a loan of £300,000 in respect of J. J. Habershon has to be repaid to ISHRA before the end of September. Not surprisingly the directors are now planning to raise fresh capital. Apparently it will be in the form of preference rather than ordinary shares. Presumably, a rights issue of ordinary shares is ruled out because £2.1 million of Founders' shares will rank for the ordinary dividend from this year and because the ordinary capital may be increased still further as a result of Firth Cleveland's undertaking to offer shares or cash for the big minority holding in Solartron. In the past two years only 39 per cent of the issued capital has ranked for dividend. The ordinary dividend has been raised from 27½

to 32 per cent. This payment would be covered only 1.8 times on the full capital and with an issue of preference shares also in prospect, shareholders must wonder how big the dividend will be on shares which though they are 6s. below their peak at the present price of 32s. yield just over 4 per cent.

## Whitbread

WHILE other brewers have built up their empires by mergers and take-overs Whitbread has remained the odd man out, content to secure outlets by taking a minority interest in smaller breweries. It seems likely to remain so for some time to come, as the chairman, Colonel Whitbread, says that the existing family control of the business will continue for at least another generation. So far the group has stood up well to the challenge of the merging giants. Last year, Whitbread's sales were buoyant: Whitbread Pale Ale sold well in the face of more competition from lager; sales of Mackeson stout, having suffered a setback in 1959, again expanded rapidly; and Colonel Whitbread says that he and his fellow directors have been astounded by the popularity of "Tankard," a draught beer served under pressure.

| Years to December 31         | 1959   | 1960   |
|------------------------------|--------|--------|
|                              | £'000s | £'000s |
| Trading profit .....         | 3,091  | 3,662  |
| Investment income .....      | 453    | 136    |
| Depreciation .....           | 559    | 636    |
| Gross profit .....           | 2,595  | 2,861  |
| Taxation .....               | 1,218  | 1,365  |
| Net profit .....             | 1,377  | 1,496  |
| Ordinary dividend .....      | 706    | 762    |
| Ordinary dividend (per cent) | 25     | 27     |

The balance sheet reflects the result of Whitbread's sale of shares in associate companies to the Whitbread Investment Company. This brought in over £2½ million and holdings of government securities rose from £1.7 to £3.1 million. Having bought substantial minority holdings in other breweries which give it a say in the management, an outlet for its own beers and blocked

## Shareholders' Mecca

THE awnings were up and the red carpet down at the Locarno Dance Hall in Streatham to greet the shareholders, voting and non-voting alike, of Mecca Limited on Tuesday. More than 500 of them turned up, attracted more perhaps by the promise of a lunch than by the formalities of an annual general meeting. The formalities were duly observed, but the embellishments of a modern dance hall gave the meeting a cheerful and informal air. A number of the directors explained to shareholders the precise part they played in the organisation—whether it was to do with banquets, ballrooms, beauty competitions, bingo or the more sedate business of building. The statistics came thick and fast: 60 million people through Mecca's doors each year; 300,000 dancers and 50,000 bingo players each week; and 3,500 private functions

last year. From them and a film of Mecca's activities, shareholders could build up a picture of a thriving and expanding group.

To some tastes, the proceedings may appear to have been a touch extrovert. But it is upon bustle that the organisation depends and shareholders have no reason to complain about the growth in profits from under £500,000 in 1956 to nearly £820,000 in 1960. They should grow again this year; so far they have shown a "consistently favourable increase" and looking further ahead the conversion, costing £1 million, of the old Empire in Leicester Square into a dance hall and cinema will soon be under way. On the dividend of 20 per cent the 5s. shares yield only 2½ per cent and the earnings yield is only 2½ per cent. Clearly investors believe that showmanship will pay bigger dividends.

take-overs—Whitbread sold many of these interests to the investment company and now Colonel Whitbread says that further sales will be made. He does not say whether Whitbread will make any further purchases, though clearly it has sufficient funds to do so. The £1 Ordinary "A" shares at 129s. yield 4.2 per cent, covered 1.8 times; this reflects some of Colonel Whitbread's confidence that the group's sales will continue to rise so long as incomes remain buoyant.

### Watney Mann

BREWERY shares in the last few months have been pushed up to high levels in, to quote Colonel Whitbread, a "fever of short term speculation" but the half yearly results from Watney Mann this week were well above expectations. Adjusted to include for both periods profits of recent acquisitions, including Phipps, Usher and Wilson and Walker, Watney's trading profit for the six months to the end of March rose by 28 per cent over the comparable period in 1959-60 to £3.4 million. Since then sales, particularly of "Red Barrel," have remained high so that the directors confidently forecast increased profits for the full year despite a rise in costs; the extent of the increase, they add, will largely depend on the weather in the summer. If, however, a net profit of £1.7 million is again earned in the second half of the financial year ordinary earnings will work out at about 34 per cent so that while the interim dividend has been left unchanged at 6 per cent a total payment of 20 per cent, against 18 per cent, seems quite possible. On this assumption the yield on the £1 ordinary shares would be 4½ per cent.

### Pressure on Margins

WARNINGS about profit margins are now coming thick and fast from practically every side of British industry. A few weeks ago the stock market shrugged similar warnings off. Now it pays them the closest of attention. One which caused a big stir in the market last week came from Sir Eric Bowater in his speech to the shareholders of Bowater Paper.

Having described 1960 as "an exhilarating year" for the group with new records being established in production, sales and earnings, he went on to say that profit margins in the newsprint and packaging industries had been brought down by competition and that rising costs are now adding to the pressure on margins. As a result though Bowater Paper's sales have risen, so far this year profits have not matched those in the corresponding period of 1959. Sir Eric said that he believed the leeway would be made good and that trading profits in the full year would match those earned in 1960. This is comforting but it is not "growth" as more optimistic investors have defined the word.

Another leading company where no appre-

### British Oxygen

Five months ago Mr J. S. Hutchinson warned of lower margins on home sales and the interim report from British Oxygen fully bears out this forecast for although sales rose from £29.5 million to £30.7 million in the six months to March 31st, trading profits after depreciation fell from £4,951,000 to £4,651,000. What is surprising is the small increase in sales, for the chairman painted a cheerful picture in January of expanding demand both at home and overseas. The group's spending on capital account is reflected in the sharply lower tax charge of £2,015,000, against £2,400,000, which has left net profits £89,000 higher at £2,308,000. The interim dividend has been effectively maintained at 4 per cent after a two for five scrip issue and shareholders would be unwise to look for anything more than the rounding up of the final payment from the equivalent of 6½ per cent to 7 per cent. On that basis the 5s. shares at 21s. 7½d. yield 2½ per cent.

### Steel Results

FOLLOWING a warning about profit margins last week by the chairman of Stewarts and Lloyds, steel shares fell to their lowest point this year. They have rallied a little this week partly in response to statements issued by Colvilles and Consett Iron. Unlike the other steel companies Consett Iron ends its financial year on March 31st and in the latest year its trading profits rose by 28 per cent, from £3.9 million to £5 million; an increase of nearly £100,000 to £1.6 million in depreciation and an interest charge more than doubled to £951,000 left its profit before tax 24 per

cent higher at £2.5 million. The ordinary dividend has been raised from 8½ to 9½ per cent but as further large investment allowances kept the tax charge down, its cover is unchanged at 3½ times. The big cover reflects the heavy demands made on Consett's resources by its capital expansion programme while the satisfactory results reflect Consett's efforts to widen the range of its products so as to reduce its dependence on the custom of the shipbuilding industry.

Another chairman to expect not much more than trading results comparable with those of earlier years was Sir Halford Reddish of Rugby Portland Cement. The mild weather early this year was reflected in an increase in the demand for cement and Sir Halford thought that consumption of cement at home would be higher this year than it was in 1960; but he said shareholders should not hope for any "glittering or dramatic increase in profits, for costs are still rising." This statement can easily be applied to many more sectors of British industry than cement.

cent higher at £2.5 million. The ordinary dividend has been raised from 8½ to 9½ per cent but as further large investment allowances kept the tax charge down, its cover is unchanged at 3½ times. The big cover reflects the heavy demands made on Consett's resources by its capital expansion programme while the satisfactory results reflect Consett's efforts to widen the range of its products so as to reduce its dependence on the custom of the shipbuilding industry.

#### STEEL DIVIDENDS

|                   | In-<br>term | Final | In-<br>term | Price | Yield |
|-------------------|-------------|-------|-------------|-------|-------|
| Colvilles .....   | 6           | 10    | 6           | 75/-  | 4.3   |
| Lancashire Steel  | 3½          | 7½    | 3½          | 43/3  | 5.0   |
| Stewarts & Lloyds | 3           | 12    | 5*          | 49/9  | 6.0   |
| John Summers ..   | 6           | 9     | 6           | 56/9  | 5.3   |

|                  | In-<br>term | Final | In-<br>term | Price | Yield |
|------------------|-------------|-------|-------------|-------|-------|
| Consett Iron.... | 5½          | 3     | 6½          | 29/6  | 6.0   |

\* Increased to reduce the disparity between the interim and final payments.

The warning by the chairman of Colvilles, Sir Andrew McCance, in January that increases in the cost of coal and in wages were not reflected in Colville's results for the year to September 30th have to be borne in mind by investors when they compare the small rise in trading profits from £7.9 million to £8.2 million in the six months to March 31st with the rise of 11½ per cent in steel output to 1,150,000 tons. A sharp fall in the tax charge of over £600,000 to £2,000,000 has left the net profit 20 per cent higher at £4,900,000. On this basis earnings are now at annual rate of about 110 per cent, covering a dividend of 16 per cent seven times. The directors say that while there is a good prospect that "a reasonable level of operation" will be maintained the pressure of demand has slackened and output has had to be cut. In view of the group's commitments in building the Ravenscraig strip mill shareholders should not expect much in the way of an increase in dividend in the near future.

### De La Rue

THE full results from the De La Rue Group bear out fully the forecasts made by the directors in an interim statement in November. Then they reported that the demand for Formica, the group's main product, had fallen largely because the furniture trade had been badly hit by hire purchase restrictions. But they added the effect of this cutback in production was being offset by increased profits from Thomas de la Rue in printing and Thomas Potterton in the manufacture of gas and oil heaters. Formica companies abroad were also doing well while good progress was being made by the new French associate, Machines Bull. This is clearly shown in the breakdown of sales for the full year to April 1st. This reveals a slight fall in home sales but sharp advances both in exports and in sales by overseas companies which were sufficient to raise total sales from £17 million to £18½ million. But as forecast, these have been made at lower profit margins. Thus trading profits fell slightly from £2,148,000 to £2,130,000 but a sharp

increase in overseas tax from £291,000 to £398,000 has been more than offset by a lower tax charge in this country and a reduction in payments to minority shareholders—American Cyanamid has a 40 per cent interest in Formica. This has left net profits little changed at £761,000, against £731,000. Yet again as forecast, the directors have maintained the dividend at 22½ per cent on the capital as increased by a one for four scrip issue. At 6s. 6d. the 10s. shares yield 3.7 per cent.

### British and Commonwealth Shipping

FOR three years the profits of British and Commonwealth Shipping fell, touching their lowest point in 1959. Last year they began to sail out of the doldrums, rising before depreciation from £6,656,000 to £8,317,000. The main reason for this improvement was a rise in the volume of traffic. The actual increase was small but it was sufficient to make an appreciable difference to margins and to offset the effect of the dock strikes. Freight rates did not improve but the higher passenger fares in operation throughout the year probably added to revenue. The company's new liners also made their contribution with the *Pendennis Castle* operating for the whole of 1960 and the *Windsor Castle* for the last five months. But expensive new liners mean higher depreciation charges and the provision for depreciation against ships rose last year. The group's aviation interests, however, now rank as trade investments following the formation of British United Airways and this means that big depreciation provisions for aircraft are no longer included in the accounts. As a result the total depreciation charge last year fell from £4,493,000 to £4,256,000 and gross profits after this charge rose from £2,163,000 to £4,061,000. The ordinary dividend has again been left unchanged at 20 per cent but the stock market was pleased and pleasantly surprised by the rise in profits and the 10s. shares rose to 38s. to yield 5.3 per cent.

### J. Lyons

PROFIT margins earned in the food and catering business are narrow: though J. Lyons' sales rose again, increased wages and raw material costs led to a fall of 25 per cent in its gross profits, from £3,456,000 to £2,539,000, in the year to March 31st. The directors admit that the rise in turnover was disappointing and their reference to the poor summer last year suggests that, in particular, ice cream sales did not come up to expectations.

The ordinary dividend has been maintained at 15½ per cent, though the earnings cover on it has fallen from 2 to 1.3 times. This is the second time in three years that Lyons has experienced a sharp setback in profits and it would appear that its business in food is especially vulnerable. In its other traditional field of business, hotels, Lyons has now to compete with some

sturdy newcomers and it is not surprising that it has just carried through an extensive and rapid conversion of the Strand Palace Hotel, designed to bring it more in line with the standards now demanded of modern hotels. The stock market, however, is not completely satisfied at the progress that the group as a whole is making and after the full report was published the "A" shares were marked down to 87s., to yield 3.6 per cent.

### John Thompson

LAST July Sir Edward Thompson, the chairman of John Thompson, said that it would be incorrect to regard the losses on nuclear work as normal trading losses. This may be so, but the shareholders have felt the full impact of these losses. The interim dividend was reduced from 7½ to 5 per cent last September and now the final dividend, which amounted to 12½ per cent in 1959, has been passed. The group's trading profits fell last year from £1,332,000 to £994,000, their lowest figure for over a decade, and a net loss of £1,777,000 has replaced the net profit of £324,000 in 1959. The provision of £1.7 million against exceptional losses incurred on the Berkeley power station contract by the AEI-John Thompson nuclear energy company is the principal cause for the slump in earnings but other provisions have absorbed another £500,000. Presumably, all the nuclear power losses have been absorbed and it is possible that with the order book in a "very healthy state" there will be a sharp recovery in profits this year. But the stock market, having learnt the lesson of the earlier atomic power boom, is not excited by the prospect, and marked the 5s. ordinary shares down by 1s. to 15s.

### Elliott-Automation

AMONG the fashionable electronic shares, Elliott-Automation at 35s. yields only 1.9 per cent on a dividend of 13 per cent, covered just under twice by earnings. The price is high—too high some investors would say. So far the company has done well: last year its sales rose by 25 per cent, from £16 million to £20 million, and its profits, excluding those from new subsidiaries, rose by almost the same proportion, from £1,016,000 to £1,256,000. The acquisition of the Rheostatic Company added another £52,000 to gross profits.

Mr Rudolph de Trafford, the chairman, says that profits will improve again this year, and the group appears to be well poised for further expansion, having concluded agreements with American firms dealing with machine tool control systems, airborne computers and microwave valves. Mr de Trafford says that the group should begin to reap the benefit of its long preparatory work in the near future. This is obviously what investors are discounting. In doing so, however, they may have exaggerated the pace at which industry will adopt automation systems and underestimated the degree of competition within the electronic industry itself.

### London Stock Exchange

|                 |        |         |         |
|-----------------|--------|---------|---------|
| FIRST DEALINGS: | May 8  | May 29  | June 12 |
| LAST DEALINGS:  | May 26 | June 9  | June 23 |
| ACCOUNT DAY:    | June 6 | June 20 | July 4  |

THE stock market continues to reflect the uncertainty voiced by several company chairman recently. Before the week end the falls in equity prices were the sharpest for six months; the warnings from the chairman of Bowater Paper that profit margins were under heavy pressure brought many small sellers into the market and jobbers were reluctant to take more stock on to their books, so that prices were generally marked down. Last Thursday and Friday the *Financial Times* ordinary index lost 9½ points to 342. After the week end the sellers fell and relatively small public investment buying helped to raise prices, though institutional buyers were still holding off. This recovery was almost strong enough to counter the previous heavy falls, and over the week to Wednesday *The Economist* indicator fell by only two points to 410.7, exactly the same point at which it stood at the beginning of April.

Selling of gilt-edged stocks pushed prices down, and though prices steadied momentarily after the week end, on Wednesday and Thursday, reflecting the fall in sterling, prices dropped quite sharply; by the close on Wednesday the *Financial Times* index of government securities was at a new low point of 77.11. Treasury 5½ per cent 1962 fell by ½ to 101½ and Treasury 5½ per cent 2008-12 losing ¼ to a new low of 90½. The irredeemables also touched new low points: 2½ per cent Consols lost ½ to 40½ and 3½ per cent War Loan ½ to 55.

Most sections of the equity market sustained heavy falls before the week end, but some of these were counterbalanced later. Bank shares, for example, showed net gains after early losses: Barclays rose by 6d. to 89s. and Lloyds by 4s. to 75s. 6d. Investment demand brought some increases in insurance share prices, with Legal and General gaining ½ to 361. But the improvement after the week end was not enough to offset the earlier falls in engineering shares, where the statement of the Vickers chairman added to fears of narrowing margins in the industry. Vickers lost 1s. 4½d. to 37s. and Metal Box 4s. 6d. to 89s. 6d. Among store shares Debenhams lost some of its recent gain, falling 1s. 10½d. to 72s., but British Home Stores gained 9d. to 22s. 6d. while Radio Rentals rose by 3s. 7½d. to 30s. 3d.

Newspaper shares were a busy market as rumours of a bid for Associated circulated: Associated Newspapers rose from 27s. to 29s. 3d., having touched 30s., and though Thomson Newspapers denied it was thinking of a bid its shares fell back 6d. to 30s. Among hotel and catering shares, J. Lyons fell after the disappointing results, but Mecca gained 2s. 3d. to 45s. after the annual meeting. Tobacco shares rose after the announcement of retail price increases by Imperial Tobacco, with "Imps" rising to 68s. 3d.

## THE MONEY MARKET

THE syndicate of discount houses retained its agreed bid at £98 17s. 10d. for the third week at last Friday's Treasury bill tender, and the average rate of discount was virtually unchanged, rising by only 0.87d. per cent to £4 8s. 9.61d. per cent. With total applications falling quite sharply, by £20 million to £420 million, for the unchanged offer of bills of £270 million, the discount market received 61 per cent of its application, against 50 per cent the previous week.

For the third week running the market has balanced its books without calling on the Bank of England for assistance at the penal rate. After the turn of the month credit was in good supply in Lombard Street and rates for day to day money fell to the clearing banks' minimum of 3½ per cent. After the weekend, however, funds tended to dry up, and on Monday and Wednesday the authorities provided the market with a moderate amount of help by the special purchase of bills. Credit was tighter still on Tuesday and the authorities gave a very large amount of assistance.

In New York last week the three months bill rate rose from 2.438 per cent to 2.516 per cent.

# THE BOWATER ORGANISATION REPORTS

*Speaking at the Annual General Meeting of The Bowater Paper Corporation Limited*

*held at The Royal Festival Hall, on 1st June, 1961,*

*the Chairman, Sir Eric Vansittart Bowater, made these points:*

**In spite of tougher trading conditions, new records were achieved in 1960 in production (2½ million tons), sales (£142 million) and earnings (£23½ million)—to which overseas operations contributed 70 per cent. In Europe, investment in the Common Market is now £12 million, covering pulp, newsprint, printing papers and packaging manufacture, with further developments in train.**

**In North America, production is being diversified, with hardboards and (next year) printing papers being added to existing large-scale newsprint and pulp manufacture.**

**In the United Kingdom, new or projected operations include new plants for packaging, for building materials and for printing papers—and a new ship**

**In Australia, an integrated tissue mill has been brought successfully into operation by Bowater-Scott, while in New Zealand a new highspeed paper machine is being developed by Bowaters for its associated Tasman Pulp and Paper Company. At the end of 1960, total issued Ordinary capital of over £40 million was owned by nearly 70,000 shareholders—61,000 of whom have personal holdings of £1,000 or less.**

**Authoritative estimates of paper and board consumption up to 1975 in world market areas of major importance to Bowaters, such as North America, Western Europe and Australia, indicate increases in demand of up to or more than double the present figures.**

Welcoming a record number of shareholders to the Annual General Meeting of The Bowater Paper Corporation Limited at The Royal Festival Hall, London, on June 1, 1961 the Chairman, Sir Eric Vansittart Bowater (referring to recent articles in the financial press on the identity of investors) said: "To me and my colleagues you are not 'Faceless Ones'—you are in our eyes members of a very lively partnership, and we like to think we have your confidence and goodwill, as you certainly have ours." Of nearly 70,000 Ordinary shareholders, there are 61,000 with holdings of less than £1,000 of Stock, almost half of whom are women.

Passing on to review the affairs of the Corporation, Sir Eric said:

1960 was another exhilarating year for Bowaters, a year in which we achieved new records in production, sales and earnings: a year in which we established ourselves more firmly in the Common Market area, and during which we continued steadily to develop our businesses in the United Kingdom, North America, Europe, Australia and New Zealand. Our production of paper, pulp, packaging and other products reached 2½ million tons, and exceeded 1959 production by 22 per cent, while sales for the year amounted to £142 million, an increase of £25 million, or 21 per cent over 1959. Whilst newsprint is still our principal product, the output of that product as a percentage of our overall global production during 1960 amounted to 57 per cent.

Consolidated trading surplus was £23½ million, of which our overseas interests contributed approximately 70 per cent. The increase in trading surplus of £3½ million, or 17 per cent over 1959, was lower than the increase of 21 per cent in sales, and this is further illustrative of the pressure on profit margins to which I have referred from time to time. To a limited extent technical improvements and increased efficiency offset higher costs but the improvement in consolidated trading surplus was mainly attributable to increased production and sales, and to the continuing development of your Organisation. The pulp mills of Bowaters Carolina Corporation contributed to earnings for their first full

year of operations, whilst the accounts of Paperies de la Chapelle and La Cellulose de Strasbourg were brought into consolidation for the second half of the year.

## NEW PLANT FOR NEW PROJECTS

During the year capital expenditures on new plant amounted to £11 million, covering such projects as the conversion of one of the United Kingdom newsprint machines to the manufacture of fluting medium; progress payments on the new Gillingham and Flexpipe plants and on the new ship now under construction, and the amounts due upon completion of the hardboard mill and the pulp mill at Catawba in South Carolina.

Bowaters United Kingdom Pulp and Paper Mills were able to operate their plants throughout the year to full normal capacity, at which level they have continued to operate to date. At the Mersey Division site at Ellesmere Port, the first unit of the new pitch fibre pipe plant has come into successful operation. This plant represents an investment of £700,000, and is a further step towards diversification. At the Sittingbourne Division work was started on the conversion of one of the machines to manufacture high grade blade-coated paper, a product in ever-increasing demand by the printing and publishing trades in the United Kingdom and overseas. This project, involving an expenditure of £1½ million, will be completed during this year.

The policy of the United Kingdom Mills company is to continue with the conversion of further of its machines presently engaged in the manufacture of newsprint to the production of other grades of paper, especially those papers used in the ever-growing packaging industry.

The death during the year of four British newspapers was of the utmost importance to our industry, for in the aggregate they were very substantial consumers of newsprint and all of them were customers of Bowaters. Fortunately most of their circulation has been picked up by others who also are our customers, so that the net loss is not as great as at one time feared. As a consequence of the good relations existing

between the parties concerned and ourselves, the recent merger of the Odhams group with the Mirror group should not adversely affect us.

The Bowater Steamship Company, which operates eleven oceangoing ships, with a twelfth nearing completion, enjoyed a satisfactory year.

## DEVELOPMENTS IN PACKAGING

Despite intensive competition, Bowater Packaging Limited enjoyed a relatively satisfactory year. Pressure on profit margins continued throughout the year, and this trend has persisted unabated during the early months of this year. However increased productivity may to some extent offset any adverse effect of these conditions on profitability. The new flexible packaging plant at Gillingham in Kent, extending over some 386,000 square feet and erected at a cost of £3½ million, is now in operation. At Stevenage in Hertfordshire, plans for the new corrugated fibre container plant were finalised during 1960 and the construction of this plant is now well under way and is due for completion, at an estimated cost of £2½ million, in the spring of 1962.

To meet the ever-increasing demand for fibre drums, extensions to our Disley and Brentford factories have become necessary to provide room for further development in this important field of packaging. An extension to our multi-wall sack plant at Mersey was completed early this year.

A new plant for the production of Perga milk and fruit juice cartons was started in South Wales in the spring of 1960. This plant has enabled us to meet the heavily increased demand for these cartons and supplements the existing Bowater Perga plant in Gateshead in County Durham.

## STAKE IN THE COMMON MARKET

Turning now to the Common Market Area, in June 1960 we acquired a controlling interest

in Papeteries de la Chapelle, one of the three most important integrated pulp and paper mills in France, with a productive capacity of some 200,000 tons annually, of which little more than half is newsprint, the balance being magazine and coated papers. At the same time we acquired La Cellulose de Strasbourg, one of the principal pulp mills in France, having a productive capacity of some 70,000 tons of chemical pulp per annum. Our investment in the Common Market is now of the order of some £12 million.

Another important step taken in Europe is the partnership agreement we entered into with the Philips international electronics organisation for the setting up of a new joint company known as Bowater Philips S.A. in which each partner has a 50 per cent interest. This new company will complete and operate the corrugated fibre container plant at Ghent, construction of which was commenced by Bowaters in 1960. The plant, which covers an area of some 350,000 square feet, will be completed in November of this year at an estimated total cost of £1,500,000.

In Italy, Bowater Italia's corrugated fibre container plant increased production and sales by over 50 per cent during the year whilst at the

Estimated increases in population and consumption of paper and board by 1975—United Nations (F.A.O.)

reorganised plant of Bowater Port S.A., at Rheims in France, modern machinery and equipment have been installed to meet the current requirements for folding boxes and flexible packaging in France. The construction of a corrugated fibre container plant at Rheims is now scheduled to commence early in 1962. All these strategically located European pack-

aging companies are being developed, but it is not to be expected that they will make any substantial contribution towards the Corporation's revenues for the next year or two.

Our associated company, Bowater-Scott Corporation, had a highly successful year within the United Kingdom and overseas, including Europe where, in partnership with leading Belgian and Italian papermaking concerns, it has now commenced production of its well-known branded products. One of the highlights of the year for the Bowater-Scott partnership was the coming into production in Melbourne, Australia, of its new integrated tissue paper and conversion plant, the first of its kind in Australia. As time goes on it is Bowater-Scott's intention to establish a second such plant in Sydney, New South Wales.

The Tasman Pulp and Paper Company of New Zealand, in which we have a substantial investment, achieved a higher level of sales and profits than at any time heretofore. Net profits amounted to over £1 million and production reached more than 84,000 tons, and it is hoped to raise this level to 95,000 tons. The installation of the Tasman company's second paper machine, designed to operate at 3,000 feet per minute, is progressing satisfactorily, and when this is achieved the total productive capacity of this mill will be some 200,000 tons of newsprint per annum.

Our principal overseas subsidiary, The Bowater Corporation of North America Limited, enjoyed a very successful year, the level of production of all its operating subsidiaries in Canada and the United States constituting an all-time record. Consolidated profits amounted to over \$41 million, and the balance of profits attributable to that Corporation was over \$10 million.

North American newsprint consumption and production in 1960 reached new peaks for the second consecutive year, USA consumption reaching its peak in the middle of that year. Consumption largely follows the business cycle which, in the view of many business people and economists, has now passed its low point with recovery expected later this year. I think it is reasonably safe to say that newsprint consumption in the USA in 1961 will be about the same as it was in 1960.

Bowater's Newfoundland Pulp and Paper Mills operated on a normal full-time basis throughout the year and production reached a higher level than at any previous time. Substantial capital sums have been and are being spent on these mills and those of Bowaters Mersey Paper Company, Nova Scotia, the benefit of which should be reflected in future operations.

## DIVERSIFICATION IN NORTH AMERICA

Bowaters Southern Paper Corporation, Tennessee, benefited from the first full year's operation of its four newsprint machines, but its earnings were adversely affected by the starting-up expenses of its new hardboard mill at Catawba, South Carolina, which came into operation in July last. Bowaters Carolina Corporation had a successful first full year of operations of its pulp mill, and its sales continue at a high level, despite difficult market conditions.

Another step towards diversification in North America was the decision to construct alongside the pulp mill in South Carolina a paper mill in

which there is initially to be installed one high-grade printing paper machine. It is anticipated that it will come into operation in the third quarter of 1962.

Returning to the consolidated accounts of The Bowater Paper Corporation, the relatively high increase in depreciation by comparison with the increase in trading surplus reflects the inclusion over varying periods of new plants and new businesses, some of which have not yet achieved the anticipated ultimate level of earnings; indeed some part of our total assets is represented by new plant and investments that have not yet reached the profit-earning or dividend-paying stage, but as time goes on these will make a valuable contribution to consolidated earnings.

It would seem that the tide has again turned in a more favourable direction, but for my part I do not look for any substantial upturn in the economies of the United Kingdom or the United States during this year. Moreover, there is usually a time lag in the affairs of the industries in which we are engaged in relation to the ups and downs of the economy generally. Another factor influencing our fortunes is the excess productive capacity that presently exists in the world, resulting in intensive competition, which in turn is reflected in shrinking profit margins. This situation is further aggravated by constantly rising costs of production, over which we have no control.

So long as we continue to develop, as we intend to do, new developments must be expected to offset, at any rate to some extent, any shortfall in profits that may occur from time to time, but the vast amount of capital employed in your Organisation—some £190 million—is entitled to a fair and proper return, and the time may well now be approaching when further consideration will have to be given to the problem of whether or not we should continue ourselves to absorb increasing costs.

## CONTINUED GROWTH IN BOWATER MARKETS

Despite continued uncertainty, your Directors are of the opinion that the outlook for our Organisation remains favourable and this, together with the substantial increase in trading surplus resulting from our continued development, influenced them in recommending at this time some further modest increase in the rate of Ordinary dividend. Accordingly the final dividend of 1s. 9d. per £1 Stock unit as now recommended makes, together with the interim dividend already paid, a total distribution for the year 1960 of 2s. 9d. per £1 Stock unit, compared with the effective rate paid in respect of 1959 of 2s. 6d. per £1 Stock unit.

An authoritative survey of prospective world demand for paper and board, published under the auspices of the United Nations, indicates substantial world increases in demand over the next fifteen years. In North America, for example, demand is calculated to reach 59 million tons of paper and board in 1975—compared with an estimated total of 36 million tons for 1960. In Western Europe, the estimated demand for 1975 is nearly double the present consumption. In Australia and New Zealand prospective 1975 consumption is rather more than twice the present level. These forecasts of continued growth constitute very solid reasons for regarding the future of Bowaters in international terms.

The report and accounts were adopted.

# Sunday Pictorial Newspapers Limited

A year of challenge and change  
Developments in periodical publishing

statement by the Chairman, Mr. Cecil H. King, at the Annual General Meeting of Sunday Pictorial Newspapers Limited 6th June.

Before reviewing the year's trading activities it is my pleasant duty to welcome formally to the Board Mr. J. S. Nener, for eight years editor of the Daily Mirror, and Mr. S. T. F. Ryder, joint managing director of the Kelly-Liffe Group. Mr. C. B. de Launay and Mr. F. J. Rogers have resigned from your Board on joining the Daily Mirror Board.

The Sunday Pictorial trading profit is less than last year. As forecast in my previous statement, the cost of producing bigger papers and an enlarged publicity appropriation made inroads into profits and has resulted in lower operating margins. Consequently, in common with other Sunday newspapers, a price rise was forced upon us in January—although too late to affect significantly the year's trading results.

## Investment Income

On the other hand, an increase in investment income has led to a total profit before taxation of £1,693,272, only £112,651 below last year's record level. Whilst £71,395 came from a special second interim paid by A. E. Reed & Co. Ltd., and this sum should perhaps be regarded as in advance of next year's income, I am sure you will agree that the increase in investment income is very satisfactory.

It is of value to record that the aggregate earnings before taxation applicable to your company's interest in the companies that constitute your trade investments, as disclosed in the last published accounts of these companies, were almost twice the £1,114,021 dividends received as shown in the accounts before you. You will realise that this provides a very healthy backing to investment income and that it offers additional cover for the dividend your Board proposes to be paid on the Company's Ordinary stock.

It is with this factor in mind that your Board recommends the payment of a final Ordinary dividend of 17½%, making 27½% for the year, an increase on last year of 2½%.

## Circulation fluctuations

Circulation has fluctuated sharply in the year under review—mainly because of the closure

of two Sunday papers. Although these closures brought a great influx of new readers to the Sunday Pictorial I was saddened by the disappearance of two old and respected competitors. As a result of the price increase we have naturally suffered some loss of sales but most of these are counterbalanced by the very considerable gains in the preceding months.

Amongst a number of staff changes made in the spring of this year Mr. L. A. Lee Howard, who has very ably edited the Sunday Pictorial for two years, became editor of the Daily Mirror. The editorial chair of the Sunday Pictorial has been taken over by Mr. R. T. Payne, a journalist of many years' experience.

## Outstanding events

The Daily Mirror Newspapers Ltd., in whose much-publicized affairs your Company has a substantial and close interest, had a most important and eventful year. Circulation of the Daily Mirror newspaper is high, advertisement revenues are buoyant, and the price increase of the current year will safeguard the level of its trading profit.

Outstanding during the year were the events leading to the acquisition by The Daily Mirror Newspapers Ltd. of the share capital of Odhams Press Ltd. The Daily Mirror Group thus becomes the most powerful publishing house in the world with control of some 220 British and overseas newspapers, magazines and trade and technical journals.

This historic event in publishing has rightly attracted intense public interest. There has been much talk of monopoly. The second Royal Commission in 14 years has been set up to investigate the Press. I welcome the enquiry.

The Daily Mirror Group has always conducted its affairs in the full glare of publicity and has nothing to hide. Let us take a look at the facts.

## Periodical publications

There are 3,800 general and trade and technical magazines in these islands, of which

some 2,000 or so are commercial in the sense that they compete for advertising. The Daily Mirror Group publishes a fraction over 200 British magazines or about 10% of the total. This is not a monopoly.

It is true that in certain specialized sectors of the market it has most of the magazines that matter. It has about three-fifths of the total woman's magazine market. The more important agricultural and motoring journals, to name two groups in the technical field, are run in vigorous opposition by a number of Mirror Group subsidiaries.

## The new grouping

This has led to the charge that the new grouping will result in the wholesale massacre of many periodicals. Nothing could be further from the truth. Most markets need more than one publication and, provided revenues from advertisements and sales are sufficient, all can flourish under the spur of competition.

It is the nature of the magazine business that publications are closed down and new ones launched fairly frequently. As an example, in the last three years 266 general periodicals have ceased publication while 257 new titles have appeared in the Newspaper Press Directory. Over the same period 143 trade and technical journals have died but 273 new titles were born.

In the Daily Mirror company's case there may be some pruning here and there where a market is over-supplied. But no one in his senses would close down any but a tiny proportion of this impressive group of publications.

## Concentration of ownership

It is claimed by some to whom bigness is distasteful and success morally dangerous that there is something sinister in concentration of ownership. They know little of publishing under present day conditions.

Production costs are so high that the spread of administrative charges and the maximum use of printing machinery is essential. It is sometimes forgotten that more

an one publication of distinguished lineage as been saved from extinction by incorporation into a group.

Charges of monopoly are nothing new in Fleet Street. While the Daily Mirror Group robustly surpasses any previous periodical publishing company in size, the concentration of newspaper ownership is slight compared with the Press empires of the nineteenth century.

In 1923 my uncle, the first Lord Rothermere, owned 14 newspapers with a substantial interest in 3 more out of a total of 158. By 1929 the Berry Group controlled an even larger number of 26 daily and Sunday papers out of 49. In contrast the Daily Mirror with the Sunday Pictorial publishes eight daily and Sunday newspapers in the United Kingdom out of a total of 139.

## Immense influence

Viewing the scene from the point of view of circulation, however, the two dailies, the Daily Mirror and Daily Herald, account for 8% of the total sales of the national dailies, while the national Sundays, the Sunday Pictorial and The People, have between them over 40% of the national Sunday circulation. These are large figures, and carry with them immense influence, but they are by no means without precedent. The Times, for example, occupied a much more dominating position amongst the newspaper reading public of a century or so ago when its circulation was at times greater than that of all the other London papers added together.

Although there have been greater concentrations of newspapers before I would not wish to imply that all is perfect in the industry. Nobody who has spent his life, as I have, keeping newspapers alive, can regard the closure of five daily and Sunday newspapers in one year with anything but dismay. Some of the factors leading up to these closures, such as low productivity and the tendency of advertisers to favour the big titans, will benefit from the public airing Royal Commission will provide.

I would like to see also, at some future date, an examination of the unpredictable operation of the law of libel which tends to be weighted against the Press so that it operates to the restriction of public information.

## Associated companies

I will turn now to the affairs of some of our associated companies, where we operate in partnership with the Daily Mirror.

Reveille Newspapers Ltd. shows a further increase in profit and its lively newspaper has maintained without difficulty its pre-eminent position in its market. Your company has received a further dividend from this source during the year.

Of our Scottish newspapers, the Daily Record again confirmed its popularity as Scotland's fastest-growing newspaper with an average circulation increase of over 30,000 copies daily. The current sale is over 500,000 and local advertisers are shrewdly taking advantage of this upward trend. The Sunday Mail, in an ever-keener competitive market, more than maintained its circulation of 600,000 copies a week.

## Overseas newspapers

Further afield, in the newly-emergent countries of West Africa, our newspapers have had a further successful year with a 15% increase in profit. The name of the parent company was changed during the year to Overseas Newspapers Ltd. to embrace the widening range of that group's interests. An important development was the entry into new markets in British Guiana with the purchase of the two leading newspapers there—the Guiana Graphic and the Sunday Graphic. Both these papers have considerable profit potential and in due course will provide a sound foothold in the Caribbean area.

## Pulp and paper industry

In the field of pulp and paper manufacture the interest we had in Anglo-Canadian Pulp & Paper Mills Ltd. was exchanged for shares of Albert E. Reed & Co. Ltd. (the Reed Paper

Group). As a result your company in association with the Daily Mirror has substantially increased its shareholding in one of the foremost groups in this important industry. Reed is well established to meet the growing opportunities in the international paper and packaging markets. Indeed, the Reed Paper Group has emerged as a world-wide partnership producing pulp, paper, board and packaging in the four main trading areas of the world.

## Television interests

A further part of our investment income is derived from the important stake we have in Associated Television Ltd. ATV's revenues from advertising have increased during the year and the company is expanding both at home and overseas. Expenditure on television advertising in Britain reached a new peak in 1960 of £77 million, an advance of nearly one-third on the £58 million spent on this medium in 1959. In his budget of April this year the Chancellor of the Exchequer saw fit to impose a tax of 10% on television advertisements. While it is too early to make forecasts about the year ahead the profits of ATV's financial year ended 30 April are not affected by it. In any event, ATV's central position in this highly profitable industry is well secured and the future is bright.

## The current year

Looking ahead for a moment at the Sunday Pictorial's prospects for the current year, it appears likely that investment income will be slightly below that for the year under review and trading profit somewhat higher.

It remains for me now to pay tribute to all personnel, both at home and overseas, whose efforts have contributed to the results before you. They have had a busy period, culminating with the move into the Daily Mirror's splendid new building in Holborn Circus at the end of the financial year. Its modern and colourful appearance makes an appropriate setting for the liveliest newspaper in the Sunday market.

## AN EXTREMELY SUCCESSFUL YEAR

## RECORD VOLUME OF NEW BUSINESS

## GROWING RECOGNITION OF T.R. SERVICES AND WORKMANSHIP

## MR W. STUART PHILCOX ON "SUBSCRIBER SATISFACTION"

The thirty-second annual general meeting of Telephone Rentals Limited was held on June 7th at the Registered Office, 197, Knightsbridge, London, SW7. Mr W. Stuart Philcox, DFC, MA (Chairman and managing director), presiding.

The Secretary (Mr W. J. H. Ainley) read the notice convening the meeting and the report of the auditors.

The following is the statement by the Chairman which had been circulated with the report and accounts for the year ended December 31, 1960.

I greatly regret that for the second successive year I have to preface my comments on the year's operations by referring to the death of one of our Directors, who can be fairly described as one of the founder members of the Company. Mr Campbell Cochran, who died on October 17, 1960, was closely connected with Telephone Rentals Limited and its predecessors throughout a period of 48 years and it is hardly too much to say that without the practical help and support he gave to the late Mr F. T. Jackson in the early difficult days the Company might not be in existence today.

He combined a sound knowledge of the law with a shrewd knowledge of business affairs, though his judgment was always tempered by human understanding. He always had great faith in the future of the Company and through his death we have lost a wise counsellor and a staunch friend.

## RESULTS FOR THE YEAR

It gives me very great pleasure to be able to report that the Company has again had an extremely successful year on all sides of the business. This success is clearly reflected in the Accounts now before you and I hope that the general picture of financial strength and solidity they present gives you as much satisfaction as it does your Directors.

Following the more common practice these days I will deal with the more important changes in the Consolidated figures of the Group rather than those of the Parent Company.

## PROFIT AND LOSS ACCOUNT

Trading income is up by £350,736. Dividends

and Interest receivable by £12,898, whilst on the other side Operating Expenses are up by £129,728 and Depreciation by £60,006. Directors' Emoluments on the other hand shows a reduction of £26,238. This reduction is accounted for by the payment made to the estate of the late Chairman in 1959, which as I explained last year was non-recurring, less the emoluments of the Executive Directors which are now included in full for the first time.

United Kingdom Taxation is up by only £45,158 and Overseas Taxation by £2,403. The UK Taxation benefits greatly by the effect of the Investment Allowance which this year amounts to no less than £120,000. This is a great help to your Company, enabling its further expansion by way of Capital Investment.

The Net Profit after Tax, but before transfers to Reserves and provisions for Dividends, is £990,012, an increase of £152,509 over 1959. The sum of £508,019 has been transferred to General Reserve and £171,200 to the Tax Equalisation Reserve.

As has been explained in previous years, the Tax Equalisation Reserve represents the difference between the amounts allowed by the Inland Revenue for Initial and Wear and Tear Allowances and the amounts provided by us for Depreciation in our Accounts. The Reserve is calculated each year on the respective written-down values of the Fixed Assets at the current rates of Taxation. Thus the transfer for 1960 is enlarged by £54,000 for the years prior to 1960, due to the increase in the rate of Profits Tax from 10 per cent to 12½ per cent in the 1960 Budget which became operative from April 1, 1960.

The additional 2½ per cent in the rate of Profits Tax imposed by the 1961 Budget will necessitate a further re-assessment next year.

The other principal item in the Profit and Loss Account, apart from the provisions for Dividends, is concerned with the Holding Company in South Africa. During the year we decided to capitalise £129,000 of the Profit and Loss Account, thus increasing the Issued Capital to £130,000 and bringing it more into line with the Capital permanently invested in

South Africa, which amounts to approximately £250,000. During the course of the next few years, we hope to make a further increase of capital in the same way to complete the operation. Meanwhile, the stamp duties involved in this transaction, amounting to £696, have been written off, and the current account of some £157,000 is being liquidated, £42,500 having been received to date in 1961.

I said last year that we might reasonably anticipate being able to maintain the increased rate of dividend and your Directors have pleasure in recommending that a final dividend of 10 per cent, making a total of 15 per cent for the year, should be paid.

After providing for the transfers to Reserves, and the Dividends on both the Preference and Ordinary Shares amounting to £243,873, we are left with an unappropriated Profit balance attributable to the shareholders of Telephone Rentals Ltd. of £353,190 as compared with £420,486 for 1959. This would, of course, have shown an increase of £62,400 but for the item mentioned above in connection with South Africa.

## BALANCE SHEET

## Liabilities

The Authorised and Issued Capitals remain the same, but the Capital Reserves show an increase of £131,646, mainly accounted for by the £129,000 referred to above. The Parent Company's Shareholders' interests, consisting of Capital, Reserves and Unappropriated Profit, amount to £6,139,533, an increase of £572,369 over the previous year.

I have already dealt with the various Tax Reserves and the remaining liabilities show only small changes due to normal trading fluctuations.

## Assets

The value after depreciation of the revenue-bearing Installations has increased by £651,304, which reflects the considerable increase in new business obtained in the latter part of 1959 and throughout 1960.

Stock and Work-in-Progress at £1,107,153 is up by £351,308, an increase of over 40 per cent. These figures bear out my statement last year that we anticipated considerable increased ex-

## THE ECONOMIST JUNE 10, 1961

penditure on materials. Not only must we carry larger stocks to cater for the higher rate of business, but there is also much more in the "pipe-line" as work-in-progress.

The increase of £131,597 in Sundry Debtors and Prepayments is almost wholly accounted for by many large jobs completed and invoiced in the last few months of 1960.

Our Liquid Resources consisting of Tax Reserve Certificates, Deposits with Local Authorities, Investments and Cash are some £283,258 less, due entirely to the increased expenditure on Stocks, as forecast.

The remainder of the items in the Balance Sheet do not call for comment, since the fluctuations are not material and arise in the course of normal trading conditions.

## COMMERCIAL ACTIVITIES

I am glad to say that our operations in the United Kingdom resulted in a volume of new business that represented an all-time record, with a continuation of the trend towards larger installations to which I referred last year. Generally speaking, trading conditions were not easier in 1960 than in the previous year and this achievement is entirely due to the efforts made by all members of the Commercial staff, both at Head Office and in the field.

Resulting from the work done in our National sales schools, there has been a great advance in our selling technique and during the year our methods of presenting T.R. Services were re-organised and improved. It is permissible to add that the record results are indicative both of the growing realisation of the importance of T.R. Services to Industry and of the still wider recognition of the Company's reputation for first-class workmanship and service.

An interesting sidelight on the growth and development of the Company in recent years is given by the fact that the new business in 1960 expressed in terms of additional annual rental was greater than the sum total of rental on the books of the Company less than twenty years ago.

## ENGINEERING DEPARTMENT

On the engineering side, the number of installations completed and put into service exceeded the number fitted in 1959 by more than 50 per cent and our engineering departments were continuously working under great pressure.

The larger volume of business, together with the effect of the longer holiday period agreed to at the beginning of the year, made it necessary for us to increase the number of men employed by about 20 per cent. Men recruited from outside are naturally not accustomed to our methods and the problem, of reducing the high work-in-hand figure whilst at the same time giving organised training was not easy to solve. As the new men have been anxious to learn and as our experienced men have been equally anxious to co-operate, the difficulties were successfully overcome and our standard of workmanship has been fully maintained. On your behalf, I offer our best thanks to all concerned.

In spite of the considerably larger orders on suppliers and the increase in man-power just described, the amount of work-in-hand still remains high and the period between the signing of a contract and the completion of the installation is still too long. This time-lag not only causes inconvenience to our Subscribers but also adds to the financial load on the Company as

## COMPANY MEETING REPORTS

we cannot submit our invoices until the work has been satisfactorily completed. This is a situation that will progressively improve during the current year, as the result of the steps taken in 1960.

## CLERICAL STAFF

Another consequence of the extra volume of business has been the automatic increase in the amount of paper work to be handled. In spite of this, so far from the number of clerical staff at Head Office and the Branches having increased, the number employed at the end of 1960 was actually 15 per cent fewer than at the beginning of 1958.

It was during 1958 that we decided to carry out the thorough investigation into our routines and methods and this quite remarkable result is due to the successful implementation of what has amounted to a major re-organisation. The change from one set of methods to another covering all sections of the business, at a time when the burden of work is daily becoming heavier, demands a great deal from the staff, and particularly the senior members of the staff. Without their willing and understanding co-operation our efforts towards greater efficiency could not possibly have succeeded.

## LONG SERVICE

For many years it has been our custom to present a gold watch and a cheque to each employee who had completed forty years of service with the Company. During the year under review it was our great pleasure to make no fewer than nine of these presentations. These long-service employees, many of whom are still active with us and who hold many different positions in the Company, have lived and worked through almost every phase of the Company's history. They are truly representative of that indefinable thing we call T.R. spirit.

At this stage, it is not inappropriate to report that included in our list of subscribers are almost nine hundred—the exact figure is 874—with whom we have had a continuous business association for forty years or more. This is a good indication both of the cordial relationship that exists between ourselves and our subscribers and of the quality of our service to them. There is a closer connection between the nine and the nine hundred than might perhaps be apparent on the surface.

## PENSION SCHEMES

We have two contributory pension schemes. The first, which has been in existence for many years, is voluntary in nature and is now almost entirely confined to female members of the staff. The second, more recently introduced, is compulsory for all males in the employment of the Company with three or more years of service, except the relatively small number who wished to remain in the original scheme.

After careful consideration we came to the conclusion that the interests of both Company and employees would be best served by contracting out of the State Graduated Pension scheme all members of our compulsory scheme. With the agreement of the members we have taken the necessary steps to implement this decision, which necessitated certain minor alterations to the scheme itself.

## OVERSEAS COMPANIES

On the whole, in spite of generally unfavourable conditions, our overseas interests continued to make satisfactory progress.

A number of visits by senior personnel, both to and from the United Kingdom, again took place. Although costly, we are sure that these visits are essential as it is only through personal contact and direct interchange of views and information that we can effectively preserve identity of interest among such widely differing circumstances.

In South Africa, although the general situation was unsettled our companies again operated profitably, and the overall volume of business was slightly higher than in the previous year. During the last three years our engineering departments, particularly in Johannesburg, have been overhauled and re-organised. Our rate of growth in South Africa during the past twelve years has imposed considerable strain on our local staff and the operation now on the point of completion, which has involved the transfer of skilled men from this country, will ensure that the work of installation and maintenance will be carried out more efficiently and economically.

In Canada, a very definite and quite severe recession developed during the course of the year and our early hopes for greatly improved results were disappointed. In the circumstances there was little we could do from here to be of practical assistance and it is therefore all the more satisfactory to be able to report that our Canadian staff are working with increased energy, having in no way lost their determination to succeed.

The balance of overseas payments in Australia worsened during 1960 and in the latter half of the year stringent credit restrictions were imposed. In spite of this and the quieter trading conditions that resulted, our jointly owned company had another successful year and they established new records both as regards the number of contracts taken and the amount of profit earned.

On the Continent, in the face of some difficulties, particularly in Belgium, our operations continued satisfactorily and profitably.

## FUTURE PROSPECTS

So far as the current year is concerned, we must expect some quite heavy increase in our internal expenditure. Although your Company does not form part of the Electrical Contracting Industry our working hours and rates of pay are to an extent influenced by those current in that industry. During 1961 we are committed to a shorter working week and a considerable wage increase on the engineering side, whilst there will be certain unavoidable rises in general overheads. It seems safe to say, however, that these increases will not materially outweigh our expected rise in revenue.

With so many conflicting views being expressed in the Press and elsewhere it is difficult to form a clear picture of the probable trend of trading conditions at home and overseas. As we do business with almost every type of commercial, industrial and professional concern, our monthly returns during recent years have represented a sort of barometer of national production and business activity.

But the experience of the Company, which covers times of depression as well as times of prosperity, shows that when trading conditions become less favourable, and when in consequence the fight against competition depends more and more on lower costs and higher efficiency, the need for T.R. Services becomes greater and more apparent.

Although later on we may have temporarily to

abandon the use of the word "record" in describing our progress and although conditions overseas may become more difficult before they improve, there is at present no evidence to suggest that, in the absence of some major crisis, we need anticipate any serious falling off in our overall results. I am at least able to say that the returns of the first four months of the year support that view.

In all the circumstances, your Board feel able to recommend the capitalisation of £506,880 of the General Reserve to be applied to the issue to Ordinary Shareholders on the register at the close of business on the 21st June, 1961, of one fully paid Ordinary Share for every five already held. We anticipate that it will be possible to maintain the present rate of annual dividend on the increased capital.

PROBLEMS OF GROWTH

Looking beyond 1961, I believe that the long-term fortunes of the Company are likely to depend less upon fluctuating trading conditions than upon our ability to deal with the problems created by our own growth.

HAMBROS BANK LIMITED

HAS RECORD YEAR

REVIEW BY SIR CHARLES HAMBRO, CHAIRMAN  
NEW PARTNERSHIP IN AMERICA

The forty-ninth Annual General Meeting of Hambros Bank Limited was held on June 8th at the office of the Bank, 41 Bishopsgate, London, E.C.2.

Sir Charles Hambro, KBE, Chairman of the Company, stated:

On April 25th the Bank suffered a grievous loss in the death of our Chairman, Mr Olaf Hambro, a great personality in the City of London, who started work in our family firm of C. J. Hambro & Son in 1908. He was one of the last representatives of that great age of Merchant Banking that helped to make London the financial centre and envy of the world. We have not only lost a great leader whom we all honoured and admired, we have lost a beloved head of the family who was a guide, philosopher and friend to all of us. Under his guidance the Bank has grown from strength to strength and it is a great satisfaction to us all that he was well enough before the end to see and approve the record figures which we are able to put before you today.

STERLING BALANCES

The activities of the Bank during the year under review have again been complicated by economic uncertainties outside our control. Last year the accumulated effect of several years of deficit in its budgets caused the United States to lose gold in considerable quantities. The uncertainty brought about by the drain of gold started a flight from the dollar in the autumn of last year, with a rise in the open market price of gold; and the resulting demand for sterling created a big increase in foreign balances in this country. These balances remained here until the revaluation of the German Mark at the beginning of March this year, but this revaluation prompted a new feeling of uncertainty in the stability of other currencies; this caused a flight from the pound sterling and many foreign-owned sterling balances were transferred abroad as fast as they had come in. By the nature of

COMPANY MEETING REPORTS

As both our subscribers and the people we employ increase in numbers and as the range of T.R. Services widens, the organisation becomes more complex and in order to get things done in the time available we must depend increasingly upon standard methods of procedure. The danger is that through our daily preoccupations, we may lose sight of the fact that our real strength lies in the personal relationships we have established with our subscribers on the one hand, and between ourselves within the Company itself on the other.

Subscriber satisfaction, which in the last analysis is the foundation upon which the business has been built, although demanding technical skill and efficient organisation, depends on something more. The annual rentals paid by individual subscribers range from something in the neighbourhood of £30,000 at one end of the scale to something under £10 at the other. Our endeavour must always be to demonstrate, through our actual performance, that we are able to satisfy, and indeed anticipate, every demand that may be made upon us, and at the same time to make it clear that our desire to give

our business a large proportion of our deposits are for foreign account, so the Bank felt the immediate impact of this ebb and flow of funds.

This unnecessary transfer of funds from one country to another can only cause dislocation of business and I welcome the recent arrangements made by the European Central Banks to minimise this in the future.

SCANDINAVIAN SERVICE

Our Scandinavian Service, introduced last year, has been widely appreciated and the facilities we have granted within the Service continue to expand. This is a "package deal" aimed at simplifying the tasks of British businessmen who want to expand or develop their trade with the Scandinavian countries.

The Scandinavian Service fits into a broader policy which we have adopted in recent years, which is to get closer to the smaller and medium-sized manufacturers, of whom there are so many in this country, who can contribute so much to the country's export efforts.

Our Investment Advisory Service has been very active during the year and many more accounts have been opened. Experience has shown how wise it is for Trustees, Pension Funds, Charities and private investors to entrust

BALANCE SHEET AT 31st MARCH, 1961

| LIABILITIES                                  |             |
|----------------------------------------------|-------------|
| Current, Deposit and Other Accounts ...      | £79,602,047 |
| Acceptances ...                              | £29,096,053 |
| Paid-up Capital ...                          | £ 4,000,000 |
| Reserve ...                                  | £ 5,000,000 |
| ASSETS                                       |             |
| Cash in Hand, at Bankers and at Call ...     | £41,002,310 |
| Bills of Exchange ...                        | £15,661,219 |
| British Government Securities ...            | £ 7,734,473 |
| Loans, Advances and Other Accounts ...       | £20,407,185 |
| Trade Investments in Subsidiaries ...        | £ 3,729,573 |
| Liabilities of Customers for Acceptances ... | £29,096,053 |

THE ECONOMIST JUNE 10, 1961

service is in no way influenced by the amount of the quarterly invoice.

This we can continue to do if we are able to preserve the sense of common purpose and mutual responsibility that exists today among all ranks in the Company. The question we must answer is whether, as we grow larger, we can remain simple in outlook and flexible in method, avoiding the risk that threatens all growing organisations of becoming some form of bureaucracy, insensitive to change or circumstances both internal and external.

I think the surest guarantee that we shall be able to answer the question satisfactorily is that we are so acutely aware of its existence.

The report and accounts were adopted and the dividends, as recommended, were approved.

The retiring director, Mr. C. H. Jackson, FCA, was re-elected and the remuneration of the auditors, Messrs Rooke, Lane and Co., was fixed.

As special Business resolutions altering the Company's Articles of Association and giving effect to the one-for-five scrip issue having been passed, the proceedings terminated.

the investment of their funds to experts who are in daily touch with the market and have knowledge of potential values.

Owing to the considerable increase in open market operations in gold and silver, Mocatta & Goldsmid Limited have had a very active year, and this has also contributed to a large increase in the operations of our Foreign Exchange Department.

RECORD FIGURES

Turning to the figures, I am glad to be able to report another satisfactory trading year, our profit showing an increase of £89,591 at £654,481. This increase reflects expansion in every department of our business. Deposits now stand at a record figure of £79,602,047, an increase of £6,333,876 during the year. At £20,407,185, as against £17,993,876 last year loans and advances have risen but they are still only 25.6 per cent of deposits and the liquidity of the Bank in Cash and Bills of Exchange is over 71 per cent of deposits, which we regard as very satisfactory. Our acceptances, despite a falling off in trade generally, have risen from £27,103,344 to £29,096,053. This rise however has taken place in the first quarter of this year and reflects the lower money rates ruling during that period.

LAIDLAW LINK

Since the end of our financial year we have taken an important step in regard to our business in the United States. We have become a limited partner in the old-established private banking firm of Laidlaw & Co. of New York. This firm, founded in 1842, is one of the two remaining Private Banks in the State of New York and, as

THE ECONOMIST JUNE 10, 1961

such, enjoys a franchise to act as a Merchant Bank and Acceptance House as well as Brokers on the New York and other American and Canadian Stock Exchanges. For many years we have thought that, as an Acceptance House, we ought to be able to place at the disposal of our customers, facilities and acceptance credits in dollars as well as sterling and this link-up will, we hope, enable us to do so.

Since March 31st the Government has announced an extension of ECGD facilities to cover risks on certain exports of capital goods up to ten years. This should be a great help to the heavy industries of this country, including shipbuilding, and we hope that, as a result, our Scandinavian shipping friends will again find it expedient to build ships in British yards. As always we are ready to assist them whenever possible.

DIRECTORS

We propose to invite Count Frederick Charles Seilern-Aspang to join the Board. He is a Director of Ruegg & Co.'s Bank, and Union Investment Company, both of Zurich. In conjunction with Mr Paul Kern he has been looking after our affairs in Switzerland and his knowledge of Germany and Austria will be of great assistance to us in developing further our business in those countries.

During the year Lord Astor of Hever retired from the Board at his own request. For many years we have been grateful for his wise counsels, and I am glad to say that the Hon. Hugh W. Astor has filled his father's place, so that our valued connection with the Astor family will be continued. Mr Edward Mocatta, who came to us with Mocatta & Goldsmid, has also joined the Board and we are asking you today to confirm these appointments.

SIAMESE TIN SYNDICATE

SALES AGAIN INCREASED

The fifty-fourth annual general meeting of the Siamese Tin Syndicate, Ltd., will be held on June 29th in London.

The following is an extract from the statement of the Chairman, Mr W. R. B. Foster, circulated with the report and accounts for 1960:

The production of the group for the year was 2,605 tons of tin concentrates; this was 972 tons more than in the previous year and 1,096 tons more than in 1958. As restriction on exports (and hence on production) was in force at varying rates from December 1957 until September 1960, no true comparison can be made of annual outputs for the last few years. For the same reason production costs have again been omitted though we have been able to include statistics which we felt would be of interest to stockholders.

Sales of tin concentrates totalled 2,735 tons, an increase of 972 tons over the previous year. The average Singapore tin market price for 1960 was a little under the 1959 figure, but as deductions (at £33 per ton of concentrate) to cover Thailand's Buffer Stock contributions ceased in April, the average net price we received for our product was higher than in the previous period.

Mainly as a result of the increased production, our profits have risen considerably and after the recent lean years it is a pleasure to be able to recommend the payment of a final dividend of 1s. 3d. per stock unit, making 2s. 9d. per stock unit for the year.

The statistical position of tin promises well for producers.

COMPANY MEETING REPORTS

BRITISH BELTING & ASBESTOS

PROFIT AND DIVIDEND FORECAST EXCEEDED

The sixty-fourth annual general meeting of British Belting & Asbestos Limited will be held on June 29, 1961, at Fountain Hall, Fountain Street, Bradford, Yorks. The following is an extract from the circulated Statement by the Chairman, Colonel Sir William C. Fenton, MC, JP:

Last year we decided that it would be in the interests of shareholders to have a Stock Exchange quotation for the Company's shares. After the sub-division of the £1 Ordinary shares into 5s. units and a one-for-one bonus issue, 1,925,000 Ordinary shares of 5s. each were offered for sale last June at 18s. per share.

At that time your directors forecast a dividend of 15 per cent in respect of 1960 and suggested that, for various reasons, the profit might be slightly less than in 1959. This has not proved to be the case; in spite of the recession in the motor industry and certain price reductions, sales increased and the Group profit before tax rose by 4½ per cent to £1,428,005, of which £921,282 was earned by the parent Company and £506,723 by subsidiary companies. The final profit, after providing for taxation and debiting the expenses of the capital increase and offer for sale, was £796,693, compared with £730,628 last year—an increase of 9 per cent.

It is a source of satisfaction to your directors that these results justify them in recommending an increased final dividend of 11½ per cent which brings the total dividend for the year to 17½ per cent, compared with the 15 per cent forecast.

REVIEW OF THE YEAR

For the parent Company this has been a year of reorganisation and development. The circumstances under which the Company's growth has taken place have made buildings and machinery unduly congested for many years and it has been impossible to segregate the Asbestos, Belting and Mintex Divisions into separate units. By the completion during the year of some of the new office and factory buildings referred to in my statement last June, we have been able to bring together the Mintex Division offices and main production units in one area and more efficient operation will result.

We have increased the production capacity of all three Divisions, our total capital expenditure during the year amounting to £601,320.

During 1960 we increased our sales abroad by 22 per cent and we are particularly pleased to report an increase in sales to Common Market and other European countries, and to Australia, New Zealand and South America.

Building expansion has taken place overseas in our companies in Germany, the United States, Australia and Spain, and at home in Versil Limited and Regina Glass Fibre Ltd.

PROSPECTS

During the first quarter of this year turnover has continued at a satisfactory level, and sales in the parent Company have been slightly higher than those for the same period of last year. I make no attempt to forecast profits for 1961. The effect of the Budget proposals is not yet known. With minor exceptions, we are assured of being fully employed throughout the year. We have in hand major items of capital expenditure throughout the organisation and we look forward to the future with confidence.

RUBBER PLANTATIONS INVESTMENT TRUST

SIR ERIC MACFADYEN'S ADDRESS

The fifty-second Annual General Meeting of the Rubber Plantations Investment Trust, Limited will be held on June 28th in London.

The following is an extract from the circulated Address of the Chairman, Sir Eric Macfadyen:

A scrip distribution of one share for ten was made to shareholders in June, 1960. The gross revenue of the Trust for the year to March 31, 1961, was £367,440 (£305,767). After deducting taxation and expenses our net revenue is £199,328 (£160,730). The Directors recommend an increase in the dividend from the 13½ per cent paid last year on the smaller capital to 15 per cent plus a bonus of 1 per cent, making 15 per cent in all. The heavy charge for Profits Tax £24,500 (£14,500) arises from the fact that the Trust is liable to this tax on a substantial portion of the dividends received from plantation companies which have qualified as Overseas Trade Corporations.

Up to 1956 the Trust's income had been derived almost wholly from dividends received on rubber and tea shares; since then the Board's policy has been, as you know, to seek greater stability of income by spreading our investments more widely. Excessive fluctuations are apt to occur in the market values of plantation shares often due to effects upon the commodity markets of quite extraneous influences and, while rubber particularly is likely to remain the Trust's largest single interest, I would not exclude the prospect of diversification of investment being carried somewhat further when that may appear to be in the interest of stockholders.

FOISTER, CLAY & WARD

CONSIDERABLE PROGRESS

The Thirty-fifth Annual General Meeting of Foister, Clay & Ward Limited was held on June 8th in London, Mr P. A. Clarke Vincent, FCA, the chairman, presiding. The following is an extract from his circulated review:

The year 1960 saw considerable progress. Having completed our present expansion programme we propose a period of consolidation to lessen the seasonal pressure on our resources.

Throughout 1960 all our machinery was fully employed apart from the men's hose section where there was some short time working. Taken as a whole production and turnover established a new record, but overheads continue to increase and in the current year have again been increased by the Chancellor of the Exchequer. How much Graduated National Insurance will cost us depends on factors which at present can only be estimated.

Your directors view the future with confidence and hope. Our productive capacity is greatly increased and there is nothing to indicate that it will not readily be sold. At present our order book ensures full production for many months ahead, but at the same time it must not be overlooked that many costs are continually rising. It is no longer possible to shrug off each increase by saying the customer will pay, except in monopolistic industries where the customer has no alternative. At present we are fighting hard in export markets against foreign competition but further cost increases could force us to abandon foreign markets to fight foreigners at home.

The report and accounts were adopted.

## WHITBREAD AND COMPANY LIMITED

### COL. W. H. WHITBREAD ON POLICY OF STEADY PROGRESS AND DEVELOPMENT

The Annual General Meeting of Whitbread and Company Limited will be held on 4th July, 1961, at the Brewery, Chiswell Street, London, E.C.1.

The following is the statement by the Chairman and Managing Director, COL. W. H. WHITBREAD, which has been circulated with the report and accounts for the year ended December 31, 1960:

From the Directors' Report you will see that your Company has continued to make steady progress, which it has done for the last twelve years. The Group has again made more net profit after tax at £1,496,438, which has enabled your Directors to recommend a higher distribution to the Ordinary stockholders of 27 per cent as against 25 per cent last year, and, at the same time, continue to plough back a still larger amount at £704,486.

Reserves have increased from £4,688,105 to £6,584,621 and the cash position has improved by nearly £2 million. We have a bank overdraft of just over £500,000, which is a temporary convenience at Christmas time to finance increased Duty during that period.

To my surprise this has all been achieved in a year during which the Board have had to use all their energies to overcome rising costs.

During the year we offered for sale a controlling interest in the Whitbread Investment Company to the Whitbread stockholders at 22s. 6d. per share. The latest quoted price is over 40s.

#### ASSOCIATED COMPANIES

The stockholders of Whitbread and Company should know that during the past few years we have invested considerable funds of the Parent Company in the Associated Companies and that now we hold very substantial interests in these companies. Although these investments have been made by the Parent Company, a time will arise when they will be transferred to the Whitbread Investment Company.

Your Board take a view here that a company is run for at least three elements—the shareholders, the staff and the employees—and management has to take into consideration the happiness and prosperity of all three. Further, with each association with other companies, our responsibilities must likewise embrace the welfare of the shareholders, staff and employees in these companies. This is what we endeavour to achieve.

The chairmen of the companies with which we are associated well know that they have the continued support of Whitbread and Company and that we have a natural desire for their companies to show successful results.

#### FREDERICK LENEY & SONS LIMITED

Until November 1960 Frederick Leney & Sons Limited was a wholly-owned subsidiary of Whitbread's. For some years we have had a trading agreement with Fremfins of Maidstone. During the year we sold the Ordinary share capital of Leney's to Fremfins for a consideration partly in Ordinary shares and partly in Debenture stock.

On the conclusion of this arrangement we have extended our mutual trading arrangements with Fremfins, and Fremfins have honoured us by welcoming my eldest son, H. C. Whitbread, to join me on their Board. As the interests of Fremfins and Whitbread's are very much the same, in that they realise that in trading as brewers they have a responsibility to the public, to employees, to customers and indeed to the economy of the country, we look forward to a happy partnership which will prove profitable to both companies.

#### THE BREWING INDUSTRY TODAY

Some people seem to think that there is an extraordinary convulsion going on in the brewing industry today. Our view is that the industry is continuing to develop naturally under the new techniques, development of transport and improving social conditions. The only element that is extraordinary is the present fever of short-term speculation, resulting in a spirit of unrest unfavourable to efficiency and prosperity.

Our industry has a tradition of responsibility to serve the public, and indeed it would be a great pity if it deteriorated into an industry which, without responsibility to the community, felt that its sole duty was to make money for its shareholders.

Your own Company, and fortunately many other family businesses in our industry which have the spirit of public service in their blood, feel that the most important duty is to run a successful enterprise which is not only of value to the national economy but will also make a contribution to the welfare and happiness of those engaged in it and of all men and women of goodwill in this country.

It is the opinion of the Board that in the long run the success of a company depends on the quality of its service to the public and this they keep continually in mind.

#### FAMILY COMPANY

I think it is time I made quite clear to the stockholders what, in our view, as a family company, we recognise are the responsibilities of the Whitbread family to the Company.

A very small group of the Whitbread family holds well over 50 per cent of the voting power of the Company. Having regard to the tradition of the past and their responsibilities for the future, this group is dedicated to maintain control of the Company for at least one more generation, and it is difficult for any man to see beyond that. The Whitbread family are determined that the commercial, financial and technical achievements of your Company should at least be as successful as any other public company; in fact they feel that the confidence and continuity which they can give to the staff and employees should achieve a loyalty which must lead to greater efficiency than can be obtained in other groups. Pride in a family undertaking, and the fact that the fortunes of the family are closely bound up with the future of the Company, surely produce an effective driving force.

In view of the highly speculative atmosphere which surrounds our industry at the present time, I consider it worth while to emphasise that the objective my Board and I have constantly in mind is the long-term prosperity and prestige of this fine old company by steady progress and development. We like to feel that the great majority of stockholders regard their investment as a permanent holding in a developing concern rather than a means to a quick speculative profit.

#### TRADE

In spite of the atrocious weather during 1960, our trade was buoyant and continues to be so, and the sales of Whitbread Pale Ale, although exposed to the full competitive and advertising impact of the brewers of lager, have continued to increase.

The rapidly expanding sales of Mackeson indicate that this is also now a national product which the public expects to be available everywhere, and that those who still do not sell it must be losing both business and goodwill.

Whitbread Tankard, one of the more recent ventures of the Company, has astounded us by its popularity and progress.

In view of the British climate, I still wonder whether lager, which at present commands only about 3 per cent of the total beer market in this country, will increase in popularity at the rate that some people assume. Your Board have made adequate and satisfactory arrangements to obtain their proper proportion of this market.

#### RESEARCH

Your Company have always made one of the first priorities of their operations constant research into the production of their beers and, besides yeast and various technical aspects of engineering, they have taken a great interest during the last few years in continuous brewing. Their policy has also been directed towards the development of the smaller efficient brewing unit rather than the large concentration of production carrying with it heavy costs of delivery and handling.

#### TRAINING FOR MANAGEMENT

One of the most important tasks your Board have had to deal with, especially during the last few years, is the training of young men for management. In a fairly large company executives are apt to specialise, and although management is not a form of black magic, a future manager must have experience of direction over various fields, although he may be expert in only one or two particular spheres.

It is our intention to recruit for management from within the Company whenever we can; and not only do we have to find management for ourselves but also we are continually being asked to find suitable men for other companies. We have for many years run training courses for potential managers, whom we accept at practically any age. Although we can train our own young men, sometimes we find it necessary to select men who have had varied experience else-

where, as it often brings a breath of fresh air to a company to appoint someone from outside after he has done a suitable course of training within the Company.

#### THE LICENSING BILL

The Government are in the process of presenting before Parliament the Licensing Bill, the intention of which, I understand, is to modernise and liberalise the present out-dated system.

Education has much advanced since the beginning of the century and I am sure the Government realise that they can trust the people to behave responsibly in spite of being given greater opportunities for relaxation. It will be a great pity if this effort by the Government is nullified owing to the Trade being unable to sort out its own difficulties of labour and expense and so failing to meet the present needs of the people.

It must be realised that if greater facilities and longer hours of trading are required by the public and sponsored by the Government, something more will have to be paid for these benefits.

#### RIISING COSTS

I am very conscious of our comparative lack of success in reducing our expenses. This is a most serious matter and your Board and all the executives are well aware of this problem.

#### ADVERTISING

Although our trade is buoyant, we are far from complacent about the volume of sales. With this in view, we have appointed two new advertising agencies during the past year, because we feel that from time to time we require new stimulating influences in our advertising which can only be achieved by fresh men with fresh ideas.

We have also sponsored a limited number of sporting events which present the Company in an attractive, dignified and popular way to the public.

#### WINES AND SPIRITS

Recently we have reorganised the management of F. S. Stowell Limited, which is a wholly-owned subsidiary of Whitbread's, in order to compete with the growing demand for wines and spirits and we are pleased with the progress that is being made.

Sales of Squires Gin have continued to increase and now represent a very sizeable proportion of the total amount of gin sold through all our outlets. Squires Gin Limited, the independent company with a membership of 95 brewery companies, has also, in the last few months, produced a straw-coloured gin—named Cornhill—to run in harness with Squires. Initial reactions to this high-quality gin have been extremely favourable, and the demand is increasing at a satisfactory rate.

#### PENSION FUND

Recently various companies have made public their conditions of employment, including their pension funds, and we were interested to note that the Pension Fund of your Company, although started many years ago, gives more generous terms than those quoted by most other public companies.

As regards contracting in or out of the Graduated State Pension Scheme, we have decided that all male members of the Whitbread Pension Fund and all foremen should be contracted out of the Government scheme, so that

they should anyhow receive the overwhelming benefits of the Whitbread Pension Fund.

#### SITE DEVELOPMENT

Like most other property owners, we have been well aware of the steep rise in values of properties owing to the inflationary climate during the last few years, and we have carefully looked into the values of our properties, including those of our breweries and bottling stores.

We have developed several of our sites and have plans in process for developing others.

#### EXPORT

As I have told you before, our policy as regards export has been the same for many years in that we keep a foothold in over sixty countries for possible development in export trade, and in a few of these markets we are seriously considering further development at the present time.

Meanwhile, our Belgian trade, in spite of the difficulties of the Belgian people owing to the collapse of the Congo, continues to increase to such an extent that we will have to spend many thousands of pounds on buildings and technical equipment in order to meet expansion of this trade.

#### INDUSTRIAL ALLOWANCES

You will be aware that the brewing industry carries on its trade to a large extent in public houses. These premises do not qualify for what is usually known as Capital and Investment Allowance, which is still applied to industrial premises only. I feel that, in fairness to the industry, similar treatment should be accorded to public houses, and if this were done Income Tax and Profits Tax on this Company's last year's profits would have been reduced by £76,000. Based on last year's profits, the extra 2½ per cent on Profits Tax imposed by the Chancellor in this year's Budget would cost your Company an additional £51,000 in a full year.

#### EXECUTIVE AND STAFF

The record results now placed before you, which have been almost wholly attained through increased sales and successful management, bear testimony to the fine efforts of all our executive and staff. On behalf of all stockholders and your Board, I tender my thanks and appreciation to all. It is the policy of your Board to promote on merit only, so that management at all levels is in the most capable hands.

Great strides have been made during the year in quality, packaging and presentation, and this is only achieved by the relentless drive and spirit of determination that nothing is good enough but the best by all those working in the Company.

#### THE FUTURE

We are national brewers, that is to say, we sell our products all over the country—and in many other countries. In view of the extent of short-time working in various industries in different parts of the country, it is difficult to be certain of the trend in the months to come. Also there is this great struggle to halt our overhead expenses to which I have already referred.

However, your Board and I have confidence that, as our beers have been nationally known for many years and their quality continues to be excellent, they will be sought by the public to an even greater extent, always providing the general level of prosperity of the country as a whole is maintained.

## GUARDIAN ASSURANCE COMPANY LIMITED

Annual General Meeting, June 7, 1961.

Chairman—The Right Hon. Lord Blackford, DSO, JP.

Summary—1960.

During 1960 the Company continued to progress and expand, acquiring the Union Insurance Society of Canton, Limited, in December. Future policy will for some time, however, be one of consolidation and the profitable expansion of general business.

The total underwriting profit carried to Profit and Loss Account for 1960 was £1,069,873 compared with £994,400 in 1959.

Investment income amounted to £2,732,610 showing an improvement of £587,848.

A proposal to increase the Authorised Capital to £10 million by the creation of a further 25 million five shilling Ordinary Shares was approved, and two will be offered to existing holders at par for every Ordinary Share of 5s. at present held.

#### LIFE DEPARTMENT

Net New Sum Assured 1959 .. £50,771,001  
Net New Sum Assured 1960 .. £70,946,066  
Transfer to Profit & Loss Account .. £93,774  
Gross Rate of Interest Earned 16 17s. 4d.  
Life Fund at end of 1960 .. £93,240,618

#### FIRE DEPARTMENT

Net Premium Income 1960 .. £10,661,088  
Transfer to Profit & Loss Account .. £130,536

#### ACCIDENT DEPARTMENT

Net Premium Income 1959 .. £19,503,687  
Net Premium Income 1960 .. £20,261,557  
Transfer to Profit & Loss Account .. £435,725

#### MARINE DEPARTMENT

Net Premium Income 1959 .. £3,769,979  
Net Premium Income 1960 .. £4,208,037  
Transfer to Profit & Loss Account .. £384,154  
Marine Fund at end of 1960 .. £5,168,661

#### PROFIT AND LOSS

Gross Investment Income 1959 £2,144,762  
Gross Investment Income 1960 £2,732,610  
Balance carried forward .. £296,057  
Dividend for year 1960 .. 3s. 9d. a share (less income tax)

#### BALANCE SHEET

A valuation of the Stock Exchange Securities was made at December 31st last and disclosed a substantial surplus over the total value as shown in the Balance Sheet.

TOTAL ASSETS OF GUARDIAN GROUP (INCLUDING UNION INSURANCE SOCIETY OF CANTON, LIMITED), £194,686,130.

The Company Transacts all the Principal Classes of Business as well as undertaking the office of Trustee, Executor and Administrator.

HEAD OFFICE—68, King William Street, London, E.C.4.

## VICKERS LIMITED

## VISCOUNT KNOLLYS' REVIEW

The ninety-fourth annual general meeting of Vickers Limited was held on June 6th in London.

The Viscount Knollys, GCMG, MBE, DFC (the chairman), presided and, in the course of his speech, said:

1960 was a good but difficult year for our Group and the trading results were satisfactory, and profits rather higher than in 1959. Total sales increased slightly to £159 million.

Engineering sales were well up, and profits, in spite of strong competition, were higher than in any previous year.

The turnover in our Shipbuilding Yards increased, but the overall profit of our Shipbuilding Company was lower due to less repair work being available and that at poor prices.

The output of English Steel Corporation increased almost to the record figure of 1957. Its profits were however only slightly higher because of narrow margins and continued slackness in orders for railway products.

Aviation trading profits suffered from the natural run-down of Viscount production. But provisions for development and special costs on aircraft were halved and were based on orders for Vanguards actually received. The amount of the provision was not affected by the merger of our aircraft interests into British Aircraft Corporation.

The income from our growing investments was rather higher, representing mainly increased dividends from Firth-Vickers and International Computers & Tabulators but a lower dividend from Metropolitan-Cammell.

No dividend was received from BAC nor can one be expected in the current year, as the newly formed Company is occupied with new aircraft and guided weapons which at present are only in their early stages.

As a result of these various factors Group profit before taxation was considerably higher at £11.6 million, as was profit after taxation at £6.25 million. After making the normal allocation to Reserves we shall have added £500,000 to the Contingencies Reserve and now recommend a dividend on Ordinary Stock of 7½ per cent, making for the year 10 per cent, the same as for 1959.

Orders in hand at the end of the year were £307 million, £25 million more than a year ago, though the margin of profit on much of the order book will be narrow.

The reserves, capital and revenue, of the Group stand at £51.3 million, with share capital remaining at £49.4 million. The return on capital employed was 9.2 per cent compared with 7.5 per cent in the previous year. If our aircraft interests were eliminated because of their special features, the remainder of the Group—Engineering, Shipbuilding and Steel—earned 12.5 per cent in 1960, compared with 10.3 per cent in 1959.

## CURRENT BUSINESS

The record and achievements of the Vickers Group in 1960 are fully described in the "Review of the Year" circulated with the Report and Accounts. Our interests certainly continue to be varied. Engineering, heavy and medium; Shipbuilding and Shiprepairing; Steel, alloy and stainless; Aircraft, Guided weapons; Rolling Stock and vehicle bodies; Accounting machinery, mechanical and electronic.

I hope you will agree that this still represents the best form of traditional policy of diversification, spreading our prospects and our risks in products we know something about, and in fields which realistically take into account the trends of world trade.

Export orders have always been and remain one of our main objectives. I have just had the opportunity of seeing one of our newer markets at first hand. I flew to Moscow to attend the opening of the British Trade Fair, where Vickers had its own large and distinctive pavilion.

I was particularly glad before leaving Moscow to have been able to announce the completion of negotiations by High Polymer and Petrochemical Engineering Ltd., the selling Company in Great Britain for Hans J. Zimmer A.G., Frankfurt, with both of which Companies we are associated, for supplying a large industrial Nylon plant worth £4 million.

## ENGINEERING

The order book to date this year is well maintained at a satisfactory level, markedly in Clearing presses, steel furniture, packaging machinery and dairy equipment, as well as in accelerated freeze-drying equipment, nuclear engineering products and asphalt producing equipment. Overall, the prospects of sales and orders during the current year are good, although margins and profit will not be easy to maintain.

Viscount Knollys then reviewed the Group's activities in Australia, Canada and India, and continued:

## SHIPBUILDING

Our Shipbuilding Yards have continued to be active in 1961. I was on board the Canadian Pacific Liner "EMPRESS OF CANADA" when she successfully completed her trials. She was handed over, and accepted by the Owners, on March 29th, the exact day forecast four years ago.

The level of activity in the Building Yards has continued to be high, but the volume of Shiprepair work remains low and highly competitive. The level of Constructional Steel Work remains good, though, as with Shiprepair work, prices are exceptionally keen.

We expect the year 1961 for our Shipbuilding Company as a whole to be at least as good as 1960. There are a good number of enquiries for new work in circulation; those suitable for our Shipbuilding Yards are being very actively pursued, and the prospects of receiving orders during the remainder of the year are quite fair. But until new orders are actually received we must retain a cautious view of our Shipbuilding prospects after this year.

## STEEL

The outstanding feature in English Steel Corporation is the progress of the new development scheme at Tinsley Park, which is estimated to cost £26 million. We anticipate that the new plant will be in operation by the end of next year—1962. When completed it will increase capacity for special carbon, alloy and stainless steel products to 850,000 tons a year. This will ensure that E.S.C. will continue to retain its predominant position in the field of special steel production.

We are also providing a new plant at Open-

shaw for producing high speed and other tool steels.

## AVIATION

Under the terms of the merger of our aircraft interests with those of English Electric, Bristol and Hunting, the financial responsibility for aircraft under development and construction (Viscount, Vanguard, VC.s10) remained with Vickers.

In March contracts were placed for four Viscount 810s—three from All Nippon Airways and one for Lufthansa. Limited production of Viscounts beyond the 429 sold to date is being continued in anticipation of further sales.

During the first four months of 1961 Vanguards were delivered at an average of one every ten days. We do not, however, in our financial calculations rely on further orders for Vanguards beyond the 43 we have sold.

The VC.s10 sales effort is being intensified and in more than one case negotiations are well advanced. The most notable order since the end of 1960 was that placed by the Government of Ghana in January for three VC.s10s for Ghana Airways. Although the number of aircraft involved is small it is equivalent in value to a sizeable fleet of Viscounts.

British United Airways, as you may have seen, have just announced their intention to place an order for VC.10 aircraft.

Negotiations have been conducted with B.O.A.C. recently with a view to introducing the Super VC.s10 earlier in the production programme. The Super VC.s10 was originally designed specifically for the North Atlantic routes, but is now somewhat smaller and more suitable for operation over B.O.A.C.'s entire world-wide network of routes.

## PROSPECTS FOR 1961

Our business in 1961 has so far been maintained at a level similar to the latter part of 1960. I see no reason why this should not continue, though profit margins of some of our engineering works look like being lower.

Shipbuilding profits should be rather better for the year 1961 at least. Steel sales remain steady, but costs have risen. The new and promising products we have been developing will not this year be contributing much to our profits. Deliveries of aircraft this year will be few in comparison with the activities of past years. We must always bear in mind the problems of aircraft business everywhere and it is, of course, still too early to assess the final financial outcome of the VC.s10. But if the remainder of the year turns out as we can at the moment reasonably expect, the 1961 results may not on balance be greatly different from 1960.

The problem of ever increasing costs is not only serious for us as a Company but also for the nation as a whole. We have got to remain competitive. We must surely have a consistent and co-ordinated national policy aimed at growth rather than at mere stability. Private initiative without a Government policy complementary to it can be rendered ineffective. I can at least assure you that for our part we are attacking the problem of costs and stimulating ideas for growth in every sphere of our activities. This must be our constant aim.

The report and accounts were adopted.

## UNION CORPORATION, LIMITED

(Incorporated in the Republic of South Africa)

## ADDRESS BY SIR CHARLES J. HAMBRO, KBE, MC, CHAIRMAN, AT THE ANNUAL GENERAL MEETING OF THE CORPORATION HELD IN JOHANNESBURG ON 1ST JUNE, 1961

Gentlemen: Before dealing with the formal business of the meeting I have to refer with deep regret to the death in July last of Mr A. V. Conrad. Mr Conrad joined the Corporation in 1932, was appointed a Manager in 1948 and joined the Board in 1957. He was a great servant of the Corporation and a true friend. He is greatly missed by us all.

Mr W. Randerson, who had been in the service of the Corporation for 35 years, and London Secretary for the last 15 years, retired during 1960. I should like to record our appreciation of his long and faithful service and to wish him health and happiness in his retirement.

The Accounts of the Corporation for the year 1960, together with the Directors' Report are submitted for your approval.

Dividend income amounted to £2,488,000 during 1960, a rise of £243,000 compared with the previous year. Share realisation profits were £395,000 lower at £1,106,000, which in the circumstances can nevertheless be considered as very satisfactory. Other income rose by £1,740,000. In this connection I wish to point out that one of the subsidiary companies in the Group is Winkelhaak Mines, Limited. The legal necessity to present a consolidated profit and loss account has had the effect of bringing into our consolidated income the whole of Winkelhaak's net revenue from its mining operations notwithstanding that, as a subsequent deduction in the account indicates, a substantial portion is attributable to minority interests. Furthermore Winkelhaak is setting aside a large part of its profits for its own capital expenditure and loan redemption and profits so ploughed back are not available for dividend and never will be. The fact that part of these profits attributable to shareholders in Union Corporation is unavailable has been recognised in the accounts by the transfer of £600,000 to Capital Reserve Account.

Net profit has risen from £2,857,000 to £3,688,000 after charging taxation and after deducting the interest of minority shareholders in the profits of subsidiary companies.

The net profit of the Corporation itself was £1,647,000 as compared with £1,542,000 last year, subsidiary companies having retained £2,041,000 including the £600,000 referred to earlier, as against £1,315,000 in 1959.

The Directors have appropriated £250,000 to General Reserve Account and £150,000 to Exploration Reserve Account.

In October, 1960, the Directors declared an unchanged interim dividend of 1s. 0d. per share less United Kingdom Income Tax. For reasons mainly connected with the recent introduction of a decimal currency system in South Africa the final dividend for 1960 has been declared in South African cents free of tax. The rate of 18½ cents per share is equivalent to approximately 3s. 0½d. per share less United Kingdom Income Tax, as compared with last year's final dividend of 2s. 9d. per share less United Kingdom Income Tax. The two dividends for 1960 absorbed £1,231,000 against a distribution of £1,148,000 in 1959, leaving £411,000 to be carried forward.

The Annual Report contains particulars of the operating results of our Group companies and of those companies outside the Group in which we are interested and accordingly I propose to do no more than review our activities very briefly.

Our interests are mainly in South Africa. Of the nine gold mines of the Group two, namely VAN DYK CONSOLIDATED MINES and GEDULD PROPRIETARY MINES, have only short profitable lives ahead of them, although the Geduld Company will continue to operate as an investment concern once its own mining operations have ceased. During the year it acquired further substantial shareholdings in various companies so that the book value of its investments rose by £565,000 to £1,566,000. EAST GEDULD MINES, which is still earning satisfactory profits, is nevertheless now mining its extensive pillars in retreat from its boundaries towards the shafts. This Company still has a number of years' life ahead of it and fortunately the grade of its remaining ore is consistently fairly high so that it can be expected to earn substantial profits in spite of increasing mining difficulties and rising costs. MARIE-VALE CONSOLIDATED MINES and THE GROOTVLEI PROPRIETARY MINES achieved record tonnages and profits during 1960. In the Orange Free State ST. HELENA GOLD MINES recorded substantially higher profits during 1960, made considerable progress in opening up the deeper levels served by No. 2 Shaft and also completed the sinking of No. 7 Ventilation Shaft to a depth of 5,338 feet. The completion of this shaft represents an important step towards maintaining good ventilation and opening up the upthrown block of reef near the eastern boundary of the lease area.

In the Kinross area we are able to report a substantial increase in the working profit of WINKELHAAK MINES, which declared a maiden dividend of 4d. per share in September last. This mine is now sinking No. 2 Shaft, which is sited 6,000 feet to the north-east of No. 3 Shaft, so as to be able to develop the deeper levels of the mine and make possible in due course expansion of its operations to a milling rate of 150,000 tons per month.

Progress at BRACKEN MINES and LESLIE GOLD MINES continues to be most satisfactory and it was possible to start underground development on both properties in March this year—that is in just under a year from the start of full scale shaft sinking. A start has also been made with the erection of a Reduction Works on each property with an initial capacity of 75,000 tons per month, and provided all goes well it is hoped to be able to start trial milling at both properties by about the middle of 1962.

Taken as a whole, the results of the producing gold mines of the Group show an increase in the tonnage milled and gold output, in net profits and dividends declared, as compared with the previous year.

Our principal industrial investment in South Africa is in SOUTH AFRICAN PULP AND PAPER INDUSTRIES. This Company which serves principally the home market and uses

virtually all South African raw materials, experienced a steady demand for its products, both from the Enstra Mill (bleached papers) and Tugela Mill (unbleached papers) and its net profit for the year showed a marked improvement. Since the year-end the large newsprint machine at the Enstra Mill has been completed and commissioned and newsprint of satisfactory quality is being supplied to the inland market. This is the first time that newsprint has been made on a commercial scale in South Africa and the commissioning of the new machine is an important event both for the Company and for the economy of the country. Moreover, the output of this machine can be increased substantially with the addition of certain ancillary items so as to meet the greater portion of the country's requirements of newsprint. For the expansion of the Tugela Mill the Company has placed orders covering the major items of plant, including a new kraft paper machine, which will enable the Company ultimately to double its output of kraft papers so as to meet the country's entire requirements of kraft grades and have a surplus for export. The tissue and cellulose wadding plant in which the company is interested is also producing satisfactorily.

## SOUTH AFRICA

Yesterday South Africa became a Republic and we wish the new Republic success and prosperity. Our confidence in the ability of South Africans ultimately to solve their difficult problems, and thus in the long-term future of the country, remains. Whilst we all regret that South Africa has at the same time ceased to be a member of the Commonwealth, we are hopeful that the United Kingdom and South African Government will enter into new arrangements which will result in little or no change in those matters which particularly affect our business, such as for example taxation reliefs. The ties between South Africa and Europe are often stressed, and rightly so. In our own Corporation British, French, Swiss and other overseas investors still hold the majority of the shares and there are sizeable non-South African shareholdings in all the publicly quoted companies in the Group. Having, as we do, very close association with the City of London, we can help to maintain some of the very valuable links with Britain, links which have been and must continue to be so valuable for the economic development of this country.

South Africa has by far the largest population of European descent in the Continent of Africa giving a relatively high ratio of Europeans to Non-Europeans and an appreciable proportion of these people are thinking deeply today not of the narrow issue of maintaining their supremacy as white people at all costs, but of preserving western civilisation for the benefit of all races. It follows that actions which damage South Africa damage the chances of western civilisation flourishing in the Continent as a whole. Conversely, one of the best ways of strengthening western civilisation in Africa is to strengthen and develop South Africa. It is the most highly industrialised part of Africa and as such could

and should play a great part in the economic development of this awakening continent. But for this country to take up such a role will require the development of a greater spirit of tolerance within and between all nations in Africa, including South Africa itself.

The outline which I have given of the Union Corporation Group activities in South Africa will make it clear that, especially with the new mining and industrial projects on which we have embarked, we are well placed to play our part in the economic development of the country, in which our Group interests already represent a factor of considerable economic importance.

For example, the value of our gold and base mineral output in 1960, and thus our gross earnings of much needed foreign exchange, amounted to £33,700,000, whilst the savings of foreign exchange made possible by the operations of South African Pulp and Paper Industries amounted to a further £8,500,000. In the Kinross field, which is unique in the history of the South African gold mining industry in that it is entirely under the control of one group, the total expenditure up to the end of last year, including prospecting and the purchase of properties, on shafts, plant and equipment, mine development, township development and housing and stores was just over £18m. By the time Bracken Mines and Leslie Gold Mines have reached production the figure will be over £30m. Most of this money must be found in the form of mining risk capital, the bulk of it coming from the Corporation itself and its partners and associates. Even where it has proved possible for our associated companies to draw on other sources of finance, such as loans from the National Finance Corporation of South Africa or from the South African Mutual Life Assurance Society, such loans have had during the risk period to be guaranteed by the Corporation. In this area, concurrently with our mining work, we have founded a new community at Evander Township which today comprises some 3,000 people. We expect that by the end of next year this township and the nearby village of Brendan, will be catering for a population of some 6,000 Europeans, principally mine employees and their families, and that by about 1970 the population will be about 10,000 Europeans.

The Non-European mine employees in the Kinross Area who will, in the course of the next 10 years or so, number some 18,000, are fed and housed on the properties of the mines themselves. We are keenly conscious of our responsibilities to our Non-European employees and are endeavouring in our compounds to maintain high standards of accommodation, feeding and medical care and are providing sports fields and other facilities for recreation. In the new Non-European hospital, which is being built on the property of Winkelhaak Mines to serve all the mines of the field, we expect to have one of the best equipped Non-European hospitals in the country.

With regard to the further development of the Kinross field a limited amount of prospecting work is still being carried out in the area to the north-west of Winkelhaak Mines and also to the east of Winkelhaak Mines. We are still unable to tell whether it will be possible to develop a fourth mine in the field.

The recent expansion of the operations of South African Pulp and Paper Industries has involved the expenditure of about £3,000,000 on the newsprint enterprise and will involve a further £5,500,000 on the new paper machine, ancillary plant, buildings and housing at the Tugela Mill. The additional savings of foreign exchange from newsprint production and the

## COMPANY MEETING REPORTS

expanded operations at Tugela will ultimately amount to some £5,000,000 per annum.

I have said that we are well placed to play our part in the economic development of South Africa but I must add that our business and the general economy of the country cannot really prosper unless steps are taken to restore the confidence of foreign investors in South African projects.

Lack of confidence in the future, if not corrected in time, can result in further economic difficulties leading to a lower standard of living for all classes. I pray that the new Republic will take such steps as are necessary to reassure the outside world that the future of this wonderful country will be both stable and prosperous.

Until confidence is restored we, as the parent company of the Group, will have to carry a particularly heavy responsibility to those companies which are in process of development and expansion.

Commitments which under more favourable conditions we could, through the medium of the Stock Exchanges, share with the investing public, may now have to be carried by us in their entirety. In the accounts you will see that the Corporation's proportion of the uncalled capital of Bracken Mines and Leslie Gold Mines at the year-end was £6.3m. Added to this, South African Pulp and Paper Industries has recently announced a rights issue. As a substantial shareholder, the Corporation has commitments in this issue, which it is also undervriting.

With our existing resources and with the assistance of a short term loan of £2m. which has recently been negotiated I am confident that the Corporation can meet the calls upon it. In the long term, the rewards to the Corporation and to you as members should be high. In the short term, however, we shall be less free to pursue new projects and undertake new commitments.

## OVERSEAS INTERESTS

Throughout the Corporation's history it has been international in nature, believing that all aspects of its business benefited from the experience gained in other fields and using its capital resources, wherever earned or raised, to further those projects where they could be most usefully and profitably employed. Although the largest proportion of our business remains in Southern Africa we have, as you know, substantial interests in the United Kingdom and in Mexico and also in certain companies which themselves are international in scope.

Under present conditions we cannot rely on being able to supply any finance which may become necessary for these overseas interests from funds available in South Africa. For this reason it was arranged early this year to bring together most of our overseas interests in a wholly-owned United Kingdom subsidiary company. We have called this company UNICORPORA LIMITED, the name Unicorpora having been a patronym associated with our business for forty years. The intention is that Unicorpora will use its own resources and creditworthiness to finance the Group's existing overseas interests and to develop new ones.

This reorganisation does not imply a separation of the various parts of our business or a direction of our resources away from South Africa, but is rather a means of ensuring that each part can develop freely with the experience of the Group behind it. One example of the way in which one part of the Group can help

## THE ECONOMIST JUNE 10, 1961

another is the establishment of the new company, UNICASES LIMITED, which has been set up with the object of manufacturing corrugated cardboard containers in the United Kingdom. For this purpose we have been able to draw widely upon the experience of South African Pulp and Paper Industries, and that Company has also invested substantially in the project.

As far as our other overseas interests are concerned, both BAY HALL TRUST and WILKES BERGER ENGINEERING COMPANY had good years. SAN FRANCISCO MINES OF MEXICO, which has large reserves of high grade ore, had a brief respite in its struggle to keep going under the twin burdens of punitive Mexican taxation and low metal prices and was able to pay a dividend for the first time in three years. Subsequently, however, conditions worsened again and the company is now barely breaking even. Legislation has recently been passed in Mexico which will ease the burden of taxation on companies which "Mexicanise" themselves, and the board of San Francisco is taking steps to negotiate with Mexican investors in an endeavour to arrange for the introduction of Mexican capital into the company on mutually satisfactory terms.

This concludes my review of the Corporation's affairs and I should like to thank, on your behalf, the Management and staff of the Corporation in Johannesburg and in London, and the Directors, Managers and staffs of the companies under our administration for their contributions to the results which I have placed before you.

## BRITISH BORNEO TIMBER RECORD PROFIT

The Annual General Meeting of The British Borneo Timber Co., Ltd., will be held on June 23rd in London.

The following is an extract from the circulated Statement by the Chairman, Mr H. G. C. Townsend, OBE:

The Accounts for 1960 show a gross trading profit of £376,748. This is £71,647 more than the previous year and the highest yet attained. Taxation, however, is up by £82,477. After adding £66,541 brought forward and a surplus of £787 on disposal of fixed assets, the amount available for allocation is £291,593 (£258,416).

The Board have transferred £100,000 to Capital General Reserve and recommend a final dividend of 9.6d. per 2s. Stock Unit, less tax. This makes a total dividend for the year of 1s. per 2s. Stock Unit, less tax.

The Board recommend a bonus share issue of £300,000 by capitalising £300,000 of the Capital General Reserve and distributing one 2s. share for each 2s. Stock Unit held. It is also recommended that the existing two-shilling Stock Units be converted back into un-numbered two-shilling shares.

Log production at 7,871,675 cubic feet was only fractionally below the record figure of 8,112,152 cubic feet for 1959.

As far as concerns current operations, royalty rates on logs have been substantially increased from January 1, 1961, but are now on a sliding scale related to selling prices. Production is running at about the 1960 level. High production must be maintained to meet the extra costs of hauling logs from further inside the jungle. Selling prices in some markets have eased, but in the timber business price fluctuations are normal.

## COMPANY MEETING REPORTS

# WOODALL-DUCKHAM LIMITED

## BENEFITS ACCRUING FROM POLICY OF DIVERSIFICATION

## GROUP'S PROMISING FUTURE POSITION

## MR T. C. FINLAYSON ON BOARD'S CAPITAL PROPOSALS

The thirteenth annual general meeting of Woodall-Duckham Limited will be held on June 26th at Woodall-Duckham House, 63-77 Brompton Road, London, SW.3.

The following is the statement of the Chairman, Mr T. Campbell Finlayson, CBE, MSc, MIE, MICE, FInstE, circulated with the report and accounts for the year ended December 31, 1960:

Before reviewing the activities of the Group in some detail, I would refer to certain changes in the membership of the Board.

In the Report of the Directors it will be noted that Mr Douglas Rider, having attained the age of seventy, retires from the Board in accordance with the Group's retirement policy. Mr Rider was a Director of your principal operating Company for 33 years, being Joint Managing Director for eight years. Your Directors would like to place on record their deep appreciation of the great contribution he made to the Group's success during his 49 years' service with it.

Two new appointments have been made to the Board of your Company—Mr W. J. Chadder and Mr H. S. Cheetham—both of whom have served for a number of years on the Board of your principal operating Company.

## THE ACCOUNTS

In my last Statement I drew Members' attention to the fact that the annual profits of the Group are always greatly influenced by the dates on which substantial contracts are completed and brought into account. The accounts for the year 1960 have, as were those for 1958, been favourably influenced by these circumstances.

The consolidated Profit and Loss Account for 1960 shows a profit before taxation of £1,441,766 compared with £968,594 for 1959. Taxation amounted to £718,757 compared with £379,672 for 1959. The Net Profit applicable to Woodall-Duckham Limited for 1960 was £696,255 against £583,138 for 1959. Out of the Group Net Profit of £696,255, profits amounting to £421,834 were retained by the Subsidiary Companies, leaving a Net Profit of £274,421 available in the Parent Company's Accounts.

The usual 5 per cent Interim Ordinary Dividend was paid in December, 1960. Your Directors propose to recommend that a Final Ordinary Dividend of 22½ per cent should be paid on the Ordinary Shares in respect of 1960 in comparison with a Final Ordinary Dividend of 20 per cent paid in respect of 1959.

## CAPITAL STRUCTURE

During the past few years the size and scope of the activities of the Group have continued to grow. Your Directors have therefore decided that the capital structure of the Company could with advantage be adjusted to take account of these facts by bringing its Issued Capital more closely into line with the capital actually employed and required in the business.

As Members will have seen from Press announcements, your Directors will recommend that the Authorised Capital of the Company be increased to £2,400,000 by the creation of 2 million new Ordinary Shares of 5s. each and that £438,395 of the Capital Reserves of the Company be utilised in issuing 1,753,582 new Ordinary Shares of 5s. each fully paid to existing Ordinary Shareholders on the basis of one new Ordinary Share for every three existing Ordinary Shares held at the close of business on June 16, 1961. The shares so allotted will rank *pari passu* with the existing issued Ordinary Shares of the Company but without participation in any dividend declared in respect of any period before January 1, 1961. Subject to the passing of the necessary Resolutions, Renounceable Share Certificates will be posted on July 7, 1961. Application will be made to the Council of the Stock Exchange, London, for permission to deal in and for quotation for the 1,753,582 shares.

The effect of this transaction will be to raise the Issued Capital of the Company to £2,153,582, comprising £400,000 5 per cent Cumulative Preference Shares of £1 each and £1,753,582 Ordinary Capital represented by 7,014,327 Ordinary Shares of 5s. each. The reason for the increase in the Authorised Capital resulting in 985,673 Ordinary Shares remaining unissued after the proposed capitalisation is to ensure that this additional Authorised Capital should be readily available for possible future developments. The Directors have no present intention of issuing any such shares.

Unless unforeseen circumstances arise, your Directors anticipate that it will be possible to pay a 5 per cent Interim and a 16 per cent Final Dividend on the increased Ordinary Capital in respect of the current financial year ending December 31, 1961, so that the Ordinary Shareholders will receive approximately the same overall return as for 1960.

## MEETING CHANGES IN DEMAND

In my last Statement I drew attention to the changing requirements of the Group's main clients in the Steel, Coal and Gas Industries and I indicated that your Directors were meeting these changes in demand, firstly by extending the range of processes and plants which the Group could offer, and secondly by acquiring new Subsidiary Companies whose activities came within the broad framework of the Group's present activities. Both these lines of approach have been actively pursued during the past year.

The value of work carried out by the Group during 1960 was £131 million compared with £12 million in 1959. The orders received by the Group slightly exceeded the value of work carried out and amounted to £133 million. Including the uncompleted orders of a new Subsidiary Company, the value of unexecuted work in hand at the beginning of 1961 rose to £214 million.

The importance of diversification of the Group's activities by the acquisition of the

various operating Subsidiaries may be indicated by the fact that, although the principal operating Company, Woodall-Duckham Construction Company Ltd., still provided the majority of the Group's orders, the six other operating Subsidiary Companies provided 34 per cent of the Group Order Book in 1960. Although these six operating Subsidiary Companies are still regarded as being in the early stages of their expansion and ultimate profitability, they together provided a valuable contribution to the Group Net Profits in 1960.

Brief particulars of the activities of the seven operating Companies which constitute the Woodall-Duckham Group are given in the following paragraphs with greater emphasis on the newer acquisitions.

## WOODALL-DUCKHAM CONSTRUCTION COMPANY LTD.

The Company continued to carry out a large volume of construction work for the Steel, Coal and Gas Industries and a number of important orders were obtained during the year for coke oven and by-product plants. Amongst these, special mention is made of an order to supply a further installation of coke ovens and by-product plant at the Orgreave Works of United Coke & Chemicals Company Ltd., a subsidiary of the United Steel Companies Ltd. Since the beginning of 1961 the Company has received a further large order to the value of several million pounds from the South African Iron & Steel Industrial Corporation to build two more batteries of coke ovens with extensive by-product and coal and coke handling plant. The extent of this new order is under review at this moment and further details will be published later. Work continued on the design and construction of the two large high pressure gasification plants, one for the South Eastern Gas Board employing the Shell Process for the gasification of oil, and the other the plant for the West Midlands Gas Board employing the Lurgi Process for the gasification of small coal.

Investigations proceeded on improved processes for the biological treatment of effluents from the Gas and Coking Industries, working in association with Ames Crosta Mills & Company Ltd.; on methods for the production of sinter fuel for the Steel Industry; on beneficiation of ores and on making the best use of the Nation's coal for coking purposes, utilising the Burslein Process.

## W. J. JENKINS & COMPANY LTD.

The restriction in demand for the Company's products by the Gas and Coal Industries mentioned in my last Statement continued in 1960. Although the overall output of the Company has been affected by the lack of large contracts, the Work's productive capacity has been fully employed. Attention has been focused upon the means of diversifying the Company's activities. The firm's selling and marketing methods have been reorganised to enable the Company to extend its activities in other fields. Profit mar-

There's more to life than meets the landsman's eye: much more, for three-quarters of the world is covered by ocean—challenging, capricious, and a hard taskmaster for those who make their living by it. But science gives the sailor powerful help. At I.C.I.'s Brixham research station, scientists study the effects of sea air and salt water on ships and their gear. Specially tough marine paints are one result; another, ingenious anti-fouling compositions, which slowly release a chemical compound to repel the barnacles that are always seeking lodgings below the water-line. To trawlermen, I.C.I. means "Terylene"—the polyester fibre that's made into nets that stand up magnificently to the rough-and-tumble of the sea-bottom. When the sea is the enemy, I.C.I. scientists are staunch allies.

# AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

## Wanted: A Foreign Policy

WASHINGTON, DC

TEN days after President Kennedy broadcast his "sombre" report to the nation on his mission to Paris, Vienna and London the American public finds itself in two moods. To begin with the visit cheered people up and this euphoria has not quite evaporated. The personable young President and his wife had a personal success in Europe. There were encouraging stories that he had made a very favourable impression on General de Gaulle and a firm one on Mr Khrushchev. A poignant chord in the national pride was touched by European homage to Mrs Kennedy as an American Queen of Hearts. The Cuban humiliation was erased and the more sophisticated commentators discoursed on the psychological benefits of the trip for Mr Kennedy's maturing presidential personality.

On the other hand, it has begun to emerge that the President used a very mild word—"sombre" was not the one chosen by his speech writers—to describe the impact on him of Mr Khrushchev's unforthcoming approach and doctrinaire inflexibility. Either Mr Kennedy felt that it was necessary to tone down his reaction lest the crumb of comfort contained in the agreement over getting a cease-fire in Laos (even on humiliating terms) should be lost, or else he felt that his American audience would question whether their champion had scored if he conveyed the full force of the uncompromising Russian *aide-memoire* on Berlin, of Mr Khrushchev's insistence on the *troika* system for giving the Russians a veto on enforcement of the ban on atomic tests, in the United Nations and in every other international procedure and of his supreme confidence that the West would cave in. This would have made Mr Kennedy look as if he had travelled to Vienna merely to be told what was going to happen in all these matters, and in the world at large, whatever the United States said or did to divert the locomotive of history. But the story that Mr Kennedy did indeed find the Russian leader even harder to talk to than he had expected (though more mercurial and less clever) and that he did not report fully on the meeting has now damped American spirits.

This hardly suits Mr Kennedy's political book at a time when the public is in any case showing signs of impatience that the Administration is still producing words rather than deeds. The President's difficulty, however, is that a great deal more talking has to be done and that this is a necessary forerunner of action—unless there is to be disaster. But perhaps the first phase of educating the American public to face the prospect of a "long and difficult" struggle with Communism, with few short cuts, many setbacks, some nerve-wracking brink-walking and little of what the average American would call "action" has been completed.

The President, back in his White House rocking chair, now faces three sets of problems. In the first place, he knows that even as he digests his European trip he may be interrupted by a new crisis—in Iran, in the Caribbean, in south-east Asia—at any time. Yet, secondly, he knows that while the Berlin situation is still

only in the warming-up stage, and while talks continue in Geneva, it is urgent to define policy in advance. If there is an American answer to Mr Khrushchev's alternatives for Berlin, it is still a secret and there has not yet been time to formulate an American response to the Russian ultimatum on the inspection of atomic tests and on disarmament. Possibly the response may take the form of a gradual backing out of futile negotiations in a way that would not lose world sympathy, and a slow approach to a resumption of atomic testing, beginning with a "peaceful" nuclear explosion. The Russian move and growing domestic pressure for tests of atomic weapons come when policy is still unsettled.

Thirdly, the President realises that the very success which he achieved in Europe has proved obsolete his idea that the conduct of foreign affairs could be returned to "normal" diplomatic channels, with the President and Secretary of State anchored at the receiving end in Washington. There will be more summits—certainly more sub-summits. For example, one result of the Paris talks is that the Americans have accepted, at least partially, General de Gaulle's demand for tripartite policy-making by the United States, France and Britain (others being co-opted at need). As the General is even more his own Foreign Minister than the President is his own Secretary of State, this points to further western meetings. Above all, though the President took care not to accept any invitation from Mr Khrushchev, care was also taken not to create an atmosphere that would have made a further meeting on Berlin impossible; the main problem was to ensure that if such a meeting were held, as world opinion would expect should a head-on clash seem imminent, it would not be the Munich that Russian self-confidence seems to anticipate.

URGENT as it is to decide policy despite these pressures, unfortunately the machinery of policy-making is still in bits and pieces. At the top, American foreign policy turns on the relations between the President, the Secretary of State and the Secretary of Defence; this in turn requires effective interaction between the White House and the departments lower down. But in fact relations at the top are unclear, and lower down they are unsatisfactory. Originally, the group of clever men with whom Mr Kennedy surrounded himself to run the Presidency agreed that the State Department must be restored to efficiency after its long eclipse under Mr Dulles's personal rule, the witch-hunting of Senator McCarthy and the vacuum that was Mr Herter. Yet it is still uncertain where policy is being made. It was natural that the military-type organisation of General Eisenhower should be ignored, since it produced no policy. It was to be expected that the new President would be more his own Secretary of State than his predecessors had been. And it is fair to say that Mr Rusk, the Secretary of State, is probably the President's principal adviser and agent in foreign policy. But he is so by only a small margin: policy is plainly often made or deeply influenced, not only by the dozen assistants in the White House who specialise in it, but also by some of the President's other confidants.

Mr Rusk often seems engaged in elaborate manoeuvres with all these gentry, cautiously awaiting the moment when he can safely assert his rights. These preoccupations, and his inevitable calls abroad, have prevented him organising his own department, the morale of which has risen scarcely at all. Mr Rusk did not

## ELLIOTT-AUTOMATION LIMITED

### MR R. E. F. DE TRAFFORD REPORTS ON GROWTH OF AUTOMATION

The Annual General Meeting of Elliott-Automation Limited will be held on June 27th in London.

The following is the statement by Mr Rudolph E. F. de Trafford, OBE, the chairman, circulated with the report and accounts for the year ended December 31, 1960:

#### RISE IN GROUP PROFIT

The profit of the Group, before taxation, last year amounted to £1,776,510. Of this The Rheostat Company Limited, which was acquired during the year, contributed £520,648, representing the profit of the Company itself for 12 months ending on December 31, 1960, but only nine months' profit of its overseas subsidiaries. Excluding Rheostat the profit of the E-A Group was £1,255,862, as compared with £1,015,630 in 1959, an increase of nearly 24 per cent. Net sales in 1960, after deducting trade discounts and after eliminating inter-Group sales, in round figures amounted to £20 million compared with £16 million in 1959 for the Group as now constituted, an increase of 25 per cent.

#### OUTLOOK: FURTHER EXPANSION

Despite the large growth in turnover, your Group's order-book has risen steadily since our last report and we can, therefore, look forward to further expansion in the volume of our business. In consequence, during the current year to date, both turnover and profits are continuing to show an encouraging upward trend, and in the absence of unforeseen circumstances we are confident we can look forward to a further improvement in our results for 1961.

There is every indication now that in the near future we shall be reaping increasing benefit from the widespread preparatory work which has been going on for several years and which is still proceeding.

#### MECHANICAL AUTOMATION

Until now, we have concerned ourselves largely with the automation of process industries such as oil, chemicals, etc., and with the automation of data processing. More recently we have turned our attention to the mechanical automation field. To quote an instance, we are the licensees of Jervis B. Webb Company of Detroit, Michigan, which gives us access to the most advanced methods of large scale material handling, including electronically controlled conveyor systems. Our orders for this kind of equipment are now building up rapidly. Another example is our manufacturing arrangement, recently concluded, with the Warner and Swasey Company of Cleveland, Ohio, a leading American machine tool manufacturer, in respect of its remarkable electronic machine tool control systems which, because of their flexibility, high quality and economic price, appear to have great potential. Additionally we are playing an important part in the mechanisation of the General Post Office by equipping it with the latest devices for the automatic handling of mail, and with coin boxes for direct trunk dialling.

#### NEW AGREEMENTS AND PROJECTS

Some of the other new developments in which we have been engaging in the last 12 months

include a sales and manufacturing agreement with the Autonetics Division of North American Aviation Inc., which covers their "Verdan," the most successful airborne digital computer in the world, for which there is a substantial demand in this country. Among important projects with which we have been entrusted is the production of an experimental system for air traffic control involving the use of our latest high speed computing techniques. Last year I was able to announce that in consequence of our agreement with them, the National Cash Register Company had invited us to manufacture in this country a computer designed by NCR in the United States. This machine, the "315," has meanwhile been publicly announced, and manufacture is actively under way. In addition, increasing numbers of National-Elliott "803" computers are being sold.

Among new licensing arrangements entered into last year, I should like to mention an agreement with FXR Inc. of Woodside, New York, for microwave instruments, and one with General Kinetics Corporation of Englewood, New Jersey, covering certain types of ball valves. We have further expanded our interest in the quality control instrument field by an agreement with Hallikainen Instruments of Berkeley, California, which grants us manufacturing rights for an important range of instruments developed in conjunction with the petroleum industry, and also by an agreement under which we have secured the rights in respect of a French range of oxygen analysis equipment of outstanding merit. A marketing agreement in respect of electric recorders of particularly high quality has been negotiated recently with the Esterline-Angus Company of Indianapolis.

#### JOINT VENTURES

I referred a year ago to the impact we had made in the high vacuum field. We have since then formed a company jointly with E. Leybold's Nachfolger of Cologne, leaders in this field, which will exploit in the British Commonwealth the experience of its parent companies and of the German company's associate, Leybold Hochvakuum-Anlagen GmbH, in the field of vacuum pumps and of specialised plants (e.g., for coating and impregnating) based on high vacuum techniques. In this connection, I would particularly like to single out the process of accelerated freeze drying, in which the food industry is now showing much interest.

Since the turn of the year we have entered a

similar type of joint venture in the microwave valve field, with Litton Industries Inc. of Beverly Hills, California, whose tube division is among the world leaders in this sphere. Our own microwave valve activity which has been developing in a very promising way, and which has substantial exports to the United States, is being transferred to the new jointly owned company, and the fact that it will be based on the combined skills of the two parent companies will, we believe, ensure its rapid growth. We have also formed a joint company with Rotron Controls Corporation of Woodstock, New Jersey, USA, to exploit their special flowmetering equipment for the British Commonwealth and Europe. In all these jointly owned companies we have a majority shareholding, and therefore their results will be incorporated in our Group figures.

#### OVERSEAS OPERATIONS GROWING

Our own operations abroad are growing apace, and to this the Rheostat network of overseas subsidiaries and associates, which includes manufacturing plants in France and the Union of South Africa, is making an important contribution. Our French associate "Manurhin" has formed a subsidiary, "Elliott - Automation (France) S.a.r.l.", to handle its new automation activities, and satisfactory progress has been made there in building up sales and manufacture of some of our major product lines.

In a number of other important markets overseas, we are now planning local manufacture through subsidiaries. In all these cases the expansion of sales due to local manufacture has the effect of increasing our own exports to the country in question.

#### COMPLETE AUTOMATION SYSTEMS

Our ability, brought about by a constant widening of our range within the automation field, to engineer and provide complete automation systems from our own resources, is gaining increasing recognition both at home and abroad. This does not indicate that our business depends largely or mainly upon a few exceptionally large orders, but in the years now before us emphasis will inevitably shift from the supply of individual items of equipment to fully planned and integrated overall systems of automation. We feel that we are, as a result of our policy over many years, uniquely placed to take full advantage of this trend.

#### SUMMARY OF RESULTS AND POINTS OF INTEREST 1960 (In approximate figures)

|                                                        |                   |
|--------------------------------------------------------|-------------------|
| GROUP SALES .....                                      | £20,000,000       |
| PROFIT BEFORE TAX .....                                | £1,776,000        |
| (being 8.9% on Sales and 15.5% on Net Tangible Assets) |                   |
| of which Taxation took .....                           | 46% £817,000      |
| Preference Dividends .....                             | 3% £49,000        |
| Ordinary Dividends .....                               | 24% £433,000      |
| Retained in Business .....                             | 27% £477,000      |
| CASH FLOW (Retained Profits plus Depreciation) .....   | £970,000          |
| FIXED ASSETS ACQUIRED .....                            | £899,000          |
| DEPRECIATION .....                                     | £493,000          |
| Earnings before tax per 5s. Ordinary Share .....       | 1s. 4½d.          |

| Total Factory Floor Area in United Kingdom .....       | 1,600,000 sq. ft. |

There are over 60 operating Companies and Divisions in the Group.

Copies of the full Report can be obtained from the Secretary, Century Works, Lewisham, London, S.E.13.

## SPILLERS LIMITED

### GROUP'S POSITION WELL MAINTAINED UNDER KEENLY COMPETITIVE CONDITIONS

#### TOTAL TURNOVER INCREASED BY £9M TO £98M

#### SUBSTANTIAL CAPITAL EXPENDITURE PROGRAMME

#### BENEFITS ONLY PARTIALLY REFLECTED IN YEAR'S RESULTS

#### SIR WILFRED D. VERNON REVIEWS WIDESPREAD INTERESTS AND ACTIVITIES

The 74th annual general meeting of Spillers Limited was held on June 2 at the Abercorn Rooms, Great Eastern Hotel, Liverpool Street, London, E.C.2, Sir Archibald F. Forbes, G.B.E. (Deputy Chairman) presiding in the absence of Sir Wilfred D. Vernon (the Chairman).

The following is the statement by the chairman which had been circulated with the report and accounts for the year ended January, 31, 1961:

#### RESULTS FOR THE YEAR

After meeting all charges other than taxation the result of the year's operations is a profit of £5,299,000. Taxation requires £2,600,000 thus leaving a net balance of £2,699,000 which is £204,000 higher than for the previous year.

The Directors recommend that the final dividend on the Ordinary Stock should be 7½ per cent making the total distribution 10 per cent for the year as against 9 1/6 per cent for the year ended 31st January, 1960. I am glad that the results justify this increase in the return on stockholders' funds invested which have again risen during the year.

If this proposal is adopted the distributions on the Ordinary and Preference Stocks of the company together with those on minority holdings in subsidiary companies will, after deduction of income tax, absorb £1,310,000 out of the net balance for the year of £2,699,000 leaving £1,389,000 retained in the business in addition to the provision for depreciation and obsolescence of £2,050,000.

During the year there was considerable capital expenditure comprising the acquisition of the whole of the Ordinary Share capital of Spratt's Patent Ltd. and certain minor investments together with substantial outlay on the construction of new factories and the modernisation of others. This amounted in total to some £10 million and was financed in part from our own resources and in part from the proceeds of an issue of £8m. 6 per cent Debenture Stock. The benefit of this expenditure has been only partially reflected in the trading surplus for the year.

Total turnover rose by some £9m. to £98m. a proportion of the increase being derived from the new acquisitions.

#### FLOUR MILLING

On the milling side output and earnings were maintained although conditions within the industry still operate to make it difficult to earn a margin which we consider reasonable in relation to the real value of the capital invested. This is due to normal competition being intensi-

fied by the existence of productive capacity in excess of the overall demand. It would be unwise to rely on any significant expansion in the latter and accordingly some further rationalisation of the industry's capacity may be inevitable in the long run.

In accordance with our practice of maintaining the fullest efficiency in operational costs a new flour mill is being constructed at Gainsborough to replace the existing mill at Grimsby which has become obsolete. The new mill which is adjacent to the new animal foods factory should come into operation towards the end of this year.

#### ANIMAL FOODS

In this section of the business deliveries were maintained but increased costs brought about some reduction in margins. I believe that our policy of seeking to produce feeding stuffs designed to give the highest conversion values to the end products on the farm commends itself to the agricultural industry. Work in this field has been intensified at our Technological Research Station and Central Laboratories at Cambridge and at our Research Farm Centre at Middle Aston, Oxfordshire. During the past year an increasing number of farmers, merchants and scientists have visited these establishments and we welcome the opportunity which this gives for them to see at first hand the nature and extent of the research which is being carried out.

We continue to be impressed by the rapid growth of the broiler side of agriculture and are pleased to think that the considerable effort which we have directed to research in this connection has been of benefit to all concerned.

There has been some delay in bringing the two new factories at Gainsborough and Aberdeen "on feed." At Gainsborough this was occasioned by late delivery of certain plant and production did not commence until the beginning of 1961. At Aberdeen construction was retarded by late delivery of steel and unfavourable weather; consequently production will not begin until next month. Both these plants should make a useful contribution to expansion in this field.

#### WHEAT AND GRAIN MARKETS

As in 1959 there was little fluctuation in wheat and barley prices or in freight rates during 1960. This stability was unaffected by some notable features occurring during the year.

The bad weather conditions in North-Western Europe while not reducing the yield of the wheat

harvest did result in a lowering of quality. In consequence some European countries which in normal years are self-sufficient in grain supplies were compelled to resort to considerable import. Russia emerged as a substantial exporter of both wheat and barley in the latter part of the year and about the same time China entered the market as a substantial buyer of wheat. It is probably fair to say that the international movement of wheat during the present cereal year will be higher than ever before.

1960 produced a record crop of homegrown barley. This is being gradually absorbed and imports of barley have in consequence been lower than for some years past. The continuance of bad weather in the United Kingdom seriously interfered with the winter sowing of wheat and it is conceivable that this may induce farmers to raise even more barley in 1961. It is to be hoped that circumstances will not bring about production of barley in excess of real needs. While absorption of homegrown barley is clearly important, it must be remembered that its usage beyond a certain point would not fulfil the nutritional requirements of certain compound foods with a consequential reduction in the ultimate competitive position of the stock-raising side of agriculture.

#### BAKING

Baking operations increased in volume but rising costs absorbed the benefit of the increase in bread prices. In the main this has been a year of consolidation with the emphasis on the modernisation of production facilities with a view to improving efficiency. This process of modernisation includes the construction of several completely new bakeries at Birtley (near Newcastle), Croydon, High Wycombe, Stoke, and Swansea. Those at Croydon, High Wycombe and Stoke came into operation in the early part of this year and the others are expected to commence production within the next few months.

Our aim is to manufacture products of high quality and of a variety likely to appeal to public taste. This I consider to be not only desirable in itself but also the most practical method of stimulating consumption. Accordingly the underlying baking companies have during the year introduced a number of new types of bread and confectionery. These have distinctive names but all come under the broad designation of "Wonder" products.

#### PET FOODS

In this sphere steady expansion has continued and the ability to co-ordinate policy with Spratt's Patent Ltd. has proved of benefit to both com-

panies. Stockholders may like to know that both concerns now manufacture canned pet foods in addition to their well-known brands of biscuits and meals. The principal canned foods are marketed under the name of "Wagat" by Spillers and under the names of "Top Dog" and "Top Cat" by Spratts. A complete range of bird seeds is also produced and sold under the name of Caperns—a subsidiary of Spratts.

#### GROCERY PRODUCTS

The Group manufacture a number of products for human consumption which are sold mainly through the grocery trade. In addition to self-raising and packed flour marketed under the brand name of Spillers there are stuffings, spices, seasonings, etc., under the name of "Pinjar" and a new egg rusk product named "Sunnysnacks."

#### GENERAL

Over the whole field of our operations the year has seen the Group's position well maintained under keenly competitive conditions and a rising tendency in costs. I feel that our policy of seeking to keep our manufacturing, selling and administrative services at a high point of efficiency combined with the evolution of new products makes us as well placed as possible for the immediate future. It is as yet early in our financial year and much can still happen, but judged by experience to date I shall be disappointed if the outcome is not satisfactory.

#### OVERSEAS INTERESTS

The Rhodesian Milling Company (Pvt.) Limited and its associated concerns had a satisfactory year. As in past years profits have been applied to development and no dividend was drawn by the proprietors. There has recently been a substantial increase in the level of African wages which will have a significant effect on the cost of production but would also in normal circumstances stimulate purchasing power and therefore demand for the company's products. So far the company has not suffered from the political problems which beset the Federation but it seems evident that if these are not speedily and satisfactorily resolved general economic development of the country will inevitably be retarded. While fully appreciative of the wisdom of raising the living and educational standards and also the political status of the African this in the nature of things cannot be other than a gradual process. It is earnestly to be hoped that the progressive development of the country and its people—which has already reached a stage not fully appreciated here—will not be prejudiced by attempting to give power in advance of creating the necessary sense of responsibility to exercise it.

Our associated company in Australia showed some further falling off in earnings as a result of a continuance of exceptional competition brought about by conditions of potential supply being considerably in excess of demand.

#### OPENING OF THE NEW HEAD OFFICE

On June 27, 1960, the new Head Office of the Company at Old Change House, Cannon Street, EC4, was opened by The Lord Mayor of London, Sir Edmund Stockdale.

#### COMPANY MEETING REPORTS

##### PERSONNEL

It was most gratifying to all his colleagues that Mr Humphrey Vernon was invited to become President of the National Association of British & Irish Millers for the second time.

I am sure that the stockholders will be glad to associate themselves with the Board in expressing warm appreciation to all those in our employ who have worked so well throughout the past year.

#### THE ECONOMIST JUNE 10, 1961

The report and accounts were adopted and the final dividend, as recommended, was approved.

The retiring directors, Sir Archibald F. Forbes, GBE and Mr Humphrey B. Vernon, MC, were re-elected; the Directors were authorised to fix the remuneration of the joint auditors, Messrs Impey, Cudworth & Company, and Messrs Deloitte, Plender, Griffiths & Company; the proposal to reconvert the Preference and Ordinary stocks into shares and to subdivide the £1 Ordinary Shares into shares of 5s. each was approved.

### BENGUELA RAILWAY COMPANY

At the Annual General Meeting of the Company held in Lisbon on 20th May, 1961, the following distribution of profits for the year 1960 was approved:—

|                                                              | 1960<br>Escudos | 1959<br>Escudos | 1958<br>Escudos |
|--------------------------------------------------------------|-----------------|-----------------|-----------------|
| Net Revenue.....                                             | 216,114,629     | 153,409,018     | 161,544,922     |
| Dividend:—                                                   |                 |                 |                 |
| Percentage to Portuguese Government.....                     | 98,696,838      |                 |                 |
| Deductions in accordance with the Articles of Association... | 15,880,031      |                 |                 |
| Staff Participation in profits.....                          | 9,440,046       |                 |                 |
| Balance available for distribution.....                      | 66,917,125      | 96,322,432      | 24,559,541      |
| Add:—Transfer from General Reserve.....                      | 181,067,514     | 129,069,554     | 126,555,339     |
|                                                              | 247,984,639     | 225,391,986     | 251,114,880     |
| Distributed as to:—Debt Service:                             |                 |                 |                 |
| Redemption of 1% Debentures.....                             | 16,299,046      | 16,299,046      | 16,299,046      |
| Interest on 4% Debentures for year 1960.....                 | 6,219,112       | 6,219,112       | 6,219,112       |
| Redemption of 5% Debentures.....                             | 8,060,000       | 8,060,000       | 8,060,000       |
| Interest on 6% Debentures for year 1960.....                 | 17,812,082      | 16,100,000      | 16,100,000      |
| Dividend of 10% on Share Capital.....                        | 47,576,554      | 40,754,445      | 41,311,551      |
| Transferred to Dividend Equalisation Reserve.....            | 82,500,000      | 82,500,000      | 82,500,000      |
| Advance Redemption of 4% Debentures.....                     | 65,185,000      | 62,319,270      | 2,044,119       |
|                                                              | 195,065,794     | 187,572,715     | 196,835,750     |

Note:—Additional new 5% debentures to the nominal value of Escudos 45,370,000, repayable as from 1st July, 1971, and chargeable to interest and redemption on the earnings of the railway whether or not sold before the end of the year 1961 will be issued forthwith to Taqanyika Concessions Limited for cash at a discount of 10%.

Taqanyika Concessions Limited owns all the Debentures and 90% of the Equity of the Benguela Railway. 60.5 Escudos = £1.

### TIMOTHY WHITES & TAYLORS LTD.

#### BRANCHES THROUGHOUT GREAT BRITAIN

Extracts from MR. G. I. RUERTON'S STATEMENT  
AT ANNUAL GENERAL MEETING, 7th JUNE, 1961

**INCREASED SALES AND PROFITS.** The Accounts for the year ended 14th January, 1961, again show an increase in profits compared with the Accounts for the 54 weeks ended 16th January, 1960. The Sales again show a substantial increase and the National Health Service prescriptions remain approximately equal to the previous year.

The Trading Profit and sundry income of the Group amounted to £2,277,740 compared with £2,073,351 in 1959. After various deductions the profit before taxation was £1,773,728 compared with £1,570,457.

**TRANSFERS TO RESERVES.** Your Directors have transferred this year £250,000 to General Reserve and £20,000 to Development Reserve.

**HIGHER DISTRIBUTION.** Your Directors recommend a final dividend on the Ordinary Shares of 10 per cent making a total for the year of 16 per cent. The total dividend for 1959 was 27½ per cent on the Ordinary Capital before the issue of one new Ordinary share in respect of each Ordinary share held, which means that the total dividend of 16 per cent compares effectively against a dividend of 13½ per cent on the present capital.

**DEVELOPMENT POLICY.** During the year under review the Stores at Liverpool, Middlesbrough and Notting Hill Gate, London, were opened and are trading satisfactorily. In continuance of the policy of closing Branches which have become uneconomic, a further 47 Branches within the Group have been closed. A large Store is in course of construction in the centre of Blackpool, and it is anticipated that it will be completed and opened in 1962. The very ambitious programme of alterations and extensions mentioned in my Statement last year was completed and the results so far indicate that the capital expenditure involved has been well justified.

**PROSPECT FOR CURRENT YEAR.** As far as the current year is concerned the turnover has again been increasing steadily except in dispensing, which has shown a fall in the number of prescriptions as a result of the increase in the prescription levy from 1/- to 2/- per item. You may be assured that your Directors and Executives are making every effort to replace any drop in National Health Service turnover by increasing the sales of general merchandise.

The report was adopted and the final dividend approved.

#### THE ECONOMIST JUNE 10, 1961

#### COMPANY MEETING REPORTS

## MILK MARKETING BOARD

### OUTPUT AN ALL-TIME RECORD

#### MR RICHARD TREHANE'S SPEECH

The annual general meeting of the Milk Marketing Board was held on June 1st in London. Mr Richard Trehane, the chairman, in the course of his speech, said: The Annual Report and Accounts of the Board covering the twelve months ended March 31, 1961, have been sent to all registered producers. Since we met a year ago, whilst climatic conditions have caused very difficult farming they have been in favour of a high level of milk output almost everywhere. The number of dairy cows on farms in England and Wales has been increasing and the latest March figures show them at the highest point since the war. Apart from this, we who go about the country know that many dairy farmers, large and small, are planning to raise output of milk or at least to maintain it at a high level. The increase in total output last year compared with the previous year was as much as 153 million gallons or 8½ per cent. This emphasises once again the tremendous influence of the natural conditions in the farming year on the level of milk output. In this connection the output in this year under review should be compared with another peak year in 1957-58, three years ago. Comparing these, the increase is only 73 million gallons or about half as much as the comparison between this year and last.

cies which have been pursued here in the last decade.

The number of milk selling farms on our registers, however, has continued to decline and since 1950 we have lost 43,000 from our lists. Many of these were small units but the signs of rationalisation in dairy farming are unmistakable and they result in higher output and better efficiency.

#### PROSPECTS

Bringing all the relevant information together in our records the Board have studied carefully the prospects for the industry currently and for the next few years ahead. We believe that the trend for greater milk output will continue in this country; it is natural for this to happen. The Board's view—other things being normal—is that milk output will tend to rise over this period at a rate similar to that which we have experienced in the last five years or so. Cow numbers will be greater, the yield of the dairy cow will continue to improve and there will be more milk to sell. If the yield per cow does rise at the rate which we estimate for this period we shall reach the position when every cow whose milk is sold will show an average yield of more than 800 gallons annually.

In the light of these estimates of trends in output we are making further plans to deal with the bigger supplies which we are expecting to receive. The Board are investing considerable sums of your capital in manufacturing enterprises and these steps will mean that the Board will be in a better position to deal with surpluses as they arise. The new project on which we have embarked in Kendal is an example of the plans we are making in this direction. The manufacturers of milk products in this country, who continue to co-operate with us closely, are increasing the capacity of their creameries all the time.

#### IMPORTANCE OF MARKETING

Whilst I have spoken so far of production of milk we do not forget that first and foremost we are a marketing organisation. Our job is to sell and to sell in the best markets to secure the best returns for the industry. We believe firmly that still more energy and enterprise must be devoted to the marketing and selling side. Sometimes I think that as a farming community we do not find this subject of selling very easy. The emphasis throughout the whole industry since the war has been on production and more recently on the need for increased efficiency through reduction in costs. It is clear, however, that there must be more attention to, and investment in, the marketing side.

The Board believe firmly in this and we have accepted it as our responsibility. We certainly have now a much better appreciation of the subject and a growing belief that this wonderful market of ours can take more of our produce with great benefit to consumers and to ourselves. We must recognise that we have important natural advantages in our own market

and equally the consumers of this country have the great benefit of a supply of fresh farm produce which is readily available to them everywhere. Here is our mutual interest and our job is to serve the public from our farms in such a manner that they can enjoy the high quality and variety of British farm produce on fair terms.

#### NED FOR FAIR TRADING

At this meeting last year I referred to the need for fair trading in face of the opening of our markets more and more to international trade. I regret to say that in this respect matters have not improved. It has been necessary for the Board to make representations to the Government against some of the more flagrant practices that we suffer. Although this was done some time ago there has been no discernible result and we are therefore making a fully formal application under the anti-dumping legislation.

I have so far made no mention of the particular pressing problem of today—whether or no we shall be more closely associated in trade with the nations of Europe. To make precise comment is difficult as the terms of any possible association are unknown. I would, however, even at this indefinite stage make one important claim. The liquid milk market in this country is a very special one accounting for a very high part of our production, and farmers and distributors have gone to very great lengths to ensure that it is served faithfully. To ensure this we have laid out our milk producing pattern in a very special way both as to the standards of quality of our milk and the burden of the high level of winter production that we have sustained. In any arrangements with Europe it is imperative that the consumer's need for service and our ability to sustain it are not impaired. Those who negotiate our future must recognise this special case and make provision for it.

#### MEETING CONSUMER DEMAND

In this statement today I have tried to give an appreciation of the trends of supplies in our industry and the confidence which dairy farmers have in their plans for the future. The consequence of increasing output, we all know, will be seen in lower average pool prices. I have nothing to say on the two-tier price issue in view of the study now being made. It is important that this feature of milk policy can be considered quite objectively by the leaders of the industry and subsequently by the producers themselves. My emphasis today has been on the market and the great scope that remains in it for us if we turn over more positively to establish and maintain high quality produce in greater variety to meet consumer demand. Every farmer can take positive action on his holding which will help to this end. And if we are to belong to a wider community of farmers in Europe the steps which we take at home in the next few years will be our greatest safeguard and I am confident should ensure our success.

The report and accounts were adopted.

## THE CHARTERHOUSE INVESTMENT TRUST

### MARKET VALUES AND REVENUE AGAIN BUOYANT

The thirty-sixth annual general meeting of The Charterhouse Investment Trust Limited will be held on June 28th in London.

The following is an extract from the review by the chairman, Sir Nutcombe Hume, KBE, MC, which has been circulated with the report and accounts:

Both market values and revenue were buoyant again during our last financial year and despite the fact that we did not receive the final dividend from The Charterhouse Group until after our year-end and had the use of the proceeds of our new issue for only three-quarters of the year, gross revenue and net revenue before and after tax increased by £47,500, £43,900 and £27,250 respectively; and so far this year, this trend has continued.

### AN INVESTMENT TRUST'S MAIN CONCERN

An Investment Trust Company must be mainly concerned with revenue and although of course capital appreciation has its attractions it is of no real use unless it carries with it an

## COMPANY MEETING REPORTS

increased revenue or is realised and then used to provide that increase.

If the market value of our investments is used as a yardstick the ordinary shares of the Trust at April 30th were worth about 24s. each, and whilst that may give one a comfortable feeling it also poses the conundrum of how to turn that fact into an increase of revenue and dividends for our Shareholders. It must of course be one of the major preoccupations of the management of any Trust Company to judge whether the market value of any investment has correctly foreshadowed an increase in dividend or has "run away" to a level which over-discounts this prospect and when that is so, to find other temporary or permanent employment for the released funds. A switch here and there into good preference shares has considerable attractions.

Whilst the day to day management of an Investment Trust may not present any serious difficulties, agreeing the policy which governs the selection of the right portfolio is not as easy as it may look and this leads me to an attempt to look ahead.

The continued profitable manufacture and sale of the things people want—or, in other words, "economic growth"—must depend for all the developed countries and for our own in particular, upon the proper use of savings and the proceeds of taxation to hold the very delicate balance between encouraging home consumption, controlling the balance of overseas trading (both

## THE ECONOMIST JUNE 10, 1961

visible and invisible) and the maintenance of full employment. The search for formulae which will produce this balance is probably the greatest preoccupation of serious-minded economists, businessmen and politicians today.

Plans are of no value unless there are men of ability and good-will first to make them wisely and then put them into effect. It is becoming increasingly realised that it is vitally important to provide greater opportunities for young people to learn the skills and arts of management. At this, however, takes time and to the extent that men's ability is needed in this process of growth (and I claim that it is the paramount need) it can only come about relatively slowly and in the meantime serious mistakes and miscalculations will be made from time to time. We must pray that one of these will not plunge us into war or a slump comparable with that of 1930.

As far as our own Company is concerned we enter into our new financial year with the feeling that the general outlook for the shorter term is—to use a slang expression—"dicey," but we believe that our portfolio is well chosen and that for the longer pull it will pay to retain our holdings in most cases, whilst always using all the skill we can command to exchange as opportunity offers into the shares of companies which look as if they will be the blue chips of the future, while they still offer a relatively high yield and good prospects of increasing profit and dividends.

## THE ECONOMIST JUNE 10, 1961

### DAVIS AND TIMMINS

The sixty-second annual general meeting of Davis and Timmins, Limited, was held on June 2 in London.

Mr F. Le Neve Foster, the chairman, in the course of his speech, said:

Although the results, based on a greatly increased sales turnover, were achieved under the highly favourable trading conditions of last year, they provide ample proof of the growth and vitality of our business.

The Group Trading Profit for the year, before taxation, but after charging Depreciation, Directors' Emoluments and Interest on Unsecured Loan Stock, is £556,673 as compared with £252,724, while the Net Profit, after taxation, amounts to £293,999 as compared with £135,586 for the previous year.

These record figures reflect the success of your Board's policy, which over the past ten years has aimed at broadening the base of the business by progressive expansion and diversification.

## COMPANY MEETING REPORTS

The Directors recommend a final dividend of 20 per cent plus a cash bonus of 5 per cent, making, with the interim dividend of 10 per cent already paid, an effective total distribution for the year on the increased capital of 34.1 per cent as against 25 per cent for the previous year paid on the smaller capital.

Sales promotion, efficient distribution and service to customers are paramount considerations which must receive priority of thought, action and expenditure, if progress is to be made. During the past eight years depots have been established in Wood Green, London, Birmingham, Manchester, Bristol and Belfast and last year we opened similar depots in Bridgend in South Wales and Newcastle. We have also firmly established ourselves in Glasgow and Edinburgh and negotiations are now going forward for a depot in Leeds. With this network of selling points, we can rightfully claim that our distribution is on a nationwide basis. The success of our Sales policy can be judged by the fact that our Group sales turnover last year was an all time record.

Our subsidiary companies make the largest

contribution towards diversifying the activities of the business and they have been responsible for a notable part of the Group profits.

The Chairman then stated that since the preparation of his address and as announced, a provisional offer, subject to his Board's approval, had been received from The Delta Metal Company Ltd., to acquire all the Issued Ordinary Shares of his Company (other than those already owned by the Delta Group) on the basis of two Delta Ordinary Shares of 5s. for each Davis and Timmins Ordinary Share of 5s., ex the final dividend but cum the proposed share bonus. The Directors, having given the closest consideration to all relevant factors, are of the opinion that the terms of share exchange are fair and have unanimously decided to recommend the offer for acceptance by the Ordinary shareholders. The formal offer, with full details of the proposals, will be posted to shareholders as soon as possible.

The Report was adopted but the proceedings for the capitalisation proposals were adjourned pending consideration of the offer.

## THE ANGLO-PORTUGUESE TELEPHONE COMPANY

### MR ALASTAIR F. ROGER ON SATISFACTORY OUTCOME OF ANOTHER ACTIVE YEAR

The 74th annual general meeting of The Anglo-Portuguese Telephone Company, Limited, will be held on June 27 at Strouger House, 8, Arundel Street, London, W.C.2.

The following is an extract from the statement by the Chairman, Mr Alastair F. Roger, which has been circulated with the Report and Accounts:

First taking the Accounts, the results of the continued progress of your Company are reflected in them for the year ended 31st December, 1960.

Total Revenue at £3,715,571 is £290,986 higher than in 1959.

Total Expenses, including Royalties paid to the Portuguese Government, Provision for Renewals, Depreciation, Taxation, Loan Interest and Service of Debentures amount to £3,101,980, an increase of £227,325 over the 1959 figure.

Net Profit of £613,591 is £63,661 higher than in 1959.

Your Directors recommend and the Accounts provide for a final dividend of 6 per cent on the £7,000,000 issued Ordinary Capital which, together with the interim dividend of 3 per cent paid in November last, makes 9 per cent for the year on the £5,810,000 Ordinary stock issued prior to November last and 6 per cent on the 1,190,000 Ordinary Shares of £1 each

issued towards the end of the year and since converted into Stock. A dividend of 9 per cent on the "A" Ordinary Stock is also proposed.

After providing for the net cost of these dividends and the dividends on the Preference Stock, and after transferring a sum of £130,000 to General Reserve, carry forward is increased by £77,319.

The issue of 1,190,000 Ordinary Shares of £1 each referred to above was made to existing Ordinary Stockholders at 21s. per share. Over 97 per cent of the "Rights" were taken up and applications for excess shares had to be heavily scaled down.

The issue enabled the Company to repay the whole of its temporary borrowings and left a balance available to provide additional equipment for capital development.

### GENERAL PROGRESS

During 1960 considerable capital development was undertaken at a gross cost of £2,175,000 and at the end of the year Total Fixed Assets stood in the Balance Sheet at £17,908,973. The total number of stations in service was 275,352, an increase of 21,800 in the year.

The Waiting List at 31st December numbered around 6,000 and new applications for service are being received at the rate of 2,050 per month without any indications of slowing down. This continued high rate of demand provides a measure of the new business available to the Company.

Both Lisbon and Oporto are rapidly growing cities and the increasing number of factories, offices and dwellings being made available by the new building projects which are continuously being undertaken provides a partial explanation of the rising demand for telephone service.

According to the publication "Telephone

Statistics of the World" the number of telephones per 100 population in Lisbon and Oporto taken together was 7.3 ten years ago. The comparable figure today is over 16.0. Few cities in the United Kingdom show a figure superior to this.

In meeting and exchanging views with the Prime Minister, H.E. Dr. Salazar, and a number of his Ministers during the year I was impressed by the goodwill which the Government has for the Company. Our friendly relationship with the Portuguese Authorities, which has extended over so many years, is a most valuable asset being founded on a mutual respect of the terms of the contract under which we operate.

### CURRENT EVENTS

Portugal, in common with the United Kingdom and other European countries which have assumed responsibility for African territories, is at present faced with problems in those areas the solution of which will require the exercise of a high degree of patience and sympathetic understanding.

The uncertainty which these problems have created in international financial circles must make us proceed with due caution in planning our future capital development. However, as I have already stated, additional profitable business continued to be available to us.

Recent visitors to Portugal will confirm that business is being conducted in a normal manner and certainly it is true that the Company's day to day operating has not been affected by the difficulties which Portugal is experiencing at the present time.

Our telephone services in Lisbon and Oporto continue to work at full capacity and if the present business conditions prevail there is every reason to believe that the results for 1961 will be satisfactory.

## APPOINTMENTS

### PRESSED STEEL COMPANY LIMITED

The Company's expanding Group Research and Development Department at Oxford requires the services of a—

## MATHEMATICIAN

Applications are invited from Mathematicians with a good honours degree and with experience in the application of mathematical techniques to industrial or commercial problems. Immediate help is needed in the following fields:

- (1) Numerical machine control (involving both the development of methods of defining mathematically empirical curves and the associated computer programming).
- (2) Design of experiments for statistical analysis of the significance of several variables.
- (3) Servo-mechanisms.

Problems in other fields will occur on an ever-widening front. Experience in any of the above fields would represent an attractive attainment; evidence of analytical ability is important.

Application forms are available from the Staff Officer, Pressed Steel Company Limited, Cowley, Oxford.

### CO-OPERATIVE UNION LIMITED DEVELOPMENT DEPARTMENT

ASSISTANT DEVELOPMENT OFFICER required. Duties involve preparation of material for Development Committee in relation to financial aspects of Co-operative Movement's development problems, and particularly the provision of advice on the development projects of individual societies. Qualifications sought are a lively mind, a detailed knowledge of co-operative finance and trade, an appreciation of trading methods. A degree or recognised second-hand or accountancy qualification would be an advantage, as would personal experience of development work at society level. Commencing salary, £1,450 p.a.; superannuation, 10% on basic salary. For further details and application form, apply to Development Officer, Co-operative Union Ltd., Holbeck House, Hanover Street, Manchester, 4.

CENTRAL OFFICE OF INFORMATION requires a SENIOR INFORMATION OFFICER (unclassified) to advise, coordinate papers on international affairs and to supervise the work of others similarly qualified. Qualifications required are an honours degree (preferably in history), research and experience and the ability to present factual information concisely and accurately. Applicants should be prepared to supply examples of work done if required. Salary £1,574 p.a. plus 10% superannuation. Details of experience and qualifications to Manager (PE 600), Ministry of Labour, Professional and Technical Register, Atlantic House, Farnborough Road, London, E.C.4.

### LANCASHIRE AND MERSEYSIDE INDUSTRIAL DEVELOPMENT ASSOCIATION

Applications invited from suitably qualified persons for appointment as DEPUTY DIRECTOR OF THE ASSOCIATION. SALARY £1,400 p.a. rising by annual increments of £75 and £300 to £1,575 p.a. Post superannuable. Further particulars and form of application obtainable from Joint Honorary Secretaries of Association, Town Hall, Manchester. Applications returnable by the 7th JULY, 1961.

For other appointments see page 1184

### SURREY EDUCATION COMMITTEE

KINGSTON TECHNICAL COLLEGE, FASSELL ROAD, KINGSTON-UPON-THAMES

Required September 1, 1961, in Department of Commerce, Languages and Professional Studies, Assistant Lecturer Grade B in Commercial Subjects. Candidates should be qualified Company Secretaries (C.O.S. or C.I.S.) with teaching experience, and be prepared to teach any intermediate or final subject which they have taken in their examinations. Ability to assist with teaching of shorthand and typewriting an advantage. Salary, Burnham 16-hour scale (now under review), Assistant Grade B, £700 x £27.10s. (119) £33.10s.—£150, plus London Allowance with appropriate allowances for tenure, training and experience. Application form and further particulars from Principal, to be returned as soon as

### A CAREER AS A TAXATION SPECIALIST

A large firm of Chartered Accountants with an extensive practice in this country and overseas has vacancies on its staff for qualified accountants wishing to specialise in taxation. Opportunities for advancement in this department are good and in addition to a generous starting salary the firm operates a pension scheme.

Interested applicants are invited to send full particulars to Box No. 1514.

Common Market? Do these matters mystify and frustrate you? Short practical courses by experts for groups on your own premises.—Apply BARRON ASSOCIATES LTD., 130 Crawford Street, London, W.1.

### EDUCATION AND COURSES

#### STAFFORDSHIRE EDUCATION COMMITTEE THE STAFFORDSHIRE COLLEGE OF COMMERCE, WEDNESBURY

Principal: H. HARRISON, B.Com. Telephone: W.L.D. 1811-2. As an introduction to a career in business the college conducts a One-Year course in PROLEMINARY BUSINESS STUDIES for boys in the age group 16-18 years. An admirable course for learning the principles of accounting and business organisation. Those with some ability to embark on a high post career could be well advised to obtain further particulars of this course, which begins in September next, from the Registrar, Staffordshire College of Commerce, Wood Green, Wednesbury.

#### SUCCESSFUL TUITION FOR THE B.Sc. ECON. DEGREE

Wolsey Hall (Est. 1920) provides Royal Courses in a wide range of subjects for the two examinations for London Univ. B.Sc.Econ. (three entrance is included at moderate fees, 134) Wolsey Hall students passed London Univ. B.Sc.Econ. exams, 1959-60. Tuition also for C.I.E.S., Law, Statistical, other exams.—Prospectus (mention examination from) E. V. Shaw Fletcher, C.I.E.S., I.L.B., Director of Studies, Dept. P16, WOLSEY HALL, OXFORD.

#### B.Sc.(CON.)

LONDON UNIVERSITY U.C.C., founded in 1887, successfully prepares students for this Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts.—Prospectus giving details of Courses for other London Degrees, G.C.E., Law Exams, etc. from Registrar, University Correspondence Centre, 60, Burlington House, Cambridge.

SCHOOL LEAVING TRAINING, especially for University graduates and older students, six-month and intensive 12-week courses. Write Organising Secretary, DAVIES, 158 Holland Park Avenue, W.11. PARK 4054.

#### EXPERT POSTAL TUITION

for Examinations—B.Sc.(Hon.), Law, Accountancy, Computing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical non-examination courses in business subjects.—Write today for free prospectus and or which interested, to the Secretary (492).

METROPOLITAN COLLEGE, ST. ALBANS or call at 30 Queen Victoria Street, London, E.C.4. Established 1910.

## APPOINTMENTS

**MSL** have been retained to advise on this appointment.

## MARKETING CONTROLLER (London)

for a group of companies in the food industry manufacturing and selling throughout the grocery and catering trades at least fifteen nationally advertised products each of which is established as a household name. The company has well experienced men in the marketing and advertising departments but now needs a man to direct the whole marketing function and to co-operate with the group's combined sales forces of approximately 300 outdoor representatives. This appointment is regarded as one of the most important in the company, and should lead to an early appointment to the Board. Starting salary £5,000 per annum with pension and group life assurance schemes.

Candidates must have held, for at least three years, a top marketing position in a successful company selling nationally advertised food products, and have had five years' experience at director or senior account executive level in a major advertising agency working on similar accounts. Preferred age 40 to 45. Please send brief details in confidence quoting reference S.5107 to C. L. F. McMillan.

In no circumstances will a candidate's identity be disclosed to our client unless he gives permission after a confidential interview at which he will be given full details of the appointment.

MANAGEMENT SELECTION LIMITED  
17 Stratton Street, London, W.1.

## NORTH EAST DEVELOPMENT COUNCIL

## APPOINTMENT OF DIRECTOR

The new post of Director to the Council offers a unique and challenging opportunity to a man of outstanding originality and determination.

The Council's OBJECT is "to assist in promoting the sound economic development of the region." The Region covers Northumberland, Durham and part of the North Riding of Yorkshire.

The Director will be required, very largely by his personal endeavours, to "sell" the Region as an area of natural opportunity for the development of industrial and commercial activity.

The qualities required are initiative, imagination and drive; the calibre and personality to negotiate at high level, and administrative ability.

Wide general industrial experience is essential; a knowledge of public relations and economics will be useful.

Salary at least £3,000.

Applications giving brief relevant particulars should be addressed to:

The Secretary, North East Development Council,  
9 Eldon Square, Newcastle upon Tyne 1.

SUBSTANTIAL City Chartered Accountants invite applications from the recently qualified for interesting senior posts. Honours or specialist experience appreciated.—Write with particulars to Box 1512.

For further appointments and other classified advertisements see page 1183.

## THE UNIVERSITY OF MANCHESTER

RESEARCH STUDENTSHIPS AND RESEARCH GRANTS IN ECONOMIC AND SOCIAL STUDIES

Applications are invited for the above. Studentships and Grants for research in Economics, Economic Statistics, Government, Social Administration, Social Anthropology or Sociology, renewable for one year in the first instance, and renewable for a further period not exceeding two years. The studentships are normally of the value of £350 or £400. They are offered to candidates who have obtained the degree of Bachelor or Master in this or any other approved University. Applications should be sent not later than July 1, 1961, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

## UNIVERSITY COLLEGE OF SWANSEA

APPOINTMENT OF DIRECTOR OF SOCIAL ADMINISTRATION COURSES.

Applications are invited for the above post. Candidates must be graduates of a British University. Salary within the range £2,375 to £2,575 per annum. Membership of the F.S.S.U. and children's allowance scheme. Further particulars may be obtained from the Registrar, University College, Singleton Park, Swansea, to whom applications (ten copies) must be sent by June 24, 1961.

## THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER IN GOVERNMENT (with special reference to international relations). Salary scale £1,050 to £1,850 per annum, initial salary according to qualifications and experience. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than July 3, 1961, to the Registrar, The University, Manchester, 13, from whom further particulars and forms of application may be obtained.

## IMPERIAL CHEMICAL INDUSTRIES LIMITED

FIBRES DIVISION  
MARKET RESEARCH

The Fibres Division of Imperial Chemical Industries Limited require a young

## FEMALE GRADUATE

in Economics or Commerce

with a knowledge of statistics, to join their Market Research Team at the Division's headquarters in Harrogate. The department is concerned with market forecasting and economic intelligence in the home and export markets. Initial duties will include the collection and interpretation of statistical and economic information and assisting in the preparations of reports.

Conditions of employment include a five-day week, membership of Staff Pension Fund, an Employees Profit-Sharing Scheme and Canteen facilities.

Written applications, giving brief personal particulars to:

Division Staff Officer,

Personnel Department,

I.C.I. LIMITED,

Fibres Division,

Hookstone Road, Harrogate, Yorkshire

Please quote Ref. T.33/H.

CARMARTHENSHIRE  
EDUCATION COMMITTEE

PIBWRLWYD RURAL TECHNICAL COLLEGE, CARMARTHEN.

Applications are invited for the post of HEAD OF DEPARTMENT OF COMMERCIAL AND GENERAL EDUCATION at the above College. Candidates should be graduates with appropriate teaching experience in technical education with organising and administrative ability.

Salary Grade 1 (Head of Department, Burnham Further Education Report, 1959, i.e. £1,420 — £1,500).

This is a new appointment offering opportunities for initiative and development. Candidates should be graduates with appropriate teaching experience in technical education with organising and administrative ability.

Application forms may be obtained from the undersigned on receipt of a stamped addressed envelope and must be returned not later than the 30th JUNE 1961.

JOSEPH HOWELLS,

Director of Education,

County Education Offices,

Carmarthen.

THE ECONOMIST INTELLIGENCE UNIT LTD. has a vacancy for an economist with a good honours degree and some experience of research work, preferably concerned with economic aspects of agriculture. Full particulars including details of education, qualifications, experience and present salary should be sent to the Managing Director, EIU, 22 Ryder Street, London, S.W.1.

## AUSTRALIAN NATIONAL UNIVERSITY

Institute of Advanced Studies

FELLOWSHIP IN GEOGRAPHY

Applications are invited for an appointment as FELLOW in the Department of Geography, Research School of Pacific Studies. The Fellow will be expected to supervise students working for postgraduate degrees, and to carry out original research in the field of economic geography, with special reference to the non-agrarian side of the Australian economy. Preference will be given to candidates with experience in the analysis of industrial distributions.

The salary range of a Fellowship is from £2,120 to £3,000. Increments are £480 per annum. The successful applicant will, in the first place, be appointed at a salary and an incremental limit fixed by reference to his standing and experience. Appointment is made for an initial period of five years; thereafter it may be made permanent. The Fellow will be entitled to one year's study leave on full pay, plus a contribution towards travel and other expenses in every seven years.

Superannuation is on the F.S.S.U. pattern. Reasonable travel expenses are paid, and assistance with housing is provided. Further details are available from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close, in Australia and London, on July 21, 1961.

WYE COLLEGE  
(University of London)

LECTURER IN AGRICULTURAL ECONOMICS

Applications are invited for the above appointment which will be made according to qualifications and experience, within the Lecturer Grade, scale £1,050 — £1,850, plus £60 London Allowance, with family allowances and superannuation under the F.S.S.U.

Duties will involve undergraduate teaching of economic principles and their application to agriculture and horticulture, and responsibility for postgraduate students.

Further particulars from the Secretary, Wye College, Wye, Kent, to whom applications should be sent by 10th JULY 1961.

NATIONAL TRADE ASSOCIATION invites applications for the position of ASSISTANT from men aged 25-35, to be trained in various aspects of its work with special emphasis on labour relations. Preference will be given to candidates with a suitable qualification in economics or law and with some previous experience in an employers' organisation dealing with trade union agreements.—Write, giving details of career and salary required, to the Director, British Footwear Manufacturers Federation, 22 Gilbert Street, London, W.1.

ACCOUNTANCY  
TRAINED MAN

with wide experience in the commercial field required for an important and highly responsible position at the Head Office, in Yorkshire, of a group of Companies.

He will be required to control and, where necessary, re-organise on modern and economical lines offices employing a staff of over 200 persons. The position, carrying a high salary and contributory Superannuation Scheme has substantial prospects for a man with energy, imagination and initiative who can produce results. Only applicants who possess the necessary qualifications and experience, should send full and detailed particulars, which will be treated in strictest confidence to:

The Chairman of Directors,  
Box 1513.

JAPAN: 187 BRANCHES  
OVERSEAS: LONDON, NEW YORK  
SAN FRANCISCO, TAIPEI

Did you know that this  
drop of water  
could sink you  
financially?

A boiler is designed to supply pure steam at a given pressure and temperature. But if the water used for the purpose contains an excessive amount of undissolved solids, harmful gases or salts, serious trouble may develop, and everything be up with the boiler. The results—delayed production, extra costs and loss of profits could be disastrous.

## Vulcan know

The prevention of scale formation and corrosion in a steam raising plant depends upon the correct treatment of the water. And the expert who knows all about that—as about so many other things—is the Vulcan Engineer Surveyor.

Industrial accidents need never happen if he regularly inspects machinery—your machinery. The inspection and protection of boilers and cranes, lifts and hoists is what Vulcan provide. It is a specialist's job. Vulcan are the specialists. That's why insurance brokers know that safety first is Vulcan first.

## Vulcan are specialists

May we send you FREE 'Vulcan'—a journal for all users of plant and machinery, with reports of accidents and safety hints. Write to Dept. 17.

## Investment Opportunities in Japan!

In 1959 Japan attained the highest economic expansion of all the industrial countries of the world. Its gross national products that year increased by 16 per cent over the previous year and has seen a yearly increase ever since. This upward trend has increasingly induced overseas investments in Japanese securities.

Daiwa Securities, as one of the four largest securities companies in Japan... capitalized at £8 million sterling and having 4,000 employees... is engaged in a wide range of business, acting as broker, dealer and underwriter of securities and distributor of investment trusts. The "pioneering spirit" which has been the motivating power behind its 60 years of expansion is still very predominant today.

Make your money work for you in Japan's booming industries by investing through expert and experienced hands. For literature on Japanese stocks, bonds, debentures, investment trusts, etc., write

## In The Economist this Week

June 17, 1961

### HOME

#### HOVERING

The British Government is playing a cautious game in Europe: the time has really arrived for hitting out, for Six (p. 1203).

• Political divisions on the common market in Britain are not between Tories and Socialists, but between liberals and illiberals (p. 1204).

• Trade union opinion seems, cannily, to be leaning towards Europe (p. 1205).

• The farmers are coming to realise that union with Europe could harness more horses to their ploughs: but Mr Soames seems to be a pro-European for the wrong reasons (p. 1206).

#### REFORMING

Prisons: a new look for old gaols (p. 1209).

Atomic energy: a little fission is a good thing for Harwell (p. 1249).

Labour Party: Mr Gaitskell's Campaign for Democratic Socialism is at present the party's most effective pressure group (p. 1211).  
International Payments: Prospects for the expansion of IMF are becoming clearer (p. 1255).

#### TRAFFICKING

By road: a recent decision of the Transport Tribunal threatens to jumble up the hauliers' ABC (p. 1247).

Railway vanmen are striking in patches (p. 1217).

By air: the US fly-American campaign affects BOAC's attempt to recover lost ground (p. 1258).

By rail: Dr Beeching is accurately taking the pulse of his new patient (p. 1251).

In goods: Britain's exports lagged in May (p. 1250); orders up but prices down (p. 1252).

#### BARGAINING

Steelworkers at Rotherham will be paid for losing their jobs (p. 1235). Scottish teachers have received a new pay offer—one which would repay study by their English colleagues (p. 1212). Mathematics teachers: new methods and higher differentials needed (p. 1214).

#### Changes in the Street

Death of a Sunday (p. 1211). Expressman's Retrospect (p. 1231).

### Finance and Politics

#### Thirty Years after 1931:

Lessons and legacies from that decisive turning point in economic and financial affairs (pp. 1263-89).

### INTERNATIONAL

#### TREBLE

Russia's argument that all international bodies must in future be run by a triumvirate, including a western, a communist, and a neutral representative, springs from the Soviet reckoning of the current balance of power (p. 1206).

#### ANOTHER TROIKA FOR MR K:

• A week of words and demonstrations has provided impressive evidence of the determination of west Germany to resist Mr Khrushchev's policies (p. 1239).

• Only the formation of a government of national unity will get the Geneva conference on Laos off the ground (p. 1212).

• Chinese who know that they are hungry can probably read between the lines of China's buoyant newspapers (p. 1212).

America's arguments: it is high time that President Kennedy defined the objectives of his foreign policy, yet his policy-making machinery is in a state of confusion (p. 1221).

• Nowhere is this causing more difficulty than in Latin America (p. 1225).

• Mr Stevenson's trip to Brazil may have confirmed him in the urgent need for social change (p. 1218).

#### TRIBAL

Southern Rhodesia: Mr Sandys's White Paper represents the most

the Europeans are now willing to concede to African nationalism (p. 1214).

Nigeria: Nine months after independence, this is an African country in need of strong personalities (p. 1239).

Angola: Only the West can rescue the peoples of Portugal and Angola from the social and economic ruin that threatens them (p. 1214).

Kenya: The government has given thousands of Africans the near-certainty of handsome profits from the land (p. 1242).

Algeria: It is too soon to believe rumours of a final break-up of the negotiations at Evian (p. 1210).

#### TROUBLE

The way in which the Canadian government has tried to prise Mr Coyne from his realm in the Bank of Canada has brought big trouble on the government's own head (p. 1208).

#### . . . and farther South

• Last week the United States Supreme Court ruled in effect that communists have lost the constitutional right to freedom of speech (p. 1222).

• The state of the American economy continues to improve but there is no boom in sight yet (p. 1222).

• Persistent unemployment is to be attacked from new angles (p. 1226).

Detailed contents on page 1203

**BEA** CHOOSE **VANGUARD**

The outstanding characteristics of the new "Vanguard" are extremely low running costs and large carrying capacity. As a result, BEA have calculated that "passenger cost per mile" will figure lower than any other aircraft.

**BEA** CHOOSE **Diehl**

CALCULATING MACHINES

FOR HIGHEST POSSIBLE OUTPUT  
ACCURACY AND VALUE

Costing the Vanguard's operation is being done by BEA on Diehl Calculators because:

- 1 Diehl's unique short cutting action gives an output rate and life factor higher than that of any other desk calculating machine.
- 2 Diehl are silent and dependable in operation and easy to maintain. If ever BEA require service, they get it within one hour.
- 3 Diehl Calculators always give the right answer. All models have complete transmission, even the least expensive.
- 4 BEA, like Archimedes-Diehl Machine Company Limited, are a progressive commercial organisation, and they always choose the most up-to-date equipment.

Follow the example of BEA and other leading organisations.  
Be in the vanguard and see the NEW Class V.

## WORLD of INDUSTRY

Wherever industry turns a wheel... shapes a metal... "cooks" a chemical... purifies a pharmaceutical or food... pipes or pumps a liquid... moves, compresses or measures a gas... some Dresser product is somewhere at work, helping to get the job done—and done well.

Under world-famed trade names, Dresser provides heavy duty engines, pumps, compressors, solvent extractors, gas turbines... for countless tasks. Dresser supplies foundry clays, couplings, blowers, exhausters, gas meters and scores of other products. In automation, Dresser is playing an increasingly important role... particularly in

electronic control instrumentation for pipe lines, process plants and automated oil production systems.

In fact, Dresser Industries, through its far-flung group of integrated companies and licensees, is able to provide essential equipment for virtually any industry—general manufacturing, chemicals, pharmaceuticals, food-processing, steel-making, non-ferrous metal processing, electronics and communications, power and petroleum in any land.

Call on Dresser for technology, for experience and initiative, for reliable, world-proved products and technical services... no matter what you make or where you make it.

## lay on Leyland lay out less

Experienced operators who *ought* to know, say that Leylands cost less to run and last longer. That's what we think too. But don't take our word for it—naturally we're prejudiced—there's a Leyland dealer near you, why not check for yourself?

Take a look at the new Power-Plus diesel—the most economical engine we've produced yet. And that's saying something. Examine the general layout. Check the transmission—engineered throughout to give year-after-year of trouble-free running. Climb into the cab. Easy isn't it? Thump the walls—note the insulation.

That's how Leylands are built—with an efficiency that gives a lifetime of economy. Lay them on now; and, thereafter, you'll certainly lay out less.

**430 enemies**

but  
many thousands  
of  
friends

There are up to 430 enemies of good paper production—430 variables which can spoil the consistency of a paper.

At J. A. Weir we have some of the best and most modern plant in the country but this alone is not enough.

Only craftsmanship, wedded to science, can ensure the perfect paper which is part of our tradition and our job is not to mass-produce thousands of tons but to meet the exacting needs of modern printing in more modest quantity.

An important man in the constant battle against these variables is the Beaterman, for on his skill and not on the machines alone depends the final properties of the sheet.

We may have 430 enemies but, thanks to our craftsmen, we have many thousands of friends.

## BY THE SEA OF MARMARA

**NEW  
REFINERY**

ON the shore of Izmit Gulf about 90 kilometres south-east of Istanbul near the town of Izmit, one can see the industrial progress of Turkey on the march. The construction of the new oil refinery for Istanbul Petrol Refinerisi A.S. and its owners, Turkiye Petrolleri A. O. and Caltex, is well under way.

This new refinery using modern catalytic processes will refine 20,800 barrels of crude oil a day and will produce a complete range of petroleum products including petrol, L.P.G., kerosene, diesel oil and fuel oils. The products will be marketed in Turkey.

The Kellogg organisation is responsible for engineering and construction of this new refinery. The technical planning, including the process engineering, the mechanical design engineering and a major part of the procurement were co-ordinated at Kellogg House in London.

Organisations contemplating new process plants in the Near East, Far East, Australia and New Zealand, on the Continent, in Africa or at home are invited to investigate the economic advantages of employing the Kellogg International Corporation to implement their plans for new plants.

## A case of natural selection

Would Mr. D. have charted the Origin sooner with his tomes of reference more conveniently arrayed—in a Minty bookcase, for instance? Did he take time off from his tadpoles to ponder the fact that books are also prone to extinction through wear and tear? Could be. Too bad, however, that the most naturally selective answer of all—Minty—was not available to him. Today, book-loving homo sapiens has the advantage—and takes it.

Minty have survived supreme for years as the makers of bookcases most fittingly designed to house valued volumes. Behind elegant sliding glass doors your books are protected in dust-free distinction and discernibility. And, since Minty bookcases are *sectional*, your library can evolve to any size you wish, starting from as little as £10.16.0.—on deferred terms if you prefer.

Only at the Minty Centres shown below can you see and buy Minty bookcases, (and furniture). The Centres are so placed that Minty furniture is within reasonably easy reach of most people. If, however, for any reason you can't call, Minty will be glad to send you a catalogue and particulars of post ordering. Write to Dept. E.15 Minty Ltd., 44-45 High St., Oxford.

Reed Paper Group's growth into world markets

# Unlimited growth in paper markets

## WHICH ARE THE COUNTRIES TO WATCH?

### AUSTRALIA EXPECTS "50% increase in next 10 years!"

Mr. Ray Z. de Ferranti, Chairman of Reed Paper Products (Holdings) Ltd, says:

"Australia is a nation with an exploding population. About 7½ million in 1945, it has now reached 10½ million and, if present trends continue, in ten years' time will be nearly 13 million people. More than half of these will be under 30 years of age.

"To keep pace with the needs of this growing population, Australian manufacturing industry has spent more than £880 million on new equipment in the last 5 years.

"Growth has brought prosperity and high living standards. Australians have a personal disposable income of £352 compared with £293 in the United Kingdom.

"Figures tell only part of the story. There have been big changes in merchandising. The growth of Self Service Stores—they handle more than half of all grocery sales though they represent only 15 per cent of stores—has stimulated the presentation of consumer goods in colourful well designed packages. This has lifted paper sales. Australians are now using about 800,000 tons of paper and paper products a year. Over the next ten years consumption is expected to increase 40 to 50 per cent."

### ITALY SAYS "Demand may double by 1970"

Dr. Luigi Bruno, President of La Centrale Finanziaria Generale S.p.A. of Milan, Italy's leading finance corporation, says:

"In answer to the challenge of a market of 170 million people, brought about by the Common Market, Italian industrial output, although still at a lower level than that of the other member countries, is now making more rapid progress than the rest of 'The Six'.

"Largely because of the demand for industrial and consumer packaging, the Italian paper and board industry is growing at the rate of about 12 per cent each year.

"The Italian today uses on average only 60 lb. of paper and paper products compared with the average for the rest of the Common Market of about 140 lb. This emphasises the vast potential for the Italian paper industry, mainly in connection with the industrialization of the South which will bring about a further improvement of the standards of life for people living in those areas—together with a widening of business opportunity.

"It is to meet this demand—that may well be doubled in ten years—that we have jointly established SICAR with the Reed Paper Group to create a vertically integrated packaging organization."

### CANADIAN OUTLOOK "Huge market potential"

Mr. Bill Soles, President of Anglo-Canadian Pulp and Paper Mills, says:

"Canada, supplying a strong and growing domestic market, is also the world's largest exporter of pulp and paper. It is, after the U.S.A., the second largest producer of these commodities. Abundant supplies of pulpwood and power, and proximity to the large U.S. market, have led to the development of an industry equipped with large modern plants and utilizing up-to-date techniques.

"In addition to a huge market potential in the highly developed economies of the North American continent, Canada is well placed to supply a major part of world requirements. This is particularly true of the Western hemisphere, where the Latin and South American markets are expected to mirror the vigorous growth experienced in Europe.

"In estimates recently prepared by the U.N. Food and Agriculture Organization, it is anticipated that demand will double in

these areas in the 20-year period, from 1955 to 1975. In total volume the increase in North and Latin America will be twice that in Western Europe. Our Company (which is part of the Reed Paper Group) serves all these markets, and plans to participate in their growth to the fullest possible extent."

### BRITAIN STATES "Britain's prospects are bright"

Mr. Hector G. Paul, Chief Executive and Director of the Paper and Board Division of the Reed Paper Group, comments:

"Last year, on average, each of Britain's 52 million people used two cwt. of paper products. Demand today for paper and board is 56 per cent higher than 10 years ago. This rate of increase will be maintained and indicates a bright future.

"Last year the output of the British paper industry increased by 11 per cent as against only marginal rises in other industries. Increased demand for packaging by the clothing and food industries more than offset the temporary fall in demand by others—such as domestic electrical appliances.

"We are still a long way behind the U.S.A. average consumption of paper of nearly four cwt. per head—and this underlines the enormous potential in the U.K.

"The growth factors are tremendous. Even more paper is needed for commerce, industry and publications of all kinds. New packaging techniques are being developed, and the growing versatility of paper products ensures that this trend will continue in the coming years."

### "NEARLY £30 MILLION INVESTED OVERSEAS—SO FAR"

says Mr. Philip G. Walker, Managing Director of the Reed Paper Group.

"The Reed Group is already anticipating a surge in demand for paper, board and packaging products over the next ten years as forecast by our experts—for instance 50% in Australia, 25% in Canada and 100% in Italy.

"In Australia Reed Paper Products are one of the leading makers of packaging products.

"Anglo-Canadian Pulp and Paper Mills Limited, valued at \$65 million (approximately £24 million), is one of the largest pulp and paper manufacturers in Canada, most of its products being exported to the U.S.A.

"In Italy we are in partnership with La

Centrale one of Italy's most progressive organizations. There, in addition to our paper and board converting activities, we are building a carton board mill.

"With our partners Sande Tresliperi A/S in Norway we are already well advanced in the construction of a £2½ million pulp and paper mill for the production of corrugating material.

"In our overseas partnerships, we add our technical, research and production experience, to our associates' invaluable knowledge of local markets.

"All these overseas interests apart from their own intrinsic value, give the Reed Paper Group a basis on which to grow in each of the main trading areas of the Free World—the Dollar Market, the Commonwealth, the Common Market and the European Free Trade Area.

"They represent so far a total overseas investment approaching £30 million."

## REED PAPER GROUP

A world-wide partnership  
producing pulp, paper, board and packaging

## NEW ZEALAND ON NEW TRACKS

A FIRST-CLASS RAIL SYSTEM is vital to New Zealand's new industrial planning. Here are two English Electric diesel-electric locomotives hauling the "Limited" Express near Dunedin.

### How more power will add to national wealth

NEW ZEALAND enjoys one of the highest standards of living in the world. She owes this largely to her rich farmlands and a century of good husbandry. Now she is busy diversifying her economy and modernising her transport system. The trend to a more industrial national outlook (which will attract many new immigrants) includes the setting up of heavy industries like steel, aluminium and oil-refining, providing rock-solid foundations for even greater prosperity.

These new industries could not exist without a plentiful supply of electric power. At present the dominion's generating capacity is just keeping pace with demand, which is still mainly domestic. Fortunately there is a big hydro-electric potential which she is developing at speed, and with

these natural resources harnessed to new, vital industries, New Zealand need have no doubts about the future.

#### ENGLISH ELECTRIC IN NEW ZEALAND

The English Electric Company has been supplying generating plant to New Zealand since 1918. Many of her hydro-electric power stations have English Electric water turbines and alternators, and the new Meremere steam power station, too, contains English Electric plant.

For New Zealand's railways, English Electric has been building electric locomotives and trains since 1921, and over 150 have been supplied. The company has also supplied most of the diesel-electric units operating in New Zealand. Other English

Both steam and hydro generating plant have been supplied by English Electric. These three 30,000-kW steam turbine generating sets were built for the recently completed Meremere power station.

Electric products in the dominion range from control gear and motors in paper-mills, cement works, and fertiliser factories, to diesel-electric engines for the biggest tug yet built in New Zealand. Orders now being carried out include similar plant for important ferries to link the Islands, electrical equipment for the first big steel and aluminium mills, and even more hydro-electric plant for New Zealand's expanding electric supply system.

And so the fruitful relationship grows. New Zealand can depend on the store of technical knowledge, skill and research which lie behind every contract with English Electric, while English Electric gains in New Zealand further valuable experience, which it can use in other countries and at home.

#### POWER FOR PEACE

## Roads to Rome

CRICKETING pundits say that England came within an ace of losing the first test match at Edgbaston last week largely because at a critical moment on the first afternoon two relative newcomers to the side, Messrs Allen and Illingworth, wasted a precious three-quarters of an hour by patting balls back to the bowler along an admittedly sticky wicket. No doubt these seemed natural tactics while the ball was rearing up so uncomfortably at them, but the main practical result was to ensure that, by the time their opponents came in to face their own off-spin bowling, the wicket had hardened in those opponents' favour. The big political question of the hour is whether the same mistake is now being made by Britain's Prime Minister in relation to the common market.

The forcing tactic that some people had hoped for from Mr Macmillan on Tuesday, despite the bumpers flying around his head, was a bold intimation that Britain now intends to apply to join the common market, subject to safeguards being negotiated to meet certain trading interests of the members of the European Free Trade Association, our farmers and (above all) the Commonwealth. Mr Sandys and his team of itinerant ministers could then have been charged to take a sort of commuters' season ticket between these European negotiations and the Commonwealth capitals, constantly carrying out the latest messages about what concessions the common market countries are willing to dispose and enabling these to be measured against the concessions that the dominions will wish to propose. Instead, Mr Macmillan went out of his way to emphasise that Britain has still taken no decision even on whether to enter negotiations with Europe—thus inviting the riposte from every European that it is high time Britain did; and he played cautiously by announcing that Mr Sandys is to be sent on his tour round the Commonwealth first. The danger is that Mr Sandys may simply come back with his briefcase full of new objections.

It is tempting to say that, in view of present Commonwealth and Conservative unease, any other order of negotiations would have been unthinkable (an epithet often used by the unthoughtful), and that it is essential to serve notice on Europe that Britain still has a lot of political awkwardnesses which it will need help to overcome. But the dangers of excessive safety play are obvious, for the sake of future Commonwealth and Conservative unity as much as for anything else. When Mr Sandys appears at its door, every Commonwealth government will be failing in its duty to its own electorate unless it tries to get the name of each of its interests that might conceivably be damaged on to his "safeguard these" list. If Britain then finds that it cannot persuade Europe to promise to grant concessions on all of them, but nevertheless goes into the European Economic Community, this is bound to stir up more difficulties for Mr Macmillan both with the Commonwealth and with his domestic critics. Only if Mr Sandys is both informed enough and brusque enough to tell his hosts which concessions Europe is unlikely to grant will his visit be fruitful; it will be a misfortune if he encourages some new Commonwealth objections that will really be bargaining bids to be specifically formulated, and thus allows a new quota of difficult questions of saving face to become involved. The idea that the more difficulties we parade the more concessions we are likely to get would hold good only if the Europeans were ready to split differences with us in order to get us into EEC; it would have precisely the opposite effect if the real aim of some of the French is to

find excuses to keep us out of it.

Possibly, these forebodings are too gloomy. Certainly Mr Sandys's bilateral missions to the Commonwealth look less hazardous as a forerunner to negotiations with Europe than Mr Diefenbaker's idea of a multilateral Commonwealth prime ministers' conference; one can see why Mr Macmillan has resisted this—and equally why Mr Diefenbaker proposed it. This problem of the British approach to the European market has come at a harsh time for Canada, which is smarting under some of the recent political and economic implications of its dependence on the North American market and is looking with a correspondingly fresh yearning for what it would like to be a Commonwealth alternative. Mr Diefenbaker's proposal is a natural attempt to pull Canada's own special chestnuts out of the fire. If there were to be a multilateral Commonwealth prime ministers or finance ministers' conference at this stage, there would be an obvious pressure for parity of concessions, irrespective of worth. Each delegate would argue that the fact that Britain had promised to seek concessions for one partner increased its obligation to seek an equal number of concessions for every other partner—instead of recognising that the more insistently Britain bargains with Europe for concessions to those dominions that have a really strong case, the more difficult it will become to secure marginal additional advantages for the next Commonwealth country in line.

And it had better be frankly recognised now that Britain's main priorities in negotiating with Europe are likely to be to secure some easements in the Treaty of Rome for the dairy products of New Zealand (which is the one dominion whose economy would otherwise be really seriously hurt) and after that, perhaps, for exports from the Asian and African Commonwealth countries (where Europe seems likely to meet us wholly or in part). By the luck of the draw, Australia might gain from any concessions that were negotiated for New Zealand, but it is going to be terribly difficult to persuade Europe that there is any equally compelling case why it should grant special concessions for Canada's industrial exports over the EEC tariff wall. For one thing, it seems clear that these Canadian industrial exports are likely to gain more from the increased prosperity that EEC would bring than they would lose from the imposition of some new tariff barriers by Britain; all exporters to Britain, but particularly industrial ones, would lose very heavily if Britain were to become an enfeebled economy isolated from the rest of Europe.

One must hope that the main purpose of Mr Sandys's private and bilateral discussions will be to rub this point home. There was a revealing incident on Tuesday when Mr Macmillan rejected the idea of publishing a white paper that would spell out the advantages and disadvantages of Britain joining the EEC, because he thought that Britain's bargaining position would be impaired if all cards were laid on the table before negotiations with Europe begin; what this presumably means is that the advantages, when spelled out, look so overwhelming that he fears that some Europeans might conclude from it that they need to offer us no concessions at all. Because of the real and emotional strength of the Commonwealth tie, any such conclusion by Europeans would be tragically wrong. Nobody therefore should underestimate the complexity of the negotiations in which Britain will now be engaged; nobody can say dogmatically how far particular pieces of timing are clumsy or wise. But the apprehension remains, as one peers

at the probable weather ahead, that the state of the wicket at question time last Tuesday might have better utilised by more forceful hitting out, for Six.

## All Liberals Now?

At first sight, the list of MPs who are shying angrily away from British association with the common market makes an extraordinary mélange: what possible connection is there between Mr Shinwell and Mr Turton, Mrs Castle and Sir Robert Grimston, Mr Creech Jones and Mr Patrick Wall, Mr Jay and Sir John Barlow, Mr Michael Foot and Sir Beverley Baxter and Mr Edwin Gooch? The answer is simple, if one thinks about it. Nominally the present House of Commons consists of 366 Conservatives, 257 Labour, 6 Liberals and one Independent. In reality, under the skin, it consists of rather over 400 liberals and about 200 non-liberals.

The liberals comprise virtually all Conservative MPs except the extreme right, plus the main centre block of Labour; the non-liberals comprise the extreme right of the Conservative party, plus both the extreme right and the extreme left of Labour. Virtually all MPs who have spoken out against the common market belong to one or other of these last three categories of non-liberals; they include the genuine protectionists, the ardent planners, and the little Englanders who just happen rather to dislike foreigners. It is possible that this division between liberals and non-liberals will gradually come to be seen as the real distinction in modern British politics, although at present recognition of this is greatly hampered by traditional party nomenclatures.

In the country, one suspects, the instinctive non-liberals may still be a larger force than they are in Parliament. That is why it has always seemed possible that emotional opposition to joining EEC may increase as the implications of the step sink in; some such recrudescence of opposition should probably be expected in the next few weeks, mainly on little Englander grounds. But the bandwagon into Europe has so far been carried forward by a pronouncedly favourable reaction from organised industrial opinion, from men who are accustomed to judge issues less in emotional terms than in terms of bread-and-butter advantage. The fact that British industrial employers are now predominantly liberal-minded, for the first time since mid-Victorian days, became apparent some time ago; indeed it was a series of industrialists' answers to an FBI questionnaire that was largely responsible for giving the Government the first push along the way that it has gone. It was not so obvious that the trade union movement would prove to be pro-European, too; but in the last few weeks a surprising number of trade union leaders have come out in EEC's support. It is probable that a cautiously worded motion in favour of joining, subject to proper safeguards, would now be able to secure a majority at the Trades Union Congress. The factors that are swaying informed trade union opinion are discussed in the next article.

## The Unions' Choice

MSPAACK, father of the Rome Treaty, once remarked that most of its economic safeguards would probably never be used; they would be bypassed by economic change. The remark has been strikingly borne out in one matter—the free movement of labour—which was once the main bogey of the British unions as they faced the common market. Three years ago—with over a million winter unemployed in west Germany and nearly two million in Italy—the fear of German workers getting the best jobs and Italian Casanovas getting the best girls was understandable enough. Today, boom is soaking up the continent's reserves of labour so fast that the fear is becoming groundless.

In Germany there are now four times as many vacant jobs as unemployed. Despite the continuing influx of workers from the east, and a vigorous recruiting drive in Italy, Spain and Greece by German firms, the labour market is now so tight that the Bonn government last week told employed workers that they need pay no contributions into the national unemployment insurance fund for six months; the fund is overflowing with cash. Italy too, though it still has over a million unemployed, is soaking up pools of concealed unemployment at great speed and its economists forecast that it will be fully employed in about six years' time. France and Holland together expect a rise in their labour force of about three million in the next ten years, but both see this as a means of sustaining expansion rather than a handicap. Free movement of labour, which looked like posing a real threat to full employment in some countries when the treaty of Rome was signed, is coming more and more to be seen by the members as a guarantee that the labour market will have at least some flexibility as all western Europe becomes fully employed.

THE safeguards in the treaty, that the free movement of labour shall not jeopardise full employment, thus look increasingly superfluous. But the safeguards are there. Under proposals for the transition period adopted by the Council of Ministers of the European Economic Community this week, workers will not be able to move from one country to another without a clear offer of a job; once there, they will not be able to switch jobs for at least a year, or change trade or profession for at least three. Ultimately the movement of labour is to be completely free. But migrant workers will have, permanently, the same legal right *vis-à-vis* employers as the citizens of their adopted countries and must be paid union rates. It is an essential feature of the common market that free movement be brought about only in consultation with the unions and through collaboration between official employment exchanges.

Free movement of labour is not the only sphere where the common market provides safeguards for labour. When the

Rome Treaty was drafted, its creators were anxious to win left-wing support; hence various provisions for a rehabilitation fund to retrain workers displaced by free trade, an economic and social council giving employers and employed a chance to comment on the shaping of policy, and so on. Moreover, the French forced their partners to accept upward "harmonisation" of some labour costs, especially equal pay for women, the 40-hour week and "equivalent" paid holidays.

So far this harmonisation part of the treaty does not seem to have had much effect. But in such matters Europe seems, quite apart from the common market, to be moving towards a common level. For some years real wages on the Continent have been rising a good deal faster than here; the German industrial employer now pays more for labour (in wages and social contributions combined) than the average British industrial employer does. In all six countries working hours generally are falling to 45 per week, and the unions aim at a 40-hour week later on. On holidays with pay a norm of three weeks seems to have been reached by the Six; Britain will have to muster a few more saints' days or bank holidays if it is to reach the common market standard.

On equal pay between the sexes, few European countries, in or out of the common market, approach the French standard. In France women's wages are, on the average, 92 per cent of men's; the comparable figure for Britain and west Germany is some 70 per cent. While male employers and union leaders pay lip service to equality in all countries, neither have shown much enthusiasm in applying it. Yet even here France's partners have been forced by the treaty to move slowly forward. The French government—helped by the European Commission, which regards equal pay as socially desirable—is now pressing hard for it. Put at its lowest, the harmonisation of social legislation at least gives the unions an opportunity to learn from one another and exert pressure for "levelling up" workers' benefits in all the member countries.

ULTIMATELY, the level of earnings will be determined not by any provisions of the treaty, but by productivity. If industry on the continent continues to expand more rapidly than British, the time should not be far off when continental earnings pass ours. If British industry pulls up its socks, then British earnings will rise too. Put in another way, the choice for the unions is, economically, the same choice as that for the country as a whole. Is British industry more likely to prosper in than out? On the whole, trade union economists tend to come down on the side of going in.

In terms of new power, some trade union leaders see opportunities too. If European unions get together with the same zest as employers are showing, their bargaining power in a European market could well be strong; joint six-nation union organisations exist in coal and steel, and British union leaders could be well placed to take a leading role in similar joint organisations in other trades. Instincts—for adventure or for caution—are thus playing a large part in the unions' choice, although inevitably the wayward winds of union politics are also having their effect. In some left-wing unions the common market is already being lumped, together with The Bomb and German bases in Britain, into the category of cold-war plots. This, however, may not have quite the effects the hot-heads intend. One left-wing, but European-

mininded, union leader recently remarked that he thought the TUC would vote yes, but for the wrong reasons. "They will vote to join to dish the left."

## No Peasants' Revolt

MINISTERS turned up in force for Monday's agricultural debate in the Commons, ready to withstand a revolt against the common market by Tory agriculturists behind them. But the *sans culottes* did not appear, and so ministers sat on in the deserted firing line, looking rather silly. The Minister of Agriculture, Mr Soames, suggested obliquely that he was in favour of joining the market, but unfortunately mostly for the wrong reasons. Mr Soames seems to be less of a consumers' champion than his predecessors occasionally tried to be. Whenever he uses the words "unsatisfactory" or "uneconomic" about food prices, he means food that is cheap; he regarded the idea of checking surplus milk production "by sheer economic pressure" (i.e. by reducing swollen prices) as "not pleasant"; he believed that "in the years ahead world food surpluses are likely to increase yet more," and suggested that even if Britain did not join the European Economic Community, it might be right to move towards

the common market's system of agricultural support because "otherwise we will find our farmers constantly at the mercy of imports at uneconomic prices." If Britain does go into the common market, it may soon afterwards be desirable to get the parliamentarily able Mr Soames out of the Ministry of Agriculture; he shows some signs of being as European as the Europeans in his thinking about methods of support—instead of being a proponent of freer trade in food, which is the pressure group role that Britain (once within the market) most definitely ought to adopt.

While the present official spokesmen of the Ministry of Agriculture were not allowed to dive right into the common market, a former Tory junior minister there (Sir Richard Nugent) was put up to argue the case for doing so. He emphasised that political factors are likely to lead to much greater nursing of the farm vote inside a united Europe than in an independent Britain; Italy has 45 per cent of her voters in farming against Britain's 5 per cent, so that at European price reviews "there will not be one Jim Turner, but rows of them." This point—dramatised by the spectacle of French Jim Turners terrorising some of their county councils in a demonstration about potato prices (see page 1211)—has now sunk in with many Tory MPs from the agricultural constituencies, and as a result much of the farm lobby's former opposition to EEC is visibly withering on its stalk. It is the rallying cry of the Commonwealth (in Canada at the moment, as well as here), objections to the idea of an undefined and open-ended political involvement, and (in some quarters) loyalty to the European Free Trade Association that now provide the main slogans for those who are whipping up resistance.

## Riding the Troika

Russia having made its strategy clear, there is now a pause while the West reconsiders its own

DETECTIVES of diplomacy, seeking to deduce the present course of Soviet foreign policy, will note that Mr Khrushchev's meeting with Mr Kennedy in Vienna has not been presented to the Russians in terms as lyrical as those used for the Camp David encounter. Soviet newspapers are still tempted to show Mr Khrushchev as an international magician capable of turning a warmonger into a dove of peace, but they have been careful not to raise too many hopes over his Viennese performance. Metaphors are often symptoms of a mood. After Camp David, the Russian press was full of clichés about the rapidly melting snows of the cold war. Now, Vienna is merely described as the modest beginning of a thaw that may take a long time to complete.

What Mr Khrushchev had to say on disarmament and the German question is no longer a secret, since Moscow published last Saturday the two memoranda he had submitted to President Kennedy. They show no change in the Soviet line. The first restates the Russian case for tripartite control of any disarmament plan. The second revives the now routine threat that, failing an international agreement in the coming months, the Soviet Union and its allies will sign a separate peace treaty with east Germany. This is not at all new.

President Kennedy may have been more surprised by Mr Khrushchev's blunt language on the subject of the uncommitted third of the world. It is here that the spirit of Vienna differed most from that of Camp David. On his trip to America in 1959, Mr Khrushchev, eager to draw Mr Eisenhower to the summit, sought to avoid unpleasant topics. Now he has emphatically asserted his conviction that "wars of liberation" are inevitable and that, sooner or later, the uncommitted countries will choose the communist path. He has coupled this with a warning to Mr Kennedy not to interfere militarily with this "historical tide." If your troops move, he said in substance, so will ours, and each local conflict runs the risk of setting off a nuclear conflagration.

Disarmament would be the logical step to minimise such risks. But progress in this field is blocked by disagreements over control crystallised in the now fashionable Soviet concept of the "troika." The Russians argue that all international bodies must henceforth be run by a triumvirate, including a western, a communist and a neutral representative, which must agree on all the key decisions. The troika ("a Russian vehicle drawn by three horses abreast," says the Oxford dictionary) illustrates Moscow's ambivalent attitude towards

neutrals. It was, after all, Mr Khrushchev who recently said that "there are no neutral men"—which was at bottom not a boast but a confession of failure, since he meant that so-called neutrals were against him. Yet now he wants to build some sort of neutrals (presumably those who may still be his friends) into the organisations of the world.

Less than a decade ago, when the western alliance and its dependencies looked to viewers in the Kremlin like an empire on which the sun would never set, any success in detaching a territory from the western camp was for the Russians an enormous achievement. In contrast with this, at the conclave held in Moscow last November, many communist speakers argued that in the future some leaders of the newly independent states, alarmed by the threat of communism at home, might turn to the West for support. Mr Khrushchev was warned not to take neutrals for granted and was entrusted with the difficult task of intensifying the "anti-imperialist struggle" without committing himself whole-heartedly to neutralist leaders; and in September in Bled the neutrals will meet to decide, for themselves, where they stand.

RUSSIA'S introduction of the troika principle may have been precipitated, as Mr Khrushchev suggests, by Soviet displeasure over Mr Hammarhjöld's handling of the Congo crisis, but the principle has its roots in the Russians' assessment of the current balance of power. Tactically, it may seem an ingenious move. The inclusion of a neutral is an apparent tribute to the importance of the uncommitted nations; at the same time, the unanimity principle implicit in the arrangement provides the Russians with a guarantee against "bad neutrals" who might align themselves with the western powers. In a sense, the Russians can maintain that their plan is a version for the 1960s of President Roosevelt's idea of five policemen, which served as the basis for the United Nations. The United States and the Soviet Union are to be regarded as two super-policemen representing their respective sides. The inclusion of a neutral is a sign of the growing influence of uncommitted sentiment since the war. The western reply is well known: a driverless troika will get nowhere, and progress in world government can be achieved only by limiting, not by extending, the area in which the veto can be applied.

There is little hope that next week's meeting between Mr McCloy and Mr Zorin (discussed on page 1210) will bring agreement any nearer on disarmament, one field bedevilled by the troika issue. A ban on nuclear tests was the one point on which the two leaders could have produced an immediate result in Vienna. Yet the latest Soviet memorandum confirms that the Russians are no longer interested in this ban by itself. Mr Khrushchev did not even try to use the French experiments in the Sahara to explain the Soviet attitude. The gist of the Russian argument is that such an agreement is not worthwhile in present circumstances. With both sides armed to the teeth and capable of increasing their armoury without further testing, and with Nato seeking to strengthen its forces in Europe, Russia apparently has no interest in opening itself to inspection. It thus concludes that an agreement on tests must be linked to the whole disarmament question; perhaps it will have to be combined with the problem of Germany as well. In that respect, the Russians

are now more awkward than before. But being more awkward does not mean being less in earnest.

When western chanceries seek signs of Soviet willingness to compromise they look towards, say, Laos or Latin America. Moscow looks to Germany and Berlin. If west Berlin can be described (to use Mr Khrushchev's words) as a fishbone in the communist throat, then the Soviet leader has been remarkably slow in trying to pull it out. He proclaimed that the situation in Berlin was intolerable as far back as November, 1958. Yet his threat of a unilateral peace treaty with east Germany, with its awkward catalytic consequences for the western allies in Berlin, still stays suspended for a period not clearly specified. Moscow insists that its latest memorandum is no ultimatum. To render it more palatable, it has introduced two suggestions: signatories to the German treaty would not have to recognise east Germany, and the two parts of Germany would be allowed to keep their military alliances for a period after the signing of the treaty. Still, it seems to be indicated that, rather than going it alone at once with a unilateral treaty, Mr Khrushchev may once again use the Berlin issue as a lever to bring about an international conference.

The leaders of the two blocks have departed from Vienna with a better knowledge of each other's stand. The Russians' presentation of their case has run so true to form that the gloomy surprise shown by some American commentators seems out of place. It is reasonable to claim that the troika is only a provisional and perhaps not very road-worthy vehicle for Mr Khrushchev, who no doubt hopes that at some future stage the international carriage will be drawn by a mighty communist mare dragging behind it a capitalist weakling. But to be astonished by Mr Khrushchev's communist convictions is as absurd as it would be for the Russians to show surprise that Mr Kennedy is not a party card-holder. The two possessors of ultimate weapons have met, agreed temporarily to disagree, and, probably, to meet again before either embarks on a road that could lead to the irreparable.

SOVIET strategy is no secret. Its immediate aim is to freeze territorial positions in Europe and to outflank the western powers in Asia, Africa and Latin America. Progress on disarmament seems to be linked, in the Russians' view, to the allies' willingness to come to a suitable arrangement over Europe. The Russians seem in no large hurry. They have put their money on the erosive powers of time, and Mr Khrushchev seems to have convinced himself that with each successive meeting the odds are shifting slightly in his favour. But he, too, must also be worried by the risks of the arms race and of the part played in it by Germany. After the Viennese preliminaries, he will certainly try to make an attempt at more real negotiation with President Kennedy, either alone or in limited company. Should he be able to announce before his party congress in October that international conferences are gathering to discuss Germany and disarmament, and that the President is coming to Moscow, Mr Khrushchev could parade, if not as a magician, at least as a successful diplomat moving adroitly along his chosen path of co-existence. Mr Kennedy and his allies now have a few months to study the files and decide whether the Russian proposals can serve as a basis, certainly not of agreement, but perhaps at least of discussion. The odds are that Mr Khrushchev will want to call them to a conference before the end of the year.

## A Political Assassination?

**Our Ottawa Correspondent unravels the motives which have led Canada's minister of finance to seek the resignation of the Governor of the Bank of Canada**

THE Canadian Government's unsuccessful attempts to persuade Mr James Coyne to resign immediately from his statutory position as Governor of the Bank of Canada, from which he can be removed only by resolution of both Houses of Parliament until his term expires on December 31st, hit Canada like an atomic bomb. But, as John Bird, a *Toronto Star* columnist, neatly commented, the immediate effects of the explosion are much less serious than those of the following fallout. Most Parliamentary observers have deduced that the fallout will include a "sunshine" budget (to be presented next Tuesday evening) with considerable tax concessions for business, the promise of large expenditures for local improvement and labour training programmes and a huge deficit—all designed to prepare the way for a general election in the autumn.

This interpretation derives from several features of the Coyne-Fleming row which are necessarily conjectural. But on any other supposition they are nonsensical, and the human mind always tries to discover rational explanations, even for Government actions which may be entirely irrational. The most significant feature of the row—and the most extraordinary apart from the almost breathtaking boldness or obstinacy of Mr Coyne—was the bland way in which the finance minister, Mr Fleming, told the House of Commons that Mr Coyne's "public declarations of policy on public issues quite outside the realm of central banking and his rigid and doctrinaire expression of views often and openly incompatible with Government policy" forbade any confidence in future co-operation between the Government and the Bank. This belated discovery of what Mr Coyne has been saying vigorously for at least two years, and more cautiously for at least four, formed the focus of the Opposition attack on Mr Fleming this week. Mr Coyne asserts that the first time Mr Fleming told him that his speeches were embarrassing the Government was on March 18th this year; and, looking back over Mr Fleming's own budgets and other speeches, the Governor must find many passages directly reflecting his views in part, if not in whole.

AGAINST this background, the fact of greatest political significance, as Canadian commentators see it, is that Mr Fleming should have chosen—or perhaps been pushed by his colleagues into choosing—this particular time to try to contrive Mr Coyne's resignation. The clue to this mystery may lie in Mr Fleming's statement that "the main reason" for requesting Mr Coyne's resignation was that he stood in the way of the Government's programme for increasing employment and production in Canada, which is a very odd comment on Mr Coyne's series of speeches and annual reports, all of them directed to these ends. Mr Coyne himself said that Mr Fleming has referred to "mysterious and alarm-

ing measures not yet clarified which it was assumed I would oppose." But he added that the Government has never expressed disagreement with his management of the Central Bank, and the Bank had never failed to co-operate in Government policy.

Searching for something rational in this mess, which may be completely irrational, the next vital clue is the way Mr Fleming described the fundamental differences between the Government and the Bank. He said Government policy was expansionist and Mr Coyne's was restrictionist. If this means anything at all, it must point to a new Budget with a Keynesian deficit running high, wide and handsome, to a disregard of the balance of payments deficit, which has always been the core of Mr Coyne's concern, and to a raft of incentives intended to encourage business. The crowning irony of this is that, until now, Mr Fleming has been the only member of the Cabinet holding out for orthodox finance, worried about the Government's ability to borrow money and acutely aware of the seriousness of the balance of payments problem. The argument between expansionist and restrictionist policies has always been one between Mr Fleming and his ministerial colleagues, not between the Government and the Bank.

The background to the Coyne-Fleming clash was set out in a special section entitled "Canadian Questions" on pages 915 to 919 of *The Economist* on May 27th.

Since Mr Coyne refused to go quietly when asked, and astutely got his statement published first, Government speeches have appeared as a deliberate attempt to smear his good name. There is no other reason for dragging in the pension question, and no justification for blaming Mr Coyne for the decision taken by the directors of the Bank on the recommendation of a foremost insurance man, Mr J. T. Bryden, in February, 1960. But it does serve an electoral purpose to keep referring to Mr Coyne as the man who will get a \$25,000 pension when barely 50. The attack on Mr Coyne may also help Mr Fleming, superficially, to round the corner and come into line with the insistence of Mr Diefenbaker and other ministers on a sunshine budget.

In business circles, where Mr Coyne was far from being a hero, it has been received with shock and deep distaste, and that is the final paradox. For the major part of Mr. Coyne's six and a half years as Governor, it has been possible to argue that his poor relations with the financial community were a major obstacle to successful financial policy. This has been especially true in recent months. But the way the Government has tried to remove him brings down on Mr Fleming's head the very hostility and suspicion formerly reserved for Mr Coyne. If Mr Diefenbaker is not deliberately planning an election, with Mr Coyne as one of the major scapegoats, he may find himself pushed into it anyway by the very burden of the problems that remain unsolved—and on present showing insoluble—by his Government.

## Trouble behind Bars

**A new look at the development of the prison service is urgently needed**

BRITAIN'S prisons are antiquated, overcrowded and understaffed. This has been common knowledge for a long time. Last week a murder at Dartmoor and a threat of working to rule by prison officers at Pentonville drove the dangers home once more. The number of prisoners has risen from a daily average of just over 10,000 before the war to 30,000 today; of these, 7,000 are sleeping three to a cell. The small prewar prison service of 2,300 officers in charge of 40 institutions has been expanded to 4,700 in 80 institutions. But it is still 15 per cent below establishment, and many officers say that the disciplinary problem is getting beyond them. They say that jobs which are necessary to security are being scamped or passed over, simply through shortage of staff. The prison officers not only have to cope with overcrowded conditions, which set tricky problems at the best of times to inexperienced or uncertain staff. They are also supposed to try to implement new policies of prisoner rehabilitation and more congenial prison relationships. These involve longer working hours (including special calls beyond the compulsory overtime introduced, as a temporary measure, during the war) and changed disciplinary methods. Their own doubts about their ability to work the new and promising penological system known as the Norwich experiment (which has now been introduced in other small, local prisons besides) have reached the point where a resolution to abandon the Norwich system was carried unanimously at the annual conference of the Prison Officers' Association last month. No doubt many of the delegates who voted for this were tough eggs expressing a dislike of what they regard as new-fangled and namby-pamby methods, but more of them were simply saying that they could not work so much overtime while the staff shortage persists.

It happens that the latest round of troubles has come when the Home Secretary's prison-building programme is at last getting under way. Mr Butler thereby came off relatively unscathed during question-time in the Commons on Monday. Eight new "secure" prisons, the first to be built since before the first world war, are in the pipeline. One, already completed, is being used as a borstal institution until new borstal accommodation is ready; the second, at Hindley, Lancashire, will be opened later this year; Mr Butler himself laid the foundation stone of the third, at Blundeston, near Lowestoft, a month ago. These institutions may help to reduce overcrowding, but the present programme will be only a first nibble at the major problem of rehousing the existing prison population from its gaunt Victorian barracks, which were designed to serve totally different penological theories and in which workshops and rehabilitation facilities have grown up,

inadequately and piecemeal, through the years. Above all, it is far from clear where Mr Butler and the Prison Commissioners expect to get the men to run their establishments, old and new alike.

RECRUITING for the prison service is now wholly insufficient to maintain the necessary expansion of staff against the wastage caused by resignation and retirement. The net gain through new entry was 270 officers in 1958, 382 in 1959 (partly the result of improved pay scales) and only 8 in 1960. Because of the uninterrupted rise in the prison population the ratio of officers to prisoners has, in fact, fallen during this time. So far in 1961 there has been a net gain of 33 officers, but the recruitment of women officers, always difficult, is now causing particularly serious concern. Staff can be shifted into the trouble spots (both Pentonville and Wandsworth are to get 10 officers apiece from Brixton this month), but the opportunity for such redeployments is strictly limited. Dartmoor, despite its disturbance, will still have to send officers to Brixton to help to make up the numbers there. Although Lord Bathurst told the House of Lords on Monday that Dartmoor was up to strength, this was less than the truth: the staff was already 10 below establishment last weekend.

Discipline must eventually be affected by this kind of run-down. In some prisons, prison officers say grumblingly, the Norwich system merely covers a "glorified relaxation of the rules." In others, there are allegations that gang bullying by prisoners of other prisoners—including, especially, it has been alleged, minority groups such as coloured convicts or misfit sex offenders—is rampant and nowadays too little checked. This has added to the doubts about staffing the new institutions: all the 46 Pentonville officers who applied for transfer to the new prison at Ashford have been told that they cannot be spared.

It is dangerous to be too dogmatic in diagnosing the recruiting failure. Pay has some effect, particularly as the prison service and the police recruit from much the same sources. The prison officers' basic scale of £10 16s. 6d. a week, rising to £15 3s. in nine annual increments, introduced on January 1st, is clearly at a disadvantage against current police rates. But overtime earnings are regular (some 20 hours a fortnight at present), and pay is not regarded as an outstanding grievance. Conditions of work, particularly in the big prisons, are open to much more criticism. There are plenty of officers who are prepared to staff open prisons, where they can enjoy country life; even Dartmoor (although the Prison Officers' Association has been stoutly opposed to Princetown) has its defenders.

The chief sources of discontent are two: the long and uncertain hours; and the absence of staff accommodation on or near the job so that men are separated from their families and may have to keep up two homes.

The average prison officer's day (for those not on night guard) begins at 7 a.m. It involves all the routine unpleasantnesses of institutional life, requires keeping discipline over as many as a hundred men at a time in a workshop, and makes special demands in guard duties, censoring letters and supervising visits from prisoners' families. (It is very possible, incidentally, that some of these duties are unnecessary and are included in the schedule out of custom; a more scientific job analysis of a prison officer's day might be useful, and enable staff to be more efficiently used.) Normal duty ends at 5.30 p.m., but is frequently extended as a result of the liberalisation of prison routine (including evening classes) to 9 p.m. or later. Special stand-by calls and the absence of social life are drawbacks in securing young officers and women officers. If staff were brought up to establishment, there would be a better prospect of introducing a regular shift system.

The Prison Commissioners have done reasonably well in providing staff accommodation where they can. The main difficulties are the absence of suitable sites near town prisons (Strangeways in Manchester is an exception) and soaring land values which eclipse the small budget available. To assist recruiting, the Wynn-Parry committee, which reported in

1958, recommended the payment of a subsistence allowance to officers who have to live away from home during their initial training. This was turned down by the Treasury.

One device to get new staff may be the introduction of a cadet service, inspired by the police experiment on these lines. This could have advantages in securing a new type of recruit; an educational qualification of three or four passes at "O" level GCE might be imposed. There is a clear need to get away from the image of the old-style warder. But men of this kind are not likely to be attracted by present wage rates. There is also the obvious danger, in present circumstances, that raw recruits may simply be handed a bunch of keys, on the quiet, and told to get on with it. The atmosphere of prison life brings its own contamination unless experiments of this type are closely supervised.

The problems of the prison service are by no means unique. But the service is a small one still, and its difficulties have a claim (which the Wynn-Parry committee recognised) to be treated as *sui generis*. The present troubles confirm the case for more purposeful action to improve working conditions. Above all, there is a need to take a hard look at the kind of service that ought to be built up, in keeping with new ideas on prison treatment. The service that was suitable for floggings and death-cell duties is by now as obsolete as the buildings which still enshrine the principles, and not a few of the practices, of a century ago.

## NOTES OF THE WEEK

### DISARMAMENT

#### Pressing on Rewardless

ON Wednesday Mr Dean Rusk told a Senate subcommittee that he felt "deeply discouraged" by the lack of progress in disarmament negotiations with the Russians. Simultaneously, Sir Michael Wright and Mr Arthur Dean, the British and American negotiators in the Geneva talks on nuclear tests, were once again pointing out to Mr Tsarapkin that the Soviet government had in effect shut the door to further negotiation by insisting that its latest terms must be accepted as they stood, and as a whole. The Russians have not only gone back on their earlier agreements by demanding a "troika" set-up which would make the control of a test ban unworkable by giving them a veto over virtually all its operations; they have now also proposed that the banning of tests, after being discussed at 318 meetings at Geneva over a period of thirty-two months, should be put back into the framework of general disarmament—for which there is not even an agreed negotiating body.

It is certainly a discouraging picture, and it is hardly surprising that President Kennedy is being urged—by the chairman of the Congressional Joint Atomic Energy Committee, Mr Hollifield, for one—to permit a resumption of test explosions, albeit in underground cavities. Public pressure

for a resumption of testing in America is now likely to monopolise much of the world's attention. It will be a pity if this controversy leads to a neglect of the broader disarmament issues. On Monday Mr Zorin, the Soviet deputy foreign minister, is going to Washington at the invitation of Mr McCloy, the head of the President's disarmament administration, to discuss ways and means of relaunching general disarmament negotiations in August. This is only a preliminary encounter, but when one recalls the bleak record of the year that has passed since the Russians suddenly stamped out of the ten-power conference at Geneva last June, there is reason to salute Mr Kennedy's readiness to press on rewardless.

Some confusion, however, needs to be cleared away from one item in the McCloy-Zorin agenda. The Russians' proposal for participation by uncommitted countries in the next round on disarmament is not identical with their "troika" demands in regard to nuclear tests or the UN secretariat. Neutral participation here would not involve any risk of the paralysis of working machinery by veto. By championing such participation, Russia has made a shrewd bid for neutral goodwill; by opposing it, the western nations can only lose goodwill. If the objection is that the uncommitted

countries have so little understanding of the real problem of disarmament that they could be easily fooled by Russia's very transparent slogans, the remedy is surely to get them round a table where they will have to look at these matters more carefully.

### ALGERIA

#### French Leave

IT is still possible to take a hopeful view of the outcome of the Evian negotiations, in spite of the French government's decision to suspend them for an uncertain period. Parisian rumours speak gloomily of a final break, but it is perhaps too soon to believe them. In spite of the French deafness to Algerian pleas for one more meeting before the interruption, in spite of the bringing forward of the break from June 20th, the time-table's original date, and in spite of the uncertainty about what will happen when, and if, the French end the unilateral truce in Algeria, the outlook is still not wholly black. The basic facts remain: both sides urgently require peace, France even more than the nationalists.

This said, it must be added that the responsibility for the failure of the talks to make any progress hitherto rests largely on General de Gaulle. It is true that the Algerian nationalists could have chosen no worse way of aiding their cause than by

stepping up the terrorist campaign, so that between May 21st and June 8th 133 people were killed and 300 wounded. Neither the French army nor French public opinion can be expected to tolerate this crescendo of murder. But General de Gaulle has instructed his delegates at Evian to ask for too much at too high a price, and given them too little freedom to make concessions. They have sought military bases under French sovereignty on Algerian soil—notably at Mers-el-Kebir; dual citizenship for the European Algerians; a "special

status" for the towns; and they have denied Algerian sovereignty over the Sahara. If General de Gaulle really supposes that the nationalist leaders can concede all this he is deceiving himself, and M. Louis Joxe and M. Belkacem Krim will have to wait until the mists clear away from his vision. Fortunately, the whole history of the general's gradualist approach to Algeria suggests that they need not wait for ever, or too long; he has previously appeared to swerve away from the inevitable, only to accept it, wisely, in the end.

### FRANCE

#### Jacquerie

BRETONS never shall be slaves. The potato-growers of Finistère, who on June 4th smashed the ballot-boxes in use during the local elections, who on June 8th, mounted on lorries and tractors, seized, and for some hours held, the little town of Morlaix, may be said to have proved this. They have also given a striking demonstration of the dissatisfactions of the French farmer, which have for long been worrying the government, and which have led many farmers' federations elsewhere in France to send messages of support and encouragement.

There is a surplus of potatoes, as of other farming products, in France, and also of middlemen, so that the price, in Parisian shops, of potatoes is much higher than that received by the producers. Thus, the farmers were receiving only 0.12 new francs a kilo when they decided to act, while in Paris the price was about 0.35 new francs.

The government's remedy for this situation is to press its partners in the European Economic Community to open up their markets; it has even threatened to hold up the transition to the second phase of the community's development until the common agricultural policy has been introduced, so anxious is it to have access to the German consumer, at present shut away behind high tariff walls designed to protect the German peasant. Unfortunately the federal elections in October make it impossible for the German government to alienate the farming vote. No action can, therefore, be expected until the end of the year. In the meantime the price of potatoes to the French producer has sunk further to 0.08 new francs a kilo.

French agricultural anxieties will be readily understood by the British, contemplating their own plunge into the European pool—in itself a factor which could make a common agricultural policy more difficult to arrive at as soon as France would like. But the loss of impetus to the common market which might result from a failure to clear this hurdle in the near future would be an even more serious matter. The French must be glad to hear that the federation of German industries has spoken of the common agricultural policy as the "test case" of a genuine community.

### LABOUR PARTY

#### All Goes Right

THINGS continue to go almost unbelievably right for Mr Gaitskell. It is now clear that he is likely to secure a majority of two or three million card votes against the unilateralists at the Blackpool conference in October; among the unions that voted against him at Scarborough, the engineers, shopworkers, builders, foundrymen and vehicle builders have already swung over to his side, and there are more to come. In addition, some serious observers are forecasting that 80 per cent of the constituency parties may vote with Mr Gaitskell at Blackpool, a proportion that would have seemed fantastic a short while ago. And this week Mr Padley has formally dropped his sponsorship of the Padley-Crossman compromise on defence, recognising that Mr Gaitskell has won.

How has it happened? Largely, of course, it has been a demonstration that nothing succeeds like success. Ever since Labour's successes in by-elections made it apparent that Mr Gaitskell still had a chance to be Britain's next Prime Minister, party waverers have hastened to scramble back on to his bandwagon; even on issues such as the common market, people like Mr Wilson have hastened to let it be known that opposing Mr Gaitskell was the last thing they ever intended to do. While the earlier policy of making verbal concessions to the Left failed miserably for Mr Gaitskell, the policy of standing up to them (which started with the withdrawal of the whip from Mr Foot) has so far gained him

much more ground than he had expected. But some credit, too, must go to the behind-the-scenes activities of the so-called "Campaign for Democratic Socialism."

This "campaign" has been organising cells of Gaitskellite supporters in key constituency parties and union organisations up and down the country; in the constituencies there are now said to be about 250 local Gaitskellite "whips." These men have shown the same assiduity in converting waverers and in urging Gaitskellites to turn up for important local votes as the Left (including the communist cells) did in organising the swelling of the vote for unilateralism last year. It remains ridiculous that the strategic organisation of a few hundred people to turn out at ill-advertised local party or union meetings should thus alter the "official policy" of a Labour party that represents half the people of the country; but this year, for the first time, this new force of CDS seems in many places to be beating CP and CND at their own game.

### THE PRESS

#### Concentrating Papers and Plant

THE shrinking and shuffling of the national press goes on. The epitaph on the *Sunday Dispatch*, which is being swallowed after over a century and a half of life by the *Sunday Express*, was spoken last Sunday by the Royal Commission on the Press itself. The commission, it was stated, could not recommend any measures "to prevent the possible sale or closing down of any particular publications whose costs of production exceed the revenue they earn." The trend towards concentrating the press stems from two immediate causes: the unprofitability of the cheap popular newspapers with circulations below two millions or more; and the desire of some successful newspaper publishers to furnish full employment over all the week for their own costly printing machinery. The death of the *Sunday Dispatch* was no surprise, because of its large running losses; even the injection of £3-£4 million in the next few years could still have failed to put it on a competitive footing (though on weekdays this is precisely what Mr Hugh Cudlipp is trying to do with what in the *Daily Herald's* own office is familiarly known as "King's cross"). The surprise, perhaps, was the purchase of the *Sunday Dispatch's* title, for merging, by Lord Beaverbrook, who has customarily and characteristically been a builder and not a buyer.

The deal is symptomatic of the busy rivalry that is going on in the "middle-class, middle-brow" Sunday field, where the very different *Sunday Express* (with over 3,500,000 readers of its own) and new *Sunday Telegraph* (with perhaps a fifth of that figure) are both bidding to bridge the gap between high-brow and low-brow readers. Lord Beaverbrook, whose own machines are in fact well occupied, gets from

the deal what proportion he can hold of the *Sunday Dispatch's* 1,500,000 readers together with, by contract with the *Sunday Dispatch's* former owners, extra printing capacity to enlarge the size of the *Sunday Express*.

Even before this purchase, the Beaverbrook newspapers, with the *Sunday Express*, the *Daily Express* and the *Evening Standard*, were the best balanced and most uncomplicated newspaper group. Balance, above all in terms of the continuous use of their own printing capacity, is precisely what other giants in the field lack. This fact is at the core of the speculation, since the *Sunday Dispatch* got its death warrant, about the future of Lord Rothermere's *Daily Mail*. Both Mr Roy Thomson's group and the *News of the World* much need employment for their machines on weekdays. Lord Rothermere has said that he and his family have no intention of "severing their connection" with the *Daily Mail* and the *Evening News*, as well as the grimly struggling *Daily Sketch*. But this form of words has not killed the belief that some further concentration of papers and plant (leaving more old machinery spare) may still be likely.

#### LAOS

### Princely Coincidence

IT is good news that the three princes who sum up Laotian politics are at last meeting. Since long before the present Geneva conference began, a month ago, it has been clear that it would make no real progress so long as Laos did not have a government which all participants could recognise. This fundamental gap accounts for all procedural obstacles: the boycotting of the conference by the right-wing government's delegates, the continuing hostilities in Laos and the inevitable complaints from each side that the other is violating the cease-fire. If the Laotian problem is to be settled by negotiation and not by military power, then only the formation of a government of national unity will get the conference off the ground.

It was Prince Sihanouk of Cambodia who first realised this simple truth, and though the three Laotian princes were slow in responding to his suggestion that they should meet, the time is probably still not fatally late. The neutralist prince, Souvanna Phouma, and his communist half-brother, Souphannouvong, have been waiting in Geneva for the past week; the right-wing prince, Boun Oum, who is not related to the others (he comes from the southern principality of Champassak) and is militarily weaker than they, was understandably reluctant to meet them. Having called on Prince Sihanouk in Nice, he was waiting in the wings in Paris. On reaching Geneva, the other two said they were tired of playing hide and seek and would be ready to meet Boun Oum there. He counter-proposed Aix-les-Bains, and then Prince

#### NOTES OF THE WEEK

Souvanna Phouma sent a message, delivered by Mr Krishna Menon via Prince Sihanouk, that the meeting could take place anywhere in Switzerland. Lausanne was mentioned, then the unanimous choice fell on Zürich, which, a few days earlier, had shown its unimpeachable anti-communism by denying a work permit to the Soviet violinist David Oistrakh. Prince Souphannouvong may, however, have failed to notice this item in the Swiss press.

At this stage it is ironical to hear Mr Gromyko accuse the American delegation of obstructionism—for insisting on a verified cease-fire before discussing matters of substance—and threatening to walk out. After all, communist obstructionism held up the Panmunjom truce talks in Korea for more than two years; and Soviet obstinacy has brought the test ban talks in Geneva to the verge of breakdown.

#### CHINA

### When One is Two

LIKE Lord Copper, Mr Evelyn Waugh's press baron in "Scoop," Mr Mao Tse-tung personally requires from his underlings a steady flow of victories. The Chinese press is as good at producing them as Copper's *Daily Beast*. Its main theme, however grim the situation, is that of new triumphs in production "achieved under the brilliant light of the three red banners." It is not its business to tell its readers of the vast quantities of Canadian and Australian grain newly bought to avert disastrous famine, or of the sharp decline in Sino-Soviet trade (revealed in *Pravda* by the Soviet trade minister) caused by China's failure to keep up deliveries to Russia; or, for that matter, of Russia's failure to relieve China's present hunger. But Chinese who just happen to know that they are hungry and hard pressed can probably read between the lines of their ever-buoyant newspapers.

With farm work repeatedly described as "on a crash basis," still more men, women and children have been shipped out of the towns, sometimes under the control of armed militia, to work on the land. A Yugoslav correspondent in Peking, totting up Chinese figures, recently reported that over 20 million townsfolk had been sent to farm work in three months. The Chinese press itself reports that, where there have been serious losses of draught animals, the relieving manpower has been used in their stead in ploughing and harrowing; that many schools have closed, and in some areas over half the farm labour consists of children. Ten-year-olds are officially recommended as fit to clear weeds, rear pigs and tend oxen. Children hoping to go to middle schools are told to "surrender to the needs of the fatherland" and work on farms instead, and reminded that "in all countries, at all times" only a minority of youth can study instead of working.

Agonised reappraisals about the incentives needed to get China's vast but wearying work force to work harder are being made.

#### THE ECONOMIST JUNE 17, 1961

The *Chiehfang Daily* of Shanghai, admitting in unusually humbled language that "our standard of farm production is still very low; we still rely on our backward manual labour; our harvests largely depend on nature," demands fairer allocation of farm earnings "to promote enthusiasm." And there is great official emphasis on "investigation," on finding out the facts behind the false statistics reported by zealous officials. But as long as Lord Mao and the *People's Beast* demand victories for publication, the painting of rosy pictures to please the powers that be is bound to continue, with all its confusing consequences. The *Chiehfang* itself has revealed the dilemma neatly in an article which began: "It is wrong to regard one as two. . . . To recognise and reform things, it is necessary to take one as one and two as two"—but prudently covered itself by adding: "What was one yesterday may become two today, and possibly three tomorrow."

#### TEACHERS' PAY

### News From The North

MR MACLAY'S second offer to the Scottish teachers will be read with interest and concern by teachers south of the border as an indication of official thinking on the pay issue. The Secretary of State for Scotland has increased his offer of a rise from 12½ per cent to 14 per cent, which would add £6.6 million a year to Scotland's education bill. This rise is still just below the Burnham committee's recommendation of an additional 15 per cent in England—which the National Union of Teachers has rejected as too little, and about which the Government has made no pronouncement yet. Mr MacLay has, however, offered a bird in the hand by proposing to date his increase from July 1st, while Burnham sticks (in accordance with the existing agreement) to next January 1st.

The details of Mr MacLay's offer are interesting. Direct comparisons between England and Scotland are difficult, particularly in the light of the Scots' insistence on graduate male teachers in secondary schools; but even a cursory glance should make the English teachers pause before contending that they are outrageously done by on the basic scale as distinct from too small differentials for honours graduates. The Scottish non-graduates are now offered a basic scale of £560-£1,070 in 14 annual increments. The Burnham proposal is for £600-£1,200 in 16 years: the English teacher would thus be £40 a year better off than the Scot at the start, then £5 worse off than the Scot after 14 years, but at that stage he (or, more probably, she) still has two considerable salary "steps" to come. Much the same is true of the ordinary graduate. The Scot is offered £680-£1,240 in 12 years, the Englishman £705-£1,330 in 16. (The English disadvantage after 12 years is £105, but is soon more than made up.) Mr MacLay has rightly given greater

preference to his honours graduates: £840-£1,600 in 10 years. The Burnham agreement merely gives the good English honours graduate who has had four years of study and training a scale of £835-£1,460 in 16 years. But so far hardly a cheep has come from the NUT about this treatment of the profession's best-qualified members.

It is true that Mr Maclay's proposals have promptly been rejected by the Educational Institute of Scotland, with the complaint that its non-graduates are far less favourably treated than their English colleagues. It is true, too, that comparisons are vitiated because the Scots are living in a country with lower wage and salary rates and lower living costs, not least in rents. But there is clear evidence here of the clash between the English NUT's obsession with the rewards for those of its members who have a minimum of training and are in easy supply, and the Government's desire to encourage the honours graduate entry into the profession. As the following note shows, it is special sorts of honours graduates who are now most badly needed.

#### MATHEMATICS TEACHERS

##### *Necessary Multiplication*

SIR DAVID ECCLES told the Commons on Tuesday that he intends to arrange a conference shortly with the universities to tackle the present shortage of mathematics teachers. A white paper may be on the way. No official figures have apparently been compiled of the precise extent of the shortage: most headmasters, however, are prepared to make up for this statistical deficiency in determinedly hair-raising terms, and their views are occasionally echoed in the universities themselves. Dr Bryan Thwaites, the new professor of theoretical mechanics at Southampton, declared in his inaugural lecture at the end of last month that the quality of the student entry may already have started on an irretrievable decline because of inadequate teaching in school. He estimated that to give the grammar schools their necessary mathematics establishment the entire output of mathematics graduates from every university for three years would have to go into school-teaching. Last year there was a turnover of nearly 50 per cent in the mathematical staff in 800 grammar schools.

The recruitment of mathematics masters has been assisted in the past by the grant of deferment from national service, which brought 612 more mathematics and science graduates into the schools in 1959. But this instrument has now disappeared, and at the same time the demands of industry and accountancy have grown markedly. Sir David Eccles told the Commons that the output of mathematics teachers from the training colleges had doubled in the past five years, reaching 1,650 in 1960-61. The new three-year course should help to improve quality, but these are not the teachers that the dons are thinking about when they want to raise sixth-form standards.

#### NOTES OF THE WEEK

This new crisis has blown up at the moment when, as an OEEC report\* has just shown, there is a growing academic awareness of a need to reform the school mathematics curriculum—in order to keep pace with rapid advances in the subject itself and in its relation to modern science and technology. The OEEC study group calls for a more unified approach to all mathematical subjects, advocates the drastic downgrading of Euclidian plane geometry (which, it claims, can be explained to mature minds in "two or three hours"), and proposes the teaching of elementary probability and statistical inference in secondary schools. If teachers of sufficient calibre for this are to be attracted here, it will be necessary to be much bolder about salary differentials.

#### THE RHODESIAS

##### *Sandys's Paper*

DARINGLY, the Commonwealth Relations Secretary has met the problem of white rule in Southern Rhodesia by persuading its prime minister to accept a constitution that many people believe he wanted in the first place. Even more daringly, Mr Sandys has done his best to let it appear as a personal triumph: a concession wrung out of an unwilling settler government in exchange for the dropping of redundant British reserve powers. But the constitution set out in Tuesday's White Paper concedes to African opinion no more than Sir Edgar Whitehead thinks he can get past his nearly all-white Southern Rhodesian electorate in a referendum. It is a charter based on a cool assessment of the relative strengths of black and white pressures in the colony.

In other colonies, the pressure of African opinion has been assisted by the Colonial Office; in Southern Rhodesia the Africans are on their own. It is their realisation of this that has made them, rightly or wrongly, choose the path of obstruction rather than co-operation in their pursuit of majority rule. From afar, 15 black faces in a previously all-white legislature, plus a bill of rights and a widened franchise, seem like a considerable advance. This is so only because what has been agreed (but not yet assented to in a referendum) is an advance on virtually nothing.

Nevertheless, if the constitution is agreed to and put into operation, a sensible government could work it in such a way that some African pressures are channeled through the constitutional machine. If this happens, Southern Rhodesia's transfer of power could come about in no less peaceful a manner than the transfer of power in other British African territories. This would require a willing white government and enough non-obstructive Africans to keep it willing. It is a dream Mr Sandys hopes will be evoked by his paper; the more likely course of events is a continuation of stormy black

#### THE ECONOMIST JUNE 17, 1961

attacks on white attempts to retain power. Nor will going back on Mr Macleod's original proposals for Northern Rhodesia make things any easier. Suspicion that this is likely to happen is increasing; if the new constitutional arrangements now being assiduously worked out in London, Lusaka and Salisbury do not point straight to the end of settler control, then they will certainly mean the end of all black faith in negotiation and co-operation as a means to political advance in the Rhodesias. Only a very daring government would risk that.

#### ANGOLA

##### *Gone with the Wind*

SIR PATRICK DEAN, speaking on behalf of the British Government in the Security Council, no doubt thought it statesmanlike to attack the resolution condemning Portugal's repressive measures in Angola as illegal interference in a member state's internal affairs, and to abstain from the vote which carried it, with only France for company. Perhaps he had forgotten what happened to the similar policy pursued with regard to South Africa until Mr Macmillan's "wind of change" speech. Britain's fundamental mistake then, as now, was to assume that the best way to influence a misbehaving associate was to be unconditionally loyal to it in public debate. In their different ways Dr Verwoerd and General de Gaulle have both proved that this is not so; do we really need another lesson, this time from Dr Salazar?

Not only is such conduct ineffective; its alternative is apparent. The Ghanaian delegate in the Security Council said that "Portuguese colonialism would collapse the next day if Portugal were to be expelled from Nato." But there is no need or reason even to threaten anything so drastic. For Dr Salazar will have to recognise soon that he cannot afford to wage a long and quite possibly losing war in Angola. His one undeniable achievement has been to keep his country solvent and at peace for thirty years. The Angolan crisis threatens to destroy this achievement at a blow. Probably nothing but a prompt and liberal settlement can save the day; yet, at present, Dr Salazar dare not attempt it, for his destruction, by his disappointed followers in both Angola and Portugal, would then be certain, and be followed by the overturning of the settlement.

If (it is, admittedly, a big if) he is to descend from the limb where he finds himself, he will need a parachute. Only the West, by conditional offers of economic assistance, can rescue Portugal and Angola from the social and economic ruin that threatens them, and from the stagnation that has characterised them for so long. If such inducements are to be effective, the West must be united in showing Dr Salazar that, if he continues on his present course, he will do so with no one but Dr Verwoerd for company. Sir Patrick's quibbles are the surest means of diverting the West from its

### The shape of Shell at Interplas

Shell plastics inspire designers, conjure up new approaches and reshape old forms in excitingly fresh ways. At Interplas—the International Plastics Exhibition which opens on June 21st at Olympia, London—you will find, not surprisingly, Shell plastics and Shell people to discuss these fascinating man-made materials. Our picture shows a model of the Shell stand. Customers for Shell plastics have the benefit of an international research and service organisation in many respects unique—plastics and chemicals pro-

duced in twenty-one centres, sold throughout the world by seventy marketing companies, inspired and supported by sixteen main research and technical laboratories. You will find all this wealth of development expressed in friendly, helpful, human terms on the Shell stand—B. 218, National Hall.

So come and talk plastics to Shell... or write for further details to the Information Officer, Plastics & Rubbers Division, Shell Chemical Company Limited, 170 Piccadilly, London W.1

proper concern, which is to bring peace to Angola, and some hope of a free and prosperous future to Portugal and its dependencies.

## TURKEY

### Generals Divided

THE divisions among the military men who a year ago united to overthrow Mr Menderes have again become distressingly apparent, although they have been at pains to hide their discords. The trouble came to light on June 9th when General Cemal Madanoğlu, one of the most forceful and important members of the National Unity Committee, resigned both as commander of the Ankara garrison and from the NUC; the first resignation was accepted, but so far not the second. The general's

General Gürsel: still helmsman

gesture seems to have been the sequel to a row inside the NUC over the appointment, announced on June 5th, of General Irfan Tansel, commander-in-chief of the air force, to be the chief Turkish military adviser in Washington; General Tansel's reinstatement as head of the air force was announced on June 8th and was followed by the purge of some 25 senior air force officers.

At the moment one can only speculate on the significance of these events. High-ranking officers outside the NUC have apparently been increasingly critical of its policies. It looks as if an attempt was made by the committee (or some of it) to get rid of one of them, General Tansel, and that when the attempt failed General Madanoğlu resigned. Like General Gürsel, the head of state, General Madanoğlu wants to hand power back to the politicians as soon as possible; he is opposed to the more radical and revolutionary ideas of the Turkes group whose expulsion from the NUC last November he strongly supported. If, therefore, his resignation was provoked by General Tansel's reinstatement, and not by some so far unrevealed disagreement, he presumably believes the head of the air force's ideas to be opposed to his own.

The clash of policies is not yet resolved. The latest crisis could be a prelude to the

return of Colonel Turkes and his thirteen supporters now in exile; it is rumoured that some members of the NUC have been advocating their return for some time. But so far the committee is refusing to budge from its charted course; last Sunday it announced that elections would be held "on time" and a referendum on the new constitution on July 9th. General Gürsel, however, will need to keep a very firm hand on the tiller.

## ADMIRALTY

### Blind Man's Buff

THE series of human failures which made it possible for the Lonsdale-Kruger spy ring to tap naval secrets at the Portland underwater detection establishment, over a period of years, now stands revealed in the Romer committee's report as more than astonishing. Whatever efficiency or initiative is normally expected of a "junior civil servant" (Mr Macmillan's description of Petty Officer Houghton's immediate superior) the senior officers concerned have earned more than the severe rebuke that the committee bestowed on them. While there is cause for satisfaction at the speed with which MI5 did its job in finally rounding up the spy ring, the country needs to be reassured that the ordinary security officers in official establishments are of a superior calibre to the men who have come out of this affair so badly. Officers have been cashiered for much less.

It is a natural conclusion, both from the Romer report and the Prime Minister's

comments on Tuesday, that an extraordinary laxity pervaded the Admiralty from top to bottom in its attitude to security. Mr Macmillan declared, in a phrase that speaks volumes, that even now liaison with the security service is "better in some departments than in others." On the Admiralty's record, it is most fervently to be hoped so. Whatever their novel means of high-speed transmission of information to Moscow, Lonsdale and the Krugers employed no new tricks in getting the material they wanted out of Portland. The documents were regularly and laboriously carried out of the base to be photographed. It is too late to ask what kind of a world the naval authorities imagined they were living in five years ago, but the Radcliffe inquiry will certainly have to be given evidence of a very different state of mind now if confidence is to be restored. It is thoroughly desirable to avoid witch-hunting throughout the public service, but crass stupidity and negligence are the surest means of inviting precisely this kind of unwelcome surveillance.

## RAILWAY VANMEN

### Mind Your Backs

TOKEN strikes of a day, a week, or even a few hours, are the normal thing on the Continent, where trade unions rarely have the money or the tight organisation needed to maintain a longer effort. Recently, this patchy demonstration technique has spread here; this week it was taken up by railway van drivers who have

## The Economist

### THE CENSUS AND FREE TRADE

There are some people who always wish to be set right. They are continually on the look-out for new principles of action, new fundamental ideas, new notions of revolutionary importance in morals and in politics. To persons of this class the facts which have just been communicated as to the late Census will afford no practical aid and will provide no intellectual data. We do not say that subsidiary suggestions and incidental anomalies may not be discovered; but we are convinced that the main conclusion from these authentic details beyond dispute is, that our present national policy is the right policy, and that no other can even for a moment bear argumentative competition or practical contrast with it. What is the present *home* policy of England, stated in a single sentence and disencumbered of any unnecessary and subordinate details? "It is the policy of free trade. It requires that the prosperity of the great seats of industry should be fostered—that the growth of the great pursuits of industry should be developed—whatever may be the consequences and the cost. There is, indeed, no reason to suppose that the agricultural interest has suffered from the legislation of late years. . . . But, be this as it may, the free-trade policy, which the national opinion of England, after years of argument and

a perhaps unnecessary accumulation of conclusive discussion, selected as the true policy, assumes that our manufacturing industry must increase,—that our large towns must enlarge,—that in them, and not elsewhere, must be found adequate employment and an increasing fund of support for the augmenting numbers of the English people. Has this been so or no? . . . It appears that speaking broadly, generally, and in those plain words which alone can be remembered, that the great seats of industry, the metropolis included, which is a far greater sort of manufacturing industry than most people are aware of,—together with their immediate neighbourhoods, carry off the superfluous augmentations of increasing population which would also accumulate in out-of-the-way parishes. . . . No one will venture to say that the increasing accumulation of population at certain fixed centres is an unmitigated good; no one will say it has not its peculiar risks and dangers; no one will say it does not bring with it accompanying responsibilities and appropriate duties. But, at all events, the fact must be clearly seen and plainly acknowledged. . . . We must confess that the commercial policy of recent years has been (as far as human sagacity can judge) essential to the national salvation.

been on what was at first advertised as a one-week unofficial strike in various parts of the country. The drivers are at present ranged in four grades for pay purposes: the lowest grade, driving loads under 5 tons, get £9 3s. basic pay a week, and the highest, driving 12-tonners and above, get £9 18s. Average earnings are probably something like £3 a week higher. The men's claim is that they should all be paid at the top basic level—which would mean a rise of 15s. for the vast majority of drivers. The National Union of Railwaymen put up their claim to the transport commission; despite the stoppage, it was turned down on Wednesday. The strike, taking place during the negotiations, was properly disapproved by the union, which now has to decide what its next move will be.

Obviously a rise given to the van drivers would lead to interminable claims from other grades of railwaymen who believe themselves to have been badly done by under the Guillebaud settlement (when the vanmen got the minimum rise of 8 per cent). The drivers have some reason to feel aggrieved, when they see drivers for private firms making considerably more than they do. The transport commission's answer is that their vanmen have advantages, in the form of security of employment and pension rights, which drivers for private companies very rarely enjoy. In any case, the effectiveness of the drivers' strike has been vastly reduced by the proof that firms are mostly perfectly well able to collect their own goods for a while, using their own drivers.

#### LATIN AMERICA

### Helping Brazil's Flatheads

MR ADLAI STEVENSON's trip to Brazil last weekend may have convinced him of two things: the urgency of President Kennedy's programme for social change in Latin America, and the implausibility, in most of the major republics, of the idea that this can be combined with collec-

#### NOTES OF THE WEEK

tive action against Cuba. While Mr Stevenson and President Quadros talked in São Paulo, Brazilian military units were helping the police to control student riots at Recife, the capital of the state of Pernambuco in the north-east. The immediate cause of the riots was a university ban on a meeting at which the mother of Cuba's minister of industry, Dr Guevara, was to speak. Students all over Latin America are vociferous supporters of the Cuban revolution; Brazil's north-eastern states have other reasons, besides the revolutionary image of Dr Castro, for unrest.

Brazil's north-east is the vast area, mainly of semi-desert scrubland, that bulges into the Atlantic. Left behind in Brazil's thrust towards development, its 19 million people have an average income less than a third of that in the centre and south of the country. And in the north-east, even more than elsewhere, this calculation is misleading since the money is largely in the pockets of a few large landowners; most of the people live on subsistence farming, and during the periodic droughts they cannot even do this. But the *nordestinos*, called "flatheads" by other Brazilians, are tough characters; although they move south during the droughts, when the rains come they return. They have the highest birth rate in the country, and also, by far, the highest infant mortality.

Last year there were two developments in the north-east. A member of the Pernambuco chamber of deputies, Senhor Francisco Julião, started organising Peasants' Leagues. These, according to how the situation develops, could become the nucleus of a responsible agrarian reform party—or the nucleus of revolution. On a different level, a number of unsuccessful and contradictory plans for developing the north-east were co-ordinated into a central agency called Sudene. The Brazilian congress approved the establishment of Sudene, but stalled over a request for 5,000 million cruzeiros to finance it.

On May 28th, President Quadros met the governors of the north-eastern states and promised to let them have 2,000 million cruzeiros (worth about \$8 million) for industry, farming, housing, and education. In addition the Brazilian bank of economic development is advancing money for a synthetic rubber plant, and the United States, under its surplus food programme, is providing money for the establishment of three hospitals in Pernambuco. President Quadros, trying to steer his country out of a tangled economic maze, is hard pressed to find adequate funds. But these parched and troubled lands of the north-east are crying out for help that is poured, not dripped.

### —and Bolivia's Miners

WITHOUT so much as a blink at the Brazilian trade missions returning heavy laden from their tours of east Europe and Russia, the United States is contribut-

#### THE ECONOMIST JUNE 17, 1961

ing lavishly to the bail that Brazil needs to extricate itself from its short-term foreign debts. Bolivia still has to pull off this double. But when Mr Adlai Stevenson arrived in La Paz on Thursday, his welcome from President Paz Estenssoro was warmed by Washington's decision, taken a few weeks ago, to reverse a cardinal principle and provide money for Bolivia's nationalised tin mines and state-owned oil industry. As part of a three-pronged project, the United States, the west German government and the Inter-American Development Bank are providing more than \$40 million for the rehabilitation of Bolivia's run-down tin mines.

Since the revolution in 1952, Bolivia has been kept going by American aid. But the country has not been able to move forward. The tin mines, on which Bolivia depends for three-quarters of its export earnings, have been steadily deteriorating. The depletion of the better deposits, and the general weakening of an industry that has seen no new investment for years, have resulted in uneconomic production and in deplorable, and dangerous, working conditions. Most Bolivians are believed to be slightly better

Paz in Quiescence

off than before the revolution; the miners are worse off. Communist agitators find their work made easy for them, and in the last few weeks there have been a series of strikes that threatened serious trouble. But the miners, although a powerful pressure group, are few in numbers, and their protest was brought under control in time for Mr Stevenson's visit.

Towards the end of last year, the Soviet Union offered to supply Bolivia with a tin smelter and, rather more vaguely, credits worth \$150 million. The trouble about the first part of the Russian offer is that the Bolivian tin industry is, at present, in no condition to contemplate refining its ore. The priorities are, first, to modernise the mines and, second, to increase the tin content of the ore. But the Bolivians and the Russians are now discussing various other projects where Soviet help might be more to the point; it would be a sad throw-back to less sophisticated days if American caution made these negotiations even more difficult than they already promise to be.

There's more to life than meets the landsman's eye: much more, for three-quarters of the world is covered by ocean—challenging, capricious, and a hard taskmaster for those who make their living by it. But science gives the sailor powerful help. At I.C.I.'s Brixham research station, scientists study the effects of sea air and salt water on ships and their gear. Specially tough marine paints are one result; another, ingenious anti-fouling compositions, which slowly release a chemical compound to repel the barnacles that are always seeking lodgings below the water-line. To trawlermen, I.C.I. means "Terylene"—the polyester fibre that's made into nets that stand up magnificently to the rough-and-tumble of the sea-bottom. When the sea is the enemy, I.C.I. scientists are staunch allies.

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

## Wanted: A Foreign Policy

WASHINGTON, DC

TEN days after President Kennedy broadcast his "sombre" report to the nation on his mission to Paris, Vienna and London the American public finds itself in two moods. To begin with the visit cheered people up and this euphoria has not quite evaporated. The personable young President and his wife had a personal success in Europe. There were encouraging stories that he had made a very favourable impression on General de Gaulle and a firm one on Mr Khrushchev. A poignant chord in the national pride was touched by European homage to Mrs Kennedy as an American Queen of Hearts. The Cuban humiliation was erased and the more sophisticated commentators discoursed on the psychological benefits of the trip for Mr Kennedy's maturing presidential personality.

On the other hand, it has begun to emerge that the President used a very mild word—"sombre" was not the one chosen by his speech writers—to describe the impact on him of Mr Khrushchev's unforthcoming approach and doctrinaire inflexibility. Either Mr Kennedy felt that it was necessary to tone down his reaction lest the crumb of comfort contained in the agreement over getting a cease-fire in Laos (even on humiliating terms) should be lost, or else he felt that his American audience would question whether their champion had scored if he conveyed the full force of the uncompromising Russian *aide-memoire* on Berlin, of Mr Khrushchev's insistence on the *troika* system for giving the Russians a veto on enforcement of the ban on atomic tests, in the United Nations and in every other international procedure and of his supreme confidence that the West would cave in. This would have made Mr Kennedy look as if he had travelled to Vienna merely to be told what was going to happen in all these matters, and in the world at large, whatever the United States said or did to divert the locomotive of history. But the story that Mr Kennedy did indeed find the Russian leader even harder to talk to than he had expected (though more mercurial and less clever) and that he did not report fully on the meeting has now damped American spirits.

This hardly suits Mr Kennedy's political book at a time when the public is in any case showing signs of impatience that the Administration is still producing words rather than deeds. The President's difficulty, however, is that a great deal more talking has to be done and that this is a necessary forerunner of action—unless there is to be disaster. But perhaps the first phase of educating the American public to face the prospect of a "long and difficult" struggle with Communism, with few short cuts, many setbacks, some nerve-wracking brink-walking and little of what the average American would call "action" has been completed.

The President, back in his White House rocking chair, now faces three sets of problems. In the first place, he knows that even as he digests his European trip he may be interrupted by a new crisis—in Iran, in the Caribbean, in south-east Asia—at any time. Yet, secondly, he knows that while the Berlin situation is still

only in the warming-up stage, and while talks continue in Geneva, it is urgent to define policy in advance. If there is an American answer to Mr Khrushchev's alternatives for Berlin, it is still a secret and there has not yet been time to formulate an American response to the Russian ultimatum on the inspection of atomic tests and on disarmament. Possibly the response may take the form of a gradual backing out of futile negotiations in a way that would not lose world sympathy, and a slow approach to a resumption of atomic testing, beginning with a "peaceful" nuclear explosion. The Russian move and growing domestic pressure for tests of atomic weapons come when policy is still unsettled.

Thirdly, the President realises that the very success which he achieved in Europe has proved obsolete his idea that the conduct of foreign affairs could be returned to "normal" diplomatic channels, with the President and Secretary of State anchored at the receiving end in Washington. There will be more summits—certainly more sub-summits. For example, one result of the Paris talks is that the Americans have accepted, at least partially, General de Gaulle's demand for tripartite policy-making by the United States, France and Britain (others being co-opted at need). As the General is even more his own Foreign Minister than the President is his own Secretary of State, this points to further western meetings. Above all, though the President took care not to accept any invitation from Mr Khrushchev, care was also taken not to create an atmosphere that would have made a further meeting on Berlin impossible; the main problem was to ensure that if such a meeting were held, as world opinion would expect should a head-on clash seem imminent, it would not be the Munich that Russian self-confidence seems to anticipate.

URGENT as it is to decide policy despite these pressures, unfortunately the machinery of policy-making is still in bits and pieces. At the top, American foreign policy turns on the relations between the President, the Secretary of State and the Secretary of Defence; this in turn requires effective interaction between the White House and the departments lower down. But in fact relations at the top are unclear, and lower down they are unsatisfactory. Originally, the group of clever men with whom Mr Kennedy surrounded himself to run the Presidency agreed that the State Department must be restored to efficiency after its long eclipse under Mr Dulles's personal rule, the witch-hunting of Senator McCarthy and the vacuum that was Mr Herter. Yet it is still uncertain where policy is being made. It was natural that the military-type organisation of General Eisenhower should be ignored, since it produced no policy. It was to be expected that the new President would be more his own Secretary of State than his predecessors had been. And it is fair to say that Mr Rusk, the Secretary of State, is probably the President's principal adviser and agent in foreign policy. But he is so by only a small margin: policy is plainly often made or deeply influenced, not only by the dozen assistants in the White House who specialise in it, but also by some of the President's other confidants.

Mr Rusk often seems engaged in elaborate manoeuvres with all these gentry, cautiously awaiting the moment when he can safely assert his rights. These preoccupations, and his inevitable calls abroad, have prevented him organising his own department, the morale of which has risen scarcely at all. Mr Rusk did not

choose all his own subordinates; many of the jobs in the department were handed round to party men before he took full charge; but in the event he works, close-lipped, more with the White House policy makers than with his own lieutenants. The result is confusion.

Up to the time of Cuba the White House itself was in such intellectual anarchy that it was said that either the President would have to select a chief of staff from among his professors or else advertise for one. Now responsibilities are fairly well defined under a *de facto* duumvirate of Mr McGeorge Bundy and Mr Walt Rostow. A system of "task forces" (*ad hoc*, non-permanent interdepartmental committees), consisting of State Department experts working with a White House aide to represent the President's point of view, is designed not only to achieve forward planning on "urgent" (e.g. Laos) and "upcoming" (e.g. Berlin) problems, but also to work out longer-range policy (e.g. on President Nasser). From each of these task forces the President is supposed to get not only a highly practical position paper on a preselected problem, but a briefing on the decisions that he must take and their implications for himself (e.g. in Congress).

All this should ensure that events cannot take the President by surprise. But some lack of assurance that this has been achieved is suggested by the creation of a special "crisis" task force, headed by a career diplomat (Mr Achilles) and Mr Stephen Smith, the President's brother-in-law, to watch over "hot" situations (such as the Trujillo affair). This indicates no great trust in the State Department's own ability to carry out its normal functions of planning and executing policy.

Between the summits the President and Mr Rusk need to clear up this muddle. Mr Kennedy's attempts to deal with every issue personally will either threaten his health further or force him to leave some of his essential functions undone. Already, for example, members of Congress complain of lack of consultation, and say that the vital preliminary political work on the education Bill and, still worse, on foreign aid was scamped. A President's functions are multifarious—they can be discharged only if he has an efficient machine under him. He must certainly carry Congress as well as his foreign allies with him. The spectacle of an obviously harassed President, unable quite to keep up with his job, would alarm American public opinion more than anything else. This situation has not arrived yet, but the problems grow and the danger is there.

## Better But....?

WHILE the latest economic indicators confirm that the recession is over, there is little in them to support the view that a boom will be racing up the charts before the end of the year. Yet many observers believe that it will and some of them expect it to be accompanied by galloping inflation. This, it is held, will be mainly the result of increased government spending and of the consequent deficit in the federal Budget. Certainly there is little sign as yet that capital spending by businessmen will be exerting as much upward pressure on the economy as it has in other recent recoveries.

In the first quarter of this year these outlays for new plant and equipment were even lower than had been forecast, largely because of the exceptionally bad weather, but they are coming up to expectations in the current quarter. The latest survey of plans for the rest of the year, made just over a month ago, when the recession was already over, shows little change since the last survey at the end of January in the total capital spending—\$34.5 billion—expected this year, although there have been a number of shifts in the plans of individual industries. The total for the year, from present indications, will be down by 3 per cent from 1960, but the trend in the

last two quarters will be upward, largely as the result of increased capital outlays by manufacturers of non-durable goods. They plan to spend 3 per cent more on expansion and improvement than they did in 1960 while spending of this type by manufacturers of durable goods—cars, machinery, etc.—is going down by 10 per cent.

This decline is greater than was forecast at the beginning of the year and businessmen of all kinds are obviously still in a cautious mood. But their plans may be revised upward again as profits improve; the earnings of many companies are now beginning to look better. A number of businessmen may also be waiting to see

what Congress does about the President's request for tax concessions to stimulate industrial growth. But in general there is far more than enough capacity available to meet demand—an excess of 20 per cent, according to one estimate—and until this gap closes there is unlikely to be any very widespread interest in further expansion.

That the gap is beginning to close, however, was suggested by the encouraging April statistics for manufacturing activity; the preliminary figures for both industrial output and retail trade in May, helped particularly by the improvement in the automobile industry, have added to this optimism. In April stocks of goods and raw materials went up because manufacturers were accumulating instead of reducing their supplies for the first time since last August. This is one of the reasons why the latest official news is that gross national product is likely to be up by \$10 billion, on an annual basis, in the current quarter and to reach a rate of \$530 billion by the end of the year. The value of new orders received by manufacturers has also been going up very satisfactorily for several months and their backlog of unfilled orders is higher than it has been since last October.

## Silencing the Communists

FROM A SPECIAL CORRESPONDENT

FREEDOM of speech for everyone but members of the Communist party: putting aside the niceties, that is the effect of the Supreme Court's decisions last week sustaining the constitutionality of two pieces of legislation aimed at the party with which the courts—including the Supreme Court—have been struggling for many years. One is the membership clause of the Smith Act of 1940, which makes it a crime to belong to an organisation advocating the violent overthrow of the government; the courts sustained the conviction of a former communist leader under this clause. The other legislation is the Internal Security Act of 1950, which

## It's an old Swedish custom

A foreign visitor to one of the big Swedish shipyards once asked, not altogether innocently: "Do you dust the steel plates every morning?" At Svenska Metallverken you won't see us dusting steel plates, because we don't have any (although quite a lot of our aluminium does go into ships). But you will see the same general tidiness that impressed the visitor to the shipyard. In nonferrous metal manufacturing it is highly important to prevent impurities from entering the product — which is one of the reasons why we install automatic machinery, and why we insist on clean floors and clean machines. The wage agreement we have with our workers does, in fact, include a stipulation that they shall spend the last *paid* hour of the week cleaning their machines. It pays all around.

**SVENSKA METALLVERKEN**

EXPORT DIVISION • VÄSTERÅS • SWEDEN

Svenska Metallverken for "semis"

Plant cleanliness is as important in producing condenser tubes or cold rolling copper and brass strip to steady tolerances of 0.002 in. With an annual output of nonferrous products in excess of 100,000 tons Svenska Metallverken does all these things and many more as well — like plate, sheet, extruded and drawn shapes, rods and wire. With our efficient modern plants, and advanced know-how covering a variety of fields, maybe we could be of help to you, too, in simplifying your assembly and fabrication problems. A letter to our Export Division will quickly show what the possibilities are.

requires "communist action" and "communist front" groups to register with the government. Once it has registered, an organisation suffers from numerous penalties; it loses its tax exemptions, for one, and must stamp all its post: "Disseminated by —, a communist organisation." Its members are barred from government jobs and it is a crime for them to use, or even to apply for, a passport. The Supreme Court sustained a finding of the Subversive Activities Control Board that the Communist party is an "action" organisation under the Act and that it is required to register and to list the names of all its officers and members. But the Court refused to pass now on the constitutionality of the penalties, saying such questions were premature.

The decision on the membership clause departs from the classic statements by Justices Holmes and Brandeis of the meaning of the guarantee of free speech in the First Amendment to the Constitution. Their view was that the government could stop speech only when it threatened "immediately" to produce dangerous, illegal acts. Justice Holmes heavily underlined the requirement of immediacy when he wrote in 1919 that the government could not

check the expression of opinions that we loathe and believe to be fraught with death unless they so imminently threaten immediate interference with the lawful and pressing purposes of the law that an immediate check is required to save the country. . . . Only the emergency that makes it immediately dangerous to leave the correction of evil counsels to time warrants making any exception to the sweeping command, "Congress shall make no law . . . abridging the freedom of speech."

The Holmes-Brandeis view was rejected, so far as Communists are concerned, in 1951 when the Supreme Court upheld the conviction of party leaders under the Smith Act for conspiring to advocate the overthrow of the government. The latest decision simply extended the crime to knowing, active membership in the party. In his opinion for the Court Justice Harlan made explicit the abandonment of the Holmes-Brandeis doctrine. He wrote—and the italics are his—that recent cases

have definitely laid at rest any doubt but that present advocacy of future action for violent overthrow satisfies statutory and constitutional requirements equally with advocacy of immediate action to that end.

The justification given for stopping communist talk before it is "immediately dangerous" is that the Communist party is something special. Justice Frankfurter, writing for the majority in the registration case, cited findings by Congress that the Communist party is controlled from abroad and uses "methods of infiltration and secretive and coercive tactics," that "a communist network exists in the United States" and that communist agents practice sabotage and espionage. Justice Frankfurter concluded that "it is not for the courts to re-examine the validity of these legislative findings and reject them."

It is no secret that Communists use espionage, sabotage and the like to achieve their end—world-wide communist domination. But such methods are not covered by the Smith Act and were not charged in this case; the crime was speaking. In his dissenting opinion Justice Douglas argued

Of course government can move against those who take up arms against it. Of course the constituted authority has the right of self-preservation. But we deal in this prosecution with the legality of ideas and beliefs, not with overt acts.

The question was whether communist speeches advocating overthrow of the government at some indefinite future date came close enough to bringing about this—or some other substantive evil—to be punishable. Few observers consider American Communists to be as persuasive as this in real life. (The number of members of the party has shrunk to 10,000—the party's own estimate—and its influence in trade union affairs, which was once notable, is now slight.) But legally, the majority of the Supreme Court was convinced. It was a 5-4 decision, two of the dissenters relying on the Constitution and two on statutory grounds.

As for making the party register and disclose the names of its members, only Justice Black found that this would violate the First Amendment's guarantee of rights of association and belief. Even his redoubtable libertarian companion, Justice Douglas, said the secretiveness and the subversive nature of the Communist party "establish that more than debate, discourse, argumentation, propaganda and other aspects of free speech and association are involved." In short, the government had the right to open the party's activities to the light of publicity, just as it was allowed, years ago, to unmask the Ku Klux Klan. Justice Douglas and the two other members of the Court dissented because of their concern that this might amount to forcing party officers or members to incriminate themselves in violation of the Fifth Amendment.

The point is that identification of anyone as an officer or member of the Communist party may make him subject to prosecution under the Smith Act. This difficulty will arise in acute form if the Communist party refuses to register on the last day for compliance, August 9th, as it threatens to do. At that stage the internal Security Act puts the burden on the officers, and later on the members, to register themselves; the Act provides a fine of \$10,000 and five years in gaol for each day a member or officer fails to comply. Communists then will be caught between punishment for not registering and prosecution under the Smith Act if they do register. The Supreme Court promised to consider that dilemma if and when it arose.

## Stevenson's Progress

MR ADLAI STEVENSON, now United States Ambassador to the United Nations, is touring the ten South American countries to prepare for next month's hemispheric economic conference in Uruguay and to test the atmosphere before President Kennedy finally decides to visit that conference. It is to launch his Alliance for Progress; if he wishes the voyage to start well it seems essential that he himself should perform the ceremony, to emphasise the effort which the United States is putting into a scheme for social development that will mean sacrifices as well as benefits for many Latin Americans, and to wipe out the memory of United States bungling in Cuba.

If Mr Stevenson hoped to organise some sort of united front to cope with Cuba, he has been disappointed; all he has found is a feeling among Latin Americans that the United States is worrying too much about Cuba and not enough about them, although Dr Castro's handling of the exchange of prisoners for tractors has done his reputation harm and that of the United States good—in the other American republics, at least. The United States has, however, dealt impeccably with the trouble in the Dominican Republic, leaving it to the Organisation of American States to decide what action, if any, is needed as a result of the Trujillo murder. Mr Stevenson, too, has managed to sidestep criticism of his visit to the military dictator of Paraguay by making his last words in Asunción a strong condemnation of the political climate in that country. The first half of Mr Stevenson's tour has gone off well, particularly when compared with Vice President Nixon's unpleasant passage, and if his hosts were disappointed that he could not make any definite promises they were flattered and com-

forted by his distinction, his knowledge of their problems and his sympathy for their aspirations.

But what would in fact do Latin Americans most good in Washington would be some assurance that their interests were being looked after efficiently in the State Department. This can hardly be done as long as the post of Assistant Secretary of State for Inter-American Affairs remains unfilled. Some twenty candidates have been considered and the job was turned down once again this week, largely, it is said, because no assurance was given that it carried with it undivided responsibility for dealing with Latin America. So far under the Kennedy Administration the area has been in the charge of a special task force led by Mr Adolf Berle, working in the State Department but under the President, and of various White House aides. The Cuban fiasco is only the most obvious evidence that this confusion is not satisfactory. The delay in rectifying it undoes the good achieved by the President's imaginative appointments to the various Latin American embassies. The latest of these is that of Mr de Lesseps Morrison to be Ambassador to the OAS. As a dynamic mayor of New Orleans he has had dealings with Latin America for many years.

## Electrical Faults

BY the end of this week the General Electric Company—and perhaps four other big manufacturers of heavy electrical equipment—seem likely to face a civil suit arising out of their conviction earlier this year on criminal charges of price-fixing and allocation of markets. A criminal suit is designed to punish offences, a civil one to prevent their repetition. The alternative to standing trial is to sign a consent decree drawn up by the Department of Justice promising to eschew certain practices. Ironically, the provision at which GE jibs concerns not conspiracies to raise prices but a promise not to sell at unreasonably low ones when this is likely to injure competition. GE considers the phrase “unreasonably low” dangerously vague, but it is prepared to promise not to sell at low prices with the purpose of stifling competition. But this does not suit the Department of Justice because it would then be up to the government to prove intent, which is never easy.

The hint of the department that it might try to break up GE if it refuses to sign—a move that would be unprecedented in a price-fixing case—probably worries GE less than the prospect of long court proceedings in which evidence about its past misdeeds and those of other firms would be spread upon the record. It was to avoid this that most of the 29 defendants pleaded guilty or no contest to the criminal charges. Their customers (who have, so far, filed suits for damages totalling \$65 million in alleged overcharges) and their critics in Congress would be glad to read the details which are at present locked away in the records of the grand jury.

The Senate Antitrust Subcommittee, under Senator Kefauver, has just completed nearly six weeks of largely fruitless hearings held primarily to discover whether top executives of the electrical

“Good Gracious, You Mean To Say Something’s Been Going On Here For Fifty Years?”

firms were really unaware of the extensive price-fixing being carried on by their underlings. Such men as Mr Cordiner, the head of GE, and Mr Cresap, the head of the Westinghouse Electric Corporation, swore that they had no inkling of what was going on under their noses, though the effect was to admit their own astounding inefficiency. Neither could the committee shake the contention of Mr Cresap that identical bids are proof not of collusion but of the purest competition—even when the bids are sealed. The items, he said, come out of stock and catalogue prices are always cut to meet those of competitors. Such identical bids are still being received by government agencies in spite of President Kennedy's order that they should be reported to the Department of Justice if they are for sums over \$10,000. Westinghouse has engaged four highly reputable outside experts to supervise its reformation but even so the subcommittee, beside recommending changes in the anti-trust law, seems unlikely to lose interest in the electrical business.

## Skills for the Job

JUNE—when school-leavers swell the numbers who are out of work—is a good month in which to ask Congress to tackle the problem of unemployment from new angles. Although college graduates are still being snapped up by employers, less fortunate young people suffer acutely from their lack of training; at the beginning of this year nearly 17 per cent of those between 16 and 20 years of age were out of work, compared with 7.7 per cent for the labour force as a whole. Last week the President sent Congress the draft of legislation for an experimental scheme to help such young people; it involves on-the-job training, both in private and public employment—a sort of apprenticeship with the federal government paying part of the wages—and the creation of a Youth Corps to do land conservation work for state and federal agencies. During its three-year trial the scheme is expected to cost about \$275 million; about 50,000 youths will be trained in the first year and more in the later years.

The week before the President had sent Congress a proposal to train or re-train older workers who cannot find jobs because they are unskilled or have skills which are no longer needed in today's fast-changing labour market. There were signs, in May, chiefly in the continued lengthening of the work-week, that industrial recovery is about to make inroads on the number of unemployed. This fell, though only in tune with seasonal expectations, to 4.8 million. But the hard-core of those out of work for 15 weeks or more rose to a new postwar peak for this time of year of 1.9 million. Obviously it would be better—for the jobless, for the government and for the economy—to spend money on training such people for productive work than on unemployment assistance.

Some are too old, too ill-educated or too apathetic to be helped, but for those willing and qualified—perhaps as many as 800,000—the President proposes up to a year of vocational training, either at schools run by the states or by private institutions, or on-the-job, with living allowances subsidised by the federal government. Workers who need to improve their skills to meet future technological changes would have the right to attend training courses and the federal government would pay half the cost of these. Finally the government would pay half what it takes for an unemployed man to move himself and his family to a place where his skills are needed. Over four years the whole programme is expected to require about \$700 million. This sum—for a good cause—is not expected to worry members of Congress unduly, but there have already been complaints that helping workers to move will suck the remaining life-blood from ailing communities. And even Senator Clark, the Bill's sponsor in the Upper House,

## ANYWHERE IN THE WORLD YOU'LL FIND THE PRODUCTS OF YALE & TOWNE!

SUNDERLAND, England.—Always present in the glass industry is the danger of breakage during handling and storage. A major glass dinnerware producer in England has chosen the Yale fork lift Worksaver for the job. The smooth operation of these trucks assures handling the dinnerware loads gently; their compactness makes them ideal for congested storage areas. Yale fork lift

Worksavers are available in capacities up to 7500 pounds, all equipped with battery-powered electrical systems that keep these trucks on the job for longer periods of time—giving you big truck operation at small truck cost. Yale Worksavers are highly manoeuvrable, simple to operate, and are ideal for handling on floors with limited load capacity.

VOLTA REDONDA, Brazil.—At the largest steel plant in Latin America, Cia. Siderurgica Nacional in Volta Redonda, 30,000 pound capacity Yale electric trucks are used to move steel coils in the cold reduction mill. These Yale trucks and others are used throughout the mill, easily handling the flow of materials to and from production and storage areas. Yale electric trucks are designed to stay on the job . . . to give long life with minimum maintenance.

wonders whether there will really be enough jobs waiting for the workers who submit to re-training. Teaching people new skills is also a small part of the \$451 million Area Redevelopment Act, which the President signed last month.

## Labour's Best Friend

THE Eisenhower Administration did its best (though it did not always succeed) to avoid interfering in industrial disputes but the new Secretary of Labour, Mr Goldberg, has no patience with a "hands off" policy when the public interest is affected. It certainly is by the costly and time-consuming strikes which have become endemic at missile and space bases and some members of Congress have favoured legislation to outlaw these. But Mr Goldberg, moving rapidly to avoid a compulsion which would have embittered the trade unions, has extracted no-strike and no-lockout pledges from both sides. To settle disputes at an early stage, labour relations committees are to be established at each base; when such mediation fails the issues can be referred to the new Missile Sites Labour Commission headed by Mr Goldberg. Its decisions will not be binding but both the trade unions and the main contractors have agreed to co-operate with it.

Many disputes at missile bases arise because of the obstinate rivalry between trade unions over who should do certain work. A similar issue provoked the six-day walk-out of flight engineers in February which caused the worst tie-up in history of air traffic and cost the airlines many millions of dollars. The engineers feared that the need to have three men with pilot training in the cockpits of jet aircraft meant that they would lose their jobs and their union its reason for existence. Rather than risk further interruptions several of the big airlines agreed to carry a flight engineer as well as three pilots. A presidential commission which has just reported

thinks that this was a mistake; it proposes that the number of men in the cockpit should be reduced to three, although only by attrition of the flight engineers—or their willingness to undertake training as pilots. The commission also suggests that the engineers' union should merge with that of the pilots. It was precisely to avoid this merger and the engineers' consequent loss of seniority that the men walked out. President Kennedy insists, however, that "he cannot have further strikes over these disputed issues."

Mr Goldberg is not confining himself to the thorny question of jurisdictional strikes, even though these are particularly annoying to the public. On a recent trip to Detroit he assured the manufacturers of motor cars and the automobile workers' union (whose contract expires in August) that the government does not mean to interfere in their negotiations but that an automobile strike, just as the economy is emerging from a recession, would be the "height of folly." His hearers concluded that if a strike seems likely Mr Goldberg will have no difficulty in swallowing his scruples about intervening.

## Hobson's Choice in New York

LAST week the Republicans chose their candidates for this year's elections in New York City: Mr Lefkowitz for Mayor, Mr Fino for President of the City Council and Mr Gilbooley for Controller. This balanced mixture is an old recipe for political success in polyglot New York. But the Republicans are hiding a broken heart. Their first love—wooed urgently but in vain by Governor Rockefeller of New York and by Mr Nixon—was Senator Javits, a crusader with a notable ability to win votes, who has close links with New York's Liberal party. The support of this group, which disposes of 15 to 20 per cent of the total vote in the city, is vital to the Republicans who by themselves have not won as much as 30 per cent of the votes since 1937 when Fiorello La Guardia was their candidate for Mayor.

Mr Rockefeller has tried hard to bring about an alliance (known as fusion) with the Liberals and dissident Democrats; a Republican victory in New York City would be a great feather in the cap of a man who is almost certain to stand for re-election next year as Governor of the State and who probably still cherishes presidential ambitions for 1964. But the Republicans conceded failure—and a defeat for Mr Rockefeller—when they issued a call for "people's fusion"—a poor substitute. The Republican candidates are worthy men, but they are not sufficiently well known or politically magnetic to persuade either the Liberals or the reform Democrats, who are at outs with the party organisation in the city, to desert a highly seaworthy ship. This is a pity; to be well governed New York needs vigorous political competition.

Four years ago Mr Wagner, the Democratic Mayor, won re-election by a margin of nearly a million votes. Since then his official—though not his personal—reputation has been tarnished by scandals and the voters, after eight years, may be growing weary of him. But if he decides to stand again (which is almost certain) and if he can hold his allies together (which is less certain) his re-election is almost a foregone conclusion. The great test of Mr Wagner's adroitness and courage is what he does about his running-mates. The ones he had in 1957 are not acceptable to his friends among the Liberals and reform Democrats. But are their successors to be chosen by such outside allies or by the Democratic machine politicians? After long temporising Mr Wagner decided to take the part of the reform Democrats, led by Senator Lehman, against Mr De Sapio, the leader of the party organisation in Manhattan. But Mr Wagner may well hesitate before alienating other powerful political figures. All nominations must be confirmed at party elections in September. Conceivably, Mr Wagner might be opposed and the resulting party split might let the Republicans in. It is the only thing that would.

Between 1950 and 1960 the Negro population of the United States rose by 3.8 million to 18.9 million, an increase of 25 per cent, compared with one of 17.5 per cent for the white population. But in the 11 southern states there were only 800,000 more Negroes; about 1.5 million moved out of the South during the decade. The only southern states where the numbers of Negroes increased substantially were Florida, Texas and Louisiana where the white populations rose even faster. Almost half of all Negroes live outside the South, compared with a third ten years ago. New York is now the state with the most Negroes (1.4 million) although four southern states and one other northern one, Illinois, each have over a million. Negroes are becoming highly urban; every big city outside the South has a larger proportion of Negroes than it had in 1950.

## Canadian Questions

SIR—Your special correspondent's report of May 27th exposes some of the raw nerves which have made it so difficult to get either reasonable or reasoned discussion of Canada's economic prospects. And the questions which he chose to discuss are probably a fair sample of the perplexity that afflicts much Canadian economic thinking at present.

The failure to harness monetary and fiscal policies, to bring together the public and private sectors, are as much symptoms as they are causes of the current economic drift. I think the phrase which your correspondent uses to describe the current mood in Canada ("make-believe") would have provided him with an even better starting point for his analysis. In its broadest sense the delusion is the feeling that the world cannot get by without Canada although Canada can get by without the rest of the world.

There are signs that thoughtful Canadians have already begun to realise the danger. The existence of a high rate of unemployment, and evidence correlating unemployment with lack of skills, has jolted public opinion. Hence a new emphasis on crash programmes for vocational training and technical education. Similarly, in the field of commercial policy there is growing realisation that the long-cherished principle of multilateral trade is giving place to regionalisation.

Canadian secondary manufacturing industry, however, is still obsessed by fears of economic impotence that lead to irrational outbursts against foreign competition. Tariff and import quotas are still regarded as the *sine qua non* of important sectors including, latterly, textiles and electronics.

To its credit the Diefenbaker Government has resisted the more extreme protectionist measures. Its oil policy, calling on the major international companies to expand their exports of Canadian crude among other things, rejected the protectionist solution of building a pipeline to Montreal in order to make that market a captive of Western Canadian crude. Yet measures that are being taken to reduce the employment slack include such hoary stand-bys as subsidies for the immensely high-cost ship-building industry, and the use of administrative powers to raise tariffs on goods deemed of a class or kind made in Canada.

But none of this is evidence that autarkic ideas will shape Canada's economic future. A clue should be next week's Budget. The general expectation is that it will contain expansionist policies aimed at stimulating exports rather than restrictionist policies aimed further at reducing imports. This may in fact provide the answer to your

correspondent's warning about the outrageous cost of ultra-nationalism.—Yours faithfully,  
DAVID GRENIER  
Toronto

## Britain and Europe

SIR—Free trade is again in fashion: progressives dream of Gatt achieving a measure of global free trade; "Europeans" and liberal economists content themselves with urging Britain to sign the Rome Treaty and join the Common Market. Arguments of economic scale are persuasive—they always have been. The variants are subtle, but the theme is constant: the larger the area in which goods, capital and men may move freely, the greater the overall prosperity.

Those who accept this style of reasoning as dogma see Britain's system of tariffs and agricultural subsidies as barriers to a higher standard of living, while fuddy-duddies who persist in finding permanent value in such forms of protection are dismissed as narrow nationalists. It may well be that if Frenchmen grew only wheat, Germans stuck to making cars and workers here to producing plastics, then, eventually, the people of Europe would grow richer and richer. But what sort of people would they become? Tariffs are nationalistic: they nurture an infant industry or protect a well-established sector of the economy from foreign competition. They offend against the logic of large supra-national markets; and they do so for reasons largely non-economic.

For subsidies and tariffs are two of the most effective instruments a Government has to preserve a balanced, yet diverse society like ours. We have a varied economy. We grow wheat, make cars and produce plastics. And if people engaged in these diverse occupations care to take a short bus ride, they can probably talk and drink together in the same pub. The prospect of a prosperous and united Europe with no trade barriers breaking the skyline and no subsidies blocking the view may be attractive to some. To others the vision will be depressing: a dreary place where distinctive and valuable ways of life are needlessly submerged in the anarchy of a free market.—Yours faithfully,  
C. J. NICHOLSON  
London, SE9

SIR—There is an even more, powerful reason than those mentioned in your article of May 20th why British farmers should be anxious for Britain to join the European Economic Community. There is a strong, and perhaps accelerating, tendency for the supply of farm products on the Continent to grow more quickly than demand, and it is unlikely that farm policies will be sufficiently modified there to achieve a balance.

Before long, Europe may have large surpluses. Does the National Farmers' Union wish Britain to be the agricultural dumping ground of the Continent? The union does not have much political bargaining power to prevent this, if surpluses emerge.—Yours faithfully,  
GEORGE ALLEN  
University of California

## Alarms and Incursions

SIR—The opening paragraph of the article in your issue of June 3rd has unfortunately been read by some to infer that the figure of up to £1.5 million annually for the breaking-and-entering loot (at least in London) refers to the losses experienced by banks alone. In actual fact the banks' losses over the whole country, through raids on their strongrooms, amount to only a comparatively small fraction of this figure.—Yours faithfully,  
J. A. HUNSWORTH,  
Banking Information Service, EC3

## Nyasaland

SIR—Is your wandering correspondent quite sure that the coming elections in Nyasaland will give that country an African government? The Executive Council is to consist of three *ex-officio* members, two nominated, two elected on a higher and three on a lower franchise. Only of the last three can one predict with any confidence that they will be Africans. Some United Federal Party supporters are confident that they will be the only Africans. All kinds of speculations are possible about the four other non-official members.—Yours faithfully,  
LUCY MAIR  
London, SW5

## Ulster

SIR—While most of the article in your issue of May 13th leaves an impression of fair and sound comment, the statement that "there is no meat-canning plant in Ulster" is not in accordance with the facts. Two meat canneries exist, one on the outskirts of Belfast and the other at Aforey, near Portadown. There is every reason to believe that, with some official encouragement from the authorities at Stormont, one or both these plants could have made a successful bid for at least part of the recent contract for the British forces which, as you say, was placed in Eire.

Unfortunately, it seems to be the policy of the Northern Ireland government to concentrate on attracting new firms whose products (chemicals, nylon hosiery, artificial fibres, oil-drilling equipment, etc.) are evidently preferred to manufactures based on indigenous raw materials, such as beef and flax.

To illustrate: Until about three years ago, a large meat-canning and quick-freezing plant, owned by a Scottish company, was a well-known landmark, just outside Belfast. The proprietors were, at one time, prepared

to enlarge this plant, which would not only have created greater local employment, but which would also have served to avoid the weight and quality losses on cattle exported on the hoof, to which you refer. However, no financial support could be obtained from the Ulster government. As a result, the entire meat-canning and freezing venture was concentrated in Scotland.—Yours faithfully,  
PETER KAUFMAN  
Caterham, Surrey

### The Faceless Ones

SIR—Reading the first article in your last issue under the heading "Britain into Europe," I am puzzled once again as to the meaning of the expression "to face up to." I quite understand facing up to the stars, the Empire State Building or even the Nelson Column, but how does one face up to the need to budge or to a delicate matter? Would I be right in assuming that it means that we are to take the whole affair lying down?—Yours faithfully,  
G. W. ANDREWS  
London, W.C2

### Bernstein and Triffin

SIR—Mr Bernstein is unfair on the Triffin plan. Mr Triffin does not propose that the official dollar and sterling holdings transferred to the IMF should automatically be bought back by the US and UK over 20 years. The 5 per cent per annum rate that he mentions is suggested as a *maximum* rate at which the Fund may require their repurchase. He implies that the purpose of this provision is to allow for an excessive lust for gold by holders of that limited share of IMF deposits which under his scheme would be convertible into gold. Such a demand for conversion to gold might not arise, and if it did there seems to be no special reason why (as Mr Bernstein assumes) the IMF would use its discretion in a deflationary direction, why it would in other words deliberately make the US or UK payments position difficult. If it requires them to buy back their liabilities for gold, it can presumably restore their reserve position by overdrafts no more onerous to them than the debts they would be cancelling. Britain's position would be no worse in this respect than at present, and it would be more secure both because of the purchase by the fund of its liabilities and because of the guarantee of a steadily increasing world total of reliable reserve media.

At the same time, Britain's general payments difficulties are not likely to be solved in the long term except by some form of sacrifice. The Stamp plan (which could be grafted on to either of the others) provides for the most pleasant and useful form of sacrifice: an increase in export demand.—Yours faithfully,

ANTHONY CLUNIES ROSS  
Pembroke College, Cambridge

## BOOKS

### An Essay in Kremlinology

Power and Policy in the USSR

By R. Conquest.

Macmillan. 495 pages. 35s.

CONTEMPORARY events are full of pitfalls for the historian. Current Soviet history is a particularly perilous field because of the gaps and shifts in the evidence. Mr Conquest must have concluded that the best possible way of tackling the problem is to sift the available evidence and marshal it into a coherent story. His book is essentially the story of the struggle for Stalin's succession. It goes back to the last years of Stalin's rule in search of elements which throw light on following events. Georgian purges, for instance, help one to grasp the mechanics of struggle as well as Beria's special position. The notorious Doctors' Plot shows that the struggle for power had already begun before Stalin's departure.

Yet it was only after Stalin's death that his heirs had to fill the gap or rather had to adapt the Soviet system of government to new conditions. Mr Conquest tries to reproduce this unfinished story, the highlights of which are well known. They include the fall of Beria, the premiership and collapse of Malenkov, the famous 20th congress of 1956 and the elimination of the "anti-party group" in the following year. The last chapters are more concerned with the rise of Nikita Khrushchev and an assessment of his power. But the book is not limited to the most striking episodes and to the struggle among the protagonists. It provides a great deal of information on minor figures and throws some light on such mysterious, though relevant, episodes as the Leningrad affair or the case of comrade Voznessensky.

Although the author gladly accepts the title of Kremlinologist, he should not be confused with the more popular brand of the species. He does not pretend to have been hidden in one of the Kremlin's cupboards. On the contrary, he proceeds with scholarly restraint. He takes the reader into his workshop. Indeed, a great deal of the actual narrative is taken up with documents and other source material usually found in footnotes or appendices. Having diligently and publicly performed his detective work, the author assumes the part of an impartial judge summing up the evidence. He produces data against his own hypothesis as well as in favour of it, and precludes all his tentative conclusions with restrictive statements, such as "it seems . . ." or "it is not inconceivable . . ."

For all these careful precautions, Mr Conquest, naturally enough, will not get agreement from his fellow Kremlinologists on all his points. Not all the experts will agree that there was a link between the Soviet leader Zhdanov and Titoism. The attempt, even a tentative one, to divide the current central committee of the Soviet communist party into supporters or opponents of Mr Khrushchev and independents will be regarded as the sort of guess that the author himself so rightly condemns. But these are minor points that only emphasise how, elsewhere, Mr Conquest has managed to tread safely on shifting ground. More disturbing is the slight feeling of bewilderment with which one leaves the book. All the available pieces of the puzzle have apparently been put together, and yet no general picture of Soviet rule seems to emerge. Is it because the whole struggle for power cannot be explained merely in terms of personalities or, even, of institutions?

Mr Conquest has chosen his method deliberately. He admits in the preface that Soviet leaders "do not live in a vacuum" but warns us that his study is only accidentally concerned with the working of social forces. He quotes as precedents for his approach to history names as impressive as those of Suetonius or Saint-Simon. The snag is that the amount of available information on recent Soviet events does not allow for impressionism and colour. Indeed, Mr Conquest, though writing current history, mostly does so like a detached scholar deciphering ancient documents.

Some weaknesses inherent in the personal approach appear in the course of the book. Controversies over such issues as agricultural policy or Mr Khrushchev's managerial revolution sound rather abstract when not set against the background of Russia's economic development. In general, the great political changes that have occurred in the Soviet Union since Stalin's death cannot be explained entirely in terms of a Byzantine struggle for power. The pace of change after his death would seem to indicate that the Stalinist political structure was no longer suited to Russia's conditions and was only preserved artificially by the conditioned reflexes of an aged ruler. Combining the skill of a scholar and of a detective, Mr Conquest has very ably summarised the changes that have since taken place at the top. He has deliberately limited his scope. The very excellence of his limited work confirms that Kremlinology is only a part—some will say a minor part—in the study of Soviet history.

### Frankenstein Looks Back

Headlines all my Life

By Arthur Christiansen.

Heinemann. 306 pages. 25s.

THIS lively anecdotal book, written in the simple, tell-it-terse, gossip way that Mr Christiansen used to command from the bright young men he picked so well and drilled so hard, has had all the wide attention due to the one-man milestone in the progress of popular journalism that Mr Christiansen was when he edited the *Daily Express*. What do we remember of the *Express* of the thirties and forties? We remember not what the paper said, but how it said and presented it; we remember, not Lord Beaverbrook the soothsayer, but Mr Christiansen the projector.

The cheap popular press is only sixty-odd years old. In that time it has seen three revolutions. The first was Lord Northcliffe's invention of cheap newspapers for many readers, to catch the diverse interests and curiosity of anybody who could read. The second, a generation ago, was Mr Christiansen's *Daily Express* with its brilliant use of type and brevity (and good writers) to catch the eye and give the message with a minimum of solid reading; it was a revolution in presentation. The third was the revolution in communication with millions of mainly young readers achieved by the tabloid *Daily Mirror*: it wrote, and writes, about the things its readers are interested in in the language that they most easily understand.

The risk in all this, which Mr Christiansen sees, is that the trivial can be made important and the important trivial. Perhaps now we are seeing a fourth and different revolution. What were once papers for the few have themselves become popular, with circulations climbing to, and passing, the million or more: the *Daily Telegraph* on weekdays, the *Sunday Times*, the *Observer*, and now, perhaps, the *Sunday Telegraph* at the weekend, they have to communicate with the many while still keeping the balance better between the important and the trivial; and this trend is having its effect on the big cheap populars, too—on the *Mail*, the *Express* and the *Mirror* as well.

Mr Christiansen, to judge both from this book and from his other thoughtful sayings since his premature retirement, will be glad about this. He has no apologies for what he so single-mindedly created; Frankenstein is properly proud of his monster. But he does tend to think that the whole deft process of professional presentation and personal news collection and commentary gossip may, by becoming an end in itself, have gone too far. Last week in the *New Statesman* he gave as the three qualities of good and successful newspapers that they "must have something to say; must say it attractively for the public they are aiming at; and must back the message with the

most exhaustive newsgathering they can afford, skilfully projected." When he was himself an editor he abjured the first quality altogether; he was, he says, a "technician without passionate political conviction": outstanding in his generation at "saying it attractively for the public he was aiming at," at exhaustive news-gathering and skilful projection; a news editor and chief sub-editor raised to the *n*th power, but with nothing to say—he left that to Lord Beaverbrook.

Now one wonders very much whether Mr Christiansen would not have been a still better editor, if very likely a less famous one, had he not spent his days in the chair doing only a superb technician's job with his editorial right hand kept behind his back. The best editor he looks back upon, he said not long ago, was A. P. Wadsworth of the *Guardian*, the greatest of our time to many newspapermen; there, indeed, was a professional, if idiosyncratic, journalist, but always with something to say, to argue, to assert, to deny or to deflate, never mistaking the skills of journalism for its substance. It is Mr Christiansen's engaging quality that after having played all those tunes upon the pipes in his famous paper, he does frankly, and modestly, perceive the lost horizon.

### Disarmers' Dilemma

The Control of the Arms Race

By Hedley Bull.

Weidenfeld & Nicolson. 229 pages. 12s. 6d.

THIS is the second considerable publication to come from the Institute of Strategic Studies under a slightly uncomfortable formula: a personal analysis, assisted (or impeded) by a study group and complemented by a brief, dissentient note—this time from Mr John Strachey. Mr Bull has, as it happens, produced an admirably comprehensive and reasoned survey of the major issues of disarmament. His particular contribution to the discussion is twofold: the recognition that the balance of power is the least evil of existing international relationships, and the awareness (which has now overtaken the nuclear test ban negotiations) that the pace of scientific development in the armaments field threatens to by-pass even those sophisticated systems of control which seemed perfectly practicable as little as three years ago.

The disarmers' dilemma is not an unfamiliar one, but it is deepening with every new weapons system that appears. In situations where political rivalries and tension persist, the pragmatist naturally welcomes the emergence of those new weapons which contribute to a stable balance of power. This is the essential service provided by a missile like Polaris. It could be equally true of missile sites established by both

## Advance, trend, and be recognised

THERE ARE two common ways of looking at history, and both of them oversimplify. The first sees it as though it were all favourites and mistresses, Bad Kings and surfeits. The other sees only trends and movements: the characters are the price of corn, adult suffrage and double entry book-keeping. Neither gives human beings their proper dignity and importance.

In dealing with the history that is being made today, newspapers often seem to be parodying one or other of these approaches.

One of the things I like about *The Observer* is the nice balance it strikes—and helps me strike. For the people who write for it, impersonal forces take their proper place as tools to help understanding, not final explanations. These writers have a knack of stripping off the slogans to show trends for what they really are—the sum of countless acts of individual responsibility. They know that to understand the world it is necessary to understand people, and some people more than others—but in terms a little more profound than who's escorting whom.

### Human faces

Hence, among other things, *The Observer Profile*—a weekly word portrait, every phrase as telling and considered as a Cézanne brush stroke, of somebody who matters in some way, whether it's President Kekkonen or Danny Blanchflower.

Hence, too, Mammon's column, "Something in the City", in which you meet the men behind the merger, and bulls and bears assume human faces. As far as I know, Mammon was the first in this country to use the techniques of skilled journalism to penetrate the traditional anonymity of big business. The results are fascinating.

In much the same way, "A London Diary" persuades me that Politics is after all worth paying attention to. And you will find other examples wherever you open *The Observer*. Why not try, this Sunday? ADVT. J.B.L.

power blocks on the moon and the planets—for their likely deterrent effect on the existing strategic arguments for pre-emptive nuclear strikes by earth-sited weapons against earthbound targets might be considered welcome. But these build-ups, however reassuring in terms of mutual deterrence, are not steps to disarmament. The idealist, on the other hand, looks ultimately to a world authority, capable of exercising full control, but this presupposes either the solution of existing political differences or a denial that they exist.

It is now open to question whether what looked like a middle way, in which a minimum of scientific controls could remove the most dangerous aspects of the nuclear arms race without requiring large-scale political concessions by either side, is really workable. It certainly will not be unless the methods of monitoring and detection keep up with the devices for concealment. This is Mr Bull's chief new point, and it is a valid one. For the rest, he does not, in adherence to the logic of his thesis, go much beyond the more obvious palliatives of a test ban, the demilitarisation of outer space and the preservation of what differences remain between nuclear and conventional warfare. His book is by no means an argument against disarmament, but it is a tough and necessary demonstration of what progress towards disarmament involves. There has been a need for such a study on this side of the Atlantic.

## Literary Symposium

**The Writer's Dilemma.** Essays first published in the *Times Literary Supplement*.

Introduction by Stephen Spender.

Oxford University Press. 109 pages. 12s. 6d.

THE republication of this series of articles provokes doubts about the value of any symposium that is journalistically engineered. Ten so-called "representative authors" were approached by the editor of the *Times Literary Supplement*. What they were representative of is difficult to say; some wrote fiction, others history; not all were English, none was primarily a poet. To them he put the question: "What are the limits beyond his own control that threaten a modern writer?"

Since writers in all ages have been threatened by such limitations as personal catastrophes, indifferent or uncomprehending readers, poverty and the attrition of the creative impulse, the emphasis in the question had to fall on the word "modern." Consequently there are many references in these articles to brain-washing, the stupefying effects of mass media and the threat of "the two cultures." But the total effect is of a scrappy miscellany. In his introduction Mr Spender recognises that some of the contributors have been concerned with the future of literature and others with the future of authors; but though he tries to impose some kind of coherence on the collection, it resists any such attempt.

"A modern writer," "a representative author"—these phrases give the game away at the start. What such disembodied entities would do when threatened by the progress of technology and the decay of institutional religion is anybody's guess, and really it does not matter. As long as men remain recognisably human, as long as society does not utterly disintegrate (and of course that may not be very long), poets will from time to time be born. A man who has his own word to say will say it, regardless of who may or may not be listening. These people, who in any age are rare, are the only ones who ultimately count. But it does seem rather a pity to distract people even of minor talent from getting on with their novels or plays or whatever, by asking them to contribute to an ill-assorted symposium.

## Decipherment

**Voices in Stone**

By Ernst Doblhofer.

Souvenir Press. 327 pages. 30s.

THE reader will be well advised to start by throwing away the dustjacket, which contains a rather misleading blurb. It starts accurately enough with the words "Here, told vividly and simply for the lay reader, is the whole fascinating story of how the last remaining fragments of scripts and

symbols from vanished civilisations came to be deciphered." Leave out the word "whole," and you have a fair description of the book. But when the blurb goes on to use the word "research" about a book that does not pretend to be based on any original work, to give a long list of acknowledged experts who have "advised in the preparation of this book," and to quote one of them as calling it "un chef-d'oeuvre de probité scientifique," it gives it an air of pondered authority which it neither deserves nor needs. Herr Doblhofer does not seem to be terribly learned: there are several false transcriptions, which hardly matter in a book of this kind, though they do not clarify the argument; and it is clear that his knowledge has fairly sharp limits—witness the astonishing statement, in a book on this subject, that Ogham is the extinct Cornish language.

Never mind; once the dustjacket is off and learned criticism is disarmed, it is a rattling good book for the layman on an exciting subject: the decipherment of several of the forgotten alphabets of the ancient world, including hieroglyphics, cuneiform, Hittite, Ugaritic, Cypriote, Linear B and the old Turkish alphabet. It is vivid and simple as claimed; and it is highly personalised, with little biographies of the characters concerned. As they were mostly strong and interesting ones, this approach is worthwhile. There is, in fact, about as much about the discoverers as about the things discovered and the method of the discovery. The book is written with bubbling enthusiasm, and even a jaded reader shares the author's excitement at a bunch of very fascinating stories. It can be warmly recommended to schoolboys of all ages, but not to students in search of a text-book, for whom it is not designed.

The translation is exceptionally good; there are lots of clear and relevant line-drawings in the right places; and there are some pretty plates which do not do much to illuminate the text.

## The Church before Islam

**The Early Christians**

By Michael Gough.

Thames and Hudson. Ancient Peoples and Places Series. 268 pages. 30s.

THE lasting conquests made by Islam in the seventh century often mask the fact that Christianity belongs equally to the east and the west. The greater good luck of western Christendom, which has led to a greater wealth of early Christian monuments in Rome than in, say, Antioch or Alexandria, adds to the unbalance of our impressions. So does the present parlous state of some of the eastern churches. Mr Gough, in a book that is both well written and beautifully produced and illustrated, helps to put things right.

He divides his story into three periods.

The first covers the first three centuries of intermittent persecution and necessary secrecy. The second deals with the two following centuries during which men could worship in security and revel in controversy over dogma. These famous quarrels he sees not as "disgraceful squabbles over minutiae" but as evidence of liveliness and desire to build on sure foundations; did they not happen at a time when the Church was spreading from Ireland to India, and Armenia to Ethiopia? His last period is the golden age of the sixth century that survives for us in great monuments such as S. Sophia in Istanbul and S. Vitale in Ravenna.

Early Christianity is wonderfully well documented. Archaeology's role is, more often than not, simply to confirm literary or historical tradition. Yet confirmation is in itself impressive, and Mr Gough, who is an archaeologist, excites interest and speculation when he discusses the art-forms and architecture of his three periods, with their evidence of borrowings from earlier cults, of the problems of daily life, and of missionary enterprise. He has lately been appointed director of the British Institute of Archaeology at Ankara. Southern Asia Minor is full of unexplored Christian sites which he could uncover to the benefit of our knowledge and of Turkey's tourist traffic. As it stands, his book is a good Hellenic traveller's companion, or senior form scripture prize.

## Racing Driver

**Sir Henry Segrave**

By Cyril Posthumus.

Batsford. 227 pages. 21s.

TODAY the racing drivers taking part in important motor races are professionals, who accept large fees in the form of appearance money as an essential adjunct to their role of modern gladiator. In the decade following the first world war this was not the case, at least in this country, where amateurs drove in motor races in the same way and for much the same reasons as they followed hounds and rode in point-to-points.

Segrave, son of wealthy parents, educated at Eton, might have been expected to follow this code. But he was more ambitious and, on leaving the Royal Air Force, decided to join the small band of professional racing motorists on the continent. This well written and illustrated book traces Segrave's career from childhood through his war service, when, apart from the brief ownership of a fierce 120 h.p. Itala car, he displayed small liking for fast cars, to that fatal attempt on the water speed record at Lake Windermere. There, Segrave, who had been knighted in 1929 for his services to British prestige in the form of absolute speed records on land and water, lost his life.

The book gives a clear picture of the

tenacity, thoroughness and drive of the man who, in 1923, was the first to bring a British car home to victory in the classic French Grand Prix and who three times broke the motor car speed record, leaving it at 231.44 mph in 1929 after having exceeded 200 mph on land for the first time, in 1927, at Daytona in America. In 1961 motor racing is a popular sport and the land speed record stands at nearly 400 mph, but when Segrave made his career among racing cars, there were far more unknown risks, and the cars he had to tame were crude and under-tyred. The qualities that enabled Segrave to surmount the difficulties are clearly brought out in this biography.

## Unpromising Dawn

**The Dawn of African History**

Edited by R. Oliver.

Oxford University Press. 103 pages. 10s. 6d. boards, 5s. 6d. limp.

THE introduction to a lay public of a subject so remote and unexpected as African history is bound to be a difficult exercise. Only with skilful presentation and great care for the reader can it hope, at this early stage, to win the sympathy and understanding it deserves. Yet here is a more or less random collection of broadcast talks and essays by authors who show, with one

## Two New Reports from O.E.E.C.

**The Problems of Rising Prices**  
An exhaustive survey by six well-known economists.  
by William Fellner, Milton Gilbert, Bent Hansen, Richard Kahn, Friedrich Lutz and Pieter de Wolff.  
490 pages 21s.

**The flow of financial resources to countries in course of economic development**  
An O.E.E.C. analysis of aid and investment programmes.  
Based on the replies to a questionnaire sent to 18 European countries, Canada, the U.S.A. and Japan.  
154 pages 12s. 6d.

Obtainable in the United Kingdom from HER MAJESTY'S STATIONERY OFFICE, P.O. Box 569, London S.E.1

or two partial exceptions, no talent at all for journalism and the arts of popular presentation, and precious little respect for the rights of the intelligent but uninformed reader. Moreover, these papers were written nearly three years ago, and already bear signs of age.

The best of the papers, perhaps, is that of Mr Hodgkin, who tries repeatedly to bring his lay listener-reader into focus with the history of the Western Sudan by offering a series of comparisons with well-known European dates, such as the battles of Crécy and Flodden. M. Vansina has an excellent essay on the southern Congo peoples, though once again one wonders how much his words can mean to the uninitiated. Dr Arkell is unexceptional on Meroe and Axum. So is Dr Kwapong on Carthage, Greece and Rome. Dr Oliver's description of the Zimbabwe culture has the vigour and polish that are to be expected of him, but oddly makes no more than passing reference to the mining element in that hinterland civilisation, and regrettably uses the word riddle in the title, although Zimbabwe is no longer a riddle in the sense that the uninformed reader will interpret the word here.

It is hard, furthermore, to see in what way Dr Oliver may be said to have edited this collection. He writes a brilliant little tail-piece, but there are no linking passages between essays that jump up and down the continent, and no notes on authors of whom most are unknown to a wide public. The maps are good, but the introduction is not. This, strangely, is by Sir Mortimer Wheeler; he dismisses the medieval cities of the east coast as merely "peripheral" to Africa although Dr Mathew, genuinely an expert in this field, accepts them later in the book as a valid part of African history. If this belated publication really represents the dawn of African history, the day is going to be damp and foggy.

## Village Society

Joseph Ashby of Tysoe, 1859-1919

By M. K. Ashby.

Cambridge University Press. 317 pages. 25s.

THIS is a delightful and absorbing book, of a kind that must be reckoned rare on three separate counts. In the first place it is a biography written by the subject's daughter that has complete clarity of sight and avoids all sentimentality. Secondly, it tells the story of a self-made man, again without false heroics or tedious over-emphasis on the struggles his life involved. Thirdly, and most remarkable of all, it offers an account of English village society in the second half of the nineteenth century that is candid and searching yet never at any point either meretricious or dull. Mr Robertson Scott, in his foreword, compares it to the Hammonds' work "The Village Labourer." Miss Ashby's book lays no claim to scholarship, as the Hammonds'

certainly does; yet it can stand the comparison, for though it has a distinct point of view it is not—like the Hammonds' work—doctrinaire. It is as true a piece of history as a biography can be.

Joseph Ashby was an illegitimate child, born in 1859 and reared in the Edgehill country, a few miles to the north-west of Banbury. He became a stout undeviating Radical, a supporter of Joseph Arch, a writer on agricultural economics (father of a professor of that subject), a justice of the peace and in the end a substantial farmer.

Miss Ashby has a most striking gift of vivid description and of catching in cold print the inflections of rural speech. Take the account in her fourth chapter of the Town Lands of Tysoe and the controversy over the disposal of the revenue from them. It is brilliant reporting and sound history. It ends with the words of Joseph Ashby's mother, a trifle wry but not in the least bitter, answering his question why the village folk acquiesced in the wrongful withholding of their dues: "Tis in their blood to expect fairness. I don't know why, but it is so."

With very unusual skill Miss Ashby succeeds in presenting her father's life sympathetically—indeed, pretty plainly, from a point of view that approximates to his own—and yet in doing spontaneous and unforced justice to those on the other side: the authoritarian old vicar, for example, and Lord Willoughby de Broke, the high Tory landowner. There is truth in every line of this biography, and it generously enlarges our understanding of Victorian England.

## OTHER BOOKS

ENGLISH OVERSEAS TRADE STATISTICS, 1697-1808. By Elizabeth Schumpeter. Oxford University Press (1960). 79 pages. 45s.

When Mrs Schumpeter died in 1955 she left a series of tables on the English commercial statistics of the eighteenth century compiled from the records of the office of the Inspector-General of Imports and Exports. As Mrs Gilboy explains in a short but moving memoir, Mrs Schumpeter's last years were devoted to completing her husband's "History of Economic Analysis," and as a result she could not complete her own work for publication. The tables have now been edited by Professor Ashton, who also, in a masterly introduction, discusses the provenance and character of the figures and suggests some of the broad conclusions that can safely be drawn from them. Besides total exports and imports, broken down by destination and country of origin, the tables included an analysis by value and volume of the principal goods exported, for selected years between 1697 and 1780 and continuously thereafter, and similar information for imports. For some imports the series is continuous from 1700 to 1808, and for certain exports there is a breakdown by destination as well as product. The tables are the product of immense labour and they make a major contribution to economic history.

THE LOGIC OF PERSONAL KNOWLEDGE. Essays presented to Michael Polanyi on his seventieth birthday. Routledge. 259 pages. 40s.

These essays, like similar collections for similar occasions, range over a wide variety of apparently unrelated subjects: some historical, some purely scientific, some philosophical. But in this case the wide range is justified by the

wide range of Professor Polanyi's own mind. Qualified as a medical practitioner before the first world war, he later became professor of physical chemistry at Manchester, then professor of social studies in the same university.

INTERNATIONAL ECONOMIC PAPERS, No. 10. Translations prepared for the International Economic Association. Macmillan. 193 pages. 21s.

These papers bring together a wide range of writings mainly by continental authors on macro-economic subjects. Although some of the articles are rather old, with one dating back to 1886, they retain a relevance to current problems. There are some famous names on famous topics—Ohlin on inflation and Lindahl on fiscal policy—as well such divergent interests as marginal utility, development aid and pricing policies in a communist economy. The collection provides an accessible source of information for English speaking economists who might otherwise be denied useful foreign opinions.

THE CHINA BIRD. The History of Captain Killick and One Hundred Years of Sail and Steam. By David R. MacGregor. Chatto and Windus. 383 pages. 42s.

Published to celebrate the centenary of Killick Martin & Co., this book is mostly concerned with the firm's shipowning period. For twenty-five years it ran tea clippers, and besides giving a factual account of the cargoes carried, the freight rates, routes and dates of voyages and so on, the book has many illustrations of these beautiful ships. There are plans of some of them, and a diagrammatic sail plan of a typical clipper, which should appeal to the nautically minded.

THE ART OF THE ANCIENT NEAR EAST. By Seton Lloyd. Thames and Hudson. 303 pages. 30s.

The 'ancient' of this book's title is ancient proper for it ends at the sixth century BC. Mr Seton Lloyd gives newcomers to the subject a good idea of the sudden spurt with which the scene in the ancient world changes, after perhaps twenty centuries of unambitious monotony, from a simple tribal economy to a flowering in cities whose inhabitants can write and carve and leave us lasting monuments. He also shows how this happened in two places at once and seemingly independently. Egypt and Mesopotamia, and the amazing evidence of artistic endowment that we see in the surviving fragments of their output, are the subject of the bulk of his book. But it also covers Persia's "distinguished and important" contribution, as well as the more derivative arts of Anatolia and Syria.

The illustrations are of Messrs Thames and Hudson's usual high quality, and are excellently captioned, although more of the captions should have given an indication of size. Without this, one is in for shocks when one visits the museum. The book is good value for money.

SOCIAL SECURITY STATISTICS. Guides to Official Sources: No. 5. Interdepartmental Committee on Social and Economic Research. Her Majesty's Stationery Office. 179 pages. 8s.

This booklet makes a comprehensive survey of the wide range of information collected by the Ministry of Pensions and National Insurance and by the National Assistance Board; it includes, as background to the statistics, an account of the various schemes and benefits. A useful appendix summarises the principal changes in the law relating to national insurance benefits and family allowances.

With an ever-growing number of people using official statistics, there is an obvious need for guides of this kind. But they are appearing pitifully slowly—at an average rate of one every two years.

THE AEROPLANE DIRECTORY OF BRITISH AVIATION 1961. Temple Press. 547 pages. 35s.

This is the first edition to incorporate all the changes in the industry's structure and in the method of licensing air services.

# HOME REPORT

In HOME REPORT members of the editorial staff and local correspondents report on life and happenings in and around Britain.

## Melting Down in Rotherham

FROM OUR SPECIAL CORRESPONDENT

THE sun shines on Rotherham by grace of Messrs Steel, Peech and Tozer. Their steelworks, stretching for a mile and a half into the borough from its frontier with Sheffield, belches smoke over the iron-grey town; 9,000 men work in the giant plant, out of Rotherham's total population of 59,000. Steel has brought prosperity and parking problems to the grim streets; but Steel, Peech's latest progressive venture—which may, incidentally, allow the real sun to penetrate more easily to the town—will give the first real jolt for years to the wealth of these men, among Britain's highest paid workers. By the end of 1965 the twenty-one open-hearth furnaces in which scrap is rendered down into ingots will be replaced by six German electric arc furnaces; the new plant will produce 30,000 tons of ingot steel a week, compared with the present capacity of 25,000 tons. Once the electric furnaces are working the plant will be employing 1,100 fewer men.

The result will not be unemployment and misery: the Sheffield area, however physically depressing, has an acute labour shortage. Steel workers, however, are exceptional people. Starting as labourers, they hope to end up as first-hand operatives, with a regular income of around £35 a week, and occasionally much more. They are good at a specific job, with specific equipment, in a specific team. But once the equipment and the team are broken up they are no more highly qualified than a general labourer. The bricklayers, electricians and other craftsmen who work on the furnaces have at least a skilled trade to offer on the labour market, although they would certainly not find wages on a building site comparable to those paid for three-shift working in the cavernous heat of the melting shop.

The personnel for the new plant is being selected from those working the old furnaces—but the company, with the full agreement of the unions, is insisting that those who have charge of

its valuable new equipment should pass examinations to prove their capabilities. The majority who will not get work in the new melting shops are to be offered jobs elsewhere in the works. Most of these men will lose between £3 and £6 a week by the change: some will lose up to £20. The company has announced that it will pay compensation, based on the reduction of earnings, length of service and age of the person concerned. The maximum payment will be £300, which will certainly not save those involved from a drastic reduction in their standard of living, but will at least help to bridge the gap between the new standard and the old.

THE company reiterates that this is an entirely exceptional measure and not likely to be repeated. But the Iron and Steel Trades Confederation, the men's canny union, sees it rather differently. It would naturally like to see a national redundancy compensation scheme for the industry, but its leaders realise that the employers would never agree among themselves on this, let alone agree with the union.

But when the South Wales tinplate industry was transformed by the building of a vast works to replace the scattered small ones a special levy was made to pay compensation: Rotherham provides another precedent for such payment. The union never succeeded in getting a national pensions scheme established for the industry—but the setting up of such a scheme by some companies soon led the others to follow. Now it looks as though the steel industry will have to accept some of the social consequences of transformations in industrial methods: perhaps Rotherham's sorrow may lead to better things for steelworkers elsewhere—and thus help to continue the fervent co-operation from the unions in the modernisation of the industry which has done so much to preserve the best labour relations in the country.

## Training the New Élite

BY OUR SPECIAL CORRESPONDENT

TRADITIONALLY, the path to management is from the bottom, whence, by exceptional ability, the lowliest may promote themselves to the direction of great concerns; and recently it has been possible for the well-educated to begin in the middle and thence to climb to the heights of administrative glory. Neither path is entirely satisfactory, for on each the ultimate skills of management have to be picked up as one goes, and the pilgrimage is itself so difficult that the pilgrim is little minded to pluck flowers between pitfalls. Thus the new manager comes all too often to his

promotion arrayed splendidly in quite irrelevant skills.

Past efforts to improve on this have not been altogether successful: the professional institutes, many technical colleges and some universities tried to include in their curricula tangential "management studies" in such forms as accountancy and office organisation courses. By their nature, such individually treated "subjects" do little to forward the art of management, which is essentially the co-ordination of diverse activities. Many improved institutions now exist, however, most of them based on the report of a Ministry of Education committee in 1947: the schemes

operated by the British Institute of Management and independent schools such as the Administrative Staff College at Henley, for instance, are admirable—as far as they go.

A further Ministry working party, reporting last year, thought they did not go far enough; and on its recommendations Hatfield College of Technology has based a new course in management studies, "new" in that it is designed to train young men at the beginning of their careers rather than those already partly experienced in management, and to train by group methods in a single co-ordinated programme instead of teaching and examining in separate subjects. High educational standards (degree, Dip.

Tech., Higher National Certificate or a professional qualification) will be demanded of candidates, none of whom may be below the age of 23; in addition the criterion of their acceptance for the course will be "their ability to benefit from it"—which means, simply, that the college believes that no one can be taught to be a manager unless he is already in possession of certain (deliberately undefined) qualities of mind and character. The course will be in two stages: in the first, instruction in various humanistic and technological aspects of management will supplement an intensive analysis of management, complete with case histories; and in the second, theory and practice will overshadow the acquisition of further ancillary skills. The course will last for 18 weeks, spread over three years, two years or one and a half years depending on the wishes of the industry concerned.

The costs will be borne, it seems, by the Ministry, for fees are fixed by the authority at what someone at Hatfield describes as "derisory" rates—from £5 a year part-time to £9 a term full-time. Henley charges £250 for its twelve-week course, and even Hatfield, in its management development scheme (for older men promoted from shop floor or junior office), charges £80 for just over three weeks. The new course begins in October.

Industry, as represented at a preparatory conference at Hatfield, is not universally amenable, although the idea is approved of in principle. Its reservations are not unreasonable. With the acknowledgment already made that "managers are born," there is a distinct possibility of the cultivation of a rigidly exclusive manager type or organisation man.

Those delegates who thought the age-group too low and the entrance qualifications too high were also, perhaps, right to be cautious. Management may well demand qualities not possessed by the *hoi polloi*. It is still essential that it remains an integral part of the economic organism, and signs of its increasing esotericism (including a jargon of its own) are to be greeted with mitigated enthusiasm.

## Span in the Works

FROM OUR SPECIAL CORRESPONDENT

THE possibility of a complaint to the Council of Tribunals by some Blackheath residents raises again some of the issues which attracted attention in the Essex chalk pit case. The occasion is Mr Brooke's decision that Span Developments' application to develop a site in Blackheath Park should be allowed, despite the contrary conclusions of his inspector who conducted the public inquiry.

Local residents contend that the Minister has not overruled his inspector on a question of policy, but on a re-evaluation of the technical evidence produced at the inquiry. The Minister opines that the development would not injure the day-lighting and outlook of the adjoining house, although the inspector decided that it would do so. If an inspector's conclusion about a small question of local observation is rejected, say the local objectors, where is the point or justice of having an inquiry? In the chalk pit case, it could at least be said that the technical issues were complex.

However, this point was probably a minor element in the Minister's decision, which seems to have been guided by broader considerations. Mr Brooke has declared his belief in the blending of new and old architectural styles, as well as his desire to see denser middle-class residential development

within easy reach of central London offices. Both aims are laudable in principle. In objecting to the housing of ten families where previously there had been one family and a large garden, the residents of Blackheath do not deserve support. On the other hand, Blackheath already contains a large admixture of contemporary design and development; and it is possible to argue that too much of its new contemporary housing is of the Span type (perhaps because a director of Span lives in the very road now in dispute). On architectural grounds, it is now other districts equally near London, but without Blackheath's rapidly diminishing heritage, which would benefit most from Span's attentions.

The trouble behind many of these planning disputes is that because inspectors at inquiries have not been sufficiently educated about the objectives of (and economic facts behind) public policy, ministers have grown too accustomed to disregarding other aspects of their reports as well. The proper course is to see that inspectors are more highly trained in economics, and then to agree that ministerial rejection of their recommendations should be very rare occurrences indeed.

the Presbyterian Church in Belfast last week. The assembly expressed "really serious concern at the danger of religious discrimination in these times of serious unemployment."

This discrimination has always had something of a political, as well as an economic, aspect in Northern Ireland. Just as the church was discussing the problem, the Nationalists in the House of Commons at Stormont—and the Nationalists in the main represent the Roman Catholics who comprise one-third of Northern Ireland's population—were questioning the Minister of Home Affairs about a municipal election leaflet in which the Unionist Party's candidates said they did not employ Roman Catholics and had no intention of doing so.

Despite these rumblings of an under-

lying intolerance, there is evidence that more people, in all political parties, take a more mature view of their fellow-Ulstermen. The Churches Industrial Council, which represents all the churches including the Roman Catholic, has denounced discrimination. When, a few months ago, a young, potentially public figure in the Unionist Party suggested a "register of loyalist workers" who would be given first choice of available jobs he was openly repudiated by Government spokesmen.

The question now is whether tolerance can be maintained, or whether unemployment will be seized on as an excuse for employers—and workers' organisations—to weed out those of different religious beliefs. It will be deplorable if Ulster lurches back into the past.

# Leo III enlists for Fort Dunlop

IN 1962 a Leo III Automatic Office, the fastest, most flexible, and most reliable Leo yet, will start work at Fort Dunlop, the largest factory in the world-wide Dunlop organisation, where the famous Dunlop tyres are made.

### What Leo III will do for Dunlop

It is planned that the installation will progressively take care of a wide variety of functions. At Fort Dunlop, LEO will produce invoices and accounts for the vast tyre replacement market—garages and distributors whose 5,000 orders a day are chosen from 30,000 different items.

In an integrated system it will produce more informative and more up-to-date sales statistics and will forecast future sales, taking current trends and seasonal factors into account. From these forecasts and statistics, LEO will be able to arrange automatically for the replenishment of Depot stocks, and make a breakdown of production requirements for scheduling purchases and manufacturing loads.

In addition to this, LEO will analyse factory production and report to management on deviations from budgeted performance and costs. It will control stocks of raw materials, engineering parts and finished products. And it will do all the necessary calculations for the 9,000 employee payroll.

### The fastest Leo yet

LEO III will be able to handle this great work load because it is fast even by computer standards. It is fully transistorised. It reads and records on high-speed tape decks. It prints its results on an Anelox machine at 880 lines per minute. Time sharing arrangements ensure that the computer itself never has to wait for ancillary equipment to catch up with it.

LEO III can even work on several jobs at the same time, sharing its large magnetic core 'memory' between them automatically. And no expense has been spared to make it more reliable. In fact, LEO III is so reliable that special 'breakdown exercises' have had to be devised to keep maintenance engineers in practice.

### What Leo III can do for you

|                                        |                                           |
|----------------------------------------|-------------------------------------------|
| Invoicing and sales analysis           | Accounting, costing and payroll           |
| Sales forecasting                      | Dividend warrants and registrars' records |
| Production scheduling and control      | Labour efficiency calculations            |
| Engineering and insurance calculations | Market Research analysis                  |
| Stock and warehouse control            |                                           |

ETC., ETC.

## Ulster's Test

FROM A CORRESPONDENT IN BELFAST

RELIGIOUS discrimination in employment is a problem that is never far below the surface in Northern Ireland. Even during the years of comparatively full employment, occasional advertisements in the Belfast newspapers have still advised applicants for positions to "state religion."

Now that unemployment in the Belfast shipyards has become a major problem—6,000 men have lost their jobs since Easter and another 3,000 will go before the autumn—discrimination begins to loom large again. A sign of the times has been the reaction of the General Assembly of

# EXPRESS SUCCESS!

The success story of the Midland Pullman began on July 4 1960, when this blue-and-white de luxe train made the first of its regular high-speed journeys between Manchester and London. On the way it was often carrying its passengers at over 80 mph—yet with a comfort they'd never known before, a smoothness and quietness which turn a long journey into an enjoyable, relaxing trip.

The success of the Midland Pullman is emphasised by the fact that today seats must be booked in advance to make sure of travelling—inter-city travellers, on business or pleasure, have found the speed, comfort and convenience of this new concept in rail travel very much to their taste.

The Midland Pullman's success points the way to further developments of this kind, typifying the new look of today's London Midland along with the great modern freight expresses which every night cover the country in a network of regular high-speed routes.

## THE WORLD OVERSEAS

### Confusing German Omens

FROM OUR BONN CORRESPONDENT

THE publication of the memorandum on Germany and Berlin that Mr Khrushchev gave to Mr Kennedy in Vienna has collided irresistibly with the immovable testimony of the "week of German freedom". If words mean what they say, the week's utterances and demonstrations sweep irrevocably from sight Mr Khrushchev's prospect of representatives of the two parts of Germany meeting within six months "to agree in any way acceptable to them on the questions concerning a peace treaty and reunification."

On the morning on which the German public read in their newspapers that the Soviet Union considered it "necessary, for preserving the peace, to fix the situation left in Europe by the war and to formulate and confirm *de jure* the immutability of the existing German frontiers," they read also of 150,000 Silesians (300,000 through some spectacles) assembling in Hanover in order to reaffirm their right to return home, and of the comforting presence among them of the leaders of the four parties represented in the Bundestag—Dr Adenauer of the Christian Democratic Union, Herr Brandt of the Social Democrats, Herr Mend of the Free Democrats, and Herr Seilboth of the All-German party. They also learned that the demonstrators' chairman, Herr Schellhaus, who is minister for refugees in the state of Lower Saxony, had perorated to the effect that the Silesians would never agree to the separation of Silesia from Germany: "We shall not only bitterly oppose any treaty sacrificing Silesia but also regard it as null and void."

The week of German freedom is ending with the observance throughout the Federal Republic of the day of German unity—the anniversary of the abortive rising in east Germany on June 17, 1953. While Dr Adenauer addresses the Bundestag in Bonn, east and west German flags that have been carried since June 1st by some 40,000 youngsters running and cycling in relays from various points on the west German frontiers will be converging on the zonal border, where they are to be set up and illuminated after dark by a galaxy of bonfires. And in response to an appeal by the all-party organisation, Germany Indivisible, millions of west Germans are buying a new edition of the Brandenburg Gate button-hole badge. Schools, bookshops, newspapers and broadcasting stations are all helping in various ways to reassert the German people's claim to the right of self-determination. Some 1,700 commemorative ceremonies ("not longer than 90 minutes," Indivisible Germany soberly recommends) are being held up and down the country. In some towns and villages, streets and squares are being renamed "Berliner Freiheit." Reassuring messages have been coming all week of Washington's, London's, and Paris's unhesitating rejection of the Khrushchev memorandum. Yet at the same time there have been reports of "official spokesmen" in the same capitals conceding warily that the time may well be ripe to hold yet another four-power conference on the future of Germany. It is all rather confusing, but the Germans are getting used to it.

With the Bundestag elections no more than three months away, some loud patriotic oratory is to be expected from prominent party men. More obscure and less inhibited commentators are inclined to believe that the Khrushchev memorandum will bring about a four-power conference before winter, in consequence of

which the two parts of Germany will be avuncularly counselled to meet round a conference table. But Mr Khrushchev is badly informed if he really believes that there is some hope in the foreseeable future of a government taking office in west Germany that would be ready to make vital political concessions to the east German regime. (Territorial concessions are another matter, whatever the Silesians say). Only some dire economic setback could effect such a change of heart, and there is no sign of the likelihood of any such disastrous turn in the Federal Republic's expanding economy.

The Federation of German Industries held its annual meeting at Nuremberg this week in an atmosphere of confident well-being and awareness of industry's political responsibilities. Over the past ten years, it was pointed out, real wages had risen by 78 per cent in west Germany, compared with rises of 50 per cent in France, 27 per cent in the USA, and 11 per cent in Britain. Herr Erhard, the minister of economics, observed the occasion by publishing another of his remarkable two-column personal advertisements in the press, championing free enterprise against collectivisation. "A home of one's own," he declared,

travel, opportunities for professional and cultural education, furniture and better household equipment, good clothes, rising pensions, millions of cars and television sets—prosperity through performance, that is to say—these are the fruits of our work in the spirit of a competitive social economy. With increasing general prosperity, the last in the land will also share in the common progress.

It is possible that Mr Khrushchev and Herr Ulbricht are trusting that the west Germans, obsessed with gaining and enjoying the chattels of the good life as catalogued by Herr Erhard, will gradually tire of the demands of the cold war. The danger has been recognised by several native Cassandras, who have been criticising the light-hearted election pledges of the two major parties, particularly their promises of lighter taxation just when Germany is being asked to do more for the undeveloped countries and western defence. Have the Germans, they are asking, the stamina required to turn the words of the week of German freedom into deeds?

### Nigeria Takes Shape

BY OUR SPECIAL CORRESPONDENT

NINE months independent, Nigeria is still a long way from bringing forth its necessary revolution. The body of the nation is slowly taking shape: a soul has yet to be acquired. Perhaps, because it is an African country, guidance should be sought from a father—but the Nigerian prime minister, Alhaji Sir. Abubakar Tafawa Balewa, is little more than the head of the

Badge of indivisibility

government, and the Governor-General, Dr Nnamdi Azikiwe, is the correctly reticent representative of a constitutional monarch. Behind his desk in Lagos Sir Abubakar is enveloped in white Northern robes: from the antique folds the visitor sees a black wrist, encircled by a gold watch, emerge for a handshake. The gentle voice is imbued with the wisdom of the British 20th century and confident in the strength of the medieval emirs who put him in control of a country that straddles time. "We are past the stage where breaking up is possible," says the strength. "We are still in the process of building a Nigerian nation," acknowledges the wisdom.

There is more commendable insight from Sir Abubakar, spoken in Macmillan English. Europe did not divide Africa—it united squabbling villages and made nations of them. These may join together now if their peoples wish it—but the pan-African state is not for this generation. Unexpectedly, the prime minister asserts that too much aid is not necessarily a good thing, for a country must grow and develop by its own sweat or the people will become lazy. The outsider wonders how, with this moderation of tone, the sweat is to be generated. Sir Abubakar speaks of a "period of excitement" following independence, but the Nigerian nation does not appear to be excited. Nevertheless, the prime minister has gained in stature since independence.

When South Africa left the Commonwealth many Nigerians gave the credit to Sir Abubakar. He gained immeasurably from the conference of twenty African states at Monrovia last month and can expect to achieve further acclaim from Nigerians when the conference is resumed in Lagos later this year. But his shrewdest domestic political move was to appoint Dr K. O. Mbadiwe as personal adviser on African affairs to the prime minister. Dr Mbadiwe has, in his time, been a firebrand in Nigerian politics and in 1958 he caused a national sensation by breaking with Dr Azikiwe on the grounds that Zik's nationalism was too moderate. Sir Abubakar can now appear to be listening to the extreme nationalists without needing to take their advice.

**B**UT Sir Abubakar cannot easily deny the advice of his own political father, the strong man of the Northern Region, Alhaji Sir Ahmadu Bello, the Sardauna of Sokoto, direct descendant of Othman dan Fodio, the founder of a feudal empire the British did not disturb. The Nigerian revolution must begin in the Sardauna's Northern Region. Life for the region's 19 million people has not become noticeably more modern since independence. But a combination of numerical superiority (the Eastern and Western Regions have only 15 million people between them) and ancient political craft has enabled the Northern Peoples' Congress to lead the federation. The NPC seems in all cases to be the senior partner in its alliance with the East's National Council of Nigeria and the Cameroons, founded by Zik and curbed by the coalition now in power.

The radicals are to be found among the young university men of all parties and throughout the opposition Action Group, which, with more verve and efficiency than anyone else in Nigeria, governs the Western Region. But there is danger in the increasing frustration experienced by the Action Group in its attempt to win seats in the North—the only practical route to federal power. In the Northern region elections six weeks ago the opposition parties, already small enough to be insignificant, were practically liquidated. The Sardauna was so certain of the result that he did not bother to campaign. The people obligingly voted the way their emirs told them to.

The Action Group has since accused the North of foul play. It complains that the district heads, responsible to the NPC, did not allow opposition meetings in many constituencies; that candidates were arrested or beaten up or threatened; that administration and NPC officials intimidated opposition voters. The

hotter heads in the Action Group say that if evolution does not right these wrongs in the North there will have to be a forceful revolution. Another Action Group solution for the problem of the North is the creation of a new region out of the area occupied by minority tribes in the "middle belt"—the southern part of the region.

This the NPC is unlikely to do, but it has neatly outmanoeuvred the Action Group in the matter of new regions. The Action Group has long called for a re-division of the country "in such a way that no region or state will feel dominated by another." This would mean new regions carved out of the East and the West as well as the North. The federal government, a coalition of the NPC of the North and the NCNC of the East, has agreed to meet the Action Group a third of the way—by making a mid-west state out of the easternmost portion of the Action Group's Western Region. This state may well vote the Action Group into opposition in yet a further portion of Nigeria, but the party, having called for new states for years, would be seriously embarrassed if it opposed the mid-west plan.

Politics are bitter in West Africa and there have been other attacks on the Action Group, not all of them inspired by jealousy of the Western Region's go-ahead look. The Lagos boundary is being extended—a matter agreed long ago, but young Western Regioners regard it as another federal cut into their territory. Most dramatically of all, the federal government has ordered an inquiry into the affairs of the National Bank, which is associated in Nigerian minds with the Action Group and the Western Region. That this move was not free of politics is shown by the comments of the Nigerian newspapers when it was announced last month. Most commentators remembered the famous inquiry into Zik's African Continental Bank in 1956; then the condemnation was for "imperialism."

But the danger that the Action Group will take desperate action is minute. The federal government is too strong and the party leader, Chief Obafemi Awolowo, too sensible. When, during the northern elections, Dr A. Doherty of the Action Group threatened secession from the federation by the Western Region he was rebuked by Chief Awolowo as well as by almost every other Nigerian leader. Some optimists see an eventual solution in a realignment of parties, with, say, the NCNC and the Action Group in coalition against the North. The NPC is too well represented in Parliament for this to be possible at present, however, and the great Nigerian question remains what Zik would do if pressure for a Republic became irresistible and he was transformed from a passive governor-general into an active president.

For the present the three regions must continue to squabble and to seek status; the East to buy a television station if the West has one; the North to think about following suit. Status-seeking is perhaps as expensive an item in West African budgets as corruption. The difficulty, for visiting economic missions, is to cost them. The Western Region has introduced "universal primary education"; the East is thinking of spending nearly half its budget to do the same.

Plenty of money is going to be needed. Within a very few months independent Nigeria's first five-year plan will probably be announced; it is expected to cost somewhat more than twice

the current £170 million plan. Four economists provided by the Ford Foundation and one Indian from the World Bank are helping with the planning. This alone is awkward, for there may well be accusations that the Americans are having too much to do with it. But Nigeria is neutral in a very western direction and the Americans are probably going to have a lot more to do with its economy. It will be surprising if Nigeria does not receive a very large amount of American aid.

This will have to be spent on many things. The Niger Dam, which will provide power for Kano and Lagos and the beginning of an inland waterway system that could reach right up the Niger to Mali, will cost £68 million in its first stage. Lagos harbour needs new berths; £20 million is being spoken of. Railway extension and conversion to diesels, a bridge at Onitsha and new roads would take another £50 million; agricultural extension services at least £40 million. The list is long and most of it is infrastructure money, with little immediate return.

A Nigerian trade mission is touring the world to drum up business; there is talk of a development corporation to squeeze private money into the country; there is hope from oil and natural gas in the area around Port Harcourt. But Nigeria still depends primarily on agricultural commodity prices, which are not in sight of returning to their earlier high levels. A Chinese trade

mission sadly acknowledged in April that while the Chinese People's Republic desired to trade beneficially with Nigeria, the Chinese drink tea, not cocoa, and are one of the largest producers of coal in the world. It was also expensive to assuage national pride by rejecting Mr Macleod's offer to pay the extra cost of European civil servants.

But production of cocoa, palm oil and groundnuts is increasing, although not always fast enough. Tin and columbite are bringing in useful money. Income tax, however, is too little and too low: 90 per cent of the taxation is indirect. This is partly to curb imports and partly to get round the difficulty of collecting taxes at all. But the luxury of high life in Nigerian cities is obvious to the freshest visitor. The country cannot afford it.

Most of all, Nigeria must spend money on education. The Ashby Report, which calls for a rapid acceleration of educational expenditure, would involve, if put into practice, capital expenditure of £56 million in the next ten years. During this period recurrent spending by the federation on education would rise from £28 million in 1962-63 to £60 million in 1969-70. Nigeria has to contemplate educational spending on this scale, although the present annual budget is around £160 million for the four governments. Only when this money has been found and spent can the true Nigerian revolution go ahead.

## Seaside Treasure Hunt

FROM A CORRESPONDENT IN ITALY

**O**NE of the most popular ways of gambling in Italy at the moment is to try to guess whereabouts on the coast the very rich are going to spend their summer holidays. Then you buy some land there, watch the value multiply, say, ten times in two years, and sell out to a speculative builder. Or, for an even higher percentage profit, you can do the building yourself: build hotels and night-clubs and restaurants and villas, and hope that the world and his mistress will come and stay. What was a fishing-village last year can become a Portofino next year, and in the translation from one to the other there is a thousand per cent profit to be made.

There are no sure guides to a safe gamble; studying the form-book of other successful resorts leaves you as bewildered as ever. No natural splendour ensures success, no dullness of nature precludes it: the accolade of smartness is capriciously bestowed. Viareggio has never been smart, for example, whilst Forte dei Marmi, which is quite as dull, has. The Adriatic belongs to the Germans, the gulf of Sorrento to the English (booming out the cricket scores to each other across the stony little beaches) and the Riviera to everyone. All have been exploited and sucked dry; none is smart.

In fact the whole coast of Italy has been more or less sucked dry by the locusts of speculation; nowhere, except in the far south, can coast-land be bought for its agricultural value (which is practically

nothing, except where it has been terraced for vineyards). Now Sardinia is all the go. Swiss business men ship their Cadillacs to Cagliari and drive round the island in homburg hats, knocking on cottage doors. They get a lot of surprises. If you knock on a peasant's door in Italy, and ask to whom a certain beach belongs, he always says, "To me." It doesn't, of course (beaches in Italy all belong to the government, from which it is possible to buy a concession for a certain number of years). Even the land behind the beach is certain to belong to a whole family who have been conducting an internecine lawsuit over its ownership for 20 years.

Even if you finally acquire the land, the immediate entanglement in local politics, which owning anything in Italy involves, is trying for orderly minds. The syndicate who last year built a night-club at Porto Santo Stefano, on the Tyrrhenian Sea near Orbetello, for example, although they had known the place and its officials for 20 years, had a battle for power for a year: with the mayor (sure that a night-club would undermine the innocence of the villagers); with the Fine Arts Commission for Tuscany (the guardians of natural beauty) who would arrive in motor cars from Siena and order the roof to be lowered until only dwarfs could get in, or even, in fits of pique, forbid the project altogether. But the club was finally built, and Porto Santo Stefano was suddenly fashionable. Its streets and bays echo with Italy's virility-symbol, the hotted-up

exhausts of cars and speedboats; its name is dropped as carefully in Rome as the names of palaces and princes (and is picked up as carefully by the Roman scandal magazine *Lo Specchio*). The money that backed the night-club there (La Strega Del Mare) must have quadrupled itself in 18 months.

From the spectacular success of Santo Stefano one lesson is to be learned by would-be dabblers in this speculation: if you want to catch sophisticated customers, bait your hook with simplicity. Fish for wise old trout with worms, not with spent olives on a "ooo" hook. Sophistication and simplicity are not opposite poles of experience, but extremely close together; an artificially created simplicity is the last refuge of an over-sophisticated society against boredom. Hence the stone walls and lush ceilings at La Strega del Mare, which have at times trapped a roomful of the most sophisticated old trout in Europe.

Inside every Count Robert de Montesquieu, it seems, there is an embryonic Rousseau, who only gets out for the summer holidays; this is a Rousseau to be nourished and pampered, because his pockets are still the pockets of Montesquieu. Set him at a rough table under a vine, with a view of the mountains and the far-off sea; bewilder him with discomfort—and you can charge him £1 for a Planters Punch made of lemon juice and crushed ice. "It's amusing," they say in their tired voices. The phrase is a golden chaplet set on the brows of investors and managers who have schemed to attract those long white cars that howl out of Rome on Thursday evenings in the summer.

## Brighter Outlook for Kenya's African Farmers

FROM OUR CORRESPONDENT IN NAIROBI

**I**N the middle of all the uncertainty, economic and political, in present-day Kenya, Silas Gathunguri spoke reassuring words. He stood at the head of his 12-acre farm in the Kikuyu district of Kiambu and looked down on his banana trees, his maize, his coffee trees and his beds of asparagus. He fondled a Jersey calf that was tumbling around an almost Alpine little meadow, and said: "I think I cannot fail to make money."

One of the proudest achievements of the Kenya government is that, mainly through enclosure and land consolidation, it has given thousands of African farmers the near-certainty of handsome profits. Last year the gross revenue of African farmers for marketed crops and livestock was 15 per cent more than in 1959, and Mr Bruce Mackenzie, the former minister of agriculture, believes that this present total revenue of £9.6 million will increase by £2 million or more every year. Although the revenue of African farmers amounts at present to only one-fifth of Kenya's total agricultural revenue, this proportion will grow rapidly and provide the broadest and soundest foundation for Kenya's economy.

It is a sound foundation because it is being widely spread over several crops. This year African-grown coffee will make up nearly a quarter of this principal Kenyan crop; so fast has Kenya moved that it seems absurd

Prosperity from the land

to remember how ten years ago the Kikuyu were forbidden to grow coffee and how this ban, imposed by the government at the settlers' behest, drove men like ex-Senior Chief Koinange to side with Mau Mau. In five years' time the acreage of African-grown tea will, according to present plans, have multiplied fivefold to 11,000 acres. Last year the revenue from both rice and pyrethrum grown by Africans doubled. African livestock sales climb steadily, if more slowly. For those who are jaded by Kenya's politics, these are cheering figures.

Undoubtedly some of this progress would have come anyway without land consolidation and enclosure. The introduction of new crops was not dependent upon the teams of clerks who for the last six years have been walking up and down the ridges and valleys of Central Province measuring with chains the fragmented little inheritances of thousands of Kikuyu and redrawing maps to gather each man's fragments together. But land consolidation must be given all credit for three improvements. In the Kiambu district the 38,000 landowners had an average of eight fragments each. By concentrating the fragments, a farmer's work also became concentrated and therefore more productive. He then had a large enough holding to plan properly for terracing and crop rotation. And more than 150,000 farmers in Central Province have now a registered title to their farms, which is security for a commercial bank loan to develop their land. In the last eight months banks have lent £100,000 to farmers in Kiambu alone.

The process is by no means finished. The Kikuyu areas were tackled first, both because population pressures (in places as high

as 1,000 to the square mile) would not permit inefficient farming and because the Emergency gave officials powers to take administrative short cuts. More than £1 million has been spent on land consolidation so far; yet in Meru, the largest and probably the richest district in Central Province, only a quarter of its 800,000 arable acres have been surveyed for consolidation. In Nyanza Province the offering of registered titles will begin next year; officials, however, expect comparative lethargy among the Luo in contrast to the competitiveness of the Kikuyu to benefit from bank loans.

Only in Fort Hall, the largest of the three Kikuyu districts, has this agrarian revolution badly misfired. Last August it was discovered that there had been wholesale corruption by junior clerks who sold farmers extra and often imaginary acres. This touched off a long quarrel between the government and local Kenya African National Union politicians. Dr Gikonyo Kiano, the Legislative Council member for Fort Hall, has asked for a complete revision of the whole area; he claims that the government has only detected corruption in the areas where the clerks' total differs widely from the total acreage calculated by aerial survey, and that it is ignoring the areas where clerks deprived one farmer of land for another's sake and made the totals tally. The administration, anxious to save money and to complete revision as soon as possible so that farmers can qualify for loans, is tackling revision piecemeal. Officials say that farmers who believed themselves deprived had time earlier to object. Even so, they have found it necessary, having checked only half of Fort Hall's 120 consolidation schemes, to remeasure holdings in 44 of them.

**B**ESIDES Fort Hall politicians, many people are prepared to point out imperfections in the practice of land consolidation while endorsing its principle. Recently Mr Jomo Kenyatta said he had heard of many ex-detainees who had been released to find their farm fragments absorbed by "loyalists." District Officers usually deny this, and say the consolidation committees of tribal elders were particularly careful to safeguard the land rights of the 77,000 detainees. But it is clear that some injustice occurred in this way, and it is only sensible to offer such men the consolation prize of first opportunity to take land in the resettled areas of the former White Highlands.

Another imperfection is that land consolidation, like the Land Husbandry Act in Southern Rhodesia, creates a group of legally landless people; there is the family who "squatted" on an unregarded fragment of someone else's farm, and there are the younger sons of the landowner who has insufficient acres for subdivision. Secondary industry may share in agricultural prosperity sufficiently to absorb all these landless, but it is unlikely. The African political leaders repeat the blithe slogan "Land for the landless," but so far have not defined who qualifies as "landless" for their bounty, nor where and how new lands will be found for them. It may be possible to accommodate them all. It would be wise to consider setting up producers' co-operatives for these poorer countrymen; at present Kenya possesses only marketing co-operatives. Silas Gathunguri, the careful Kikuyu, intends to prosper enough to buy up neighbours' holdings for his five sons. But this policy leaves the hindmost farmer for the Devil to take.

A wider criticism still can be levelled at land consolidation officials. They have become immersed in details, and believe results will speak for themselves without presentation to dubious African politicians or interested, if ignorant, foreign investors. An economic survey of the Central Province is urgently needed to provide statistics that would show how these enormous agricultural changes are magnifying opportunities for commercial investment. It would also serve to impress the African politicians who, like Mr Kenyatta, sometimes speak of the registered titles as "mere scraps of paper."

A new £10 million blast furnace at Port Kembla, N.S.W. which has produced well over 2,000 tons of pig iron in a day—a record in the British Commonwealth.

Below: Hot dip tinplate production running at 90,000 tons a year. A new electrolytic tinplate plant of 150,000 tons capacity will commence production in 1964.

## AUSTRALIAN STEEL FORGES AHEAD

10,000,000 Australians use steel at almost the same per capita level as do Britons, Canadians and West Germans. Today, Australia is producing very nearly all the steel she consumes—and is, in fact, a net exporter of steel. It is an exciting story of massive expansion—backed by a capital investment of some £A200 m. since 1948. Ingot production has doubled in the last 7 years to a current output of 3.3 m. tons. With the advent of tinplate manufacture in 1957 and cold roll stainless steel from a Sendzimir mill in 1959, new steel products are diversifying Australia's manufacturing scene. Yet large scale expansion still continues. More than £A100 m. will be expended over the next few years. Such is the confidence that Australia's steel makers place in their country's continuing vigorous growth.

Australia's fully-integrated steel works, situated on the coast with coalfields adjacent, enable her to produce one of the cheapest high grade steels in the world.

Australia looks forward to a continuing trading, manufacturing and financial partnership with Britain. Any information about trade, investment or migration will be gladly supplied by Australian government representatives in the United Kingdom. They are located at Australia House and also at the offices of the Agents General for each State.

At present the District Officer or the agricultural official tends to look on land consolidation with proprietary pride; he gazes from his Landrover across the valleys to the neatly reorganised ridges—an administrator's dream come true. The divisional and provincial boards, which keep the machine running by approving transfers, sponsoring loans, hearing appeals and laying down the minimum acreage for subdivision, are manned by officials and trusty Africans of the old school. KANU branches have asked, possibly for the wrong motives, to have representation on these boards. Frosty replies come from the administration. Yet it seems important to associate the younger generation of African leaders with the running of the scheme through membership of these boards. Otherwise there is considerable danger that, when they shortly come to full political power nationally, they may in ignorance make radical and harmful changes. And land consolidation deserves to survive undamaged into the new regime.

## Jugoslav Economic Experiments

BY A CORRESPONDENT LATELY IN BELGRADE

"If Mr Selwyn Lloyd were to come here tomorrow he would probably grasp better the meaning of the changes in our economy than his Soviet counterpart." This remark by a member of the government is characteristic of the way in which the economic reforms introduced in Yugoslavia during recent months are being discussed. For the first time in the history of a communist country the Yugoslav government has initiated a general overhaul of the economic system, which involves a process of readjustment to the world economy and a decisive shift of emphasis from state administrative controls to market mechanism as well as to monetary and fiscal policy.

One of the main features of the new economic model is the introduction of a new foreign exchange and trade system. The multiple rates of exchange and the coefficients for imports and exports have been replaced by a single fixed clearing rate of 2,100 dinars to the pound sterling (the new tourist rate is 1,680 dinars to £1) and a provisional general customs tariff. Some 30 per cent of imports have been freed from administrative controls, the rest being regulated by quotas and general and restrictive licences. Thus Yugoslavia has become the only communist country that allows any currency convertibility or free trade.

Side by side with the foreign exchange and trade reform, new impetus has been given to the free formation of prices; administrative interference in the activities of factories and firms run by workers' councils has been reduced; the degree of featherbedding given to inefficient industries has been cut; and a new system of payments that will provide effective incentives to increase productivity and eliminate surplus labour has been introduced.

One of the most interesting measures concerns a new rate of taxation for company profits. Under the previous system, the profits remaining after costs, depreciation, interest and communal and turnover taxes, were taxed at a highly progressive rate taking an average of about 24 per cent of the net income. The restrictive effects of the old regulations have now been largely, albeit not completely, eliminated. A new uniform rate of taxation on company profits has been fixed at 15 per cent. At the same time an excess profits tax will be imposed if the annual net profits of a company surpasses 6 per cent of its total assets. The new tax, which will take 25 per cent of these surplus profits, has been widely criticised as a discriminatory measure hitting the "growth industries" and weakening the advantages of the general tax concessions. Nonetheless, the enterprises have been given more say in the formation

of prices and earnings, and the changes in the fiscal system are expected to stimulate the more rational utilisation of labour, productivity and capital.

The Yugoslav planners are keenly aware that they have considerable problems of readjustment to solve and serious handicaps to overcome. But they have a surprisingly open-minded attitude to their task. "We want to create an optimal relationship between decentralised planning and the market mechanism," said Mr Gligorov, the economic secretary of state. "We have no dogmatic prejudices, none whatsoever..." Control of prices and wages as well as direct state intervention in economic management have, in fact, been reduced to a minimum. A new system of wage and salary payments has been worked out which applies the principle of sharing the profits in practice. Nevertheless there are fears that the new era of profitability and competition will create great inequalities within and between factories, affecting whole industrial branches as well as such underdeveloped areas as Macedonia and Montenegro. A crucial problem is how to define and safeguard sectional and federal interests without reverting to administrative intervention.

Inevitably, the free play of market forces will have to remain within the framework of a planned economy. It is the investments that keep the frame together. The key role is assigned to the Federal Investment Bank which allocates about 38 per cent of the credits. Thirty per cent of gross fixed investments are financed by enterprises and the rest by the communes (the 800 territorial units of self-government) and the six federal republics.

A thorough reorganisation of the banking system is at the moment being carried out in order to make credit control operate more effectively as an instrument of economic policy. The communal banks will be the bankers for the entire economy in their region and their number will be raised from 120 to 600-700. At the same time the National Bank, which has so far been both a central and a clearing bank, is to remain in operation as a central bank controlling money supply and monetary movements, as well as issuing bonds and Treasury Bills. In marked contrast to the "orthodox" communist countries, the three special banks (foreign trade, agriculture, investments) are entitled to carry out direct transactions with foreign countries.

THE introduction of obligatory reserves to be kept with the National Bank and of a Bank Rate are further measures aimed at securing economic expansion without inflation. With the balance of payments still deeply in the red (1960 closed with a deficit of some £90 million), restrictive measures have been introduced to force companies to transfer from their reserves to their working capital instead of financing "wild investments."

The pressure of the world market and intensified domestic competition have led to sizeable cuts in profit margins (for example in agricultural machinery and textiles) but also to sharp price increases. A previous 10 per cent flat increase in wages and salaries as well as other benefits have, however, more than offset the effects of the price movements. By the middle of May the market had, on the whole, become stabilised and real earnings during the first four months of 1961 are said to have increased by more than 7 per cent.

Though the currency and trade reform could not have been possible without the loans worth \$275 million, granted by the International Monetary Fund, the United States and west European countries, it is also clear that they are the conclusion of a seven-year economic march which is one of the most rapid in Europe. Whatever the final ramifications of the new reforms may be, they are expected to give an even more vigorous impetus to the competitive forces which have already generated, by east European standards, a modest prosperity.

## In 20 Years—his tractor will be real

Today it's a toy. But in 20 years, all being well, he will have a place of his own, with man-sized tractors, combines, balers and ploughs to work for him. And, like his father, he will turn for these things, and for the other machines and implements that he needs, to an organisation whose name is a by-word for quality and reliability: International Harvester. For their part International Harvester are planning *now* to ensure that the equipment they make tomorrow will be as advanced, as efficient and as utterly dependable as that they produce today.

INTERNATIONAL HARVESTER COMPANY OF GREAT BRITAIN LIMITED • HARVESTER HOUSE • 259 CITY ROAD • LONDON EC1

## Every 25 minutes... A PLANE LEAVES LONDON FOR A COUNTRY SERVED BY BARCLAYS BANK D.C.O.

To Africa, to the Caribbean, to the Mediterranean fly the planes. Some go direct, some connect with other smaller air lines which carry businessmen, tourists or government officials on to little-known and far-off places.

It will be a small township indeed which does not contain a branch of our bank. From the mines of the Rand to the cocoa trees of Ghana, from the coffee plantations of Kenya to the oil wells of Trinidad the name of 'The D.C.O.' means modern banking service at its best.

All in all we have over 1,250 branches in 41 territories extending over half the width of the world.

## Trader or Haulier?

**T**WENTY-EIGHT years ago competition between road hauliers was put under restraint by a system of goods vehicle licensing. Ever since, a distinction has been jealously preserved between a public carrier and a private carrier of goods. The professional haulier has been compelled to convince the licensing authority that there is room for him to put more lorries on the road, with evidence and witnesses supporting his claim that they have specific work to do. But Parliament has never put a barrier in the way of anyone, big manufacturer or corner grocer, who chooses to move his own property in his own goods vehicles. The private carrier gets his "C" licence simply by filling in a form. Even the postwar Labour Government pursuing an unattainable "co-ordination of all inland transport" finally ran away from its first idea of confining private carriage "as of right" to retail and wholesale distribution within a 40-mile radius. But the "C" licence operator, free from restriction in moving his own goods, has always been banned from carrying anyone else's. The professional road haulier has been shielded through the licensing system from the pressures of uninhibited competition from other professionals, but this in turn has imposed outside control over the conduct and growth of his own business.

This long-standing division of function and regulation in the carriage of goods on British roads has now been threatened by the Transport Tribunal's endorsement of an appeal by Merchandise Transport, Ltd., from a decision of the Metropolitan Licensing Authority. For the first time, a firm running lorries under a "C" licence has been allowed to transfer its fleet to an "A" licence, the professional hauliers' ticket. Merchandise Transport will thus be free to ply for hire to get return loads—the enforced lack of which has always been the main snag to economical "C" licence operation, and are often enough scarce for professional hauliers too. Merchandise Transport is not yet assured of being able to run the gamut from C to A, for a number of road hauliers are taking the Tribunal's decision to the Court of Appeal. The Tribunal gave a bare oral decision in January, and the haulage industry has been waiting until this week for the Tribunal's reasoned judgment in writing. But the number of applications made in the meantime by other "C" licensees to transfer to "A" licences has already confirmed the hauliers' fears of the epochal importance of the Tribunal's decision.

Indeed, if private firms running transport fleets of their own had wanted to choose a test case, the situation of Merchandise Transport could hardly have been more typical. It is a wholly owned subsidiary of Harris Lebus, the furniture manufacturer who, like a large number of other industrial firms, relied almost entirely upon public hauliers until long-distance road haulage was nationalised in 1949. Harris Lebus then began building up a "C" licence fleet and in 1955 it formed Merchandise Transport as a separate company to take over one of the state-owned road haulage units that were being sold off with a special "A" licence. A few years later, it added to its transport subsidiary's fleet by buying out two small private haulage businesses operated under ordinary "A" licences, but the parent company still ran lorries under "C" licences. The case arose from Harris Lebus's natural desire to simplify its transport arrangements by putting all the vehicles of the group under the management of its subsidiary and to get the best return on its investment in the combined fleet by operating all but a handful under "A" licences. All the parent company's vehicles were used on the group's business and only a minor part of the subsidiary's earnings came from carrying other firm's goods—and that almost entirely on journeys back to base.

**T**HE issue, before the licensing authority in February 1960 and before the Transport Tribunal last November, was whether 112 of the parent company's Luton furniture vans, plus another seven the group wanted to add, should be run by the subsidiary company on "A" licences. The question whether Merchandise Transport should get a "B" licence, instead—the third main category of goods vehicle licence,

authorising the carriage of the owner's and other firms' goods on certain conditions—did not arise. "B" licences were not asked for, and although some of the sixty-four objectors, which included British Railways and British Road Services, suggested this solution, neither the licensing authority nor the Tribunal would consider it.

The Tribunal's judgment has overthrown a precedent set by its predecessor, the Appeals Tribunal, before the war. But it was not wholly unexpected. For the Transport Act of 1953 made a significant change in the criteria for the granting of applications for "A" licences. Instead of considering "the interests of the public generally,

including those of persons requiring, as well as those of persons providing, facilities for transport," as in the original Act of 1933, licensing authorities were instructed to "have regard to the interests of the public generally, including primarily those of persons requiring facilities for transport, and secondly those of persons providing facilities for transport". The needs of a haulier's customers were placed above the interests of his competitors. Parliament's intention in 1953, in making this and certain other changes to the rules for road haulage licensing, was to unloosen by a notch or two the tightness of control over competition in haulage. A number of decisions by the Transport Tribunal since 1953 have reflected this change in emphasis but in ways to which professional hauliers have not taken kindly. Largely, the effect in practice has been to encourage transfers to "A" licences from other licences, rather than to attract any greatly increased number of new entrants to an industry for which the cost of entry, particularly in these days of ready hire purchase, has never represented any real deterrent.

Previously, the Tribunal has allowed C-hiring licences (which permit the hire of lorries, but not drivers, to a single customer) and A-contract licences (which authorise the hire of lorries and their drivers to one customer) to be converted into ordinary "A" licences. It had also declared that, if a customer wanted to change his transport arrangements and employ another haulier, even though the new carrier was a wholly-owned subsidiary of the same customer, then that circumstance by itself would not vitiate the "proof of need" required for the grant of an "A" licence. So an application was bound to come sooner or later from a firm's transport subsidiary to take out "A" licences to carry the freight its parent company had been moving in "C" licence vehicles. And the Tribunal's decision seemed equally predictable. The Metropolitan Licensing Authority considered that to allow the group's Luton vans to bid for return loads would "extract" traffic from existing hauliers and also that the application was "less than genuine." The Tribunal rejected the first point as something the authority was expected to take into consideration but not to regard as the acid test. It rejected the second because Harris Lebus's desire to make the best use of the group's transport facilities was entirely genuine. It now remains for the Court of Appeal to decide whether the grant of these "A" licences correctly interprets the 1953 Act.

WHATEVER the upshot of this further appeal, it has become increasingly clear that the licensing system is not satisfactory. It was shaped in the aftermath of the 1929-31 slump in the hope of restoring some order in road haulage. This infant industry was still characterised by one-man businesses, while the railways were still treated as monopoly carriers. And competition, already intense, turned bitter through sheer lack of business during the pit of the depression. Although the Salter Committee in 1932, which fathered the licensing system, appreciated that it would need to be adapted to changing circumstances, road haulage licensing has never since been made the subject of a full review.

In a sense the principal objective of licensing—to limit the competition facing road hauliers—has failed for the simple reason that restriction was placed on only one part of the carriage of goods by road. The number of lorries run under "A" licences has not markedly changed (though their capacity in annual ton-miles is markedly higher): in 1936 some 25,000

hauliers operated about 85,000 vehicles between them, whereas by 1960 just under 16,000 hauliers, plus the state-owned British Road Services, ran only 91,000 vehicles all told. In contrast, "C" licence fleets have risen four-fold, from a total of some 300,000 in 1936 to more than 1,200,000 at the end of last year. A high proportion of these fleets are vans and light trucks used for local delivery. But over half of the larger lorries of more than 3 tons unladen weight have a "C" licence authorisation. A good three-fifths of the freight moved by road in this country, measured by ton miles, is now carried "on own account" in private lorries—or a third of all road and rail freight traffic together. Private transport is the real competitor for all public carriers, road and rail, and if the Merchandise Transport decision is upheld it can only add to the pressure by affording "C" licensees the chance of cutting the cost of empty return journeys.

The licensing system, considered by itself, has a number of weaknesses. It appears to be not so very hard to get round, by such devices as "buying" goods from other firms to provide "C" licence vehicles with a return load. Enforcement is always difficult. Road hauliers frequently find "pirate" vehicle operators who have put down a deposit on a second-hand truck, but have omitted to apply for a licence, undercutting them for the transport of, say, building materials to a large construction site. Rate competition in long-distance haulage has been fierce ever since the railways won commercial freedom, and for long periods quite uneconomic.

But perhaps the major criticism of haulage licensing is that it appears to have inhibited the growth of large, privately-owned firms able to afford the overheads of efficient transport management and big enough to organise themselves to handle return loads efficiently. Although the Transport Development Group has built up, mainly by buying up other hauliers, a fleet of over a thousand lorries, only one per cent of all hauliers yet run more than forty vehicles and fewer than five per cent operate twenty-five or more. Under licensing, a haulier wishing to add to his fleet has to face the deterrent of countering objections from any of his competitors who are minded to stop him expanding. If the "normal user" of his licence—or the detailed statement of traffic he expects to carry—changes in any significant way during the five years or so that the licence is valid, he has to put in a fresh application to the licensing authority, with all the attendant paper-work and the mobilising of evidence from customers, seeking a change of "normal user." In the last few years the licensing authorities have been looking with a distinctly jaundiced eye on such broad statements of intention as "general goods, Great Britain": they have been forcing hauliers to be a great deal more specific.

In the main, licensing has tended to crystallise the professional part of road haulage into a rigid pattern, and has made adaptation to change too cumbersome. At the same time the private part of goods carriage has been entirely unhindered and shown itself highly dynamic. Whether a different form of licensing for the public carrier, by route and area served, as in the United States, rather than by vehicle, as in Britain, would be more flexible in operation—and could be transplanted here—are questions not easy to answer. Restrictions upon "C" licences, as an alternative, are no more digestible politically now than they ever were. If the arguments for complete abolition of licensing are still not clear, at least a major study of how licensing has worked and how it could be improved is now very much to be desired.

## Report from Harwell

**Our Special Correspondent finds that the Atomic Energy Research Establishment is asking the right questions about itself.**

AN exasperated admirer wrote recently that Miss Marilyn Monroe reminded him of a sloth: "You stick a pin in its belly and three weeks later it says 'ouch'!". He could as easily have been talking about the Atomic Energy Authority which, pricked and goaded by criticism at home and abroad, has finally "ouched" and is beginning to put its house in order. This will be no light task; it is easier to diagnose what is wrong with the authority than to suggest a cure.

The AEA may conceivably be efficient as a producer of nuclear weapons and fuels but it is certainly too large for an efficient research unit and this is specially true of its main research centre at Harwell. This was the cradle of atomic energy in Britain but the child grew incredibly fast. A staff of 600 has grown to 6,000 in ten years. Whatever the optimum size may be for a research station, this is hopelessly too big. It can be argued that a staff of around 1,000 is the most that can be administered efficiently; even if the ceiling were as high as 2,500, Harwell cannot guarantee efficiency and good research with its present numbers.

Elephantiasis at Harwell has many causes, but the principal one is the excitement of a crash programme in which much of the research for the accelerated nuclear power programme and for fusion was carried out in the fifties. It also coincided with a time when Harwell had three directors in quick succession. The consequences are now coming out: faults in nuclear power stations about to be commissioned that ought to have been recognised years ago; doubts about the soundness of the authority's long-term programme of new reactor development; the recasting of research into fusion; and a low esteem for British work in pure nuclear physics. Harwell's once-bright public image has become tarnished.

The Atomic Energy Authority has not been wilfully blind to what was happening—it would have needed to be deaf, too, to ignore complaints coming from Harwell itself, which enjoyed the esteem of being one of the world's major centres of nuclear research and a Mecca for so many foreign scientists. But the authority was unable to bring Harwell under a new regimen when its two major tasks had been completed with the opening of Calder Hall and the explosion of an H-bomb. There were exhortations to Harwell to stop growing, but no one suggested how.

Two steps that are now being taken will not make Harwell any smaller though they may stop it from growing larger still. One is to establish a new division solely responsible for the development of reactors. This is an important change of policy. Until this year Harwell was responsible for new reactor designs in their experimental stages. If the early results looked discouraging, nothing more was heard of them. If they showed promise, they were handed over to the AEA's engineering divisions for scaling up to prototype power station size. This practice started when Harwell was the only atomic laboratory in Britain, and Sir Christopher Hinton kept a drawing office at Risley in Lancashire to prepare blueprints for the big pro-

duction plants. While there was one basic type of reactor in Britain it worked, but as the scientists began to explore other possibilities, the buildings at Harwell became cluttered with baby reactors which had eventually to be moved to Winfrith Heath in Dorset. This eased the pressure on Harwell's accommodation but increased its administrative problems as well as the opportunities for friction with the engineering divisions.

THERE will be further relief when fusion research begins to move from Harwell to new quarters at Culham airfield in Oxfordshire. This move will be significant in several ways for the authority. It has perhaps dealt more ruthlessly with its programme of thermonuclear research since the Zeta fiasco than with any other branch of its activities—possibly because this is one field where it has no outside commitments. The thermonuclear laboratories today present a remarkably different atmosphere compared with three years ago. Now the over-ambitious projects have been cancelled and research is being carried out on a broad front. The aim is no longer to seize control of fusion by one master-stroke but to discover by a series of patient steps (one forward, two back) what tricks of nature make fusion so difficult to achieve in a laboratory when it works so well in the sun (and in H-bombs). Equipment for a single experiment can cost £100,000 and the bill for a whole experiment can run to £250,000, but there is some comfort in the fact that fusion research has led to some striking developments in electrical techniques. These experiments require quantities of power of the order of three megajoules at a time released in fractions of a second; this has led to the design both of unusually high-speed switching devices and of unexpectedly cheap storage condensers.

The authority has re-planned its fusion programme with a determined effort to keep it to a manageable size. The director of the new (and autonomous) thermonuclear research centre at Culham intends to keep the staff down to 750, if he can. The first two stages of the new station (there is a third not yet designed or approved) will cost £4½ million to build and about £2½ million a year to run, against £15 million for Harwell. These are large sums for research that may yield little fruit within the lifetime of anyone reading the figures; but it is questionable whether thermonuclear research on any smaller scale would be worth while.

Harwell has hived off some, but not all, of its research into pure nuclear physics to the new Rutherford research centre at its gates; this comes into business in 1963 when its giant particle accelerator begins work. Here is another example of nuclear research on the multi-millionaire scale. One tool of this kind is essential for pure nuclear research and since it costs several million pounds, several universities and Harwell have clubbed together to pay for it.

These changes will reduce the number and scope of Harwell's responsibilities and swing the emphasis away from the recent preoccupation on engineering development back towards research. But they may not reduce its physical size very much. So long as Harwell remains responsible for much of the basic research into reactor physics and into reactor

materials (especially that intractable fuel, plutonium); so long as it has to keep a watching brief on health and safety in atomic practice; so long as it is pre-occupied with the search for safe and convenient means of disposing of the gallons of lethal radio-active waste from nuclear power stations; and so long as it makes and sells isotopes it is difficult to see how Harwell will be reduced to more reasonable size. Some fields of research are so difficult that several laboratories are needed to cross-check each other's results. This does not necessarily imply duplication—the director, Dr F. A. Vick, explained how the work on graphite to be done at the Central Electricity Generating Board in its new laboratory at Berkeley differs from similar work already under way at Harwell. This sounds less than finally convincing—there may well be scope for transferring more of Harwell's current work to new laboratories.

But something more is needed than reduction in size. Harwell laboratories today give the impression of serving as a maid-of-all-work on whatever jobs come along, applying skill and devotion to a programme that is in some respects arbitrary and haphazard. The laboratories are doing much valuable work on new fuels for new reactors, especially various compounds of plutonium for reactors of the Dounreay type. Plutonium must work as a fuel, and must work in Dounreay because the future British nuclear power programme rests on the assumption that plutonium—produced by the ton in the CEB's nuclear power stations—is a nuclear fuel of considerable commercial value. At the moment it is a nightmare, provoking one scientist to the comment: "Nature never meant us to get at nuclear energy." In less complicated fuels, such as the various ceramic (or sintered) forms of uranium, Harwell's work is probably years behind the French, and for water cooled reactors, it is even further behind the Americans. The reason is that the directors of the authority ordered crash programmes on a narrow front, instead of cautious preliminary investigation along a broad front. Harwell's research began

one-sided and Britain's knowledge of reactors is one-sided in consequence.

At least the need for flexibility and accommodation for new ideas is now recognised at Harwell. Work there, however interesting it may be, should in future be handed on at the appropriate stage for others to develop. Constant exchange of staff with the universities and with other countries is intended to keep ideas freshly flowing. Dr Vick, referring to the 20 per cent of Harwell's effort devoted to pure physics, spoke as the director of a research station whose heart was in research and not in empire building.

But the question remains: can these objective standards be met by a centre with 6,000 workers? Is there any chance of breaking it down into autonomous sub-divisions of more reasonable size, corresponding to the new thermonuclear centre at Culham? Is there anything in the counter argument that the economies of common services provided by Harwell outweigh the administrative difficulties and that these can be met by decentralisation within its boundaries? Another point left unresolved is that Harwell is a relatively small unit in the AEA's empire. It is the centre of the authority, but while it employs 6,000 scientists and costs £15 million a year, the rest of the AEA employs 34,000 and admits to spending £63 million with a further undisclosed sum on weapons. The key to research does not really rest at Harwell, although Harwell gets the blame if it is ill done. The big decisions rest with the new reactor division, and if this chooses to ignore certain lines of development, Harwell can do little to set matters right.

Dr Vick has shown what Harwell does (and what it does not do), what it costs, and the kind of men who do the work. He has explained how he is trying to correct Harwell's middle-aged spread. And he has shown that he accounts for at most a fifth of the authority's huge budget, and less if weapons are taken into account. It is now for the AEA to explain about the rest when the annual accounts are presented next month.

## BUSINESS NOTES

### THE EXCHANGES

#### *A Reassurance in Time*

THE hope that the annual meeting of the Bank for International Settlements last weekend would provide the occasion for calming the exchange markets has been fulfilled. The central bankers themselves were able to keep their traditional silence. It was left to the chief of the International Monetary Fund, Dr Per Jacobsson, who has no qualms about committing himself in public, to provide the public reassurance, in well chosen words.

"I happen to know," Dr Jacobsson told the Basle Economic Society, that in all the major financial centres the monetary authorities are determined to maintain existing parities. There is no foundation whatever for the rumours that there are some new plans under international discussion for currency adjust-

ment whether by revaluation, devaluation, widening of margins, or in any other way.

This is not the first time Dr Jacobsson has put his office and his reputation behind the defence of sterling. He went on to say:

I have been very glad to see in Basle this weekend renewed evidence of the firm attitude of central banks and of the effective co-operation which is going on between them.

Following the recent statement by the German Bundesbank in its annual report that this co-operation "has already worked excellently . . . and is in future to be developed and made still closer," this is a reassuring sign that mutual aid between central banks is more than a temporary expedient.

It immediately reassured the markets. Foreign exchange dealers returned to their telephones on Tuesday morning of one accord, to buy sterling, and the rate on the dollar went up smartly from \$2.79 to \$2.79½. On Wednesday sterling rose to \$2.79¾, and would have gone higher if the Bank of England had not intervened to buy back some of the dollars it had sold at the end of last week. But the amount of sterling that operators have bought is probably smaller than the amount they sold last week. Speculators have been made to pause; those who were running a very short position in sterling have been induced to cover, and some have had to buy back their sterling dearer than they sold it. Speculation has been calmed—and it partly switched to the Canadian dollar after the public dispute between Mr Coyne and Mr Fleming came fully into the open. By Wednesday the Canadian dollar had fallen from 101.17 to 100.45.

But the more general anxieties about

Britain's competitiveness and the course of the domestic economy remain; these could not be expunged by a statement from Dr Jacobsson. The anxieties find their technical reflection in the maintenance of high margins against sterling in the forward exchange market; the discount is equivalent to an annual rate of just over 2 per cent against the dollar and 4 per cent against the Swiss franc. On Thursday the publication of poor trade figures for May—which put exports in March-May together 4½ per cent below those of the three preceding months, still a slightly smaller reduction than that in imports—caused a slight setback in sterling, and the spot rate fell to 2.79¾. The world bankers are providing the credit. It remains for the British Government to provide the policies.

### IN THE MARKETS

#### *Following Sterling*

ONCE again, both sides of the stock market have faithfully reflected the downs followed by the ups in sterling, with gilt-edged and equity prices falling before the week-end, rallying a little later and faltering again on Thursday on the news of the poor trade figures. This reflects quite rational doubts about how the economy will fare in the coming months. The volume of trading has fallen sharply and on Wednesday business was at its lowest level for five months. The fall in gilt-edged prices was checked on Wednesday, when War Loan gained ½ to 55, but there was no evidence of any real resumption in buying. Investors are still shaken by the recent fall and may have been unnerved by some extravagant press comment. Similarly, though a few have had a flutter in newspaper shares, there has not been much buying in the equity market. At the same time, there has been no nervous spasm of selling to shake the market again. Throgmorton Street has much the same appearance as Wall Street with the indices swinging idly—some would say uneasily—below their peaks; this week *The Economist* indicator, reflecting the fall before last week-end, lost 8.4 points to 402.3.

The fall in gilt-edged prices came at an inopportune moment for the offer to stockholders by Rolls-Royce of £12 million 6½ per cent debenture, 1981-86; over 80 per cent was left with underwriters. In view of the terms that have to be offered in the London market to gain investors' support, a few companies have gone abroad for new capital at cheaper rates. British Aluminium, for example, is to make a second loan in Switzerland to raise about £4½ million. Through a banking syndicate, it is offering Sw. Frs. 60 million of a 4½ per cent unsecured loan stock, with a life of 15 years, at par. The opportunity to look abroad is not available to all companies, and some might not be able, or wish, to take on the exchange risk.

### STEEL PRICES

#### *Third of a Loaf*

SINCE the Iron and Steel Board rejected the steel industry's request for higher maximum prices last autumn following the increased cost of coal and coke, the industry has agreed to higher wages, charges for road haulage, pensions and insurance have gone up, and a duty has been put on the oil fuels the industry uses. The steelmasters had already submitted another formal application to the board before the budget added the oil fuel duty to its list of cost increases. This week the board granted the industry an increase of about one per cent, or ten shillings a ton, in permitted maximum prices across the full range of steel products from June 19, 1961. In the event it seems that oil companies have passed on only about half, in some cases slightly more, of the twopenny a gallon impost on oil fuels: on the tar and pitch mixtures that the steel industry produces for itself, the full amount has had to be borne.

The new prices will bring in roughly £9 million a year more, or only just over a third of the industry's own estimate of the total increase in costs since last November. Evidently, the board does not quite see eye to eye with the steelmakers on all the figuring behind this estimate. Doubtless, too, the board is once more using its control over steel prices to exert pressure for further improvements in efficiency in steel making. Next week's increase is an interim measure to bring some quick and remedial relief to profit margins, not one of the full scale price reviews the board conducts every two or three years, taking into account the latest technical advance in steel making. But the decision to allow higher prices, which for the present reverses the trend in steel prices over the last three years, has not been influenced either way by the present slackening of demand for steel. In May steel output was running at only about 87 per cent of capacity—as against 95 per cent a year ago, before several new plants came in, and as against, too, the assumed operating rate of 90 per cent on which the last major review of the steel price structure was based. The rate of home orders has for several months been lower than the current rate of deliveries as the rate of stock building by steel users has run down to a virtual halt. But actual steel consumption is still held up by the high level of activity in building, industrial plant manufacture and general engineering, and motor output is now showing some signs of revival. Steel output this year is still expected to come within the predicted range of 24-25 million tons, though it may now be nearer the lower of these two figures.

### RAILWAYS

#### *The Heart of the Matter*

DR BEECHING has unerringly found the right pressure point to take the pulse of his new patient. Certainly there is room

for a profitable raising of some rail fares and charges. But not much, and certainly not enough to make much of an impact upon the present rate of loss. The higher passenger fares announced this week, for instance, are not likely to yield much more than £6 million or so in a full year. Again, there is plenty of room for cutting down manpower and hacking dead limbs off the railway network, but the potential savings here, too, are not considerable. The key to successful railways is in fact freight traffic. "Unless freight traffic receipts can be considerably increased," Dr Beeching said this week during his first public interview since becoming chairman of the Transport Commission, "the main line system will not pay, nor is it certain that it could be made to pay on any reduced yet reasonable scale." If the main line system does not pay, what hope is there for British Railways as a whole?

Of the different freight traffics, general merchandise has to be the main hope, for neither coal nor minerals traffic offers a very promising prospect. Dr Beeching has accordingly put five major studies in hand:

(i) how the railway system of freight handling could best be modified to attract the maximum amount of remunerative traffic;

(ii) the volume of traffic likely to be attracted by modifications of the system;

(iii) the pattern of traffic flows by rail and other transport to discover how much of Britain's goods traffic rail would be more suited to carry;

(iv) determination of the forms of traffic that railways do handle or could handle more satisfactorily than other transport; and

(v) costs of handling existing traffics by existing methods.

These studies may take a year or more to complete. That they have not been done already is deplorable, but no surprise.

Passenger traffic in the London area and on the main lines is buoyant but hardly profitable. So this week's increases are reasonable enough, as far as they go. Ordinary passenger fares are to go up by ¼d. a mile this autumn to 2½d. a mile (second class: the increase in first class fares will be proportionately much bigger), although the present head-room up to which the railways can go without recourse to the Transport Tribunal is 3d. a mile. Clearly it is a better risk to move only half-way and get a probable £3 million a year net, rather than to put on a full halfpenny a mile more in one go and expect to lose proportionately more customers. For the other fare increases announced this week—all railway season tickets, day returns in the London area, and on the longer journeys by London Transport—permission had to be sought from the Tribunal. Though some kind of tribunal might be justified where rail still has a monopoly—and it is arguable whether it now has one even in the London area—the decisions of the Tribunal on the com-

mission's applications for higher season ticket rates are another example of how the apparatus of control can inhibit sound commercial policy. It has endorsed the 5 per cent increase asked for on London area seasons, but postponed its introduction until next January. And it has turned down the request for a 20 per cent headroom on season rates outside London, granting instead an immediate 5 per cent increase and another 5 per cent increase next January. The future of the Tribunal's determination of railway fares is under review, according to a Government announcement last December. The conclusion ought to be forthcoming quickly.

#### BUILDING SOCIETIES

##### Sheep and Goats

MUCH of the fire that might have been expected in the debates and conversations at this year's annual conference of building societies has been damped by the decision of the Building Societies Association to recommend an increase in rates. The only matter now open to dispute is whether this increase is sufficient. Many of the leading societies have already said that they will fall in line with the recommended rates; the notable absentee is the biggest of all, the Halifax, which remains outside the association and which might be able to continue to pursue an independent line on interest rates. The increase in rates improves reserve margins and the composite rate of income tax has risen by only 1d. to

#### BUSINESS NOTES

5s. 5d. in the £. Even so, some societies have again pressed the Chancellor to relieve their surpluses from profits tax. He has resisted this pressure. The tax is a minor cause of irritation, not a major point of principle.

The provisions of the new act are now beginning to bite, notably in the case of Lloyds Permanent. In his annual report\* the Chief Registrar of Friendly Societies, Sir Cecil Crabbe, refers to this case and to others, including that of the Alliance Perpetual, dealt with under older legislation. For those who need any reminder of the shortcomings of that legislation, and of human nature, there is a separately printed appendix containing the interim and final reports† of Mr William Lawson on the affairs of the State Building Society. These investigations give added point to Sir Cecil's warning to investors "always to consider carefully before investing in societies which, for example, offer rates of interest in excess of those adopted by reputable societies generally." If a society borrows at excessively high rates it has to charge correspondingly high rates on mortgages which, Sir Cecil points out, would "normally only be obtainable where the property to be mortgaged is of doubtful security." There is one easy check that would-be investors can apply to a society with assets of more than £500,000: has it been granted trustee status by the Chief Registrar? If it has not, the investor should stay clear.

#### BUSINESS OPINION

##### Ups and Downs

THE latest collection of British businessmen's opinions taken by the Federation of British Industries contains some encouraging signs. A majority of the 701 industrialists who at the beginning of this month reported any change in their activity since February recorded it as having gone up. This is not surprising: the official index of production may well show some rise from its plateau when it comes to be calculated for the current period. But a confusing factor is that these FBI surveys were suggesting that output was rising, on balance, last year at a time when the index said it had levelled off.

The precise significance of the replies to the FBI's questions is hard to judge since one cannot weight them according to the importance of the individual firms, which vary from giant to fairly small. If, however, one looks, not at the excesses of those answering "Up" over those answering "Down," but at any tendency between one survey and another for the proportion of "Ups" to rise and the proportion of "Downs" to fall, then the following table

emerges; this suggests a clear change in the trend of output in the last four months:

| Questionnaire taken | Percentage reporting |      |      |          |
|---------------------|----------------------|------|------|----------|
|                     | Up                   | Same | Down | No reply |
| February, 1960      | 54                   | 36   | 9    |          |
| June.....           | 52                   | 40   | 7    |          |
| October.....        | 40                   | 48   | 11   |          |
| February, 1961      | 32                   | 48   | 19   |          |
| June.....           | 38                   | 48   | 13   |          |

The apparent evidence that stocks at all levels have again risen may also be questionable. Half the businessmen said that their stocks of raw materials were the same as four months ago, 20 per cent reported them down, and 27 per cent up; much the same picture was given of stocks of finished goods. On the other hand, the changes in the distribution of replies since February suggest a lower rate of stockbuilding, although work in progress seems, if anything, to have been increasing rather faster. (The Board of Trade's view of manufacturers' stockbuilding, published this week, is that it was brought virtually to a halt in the first quarter of this year; small rises in the stocks of materials and in work in progress, together with a small fall in stocks

#### THE ECONOMIST JUNE 17, 1961

of finished goods increased the total level, after seasonal adjustment, by a mere 0.2 per cent.)

By a small majority, these businessmen felt more optimistic about the business situation than four months ago. Their rate of booking new orders was apparently higher and orderbooks slightly longer. On the other hand, 45 per cent said they were working below capacity—the same proportion as in February. Their ideas on capital expenditure had changed little: they expected to spend less on buildings in the next twelve months than in the last, but more on plant and machinery. A majority view was that costs and prices had risen, but profit margins fallen. Looking to the future, immediate demand was less of an anxiety as the prospects of shortage of skilled labour.

##### Export Pricing

TO its latest general questionnaire, the FBI attached a detailed inquiry into exports, asking for replies only from those businessmen whose companies exported more than £10,000 a year. About half of the 499 respondents, exporting between them about a quarter of their total output, felt the same about their export prospects for the next year as they had done four months ago, but 28 per cent felt more optimistic compared with the 21 per cent who felt less so. Markets in which a decisive majority felt prospects were improving were EFTA, North America, the Common Market and the Communist block countries: the black spots were Australasia, Africa and India.

According to these replies, export orders have risen in the last four months. But in contrast to the reported rise in home prices, the exporters who said prices had fallen outnumbered those who said they had risen. Nevertheless, exporters still expect that competitive pricing will be their biggest headache in the immediate future: two out of five reported it was likely to make overseas sales more difficult during the next four months.

#### MOTORS

##### BMC in Germany?

REPORTS that the British Motor Corporation is negotiating with Dr Carl Borgward to buy his option to re-purchase the Borgward car company from the Bremen municipal government have a degree of plausibility, even though it seems that there are other buyers in the field and any negotiations are at an early stage. They must, however, be concluded by the end of this month, when Dr Borgward's option to buy back the company for £5½ million expires. The Bremen city council, which took over the company from Dr Borgward last February to save it from bankruptcy, now appears to be anxious to relieve itself of the responsibility. Its aim is to assure

## the next step...

The next step, after you have qualified or secured your first appointment, is to decide what you are going to do about a Bank.

When business responsibilities increase, you will need experienced friends in the City to whom you can turn for practical knowledge and advice on all sorts of business and financial problems.

At Glyn's you can expect a really personal banking service, and that will include a statement of account to suit your own requirements.

## LESSON 3

THE BRITISH have many quaint customs. These must not be confused with Customs & Excise which are not a bit quaint. One custom was started at Colchester by Old King Cole when he found there was an oyster in the month. He immediately said "R!" and opened the COLCHESTER FESTIVAL. The drinking of Guinness with oysters has always been a very popular custom.

Altogether in the Floral Dance

The oysters are very fine.

**GUINNESS**  
Manners & Customs

THE FLORAL DANCE is danced in the altogether to the sound of the fiddle, cello, big bass drum, etc. Another Cornish custom is pasties which are customarily eaten with Guinness.

THE DUNMOW FLITCH is an ancient piece of bacon which they have been trying to give away for years to people who are happy in spite of being married.

Give them a Bacon to lose the Guinness.

HOUSEY-HOUSEY is an Old Army Custom. It is done by numbers, and is not at all like Crown & Anchor where players often finish up in the Glass Housey Housey.

Pencake Duff—The start of Flat Racing

Wherever you go you get

**GUINNESS**

It's a wonderful country!

continuity of employment for the workers, though it has had to dismiss 2,500 of the 20,000 already, and it has threatened to dismiss more. BMC might be interested in buying a company which provided manufacturing and assembly facilities in the northern half of the common market. If Britain did not join the common market, BMC without such facilities might be squeezed out of much of the European market; if Britain did join, they might still be a useful means of reducing the disadvantage of higher transport costs.

BMC already has an agreement with Innocenti of Milan, which provides for the assembly of its cars for sale in Italy and other common market countries; so far the A40 is the only model to be assembled there, but other models will follow and eventually it seems that BMC will supply little more than the engines. At present BMC has only two small assembly plants, operated by its distributors in Holland and Belgium, to supply northern Europe; these are hardly adequate for a major sales drive. The cost of buying Borgward is unlikely to worry BMC: it holds £30 million in liquid assets, but it has its own expansion plans to finance as well, which will absorb £55 million in the next 2½ years.

#### EXPORT CREDITS

### The Five Year Breach

THE annual gathering of export credit insurance organisations in Vienna last week was not an acrimonious one, but there must have been some poignant moments. "The meeting reaffirmed that Berne Union members would continue to co-operate in restricting any general lengthening of terms of credit beyond five years in their field of operation." The innocent may blink at this apparently sanguine extract from the communiqué: has the five-year limit not been breached wide open? But the communiqué is correct as it stands; the great point about the rule that ordinary export credits should not be insured for more than five years is that anything insured for more than five years is not an ordinary export credit. If Britain's Export Credits Guarantee Department has breached the spirit, though not the letter, of the agreement by its recent provisions for official guarantees and matching of terms covered by credit insurance organisations in other countries, those countries which led the way are hardly in a position to complain. The atmosphere at Vienna appears to have been that of quiet resignation rather than outraged protest. But the technicians in export credit insurance are certainly concerned about the blurring of the line between export credits and overseas aid, and those who are able to read so closely between the lines that they hardly see the lines at all may even find this concern reflected in the official communiqué.

#### TIN

### At the Top

THE problem currently racking the international tin stabilisation scheme is less serious but possibly more intractable than that faced in the past. The International Tin Council exercises control over prices at two points: the flow of supplies can be turned down by imposing export quotas on producing members; and the council's buffer stock manager can buy and sell in the market to the limit of his resources. In the six months from September, 1958, the screw was turned down to permit the export of little more than half members' basic quotas. Meanwhile, prices were buttressed by a further levy on members to finance buffer stock purchases. Ultimately, all that is needed to support prices at any point is a bottomless purse.

But money will not buy tin that does not exist. The council permits its buffer manager to sell tin when the London spot price is £830 a ton; at £880 a ton, he must sell. Last week a further short step brought prices to his ceiling. He therefore had his back to this wall of the council's own choosing and on Monday he was forced to sell exceptionally large quantities of tin from his reserve which might now contain less than 8,000 tons. In New York, Singapore and forward dealings in London, tin has touched £890 a ton—in the case of forward tin, close to its limit, while spot supplies are available at £880 a ton. Consumers' stocks were low at the start of the year, output in most of the main producing countries has faltered and demand threatens to swallow all normal supplies and still be incompletely satisfied. For those who see little immediate prospect of releases from strategic stockpiles there is a strong inducement to buy now. Although the buffer manager is halting the surge in prices, the meagreness of his reserve leaves him in danger of being bulldozed out of the way.

Had the international tin agreement been renewed after the recent upsurge in prices, the adequacy of the present ceiling might have received more searching inquiry. Apart from stimulating consumption (which now seems inappropriate in view of fears of declining production) and completing the symmetry of the scheme, the ceiling is little more than a douceur to consumer members of the agreement. But a stable price demands adequate supplies to cover all likely requirements, otherwise there can be no meaning in a ceiling in a free market economy. Scarcity is far more harmful to tin's competitiveness than high prices. In 1950, 1951 and 1952 peak prices paid for tin were higher than £1,000 a ton, and the rise to £1,600 a ton during the Korean emergency has evidently done no lasting damage. Some producers are calling for a higher ceiling; if consumers could be given a suitable say in the timing of disposals from the buffer stock, no ceiling might temporarily be more appropriate.

#### EUROPEAN EQUITIES

### French Bank for London

TWO German equities, August Thyssen-Huette and Bayer are already quoted on the London stock exchange and preparations are being made to quote the shares of certain leading German banks in this country. This is one sign of the City's interest in common market equities, just as the premium on the "soft" dollar is. Another was announced this week, by the merchant bankers, M. Samuel: the introduction of the shares of the Banque de Paris et des Pays Bas to the London market—the first French share and the first Continental bank to gain a London quotation since the war.

The introduction follows the usual pattern: sufficient stock will be available to meet the expected demand in London. At the outset, this is likely to come mainly from the institutions, for by British standards the price is heavy—at Fr 556 per Fr 100 nominal it is equivalent to about £44 allowing for the "soft" dollar premium—and the yield of 2 per cent is slender. But the statistical record of growth, so far as it is revealed in the bank's accounts, is strong and the yield is not out of line with the returns on the shares of London merchant banks. The proposed introduction of trading in deposit receipts at a smaller nominal value than Fr 100 may in due course lead to a broader market.

The chief attraction to British investors is that as a *banque d'affaires* the Banque de Paris et des Pays Bas has a finger in many pies in France and the rest of the common market (especially in Belgium). It is not strictly comparable with an institution in this country, for it combines the functions of a merchant bank, an issuing house, an investment bank and also a commercial bank.

#### ELECTRICITY

### Channel Current

NOW that the British half of the cross-Channel electric power cable has been laid, consumers in southern England can hope to be connected to both the French and the British super-grid systems by next winter. The attraction of the cable to the British and French electricity authorities is that the peak of French electricity demand comes at a different time to that in Britain, partly because continental time is normally an hour ahead of British and partly because of differing social habits. When British resources are strained, French power stations have capacity to spare, particularly in the winter when their hydro-electric stations can make their biggest contribution to the base-load supply. Conversely, the French will be able to take current from British base-load stations during their peak

consumption periods, especially in the summer when the hydro-electric stations often lack water.

The cable will cost £4.6 million, and it is designed to carry 160 megawatts though the Central Electricity Generating Board hopes that it will be able to take a maximum load of 200 megawatts. The capital cost of a base-load station generating 160 megawatts is about £6 million, or £8 million for 200 megawatts. But the CEGB does not build stations to take peak loads; its new stations, which are now a great deal larger than 200 mw, take the base load, and old ones are kept in for peak demand, sometimes at high generating costs. So the choice is between the cable and keeping old stations in commission. The true financial gain to the CEGB from the cable will not be in capital outlay, but in the difference between the costs of generating at its least efficient peak-loads stations and the price it pays for French base-load electricity.

#### IMPORTS

### More Goods from Japan

JAPANESE companies have lately been setting their cap at the European market for engineering and precision goods. The appearance of Japanese Honda motor cycles in the TT races in the Isle of Man last week-end was part of this bid and their success ought to help. So far, however, sales of Japanese goods in Britain have not been substantial because of the relatively small quotas permitted. Imports of cameras, radios and motor cycles are limited to £48,800 a month. In the first quarter of this year some 310 motor cycles, 8,750 cine and still cameras, and 12,500 transistor radio sets—all told worth £175,000—arrived in Britain from Japan. This is hardly enough to worry the most nervous manufacturer. Total Japanese imports came to £13½ million, of which £8 million were

## Agenda for IMF Reform

Tentatively, one may now attempt to piece together the possible form and timetable of the projected improvements in international credit facilities.

#### The Plan

THE basis of the reform, as has been clear for some weeks, will be the Bernstein plan, which is designed to bring the currencies of the countries which are gaining reserves into the Fund so that they may be lent to countries losing reserves. Each of a select number of member countries, in addition to its present paid-up quota, would accept a stand-by commitment to give medium-term credit to the Fund, to an agreed limit, when requested. But two amendments in the Bernstein plan are envisaged by the IMF administration. First, it is not intended that drawing rights should be made automatic—this would be a reversal of the welcome trend of recent years towards greater flexibility. Secondly, there is no inclination to form a separate agency to handle the Fund's new borrowing arrangements. The present design is to keep the reform entirely within the existing framework of IMF; borrowing from member countries is provided for under Article VII.

#### The Amounts

THE total amount involved in the new credit lines is expected to be in the region of \$6.9 billion. The lower figure is equal to the combined quotas of the United States and Britain, and since in the very nature of

the scheme it could hardly happen that all the new credit was called at the same time, an increase of this order would probably be essential to ensure the possibility of a major drawing even by the United States alone. The United States would be expected to commit itself to about one-third of the new credit liability; Germany is believed to have indicated that it will put down for the same as Britain—to offer more might be carrying generosity beyond the limits of diplomacy. Thus, very roughly, on a basis of \$6 billion, the United States might take a commitment of \$2 billion, Britain and Germany \$1 billion each, the remaining \$2 billion being spread among the five other common market countries and Canada, Japan, Sweden and Austria.

#### The Timetable

THE procedure of getting the plan through is likely to follow the lines of the 50 per cent increase in quotas three years ago. It is hoped that agreement on principles will be reached at the annual meeting in Vienna in mid-September. A draft plan would then be drawn up by the Fund Administration and submitted to the governors (i.e. the finance ministers). Finally, the plan would need ratification in the legislatures of many countries, including the United States Congress—which will have to be persuaded that accepting a new commitment to provide money to IMF is in fact the one way to enable America to draw money from it. Congressional action could hardly come before Easter, 1962, and Continental countries are unlikely to act first.

foodstuffs and £4.2 million manufactured goods. This latter figure compares with £3 million a year ago, the biggest increases being in cotton yarn and woven fabrics, followed by iron and steel, scientific instruments, and chemicals.

The advantages possessed by Japanese industry in cheap and skilful labour may well make it a serious competitor in certain types of manufactures such as motor cycles (of which it is now the world's biggest maker), as it already is in manufactures like transistors where the labour content is considerable. But the main threat from Japanese competition is likely to come in common export markets. The Japanese successes in the TT races may help them in the market for sporting motor cycles in the United States, which at present is the biggest export market for British manufacturers. Japanese makers have ambitious plans to ship 150,000 machines in 1961, mostly to Asia and the Americas. In January their shipments to the United

#### The Opposition

THE Continent, indeed, is the main centre of resistance to such wider arrangements. Western Germany always conscious of the need to put on a good face internationally and genuinely concerned about its external surplus, has admittedly pronounced itself fully willing. But the same is not true of France. French bankers and financial officials have expressed their doubts about the need for any increase in international credit facilities; and they stress the dangers of credit acting as a palliative, postponing the essential cure. This line of argument may sound a little surprising to those who recall the direction of much international credit in the first fifteen years after the war; but the fact is that French finance has always, in its own way, been unreservedly "sound." Another element in recent French opposition has been resentment at the undue weight of the Anglo Saxons in IMF—Britain and the United States have over 40 per cent of the voting rights. If the Continental countries in fact put up the bulk of the new credits, they may reasonably ask for a bigger voice in the direction of the Fund—for while formal votes are rarely taken, it is equally rare that someone does not do a silent count while the voices are heard.

French opposition is believed to have softened somewhat, particularly since it has been made clear that the credits to the Fund will be guaranteed in gold, so that the 2 per cent interest which is about the most that the Fund could pay would not appear so unattractive. Once the leading countries agree in principle, the technical snags that have been mentioned are unlikely to cause trouble. No one worried about Article VI, which formally disallows the Fund from lending to finance an outflow of capital, at the time of its Suez operation, when Britain was running a substantial current surplus.

## SET THE STYLE-MAKE THE PACE-WITH THE ALL-NEW CLASSIC

The Classic is styled to fit the modern scene, powered for today's new highways. Taking its place between the exciting Anglia and the Consul 375, this 4 5 seater offers you more in both looks and performance than any other in its class. **LOOK** at it first: the Classic's long low look is the new look of international motoring, the outward expression of the most advanced design on today's roads. **START** the amazing 1340 cc 4-cylinder 56.5 bhp engine—high compression gives speeds into the 80's. **ACCELERATE**—and feel the power packed in that compact unit as you climb from standing to 60 in 23 seconds. **CRUISE** comfortably—four forward gears help you to enjoy smooth riding whether crawling in traffic or making the pace down the motorway. **OVERTAKE** with confidence—the engine responds with loyal certainty. **CORNER** with control—your Classic is an outstanding road-hugger. **TURN AND PARK** with ease in the meanest spaces—34' turning circle gives greater manoeuvrability than any car in its class. **STOP** safely whatever the conditions—front wheel disc brakes are standard for the first time in a British car of this calibre. **SEE EVEN BETTER AT NIGHT** with the twin headlamps—another class exclusive. **STRETCH** in both front and back seats—the spacious Classic gives more leg-room, the rake-back rear window gives greater visibility, more headroom. **FILL THE BOOT**—if you can! There's 21 cubic feet of usable space . . . more than any car in its class. **CHOOSE** between 2- and 4-door models: floor gear-change or column gear-change option on de luxe models: twelve brilliant colours: seven 2-tone combinations. **ENJOY** your Classic to the full, knowing it's backed all the way by the world's finest service organisation, giving you low fixed price service and running costs for years to come. **ENJOY** your Classic with Ford's easy H.P. terms, low insurance rates, and traditionally good re-sale value. **GO** see it—go drive it—at your Ford dealer's soon.

Ex-works from \*

\* 2-door Standard model £744.17.6 (£525 + £219.17.6 p.t.) 4-door Standard model £773.4.2 (£545 + £228.4.2 p.t.)  
2-door De luxe model £773.4.2 (£545 + £223.4.2 p.t.) 4-door De luxe model £801.10.10 (£565 + £236.10.10 p.t.)

States exceeded those from Britain, but most were lightweight motor cycles or scooters. To hit British sales, the Japanese will have to wean Americans from their fondness for large and powerful machines.

#### INSTALMENT CREDIT

##### Eurofinas

EUROFINAS, the association of European finance houses set up in 1959 to exchange views and disseminate information, held its first international conference on instalment credit in London last week. There were only thirty-four delegates from the Continent and the information they received was, on the whole, rather prosaic. Mr Ralph Harris, general director of the Institute of Economic Affairs, said that instalment credit was good and that Government controls were bad. He also backed the recent proposals for personal credit direct from the finance houses which would, he argued, reduce present risks and remove the dealers' commission; and he made a plea for more public information and statistics on instalment credit.

The conference highlight was Mr J. R. Cuthbertson advancing his thesis, discussed in *The Economist* on May 27th, that any regulation of hire purchase deposits and maximum repayment periods is likely to cause "a totally unexpected boom or slump two or three years later." His next boom year is 1962, when the three-year contracts made in 1959 and the two-year contracts made after April, 1960, run-off together, and his next slump year 1963, when he foresees a dearth of maturing car contracts. From the Treasury Mr R. T. Armstrong (who was secretary of the Radcliffe committee), kept the Cuthbertson model at a distance, saying that he was inclined to query some of its assumptions. He did agree that fuller information on hire purchase credit is needed and conceded that if this was forthcoming the Treasury might be able to improve on present methods of control. But he warned the finance houses that the possibility of official intervention is a risk that they have to learn to live with.

#### PROPERTY ISSUES

##### Test for the Tender

IN addition to such well known names as Penguin Books, Jaeger, and Tonibell, new issues of property shares have recently captured the attention of the stags. Their eagerness to buy the shares so as to sell them for a quick profit has given new life to suggestions that the traditional ways of bringing shares to the market need to be re-examined and it is not surprising that Kleinwort, Benson, Lonsdale has chosen a property share for its experimental sale by tender. The issue is a small one, of 25 per cent of the one million 5s. shares of Parway Land and Investments. At the minimum tender price of 16s. the issue would raise only £200,000. The company has investments in properties worth

£334,000 but the major part of its portfolio is made up of properties still being developed; these, when completed, will have an estimated value of £877,000. In addition properties worth £375,000 in their existing state are held for development in the future.

As with many other property companies, Parway has a link with an insurance company; the Royal Exchange, which owns 11½ per cent of the Parway equity, has agreed to take up debenture stock to a maximum of £3 million. Clearly it is difficult to assess the worth of shares in this type of company but the backing is sound. On the minimum dividend estimate the shares yield about 3 per cent and the issue may attract sufficient applications at, say, 1s. above the minimum price. To protect any rash people from impetuosity, all the shares will be issued at the lowest accepted price and if applications are received for less than the total number of shares offered the price will be the minimum of 16s. per share. Hedged about by proper safeguards, this should provide a suitable test for sales by tender; but the real test is not the number of applications which are received but the price the shares fetch in early dealings. If the shares then jump well above the tender price, this method, though it is of advantage to the issuing client, would be shown to be no more successful than more straightforward offers in checking excessive exuberance in the market.

Two offers in the traditional form have been made this week. The first—one million 5s. ordinary shares in Holloway Properties at 14s. per share—has been heavily oversubscribed. Unlike most other property offers the issue price represents a sizeable discount on the net asset value of 17s. 9d. The company's properties are mainly in London and net profits from them are expected to rise by 50 per cent over the next seven years. A smaller issue from Stem Properties at 7s. 1½d. has also been well received; by far its biggest property is the new Imperial House at Harrow, which is let partly to Northern Assurance and partly to Kodak. Other property issues are in the pipeline. One of these will eventually arise out of the deal between City Centre, the property group of Mr Clore and Mr Cotton, and the private company, Samuel Estates, which controls the London properties originally purchased by the first Lord Bearsted. Half the capital of this company has been sold for 850,000 City Centre shares; the merchant bank, M. Samuel, says that the remaining half of the share capital of Samuel Estates and the City Centre shares will eventually be consolidated in a holding company, for which a quotation will be sought later in the year.

#### SCOTTISH BANKING

##### Deposit Problems

MR DAVID ALEXANDER, general manager of the National Commercial Bank of Scotland, points in his presidential address to the Institute of Bankers in

Scotland to an objection to special deposits which is more widely recognised among bankers now than when they were introduced—the difficulty of removing them "without showing a green light stronger than the authorities may consider fitting." Mr Alexander is concerned generally with the ability of the banks to attract sufficient deposits to meet the needs of the growing Scottish economy. Now that investment holdings are no longer excessive, increases in advances are largely dependent on increases in deposits. Where are these to come from? The budget estimates hardly allow for an increase in bank deposits this year, and Mr Alexander lays emphasis on the competition for deposits and the greater interest-consciousness of the public. This has produced an increasing leak to the National Debt Office in the circle of credit, with the general public making increasing use of the Trustee Savings Banks and National Savings and the business community investing in Treasury bills and Tax Reserve Certificates. Forget about the business community, Mr Alexander advises: the best source of new money is the wage-earner, who now controls about 40 per cent of national income. He must be taught the benefits of having a bank account. A flexible charging system has already been introduced in Scotland. The next step, Mr Alexander suggests, may be evening opening in certain areas, coupled with a five-day week for bank staff in rotation. In this respect the Scottish bankers, for whom competition from the trustee banks is stiff, seem to be well ahead in their ideas.

#### AIR TRANSPORT

##### BOAC's Traffic

BOARD of Trade appeals to the United States government not to press its efforts to send American traffic by American transport have special urgency for BOAC which carries substantial numbers of American passengers and which finds itself, not for the first time, with too many seats and too few people buying them. The corporation itself drew attention this week to the fact that its new fleet of 15 Boeings has increased its North Atlantic capacity by 50 per cent, while the traffic carried has risen by only 10 per cent. Every airline taking delivery of a new fleet expects capacity and traffic to get temporarily out of phase and tries to space out deliveries to keep this disparity to a minimum. BOAC is also unlucky in its timing for the delivery of its fleet happens to coincide with one of those unpredictable dips that recur every so often in North Atlantic air traffic. But this is not the whole story.

BOAC is making an audacious bid to capture not only its own share of new traffic but also that of other airlines; until total traffic expands, it can fill its new fleet only at the expense of other North Atlantic operators. Those airlines are fighting back, notably Trans-World Airlines which, revived by new management, has regained

spot

## Europe's first C-E-I-R Centre

**WHAT** precisely is a C-E-I-R Centre? In brief, it is the 'operations room' for the control of any and every technique of scientific commercial and industrial management. In the United States there is already a nation-wide network of C-E-I-R Centres, equipped with the most advanced available computing systems.

**WHO** are the people who run the Centre? C-E-I-R (U.K.) Limited, the British subsidiary of the largest independent commercial computer services organization in the world. The organization has a staff of over 400 mathematicians, economists, scientists, computer specialists, and programmers.

**WHY** is a London C-E-I-R Centre necessary? Because C-E-I-R's list of clients, which includes government departments and many famous commercial corporations, has extended rapidly in Britain. On-the-spot services were

urgently needed—and now here they are, with some of the world's most advanced computer facilities to hand.

**WHEN** does a commercial or public service organization need the help of a C-E-I-R Centre? Whenever it has any kind of management, stock-control, economic, scientific, or development problem (however large or small) that can be solved by up-to-date logical or mathematical methods.

**HOW** much do C-E-I-R's services cost? That depends, of course, upon the nature of the problem—but it is safe to say that C-E-I-R's charges, project for project, are the lowest in Europe. And that goes for the straight hire of computer time here in London as well.

**WHERE** do you find out more about C-E-I-R? By ringing up either the Main Office of C-E-I-R (U.K.) Ltd. at the number shown below, or the new C-E-I-R Centre itself. The address is: 58 NEWMAN STREET, LONDON, W.1. Tel: LANGham 8658.

## opens in London on June 20th

from BOAC its traditional position as second in the North Atlantic league table. It would be unreasonable to criticise the board of the corporation for wanting to make BOAC big, and it is perfectly proper for BOAC to set its sights on recapturing the ground lost to other airlines in the years that followed the loss of the first Comets. This is the target that decided the size of the present fleet. BOAC's present problem is to make up this lost ground quickly and against strong competition.

### AVIATION INSURANCE

#### How Risky are Jets?

IN three years of commercial jet flying, there have been more than 40 accidents, with 12 aircraft totally destroyed. Even if

a large jet is only damaged, the cost can be very high; when a BOAC Boeing 707 ran off the runway at London Airport at Christmas the underwriters had to pay out £500,000. Last winter, the first of intensive operation by jet aircraft, cost insurers \$30 million; total jet claims have reached nearly \$70 million. There are now 500 jet aircraft in service and another 200 are scheduled for delivery by this time next year.

These figures were given by Mr A. B. Hunter, Principal Surveyor of the British Aviation Insurance Company at the annual meeting of the International Union of Aviation Insurers at Montreux which was attended by representatives from 22 countries. If the present "wrecking rate" of one jet per 100,000 hours flying time is not reduced, there will, on the average, be a crash every 15 days when all the new jet aircraft now on order are flying. On this

footing, accidents to jets during the next twelve months could cost insurers a further \$70 million. In fact, Mr Hunter expects that the accident rate will be brought down to not more than one crash for each 150,000 hours flying time, though he does not think that many airlines will approach the safety record for piston engined aircraft of one accident in 500,000 hours flying time (this would hardly be reasonable, since the jets cover so many more miles in the same time); at best, jets might do half as well.

Lloyd's underwriters, who share the British aviation insurance market with the insurance companies, and were in the red for this business in each of the latest three years for which their accounts have been published, were said to be involved in a tussle with BOAC recently over the premium quoted for continuing the insurance of its fleet of Boeing 707s and Comet 4s. These insurances were ultimately renewed, after rumours that BOAC was considering the pros and cons of running the risk itself.

### COCOA

#### Will Consumers Revolt?

BUYERS have swallowed the bulk of West Africa's gigantic cocoa crop, though a lot more rumbling may be heard as it disappears down the pipeline. The largest part of the crop is normally shipped in the first half of the year, but exports appear to be behind schedule though they are now picking up. The arrival of the remaining cocoa in consuming countries will be a stiff test for prices, which have already fallen to £175 a ton for spot supplies of Ghana cocoa and are, after a short-lived rally, therefore again within about £20 of their lowest level since 1947. Manufacturers seem less willing to swallow the stabilisation scheme which is a by-product of the third successive rise of about 130,000 tons in world cocoa production. Governments decide whether to support this kind of scheme on something wider than sectional considerations, but American manufacturers are openly opposed to it; in Germany and Holland manufacturers are probably no less adamant.

Britain and France might give the scheme a warmer reception for the sake of their political links with producers. But though international stabilisation schemes do function without the participation of all major consumers, the defection of the three biggest consumers would cripple a scheme for cocoa. An assurance that non-member producers would not be allowed to increase their exports at the expense of members seems essential to a system of export quotas. Work starts on drafting an international cocoa scheme based on this system on Monday. A prominent American manufacturer has already dragged a red herring across its path by suggesting a rival system based on large funds mainly for sales promotion. When the point of ratification is

### Visiting Day at Farnborough

IT is six years since the Royal Aircraft Establishment at Farnborough held an open day for visitors. After the Sandys axe cut the development of new military aircraft, Farnborough had little to show and no money to push back the frontiers of flying knowledge. Research into systems of air traffic control and blind landing, however, continued, and here the RAE is, for the time being, the acknowledged world leader.

In the last year or so, Farnborough's prospects have brightened and scientists have new money and apparatus to spur their research. An open day on Friday last week demonstrated the RAE's recovery, much of it concentrated on the space satellite, and the supersonic airliner. These are still acts of faith; no decision has been taken to send Britain into space or into the supersonic airliner business.

Farnborough has done a great deal of work on the kind of satellite required for a world-wide system of space communications, its power supplies, its steering equipment (a communications satellite has to be jockeyed gently into a precise orbit after the rocket puts it roughly where it is needed) and its electronics. The engineering of these satellites is tricky if the communications links are to give high performance. Farnborough teams have been working hard on these requirements with no assurance that their efforts will be used. It is not certain that Britain will go into space; or that, if Mr Thorneycroft's space club is formed, the European members would accept Farnborough's ideas about how it should be run.

This feeling of all dressed up with nowhere to go affects those departments working on supersonic research rather less. But they have frustrations of a

different kind, in that the work they are now doing should have been started several years ago to be of help to the government now. It is vital, for example, to know how long an airliner's structure could be expected to stand up to repeated heating and cooling involved in supersonic flying. Alternating loads of this kind are far more weakening than high temperatures alone—"thermal fatigue" is a major threat to supersonic airliners. But neither Farnborough nor research establishments in the United States have much data on this. Plant to carry out the tests is not easy to build, and Farnborough has only recently been able to order apparatus for them. The tests themselves cannot be hurried; it is reckoned that 31 years would be needed to reproduce in the laboratory the effect of ten years of airline operation (or 30,000 hours of civil flying) which is the minimum life that the airlines need. These tests will determine whether a supersonic airliner can be built at all, and of what materials.

So far, Farnborough's supersonic research has been concentrated on the behaviour of light alloys and titanium, based on the premise of building an aircraft flying at twice the speed of sound. This research shows that these materials present difficulties and the RAE is, fortunately, just starting to investigate the alternative of a steel aeroplane, intended to fly at three times the speed of sound. Farnborough should be allowed to explore the alternatives dispassionately and compare the results, studying both types and different materials. The RAE should be treated as the judge, with the right to call and cross-examine witnesses. It should not be put in the position of a barrister with a brief to argue a given case to win.

eventually reached, there may not be even the qualified support among consumers that there was for setting up a drafting committee.

OILS AND FATS

Seeds of Change

For seed crushers 1960 was a bad year. At the seed crushers' congress held in Stockholm last week, the president of their association suggested a way in which they might improve their lot. Mr Guy Chipperfield blamed crushers' conservatism for the relatively slow progress of flexibility in the use of raw materials. To prevent speculators holding them to ransom, he suggested that minimum requirements of raw materials for which there is no ready substitute be reduced and, where feasible, synthetics or other materials introduced. But in his review of world oil and fat supplies, Mr J. C. A. Faure of Unilever shows that there is already a far higher degree of flexibility in Europe's intake of coconut oil, which reacted sharply to high prices in 1958 and 1959, than in consumption in the United States where it is used "mainly for specialised purposes." American imports of copra and coconut oil were completely unaffected by the steep rise in prices.

A fall in the price of most oilseeds was at the root of the sharp decline in crushers' profits last year. But it appears from Mr Faure's figuring that because of lower prices the equivalent of 400,000 tons of oils and fats were added to stocks in Europe. However, for most of the year, groundnuts, normally the chief constituent in margarine, were too expensive to process while cottonseed and soyabean oil could be imported as a cheaper substitute. This year, the continued rise in soyabean prices temporarily made the extraction of soyabean as well as groundnut oil uneconomic. In Britain there is also surplus capacity for the manufacture of animal feeding stuffs. At the congress, Mr Chipperfield put his finger on a possible solution. Most of Europe's livestock is badly nourished judged by standards elsewhere. France and Germany could increase their consumption of mixed animal feedingstuffs fivefold; Italian stock could stand a tenfold improvement. But any rise of that order would probably be partly reflected by even greater pressure by butter on margarine sales.

According to Mr Faure, European butter consumption will rise again this year at the expense of other fats and oils. He estimates that consumption in Britain will rise from 435,000 metric tons to 459,000 tons, while margarine sales will contract to 356,000 tons. He forecasts an increase of about 500,000 metric tons to 32.6 million tons in world production of all fats and edible oils in 1961 and a further rise of between 1 and 2 million tons next year. Despite the growth in total consumption throughout the world average consumption has remained

BUSINESS NOTES

virtually unaltered at about 24 lbs per head per year. But European crushers depend almost entirely on extra-European supplies of raw materials and could one day find themselves in difficulties. The only suc-

THE ECONOMIST JUNE 17, 1961

cessful crop introduced into Europe appears to be a limited amount of rapeseed produced in Sweden. Mr Chipperfield suggests an effort should be made to develop other seed strains for cultivation in Europe.

SHORTER NOTES

The scrip issue which is to follow the proposed one for ten rights issue at 130s. a share by Hudson's Bay is to be on a one for one basis and not as stated last week on a one for ten basis. Thus with the shares at £10½ the equivalent ex all price is 99s., giving a yield of 3½ per cent on the assumption that the current trading dividend is scaled down to 12 per cent and the tax free distribution from land sales to 2½ per cent.

According to the Board of Trade's provisional estimates, capital expenditure of manufacturing industry rose some five per cent in volume, after seasonal adjustment, in the first quarter of this year, thus reversing the slight dip in the previous three months. Expenditure by "other industries and services" was one per cent higher.

The three leading British fertiliser firms, Fisons, Imperial Chemical Industries, and Shell Chemical, have all cut their prices in the past week. First Fisons cut the price of its 41 compound fertiliser by 7s. 6d. a ton. Then ICI reduced the prices of its compound fertilisers by £1 a ton, apparently making them rather cheaper in relation to fertiliser content than the Fisons brand, and cut the price of nitro-chalk by 21s. 6d. a ton and of sulphate of ammonia by 12s. 6d. a ton. Finally Shell has taken 23s. 6d. off the price of Nitra-Shell, its brand of nitro-chalk, and 30s. a ton off its compound fertilisers.

Tate and Lyle is to reacquire its former subsidiaries, Tate and Lyle Investments and Silvertown Services. For every eight shares of Tate and Lyle Investments and every ten shares of Silvertown Services three Tate and Lyle shares are offered. Existing Tate and Lyle holders are to receive a one-for-ten scrip issue on their holdings and the directors forecast a maintained dividend of 12 per cent on the bigger capital although profits are likely to be lower.

Sir George Albu, the chairman of the General Mining and Finance Corporation, says that the fall in market values has cut the value of the corporation's portfolio from £22 million to £17½ million in less than twelve months; Sir George declares that it

will be increasingly difficult to raise fresh risk capital, particularly from those overseas investors who in the past have played such a vital part in South Africa's growth.

Vauxhall has announced that it has modified its plans to build a new commercial vehicle factory at Ellesmere Port on Merseyside. The factory will instead be a machine shop: Car and commercial vehicle assembly will remain at the present factories in Luton and Dunstable. About 4,000 people will eventually be employed at Ellesmere Port; the new factory, of one million square feet, will start production early in 1963.

Four trade agreements were declared void by the Restrictive Practices Court last Monday, the associations concerned having decided not to defend them. The associations were the British Radio Equipment Manufacturers' Association, the Leicestershire Granite Association, the National Federated Electrical Association, and the Reinforcement Conference.

International loans to the Sudan totalling \$51½ million have been arranged to help finance construction of the Roseires Dam on the Blue Nile. The World Bank is providing \$19½ million for a term of 25 years, with interest at 5½ per cent; the International Development Association is providing \$13 million repayable over 50 years, free of interest—the same terms as in IDA's first loan to Honduras; and the Kreditanstalt für Wiederaufbau of Germany has agreed to a long term loan of \$19 million.

## LLOYDS BANK LIMITED

Overseas Department: 6 Eastcheap, London, E.C.3

Local overseas departments: 6 Pall Mall, S.W.1. Birmingham, Bradford, Bristol, Cardiff, Liverpool, Manchester and Newcastle upon Tyne.

What happened thirty years ago this summer is not just a piece of fascinating (and remarkably neglected) history.

The phobias and the prejudices, the lessons and the warnings that emerged from the great collapse remain a powerful influence on the economics and politics of the present day—though their relevance to current disturbances in the exchange markets is the precise opposite to that which would occur to the scaremongers.

It was clear from the start that Britain's departure from gold in September, 1931 had momentous implications—"The End of an Epoch," *The Economist* promptly proclaimed. It was the end of the attempt to carry the nineteenth century into the twentieth, to pretend that the Great War and the convulsions that followed it had never happened. It was the end of the attempt to pretend that finance could manage itself. Inevitably, the bankers suffered greatly in prestige and standing for having held to that pretence, and not surprisingly, the reaction from the gold standard carried policies to other extremes. Attempts at insulation from the evil influence of the international economy led to exchange controls and tariff protection—protection which is widely recognised as a major cause of uncompetitiveness in parts of British industry today; while determination to avoid a repetition of the awful unemployment of prewar years has gravely compromised postwar attacks on inflation, at least in those countries which have never experienced a real inflation—and this is the other major handicap to the postwar progress of Britain's economy.

Yet, if there is such a thing as a long view that can brush aside one great depression and one great war, 1931 had its positive side. This was the time when it was finally established that to obtain the real benefits of *laissez faire* a society could not apply it to economic management; and that such management had to extend to international finance. The revolution is still not complete. The world was not ready for Keynes's currency plan at the end of the war and is not ready for its successors today. How well we cope with the economic and financial problems of 1961 still depends, in part, on how well the responsible officials, the bankers and the public have yet absorbed the lessons of 1931.

## Unrepeatable Folly?

**M**OST of the men who are in today's topmost positions in British industry, commerce, finance, education and the public service were already of voting age in 1931; and the great majority of them must have voted in that year for a government dedicated to the proposition that it was sensible to try to economise one's way out of a recession. Indeed, to be fair, they had no real alternative to doing so; for the outgoing Labour ministers also believed that economies were the right course for the country, but preferred (as Sidney Webb frankly admitted) that the Conservatives should incur the odium of imposing them; while the Lloyd George Liberals, the only other real opponents of the National Government in the general election of October, 1931, were not so much opposed to the economies as to the measures of import restriction which would have made it easier to go over to the obviously much more desirable policy of reflation.

Does all this mean that there has been an enormous advance in the last thirty years in the economic knowledge, sophistication and administrative nous of democracies? Or was the only real difference of degree in the scale of the problems that most governments in 1931 happened to have to face? Could we really be sure that modern politicians and economists would handle the problem of world depression if it reappeared—with much more skill than, say, they handled the opposite and in fact slightly less difficult problem of world inflation

when it appeared just after the war? In looking back in this survey to the story of 1931, this is the nagging question that must keep recurring.

The first point that emerges from a study of old newspaper files is that the political parties thirty years ago were already more nearly Keynesian in their attitude to domestic economic problems than most modern critics grant. At the preceding general election in 1929 the Liberal party's programme of large-scale expenditure on public works was really a remarkably good one; Labour's programme was an only slightly woollier version of the same thing, and even the Conservative programme was not utterly asinine. But when the Labour government came to office, with Liberal support, it was faced by Wall Street's collapse during its first four months of office; and during its first year British unemployment soared upwards to well over the 2 million mark. Labour's programme of public works, drawn up in its first

Mr Governor: 1920-1944

few months of power, concentrated only on works that would be productive and economically sound. One minister in charge of part of the programme, Sir Oswald Mosley, Labour's Chancellor of the Duchy of Lancaster, immediately proposed that the programme should be vastly expanded, with orthodox considerations of economic soundness thrown away; in view of all that has happened since, it is not surprising to note that he put forward his views with an intemperance of language, a wildness of threat and arrogant mien, and some appendages of utter economic balderdash which did his basically sensible cause of deficit finance considerable harm. By the end of 1930 the main supporters of the new Mosley manifesto were the wild and ageing A. J. Cook, the young and even wilder Aneurin Bevan, the politically angular John Strachey and the mercurial W. J. Brown; it was not easy for anyone who cherished a reputation for some degree of economic uncrankiness to say anything which might appear to put himself in that galley.

But while it is understandable that the alliance of politicians, civil servants and "sound" outside minds which generally rules England did not go Mosleyite, was it a sign of its quite exceptional stupidity at this time that it went so far the other way? Why was it that by the beginning of 1931 the idea had begun to spread that the emerging deficits in the budget and the unemployment insurance fund—which we now regard as a natural and desirable consequence of recession, which need indeed in a real recession to be artificially increased—must instead at all costs be expunged? Once again the initial arguments for this were not extreme and reactionary ones, but were couched in moderate language of terrifying plausibility. The catalyst was the publication in January 1931 of the Treasury or "Hopkins" memorandum to the Gregory commission, on the subject of the deficit in the unemployment insurance fund. The Treasury agreed that "the State has every year to borrow large sums for various productive purposes." But it warned that "this additional borrowing (in the finances of the unemployment insurance fund), for purposes other than productive," was coming to be regarded by suspicious speculators abroad as something which "called in question the stability of the British financial system." Sir Richard Hopkins's memorandum was published at a time when a run on sterling was being mounted across the exchanges; it was on the heels of this that the Liberals proposed, and the House of Commons with near-unanimity passed, the motion setting up the ill-fated May committee to inquire what should be done.

Even at this stage, despite the mounting run on the pound,

For  
Reflation:  
Oswald  
Mosley  
in  
1930

(in order to restimulate activity) but to have put interest rates up (in order to attract funds from abroad). However, the 1960s can hardly sneer at the 1930s about this, for the lesson of when to use fiscal policy and when to use monetary policy has not been properly learned by government economists even now. The result in 1931 was that by the time the May report was published in July the run on sterling was at its height. The signatories of that report conceived it their duty to lay on their warnings about the need for a tough policy, in order to restore foreign confidence in the pound, with a very thick trowel indeed. The result, of course, was that their dire warnings of the perils ahead caused the flight from sterling to redouble in the week after their report came out. This sort of development—a "tough" speech by a Chancellor during a crisis leading to panic assumptions by foreigners that a British crisis is even worse than they had supposed—has also not been unknown in the postwar years.

The most sensible comment at the time came from Sir Hubert Henderson, the (generally anti-Keynesian) economist, in a memorandum to the Economic Advisory Council of which he was secretary. The May report, he said, "is in many ways unfair, and coming at the present juncture most unfortunate." But:

if after this has been said so authoritatively, and with so much publicity, nothing, or nothing substantial, is done along the lines indicated by the Committee, the conclusion will be widely drawn that sterling is doomed, and, having regard to the weakness of the position of London, it would prove impossible in my judgment to maintain sterling at parity throughout the ensuing year. The ill consequences of an abandonment of the gold standard can no doubt be exaggerated; but they would be formidable and enduring; and I cannot think that the time has yet been reached when we should reconcile ourselves to so serious a step. But I feel convinced that an indispensable condition of maintaining

Mr MacDonald's government and the country did not go over to the full and foolish rigours of orthodox finance. The budget of April, 1931, was an essentially neutral one, and Bank rate was kept at the low figure of 2½ per cent until late July as a deliberately reflationary measure. Looking back, it would surely have been wiser to have run a large budget deficit

the gold standard is that we should go, not necessarily the whole way, but at least the greater part of the way, towards bridging the gap in the Budget indicated by the May Committee.

This, in effect, was the view supported by nearly all the responsible politicians in the country. It is too often forgotten that a majority even of the Labour cabinet voted with MacDonald in favour of economy cuts. As for the Liberals, it seems to have been Sir Herbert Samuel who did most to persuade King George to call upon MacDonald to remain as Prime Minister of an economising government. He wrote later: "We [the Liberals] deprecated a purely Conservative government as we thought that it would have great difficulty in securing popular support for the necessary measures." Thus Britain was given and soon voted overwhelmingly in favour of a National Government under which, despite a depreciated pound, unemployment rose to over the 3 million mark.

SUCH, then, was the sad, mad story of 1931. Could we ever be so inept and so inexpert as to let it happen again? That question, perhaps, subdivides itself into two others. First, can we be sure that the free world economy will continue for ever on its present course of secular boom, so that "recessions" merely take the form of a temporary cessation of growth—instead of something much more horrid? The problem of why and how some countries get into a stage of secular boom, others of secular stagnation, and others (though this has happened to no major country since the war) of a trend towards secular downturn, has never been satisfactorily answered by even the cleverest of economists, either before 1931 or since. It follows that nobody can say with absolute certainty that all governments would always spot the occasion when an apparently small initial recession might strike a country just as it was moving from one stage to the other—and then dramatically snowball into a depression. No country since the war has had to face the sort of situation which confronted Britain's Labour government after 1929's Black Friday, when almost any prepared programme of public works was likely to be overwhelmed. It follows that nobody can be sure that a recession might not temporarily break through prepared defences again, and for a short time thrust a very large number of people into unemployment.

Secondly, however, if this did happen, would compensatory measures then promptly be taken—or might some country, even at the bottom of a recession, feel obliged to hold back from reflation because it was afraid for the stability of its rate

of exchange? On a narrow view, it might seem possible to give an unoptimistic answer to this question too. The problems that did the most damage in 1931 are still those that free societies have done least to solve. Governments still seem to be extraordinarily unskilful in assuming that the right measures to stop a run on the pound must always be those that will do most to depress industrial production; purely speculative movements of funds are still allowed to exert too large an influence on the stringency (or buoyancy) of Chancellors' internal policies; and whenever proposals are made to cure this by increasing the liquidity of the international trading system, the "soundest" men within the financial establishment are always regarded as being those who speak up only for the most picayune and conservative reforms. But on a broader view one can be less gloomy. There has been an obvious change in domestic political attitudes since 1931. If a country were carrying two million unemployed it would be much less frightened nowadays of letting its exchange rate depreciate; a large part of the fears that swayed Britain thirty years ago were based on a complete misunderstanding of what had happened in Germany in 1922-23. And, however disappointingly small the reforms in world liquidity so far, there has been an obvious change in international financial attitudes too; if any country reached the stage of Britain in 1931, the IMF would quickly mobilise large stand-by funds to support it instead of leaving one of the world's major trading nations at the mercy of a purely commercial calculation by Messrs. J. P. Morgan.

But the tragedy of economists' ineptness in 1931 was threefold. It issued in a decade which, first, threw millions of people on to the scrapheap of unemployment for long weary years; which, second, wasted a period that should have been used for a great programme of national and international development; and which, thirdly, at least partly through the disillusion and wastages thus caused, came within an ace of delivering the free world to Hitler. If one asks economists at the gate of the 1960s whether they think that governments know how to avoid the first misfortune, the answer—now that Keynesianism has become more codified and respectable—is probably yes; if one asks whether they can be quite sure that governments know how to avoid the second and third misfortunes (with Hitler's role now shifted eastwards), the answer must be much more tremulous. This, in itself, provides a good reason for looking closely in this survey at Britain's experience in 1931, when free mankind made all three mistakes at once.

The idea that interest rates should rise and fall with the business cycle is not entirely new

# Why It Happened

By E. VICTOR MORGAN

*The fundamental weakness in the gold standard of 1925-31:*

LOOKING back on the monetary history of the nineteen-twenties, one of the most surprising features is the unanimity with which economists and bankers, politicians and businessmen accepted the desirability of a return to gold at prewar parity. During the First World War the legal form of the gold standard had been carefully preserved; both Bank of England and Treasury notes were legally convertible into gold (though in practice conversion was discouraged and was hardly ever attempted); there was no legal embargo on gold export, and actual exports were restrained only by the pegging of the exchange and by war risks. When, at the end of the war, it became necessary to choose between banning the export of gold and suspending the convertibility of the note, the decision was to sacrifice the substance of the gold standard in order to maintain its form; notes remained formally convertible, but gold export was prohibited. In 1918, the Cunliffe Committee, headed by the Governor of the Bank of England, had reported that, "in our opinion it is imperative that after the war the conditions necessary to the maintenance of an effective gold standard should be restored without delay"; and in 1925 the Bradbury Committee, headed by a former chief of the Treasury, stated that, "as a practical present-day policy for this country there is, in our opinion, no alternative comparable with a return to the former gold parity of the sovereign."

When opinion is unanimous there is no need for argument, and so the literature of the time does not go deeply into the reasons for the allegiance to gold. It appears, however, to have been inspired partly by a fear of inflation and partly by the desire to provide a stable basis for the expansion of overseas trade. Both these points are made by the Cunliffe Committee:

Unless the machinery which long experience has shown to be the only effective remedy for an adverse balance of trade and an undue growth of credit is once more brought into play, there will be grave danger of a progressive credit expansion which will result in a foreign drain of gold menacing the convertibility of our note issue and so jeopardising the international trade position of the country.

The fear of inflation, confirmed by the experience of Germany and other European countries in the early nineteen-twenties, persisted for many years as an obstacle to rational policies to combat depression. Meanwhile, by 1924, Britain had achieved something like its prewar share of world trade, and it seemed reasonable to argue that continued unemployment in the export industries was

due not to their lack of competitive power, but to the slow growth of world trade as a whole. It was generally believed that instability of currencies was the major obstacle to the growth of trade, and so it could be argued that the re-establishment of the gold standard was a positive step towards expanding employment in Britain. For reasons such as this, the return to gold was welcomed by most of the business and commercial world, including the Federation of British Industries.

## One Lone Voice

Almost the only consistent opponent was Keynes. In the "Tract on Monetary Reform" (1923) he pointed out that under a gold standard circumstances might arise in which the country might be forced to sacrifice stability of domestic prices to stability of the exchange value of sterling. He regarded price stability (i.e. keeping prices up) as the more important objective, partly because he already realised far more than most of his contemporaries the difficulty of bringing prices down without creating prolonged unemployment. Hence he advocated a "managed" currency operated so as to give the greatest possible degree of price stability, and a fluctuating exchange rate. If, however, the politicians were determined to return to gold, Keynes argued that the realistic value for the pound in 1925 was not the prewar \$4.85 but about \$4.40.

The problem of re-establishing the "right" value of a currency after a period of great upheaval is always a difficult one and, even in retrospect, it is impossible to say precisely how much sterling was over-valued. The actual course of the exchange in the few months before April, 1925, is no real guide, as it was influenced both by interest differentials between London and New York, and by speculation. Index numbers of general purchasing power are of little use as the prices of goods which are not traded internationally can vary widely between countries; on the other hand, the prices of staple commodities entering into trade adjust themselves very quickly to exchange variations, so that a comparison of such changes can never reveal the full extent of disequilibrium. Keynes contended that the gold price of labour was the best indicator and, on this basis, he maintained that the return to the prewar parity raised British costs, in relation to their prewar level, about 10 per cent above American costs. On any reasonable basis of comparison, it appears that sterling was slightly over-valued in terms of the dollar and rather more substantially in terms of the German mark; moreover, France, Italy, Belgium and some other European countries

The golden tide which had been running so strongly across the Atlantic turned in the early fifties; but it still missed the British Isles

## Expert aid for **EXPORT** trade

The entire organization of the Midland Bank is available to give the fullest co-operation in the Government's drive for further exports. At the Overseas Branch in London the **FOREIGN TRADE PROMOTION DEPARTMENT** is equipped to give practical assistance to businessmen making new efforts to extend their export trade.

Some of the services which the Department is happy to provide are:

- 1 Information on markets and conditions of trading in countries overseas;
- 2 Advice on methods of payment, foreign exchange, credit insurance, etc.;
- 3 Obtaining the names of buyers or agents abroad interested in British exports;
- 4 Personal visits to manufacturers and traders for discussions on export trade problems.

In addition the Bank has its own team of specialists to assist British businessmen on questions arising from the Common Market and the European Free Trade Association.

A further step has been the preparation of a revised edition of a booklet called **TRADING ABROAD**. It deals with many of the problems confronting those engaged in foreign trade. These services are not confined to customers, and are readily available through any of the many branches of the Bank throughout England and Wales.

subsequently stabilised their currencies at levels that gave them a considerable competitive advantage.

The over-valuation of sterling was, however, only one source (and probably a minor one) of the weakness of the new gold standard and the crisis of 1931. In fact most of the basic conditions which enabled the gold standard to operate effectively in the forty years before 1914 were absent in the period from 1925-31. Before 1914, London was supreme as a financial centre, Britain was a substantial creditor on short-term capital account, and there was a balance of payments surplus sufficient to finance without strain a very large volume of long-term lending. In the inter-war period London was rivalled by New York and, to a lesser extent, Paris, and capital movements between these centres became an important and sometimes very disturbing influence. The war wiped out London's short-term creditor status, and also reduced current earnings by the destruction of a large amount of shipping and by the forced sale of some of Britain's most valuable overseas investments. In the postwar world, staple British exports had to face adverse conditions; cotton suffered from Indian, Chinese and Japanese competition; steel from the rapid expansion of European production during and after the war; and coal from the change to oil for ships' bunkers and from subsidised European competition.

### The Bank's Endemic Conflict

Hence, although the nineteen-twenties—like the nineteen-fifties—generally showed a current account surplus, it was seldom large enough to meet the demands on London for long-term overseas investment. The balance of payments estimates are very imperfect, and the figures for new issues take no account of repayments or of transactions in existing assets. Nevertheless, it seems clear that there was a chronic tendency for long-term lending to outrun the current surplus, and that this was particularly so in the years 1924-28 and 1930-31. This excess of long-term lending over current earnings had, of course, to be met by short-term borrowing. When the Macmillan committee compiled its (again very imperfect) estimates of London's net short-term indebtedness they showed a figure of over £250 million for June, 1927, rising to more than £300 million by the end of 1928. There had also been a deterioration in the quality of London's short-term assets, as bills discounted by the London market came to include a growing proportion of finance bills, and it was generally believed that foreigners held a large volume of short and medium term government securities not covered by the Macmillan estimates.

The misfortunes of British export industries were, of course, reflected in the level of unemployment and, even in 1929, there were a million insured persons out of work. Before the war, it was only occasionally that the Bank of England had felt any conflict between the requirements of domestic industry and those of the external situation; now such a conflict was endemic whenever

external influences put any pressure on the reserve, and the reserve was far more vulnerable than before.

For the first four years of the new gold standard, these weaknesses were masked by a rise in world economic activity, a large outflow of funds from the United States and close co-operation between the Bank of England and the Federal Reserve Bank of New York. The first severe test came when the 1929 stock market boom in New York reversed the outflow of American capital and caused the Federal Reserve Bank to raise its rates in an attempt to check speculation. The boom on the London Stock Exchange was very modest, commodity prices and wages were falling slightly, and over 10 per cent of the insured population was unemployed, yet Bank rate was raised to 6½ per cent in September, 1929. The Bank had chosen to protect its reserve, even if this meant aggravating the troubles of domestic industry.

The depression which rapidly followed the 1929 Wall Street crash produced three results that eventually combined in the 1931 crisis in Britain. First, falling tax revenues and the rising costs of unemployment relief sent the budget into deficit. Today, such a result would be generally accepted as a "built-in stabiliser," a healthy contra-cyclical influence. Budget deficits, however, had been a feature of all the great European inflations, and as yet only a few academic economists distinguished between the effects of a deficit in depression and in conditions of full employment. There is no doubt that the deficit was a decisive factor in sapping confidence both at home and abroad. Secondly, there was a sharp deterioration in the balance of payments and for the two years 1930-31 there was an estimated deficit of £76 million, while new foreign issues totalled £155 million. Finally, depression in Europe brought bank failures in Austria and Germany and so touched off a "liquidity panic," which both caused the withdrawal of short-term funds from London and made many of our short-term assets worthless.

The severe credit restriction that had still been possible in 1929 was impossible in 1931, with nearly 2 million unemployed. The Bank used as much of its reserve as it thought prudent, and as much foreign credit as it and the Treasury could raise; and, when these were exhausted, the gold standard was abandoned. In the final crisis Bank rate was kept at 4½ per cent from July 30th to September 21st and the Bank actually offset the effect of gold exports on the credit base. Only on the day when the Gold Standard (Amendment) Act was passed was Bank rate raised to 6 per cent in a rather empty gesture of reassurance to those (and they were many) who still feared inflation.

The circumstances of the 1931 crisis were partly fortuitous but, given the basic economic weaknesses of the inter-war period, a clash between the requirements of the gold standard and those of domestic industry was inevitable, and it was inevitably resolved by the sacrifice of exchange stability.

My fear is that if the present disequilibrium [in world payments] persists, we shall be unable to earn a sufficient surplus to meet the rising scale of our aid in addition to our other commitments.

Mr Selwyn Lloyd addressing the IMF last September

## Crisis Close-up

*The crisis of 1931 started in the manner of the classical financial crises of the nineteenth century, a panic about particular banks; by the time it ended it had exploded into the first modern-style panic about a major reserve currency*

ON May 11, 1931, the world learned that the Creditanstalt of Vienna was insolvent. On Sunday, September 20th the British Government relieved the Bank of England of its obligation to buy and sell gold at the fixed parity. Within four months, Europe's financial structure trembled and fell like a gigantic house of cards. The Creditanstalt, until its collapse, was considered to be one of the most powerful banks on the Continent, controlling about 75 per cent of Austria's industrial resources and having extensive commitments and connections in the succession states of the Hapsburg empire and in the leading European financial centres. In the twenties it obtained large credits from American, British, French, Dutch, Swiss and German banks: when it collapsed those banks saw their credits frozen.

The business depression had already taken a heavy toll, and forced many of Austria's banks and commercial concerns to surrender independence to the Creditanstalt in return for financial support. Dwindling trade, intensified in this part of Europe by the economic dissection of the Hapsburg empire, destroyed their ability to repay, so that the Creditanstalt was eventually unable to meet its own recurring liabilities. The Austrian Government, the Austrian National Bank, and the Vienna house of Rothschild (which itself founded the bank in 1855) provided immediate support, but it became obvious as foreign creditors withdrew their funds that international assistance would be necessary.

The Creditanstalt was the dominant bank in Eastern Europe and a moratorium would have destroyed Austrian credit. In London, Rothschilds, Morgan Grenfell, and Lazards took the initiative in forming an international committee of the bank's creditors, and when on May 28th the Austrian Government agreed to guarantee the Creditanstalt's liabilities, the committee agreed to maintain its credits with the bank rather than to attempt withdrawal. The Austrian Government tried to arrange a loan from private bankers to the Creditanstalt, but the French insisted that a renunciation of Austria's proposed customs union with Germany should be a condition of the loan, and the Austrian Government resigned. As a holding operation the Bank of England provided a credit of £44

million to meet the deficiency. At the same time the Austrian National Bank was granted a credit of £5½ million by the Bank for International Settlements and ten central banks. By mid-June the necessary first-aid had been mobilised for Austria. But long before this Austria's difficulties had infected Germany.

The run on the German banks began at the end of May. The difficulties in Austria transformed passive uncertainties into active misgivings about the financial stability of Central Europe, and Germany was in no position to withstand any such doubts. After the inflation of the early twenties, the German banks had offered high interest rates in an attempt to replenish their funds and attracted large foreign deposits. By 1928 about 45 per cent of German bank deposits were foreign-owned. The vulnerability of the German banks was the greater since they had continued to pursue their traditional role of supplying industry with long-term capital, most of which was uncalled in an emergency. When foreign creditors, alarmed by the Creditanstalt collapse, began to withdraw their funds, the full weight of the withdrawals was thrown on to the meagre reserves of the Reichsbank. In the first ten days of June the bank lost £27 million in gold and foreign exchange and by June 19th the gold cover for its note issue was perilously close to the legal minimum of 40 per cent.

On the following day, President Hoover offered Europe the chance of checking the slide: he proposed a one-year postponement of all payments on inter-governmental debts. But France quibbled, the argument dragged on, and by the time France agreed to Washington's terms on July 6th the chance of a psychological boost to confidence had been lost. In the meantime a Bank of England credit to the Reichsbank granted on June 22nd was replaced two days later by a credit of £20 million made available by the BIS, the Bank of England, the Federal Reserve Bank, and the Bank of France. The withdrawals, temporarily checked by the Hoover proposal, began again on July 1st; a week later Germany's reserves were exhausted. Attempts to secure further credits in London and Paris were unsuccessful.

Confidence received a new blow by the failure of Germany's largest textile firm, Nordwolle, and on July 13th the Danat Bank, Nordwolle's largest creditor, suspended payments. In the general rush throughout Europe to withdraw deposits, a number of banks found themselves in difficulties. In Germany the Government was forced to issue emergency decrees limiting withdrawals by both domestic and foreign depositors, and imposing a comprehensive exchange control.

London's merchant bankers had so far refrained from attempting to call in their German credits. Now they again approached the Bank of England for advice. Attempted withdrawals, they were told, would probably fail and they would certainly precipitate a worse collapse. New York bankers were canvassed and joined in negotiations with Germany which duly resulted in the Standstill Agreements, under which credits to Germany were frozen but their service guaranteed.

Once again, however, rescue operations were too late. Germany's difficulties immediately affected the United Kingdom and by mid-July many banks were forced to recognise that their German assets were effectively frozen. London's own creditors—notably the French—were now hell-bent on strengthening their liquidity. They repatriated whatever balances they could, which for the most part meant those held in London.

London was deeply involved in the breakdown of German banking and the Macmillan report, published a few days before the German collapse, made the first estimate of London's short-term indebtedness, the extent of which thoroughly frightened the Continent. The sterling exchanges fell below the gold point, but the heavy outflow of gold obstinately failed to produce a recovery in sterling. On July 23rd Bank rate was raised to 3½ per cent and a week later to 4½ per cent and the Bank began to intervene on the exchange markets. The Bank's holdings of dollars and francs, however, were not sufficient to support the rates for more than a few days. Borrowing abroad became imperative.

Credits of £25 million each were quickly raised in Paris and in New York, but they were insufficient to prop up failing confidence; and in the first days of August a new wave of distrust was created by the publication of the May report. The drain on the reserves increased, the Franco-American credits dwindled rapidly and it became clear that the movement of funds was too large to be handled by temporary inter-central bank credits, or to be stopped by raising Bank rate—a move which the Bank of England was told by its foreign contacts would further weaken confidence in sterling. On August 13th New York was sounded on the possibility of a loan to the Government rather than to the Bank. The question was thus thrust into the forefront of national financial policy and politics. Advisers in Paris and in New York made it clear that credits could not be organised unless British finances showed signs of being reformed. The Continent continued to withdraw massive sums from London.

Following the formation of the National Government on August 23rd credits for the equivalent of £40 million each were secured from New York and Paris. The drain was momentarily checked but withdrawals and speculation soon resumed. It was obvious to the Continent that the credits must be nearing exhaustion. On September 15th the Admiralty reported "unrest" in the Atlantic Fleet stationed at Invergordon as a result of pay cuts which formed

part of the national economy drive. The lower decks, which learned of the proposed cuts from the wireless and not from their officers, considered them unreasonable and offered passive resistance by refusing to muster on the morning of the 15th. "British Navy Mutinies" screamed the foreign headlines, and Continental bankers concluded that Britain was indeed disintegrating.

Losses of gold and foreign exchange shot up to £10 million on September 17th and next day were £18 million. Approaches were made on the Friday for a third overseas credit. The French agreed to put up £32 million, provided New York matched it. New York refused. The cupboard was bare. The drain since mid-July amounted to £200 million—£130 million from credits and £70 million from the reserves. These were now down to £130 million—a sum equivalent to the obligations incurred under the credits. The Bank thereupon asked the Government to be relieved of the obligation to supply gold at a fixed price. The Government instructed the Bank to act as it thought fit, and on Monday, September 21st, a Bill of Indemnity suspending the gold standard was rushed through Parliament.

## A Bankers' Ramp?

By R. BASSETT

*"The first Labour Government was destroyed by a Red Letter and the second by a Bankers' Order."*  
—Hugh Dalton in 1931. Fact or Fiction?

THE Labour Government of 1929-31, like its predecessor of 1924, lacked a majority in both the House of Commons and the country. When, in the summer of 1931, heavy and continuous withdrawals of funds from London brought about an urgent financial crisis, both political realities and the views generally held by the recognised financial experts made it imperative that the Government should act on orthodox lines. Ministers themselves were agreed on the main points concerning their distasteful and inevitably unpopular task. They had no thought of abandoning the gold standard; they rejected devaluation; they agreed that the budget must be balanced, and that large-scale economies were required as well as increased taxation. All of them, it should be noted, agreed to a considerable reduction, and to specific cuts, in unemployment expenditure. What in the end they could not agree upon was that this reduction should in part be achieved by a direct cut in unemployment benefit rates. On this point nearly half the Cabinet, much influenced by the declared opposition of the TUC General Council, would not give way.

On the night of August 23rd, a hopelessly divided Government

1931: Emergency conference in London

1961: Sir Frank Lee leaves for Washington

Old problem gone; financial consultations are now continuous

1931: First day off gold

1957: August strains

1960: Bank Rate 6 per cent

had no alternative but to resign. A dissolution of Parliament was ruled out by the nature of the crisis. King George V had to find a new Government without delay. The Liberal and Conservative leaders (Samuel and Baldwin) advised a National Government under MacDonald's leadership; and next morning, at a conference with them summoned by the King, MacDonald accepted the proposal.

Immediately, both the change of Government and the financial crisis which occasioned it were attributed by the Left to a "bankers' ramp"; and the view that the second Labour Government had been torpedoed by the money-power was to remain an important part of the stock-in-trade of Labour spokesmen and publicists, from Ernest Bevin to Harold Laski.

THE charge was made in various versions. The common element was that "the bankers" had sought to effect a radical change in British social policy by insisting upon such conditions for the credits required by the Labour Government as would be unacceptable to the Government and would lead to its destruction. The bankers were alleged to have demanded drastic reductions in social expenditure, and, specifically, cuts in the rates of unemployment benefit. The Federal Reserve Bank of New York, American bankers, "international finance" and "the City," were all attacked in the *Daily Herald's* initial "startling disclosure." Most directly, the ex-Financial Secretary of the Treasury said in the House of Commons on September 10, 1931—"with deliberate intention and a careful use of words"—that the National Government had been "formed for the express purpose of placing the neck of this country underneath the foot of foreign finance." So presented, the alleged bankers' ramp obviously merited Lord Samuel's "stuff and nonsense." But was it entirely baseless?

The movement of funds from London was due to the combined (and intertwined) effects of Europe's liquidity scramble and an increasing distrust of sterling. The heavy and rapidly growing burden of unemployment expenditure, the growing deficit in the budget, and the inherent instability of a minority Labour Government beset by widening internal differences, all contributed to the undermining of foreign confidence. Undoubtedly, also, foreign apprehensions were increased by partisan criticisms of the Government, by the calls for economies in public expenditure, and, more particularly, by the report of Sir George May's committee—which even many orthodox-minded observers of the time regarded as unjustifiably alarmist. To "international finance," as represented by the chief central banking authorities, the maintenance of the stability of sterling was a matter of the utmost importance. The central bankers were very ready to provide such assistance as was within their power.

Under reconstruction: Bank of England in 1931

Credits from the Federal Reserve Bank of New York and the Bank of France were arranged; but the temporary support thus given to the Bank of England proved inadequate. The outflow of funds accelerated; and, with the credits nearing exhaustion, the task of dealing with the situation passed definitely to the Government itself.

Later on, much was to be made of Neville Chamberlain's recorded statement that the Bank of England's representatives had insisted (a) that the cause of the trouble was not financial but political, viz.: foreigners' lack of confidence in the Government, and (b) that

"Keeping prices stable" means something very different today

the Government alone could provide the remedy. The Bank's representatives were, in fact, simply saying that the real problem, the restoration of confidence, depended upon governmental action. They made no attempt to prescribe what measures the Government should take.

The Labour Government itself had never challenged the orthodox prescriptions of balancing the budget and maintaining external stability of the pound. In the interim this required further large credits from New York and Paris. These credits were most unlikely to be forthcoming unless proposals for balancing the budget were announced or implemented. Such proposals would have to be acceptable to, if not actually approved by, Parliament. Discussions with the bankers' representatives at home and abroad were necessarily involved. So also were discussions with the leaders of the two Opposition parties, which together commanded a majority in the House of Commons.

In the three-party crisis conferences, the Opposition leaders certainly made no specific demands, either in regard to the total of the economies or in regard to unemployment expenditure; but they

on Australia's Rapidly Expanding  
Economy.

"OPPORTUNITY AUSTRALIA" is the title of a book recently published by The Commercial Bank of Australia Limited for the information of investors and businessmen contemplating investment in, or establishing trade relations with Australia. The book presents in 19 informative chapters an overall picture of Australia's economy, major developmental works, and many facets of primary, secondary and tertiary industries.

A copy will be forwarded gladly to you upon request without charge or obligation.

You are cordially invited to write to:

TGA 135/1

declared plainly that the Cabinet's agreed economy proposals were inadequate and would therefore be rejected in Parliament, and they reiterated the view they had held throughout that cuts in unemployment benefit rates would, in all probability, prove necessary.

The case is different with "the bankers." There is no evidence whatever that either the Bank of England or the New York financiers called for or demanded any specific reductions in expenditure. The Bank's representatives, when consulted, gave their views on the prospects of securing the required credits or loans. They acted, in short, as expert advisers. MacDonald, in the House of Commons, stated emphatically that never in the whole process of the negotiations did the banks interfere with political proposals. As for New York, the Federal Reserve Bank, as such, was no longer involved: it was not allowed to lend to a foreign government. Harrison, its chairman, acted in effect as a personal adviser to the British Government in its dealings with its New York agents, J. P. Morgan & Co., who in turn negotiated with a consortium of private bankers.

The opinion of both Harrison and Morgans was that there was no prospect of raising a public loan on the New York market until Parliament had actually rectified the budgetary position. They thought it possible, however, to arrange a private short-term credit if agreement could be reached by the party leaders on a scheme to be submitted to Parliament. There was no ultimatum from the New York financiers, who were in any case unenthusiastic. But whilst there was no demand that unemployment insurance benefits should be cut, no demand for any specific measure, the foreign bankers no doubt shared the general view that the British budget could not be put in order without economies in unemployment expenditure.

WHAT gave some degree of plausibility to the alleged "ramp" were the consultations and negotiations with the bankers in London and New York. In the mood of resentment aroused by the formation of the National Government, and by a situation in which policy affecting unemployment benefits and wages was conditioned and in part determined by external opinion, it was easy to suggest, and perhaps natural genuinely to suspect, that the bankers had imposed political terms for the requisite financial assistance. The fact that the drain of funds continued after the National Government was formed was itself a decisive sign—as Oswald Mosley pointed out at the time—that politics was not the point at issue for the bankers.

The obvious and straightforward explanation of the whole episode was (1) that people who are asked to lend money invariably require what they consider to be adequate safeguards, and (2) that

the minority Labour Government needed the co-operation of the Opposition parties in Parliament, and also desired it for electoral reasons. But such an explanation was unacceptable to official Labour, angered and distressed by what had happened. It was felt that the situation should never have arisen.

## A SHATTERING EXPERIENCE

AT the general election that followed the formation of a National Government in 1931, despite my distaste for politics except as a mildly cynical spectator, I felt bound to go down to Norfolk and to do my best to unseat our Labour member. I led off with an article in the *Eastern Daily Press*, in which I demonstrated with, as I thought, irrefutable arguments that if this country was driven off the Gold Standard it would starve. I followed this up by speaking night after night in draughty, dimly-lit village halls, introducing myself as a non-party banker, and trying to put the fear I honestly felt into the hearts of the cautious, suspicious, but attentive and ruminating villagers of North Norfolk. Even "Friday" Layton, the bearded "larned" radical of my own parish, who was accustomed to down all opponents with his book-larnin', found himself at sea over the Gold Standard. The whole question was new to them; the old familiar heckling-guns were useless against my technical, non-political attack, and I used to drive home to unnatural, belated meals with a comfortable feeling that the labourers of Little Walsingham and Subbard, of Great Snoring and Trunch, were, for all their long memories of Joseph Arch, not unwilling to rally in defence of their country's gold. I have no idea how far my intervention helped, but in the event the National candidate won this traditionally radical seat by a decisive majority. The country promptly went off gold, did not starve and has remained off gold ever since. The sole monetary principle for which, as a result of all my studies, I had been ready to speak out publicly and with utter conviction was now shown to be a delusion.

★

There must be millions who shared, in one form or another, the unnerving revelation recorded so delightfully by Sir Lawrence Jones in this extract from his reminiscences, *Georgian Afternoon* (Rupert Hart-Davis). Pedantic readers of this survey may point out that the gold standard was in fact abandoned five weeks before the 1931 election. Which just shows.

August, 1931: Ramsay MacDonald leaves Downing Street for Buckingham Palace, and forms a National Government

# The Political Legacy

By ROY JENKINS, MP

*The ugly marks of 1931 are an important element in the difficulties besetting the Labour Party today*

FOR the development of party politics, 1931 was significant from three points of view. First, for reasons almost entirely unconnected with the economic crisis, it marked the end of early twentieth century politics. Just as the Edwardian age was a postscript to the nineteenth century so the twenties were a hangover of the pre-1914 years. But 1931 brought this to an end. It was partly that the great prewar figures were no longer hovering in the background. Asquith died in 1928, and Balfour and Rosebery in 1930. More significant is the fact that from the standpoint of today, politics of the twenties seem infinitely more remote than those of the thirties. Hoare's ill-fated arrangement with Laval or Baldwin's handling of the abdication crisis did not happen yesterday, but they seem decades nearer than the TUC leaders shuffling in and out of Downing Street in 1925 and 1926 or than Birkenhead and J. H. Thomas, those highly characteristic figures of the twenties, exchanging pleasantries over their boiled shirts in a decade of politics by public banquet. But a change of atmosphere would in any event have occurred within a year or two. The formation of the National Government merely made it more dramatic by destroying the political balance of the preceding years.

The second significance of 1931 was that it resulted in defection from left to right on a scale comparable only with the Hartington-Chamberlain switch of 1886. But there were several important differences between these two decisive shifts to the right. In the first place the economic motivation of those who left Gladstone over the "political" issue of Home Rule was, paradoxically, much clearer than that of those who went with Ramsay MacDonald over the "economic" issues involved in the 1931 crisis. Liberal Unionism was a two-headed beast, but it was relatively easy to categorise its adherents as either Whig landowners who followed Hartington or Midland businessmen who were moving with Joseph Chamberlain towards the imperialism of the nineties and the tariff reform movement of the nineteen hundreds.

The National Labour Party which MacDonald established, on the other hand, was hardly a coherent animal at all. It represented no social forces in the country, and there was no common background or ideology between its main leaders, let alone the lesser participants. Of the four members of the Labour Cabinet who joined the new Government, MacDonald and Thomas might each in their different ways have been regarded as extreme "social

collaborationists," but the one was as cloudy as the other was earthy. And the bitter, puritanical, doctrinaire free trader Snowden, who despised both of them, represented an entirely different outlook, as did Sankey, the rather non-political, high-minded lawyer. They might all have been called right-wing, no doubt, (although nine years earlier it was as a left-wing candidate that MacDonald, with his pacifist past, had been elected to the leadership); but as a unifying description this would have been tautological, for the main basis for the label was that they behaved as they did in 1931. Beforehand it is doubtful whether they were to the right of the solidly reliable Henderson and Clynes.

Two things followed from this lack of coherence on the part of the MacDonaldites. The first was that they had no continuing direct influence on British politics. The Liberal Unionists were still a real force twenty years after their secession. The National Labour Party, always puny, was effectively dead after the humiliating defeats of its leader and his son at the 1935 general election. The second and more significant was that their secession had no permanent effect on the social shape of the Labour Party. It had, of course, an immensely weakening electoral effect, which lasted a decade. And it had a most powerful and traumatic temporary effect on the mood of the party, as will be discussed below.

But, just because the MacDonaldites were a thin cross-section of the whole party (two from the old ILP, one trade union mandarin and one recent professional recruit) their going removed no particular section of its support. The Home Rule split, if the parallel may be used once again, took the great landed families out of the Liberal Party as a class. It meant that there was hardly a magnate left to vote for the Parliament Bill in 1911. No similar consequence followed for the Labour Party in the thirties. It may have been lacking in mass electoral support, but so far as its active command was concerned, the unions were still there, the liberal internationalists were still there, and so were the Fabian planners, the ex-ILP evangelists, the fringe of Marxists and the radical lawyers.

What MacDonald did take from the Labour Party, however, apart from a decisive slice of its immediate electoral support, was its self-confidence. This had been somewhat precariously built up during the twenties by the immensely rapid transition from a working class pressure group to a major party in the State, by the modest success of the first Labour Government, by the easy return to office in 1929, by Henderson's work at Geneva and by MacDonald's own stature as a world statesman. All this was destroyed at a stroke by 1931. It deprived the party of all its senior leadership—in the new House of Commons only the former Commissioner of Works remained to lead the Opposition; it left it with a derisory parliamentary strength, barely a third the size of the previous smallest opposition since 1832; and it destroyed its faith both in its own leaders and in its ability to be successfully reformist.

On unemployment—the main domestic issue of the whole inter-war period—an ignominious failure had been achieved. The forces of capitalism, it seemed to many bruised supporters of the Labour party, were not merely unreformable but were able, at a time of crisis, to disperse the would-be reformers with contemptuous ease. The events of August, 1931, were the only substantial piece of evidence against the liberal theory of the state since the outbreak of the first world war had put an end to the Ulster revolt. The members of the Labour Cabinet were given an ugly glimpse of normally hidden sources of industrial and financial power, and of the way in which the machine of the state, from Buckingham Palace

downwards, was weighted against a left-wing party. And because their nerves were in a bad condition at the time they exaggerated the monstrosity of what they had seen.

This led on directly to the cataclysmic mood which dominated the Labour Party in the early thirties. This was the third political consequence of the 1931 upheaval. The remoteness of any probable move towards socialism was to be compensated for by its completeness. Sir Stafford Cripps announced that "the one thing which is not inevitable now is gradualness." The Webbs enthusiastically discovered Soviet Russia in their old age. Professor Laski superimposed a thick layer of Marxism upon his neo-Benthamite thought. And even Lord Attlee made some pronouncements which now sound distinctly odd.

So long as there persisted this "rather too catastrophic view of progress," as Lord Attlee himself subsequently described it, the country was without a real alternative government. There was too wide a gap between the extremism of the Labour Party and the depressed and cautious mood of the electorate. And the country paid the price of an untrammelled government of the right which was as unadventurous at home as it was pusillanimous abroad. This sullen extremism did not persist for long, however. For one thing it was never a unanimous mood within the party. Lord Morrison

THE WRONG BUS.

Socialist Party (to Sir John Simon): "I WANT THE BANK OF ENGLAND"  
Sir John Simon (to P. O. Bell): "SHE DON'T WANT MUCH, DO SHE, MATE?"

and Lord Dalton, an influential but, as they now appear, surprisingly assorted couple, never subscribed to it, and the latter presaged a return to gradualism with the publication in 1934 of his significantly titled *Practical Socialism for Britain*.

By that time the electoral prospects were looking a little brighter too. The Labour Party had won quite a number of by-elections and had gained control of the London County Council. The world climate also was becoming rather more healthy for reformism. The Swedish Socialist Government had come to power in 1932, and had succeeded, without any resort to revolutionary methods, in effecting a recovery from slump conditions. Roosevelt took office in 1933. And in 1936 the New Zealand Labour Government was elected and Keynes published the *General Theory*. This last event provided a theoretical justification for the direction in which, fumblingly and hesitantly, some ministers had wished to go in 1930 and 1931. Both practically and intellectually the hopelessness which had succeeded the MacDonald split was being dispersed. By 1937 the Labour Party had returned almost completely from its excursion to extremism and had published a programme which, although radical enough to form the basis of most of the legislation of the 1945 Government, was moderate in the sense that it was both precise and limited. Had the war not prevented the election of 1939 or 1940 the party would probably have returned to about its 1929 strength. But it required the upheaval of the next five years to give it a real majority.

What have been the longer term effects of 1931 upon the Labour Party and the course of politics? First there is the legacy of suspicion which MacDonald has left to his successors in the leadership. Before the first world war the Labour Party kept its leaders firmly in their place, often changing them every year and never giving them a more elevated title than that of chairman. In the twenties MacDonald changed this and, despite a continuing undercurrent of criticism, achieved almost a hero's dominance. The reaction was swift, and not merely Lord Attlee, during his twenty years of quiet leadership, but still more Mr Gaitskell since, have paid the price for MacDonald's apostasy. Second, something of the continuing strength of the trades union position within the party dates from 1931. They held firm while others were defecting, and, by so doing, they saved the party from disintegration. Partly as a result they remain the unchallengeable sheet-anchor.

Third, the party has not forgotten that, in the years after 1931, it survived and kept something of its morals by battering down and turning in upon itself. *Contra mundum* it was, and *contra mundum* it half convinced itself that it was happy to be. Some sections have been anxious to react to more recent defeats in the same way. But it should be remembered too that real recovery only began when a more outward looking mood was attained, and that, in any event, the lessons of a sudden setback are not readily applicable when the problem is one of a slow, ten-year decline.

# The Trouble About Money

BY GEORGE SCHWARTZ

I TAKE it that we can flatter ourselves there has been a considerable if not revolutionary change in economic thinking compared with the lamentable performances of thirty years ago. The contrast, in our case, between three million unemployed and the contemporary state of full employment should be sufficient evidence of that.

One could be captious and perverse by pointing out that after all the intervening enlightenment we seem to be still concerned with the same problem in 1961 as in 1931. There isn't enough money to keep the show going properly. Now we talk about a shortage of liquidity, then it was the actual amount of money that was deficient. In each case the basis of national and world credit has appeared too narrow for the business it was and is required to support.

The chief difference is that in 1931 the deficiency manifested itself in unemployment, while today the outcome is allegedly stagnation, a shortfall from the great potential productivity supposedly at our command.

All the money there is is fully employed; there isn't any to spare for other needs. That was the argument in the thirties, and I remember an article by Professor Gustav Cassel promulgating this view. There was no idle money about. You had only to study the balance sheets of the banks and the other credit institutions to see that, operating around the minimum of reserves consistent with solvency, all their funds were fully engaged. Presumably a similar argument holds today, for what else is behind the Triffin, the Bernstein, the Stamp and other proposals for expanding the volume of credit at the disposal of mankind?

In the twenties the supply of gold was the limiting factor, the stock of monetary gold refusing to expand by the prescribed minimum of 3 per cent per annum. (What is the magic in the number 3?). As a pert novice in this matter I wrote an article for the former *Nation* playing on the fact

that gold was with much effort raised from under the ground and promptly buried again below the ground in sunken vaults where the bulk of it might remain until the Day of Judgment.

## Atlantic Gold Reserve

I suggested therefore that since the presence of gold in sea-water was known, scientists could make a rough estimate of the amount, and for a start we should earmark the Atlantic as part of the world's monetary reserves. If that boost to credit and economic expansion proved inadequate we should go on to earmark the Pacific.

I received a note from the great Maynard Keynes expressing his amusement at the proposal and a hint of his appreciation of it. I wish I had kept the note to flourish about today.

Also I remember that great man throwing up his hat in 1929 at the time of the Wall Street collapse. This was what we had been waiting for, a relief to the pressure on money arising from the security speculation there. Now we would have cheap money and could go ahead. The end of the depression was in sight.

What depression? Why, the depression that had afflicted Britain since the collapse of the postwar boom in 1921. The depression that had loaded us with around a million unemployed all that time, the maximum amount of unemployment that the finances of the country could stand.

It was the revelation that this million was a minimum—revealed afterwards as a secular and not a cyclical phenomenon—that provoked the debacle in this country, for, with the monetary reasoning of that time, the swelling total of unemployment (it rose to 3 million) involved the bankruptcy of the Unemployment Insurance Fund, and since this was a national fund it threatened the solvency of Government finances, and by extension the financial repute of the

nation at large. Drastic measures of economy were called for to ensure financial solvency, and lurid accounts will be found elsewhere in this survey.

How is it that today, if a similar situation developed, the City of London, the temple of the hard-faced bankers, would be the first to advocate a budget deficit?

I can see now that by the end of the nineteenth century people, and that included informed people, had ceased to think of the economic system in real terms. The system had apparently worked so well, and with such comparative smoothness with stable money and exchanges, that the shorthand of money told the whole story. Was the balance sheet in order? If, in each and every case, it passed the test of solvency the individual was all right, business was sound, and on the same test, with Government finances in balance, the State was solvent, so that in sum the national economy was functioning at or near its best.

## A Collection of Money Delusions

On this purely monetary reckoning a mass of delusions and fallacies prevailed, uncovered but not appreciated with the advent of a war economy. These delusions, which result in the monetary approach being often in direct contradiction of the real situation and necessities, persisted in the inter-war period, were current in the second Great War and are still prevalent today.

The fallacy of composition obtained on the assumption that because an individual could shift some of the real burden of his current needs by borrowing money, a nation could load some of the real sacrifice of war-time on to posterity by borrowing. It was even proposed that this should be done neatly on a fifty-fifty basis, half the money cost (identified with the real cost) from taxation, and half by borrowing. The war loans which still disfigure the national accounts are a legacy of this.

I have a lively, if sombre, collection of these monetary delusions. Outstanding is the subsequent disillusion about postwar credits, assumed to be a fund tucked away

for prompt distribution the day after the armistice. It is still difficult to persuade people that the money went up in the smoke of war. A gallant lieutenant-colonel was so staggered by this revelation that he wrote to me declaring that with my authority for its truth he would forthwith surrender his claim. I had to write back in a hurry urging him to do nothing of the kind, and insisting that a man with his record should have no compunction in exercising his right when the real state of affairs allowed it.

There were the old ladies anxious to do their bit by writing as many letters as possible in wartime. The revenue accruing to the Post Office would swell the war coffers of the Government. The patriotic method of releasing a postman for the forces by not writing letters doesn't accord with simple monetary reckoning.

Nor does the rationing of petrol, since the Government loses the revenue from motor spirit duties badly needed to acquire motor spirit for Government purposes. Now explain that the ideal yield of a purchase tax in wartime is nil. It was an advertisement of the National Savings Movement that postulated that putting money under the mattress was "as good as robbing the soldiers."

If a deficit on the National Insurance Funds was a foreboding of economic disaster in the thirties we should be sitting pretty now, for there is a handsome surplus of over £1,000 million in these Funds. Why worry about the balance of payments with this margin in hand? Surely our concern should be that by maintaining full employment these funds will pile up uselessly and run to waste. Why not a periodic share-out? Indeed, the West German government, plagued by full employment, is to suspend all unemployment insurance contributions for six months from August 1st. The money is choking the funds.

What are these Funds? Where are these Funds? Have they any significance apart from the compilation of administrative records? Is it not true that, Fund or no Fund, any unemployed in 1980 will obtain relief out of the national (real) product of 1980, and that previous monetary and actuarial calculation will not be the relevant issue.

1920's: Reparations from Germany

## In Six Easy Lessons

The repercussions of past slumps were primarily monetary repercussions, which admittedly brought real economic losses in their trail. Because a large financial institution defaulted on its monetary obligations (however valuable its real assets) it was assumed that associated undertakings would or might default, and the precautions taken against this ensured that many of them did default. Starting with the Creditanstalt a chain reaction would spread round the globe. Now we assume that monetary rescue operations would check a *sauve qui peut* at the outset. It is salutary, if disturbing, to reflect that if a revolutionary Government

repudiated the National Debt *in toto* that, in spite of the widespread financial ruin of individuals and undertakings, the real economy—the factories and all other capital equipment, and the working abilities of the populace—would remain intact, and as capable as on the day before of maintaining the national product.

Why, oh why didn't I see all this clearly thirty years ago? And why with all this belated wisdom do I have the feeling that if full employment obtained all over the globe there would still be complaints of the shortage and dearth of money. Money was a great human invention, but it should have been accompanied by a complete book of instructions.

## THE SITE VALUE OF BERLIN

I SHOULD like to tell you a story, which I fear rather reflects on a former Governor of the Bank. This story shows what was the state of knowledge in high quarters when I went into the City in 1910 about what is now called the transfer problem, which was not known to a man like Poincaré at all; he thought that we could get more money out of Germany by invading the Rhineland. When I went to see Sir John Bradbury one day in 1919, he said: "Lord Cunliffe, the Governor of the Bank, has just brought me the report of the committee appointed by Lloyd George to say how much Germany could pay; and the figure is gigantic." I think it was £23,000 million. He said: "I asked Lord Cunliffe one or two questions. I asked him why he said that Germany

could pay £200 million of gold. He said: 'Because it is twice as much as they have got.' Then Sir John Bradbury said: 'The second question I asked him was: 'How do you think they can possibly pay these sums?' Lord Cunliffe said: 'Do you know what the site value of Berlin alone is?' That is an indication that the Governor of the Bank thought that we could move the site value of Berlin from Berlin into sterling and other currencies and with them we could buy food, raw materials and everything else abroad. That was a merchant banker who had spent all his life in banking.

—Lord Brand, a member of the Macmillan committee, to the Radcliffe committee, 1958.

## The Lessons of Finance

*In the foreign exchanges, the present-day contrasts with 1931 are much more significant than the parallels.*

IN one sense, the central difficulty that underlies recent disturbances is indeed the same as that of thirty years ago—how to run a system of stable exchange rates between countries that pursue independent domestic policies. The system could also be said to rest on the same sensitive base: the role of national currencies as international reserves, assailed in the past by the most conservative of bankers and today by the most radical of reformers, has markedly increased. Professor Robert Triffin, launching his campaign more than two years ago, headed his diagnosis: "The Return to Convertibility: 1926-31 and 1958-?" and there have been times in the past year when some people have been tempted to reach for their pens to fill in the missing date. The parallels are there, but how significant are they? Any assessment has to take into account not only the sharp difference in the background between full employment and world depression, but also the improvements in international finances which have stemmed partly from the awful lesson of 1931 itself.

The lesson was certainly in high prominence in the plans of a new system worked out between American and British experts in the war—for the unrelenting critic of the old system, Maynard Keynes, had become the leading British negotiator. Even the compromise scheme that emerged contained two built-in improvements—machinery for international credit, such as had never existed before, and provision for occasional changes in exchange rates, which had never been conceded before. In these ways the Bretton Woods scheme was an advance on the gold standard. Left to itself the scheme would never have got off the ground. The quotas in the International Monetary Fund were inadequate for immediate needs, and the provision that exchange rates should be basically stable but changeable to a new fixed peg in cases of "fundamental disequilibrium" has proved virtually impossible to effect in practice. Both these difficulties were foreseen by critics, and indeed by Keynes himself: and the difficulty about exchange rates has itself increased the need for international credit.

In practice these deficiencies in the Bretton Woods formula have been largely made good by massive support from outside, and notably by the enormous funds provided in aid and loans

by the United States. This continuing stream of liquidity made a success of postwar reconstruction and, after the false start of 1947, provided the basis for the gradual and collective approach to convertibility. Once achieved, thirteen years after the end of the war, convertibility was on a much sounder base than the system established in the decade following the first world war. Then, "return to convertibility" involved not the dismantlement of exchange control (which had not yet been invented) but stabilisation after the transitional period of fluctuating rates; as the stabilisation schemes were worked out piecemeal, in an unco-ordinated way, they were self destructive—overvaluation of the pound being followed, for example, by undervaluation of the franc; and everything was complicated by the burden of reparations. In these three important ways, then—better credit, sounder postwar financial reconstruction and a shade less inflexibility on exchange rates—the present system is better based than that of 1931.

AND there surely is better sense all round. Even those people who are not very impressed with the practical benefits of present techniques of economic and statistical analysis may be shocked, in retrospect, by dilettantism of the kind related by Lord Brand. Internationally, co-operation is on a much higher plane. In the twenties the efforts of Montagu Norman and Benjamin Strong were continually upset by the prejudices of the politicians. The dominating fact of world politics, French suspicion of Germany, worked directly against monetary co-operation at its most important point: for France, after 1926, was the great gold magnet, with almost one quarter of the world's gold by 1931. After the second world war, the dominating fact of the Soviet threat pushed the west into closer economic co-operation.

The United States has set the outstanding example, but the principle that financial maladjustments impose responsibilities on creditors as well as debtors is accepted reasonably well. The German Bundesbank in 1960 had some fears for the dollar, but it did not convert its dollar balances into gold, as the Bank of France converted its sterling balances in 1931. When the exchanges were thrown into upheaval three months ago by the revaluation of the mark and guilder, Europe's central bankers quickly agreed to check the speculative run

by providing each other with mutual assistance in a way that would have seemed inconceivable thirty years earlier, when the newly founded Bank for International Settlements was little more than a by-stander, and bankers to a man disclaimed any power to control events.

The improvement since the second war has come not only through the much more comprehensive formal machinery for financial co-operation, from IMF and OEEC to the World Bank, but from the underlying change of attitude among financial authorities about what is possible and what is sound. It is much less widely assumed that any and every financial difficulty constitutes an immovable financial discipline. In some directions, in domestic policies, this loss of scruple about creating or borrowing money has had the ill effects, in a world of full employment, that earlier generations predicted. Internationally, however, it has been wholly constructive, whether in the finance of India, or in Basle-cum-Bernstein.

THESE improvements are real. They are also limited. Above all, they have not yet been really tested. The system has managed to survive a 5 per cent revaluation of two Continental currencies in the spring of 1961. How would it fare under the weight of anything like the world depression that started in 1929? In part of course the improvements in the international financial mechanism themselves reduce the danger that slumps will be allowed to develop and to infect the globe. They give each country a breathing space and ought to be sufficient to stop currency speculation feeding solely on itself. But it remains true that the machinery of international finance still has major gaps and imperfections. The revolution of 1931, which was to give room for manoeuvre for positive management of domestic economies, has never been completed. Domestic economies are unashamedly regulated from the centre; but in international balance there is still too much hit and miss.

The stark anomaly of the gold standard after the first war was that it depended on countries devoting themselves entirely to putting stability of the exchange rate before all else, at a time when other aims—stability of prices and of employment—were becoming increasingly important. In the reaction from this unnatural rigidity in the thirties, countries seeking to re-expand their domestic economies insulated themselves from international difficulties in two main ways: by exchange

depreciation, on the one hand, and by tariffs and (in central Europe) exchange controls on the other. Both brought their own evils and the search for a modern monetary standard is a search for a middle way—and one that is consistent with steady economic growth as well. The Bretton Woods formula, of occasional changes in exchange rates, has not been very helpful. Against a background of cost inflation rather than unemployment, exchange depreciation is a much more chancy corrective. In these circumstances, up-valuation of currencies ought to be more frequently considered. But there is the general difficulty that any alteration in exchange rates tends to be anticipated and to lead to huge speculative movements. It seems likely indeed that if such changes prove to be necessary for major currencies, even at intervals of years, there might in the end be less speculative disturbance if the principle of stable exchange rates were modified in favour of a moderate range of fluctuation, perhaps influenced by an international exchange equalisation fund. No one should be under any illusion about the possible dangers in a system of this kind; it would make exchange speculation a permanent feature of the scene.

Whether or not some degree of exchange rate uncertainty can be avoided really depends on how fast the main western economies develop closer links. The more closely these economies are integrated, not only in trade but in movement of labour and capital, the less will be the need for variations in exchange rates. Scotland has its own pound notes, but it does not think of devaluing them. Without moves to integration, efforts at co-ordination can be of very limited use, and are likely to create new disturbances domestically. A country whose domestic economy is running full out will not feel happy to reduce its interest rates and raise domestic spending simply because it is gaining reserves: rightly, it regards the simple gold standard rules as too narrow. Such conflicts between the new demands of internal balance and the classical gold standard rules of the game are not frequent—Germany has been the outstanding case. They have to be dealt with, either by changing exchange rates or, if the disturbance is considered temporary, by a liberal supply of international credit. The facilities of international credit are now being strengthened, and links between leading industrial economies are growing closer. Everyone today knows that they can be taken far enough to avert a major crisis of the exchanges; if the moral of 1931 has been absorbed, they will be.

# Full Circle for Britain?

LOOKING back at the sweep of Britain's economic experience since the first war one cannot fail to be struck by a remarkable phenomenon. While what are usually regarded as the underlying economic circumstances could hardly have been more different after the two wars—inflation rather than deflation, an undervaluation of the pound in 1949 rather than an overvaluation in 1925—so many of the problems have been the same. The gold reserves are inadequate; the current surplus is too small to cover external investment; the war has left financial burdens which linger on, rather than physical destruction which is a challenge to effort and improvement; coal, cotton and shipbuilding are depressed; and foreigners complain of Britain's insufficient drive—all this is as true now as it was thirty years ago. Keynes observed in the twenties: "Look at the French; they have done all the unorthodox things, yet appear as apostles of orthodox finance, and thrive. While Britain

has done all the orthodox things, is suspected by foreign bankers of being unsound, and stagnates." Look at the Continent today and the parallel is very close.

None of this, perhaps, would have come as any surprise to opinion of the old school, typified by Montagu Norman, who maintained throughout that financial policy could do nothing to cure "real" problems which required changes in social attitudes and industrial management. Norman grossly overstated his case, and indeed did himself much less than justice. There are situations in which finance, as an instrument, is wrongly set, pushing the economy along the wrong path, sometimes into a dead end, as it did in the late twenties. When things go wrong in an economy, a change in fiscal policy, monetary policy, exchange rates, must be considered. These are not sacrosanct. But neither are they the only governors of economic performance, or even, at times, the decisive ones. That is one of the sobering lessons of 1931-61.

## COMPANY MEETINGS

Chairman's Statement: ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LIMITED  
Incorporated in the Republic of South Africa

## Urgent Need of Republic is to Restore Overseas Confidence

GRAVE RACIAL PROBLEMS INSURMOUNTABLE  
UNLESS LIVING STANDARDS RISE

### Mr H. F. Oppenheimer Discusses the Challenge to South Africa

The following is from the statement by the chairman, Mr H. F. Oppenheimer, which has been circulated to members:

The accounts of the Corporation reflect at once a successful year's operations and the anxieties of investors about the future. The continued expansion of the major industries in which we are interested brought about a very important rise in our investment income, which, at £8,159,327, exceeded the previous year's figure of £7,053,463 by no less than 15.7 per cent. As a result of political factors, however, the market value of our quoted holdings fell by 23 per cent during the year, from £129,938,543 to £99,828,153. Largely in consequence of this, the opportunities for the favourable realisation of shareholdings were very few, and it was necessary to write down many investments. The result was that, while in 1959 there was a net profit of £413,600 from realisation of investments after providing for all amounts written off, in 1960, by contrast, profits from realisation of investments were less by £1,189,612 than the amount required for writing down purposes. This marked reverse in an important part of our operations—an adverse swing of £1,603,212—more than offset the increase in our dividend income. However, a consequential decrease in the amount required for taxation, together with increased revenue from certain other sources, resulted in the net consolidated profit, at £7,844,000, being greater by £113,000 than the previous year's figure. In the difficult circumstances, this must, I think, be regarded as a very satisfactory result.

#### Withdrawal of Capital

The severe fall in share prices to which I have referred was caused, in the main, by heavy selling of South African shares by investors outside the country. In total, the net withdrawal of foreign capital during 1960 was about £80 million. Since the end of the year this trend has continued.

A capital inflow on a fairly large scale is essential if we are to realise the country's full economic potential. The falling-off and, more recently, the reversal of this inflow are already seriously retarding new development and must,

if not arrested, threaten the living standards of the people.

The evaporation of overseas confidence in South Africa is a matter of particular concern to the Anglo American Corporation. The raising of new risk capital from the public for our enterprises has become much more difficult and for the time being we shall have to rely principally on our own resources, supplemented where possible by such sums as may prudently be raised by way of loans. Fortunately, the resources of our group are considerable.

Western Deep Levels Limited is an interesting example. This company of our group is engaged in the largest individual gold mining project ever undertaken in South Africa. In spite of the fact that development results from the property have been entirely satisfactory, and its future prospects are generally regarded as excellent, there was plainly no possibility of raising large sums from the public shareholders. Nevertheless, an offer of shares to raise £8.4 million was made to shareholders and underwritten by the Anglo American Corporation and its associates in the clear knowledge that public support was not to be expected. In the result, including underwriting, approximately £6,610,000 of the issue was subscribed by Anglo American Corporation and companies closely associated with it, and approximately £1,450,000 by other mining groups for whose support we are very grateful. Only some £340,000 of the issue was subscribed by the general public. We are fully satisfied with the long-term prospects of this large investment; but it is worth pointing out that if we had not had sufficient cash resources and the necessary confidence in the future of the mine and of the country to follow the course we have done, there would have been no alternative but to close down this huge project with all its potentialities for the economic development of the country. We shall approach all our new enterprises in the same spirit as we have tackled (and shall continue to tackle) the affairs of Western Deep Levels Limited; but it is obvious that this implies a conservative dividend policy in the group and, possibly, a slower rate of advance than we would have liked to see. There can be little doubt that these factors, making

for a more cautious policy in our group, apply with at least equal force to the business community as a whole.

The continued outflow of foreign capital from South Africa with its drain on the country's reserves has now forced the government—which all last year persisted in an expansionist economic policy—to tighten import and currency controls drastically and to take steps to restrict the supply of credit. It is deplorable that in a country with an economy as basically sound as South Africa's, such "war-time" measures should be necessary. It must however, be agreed that in the situation that had been allowed to develop, these steps were unavoidable and, as interim measures, right. It is quite impossible, however, to find a long-term solution to our problems along these lines. What we are suffering from is not any unreasonable disparity between our exports and imports—indeed, South Africa's current account with the world outside is absolutely sound—but a flight of capital occasioned by a crisis of confidence. Confidence is not restored by strict controls—quite the reverse, in fact—and the best that can be hoped from these measures is that they may give us time, if we are wise, to tackle the social, human and political problems that are the real causes of our difficulties. If these basic matters are not faced up to and confidence restored, we will only be able to protect our external balance of payments at the cost of stagnation in the economic life of the country.

#### Events in the Federation

The economy of the Federation has also been seriously affected by political events, and here, too, the authorities have recently applied strict measures of exchange control. There are, however, important differences between the Federation and South Africa in regard to both the nature of the economic difficulties and the political problems that lie behind them. In these testing times, the economic advantages of the federal structure have shown up to great advantage.

During 1960, the foreign assets of the Bank of Rhodesia and Nyasaland ranged between £33.9 million and £47.9 million, and in the

## THE ECONOMIST JUNE 17, 1961

middle of May of this year stood at £41.1 million. These figures are, in the circumstances, impressive, and the currency restrictions which have been applied were presumably intended as a precautionary measure to make sure that, if the stable door had to be bolted, the horse would be on the right side of it. In so far as there has been reason for concern about the Federation's balance of payments, it has arisen not—as in South Africa—from a withdrawal of foreign capital through the Stock Exchange, which in the comparatively undeveloped state of the Rhodesian capital market would not have been possible, but from the apprehension that some Rhodesians would wish to realise their assets in cash and transfer it abroad on account of their fears about (amongst other factors) the consequences of British policy in Northern Rhodesia.

The racial situation in South Africa and that in the Federation are, of course, in many ways similar, but, as the point I have just mentioned illustrates, there are also basic differences between them. Both countries are deeply influenced by the far-reaching political changes that have taken place further north in Africa.

Obviously, these changes were bound to bring great pressure to bear on South Africa and the Federation to work out liberal solutions to their racial problems; and this the Federation is showing itself willing to do. But, in the Federation, African ambitions have gone much further than that. The federal constitution and that of each of its constituent territories have, in terms of a long-standing agreement, come up for review.

Even in the most favourable circumstances the revision of the constitution of any state is likely to arouse suspicions and antagonisms. In the Federation, the circumstances were far from favourable; and African politicians in Nyasaland and Northern Rhodesia would like to bring Federation to an end in order to be able to develop their countries as purely African states on the model of other Commonwealth territories in West and East Africa. The British Government, which retains ultimate responsibility in Northern Rhodesia and Nyasaland, has appeared to oscillate between, on the one hand, an inclination to meet these African Nationalist aspirations in the same way as it has elsewhere, and, on the other hand, a sense of its undertakings to support the development of the Federation as a multi-racial state. This ambiguity in British policy is a serious misfortune. And when it is realised that there is a substantial body of white opinion which reacts to extreme African demands with an intransigent defence of white privilege, it will be obvious that the task of building a united nation on the basis of racial partnership is far from easy. I am convinced that it can be done, and that it is something infinitely well worth doing. Much will depend on whether the moderates on both sides of the colour line who are working for racial co-operation and national unity receive the sympathy and support they deserve.

#### The Challenge to South Africa

It is idle to contend that the dislike of South Africa's policies abroad arises merely from misunderstanding. Certainly there is much ignorance and confusion about the nature and the complexity of the country's problems and an unwillingness to give credit for what is being done in South Africa—which is considerable—for the benefit of the non-Europeans. Nevertheless, the fact remains that the South African Government has been at great pains and con-

## COMPANY MEETING REPORTS

siderable expense to explain its policies overseas and, recently, the Prime Minister himself put his case at the highest level and with conspicuous ability—but without effect. The truth is that the fundamental principle upon which South African policy is at present based is morally unacceptable to practically all the nations of the world, European as well as non-European. No amount of provision of social services for non-Europeans, no amount of development in the native reserves, nor the granting of local self-government or even full independence in African tribal areas will reconcile the world to a policy under which African, Indian and Coloured people, no matter how high their individual capacity or character may be, are denied, on grounds of race and colour alone, rights of citizenship in the country in which they live.

It is regrettable but, in the circumstances of South Africa, scarcely surprising that Africans should look for remedies for their grievances by irregular means such as strikes and boycotts. But such action is extremely dangerous, not only because of its economic consequences but because it undermines law and order and threatens the normal processes through which a civilised state operates. I have no doubt that at present the government is capable of controlling the situation by force. Perhaps it can be held in this way for a long time, but only at the cost of a perpetuation of racial conflict, which must become progressively more embittered. And while this conflict lasts, it will be impossible to restore confidence in the future of the country, and the economy will be threatened with stagnation.

#### Race Relations in Industry

The responsibility for improving race relations in the political sphere lies essentially with the government, but some initiative in removing grievances and in fostering goodwill can be taken within industry itself. The relationship between African wages and productivity offers scope for continuing study of how it may be possible to increase wages without adversely affecting the delicately-balanced structure of local industry. While we do not anticipate that the economic circumstances of the gold mining industry, with an unchanging price for its product and an unchecked rise in working costs, will offer scope for dramatic changes, it is our intention to pursue investigations in the hope that, between these harsh millstones, some way can be found of giving adequate increased recognition to higher skills and improving efficiencies amongst our African employees.

There are, moreover, certain fundamental aspects of labour relations which have not received the attention they deserve in their application to our labour forces. At present we house, feed and look after our African employees from medical and social points of view extremely well. Indeed, there are few industries in the world that give the careful attention we do to these subjects. But I feel we can go further. By aptitude testing, training and placement procedures, a reasonable degree of equity and efficiency is achieved today, but if we are to achieve higher levels of productivity, greater attention must be given to the abilities, personal needs, inclinations and aspirations of individual Africans.

#### Resources of Goodwill

Viewed against the tremendous problems that face South Africa these aims and what they can

achieve may seem relatively unimportant. They affect only a limited number of people and in a limited number of ways. They offer no solution to the major problems that face our country. I hold the view, however, that these major problems depend for their solution, much more than is generally recognised, first upon the establishment on the personal level of attitudes of respect and affection for people of other races; secondly, on the extension of these attitudes on to the level of industrial and other organisations; and, only thirdly, on political policy.

There are, unfortunately, many pessimists of all races who believe that the differences between our peoples are too great to admit of compromise. But in spite of all the mistakes and missed opportunities of the past, there are undoubtedly great resources of good will, and it is still generally accepted that co-operation between black and white is essential for the happiness and security of all South Africans. I believe that, by our policies and our practice, we in the Anglo American Corporation have been able to do something and may be able to do more to foster and sustain interracial understanding and sympathy, and to keep open the possibility of a solution to our problems based not on superior force but on compromise and reason.

Copies of the complete statement are obtainable from the London Office of the corporation, 40 Holborn Viaduct, E.C.1.

## SOCIETE FRANCO AMERICAINE DE BANQUE S.A.

23, Boulevard Haussmann,  
PARIS, 9e

CAPITAL N.F. 5,000,000

The Annual General Meeting of Shareholders held on May 24, 1961, under the Chairmanship of Mr Raymond Wallier, re-elected Mr Hubert Cromback to the Board of Directors and confirmed that Mr Harry Recanatani, a Director of the Discount Bank (Overseas) Limited in Geneva, Mr Maurice de Botton, and Mr David de Ciaves had been co-opted.

After noting the satisfactory progress of the Bank's business, the Meeting decided to allocate the profits to various reserve accounts.

# GENERAL MINING AND FINANCE CORPORATION LIMITED

(Incorporated in the Republic of South Africa)

## CHAIRMAN'S SPEECH

In the absence, through illness, of the Chairman, Sir George W. Albu, Bart., Mr C. S. McLean, Deputy Chairman, presided at the Annual General Meeting of Shareholders of General Mining and Finance Corporation Limited, held in Johannesburg on June 13, 1961, and said:

In order to avoid the confusion which would result from the mention of two currencies the accounts submitted for approval at this meeting were recorded in pounds, and all figures quoted in this address will be in that currency.

In June last year the state of emergency, declared in March, was still in force and international confidence in this country as a safe and profitable field for investment was low and tending to decline further. The repatriation of cash and loan balances so evident earlier in the year continued at a heavy rate, augmented by further extensive sales of South African securities on foreign account. According to the South African Reserve Bank statistical reports the net outflow of privately held capital funds in 1960 was £97,000,000 or some four times the figure for 1959, whilst the inflow due to external borrowings by the Government, the Reserve Bank and the Commercial Banks was £16,000,000. The net loss of funds on capital account was, therefore, £81,000,000. Notwithstanding the serious implications of this outward movement of funds an appreciable rise in imports was permitted and, with virtually no improvement in the value of merchandise exports, the adverse trade balance was nearly double that of the preceding year. The improvement in gold output equalled the increases in current expenditure other than imports, and consequently the favourable balance of payments on current account declined sharply to £15,000,000. The Union's gold and foreign exchange reserves, therefore, fell during the year by 43 per cent or £66,000,000.

Despite the disturbed financial and political conditions, however, the gold and uranium industry maintained its normal development programme last year. The labour supply was adequate, labour relations were good and new records were achieved in revenue, profits, taxation and dividend payments. The industry played a very important part in sustaining the country's economy in the face of the mounting financial problems. It was, therefore, once again a disappointment that in the recent budget no relief from the existing discriminatory gold mining taxation was granted. Early in 1961 arrangements were concluded by the industry, with the approval of the Government for the "stretch-out" of uranium production until the end of 1970 with no change in the total quantity to be sold but a slight reduction in the average selling price. Uranium producers have been affected in various ways by these arrangements but in general it may be said that the country, although facing immediate reductions in foreign exchange accruals from this source, will on the other hand be well placed to compete with other world producers in the uranium market in the 1970's.

Notwithstanding the industry's excellent record, the Stock Exchange prices of mining and related financial and holding company

shares fell heavily in the first six months of last year and would probably have fallen even lower but for the steady influence exerted by certain South African institutions which entered the market as buyers from time to time. As the second half of the year commenced, however, prices became more stable, and in the closing months, with pressure on the dollar and the sharply increasing "free market" price of gold, they rose fairly sharply on rumours of an early increase in the "official" price. These hopes unfortunately turned out to be short-lived and after the close of the year prices subsided once more.

## GRAVE DECLINE IN SECURITIES

The affairs of this Corporation have been adversely affected by the successive sharp declines over the last eighteen months in the market value of its quoted investments. At December 31, 1958, the total value of this portfolio stood at about £22,000,000. One year later, after additional investments of £1,000,000, the value had risen to more than £30,000,000, but thereafter in the short space of a few months it fell by June 1960 to less than £22,000,000. The general improvement in the last quarter of the year, as I have already mentioned, was not sustained and conditions since then have deteriorated even more sharply than last year, due primarily to mounting uncertainties and fears in the minds of investors both local and overseas because of South Africa's racial policies, her departure from the Commonwealth and developments in other parts of Africa. The value of the portfolio, which by the end of April had fallen to £17,500,000, suffered a further sharp decline thereafter reaching a low point a month ago from which, however there has been some recovery.

The grave decline in the valuation of South African securities, the present limited market in such securities and the absence of any substantial overseas interest, give point to current fears that the raising of risk capital for the expansion of existing undertakings and the launching of new ventures will become increasingly difficult. Over the past 50 years those responsible for the promotion of mines and industries in this country have always relied to a significant extent, when mobilising such capital, on the overseas investor both directly as a contributor towards new capital issues and indirectly as a purchaser of shares in established concerns. Foreign capital has in this way played a very important part in the development of our gold-fields and industrial areas, but under present conditions this source of funds appears to have fallen away. It is obvious, therefore, that until confidence has been restored risk capital will have to be found to an increasing extent in this country and mining houses and others similarly placed may be obliged to conserve their resources to a degree not found necessary in the past. They may also consider it advisable to defer the expansion of some undertakings and the launching of others until there is a material improvement in financial conditions.

The Corporation's net income for 1960, after provision for all operating expenses and for tax, increased by approximately £50,000 to

£1,966,208. There were improvements in income from dividends and in revenue from other sources against which, however, there was a small decline in the surplus derived from the sale of investments. Total deductions from income were slightly higher, principally owing to increases in interest paid and the provision for taxation, these increases being partially offset by a reduction in expenditure during the year on furniture, equipment and motor vehicles. Of the amount of £281,629 provided for the writing down of certain assets £46,850 was for depreciation of the Holland Street building, £22,294 was in respect of mining and other properties and rights and the balance of £212,485 was applied in reduction of the book value of investments in accordance with the Corporation's established procedures. It was also decided that in view of the substantial fall in the market value of the portfolio during the first four months of 1961, the Investment Reserve should be strengthened by an amount of £350,000 thus raising it to £1,350,000. The net expenditure on exploration last year was £138,545 and this amount was appropriated from the year's profits, together with a further transfer of £100,000 to Exploration Reserve.

The dividends on the Ordinary shares were maintained at a total of 7s. per share and, with the distributions to Preference shareholders, absorbed in all £1,054,578, leaving a balance of £41,456 from the year's profits to be carried forward which increased the balance of unappropriated profits to £335,042.

## GROUP INTERESTS

The Mines of this group, in keeping with the general industry pattern, recorded good progress last year in their development operations and, with the exception of Ellaton which is nearing the end of its working life, their ore reserves were well maintained both in respect of tonnage and grade. Distributable profits and dividends were also satisfactory in spite of continued heavy capital expenditure at Buffelsfontein and Stilfontein and a marked increase in tax and lease payments by Stilfontein. Since the end of the year all the group uranium producers have concluded negotiations for the "stretch-out" of their production quotas until the end of 1970, and there have been certain re-arrangements of these quotas, whilst additional quotas have been taken over from producers outside the group.

The quotas allocated to the Afrikander Lease, Babroscro, Ellaton and Stilfontein companies, have been taken over by Buffelsfontein, which will consequently produce uranium on approximately the same annual scale as hitherto but over the extended period of 10 years: the total profit it expects to earn from this source under the new arrangements should exceed that which could have been earned under the old contract. The mine is capable of a substantially increased output of uranium without further capital expenditure and therefore, with its very low unit cost of production, will be well placed to participate in any additional sales contracts which may become available in the future. The gold yield per ton has shown a gratifying improvement during the current financial year with a resulting

## THE ECONOMIST JUNE 17, 1961

rise in profits. Preparations are now being made for the commencement in 1962 of the sinking of twin shafts from surface in the eastern portion of the lease area. The lower levels of the mine will be exploited by means of sub-vertical shafts the first of which, located in the vicinity of the existing Pioneer Shaft System, has almost been completed, and the second will be started on the completion of the eastern twin shafts.

Although Stilfontein has ceased to produce uranium and acid, it will receive royalties over the next ten years from the cession of its uranium production quota, and it is also negotiating with the industry a compensation claim to cover the loss in profits due to the closure of the acid plant. Gold operations continue to be satisfactory notwithstanding the tendency for working costs to increase, and it is particularly pleasing to note the encouraging improvement in development values which suggest that the mine has passed through the poorer zones which adversely affected its results in 1959.

At South Roodepoort the existence of the Kimberley Reef Horizon on a portion of its mining area has been proved at moderate depth and an agreement has been reached with the owner of certain adjoining ground to explore and mine this horizon on that property. Such limited exposures as have already been made in underground development and boreholes have been encouraging and this work is being continued. Much further development, however, will have to be completed before the potential of this new source of ore can be determined.

For West Rand Consolidated the "stretch-out" arrangements until 1970 for uranium production are of the utmost importance as this mine has large reserves of uranium-bearing ore of high grade which will be available for exploitation after that date to meet any demand then arising at economic prices. In the meantime, notwithstanding the taking over of portion of the quota allocated to the Orange Free State Joint Uranium Production Scheme, output at the mine will be curtailed in 1962 and succeeding years but, despite the substantially lower scale of operations, regular though reduced dividends can be anticipated.

The Corporation's most important holdings in gold mines outside the group are in Free State Geduld and Loraine. In both mines there are very promising areas still to be developed from which large tonnages of high grade ore may reasonably be anticipated. Under prevailing market conditions the shares of these two companies have depreciated considerably, with marked effect on the current value of our portfolio, but nevertheless this has in no way affected our faith in their dividend potential.

About 20 per cent of our portfolio is in shares of financial and holding companies, in and outside this group, with large interests in the gold mining industry. Dividend income from these investments was well maintained last year, but their market values were, of course, adversely affected by the conditions I have described. The future of these concerns will be governed by the same factors as affect the Corporation.

Our industrial interests have not changed materially in recent years and do not represent a significant proportion of our holdings. Dividend income from these sources declined in 1960.

## ESTABLISHMENT OF NEW INDUSTRIES

During 1959 the Corporation participated with West Rand Consolidated and others in the establishment at the West Rand Mine of a plant to produce electrolytic manganese using the

## COMPANY MEETING REPORTS

effluent from the uranium plant as a raw material. This concern, Electrolytic Metal Corporation (Proprietary) Limited, came into full production at the end of 1960 and has found a ready and profitable export market for its product which has made excellent headway in the markets of Europe and the United Kingdom. The plant is now being doubled and the increased output should be available for sale in 1962. In view of the diminishing supplies of effluent at West Rand alternative supplies of raw materials have been arranged.

The Corporation has recently concluded an agreement with West Rand Consolidated and others to set up, also at the West Rand Mine, a plant for the manufacture of ferro-chrome. Portion of the mine's redundant equipment will be hired to the operating company, Palmiet Chrome Corporation (Proprietary) Limited, thus saving it considerable time and capital expenditure. There is an expanding world demand for this product.

In participating substantially in these two enterprises the Corporation and West Rand Consolidated were concerned with the need to develop to the maximum extent the processing in this country of ores which even today are being exported in large tonnages with the loss of foreign exchange in respect of the final processing operations.

## KATANGA CONCESSIONS

In keeping with its policy of searching continuously for new mining areas the Corporation recently concluded an agreement with the Government of Katanga under which it has been granted a concession in that territory over some 8,000 square miles adjoining the Northern Rhodesian Copper Belt. A prospecting company is in course of registration in Katanga which, when all formalities have been completed, will commence a comprehensive examination of the concession area. After an initial period of six months the new company will be obliged to expend on exploration a sum of not less than £30,000 per annum. The Government of Katanga will be entitled to participate substantially in any mining companies formed to exploit payable mineral deposits. The Anglo American Corporation of South Africa Limited will participate with us in this venture.

The commitments facing the Corporation at the present time in respect of the undertakings for which it is primarily responsible are relatively light and it is not anticipated that any heavy obligations will arise in the immediate future in respect of interests held outside the group. It is, however, essential that the Corporation should be able to follow up all favourable investment opportunities which may be offered to it either in respect of existing or new undertakings. Such opportunities are normally lucrative and constitute an important part of the long-term process of building up a well spread and low priced investment portfolio. In view of present market conditions under which it is manifestly impossible to realise substantial blocks of shares on favourable terms, the Corporation has again arranged for the grant of loan facilities by Anglo American Corporation of South Africa Limited on mutually satisfactory terms. These facilities will remain in force until December 31, 1963, and the Corporation is at liberty to borrow up to £1,500,000. No drawings have so far been made.

## CAPITAL FAMINE

Since the year end the outflow of funds from this country has continued at an alarming rate

leading to successive further sharp declines in the gold and foreign exchange reserves and, consequently, to the recent tightening of import control, restrictions on loan facilities by the commercial banks and the general increase in interest rates. The growing shortage of funds and the increasing concern among investors and the business community generally have contributed to the further decline in share market values. There are many signs of decreasing economic activity, including rising unemployment in some sectors of the economy. Fortunately these factors have not affected the current operations of the gold mines, but they may well exert some influence on the profits and financial resources of industrial and finance companies.

In the circumstances it is difficult to forecast with confidence what the immediate future holds for the Corporation. On present estimates the net income figures for 1961 and 1962 are likely to be somewhat lower than in 1960, largely because of the uranium "stretch-out" arrangements within the group which will lead to reduced dividend income and lower revenue from administration fees. These estimates, however, do not make provision for the possible adoption of conservative dividend policies by any of the companies in which the Corporation is interested. I must also point out that since December 31st last there have been further violent fluctuations in the market values of our investments, certain of which have fallen at times to levels below their individual book values. If there is a return by the end of this year to the low point recorded last month substantial writing down of investments will then be necessary. Against this, however, we have at our disposal the augmented investment reserve.

The serious financial difficulties in which this country is involved have been felt throughout the economy and it is, therefore, natural and proper that those whose interests have been affected should consider the basic causes of the present situation and discuss the possible remedies. It is generally agreed, both here and overseas, that the causes are fundamentally socio-political in origin. The growing loss of confidence, leading to the recent heavy withdrawals of capital, has arisen, it is maintained, largely because of the manner in which the relationships between the white and non-white sections of our population are controlled.

Recently also confidence was severely shaken by the constitutional changes effected against the wishes of a large and well-informed section of the electorate holding a very important stake in our economy. This group has accepted with dismay the severance of our traditional links with the British Crown and considers our departure from the Commonwealth to be nothing short of a disaster. It is not surprising, therefore, that the recent loss of confidence was not confined to investors overseas.

On the other hand this group will be as loyal to the Republic of South Africa as any other and recognises, and subscribes wholeheartedly to, the urgent need for greater unity and understanding between all races in this country and particularly between the two sections of the white population.

## CO-EXISTENCE

The doctrine of "apartheid" and its many applications in South Africa are regarded with growing repugnance throughout the world, even by our closest friends, and the concept that any race, because of its colour, should be subservient to another is no longer tenable.

Events elsewhere in Africa lend greater significance to our problems and have no doubt added appreciably to present difficulties. They do suggest, however, that in our multi-racial state fundamental changes cannot be made rapidly, but must take place over a sufficiently long period to permit of their gradual acceptance. For example, the immediate application of the "one man-one vote" system for all would inevitably lead to economic and political chaos. The solution for the present, therefore, must surely lie somewhere between the extreme points of view, i.e. "apartheid" and universal franchise, and must ensure that, now and in the future, political and economic control will remain in the hands of those, whatever their colour, who are capable of accepting the responsibilities involved.

The non-whites in South Africa are fundamentally patient and law-abiding peoples who have undoubtedly enjoyed much greater educational and material benefits than have been generally available in other parts of Africa. At present they are mainly concerned with improving their educational standards and the economic and other circumstances in which they live. It is, therefore, important that we should work without delay towards the establishment in due course of conditions in which the potential of each individual, whatever his race, can be realised to the full for the benefit of all, and this, of course, can only be achieved in a society in which individual advancement in all spheres of activity depends upon individual merit. This is not possible, for example, when one section of the population enjoys a privileged position in respect of certain avenues of employment or when opportunities for advanced education are denied to the majority of the population. These and other inequalities are to be found in this country and they infringe those fundamental human rights which every law-abiding citizen should be entitled to enjoy and which are the very basis of the civilised standards to which the western world subscribes.

#### MULTI-RACIAL DISCUSSIONS

For months there have been suggestions from all quarters that consultation between the different racial groups has become urgently necessary with a view to seeking a more just and humane approach to our racial problems. There have been recent public statements by both our President and Prime Minister promising greater unity in this country now that the Republic has been achieved. Our leaders should, therefore, make the first move in this direction by creating the opportunity for careful and co-ordinated discussions with the leaders of all sections. Only by this means can a generally acceptable solution to our problems be found. There is little doubt that such action on their part would be widely welcomed and supported both in South Africa and overseas and would be an important step towards the restoration of confidence.

The Union of South Africa owed its phenomenal development during its short life of fifty years to the leadership and productivity of the white section and to the capital resources that section was able to mobilise, largely from overseas, coupled with the labour and willing co-operation of the non-white peoples. The joint effort of all these groups in our expanding mining and industrial complexes must obviously continue, but on a basis which permits the non-white groups to make an increasing contribution with corresponding improvements in their share of the benefits. I believe that, given enlightened

#### COMPANY MEETING REPORTS

leadership, this can be achieved and in that event the future prosperity of South Africa will be assured.

The establishment of a Republic in South Africa should present no obstacle to the solution of the problems which I have outlined for I am confident that those who have with pride and loyalty served this country's interests during the fifty years of Union will continue to do so under the Republic. I would go further and express the hope that under the régime now established the Government for its part will set this country on the path of international rehabilitation by initiating, on a truly national basis, a system of consultation and discussion such as I have advocated.

It may seem unusual for the Chairman of a financial company to dwell for so long on matters

#### THE ECONOMIST JUNE 17, 1961

entirely political at an annual meeting of shareholders, but they are the root cause of present financial uncertainties. My colleagues and I have seen the market value of the investments for which we are responsible decline in about eighteen months by some 40 per cent, or £12m. due to events entirely beyond our control and in such circumstances I have a duty to draw attention to the underlying factors in the situation.

In conclusion I would like to refer with very sincere regret to the death last February of Mr A. Comar Wilson who had been a London member of the Board of the Corporation for some five years. His charming personality and friendly help at all times will be greatly missed by our colleagues in London and by all of us in Johannesburg who had the privilege of knowing him.

### THE BRITISH INVESTMENT TRUST LIMITED

Statement by the Chairman, Mr A. H. Bowhill, at the Seventy-Second Annual General Meeting of the Company held in Edinburgh on June 12, 1961.

As will be seen in the report, Mr Wood, Mr Watson and Mr Weir have all expressed their wish to retire. Mr Wood became a Director of The Realisation and Debenture Corporation of Scotland in 1929 and Chairman in 1942. Mr Watson became a Director of that Company in 1942 and Mr Weir has been a Director of The British Investment Trust since 1943. Their colleagues much regret their decision to resign from the Board and feel sure that members will wish to join with them in recording their appreciation of the services they have rendered over many years.

The amalgamation of the two Companies became effective on July 1, 1960. The accounts before you for the year to March 31, 1961, include, therefore, only nine months' revenue from The Realisation and Debenture Corporation of Scotland investments acquired and consequently no comparison can be made with the previous

year. Had a full year's revenue from these investments been brought into the accounts the annual gross revenue would have been approximately £1,485,000, and the earnings on the present Ordinary Share Capital £28.5 per cent.

It is now proposed to pay a final dividend of 14 per cent making 23 per cent for the year which represents an increase of 2 per cent over last year.

The valuation of the investments shows an appreciation of 124 per cent and this would have been considerably greater had it not been for the fact that The Realisation and Debenture Corporation of Scotland investments were brought in at market value.

We still continue to lay emphasis on investment in growth industries, both here and in USA and Canada. In view of our large dollar holdings the Manager visited North America twice during the year and we see no reason to alter our views on the long term future growth in that continent.

I referred last year to the extra work entailed by the progress of the amalgamation. On this occasion I must pay tribute to the Manager and the combined staff for the way in which they completed the amalgamation of the two companies in addition to the successful conduct of our normal business.

The Report and Accounts were adopted.

### AUTOMATIC TELEPHONE & ELECTRIC COMPANY

#### GENERAL EXPANSION OF ACTIVITY

The annual general meeting of the Automatic Telephone & Electric Company Limited will be held on July 5 in London.

In the course of his circulated statement, the chairman, Sir Thomas Eades, referring to the fall in Group Trading Profit, said that the results of the Subsidiary Companies in the aggregate compared favourably with those achieved in 1959; thus the decline in Profits was confined to the Parent Company. In 1960 costs had continued to rise and prices, both home and export, had declined. Another factor which had a most important effect on the 1960 results was the heavy expenditure incurred on medium- and long-term projects which could not yield immediate results.

The chairman continued: The Group Trading Profit including Dividends received was £1,065,507 compared with £1,543,198 for 1959. The Net Profit for the year is £631,756 compared with £886,685 last year. Capital Reserves are £6,257,953 and Revenue Reserves and Surplus now stand at £4,074,245. In total the Assets of the Group have increased by nearly £3 millions, reflecting the general expansion of activity.

Our Order Book shows an all-time record. This is mainly due to forward requirements of the Post Office, and to increased Export orders pursued in response to Government exhortations for increased exports. Competition for exports was keen, prices were low and whilst we expand our sphere of influence throughout the World and ensure future orders, much ingenuity will be required to make the business cover all selling costs and Export Credit Guarantee charges.

In 1960 expenditure on Research and Development totalled £580,766, of which from the United Kingdom, and our Sales turnover during 1960 exceeded that of 1959.

In the Home market the Post Office is embarking on broad schemes in which we are playing a substantial part, and altogether we may expect a somewhat larger and steadier ordering programme for the industry.

In 1960 expenditure on Research and Development totalled £580,766, of which £500,000 has been charged against the Reserve set up for this purpose. Your directors attach great importance to new developments for the future, but are concerned to control the resulting expenditure and some limitation of the programme of work may have to be made.

Naturally you expect me to tell you something more of the year's prospects. We have a full programme for 1961. Employment will run at a very high level, but it is doubtful if results will be suitably commensurate.

I believe that difficult conditions will obtain for a year or two, and I would emphasise that during this period dividend rates may not be maintained, but meantime no effort will be spared to put the business on a better basis, nor will there be any relaxation of our efforts to improve the working efficiency of all sections of our Organisation.

### F. FRANCIS & SONS (HOLDINGS)

#### INCREASED SALES—NARROWING MARGINS

The 60th annual general meeting of F. Francis & Sons (Holdings) Limited was held on June 14 in London, Mr Frank Fox (chairman and joint managing director) presiding.

In the course of his circulated review, the Chairman reported that the Group profits were still rising and for the year ended 31st December, 1960, had increased from £443,146 to £505,216. The Directors recommended a total distribution for the year of 23 per cent.

Reviewing the Group activities, Mr Fox said: The position is as it was last year in that the Group is divided into two sections; the packaging interests and the engineering interests. Whereas last year I had to report further interests taken up in the engineering field, this year our extension has been in the packaging field by the acquisition of Lacrinoid Products Ltd. and Containers and Closures Ltd.

Our sales throughout the Group show a very encouraging increase but, on the other hand, our net margin has narrowed.

We are still optimistic about the future and we shall, should the opportunity arise, expand our efforts by taking into the Group any Company which would fit in.

Finally, it is a pleasure to once again pay tribute to the efforts of everyone concerned with the Organisation and to say thank you for your efforts in the past—and I would say—difficult year.

The report was adopted.

### HIGHAMS LIMITED

#### SATISFACTORY GROWTH OF SALES

The fifty-third ordinary general meeting of Highams Limited will be held on July 5th in London.

The following is an extract from the circulated statement of the chairman, Mr Alec E. Higham, OBE, JP.

I would have liked to have been able to report an increase in the profit earned before the deduction of tax for the year under review and this would have been the case but for a very serious flood at one of our branches last Autumn, the estimated cost of which was in excess of £50,000 and you may rest assured that steps are being taken to prevent, as far as possible, any recurrence.

On the commercial front I am pleased to state that sales show a satisfactory growth this year in all branches of the Group.

The reorganisation scheme to which I referred last year is proceeding according to plan; production is steadily increasing at the new mill and I hope that it will be operating at full capacity early next year.

As to the future, we have nothing to fear from fair competition, but one is bound to speculate how far imported cloth from Hongkong, Pakistan and certain European countries, does genuinely fall within the category of fair competition. The Government should be very mindful of this problem or else the cotton trade might have to face yet another planned contraction, unless there is some limitation imposed on the import of such cloth.

## THE BOOKER GROUP

Agriculture, Shopkeeping and Wholesale Distribution,

Shipping, Rum, Engineering, and Light Industries

### Statement by Mr. David Powell, F.C.A. Deputy Chairman of Booker Brothers, McConnell & Co Ltd

Our Chairman, Sir Jock Campbell, has not yet fully recovered from his illness, so this year I am writing the statement which is normally written by Sir Jock. Since our last annual general meeting Mr A. R. Woolley, DSO, and Mr Peter Parker, MVO, have joined the Booker Board.

#### FINANCIAL RESULTS

The net trading profit of the Booker Group in 1960, after tax and all charges was £1,344,603, compared with £1,248,751 in 1959. In addition there were capital profits of £123,071, against £100,224 in 1959. Your directors are recommending a final Ordinary dividend of 8d. per share free of income tax, making 1s. for the year, an increase of 10 per cent.

The Group has continued to expand, and during the last ten years, while there has been no issue of shares for cash, the total Ordinary dividend has been increased in every year but one. This has been possible, because, on the whole, we have been able to keep a balance between money used in established profit-earn-

*This is an abridgement of Mr. Powell's full statement.*

ing businesses, in extensions to them, and in the acquisition or building of new businesses.

#### THE IMPACT OF INDEPENDENCE

If we only had to cope with the relatively straightforward hazards of normal business life I would have no fears that Bookers would continue to go from strength to strength and that profits would continue to increase. Indeed, I have no doubt whatever that we shall, over the years, continue to earn an acceptable return on the money entrusted to us. But it would be wrong not to sound a note of caution about some aspects of our business during the next year or two. Over half the profits of the Booker Group in 1960 were earned by our operations in British Guiana, the West Indies and Central Africa. The peoples of these areas are racing towards self-government. Such progress is both inevitable and desirable, and in the long run independence will stimulate economic activity and thus bring fresh opportunities for companies operating in these new and industrially growing communities. But in the short term it seems possible that the birth-pains of these emergent nations may, in some cases, change the pattern of trading and profit earning to which our businesses operating within their borders are accustomed.

However, we are continuing to back our faith in the future of the emergent countries by making new investments in them while keeping a balance, over the Group as a whole, by enlarging our complementary interests in the industrially more advanced countries.

There is understandable concern at events in some territories in the Caribbean and in Africa, but now, if ever, is the time when enterprise needs strong nerves. We who do business from the industrially advanced countries must make it clear to the peoples and politicians of the newly independent or emerging nations in which we operate that we understand and accept that these countries must fashion their own destinies and that in the last analysis it is for them to decide how far firms financed from abroad can successfully continue to do business in them. Companies like Bookers have much to offer in the way of capital, technical skills and hard-earned experience, and it is to the advantage of everyone that they should be used. If good economic and commercial relationships are not maintained and strengthened there can be no doubt whatever that the yawning gap between the economically mature countries and the rest will widen—and this would be in nobody's interest.

#### ADVANCES IN SOCIAL POLICY

We believe it is the desirable pattern for any company in any country that the business should mainly be run by the people of the country, and that promotions too should mainly come from within. But how far and how quickly the first of these policies can be implemented of course depends on the available supply of

local people with the necessary qualifications and experience, and this helps to account for the high priority which training has in all our activities.

There have also been some outstanding advances made in industrial and community relations and conditions of service in the past year. The agreements with the sugar workers' unions in British Guiana provided substantial increases in wage rates, and new ground will be broken through the introduction this year of a comprehensive contributory pension scheme for some 20,000 Guianese. There has been a "new deal" giving more security and better pay to waterfront workers in Georgetown. A contributory medical insurance scheme for Georgetown employees and their families covering nearly 7,000 people and a supplementary works pension scheme for the engineering companies in the United Kingdom have also been introduced.

We also believe that when the circumstances are suitable it is desirable that local people, particularly employees, should be able to invest in the companies which form part of their communities. In Canada, 15 per cent of the shares in Prairie Pacific Distributors, the new parent company of all our Western Canadian companies, are now owned by employees. In British Guiana both employees and the public have bought shares in Guiana Industrial and Commercial Investments, a company formed in 1960 which owns 10 per cent of the shares of our companies there.

#### AGRICULTURE IN BRITISH GUIANA, THE WEST INDIES AND AFRICA

Our agricultural operations are becoming more diverse, instead of being concentrated almost solely in sugar growing and manufacture in British Guiana.

The weather in 1960 was exceptionally favourable for sugar growing and harvesting in British Guiana. A record crop of over 270,000 tons was produced on the estates for which Bookers are responsible—nearly 20,000 tons more than the former record crop of 1958.

We were fortunate to receive some additional temporary quota allocations, including a new outlet for 24,000 tons in the favourably priced United States market. Attractive though such windfall additions to our revenue might seem, the free world market price, at which we sold over one-third of our sugar last year, remained at a wholly unprofitable level and sugar profits were very little better than those earned in 1959, still only representing one-fifth of the profits of the Group after tax. The Commonwealth Sugar Agreement remains the prop and stay of British Guiana's sugar industry and our first priorities must ever be the vital markets of the United Kingdom and Canada.

There are now 185 acres of tea planted at Chombe, our tea estate in northern Nyasaland, and we expect to have 500 acres planted by the 1963-64 season. Our factory should start manufacture at the end of this year, and we hope later to encourage local Africans to grow tea for processing in it.

At our pilot project in Nigeria the experimental plots reaped so far have indicated that satisfactory yields of sugar can be expected. The final decision whether to go ahead with a full-scale project will be taken in June with our partners the Federal and Northern Regional Governments and the Northern Region

Development Corporation. If the decision is favourable the next step will be to set up a Nigerian company in which we shall have a minority shareholding and which we shall serve as managing agents.

In Jamaica during 1960 we acquired a 55 per cent interest in Innswood Estate Limited. This is a medium-sized estate, having made an average crop of about 15,000 tons of sugar in recent years. The estate's crop in 1960 was an all-time record of 19,000 tons, but in terms of total Booker Group assets employed and profits earned this venture is still of course small.

#### SHOPS AND WHOLESALE DISTRIBUTION IN FOUR CONTINENTS

For our shops and wholesale distributive companies 1960 was a year of consolidation, although their total profits, which provided two-fifths of total Booker Group profits, were a little better than in 1959. Such expansion as did take place was mainly in Western Canada, where our Prairie Pacific Distributors group of wholesale companies sell motor-car parts and some domestic appliances and sporting goods, operating from the head of the Lakes to the Pacific. Bookers Stores in British Guiana did particularly well and achieved record sales and profits. In Northern Rhodesia, Campbell Booker Carter (Central Africa) had a very much better year, in both sales and profits, rewarding their management and staffs for all their hard work during the past difficult years. In Nyasaland, The London & Blantyre Co. had another troublesome year although profits were better than in 1959. In Trinidad our two department store companies and our retail drug company together again earned useful profits.

Our wholesale and retail businesses in London and the Home Counties had a better year than in 1959 and the improvement continues in 1961. Our buying, shipping, confirming and agency companies in London, British Guiana, Trinidad and Central Africa again provided sizeable profits and a high return on Group capital employed.

During the last twelve months I have visited all these companies in Canada, Central Africa, the Caribbean and England. I was much encouraged by all that I saw.

#### SATISFACTORY SHIPPING PROFITS ON BOTH SIDES OF THE ATLANTIC

Our shipping interests based on Liverpool, Georgetown and Port of Spain improved in 1960 on the good results of the previous year. Their contribution to Booker Group profits represented about one-tenth of the whole, but we hope in the future to add to the number of ships employed, and further expand our other shipping activities.

A third new ship of about 1,000-ton cargo capacity for our United Kingdom coasting business is on order for delivery in December, 1961. Plans are also going forward for enlarging our Caribbean coasting fleet. Our new 10,000-ton bulk sugar carrier, *mv Booker Venture*, is now plying between the West Indies, North America and the United Kingdom, and the new bulk sugar storage and loading plant

on the Demerara river in British Guiana was opened earlier this year.

#### ANOTHER GOOD YEAR FOR RUM

The trade done by our Rum group in 1960 again constituted a record and contributed rather more than one-tenth of total Booker Group profits.

The new distillery at Innswood Estate in Jamaica will make an important contribution to the constituent elements of United Rum Merchants' *Lemon Hart* and *Red Heart* Jamaica rums. Our Demerara rums continue to make most satisfactory headway. More *Tia Maria* liqueur was again sold; it is already one of the leading liqueurs in the United Kingdom and its popularity is now spreading rapidly in North America.

#### LIGHT INDUSTRIES AND PRODUCE

The operations of the variegated group of companies covered by Bookers Industrial Holdings made a modest contribution in 1960 to total Booker Group profits. This contribution was, however, satisfactory both in the light of the capital employed and the inevitable losses incurred in beginning to build up our new company in Trinidad—Caribbean Printers—where we are in partnership with Brown Knight & Truscott.

Much of the business of this part of our Group, however, remains that of developing successful light industries in British Guiana—such as printing, drug manufacture, box-making, stockfeed, and balata.

#### INTENSE ACTIVITY IN BOOKERS ENGINEERING HOLDINGS

Production in our Engineering businesses is fast increasing and expansion is rapid—and so far the expansion has not prejudiced the efficiency of production. Our Engineering group contributed only one-sixth to total Booker Group profits, but it is at present growing faster than any other of our six functional groups. Its profits, moreover, represented a high return on Booker capital currently employed in Engineering.

Bookers Sugar Machinery Group, George Fletcher of Derby and Duncan Stewart of Glasgow, achieved record new orders and output of which the proportion represented by exports was more than half the total sugar machinery exported from the United Kingdom in 1960. Productive capacity was increased, and George Fletcher also made encouraging progress in the development of a new type of hydraulic roof support for the coal-mining industry.

The sugar machinery manufacturer now has to take into account the natural trend for sugar-producing countries to establish their own sugar machinery manufacturing industries. To conform with this trend, we are developing technical collaborations in Africa and the Far East and, through our partnership in India with the Sawhney family, building Triveni, our new sugar machinery manufacturing works near

*Continued overleaf*

# THE BOOKER GROUP (Continued)

Allahabad. The factory is planned to start operations by the end of 1961.

Orders received by Sigmund Pumps were half as much again as those received in 1959 and exports doubled. The works were extended and the new foundry came into full operation. Output of *ThermoPak* accelerator pumps, which maintain their lead in the central-heating market, continues to increase rapidly.

Moreover, we have just made a bid for the Pulsometer Engineering Co. We should know the outcome by the time of our annual general meeting. If the bid is accepted we shall—after transferring part of the Pulsometer Group to G. & J. Weir Holdings—take over the Pulsometer name and the Reading pump factory. In that event our Engineering group's profitable pump-manufacturing operations would be substantially expanded.

During 1960 International Boilers and Radiators began production in their new factory catering for the domestic-heating market of this country which, we think, has particularly good prospects for growth. A partnership, which takes Bookers as manufacturers on the continent of Europe for the first time, was entered into with Société Anonyme des Gaz Industriels (SOGAZ) for the manufacture of central-heating boilers in Belgium for sale in the Common Market.

## OUR FUTURE PROSPECTS

If in the next year or two the trend of events beyond our control turns out to be more favourable than I have suggested, I am sure shareholders will understand why I have felt it my duty now to point to the unfavourable possibilities while at the same time drawing attention to the many developments which are undoubtedly favourable. Our great strength, of course, lies in the courage, adaptability and skill of all my friends and colleagues in our companies everywhere. They provide the rock on which we can depend and build.

*The sixty-first annual general meeting will be held at the London Chamber of Commerce, 69 Cannon Street, London, EC4 at 12 noon on Tuesday, July 4, 1961.*

Readers are invited to apply to the Secretary, Booker Brothers, McConnell & Co., Limited, Bucklebury House, Cannon Street, EC4, for copies of the Report and Accounts and the *Review of the Year*, in which Mr Powell's statement appears and which illustrates the products and services of the Booker Group.

## COMPANY MEETING REPORTS

### WESTERN GROUND RENTS

#### A YEAR OF PROGRESS

The 22nd Annual General Meeting of Western Ground Rents Limited was held on June 9 in London, Sir Andrew H. Rowell (the Chairman) presiding.

The following is an extract from his circulated statement:

The profit before taxation amounted to £278,014 and, after providing £145,205 for taxation, there remained a net profit of £132,809 as compared with £116,916 in the previous year. If there be added to this net profit of £132,809 the balance brought forward from the previous year and taxation adjustments in respect of past years, together totalling £95,427, the amount available for distribution becomes £228,236. This figure exceeds by £48,037, the corresponding total for the preceding year.

During the year, an interim dividend of 10 per cent, less Income Tax, was paid on the present capital of £500,000 and the Board recommends the payment of a final dividend of 15 per cent, less Income Tax, on that same capital, making 25 per cent for the year.

Since 25th December, 1960, the Company has acquired further properties at a cost of £326,000 which will produce, in the current year, additional income of £26,750. The cash resources of the Company are now fully invested.

At an Extraordinary General Meeting to be held after the Annual Meeting Shareholders will be invited to consider and, if thought fit, to pass a Resolution to increase the authorised capital of the Company to £2,000,000 by the creation of a further 2,000,000 Ordinary Shares of 5s. 0d. each.

#### ISSUE OF ADDITIONAL CAPITAL

In order to assist the expansion of the Company's activities the Board proposes to issue 600,000 new Ordinary Shares of 5s. 0d. each to the Ordinary Shareholders of the Company whose names appear on the Register at the close of business on the 9th June, 1961, for a subscription at par by way of right on the basis of three new Ordinary Shares in respect of every ten Ordinary Shares then held.

Earnings continue to expand and the Board is of the opinion that future income should be adequate to enable the present rate of dividend to be maintained, with adequate cover, upon the increased capital.

Addressing the meeting, the Chairman said:

A number of statements have appeared in the Cardiff Press about Western Ground Rents Limited and the policy of your Company. I, therefore, think it desirable that I should make it clear that none of these statements has been authorised by the Board. In particular I would state that it has always been the policy of your Company to offer occupying residential tenants the freehold or a new tenancy in the event of an application being made. The present policy includes the offer of the freehold in almost every case. Obviously a case sometimes occurs where it is not good estate management to sell the freehold or grant a new lease, but these circumstances are very exceptional and seldom occur.

In addition to the Cardiff Estate which produces about half the income of the Company, Western Ground Rents Limited owns many im-

## THE ECONOMIST JUNE 17, 1961

portant properties in the West End of London and elsewhere and I would particularly like to mention the Canonbury Estate. This estate, comprising some 400 properties, has in recent years become a much sought after residential district and will no doubt continue to increase in value owing to its close proximity to the City of London.

The report and accounts were adopted, and at the following Extraordinary General Meeting the resolution for increasing the Authorised Capital was duly passed.

### TRINIDAD CENTRAL OILFIELDS LIMITED

The forty-fifth annual general meeting of Trinidad Central Oilfields Limited was held on June 8th in London. The following is an extract from the circulated statement of Mr Jack E. Duckham, Chairman and Joint Managing Director:

TRINIDAD: The gross sale of oil and gas in 1960 amounted to £556,274, which was 5 per cent less than in the previous year. Economies in field operations lowered overall development cost. Very satisfactory initial trading has been achieved for the first six months of business at the Farrell House Hotel opened on July 5th last.

CANADA: During 1960 the Group's operations were consolidated on purchase of the petroleum and natural gas assets of Tricentrol Oils Ltd. by Canadian High Crest Oils Ltd. for shares following the acquisition of a controlling interest in the company. Your Canadian Board's policy is so to spread their portfolio that advantage can be taken promptly of the inevitable upswing of Canadian oil prices and allowables while avoiding erosion of capital by losses on high risk ventures.

The decrease in gross sales in Trinidad has therefore been more than offset by an increase from your Canadian subsidiary.

PROFIT AND DIVIDEND: The profit available for distribution amounted to £193,303 (£227,180) and your Directors have considered it prudent to recommend a final dividend of 17½ per cent which, with the interim, makes a total of 27½ per cent, less tax, for the year as compared with 30 per cent for the previous year.

The report and accounts were adopted.

## THE ECONOMIST JUNE 17, 1961

## COMPANY MEETING REPORTS

The 67th Annual General Meeting, held on 16th June, 1961, at the *Grand Spa Hotel*, Clifton, Bristol 6.

# JOHN HARVEY & SONS, LIMITED

"Your investment will prosper"

Mr. G. E. McWatters, Chairman.

Group sales have increased by 24.87%, from £4,799,943 to £5,968,799. This does not fully reveal the home market increase, as duty on fortified wines — Sherries, Ports and Madeiras — was reduced last year by two shillings a bottle. Taxation of profits, however, rose by 33.89%, from £293,513 to £392,991. The salient figures for the year are:

| GROUP                                | 1961<br>£        | 1960<br>£       | Increase or Decrease<br>of 1961 over 1960 |          |
|--------------------------------------|------------------|-----------------|-------------------------------------------|----------|
|                                      |                  |                 | Amount<br>£                               | per cent |

#### Additional Space for Warehousing

New Production and Bonded Warehouses and Offices have been opened at Whitchurch — the cost of this move being borne in the year's accounts. A further increase in sales has necessitated increasing the facilities at Whitchurch, and an extension should be completed early next year.

#### Sherry and Port—increased supplies

Don Zoilo Ruiz Mateos, our colleague in Spain, has increased his Sherry stocks to meet our needs, and has completed a new bodega to house six thousand butts of Bristol Cream. To secure our position in Portugal, further interest has been acquired (now 40%) in Cockburn, Smithes & Companhia Limitada.

The old established firm of Martinez, Gassiot & Company Limited has also been acquired. We welcome Mr. G. R. Beresford Smith, its chairman, and his colleagues to our executive team. Sales of Port are increasing and we are well placed to meet demands.

#### Dry Sherry Sales doubled

Advertising and merchandising campaigns for the three Bristol Sherries — Cream, Milk and Dry — have proved successful and the sales force has been extended. A campaign promoting sales of Bristol Dry, emphasising the virtue of serving it chilled in warm weather, has doubled the sales of this Sherry during the year.

#### Overseas, the prospects are good

We have formed an Export Division under Mr. H. H. Waugh, our Export Director, assisted by Mr. A. L. Selway, General Manager of Export Sales, who are both on the Boards of our recently formed Overseas Companies, in Belgium, South Africa and Rhodesia. In Rhodesia and South Africa we are undertaking an advertising campaign to establish our position. Mr. Waugh recently reported favourably on our prospects in Africa. Our American Agents also report encouraging increases in sales. The Common Market is growing in importance, and we have appointed Mr. L. Bardsley to be European Sales Manager and are reviewing our sales organisation.

#### New Business Assets

We have acquired the entire share capital of A. J. Smith & Company Limited, operating some twenty-five retail off-licences in London. We have appointed Mr. Glyn Davies Managing Director of this subsidiary.

We have obtained the entire issued share capital of Cater, Stoffell & Fort Limited, based in Bath and Bristol and controlling licensed grocers' shops, restaurants, and a banqueting hall. They also manufacture Bath Oliver and other biscuits.

We have also bought the whole of the share capital of Connolly and Olivieri Limited, Birmingham wine merchants.

#### From strength to strength

Our Whitchurch facilities are unequalled in the wine trade in this country. We have opened new depots in Birmingham and Glasgow and are building additional depots in Cardiff and Portsmouth. Our position in Spain and Portugal and relations with growers in France and Germany should enable the Company to grow from strength to strength. Our recent Rights Issue raised £1,600,000 additional capital to finance further developments. We believe that, in our hands, your investment will prosper and our growth continue at its present high rate.

Copies of the Report and Accounts may be obtained from the Secretary, John Harvey & Sons, Ltd., 12 Denmark Street, Bristol 1

# BOOTS PURE DRUG COMPANY LIMITED

## SALES UP 10 PER CENT

### INTENSIFIED PROGRAMME OF RETAIL DEVELOPMENT

#### MR WILLOUGHBY R. NORMAN ON THE IMPORTANCE OF PHARMACEUTICAL RESEARCH

The Seventy-Third Annual General Meeting of Boots Pure Drug Company Limited will be held on July 13th. The following is a Statement by the Chairman, Mr WILLOUGHBY R. NORMAN, which has been circulated with the report and accounts for the year ended March 31, 1961:

In this my first Statement as Chairman I must begin by paying tribute to my predecessor, Mr J. P. Savage, who retired on March 31st after serving the Company for nearly fifty years, during the last seven of which he was Chairman. With his natural ability and long experience of the business he has made a great contribution to our affairs over many years. On personal grounds too, he will be greatly missed by his colleagues and many friends, and we all wish him a long and happy retirement.

#### YEAR'S RESULTS

I am happy to tell you that the year just ended has been another good one for your Company, though as was forecast, the profit increase is not on the same scale as last year. Home retail sales increased by 10.4 per cent, and wholesale and overseas sales including the sales of our overseas subsidiaries by 6.7 per cent, making the total sales of the Group to outside customers £99,690,000, an overall increase of exactly 10 per cent. As is the general experience gross margins were trimmed during the year but the expense position was again well held resulting in a profit before tax of £8,826,093 compared with £7,560,697 last year, or after tax of £4,263,303 compared with £3,826,004.

#### DIVIDENDS

On these results the Directors are recommending a final dividend of 8 per cent which, with the increased interim of 4 per cent (8 per cent on the old capital) will make a total distribution of 12 per cent for the year on the Ordinary Capital. This represents an increase of 1½ per cent over the total for the previous year adjusted to the new capital, and will still leave a dividend cover of nearly 2½ times.

#### FINANCE

Tax ab-orbs a higher proportion of the profit this year because of the increase in profits tax in the 1960 budget and the inadequacy of depreciation allowances, and this is illustrated by the fact that while our pre-tax profits increased by 17 per cent, profits after tax were only 11 per cent higher. Depreciation charged is up from £1,592,951 to £1,760,065 and undistributed profits increase by £204,599 to £2,322,444, so that the cash flow shows an increase of £371,713 and now exceeds £4 million.

There is nothing else in the accounts to which I need draw your attention except to the increase in the authorised and issued Capital, and the big movements in the capital reserves brought about by the one for one scrip issue of ordinary shares in November last.

On capital account we plan to spend during the current year £3½ million, divided as to £2½

million for the Retail Development Programme, and £1½ million on buildings, plant and machinery for the wholesale side of the business. This is an increase of £350,000 over what was actually spent during the year covered by these accounts, and the new expenditure of £3½ million is well within the cash flow.

Published with the Report and Accounts there is a table setting out a number of figures on a comparative basis over the past ten years.

#### STAFF

This year the profit earning bonus, which is 8½ per cent on the pre-tax profit and is divisible amongst the staff according to earnings and length of service, amounts to £819,911. This is an increase of 17 per cent and it rises, or falls, in exactly the same proportions as the pre-tax profits, thereby giving the staff as is right and proper a direct interest proportionate to the success of the Group.

During the year we introduced a forty-hour week for everyone in our factories, warehouses, and works.

It is very important as salaries increase and retail competition grows fiercer to watch most closely the percentage of salary to sales, and I am glad to say that because of another good sales increase this percentage figure is still moving in the right direction. This matter is particularly pertinent at the moment because if the Chancellor of the Exchequer used his pay roll tax "regulator" it would fall most brutally on organisations like Boots with a very large retail staff where opportunities for labour saving are obviously limited.

Here let me tell shareholders how immensely proud we are of our staff, their spirit, their energy and their skill, and I am sure that you also are aware of their quality, as for example from your visits to the Company's shops. On your behalf I would like to thank them all very warmly, wherever they are in the world, for what they are and do, and to assure them that their efforts are really appreciated.

#### RETAIL DEVELOPMENTS

We have two fewer shops than we had last year but that is not significant. Our policy is to close unprofitable ones, and wherever we have shops near together and not ideally placed, we try to close them in favour of a larger one in the best trading position obtainable. All the time the average size of our retail trading unit is getting bigger in order to handle an expanding volume of business in the most economical way possible.

The retail development programme is now really beginning to show results. During the past year modernisation of a major nature was in progress in 110 branches of which 57, including large shops in Slough, Gloucester, Lancaster, Huddersfield, Cambridge and Canterbury, were completed. New shops were opened in nine shopping centres, including Basildon New Town. The rebuilding of our Union Street store in Glasgow is well ahead of schedule and it

is hoped will be finished by April 1962. Other large shops to be completed during the current year will be Kettering, Taunton, Bradford, Bolton and South Shields.

These modernised shops give more selling space, freer circulation of customers and staff, better opportunities for customer self-selection of merchandise, and easier handling of goods from the time of arrival until their display in the fittings, all in well-lit, attractive working conditions. Our object too, is to make the shop fronts as attractive as possible, conforming to the best features of any surrounding architecture.

I do not know whether shareholders generally realise that normally all the shops are planned, designed, and fitted by ourselves, only the building work of the structure, and such things as heating and ventilating, being put out to outside contractors.

#### RETAIL TRADING

Retail business was generally well balanced throughout the year in spite of the wretched summer weather. We had another record Christmas, and our dispensing staff, who during the year dispensed more than 37 million prescriptions accounting for 14 per cent of our turnover, was fully extended during the post-Christmas epidemic.

Our chemist inventory has been extended by a number of new lines including a triple-action cold-relief tablet called Febs, Nasofen nasal drops for the relief of congestion in head colds and hay fever, and Paxedin tablets for relief of pain and feverish conditions. The toilet and household ranges also have a considerable number of additions and reformulations.

#### STOCKS

Stocks show a further considerable increase. In large degree this is a reflection of the increase in sales, but with higher sales an improvement should be possible in the rate of stock turnover and measures are being taken to this end. This is a very complicated matter when you consider that we currently carry some 60,000 stock lines in our warehouses, and this number is additional to lines carried for special order only.

The EMIDEC electronic computer was delivered in April last year and has been in commercial operation since September. Two departments, Photographic and Surgical, are now being handled by the computer and additional departments will be added as time goes on. Having regard to the extreme complexity of the task the conversion has been made very successfully. We are already seeing considerable operational benefits from the new system particularly in the warehouses.

#### RESEARCH

Our expenditure on research and development is now running at the rate of £750,000 per annum and is rising. With present profit margins we could not hope to justify expenditure of this order solely from sales in the home

market, and so we are looking more and more to overseas outlets to increase our production and help finance this cost.

Because of our wide manufacturing and selling interests we research actively in many fields, sometimes alone and sometimes in collaboration with other companies. In appropriate cases we market a product containing a new active ingredient offered to us by another company, even if it involves us in substantial research and development which must be done at the expense of products original to ourselves. We believe that such collaboration is sound in that it builds up a desirable contact with other companies while at the same time it develops the rather special marketing position we wish to maintain.

In the field of human medicine we have marketed during the year a new anti-histamine drug, Febramine, which has the special merit of being particularly free from side-effects. Also two new saluretic products, Aprinox and Abicol. The success of our product, Entamide, for the treatment of amoebic dysentery has now been reinforced by our introduction of another new product, Furamide, which has a more extended range.

In the animal husbandry field, we have developed two new poultry pesticides which have proved very successful in use, and we have also introduced Eludon, a new anthelmintic for sheep which has particular application in the Australian market.

Among new plant protection products are a Codling Moth spray and a product for controlling Big-bud Mite in blackcurrants. The range of fungicides has been extended by a new Potato Blight spray. Keeping our lead in the selective weed-killer market, we have added to our well-known Cornox range two new products, Cornox RK, for control of red shank and other weeds, and Cornox G, which offers a new product and technique for control of weeds in grassland.

New and improved drugs and chemical compounds are the life-blood of our industry, and through them enormous advances have been made since the war in the prevention and cure of human, animal and plant disease. But unless British manufacturers are enabled to earn profits from pharmaceutical manufacture sufficient to support the very complicated and expensive research which is necessary, we shall lose our place in the markets of the world and have to import these vital products from overseas. Pharmaceutical manufacture in America is much more profitable than here and in 1960 was able to support a research expenditure of £76 million. Expenditure for Britain was probably about £5½ million, and it is common knowledge that at least five of the biggest United States pharmaceutical companies each spend annually on research more than all the British firms put together.

#### NATIONAL HEALTH SERVICE

I cannot leave this matter without referring to the National Health Service which closely concerns your Company both as retail chemists and as pharmaceutical manufacturers.

For the coming year the total estimates of gross expenditure on the National Health Service amount to more than £800 million. This is an enormous figure and it is only right and proper that it should be the subject of careful scrutiny. But the cost of the pharmaceutical services accounts for only £96 million, or less than one-eighth of the total, and of this £23 million is paid by the patient in prescription

charges, leaving the net cost to the Government as £73 million.

The "drug bill" is said to be rising all the time, and first the patients are accused of excessive demands and the doctors of excessive prescribing; then the retail chemist is accused of making excessive profits and the manufacturer for charging excessive prices. But the statement that the national drug bill is an increasing burden is not true. The cost of the pharmaceutical services has remained a virtually constant proportion of the national income during the whole life of the National Health Service. When the Hinchliffe Committee in 1959 examined the matter it reported that between 1951/52 and 1957/58 hospital service and local and general medical services all rose more than the cost of the pharmaceutical services. Such statistics as are available from the United States and Europe show that the great majority of countries spend a higher proportion of their national income on pharmaceutical services than we do. The Board of Trade wholesale price index records that "pharmaceutical preparations" rose 0.9 per cent between 1954 and 1960 whilst over the same six years "all manufacturers' products" rose 13.1 per cent—fourteen times as much. The improvement in the health of our citizens brought about by the pharmaceutical industry must save the nation many millions of pounds in the cost of hospitals, doctors, and nurses, as well as through improved efficiency and less sick absence.

We are all tax payers and we all have an interest in efficient and economical administration but it is difficult to escape the conclusion that the continual attacks made on the size of the "drug bill" are inspired more by ignorance than by the merits of the case. There is in fact very close control over the cost of the pharmaceutical services and the chemist cannot charge what he likes but is only paid an amount allowed by the Ministry. Any suggestion that great profits can be derived from supplying drugs to the National Health Service is wide of the mark. The Government is getting the business done not only efficiently and economically but at a lower cost than would be possible in any other way.

#### WHOLESALE DIVISION

Good progress was made in our Home wholesale business during the year. Sales of our medical specialities again showed a significant increase and bulk sales of pharmaceutical and industrial chemicals, despite intense price competition, were higher than before.

#### INTERNATIONAL DIVISION

Although still small in relation to our home business we have continued to put much effort into developing our International business, and sales to agency markets showed a marked improvement during the year. Sales and profitability of the overseas Companies set up a new record, and progress is shown by the fact that sales have doubled in the last six years.

There have been several interesting new developments overseas during the year. The Indian Government has given a licence to our Indian Company for the manufacture of solid and vialled Insulin, which we propose to carry out at our Bombay factory. Plans are now well in hand for this important addition to India's basic manufacturing resources.

In order to give us a foothold within the Common Market we have opened a Benelux

Branch Office in Rotterdam. Work has commenced on the construction of a new head office and warehouse building in Wellington for our New Zealand Company, and in Nigeria, where we have been trading for some years, we have formed a new subsidiary Company.

Our thanks go out to all our overseas agents, as well as staff, for their efforts throughout the year.

#### SUMMARY AND PROSPECTS

Taken generally I feel that the year has been one of steady progress for your Company, and we look ahead with quiet confidence. Consumer expenditure is rising in real as well as monetary terms and I forecast increasing sales, but we may have to face lower profit margins in certain sections of the business. Tax burdens will again be higher as a result of the recent budget, but we see no reason why these difficulties should not be met by bigger turnover and improved efficiency.

## FOY, MORGAN & CO., LIMITED

### DIVIDEND FORECAST EXCEEDED

#### MR. PETER MORGAN ON THE VERY SATISFACTORY RESULTS

The 26th annual general meeting of Foy, Morgan & Co., Limited, was held on June 8th at the Offices of the Company, 16, Eastcheap, London, E.C.3, Mr. Peter Morgan (the chairman) presiding.

The following is the statement by the chairman which had been circulated with the report and accounts:

I have pleasure in submitting the Accounts for the year ended December 31, 1960, which show a very satisfactory year's trading.

The forecast I made in my last year's Statement has been amply fulfilled, and we have been able, not only to pay a Dividend of 18 per cent. on the Ordinary Share Capital, which I then indicated, but to increase this to 20 per cent. for the year. This has been paid in two equal instalments.

We have also felt justified in writing off the sum of £11,000 against the item of Goodwill in the Balance Sheet, and, thereafter, as you will see, have added a substantial amount to the net balance remaining on the Profit and Loss Account.

1960 was a very good year in the Timber Trade generally, and larger quantities of wood than usual were imported. As a result, the stocks in the country at the beginning of 1961 were considered by many to be dangerously high. Consumption has, however, continued to be good, and although I do not anticipate that the same quantity of wood will be imported during this year, as was imported during 1960, I nevertheless believe that it should be well up to average.

I am happy to say that all Departments and our Subsidiary Companies have contributed to the very satisfactory results and our thanks are once again due to the members of our Staffs for their able and willing work.

The report and accounts were adopted.

# MARKS AND SPENCER LIMITED

RECORD TURNOVER OF £166,500,000

MASSIVE INVESTMENT IN STORES

"ST. MICHAEL" A GUARANTEE OF QUALITY

ADVANCES IN MODERN MANUFACTURING TECHNIQUES

The thirty-fifth Annual General Meeting of Marks and Spencer Limited was held on June 8th at 47-67 Baker Street, London, W1.

Sir Simon Marks, DSc, Hon FRCS (Chairman and Joint Managing Director), who presided, said:

Ladies and Gentlemen, may I take it that, following our customary practice, the Directors' Report and Accounts as circulated may be taken as read?

## PROFIT AND LOSS ACCOUNT

Our net profit for the year amounts to £10,295,000 compared with £9,081,000 last year. This is after the provision of £10,200,000 for taxation compared with £8,725,000 last year. Income tax required £7,700,000; and profits tax £2,500,000. The total available for distribution including £2,407,000 brought forward from last year is £12,702,000.

The directors recommend a final distribution of 32½ per cent, making 47½ per cent for the year against 40 per cent last year.

We propose to transfer £3,988,000 to the general reserve, bringing this reserve to £15,000,000. After the payment of dividends and the appropriations set out in the Directors' Report, there will remain a balance of £2,107,500 in the profit and loss account to be carried forward to next year.

The revenue reserves will thus total £17,107,500; the capital reserve remains at £19,323,000.

We propose to capitalise the sum of £2,171,276 from the general reserve to enable a scrip issue to be made on the basis of one "A" Ordinary share for each ten Ordinary or "A" Ordinary shares.

## PROPERTIES

Our expenditure during the year on the acquisition of sites and the development and modernisation of our stores amounted to £7,650,000, of which £1,591,000 has been charged as Repairs and Maintenance in our profit and loss account. £1,015,000 has been provided for depreciation, and our properties, fixtures and equipment now stand in the balance sheet at £56,340,000 compared with £51,294,000 a year ago.

## STOCK

Our stock-in-trade amounts to £12,541,000 compared with £11,098,000 last year, while the increase in our advances to our subsidiary companies at £1,381,000, and in debtors and amounts paid in advance at £1,983,000, represents the additional cost of financing the supplies of raw materials to our suppliers.

## CASH

Our cash balances and our holdings of Tax Reserve Certificates and Treasury Bills amount

to £12,257,000, compared with £11,052,000 a year ago.

## GENERAL SURVEY

I am glad to be able to report the Company's continued progress during the past year. Our sales, at the record figure of £166,500,000, exceeded last year's figure of £148,000,000 by £18,500,000. Profits after tax were £10,295,000, as compared with £9,081,000 in the previous year, an increase of £1,214,000.

This increase both in turnover and in profit continues the remarkable advance which the Company has made since the war, and especially in recent years. The ten-year statement which has been issued with the accounts shows that in that period sales have increased from £75,900,000 to £166,500,000, and profits after tax from £2,306,000 to £10,295,000.

Such figures tell their own story; but figures can be cold and dry, unless we remember the spirit which is at work in them, and in our case especially the devotion and dedication of our executives and staff and our suppliers, and of course we must not forget the spectacular improvements that have been made in our stores.

Our progressive advance is the result of a policy which has been followed consistently over a long period. It is a policy which reflects the growing prosperity of the community, the higher standards of life, and the discriminating demands and tastes of the public which we are happy to serve.

Our sales have increased year by year, because we have always aimed at improving the quality of our merchandise and of the conditions in which they are offered for sale in our stores. Such an aim is a response to the public's increasing demands for better values. In this the public and the Company are at one, and the best symbol of our common interest is our brand name "St. Michael," both because of what it stands for in quality and value, and because of the popularity it enjoys throughout the country.

In all our efforts to establish "St. Michael" as the mark of high quality, exclusive to our stores, we have been sustained by the goodwill and confidence and, I almost dare to say, the affection of our customers.

## BUILDING DEVELOPMENT

It has been an integral part of our policy that while improving the quality of our goods, we have at the same time continuously increased the selling space, the convenience, the amenities, and I hope I may say, the pleasure of shopping in our stores. Since the end of the war we have invested nearly £50,000,000, provided out of retained profits, on the general development of the business.

The cumulative effect of this massive investment has been that many of our stores have

undergone a complete process of transformation in size and appearance. They have been given an entirely new look, which expresses the nature and scope of our development programme much more clearly than any statistics or a speech could convey. Year by year, we are benefiting, as our volume of trading and our profits show, from the developments we have carried out in the past.

Our building programme is a continuous process. At any particular moment, work on some stores has been completed; some are at various stages of construction; on other building operations have only just begun. Beyond this are a number of schemes in various stages of planning. The weight of our activities is clearly laid on the expansion of our existing stores, which have served us so well in the past. But our plans do not exclude the acquisition of sites in towns where we are not already represented and changes of premises where existing stores are too limited in space to be adequately developed.

Thus we are continuously engaged on a fundamental reconstruction of our stores. In the year under review, expenditure on development amounted to £7,650,000. Of this, £2,200,000 was spent on the acquisition of sites and the enfranchisement of leasehold properties, and the balance of £5,450,000 on building operations and modernisation. Work was completed on 23 stores, and work is now in progress on 25 more; others will follow as our plans are finalised.

It takes two years or more to build and equip a major store. The cost is heavy and its importance is shown by the fact that it may vary from £100,000-£500,000, according to the size and needs of each individual store. In the coming year we estimate that the programme will require a further investment of over £6,000,000.

Our properties, which appear in our balance sheet at £50,285,000, are an asset which cannot be over-estimated. They contribute significantly to our trading profit, because no interest charges are incurred on this large sum; and because they include properties as yet undeveloped, they provide a basis for expansion on a considerable scale for several years to come.

We are able to undertake such developments with all the greater confidence because most of our properties are either freehold or freehold in character, in the sense that they are held on very very long leases.

## "ST. MICHAEL"

Our brand name "St. Michael" continues to grow in popularity. The volume of trading reflects the confidence of the public in the value and quality of "St. Michael" goods. Science, technology and modern manufacturing techniques have enabled us to widen the range and the variety of the merchandise we sell, to the evident appreciation of our customers.

Our technologists keep abreast of scientific developments in the textile field, and in conjunction with the suppliers establish specifications of the construction of the materials to be used in the manufacture of our garments. There follows the study and application of new processes, finishes and dye-stuffs, which make it possible to create new and delightful fabrics, with special performance value.

Our executives and their staffs are responsible for the conversion of these materials into garments of style. They are also responsible for planning the production, and for organising the distribution to stores, of the vast quantity of goods we require.

It is due to this combination of the skills and experience of executives and technologists, working together as a team, that we are able to present so varied a range of fine products which make their appeal to the millions of customers who shop at our stores week by week.

By such methods, which reflect what is in many ways a new approach to the problems of retail organisation, we have created a unique form of collaboration between the basic producer of materials, the manufacturer, and ourselves as distributors. I like to think that in this way we have been in the vanguard of the scientific revolution which has transformed the textile industry in recent years; certainly there can be no doubt that we have greatly helped to make the products of that revolution available to the public with the shortest possible delay.

## FOOD DIVISION

In recent years we have devoted much time and thought to applying to the food side of our business the same fundamental approach which we have applied in the field of textiles and I am glad to say that this policy has shown encouraging results. The progress made by our Food Division, whose turnover last year was £28,500,000, as against £24,500,000 in the previous year, is the best evidence of the public's increasing appreciation of the high quality and freshness of our foodstuffs.

We are concentrating on a large variety of specialised lines of bakery products, and selected and graded fruits of high quality, but are now also developing other food departments. We work in increasingly close co-operation with our suppliers. Together, we try to improve the quality and presentation of our products and the

standards of cleanliness and hygienic food handling in the factories and the stores. We specify the use of only the best ingredients, and aim at the highest standards of freshness.

To meet the standards we set, I am glad to say that many of our suppliers have already engaged technologists and installed laboratories to safeguard the high quality and purity of their products. Their efforts have involved a large capital investment; during the last three years they have spent nearly £6,000,000 on expanding and modernising their plants. They have been able to undertake this investment with confidence because of the increasing market which our stores offer for "St. Michael" fine quality food products at reasonable prices.

## COSTS OF ADMINISTRATION AND SIMPLIFICATION OF PROCEDURES

We continue our efforts to control the costs of administration and to reduce the burden of paper work in our business, and in doing so have achieved results which have made a considerable contribution to the year's profits.

The Simplification Exhibition at Head Office, which illustrates the methods by which we have tried to solve this vexing problem, has attracted some 5,000 businessmen and administrators from all over the world and we are always glad to welcome such visitors. Our campaign against wastefulness in administration has received world-wide publicity, which continues to draw attention to our efforts to overcome one of the troubling problems of management.

## TRIBUTE TO MANUFACTURERS

It has been my privilege year by year to express our thanks for the invaluable co-operation we receive from our manufacturing friends.

I have already emphasised the importance we attach to modern manufacturing techniques. It is pleasing to record the progress our suppliers are making towards increasing productive efficiency, which is the objective we both have at heart.

We set high standards for the manufacture and finish of "St. Michael" garments. They can only be achieved by the use of modern plant and equipment, skilled management of trained labour, and appropriate factory layout which ensures flow production on a large scale.

An important service which we freely offer our friends is provided by the Production Engineering Department, which we set up in 1947 at a time when British industry was all too slowly recovering from the effects of the war. This department advises manufacturers on all aspects of factory administration and production problems. I am glad to say that nearly three hundred of our friends have taken advantage of this service, which has proved so mutually beneficial.

We gratefully acknowledge the efforts and enthusiasm which our suppliers devote to the task of increasing efficiency and it is because of their efforts that we are proud to be able to say that our goods are 99 per cent of British manufacture. Without the wholehearted support of our friends it would be impossible for us to achieve this object and therefore I wish to thank them once again on behalf of the Board for their splendid co-operation.

## TRIBUTE TO STAFF

No speech would be complete without my thanking the staff for their devoted work. Throughout the years it has been our constant concern to give our staff a sense of pride and satisfaction in their labours. We have tried to do so by providing good conditions of employment, the most modern amenities, and proper security against old age, so that they may have confidence in their future.

For all this we are amply repaid by the spirit of loyalty and devotion which animates the staff in the stores and at Head Office. Such a spirit of goodwill and enthusiasm creates an invaluable asset for our business, and we believe that it is a spirit which radiates beyond the staff; it is an integral part of the goodwill and confidence which the public has increasingly shown towards us. Of the many compliments we have been paid by our customers, none is more frequent than a customer's thanks for the friendly and individual care and attention which he, or more often she, has received from the staff in our stores. In that sense our staff is the best advertisement any business could well ask for.

We deeply appreciate the loyalty and devotion of all who serve the Company, and on behalf of the Board I wish to thank them most warmly and sincerely.

The report and accounts were unanimously adopted.

# MONTECATINI

Società Generale per l'Industria Mineraria e Chimica

MILANO, ITALY

## SIGNIFICANT PROGRESS IN ALL SPHERES OF ACTIVITY

### GROWING EXPANSION ABROAD

### OUTSTANDING RESULTS IN SCIENTIFIC RESEARCH

### NEW PLANT, INCREASED PRODUCTION AND FULLER EMPLOYMENT

The Ordinary and Extraordinary General Meetings of Montecatini took place in Milan on April 26th under the chairmanship of Cav. del Lav. Count Dr Faina, Chairman and Managing Director of the company, in the presence of 557 shareholders representing in person or by proxy 89,572,556 shares. Dr Faina, reviewing the Report of the Board of Directors, said that 1960 had generally been a favourable year for both the European and Italian economies, and that one of Montecatini's main reasons for deciding to step up its level of investment in 1960 was its ambition to make an even greater contribution to the development of Southern Italy, combined with a desire to achieve production levels appropriate to the Common Market. He quoted a number of examples, including the huge petrochemical plant under construction at Brindisi, destined to be amongst the largest in Europe, the potash workings in Sicily and the discovery of a natural gas field in the Abruzzi which had led to the building of the first natural gas pipeline in the South and had enabled a large-scale petrochemicals programme to be embarked upon at the Montecatini works at Bussi. There were also other reasons. The fierce competition on a continental scale now met with in the economies of the main capitalist countries could be severely detrimental to enterprises whose scientific knowledge was allowed to fall below modern standards and whose application of this knowledge in the form of large-scale production was not immediately forthcoming. At this point Dr Faina asked whether Montecatini, to which the credit was largely due for an important scientific and technical revolution in the petrochemicals field, could possibly allow itself to be overtaken by other developments in this sector. The substantial projects of the past year had, the Chairman said, been intended not only to benefit the development of Southern Italy but also to keep Montecatini in the forefront of the most promising branch of the chemical industry, thus strengthening the company as a whole and making it European in size and organisation. In 1960 the Italian Montecatini Group achieved a global turnover of 350,000 million Lire, a figure which ranges her as a large international concern. The Chairman then passed on to the main results of the Group's various activities.

Mineral output had been more than satisfactory, including 240,000 tons of bauxite and 1,397,783 tons of pyrites. The extraction of pyrites in the Maremma for use as iron ore was especially important in view of the state of the sulphur market, and original patented processes would enable the Maremma pyrites to be converted into iron ore which ranked amongst the best in the world in quality. Galena production had been maintained at the average level for the past five years and there had been a further increase in the output of marble; sales had increased and 33.5 per cent had been exported to

sixty-six countries. In Sicily the production of potash at the new San Cataldo mine had reached 3,000 tons per day and a further two deposits had been discovered, one at Palo, where operation would begin in 1962, and the other at Racalmuto.

The progress of the Group's chemical activities had been equally promising. Plant had operated at full capacity and the market had proved capable of absorbing a generally steady rise in output. 1,237,449 tons of MH sulphuric acid had been produced in 1960, a phosphorus plant had started operations at Crotone and a substantial output of alcohols and aldehydes had been achieved. In addition there had been continuous progress in the production of natural pigments and a big new titanium dioxide plant would come into operation at Spinetta Marengo in 1961. Substantial progress had been recorded in the precious metals and fertiliser fields, in the second of which Montecatini held a dominating position, as it did with fungicides and insecticides.

In the plastics and synthetic fibre sectors the Group's manufacturing programme was proceeding largely on the basis of the new scientific discoveries concerning the polymerisation of the olefines made by Professor Natta and Montecatini's research workers. A second "Moplen" production unit had commenced operating at Ferrara and a third would follow within a few months. The Brindisi unit would be brought into service early in 1962. Outside Italy, too, "Moplen" continued to forge ahead, as shown by the latest manufacturing licence agreement with Svenska Esso for the Scandinavian countries. Other negotiations were in progress.

The Company's plans did not stop short at "Moplen," however—new polyolefines were in an advanced stage of development. A particularly interesting example was polybutylene, for which a pilot production plant had been brought into service at Ferrara, along with a further pilot plant for the production of ethylene-propylene copolymers, known on the international market as "Dutral." The latter would be manufactured industrially at Brindisi in 1962. Excellent progress had also been recorded with other plastic materials, of which Montecatini produces the largest range in the world, e.g., "Fertene," which had passed the 24,000 tons per annum mark in 1960, "Vipla," the "Crilat" acrylic esters, the "Vedril" metacrylic monomers and polymers, "Montivel" polyester film, "Moplefan" polypropylene film, etc.

In the sphere of synthetic fibres Dr Faina stressed the importance of the new polypropylene fibre "Meraklon," which showed great possibilities throughout the textile field. Extensions were at present under construction at Terni in order to increase production, which would rise even further when the Brindisi plant came into

operation. Abroad manufacturing licences for "Meraklon" had recently been granted to ICI for the United Kingdom and to three large Japanese groups. Excellent results had been obtained in the manufacture of nylon and "Terital," and the figures for "Movil" were more than satisfactory.

As regards other chemicals, there had been a noteworthy increase in the production and sales of paint and intermediate paint products, particularly "Ducotone." Activities in the field of coal derivatives were normal and very good results were recorded in the mining explosives and fireworks. ACNA's output of intermediate products and dyes had been maintained at a thoroughly satisfactory level, and the same was true of Farmitalia's pharmaceutical products, and Vetrocoke. No less vigorous and rewarding had been the activities of Montecatini's associated companies abroad. Production by the Compagnie Néerlandaise de l'Azote (Netherlands) was increasing; the Novamont Corporation was well ahead with the construction of a polypropylene plant at Neal, West Virginia (USA); Danubia Petrochemie AG would shortly start manufacturing polypropylene at its Schwechat plant in Vienna; Rotterdamse Polyolefinen Maatschappij, a joint venture with the Royal Dutch-Shell Group for the manufacture of polypropylene in the Benelux countries, had begun construction of a plant at Pernis, Holland; Fertilizantes Sintéticos SA (FERTISA) had finalised production arrangements at its works in Lima (Perú); Corporación Venezolana de Aluminio SA (Covenal) was now operating normally.

Lastly, in the hydrocarbons field, the partnership consisting of the French PREPA group on the one hand, and Montecatini, Fiat and Snia Viscosa on the other, had commenced operations in the Algerian Sahara and preparatory geological surveys were in progress in the two zones for which licences had been obtained.

The Montecatini Group's activities in the patents field had also been outstanding: more than 3,000 applications had been filed in 1960, 2,800 of them abroad. There were now 277 nitrogen plants throughout the world employing the Fauser-Montecatini processes, representing a total output of some 4 million tons of pure nitrogen.

Turning to the Group's remaining activities, Dr Faina stated that the production of electric power in 1960 had been 3,500 million kWh, an increase of 22 per cent over 1959, and that of aluminium 51,378 tons, representing an increase of 15.11 per cent. Two new 100,000-amp furnace units were being installed at the Bolzano factory and modernisation and extension programmes were in hand at Mori and at the Porto Marghera alumina works. As regards plans for new factories these were as always subject to the

availability of energy at a price which enabled costs to be kept down to a competitive level from an international point of view. Lead production had been 15,225 tons and zinc 19,503 tons, the latter being a record for the 25 years of operations at Porto Marghera.

Dr Faina terminated his remarks with a reference to jute and building materials and to the active and vital work carried on by the various Research Laboratories and Institutes. He then thanked all the Company's employees—executives, office and industrial workers—for their valuable contribution to the favourable progress reported.

After the report of the Board of Auditors points were raised by a number of shareholders to whom the Chairman replied in detail. His remarks were greeted with warm applause. All the resolutions proposed were carried unanimously, with a single abstention by a shareholder representing 100 out of the 89,572,556 shares present.

The dividend for 1960 of 115 Lire per share (effective as normal) and 28.75 Lire per share (effective October 1, 1960) would be payable as from May 2, 1961. At the Extraordinary General Meeting the Chairman Dr Faina reviewed the proposal for the issue of a 50,000 million Lire debenture loan carrying interest at 5½ per cent and repayable after 20 years, which would enable a much broader programme to be pursued in the field of plastics, synthetic fibres and elastomers on the basis of the successful results of the research work carried out in the Group's Laboratories. The resolution was carried unanimously.

## ESTATE DUTIES INVESTMENT TRUST

The 9th annual general meeting of Estate Duties Investment Trust Limited was held on June 9 in London, The Rt. Hon. Lord Piercy, CBE (the chairman), presiding.

The following is an extract from his circulated statement:

The year under review, while not specially remarkable, was a satisfactory one. As usual a considerable number of propositions was examined. In the upshot, about the same number as in the preceding year resulted in business. The investments at book value increased by £271,962 (1959-60: £42,643); offers outstanding for the purchase of stocks and shares amounted at March 31, 1961, to £329,000 (£222,875).

Income for the year, after all expenses but before tax, at £271,470 compares with £237,694 for 1959-60, and £200,027 for 1958-59. The Directors recommend the payment of a dividend of 9 per cent (8½ per cent in 1959-60, equal to 7.7 per cent on the present issued capital).

Capital and Revenue Surplus, taken together, stand in the Balance Sheet at £380,778 (£427,982), despite the capitalisation and distribution of £200,000 from reserves during the year.

In providing a solution to the problem of Estate Duty liability on private companies in a way which leaves control of the undertaking still in the hands of the family or group, Estate Duties Investment Trust can claim to make a real contribution to the peace of mind of those upon whose efforts the economic development of this country so greatly depends.

The report was adopted.

## THE METROPOLITAN RAILWAY SURPLUS LANDS COMPANY, LIMITED

The Twenty-eighth Annual General Meeting of The Company will be held on June 21, 1961. The following is an extract from the Chairman's Statement issued with Report and Accounts for the year ended March 31, 1961.

**PROFITS AND DIVIDEND.** The steady improvement in gross and net rents averaging 12½ per cent per annum over the last five years and the regular improvement in other investment income have continued and have been coupled this year with an exceptional increase in profits on the purchase and re-sale of properties in our principal subsidiary.

Net rents increased by £42,680, interest and dividends on investments increased by £20,563 and profits on purchase and re-sale of properties increased by £163,357. The profit before taxation, which was £608,784, showed an increase of £174,819. Net profit after taxation was £301,371, an increase of £74,801.

We propose a final dividend of 6½ per cent making 10½ per cent for the year, leaving £153,223 to be carried forward against £106,618 brought in.

**NEW FINANCE.** We are proposing (subject to the completion of underwriting arrangements) to make an issue of 10s. shares at the price of 20s. per share on the basis of one share for each ten such shares held. Furthermore, negotiations are well advanced for the placing of £2,000,000 of Debenture stock secured by way of first charge on selected properties held by the parent Company.

**THE CONSOLIDATED BALANCE SHEET** shows an increase of nearly £1,000,000 to £7,364,183 in the total assets; £350,000 is in freehold and long leasehold properties held for investment, £300,000 in properties held for re-sale and £225,000 in trade investment. These increases in assets are reflected in an increase in liabilities, principally loans. The new share and loan capital proposed will enable us to clear the overdraft with a margin to spare for the initial finance of the developments we have in hand.

Furthermore we have arranged loans secured on some of the assets of Ortem Estates Limited, and with our co-partners on the assets of The Whelmar Property Company Limited. These arrangements are part of our policy of financing our trading interests in subsidiary and associated companies to a considerable extent from outside sources, reserving the bulk of our own resources for the expansion of the parent Company's property investments.

**DEVELOPMENTS.** Our development programme falls into three classes. Firstly there is our existing London Estate with which we are dealing in various ways. Secondly, there are sites acquired for development as permanent investments; these require over £4,000,000 in the next three years. Thirdly, The Whelmar Property Co. Ltd., which The Metropolitan Railway Country Estates Ltd., and ourselves own jointly, is likely to build and sell over one thousand houses in 1961.

**GENERAL AND PROSPECTS.** The Chairman then referred to the record of growth circulated with the Accounts showing increases in profits before taxation from £257,575 in 1957 to £608,784 in 1961 and in profits after taxation from £98,988 to £301,371 in the same years, and continued:

Our primary aim is to expand our income on a permanent and steadily improving basis from rents derived from modern properties. The current year seems likely to be a year of consolidation, but we hope to maintain the dividend although this must depend on the continued success of our subsidiary and associated companies. Looking to 1962-63 and beyond the prospects seem to be well assured.

(A copy of the full Report and Accounts together with the Chairman's Statement will be sent on application to the Secretary, Kensal House, 553/579, Harrow Road, W.10.)

# THE NATIONAL BANK OF NEW ZEALAND LIMITED

EXTRACTS FROM THE STATEMENT BY THE CHAIRMAN  
MR. ARTHUR H. ENSOR, TO BE PRESENTED  
AT THE EIGHTY-NINTH ANNUAL GENERAL MEETING  
ON JULY 6th, 1961

## BALANCE SHEET AND PROFIT & LOSS ACCOUNT

Our deposits at £78,115,000 show an increase of some £8,000,000 over last year but the major part of the increase is accounted for by abnormal and special deposits in London.

The demand for bank loans has been stronger than for many years and our advances at £48,460,000 show an increase of more than £8,000,000. The Banks endeavour to co-operate with the Authorities with the object of restricting advances but the pressure for finance has sprung from a number of causes.

Our net profit at £316,586 is slightly higher than last year but, as I have mentioned on previous occasions, our earning capacity is severely limited by official policy.

From the net profit £100,000 has been allocated to General Reserve. In January last an interim dividend of 4%, less income tax at 7/9 in the £, was paid and the Directors now recommend for your approval a final dividend of 5%, less income tax at 7/9 in the £, leaving a balance of £180,344 to be carried forward.

## BUSINESS DEVELOPMENT

Internal business activity has been running at a high level this year and the number of our accounts has increased at a very satisfactory rate. During the year our Civic Centre Branch at Wellington was opened and five new Agencies have been commenced in areas of growing commercial importance.

## NEW ZEALAND'S OVERSEAS PAYMENTS PROBLEM

Several measures have been announced recently which will, in time, make an important contribution to relieving the present overseas payments difficulty and will help to establish more stable conditions, which should enable a steady expansion of the economy to proceed.

The measures taken by the Government may be expected gradually to improve the overseas payments position but, meanwhile, a £20,000,000 issue of New Zealand Government 6% Stock has been made in London.

## THE INTERNAL ECONOMIC SITUATION

The past year has been a very prosperous one for business in New Zealand, with retail trade turn-overs and the production of most consumer goods attaining high figures. At the same time, the liquid resources of the community increased markedly and at the end of the year the volume of money was 14% greater than at the end of the previous year, the larger part of which was due to increased Government borrowing from the Reserve Bank. Nevertheless, prices, as measured by the official consumers' index, rose by less than 2% over the year and a large share of the credit for this should go to the multitude of small savers and the rather smaller but increasing number of Stock Exchange investors.

## MONETARY POLICY

It is reassuring to learn that the Government is intending to screen public expenditure more carefully in future, for the surplus ultimately achieved in the public accounts in the last financial

year was largely the result of some non-recurring items on the credit side and the under-spending of some appropriations. The very large amount of Government indebtedness to the banking system at the end of last year confirms the necessity for a much tighter rein on the public purse, as well as the private sector of the economy. However, it is encouraging to see that there has been a substantial reduction in Government short-term borrowing in recent months.

The Government has also considered it necessary to re-impose hire purchase controls on household goods and furnishings, as well as increasing the minimum deposit and reducing the repayment periods on new and secondhand cars. This is a highly discriminatory form of control but will probably have a marked effect on consumption.

It may well be that fiscal measures and further Government loans will also be needed to contribute to the policy of restoring a proper balance to the economy. On the other hand, additional restrictions on demand may not be necessary, as there is a certain truth in the adage that "time is a great healer", even as applied to economic affairs. There is a time lag between cause and effect, often overlooked, which must be allowed for in assessing future trends, but Government policy is of the first importance. If prices cannot be kept down in the next few months, a General Wage Order is probably inevitable, which will lead to a rise in costs likely to be far more damaging to the New Zealand economy than a temporary surplus of liquid funds.

As the result of increased business activity, new industrial development and the demand for more imports following last year's liberalisation of licensing, the Trading Banks' average advances rose this year by 11%, but in the last half year to March there was a much sharper rise of 18% over the comparable figure of 1960. In order to maintain the credit squeeze at a time when funds were rising, the statutory ratios have been kept at high levels this year and the Trading Banks have been forced to keep on the average one quarter of their total deposits frozen at the Reserve Bank where no interest is earned. It may be questioned if the statutory ratio system, operated as it is, can be considered a very effective control, as it is difficult to give priority to desirable and approved projects while at the same time restricting the total level of bank advances. It is also well to remember that increasing Trading Bank advances are frequently a symptom of increasing demand and it is, therefore, to the root causes of credit creation, largely through excessive Government expenditure, that the monetary authorities will have to direct their attention, if persistent inflation, albeit in small doses, is to be successfully avoided. The restriction of bank lending by itself is not a deflationary policy. It must form part of a reduction of the over-all liquidity of the economy, and if that is lacking, the fall in advances will have little meaning.

## NEW ZEALAND'S CAPITAL NEEDS & INDUSTRIAL DEVELOPMENT

Recent studies have clearly shown the need for large amounts of fresh capital investment if New Zealand's economy is to expand as rapidly as those

of other progressive countries. New industries, many of them on a large scale, will need to be established and much investment in essential services will be necessary to maintain the country's present high living standards and relieve the burden which in the past has so largely fallen upon the primary industries.

In the past two years important new industrial developments have been initiated and several others are now being investigated. Large amounts of capital are involved in such developments. Although it is desirable that some new industries should be wholly financed by local funds or with a substantial New Zealand participation, considerable investment from overseas will be necessary for financing the larger enterprises. The servicing charges on this investment could be heavy, perhaps leading in the short run to a net drain on overseas reserves, but if the industries established were either export producing or import saving industries, they should save overseas exchange as well as making a valuable contribution to the country's economic progress.

All this development must be subject to the steady growth of population so that the present over-full employment position is not aggravated.

## NEW ZEALAND'S OVERSEAS TRADE

In company with other commodities, New Zealand's main export earners have had to contend with marketing difficulties and lower prices this year. Wool continues to be the largest earner of overseas exchange, whilst meat has displaced dairy produce as the next most important export earner. This change has arisen mainly as a result of the variations in the levels of prices received overseas.

New Zealand's trade pattern is gradually becoming more diversified and every effort to develop new markets is being made by the producer organisations, marketing boards and the Government, through trade surveys and by new trade agreements. Nevertheless, the United Kingdom is still New Zealand's most important market and single largest supplier. Thus, there is a natural concern to safeguard this privileged trade relationship. New Zealand is at the moment apprehensive lest any closer association between the United Kingdom and the countries of the Common Market should adversely affect her trade. The New Zealand attitude was made clear during the Commonwealth Prime Ministers' Conference and it is certain that in any future negotiations between the United Kingdom and the Economic Community, New Zealand's trading interests will not be forgotten. However, it could well be that an agreement between the United Kingdom and the six countries of the Common Market would be to New Zealand's ultimate advantage, provided due allowance was made for the special position of Commonwealth primary products in the United Kingdom market.

## PROSPECTS

New Zealand is entering a fresh phase of economic development and a fresh approach is needed to help solve the new problems likely to arise. The necessity for employing more capital more effectively carries with it the obligation of using labour more productively. The sciences of organisation and management are not being ignored but they should become more readily accepted. A new scale of national priorities will have to be adopted if orderly economic expansion is to proceed. The amount of capital and labour at present available is insufficient to support—all at the same time—the development of new industries and public utilities, the high level of personal consumption and the generous amount of social welfare being provided. There is a widespread appreciation that present over-consumption must not be allowed to jeopardise the development necessary to give a proper balance to the New Zealand economy, and it is to be hoped that the good sense of the New Zealand public can be relied upon to support the policies required to achieve this end.

# THE UNITED SUA BETONG RUBBER ESTATES, LIMITED

## COMPETITION BETWEEN NATURAL AND SYNTHETIC RUBBER INTENSIFIES

### SIR JOHN HAY'S VIEWS

The fifty-second annual general meeting of the United Sua Betong Rubber Estates, Limited, was held at 19, Fenchurch Street, London, E.C.3, on Wednesday, June 14th at 12 noon.

Sir John Hay, the chairman, in the annual statement to stockholders, deals with the year's successful operations and the Company's sound financial position and pays tribute to the services of the staff and labour force.

Sir John goes on to say:

### RUBBER OUTLOOK

In his recent speech the Chairman of the Rubber Growers' Association did well to draw attention to the technological advances in the development of new synthetics and the greater competition with natural that is likely to result. Although this prospect should not cause dismay, the warning implicit in his address should not pass unheeded. The first safeguard for the producer of natural rubber is to modernise his plantations and render his processes efficient in all phases, with the ultimate aim of getting costs down to the lowest level, and in working to that purpose he will rely confidently on the continued co-operation of Government and labour.

Taxation should not exceed the level appropriate to a highly competitive industry and the same consideration must influence the rate of rewards to labour. A continuing prosperous rubber industry is essential to the welfare of the main producing territories and to the maintenance of employment at the present high wage rate, with its generous standard of social services and amenities.

Past experience would seem to demonstrate that research would prove more fruitful if in its primary aim it was more concerned than hitherto with the problems of production. We still remain in a state of ignorance regarding such a fundamental matter as the function of latex in the tree, whilst in many of our plantation difficulties we are without any scientific findings upon which to base our treatment.

Without such guidance we are still at the stage in some important matters of following with uncertain results the practices that were in force 30 or 40 years ago. Research activities directed to the production of specialised rubber have had little or no commercial success. It is significant that the highest claim made by synthetic is that it is "as good as natural." It is as producers of natural rubber that the plantation industry will stand or fall. Expertness in that field is of first importance.

Happily, the course of events is likely to be such that the plantation industry will be granted a respite in time to adjust itself to the stronger competition that is in prospect, for the new rubber substitutes are not likely to come into production on a significant commercial scale for some time to come. If that opportunity is wisely used, and supported in the sense indicated here, our industry should be well equipped

to meet and match the achievements of other products in terms of price and quality. The existing disparity in price between synthetic and natural is not so wide as would appear by a comparison between the fixed price of the former and the published quotation for the latter which is generally expressed in terms of first grade.

Not more than about half of total production is in that form, and other grades are available at lower prices. The true differential can be bridged without rendering plantation rubber unprofitable. It is encouraging to note that despite its higher price this year's total demand for natural rubber is expected to exceed the total consumption of synthetic, despite the sobering fact that demand from the USA is likely to be in the proportion of 70 per cent synthetic and 30 per cent natural.

### PROBLEMS OF PRICE

There still remains the problem of the fluctuating price of natural rubber, a consideration which often determines the choice in favour of a product selling at a fixed price. Wide variations in price are not only vexatious to the producer and consumer alike, they are productive of economic difficulties in territories such as Malaya which are heavily dependent on one or two primary commodities and encumbered with a rapidly increasing population eager for a higher standard of living. The net exports of rubber from the Federation of Malaya in 1960 were 659,000 tons. Export Duty thereon forms a major portion of Government revenue. Under the sliding scale now in force a moderate fall in price can result in a quite disproportionate fall in revenue.

On the 1960 exports, at a \$1 per lb, duty would amount to over \$210,000,000. At 80 cents per lb the figure would be little more than \$90,000,000. This fall of 20 per cent in value involves a 57 per cent drop in Government receipts. With this consideration in mind it is perhaps not surprising that the search for means to establish stability in price should be revived from time to time. Wide variations in price are by no means peculiar to rubber, they afflict many commodities and in a number of cases to a greater degree. In the six years 1955/60 the spread between the highest and the lowest prices of rubber, expressed as a percentage of the latter, was 108, copper 172, sugar 158, cocoa 138 and coffee 200. The one exception to these wide movements is tin, which comes out at 39, but if the present trend is continued that relatively modest percentage may well be changed, despite the support of the present scheme of control operating under conditions to which there is no parallel in rubber.

This is not the occasion for a detailed examination of any scheme for stabilising rubber prices. The very existence of a powerful synthetic industry and the possession by the USA of a stockpile of natural rubber amounting to over 1,000,000 tons, part of which is now in the process of liquidation and neither of which could

be brought under control, would constitute a serious threat to the success of any regulation of rubber supplies.

No less formidable would be the difficulty of reaching agreement on fair and equitable terms between producing countries operating under different systems of Government and with widely varying administrative capacities. It is well to recognise that the circumstances under which rubber supplies were regulated from 1934 to 1940 have profoundly changed and that any attempt to repeat that or apply any similar device would be fraught with danger.

Admitting that the rubber market is unpredictable, it is yet not unreasonable to expect that the course of events will bring in its train some limitation in price movements. With a continuing increase in the demand for rubber, which cannot be wholly met by natural, synthetic must necessarily be required to increase its supplies and thus exercise a steadying influence on prices and if the manner of disposing of stockpile rubber can be made more flexible the violent upward surges in price to be followed by corresponding falls could largely be checked. In its contest with synthetic the plantation industry is not likely to be helped by any fettering of its freedom to produce, export and market.

# SIMMS MOTOR & ELECTRONICS CORPORATION

## MR G. E. LIARDET'S STATEMENT ON 1960 ACCOUNTS

At the Annual General Meeting of Simms Motor & Electronics Corporation Limited held on June 9th at Finchley, Mr G. E. Liardet (Chairman) presided and in the course of his circulated speech said:

Group profit before tax was £1,408,147, an increase of £370,457 over 1959. This is a record although the assets employed have increased substantially in recent years. Profit margins have narrowed considerably and only the great expansion in turnover, both home and export, enabled us to offset to some extent the higher material prices and rising labour costs.

Taxation takes £705,500, leaving a net profit of £702,647 compared with £489,490 for the previous year.

Your Directors have transferred £100,000 to General Reserve and recommend a final ordinary dividend of 12½ per cent for 1960 on the increased capital making a total of 17½ per cent, which compares with 15 per cent for 1959 on the smaller capital. All major companies have contributed to the Group profit.

In July 1960 a Rights Issue of one Ordinary share for each five held was made at a price of 10s. per share. Later in the year we capitalised Reserves by the issue of one fully paid share for each ten held.

For the Simms Group 1961 will be a year of considerable capital investment, which will certainly bring us benefit in future years.

I have already said that profit margins are narrowing but if we can maintain high volume output I have reason to believe you will not be disappointed with our results at this time next year.

## THE EVER READY COMPANY (GREAT BRITAIN) LTD.

### A proud export achievement

#### STATEMENT BY THE CHAIRMAN,

##### MR. E. N. ROWBOTHAM

It is with a deep sense of personal loss that I refer to the death on the 15th November 1960 of our colleague Mr. R. H. Spettigue. Mr. Spettigue was chiefly concerned with research and production; he had served with this Company for 41 years and was elected a Director of the Company in 1943. His death is a great loss to my colleagues and myself.

The Directors have appointed Mr. H. L. Taylor, formerly Secretary of the Company, to be a Joint General Manager responsible for the Company's overseas investments, and Mr. A. E. Gibbins, Joint General Manager responsible for development and research. Mr. B. G. Phelvin has been appointed Secretary of the Company.

#### Record Sales and Profits

It is with considerable satisfaction that for the eighth year in succession I am able to report in this the Jubilee Year of the business an increase in the sales and net profits of the Company. The Accounts for the fifty-two week period ended 25th February 1961 show that the net profit after taxation has increased from £1,550,982 to £1,706,526. I am particularly gratified that the export business of the Company under our trade mark "BEREC" has again made an increased contribution to the sales and profits. In view of the many statements by Government officials and press reports that this country must increase her exports, it may interest shareholders to know that the dry battery industry exported approximately £7,000,000 worth of goods during 1960. This figure is 4½ times greater than ten years ago.

I again pay my tribute to the work of all employees of the Company, both at home and overseas, who have contributed so much to the successful result of the year's work.

#### Increased Dividend

In view of the good results achieved during this period the Directors recommend a Final Dividend of 17½% making 22½% for the year on the Ordinary Shares compared with 20% for the previous year. Your Directors are concerned, however, at the continuing increases of costs year by year, particularly the cost of

labour. While the measures which the Board have taken for the modernisation and improvement of plant and machinery, combined with the increased turnover which it has been possible to achieve, have more or less offset these increases to date, the Board feel that any further substantial increases must have their effect on the profits of the Company.

In the domestic market in the United Kingdom, in spite of increasing costs, we have not increased the list prices of any of our battery products since 1951, in fact battery prices today are lower than they were 10 years ago and approximately double pre-war prices in spite of the fact that the cost of living index has increased by approximately 300 per cent.

#### Expansion of Overseas Interests

As indicated in my statement last year, during the course of this year we have extended further our interests in the Common Market and we acquired a majority interest in the largest dry battery Company in Italy trading under the name "SUPERPILA".

In France, as was announced in the press on 19th May 1960, we acquired a substantial interest in the largest dry battery manufacturers in that country trading under the names "CIPEL" and "MAZDA". These new interests together with our subsidiaries in Germany trading under the name "DAIMON" will strengthen substantially the position of this Company on the Continent of Europe.

In accordance with the Company's usual practice, all Intangible Assets relating to the acquisition of new subsidiaries have been written off.

#### Progress of Subsidiaries and Trade Investments

All our subsidiaries, both at home and abroad, have experienced satisfactory trading and profits have been increased. The new interests on the Continent of Europe are showing very satisfactory results and Eveready South Africa Limited, in which we have a large investment, has recently announced a Capitalisation Issue of one share for every two shares held in order to bring its Issued Capital more into line with the present-day value of its assets.

#### Strong Financial Position

Following the normal practice of showing the assets of the Company at realistic values your Directors have decided to increase the book value of its investment in The Ever Ready Trust Company Limited as shown in the Capital Reserve Account, and as a result of this and the new investment in France, the book value of the Trade Investments of the Group has increased from £773,017 to £1,505,787 an increase of £732,770 and, in addition, a sum of £1,495,518 has been expended on Land, Buildings, Plant, Machinery, Equipment and Vehicles chiefly for the further expansion of the Group's productive capacity. In spite of these large capital payments the surplus of Current Assets over Current Liabilities (including Deferred Liability for future taxation) has decreased only slightly from £4,102,288 to £3,948,794, immediately available Cash Assets being decreased from £2,866,473 to £2,234,266, but Stock-in-Trade, Debtors and Creditors have all increased substantially due in the main to the inclusion for the first time of the Assets and Liabilities of the Italian subsidiary acquired during the year. The same acquisition has resulted in a considerable increase in the minority shareholders' interest in subsidiaries. The market value of the Group's Trade Investments has increased substantially during the year.

In the Parent Company's Balance Sheet the figure of Subsidiary Companies' Share Capital is increased from £1,054,499 to £1,435,300 as the result of the acquisitions made during the year. Subsidiary Companies' Loans and Current Balances, less Deposits, are also increased from £591,967 to £1,186,636 partly because of increased temporary finance for certain expanding subsidiaries and partly due to a reorganisation of the businesses of other subsidiaries which has resulted in an increase in the figure of Loans and Current Balances accompanied by a corresponding reduction in the figure of Debtors of the Parent Company from £783,930 to £658,165. Creditors have increased from £1,103,247 to £1,287,190 by reason of increased purchases of raw materials in the last months of the year.

Shareholders will also notice that, due to the fact that the Parent Company receives the benefit of the Income Tax Capital Allowances on all the new plant, the liability for future taxation in the Parent Company's Balance Sheet has fallen from £436,000 to £393,625. The total Liability for Future Taxation shown in the Consolidated Balance Sheet has increased from £931,853 to £1,046,928.

The current trading year has started satisfactorily, sales to date being in excess of those for the corresponding period last year.

The Ever Ready Company (Great Britain) Limited, Hercules Place, Holloway, London, N.7.

## CITY DEEP, LIMITED

(Incorporated in the Republic of South Africa)

The Sixtieth Ordinary General Meeting of shareholders was held in Johannesburg on June 15, 1961.

The following is an extract from the circulated statement by the Chairman, Mr P. H. Anderson, dated June 1, 1961.

#### ACCOUNTS

In the Directors' Report it is stated that capital expenditure during the current financial year is estimated at approximately R200,000. As a result of a decision taken after the Directors' Report was prepared, to re-open and equip 45 Haulage, this estimate should now be increased to approximately R300,000.

#### OPERATIONS AT THE MINE

In the K1 area below the dyke the develop-

ment footage sampled on Main Reef Leader during the year totalled 1,340 feet. From the start of development in this area, the total footage sampled on Main Reef Leader up to the end of April, 1961, was 3,390 feet averaging 17.5 dwt. over a channel width of 20 inches, or 349 inch-dwt. In the K4 Shaft area, further east and above the dyke but also in the deep levels of the mine, the footage sampled during the year totalled 450 feet of an average value of 17.1 dwt. over a channel width of 18 inches, equal to 308 inch-dwt.

As the longwall system of mining is, or will be, in use in these areas it is important to note that the values given above for the K1 and K4 Shaft areas relate to all the footage sampled and not only to the payable footage.

It can be said that the good values now being encountered in the deeper levels indicate a better "ore in sight" position than has been the case for many years, and it is hoped that future work will give the mine greater flexibility by removing the shortage of stope faces which has ad-

versely affected operations in past years.

At the end of the year the ore reserves below the Vierfontein dyke were much greater than at the end of the previous year, but in total the ore reserves decreased by 310,000 tons to 3,151,000 tons; this position is accounted for partly by a reduced development footage on reef and partly by the increased rate of mining. At 5.8 dwt. per ton the average value of the available reserve increased by 0.1 dwt., the width being 0.5 inch less.

Now that the main zone of stoping operations has moved below 45 Haulage elevation, work has started on the reopening and equipping of this haulage in order to provide a common working level between the various shaft banks. Once this is accomplished it should be possible to close down several of the upper incline shafts between 32 and 45 levels and so reduce hoisting costs.

The Company has adequate funds to meet the overall expenditure now contemplated for the mine.

## THE CITY OF LONDON REAL PROPERTY COMPANY

#### PROGRESS OF CURRENT DEVELOPMENTS

The ninety-seventh annual general meeting of The City of London Real Property Company, Limited, will be held on July 4th in London.

The following is an extract from the circulated review of the Chairman, Mr Leonard J. Williams:

In my review accompanying last year's accounts I informed you that ordinary stockholders would be invited to subscribe for a further 1,000,000 ordinary shares (subsequently converted into stock) of £1 each in the proportion of one share for every £10 ordinary stock held on May 16, 1960. The shares were issued at 65s. per share and the issue was substantially over-subscribed.

In the following August a bonus issue of ordinary capital was made on the basis of one

ordinary share of £1 (subsequently converted into stock) for each £2 of ordinary stock then held. This was effected by capitalising £5,500,000 of the amount standing to the credit of share premium account.

In the result the ordinary capital of the Company now stands at £16,500,000.

There has been a further substantial rise in Gross Rents and Service Charges, and after deducting the usual outgoings the balance credited in the consolidated revenue account amounts to £2,615,109, an increase of £166,291 over the corresponding figure last year.

Your Directors recommend a final dividend of 7½ per cent on the ordinary stock, making a total of 11 per cent for the year.

#### GROUP ACTIVITIES

Excellent progress has been made with our important development on the Stag Brewery site, the whole development should be completed well ahead of the programme date of December, 1962.

Work on the office building on the adjoining

site Nos. 1-9 Warwick Row and No. 25 Allington Street, S.W.1, has started and completion is expected in September, 1962.

The development of Kempson House, Camomile Street, E.C.2 was completed in October of last year and the building is wholly occupied.

The office and shop development at 70 Brompton Road, S.W.1, is virtually complete. The property is fully let and income producing.

Good progress is being made with the redevelopment of the sites of Nos. 35/38 Trinity Square, E.C.3, which will form an extension to the Company's existing leasehold building No. 40 Trinity Square.

The first stage of the redevelopment of Nos. 14/15 Seething Lane and Byward Street, E.C.3, is making satisfactory progress.

Negotiations are still afoot with regard to some of the matters mentioned in my March review; in addition, other propositions have come forward since that date. Consistent with our policy of expansion your Directors are still concerned to see that our investments are made on the lines of sound security and potential revenue.

## EUROPE'S LARGEST DRY BATTERY MANUFACTURERS

# COMPANY AFFAIRS

## Seven League Boots

IN the last two years, the shares of Boots Pure Drug have really captured the attention of investors and have taken an established place among the leading growth stocks. Investors, in fact, were slow to recognise that Boots, like Marks and Spencer, is a cash multiple with a considerable say in the quality and price of the goods it sells. Like Marks and Spencer its shops are its advertisement. Much of its capital investment has been used to make the shops more attractive and to add to their trading area, drawing the customer right into the shop, so that as well as buying his bottle of aspirin he buys something else, a cake of soap, or a garden fertiliser or anti-

example been a sharp fall in the number of prescriptions dispensed since the patients' charges were doubled. He is hopeful, however, that the effect upon trading results will be mitigated by an increase in sales and a further improvement in efficiency. Boots shares have fallen from a peak of 36s. to 28s. 3d., and still yield only 2 per cent on a dividend of 12 per cent. Certainly 36s. was too high, but is 28s. 3d.? The return is low, but so consistently has been the return on Marks and Spencer and investors have not fared badly in following that star.

## Marks and Spencer

FOOD sales of Marks and Spencer rose in 1960-61 slightly more than the average rise in total sales of 12½ per cent; at £28½ million, compared with £24½ million, they represented just over 17 per cent of the group's total turnover of £166½ million. This proportion is likely to become bigger, for Sir Simon Marks, who is now to be made a baron, told shareholders that the group is developing other food departments, besides those specialising in bakery, confectionery and fruit. Suppliers of food products to Marks and Spencer have already spent £3 million on adding to their plants so as to satisfy the demands that will be made upon them.

Since the end of the war Marks and Spencer has used nearly £50 million of retained profits to develop the business; some £7,650,000 was spent last year, £2,200,000 on site acquisitions and the enfranchisement of leasehold properties and the remainder on the modernisation of its stores. The development of 23 stores was completed in 1960-61 and work is under way on 25 more; capital expenditure this year is likely to exceed £6 million. With a cash flow of almost £6½ million and liquid assets of £12½ million the company should have no financial difficulties.

Spending at a level as high as this shows clearly how confident the directors are—as they have every reason to be on the past record of growth. Over the past ten years, for example, sales have risen from £76 million to £166½ million; net profits from £2½ million to £10½ million; and the net amount paid in dividends from £1 million to £6.4 million. If anything can justify the present yield of just over 2 per cent these figures do. There can be little doubt that the current dividend rate as increased from 40 to 47½ per cent will be at least maintained on the capital to be increased by the proposed one-for-ten scrip issue. On this assumption the return on the 5s. "A" shares at 114s. 10½d. improves to 2½ per cent.

## House of Fraser

THE preliminary statement of the House of Fraser is not as clear as it should be. In his statement a year ago, Sir Hugh Fraser hoped for a "satisfactory measure of progress" in 1960-61 and a 9 per cent rise in trading profits from £5.9 million to £6.4 million would seem just sufficient to fulfil that hope. But this is not the full story, for the comparison is distorted by the large amount of £1.1 million deducted for Harrods' pre-acquisition profits in 1959-60. A very small sum was deducted for pre-acquisition profits in 1960-61 and to arrive at a true comparison of profitability of the House of Fraser plus Harrods in the two years pre-acquisition profits have to be added back. Then it appears that profits before tax, which ostensibly have risen by 22 per cent, have in fact actually fallen slightly, from £5.5 million to £5.4 million, and net profits have declined from £2.7 million to £2.4 million. As forecast the dividend is maintained at 45 per cent but on the capital as increased by a 5 per cent scrip issue, so that the effective increase is 2.1 percentage points. This payment is covered only 1.3 times, so that the implications of the proposed one for two scrip issue for future dividends are limited.

The principal reason for the marked difference between trading profits and gross profits, with the former going up and the latter going down, would appear to be interest charges, which largely reflect the cost of acquiring Harrods. Unfortunately the preliminary statement does not specify how much these charges were. The 1959-60 balance sheet showed a loan of £10 million from the National Commercial Bank of Scotland (from which Sir Hugh has now resigned as a director) to finance part of the Harrods purchase; and development schemes, including Harrods' £4 million site in Birmingham, required a further £5½ million. Funding of the bank loan, which Sir Hugh said last year had been reduced by "temporary adjustments of cash balances within the group," was to be carried out by borrowings on mortgages and by the realisation of certain freehold and leasehold properties. How far and in what way the funding has proceeded is a matter that Sir Hugh should make plain in his statement to shareholders. Lacking any up-to-date information on these matters and confronted with disappointing trading results the stock market marked the 5s. shares down by 4s. 6d. to 64s. 1½d., at which they yield 3½ per cent. This return appears to discount the growth prospects of various developments within the group. Sir Hugh has still to justify the high price paid for Harrods.

## Tesco Stores

A PIONEER in self service stores, Tesco Stores (Holdings) has expanded rapidly by investing money in the shops it already owned and by acquiring other chains. Last year, for example, John Irwin and Harrow

Stores (Watford) were brought into the Tesco group and these acquisitions make profit comparisons difficult; but on the basis of these companies' earlier profits it would appear that they contributed about £300,000 to the increase of £388,000 in profits before tax for the group as a whole in the year to end-February, 1961. Thus Tesco's own increase in earnings does not match those scored in earlier years, but even so it represents a sizeable increase in turnover in the face of lower profit margins. Shareholders, however, are unlikely to grumble at the advance from £819,000 to £1,207,000 in gross profits and from £441,000 to £607,000 in net profits.

As forecast, the ordinary dividend rate is maintained at 22½ per cent, but this in fact represents an increase of 50 per cent in the payment as the latest dividend is payable on the capital as increased by a one-for-two scrip issue. The directors expect to pay a similar dividend in the current year on the capital to be increased by a one-for-five scrip issue and a one-for-eight rights issue. The latter is at 10s. a share and it will raise just under £1½ million. The funds will be needed to carry through the group's "biggest ever" expansion scheme, in which the aim is to have more than 50 supermarkets (compared with the present 20) in operation before the end of next year. The directors hope to extend trading to cover the whole of this country; this could mean more takeovers. At an estimated ex all price of 18s. the 1s. shares yield only 1½ per cent on the forecast dividend and just under 4 per cent on earnings. This looks well ahead for a company which, however well-managed, has many powerful competitors.

## Smith's Potato Crisps

THE exceptionally wet summer of 1960 hit Smith's Potato Crisps in two ways, affecting sales in the peak holiday period and reducing the yield of crisps per ton of potatoes, which were of unusually poor quality. These factors led to a sharp reduction in profit margins though trading results in the year to March 31st were not quite as bad as had been inferred by the directors' cautious interim statement. Sales over the full year were slightly higher but net profits fell from just over £1,000,000 to £876,000. An ordinary dividend of 55 per cent has been maintained on the capital as increased by a one-for-five scrip issue, and this payment was covered over twice by earnings.

Partly as a result of a "bear squeeze" the 5s. shares have risen by 6s. 9d. and at 85s. 3d. now yield 3½ per cent. The present price seems to discount further growth fairly fully, particularly when it is borne in mind that the company's results are often at the mercy of the cost and quality of one commodity—the potato. Competition, moreover, appears to be growing: Marks and Spencer for one has been actively promoting the sale of its family packs of crisps under the "St. Michael" trade mark.

## United Sua Betong

A YEAR ago, during a period of acute scarcity, the price of rubber soared to 40d. a lb. But over the year, average prices did not differ much from those of 1959, and United Sua Betong's profit before tax was only £36,000 higher at £1,188,000. Since the beginning of this year, rubber has been unusually stable with prices at a level which makes natural rubber quite competitive with synthetic and which some producers believe might be the long-term average price for rubber unless synthetic rubber achieves a major advance. In his annual statement, Sir John Hay reveals that about half United Sua Betong's expected output this year (23.5 million lbs., according to a published estimate, compared with 23.7 million lbs in 1960) has already been sold at higher prices than those now current. Sir John implies that if prices remain at about the present level for the rest of the marketing period profits will not be substantially short of those for 1960.

Only half of all the rubber produced is in the form of RSS, the premier grade

## American Aid

TWO ailing companies have this week received help from across the Atlantic and this has pushed up the price of their shares, the injection of money and in one case "know how" being interpreted as signs of a brighter future. The past history of Dollar Land Holdings has been short—and bleak. Issued at 28s. each in January, 1960, through London and Yorkshire Trust, the shares had fallen early this year to 13s. Within a few months of its inception, the company, with property interests in the United States and Canada, was the subject of a struggle for control on the part of Mr Kenneth de Courcy, who has a large shareholding, and by then it was already apparent that profits would fall short of the estimate in the prospectus.

Its accounts now reveal pre-tax profits of £173,000, compared with an estimate of £409,000. Less than half this short-fall can be attributed to exceptional expenses and the failure of New Townships to pay its £80,000 contribution towards administrative expenses, for rentals were £54,000 less than expected, while New York real estate taxes were £75,000 higher than had been originally estimated. Instead of a forecast dividend of 7½ per cent shareholders are to receive 2 per cent.

It does not need the delayed report on the company's affairs from Peat Marwick and Mitchell to show the need for the injection of expert property management into the group, for the trading results prove quite conclusively that this is what Dollar Land lacked. This the company hopes to achieve in the persons of Mr Tankoos and Mr Yarmon, two North American property developers. Recently these gentlemen have bought 170,000 shares in Dollar Land, presumably at depressed prices; they have

which is normally accepted as reflecting rubber prices; lower grades are closer to the price of synthetics. Though fluctuating prices still give synthetic rubber a competitive advantage, Sir John is sceptical of any attempt to stabilise them. The United States is liquidating part of its million ton stockpile of rubber, and synthetic production could jeopardise the success of such a scheme. It would be difficult to implement fairly and conditions have altered radically since 1934-1940, when supplies were regulated. But Sir John does believe that as synthetic rubber takes a bigger share of the market, it will exert a stronger stabilising influence on the price of natural rubber. A more flexible policy in releasing stockpile rubber could also help to check any surge in prices. Sir John points to shortcomings of research which neglect problems of production, noting that the quest for specialised rubbers has not met with success. In the interval before synthetics can be produced in quantity, he feels that greater efforts should be made to reduce costs. At 80s., the £1 units of United Sua Betong yield 12½ per cent on the unchanged dividend of 50 per cent.

now been granted options on 500,000 shares for which they will now pay a non-returnable 2s. 6d. each. They will have the right to buy 200,000 shares at 20s. till the end of 1963, another 200,000 shares at 22s. 6d. and a further 100,000 at the original issue price of 28s. before the end of 1965. If they exercise their options in full and hold on to the shares they already own Mr Tankoos and Mr Yarmon will control nearly 20 per cent of the equity. They are to be co-opted on the boards of the subsidiaries but not for the moment on the board of the holding company. Their aim is to invest funds in income-producing properties and the chairman, Mr H. J. S. French, seems to be confident that funds will be available for further developments. Shareholders would probably be well advised to support this plan, for although it will involve a certain dilution of the equity it seems to provide the best chance of some recovery in the price of the shares, which now stand at 16s. 4½d.

From America has also come the promise of a loan to Arusha Industries. Mr Lindsay Carstairs, the former chairman of the company, has thus fulfilled the undertaking he made at the annual meeting in April to raise £1½ million within two months. Full details of the loan have not yet been announced, but it is for a minimum period of 3 years at an interest rate of 6½ per cent and it gives the lender, an American finance corporation, certain conversion rights. While this loan must come as a welcome relief to Sir Harold Gillett, the new chairman, he and his colleagues still face the long and difficult task of putting this company back on its feet as a trading concern. The shares have improved from the "low" of 7s. to 12s. 3d.

freeze for his car. Not long ago Boots' lending libraries were a great draw but nowadays, though it has not followed W. H. Smith in closing its libraries altogether, it devotes less space in its shops to them. This is perhaps a sign of how well the shops are established in the customer's esteem. So far the group has financed its modernisation programme from its own resources. Clearly this has paid handsome dividends, margins on sales having risen from 6 per cent in 1958-59 to 8.3 per cent in 1959-60 and to 8.8 per cent in 1960-61. Over the last ten years, as the table shows, the growth in sales and profits has been remarkable, not least because the total number of branches has risen by only two, from 1,303 to 1,305. Clearly more than two new branches have been opened but a number of less profitable shops, particularly where there were two close together, have been shut down.

In the current year the group is to spend another £2½ million on store development and £1½ million on new plant for the expanding wholesale side of the business but the new chairman, Mr Willoughby R. Norman, says that the total expenditure of £3½ million is well within the group's cash flow, which in 1960-61 was of the order of £4 million.

For the current year Mr Norman forecasts bigger sales, but foresees the possibility of lower profit margins in some sections of the business; there has for

## Booker Brothers McConnell

A STRONG hint that Booker Brothers McConnell is considering its first substantial issue since 1949 is contained in its full report. Though ordinary dividends have been raised in all but one of the past ten years, something like two-thirds of the group's net profits have been ploughed back into the business. But rapid expansion and diversification have begun to reduce liquid resources. Bank loans have grown steadily from under £400,000 to £4,600,000 and liquid assets have been brought down to less than £200,000. Since the beginning of this year, £2½ million has been raised from outside sources—£1½ million on a 20-year loan in Canada and £900,000 through a sale and lease-back arrangement involving the group's new bulk sugar carrier.

The group likes to maintain a fairly consistent balance between ordinary distributions and capital employed, and in his review, the deputy-chairman, Mr David Powell, says that "in due course" more permanent or long term capital might be raised to finance expansion. The group's low capital gearing favours an issue of loan stock, but the political risks emphasised by Mr Powell may pull in the opposite direction. On average, about 60 per cent of the group's profits are earned in British Guiana and the West Indies, and almost 30 per cent are derived from sugar, though these proportions are declining. Moreover, the group is adding to its interests in Africa, as well as developing its business in Britain and Canada.

The Booker group is anxious to offer local shareholders an increasing stake in its enterprises, but in British Guiana, for instance, local capital is scarce, and because of its overwhelming importance in the economy, the group is often obliged to extend its activities there. Booker's chairman, Sir Jock Campbell, has said that the *raison d'être* of the group is to invest in the under-developed countries of the Commonwealth. But the group's policy is far from being one of blind faith. Increasing its stake in Britain and Canada has given the group a more stable base. Expansion has been confined to projects which fit in conveniently with its existing business and all these new ventures are located so as to facilitate the tasks of the management. Consolidated trading profits rose from £4½ million to £5 million last year and further investments will begin to earn profits this year. The 10s. units at 28s. 4½d. yield 5½ per cent on the tax-free dividend of 10 per cent.

## Steel of Wales

THE interim statement from Steel Company of Wales is far from exciting, for though the production of ingots was maintained sales of tinplate and sheet steel fell below those in the same period of the previous year. Because of higher prices for

fuel and increases in wages, costs were higher and while total sales fell by only 3 per cent, compared with the first half of 1959-60, trading profits fell by as much as 16 per cent and compared with the second half of the financial year, they were as much as 22½ per cent down.

Depreciation has not risen very much, but £1,500,000 has been appropriated to fixed assets replacement reserve, compared with £1,350,000 a year ago, and though tax fell sharply net profits fell by nearly 30 per cent, from £3,010,000 to £2,133,000. The

| Six months to        | April 2, 1960 | Oct. 1, 1960 | April 1, 1961 |
|----------------------|---------------|--------------|---------------|
| Sales & other income | 70,901        | 72,195       | 68,650        |
| Trading profit       | 14,610        | 15,869       | 12,300        |
| Depreciation         | 4,025         | 4,192        | 4,200         |
| Tax                  | 3,800         | 3,600        | 2,100         |
| Net profit           | 3,010         | 4,017        | 2,133         |

interim dividend has been maintained at 5 per cent and though this week's increase in steel prices may relieve some of the pressure on margins, shareholders must expect a sharp fall in the earnings cover this year. The stock market was disappointed with the results and immediately marked the £1 ordinary shares down by 2s., but they have since risen slightly to 39s. 9d. and yield 6.3 per cent on the assumption of an unchanged final dividend of 7½ per cent.

## Wall Paper Manufacturers

IN 1959-60 Wall Paper Manufacturers earned a record trading profit of £7½ million, with the sales of almost all its wallpapers, paints and plastics rising. This year it has added to its holdings in two other companies manufacturing and distributing wallpaper and paint, Smith and Walton and K. L. Holdings, to secure absolute control. But when it did so its directors said that competition in the paint and paper divisions was beginning to cut into profit margins.

The decision to make these big acquisitions at a time when profits were falling has put a strain upon the WPM's financial resources and bank overdrafts have risen from £1½ million at the end of June to £8½ million. Not surprisingly, the directors have announced a three-for-ten rights issue at 120s. per share, making the rights worth about 6s. 9d. The issue will bring in £9.8 million net, which will be used to repay bank overdrafts and to finance additional working capital. In making this announcement, the directors say that they expect gross profits in the year to June 30th to fall from £6.2 million to £5 million, though they hope for an improvement in 1961-62. They intend to maintain the final dividend on the increased capital at 17½ per cent. On the assumption that the full year's dividend will not be less than 25 per cent on the increased capital, the £1 shares at an ex rights price of 142s. 3d. yield 3½ per cent. The size of the issue, designed primarily to cover past expenditure, and the news that profits are falling, unsettled the market in the WPM shares, which fell back from 168s. 9d. to 149s. on the announcement.

## London Stock Exchange

|                 |         |         |         |
|-----------------|---------|---------|---------|
| FIRST DEALINGS: | May 29  | June 12 | June 26 |
| LAST DEALINGS:  | June 9  | June 23 | July 7  |
| ACCOUNT DAY:    | June 20 | July 4  | July 18 |

As the account drew to its close last week-end prices of both gilt-edged and equities fell; both were depressed by the weakness of sterling. Interest in equities did not revive at the opening of the new account but the volume of stock sold fell towards mid-week and prices rallied a little. This was not enough to offset earlier losses and over the week to Wednesday *The Economist* indicator fell by 8.4 points to 402.3. On Wednesday the number of bargains marked was the lowest for five months.

The improvement in sterling led to a rally rise in short and medium dated gilt-edged stocks on Tuesday, and a sharp increase in all gilt-edged prices on Wednesday. The losses in gilt-edged when the Treasury Bill Rate rose before the week-end were thus made good and over the week the *Financial Times* index of government securities was unchanged. Some of the short dated stocks made notable gains, including Treasury 5½ per cent 1962, which rose by ½ to 100½. Among medium dated stocks Conversion 5 per cent 1971 gained ¼ to 90½ xd. War Loan failed to rise above 55 and 2½ per cent Consols lost ½ to 40½ xd. Corporation and Dominion stocks moved little over the week but there were some small gains on Wednesday.

Nearly all sections of the equity market made net losses over the week. Bank shares fell, with Barclays losing 1s. to 88s. and Lloyds 1s. 6d. to 74s. Insurance shares were also dull and some of the leaders sustained heavy falls; Legal and General were 1½ lower at 35. Among Brewery shares Vaux were again mentioned in take over rumours and gained 3s. 9d. to 187s. 6d. Among store shares House of Fraser lost 4s. 7½d. to 64s. 9d. on the disappointing results but demand for Marks and Spencer in a market short of stock pushed them up by 2s. 7½d. to 115s. 3d. Steel shares were depressed by the news from Steel of Wales and the temporary shut down of some of Stewarts and Lloyds' plants. But there was a rally on Wednesday on the expectation of higher steel prices so that over the week Steel of Wales lost only 6d. to 41s. Engineering shares were also rather dull and Guest Keen lost 4s. 3d. to 93s. There was a strong demand for London Grocers and they gained 10½d. to 22s. 10½d.

Further news of narrowing profit margins depressed prices of several shares; BTR Industries, for example, lost 3s. 6d. to 13s. 6d. The interim statement from British Oxygen led to a fall of 2s. 3d. to 21s. 3d. Following early falls BMC made net gains of 3d. to 16s. 4½d. when its name was linked with Borgward. British Drug Houses gained 2s. 7½d. to 24s. 9d. after take-over rumours. Kaffir shares fell after Mr Oppenheimer spoke of a more conservative dividend policy and the dangers of racial tensions, with Anglo-American losing 2s. 6d. to 128s. 9d.

## EXCHEQUER RETURNS

For the week ended June 10, 1961, there was an "above-line" deficit (after allowing for sinking funds) of £342,000 compared with a deficit of £10,005,000 in the previous week and a deficit of £17,324,000 in the corresponding period of last year. There was a net expenditure "below-line" of £12,265,000 leaving a total cumulative deficit to date of £129,486,000 compared with £162,384,000 in 1960-61.

## Money and Exchanges

## THE MONEY MARKET

AFTER maintaining its agreed bid at £98 17s. 10d. for three successive weeks the syndicate of discount houses lowered its bid by 2d. (a rise of 8d. in the annual rate of discount) to £98 17s. 8d. at last Friday's Treasury bill tender. The weakness of sterling and the rumours prevailing on the Continent provided ample justification for this move. The average rate of discount rose by 6.53d. to £4 9s. 4.14d. per cent. The market received the fairly low quota of 39 per cent compared with 61 per cent a week earlier; there was a sharp rise in total applications for the £270 million bills on offer of £43 million to £463 million, and in the event the allotment was cut down to £260 million.

Credit conditions in Lombard Street followed the pattern of the previous two weeks—comparative ease in the three working days to last week-end and an abrupt change to difficult conditions on Monday, which persisted through to Wednesday. For the fourth week running the market balanced its books without borrowing from the Bank of England.

In New York the three months bill rate fell sharply last week from 2.516 per cent to 2.295 per cent.

(1) Current statistics of employment by industry, based on the 1958 Standard Industrial Classification, go back only to May, 1959. Manufacturing employment for earlier dates is shown on the old basis (1948 SIC). (2) Engineering and electrical goods, shipbuilding and marine engineering, vehicles, metal goods. (3) Textiles, leather goods, clothing, food, drink and tobacco, timber, furniture, paper, printing and publishing. (4) Number registered as unemployed expressed as a percentage of the estimated number of employees. (5) Dorset (excluding Poole) was transferred from the Southern to the South Western Region on May 12, 1958. (6) Average for first quarter. (7) Great Britain. (8) Excluding all screening losses normally amounting to around 5,000 tons a week. (9) Average for second quarter. (10) England and Wales.

## MODERN MANAGEMENT TECHNIQUES

FORD MOTOR COMPANY LIMITED has made significant progress in developing the most modern techniques to assist management in formulating policy and controlling the Company's operations. Continued expansion has now provided a number of opportunities in the central staffs employing these techniques. The positions to be filled are suitable for men with experience or special interest in any of the following work:

- Industrial Economics
- Cost Control—Manufacturing or Commercial
- Office Methods and Machines
- Financial Planning—Capital Expenditure
- Financial Planning—New Products
- Operational Research

Applicants are expected to be competent in their own field and at the same time to possess the personal qualities to merit early promotion to broader responsibilities. Prospects and salary depend entirely on results and there are no restrictions on rate of advancement. The minimum qualification is a good honours degree or an appropriate professional qualification passed at the first attempt. The upper age limit is 40; there is no lower age limit provided the ability and will to succeed are apparent.

Men who can fulfil the strict requirements for these positions are invited to send brief particulars, indicating alternative dates and times at which they can be available for interview at Dagenham, to

H. G. PEARMAN, TRAINING & RECRUITMENT DEPARTMENT  
FORD MOTOR COMPANY LIMITED, DAGENHAM, ESSEX

Please mark envelopes C/109E

## ASSISTANT TO EXPORT CREDIT ADVISER

for London office of a major Company in the steel industry with a turnover exceeding £125,000,000 per annum.

He will be principally concerned with (1) the preparation and actual maintenance of status reports; (2) credit control of overseas accounts, and (3) collation of market information. Experience in the Economic Intelligence Section of a bank or finance house and with E.C.G.D. procedures would also be an advantage.

Age between 25 and 35.

Salary will be commensurate with age and experience. Apply in writing with full details to Box No. 1516.

## IMPERIAL CHEMICAL INDUSTRIES LIMITED PHARMACEUTICALS DIVISION

## Organisation and Methods

The Pharmaceuticals Division of Imperial Chemical Industries Limited has a vacancy at Division Headquarters, Fulshaw Hall, Wilmslow, Cheshire, for an Assistant in the Organisation and Methods Section. Candidates should preferably possess a degree or a professional qualification. Previous experience in the techniques of organisation and methods would be an advantage.

The appointment is to the established staff with the benefits of a Pension Fund and participation in the Company's profit-sharing scheme.

Applications, with brief particulars, should be addressed to the

Staff Manager,  
IMPERIAL CHEMICAL INDUSTRIES LIMITED,  
Pharmaceuticals Division,  
Fulshaw Hall, Wilmslow, Cheshire.

M.I.Mech.E.; M.I.Prod.E.; M.I.Mat.E.  
Applications are invited for the following posts, duties to commence on September 1, 1961, or as soon thereafter as possible:—  
**Department of Commerce**  
Two Grade "A" Assistants to teach Book-keeping, Commerce, Commercial Arithmetic and Accounts.  
**Extra-Mural Department**  
The Department is based at St. Austell with subsidiary centres at Wadebridge and Liskeard.  
Two Assistants, Grade "A" to teach Shortland and Typewriting, together with Commercial Arithmetic or English. (One based on St. Austell, the other on Liskeard.)  
Salaries in accordance with Burnham Technical Scales.  
Further particulars and forms of application can be obtained from the Principal, to whom completed forms should be returned not later than July 17, 1961.  
J. G. HARRIES,  
Secretary for Education.

County Hall,  
TRURO.  
UNIVERSITY OF NOTTINGHAM  
DEPARTMENT OF AGRICULTURAL ECONOMICS  
Applications are invited for the appointment of an ASSISTANT AGRICULTURAL ECONOMIST in the above department at the School of Agriculture, Sutton Bonington. Candidates, who should have a good Honours degree in Agriculture or Economics, may read for a Higher Degree. Salary scale (graded as Assistant Lecturer) £500 x £550 to £950 with superannuation benefits and children's allowance. Conditions of appointment and form of application, which should be returned by July 10th, from the Registrar, The University, Nottingham.

THE UNIVERSITY OF MANCHESTER

Applications are invited for the non-resident post of STAFF TUTOR, Extra-Mural Department, to work in Holly Road, the Department's residential college in Manchester. The Tutor should be qualified to teach in the field of the social studies and should have a good honours degree in an appropriate subject. Some experience of industry and an interest in its problems is desirable. The appointment will be in the grade of an Assistant Lecturer for an initial period of three years: salary £500 x £550 plus P.S.S.U. and Children's Allowance. Applications should be sent not later than July 1, 1961, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application should be obtained.

## UNESTABLISHED DISTRICT COMMISSIONERS

NATIONAL SAVINGS COMMITTEE  
Several vacancies, mainly in the Provinces, for men or women with knowledge of economics, organising ability, preferably with experience of public speaking and voluntary organisations. University education desirable. National salary £775 (age 25 and over) to £1,430. Possible establishment later. Application forms from Manager (PE 1547), Ministry of Labour, Professional & Executive Register, Atlantic House, Harrington Street, London, E.C.4. Closing date for completed application forms Friday, June 30, 1961.

CANNING HOUSE  
(THE HISPANIC AND LUSO BRAZILIAN COUNCILS)  
requires Assistant to Director General. He should have a broad knowledge of Latin America, its political and economic affairs, and should speak fluent Spanish and, if possible, Portuguese. The post offers considerable prospects. Salary and conditions of service would be a matter of arrangement. Write to Director General, Canning House, 2 Belgrave Square, London, S.W.1.

## EAST MIDLANDS GAS BOARD

Require an

## ASSISTANT STATISTICIAN

in the Commercial Manager's Department, at Leicester.

The post is open to persons with qualifications in economics and/or statistics, and/or mathematics. Preference will be given to applicants who have a knowledge or experience of market research.

Salary within the range £710 to £1,015 per annum.

Detailed applications should be made within 10 days to

The Secretary.

East Midlands Gas Board,  
Beverly House,  
University Road, Leicester.

## PRESSED STEEL COMPANY LIMITED COWLEY, OXFORD

### DEVELOPMENT OF MANUFACTURING PROCESSES

The Process Development Section forms part of Pressed Steel's expanding Research and Development Department. Projects being tackled at present include:

The application of numerically controlled contour milling to die-sinking.

The electrochemical machining of metals.

Determination of performance criteria for cutting steels in press tools.

Many more projects await the right men to tackle them: We need:

**MECHANICAL ENGINEERS.**

**PRODUCTION ENGINEERS.**

**CONTROL ENGINEERS.** (With experience of servo-mechanisms.)

**MATHEMATICIANS.**

**DRAUGHTSMEN.**

Applications are invited from men whose qualifications and experience will enable them to contribute to this work.

Application forms are available from the STAFF OFFICER, Pressed Steel Company Limited, Cowley, Oxford.

### COUNCIL OF EUROPE RESEARCH FELLOWSHIPS, 1962

Awards of these Fellowships, which are offered annually and are of the value of 6,000 new French francs each, will be made in December 1961. They are intended to encourage research into the following questions, considered in the light of their present-day importance:

(a) Political, legal, economic, scientific, agricultural, social, educational, and youth problems connected with European integration.

(b) European civilisation (philosophy, history, literature and the arts).

Candidates must normally be nationals of a member State of the Council of Europe or of a State which has acceded to the European Cultural Convention. Refugees from European countries which are not members of the Council, but who are resident in the territory of a member State, are also eligible for awards.

Application forms, which must be returned before September 4, 1961, may be obtained from the University Department, The British Council, 65 Davies Street, London, W.1.

### THE UNIVERSITY OF LIVERPOOL

Applications are invited for the post of Temporary Lecturer in Economics. The initial salary will be within the range £1,050-£1,200 per annum, according to age, qualifications and experience.

Applications, stating age, academic qualifications and experience, together with the names of three referees, should be lodged, not later than June 30, 1961, with the undersigned, from whom further particulars may be obtained.

### LEEDS EDUCATION COMMITTEE LEEDS COLLEGE OF COMMERCE

43 Woodhouse Lane, Leeds 2

Principal: E. V. Roberts, B.Com., A.C.A.

Applications are invited for the following posts:

(a) Lecturer in Management Studies. Candidates should have a degree. A recognised professional qualification is desirable. Research and consultancy are encouraged. Salary £1,370 x 135 = £1,850.

(b) Assistant, Grade B, with appropriate qualifications and experience in the production aspects of management, including Work Study. Salary £700 x 127 10s. = £1,150.

Starting salaries for both posts may be above maximum of scale.

Further particulars and application forms may be obtained from the Principal at the College.

### UNIVERSITY OF GLASGOW ASSISTANTSHIP IN POLITICAL ECONOMY

Applications are invited for an Assistantship in Political Economy. Salary scale: £800 - £950 per annum. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (three copies) should be lodged, not later than June 30, 1961, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,  
Secretary of University Court.

## BRITISH TRANSPORT COMMISSION OPERATIONAL RESEARCH UNIT

Applications are invited for the following posts at London Headquarters:

**ASSISTANT DIRECTOR** Commencing salary not less than £2,250 p.a. To assist in managing a growing Operational Research unit including the deployment of research groups, arrangement for outside research contracts, and training and recruitment. Good qualifications and experience are essential with evidence of management ability and leadership.

**TWO LEADERS FOR RESEARCH GROUPS** which are being built up to study problems concerning movement of traffic and optimum size of transport units. They should be well qualified academically and with considerable experience in application of operational research.

Opportunities also exist for graduates who wish to gain experience of operational research in practice in these groups, and later to assume individual responsibility for investigations.

The senior posts carry a salary up to £2,250 p.a.: the others between £780 and £1,290 p.a.

Superannuation scheme. Certain travel facilities. Medical examination. Write stating post desired, age, qualifications and experience to Director of Establishment (Dep. E), British Transport Commission, 222 Marylebone Road, N.W.1, within 14 days.

## THE WIGGINS TEAPE GROUP TECHNICAL LIAISON OFFICER

Applications are invited for a senior technical liaison post in this expanding Group of Paper Makers and Merchants.

The selected candidate will be required to evaluate long term trends, both technical and economic, and to advise top management on the formulation of development policy. He will join a team based on the Group's Research Headquarters at Beaconsfield, Bucks, but must be prepared to travel.

The appointment demands initiative, maturity, tact and considerable judgment. Prior experience of papermaking is not essential but some experience in technical consultancy or market research is desirable. The starting salary will depend on qualifications and experience and will be commensurate with the importance of the work.

Applications, which will be regarded as strictly confidential, should state age, qualifications, and appointments held with the salaries earned. Mark envelopes "Personal (T.L.O.)" and address to Dr. H. F. Rance, Technical Director, The Wiggins Teape Group, Gateway House, 1 Walling Street, London, E.C.4.

### UNIVERSITY OF ADELAIDE

The University invites applications for the following posts, all of which are new:

In the Faculty of Arts:

Lecturers in Education, English (2), History (2), Philosophy and Psychology (2).

SALARY SCALE: £1,675-£2,340, with superannuation on the F.S.S.U. basis. The initial salary may be fixed within the scale in accordance with the successful candidate's qualifications and experience. Salaries are paid monthly.

FURTHER INFORMATION: (a) The Calendar of the University may be consulted in the Library of any University which is a member of the A.U.B.C. or at the office of the Association. Inside the covers are plans of the University buildings and site and of the Waste Agricultural Research Institute at Glen Osmond (four miles from the University).

(b) A potential candidate for any post should also seek from the Registrar of the University or from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1, the following documents:

(i) General Conditions of Appointment, which include particulars of tenure, superannuation, removal expenses, invalidity and study leave.

(ii) A statement giving further particulars of each post and of such matters as help in housing, conference grants and special support for research.

(c) The University will gladly supply any further information desired on request to the Registrar.

APPLICATIONS, in duplicate, should give the information listed in the final paragraph of the General Conditions of Appointment, and should reach the Registrar, The University of Adelaide, Adelaide, South Australia, not later than July 17, 1961.

APPLICANTS, in duplicate, should give the information listed in the final paragraph of the General Conditions of Appointment, and should reach the Registrar, The University of Adelaide, Adelaide, South Australia, not later than July 17, 1961.

# LAOCOON ECONOMY

How can the British economy  
cut free from having to be  
constantly squeezed into such  
agonising contortions?

BERLIN • Before the Dead End

I could sit here all day watching them make locos like this which are called diesel-electric and made by the Yorkshire Engine Company who are one of US you know United Steel and they used to make steam engines in the old days but now everybody wants diesel-electric or diesel-hydraulic which are much better especially as Yorkshire Engine Company makes the best ones in the world and all sorts of people want them like ports and steel works and chemical plants and mines and British Railways who use them for shunting not to mention abroad which is called exports and very important for us all as well as US so that's why they're all so busy and I could sit here all day but I think I'll creep away and see if I can drive one

## In The Economist this Week

June 24, 1961

### HOME

#### STRICTURE

The Chancellor may have to sit hard on Britain's pneumatic economy again: a longer, and franker, look at the pump mechanism (and an extra man to control it) could prevent the same thing from happening in the future (p. 1341).

No rise in the Bank rate was announced on Thursday, but Mr Selwyn Lloyd could offer only the vaguest of placebos in its place (p. 1349).

Too much should not be read into last month's one-point rise in the industrial production index (p. 1395).

There is some ground to fear that the Government intends to deal with immigration from the Commonwealth by restrictions as impracticable as they are indefensible (p. 1349).

#### RUPTURE

The Tin Council's attempts to restrain the market have collapsed with the sweeping aside of its buffer (p. 1391).

Cunard-Eagle have been granted a trans-Atlantic licence by the Air Transport Licensing Board; but there will be loud appeals from BOAC to the Minister (p. 1396).

### INTERNATIONAL

#### DIVISIONS

A divided Berlin in a divided Germany threatens to be the centre of a crisis bringing the most serious danger of nuclear war the world has yet faced. The object of western diplomacy should be to avoid a dead end where the only choice is between ignominious retreat and universal destruction (p. 1343).

Divided Vietnam and divided Korea provide fields for experiments in disengagement and controlled disarmament (p. 1345).

Mrs Bandaranaike's government, with the aid of emergency measures, continues to struggle with the problem posed by Ceylon's division into two linguistic communities (p. 1379).

Divisions within Turkey's ruling junta of soldiers are symptoms of the deeper conflict between the ossifying principles of Ataturk's revolution and the new radicalism (p. 1380).

#### MULTIPLICATIONS OF PROBLEMS

The Canadian finance minister has presented a budget which, coming on top of his quarrel with the governor of the Bank of Canada, can hardly be said to clarify the political situation in Ottawa (p. 1375). Mr Fleming's attempt to force down the exchange rate of the Canadian dollar, although necessary, may be too successful (p. 1393). The record of Mackenzie King, who dealt successfully in his time with Canada's problems, is discussed on p. 1358.

The first full-scale examination of American monetary and credit policy for fifty years finds no need for a basic overhaul but recommends many smaller changes (p. 1367).

The three princes of Laos have not so far talked peace any nearer; and Prince Souphannouvong's expressed wish to substitute a troika for a rickshaw government may have the reverse effect (p. 1349).

Taxi-men and mini-men have tested their vocabularies in London this week: the mini-men are confident of profit (p. 1402).

Teachers are far from unanimous in their desire to strike, but their delegates in conference have forced the adoption of artisan tactics to bolster professional egos (p. 1384).

#### RAPTURE

Only gross national boredom can explain Britain's surrender to the Bingo craze (p. 1346). In London, "news" cinemas relieve a milder ennui (p. 1384).

#### MIXTURE

The proposed infiltration of the public schools by state-educated boys would not remove the worst aspects of those institutions; and it would be the wrong way to spend state money for education (p. 1354).

Mr Brooke's proposals for putting the town in the country have been misunderstood—and they do not go far enough (p. 1350).

#### CENSURE

Mr Faulk's report on the unsavoury Jasper affair takes the banks to task (p. 1399). GEC and British Railways share the blame for last December's electric train failures (p. 1402).

Under conflicting pressures from all sides, Mr Macleod has taken refuge in mystery over Northern Rhodesia (p. 1349).

#### FRACTIOUS FRACTIONS

Austria and Italy should work together to solve the problem of the South Tyrol (alias Alto Adige) (p. 1353).

South Africa has gone back on its word and extended exchange controls to non-residents, thus facing investors with an unpleasant choice (p. 1398).

#### ADDITIONS A LA HUMPTY-DUMPTY

Mr Hammarskjöld and his colleagues may, if the reconvening of the Congolese parliament goes according to plan, have succeeded in putting the Congo together again (p. 1348).

Kenya, Uganda, Zanzibar and Tanganyika could build themselves into one of the strongest and most promising states in Africa (p. 1354). The people of Jamaica have now to decide whether the promising venture of a West Indian federation is worth their support (p. 1355).

Mr Macmillan's individual combination of cwthmanship and Europeanism is shown by his choice of King's men to send round the Commonwealth to explain why Britain hopes to add itself to the European Economic Community (p. 1348). Washington is preparing for its battle next year over tariffs in the age of the common market (p. 1365).

#### EQUATIONS

The British Government will have to decide whether it values Portuguese or African goodwill more (p. 1348). Dr Castro's equation of men with machines has damaged his reputation; and the Republicans may profit, now that his proposed exchange of prisoners for tractors looks like falling through (p. 1368).

Detailed contents on page 1341

## *Judge the standard by the company that sets it...*

At Darwen, The Walpamur Company Limited has been making superlative quality paints for over fifty years. Management, scientists and craftsmen have dedicated their efforts to the realization of an ideal—the manufacture of paints, enamels and varnishes as near to perfection as men and materials can make them!

# FOOD FOR THOUGHT

The Accelerated Freeze Drying technique for preservation of foodstuffs is no longer an experimental process. Housewives will be buying the new foods this year.

The Vickers development of commercial scale plant means fresh thinking and wider horizons, because the benefits to consumer and processor are so great.

Food can be stored *for years* in sealed packets without refrigeration, and can be restored in a moment so that it looks, tastes and smells exactly as it did at the moment of preservation. Even the colour, the calories and vitamins are the same. All that has gone is the water and the weight—about 90% of it.

*Think of the economies in transportation, packaging and*

*storage! Think of the opportunities to expand sales to markets that are now closed owing to high freightage costs or lack of cold storage facilities! Think even more of the opportunities for automatic vending! The implications are endless.*

TODAY many processors at home and abroad have been familiarising themselves with the technique using the low-cost pilot plant and full-scale commercial plant is now installed.

TOMORROW? Vickers laboratories are constantly extending the list of freeze dried foods that can be effectively and profitably marketed. Invite Vickers engineers to examine the application of this new process to your business.

## VICKERS-ARMSTRONGS [SOUTH MARSTON] LTD

South Marston Works Swindon England Telephone Stratton St. Margaret 3241

*In addition to Accelerated Freeze Drying Plant, Vickers-Armstrongs (South Marston) Limited are working on technically advanced government and industrial engineering contracts for the General Post Office, the United Kingdom Atomic Energy Authority, the British Transport Commission and the War Office. The Company's design departments, renowned in many fields, are at work on Food Processing Plant, Linear Accelerators for Radiotherapy, Radiation Sterilisation Equipment, Hovercraft, Nuclear Research, and Nuclear Training Equipment.*

## MOST CONVENIENT AIR CARGO SERVICE TO THE U.S.A.

On Pan Am: 81 flights a week—a cargo capacity of nearly 500 tons—direct to 11 U.S. cities—and you can reserve cargo space!

Now more than ever, Pan Am Clipper Cargo is the most convenient, most profitable way to ship to the U.S.A. Pan Am offers 72 jet flights and 9 DC-7F all-cargo flights to the U.S.A.—a weekly capacity of nearly 500 tons!

You can ship from Europe direct to New York . . . or to Boston, Philadelphia, Baltimore/Washington, Detroit, Chicago, Portland, Seattle,

San Francisco, or Los Angeles. In addition, for bulk shipments Pan Am also offers DC-7F all-cargo Clipper service to New York . . . and the *only* all-cargo service to Chicago and Detroit from Europe.

Pan Am Clipper Cargo saves you money all along the line. Insurance, handling and crating costs are much lower—and Clipper Cargo rates are as much as 38% lower than a year ago!

For a free, on-the-spot analysis of your shipping operations, call your cargo agent or your local Pan Am Clipper Cargo Representative.

**WORLD ELECTRICAL NEWS—15**

# Electricity shapes the future

## SHIP OF THE CENTURY

Our ships are ambassadors of Britain, so there is a special significance about a maiden voyage. Rarely has the skill of engineers, designers and artists been so closely welded together as in the "CANBERRA"—P & O-Orient Lines' new liner, now on her way to Australia. She is not only a big ship—45,000 tons—but she makes the most of her size by revolutionary design. Amidships there is one huge "hotel block", ten decks high and uninterrupted by engines, shafts and funnels. All her main machinery—electrical propulsion machinery—is placed well aft. AEI turbo-electric drive was chosen for the "CANBERRA" because of its reliability; but another advantage is the freedom it gives in positioning the engines. This is because the turbine-generators and propulsion motors are connected only by cable—not by shafts. Electricity has helped in other ways to make the "CANBERRA" a finer ship. Two of the world's largest marine propulsion motors, 42,500 shaft horsepower each,

give her a smooth, quiet 27½ knots (all the quieter because the engines are tucked away aft). Electric drive also allows the synchronising of the propellers, so reducing vibration. In addition to the turbo-electric propulsion machinery, AEI made the auxiliary turbine-generators for the ship's power supply system, more than 90 miles of cable, and the turbine-compressors used in the air conditioning plant.

This new ship will shorten the U.K.-Sydney run by at least four days and will go on across the Pacific to the United States (see map). The speed and roominess of the "CANBERRA" and the attention given to passenger comfort—even down to iced water "on tap" in all cabins—make her a true ambassador for Britain on this highly competitive route.

## THE WORLD!

Do you need aluminium? No matter where in the world you are, Kaiser Aluminum can supply the high quality aluminium you need... when you need it. Our plants, on or near salt water ports in America, have a capacity of 609,500 short tons of aluminium every year. Here is a dependable and continuous supply of primary metal to help you meet the growing demands of the world

...now and for the future. If you need aluminium fast (?) phone: Kaiser Aluminium Company, Ltd., Hyde Park 5677-8; 16 Berkeley St., London W.1; Kaiser Aluminum International Inc., Phone: 47-59-00; Klausstrasse 43, Zurich 8, Switzerland. Also in Bremen.

*New leadership in the world of aluminum*

## THE BUDD COMPANY . . . one of the world's great names in industry

It's a far cry from railway cars to space craft, but Budd's skills extend that far—literally. One division of Budd is a leader in railway car design; another creates electronic components for space-age applications. Between these extremes, other Budd divisions pioneer new developments in the automotive and other metal working fields... encapsulate radioisotopes and produce radiation equipment for therapeutic and industrial uses... design a wide line of testing machines and quality control equipment for industry and science... produce special plastics for unusually demanding applica-

tions. Multi-faceted activities like these are all made available to the world market by the International Division of Budd, and frequently help bring to fruition ideas created by industrial designers throughout the world. Pioneering skills in engineering... metallurgy... tooling... welding... research and development, and production for international industry have helped Budd rank high among the world's 250 largest industrial concerns. Write for our Annual Report. The Budd Company, Philadelphia 32, Pa., U.S.A.

INTERNATIONAL **Budd** DIVISION

# "We feel satisfied that Western Australia has laid the foundation for a vast expansion of her economy"

—from the report of an independent team of nine U.K. Industrialists which visited Western Australia last year

Western Australia offers good opportunities for financial investment, expansion of existing industries, and the development of new ones

## WHAT WESTERN AUSTRALIA HAS TO OFFER

- Proximity to growing markets in Indian Ocean countries with populations totalling 1,350 million people.
- At the Port of Bunbury, 100 miles south of Perth, there are available unlimited potable water and power, cheap coal, cheap industrial sites, road and rail access.
- No language or colour problem. Population—European mainly British descent.
- Stable social and political background.
- Cheap industrial sites, developed ports, power supplies, roads and railways.
- An adequate, skilled, and highly productive labour force.
- A climate admirably suited to Europeans.

## POTENTIAL FIELDS OF DEVELOPMENT

- Minerals—exploration, mining and treatment.
- Primary Products—processing and conversion before export.
- Development of Chemical and Petrochemical Industries using locally available materials. Scope for fertilizers, insecticides, paints, plastics, etc.
- Textile Manufacturing.
- Tyre and Rubber goods manufacture.
- Manufacture of Agricultural Machinery.
- Goods imported in 1960—£A169,000,000.
- Clothing and Footwear manufacturing.
- Assembly of imported consumer goods.
- Manufacturing under licence.
- Utilisation of Forest products.
- Development of Tourist Trade.
- Irrigated land for specialist crops such as Cotton, Safflower, Linseed, Rice, etc.

## PROJECTS NEGOTIATED OR IN COURSE OF NEGOTIATION SINCE OCTOBER 1960

- B.P. Refinery Ltd. (U.K.) £A8,000,000
- Broken Hill Pty. Co. Ltd. (A) £A45,000,000
- Standardisation of Railway (A) £A41,000,000
- Australian Paper Manufacturers (A) £A3,000,000
- Laporte Industries Ltd. (U.K.) £A4,000,000
- Rugby Portland Cement Co. Ltd. (U.K.) £A1,000,000
- British Insulated Callender's Cables Ltd. (U.K.) £A500,000
- Foster Clark Custard Co. (U.K.) £A500,000
- Edward MacBean & Co. Ltd. (U.K.) £A100,000
- Manufacture of Alumina from Bauxite. (A) £A5,000,000
- Sundry smaller projects (A) £A1,000,000

"We have now broken through the industrial barrier and on behalf of the Government of Western Australia, I invite every industrialist to give thought to participating in the industry of our country. We will welcome and assist you in every way possible."

C. W. Court, Minister of Industrial Development, Perth, June, 1961

Details of the opportunities open to your business are readily available.

## The man who bends rivers

Joe, taking time off in the boom town of Cooma, is just one of the thousands working on the great Snowy Mountains hydro-electric scheme in south-eastern Australia. He and his fellow-workers have already dammed the eastward-flowing Snowy River, the Eucumbene and other rivers, harnessed them for power and turned them back westward through a system of long tunnels deep in the mountains, to carry precious water to the desert interior.

After ten years' heavy work the Snowy Mountains scheme, due

to be completed in 1975, already provides one sixth of the ultimate 1,800,000 acre/feet of irrigation water a year—and more than 10% of its ultimate generating capacity of 3 million kilowatts. Atlas Copco rock drills, fitted with Sandvik Coromant drill steels and driven by Atlas Copco compressors, are being used for much of the work on these tunnels, dams and underground power stations. And this is only one of the major engineering projects in which Atlas Copco and Sandvik Coromant equipment has played a part.

Group Headquarters: Atlas Copco AB, Stockholm 1, Sweden.

## The Laocoon Economy

WHAT Mr Selwyn Lloyd is going to have to do with the British economy in 1961 seems all too glumly clear, and more than glumly familiar; it is very likely that within the next few weeks he is going to have to resort to new measures to tinker with his external difficulties by cutting back domestic demand and restricting Britain's now slowly increasing production. Everybody—including the Government—has got expostulations or platitudes or criticisms or patter ready for when that happens; it is easy to write them because one has only to look back to the files of 1960 and 1957 and 1955 and 1951 and 194—(next figure censored). And the awesome thing is that, on present form, everybody is expecting to have to write the same things again in 1963 or 1965 or whenever it is that Britain will again be due to get stuck at this stage of the bad film that we have seen so many times before.

It is for this reason that the economic crisis of 1961, although in its short-term manifestations it may prove less serious than the half-dozen other economic crises since the war, should be treated as a cataclysmic event. The fact that the Chancellor may need to restrict again so soon is proof that the present administrative and executive and attitude-creating mechanism in Whitehall for providing Britain with a long-term economic policy has failed. A major task of economic statesmanship now is to make changes in it, perhaps especially in what we have called "attitude-creating" and what Walter Bagehot once called Parliament's

"teaching function. A great and open council of considerable men cannot be placed in the middle of a society without altering that society. It ought to alter it for the better. It ought to teach the nation what it does not know."

It is quite obvious that in economic affairs the Conservatives have failed in this basic function, and they should now start to ponder specific suggestions for changes in their way of performing it.

It will be best to begin by referring to that chameleon word "planning." When the Tories came to power in 1951 "planning" was understandably a dirty term, because Labour had made such a mess of it. Labour's theory of planning—as expressed in its attitudes even if never quite specifically in its white papers—was that a few hundred top people in Whitehall, in their time off from the very full-time job of carrying out the other tasks of economic government, were likely to be wiser than a mass of private businessmen in gauging probable trends in market demand (and thus in the right levels of investment or raw material allocation or productive priority) for those businessmen's own specific products—some of which, hidden among the tens of thousands of products in the census of industrial production, were things that Whitehall had never heard of. Labour's theory of economic administration was that some cabinet minister other than the Chancellor should be in charge of these prodigious planning programmes; we now know, most lately from Lord Dalton's memoirs, that senior ministers were constantly fighting like Kilkenny cats with each other because each thought that a different man (usually himself) should be appointed to this plum impossible job.

When the Tories came in, they looked at the history of these rows and of these nonsense programmes, and made two decisions. First, civil servants were told to stop drawing up long-term planning forecasts or "forward looks"—or at least if they did sometimes privately make such forward looks they were told on no account to publish them. Secondly, the Tories decided that economic policy

was to be kept under the control of one senior minister, namely the Chancellor of the Exchequer.

Gradually, the first of these decisions has been mitigated as time has worn on, but only to a certain extent. The Treasury nowadays compiles many more figures about what it believes would be the right forward trend in various indices than it did in the first carefree anti-planning days just after 1951. But these figures are always kept very mum from the outside public. It may seem absurd, at first sight, to say that the mere publication of these figures could have any curative effect on the two main economic ills of present day Britain: namely, its toleration of cost inflation and the consequent enforced toleration of periodic bursts of restriction which hold up economic expansion. But in some respects publication probably could provide the first step forward to the change in public attitudes that is now so badly needed.

The most important hidden Treasury statistic in relation to inflation concerns the amount of wage increases that would be likely to topple the economy off course. At present the Treasury make such estimates each autumn as the major season of wage bargaining approaches, but in a private and powerless and apparently hopeless sort of way. As negotiations proceed in each individual industry, the Treasury sits looking sadly at its private estimates about what would be a tolerable and what an inflationary settlement; the calculation is a complicated one because it has to take account of the time interval since the last award took place, the growth of productivity since then, the effect of things like the reduction of working hours attached to different settlements, and so forth. Two international bodies and Lord Amory have now urged the Government that it should publish such estimates, and let the country know that whenever a major settlement goes beyond the safe limit, this must make it likely that restrictive action will have to be taken against the whole economy. But the Government's invariable reply has been that such brutal frankness would not be good for industrial relations.

Yet if these estimates were published, and if they found their way into the headlines as each wage bargaining bout neared its crunch, a considerable public pressure against inflation (and thus against the necessity of later restriction) could be built up at just the right time. The fact that publication would represent a major change of political course can be seen by considering what the announcement this year would have to be: the safe permissible limit for increases in basic wage rates (as distinct from in piece work earnings) in the great majority of industries during the rest of this financial year will be nought.

THE other hidden Treasury estimate that is of most importance in the short term is the notional official estimate, underlying each Chancellor's speech at budget time, about what the national income in the year ahead is likely to be. This estimate is never published nowadays, although detailed estimates which have to be derived from it (such as that for expected tax receipts) are solemnly published. The muddle about long-term "forward looks" is even murkier. At present, the only long-term target in common use arises from a phrase that was almost accidentally inserted into the peroration of a speech by Mr Butler in 1954, when he spoke of doubling Britain's standard of life within twenty-five years: Mr Butler might almost equally well have said "in twenty or fifteen years" instead, and if he had been speaking at any period

after 1954 he probably would have done. One does not have to be a doctrinaire planner to say that this is an unsatisfactory way to have set up an oriflamme to guide Britain's advance into the new industrial revolution, and to wish that both the public and officialdom should be encouraged to be a little more purposeful and scientific in their looking ahead. In this year's budget speech Mr Lloyd announced that he had set in hand an inquiry to "look at all public expenditure . . . for a period of years in relation to prospective resources"; when the results of this inquiry are presented to Parliament they will presumably be in the form of provisional long-term budget estimates, which once again will not make sense unless some estimate of the growth of national income in, say, the next five years lies behind them. There is now a good case for saying that there should be an annual re-presentation each autumn of these provisional government expenditure estimates for five years ahead, and a debate both on the adequacy of the initial Government assumptions underlying them and on any changes that the Government feels obliged or enabled to make in those assumptions as the years pass by.

If rough Government estimates of reasonable targets for total national expansion became more common currency, the next steps towards a slightly greater degree of forward planning in the British economy would probably follow automatically. Various private industries should find it worthwhile to take more interest in compiling and studying long-term, published assessments of the likely future demand for their goods—as the steel industry already does in this country and as such bodies as the French *Commissariat Général du Plan* do on the continent. Of course, such plans should never become sacred cows. But once informed people in Britain had got used to discussing—and no doubt at times arguing fiercely about—detailed projections of possible demand for a wide variety of products five years ahead, one suspects that at least one other subtle and useful change might come over British economic policy.

AT present Britain tends to get worried only when declining industries fall below their "normal" rates of full employment, and so is apt to thrust out Government aid or tariff protection to its least economic industries like shipbuilding or fishing or horticulture. It gets much less worried when growth industries fail to reach targets which could reasonably have been set for them. Indeed when growth industries do grow, it is usual for Britain to say that these industries are voraciously demanding an unfair share of scarce resources, and to devise discriminatory restrictions specifically to keep them down. Thus it was that Britain relied far too heavily on hire purchase controls during the consumer durables boom of the fifties. Now that it is obvious that the boom is switching from things that people put into their houses to the construction of houses themselves, the same Little Noddy school of economists which did so much harm in the fifties is switching to advocate building licensing in the sixties. A country that had accustomed itself to looking forward would surely see that this bias towards always restricting the natural growing points of an economy, and towards always cossetting the dying ones, is precisely the reverse of what is needed.

The story of the hire purchase controls and of the pressure for introducing building licences provides one of the most obvious examples of the way in which the failure of the

attitude-creating mechanism in British economic government has led to executive mistakes by it. But what of the administrative mechanism itself? The second of the big economic decisions made by the Tories just after 1951—that economic policy should be kept under the control of only one senior minister at the Treasury—has remained inviolate to this day. The result is that although no Chancellor has done the full job that he ought to have done—if anyone requires proof, let him look around him—the job that each has done has proved to be very much more than a full-time one. After a relatively short period in office three of the last four Chancellors have therefore retired or resigned either just before or some time after overwork drove them neurotic.

*The Economist* has long argued that the best course now would be to have two cabinet ministers in the Treasury: the senior one (to be called either the First Lord of the Treasury or the Chancellor) to be charged with management of the economy, and the slightly less senior (to be called either Chancellor or Minister of the Budget) to take charge of the apportionment of government expenditure, the supervision of the inland revenue, the management of the national debt and the preparation of the annual Finance Bill—but with the obligation that his operations should seek to exert whatever degree of net deflationary or reflationary pressure the First

## Before the Dead End

It is true that only the western readiness to use force can save west Berlin from communist encroachment, but the present danger is of war in the wrong circumstances and for the wrong cause

IT is not easy to say what one thinks about the problem of Berlin. No one likes being told that his pale cast of thought is endangering the native hue of resolution; and Hamlet's words are a mild way of putting the charge some people level against anyone who says that the Berlin question needs more thought than it has been given in the past. If a journalist talks of compromise, he is accused of complicating the diplomats' task by revealing the cards they want to conceal until the bargaining table is reached, and of raising Russian hopes that "compromise" means "surrender." Let it be said in advance, therefore, that the ideas put forward in this article signify no weakening of resolution, in the sense of determination to defend what is essential for the freedom of Berlin; and that, when compromise is discussed, the purpose is to exchange concessions with the Russians only in such a way that the central interests of the West (as distinct from its peripheral hopes) are more strongly protected than ever.

This having been said, no bones should be made about the need to re-examine allied policy on Berlin. This is not simply because the crisis that will almost certainly develop over Berlin before the year's end brings the most serious danger of nuclear war the world has yet faced. The lamentable thing is that the West, if the present direction of its policy remains unchanged, looks like arriving in the teeth of this danger without having examined the routes by which it might have been able to avoid it. It is widely known that some of President Kennedy's advisers are in favour of telling Mr

Lord deems is desirable at the beginning of each financial year. The Foreign Office now has, in Mr Heath, a second cabinet minister working in reasonable harmony under the ægis of an even more senior minister in Lord Home. We would like to see the Financial Secretaryship to the Treasury similarly elevated to be a cabinet post.

It is possible that the Financial Secretaryship will be one of the posts affected by the minor government changes that were expected shortly after we went to press. But it seems very unlikely that Mr Macmillan will have made the change that would have been most fruitful: namely to move an existing or new cabinet minister (Mr Brooke? Mr Thorneycroft? Mr Powell?) laterally into it. Yet the case daily grows stronger for saying that some such major administrative change—together with a more purposive and forward-looking formulation of domestic policy—ought to be tried if Britain is to shake itself free from its present strangled, restrictive, Laocoon-like and provenly unsuccessful system of economic government.

(*Laocoon, the figure in the famous statuary shown on our cover, was the Trojan priest who was squeezed to death by a serpent when on the point of sacrificing a bull. He seems to be an appropriate figure to recommend to Mr Selwyn Lloyd's attention this weekend.*)

Khrushchev, in effect, that the United States is not going to negotiate at all about Berlin because it thinks he is bluffing. Mr Dean Rusk, although he has not gone as far as that, said on June 16th that no basic revision of policy was under consideration; Lord Home, for his part, suggested a couple of days earlier that the allies would not discuss the legal basis of their presence in the city. Unless Mr Kennedy takes a decisive grip on the wheel, the West is in danger of by-passing one possible line of compromise after another until it reaches a dead end where neither it nor Russia has any choice except between ignominious retreat and nuclear devastation. Those who know the mettle of Mr Kennedy and Mr Khrushchev find it hard to believe that either of them would choose ignominy.

TO avoid dead ends is the business of diplomacy. The immediate aim of Mr Kennedy, and of those who have his ear, should be to give the allies more room to manoeuvre—first, by letting it be known that they are willing to negotiate and, secondly, by deciding what they are (and what they are not) willing to negotiate about. At this stage in the proceedings there is little point in the onlooker's trying to spell out exactly what kind of settlement should be sought—as Senator Mansfield and Lord Montgomery, in their different ways, have recently tried to do—since it is impossible to tell how the negotiations will develop. It is in order, however, to suggest

some basic points for the allied leaders to bear in mind as they consider what to do next. Three such points are of particular importance; they do not—they cannot—offer a detailed solution to the Berlin problem, but they do suggest at least the limits within which a solution should be sought.

First, it is important to distinguish between what is vital to the West's interest in Berlin and what is marginal (and therefore subject to negotiation). The one requirement on which there can be no compromise is the right of the population of west Berlin to choose how it will live, and for this it is essential to obtain guarantees on a number of matters. The Berliners must have a free choice of political systems and connections, "free" being defined in western terms; they must be able to transport goods and people in and out of the city without restrictions that endanger their liberty; and their possession of these rights must be guarded by the presence of a certain number of allied troops—not necessarily the present number, and not necessarily alone, but enough to establish Berlin's link with its western friends. Simply to list these requirements ought to show that no appeasement is in the air. Herr Ulbricht, who said last week that he wants to limit Berlin's freedom far more narrowly than this, will not find them easy to accept.

One element in the allies' position, however, has far less claim to be regarded as immutable. This is their reluctance to let the east Germans join in the arrangements over Berlin. If the guarantees that protect the freedom of Berlin are solid ones, how they are arrived at and through whom they are put into practice is considerably less important. It is best to be frank about the implications of this. If the east German government became one of the signatories of a treaty fixing the rights of Berlin, and if the allies agreed to deal with east German officials in using their lines of communication with the city, a considerable step would have been taken towards the recognition of Herr Ulbricht's regime. The claim that the allies are in Berlin by virtue of their rights as victors in 1945 would in effect have been abandoned; so would the claim that the west German government is the only legal representative of the German people. But the passing of time, and the abrasive action of hard reality, have already worn these beliefs thin. The question is whether it is better to preserve such claims, or, abandoning them, to seek a new and surer basis for the freedom of west Berlin.

The second point for the West's leaders to bear in mind arises out of this. Those who believe that it is necessary to maintain the West's postwar occupation rights in Berlin argue that, in the last resort, nothing but a western threat to use force will save the Berliners from communist encroachment. This is true; but it is not an argument for insisting on the occupation rights as the only sound basis for the western presence in the city. The allies' readiness to go to war rather than let Berlin succumb is equally valid (and would be equally necessary) as a means of enforcing a new treaty. Indeed, this ultimate and indispensable sanction might be more convincing if a new agreement replaced the present basis of western rights; it is easier to be resolute in defence of a freshly inked document than in defence of a fifteen-year-old arrangement which one party has already denounced.

Thirdly, it must be remembered that the problem of Berlin will never quite vanish until the whole of central Europe is at peace with itself. Even if a new agreement can be negotiated,

defining and safeguarding the Berliners' rights in unmistakable detail, the city will still be marooned in the territory of a hostile political system and surrounded by the troops of a hostile super-power; like a tin hat stuck on the barbed wire of no-man's-land, it is a perpetual temptation to the trigger-happy. For this reason, if the western powers decide to negotiate about Berlin, they must seek to include all central Europe in the discussion. Ultimately Berlin can have no secure future except in a reconciled Germany.

Perhaps this can only be achieved by ways that offend some western taboos. The aim should be to seek arrangements which, by untautening nerves in the entire region, take the tangle out of the fingers encircling Berlin. It may well be that the Berliners would be allowed to sleep more easily at night (and Germany, in the end, have a better chance of reunion) if the western powers could bring themselves to acknowledge at any rate the factual existence of east Germany and the finality of the western frontier of Poland. Eventually the conversation might ramble still farther afield; the idea of disengagement might be revived (as Lord Montgomery has suggested) and the governments of the two parts of Germany, already linked by the bonds of commerce, might bring themselves to discuss other matters as well. The direction the negotiations about central Europe might ultimately take is as uncertain as the prospect that they might result in an accommodation; but it is advisable for the traveller to know which way the path starts.

**M**R KHRUSHCHEV has two possible motives in raising the question of Berlin. If, as many people think, his chief aim is to secure recognition of the present situation in eastern Europe, the offer of terms along the lines suggested in these three points might persuade him, in exchange, to offer terms for Berlin that would safeguard the city's freedom until the future of central Europe became clearer. The West, for its part, might continue to hope for a change in the politics of eastern Europe, but it would have to wait for internal pressures to produce the change instead of making it an objective of its foreign policy. If, on the other hand, Mr Khrushchev's real ambition is simply to force the allies out of Berlin, then the offer of these terms would at least enable the West to take its stand on the best available ground. The issue would be the physical defence of Berlin, not whether it is proper to talk about the city's status or to deal with east German officials. If there is a danger of war, it is necessary to rally public opinion behind the western case; the case must therefore be simple, obvious and just.

There is a difference between last ditches and dead ends. In certain circumstances, most people agree, it is necessary to look the possibility of nuclear war unflinchingly in the eye. The danger over Berlin is that, if diplomacy gets stuck in a cul-de-sac, war might come in the wrong circumstances and for the wrong cause. The report that Mr Kennedy is considering a partial mobilisation this autumn, and Mr Khrushchev's retort on Wednesday that he will spend more money on weapons if the Americans do, suggest that the clouds are darkening. It will take a wrench of the mental muscles for the West to accept the compromises by which a way might just conceivably be found out of the difficulty. But the problem of Berlin calls for a mixture of resolution and imagination; it would be absurd to have a nuclear holocaust because imagination had not been put to work.

## Time-bombs for Defusing

**Two Asian countries that generate disproportionate tension might usefully be looked at as fields for an experiment in disengagement**

**N**EUTRAL zones are in the air in Asia, as they were, two or three years ago, in Europe. In many ways, the Far East offers a more promising outlook for limited disengagement than central Europe ever did. The obscure disputations of the powers about the future of Laos could indeed, given a measure of sense and vision, lead to the kind of constructive contribution to world peace that qualifies individuals for international prizes.

The most promising areas for experiments in those polysyllabic twins—demilitarisation and neutralisation—are those that are usually omitted in discussions of this kind: Vietnam and Korea. True, in 1958 the Chinese and Russians were proposing a zone free of nuclear weapons in the Pacific area; and more recently Prince Sihanouk of Cambodia has proposed a neutral belt for south-east Asia. But each proposal has stopped short of the radical yet relatively simple suggestion that would be both practical and effective. The Chinese one had the fatal flaw that it merely invited the United States to put itself and its allies at a military disadvantage. Prince Sihanouk's proposal, though practical enough, stops short of Vietnam, which houses a built-in threat to peace.

Mr George Kennan's advocacy of disengagement in central Europe arose from an urgent sense of the need to counter the permanent threat to peace presented by the division of Germany; and the extended discussion that followed brought out the immense difficulties of disengagement from so powerful a country, in which the great powers were directly involved. Those other divided countries, Vietnam and Korea, also present a permanent threat to peace. Neither, however, is vital to the rival military blocks in the way Germany is; neither is, even potentially, a great power, except in a regional and relative sense; and in neither does the degree of great-power involvement preclude demilitarisation.

The parallel between Vietnam and Korea is striking, but only up to a point. Both countries are divided; each has a communist government in the north and an anti-communist one in the south; in both, division and mutual hostility have led to the maintenance of far larger armies than the economy of either half-country could sustain unaided. There, however, the parallel ends. North Korea is a threat only to south Korea, whereas north Vietnam is a threat to Laos as well as to south Vietnam, and potentially to Cambodia and points beyond. On the other hand, the United States—thinly disguised as the United Nations—is directly involved in south Korea, where it has military bases and forces; whereas in south Vietnam it has only military advisers and money.

Even Prince Sihanouk has balked at advocating neutrality for south Vietnam, arguing, quite logically, that the presence of a communist government in the north makes neutrality impossible in the south. This is true enough. To partition a country is to subject it, indefinitely, to the cold war; partition is the antithesis of neutrality. There is, however, or ought to be, a distinction between neutrality at home and neutrality in foreign relations. Austria and Finland are

examples of this, and show that demilitarisation does not have to wait for the formation of governments of national unity, including both communists and anti-communists. In specific terms, it may be impracticable to unify Vietnam—or Korea—just as it is idle to urge the rival governments of either country to cultivate friendly relations. But there is no reason why the capacity of each to harm the other should not be reduced.

"Demilitarisation" needs to be defined, in its Vietnamese and Korean contexts; and, once defined and agreed, it will have to be guaranteed. Any definition will have to provide for the needs of internal security. On the supposition that south Vietnam is going to be invaded from the north, the present modern army of 150,000 men, with auxiliaries of various kinds adding a further 100,000, makes sense. But if it is agreed that the armies of north and south are to be reduced to a level that rules out direct aggression, then 30,000 to 40,000 will seem a more reasonable figure. An army of that size would be no less able than the present much larger one to contain the 10,000 communist guerrillas operating in the jungles and paddy fields of the south.

In Korea's case, demilitarisation would have to include the withdrawal of the United Nations troops (the Chinese having pulled out of the north three years ago). Doubtless the Americans would argue that the circumstances that prevented them from following the Chinese example would still substantially apply, even if north Korea's capacity for aggression across the 38th parallel were diminished; the Chinese armies would remain, as it were, round the corner, but with the UN troops withdrawn there would be no ready answer to a renewed Chinese aggression. Military men will always be tempted to argue on such lines, but this would not be a very convincing argument. The Korean war started because the north Korean army invaded the south; and the Chinese intervened only when they began to fear that the UN response was a threat to their own security. An unprovoked Chinese aggression in Korea is not, of course, unthinkable, but it would be a major new departure, inviting major reprisals. To be on the spot may be valuable, but if the Americans withdrew from Korea, they would still have the Seventh Fleet and the giant base on Okinawa as deterrents in reserve. In the meantime, the drastic reduction in the size and fire-power of the opposing Korean armies would have correspondingly reduced the risk of a clash of arms that might provoke renewed Chinese intervention.

**W**HETHER in Vietnam or in Korea, the economic benefits of demilitarisation might be considerable. Military expenditures of various kinds have accounted for the greater part of the aid poured into south Vietnam and south Korea by the United States. If a reasonable portion of American military expenditure were diverted to economic ends, the day when they could stand on their own feet (which is far closer in Vietnam than in Korea) could be hastened. True, the already alarming unemployment problem in south Korea might be temporarily aggravated by a reduction in the country's inflated armed forces which, at more than 600,000, are in numbers, at least, appropriate to a great power. But,

in the long run, the intelligent use of funds released by demilitarisation would create more jobs than the numbers thrown out of work by demobilisation.

On the communist side, too, the economic benefits would be appreciable. Indeed, north Vietnamese spokesmen have lately hinted at the need for cutting down the numbers of the formidable force which defeated the French expeditionary corps, and which has since been further strengthened in defiance of the Geneva agreements of 1954. The Russians, for their part, would find it difficult to oppose a project that would reduce the likelihood of a resort to arms in two particularly sensitive areas. The Chinese might well be less attracted to such an idea, but nothing would be lost, and probably something gained, by forcing them to take up a public position on the issue.

The snags should not, of course, be minimised. One of these would probably be an initial refusal by south Vietnam and Korea to co-operate, on the ground that the north would

merely simulate disarmament and attack once the south had made itself defenceless. Given the performance of the international control commissions in Indo-China, such a fear would be far from irrational; it could be met only by the firmest guarantees, including foolproof inspection and control. The provision of such guarantees would constitute another snag. It can be fairly argued, however, that since the wider international discussions of disarmament and of the control of nuclear testing have got nowhere, it would be worth setting one's sights at a more modest level and trying things out on a smaller scale. If controlled disarmament cannot be made to work in relatively small areas like Vietnam and Korea, it will surely never work in Russia or China. True, Soviet insistence on a communist veto in any control and inspection arrangements in Laos is discouraging. But, once again, there would be nothing to lose in putting communist intentions to the test of practice. The potential gains are great enough to justify the attempt.

## A Most Contagious Game

*What revels are in hand? Is there no play,  
To ease the anguish of a torturing hour?  
—A Midsummer Night's Dream.*

THE least of the excesses expected to follow hard upon the promulgation of the Betting and Gaming Act of 1960 were tiny, foetid hells specialising in *chemin-de-fer*, baccarat and other foreign *jeux*, the fleecing of the gullible poor to cries of "*Rien ne va plus*," and heaven knows what further incubators of mortal sin. Expectations, perhaps to the chagrin of the fulminators against wickedness, have not been realised. The main thing that seems to have happened is that Britain has caught the craze for Bingo.

Bingo is the childish name of an infantile game, the solace of measles children in damp Victorian nurseries, of inactive troops bored to death by tedious passage over girl-less seas, of happy campers disconsolate on a wet summer's day at Southend. Its rules are simple. There is a card, slightly varied in format to suit its several names (Lotto, Housey-housey, Tombola, Tumbule, Keno, Po-Keno, Beano, Screeno, Bolito), divided into squares (usually 25) in each of which appears a number, chosen at random between one and 75 or 90. From a bag, box, blower or hopper, a caller draws numbered balls, counters, or slips of paper and the number is called out, often in an impenetrable jargon (*legs, barnitzvah, doctor's orders, Kelly's eye*). Players who find these numbers on their cards cover them or cross them out. Eventually one of them will have a whole row of numbers obliterated. He will shout "Bingo!" or "Lotto!". He has won the game.

The fatuity of the game is somewhat dignified by its antiquity: it has come to us almost unchanged from pre-Christian times, one of the few things (including human beings) which have not changed for the better since then.

It evolved originally from the simple drawing or casting of lots, perhaps adding an edge to the rapidly blunted thrill of watching someone else's number come up. At one time, as Lotto, the game enjoyed a certain aristocratic cachet: the Genoese fathers of the sixteenth century showed their contempt for the psephological skills of their subjects by electing themselves on the results of this game. But it has never had much appeal to any but those incapable of otherwise occupying their periods of release from more pressing activities. It makes their boredom supportable.

Nor is the game young in this country. Like many less innocuous habits, we have to thank the holiday camps and the Americans jointly for its popularity. The camps used it to keep the campers from wrecking their quarters or trying to seduce the staff during bad weather. The Americans made it a business. In that country it booms as loudly as the fruit-machines and the crap (or dice) games; and it is encouraged, supported even, by many states as a useful source of revenue. (It is from America that the name Bingo has come: it is the most successfully explosive sound a winner can make.)

The profits to be made from the game did not go unmarked in Britain, once the news broke that a new Gaming Bill to legalise small gambling was on the way. The larger promoters started planning how best to take advantage of what promised to be a healthy venture. In the event the Act was a disappointment, since it laid down not only the expected direction that each player should have an equal chance at the prize, but also that *all* money taken as stakes should be

returned to the players as prizes, with no provision for expenses and no entrance fee. The harshness of these rules was, however, mitigated in the case of clubs, which could do much as they pleased within the two fundamental rules—equality of opportunity and the return of the whole stake as prizes. Clubs are easy to found: anyone can become a member and, after 24 hours of membership, play Bingo. The promoters therefore formed clubs. The first of them opened on January 3rd, two days after the Act came into force.

PREVIOUSLY, Housey-housey and Tombola had been played for the ostensible support of charities. But the bona fides of charities are difficult to establish; many evasions were perpetrated and substantial profits made before an Act of 1956 limited prizes to £100 and charitable profits to £750. This particular charade may not now continue, but specially-formed clubs (which for some reason seem immune from the restrictions suffered by common and unclubbable Englishmen) may charge what they like for entry to their premises—and make what they can from their catering. The big promoters are careful to behave themselves and to see that their clubs do so too; but there are some little clubs with memberships below 100, on whose interpretation of the rules about returning all stakes to members, the law, if it knew, might not be disposed to smile.

The large and respectably law-abiding organisations, however, benefit most from the current infection of infantilism. The clubs formed by Mecca Limited and the Rank Organisation, each of which has premises, management, catering and capital to spare, lead the field. The troubles of the cinema industry are well known, and some dance halls have also recently suffered, if not a falling off, at any rate a redistribution of their custom: the throngs of young terpsichorophile who used to foot it feathily in the afternoons now turn out, substantial and free-spending, mainly in the evenings. Expensive establishments were left idle during the day (and even on some evenings); now Bingo has come to succour them. Dance halls (40 of Mecca's, 15 of Rank's) are loud again with happy cries (*clickety-click, never been kissed*); and cinemas, forlorn for months, are filled, four times a week, with Bingo-maniacs. Lately another large cinema group, Essoldo, has begun to fill its spare time and empty houses with Bingo; and at least one suburban theatre has leased its house for Sunday sessions to Mecca.

Just as there is in the opposition, so there is in the defence, a good deal of sanctimony about Bingo. Promoters profess themselves shocked by the very thought of interference with the normal course of business. Such phrases as "public service," "social centre," "helping the live theatre" recur in their conversation; a (surely new) concern, deep as it is long, is expressed for lonely spinsters, worn-out wives and shy mice in garrets, whom Bingo is to rejuvenate and rehabilitate.

The Act prohibits the participation of young people under eighteen in Bingo; but the prohibition seems hardly necessary. Three-quarters of the fans are middle-aged women, and the other quarter is made up mostly of middle-aged men. The young perhaps have children to look after. Neglect of children by Bingo-crazed mothers has been charged to the promoters' account; but it seems obvious that a neglectful mother would choose drink, cinema, dance hall or friends, if Bingo were not available, and whatever legitimate criticisms

may be made about this pap to feed the idle, that one at least is probably without foundation. Mecca, however, intend to disarm even unfounded criticism by installing crèches, complete with nurse, at their sessions during the school holidays—but only for children under ten. After that age, it is felt, children may be tempted to play themselves.

The charge of ruinous gambling is also not well-founded: no real gambler would waste his time at a Bingo session. If the prizes are large, the excitement is small and the odds long. The amount actually spent is hardly likely to bring ruin. Entrance is between 2s. and 3s. 6d. in most big sessions which, with the numbers involved (average Mecca and Rank just under 2,000), covers the promoters' costs, including a return on a capital investment in special chairs and equipment of up to £5,000. Inside, the staking is done by the sale of books of five cards for 2s. (sometimes more), and the possibility of cheating is countered by the use of colour codes and serial numbering. Each card is used once only. On the completion of the first card, one twenty-fourth of the stake pool is paid out as a prize. The second winner gets a twelfth, the third an eighth, the fourth a quarter and the final winner, of the fifth game, a half. This may be as much as £250, but is more often between £60 and £80. Any excitement is engendered by the size of the prize rather than by any interest inherent in the game itself; when 30 people are waiting for one particular number to complete their cards, the greedy begin to sweat.

On the entry fee the average promoter makes little more than his costs. It is on his catering (special trays adapted for fitting on to the arm of the "purpose-designed" Bingo chair) that his profit is made. Its size is not revealed, but the promoter's own resources being used from first to last, without the middleman's drain, it may well be substantial—say, on the lightest of snacks, 6d. to 9d. a head. And in the biggest halls there are 2,000 heads.

So far no assessment has been made of the total number of people who have succumbed to the threat of their own company and become Bingo-players. But Mecca, starting with 50,000 books a week, now sell over 500,000 books of cards every week. There are three sessions (15 games) an evening and, allowing for overlaps, perhaps 150,000 people each week buy the books in Mecca's halls alone. Rank's turnover is probably similar, and another 200,000 are perhaps spread over smaller legal and illegal clubs. The money added to the national gambling "take" (at present nearly £700 million a year) will be significant but hardly important—say £20 million a year. And the promoters, on present indications, might benefit by perhaps £2 million a year. There is not really enough involved (it is hard to spend more than 10s. a night) to wreck the country's, or any family's, finances.

However, Bingo is catching on, and the numbers playing it may be expected to rise to a peak of well over a million within the next year. But like all crazes, the numbers will fall again, and in a few years' time possibly no more may be playing Bingo than now play Canasta, or Diabolo, or Yo-Yo. Then there will still be two main centres of the addiction, Lancashire and London, and the rest of the country may have forgotten about it. It all seems innocuous enough. If there is evil in it, it is in its rôle as symptom of a national ennui which enthralls not only our but other affluent societies.

# NOTES OF THE WEEK

## EUROPE

### Commonwealth Hurdlers

MR MACMILLAN'S choice of emissaries to sell British membership of the common market to the Commonwealth is an earnest of good European intentions on his part. The two most European-minded members of the Cabinet are to be sent to the two most tricky regions of the Commonwealth. Mr Sandys, now Secretary for Commonwealth Relations, but secretary of the European movement ten years ago, is to visit Canada, Australia and New Zealand, whose agricultural (and now in Canada political) worries pose the gravest problems. Mr Thorneycroft, who when out of office in 1959 pioneered the idea of a new relationship between the Commonwealth and Europe, is to take French leave from the Ministry of Aviation to visit India, Pakistan, Malaya and Ceylon. These Asian countries may profit from expanding European demand for their raw materials and food, but they may have to be persuaded that they can maintain their exports of manufactures (even if they lose their privileged tariff position in Britain) by benefiting from a joint European programme to enlarge import quotas.

As Mr Macmillan plays his European cards, the significance of the cabinet reshuffle last July, which brought Mr Thorneycroft back into the cabinet and Mr Sandys to the key Commonwealth post, is becoming apparent. The third member of the team of envoys is a surprise: Mr Hare, the Minister of Labour. Mr Hare has not hitherto shone as a European star; but his beat is the African territories, which almost certainly stand to gain if Britain joins the Six. One name—that of Mr Maudling—is conspicuously missing from the list of messengers. Absent in Moscow at the British trade fair when the crucial domestic battle on agriculture was

Exception has been taken to the statement (in a leading article entitled "No Peasants' Revolt" on page 1206 of the issue of *The Economist* dated June 17th) that, in the recent debate on agriculture in the House of Commons, Sir Richard Nugent, a former junior minister, was "put up" to argue the case for going into the common market. We wish to explain that this form of words was the maladroit result of shortening the original version of the article and was certainly not intended to convey any imputation on the independence and integrity of Sir Richard Nugent or on the "Chair's" principles for selecting speakers. We apologise for any misunderstanding that may have arisen.

being fought, he is now, it seems, too busy to undertake a Commonwealth expedition.

Next week, however, he and Mr Heath will both attend a meeting of the Council of the Seven. The task there should be a great deal easier than Mr Sandys's, for all of the Seven except Sweden now seem to have adapted themselves to the prospect of British membership of the common market. If Mr Sandys and Mr Thorneycroft succeed in their missions, it would thus still be possible for Mr Macmillan to announce a decision to try and join before Parliament dissolves in late July or early August. But rumours of a postponement till the autumn are now widespread.

## PORTUGAL

### Baptism of Fire

IN the absence of any sufficient refutation by the Portuguese of the atrocity charges brought against them by the Baptist Missionary Society, and in view of their refusal to admit the press to northern Angola to check the charges, the world may reasonably accept the allegations of these devoted men as true. From what the missionaries say it seems that, unless Dr Salazar swiftly reverses his policy, fifty thousand Angolans are in danger of being killed in fires deliberately started by the Portuguese in the long jungle grass. According to one report, the fires have already started. Even if the casualty list is not as long as the missionaries prophesy, it should make the British Government wonder whether, in standing by its ally, it is not making a mistake.

Its mistake consists in having assumed that the United Kingdom can do nothing to change Dr Salazar's policies. It is under growing pressure at least to try. The evidence is slowly building up that Britain is shortly going to be faced, in the United Nations and elsewhere, with a choice as embarrassing as that it faced over South Africa in the Commonwealth. Mr Nyerere has requested the Government to expel the Portuguese representative from Tanganyika; Ghana is to discontinue all diplomatic and commercial relations with Portugal; Norway has refused to sell Portugal ammunition; Russia has called for sanctions against Portugal, and Britain and France have found themselves isolated from the United States in the Security Council on the Angola issue.

Last month's arrests of liberal opponents of Dr Salazar have rubbed home the fact that Britain is supporting a police state as well as an oppressor of colonial peoples. It seems a high price to pay for Portuguese adhesion to Nato.

## CONGO

### Back to the Benches

IF the reconvening of the Congolese parliament proves successful, it will be a triumph for the quiet, but undaunted, diplomacy of Mr Hammarskjöld and his colleagues. Tuesday's joint communiqué by representatives of the Leopoldville and Stanleyville authorities, announcing their agreement that parliament should meet again, paid due tribute to the role of the United Nations representatives in maintaining contact with both camps and bringing them together in spite of all the bitterness of recent months. Under the plans announced, the UN force will seal off the area of Lovanium university, a few miles outside Leopoldville, where the members of parliament will meet in total seclusion; and all Congolese troops in the Leopoldville area will surrender their arms to UN custody for the duration of the session. It is a notable achievement merely to have obtained consent to such terms, whether or not the parliamentary meeting yields any immediate results. If the UN operation had been stultified or abandoned—as both Mr Khrushchev and some people in the western world wanted it to be—the consequent plunge into unbridled blood-letting would have made it impossible for the rival Congolese factions to meet anywhere except on the battlefield.

The notable absentees from the gathering on the parliamentary benches will, at least in the first instance, be the representatives of Katanga, where Mr Tshombe's political heirs have reaffirmed their independence. They may have been encouraged by the spectacular profits lately announced by the *Union Minière*, and by their five days of "unofficial" talks last week with a visiting envoy from the Rhodesian federal government. But how much real bite is there behind Katanga's latest bark? Mr Tshombe on Thursday declared himself for co-operation with Leopoldville; and, although his authority over his lieutenants is now uncertain, Katanga's bargaining position *vis-à-vis* the rest of the Congo is already being eroded, with mayhem still spreading in Angola to its west, independence approaching for Tanganyika to its east, and a showdown threatening in Northern Rhodesia, its only other external neighbour. If the rest of the Congo now begins to knit itself together

again, the outlook for Katanga separatism will become dimmer than ever. Mr Nwokedi, Mr Hammarskjöld's Nigerian political officer, may be discreetly but firmly pointing this out in Elisabethville.

## NORTHERN RHODESIA

### Mist of Change

MANY Africans believe that Mr Macleod's heart is in the right place; even more believe that his seat, in a Tory Cabinet, is not. That is why Mr Kenneth Kaunda, leader of the United National Independence party, and Sir John Moffat, leader of the Liberal party, flew to London from Northern Rhodesia this week to warn the British Government of the consequences of keeping a settler government in power in the country. The trouble is that Sir Roy Welensky has spent many months warning the British Government of the consequences of not keeping a settler government in power—and, aided by his Tory rebels and his public relations machine, Sir Roy may have got somewhere. Perhaps he has not got far enough, though; Sir Roy's emissary, Mr Julian Greenfield, has come to London to keep the settlers' end up.

Mr. Kaunda: representative African.

Beset by conflicting pressures in Rhodesia and Westminster, Mr Macleod has taken refuge in mystery. He told Parliament on Monday and Mr Kaunda on Tuesday that he would stand by the spirit and framework of the White Paper he issued in February. That could be made to mean a constitution which might put the Africans in, or the settlers in, or the Liberals in, or a combination of all three, or none of these things. What Mr Macleod wants to do may be the right thing: it is to let Africans and white Liberals take power instead of Sir Roy's United Federal party. What his position allows him to do could only be guessed this week. What is sensible for him to do is laid down in the Government's Monckton Report: this is to allow the representative Africans (which means Mr Kaunda's party) to win a majority of seats in the legislature.

## CHANCELLOR'S SPEECH

### Still Unspecific

THURSDAY midday passed without an announcement from the Bank, but the Association of British Chambers of Commerce did get a lunchtime speech from the Chancellor. The only positive step he had to announce was that he is going to make reductions in government expenditure—both at home ("some necessary programmes will have to be postponed") and, especially, in military and other expenditure overseas. Otherwise, although he insisted that he was making "no attempt to conceal the problems facing us of our national situation," he did very successfully conceal what he was going to do about it. He rightly picked out restrictive labour practices as one of Britain's main long-term problems, and was fairly specific about which he wanted to be changed: "the training of apprentices . . . surely could be made much more flexible and efficient," and "the complex trades union structure in many of our industries cannot work efficiently without a far greater measure of inter-changeability and co-operation." But his only remedy seemed to be that these things "should be brought out into the open for discussion between the people who understand the issues involved."

Similarly, he said that in his budget he had taken "a calculated risk in order to allow activity to expand"; and that "it is not enough to rely on taxation as a restraining force . . . there must also be restraint over the growth of pre-tax incomes." The "day cannot be put off much longer" when the country should realise that leap-frogging wage and other claims must stop. But he again implied that the process of stopping them should come only from "the hard-headed commonsense approach of a nation—acting through the rich variety of its institutions, through employers, trade unions, chambers of commerce, local authorities, trade associations, through the decisions of individuals—all working together for common purposes." As this passage followed shortly after his implied complaint that the trade unions were constantly unable to work together even among themselves about demarcation of jobs, and as his speech came the day after the confederation of engineering and shipbuilding unions had just formulated a large leap-frogging wage claim for three million workers, this hardly seemed to be an incisive peroration.

## IMMIGRATION

### Colour Bar Ahead?

THE Home Secretary, addressing a conference of Conservative teachers, has dropped another hint about present official thinking in the matter of West Indian immigration. "If you give the Government a little longer," he said, "we shall try to

find a solution as friendly to these people as we can, and not based on colour prejudice alone." There is no reason to suppose that Mr Butler, of all people, was conjuring up imaginary castles in Spain. His words must be taken as carefully chosen and be weighed as what they are: the clearest of several recent signs that the Government is soon liable to abandon the principle of free entry for Commonwealth citizens into this country. The most obvious system to replace it might be entry only for those who have got "work permits" or "jobs lined up" before they leave their homelands.

This is a depressing prospect, and it could be a movement along a very dangerous road. Economically, this country has gained considerably from the free flow of West Indian labour into it: under full employment the national income necessarily gains from the immigration of any active worker who is encumbered by less than the average number of non-working dependants—as most immigrants are. It is therefore hypocrisy to deny that colour prejudice will be the main reason for any new barrier. No doubt care will be taken to see that there is no overt race prejudice in the granting or withholding of any work permits, if that is the method used: but the fact that we may then keep out some Canadians or Australians as well as West Indians will not make such a step any better. It will make it worse.

No doubt it will be said that permits would always be granted liberally for Commonwealth citizens, at any rate in areas that are not already "overcrowded with immigrants" and especially for jobs for which Englishmen find themselves increasingly too fastidious; already public transport undertakings, hospitals and some local authority services could ill do without the West Indians, who perform unsavoury or unpopular duties. But if a "work permit" system is formalised, the logical consequence of it could be job-reservation, differential wages, less favourable treatment of Commonwealth than of European citizens if Britain joins the common market, and all sorts of problems when the particular jobs for which new immigrants have been given work permits run out. In what way then would the "tensions" of predominantly coloured districts be alleviated? Is placating Sir Cyril Osborne worth it?

## LAOS

### Slow Clap

IF the main attraction of the gathering of Laotian princes in Zürich was its advertised aim of getting the Geneva conference on Laos off the ground, then it is in danger of flopping badly. On Tuesday, a leading member of the cast, Prince Souvanna Phouma, was confined to his room after minor surgery, and there was no performance. Before that, the visiting communist

star, Prince Souphannouvong, had bewildered the audience by introducing unscripted lines, and the third celebrity, Prince Boun Oum, had said through a spokesman, in effect, that since the other two were in league with each other the plot really had two characters and not three.

Princes three: together, but still apart.

Less metaphorically, the differences already brought to light are profound and will not easily be bridged. The right-wing prince (Boun Oum) argues that since the neutralist prince (Souvanna Phouma) and the communist one have made common cause, they now constitute a united block. The unexpressed corollary is presumably that, if a government of national unity is to be formed, the communists might as well be represented by the neutralists. As if to justify this viewpoint, the two other princes began the talks by submitting a joint declaration defining Laotian neutrality. Prince Souphannouvong, however, maintaining firmly that those present stood for the three mainstreams of Laotian politics, argued that all three should be equally represented at all levels in the government, army and civil service throughout the country. This looks like a particularly mischievous extension of Mr Khrushchev's "troika" principle, which would give the Laotian communists a built-in veto over every aspect of public affairs.

This proposal is grotesque and unacceptable. If Prince Souvanna Phouma subscribes to it and Prince Boun Oum acquiesces in it, Laos will become ungovernable except on communist terms. It cannot seriously be suggested that this is a condition of neutrality. Political and military realities may make communist participation in the government unavoidable; but partition, or perhaps even the risks of continuing the civil war, would be preferable to the slow strangulation implied in Prince Souphannouvong's proposals.

#### PERSIAN GULF

### Backward

THE three Bahrainis released from St Helena by the ruling of a British judge have much to be thankful for. They have won a famous victory against the British Government, and have enjoyed throughout their struggle the dogged championship of Britain's Parliament and press. Now, in their triumph, they may be drily reflecting

#### NOTES OF THE WEEK

that, but for Britain's hastiness in snatching them out of their homeland after fourteen-year sentences were passed on them by a Bahrain court in 1956, they would still be prisoners today—in a Bahrain jail. No wonder they are delighted with British justice and hope for a second helping when they come to England next month. The question of compensation for their four years in British custody may then arise. They may have legal grounds. These Winslow boys of the Gulf secured their liberty on a fine point of law; the point may still have some prick in it.

But the political dilemma that faces the British Government is worse than its legal discomfiture. Mr Heath had his back to the wall when answering questions in the House of Commons on Monday. And a very stiff back it was. He had nothing gracious to say; he merely reminded his questioners that the *habeas corpus* writ on which the prisoners were released was granted, as he understood it, on the grounds of a defective warrant, not a defective trial. This appears to be true. Nor need it be forgotten that, whatever the nature of the trial, the charged men were responsible for political demonstrations which, though intended as peaceful, ran rapidly amok. The damage was great, the local reaction violent. But Britain is rash to have assumed responsibility for the kind of rough justice meted out by a country whose legal and social institutions are, by any standards, backward. This false political position is fundamentally more dangerous than any legal mistake. Bahrain goes but slowly in modernising its outlook and, however charming a toddler, must remain an embarrassing charge so long as it will not grow up.

### Forward

UNLIKE Bahrain, Kuwait has been filling out so well as a state with a truly sovereign character that this week the restrictive clauses in its 62-year-old agreement with Britain were annulled. In fact, these clauses, which related to foreign policy, ceased to operate some time ago. For many months now Kuwait has been free to accept foreign consulates and to join the United Nations or the Arab League. (It has not joined either, although it belongs to a number of other international bodies.) The annulment simply confirms its ruler's full liberty of action and celebrates his achievement in reforming his law courts and assuming jurisdiction over foreigners, a function handed over by Britain now that his courts are good enough. The future development of the relationship between the two countries is now up to the ruler. Britain still undertakes to come to his help, if he asks, against internal subversion as well as aggression from without. Thus Britain is committed to the ruler rather more than he to Britain. In brief, Britain still is responsible—if called upon so to be.

#### HOUSES

### Great Wen

MR BROOKE has been telling local authorities that plans will have to be laid for coping with a large volume of new housing development "outside the towns." The minister pointed out that present local plans, many of them drawn up a decade or more ago, do not allow adequately for the continuing increase of the population. Nor do they allow for the present trend towards having fewer people in each house, a trend which in southern England has already increased the demand for dwellings by 10 per cent. Since Mr Brooke was addressing the Rural District Councils' Association, his remarks have been represented as conjuring up a vision of new development sprawling rapidly across the English countryside. In fact, however, he quoted all the usual policy desiderata: the need to guide the new development to suitable places by firm planning, while protecting good agricultural land, green belts, the beauties of the countryside, and so forth. If anything, his speech underestimated the scale of the problem.

Since employment is still growing in Greater London while population moves out, the pressure for new homes in the surrounding region—already intense—seems bound to increase further. The high price of building land anywhere within 40 miles of Piccadilly is ample evidence that the planning authorities are not allocating nearly enough land for new development. As the minister implies, this policy must be changed. But where are the new homes to go, apart from those which should certainly be provided by encouraging redevelopment and improved housing within the inner suburbs of London itself? If new homes are scattered among 200 smaller towns and 2,000 villages in southern England, the main trouble will not simply be that the countryside will wilt under this mass invasion. It will be that, while the housing problem will be eased, traffic and communications with London will become chaotic.

If the development of southern England is to be sensibly guided, it is imperative that the magnetism of London to commuters should be reduced and that many of the new houses should be concentrated in fairly large towns, which can develop local sources of employment and offer other counter-attractions (such as good shopping centres) to the pull of London itself. This calls not so much for a new instalment of the new towns programme, as for the development of what might be called sub-regional centres. They should be loosely linked with London but be larger and more distant places than the present new towns. Might not such towns as Northampton, Peterborough, and Ashford be deliberately developed in this way, and act as focal points for other expanding towns and villages in their vicinity?

*Don't do it, Doherty! Think of the office cleaners!*

We're sympathetic, naturally. We know that a man's morale can only stand just so much. And that doesn't include the worries and frustrations of getting a big engineering or building project 'off the ground'.

Why not come to Costains? Costains are geared to handle the whole operation, from the idea stage onwards. From the moment you and your consultants contact Costains the specialised knowledge and enthusiasm of the entire organisation are at your disposal.

We plan—we work fast. You save time, expense...and your sanity.

it's never  
too soon  
to call in

## A House Undivided

"THIS case will not lie down." In an  
impressive opening speech in an im-  
pressive debate last week, Mr Gordon  
Walker put forward the Labour party's case  
for a new inquiry into the affair of Timothy  
Evans and for the transfer of Evans's  
remains to his family for a Roman Catholic  
burial. No member who took part in the  
debate was prepared to announce his belief  
that Evans murdered his wife and baby—  
with the possible exception of Sir Hugh  
Lucas-Tooth, who was Under-Secretary at  
the Home Office in 1953 at the time of  
Christie's conviction as a multiple murderer  
of women in the house where Evans had  
lived. And Sir Hugh was really only con-  
cerned to defend the propriety of the way  
the subsequent Scott Henderson inquiry  
in 1953 was conducted. Mr Chuter Ede,  
the Home Secretary who refused to recom-  
mend a reprieve for Evans in 1950, has had  
the courage to admit that his decision has  
since been proved wrong.

Since 1953, the Evans case has not lain  
down. It will not lie down until Evans's  
guilt is established beyond doubt or,  
through the grant of a posthumous pardon  
and the transfer of his remains, he is given in  
death the benefit of the doubt he would  
have been given in life had the full truth  
about his fellow lodger Christie been known  
when he was tried. Mr Butler admits the  
doubts about Evans's guilt, but denies that  
a new inquiry could establish the truth and  
argues that Evans's innocence must be  
proved beyond doubt before a free pardon  
can be granted and the remains transferred.

It is true that a new inquiry might well  
not be conclusive. But last week Mr  
George Rogers, MP for the area where  
Evans and Christie lived, implied that new  
evidence might still be forthcoming. In any  
case, without a further inquiry, or at least  
without an impartial reappraisal of the  
whole affair (including the way the Scott  
Henderson inquiry was conducted) the  
public cannot judge whether the points  
constantly brought forward in favour of  
Evans's innocence are valid or not. Mr  
Butler was so impressed by the weight of  
opinion expressed in the House of Com-  
mons that he is "to continue thinking about  
this". Is he inhibited from taking action  
as long as the man who was Home Secre-  
tary in 1953, and accepted the Scott Hen-  
derson report without question, continues to  
hold office as Lord Chancellor?

## RUSSIA

### Pre-Gagarin

THE moon is not enough. Russian  
scientists, meeting in congress earlier  
this month, were not allowed to rest on  
Major Gagarin's laurels; indeed, they  
were the targets of criticism. Mr  
Kosygin, the deputy prime minister,

admitted in his closing speech that western  
science and technology were advancing  
fairly fast "in spite of their contradiction."  
Soviet science, on the other hand, he  
argued, is brilliant in some fields, but is  
not sufficiently responsive to the needs of  
the economy in others. He mentioned  
chemistry and electrical engineering among  
the culprits. The scientists were told that  
there was a lack of co-ordination and plan-  
ning, and a failure to put the fruits of  
research to practical uses. Mr Kosygin  
even suggested an exchange of patents with  
the West.

In the Soviet Union, the Academy of  
Sciences has hitherto been the responsible  
organisation in this field. It is a vast body,  
dealing not only with pure science and  
technology but also with philosophy,  
history, economics and literature. Each  
branch has its own institutes, laboratories  
and museums in different parts of the  
country. The academy now employs,  
directly or indirectly, some 300,000  
scientific workers. Yet, for some months,  
it has been under fire for the reasons men-  
tioned by Mr Kosygin. Its difficulties may  
account for the recent departure of its  
veteran chairman, Mr Nesmeyanov. His  
successor, Mr Keldysh, a 44-year-old  
specialist in mathematics and engineering,  
now has the task of streamlining the  
academy and improving its relations with  
the planners.

What the academy's critics have not put  
enough emphasis on is the striking con-  
trast between the modern and the back-  
ward in Russia. Factories using up-to-date  
equipment stand side by side with others  
that are totally obsolete. There has been  
spectacular progress in medicine, and yet  
there is still a shortage of basic medical sup-  
plies at the local chemist's. Efforts are  
now being made to close these gaps.  
Soviet expenditure on science has more  
than quadrupled over the last decade. It  
is largely on the contribution of science  
and technology that Mr Khrushchev relies  
to ensure the transition of Soviet society  
"from socialism to communism"—the  
increasingly fashionable slogan, which will  
dominate next October's party congress.

## ITALY AND AUSTRIA

### Alpine Flurry

TO most outsiders the bickering between  
Italy and Austria over the Alto-Adige,  
as the Italians call the area (it is South  
Tyrol to Austrians), looks like a storm in a  
teacup. But minor frontier irritations have  
a way of spreading dangerously. The way  
this one has flared up into terrorism in the  
last few weeks is a reminder that even  
though western Europe is moving towards  
unity it still cannot afford to let local  
nationalism get out of hand.

The inhabitants of the Bolzano province  
of Italy are the only significant German-  
speaking minority left in western Europe  
outside the frontiers of German-speaking

states. After the war, while Czecho-  
slovakia and Poland were solving their  
minority problems in a radical way by  
throwing the Germans out, the Italians  
reached a more sensible and humane  
agreement with the Austrians; they kept  
the province and its inhabitants in Italy,  
but agreed to grant it a measure of

autonomy at the same time. For some years  
things went smoothly, but since 1956 the  
Austrians have become increasingly dis-  
satisfied, holding that the promised auto-  
nomy has been incomplete. The Italians,  
on the other hand, alarmed by the increas-  
ingly vigorous demands for *Anschluss* with  
Austria by leaders of the local German-  
speaking group, have felt increasingly reluc-  
tant to let self-rule go too far. They fear  
that, if the province gained complete con-  
trol of its affairs, it might take the final step  
and join Austria.

The Austrians took the issue to the  
United Nations last November, and were  
told to discuss matters with the Italians  
once again. As a result Herr Kreisky, the  
Austrian foreign minister, and Signor  
Scelba, Italy's minister for the interior,  
met somewhat discordantly in Milan in  
February, and a little more harmoniously  
in Klagenfurt in May. They were to meet  
again in Turin on Saturday. But so far it  
cannot be said that a solution is in sight.  
The danger is that this petty dispute could

become the focus of wider German nationalist feelings, in Austria, if not in western Germany. The Italian government is coming to recognise that there is a strong case for a determined effort to give autonomy more practical meaning. But the Austrian government, which on occasion has found it convenient to make Italy a whipping-boy on this issue, will have to give some ground as well. In the long run there is perhaps only one solution—to develop as close a political relationship between Italy and Austria as the French and Germans have managed to achieve. This vision, which inspired the original post-war agreement between Signor de Gasperi and Herr Gruber, has subsequently been lost.

#### PUBLIC SCHOOLS

### Fees Complex

LAST Friday's Commons debate on the public schools was interesting, if only for the acceptance by members everywhere in the House of the need to reduce the social and educational gap between the embarrassingly named public schools and the state educational system. Snobbery and social exclusiveness, however tacit, are still a by-product of a public school education: they are obnoxious to many and useful to none. This realisation may underlie the comments from some distinguished headmasters, who have welcomed the proposal to open some ten per cent of public school places to free (i.e. Government-paid) entry by boys from the state educational system.

But the second interesting feature of the debate was that the Government is rightly not inclined to favour this neo-Fleming approach to an embarrassing problem. At present, if "public school" is taken to mean schools whose headmasters are members of

the Headmasters' Conference, there are 117 public schools with 55,000 boys, of whom 37,000 are boarders; they account for about six out of every hundred boys between the ages of 13 and 18 who are now in secondary schools of all kinds. The Middlesex county education committee has worked out that it would cost as much to send one boy to Eton as to provide five county grammar school places. It is not easy to persuade local authorities that they or the state should skim off the brightest one per cent or so of boys from their maintained schools in order to spend five times as much money on them away from home (if their parents should happen to agree to a transfer) in the belief that this will then somehow marginally reduce the social offensiveness of the public schools.

This becomes even less easily defensible when it is seen as a device for subsidising from public funds bodies which are able to command a very high price for their services on a free market. The need is to nullify the public schools' undesirable aspect—that they encourage the survival of a hateful sense of social superiority among a minority of their less bright pupils—while retaining the quality to which all speakers in the debate paid tribute—that they provide an excellent education. The answer, as Sir David Eccles intimated, is to spend what money the Government can in making "the maintained system so good in quality and the choice for parents so wide, that an overlap between the two systems will become obvious to all parents." There is already quite a considerable overlap, which Sir David claimed to be "growing at a pace which one can really appreciate." When it is no longer backed by the real effects of superior teaching, the factitious superiority of public schools will fade away: this should be the aim of the reformers.

#### EAST AFRICA

### Building Blacks

HAPPILY, Mr Macleod is leaving his east Africans alone to build their federation; unhappily, so many people are on the job that someone may knock a block over and make it all fall down. A lot depends upon Mr Macleod's decisions about internal affairs in Kenya, Uganda and Zanzibar. The British Government's left hand has lately become unsteadier in African matters, and there is a danger that its right hand may force the Colonial Secretary to

Mr Nyerere: focus for federation?

go on keeping Kenya blacks in their—wrong—place. It is being said that Britain should grant self-government to Kenya in 1961 so as to bolster the power of the minority government led by Mr Ngala which the settlers and back-bench Tories prefer. The sensible policy for Mr Macleod, however, is to release Mr Jomo Kenyatta immediately and let him lead the majority party of a self-governing Kenya into federal talks.

Advance in Kenya is all the more urgent because without it Tanganyika's patience will come to an end and Mr Julius Nyerere will stop practising national restraint in the interests of a future federation. The leaders of Kenya, Tanganyika, and Uganda attended talks in London this week to see how an independent Tanganyika could continue to share common communications and technical services with the other two territories. These services are at present provided by the East Africa High Commission, a colonial institution. It seemed this week as if Mr Nyerere would be glad to retain these services after Tanganyika's independence in December, but on two conditions. The first is that his country's sovereignty must be made clear in a new formal agreement between his government and the High Commission; the second is that there must be some prospect of federation in the near future.

The High Commission is itself a useful base for a federal structure. But East

Africa has more. It has two common languages—English and Swahili; it has a common market; it has 80,000 indigenous whites to provide expertise; and it has the expressed desire of the nationalist leaders to unite in one country. But, as Mr Nyerere has pointed out, it will be harder to agree on federation if each country becomes independent separately, for then each government may be jealous of relinquishing its new status. Tanganyika's forbearance can, for a while, be counted on, but it is important to promote strong representative government in Zanzibar, Kenya and Uganda within a short time if the 23 million people of east Africa are to build what could be one of the most powerful and promising nations of Africa.

#### WEST INDIES

### Jamaica Ruminations

IN the wake of the West Indian constitutional conference that ended in London last Friday, some delegates have been attending a so-called "hangover" conference—the term rather aptly coined by Mr Macleod. If a tonic could help their hangover, Mr Macleod was equally apt in having one in his pocket when he spoke to the House of Commons on Monday. This was the bracing news that the United States is ready to take part in Britain's plans to step up development schemes in the West Indies that offer quick returns. Only a strong dose of foreign aid can ease the economic strains that threaten the federal structure. The small islands, still undeveloped, must harness their resources of land, water and labour (they have plenty of labour) and follow Jamaica's example in building up small local industries; otherwise they will remain poor relations, a drag on the federal kinship that is still more theory than fact.

The blue-print for a constitution that was drawn up at Lancaster House will, if accepted by the ten separate legislatures, assure the West Indian federation of independence in May, 1962. Pending its publication in a White Paper, promised soon, its principal features must be gauged by Mr Macleod's own allusions. A loose federation is contemplated; all the trickier

questions—taxes, freedom of movement and customs union—are either delayed for nine years or else consigned to solution by stages. This is less than keen federalists wanted, but as much as Jamaica could take. Even so, it is not certain that Mr Manley can, in his referendum, carry the Jamaican electorate into the federal fold. The natural detachment of an island is aggravated in Jamaica by the thousand miles that separate it from all the other islands. Yet the prospect of independence, a voice in the United Nations and potentially abundant economic aid should help to convince its people that the venture is worth a trial.

#### CENSUS

### Censure on the Scots

Nobody should want to do away with local customs in these islands: bagpipes, the kilt, haggis, oatcakes and lairds may all be held in affectionate esteem. But when it comes to the production of important national statistics, in particular the ten-yearly expensive census, surely it is high time to recognise the existence of Great Britain, and even of the United Kingdom? The Registrar-General for Scotland produced his preliminary report on the census at the same time as did the Registrar-General for England and Wales. (We still await the one from Northern Ireland.) It would be unfair to say that they are as unlike as chalk and cheese, but there are maddening differences which almost seem designed to make the use of the census by outside statisticians as difficult as possible.

Perhaps the special Scots nomenclature of large and small burghs and landward areas is too ingrained to disturb; and by all means let the Scots have their additional question on the census form about the number of their countrymen who can speak the Gaelic. But was it necessary to analyse

this question about Gaelic speakers among the preliminary findings and yet leave out acreage, the ratio between the sexes, the rate of growth or diminution of urban populations in towns of different sizes, as well as a count of households and dwellings? All of these other figures are recorded for England and Wales (although it must be regretted that the London authors make a bland comparison between the 1961 count of dwellings, including some unoccupied, with 1951 figures excluding them). A further minor irritation is to be presented with percentage changes in population since 1951 in England and Wales but a percentage ratio between 1961 and 1951 for Scotland.

If the Edinburgh Registry Office likes to display its independence, it cannot complain if the London one shows off its more accurate estimation (better luck or better management?). Between the censuses, annual estimates are based on births, deaths and migration, the latter being the headache. The population count in England and Wales on census day is now provisionally recorded as having been less than 0.05 per cent higher than the figure of 46.051 million which had been deduced in these estimates. The count in Scotland, on the other hand, shows a population 0.6 per cent lower than the 5,208,500 which the Scottish Office says was its previous estimate (but this 5,208,500 itself curiously implied no growth at all between June, 1960 and April, 1961 and the London estimate of the Scottish population was 5,223,000). Bearing in mind that estimates for smaller areas are likely to be wider of the mark, but also bearing in mind that the census itself contains errors and that nobody wants an accurate count down to the last head, it looks as if the real lesson of this census is that expensive full censuses are no longer necessary. Surely a sample will suffice? But, please, let it be for the United Kingdom.

## The Economist

JUNE 22, 1961

### BELLIGERENT PERPLEXITIES

Though till this week's accounts no blood yet appears to have been shed, except by riot, accident, or individual assassination, the war may be considered to have actually begun between the two halves of the severed Republic. At sea, hostilities have actually commenced, not indeed, by *bona fide* fighting, but by reciprocal seizures. The blockade of the Southern ports has been extended, in a more or less effective and more or less continuous fashion, and has now reached the busy city of New Orleans. Many vessels have been captured by the blockading cruisers, rightfully or wrongfully; some have been released, and others have been retained as lawful prize. Several more have been warned off, and obliged to return home or carry their cargo to other markets; and even, it is said, when there was no actual blockade to justify such a proceeding. Some of these ships were British. On the other hand, we learn that several prizes have been taken into New Orleans by the privateers of the

seceding States. We read also of British subjects in the South having been impressed and forced to serve in the volunteer ranks; and of British subjects in the North having spontaneously proffered their services to the Federal army. It is impossible at present to guess how much of truth and how much exaggeration there may be in these various accounts; but there is enough to raise the gravest uneasiness as to the difficulties which lie in wait for neutrals when two exasperated foes like the present belligerents take international law into their own hands. In every capture and in every stoppage of a merchant ship on the coast of America lie the almost certain seeds of a misunderstanding and a dispute, and the possible seeds of a bitter quarrel. Few seizures are so clearly rightful and legal as to leave no case for litigation or complaint; and where litigation begins between the wrong-doer and the victim with no tribunal of supreme and unquestioned authority to appeal to, war is seldom far off.

## The Rising Cost of Living

PERCENTAGE CHANGES APRIL 1961  
COMPARED WITH APRIL 1960

# LETTERS

## Europe and the Commonwealth

SIR—Those of us who respect *The Economist's* past are sometimes grieved by what it says nowadays. Last week, in a leader, you found something illiberal in those who have doubts about signing the Rome Treaty as it now stands.

I cannot speak for others; but my own doubts spring from the fact that I favour the greatest possible expansion of world trade, and in particular free trade in food and raw materials. Food and raw materials are at present imported into this country from the Commonwealth virtually duty-free, as they have been for generations. *The Economist* fought for and championed this system for at least a century.

The present common external tariff of the Six (according to figures given me last month by the Board of Trade) provide, as you are presumably aware, for the following import tariffs on the main foodstuffs: wheat, 20 per cent; beef, mutton and lamb, 20-24 per cent; bacon, 20-25 per cent; butter, 24 per cent; cheese, 23 per cent; tea, 18-23 per cent. Certain raw materials, now tax-free, would be taxed also. Since these taxes or corresponding import levies would apply to imports from the Commonwealth from which most of our food imports come, adherence to the present common market tariff would mean imposing these taxes on the bulk of foodstuff imports into Britain. Food prices, the cost of living, and all our industrial and export costs must rise; and the distribution of real incomes would be shifted still further to the disadvantage of the poorest.

Throughout the 1930s *The Economist* campaigned, consistently and honourably, for subsidies and not food taxes to support agriculture, because this was socially and economically more liberal. In a recent issue you shocked me by advocating the Common Market food tariffs, as if this was just a minor technical point. Do you no longer believe in either social justice or free trade?

Since the total value of imports on which the UK would raise tariffs (if we signed the present Rome Treaty) would vastly exceed those on which we should lower them, and since we should raise them against the greater part of the world, and lower them only against the Six, the result would be the biggest step towards protectionism taken since 1846.

Do you really want this? If so, to call others illiberal is to use English in a way more reminiscent of Orwell than of Bagehot. But if not, if you want to keep tariff-free food imports, as I do, why not say so?

We are told that the Common External Tariff on foodstuffs is still negotiable. If so, the UK in my view should require as a condition of adherence to the Rome Treaty that the Common External Tariff should be

zero on all goods now entering the UK from the Commonwealth tariff-free. On that genuinely liberal condition, I should enthusiastically support Britain's adherence to the Six.

For the whole of Western Europe would then be opening its markets to the primary, and other, products (I would not stop at primary) of the less developed continents. That is what we ought to do, in the interests of both our own population and the poorer countries, as is forcibly argued by Professor J. E. Meade in this month's "Three Banks Review" (pages 15-19); and not relapse into a narrow "European" protectionism. It is because I wholly agree with Professor Meade's arguments that I cannot accept the Six's present protective tariff.

And that is what *The Economist* ought to demand, if it has any respect left for the principles of F. W. Hirst, Bagehot, or almost any previous editor. For your own reputation, I still hope you may.—Yours faithfully,  
DOUGLAS JAY  
*House of Commons, SW1*

## Kenya

SIR—As I presume that your special correspondent lately in Kenya had access to the Treasury publication *Economic Survey*, 1961, issued shortly before I delivered my budget speech, I am surprised at the error which appears on page 791 of the article in your issue of May 20th last.

Your correspondent alleges that *per capita* income in Kenya is only £12 per annum. This is far from correct: in 1960, even on a 1954-deflated basis, it was £32. In money terms it was £35.6. Admittedly, these figures are based on mid-year population estimates which are probably too low, having regard to the results of the 1957 Tanganyika and 1959 Uganda censuses. But even if these estimates are adjusted upwards the *per capita* income in 1960 was, at £29 (1954 prices) or £32.2 (current prices), still very much higher than reported by your correspondent.—Yours faithfully,  
KENNETH MACKENZIE  
*Nairobi*  
*Minister for Finance & Development*

## End of a Monopoly

SIR—Your Business Note on June 10th does less than justice to the efforts of the Birfield Group to keep pace with, and even be a step ahead of, the motor industry in its vast expansion programmes since the war.

Universal joints and propeller shafts manufactured within the Birfield Group are produced by Hardy Spicer Limited in Birmingham, and I agree that, ever since that

THE ECONOMIST JUNE 24, 1961

company introduced universal joints and propeller shafts for road vehicles to this country in 1925, it has been a monopoly producer. But this monopoly arose not because Hardy Spicer propeller shafts embodying Hooke's type joints enjoyed patent protection, but because the motor industry found it cheaper to buy the products of large scale manufacture than to make the shafts themselves.

Between 1952 and 1958 Hardy Spicer Limited supplied their complete propeller shafts to the British motor industry at less than cost for five of the seven years; this was made possible solely by profits resulting from replacement business, but we believed it was right to make this contribution to keep down the cost of cars, particularly for export markets. So much for the benefits of "enjoying" a monopoly! During this period our selling prices were far below any other manufacturer's in the world.

Since large-scale car production was resumed after the war, great expansions of Hardy Spicer manufacturing capacity have taken place, culminating in 1959 with the opening of an entirely new works having a floor area of 675,000 square feet. Weekly production rates of propeller shafts averaged 20,000 in 1953, 33,000 in 1955, and 45,000 in 1959. The new factory is the largest universal joint plant in the world and is the most fully integrated, making almost all of its own tube (at times up to 75 miles per week) and its total requirements of needle roller bearings, running into many millions per week. No other propeller shaft manufacturer in the world makes these elements. The present output of propeller shafts from the Hardy Spicer factory covers 75 per cent of the British motor industry's requirements and not 50 per cent as implied by your article, while every major car and commercial vehicle manufacturer in this country is a current Hardy Spicer customer.

The Birfield constant velocity universal joint is also produced by Hardy Spicer Limited. Almost half a million of these joints have been delivered for use on the Morris Mini-Minor, the new Austin Seven and the Lancia Flavia. Not one failure of these joints has been reported to us.

Finally, until some car companies encouraged GKN to enter the propeller shaft market as an alternative supplier, at no time were the car production lines of this country held up for supplies of Hardy Spicer shafts. Despite our good record we can appreciate, however, that some car manufacturers felt reluctance to rely on one manufacturer alone for these essential components.—Yours faithfully,  
H. E. HILL  
*London, W1*  
*Chairman, Birfield Ltd.*

## Chilean Agriculture

SIR—In your issue of April 22nd last, an article under the heading "Agricultural Paralysis in Chile" purports to give a picture of the agricultural situation in my country. There are so many erroneous statements in the article that it would not be

THE ECONOMIST JUNE 24, 1961

possible in this reply to refute them one by one, so I will refer to a few of them only.

The chief point you make—in accordance with your headline—is that of "agricultural paralysis." The last comparable international figures available are to be found in the FAO Annual, corresponding to the year 1955, and are as follows:—

### INDEX OF AGRICULTURAL PRODUCTION 1934-38=100

|                      | 1954-1955 |

In subsequent years the average rate of increase in production has been higher. Anyone who speaks of "paralysis" in reference to an agricultural production with an annual increase of more than 2 per cent has simply not examined the matter objectively.

You say that the Central Valley is fertile, well irrigated from the snows of the Andes, and semi-cultivated. We do not understand how it can be maintained that irrigation is "easy." The country has 1,200,000 hectares of artificially irrigated soil, of which four-fifths were provided with irrigation by the farmers themselves, while the remaining fifth was undertaken by the State. 85 per cent of these projects resulted in loss to the agriculturists, 45 per cent of whom were ruined. Those who managed to carry on did so through their having at their disposal ample funds derived from other activities, particularly mining.

Irrigation is provided in the form of canals, some of them over 100 km long. It is not uncommon for farms to be 30 or 40 kms away from the source of the water supply. This is because the "fertile Central Valley of Chile," as you call it, has no rain for seven or eight months of the year, and all the rainfall takes place in winter—one of the conditions least favourable to agriculture.

You say that almost two-thirds of the seven million inhabitants of Chile live on the land. The facts are the exact contrary: one-third of the population lives in the country and two-thirds in the cities.

You say that statistics are easily obtainable in Chile and that the larger part of the fertile properties of the Central Valley are in the hands of a small number of landowners. Statistics of landed property in Chile are compiled solely on a geographical basis. Our country is mountainous and its land differs greatly in quality. In the province of Santiago 52 landowners have 14,656 hectares between them; this represents 0.5 per cent of landed property, occupying 57.3 per cent of the province. An analysis of these properties gives us the following table:—

### LETTERS

#### AVERAGE AREA OF FIFTY-TWO LARGE PROPERTIES

|                                                     |                  |
|-----------------------------------------------------|------------------|
| Total area .....                                    | 14,656 hectares. |
| Sterile land .....                                  | 4,541 "          |
| Land suitable only for pasture .....                | 7,470 "          |
| Land partially irrigated .....                      | 133 "            |
| Land permanently but insufficiently irrigated ..... | 40 "             |
| Land permanently and sufficiently irrigated .....   | 93 "             |
| Land totally unirrigated .....                      | 2,377 "          |

The above shows that of those "uncultivated properties," totalling 57.3 per cent of the Province, only 3.8 per cent are really suitable for intensive cultivation—in other words, they consist of huge areas of mainly infertile soil. The national statistics with which you suppose us to be so well provided have not taken into account these less known figures of our national economy.

Agricultural workers, whom you say are so poorly paid, are the owners of 16 per cent of the cattle, 23 per cent of the bloodstock, 5 per cent of the sheep, 31 per cent of the pigs and 21 per cent of the goats. In other words, they are the only type of worker in Chile who own important means of production, although statistics, supposedly accurate and impartial, would seem to prove the contrary.

You say that, owing to the disastrous condition of Chilean agriculture, the mortality rate in the country, according to official sources of information, "is surpassed only by that of Egypt." This is utterly untrue. The mortality rate in Chile is 12.8 per 1,000. This is the same as Colombia, less than Ecuador (14.8), but higher than countries such as Venezuela, Peru, Uruguay, some of which do not include in their figures their indigenous populations. In Europe, the mortality rate is similar to that of Chile: Austria, 12.2; Belgium, 12.2; France, 12.2. The United Kingdom rate is 11.7 and in Scotland 12. The mortality rate in Egypt is 18.4 per 1,000, and is not the highest in the world. These figures are taken from the United Nations Yearbook for 1956.

Our country, like the whole of Latin America, has many problems. With a rise in population which is not appreciated in Europe, it is necessary to increase food production very much more in order to raise our standard of living. The conditions of rural life must also be improved, as an essential part of the general struggle towards greater economic development. It will be difficult to find adequate solutions to these problems if the basic realities are distorted and if false interpretations of fact are allowed to go unchallenged.—Yours faithfully,

GUILLERMO NOGUERA  
President, National Agricultural  
Santiago, Chile Society

## Teachers' Pay

SIR—I am President of Middlesex Secondary and Technical Teachers' Association—a branch of the National Union of Teachers. On June 8th our General Meeting decided that the present salary award

should be rejected. May I be permitted to give you some of the reasons for the rejection of the proposed scale and to reply to the note in your issue of June 10th?

We object to your saying that it is the young teachers and the militant training college students who are responsible for the executive's decision to reject the scales. Those members of the executive who voted for the rejection are either teachers of long service or head teachers. Also the attendance at local associations is mostly made up of teachers of long standing.

We object to the structure of the proposed scale. If you have a scale of £600 to £1,000 spread over 16 years the average increment is £37 10s. a year. The proposed scale starts off with an increment of £5—that is, less than 2s. a week. This is an insult. Then the scale proceeds by increments of £30 a year, so that by the fifth year the proposed Burnham scale is £192 10s. less than the regular incremental scale. The "booster" increment which you praise so much just brings the proposed scale into accord with the regular £37 10s. incremental scale. Then the proposed Burnham scale lags behind the regular £37 10s. incremental scale until the final year, so that over the whole scale teachers have lost over £500 on the regular incremental scale.

The primary teachers do not rest their case on having power when the new bulge comes into the primary schools. They rest their case on educational grounds, viz., that all stages of education are equally precious to the development of a child's mind and personality. Under the Burnham scales children under 13 are valued at one point, and the ages from 13 to 15 two points and from 15 to 16 four points, 16 to 17 six points and above 17 ten points. The point value of a school depends on the number and of the valuation given to each child, and the salaries of head teachers, of deputy head teachers and the number of posts in which payment is made above the scale depend on the number of points. We think that all children staying on to school leaving age should have the same point valuation, otherwise a feeling of inferiority creeps in.

We object to the start of the scale as this is too low. After long and expensive training these pupils start at a salary of £600 a year, which is about £11 11s. a week. The average wage of a manual labourer is £14 10s. 8d. a week, and of a clerical and administrative worker is £19 3s. 7d. Therefore the teachers' average wage on the new scale does not equal the manual labourer's until the fifth year of service. After the three year training which we hope will raise the status of teachers, all we can offer them is a compensatory increment of £5 a year.

In our opinion the length of the incremental scale should only be about ten years.

We now come to the real reason why you want these scales accepted. You say that "the money cannot be found." All of the other reasons for acceptance seem to be subsidiary to this. May I ask why the money cannot be found?—Yours faithfully,  
S. GALIN

## BOOKS

### *The Artful Reformer*

**The Mackenzie King Record, Vol. 1, 1939-44.**

By J. W. Pickersgill.

University of Toronto Press, London:  
Oxford University Press. 738 pages. 92s.

ONLY very rarely will there be such a subject for political biography as Mackenzie King. He understood politics as few men have; and he acted as he understood. His quality even gets through the wordy compound of autobiography and biography provided by Mr Pickersgill's book.

Shortly after King's death, MacGregor Dawson was commissioned to write an official biography. After years of work on the mass of King papers, he completed the first of three intended volumes, and it was excellent. But in 1958, when it was published, Dawson died. Responsibility for a second volume, covering 1923-39, was handed to another professional historian. For the 1939-50 period, Mr. Pickersgill—who served King as a civil servant, is one of his literary executors, and is now himself a politician—is preparing what he calls a narrative, of which this book is the first half. It consists mostly of such extracts as Mr Pickersgill thinks appropriate from King's voluminous diary. The pace, in this volume, averages little more than two days a page, although Mr Pickersgill has provided only the minimum of connecting material to make the diary extracts hang together. He has done this with skill.

Nevertheless, the result is an unsatisfactory falling-between-stools. King, by King, the diary in full, would be endlessly fascinating despite its wordiness. King screened by Mr Pickersgill loses a lot of life. The reason is obvious. Mr Pickersgill has a heavy stake in the public regard for King's surviving associates, including Pickersgill the Liberal politician. That is pathetically obvious when he describes Mr St Laurent as King's "peerless successor." Whether this means he was a better Prime Minister than the one other successor to date (Mr Diefenbaker) or better as leader of the Liberal party (where the competition is Mr Pearson) is unclear. But however those comparisons come out, there can be little doubt that, compared with King himself in both capacities, Mr St Laurent was a candle to the sun.

For the most part, however, Mr Pickersgill's involvement has a different effect. Trying hard not to show it, he fails to show many other things besides. He is inhibited. The narrative is bare and cold. It is almost

as if Mr Pickersgill, in his précis of the diary, had squeezed the juice out of King and then thrown a lot of it away.

Fortunately, there was plenty of juice to begin with. In the period covered by this volume we see King chiefly as the wartime negotiator. Internationally, this meant working closely with Roosevelt and performing with skill Canada's role as the hinge in the Anglo-American alliance. Domestically, it meant continuously walking a tight-rope to keep English and French Canadians from a disastrous quarrel. Because of that tension—which had torn the Liberal party in two in the first world war—there could be no wartime coalition government. Canada had to conduct six years of intensive war effort while party politics continued.

This situation made full demands on King's ability. But by then he had the powerful weapon, within his party and cabinet, of his own indispensability. Time and again he got his way by threatening to resign. As a result, there are in this narrative many points at which King's stuffy, pompous yet scheming nature shows at its least attractive.

These were the defects of a strangely isolated man. And that was also the real source of his much misunderstood strength. King was so successful—Prime Minister for twenty-two out of the twenty-seven years before he retired in 1948—that it has been easy for his enemies to represent him as a man determined to hold office at all costs, the archetype of the political manipulator. It was said of an earlier Canadian Prime Minister that, when he arrived at the gates of Paradise, he would immediately negotiate an honourable compromise between God and the Devil. If King's critics had thought of that, they would have left out "honourable."

But the critics were wrong. Recognising the necessity of compromise is the obvious part of the politician's art. The inveterate compromiser merely judges successfully which side has the bigger battalions, and by how much. King's greatness lay in his extraordinary resourcefulness in manoeuvring big battalions on to the side of the angels. Until he had got them there, he compromised patiently. But he knew what he wanted, and he judged with great accuracy the moment when he could act decisively to get it. And therefore he did not merely hold office longer than other Prime Ministers; he used his office to change his country far more than a less patient reformer could.

These qualities appear chiefly in the sort

THE ECONOMIST JUNE 24, 1961

of domestic politics that are a minor part in Mr Pickersgill's story. For example, we see King rallying his wavering cabinet to resist powerful business pressure and keep main-line air services for public ownership. That is an especially significant incident. The penalty of having been so successful is that King is often now regarded as a man of the Establishment, North American big business style. There was more truth in the viewpoint of the delegates who unsuccessfully—but only just—opposed his election as party leader at the 1919 Liberal convention. They said he was a socialist. As that label is still widely misused in North America, he was. That is to say, his liberalism was of a variety—egalitarian, welfare-minded, interventionist—far removed from the nineteenth-century philosophy predominant in his party when he began to lead it.

King believed that, in a country too diversified for its politics to be strongly ideological, the gradual education of his party to the twentieth century was the practical way to successful reform. It was a slow way. It required him often to conceal his views, even to lay them aside completely for long periods; it intensified the personal idiosyncrasies of a lonely man. But politically it worked, on the whole, well enough. If Canada in the 1940s and 1950s had an unusual share of the virtues of a free society, it was thanks in considerable part to the measures of political conciliation, economic management and social welfare that the King style of government fostered. But the style did not, despite Mr Pickersgill's wishful viewing, survive.

### *Queen and Pawn*

**A Tudor Tragedy: The Life and Times of Catherine Howard.**

By Lacey Baldwin Smith

Cape. 222 pages. 21s.

It is appropriate that the jacket for this biography of Catherine Howard should be in the form of a jigsaw, for Catherine was in fact the central piece in a brief game of politics that had the overthrow of the king's chief minister, Thomas Cromwell, as its prize. Her importance lies in the part she plays rather than in herself. The facts of her life are simple. She caught the king's eye at a moment when he was being forced into a diplomatic marriage arranged by Cromwell in the Protestant interest. The conservative party led by Catherine's uncle, the Duke of Norfolk, and Bishop Gardiner saw in Catherine a possible means of increasing their own influence and overthrowing Cromwell. In this they succeeded, and the execution of Cromwell and the king's marriage to Catherine followed in logical sequence.

What the conservative party did not calculate on was the fact that Catherine was known to have had a lover (the unfortunate Francis Dereham) and was singularly un-

### The shape of Shell at Interplas

Shell plastics inspire designers, conjure up new approaches and reshape old forms in excitingly fresh ways. At Interplas—the International Plastics Exhibition at Olympia, London—you will find, not surprisingly, Shell plastics and Shell people to discuss these fascinating man-made materials. Our picture shows a model of the Shell stand.

Customers for Shell plastics have the benefit of an international research and service organisation in many respects unique—plastics and chemicals pro-

duced in twenty-one centres, sold throughout the world by seventy marketing companies, inspired and supported by sixteen main research and technical laboratories. You will find all this wealth of development expressed in friendly, helpful, human terms on the Shell stand—B. 218, National Hall.

So come and talk plastics to Shell... or write for further details to the Information Officer, Plastics & Rubbers Division, Shell Chemical Company Limited, 170 Piccadilly, London W.1

## FRIENDLY QANTAS SERVICE BEGINS WHERE YOU SEE THIS SIGN

### Consult your Qantas Travel Agent for free advice on all overseas air travel

To anyone not used to them, airline timetables look extremely complicated. The man who understands them is your authorised Qantas Travel Agent. Leave the looking-up to him! If you want to get from Calcutta to Bangkok on a Sunday, he'll tell you how. Your Qantas Agent has complete and up-to-date details of Qantas jet flights and connecting services right round the globe. He knows the best route to take and the time of any flight from any part of the world. He'll book your tickets, help with documents, and if you'd like to fly on a 10% deposit with up to two years to pay the balance, he'll arrange that too. Additionally, he'll book your hotel accommodation, sight-seeing tours, or a hire car. Just say "Book me on a Qantas flight" and leave the rest to him.

AUSTRALIA'S INTERNATIONAL AIRLINE

Qantas, in association with Air India and B.O.A.O.

suited for the position into which they had thrust her. It was only a matter of time before the opposition party unearthed the early scandal (made worse by the fact that Catherine had found a place for Dereham in her household) and added to it evidence of another liaison contracted since her marriage. In spite of the fact that the ageing Henry was pathetically reluctant to believe the evidence, it was too circumstantial to be refuted. Norfolk and Gardiner dissociated themselves as quickly as possible and left Catherine to her fate.

As a subject for a biography Catherine is trivial; it is only in her setting that she has meaning. Mr Baldwin Smith's mastery of the background is so complete that his descriptions of society and politics, the court, the ramifications of the great Howard family, Catherine's upbringing in the household of her grandmother, carry the reader forward in concentrated fascination. There is only one other study of Catherine that comes near it, the fictional "Ramping Cat" by Christian Mawson with its haunting description of the Tudor police state. Mr Baldwin Smith brings together all the pieces of the puzzle, the brutality of the age, the danger of power politics, the pathetically vain and heedless queen. By making her part of her age, he has given Catherine a significance that in life she did not possess.

### Low in the Growth League

Investment and Growth in Mature Economies

By A. Lamfalussy.

Macmillan. 224 pages. 31s. 6d.

HALF of this book is about Belgium and half of it is about the theory of investment. The author, who wrote an earlier version of it as a thesis for the DPhil at Oxford, is economic adviser to a Belgian bank and lectures in economics at the University of Lille.

Belgium, like Britain, comes rather low in international league tables of growth. Another similarity is that, at least until recently, both countries devoted a relatively small proportion of their gross national products to investment. Here the similarity ends, for Belgium has rarely suffered from an excessive pressure of demand, so that labour has not been scarce even though there has been no expansion of the labour force. Furthermore, Belgian exports rose fairly rapidly in the years 1948-1957, which is the period covered by this study, while British exports unfortunately did not. Despite these differences, however, the Belgian record is not very satisfactory. Indeed, as Mr Lamfalussy points out, the behaviour of investment and the development of productivity have been rather puzzling. His purpose is to explain why.

The puzzle arises mainly because it appears that some Belgian industries which had a very poor profits record over the

period nevertheless invested quite heavily. One would expect prosperous industries to expand capacity by large investment programmes and to take resources from the industries that are doing badly. But it is surprising that there was so much investment in the less prosperous industries.

In an attempt to provide an explanation, Mr Lamfalussy devotes several chapters to the theory of investment. He ends up with a distinction between "enterprise investment" and "defensive investment." The former consists largely of introducing a large expansion of capacity to satisfy growing markets, while "defensive investment" occurs largely in response to squeezed profits and involves patching and improving existing plants rather than the construction of totally new ones. There is certainly something in this distinction and Mr Lamfalussy is right in saying that the theory of investment has neglected investment in declining industries. The distinction is not a very precise one, however, and can be formulated in everyday terms, although Chapter VII on defensive investment does provide some analysis of the determinants of this kind of investment. The trouble is that while the theoretical section of the book starts off fairly rigorously, as the argument proceeds more and more presumptions about the likelihood of this and that are thrown in. Consequently the proportion of logical demonstrations declines and is replaced to an increasing extent by mere assertions of plausibility. The theoretical section thus furnishes an account of what might happen rather than a set of testable hypotheses.

The result of all this is that when Mr Lamfalussy returns to Belgian experience in the last part of the book he is equipped to explain almost anything, and this is very nearly what he proceeds to do. For each of the nine industries for which he has figures he provides explanations of behaviour that verge upon the *ad hoc*, and then asserts that defensive investment was a large part of the total. His general conclusion is that the low pressure of demand and an unfavourable composition of exports kept profits low; this favoured defensive investment which, in turn, accounted for slow growth and low demand pressure.

The discussion is plausible, but no more. Belgian statistics are poor, which has hampered the author, who is commendably frank about the resulting limitations on his work. Thus, while he has not proved anything he has put forward some very interesting ideas and, what is more, has done so with unusual lucidity.

OXFORD UNIVERSITY PRESS

related to the aristocracy, educated at Cambridge, looking like a Governor of the Bank of England, living on income from international investment, Hyndman was certainly Britain's most bizarre socialist pioneer. His frock coat and top hat were at least as distinctive on open air platforms as Keir Hardie's famous cloth cap in the House of Commons. He never succeeded in becoming a Member of Parliament himself, although he dreamed of being chosen as Britain's first socialist prime minister. If Shaw had invented such a character he would have been accused of whimsicality and extravagance. The biography of such a man might well have engaged the attention of a great artist. As it is, Dr Tsuzuki, a Japanese scholar, has produced a careful and well documented study which is useful without ever being exciting. It is based on a number of scattered unpublished materials and on a most meticulous use of the socialist periodical *Justice*, which Hyndman and his friends first launched in 1884.

It is difficult to disentangle Hyndman's biography from the story of the Social Democratic Federation, which was his main instrument of purpose and power. Dr Tsuzuki provides much detail concerning this organisation, which in its way was as strange as Hyndman himself. It was never larger than a sect, yet it was continually being torn apart by sectarianism. It was Marxist in outlook, yet Hyndman was detested by Engels and in his turn detested Lenin. It included a number of men who

He made a fortune—you may profit from his experience.

## BOOKS

went on to found the Communist Party of Great Britain, yet Hyndman himself was a vigorous supporter of the war effort from 1914 to 1918 and even volunteered on one occasion to help the police investigate the activities of "German spy waiters" in London. It talked in tough working-class terms, yet it was suspicious of trade union initiative. All these incongruities were crowned by Hyndman himself, and Hardie was surely right to caricature the "quaint spectacle" of "a top-hatted, frock-coated member of the prosperous middle class sweating on a platform to prove his 'class-consciousness' with the poor worker."

To explain such incongruities requires endless patience and abundant insight. It also requires detailed knowledge of local conditions and of the kind of people who joined the SDF and its derivatives. Dr Tsuzuki has the patience, but he can hardly be blamed for not being able to give entirely satisfactory explanations. He offers a number, but they are not fully worked out. Hyndman was by family background and by political instinct a Tory rather than a Liberal. There was a place, although a strictly limited place, for a left-wing political organisation in Britain that was both by instinct and by design basically illiberal. The SDF filled this place. In other countries the place was an important one. Perhaps the most interesting of Dr Tsuzuki's observations relates to Germany, a country which Hyndman always disliked. The basic policy of the German Social-Democratic Party, Dr Tsuzuki suggests, was *mutatis mutandis* very closely akin to that of the very much smaller SDF, although the SDF, having no parliamentary representation, did not need to worry quite so often about the reactions of public opinion. If it had worried more about public opinion, it would certainly have been less bizarre. It would probably, however, have been forced to get rid of Hyndman.

These "ifs" seem to lie outside the logic of British labour history. The SDF itself is a footnote. Paradoxically Hyndman's continuous interest in Asia may have more abiding historical interest than his prolonged commitment in Britain. A Japanese scholar might have made more of this.

### Thuggee

The Yellow Scarf

By Francis Toker.

Dent. 227 pages. 25s.

TRANSFORMED by usage, thug has lost its original, specific meaning. Nowadays the image it conjures up is that of the brutal thief wielding a cosh. To the Victorians it had a different and possibly more sinister meaning, that of the strangler haunting the great roads of India. The thug found a place in Victorian fiction, including, it has been argued, "Edwin Drood," and like earlier brutalities thuggee took on certain

## THE ECONOMIST JUNE 24, 1961

romantic overtones. The strangling scarf (the rumal), the worshipping of the goddess Kali, the superstitions and the argot which the thugs, like other thieves before them, had developed tickled the sense of the macabre. But the plain fact is that this was murder for profit, a terror in a sub-continent used to terrors.

Thuggee went unchecked for hundreds of years, not least because the death of thousands of travellers, in a country of millions where hundreds of thousands perished in famines and pestilences, went unnoticed. In the end, the modern communications of railways and telegraphs would have killed thuggee; but, thanks to the dedicated efforts of one man, it was destroyed before the wires and lines were strung across India. Like all great detectives, Sir William Sleeman hated crime, and to destroy it fell back on the patient accumulation of fact after fact—one leading to another, one informer leading to the next. How ruthless he was it is now impossible to judge, but he has every appearance of being a just man. He deserved a biography, and Sir Francis Toker has written a worthy and pleasantly discursive one. In it, Sir Francis pays as much attention to Sleeman the Indian civil servant as to Sleeman the suppressor of thuggee, arguing cogently that it would have been better for India if Sleeman's policies in Oudh had been given a trial instead of the drastic surgery of annexation. But what emerges most clearly

## THE ECONOMIST JUNE 24, 1961

from the book is that Sleeman was one of humanity's servants. He was one of the great administrators who loved India and gave their lives to it. While it is as well to recall that, at the time Sleeman was working in Central India, the ruinous folly of the Afghan adventure was being perpetrated, the good has to be weighed with the dross.

### Londoners' London

What's Where in London: The BP  
Guide to Shops and Services

By Denys Parsons.

Kenneth Mason Publications. 114 pages.  
Paperback. 6s.

THIS is not another book about where to eat and drink. But if you want to buy bullet-proof waistcoats, aeroplanes, fountains, boomerangs, kangaroo soup, fried grasshoppers, false noses, cheese box labels; if you would like to compete with Madame Helena Rubinstein for Victoriana honours, stop a suicide, dump a baby, get your car safely home after a too-good cocktail party, take a sauna or a dry-skiing course, get rid of unwanted wedding presents, hire a detective or a jigsaw puzzle, have a lock picked at night, your ears pierced or your chest tattooed—this book will tell you a place to try in London. There must be getting on for a thousand addresses, with telephone numbers, of shops and service establishments.

If all this sounds a bit precious, there is more down-to-earth advice: such as where the handyman can go for special tools and materials and where to get repairs of many kinds done—repairs to clothing and other everyday things as well as to that antique clock and barometer bequeathed by Uncle Willy and that precious bit of Meissen given to the family by Aunt Emily. This book may also introduce the reader to some less well-known shopping streets like the pleasing St. Christopher's Place off Wigmore Street and entertain him with stories about the Portobello Road stallholders (but there is no mention of the Islington street market recently introduced to millions of televisioners).

There will be complaints that some particularly good shops and craftsmen have been left out. Send such complaints to the author. He invites suggestions and this book deserves to go into a second edition.

### Precursor of D-Day

Salerno

By Hugh Pond.

William Kimber. 256 pages. 30s.

BIT by bit the remaining chinks in the history of the second world war are being filled in. The battle of Salerno is one of these. In this wide bay south of Naples was mounted in September, 1943, the first

## BOOKS

large scale opposed landing on the continent of Europe, the precursor of the Normandy landings. But it came near to disaster. The British and American troops of the Fifth Army, tensed up for the battle ahead, heard over the ships' radios the news of the surrender of Italy. They relaxed, expecting a walkover—only to find themselves facing highly efficient German divisions, hardened in the Russian campaign. Nothing but the ferocious pin-point shelling of the Allied navies enabled the precarious beach head to be held.

Major Pond brings out well the peculiarly grim aspect of the whole Italian campaign which was already apparent at Salerno—the fact that it was fought in a highly populated country, with civilians and beautiful buildings caught helplessly between the two massive military machines. It was at Salerno that "the red hot rake of the battle line," as Churchill called it, was first thrust into the Italian soil, to be drawn remorselessly up the length of the peninsula.

This book also throws some further interesting light on the mutiny of the 192 ex-Eighth Army men, sent ashore as reinforcements at Salerno for the Fifth Army, who refused to move off the beach because they wished to return to their Eighth Army units. Their attitude has been widely excused as an excess of regimental loyalty, but Major Pond argues that another, less creditable factor was also involved. Many of the men had heard that the Eighth Army units to which they had belonged were about to be posted home in readiness for the Normandy landings, and they wanted to get back to Britain.

Major Pond tells the story of the battle in considerable detail, but the shape of the battle as a whole tends to get lost. This is partly due to one cardinal error—there are no maps other than a general sketch map in the end pages. To tell the story of any battle, maps are important. For a confused battle like Salerno they are essential.

## OTHER BOOKS

YOUNG EUROPEANS' TRAVEL GUIDE, 1961. By Peter Latham. MacGibbon and Kee. 276 pages. 21s.

This book will be of great help to young people wanting to holiday abroad at low cost and at maximum profit. The first chapters give information on youth hostels, voluntary work camps and international organisations, and the last two on group hostels and "workers abroad" respectively. In between, each country has a chapter to itself. Information is given on travel, university courses for foreigners, sporting holidays (with particulars of camps), festivals of the arts, students' hostels, and so on. Wherever possible, current prices are given. The book is well indexed.

AMERICAN SUFFRAGE FROM PROPERTY TO DEMOCRACY 1760-1860. By Chilton Williamson. Princeton University Press. London: Oxford University Press. 306 pages. 48s.

This is a scholarly study of the broadening of the suffrage in the American states before the Civil War; it challenges the Turner thesis that the influence of the frontier was responsible for the ending of restrictions on voting rights in the east.

## Famous pencil sharpener gets the sack!

"Stubby" Carver, as millions will remember him

"Stubby" Carver, the man who cut himself out a reputation as the world's finest pencil sharpener, is out of a job.

Yesterday, after 43 years as Personal Pencil Sharpener to the Chairman of Britain's largest importers of camel saddles, he was told that his services were no longer required.

The Chairman has bought himself an electric pencil sharpener.

"Zum noo-fangled gadjit" was Stubby's description of it.

But the Chairman told our reporter: "It's fantastic, Sir. Entirely automatic, y'know. Not even a switch to press. You simply dip your pencil in, hold it there just a couple o' seconds, and you've got a perfect point."

"It's an immaculate-looking instrument too (not like old Stubby!). Self-contained... no flex trailing about. Looks extremely smart on me desk."

Stubby's dismissal is causing consternation in the pencil sharpening trade, and a Union meeting has been called for tomorrow to "ascertain the seriousness of the situation."

Meanwhile, businessmen all over the country were today sending their secretaries out to buy Kent Kordless Electric Pencil Sharpeners. It looks as though automation is here to stay!

Studley, Warwick.

## SPENCE CHEMICALS FOR EXPORT

PETER SPENCE & SONS LTD • WIDNES • LANCASHIRE  
London, Bristol & Glasgow

A MEMBER OF THE LAPORTE GROUP

Whether it is catalysts for oil refining, aluminium sulphate for paper making and water purification, or organic titanium compounds for the paint, plastic and textile industries, Spence chemicals are playing an important part in home and overseas markets.

Further details of our full range of products are obtainable on request.

# AMERICAN SURVEY

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

## Protection Against Protection

WASHINGTON, DC

**A**LTHOUGH the major battle over foreign trade is still a year off, the Kennedy Administration is already involved in skirmishes on minor issues. The showdown will come next summer when once again it will be time to renew the basic code that regulates trade policy. This is the Trade Agreements Act of 1934, the law that transferred the power to regulate tariffs, within specific limits, from Congress to the President, and authorised him to negotiate with other countries for reciprocal reductions. This system, which replaced the 1931 Smoot-Hawley legislation, the highest and last specific tariff Act, has stood ever since, although there have been many amendments as it has come up for its periodic renewals. These amendments, largely the result of intense pressures from various industries seeking protection and from Congressmen who sympathise with them, have made an unholy tangle of American trade legislation.

On the one hand, the law has been widened to enhance the President's authority by giving him additional percentage margins within which he can negotiate further cuts in duties. On the other hand, his authority has been restricted by the introduction of procedures whereby an industry can appeal against reductions made by the President, if it can prove that these bring injurious competition from abroad. While protectionist-minded Congressmen and industries have nothing but scorn for the protection actually afforded them as a result of the way in which succeeding Presidents have administered the Act, economic liberals consider that the restrictive amendments have made the Act unworkable as an instrument of modern trade policy. So the battle takes shape. The protectionists talk of diluting the President's authority still more, while the Administration and the liberals talk of something "all new," such as power to cut tariffs across-the-board for purposes of negotiation with the world's new trading groups, aid from the federal government to help injured industries to adjust themselves to new ways of making a living, and the placing of tariff protection (if any) on a self-terminating basis.

There have been several attempts to probe the atmosphere for liberalisation of trade in this year's session of Congress. One failed and two others are starting. The failure was an amendment to the depressed areas Bill which would have given special aid to districts where economic distress could be traced to competition from imports. This was a try-out of the "trade adjustment" scheme that the liberals hope to insert into the 1962 trade law. But rather than spoil next year's plan with a partial substitute, and rather than risk this year's depressed areas programme by a fight over foreign trade, the amendment was excised.

Other moves and counter moves have been made in congressional committees. A subcommittee of the House of Representatives has started a summer-long series of hearings on "the impact of imports and exports on American employment." The subcommittee's membership is so much slanted to the side of protection that the group intentionally picked a liberal professor as its staff director. They started their inquiry, into coal and competitive fuels, last

Monday. On the following day, as if in quick rebuttal, a subcommittee of the Joint Economic Committee of the House and Senate announced the appointment of two nationally-known personalities, Mr Christian Herter, the former Secretary of State who made his name in Congress fifteen years ago with a study on the postwar need for foreign aid, and Mr Will Clayton, who was Under Secretary of State for economic affairs at that time, to make a report on foreign economic policy by October 1st. These studies will produce no law but will provide ammunition for the contestants for next year.

There are more immediate issues arising either from the old trade law or from challenging developments around the world. Already President Kennedy has turned down recommendations from the Tariff Commission for higher duties on two kinds of cord, and now he is faced with three more such requests affecting mosaic tile, baseball gloves and flat glass. Each is terribly important to the manufacturers concerned, and thus a terrible headache to the unhappy officials who must decide them. More cases are in the offing, but the important cases are not—indeed they rarely are—matters for the Tariff Commission: they concern the chronically depressed textile and lead-zinc industries. The Kennedy Administration has not yet devised a way to quiet the prolonged agonising of either one but for both it holds out hope in a new approach, through multi-national agreements.

The textile industry was recently invited by the President to lay its case for protection before the government authority of its

**T**HE Department of Commerce is determined that there shall be no slackening of the recent improvement in sales of American goods abroad; the growth in exports in 1960, which has continued this year, is one of the main reasons why the balance of America's international payments is no longer a matter of immediate concern. To assist industry to expand exports

still further is the purpose of the trade centres being set up under the sponsorship of the United States government in various countries. The first opens next week in London, very suitably since Britain buys more American goods than any other country except Canada. It will be a permanent showroom for American products and a source of information, contacts and encouragement for would-be American exporters and would-be British importers.

The articles which will be displayed to buyers for British shops, but only incidentally to the general public, will be chosen because they offer something different from those produced in this country. The opening display will be of household goods—everything for the kitchen, bath, patio and laundry room—and will be followed by other exhibits devoted to those categories of American goods which are thought most likely to succeed in Britain. The centre will also help to promote increased travel to the United States.

choice; it chose to go to the Office of Civil and Defence Mobilisation, which deals with appeals against tariff reductions based on claims that the "national security" is being threatened by imports. The invitation was not intended to be an open-handed offer of the protection the industry seeks (though the Administration was pleased to have the industry pleased with the prospect); rather it provides a club in the closet, an "either-or" proposition meant for consumption abroad. Either the nations will agree to help each other with the problems of this industry (which is rated as "basic" in America) or the United States will help itself. (In fact, only one industry has received protection so far on national security grounds—oil, the industry for which this excuse was written into the law.) Mr George Ball, the travelling Under Secretary of State, has arranged a much advertised conference in Washington this week of countries which import textiles. In preliminary talks, low-cost producers in Hongkong are being asked to cut exports to the United States by 30 per cent, and other industrial countries are being requested to siphon off more of the abundant supply of textiles from less-developed countries than they have done so far. A formal agreement on cotton textiles between producing and consuming countries is to be discussed later in the summer; wool and silk will be taken up at a still later date.

Lead and zinc form part of the "commodity problem," the problem of underdeveloped economies dependent on one natural resource—or a few—which are producing too low an income, at present prices and rates of sales, to sustain the necessary growth of the economies concerned. Domestic lead and zinc interests are active in promoting a Bill now before Congress which would subsidise small mines. The Department of the Interior evidently wanted to support the Bill, but the White House refused. No international conference on lead and zinc, as such, is planned, but there is a new official willingness to talk about international commodity agreements.

The willingness is generated primarily by the over-supply of coffee, and of sugar, and the effects of this on Latin American countries. But at present the United States wants to maintain

an open position, uncluttered by new protective devices, particularly as it prepares for the first session of the "Alianza Para Progreso" in Montevideo, which is to foster social and economic development in the western hemisphere. All that officials will admit that they have in mind is to enter into discussions with other countries; they do not know exactly what is in store, but feel sure that it is something worthwhile.

The commodity problems of the underdeveloped countries tie in, of course, with the new regionalism among the developed. Europe's "Six" have been told that the United States opposes any freezing out of Latin American products in favour of the former African territories of the members of the European Economic Community. On the common market, the United States has two positions. For the world to hear, it urges passively that Britain become a member provided that this does no violence to the aim of political integration. For the ears of the interested parties, the United States is "pushing like mad" (to quote one official) to get Britain in for political reasons.

The Kennedy Administration has enjoyed two pieces of good fortune in its wrestlings with international economic issues. Both the crisis in the balance of payments abroad and the recession at home "bottomed out" soon after the President was inaugurated. The bottom is not the end of such difficulties, but it is the end of mounting pressures to do something drastic. The forces working for protection are powerful even without the pressures of a slump in jobs and an outflow of gold to reinforce them. But, however powerful they may be, the Kennedy Administration is looking outward toward liberalisation, not inward towards restriction.

## TNT in Washington

WITH President Kennedy's firm message to Mr Khrushchev last Saturday making it clear that in his opinion the Soviet Union is no longer interested in concluding a treaty banning nuclear tests and with the recall of Mr Dean, the leader of the American delegation at the negotiations, it is being taken for granted that it is only a matter of time until atomic testing is resumed in the United States. To assume this, however, is premature. Apparently the Americans have not yet even completely rejected the Russian proposal that negotiations on a test ban should be merged with those on disarmament which are being discussed with Russian representatives in Washington this week. The presumption is that the United States will not itself break off the negotiations on a ban, even if it undertakes nuclear tests. The procedure is likely to be "test 'n talk"—the TNT approach—accompanied by constant efforts to explain to the world that the refusal of the Russians to co-operate must be blamed for the resumption of testing.

The recall of Mr Dean from Geneva has two purposes: firstly, to warn the Russians of the nearness of a breakdown in the conference, without incurring world opprobrium by a premature withdrawal; secondly, to check the growing agitation in the United States for a resumption of tests while the domestic and foreign implications of such a resumption are being assessed. While the balance of opinion in America is shifting, at present it favours a continuance of the existing unpeliced moratorium on tests. Resumption is still firmly opposed by the President and his scientific advisers, by the Cabinet and by the State Department and also by American Ambassadors to India, Japan and other countries who feel that the effect of renewed testing of goodwill towards the United States would be deplorable, especially after the Cuban intervention. Favouring resumption of tests, but not of indiscriminate ones, are many defence chiefs, many leading scientists and above all Congress's influential Joint Committee on

## New Look at Credit

FROM A SPECIAL CORRESPONDENT

THIS week the Commission on Money and Credit made public a 300-page report which took almost three years and over \$1.3 million to produce. It has been hailed as the first full-scale examination of the American monetary system since the investigation fifty years ago by the National Monetary Commission which recommended the formation of a central bank along regional lines and is regarded as the progenitor of the present Federal Reserve System. But it is doubtful whether the new commission will gain as notable a reputation, simply because it is fairly content with the way things have worked. It finds no need to propose any basic "overhaul of our financial structure," but concentrates on reform through a great many small changes.

Moreover, unlike its predecessor, the present commission has no governmental standing. On the contrary, it was established only after Congress (which could not agree on who should conduct the investigation) refused to approve President Eisenhower's request for an inquiry by a group of private citizens. Instead the Committee for Economic Development, a non-partisan association of forward-looking businessmen, with the aid of a grant from the Ford Foundation, selected twenty-five citizens with varied backgrounds—in labour, commerce, banking, government and farming—to carry out an independent study.

The report reflects the size and diversity of the commission which on many controversial issues either failed to reach a consensus and suggested further study, or else favoured the obvious compromises. The document lacks the cohesiveness of the Radcliffe report which, whatever its faults, provided a new insight into the workings of the British monetary system. The American study ranges over a great many areas—monetary policy, fiscal policy, the public debt, private financial institutions, government credit programmes, international monetary relations—and had the benefit of over 100 separate projects undertaken by its research staff. But the study suffers from its piecemeal nature; the parts are somehow better than the whole.

NEVERTHELESS, its major conclusions are logical and constructive; they call for greater centralisation of the Federal Reserve System with the aim of transforming it into a wholly unified central bank and for greater co-ordination between the Fed and the White House in the formulation of national economic policy. And many of its recommendations for improving the private financial system are bold enough to provoke opposition from specific groups which would be affected if the commission's proposals were to be adopted. For it wants to see a relaxation of the state barriers against branch banking, something which is regarded as heresy by independent unit banks; liberalisation of in-

vestment policy for banks and other savings institutions, which would hit the investment trusts; equality of taxation as between savings institutions and commercial banks, which is opposed by savings banks and savings and loan associations; and regulation of corporate pension funds, which would naturally prove unpopular with the managers of these funds.

Even though the commission had an orthodox and conservative majority, it recommended a closer relationship between the Executive Branch of the government and the central bank, something which has been stoutly resisted by many on the grounds that the Fed must enjoy complete independence. The commission did not engage in a frontal attack on the central bank, which in the last few years has acted as if any change in its status would be disastrous, but the report suggests that co-operation is more important than independence which, in any case, cannot be absolute.

In taking this position the commission makes plain its view that monetary policy is too important a weapon in the arsenal of economic stabilisers to be left to a group which is completely insulated from the electorate; it thinks that the central bank must be responsive to the President, who is charged with formulating economic policy as a whole. The study is not very explicit about how such co-ordination should be achieved, but it thinks that closer and more formal ties should replace the rather loose arrangements that now exist. For example, it suggests that the President, at the beginning of his term, should have the power to appoint a new chairman of the Federal Reserve Board. Thus the commission appears to be seeking a central bank in which the traditional American trappings of independence would be combined with the instinctive responsiveness of the Bank of England.

The report also urges that control over the tools of monetary policy should be concentrated in the Federal Reserve's Board of Governors in Washington, which it thinks should be reduced from seven to five members. The commission would also definitely

deprive the presidents of the twelve regional Federal Reserve Banks, including the powerful one in New York, of the important powers which they now possess over both open market operations and the discount rate. The commission is critical of the "bills

only" policy that the Fed pursued during most of the nineteen-fifties and endorses the current practice of trading in government securities of all maturities; it also suggests that changes in the discount rate should be uniform all over the country because regional differences have virtually disappeared.

The commission was split over the issue of supplementing the central bank's general controls over credit with specific controls, over consumer credit, for example, although it notes that its present weapons tend to discriminate against certain classes of borrowers. While the report recommended that all commercial banks should be required to become members of the Federal Reserve System (about 7,000 are now outside it), it rejected the idea that the central bank should be given powers over non-bank financial institutions, whose rapid growth has caused some concern.

IN reviewing the relation of monetary policy to the problems of debt management and fiscal policy the commission's ambivalence is particularly noticeable. On the one hand, it takes a conservative and almost passive approach, calling for a halt in the shortening of the maturity of the public debt before this becomes an unsettling and potentially inflationary factor. On the other, it adopts a very liberal stance in favour of planning contracyclical expenditures on public works over a five-year period. It would also permit the President to make temporary changes in the rates of personal income taxes, if Congress did not object. The commission considers that changes in the tax structure are outside its province, but it feels that the ability to make moderate changes in the rate of tax on the first \$2,000 of income—which is now 20 per cent—would reinforce discretionary control over the supply of money and help to attain the three goals of economic policy: low unemployment, stable prices and an adequate rate of growth.

The commission takes the position that monetary policy should be concerned primarily with domestic conditions, although it recognises that the deficit in the balance of payments may exert a restrictive influence. It does not feel that monetary policy has a major part to play in curbing this deficit and its only suggestions are that the gold reserve requirement should be eliminated so that the entire gold stock will be available for international settlements and that new multilateral arrangements should be made to deal with potential crises of foreign exchange. Apparently the commission arranged its work before it became aware of the importance of the international financial situation so that its treatment of this field is cursory if not actually casual.

It is difficult to assess the eventual impact of the commission's report. The general tenor of the recommendations, particularly its appeal for greater executive responsibility and for increased co-ordination in the use of economic stabilisers, should be welcomed by the Kennedy Administration. But the large number of its recommendations and their very moderation may tend to encourage inertia, rather than action, in Congress.

Atomic Energy, headed by Representative Holifield, a liberal Democrat.

The probability is that the Russians still have more to gain technically from a resumption of tests than has the United States, but the final decision will turn to a great extent on whether there seems to be conclusive evidence that the Russians have been conducting tests secretly during the moratorium. If the United States does resume testing Mr Holifield proposes that all tests should be underground, thus eliminating radioactive fall-out and that experiments to improve methods of detecting underground explosions should come first and be followed by demonstrations of the peaceful uses of atomic bombs; preparations would be made for tests of weapons, but these would not be begun until the President determined that they must be. But underground tests and tests of peaceful uses would not satisfy the defence experts who argue that it is essential to detonate nuclear warheads under military conditions if the United States is to have the full benefit of the latest advances in weapons.

## Unfair Exchange

DR CASTRO is being as kind to the Republicans in the United States as he is cruel to the imprisoned Cuban invaders whose hopes of being returned to their friends in Florida he has dashed. For the Republicans insist that his offer to exchange his prisoners for tractors was a blackmailing attempt to force the United States to pay him tribute which should never have been considered, particularly not with encouragement from the Administration. Now Dr Castro has provided the Republicans with more ammunition. When representatives of the private American committee which is handling the exchange arrived in Havana last week to arrange the final details—there had already been preliminary discussions—they found that he was not prepared to accept the 500 farm tractors valued at about \$3 million which they were empowered to offer. He stood firm on his original proposal of 500 bulldozers which the committee had already refused to give because they would be useful for military as well as agricultural purposes. In that case, Dr Castro said, he must have ordinary tractors of an equivalent value—\$28 million according to his calculations; he also reduced slightly, to 1,173, the number of prisoners which would be freed in exchange by withdrawing a few of the more important ones from the bargain.

The committee has now refused to send anything but 500 agricultural tractors and has given Dr Castro until this Friday (after *The Economist* has gone to press) to answer this ultimatum; he is expected to reject it. Quite apart from the unsuitability of submitting to what looks like extortion, particularly when Dr Castro insists on calling it "indemnification," the committee is very doubtful whether it can raise such a large sum. Contributions have been pouring in, but they are not to be opened unless there is a satisfactory agreement with Dr Castro. Meanwhile the Republicans in Congress have objected to such contributions being free from taxation and the committee is being charged in the courts with violation of the Logan Act which forbids private American citizens from treating with foreign governments.

Nevertheless the committee's decision may not be the right one. It is in effect a refusal to pay the price of human lives, of freeing prisoners and raising Cuban living standards. The ultimatum will weaken the good impression made in Latin America by the willingness of individual Americans to try to undo some of the harm done by their government's encouragement of the abortive Cuban invasion. But whatever happens Dr Castro comes out of the affair badly. His cynical readiness to equate men with machines repelled many whose sympathies will not be regained by his attempt to wriggle out of the offer now that he realises that it was a mistake.

## Striking Foreign Flags

Mediator in the Middle

CONFLICTING interests which divide both the shipping companies and the six seafaring trade unions complicate the settlement of the strike which broke out last week along all three coasts just as the holiday traffic was reaching its peak. A particularly strange example of cross-purposes was the one-day strike of the supposedly sympathetic dockers in New York which involved foreign vessels for the first time in this dispute. Ostensibly it was called to clarify the issues, but in fact the dockers are angry because they are bearing so much of the brunt of the strike and Mr Curran, the head of the National Maritime Union, one of the two chief unions involved, hastily urged his "gallant allies" to return to work. The big issue, at least, is something on which both the NMU and its rival, the Seafarers' International Union, are agreed: the right to organise American-owned ships sailing under so-called "flags of convenience"—mostly those of Liberia, Panama and Honduras. There are over 500 of these ships and about 450 belong to firms which have contracts with trade unions in the United States.

THE great attraction of foreign registry is of course lower operating costs—particularly wages—and taxes. The trade unions want to reduce this attraction so that there will be less incentive for owners to "run away" at the expense of American seamen's jobs. The shipping companies insist that this issue is not negotiable and indeed that it is legally beyond the pale. But the firms which fly no foreign flags are understandably less adamant than those which do—mostly ones operating tankers and ore-carriers. Some are quite prepared to give way. It is doubtful, moreover, whether the employers are on very firm ground. Recent rulings—from the Supreme Court itself—have upheld the jurisdiction of the National Labour Relations Board over workers on American-owned ships registered in other countries. The unions, on the other hand, are split over subsidies. The NMU, which supplies men chiefly to ships which receive federal subsidies, fears that there may be a tax-payers' revolt if subsidies are extended to tankers, the ships which the SIU and its affiliated unions man.

The Administration, which tried in vain to postpone the strike, may in the end have to resort to an 80-day injunction under the Taft-Hartley Act if the stoppage begins to cause great economic havoc. But this may not be very soon. The strike was long foreseen and stocks are high. Many ships were at sea; so far only about 130 of the nearly 1,000 which may be affected have actually been put out of service. Finally American ships carry only about 12 per cent of the bulk cargo passing through American ports and 35 per cent of the general cargo. All the oil, however, moves in American bottoms. There are good stocks but if the strike drags on conceivably the picketing of refineries and of supplies at the docks might be decisive.

Men who buy well,

buy **DICTAPHONE** TIME-MASTER

Men who value quality and service are the men who buy Dictaphone Time-Master, because the transistorised Time-Master is the quality dictating machine. It's a precision instrument designed to save time for a man whose time is valuable.

Dictating with Time-Master is as easy and pleasant as normal dictation to a secretary, but

it is much more convenient and time saving. No matter where your secretary may be, you simply speak, and immediately your thoughts are on permanent record. Time-Master has these unique advantages because only Time-Master has the DICTABELT record.

The Dictabelt recording is permanent and visible, ensuring complete safety from acci-

dental erasure. Reproduction is crystal clear and placefinding is instantaneous.

Dictaphone Company Limited, 17-19 Stratford Place, London W.1. Tel.: HYDe Park 9461. Branches throughout the British Isles

The words DICTAPHONE, TIME-MASTER and DICTABELT are registered trade marks.

# COAL helps BULMER'S Woodpecker Stay Top of the Tree

'BITTER-SWEET' apples cared for in the sun-tanned orchards of the West Country... that's how cider, one of the traditional drinks of England, is born. From the succulent juice of these apples Bulmer's blending experts, skilled in the art of cider making, produce the sparkling, refreshing taste of their famous Woodpecker cider. Today this popular cider is enjoyed by the young at heart all over the world.

The men who control the policy of this company choose coal to provide the steam power at the world's largest cider works in Hereford. They know that coal, fired automatically and burned smokelessly, gives maximum efficiency at the most economical cost; that supplies of this home-produced fuel are assured for generations to come.

If your voice is a deciding one in the question of fuel, remember Bulmer's. You could well follow their example and see how coal satisfies a thirst for progress.

Here are some key facts and figures about the consumption of coal at Bulmer's Hereford Plant:

|                         |                             |
|-------------------------|-----------------------------|
| Number of boilers       | 3 shell type                |
| Method of firing        | chain grate stokers         |
| Steam pressure          | up to 160 p.s.i.            |
| Steam temperature       | 341°F. and 370°F.           |
| Max. continuous rating  | 28,000 lbs of steam per hr. |
| Annual fuel consumption | 5,500 tons of coal          |

## Hold-up over Schools

THE Rules Committee of the House of Representatives, whose power to hold up legislation was supposed to have been checked in a historic battle at the beginning of the session, was back in its old form this week. By a vote of 9 to 6 it decided not to clear the Bill providing federal aid for tax-supported schools, which it has had since May, until another Bill, providing aid for private—and particularly for Roman Catholic—schools comes forward from committee. Two Roman Catholic Democrats deserted their liberal colleagues to vote with the two reactionary Southern

Democrats and the five Republicans who dislike aid to schools on principle. This move may have no other purpose than to ginger up the dilatory House Labour and Education Committee; it seems to be having this effect. But it has made Mr Rayburn, the Speaker, and Mr Powell, the head of the Labour Committee, publicly gloomy about the prospects of the conservative House following the example of the Senate, which voted a month ago to approve federal aid for schools totalling \$2.5 billion over a period of three years.

Early this year the Roman Catholic hierarchy announced that it would oppose aid to tax-supported schools unless aid were also provided for the 5 million children in the parochial schools, which

## How Safe in the Air?

FROM A SPECIAL CORRESPONDENT

IN some ways it was perhaps logical for the Senate Aviation Subcommittee to decide, as it apparently has, against issuing a report which would summarise and analyse its investigation into safety in the air. Senator Monroney, the chairman of the subcommittee, said at the outset that he hoped to limit the investigation to a small number of technical questions. It was also made clear that this year's public hearings were intended mainly to bring the record of last year's investigation up to date—and last year the subcommittee decided not to issue a report.

Yet there is good reason to question the judgment of the subcommittee in electing to pass over 1960's record on air safety without comment. In fact, there are 500 good reasons. This is the number of people who were killed last year in accidents to commercial aircraft. Counting all the passengers, members of crews and bystanders who were killed, 1960 was the worst in history for America's airlines. The tale is better this year; so far there have been only two fatal crashes which killed eight people.

Yet at the hearings none of the Senators who attended from time to time asked a single question of the representatives of the Air Transport Association, the principal trade association of the commercial airlines, which put into the record a chart (reproduced below) that purported to show a steadily declining death rate. This particular bit of evidence is a perfect example of the kind of self-serving testimony which was offered so freely during the hearings by a number of witnesses from the industry. With this chart the ATA was able to make it appear that the accident rate on the commercial airlines, which had been getting worse for the last four years as aircraft have been getting bigger, was getting steadily better.

At the bottom of the chart the ATA noted that the source of its figures was the Civil Aeronautics Board. In a sense this was true. But the ATA made some changes in them. It eliminated all accidents that did not involve scheduled

operations. Thus the charter flight which crashed on take-off at Toledo, Ohio, last year, killing 20 undergraduates, was not counted at all. The ATA also eliminated all deaths among crews and all deaths of people on the ground. Thus for 1960, where the CAB lists 500 deaths (including one caused by a ground employee walking into a propeller) the ATA cut this to 336. Still, it was hard to get away from the fact that for the past three years the death rate had been rising sharply. So the ATA, following a standard practice of the airlines, divided the number of deaths by the total revenue passenger miles flown to obtain a rate which allowed for the fact that more people were flying more each year. But the figures still rose steadily.

### DOMESTIC SCHEDULED AIRLINES (ATA Calculation)

|                                            | 1957 | 1958 | 1959 | 1960 |
|--------------------------------------------|------|------|------|------|
| Actual Deaths                              | 30   | 113  | 211  | 336  |
| Deaths per 100,000 revenue passenger miles | 0.12 | 0.45 | 0.72 | 1.10 |

To get around the fact that the accident rate has been rising in spite of the creation of the Federal Aviation Agency, with almost unlimited money and power to make flying safer, the figures were then averaged over periods of five years and these averages were plotted. Because the death rate was so low in 1957—ironically this was the year when Senator Monroney and the airline industry worked so hard to establish the FAA to solve the growing problem of air safety—the average for the period from 1956 to 1960 was slightly lower than the average for 1951 to 1955.

Yet there is ample evidence in the nearly two thousand pages of testimony to support a scathing report on the progress toward air safety—or the lack of it—if even one Senator wanted to look seriously into the question. The full statistical record on aircraft accidents was put into the record by the CAB, though only as part of the appendix. Some serious charges were made—and passed over. A spokesman for the operators of business aircraft, for example, charged that the

CAB is ignoring its legal responsibility to find out "what will best tend to reduce or eliminate the possibility of, or recurrence of, accidents".

United Air Lines presented a complaint against the FAA, charging that the control of air traffic was careless and faulty, and that this resulted in the mid-air collision last December between a UAL jet aircraft and a Trans-World Airlines propeller-driven airliner. The FAA denied this charge and warned the subcommittee that if it probed into this question it would be, in effect, trying to determine the "probable cause" of the accident—which under the law is the job of the CAB.

If any of the Senators on the subcommittee needed a sign from on high to stimulate him, it was provided by a fatal crash which occurred the evening before the two weeks of hearings started. This was the accident which killed both the pilot and the co-pilot of Vice President Johnson's private Convair 340. Since this was a "business aircraft" it will not be counted among this year's accidents to air carriers. Because the CAB is investigating the crash the subcommittee did not make any inquiry of its own. Nor did it look into the two fatal air accidents which occurred earlier this year. The first was to a cargo aircraft which crashed in Texas, killing the two members of the crew. The other was to an American Airlines Boeing 707 which dived into the water on a training flight off New York. A crew of six was aboard; all were killed. Yet according to the ATA the air safety record so far this year is a perfect one.

## THE WORLD OVERSEAS

Mr Fleming's words

on Tuesday he presented a budget that relies almost entirely on reducing the exchange value of the Canadian dollar by market operations. When he admitted later that the Canadian dollar at a "substantial discount" would mean increased interest cost to provincial governments and to companies who had borrowed in New York, he was asked whether this was the wages of sin. "You would know more about that than I would," he replied. Mr Fleming has a way of surrounding himself with a cloak of righteousness; this is one of the areas of stiff competition between him and his prime minister, Mr Diefenbaker. After listening to his budget speech a Liberal critic, Mr William Benedickson, was moved to quote Professor Galbraith's remark that unctious even buttressed by pomposity is no substitute for good evidence.

Mr Fleming evidently took almost as much persuading that he should use the exchange fund to lower the value of the Canadian dollar as he took to ask for Mr Coyne's resignation last month. His reluctance to take either step is very understandable; he had repeatedly asserted Mr Coyne's complete right to say what he thought, and when he presented his 1960 budget on March 31st last year he had declared emphatically that the use of the exchange fund to drive down the dollar was a "gigantic financial speculation with no assurance of success." The present circumstances are, he says, quite different. But he is not specific about what these differences are. He rejected any suggestion of further tax measures to reduce the capital inflow, though it is known that he hoped and believed that his small changes in the withholding tax last December would bring the dollar down much more than in fact they did.

Mr Fleming seems to be relying on the tone of his comments on foreign investment to curb the inflow of foreign funds. There were passages in former budget speeches warning the country against the danger of excessive reliance on foreign capital, but they were always accompanied in adjacent paragraphs by soothing assurances designed to ensure that no foreign investors were in fact discouraged. The same mixture was there this week, but with a subtle change of emphasis that brought Mr Fleming perceptibly nearer to Mr Coyne's position. Both in his budget speech and in his later press conference, Mr Fleming loosed the most vigorous denunciations of Mr Coyne that he has yet made. This increased vigour was necessary because so much of the budget appears both in word and action to be a direct echo of Mr Coyne's own speeches and proposals. The biggest remaining difference between the two points of view seems to be that Mr Fleming has been converted to the view that budget deficits are a good thing. This is not

### Canada's Cloudy Budget

FROM OUR OTTAWA CORRESPONDENT

MR DONALD FLEMING, Canada's finance minister, is doubly assured of a place in Canadian history. On May 30th he made an unsuccessful attempt to persuade the governor of the central bank to resign, and

unexpected, since his budget deficits over five years now total more than \$2,000 million—if one accepts his estimate that this year's deficit will be between \$600 million and \$700 million. Mr Coyne's proposals, submitted to the minister of finance in February and published by him on the eve of the budget, emphasised the need to balance the budget and suggested a time limit of two years.

Another difference, stressed by Mr Fleming, concerns the level of interest rates. Mr Coyne argued that interest rates had no deep economic effects and anyway could not be set by the Bank of Canada. Mr Fleming made a somewhat flamboyant promise to bring them down, perhaps relying on the new confidence of the financial community once Mr Coyne is finally ousted. But at the same time he announced total cash requirements of \$1,000 million in the present fiscal year—without counting any of the extra money that he may have to raise for the exchange fund's new operations. He used almost the same words as Mr Coyne in rejecting the idea that interest rates should be reduced by an "irresponsible expansion of money supply," but he seemed to promise that it could be achieved once he got his new governor in the Bank of Canada. Mr Fleming was confident that the short-term business cycle is now heading upwards, and he dared to prophesy that by the end of 1962 tax revenues at the present rates would balance expenditure (presumably also at current rates). But he said frankly that this upturn was unlikely to reduce unemployment to a tolerable level without the incentives which his budget provides.

The minister's statements on trade and tariff policy were equivocal, especially when referring to the recommendations of Professor Bladen's one-man royal commission on the automobile industry, which recommends, among other things, putting a tariff of 10 per cent on British cars. The government commends these proposals for public study. Equally equivocal was Mr Fleming's brief reference to Britain's negotiations with the European common market. While insisting that the Commonwealth trading system, of which "the keystone is free Commonwealth access to United Kingdom markets," should be preserved for political as well as economic reasons, Mr Fleming acknowledged his full awareness that Canada's interest lies in discovering the best possible "mix" of tariff arrangements with both Britain and the Six. The government has not yet decided what that mix may be, but it is searching.

This was not the sunshine election budget many people had expected. It leaves Ottawa more uncertain than ever of where Mr Diefenbaker's government is heading in the next few months. It is quite possible that this uncertainty embraces ministers of the crown as well as members of parliament and, of course, parliamentary reporters.

Mr Coyne's echoes

## Potato Poujadism

FROM OUR PARIS CORRESPONDENT

By parading their tractors in the towns, blocking some of the main roads and invading both railway stations and town halls, Breton farmers have dramatically drawn attention to what is euphemistically described as the peasant *malaise*. This is not a new illness. The second phase of France's industrial revolution, which has been going on since the end of the war, includes the modernisation of farming techniques; the inevitable result is that some marginal producers are being squeezed out, and every year some 100,000 Frenchmen migrate from the country to the towns. For a time this process can go on quietly. But it only needs a sharp drop in the price of some agricultural commodity to generate a disturbance. The political structure of the Fifth Republic encourages social unrest to take a violent rather than a parliamentary form.

About one-fifth of the French population still get their money from farming. Statisticians disagree on the actual share of the national income that goes to the farming community, but they agree on two things: it is proportionately low, and it has been declining since the war. Despite the movement to the towns and the striking increase in farm productivity, personal incomes in France, as in many other countries, have risen much more slowly in the country than in the towns. These are the roots of the peasant discontent that, from time to time, breaks surface.

That it should now break out in Brittany is not surprising. The 2.3 million inhabitants of Brittany's four departments (Côtes-du-Nord, Finistère, Ille-et-Vilaine and Morbihan) live in one of the most populated rural regions of France. The last census in 1954 showed that 37 per cent of Bretons derive their income directly from agriculture, compared with a national average of 22 per cent. Intensive methods of farming have not, so far, prevented an exodus from an area where family smallholdings are the rule, and, year after year, over 20,000 young Bretons have to seek their fortune outside their province.

M. Pleven, who has twice been prime minister, has just published a tract on the future of Brittany that sums up Breton grievances. The gist of his argument is that the government's attempts to relieve Brittany's disadvantages have only reinforced them. The handicap of being so far from the main centres of consumption has not been overcome by a relatively poor network of railways and roads. The lack of proved mineral resources is made a worse disadvantage by the relatively high cost of power. Not enough has been done for education in a region that is known for its respect for learning, so that the young people who stay on the land are not properly instructed in new farming methods, while those who leave tend to swell the ranks of Breton maids and unskilled labourers. Natural outlets, such as fishing or tourism,

even if properly developed, would not be able to absorb the surplus of the agricultural population. Industry, it seems, is the solution, and, M. Pleven insists, the government has not done enough to industrialise the area: the decision to shift the Citroën works to Rennes is cited only as the exception confirming the rule. M. Pleven pleads with the government to revise its policy of regional decentralisation so that Brittany should not become part of a "French desert" that is in danger of being abandoned for the sake of expansion in the Paris area and in the north-east.

Breton peasants have tried to improve matters by raising their yields and by experimenting with new agricultural products. But the price support system is more helpful to the large-scale producers of, say, wheat or sugar than to smallholders producing eggs, poultry or early vegetables, all of which are particularly vulnerable to market changes. A glut of artichokes provoked a disturbance last year, and a surplus of early potatoes has precipitated the present outburst.

The unrest is now spreading from Brittany to neighbouring agricultural areas. In some respects this peasant resistance of the nineteen-sixties is reminiscent of the *poujadist* movement of the nineteen-fifties. Both movements are rearguard actions against concentrated production and market forces; and both signify the refusal of the small to be devoured by the large in the name of economic progress. But the parallel should not be overdrawn. The wrath of the *poujadist* shopkeepers was largely directed against those modern giants of trade, the chain and multiple stores. French landowners, on the other hand, have been more successful in preserving a united farming front. The fact that this *jacquerie* was staged with tractors, not with scythes, is significant; so is the fact that it is mostly organised, and efficiently, by young men belonging to farming unions. The shopkeepers hoped to arrest an economic trend; many of the farmers, particularly the young ones, hoped to survive by swimming with the tide, and so bought tractors and other equipment on borrowed money. Then came the surpluses and their incomes fell. These young farmers, many of them heavily in debt, seem to be the vanguard of the present movement. They are angry with the government for its failure to provide outlets for their surplus products and for its failure to streamline the channels of distribution. Possibly some advocates of French Algeria are trying to make use of this movement (if only to keep the police busy outside Algeria), but their influence, at least for the time being, is slight.

THE government's emergency measures, including the export of surplus potatoes to Algeria, help for poultry breeders and the building of an *autoroute* from Chartres to Le Mans, may quieten the present unrest, and so allow a breathing space before a fresh explosion. But one consequence of the Breton alarm will be international. French farmers have always hoped that the common market would provide outlets for their surpluses. In the present climate a French government cannot accept an accelerated application of the Rome treaty without agreement on a common agricultural policy. Since the Germans cannot be expected to agree to any concessions before their general election, a decision on the speeding-up process may be postponed at least until the end of the year.

The lesson, for France, is political. M. Pleven last week appealed to the Breton farmers, now that they have stated their case so theatrically, to leave the rest to their elected representatives. But it was the ineffectiveness of the deputies that was partly responsible for this outburst. It was only after the farmers' own demonstration that the government agreed to measures that for years had been buried in official files. With reduced parliamentary safety valves, the social consequences of France's industrial revolution become more explosive. The peasants reached for their tractors, as the soldiers, on other occasions, have reached for their tanks.

## AUSTRALIA/country, continent... a world of opportunity

One of the new petrochemical plants now taking shape against Australian skies.

Below: Spearheading the establishment of Australia's petrochemicals industry is this £A2m. carbon black plant which has been in production since June, 1959. Present capacity is 30m. lb. a year.

## AUSTRALIA TURNS TO PETRO-CHEMICALS

At this moment more than £A40,000,000 worth of petrochemical plants are under construction in Australia. Most will be in production next year following hard on the heels of a recently established £A2,000,000 carbon black plant. British, American and Australian interests are interlocked in this major venture. The whole has been skilfully co-ordinated to place each unit on a highly economic basis—supplying and drawing materials one from the other to produce such substances as ethylene, styrene monomer, polyethylene, polystyrene and polyvinylchloride, epoxy resins, butadiene and synthetic rubber. All are sited near the oil refineries supplying their raw materials. Yet Australia's petrochemical story has only just begun. At least 80,000,000,000 tons of readily accessible brown coal await as a potential alternative source of raw material. Australia welcomes British participation in her continuing growth and expansion. Australian Government representatives in the United Kingdom will gladly supply information about trade, investment or migration. They are located at Australia House and at the offices of the Agents-General for each State.

## 83% of British Public favour FLOGGING AND BIRCHING

Despite wide publicity against corporal punishment, the people would like to see it re-introduced. A recent National Opinion Polls survey showed that 83% of the British Public believe the punishment should fit the crime. Analysing, with consistent accuracy, all the major trends, National Opinion Polls are now recognized as Britain's most important source of public opinion.

## Ceylon's Angry Young Man

FROM OUR CORRESPONDENT IN COLOMBO

MRS BANDARANAIKE'S government, which has just entered a third month of emergency rule, successfully negotiated a potentially dangerous curve last week when it forcibly removed Mr K. M. P. Rajaratne from the premises of parliament and deposited him safely in his suburban home. He was on the eighth day of a fast to death when police, acting under the emergency regulations, carried him away. The public had never been clear about the reasons for his fast, but a prime ministerial statement next day suggested bluntly that his real grievance was against the court of criminal appeal, which had rejected his appeal from a previous conviction for leading an unlawful assembly during the 1958 communal disturbances. Mr Rajaratne had been sentenced to eighteen months' imprisonment—which involves the loss of civic rights for seven years, including the right to take part in parliamentary elections.

The government, at his request, has stayed execution of the sentence till the Privy Council hears his final appeal. Though the prime minister stressed the strictly private nature of Mr Rajaratne's grievance and the impropriety of his attempts to exert pressure and make backstage appeals for pardon (which if conceded, the prime minister remarked, would shake the fabric of justice in the country), there were obvious political overtones to the whole episode. Indeed, the minister of justice claimed that Mr Rajaratne was seeking to exploit the language issue and the present discontents for his personal advantage.

Mr Rajaratne is a peculiar product of post-1956 politics in Ceylon. A young and fiery rabble rouser, he is more rabid about race and religion than the extreme right, but scoffs at the Marxist left for its compromises on socialist economics and its not infrequent reticence on controversial international issues. Holding these seemingly contradictory positions with the vigour and self-assurance of a Kandyan dancer, he confounds the foreign observer, who cannot classify him, or indeed many others of Ceylon's new phenomena, into categories that make sense to the westerner.

ESTIMATES of his political importance vary. To the English-educated he is a grotesquely comic aberration; others, more sensitive to the forces active in Ceylonese society today, consider him the island's angry young man, with a strong appeal to the rising Sinhalese-educated intelligentsia. Over 200 young monks and students from the Buddhist university, in which he is a lecturer, slept on the pavement opposite parliament during his eight-day fast. Actually, his importance is not in himself. As leader of a two-member party in parliament, he has little say in the House; but he is an extremely articulate demagogue, speaking a language which strikes a responsive chord in the minds of government backbenchers. Like him, they are creatures of the social forces which propelled the late Mr Bandaranaike to power in 1956. As long as these forces can erupt in violent, ugly forms, a man like Mr Rajaratne cannot be dismissed as a bizarre entertainer on the lunatic fringe of local politics.

A Ceylonese sociologist told this correspondent recently that "under pressure, even the Sinhalese liberal starts to talk like Rajaratne." This is particularly true of the Freedom party's rank and file, who draw their emotional and political sustenance from the Sinhalese peasant. For them, language and religious slogans are not merely modes of self-expression and attempts at defining national identity, but effective weapons in their assault on privilege. The privileged classes, in their view, are the western-educated and the religious and racial minorities who, they feel, received unfair advantages under British and earlier foreign rule. Increasingly

desperate over his own poverty, the average Sinhalese is only too easily tempted into the belief that his only salvation lies in a full-scale attack on the minorities. The government back-bencher is a man sensitive to these feelings. He has no real political experience; politics for him is largely a verbal affair, and he speaks the basic Sinhala of slogans on a frequency not very different from Mr Rajaratne. To the average backbencher, Mr Rajaratne is his *alter ego*. Thus, 45 of them signed a petition to the governor-general appealing for a pardon to Mr Rajaratne—although they withdrew their signatures when they realised the government's embarrassment. The gesture was more than one of private sympathy.

The government was wise in containing the whole affair. The prime minister, Mrs Sirima Bandaranaike, has been more fortunate than her husband, who was caught up in an explosive clash between Sinhalese and Tamils in 1958. The mass of the Sinhala people have acted with unusual restraint in this year's crisis. The present surprising self-discipline of a people usually demonstrative on these issues may reflect a feeling that the Tamils have a genuine grievance over their language rights, even though the Tamil leaders of the Federal party have exploited this sense of grievance to make provocative demands such as that for a separate state. Further, the grim memories of 1958 are still fresh. But the main reason for the calm amongst the Sinhalese is their conviction that the government will not let them down. It was a similar trust that made the Buddhist public refrain from retaliation when the Catholics conducted an anti-government campaign over the schools issue last year.

HOWEVER, the government cannot suppose that the emergency measures have solved the problem. The problem is very much alive, and a political solution has still to be found. Basically, Ceylon's difficulties in what the late Mr Bandaranaike used to call "this period of transition" amount to finding a way of satisfying the age-old grievances of the majority without thereby alienating minority groups and thus endangering all prospects of national unity. It is visibly evident that the living conditions of the Sinhala people are better today than they were during four centuries of foreign rule. At the first stirrings of national consciousness, the majority has become aware also of its power as a majority and is therefore sometimes aggressive in asserting its rights. Political parties contending for power are not only responsive to these demands, but tend also to accentuate them for tactical reasons. The immediate future is likely to call for great qualities of leadership if there is to be no permanent impairment of the nation's unity.

Though there have been moments of anxiety, Ceylon still maintains parliamentary traditions. It is outstanding in a turbulent Asia as a country where the group in power at the time of independence was ousted after nine years, came back to power for a brief three months, and was ousted again—all by the ballot box. Recent events, however, have increasingly shown the danger that sections of the community can be misled into seeking quick solutions through extra-parliamentary activities, such as the Catholics' occupation of schools and the Tamils' *satyagraha*. The prime minister has now appointed a committee of six senior officials, three Sinhalese and three Tamils, to examine the workings of the government's language policy in the administration and suggest how hardships can be avoided. The government has stated its readiness to rectify any wrongs in the operation of the language policy, though its concessions may not go far enough to satisfy all Tamils. It has tried to show the Tamil people that the Federal party has misled them and exploited the language issue for separatist aims which the majority of Tamils do not support. Thus, the government's best hope is a unilateral declaration on language that satisfies moderate Tamil opinion. This could isolate the extremists in the Federal party who have assumed political control of the Tamil community as a result of earlier mistakes and misunderstandings on both sides.

## Japan's Low Posture

FROM A CORRESPONDENT IN TOKYO

JAPAN'S prime minister, Mr Hayato Ikeda, who is now on an official visit to the United States, owes much of his success to his "low posture"—the Japanese phrase that describes his honourable humility in debate and policy. A hard-headed Hiroshima business man, with invaluable experience in the all-powerful finance ministry, he had observed coldly and objectively the melancholy fate of his predecessor, which followed Mr Kishi's enforced interest in foreign affairs and his policy of closer alliance with the United States. Last year, when, with the blessings of the Sage of Oiso, venerable Shigeru Yoshida, Mr Ikeda took command of the prickly factions that constitute the Japanese Liberal-Democratic party, he proclaimed his low posture and concentrated on internal affairs and, in particular, on his plan for doubling the Japanese national income within ten years.

He has since done very well. Japan's prosperity continues to soar—indeed, the Bank of Japan and other ultra-conservative interests are now saying that the boom is becoming too uninhibited and that anti-inflationary checks are required. The recent demonstrations against Mr Ikeda's anti-political violence bill, which provides mild and belated police reforms for the maintenance of law and order in and around the precincts of parliament and also provides tougher penalties for *seijiteki* (politically motivated) crimes, were spontaneous and largely abortive. The police were far more effective and the press far more reasonable during the hoodlumism in the streets and the monkeyshines in the Diet. The local communists are rubbing their bruises and their discomfited secretary-general, Mr Miyamoto, is now taking his instructions from Moscow instead of Peking.

True, the socialists, in an excess of democratic parliamentarianism, again attempted to seize the Speaker and destroy the ballot papers, and eventually Mr Ikeda decided, by a one-step-backward-two-steps-forward manoeuvre, to postpone the contemplated steam-rolling of the legislation through the upper house. There is some straight-faced talk of substituting an electric eye and a megaphone public address system for the physical presence of the harassed and vulnerable Speaker in the Diet chamber. But the anti-violence bill will go through the upper house without difficulty at the next session.

Like a good judo wrestler, Mr Ikeda has succeeded in silencing the restive factions in his own party and the embarrassed enemies in the Socialist opposition by appearing to yield but prevailing in the end. His low posture disarmed his official enemies and restored some semblance of unity among his more dangerously illiberal and undemocratic friends inside the Liberal-Democratic party. How long this success in humility will endure is another matter. The weakness of the Socialist opposition encourages dissension and intrigue among the conservative factions. Pedants identify no fewer than eight contending camps. Mr Ikeda contemplates a low-posture but large-scale reshuffle of his cabinet on his return from Washington. It is reported that he wishes to form a new government of leaders of all factions, but that Mr Yoshida is using high-posture influence to restrict the appointments to three main factions.

Mr Ikeda's low posture may lack appeal in Washington, where there is impatience for more active Japanese participation in international affairs and for more generous contribution from the booming Japanese economy to under-developed countries. The Japanese government, perhaps because of humility, has a tendency to beat its breast over Japan's poverty and difficulties and to confuse trade promotion measures with "aid."

By accepted postwar custom, a visiting Japanese prime minister to Washington expects to carry home an *omiyage*—or souvenir gift. Mr Ikeda would certainly prefer to accept some assurances about the continuing accessibility of the American import market rather than assurances about the continuing anti-Peking line of American diplomacy. Most intelligent Japanese believe that improved relations with China are necessary, and indeed desirable; many of them forget that the initiative and will for greater accord does not rest only with Japan. A low posture, unhappily, is seldom an asset in negotiation with communism.

## Battle in a Long War

FROM OUR ANKARA CORRESPONDENT

LOOKED at in isolation, the recent convolutions in the high command of the Turkish armed forces were tortuous and obscure. Only when they are seen against the larger backcloth of Turkish history and politics do some of the pieces of the jigsaw fall into a place of sorts. On June 5th, General İrfan Tansel, commander of the air force, was appointed military adviser in Washington; three days later he was reinstated in his old job. The next day, June 9th, General Cemal Madanoğlu, thought to be the most powerful member of the National Unity Committee, resigned his command of the Ankara garrison, and offered to resign from the NUC itself. As an aftermath of this storm, both the commander of the land forces and the commander of the naval forces have been retired, and a number of other changes have been reported.

An intense secrecy, always a feature of Turkish military activities, has pervaded the whole operation. There seems no doubt that for some months the military leaders have become increasingly riled by the interference of those colonels who hold senior posts in the NUC; possibly they considered General Tansel's appointment to Washington the last straw. General Tansel is believed to be very popular in the air force, and his reinstatement as commander-in-chief may have been insisted on by the high command of the armed forces as a means of asserting itself against the National Unity Committee. In effect, the army leaders seem to have told the committee to stick to politics and leave military affairs to them.

But this may be only a minor aspect of a much deeper and more devious affair. The incontrovertible fact that emerged from the crisis once the dust had settled was that General Madanoğlu had been forced to give up the command that formed the sinews of his power, since it gave him direct control of more than a division of troops and tanks in the Turkish capital. His relinquishment of the Ankara command conformed to the rule that members of the National Unity Committee should not hold outside military posts; but another member of the committee, Colonel Osman Köksal, has not yet given up his important command of the presidential guard. The vital question is, who wanted to oust General Madanoğlu from the Ankara command, and why?

A clue may be provided in the rumour that the 14 radical members of the National Unity Committee, led by Colonel Turkes, who were expelled in November, will shortly be returning to Turkey. There is no evidence yet that this is true, but it is interesting that these rumours should coincide with the present crisis.

All roads lead to İnönü?

Since it is known that General Madanoğlu played a key role in the expulsion of the 14 officers, and also that Colonel Turkes had been his chief rival for power inside the committee, it is logical to infer that what is bad for Madanoğlu is good for Turkes.

This latest tussle in the armed forces only makes sense against the backcloth of the struggle for power and political principles now going on in Turkey. General Madanoğlu may possibly have been deprived of the Ankara command because he had let it be known that he was an ardent partisan of Mr İsmet İnönü and supported his return to power as president of the republic. There are groups both in the armed forces and in the National Unity Committee who are anxious to keep Mr İnönü out, and General Madanoğlu may have become a target for these groups. The more one looks at Turkish politics today, the more they seem to revolve round the historic figure of Mr İnönü, now 77 years old. This small, white-haired, smiling man is almost the last link with the great days of Kemal Atatürk. In Atatürk's day the Republican People's party was a revolutionary force; today, the party and its leader, Mr İnönü, are regarded by the youth, by many of the younger intellectuals, and by groups in the armed forces as having a primarily conservative influence. Mr İnönü himself, with his great name and vast political experience, is strongly entrenched. But his power is weakened by the fact that the Republican People's party is split between rivals and contradictory ideologies, and may well fall apart. It is this that makes the government of the country after the elections so uncertain.

The important question today is not whether elections are held—they are a point of honour for Turkey, and will certainly take place unless there is a new coup by entirely new people—but whether the radical social ideas of the Turkes group have affected the armed forces as much as they have clearly affected the intellectuals. Since the Turkish army has always been a progressive force, it is reasonable to assume that they have. It was a striking fact that the 14 officers, although publicly denounced at the moment of their expulsion as traitors and fascists who had plotted to seize power, and even to kill General Gürsel, were not executed or imprisoned, but were given highly paid jobs abroad. The only plausible explanation for this extraordinary moderation was that the expelled officers had substantial support within the armed forces. Whether or not these officers return to Turkey in the near future, the struggle between the ideas they represent and the more orthodox principles of Atatürk's revolution—which have now to some extent ossified into a sort of conservatism—is almost certain to continue. In this struggle, the elections will be hardly more than a passing event.

## Mr Ben-Gurion's Triumph

FROM OUR CORRESPONDENT IN TEL AVIV

AT a Paris banquet in honour of Mr Ben-Gurion on June 6th General de Gaulle greeted Israel as "our friend and ally." Although co-operation between the two countries has been close for years, the relationship has never before been defined in such distinct terms. For Israel this means that the help it has been getting from the French will go on as before, and perhaps even more generously. Economic and scientific help may be added to military aid. As General de Gaulle's reassurance has come at the time when at long last it looks as if the Algerian problem might be solved, it puts an end to the fear, held by some Israelis, that France's friendship for Israel might cool when Paris no longer needed moral support against the Arabs. If nothing else, Mr Ben-Gurion has brought back from his trip to Canada, the United States, Britain and France the means of physical survival for his country if there were to be a clash with the Arabs in the near future.

Physical survival in a hostile environment has been Mr Ben-Gurion's main preoccupation. He has been concerned principally with keeping the Israeli army at fighting strength and with matching the weapons that Egypt gets from the communist block. At the same time the Israeli foreign office has made strenuous efforts to win support for Israel among the new countries of Asia and Africa. The setting up of Israeli embassies in as many countries as possible, the extension of technical aid, the granting of scholarships and the organisation of the Afro-Asian Institute in Tel Aviv are all designed to bolster Israel's position.

Lately, however, some Israelis have begun to doubt whether all this was enough to keep the *status quo* in the Middle East or whether a more flexible policy could not be evolved which would gradually lead to a relaxation of the tension between Israel and its neighbours. Mapam, the left-wing socialist party, has always urged a more neutralist policy; now the new Liberal party, under the influence of Dr Nahum Goldmann, favours the abolition of military rule in Israel's Arab districts and a cautious compromise on the refugee question. It is thought that the day may be near when the new American Administration will try its hand at some sort of settlement in the Middle East, and that Israel should not await such suggestions passively but try instead to work out a compromise proposal on its own.

WHEN Mr Ben-Gurion decided on his trip to Canada, the United States and Europe he was well aware of this feeling. He succeeded in meeting President Kennedy on the eve of his journey to Europe and learned from him and from Mr Adlai Stevenson that the United States felt that something must be done about the refugees. All he could do was to impress upon the American leaders his personal views. The London meetings were also inconclusive. But the Paris talks turned out a victory for Mr Ben-Gurion.

It was a victory, however, that may prove embarrassing. Israel succeeded in establishing friendly relations with the new Asian and African countries because it is not suspected of imperialist ambitions. But President Nasser has always tried to depict Israel in African and Asian eyes as the catspaw of imperialism, and to be called France's friend and ally may yet prove grist to the Egyptian propaganda mill. Mr Ben-Gurion and his supporters will answer that this cannot be helped; that a small country like Israel has no hope of survival if it cannot shelter under the wing of a great power, and that France has turned out to be this power. Israel, they will say, must be ready and prepared to meet the Arab armies at any moment. The prime minister's critics do not deny this, but they claim that military readiness is not enough. They believe that since Israel above all needs international sympathy, it should be careful not to align itself with one power. Instead, the government should do what it can to allay Arab suspicions of Israel's expansionist intentions.

As the campaign for the elections due on August 15th warms up, these topics are being discussed with rising passion. The opposition accuses Mr Ben-Gurion of staging his journey to the United States and Europe mainly for election purposes. This accusation would be justified if there had been no need at all for the prime minister to seek contact with western leaders at the present juncture. However, to throw out feelers to the new American Administration was imperative and the meetings in France proved that the journey has not been in vain. But this does not mean that the visit was not also useful for election purposes. During the past few weeks, when his picture in company with the leaders of the world has daily been on the front page of the newspapers, his image has recaptured some of the glamour that it had before it was tarnished by the Lavon affair. Cheering crowds of Jews met him abroad wherever he went, and he has come back to Israel in fighting form. There is still no Israeli personality able to stand up to him.

FROM 1 TO 9: FOU AND GNAT TRAINER — MACCHI MB 324 — HUNTING JET PROYOST TRAINER — FLM TIE 2 — FLAT G 2

5 of the world's foremost jet trainers selected for the air forces of 5 coun . .

# ...AND BRISTOL SIDDELE SUPPLY THE POWER

One of the largest manufacturers of motive power units in the world, Bristol Siddeley Engines Limited produce the very successful Orpheus and Viper turbojets.

These engines power many different types of production aircraft, ranging from strike fighters to target drones. Specially adapted versions of the Orpheus and Viper have been developed to meet the stringent require-

ments of the new generation of jet trainer and now power 5 of the world's foremost jet training aircraft which have already been selected for the air forces of Britain, Germany, Italy, Japan and Ceylon.

Manufacturing licence agreements for the Orpheus have been signed with France, Italy, India and Germany, and for the Viper with France and Italy.

**BRISTOL SIDDELEY ENGINES LIMITED** CENTRAL OFFICE: MERCURY HOUSE, 195 KNIGHTSBRIDGE, LONDON SW7.

AERO-ENGINE DIVISION: PO BOX 3, FILTON, BRISTOL, ENGLAND. POWER DIVISION: PO BOX 17, COVENTRY, ENGLAND.

POWER FOR THIS

**The Bristol Siddeley Industrial Proteus** gas turbine engine powers a 3,000-kilowatt turbo-generator. Designed for peak-logging and stand-by generation, this new pocket power station, two of which are in service, delivers full power within 2 minutes of a cold start for a lower capital cost than any other comparable type of installation.

...AND THIS

**Bristol Siddeley Maybach** diesel engines power Britain's crack express train—the British Railways "Bristolian". Two Type MD 650 engines, developing a total 2,200 hp, give the "Bristolian" a top speed of 90 mph. 286 Bristol Siddeley Maybach diesels have been ordered by British Railways alone.

...AND THIS

**The Bristol Siddeley Pegasus** lift thrust turbofan powers the Hawker P1127 strike aircraft—the world's first VTOL jet aircraft designed for operational service. Thrust is applied through four movable nozzles evenly disposed around the centre of gravity, providing a single power source for all conditions of flight.

## Men or Mendicants?

BY OUR SPECIAL CORRESPONDENT

MONTHS of rising expectations, spurred by rising costs of living, the recent increase in policemen's salaries, and greater self-confidence after years of passive acceptance, culminated last Saturday by the seaside at Margate, where the special delegate conference of the National Union of Teachers voted to reject *in toto* the most generous Burnham award ever. The atmosphere of drama that pervaded the Winter Gardens as the meeting began was augmented by the tightly-guarded secrecy of the affair; even the windows were kept shut, much to the discomfiture of both the stifling 2,200 delegates within and the oddly-assorted gathering of hangers-on without. A militant group of twelve student teachers from Coventry Training College, plus the usual handful of ardent socialists and unilateralists, picketed the entrance in a scarcely-needed effort to encourage drastic action. It was clear from the first gavel that there was little chance that these outwardly calm but inwardly seething teachers would accept the Burnham offer; it was to be a question of how much was to be rejected, and on what basis the NUT negotiators, strengthened by full union support, were to demand re-opening of the bargaining in the Burnham committee.

The moderates, led by Mr Exworthy (an ex-president and a member of the executive, speaking, however as an individual) called for cool-headed realism, and a rejection solely of the irksome operative date of January 1, 1962, as this was the only point on which the authorities were felt to be likely to yield. But Mr Exworthy was soundly defeated. The motion that the delegates eventually carried (by some 118,000 card votes to 99,000) went even further than the original executive recommendation, which had singled out the operative date, beginners' salaries, and unfair treatment of primary school teachers as the three "festering sores" of the Burnham award. The conference resolved that the NUT negotiators would seek to start again by demanding all the concessions claimed

should be done; it was foolish, he maintained, to make a decision without knowledge of what might happen in the meantime, and the local authorities had just given warning that they would refuse to re-open negotiations under a strike threat. Opposing Mr Exworthy, Mr Allsop (also a member of the Executive, and speaking on behalf of the Executive) demanded direct action. He attained the conference's rhetorical zenith when he exhorted the cheering teachers (including the females) to act like men, not mendicants. They did. For the second time, Mr Exworthy and his supporters saw caution swept aside. By now a note of urgency had crept in, since the floor had to be evacuated by 4 o'clock to make way for an invasion of dancing girls for the Winter Garden's usual Saturday evening entertainment. The president ruled that, if the delegates rejected Mr Exworthy's amendment, this would be taken as an affirmation of the executive's radical threats. And so it was. The plan, if the talks fail, is for a token one-day strike of all NUT members in both primary and secondary schools, followed by long-term strikes in certain selected areas.

In opting for strike action, the delegates hurled a direct challenge at the equally adamant local authorities; some sort of crisis, during which the teachers and the union must undergo financial strain and the government suffer much embarrassment, now appears nearly inevitable—unless the strike call proves to be a complete flop. But the teachers' delegates felt their decision justified: at stake was not merely the difference between £600-£1,200 in sixteen years and some advance towards the NUT's initial demand of £700-£1,300 in ten, but the respect that the teachers felt was merited by their professional status. (For one teacher's views, see the letter on page 1357.) Thus they elected to employ non-professional tactics to secure professional dignity. As one leftist picketer put it, "It was about time we teachers learned something from the proletarians."

## Idleness Enriched

BY OUR SPECIAL CORRESPONDENT

CARTOON (or, euphemistically) news cinemas are a distinctively London amusement. These temporary havens from wind, weather and an hour of *longueurs* exist in other cities; but singly, and often in places of dubious name. In London they abound. There are a dozen at least within a mile of Charing Cross, catering for enforced or voluntary idlers, disappointed provincials, touristic pilgrims for whom the whole world of grey stone and weeping monument has become stale, flat and viciously unprofitable, and for those poor shades who would other-

wise, with disconsolate cries, wander about the caverns of London's railway stations, waiting for a connection.

The cinemas are of two main types: mass-production and plush. The first are simple to the point of austerity, mere workshops for the swift assembly of *ersatz* solace, where a tiny foyer (sweets, cigarettes, tickets at a shilling or half-a-crown) leads without ceremony into an auditorium only slightly larger, jammed with seats from the rear wall to the very foot of the little screen. Outwardly the plush are indistinguishable from

by the union's general conference at Easter. The delegates thus gave their representatives on the teachers' panel a completely free hand in the struggle to wring from the authorities the maximum for teachers' pay and pride.

On the all-important question of what was to be done if the new negotiations failed, Mr Exworthy cautiously urged that in such a circumstance another special conference be held to determine what

on the spot

# Europe's first C-E-I-R Centre now offers computer services in London

**WHAT** precisely is a C-E-I-R Centre? In brief, it is the 'operations room' for the control of any and every technique of scientific commercial and industrial management. In the United States there is already a nation-wide network of C-E-I-R Centres, equipped with the most advanced available computing systems.

**WHO** are the people who run the Centre? C-E-I-R (U.K.) Limited, the British subsidiary of the largest independent commercial computer services organization in the world. The organization has a staff of over 400 mathematicians, economists, scientists, computer specialists, and programmers.

**WHY** is a London C-E-I-R Centre necessary? Because C-E-I-R's list of clients, which includes government departments and many famous commercial corporations, has extended rapidly in Britain. On-the-spot services were urgently needed—and now here they are, with some of the world's most advanced computer facilities ready to hand.

**WHEN** does a commercial or public service organization need the help of a C-E-I-R Centre? Whenever it has any kind of management, stock-control, economic, scientific, or development problem (however large or small) that can be solved by up-to-date logical or mathematical methods.

**HOW** much do C-E-I-R's services cost? That depends, of course, upon the nature of the problem—but it is safe to say that C-E-I-R's charges, project for project, are the lowest in Europe. And that goes for the straight hire of computer time here in London as well.

**WHERE** do you find out more about C-E-I-R? By ringing up either the Main Office of C-E-I-R (U.K.) Ltd. at the number shown below, or the new C-E-I-R Centre itself. The address is: 58 NEWMAN STREET, LONDON, W.1. Telephone: LANgham 8658.

C-E-I-R

(U.K.)  
LTD

Main Office: 84 Kingsway, London, W.C.2. Tel. CHAncery 1551

**WOULD  
IT  
BE  
BETTER  
IN PLASTIC?**

Plastic pennies? Light and strong, gay colours perhaps? No more holes in trouser pockets. But to a true-blue Englishman—anathema!

Still, Englishmen of all colours are swallowing new ideas about plastics which are almost as revolutionary as plastic coinage, though often more subtle.

Ask us at BIP—we're the people who know. There's the statue in St. David's Cathedral carved in laminated wood (laminated with a BIP adhesive); the "Glass Slipper," one of the world's biggest plastics sailing-boats (glass fibre moulded with BIP resins); and hundreds of everyday objects (made with BIP plastics) which you accept without thinking that they are made with plastic, just because they are efficient and pleasing to hand and eye—creaseless cottons, for example, or your steering-wheel.

**What about your product?** Again, ask us at BIP. British Industrial Plastics runs an Advisory Service which will take your product and tell you if and how plastics can improve it. We have been in the industry from the start and are plastics men to the marrow (we process the raw material, we build the press and tool plant, we make our own moulded products), so we know what plastics can and cannot do: our Product Design Service will work with you or for you at the drop of a hat. Up to you now to drop it...

**GO ON—ASK US! WOULD IT  
BE BETTER WITH  
PLASTICS?**

BRITISH INDUSTRIAL PLASTICS LIMITED  
OLDBURY, BIRMINGHAM

the austere, but once past the box-office (half-crown only), endless stairs give way to subterranean halls of muted splendour, resting rooms, reading rooms, retiring rooms, restaurants (faint mockeries, all of them, of *salles privées* in Edwardian cafés) and an auditorium in which the seats are spaced decently far apart so that the weary shopper and genteel unemployed may stretch and, if they choose, sleep.

The fare in all of them is rigidly conventional. Often a single newsreel will furnish out a thin feast of cartoons and comedies. A royal wedding, a Derby, a Trooping the Colour will supply a quarter of the programme in its season. Travel films, an occasional naturalist's documentary, odd connoisseur's pieces, will sometimes shine among this dross. But in general it is a gourmand's rather than a gourmet's meal; and the addict may expect to find repeated in each the pot-boiled biographic episodes of Tom and Jerry, Speedy Gonzales, Sylvester and Tweety, Donald Duck, Bugs Bunny *et al.*

The *cinéaste*, picking through this incandescent porridge, fares not so well, but does not starve. Those acid fruits, the UPA cartoons chronicling the eccentricities of Gerald McBoing-Boing and Mr Magoo, can be discovered; but rarely. Intellectual goon films, running, jumping and standing still or expounding the mystique of the Mukkinese battle-horn, draw crowds wherever they are shown; but they are not often shown. And once in a summer some esoteric and highly-prized tidbit (perhaps that British film made with British labour, *The Do-it-yourself Cartoon Kit*) will briefly glimmer. Moreover, news cinemas are the last repositories of the great reputations of film comedy: Chaplin, Laurel and Hardy, Buster Keaton and the Keystone Cops compete bravely with the humourless sadists and desperate clowns of the post-slapstick depression.

**P**ROGRAMMES last an hour, more or less, and the clientèle is drawn indiscriminately from the amorphous crowds outside. A shower of rain will bring in coatless hundreds, a fog will fill them for the whole twelve hours of their daily opening, winter winds will drive the most respectable to a taste for this slightly disreputable (because self-indulgent?) entertainment. And when the doors shut, at eleven at night, among the last to leave will be discovered scarecrow figures who, jobless, penniless, bootless and bedless, have nevertheless managed to raise the shilling admission which applies before lunchtime and have slept their waste of days away, snoring, faintly smelling, indelicately coughing and dreaming who knows what dreams inspired by the tinny fantasies on the screen.

The situations of the little cinemas seem not to have been so much planned as opportunely grabbed, as basements became available. A few, like the three round Picadilly Circus and that in Leicester Square, are ideally placed; and in a normal day will

bring in 1,000 customers each. A royal wedding will double that. But there are others, hopefully installed at quiet stations or set down in a desert of clerkly business, whose trade is forlornly sub-economic. Some have disappeared altogether, others have suffered an X-change, to become fully-fledged, if miniature, emporia of nudism, real violence and the seedy disillusion which rides on the crest of the *nouvelle vague*. The proprietors, more secret than the Admiralty, will not say whether they are more profitable for the change or not: but they have none of the raffish charm of the things they grew from, where every film is U; and the need they fill is less innocent.

But the cartoon cinemas serve a well-defined demand: to while away the idle hours which beset unintellectual people in large cities, whether waiting for trains, avoiding the rush hour or simply lonely in their lunch-breaks. In these warm little cellars they may put off their earnestness, laugh uninhibitedly because unseen at childish shadow-shows (for which they would have to pretend contempt in the light of day), escape the thronged and shuffling gloom of the pavement outside and, for an hour, forget the real world, where the head blown off in a tumultuous explosion can never successfully be put back on again.

FROM A CORRESPONDENT IN EAST ANGLIA

**D**OVER sole is as likely as not to come nowadays from Lowestoft, in Suffolk, which boasts itself the premier British near-water fishing port. It has a curious history. In 1830, after a quarrel between Norwich and Yarmouth over the tolls levied on cargoes shipped up the River Yare, an artificial harbour was built at Lowestoft, and connected by canal and river to Norwich.

That scheme—a belated venture of the canal-builders of the industrial revolution—was a failure. But Lowestoft harbour was acquired by the railways, which built large fish docks, and fostered the growth of a fleet of trawlers similar to Brixham smacks. The days of the great East Anglian autumn herring fishery, in which fifty years ago more than a thousand Scottish and English drifters used to engage, are done. The old trade with eastern Europe in salted herring, diminished by the Russian revolution, has since 1950 died away to a trickle—not because the Russians would not buy the herring, but because the herring shoals themselves have been depleted.

The scientists are still dubious about the reason, but the fishermen are convinced that it is "industrial fishing." The drifters' nets catch only the mature fish, but large foreign (and notably Danish) trawlers are sweeping up enormous quantities of herring indiscriminately for oil and meal factories. Thus, say the East Coast fishermen, they have broken up the fishing that for 800 years was the foundation of their fortunes.

Yarmouth consoles itself with a holiday trade, but its fishing fleet has almost died out. Lowestoft still maintains about

fifteen drifters and drifter-trawlers, whose crews find themselves compensated for the scarcity of herring by their high price. Smoked kippers are still in demand for upper class breakfast tables; they have ceased to provide a popular relish for the workman's tea.

But although the seasonal fishing for herring has diminished, the year-round trawling for white fish has greatly increased at Lowestoft. Like Yarmouth, the town was heavily bombed during the war and had to evacuate half its population, but since then it has been restored to a community of 45,000 people, with big quick-freezing, canning, radio and motor coach building industries, and new shipyards. The suggestion in *The Economist* of January 21st that—rather than try to eke out its career as a fishing port with the help of yet another government subsidy for trawling—Lowestoft should export labour to booming Ipswich was received with a mixture of local anger and derision.

To start with, Lowestoft men say, the town is not a depressed area. Much of its fishing fleet was lost in the minesweeping service during the war. But since then it has been rebuilt—with help from the subsidy. It now consists of more than a hundred trawlers, seventy of which have been built during the past ten years—many of them in local yards. The trawlers have cooled and insulated fish rooms; when landed the fish is sent in insulated vehicles straight to its inland destinations. Before the war much Lowestoft fish passed through Billingsgate and Birmingham. Now one local firm alone

sends fish direct to about eight hundred fishmongers and friers.

Reduction in the British consumption of fish has taken place mainly at the expense of the distant-water fisheries. About 45 per cent of the Lowestoft catch is of plaice. The cod and haddock (which make up about 36 per cent) are said to be very different commodities from the Iceland stuff that has been much longer in the fish-hold. There is a useful trade on contract with the freezing plants, whose dealings with vegetables, fruit, poultry and meat, as well as fish, have grown so large that they employ ten per cent of the labour in Yarmouth and Lowestoft.

THE old type of owner-skipper has gone out of the Lowestoft fishing. Now that a new trawler costs between £90,000 and £100,000 to build, ownership and management can be undertaken only by large concerns, but most of the men at the head of them are still members of local families who have been interested in the fishing for generations. They find the subsidy indispensable. One of them declared: "It's hard to interest the City of London in this industry. If you get more than 5 per cent on your capital in the fishing industry, you're doing very well indeed."

The skippers are vastly changed from the school that found its way about the North Sea by instinct, "the colour of the water," and soundings with the lead. Lowestoft technical college originated a pre-apprenticeship scheme for fishermen, a school of navigation for them, and a school of diesel engineering. The modern skipper is a well-educated man, who may be earning between £2,000 and £3,000 a year while still in his twenties. Similarly, with his share in the boat's earnings on top of his basic wage, a deck hand of 17 can earn £700 a year. The fisher lads walk Lowestoft's streets like an aristocracy of labour. The little gold rings they wear in their ears, as their forefathers did, are marks of rank.

Yet fishing is still one of the most arduous as well as dangerous of jobs. And, as one Lowestoft man put it: "A fisherman has no social life. He's never home for long, and he never knows exactly when it's going to be." The women folk, as well as the men, need to be bred to the demands of this calling. High though its rewards and prestige still are, the temptations of softer jobs ashore are great.

The men and boys who resist those temptations, and continue to follow the most honoured vocation on the East Coast, are admittedly of a very fine type. And in this one owner, asked to justify the retention of subsidies for the fishing industry, found his ultimate argument. "It's worth something for the country to keep this industry going," he said. "Look at the men it breeds—they're better than factory hands! They're a reserve of seamen!" The need "to preserve the breed of seamen" is a claim for subsidising the fishing industry that has been heard since the reign of Elizabeth I. Will it still prevail now?

## Irrelevant Oxbridge?

FROM A CORRESPONDENT IN OXFORD

POPULAR criticisms of Oxford and Cambridge, and speculation about their future within the system of British university education, have taken a number of lines. One of these, that their doors are still too tightly closed because of social prejudice, was discussed in a previous article (*The Economist*, April 22, 1961), where it was argued that the real trouble lay in the inability of many schools to meet Oxbridge's high entrance standards. The present article is concerned with two other criticisms, which seem separate but are in fact connected with each other.

The first is that Oxbridge syllabuses are irrelevant to the urgent needs of the modern world. What is the use of learning symbolic logic in the age of the hydrogen bomb? This can be corrected, it is claimed, by redrawing syllabuses academically so that, say, African Studies replace Greek History; and by designing practical courses like Accountancy or Management as an addition to the theoretical syllabus. (Churchill College has recently announced a course of this sort.)

Arguments against this were developed some years ago during the controversy over Sir Walter Moberly's *The Crisis in the Universities* published in 1949, and have recently been re-stated by Mr Alan Bullock, among others. The university, according to this view, exists primarily to give the country's ablest young men a pause of three or four years to think, to learn, and to reflect; to acquire intellectual (and perhaps social and aesthetic) standards which will enable them to see through bogus arguments quickly and to develop valid ones with conviction; and to realise that the frontiers of knowledge are neither certain nor static. The core of this process is the mastery of the basic theoretical principles of one or two subjects, and some acquaintance with those of others. The method consists as much in mutual discussion between the undergraduates as in formal or informal tuition. In this connection the really able men play a part out of all relation to their numbers, for they teach each other, form a serious link between dons and undergraduates, and set the intellectual pace for undergraduate life in the university as a whole.

The objection that study of this sort is socially unjustifiable is met by the claim that it is in fact closely relevant to the needs of an increasingly specialised and intricate society. For no other method simultaneously concentrates and expands

the powers of the mind, thus enabling the graduate to grasp and criticise a whole range of practical subjects, and to bring an independent judgment to bear on them. Studies perfect nature and are perfected by experience. Conversely, experience without studies can lead to narrow and uncreative views, and the retention of traditional methods at the expense of efficiency; as Keynes never tired of repeating.

THIS view of what a university education should be necessarily leads to suspicion of "practical" and "relevant" courses. It can plausibly be argued (on the normal grounds of the benefits of specialisation) that "practical courses" are best pursued in technological colleges or within businesses themselves. One learns by doing. And it is really not too difficult to see that courses meant—with the best will in the world—to be "relevant" to today's needs may prove to be horribly irrelevant to tomorrow's. To use a military metaphor, those who argue for direct relevance are always committing their main forces to action against enemies who may not exist, or whose strength may be wildly misjudged.

This discussion is germane to another line of criticism of Oxbridge: that it takes the cream of the school entry, thus depriving Redbrick universities of the leaven they need for their student body. The deprivation is the more keenly felt because many Redbrick staffs are themselves Oxbridge trained, and therefore know what they are missing.

One remedy proposed is to spread the entry by some system of regional quotas. It also looks as though some thought is being given to the idea of developing Oxbridge as a primarily graduate centre, thus freeing the talented undergraduate for admission elsewhere. Now the main achievement of Oxbridge has always been in teaching, and this has depended on the presence there of a nucleus of clever undergraduates. The main achievement of Redbrick has, on the whole, been on the side of research. Would it not be a better policy to continue to foster undergraduate studies at Oxbridge and to export her graduates to Redbrick universities for advanced study and research degrees?

## WHAT'S NEW IN SHOPPING?

### Why have millions gone over to frozen foods?

## ASK PRESSED STEEL

Quick-freezing has given a new dimension to shopping. Ask any woman buying out-of-season greens (shelled or de-stalked, and ready to cook). Or a pre-cooked meal. Or having to cope at short notice with a dinner for six.

On the retail side, shops are being planned round the frozen food cabinet. As a Hounslow retailer said: "They attract more customers, sell more food, save time, save money, and make more profit."

Not surprisingly, he had a Prestcold frozen food cabinet. Not surprising, because Prestcold helped to launch frozen food in this country, and have the largest range of cabinets. They make them for butchers, fishmongers, bakers, delicatessens and self-service stores, and for homes, for hospitals, for the Houses of Parliament and for the U.S. Embassy. Prestcold have the freshest ideas in Britain.

PRESSED STEEL COMPANY LIMITED • COWLEY • OXFORD

Prestcold Division: Swansea, Glamorgan

## the new men ... the computer-minded

This is the age of computers—and the progressive men who *use* computers; of time saved, waste saved, money saved. Sooner or later you'll need one in your business. Sooner than competitors—or later? The decision is yours. . . .

Another decision: which make of computer? Worth remembering . . . Ferranti offer you a wider range of computers, programs, training facilities and services than any other company. And current Ferranti activities include Nebula

(Natural Electronic Business Language for commercial programming), Orion (revolutionary new "second generation" computer) and Atlas (most advanced super-speed computer system in the world).

Which type of computer? Here Ferranti can be helpful indeed. They'll tell you if you can't make economical use of a computer at all. But probably you can. Look at three spheres of business where Ferranti have proved their worth.

**PROCESS CONTROL.** A major chemical company is installing a FERRANTI ARGUS computer for complete automatic control of a manufacturing plant. The ARGUS will replace about 100 conventional control devices and also provide information for analysis.

**750,000 INSURANCE POLICIES** are processed monthly by each of the PERSEUS computers in Stockholm and Cape Town, which keep policies up-to-date from punched cards and also print renewal notices. By any standards, by far the biggest job ever done on British computers.

**NOT ALL USERS ARE OWNERS.** The Wimpey Organisation bought time at Ferranti's London Computer Centre, using a standard frame-analysis program on steelwork design for the new Ascot grandstand. Many clients use Ferranti's 'do-it-yourself' programming aids.

# THE BUSINESS WORLD

## Lesson from Tin

*The Buffer Stock Manager of the International Tin Council has withdrawn as a seller of cash tin on the London Metal Exchange at the ceiling price in the agreement of £880 a ton, as the stocks of tin at his disposal are exhausted—Statement by the ITC, June 20th, 1961.*

**L**AST Tuesday, the defences of tin's stabilisation scheme collapsed as dramatically as a New Year's resolution. In April, when the cash price for tin reached £830 a ton, the manager of the tin buffer stock began to sell with the assurance of a man with 5 per cent of likely world demand this year in reserve. A fortnight ago, when the buying wave lapped at his dyke of £880, he may have held about 8,000 tons of tin and the conviction that he could still hold out for some time. But on Monday, June 12th, turnover in the London market was larger than at any time since the uncontrolled boom of 1950-51. This week, turnover easily topped 1,500 tons again on Monday, and the premium on three months' metal was stretched to £15 a ton; this made spot tin cheaper to buy and hold if one had the cash. The end came swiftly: turnover on Tuesday morning rose to 2,000 tons; a great shout went up for tin at £880 when the second ring of the afternoon session opened. The broker for the buffer pool said he had only 440 tons left and shared it out. Total transactions exceeded 5,000 tons (under 200 tons is normal), and at the end of the day bargains were being struck at a level well above the submerged £880.

A fortnight short of its first five-year span, tin has shot through the roof. In 1958, it had crashed through the floor. So, to the satisfaction alike of producers who wanted higher prices, of cynical disbelievers in any kind of commodity stabilisation and of speculators who made the killing, the

tin buffer scheme double-faulted. The humiliation of this jewel among stabilisation schemes, adapted widely as the basis of many international commodity agreements since the war, is bound to cast a deep shadow.

But the failure is a matter of degree; even the headlong events of the past fortnight do not add up to a fiasco. The tin scheme was the victim of its own rigidities—a limitation recognised in the greater flexibility written into the new agreement designed to succeed the first. Within its resources and terms, the tin buffer operation has been moderately successful. It managed to store 23,000 tons of tin when demand was weak and realised the last of it when demand was strong. Its special fund likewise helped to smooth out the market—and to make money too. But when they tried to fix the "right" range for tin prices the designers of the scheme lost sight of the point that, if it had a thin floor and a fragile ceiling, it would need correspondingly more headroom to allow market forces to work.

Havana's imprint lies heavily on the international tin agreement. Consumer members share equal voting rights with producers and a distributed majority is needed for all decisions. In practice, producers of nearly all the free world's tin supply are equally represented with consumers of only 40 per cent of it—why other consumers do not join the club is something of a mystery. Membership costs practically nothing, and consumers have the right to veto proposals to

### TRENDS IN TIN

restrict tin exports and change price limits. Perhaps if supplies were distributed at times of shortage specifically in favour of consuming member countries, more would join. If it were considered desirable, pressure could in this way be brought to bear on the United States to release tin from its stockpile. The parties to the agreement have co-operated effectively in the past, but producers feel an added degree of concern about the lower part of the price range and consumers are exercised about security of supplies and the price ceiling.

Producers scratched together the £17 million to establish the buffer pool, and further resources needed to defend prices in the crisis of 1958. Consumers, who can call the tune, had the right to contribute voluntarily to the fighting fund, but did not do so. In fact, as compensation for the imposition of export restrictions from producing countries, they extracted an agreement that the buffer manager should be allowed to deal, at his discretion, within the middle price range of £780 to £830 a ton to forestall a sharp rise in prices. After tin recovered from the worst in 1958, this resulted in a lengthy period of stability which nevertheless succeeded in pleasing no one, least of all the market.

For the loss of tin production when quotas were cut (as low as 52 per cent for six months between 1958 and 1959) consumer members share the blame. They were presumably convinced of the fairness of the scheme they helped to establish, and they could have helped themselves, and saved producers from avoidable distress, by more wholehearted support of the scheme. Both production and consumption of tin are notoriously unresponsive to price changes; now that consumers are at the wrong end of the stick one cannot altogether sympathise with them.

THE RISE IN TIN SHARES

With restraint on production relaxed, all tin in the buffer stock sold, and nearly every stockpile (except that of the United States) emptied or emptying, the tin agreement is now a floor and nothing else. Costs of production are steadily rising as richer deposits are exhausted; and demand is increasing—last year, consumption reached the high level of 182,000 tons. But higher prices will squeeze tin out of the uses in which the most convenient substitute is available. If the output from the six major producers in the scheme were never to exceed 150,000 tons a year, and possibly to fall below this, any ceiling price could be positively injurious. Until or unless tin falls by more than £130 to £780 a ton, the buffer manager has no power to buy in tin and meanwhile there can be no upper limit. But it would be doubtful wisdom, because of the destruction of the ceiling, to neglect the floor. Despite the borrowing powers written into the new agreement, even greater resources might still be necessary in a crisis and the level of the floor will need careful review. The mines make the point that tin that is unpayable when ground is originally worked might never be recovered later. Even worse are the harmful social upheavals caused by recession. Nearly all low-cost tin production is in south-east Asia. But for the

forerunner of the present international tin scheme which tried to rescue producers after the slump of 1930-31, comparatively new high-cost producing countries like Nigeria and the Congo might have suffered a complete shut-down for a lengthy period. Each miner may support two other persons directly, and indirectly perhaps twenty more. Between 1948 and June 1959, after export restrictions under the current agreement had been most severe, the number of Nigerians engaged in tin mining was halved, and the country's revenues correspondingly affected.

Now there is no longer a buffer stock to operate, the Tin Council, meeting next week, will have to concentrate on how to satisfy—or pacify—demand for tin this year and next. Malaya, which has the greatest potential, may be able to promise more land for tin mining. Some landowners still prefer to grow food on tin-bearing land to feed their populations. Although some tin companies operating in Malaya are already taking advantage of freedom from export restrictions, the equally important multitude of smaller producers seem so far to be unresponsive. Expansion is difficult for a small miner and capital is scarce, especially with the growing range of other investments now open in Malaya. Bolivia nationalised its tin mines in 1952; Indonesia parted company with Holland in 1958; and the Congo has broken its links with Belgium. The limited output of these countries has been disappointing and is naturally an embarrassment to them. These three important producers ought to be able to make up some of the lost ground in future.

With independence for Nigeria and Malaya, control of tin production has been transformed since the war. It therefore seems odd that the United States which nurtured grievances against the international schemes operated by the "colonial powers" before the war and had such a large hand in the establishment of the present scheme, never joined it. It might be persuaded to redeem itself by releasing some of its 300,000-ton stockpile through the buffer scheme. For strictly strategic purposes, America has enough tin to fight a modern version of the Thirty-Years War. But though other consumers would join American taxpayers in urging their government to reduce its stockpile at this propitious time, many of them are also producers of other materials in over-abundant supply that have sought refuge under the wing of America's strategic stockpiles. For them, America's tin is strategic in the sense that a decision to let some of it go in addition to releases of other materials already being made might generate inconvenient disposals of a lot more commodities.

Speculators must hold some tin wanted for consumption this year. Theirs is the worry of what price will balance demand with supply. A release from the American stockpile, storms that halve crops, or one of the other swift changes in fortune that seem to afflict tin might upset the calculations. A ton of tin goes a long way, and consumers are constantly striving to make it go a lot further. Since 1939, America has raised its use of reclaimed tin from a quarter to a half of annual consumption and the smaller, neater metal goods now being produced use considerably less tin. Tin is convenient rather than indispensable, but the right value in the long run for that convenience may be considerably higher than the present price of £915 a ton.

## Canada's Floating Dollar

PERHAPS inevitably in this year of currency upheaval, the new exchange tactics announced by Canada's minister of finance in his budget last Tuesday (on which our Ottawa correspondent reports on page 1375) are being cited in some circles as another indication that world exchanges are in flux, that the basis of certainty in exchange relationships has been removed. This is too simple a view, for Canada's financial problem is in many ways unique. The Canadian dollar, alone among major currencies, has had no fixed exchange parity for over ten years. From September, 1950, it has been a floating currency without official limits, and it still is. What Mr Fleming has decided is that the official exchange fund should now intervene with the positive aim of driving the exchange rate down. This should come as no great surprise. What has been remarkable through the past few years is that the heavy deficit in the balance of payments did not itself drive down the Canadian dollar. The Canadian authorities, far from adopting the familiar posture of assuring all and sundry that their currency would never depreciate, have been hoping that it would and warning the world that it might. The presumption, admittedly, was that the depreciation would be the result of ordinary market forces. Now that the market has failed to do the job itself, the authorities are stepping in to help it along. That in itself involves a major departure, which raises quite new questions for Canada, and also carries some interesting lessons of general application on the role of floating exchange rates. But while no one can be sure at present where this move will lead the Canadian dollar, it is important to note that the initial step has not been taken under immediate exchange market pressure.

Because of Canada's floating rate, and because of the specially close links with the United States, indeed, there has hitherto been virtually no pressure on the Canadian dollar even though the Canadian economy has long run an external deficit that ranks as a world record. When the Canadian dollar was removed from its peg in the early months of the Korean war, the aim was to check the massive inflow of funds that was taking place in expectation of an up-valuation. In these circumstances Canada was given a special dispensation by the International Monetary Fund, which requires fixed parities with fluctuations of at most 1 per cent on either side.

At first it was thought that Canada would return to a fixed peg, as soon as it was clear what this should be, but this day of decision never arrived. The balance of payments underwent a basic change. In 1960 the current balance swung into heavy deficit and, with a momentary exception in 1952, the deficits have continued. In every year since 1956 indeed they have exceeded \$1 billion.\* The deficit on merchandise trade has recently been reduced, but working against this is the ever-rising deficit on invisible payments, which arises largely from the servicing of the huge volume of foreign investment in Canada. The flow of this investment, both through direct participations and transactions in securities, has risen almost in step with the current deficit, and the size of this inflow has been a major factor in the Coyne-Fleming clash. But it has still not been quite as large as the current deficit, and in each of the last five years a substantial

\* The dollar sign refers throughout to Canadian dollars.

gap has remained. The official reserves of gold and foreign exchange have moved insignificantly; why then did the premium on the Canadian dollar remain, fluctuating only within its range of one to six cents?

The answer is given in the last column of the table. The great equilibrating force has been short-term capital. This has been attracted partly by the increased differential in interest rates that has prevailed since 1958, when the rise in Canada went considerably further than in the United States. A differential of one per cent or more has persisted, bringing Canadian borrowers to New York and United States investors into the Canadian money market. Secondly, the floating exchange rate developed a built-in stability of its own. The fact that (1) it had fluctuated within very narrow limits and (2) that a vast volume of funds was always ready to move for exchange or interest arbitrage, meant that whenever long-term forces pulled the rate down by a cent, money market operators would start thinking about the chance of an exchange appreciation, and begin to move funds in, bringing the rate up again.

So the floating rate did not float much in practice and did not adjust, or even register, the major disturbances in the balance of payments. Rather remarkably, it has been demonstrated that just as exchange speculation can artificially exacerbate "natural" fluctuations in exchange rates where confidence is weak, so in opposite circumstances of firm confidence and high mobility between capital markets the natural fluctuations in exchange rates can be artificially ironed out. In both cases, speculation is an independent factor that itself plays a big part in putting the rate where it is. Between the beginning of 1955 and the end of 1960 Canada ran a basic deficit, after crediting all long-term capital, of \$1,600 million; yet neither its official reserves nor its free exchange rate bore any trace of it.

The underlying forces, clearly, have pointed to a depreciation of the Canadian dollar, but have been frustrated by short-term capital movements. Now the authorities have declared their intention to drive down the rate to a "substantial discount." They are prepared to use the exchange fund to sell Canadian dollars against United States dollars to achieve this

CANADA'S SELF-BALANCING PAYMENTS

|                       | Trade balance | Invisibles        | Current balance | Balance after crediting long-term capital | Financed by: Changes in reserves (minus shows rise) | Short term capita |

| 1960 .....            | - 148         | - 1,122           | - 1,270         | - 418                                     | + 39                                                | + 379             |
| 1961 (1st qtr.) ..... | (- 8)         | (- 353)           | (- 361)         | (- 208)                                   | (- 105)                                             | (+ 313)           |

purpose. The intriguing question is how far they will have to. For the Canadian dollar, as has been seen, was being held up only by a market view, which the Canadian government has now upset. United States investors in assets denominated in Canadian dollars have taken losses, while Canadian borrowers who have accepted obligations in United States dollars have incurred additional liabilities. Will they now be undismayed, believing that despite the underlying balance of payments and despite the new Fleming policy the Canadian dollar will return to parity and above it? Or will they expect the depreciation to go further?

If many people do take this view the task before the Canadian exchange authorities may be not how to push their dollar down but how to check its fall. In first dealings on Wednesday the discount on the US dollar was no more than 3 cents, having fallen from a premium of just over one cent to parity immediately after the Coyne dispute came fully into the open. Exchange dealers in Europe expect to see the discount widen towards 10 cents once the broad mass of United States investors and corporations are fully seized of what has happened. "When an exchange rate more appropriate to Canada's economic position has been achieved," Mr Fleming said, "the government will use the exchange fund to keep the rate within the range appropriate to the changing economic situation."

Provided the fall in the exchange is kept within limits, it will be to Mr Fleming's liking. But there is an obvious danger that overseas investors, hurt by their exchange losses and disturbed by the large budget deficit, may undergo a major change of heart. In that case Mr Fleming might well start longing for some of his old problems back. There is no country in the world that is so dependent on the confidence of foreign investors as Canada, and the Canadian government would be foolhardy to neglect it. Mr Fleming has put forward

specific proposals for reducing interest rates. New Federal issues are to be confined to short-dated bonds in the next few months and a sinking fund for retirement of debt is to be established. But while, in theory, the new policy of effecting a "substantial" exchange depreciation may require a concomitant reduction in interest rates, Mr Fleming would be unwise to pay too much regard to the theoretical model until he sees what is happening to confidence. The stimulus of a ten per cent depreciation plus the budget deficit should themselves give a good initial boost to the domestic economy. Investors are already uncertain whether to buy Canadian bonds on the strength of the new policy or sell them on fears of inflation.

But there is everything to be said for Canada adopting a positive policy on interest rates. The sorry course of dispute about Canada's economic affairs marks the utter failure of the negative approach to economic management. The bad example was set first by the Bank of Canada itself when it declined responsibility for the level of the exchange rate and then even of its own Bank rate; the next step was for the Conservative government to shrug off any economic criticism by referring to the responsibility and independence of the Bank—instead of knocking heads together and hammering out a coherent policy. A lower exchange rate, possibly in time a lower interest rate, make sense to a certain degree for Canada in its present state of external deficit and domestic depression. But they will make sense only so long as the stimulus to the domestic economy is not allowed to raise domestic wages and costs. This is the vital point. There is nothing in this exchange manipulation that will make it easier for Canadians to match the United States in its pay scales before they have matched it in productivity. Depreciation, even if there is a fairly clear cut Keynesian case for it in Canada now, is not an easy palliative even there.

## BUSINESS NOTES

### STERLING

#### Still Under Fire

FIRST reactions in the London market to the new tactics for the Canadian dollar were calm. The move was not unexpected in well-informed circles and clearly has little bearing on sterling's troubles. But not all operators are well informed, and on Wednesday afternoon sterling came under sudden pressure in Paris and also in Zurich, where there was a recrudescence of the rumour that the Swiss franc might be revalued. The United States dollar weakened against the Swiss franc but was firm against the D-mark. This movement may have been attributable to operations of the newly active United States stabilisation fund, which has been operating in forward markets.

Sterling weakened to \$2.78½ against the dollar and the Bank of England stepped in with more official support. On Thursday selling from the Continent was resumed

after the announcement of no change in Bank rate. There have also been heavy sales of sterling in the forward market, and discounts have widened further to 2½-2 cents for three months on the US dollar—equivalent to an annual rate of interest on the spot rate of around 3 per cent. The market sees increasing evidence of "Great West Road" selling by United States subsidiaries to secure some cover for their sterling assets.

The official estimate of Britain's balance of payments in the first quarter of 1961 caused few surprises. It confirmed the evidence of the monthly trade figures that the deficit was smaller than in the last half of 1960 but still higher than in the first quarter of last year. On the payments basis, valuing both imports and exports fob, the merchandise trade deficit in January-March was £58 million, compared with £46

million a year before. (For April and May, the trade figures indicate a slight improvement on the year.) Net invisible earnings were again very poor in the first quarter—a mere £2 million—and this was attributable to a further rise in net overseas spending by the government, to no less than £85 million in the three months—a rate of £380 million a year.

The Chancellor of the Exchequer on Thursday made it clear that the Treasury is at last moving to reverse this trend. Mr Lloyd declared that overseas military expenditure and the foreign exchange cost of the forces must be reduced; so must other government expenditure overseas. In addition:

We must say clearly for all to hear that a country without a satisfactory surplus on its balance of payments just cannot provide unlimited quantities of aid, even if some of it is tied.

All this is reasonable enough, but it is not a policy.

On the capital account, the first quarter

### THE ECONOMIST JUNE 24, 1961

inflow of £58 million in private investment is attributable to the £130 million received from Ford, which came out of non-sterling countries' holdings of sterling balances in this period. These figures are also shrouded by the support operations by European central banks, and the accumulations of sterling under these arrangements

\* Provisional.

may also be partly reflected in the inflow of £60 million in "other monetary movements." The balancing item obstinately remains positive, at £50 million, despite the turn in the tide of short term capital movements. This seems to confirm that a good part of this unidentified inflow is in fact on current account. To this extent the identified current balance shows too gloomy a picture.

### INTERNATIONAL FINANCE

#### Basle's New Voice

THERE was a time when the one notable thing about the Bank for International Settlements was its annual report. This year the bank has attracted much wider attention, with the new essay in central banking co-operation arranged under its auspices: "in the shorthand of the exchange markets, 'Basle' today means something very different from 'Zurich.'" At the same time, the BIS has filled the gap in its economic department left by Dr Jacobsson's departure in 1956, and this year's annual report prepared under the supervision of Dr Milton Gilbert ranks with the best of the past.

The report turns critical attention on the interaction between domestic and external

### BUSINESS NOTES

economic influences in leading industrial countries. It shows how some countries, such as Italy and Switzerland, directed policy measures to curbing the external surplus as well as restraining a domestic boom, and had a good measure of success on both sides. On the other hand, Germany's exclusive concentration on domestic stability failed on all counts, necessitating a reversal of policies late in 1960 and the disruptive revaluation early this year. In Germany, as in the United States in opposite circumstances, difficulties arose partly because of reluctance to use fiscal policy as a stabilising device. Too much of the burden of adjustment accordingly fell on monetary policy; international differences in interest rates became unnaturally large; and in the new circumstances of 1960 this led to enormous movements of short-term funds. The outflow from the United States was over \$2 billion; and the shift of funds in Europe in a single week in March, 1961, reached \$500 million.

These movements and the new problems set by European convertibility and the transformation of the dollar problem also receive detailed attention in the second annual report of the European Monetary Agreement. One interesting new estimate in this report is that the amount of gold that "disappeared" into private hands between October, 1960, and January, 1961, was as high as \$800 million. The European Monetary Agreement itself, which was drawn up in 1955 in preparation for con-

vertibility, has in practice hardly taken effect, since settlements are normally transacted through the exchange markets. The agreement is due for review by the end of this year but no major changes are expected.

For Britain, the BIS analysis is eminently sensible. It gives warnings against painting the picture too black and points to "real progress" between 1955 and 1960. It gives a reminder that the lack of dynamism in the British economy is attributable to long-term influences such as the structure of taxation, the direction (it does not say the absolute total) of public investment, and resistances to the shift of resources to the more productive industries. The BIS is at pains to point out that it "takes no position" on these social questions, but emphasises that "the choices made are directly related to the problem of growth." The analysis also emphasises the role of wage inflation in Britain, echoing the theme of the recent OEEC report, in which Dr Gilbert also had a hand. And, in a transfiguration of this year's "Economic Survey" it bluntly but realistically substitutes the past tense for the conditional mood:

If (As) increases in pay continue (have continued) to outstrip the rise in national productivity, the pressure on costs and prices will be (has been) intensified and ability to export will be (has been) impaired.

This would make a fitting text over the Cabinet room fireplace, to be illuminated automatically whenever mention is made of economic growth.

### THE ECONOMY

#### Edging Upwards

INDUSTRIAL output may well be looking up, but the evidence is by no means overwhelming. The official index for April, after seasonal adjustment, is put at 122 (1954=100), compared with 121 in January. Does this justify the Treasury's comment that "output in April was clearly above previous months"? On the published data, it does not. Revisions have raised the February index (unadjusted and adjusted) a point; revisions could just as easily lower the April figure a point. Apart from this, the rounding-off of this index to a whole number coupled with the hazards of seasonal adjustment (just given its annual overhaul)

make a point movement look pretty inconclusive. Nevertheless, this cautionary tale told, some rise in the index fits in what businessmen think has been happening.

Various bits of the statistical jigsaw for the first quarter of the year can now be fitted together. Looking throughout at seasonally corrected data, industrial output appears to have been running at about the same level as in the previous three months. Fixed investment continued to be the most buoyant element in demand. According to provisional estimates, manufacturers stepped up their capital expenditure by some 5 per cent in real terms and the other industries and services covered by

#### TRENDS IN CAPITAL EXPENDITURE Per cent changes from a year earlier at average 1954 prices.

| 1961 1st qtr.                          | +3                | +9       | -9            | +1    |

the Board of Trade's inquiry increased theirs by 1 per cent: the combined rise was 3 per cent. (The table compares the rates of growth in different kinds of investment.) Full details are not yet available of consumer spending but this probably rose by about 2 per cent. Exports went up some 4 per cent in volume, but most of this apparent recovery reflected delays in shipments resulting from last autumn's dock strike.

If these indicators are correct, then stocks must have fallen; this has now been established. Manufacturers and distributors between them hold three-quarters of all stocks in the country and, according to the Board of Trade's provisional estimates, the rise in these stocks in the first three months of the year was smaller than in any recent quarter: it amounted to only £73 million (at 1954 prices, seasonally adjusted), £88 million less than in the three previous months.

### What Now?

It is by no means easy to get a measure of what has been happening more recently or to assess the momentum behind these tentative signs of growth. Retail business has been doing well, although a little of the zip seems to have gone out of it; exports have remained on a plateau. Steel output has levelled off; the recovery in the car industry has been hampered by strikes; and textiles have been quiet. The positive signs of growth stem from home demand for plant and machinery and new construction. New business for engineering firms was very brisk in March and new orders received by the building and civil engineering industries in the first quarter of this year were a record, worth £521 million or 10 per cent more than those received in the same quarter of last year. But one rather longer-term—though less certain—indicator of future demand, the new commissions received by private architects, showed a fall of 22 per cent over the same quarter of 1960.

The only up-to-date indicator is of the labour market. On June 12th unemployment amounted to a mere 1.2 per cent of the labour force; for what the observation is worth, this shows a smaller fall since May 15th than is usual. If school-leavers, workers laid off temporarily and ordinary seasonal ups and downs are excluded from the figures, unemployment has not changed significantly this year. On the other hand, the demand for labour has increased steadily. The seasonally adjusted numbers of vacancies and wholly unemployed were in balance a year ago; in January the excess of vacancies was 17,000; now it is 60,000.

### AIR TRANSPORT

#### Shape of Things to Come

A SIZEABLE bombshell was lobbed into the airlines' closed shop on Thursday morning by Professor Jack and his colleagues

### BUSINESS NOTES

on the new Air Transport Licensing Board. With an unexpected speed, they have decided that there is room for a second British airline on the North Atlantic, flying in competition with BOAC, and have awarded a 15-year licence for the second service to Cunard-Eagle. The board's decision gives Cunard-Eagle the right to a daily return flight between London and New York—and accordingly offers it the chance of starting its new service on a commercial footing, in marked contrast to the former habit of throwing odd crumbs to the independent airlines to give them a start in business but not with the frequency needed to make money.

The decision may have important bearings on the hearings that the board started on Tuesday—they are expected to last six weeks—involving 78 applications (and 283 objections to them) by independent airlines wanting to start a European network in competition with BEA. Unless the airlines get licences to fly on most of the routes they are seeking, it will not pay them to invest in new aircraft; the board's North Atlantic decision seems to recognise this point.

The board's decisions affect not only British airlines but foreign operators and

### THE ECONOMIST JUNE 24, 1961

foreign governments. Cunard-Eagle is only over the first hurdle; although it has cleared this in fine style, there are some nasty fences ahead. At home, BOAC has the right to appeal to the Minister against the decision of the board and has already announced that it intends to do so—BOAC will be able to argue strongly that its current losses will be aggravated by competition from Cunard-Eagle. But Mr Thorneycroft may not be guided solely by such considerations; he could withhold the licence if the Civil Aeronautics Board in the United States were to refuse to allow Cunard-Eagle right of entry. This is a danger of which Mr Thorneycroft's predecessor at the Ministry, Mr Sandys, was aware when he prepared the new act, and Mr Sandys was careful to insert a clause that gave the Minister the right to withhold a licence recommended by the board if it was going to create difficulties with other countries. It is the rock on which the whole experiment might founder. An American team now in London negotiating air traffic agreements will present the Ministry with a convenient opportunity to test American reactions to this new British experiment to bring competition into the air.

### IN THE MARKETS

#### Something Has To Happen

*The position of sterling had not been happy for a considerable time, so it was on the cards that something would happen; something had to happen.*

*What did you expect to happen?*  
—I do not know.

So a City witness described to the Parker tribunal the atmosphere of the summer of 1957. It fits exactly the mood of to-day; investors and dealers firmly believe that the government will take some action to check inflation and to bolster the pound, but they are far from certain what the actions will be or when they will be taken. The Chancellor cannot exercise his power to raise indirect taxes until the Finance Bill is passed, some time in July, and the further fall in sterling before the week-end follow-

ing the poor trade figures for May led the market to consider whether as an interim step Bank rate might be raised to 6 per cent—or even higher. At that point the betting was about "evens" on a rise. The yields on gilt-edged securities are already higher than in the days of 7 per cent Bank rate and to that extent the market has broken contact with the yardsticks of the past. Persistent selling, though light in volume, forced prices down quite sharply and, though there was a momentary rally on Tuesday, War Loan had fallen on Thursday to 53½, the lowest price ever.

As the Bank rate announcement drew nearer, opinion began to harden that another Thursday would pass without a change. It was only a tentative opinion based on the argument that what was required was action that would have a long term remedial effect

### THE ECONOMIST JUNE 24, 1961

## Toheroa Soup!

### WHAT ON EARTH'S THAT?

SORRY, GASTON. We know you're a wonderful source of information about la grande cuisine, but this is different. This is a New Zealand matter and the enquiry ought to have come to us. For with more than 160 branches and agencies throughout the North and South Islands, we, too, are a 'wonderful source of information'—on New Zealand. If you want to know about things of national interest in New Zealand, ask us—

## How much do you know—about YUGOSLAVIA?

### Did you know—

—that the value of U.K. exports to Yugoslavia in 1960 rose by £3½ million, the largest increase for 10 years?  
—that Yugoslavia is likely to buy still more from the United Kingdom during 1961?

### Can you say—

—for what particular purpose the World Bank last year agreed to lend Yugoslavia £10 million?  
—how many categories exist under which goods can be imported into Yugoslavia and what those categories are?

The answers to these and other questions concerning trade with Yugoslavia are in a report which has been prepared by Barclays Bank. Other reports revised in June deal with the Common Market, Denmark, Hong Kong, Iran, Japan, the United States of America and Venezuela. —For copies of these, and of reports on any other of the main trading countries of the world, please apply to:

## THE INTELLIGENCE DEPARTMENT BARCLAYS BANK LIMITED

54 LOMBARD STREET, LONDON EC3

or to any branch.

rather than the use of a weapon more appropriate to a short term crisis. It proved right last Thursday, but the logic is not that Bank rate will not be used but that it may be kept as a reserve weapon to be brought into play together with other measures. A rise in short-dated bonds reflected the slight change in mood about interest rates but, whatever the day-to-day movements at the short end of the market, it is all Lombard Street to a China orange that the government will have to act, and that has left the long end of the market groping blindly, dismayed by its past, disheartened by the present and uncertain of its future.

The industrial market is in only slightly better shape. No longer can it blithely comfort itself that inflation is good for equities; instead it has to anticipate what counter-measures will be taken and to live uneasily with the continuing evidence that profit margins in British industry are being squeezed and are more vulnerable to foreign competition. Over the week-end this took tangible shape, first, in a slight increase in the volume of selling and, secondly, in the sharp precautionary moves the jobbers took in marking prices down. In three days' dealings to the close on Monday, the *Financial Times* index dropped from 340.0 to 322.6. This was close to what has been thought to be a psychological resistance point (in the sense that yields at this level are approximately the same as they were before the bull market got into its stride late last year) and, to no one's surprise, bargain-hunters appeared at this point. Their buying was sufficient to drive the *Financial Times* index up to 330.6 on Wednesday. Spanning both the sharp fall and the later rally, *The Economist* indicator fell from 402.3 to 391.2. Views are mixed on the prospect of equity prices plunging lower than they did immediately after the week-end; but it is now clear that they have no early prospect of climbing back to their mid-May peak.

## Caution in Wall Street

A Correspondent cables:

THE mood in Wall Street has shifted from exuberance to caution and, reflecting the change, the Dow Jones industrial average has fallen from its May peak of 705 to 682 this week. Some individual issues, especially in the electronics industry, have fallen very sharply. Brokers say that the fall has been due to a drying-up in demand for equities rather than any widespread disposition to sell; they cite the big reduction in the volume of trading, which has fallen in a few weeks from well over four million bargains to just over three million a day.

Many dealers believe that the decline is unlikely to go much further and that current prices may be sufficiently attractive to spark off the traditional summer rally. With a recovering economy, easy credit and deficit financing they are convinced that equities will still be the preferred investment. The cooling-off in the speculative demand for

new and unlisted issues is thought to be salutary; it may lead to renewed interest in the standard industrial groups that have been relatively neglected. So far the decline has been moderate—no more, some argue, than the kind of technical correction that is normal in a bull market—but, even so, there is a feeling that investors are unlikely to regain their old enthusiasm very quickly.

Price cuts in many industries have raised the spectre of profitless prosperity and Wall Street is beginning to wonder whether the new administration will provide as temperate a climate for business as it had once

## SOUTH AFRICA

THE South African Government has accepted the inevitable consequence of its policies and has extended its exchange control to non-residents, disregarding its earlier promises to the contrary. Non-residents who sell South African shares are now being paid in blocked rands, which may not be repatriated and which may be used only to purchase other securities. Investors are faced with the choice of getting their money out by selling in London at a discount or leaving it in South Africa indefinitely.

The precise meaning of some details in the new controls is still not clear, but it has emerged, contrary to early suppositions, that blocked rands are in fact not transferable between non-residents. Thus although blocked rands are to be termed security rands they are by no means the counterpart of security sterling. This limitation will prevent a market in blocked rands developing in South Africa. In such a market the rands would have been quoted at a heavy discount, equivalent to that ruling in the London market for Kaffirs. It seems, however, that securities bought with blocked rands are transferable to the London market, although they must first be endorsed by an authorised bank and sanctioned by the exchange control. Such transfers will have no effect on the South African exchanges; and if they are freely approved, London brokers should still be able to maintain an organised market for Kaffirs in London.

The net outflow of capital from South Africa last year was £81 million, of which

hoped. While a drastic selling wave is not thought to be likely, investors are expected to be more selective in concentrating upon shares that seem to be assured of rising profits. At the moment, however, the economic recovery has been substantially discounted and prospective buyers are waiting to see whether the second quarter's earnings are up to expectations. A good deal of interest is centred upon the latest offer of Ford shares by the Ford Foundation and its reception should provide some insight into the strength that may underline the present cautious mood.

## On Its Own

£39 million was accounted for by the sale of securities to South Africans by non-residents. Since the beginning of this year South Africa's reserves have fallen by £15 million, despite a drawing from the IMF of £13½ million, and the reserves are now £71 million. In the month from mid-May the loss was £5 million.

Dr Dönges, the finance minister, now feels that the main leakages of exchange from South Africa have been blocked. At the same time, however, South Africa has taken a big new step towards financial isolation, cutting itself off from the inflow of capital that has sustained its economy for so many years. In future South Africa must finance its own development. In fact the first five months of the year have produced a current surplus of £39 million, compared with a surplus for the whole of 1960 of £15 million. Imports have fallen as a result of recent controls and gold sales continue to rise. In the first five months of this year they contributed £128 million to total exports of £321 million, rising by £29 million over the corresponding period of 1960. The present exchange control is doubtless seen as an alternative to devaluation. But if in the future South Africa feels impelled to strengthen its current balance further, devaluation would give a sure boost to gold production and sales by bringing some of the old mines back into profitable production. Few countries have available an unlimited world market at a fixed price for their largest single export.

The immediate reaction of the London

stock market has been to mark down all South African mining and industrial shares sharply. There was—and to some extent there still is—uncertainty about the working of the new controls. But partly as a result of the dealers' prompt action to protect themselves from losses, there has been very little selling. Discounts on Johannesburg prices, which since last month's restrictions on forward currency dealings had amounted to about 5 per cent, have widened in some shares to as much as 20 per cent. While prices slumped in London, they rose in South Africa, for the big South African institutions which had bought the bulk of the stock sold by non-residents in the past eighteen months have now turned to the Johannesburg market. In London as the market began to settle down a few bargain hunters appeared. The yields might be thought to be tempting; but so they did in March immediately after South Africa decided to leave the Commonwealth and, as the table shows, any investor who gambled then has now a big book loss.

## SHIPBUILDING

### Aid or Self-help?

A CLEAR hint that the Government is considering special aid for British shipbuilding and shipping came from Mr Marples at Port Glasgow last week at a ceremony marking the reconstruction of the Kingston yard of the Lithgow Group. The Minister of Transport virtually committed himself to announcing "some constructive proposals" later this year. Discussions are going on with shipbuilders and shipping companies, and the final form of any aid will be decided upon when they are completed. A Government sponsored scrap-and-build programme has been recently suggested; but shipowners are not keen on a purely British scheme and the chances of an international agreement are remote. Development contracts are favoured by some Government officials, but they would depend upon the willingness of shipowners to charter technically advanced ships; the Government's experience in the parallel case of aircraft development has not been encouraging. There remains the possibility of modernisation loans for shipbuilders, but these would not by themselves stem the growth of unemployment in the shipyards—which is the source of the Government's immediate concern.

Indeed the occasion of Mr Marples's trip to Port Glasgow itself raises the question whether Government help would be justified. The Lithgow Group is one of the few in British shipbuilding that has undertaken modernisation to an extent comparable with the better Continental shipyards—and entirely on its own money. The group includes the Fairfield Shipbuilding yard at Glasgow, which is now about halfway through a heavy ten-year spending programme and is one of the five yards tender-

ing for the new Cunarder. The group's Hamilton and East yards at Port Glasgow are to be rebuilt into a single and bigger yard at a cost of about £1½ million, now that the complete reconstruction of the Kingston yard next door has almost been finished at a cost of more than £3 million over the last four years. Larger building berths and a reconstructed fitting-out basin will enable this yard to build ships of up to 65,000 tons deadweight, against 35,000 tons before.

Provision has also been made for more prefabrication. Completely new plate preparation and fabrication sheds have been built capable of assembling up to 60-ton sections of ships' hulls. These are dropped into place on the assembly berth by travelling cranes running up the centre line of each berth as the erection of the ship pro-

## MURRAY NOT JASPER

### Mr Faulks Reports

THE Jasper affair is unlikely to get any other name, but, as Mr Neville Faulks, QC, says in the final sentence of his report,\* "These are not the Jasper but the Murray group of companies." With Mr Murray and Mr Grunwald in prison it is unnecessary to plunge once again into the intricacies of this unsavoury episode, particularly now that Mr Faulks has reported on them in such lively terms. Mr Faulks describes as "pedestrian" the style of a report which, among its other felicities, describes Mr Murray as "elderly, unscrupulous and rich" and Mr Grunwald as "young, unscrupulous and poor." It is easy to appreciate Mr Faulks's view that "fully to savour the atmosphere of the State Building Society over the last few years the reader must have sat in my place." Mr Faulks continues:

I have heard a witness describing that institution as a den of thieves with Messrs Murray, Grunwald and Jasper relying on and at the same time gravely mistrusting one another. I have been told of Mr Grunwald being closeted with Mr Murray every day from 12 to 1 and almost invariably arriving with a briefcase bulging with banknotes, and have listened to the evidence of a clerk in Harewood & Co. telling me how he went on Mr Grunwald's orders to the bank, drew out £11,000 in cash, and delivered it to Mr Murray who counted it behind locked doors. I have been given accounts of Mr Murray demanding his cash, Mr Grunwald protesting that the dividends have to be washed and Mr Jasper washing away in the City.

Mr Faulks chooses the adjective "acrimonious" to describe a meeting with Mr Murray, whom he characterises elsewhere as "quick-tempered to a degree," and he savours the discovery that at one time Murray was a bull of Capital and Provincial News Theatres and H. Jasper and Company, thinking the shares over-priced, was a bear. In all, as Mr Faulks notes:

There is nothing more incredible than a building society, which by law cannot take

\* "Investigations into the Affairs of H. Jasper & Company Limited." HMSO. 6s.

gresses from stern to bow—an arrangement Lithgow adopted in preference to side cranes during the war to avoid being limited in the breadth of ships it could build. Part of the plate shaping and welding processes are now done automatically. The most impressive new machine is a Messer-Sicomat automatic plate cutter bought from Germany: the movement of four burning heads is controlled by an electronic scanner reading direct from draughtmen's drawings on a tenth scale. With this machine, even the most complex shapes can be cut to an accuracy of 1/16 inch at the rate of 21 inches a minute. The order book for this yard is notably longer than for most other yards; a few days before Mr Marples's visit, it won a contract for a 54,000 ton Norwegian tanker in the face of exceedingly tough competition.

collateral security for loans to non-members, and which, paying a high rate of interest to its depositors, cannot afford to let its money lie idle, handing £3,255,500 to its solicitor pending completion of mortgages to that amount by 161 companies, then either non-existent or non-members, with no written report on title to the properties and no applications in writing for the advances, purporting to demand all the assets of Lintang, the parent company, as collateral security for the advances—AND YET FAILING between 28th July 1959 and 14th September 1959 to make any enquiry in writing as to why the companies have not become members or as to why the mortgages have not been completed, notwithstanding the fact that similar failures to observe the proper practice had occurred on occasions without number. . . .

The last of this affair, which has produced a new building society act and the Jenkins Committee on company law, has yet to be heard. The Lintang has still to be unraveled. As Mr Faulks says: "The position as to civil liability is not uncomplicated."

### Is Section 54 Enough?

THE banks which lent money against the collateral of shares are interested in the unravelling of the complications surrounding the Lintang deal and it is against them that Mr Faulks levels criticism on a point of company law. In his opinion, Section 54 of the 1948 Companies Act (which prohibits a company from providing financial assistance either directly or indirectly for the purchase of its own shares) is

generally . . . honoured more in the breach than the observance. The reason is not difficult to find when the fact that the maximum penalty is £100 is considered. Breaches are not only committed by companies and their directors, but also connived at by the banks and financial institutions.

Mr Faulks sums up his construction of the attitude of the banks:

If clients come to us with a proposition which obviously infringes section 54 of the Companies Act, 1948, we will have nothing to do with it, but we take the view that a breach

## Potterton heats hotel or home handsomely

Potterton make boilers—oil-fired or gas-fired—rated from 31,000 to 2,000,000 B.th.u./hr. They are automatic, efficient, economical and purpose designed.

Potterton have been making boilers since the year dot. Very experienced people. Very reliable boilers. Pick Potterton. It pays. Is your Potterton file up to date? For all the latest information by return post, just jot "boiler information, please" on your letterhead and send it to us.

### Potterton Boilers at the heart of efficient central heating—oil or gas

THOMAS POTTERTON LIMITED, DEPT. MM, 20-30 BUCKHOLD ROAD, LONDON S.W.18. VANDYKE 7202

Potterton is a registered trade mark

Two Potterton FOA oil-fired boilers (outputs: 1,000,000 and 625,000 B.th.u./hr.) heat the Griffin Hotel, Leeds. Heating engineers: Modern Heating Co. (Button) Ltd.

And domestic gas-fired Pottertons, installed in co-operation with the North Thames Gas Board, heat 115 new homes built by Wates Built Homes Limited on the Abbotsbury Road Estate, Kensington. Architects: A. E. Stone, Toms & Partners.

A MEMBER OF THE DE LA RUE GROUP

of that section does not invalidate the transaction and in cases where we suspect that there may be such a breach but it is not clearly apparent there will be, then we are prepared to deal.

With an important qualification—"if this section is considered to be of any importance"—Mr Faulks suggests a steep increase in the maximum penalty and a provision that a person or corporation aiding or abetting an infringement should be penalised.

The question whether this section has an important value in modern business practice has been argued before the Jenkins committee. The clearing banks in their evidence questioned whether section 54 served any useful purpose, arguing that the present penalty is not a deterrent to fraud. Moreover, their experience had shown that the section presented difficulties to businessmen in carrying through what appeared to be perfectly legitimate transactions (notably in connection with bridging finance when companies are acquired). As a result, the banks have found that the section is being increasingly ignored. The general tenor of their evidence was that this section should be made effective only where minority shareholders needed some form of protection and that fraud would be best prevented, not in the general terms of the section, but by proscribing and penalising particular actions. The choice, then, is between a complicated solution, as put by the banks, or a simple one, as put by Mr Faulks.

### MACHINE TOOLS

#### Russia Not So Hot?

THE forty-two British engineers and plant managers that returned last week from a tour of Russian factories making and using machine tools can hardly be described as a group of disinterested observers, but they ought to know machine tool efficiency when they see it. They came back far from impressed, according to the representative of *Metalworking Production* accompanying them. Russian progress in certain fields of development, such as spark erosion, ultrasonics and the use of tungsten carbide tips, is readily granted. But despite the strict specialisation that characterises Russian machine tool manufacture, and indeed most of their industrial plants, the group considered that quality was sacrificed for the sake of output. Machine finish was "rough and ready," equipment appeared "heavy and clumsy for the tasks," some machines were designed "out of proportion to their capacity" and the quality of instrumentation was even rated lower than the quality of the machine tools. Many of the production figures freely made available at different plants, moreover, could not be matched with the engineers' own assessments of what these plants were capable of—they were far too high.

But it was the poor standard of mainten-

ance of machinery and of entire plants that gave these engineers their biggest surprise. On this opinions were almost unanimous. One summarised their reaction thus:

Despite certain very creditable achievements, something was very wrong. . . . If British or American plants were given the same opportunity for specialisation that Russian factories have, we would be much further advanced. I came away with the impression that they were somewhat disorganised. I suspect they are victims of their own bureaucracy.

However, these weaknesses, the engineers thought, would probably be made good within "five or ten years" considering the extensive training programme now under way for engineers and technicians. They returned "really impressed" by the extent of technical training going on in special schools and the amount of classroom work that was fitted in with practical experience in operating plants.

### Gearing Up British Research

AFTER several anxious months, the machine tool industry's new research association is now assured of raising enough money to qualify for a grant from the Department of Scientific and Industrial Research. The terms of the grant are generous. For the first three years the DSIR will provide £40,000 annually if the association raises an equal sum. If it collects more, the DSIR grant will be bigger but not proportionately so, reading £68,000 if the industry itself raises £75,000. In 1964 and 1965 the grant will be geared down but will still be munificent. The industry will have to put up a minimum of £80,000 before the DSIR pays £60,000 with a ceiling of £80,000 if the industry is able to muster a total of £110,000.

The association submitted the usual outline research programme to support its application for a grant. Although this programme ranges widely it will be some time before staff are recruited and established in a permanent headquarters somewhere "to the south of Manchester near to the geographic centre of the industry." Part of the association's difficulty in fund raising arose from the reluctance of several of the industry's leading firms in research to join it. Perhaps understandably they look upon MTIRA as primarily for the benefit of the smaller fry and for the laggards in machine tool research; they are willing to co-operate but not join. Alfred Herbert, the largest manufacturer, is one of them; it is ready to support the association as a buttress supports a church—from the outside. The official opening this week of Alfred Herbert's new applied research centre at Coventry, whence all its development work will in future be controlled, marked the completion of this company's own six-year £2½ million plan to expand its research and development facilities.

### ISSUE BY TENDER

#### Parway's Success

STAGS are unloved until bears move into the stock market. Then the creatures who are said to embarrass the issuing houses and to disrupt orderly dealings when the market is booming are welcomed. It all seems a little unfair, particularly when the impracticable suggestion is made that the capital profits made by the stags should be singled out for tax. But it has to be admitted that the energy of the stags in recent months has disturbed the market more than is usual—some issuing houses would say more than is warranted. To overcome the difficulties, Kleinwort, Benson, Lonsdale made the experiment of offering 250,000 ordinary shares in Parway Land and Investments for sale by tender. Applications for 886,300 shares at prices ranging from the minimum of 16s. to 40s. per share were received. The issuing house protected the impetuous (one of whom put in for 100 shares at 40s.) by offering a rationed allotment at 17s. 6d. per share to applicants for 297,100 shares at prices of 17s. 6d. or more. Applications at less than 17s. 6d. were ruled out; this excluded many institutional applications and the allotment was reasonably well spread among smaller investors.

The experiment must be judged a success. The client secured some of the "profit" that would otherwise have been pocketed by the stags; the number of multiple applications was kept to an insignificant number; and dealings began in an orderly fashion, with the price rising to 22s. Thus there was a profit for those who wanted to take it.

The Parway issue has some useful lessons for any other companies tempted to follow this experiment. Sale by tender must be hedged with safeguards, such as those adopted by Kleinwort, Benson, Lonsdale, by fixing a minimum price and in issuing all the shares at the lowest accepted price. Secondly, the distribution of applications, as shown in the chart, suggests that applicants can judge fairly shrewdly and that those who offer fancy prices are few. Thirdly, this offer emphasises the dangers of putting in applications at ridiculously

high prices to obtain an allotment; it would not need all that many to force the issue price up to such a level that dealings would begin at a discount. But even when the lessons are digested it remains true that a normal issue at the right price is as good a method as any other.

#### INSURANCE SHARES

### Adding to the Supply

INSURANCE shares are among the casualties of the fall in equity prices. It was not much more than three years ago that dealers and investors first realised that insurance shares had growth possibilities equal to those of leading industrial equities; but once the idea took hold, prices climbed rapidly and dividend yields became thin. In the last month or so the shares of a few offices have held their ground remarkably well, but almost all issues are well below the peaks they touched in May. Yields still look a good way ahead, but, as the rights issue from the Royal shows, the prospect that a further rise in investment income will be reflected in higher dividends has not been perceptibly dimmed. As with many past insurance issues, the Royal's rights offer is on bonus terms. The issue, designed to raise £22 million by offering shareholders three new 5s. shares at par for every one held, is a big one and it more than covers the cost of the acquisition of two Canadian insurance offices earlier this year. The fact that the terms of the offer compensate for

| Royal Insurance      | 140/9          | 182/-        | 160/3           | 166/9           | 3 3           |
| Royal Exchange       | 106/11 1/2     | 129/3        | 109/3           | 113/3           | 3 3           |

its size has been reflected in the rise in the shares from 160s. to 166s. 9d. Ex rights, the price is 45s. 6d. and this, being far less "heavy," should improve marketability. After the increase in capital the first full year's dividend is not likely to be less than 1s. 6d. a share, so that the prospective yield is about 3 1/2 per cent.

This is the yield, based on a dividend forecast of 15 per cent, on which the shares of the Provident Life Association have been successfully offered, in 520,000 composite units at 45s. each, made up of one "A" (voting) 5s. share and one "B" (non-voting) 5s. share. Provident Life is primarily concerned with ordinary life assurance; for many years most of its policies were issued in connection with house purchase schemes but since 1952 the company has imposed a strict quota on this type of business, giving itself a greater chance to switch from mortgages to equities. This change in policy will, however, take time to emerge in terms of investment income, and though the company's growth has been steady it is not spectacular compared with other offices.

#### BUSINESS NOTES

#### RAILWAY ELECTRIFICATION

### Learning on the Eastern

BRITISH RAILWAYS and the General Electric Company have not much to be proud of in the story that Brigadier Langley, the chief inspecting officer of railways, unfolds in his interim report on the failure of the multiple unit electric trains on the Eastern Region last winter. He makes it clear that the new trains were not fully tested before they went into service: hardly any of the test running took place on lines electrified at 6.25 kV, though this was the novel feature of this form of traction and apparently the source of most of the trouble. Moreover, most of the testing was done on the Clacton-Walton line, which is straighter and has fewer stations than the Liverpool Street-Bishop's Stortford line—the line the new trains were designed to serve. The immediate cause of the failures was voltages higher than the motors and other parts of the electrical circuits could withstand. The reason for these excessive voltages have been difficult to trace; there appears to have been more than one contributory factor.

The first of these was that the pantograph, which collects the electric current for the motors, was liable to bounce off the overhead wire. This can particularly happen when the level of the wire changes under bridges or through tunnels, and when the pantograph meets a neutral section of wire which is whenever the voltage or phase of the electric current has to be changed. Gaps between these different sections make the wire uneven. A bouncing pantograph makes for an irregular supply of current, and this surely predictable phenomenon played havoc with parts of the electrical system. It caused the circuit-breakers to cut in and out in a manner that gave rise

to excessive voltages. More serious was the effect on the rectifiers: whenever the current was interrupted several times in rapid succession they cut out and failed to re-ignite for up to eight seconds, so passing a.c. current to the d.c. motors, and if the circuit-breaker switched on while some of the rectifiers had cut out, very high voltage current passed to the motor and transformer. Worse still, the battery charger, which supplied current to re-ignite the rectifiers, was also liable to be wrecked by these excessive voltages. On the 6.25 kV line, excess voltages were four times as high as on the 25 kV sections, so trouble was concentrated on these sections.

GEC hopes that it will be able to get these trains back into service by the end of the summer. But several problems remain unsolved. No cure has yet been found for the rectifier's habit of cutting out: Brigadier Langley recommends that the excitation gear should be re-designed. The rectifiers themselves have also failed, for a reason that has not been discovered, though it is thought that metal fatigue and inadequate cooling may have something to do with it. Until modified rectifiers have been made by GEC and tested, there is no means of knowing whether the changes it is making to the design will overcome these weaknesses. In addition, British Railways are still unhappy about the transformers, and want to make further tests before deciding whether they, too, need modifying.

The electric multiple unit trains that English Electric built for the Southend line to operate on 6.25 kV current have not suffered such serious troubles as those of GEC, and for a while some of them replaced GEC trains on the Bishop's Stortford line. They have the same circuit-breakers and pantographs as the GEC trains, but different transformers and rectifiers, which are able to stand up to pantograph bounce.

The electric multiple unit trains that English Electric built for the Southend line to operate on 6.25 kV current have not suffered such serious troubles as those of GEC, and for a while some of them replaced GEC trains on the Bishop's Stortford line. They have the same circuit-breakers and pantographs as the GEC trains, but different transformers and rectifiers, which are able to stand up to pantograph bounce.

#### MINICABS

### Opening Salvo

AFTER three days' experience, Welbeck Motors feels confident that its minicab service will pay its way. Nearly all cars have been earning more than the average of £6 for a two-shift day needed to show a modest profit; good drivers have been earning £4 to £6 a shift. At 1s. a mile (plus 1 1/2d. a minute when waiting) this means that their cars have been gainfully employed for at least 80 miles in each eight-hour shift, and some for 120 miles—a utilisation that would suggest that they are rarely at a standstill. The drivers who take £4 a shift will be on the guaranteed rate of £8 a week

—they get a third of the takings, and most work six shifts a week—but they seem to be getting good tips. Welbeck finds that many of its calls are for the longer trips that it is most anxious to get, as giving a better chance of high utilisation. Minicabs in fact operate little in central London, spending most of the time taking people in and out.

Most minicab bookings have so far been made by telephone, not by hailing a cab in the street and waiting while another is called up by radio; though this has averted friction with the taxi drivers, it has overloaded the telephone switchboard at

# SCOTLAND'S LARGEST APPLIANCE FACTORY

## Cubitts' precision planning speeds construction

ARCHITECT: Wylie, Shanks and Partners. QUANTITY SURVEYOR: James Barr & Sons

Mr. A. E. Hitchcock, B.Sc., Technical Director of Morphy-Richards (Astral) Ltd., says: "Having been closely concerned with the development of the project, I have been able to appreciate the way in which the many problems of site preparation and construction had to be overcome. Building for industry requires the closest co-operation from the Contractor who must combine speed of construction with an understanding of the specific needs of his Client. The completion of this plant on schedule demonstrates the value of this kind of co-operation."

Mr. A. F. Keary, Managing Director of Holland & Hannen and Cubitts (Scotland) Ltd., says: "From commencement to completion of a contract we like to work in very close collaboration with the clients and their consultants. Such a relationship ensures an up-to-the-minute appreciation of clients' requirements and job problems. At Dundee this close co-operation has enabled extensive areas of the factory to be handed over to Morphy-Richards (Astral) Limited for plant installation many months before the due completion date."

Close programming of construction enabled Cubitts to make half the factory floor area available for plant installation four months ahead of schedule. Thanks to this time saving the largest domestic appliance factory in Scotland can go into production earlier than anticipated.

The new Astral factory at Dundee, covering 350,000 sq. ft., is an excellent example of how Cubitts' policy of precision planning saves time—and benefits the client. From the very beginning, Industrial Estates Management for Scotland, Morphy-Richards (Astral) Ltd., the consultants and Cubitts co-operated on detailed construction planning. Every major operation was work studied—for example, it was discovered that the best way to tackle the initial clearing of the eight acre site was by using only one excavator and ten dump trucks. They moved over 100,000 cubic yards of earth and rock within a few weeks. Then, in under three months the vast steel framework measuring 750 feet by 450 feet was erected, and the remainder of the construction work moved forward swiftly according to plan.

## Sales under control with I.C.T

Business sails along smoothly when the facts and figures of your sales are young and fresh and always immediately at your beck and call.

I.C.T data processing will give you comprehensive sales analysis...sales comparisons; sales by area, customer, product, representative; delivery mileages; freight charges; discounts. Order analyses, as well, to help your production planning. You get the facts you need in the form you can use for management decisions—as news, not history.

For constructive advice on how I.C.T data processing can keep vital management information always under your watchful eye, phone your nearest I.C.T office, or write to us now.

the booking office, so that many potential customers are being lost because they cannot get through or find that they will have to wait too long for the cab to come. At times Welbeck has been getting 15 times as many orders as it can handle. The funds that Mr Isaac Wolfson's General Guarantee Corporation has put into Welbeck, £150,000 for ordinary shares and short-term loans of nearly £1 million secured on its car fleet, seem likely to be profitably employed.

The minicab drivers have hardly been welcomed by the London taximen; though none have yet ended up in hospital as a result of their clashes, some violence has been done to their persons and their cars. Most taxi drivers, however, are obeying their union's instructions to ignore the minicabs, and the small number operating in central London will, Welbeck hopes, convince taximen that they need not fear their competition. So far no minicab drivers have been prosecuted for "plying for hire," though the taximen claim that they have evidence of several cases where minicab drivers have picked up passengers without going through the process of radioing headquarters to send another cab for the passengers. And there is no sign yet of a test prosecution on the legality of this method of booking.

### RADIO INDUSTRY

#### Tube Merger

THE slump in television sales in the past year has initiated a number of mergers in the radio industry, most of them at the set-making end of the business. The decision of Associated Electrical Industries to form a joint company with Thorn for the production of cathode tubes and valves indicates that component makers are feeling the pinch. Thorn, through a series of mergers and purchases, is now the largest producer of television sets in Britain but until six months ago, when it bought Brimar, Thorn made few of its own components—a project announced in 1955 to sell cathode tubes at prices one-third below the then current retail prices having come to nothing. AEI makes no sets, but in a good year it produces perhaps a third of the cathode tubes and a fifth of the valves made in this country. Some of these go into sets made by Ultra, whose set-making factories were taken over by Thorn last month.

The fall in television sales has left both AEI and Brimar with surplus capacity; the object of the AEI-Thorn valve and tube merger is presumably to concentrate production in the most efficient factories and close down or switch the others to different work. The heavy electrical industry has drawn much of its profits in the past few years from an expanding trade in electronics, but recent months has shown a widening gap between standards of performance and design of components used for industrial equipment and those used in domestic

receivers. Since the two can no longer be produced on the same assembly line, this creates difficulties for manufacturers, particularly in valves, which have now been largely replaced in industrial and military equipment by transistors or by special duty valves bearing little resemblance to those found in a television set.

### OSCAR HOBSON

#### Founder of a Craft

FEW things gave financial writers more pleasure than Oscar Hobson's knight-hood in 1955 for his services to journalism. No man will be more missed by the present generation of city editors who, many of them directly and all of them indirectly, owe their status and most of their professional opportunity and skill to him. Hobson made his mark in popular economic writing not because he was a contemporary in economic thought but because he was honest, fearless and clear in everything he wrote. His was a mind of classical quality which he used to bring economic matters of the utmost complexity within range of ordinary comprehension, with skill and charm, often with outright words but never with condescension. His monument is the quality of British financial journalism which at its best—and indeed when it is most wayward—will always acknowledge with gratitude Hobson's example of mind and craftsmanship.

### STEEL

#### Spending on Growth

ONE of the most prominent of the manufacturing industries spending heavily on new capital outlays this year and last is steel—as the annual report of the Iron and Steel Board shows in conclusive detail. In 1960 capital expenditure by steel firms ran to £146 million, almost fifty per cent more than in 1959 and almost double the level of steel investment in 1956. This year the board expects capital spending to be "substantially" greater still. It approved a record £223 million worth of new development schemes during 1960, most of them extending over several years. The Board of Trade, in recording that manufacturing firms expected to pay out on new capital assets about 30 per cent more this year than last, put iron and steel among the industries in the van of this further capital expansion.

#### STEEL'S CAPITAL EXPENDITURE

|                                             | (£ million) |      |      |      |      |      |
|---------------------------------------------|-------------|------|------|------|------|------|
|                                             | 1955        | 1956 | 1957 | 1958 | 1959 | 1960 |
| Coke ovens .....                            | 7           | 8    | 8    | 9    | 8    | 8    |
| Materials handling and blast furnaces ..... | 19          | 21   | 25   | 26   | 23   | 30   |
| Melting shops .....                         | 8           | 10   | 13   | 14   | 12   | 19   |
| Mills & finishing plant .....               | 21          | 34   | 44   | 50   | 51   | 84   |
| Other .....                                 | 3           | 2    | 5    | 6    | 5    | 5    |
| Total .....                                 | 58          | 75   | 95   | 105  | 99   | 146  |

Much the biggest part of this increased steel investment, in the closing years of the industry's third postwar development plan and as it was preparing a fourth look-

ing ahead to 1965, has been put into rolling and finishing capacity. Development schemes now under preparation involve raising steel making capacity from about 27 million tons this year to about 32 million tons by 1965, expansion and modernisation of light rolling facilities, and new techniques of steel making using oxygen and continuous casting. Five large continuous casting projects came before the board in 1960. Among the new oxygen blowing processes included in present plans are examples of the L-D, Kaldo, Rotor and bottom blown oxygen converter processes. Productivity in steel making rose, the board estimates, by 23 per cent between 1954 and 1960. New plant is about twice as productive as existing facilities and it expects the present high level of expenditure on modernisation and development to lead to further substantial gains in steel productivity.

### MOTOR INSURANCE

#### More To Pay

SOONER or later it was bound to happen, with so many insurance companies making losses on motor insurance. The Accident Offices Association, representing one hundred and eighteen insurance companies, has announced that from September 1st premiums charged by its members on the insurance of private cars are to be increased. The association covers about 50 per cent of all policyholders and the proposed increases will affect about one third of its clients. This means that just under one million car owners are going to be asked to pay higher premiums. The last increase was in 1957.

The increases are based on the district rating system introduced in 1934 and in general they affect areas of high traffic density—this is measured by where the car is garaged. The association, fearing the prying eyes of rival insurers, has given only a general outline of the changes. Motorists in Central London and the inner suburbs will have to bear increases of about 20 per cent and 10 per cent respectively. The increase in the comprehensive rate for cars in the Ford Anglia-Austin A.40 price range garaged in Central London will be from £28 to £33 15s. Cars garaged inside the Metropolitan Police Area but outside the London Postal District will, in general, be unaffected. In the rest of England and Wales there will be increases of 10 per cent in some counties and in some larger towns and cities. Many of Scotland's motorists have apparently been enjoying bargain rates in the past; in some cases their rates will increase by 30 per cent though increases in Scotland will generally be in the region of 10 per cent. These revisions should produce an increase of around 5 per cent in the premium income of the companies; this suggests that as only a third of the policyholders are affected the average increase in premiums will be about 15 per cent.

## HONGKONG TEXTILES

*No Obligation without Representation*

PRESIDENT KENNEDY'S emissaries provided Hongkong's cotton spinners and weavers with an excellent brief to replace their fulminations against compromise with Lancashire over the future of voluntary curbs on exports to the United Kingdom. Hongkong's official representatives appear to have been told that an immediate voluntary curtailment of exports to the United States might forestall restrictive legislation. The final suggestions of the American representatives seem to have been couched in presentably liberal terms, and the pill sugar-coated by the grandiose project of an international conference to discuss controlled expansion of imports from low-cost producers. But when the colony's officials called a meeting to discuss these two questions, the spinners and weavers refused to take part, though the garment manufacturers took part alongside other industrialists and exporters.

In reply to the Hongkong government's request that they should join these discussions, they said in elaborate phrases that only an overall settlement would be satisfactory and that concessions should not be granted piecemeal to pressure groups. Reflecting the lofty realms to which this problem has now been elevated by the intrusion of economists, they also insisted that "demands" for quota protection should be based on a "sound and cogent economic basis" as one of the conditions under which they would be prepared to take part in the talks.

At first sight it seems unrealistic that this small colony should adopt such a tough line with its powerful trading partners. If the unofficial talks between government and manufacturers remain deadlocked, the government will still send its representatives to the impending international conference. The machinery for restricting exports from Hongkong already exists. Not for the first time in its history an important body of the colony's traders is at loggerheads with the government, which seems to believe that the manufacturers would get more favourable treatment especially in such questions as Britain's entry into the common market by being conciliatory now. But Hongkong is widely admired for its spirit of self-help and staunch independence. Its truculent defence of free trade would not necessarily bring worse treatment if embarrassing official restrictions have to be imposed, and while its manufacturers are not talking for the good reasons they have enumerated, they cannot be landed with the sort of obligations that have proved inconvenient in the past.

## FILM FINANCING

*Judgment and Luck*

THE National Film Finance Corporation achieved a profit last year for the first time since 1957. The surplus was only

## BUSINESS NOTES

£18,000, and it was struck after providing £95,000 against doubtful loans, but it does show that this "dirty end of the stick" exercise in government aid for film making can be self-supporting—given an improvement in the health of British film production as a whole, as was the case last year. More film producers found finance for their own productions, and NFFC backed only 60 per cent of the British films not made by American companies here, whereas in 1959 it had backed 70 per cent. Rank, Associated British and Anglo-Amalgamated are financing their own films now. The corporation approved loans for 30 first-feature films during 1960, as against 46 in 1959, but the total sum lent fell by only 18 per cent, to £1,046,890.

The profitability of most British films is still marginal even if more production companies are able to invest more in them. The

## THE ECONOMIST JUNE 24, 1961

33 long films backed by the NFFC and released in 1960 are expected to recover only 5 per cent more than their total cost. But for the statutory levy, which brought British film producers £3.9 million in the year to October, 1960, this small profit would have been a substantial loss. To judge from the list of the more profitable films that NFFC backed last year, farce remains the safest bet in British film making. But NFFC is prepared to help the new groups coming into film making as well. It provided finance for "The Entertainer" and "Saturday Night and Sunday Morning." It has lent the full cost of making "The Kitchen," which is based upon the Wesker play, a marked departure from its now customary practice of asking the producer to put up some "end money" and obtain distributor's guarantee as well.

## SHORTER NOTES

The Halifax Building Society is raising its mortgage rate from 6 to 6½ per cent, but existing borrowers will not pay the higher rate until February 1, 1962. From December it will raise its interest rates to most shareholders from 3½ to 3¾ per cent and to depositors from 3¼ to 3½ per cent. These rates are in line with those recently recommended by the Building Societies' Association, of which the Halifax is not a member.

Certain shareholders in British Drug Houses are seeking support for an extraordinary meeting to consider "such offers as have recently been made for the equity of the company" and how soon benefits can be expected from the company's oral contraceptive. Early in 1960 British Drug Houses fought off a bid from Fisons and it was then that the first announcement about the new contraceptive was made. Since then there have been rumours of other take over bids. Last month BDH said it was negotiating with Mead Johnson of Indiana for a closer link between the two companies and that this could lead to the acquisition by Mead Johnson of a minority interest in BDH.

Horlicks has failed to gain control of Burt Boulton and Haywood but it has received enough acceptances to its offer to increase its interest in the company from 11 to 31 per cent. It intends to hold on to this as a trade investment.

In Hongkong the rush to subscribe to the offer of shares in Jardine, Matheson produced a heavy run on the head office and branches of the small Chinese Liu Chong Hing Bank, which stayed open after hours

to pay out doubting depositors. The Hongkong and Shanghai Banking Corporation and the Chartered Bank, after night-long conferences, decided to support the bank. The offer was in fact oversubscribed 56 times.

The International Development Association has extended a credit of \$60 million to India for highway development. Terms are on the same generous basis as IDA's first two loans to Honduras and the Sudan—no interest, amortisation to begin after a ten-year period of grace and then spread over a further forty years.

Bankruptcies increased sharply last year and were nearly back to prewar levels. Failures among hardware and electrical retailers doubled, and in total were a close second to builders. The total number of receiving and administrative orders made in 1960 was 2,801—about 500 more than in 1959—and estimated liabilities rose from £7.7 million to £10.6 million.

Britain's new, smaller 10s. note is to be issued in October. The Isle of Man, as a new departure, is to issue its own notes.

## COMPANY MEETINGS

## THE AUSTRALIAN ESTATES COMPANY LIMITED

## SIR DENYS LOWSON ON THE COMPANY'S FOURFOLD SPREAD OF ACTIVITIES

## A GOOD YEAR

The Annual General Meeting of The Australian Estates Company Limited will be held on July 5th in London.

Sir Denys Lowson, Bt, the Chairman, in his review, which has been circulated to stockholders, says:

## ACCOUNTS

I am pleased to be able to report that gross revenue for the year 1960 has again increased, the total of £1,333,775 being 8 per cent greater than that for the preceding year.

The year under review was by no means an easy one, and our agency profits as well as the earnings from our cattle stations were lower; although, in spite of adverse seasonal conditions in Queensland, our sheep stations increased their earnings. Thanks to being permitted to mill 8½ per cent over the "peaks" and aided by a favourable season our two sugar mills earned substantially greater profits than in 1959 when "peak" production could not be exceeded.

Owing to an increase in the required provision for Australian taxation the group net profit at £418,520 is about £8,000 lower than last year. The subsidiaries have transferred £168,000 to General Reserves and after making the proposed allocations the carry forward of the parent company will be increased by £37,934 to £457,048.

It will be remembered that last year the company declared a dividend on the Ordinary and "A" Ordinary Stock of 8 per cent and a bonus of 2 per cent less income tax at 7s. 9d. This year we propose to pay a dividend of 10 per cent less income tax, which is equal to 6½ per cent free of tax, and is the same total amount as was paid for 1959. We find that Australian and other overseas stockholders are confused by the method of declaring a dividend at a rate from which allowance must be made for deduction of United Kingdom Taxation (most or all of which is not recoverable by them) before arriving at the actual sum which they receive. By also showing the dividend free of tax we hope that this confusion will be avoided.

## TAXATION

Another Finance Bill has been drafted, and there is still no relief for Overseas Trade Corporations which are trading overseas through subsidiaries as opposed to branches. It will be seen from the Profit and Loss Account that it was necessary to make virtually no provision this year for United Kingdom Income Tax and this indicates that the company is already receiving substantial benefits from the working of the original Overseas Trade Corporation legislation.

I must, however, point out that a substantial part of the company's activities in Australia is carried on by subsidiaries, and the payment of dividends by them would require provision for United Kingdom taxation in spite of the fact that they are purely trading companies and will already have borne Australian tax. At present it is important for those subsidiaries to conserve their funds, so that they may be able to meet

the cost of normal capital replacements and requirements and to have sufficient working capital of their own; but the time will clearly come when it will be appropriate for them to pay dividends to the parent company and it is hoped that by then the present anomaly in the treatment of overseas subsidiaries will have been corrected. This is all the more necessary in these days when it is important also to have local shareholders if this is at all possible; and when the additional United Kingdom income tax payable would appear to be entirely unjustified.

## PASTORAL—SHEEP

Rainfall on our New South Wales and Queensland sheep stations was generally below average in 1960. Drought conditions existed at Dagworth and Bonus Downs for the latter part of the year, making hand feeding and scrub pushing necessary; Mount Morris also fed a supplement to lambing ewes; general rain in the last week of December gave most Queensland properties relief and a promising start. In New South Wales the properties were dry at the close of the year, and all of them were in need of good general rain.

Excellent lambings have increased stock numbers and mortality was lower. Wool clip was 317,500 lb. (representing 987 bales) above last year; more sheep and lambs were shorn, but the overall cut for grown sheep was slightly lighter.

Raby won the Grand Champion award of the Sydney Sheep Show in the strong wool section; and both Raby and Terrick Stud had a number of successes at country shows.

In Queensland, Bonus Downs lease expired at December 31, 1960; but our occupancy has so far gone on undisturbed. Kyabra is to be resumed during 1961, and two small Thylungra additional areas resumed from that lease have already been taken up. Mount Morris will probably lose about 44,800 acres in 1962. In every case we have applied in vain for a renewal of the lease. Terrick Stud has been granted a new forty-year Stud lease, and an application for a five-year drought relief extension of the Dagworth lease is now before the Land Administration Commission in Queensland.

Tyrie, although a freehold owned by us, has been resumed by the New South Wales Government under the New South Wales Closer Settlement Act; and delivery has to be given on November 30, 1961.

## PASTORAL—CATTLE

A favourable selling market for cattle was maintained throughout the year. The season was generally satisfactory on all properties except Chatsworth, where drought conditions again prevailed; this property has had little relief during the last three years. Brandings were down due to adverse conditions at Chatsworth and to the hot, dry period at the end of

1959 on the other breeding properties; the extreme heat at this time caused heavier than normal mortality in young calves.

Following a useful flood in the Cooper, we were able to place cattle to fatten on Mount Howitt for the first time since 1957. We have continued to develop our Santa Gertrudis herds, and to experiment with various crosses from the pure-bred animals. One new lease, Burleigh, was purchased with a herd of nearly 7,000 Hereford cattle. This is the first Hereford herd to be acquired by the Company.

## SUGAR

Australian production of raw sugar in 1960 was 1,383,000 tons, the second highest in the industry's history and some 95,000 tons more than in 1959; of this total 1,320,000 tons were produced in Queensland, compared with 1,217,000 tons in 1959.

Conditions under which the 1960 Queensland crop was grown were not quite as favourable as those of the previous year; however, cane available for harvest was again in excess of available markets, to which sugar production was restricted. A record 776,000 tons of raw sugar was exported; being about 58 per cent of the total output. The increased amount was due to substantial short-falls declared by other British Commonwealth exporters, notably Mauritius. The British Commonwealth Sugar Agreement has again been extended for another year and will now operate until the end of 1968.

Kalamia Mill crushed 343,000 tons of cane, compared with 325,000 in 1959; Pleystowe Mill treated 305,000 tons of cane, compared with 288,000 in the previous year; both Mills maintained a high standard of efficiency. Cane crushed from the Company's own cane farms at Kalamia amounted to 18,000 tons, an increase of 1,100 tons over 1959. During 1960 we acquired the few shares in Amalgamated Sugar Mills Pty. Ltd. (the company which operates Pleystowe Mill) formerly held by outside shareholders; this mill is now wholly owned through our subsidiaries.

About 80 per cent of the Queensland sugar production was handled in bulk during the 1960 season, and in 1961 this should increase to 85 per cent, as Southern Queensland mills' production will be sent to Brisbane in bulk. Mechanical harvesting of cane is increasing; in 1960 almost 3 per cent of the crop was harvested mechanically, while some 48 per cent was mechanically loaded. On present indications it appears that about 100 mechanical harvesters of various types will operate next season, almost double the number in 1960; but, none of them appears to be completely efficient yet under all conditions; particularly when the cane has been badly twisted and bent by storms and rain.

## AGENCY

Wool sold through Brisbane and Melbourne stores amounted to 186,600 bales; an increase of 4,000 bales over the previous year. Average

values per bale were from £1 to £2 lower. In common with the market as a whole turnover of both sheep and cattle was lower; sheep values were reduced in Queensland but were higher in Victoria; the cattle market remained firm.

I referred last year to the need to extend our existing wool store in Melbourne to provide for the storage of another 18,000 bales; and also in particular the display of a further 1,650 bales. This extension was completed in November, and modern fire protection equipment has been installed throughout the whole of the building. This with the maximum use of mechanical equipment, makes the store one of the most modern and efficient of its type in Australia.

#### FARMING AND PASTURE IMPROVEMENT

The University, CSIRO, and the Departments of Agriculture and Stock in Queensland and New South Wales have again given us valuable assistance over the year, and I take this opportunity to extend to them our thanks. Seasonal conditions in Queensland prevented any sorghum ensilage conservation; a small area was sown at Terrick Stud, but there was not sufficient rain to make a crop worth harvesting, although it was used to good advantage for grazing purposes. Two thousand acres of fallow were prepared for sowing in 1961 at Terrick Stud, Gowan, Terrick Flock and Dagworth. Reasonable crops have been harvested at the first three of these areas; but at Dagworth lack of rain and grasshopper infestation prevented any harvest. At Terrick Stud about 700 acres of pulled gidyea country has been raked and burnt, and is in readiness for sowing to buffel grass; an area of 1,000 acres of pulled mulga at Mount Morris will also be sown to buffel.

Further areas were sown to improved pastures on Tanderra, to complete treatment of the area of brigalow razed during the two previous years. Cattle grazed on oats grown under cultivation on this property were fattened and turned off during, and immediately following the winter, when prices were at their peak. The area to be sown to this crop in 1961 will be considerably extended. On Granada an area of five acres of lucerne has been established under irrigation, and 400 acres have been cultivated in preparation for dry farming. At Dalgona 25 acres will be placed under irrigation, and dry farming experiments made.

In New South Wales, the dry lucerne area at Raby has been extended and produced 217 tons for the year, as well as giving good grazing; it is proving a valuable addition to the property's natural pastures. Jemalong produced 37,000 bushels of wheat, and is also growing 140 acres of cotton experimentally, to be harvested in 1961. Tyrie crops did well—the oats produced valuable grazing and finally yielded 9,400 bushels; while a small area of wheat gave 2,800 bushels.

#### WOOL

Wool estimated to be received into Australian Wool Selling Brokers' Stores for the Season 1960-61 is 4,636,000 bales—about 300,000 bales below the record figure for 1959-60.

Estimates for each State are:

|                   | 1959/60<br>Actual | 1960/61<br>Estimated |
|-------------------|-------------------|----------------------|
| New South Wales   | 1,706,602         | 1,530,000            |
| Victoria          | 1,402,696         | 1,350,000            |
| Queensland        | 782,571           | 750,000              |
| South Australia   | 530,500           | 470,000              |
| Western Australia | 404,526           | 450,000              |
| Tasmania          | 98,711            | 86,000               |
|                   | <u>4,925,606</u>  | <u>4,636,000</u>     |

#### COMPANY MEETING REPORTS

Wool from New South Wales, Victoria, South Australia and Tasmania was generally thinner and less well grown. Western Australia provided a better quality clip than in 1959-60, while Queensland production varied considerably, according to rainfall.

Sales over the last five years were:

|                | Bales     | £ (A)       | Average<br>per lb. |
|----------------|-----------|-------------|--------------------|
| 1956-57        | 4,886,561 | 482,859,860 | 79.66              |
| 1957-58        | 4,374,694 | 337,770,554 | 62.45              |
| 1958-59        | 4,790,282 | 295,652,526 | 48.57              |
| 1959-60        | 4,929,227 | 359,429,490 | 57.92              |
| 1960-61 (Est.) | 4,670,000 | 305,301,070 | 52 (Est.)          |

Japan, with a 25 per cent share, should be the largest individual buyer of the Australian clip this season, with the United Kingdom second and France third. Eastern European Countries purchased a larger volume than in 1959-60, but did not give steady competition.

Market movements during the current season are shown by the following clean costs on Australian Show Floors:

|              | Average 64's<br>(Australian Currency) | Average 56's |
|--------------|---------------------------------------|--------------|
| 1960—June    | 111d.                                 | 90d.         |
| August       | 94d.                                  | 79d.         |
| December     | 101d.                                 | 82d.         |
| 1961—January | 96d.                                  | 83d.         |
| February     | 103d.                                 | 90d.         |
| March        | 106d.                                 | 91d.         |
| April        | 114d.                                 | 94d.         |
| May          | 114d.                                 | 93d.         |

#### AUSTRALIAN WOOL MARKETING

An endeavour to hold wool sales in every month of the selling season in 1960-61 met with a disappointing response in July, 1960, when offerings were only 100,900 bales, principally in New South Wales and South Australia. The plan will be continued in 1961-62. A greasy wool futures market opened in Sydney in May, 1960.

At the request of grower organisations, the Commonwealth Government has set up a Wool Marketing Committee of Enquiry to enquire into and report upon the present system of marketing and promotion of the sale of the Australian wool clip. The committee has already taken evidence in Sydney, Melbourne and Brisbane.

The Company has tried in a small way to assist with wool promotion; displays of woollen garments and materials (currently readily obtainable from retailers) were organised at the opening of our new Swan Hill Office in 1960, and at Terrick Stud and Flock Auction Sale early in 1961. These displays created considerable interest.

#### GENERAL

One of the main problems of the Australian economy in 1960 has been the decline in the balance of payments position. Following relaxation of import licensing in February, the volume of imports greatly increased, and this together with some inflationary and speculative trends in the economy, caused the Government to take serious measures in November known generally as the 'credit squeeze.' These measures have already caused increased demands on us for finance from our clients.

The primary producer suffers another squeeze between the steady rise in costs (many of these such as wages, rents, rates, freights, etc., being beyond his control), and a decline in prices for his product. Wool prices were not high, and cattle prices fell during 1960 affecting our pastoral and agency earnings; sugar prices in-

#### THE ECONOMIST JUNE 24, 1961

creased, although not substantially. The season was not generally a good one; and the Company's overall results were therefore good.

Australian and overseas authorities are agreed that the picture of the country's future is one of continuing development and increasing economic strength. The population has grown by 3 million since 1945 to a total of 10,400,000 at the end of 1960. It is estimated to reach 15 million by 1980 and 20 million by the year 2000. Of the increase of 3 million since 1945, immigration comprised 1,160,000 of which some 50 per cent were British.

#### DIRECTORATE

Following the sad loss to the Board last year of the Marquess of Carisbrooke, we welcome Air Vice-Marshal Sir Robert George, KCMG, KCVO, KBE, CB, MC, and Mr E. W. Tulloch, CA, who were appointed Directors on July 1, 1960.

Sir Robert, also on the London Board of an important Australian Bank, has had a distinguished service career in the First and Second World Wars, holding a number of high military and diplomatic posts, before being Governor of South Australia from 1952 until 1960. Mr E. W. Tulloch, a Chartered Accountant, has been Secretary of the Company since 1950 and has a wide knowledge of the Company's affairs and intricate tax problems.

We are confident that these appointments will be of real service to us in the years to come.

#### STAFF

Staff training has continued throughout the Company's organisation, and by regular reviews of organisation and duties, we have tried to see that our staff resources are employed in the best and most economical way possible. In most parts of our organisation salaries and wages are the major business cost, and the efficiency, loyalty and enthusiasm of our staff is one of our chief assets.

We would like to record again our sincere appreciation of the very good work done by all the Company's Australian staff at Mills, Stations, country Branches, and city Offices: they have worked hard and capably in the Company's service, and I express our keen appreciation. To this must be added in particular our thanks to the top Management Group under the ever able and inspiring leadership of our General Manager, Mr G. S. Colman. Once again we owe him and the Assistant General Manager, Mr G. H. Colman, a real debt of gratitude.

#### CHAIRMAN'S VISIT TO AUSTRALIA

During my visit to Australia in November and December, 1960, I had the opportunity to visit many of the Company's Stations, Sugar Mills and Offices in Queensland, New South Wales and Victoria.

Altogether, I travelled over 6,000 miles in Australia mostly by chartered aircraft; visiting in particular Canobie, Kamilaroi, Granada, Chatsworth and Mount Howitt, of our North-west Queensland cattle stations; Thylungra, Terrick Stud and Flock, of the Queensland Sheep stations and Buckingham, Raby and Jemalong of our New South Wales Sheep stations; as well as flying over several of our other stations, including Millungera and Dalgona.

Pleystowe and Kalamia Sugar Mills were inspected; here substantial amounts have been spent on new plant and machinery in recent years to improve capacity and effi-

#### THE ECONOMIST JUNE 24, 1961

ciency, resulting in worth-while gains in the rate of crushing per hour as well as an increase in capacity of about 60 per cent compared with pre-war. The combined output of these two Mills represents about one-twelfth of the total Australian production of raw sugar; the group ranking third in the Australian raw sugar industry.

I was able to spend some time at our offices in Brisbane, and took the opportunity to visit a number of Queensland and Victorian Branches during my tour. In Melbourne I had valuable conferences with the General Management at Head Office, and throughout my visit was able to meet Station Managers and Senior Executives of the Company, so as to learn something of their problems and ideas. Whilst in Melbourne I attended a number of Company functions, including the official opening, which I have referred to above, of the important new Wool Store extension at West Footscray, by the Premier of Victoria, the Hon. H. E. Bolte.

#### FUTURE PROSPECTS

The Company's results are always largely dependent on favourable seasons and prices, factors which are beyond our control. In 1961 so far there has been no general wet season; but some areas have received beneficial rains. In Queensland, Terrick Stud, Terrick Flock and Mount Howitt, and in New South Wales, Oolambeyan, have had good rain. At Tyrie and Jemalong the situation is satisfactory; but patchy storms have only afforded temporary relief at the other stations and relief measures will be necessary unless good general rain is received. The Northern cattle properties generally are very dry, and will have great difficulty in the winter if no relief comes.

There is every indication that the American demand for third grade beef will continue throughout 1961. Prices for first and second quality meat for export to the UK market are low by comparison; but the keen demand for beef suitable for the local Australian trade maintains competition. We expect that these three outlets will sustain prices at a satisfactory level; although these will be lower than in 1960.

Wool prices have firmed a little in recent months, and it is hoped that this improvement will be maintained for the balance of 1961 and extend into the 1961-62 wool selling season.

The season in the sugar areas has so far been dry: production is expected to be steady at about existing levels under the International Agreement. Although the future of world markets is somewhat obscure due to the Cuban situation, it does not appear likely at present that we will be permitted to increase production greatly.

On the agency side, while in Victoria the season generally should be good, it is far from assured in many parts of Queensland, so long as the present dry conditions continue.

#### FOURFOLD DIVERSIFICATION OF ACTIVITIES

Primary produce comprises 75 per cent of Australia's exports, of which 44 per cent is from wool and sheep skins, 10 per cent from meat and 3 per cent from sugar. Wheat, flour and barley account for a further 9 per cent, while metals and manufactures also amount to 9 per cent. It will thus be seen that the country is still vitally dependent on the future of wool and the maintenance of its position among the essential textile requirements of the world. However, as I have indicated on previous occasions, the

#### COMPANY MEETING REPORTS

strength of this Company lies in the fourfold diversification of its activities; namely, sheep, cattle, agency and sugar.

These are entirely connected with Australia's primary industries and production. It would seem reasonable to assume that over the years primary industry will continue to play a vital part in the Australian economy; not only from the angle of earning additional export income, which Australia needs so badly at the present time, but also to support the ever-increasing population of Australia itself. We believe that we have a vital role to play in Australia's future, and we shall continue our endeavours to fit our various products and activities into what will be most helpful, effective and beneficial to that great country.

### AMBER CHEMICAL INDUSTRIES LIMITED

#### IMPROVING OUTLOOK

#### MR D. G. N. LLOYD-LOWLES REVIEWS ACTIVITIES

The following is an extract from the chairman's statement circulated with the report and accounts for the year ended December 31, 1960:

Our "top-line" profits rose from £17,133 in 1958 to £22,423 in 1959, and for last year—1960—to £31,872, an increase of nearly 50 per cent.

After making full provisions for depreciation and the other usual items, we are left with a net profit, subject to tax, of £17,825 compared with £7,464 in 1959, nearly 150 per cent increase.

With regard to the trading position, the Group is now divided into three main Divisions, each one of which traded at an increased rate of turnover and profitability during the year under review.

These three Divisions are:

1. OILS, which include Metal Working Lubricants, Ambersil and Fuel Additives: I told you last year of our tie-up with D. A. Stuart Oil Co Ltd, of Canada and USA. This has proved of the utmost value already, and, in the view of your Board, its potential is very great. The range of cutting oils which Amber has evolved over the years, and for which it has gained an excellent reputation, continue to find acceptance amongst some of the best known names in the engineering industry, but there is no doubt that our association with Stuart has opened the door to a much larger field for the future.

2. CAUSEWAY REINFORCEMENT: The turnover and profits of this subsidiary, of which we own 75 per cent, have not only proved a record but have actually exceeded our forecasts. A sound and progressive business has been built up in our Northfleet Works, which, judging from orders in hand, will materially surpass last year's performance.

3. INDUSTRIAL CHEMICALS AND FELTS: Papermaker's felts which we have for many years imported from Canada, have more than doubled their sales and, if trials at present being undertaken by several of the leading paper manufacturers in the country are successful, we should enjoy a further increase next year, now that the import quota has been lifted.

### WESTERN SELECTION & DEVELOPMENT

The thirty-first annual general meeting of Western Selection and Development Co., Limited, was held on June 16th in London.

Mr C. J. Burns, Chairman, presided, and the following is an extract from his circulated Statement.

Members will have noted from the Report of the Directors that changes in the operation of the Company have been proposed following the successful offer made by Philip Hill, Higginson, Erlangers Limited on behalf of the Ghana State Mining Corporation to purchase shares of certain mining companies operating in Ghana.

The profit for the year ended September 30, 1960, amounting to £165,982 was not affected by this offer and represents an increase of £32,115 over that of the previous year. Opportunity has however been taken in the Accounts to revalue the holdings of the Company recently taken over by the Ghana State Mining Corporation and the resulting surplus of £265,862, together with the balance brought forward from the previous year of £90,415, make available a total of £522,259, from which sum an appropriation of £430,098 has been made against shares in and advances to Canadian prospecting and mining companies.

Your Directors recommend a dividend of 8 per cent, less income tax, and, subject to the confirmation of the Court, a further distribution by way of return of capital equivalent to 1s. per unit of stock.

This Company's business has, in the past, been concerned mainly with the acquisition, development and promotion of gold mining properties in West Africa. The records show how successful over the years these activities have been, and how much this Company has directly and indirectly assisted in the development of Ghana.

Of recent years, due to rising costs, particularly wages, and the unrealistic price received for gold, mining operations have been made acutely difficult.

The offer made on behalf of The Ghana State Mining Corporation was considered to be fair and reasonable and your Directors accepted and, as a result, the Company has received £678,000.

At the present moment it is still too early to make a complete appraisal of the possibilities of future mining operations in Canada and accordingly a reserve has been provided to cover all prospecting work to date.

#### POLICY

In recommending a distribution of 1s. per Unit of Stock by means of a capital reduction scheme, your Directors have given careful consideration to their future policy for the Company. Over the past few years the Company's portfolio has been gradually strengthened by the purchase of investments outside Ghana. This has been successful to the extent that the Company's quoted investments currently have a market value in excess of £450,000, in addition to which is the cash received from our Ghana holdings.

It is the policy of your Directors to concentrate on investment within the United Kingdom and should favourable opportunities arise, direct interests will be taken in suitable industrial and commercial undertakings.

The report and accounts were adopted.

## Review of 1960

## ROLLS-ROYCE LIMITED

The following are extracts from the statement by the Rt. Hon. Lord Kindersley, C.B.E., M.C., the Chairman, which has been circulated with the report and accounts for the year ended December 31st, 1960.

## General Review

We started the year 1960 with the knowledge that great efforts would be required to meet the production programme which had been set for aero engines and motor cars. Although a substantial increase in output was achieved in both cases it still fell short of what was needed to satisfy customers' requirements.

The increase in revenue to over £100 million is of itself encouraging but even more so is the increase in exports to £53 million. In all three divisions of your company the possibilities of maintaining our total revenue depend upon the export of our products throughout the world. However, as I have said before, increasing sums must be spent upon the development of new products if we are to maintain our rate of growth in highly competitive overseas markets.

Stockholders will wish to know about the possible implications of the Budget proposal

relating to motor cars costing more than £2,000. At the time of writing it is too early to gauge what the effect on our own business will be, but I cannot emphasise too strongly that any circumstance which jeopardises the future of Rolls-Royce cars may have repercussions which go far beyond the affairs of our Company. At a time when the importance of exports dominates the national financial scene, to risk the disappearance of an accepted symbol of British quality surely requires greater justification than has so far been made apparent.

## Dividend Decision

The last four years have seen an increase of some £20 million in the stockholders' funds employed in the business. Half of this has been subscribed by the stockholders and half has resulted from the retention of profits. During the same period many millions have been charged against profits for the development of

new products. These factors have made possible the increased revenue in 1960 and stockholders are clearly entitled to some share in this improvement. Your Board are therefore recommending that the total distribution should be increased from the level at which it has been held for the last four years.

Your Board have also considered their policy in relation to the payment of interim dividends and feel that future interim dividends should represent a larger proportion of the total distribution anticipated for the year. In the absence of unforeseen circumstances they will hope in due course to recommend an interim dividend on account of the year 1961 at the rate of 5 per cent.

The present high rate of production, coupled with the capital expenditure associated with new products and the increasing amount of business on deferred terms, has resulted in recourse to substantial bank overdraft facilities and other forms of temporary borrowing. Your Directors consider that it would be prudent to finance at least a part of the present requirements on a more permanent basis. They have therefore taken steps to increase the amount of debentures in issue by £12 million.

## Aero Engines

The first task in this division for 1960 was to recover the ground lost by the fire at Mountsorrel in 1959. It was, therefore, particularly unfortunate that all the efforts made to achieve this should have been offset by other problems and in particular those which resulted in the delay of delivery of Tyne engines. This was a great disappointment but only serves to emphasise the exacting nature of the aero engine business.

Production of engines for the British Government has continued to occupy a substantial part of our capacity during 1960. Deliveries of Conway engines for the Victor, and of Avon engines for Lightning and Sea Vixen aircraft have continued, and during the year the Lightning entered Squadron service with the R.A.F. It is of interest that Rolls-Royce engines power over thirty types of military aircraft in service with, or on order for, the armed forces of twenty-eight countries. During the year we also started delivery of Dart engines for the Argosy military freighter.

The development of the first of the new generation of by-pass engines proceeded satisfactorily during the year and the Spey engine ran for the first time. A larger version of the Conway for the Vickers VC 10 also commenced its development phase.

During 1960 we have received orders for our established range of commercial engines at nearly double the rate for 1959 and we ended the year with an increased order book.

## Motor Cars

During the year under review a record output of cars was achieved, about half of the production being exported. Generally speaking, we are susceptible to the same trade cycles as affect the British motor industry as a whole,

## Condensed Statement of Accounts for 1960

| NET ASSETS                                              |     | £           |
|---------------------------------------------------------|-----|-------------|
| Cash                                                    | ... | 690,220     |

| Net dividend (11 per cent.)                             | ... | 1,352,254   |

although for several reasons the phasing may be different. The large back-log of orders which followed the successful introduction of the 8-cylinder engine in the autumn of 1959, however, tided us over the recession experienced by the industry in general in the latter half of 1960.

## Oil Engines

Last year, after a promising start, demand slackened somewhat in mid-summer. However, in the autumn, there was evidence of a revival in enquiries for contractors' equipment, and there has also been an encouraging increase in orders for marine propulsion and generators, and other applications.

## Rail Traction

This part of our activities is extremely buoyant, particularly in the sphere of supplying engines and hydraulic transmission for industrial locomotives. An encouraging order has been secured for the propulsion equipment for 50 locomotives in Sweden. Rolls-Royce rail traction equipment is now operating in all five continents.

## Nuclear Engineering

Work is continuing by our subsidiary, Rolls-Royce and Associates Limited, in collaboration with Vickers-Armstrongs (Engineers) Limited, on the installation of the nuclear machinery in the hull of Dreadnought I and also in the land-based prototype at Dounreay.

Work is now proceeding on the nuclear compartment equipment for the second nuclear submarine. This equipment will be mainly of British manufacture and the reactor core will be produced by Rolls-Royce in a new factory in Derby which is also producing the core for the land-based prototype at Dounreay.

You will no doubt have read in the press that your company has joined forces with Imperial Chemical Industries Limited (Metals Division) and Rio Tinto Limited, to form a

The new Spey by-pass jet engine being assembled at Derby for development testing.

new company to operate in the field of civil nuclear engineering in collaboration with the Atomic Power consortia. The new company is to be called Nuclear Developments Limited.

## Rocket Motors

The Government face a difficult decision as to whether we can, with European collaboration, afford to venture into space, and the effort by the Minister of Aviation to form a European space club is quite remarkable—he is to be congratulated for his tenacity of purpose. It would be a very sad decision if we were unable to participate in this advanced technology with its great promise in regard to international communication systems.

After reviewing the Group's overseas activities, the Chairman continued:—

## The Future

The year under review has seen many new records established—the highest figure of exports yet recorded, coupled with total sales and the backlog of orders reaching new high levels.

What of the future? Our motor car business accounts for some 10 per cent. of our total sales. Our oil engines business is still in the early stages of its growth. Our earning power in the immediate future must therefore continue to be largely dependent on our aero engine business.

I am glad to say that our output of aero engines is now running at a higher figure than last year. Development expenditure will remain at a high level but I have every hope that in 1961 we will see a better return for the many millions which have been spent on the development of new aero engines in recent years.

Our efforts in the oil engine field were originally concentrated within fairly narrow limits, but each year has seen these limits extend, and I am hopeful that this trend will continue.

Finally, I express my thanks to all who have contributed to the success of our business during the year and for the excellent spirit and teamwork which has continued a feature throughout our organisation.

## CASTROL LIMITED

### GROUP SALES THROUGHOUT THE WORLD AGAIN A RECORD

#### PROFIT MARGINS AFFECTED BY HIGHER COSTS

##### MR L. W. FARROW'S REVIEW

The forty-fourth annual general meeting of Castrol Limited will be held on July 14 at Castrol House, Marylebone Road, London, NW.

In his statement which has been circulated with the report and accounts for the year ended December 31, 1960, Mr L. W. Farrow, CBE, the chairman, said:—

On August 2, 1960, the name of the Company was changed from C. C. Wakefield & Company Limited to Castrol Limited, in order that the maximum benefit might be derived from the goodwill attaching to its principal product. Since then certain overseas subsidiary companies have made similar changes and on January 2, 1961, Wakefield-Dick Industrial Oils Limited, our principal United Kingdom subsidiary, became Castrol Industrial Limited.

##### GROUP TRADING

The general picture of Group trading during 1960 was one of increased sales and lower profit margins. I am pleased to report that total sales throughout the world constituted a new record but the benefit of this additional business was more than offset by a rise in costs and operating expenses, with the result that the Group trading profits of £4,586,845 showed a reduction of £112,291 in comparison with 1959. Having regard for the fact that the Group has continued to meet fierce competition in all aspects of its trading, I am sure that stockholders will agree that the achievements of the year are not unsatisfactory.

Although it is well known that there is a current world surplus of crude oil, this situation does not apply to base lubricating oils and the grades purchased by the Group in 1960 were generally more costly than in the previous year.

Group sales of Castrol showed a further expansion last year, reaching a new ceiling, and in the United Kingdom this principal product of your company continued to dominate the branded motor oil market. This is evidence of the unequalled reputation for consistent high quality built up by Castrol over a period of more than 50 years.

Many stockholders will be aware of the decision of the Board of Trade last year to refer to the Monopolies Commission for investigation and report the solus sites system of retailing developed by the major petrol companies in recent years. We welcome this enquiry in so far as it relates to lubricants as we firmly believe that it is not in the interests of the motor trade or the motoring public for the availability of competitive products to be restricted.

##### INDUSTRIAL OILS

In 1960 the demand for the Group's industrial products showed a gratifying increase and both our subsidiary companies operating in this market in the United Kingdom, Castrol Industrial Limited and Fletcher Miller Limited, achieved higher sales than ever before. However, for the reasons that I have already men-

tioned, the aggregate trading profits returned by these two companies remained virtually the same as in 1959.

The Group's output of industrial oils is substantial and this business continues to make a valuable contribution to the overall profits.

##### RESEARCH AND PRODUCTION

In my statement last year I referred to the board's decision to establish a new Research Centre. This will be situated at Bracknell, Berkshire, and it is anticipated that the project will be completed by the end of 1962.

As specialists in lubrication for more than 60 years and the pioneers of many of the important technical advances in this field, we appreciate to the full the value of research and it is your directors' intention that this aspect of the Group's activities shall continue to receive the degree of priority that it deserves.

The United Kingdom works' developments that I mentioned last year are proceeding satisfactorily. A part of the extension at Rotherhithe should be available for use in September next and the construction of the Blancyre installation is expected to be completed early in 1962.

In order to provide for the future production requirements of the Group in the West Country, a plot of land adjacent to our Bristol works has been acquired for development in due course.

##### SYNTHETIC LUBRICANT FOR GAS TURBINE ENGINES

I am pleased to report a considerable increase in the demand for this product during 1960 and stockholders will be interested to learn that more than half the Rolls-Royce Dart engine aircraft used by civil airlines in Europe are now lubricated by Castrol 98.

In addition, this lubricant has been accepted by the Ministry of Aviation as suitable for use in military aircraft. We are the first and only British company to produce a synthetic oil to meet the requirements of the particular specification concerned.

##### OVERSEAS TRADING

In 1960 the Group's sales overseas continued their upward trend and, in the aggregate, exceeded the record of the previous year by a satisfactory margin. Due principally to the effect of higher costs and operating expenses, however, the overall trading profits derived from these operations showed a slight reduction in comparison with 1959. It is gratifying to record that, in spite of undiminished competition, the demand for our products increased in all but one of the 20 countries abroad where our affairs are conducted through branches or subsidiary companies.

It is perhaps opportune to remind stockholders that approximately 50 per cent of the Group's turnover results from its overseas business.

Due to continued adverse trading conditions

in the countries concerned, one or two subsidiary companies were again unremunerative. However, your directors are hopeful that the special attention being given to these particularly difficult markets will result in an early improvement in the position of the subsidiaries in question.

Progress is being made in the premises and plant developments in Australia and New Zealand which, when completed, will considerably strengthen our branch organisations in those two countries and provide them with sufficient productive capacity to meet future sales expansion. 1960 was a record year for Castrol sales in Australia and our branch there is actively engaged in extending its industrial oils business, where there is a rapidly increasing potential. New Zealand branch had a most successful year, achieving a new peak in both sales and profits.

In Italy, also, we have decided to erect a new production unit to cater for expanding sales. This will be located on the outskirts of Milan and will be owned by Saito S.p.A. in which the Group now has a 75 per cent interest. Our contribution towards the cost of this project will be provided entirely by Castrol Italiana S.p.A. from undistributed profits.

Towards the end of last year the parent company acquired from its former agents in Brazil, their holding of 25 per cent of the issued capital of Castrol do Brasil S.A. which has thus become a wholly-owned subsidiary. The Brazilian company has made rapid trading progress since its formation in 1956. This expansion of business, coupled with the local economic situation, has rendered it necessary for Castrol do Brasil S.A. to retain the major proportion of the profits that it has made to date.

##### SUPPLEMENTARY SUPERANNUATION SCHEME

The Group's long established superannuation schemes impose a limit on the maximum pension payable to any member. As a result of the rise in the cost of living and the growth of the Group in postwar years, the maximum pensions provided by the schemes for certain directors and senior executives are disproportionate to their current salaries. Accordingly, supplemental pension agreements from time to time have been entered into with the persons concerned and, in order to provide for the major portion of the Group's liability in this respect, the board has established a Trust Fund which has received the approval of the Inland Revenue.

Following an actuarial valuation, an initial sum of £283,055 was paid into the fund in 1960. This comprised the payment of £258,000 in respect of service prior to the year 1960 and a standard contribution for 1960 of £25,055. Standard contributions will continue to be made annually and new members will be admitted as and when they qualify.

Payments into the fund by the Company and its United Kingdom subsidiaries will be an allowable charge against profits for taxation purposes, although the allowance for the £258,000 will be spread over a period by the Inland

### THE ECONOMIST JUNE 24, 1961

Revenue. The income of the fund will also be exempt from tax.

After due consideration of the provisions of the National Insurance Act, 1959, the board decided that the Group would participate in the Government's Graduated Pension Scheme in respect of all employees in the United Kingdom.

The increased State pensions resulting from this decision will be additional to the benefits provided by the Group's private schemes.

##### ACCOUNTS AND DIVIDENDS

The consolidated net profits of the Group amounted to £1,704,947 (1959, £1,819,431).

The increased charges for staff superannuation schemes and directors' emoluments, in comparison with 1959, result chiefly from the payment of the 1960 standard contribution in respect of the new supplementary superannuation scheme.

By reason of additions to the fixed assets of the Group there is an increase of £50,266 over 1959 in the sum set aside for depreciation.

Your directors recommend the payment of a final dividend on the ordinary stock at the rate of 13½ per cent, less income tax, making a total for the year of 20 per cent which, on the capital as increased by the one-for-two scrip issue in July, 1960, compares with an equivalent of 18½ per cent paid in respect of 1959.

Preference and ordinary dividends absorb a total of £692,738 (1959, £637,884). Net transfers to reserves in the Group accounts total £971,487 which includes £921,441 to general reserve (parent company £900,000). After these appropriations the consolidated profit and loss account shows a carry forward balance of £930,017 (1959, £889,295).

It will be observed that of the consolidated net profits for 1960 a sum of approximately £1,000,000 is being retained in the Group.

Current assets of £16,574,112 exceed current liabilities and provisions by £8,596,275, virtually the same position as at the end of 1959. This is after having made payments during the year for additional fixed assets, the initial contribution to the new supplementary superannuation scheme and the purchase and cancellation of £111,243 of the company's debenture stock, amounting in all to approximately £1,000,000.

The additional cost of financing an expanding international business has inevitably led to some depletion of the liquid resources of the Group but its net assets have increased and the consolidated balance-sheet indicates a position of considerable financial strength.

On December 31, 1960, total stockholders' interests amounted to £13,264,627, an increase of £745,409 over the previous year.

The financial results for 1960 reflect a further year of satisfactory trading and development.

##### DIRECTORS

Mr W. F. List, who was appointed to the board in 1947 and who has been assistant managing director of the Company since 1952, will relinquish that office upon his retirement on December 31, 1961, after more than 50 years' distinguished service to the Group at home and abroad. I am happy to announce, however, that the benefit of his valuable experience and advice will continue to be available to the Group as he will remain a director of the Company.

Having regard for the expansion of the business during recent years and the extent to which

### COMPANY MEETING REPORTS

the interests of the Group have grown, your board considers that, in future, the weight of responsibility immediately below that of the managing director should be spread. It has been decided, therefore, that Mr J. A. V. Watson, Mr L. G. Packham, Mr C. E. R. Millidge and Mr A. A. Barr will be appointed assistant managing directors of the Company with effect from January 1, 1962. In his new capacity each of the aforementioned directors will be assigned particular spheres of special interest in the day-to-day management of the business.

##### OUTLOOK

Group sales are continuing to expand and for the first four months of the current year show an increase over the corresponding period of 1960.

Notwithstanding the increases last year in our

selling prices in the United Kingdom, which had remained unchanged since 1956, there are no indications at present of any lessening in the pressure on profit margins. The results for 1961 will largely depend upon the extent to which margins are affected by costs during the year.

##### MANAGEMENT AND STAFF

I know that you will wish me, on your behalf, to express to our deputy chairman and managing director, Mr L. M. Broadway, and his colleagues on the board our appreciation of their management of the affairs of the Group throughout 1960. Our thanks are also due to the directors of our subsidiary companies and all members of the staff of the Group, at home and overseas, without whose continued diligence and loyalty the achievements of the year under review would not have been possible.

## COMPAGNIE GÉNÉRALE D'ELECTRICITÉ

PARIS, FRANCE

(Electrical Engineering)

The Annual General Meeting of Compagnie Générale d'Electricité was held in Paris on May 31, and the following are details of the report presented by the Board of Directors:

##### REVIEW

Exports showed an encouraging increase and were 10 per cent up on the previous year. The Company's sales network now covers practically the whole world, and in the Common Market, Tunisia, Morocco, the new Republics in former French Africa, Switzerland, Spain, Portugal, the United States and Argentina, the Company is represented either by associated companies or wholly-owned subsidiaries.

In the field of research, the second stage of the group of laboratory buildings at Marcoussis was completed in 1960, and the building project is expected to be finished in the course of this year. A total of 225,000 sq. ft. of laboratory space will then be available to serve the Group's research requirements.

The total number of people employed by the Group in France amounted to 32,000. Group turnover reached N.F.1,200 million and orders placed during the year totalled N.F.1,300 million. In absolute terms the Company's turnover has doubled during the past five years.

##### PRODUCTION AND SALES

The activities of the Cable Division continued to increase satisfactorily and new orders received included a second marine telephone cable to link France with North Africa.

The Delle plant, which specialises in electrical engineering, increased its turnover by 20 per cent.

##### PROFIT AND DIVIDENDS

Net profit for the year amounted to N.F.24,370,075.78 as against N.F.20,801,926.87 in 1959, and it is accordingly proposed to distribute a net dividend of 9.03 per share as against N.F.8.77 in 1959 and Frs.853 in 1958.

The report, the accounts, and the proposals put forward by the Board of Directors were adopted.

## FITZROY FINANCE

### PROPOSED RIGHTS ISSUE

The thirteenth Annual General Meeting of Fitzroy Finance, Limited, was held on June 16th in London.

Mr H. D. Michaels, Chairman and Managing Director, presided, and the following is an extract from his circulated Statement:

The net profit for the year ended March 31, 1961, amounted to £46,404 as compared with £26,393 for the previous year. This profit compares favourably with the forecast of £43,000. Your Board recommend a final dividend of 8 per cent, less tax, making 12 per cent for the year, as forecast.

The Company has continued to make steady progress and the upward trend of new business financed is still continuing.

I fully expect that the new business transacted by us for the year ending March 31, 1962, will be in excess of any previous year. The working relationship with our associated companies ensures us a constant flow of sound new business and the amount of business placed with us by other associates in the trade is increasing and could be increased still further, if our resources permitted.

As I reported in December last, the £70,000 arising out of the recent flotation has been quickly absorbed and since then we have made arrangements to increase the Company's borrowings from outside sources. All the additional finance thus obtained has been fully utilised.

The report and accounts were adopted and resolutions were passed approving an increase of the Capital from £200,000 to £750,000 by the creation of 2,750,000 shares of 4s. each and sanctioning the capitalisation of £57,000 from Capital Reserve and £5,294 from Profit and Loss Account for the purpose of distributing fully-paid shares to existing holders in the proportion of one new share for every three shares held.

##### CHAIRMAN'S ADDITIONAL REMARKS

The Chairman, addressing the meeting, said: I have pleasure in announcing that it is our intention to maintain the dividend at not less than the present rate of 12 per cent on the new increased capital. I have already referred to the need for further capital in order to expand our business and to provide this we intend to ask your approval in the near future to make a rights issue on advantageous terms to shareholders.

## J. LYONS & COMPANY LIMITED

### INCREASING COSTS OFFSET HIGHER TURNOVER

#### MR B. A. SALMON ON CHANGING TREND OF CATERING SERVICE

The Annual General Meeting of J. Lyons & Company Limited will be held on July 4, 1961, at the Trocadero Restaurant, Piccadilly Circus.

The following is the Statement by the Chairman, Mr B. A. Salmon, which has been circulated with the Report and Accounts for the year ended March 31, 1961:

In December last, Mr I. M. Gluckstein expressed the desire to relinquish the office of Chairman of the Board which he had occupied since July, 1956, with distinction to himself and to the inestimable benefit of the Company. In deference to his wish, his resignation was accepted, and he was appointed to the office of President. I am pleased to say that he is remaining on the Board, and we shall thus continue to enjoy the benefit of his exceptional experience.

It is with deep regret that I have to record the death, during the year, of Mr A. H. Salmon. He took an active part in the running of the business until shortly before his death. He served the Company throughout his business life, and possessed an outstanding technical knowledge of the catering trade. He is sadly missed by his colleagues on the Board and the staff who worked with him.

During the year, Mr Brian Salmon was appointed an Ordinary Director of the Company. He is a son of the late Mr Julius Salmon, and, like all members of his family, was born and bred in the business. He has had a long training in all important activities of the Company, and for some years has been a General Manager. In accordance with the Articles of Association of the Company, he holds office until the forthcoming Annual General Meeting, and will then be eligible for re-election.

#### THE YEAR'S TRADING

From the Company's Profit and Loss Account it will be seen that the balance from trading account is £4,808,200, compared with £5,583,951 for the previous year, and the net profit for the year is £1,036,907, compared with £1,399,255.

We propose the payment of final dividends at the same rates as last year on the Ordinary, the "A" Ordinary and the Proportional Profit capital which, with the interim dividends paid in December last, will absorb £610,055. The dividends paid and accrued on Preference and Preferred Ordinary Stocks amount to £315,935. The balance of the net profit for the year is £110,917; after adding the balance brought forward from the previous year, there is a balance of £561,503 carried forward in the Profit and Loss Account.

This year's profits are disappointing. Although turnover was higher than in the previous year, the increase was not as much as we expected when we planned our expenditure, the poor summer of 1960 contributing to this shortfall.

The cost of some important raw materials rose; other costs, including wages, increased, and these factors more than offset the profit from the increase in turnover. We have continued our policy of offering the best value to the public, and this involves holding prices down as long as possible. We are confident that this is the right policy for the Company, though it may at times adversely affect profits.

#### ROLLS CONFECTIONERY LTD.

We recently came to the conclusion that to make progress in our chocolate and sugar confectionery business it would be essential to operate on a much larger scale. To do that meant either investing heavily in promotion and advertising, or acquiring one or more companies to add to our subsidiary, Rolls Confectionery Ltd. The alternative was to withdraw from the business altogether. We came to the conclusion that our resources would be better applied to the expansion of other divisions of the business, and that withdrawal was the more advisable course. Accordingly, in May last, we entered into an agreement with Callard & Bowser Ltd., a subsidiary of Arthur Guinness Sons & Company Ltd., whereby on July 1st they acquire the goodwill, trade names and manufacturing facilities of our chocolate and sugar confectionery business. The manufacture of chocolate couverture which is used by our own departments and subsidiary companies, and of the Maison Lyons range of chocolates and confectionery, will continue unchanged.

#### CATERING

The rising standard of living offers further opportunities for the expansion of our substantial catering business. In order to take advantage of these opportunities, we have to try to assess the changing requirements of the public, and then to provide economically what is wanted. Such assessment involves decisions on the type of meal to be served and the form of service to be used, namely, waitress service, counter service, self-service, or a combination of these methods. The speciality restaurants at our Corner Houses show how these factors can be balanced; they are an adaptation of fundamental catering principles to changed conditions. This is a process which must go on all the time, and we believe catering in 1980 will differ as much from catering today as the present form of catering differs from that of 1940. We have already announced our plans to extend to other areas the form of catering which has been successful in the West End of London, and a beginning has been made during the year under review with the opening of the London Steak House in Baker Street, and a modified Corner House in Notting Hill Gate. As a result of our experience, we plan to open twenty-five or more Steak Houses in locations within a fifty mile

radius of London. The capital expenditure to carry out this programme, although spread over several years, will be high.

It is our intention that the Steak Houses should be fully licensed but unfortunately it is still difficult to obtain a licence, even one restricted to serving liquor with meals. Here I would mention that it is not the volume of sales of alcoholic drinks in this type of restaurant which is so important as the right of a customer to enjoy a drink with a meal, if he wishes. We are hopeful, therefore, that the Licensing Bill now before Parliament will become law in a form which will put an end to these difficulties.

Now I turn to our unlicensed establishments. These serve a whole cross section of the public, and are an accepted form of popular catering which constitutes an established feature of twentieth century life. Here again tastes change, and we are devising, within this range of unlicensed establishments, various types of service which will be developed during the forthcoming year.

Throughout the whole of our catering business, we serve more than three million meals every week, and to do this we must maintain a large staff. It follows that we have to be efficient in the use of staff, and be able to train them quickly. The streamlined menus of our speciality restaurants enable us to train in a comparatively short period the staff necessary to prepare and cook perfectly a limited range of dishes. The speciality restaurants and simplification of menus lead to economy in the use of labour, equipment and space, and thereby enable us to charge lower prices than if we served a wider variety of dishes.

But there are still many customers who prefer a more comprehensive menu on classical lines; we continue successfully to provide for them, notably at the Trocadero and in our Banqueting and Outdoor Catering Services.

#### EXPORT, OVERSEAS BUYING

Because of the vital need for this country to increase its exports, it is appropriate to make a reference to our own activities in this field. The scope for exporting finished food products is limited, and is continually being restricted by the action of foreign governments; nevertheless, we are constantly exploring all possible overseas markets, and our representatives and executives travel extensively to explore markets for Lyons products. We now sell our products through subsidiaries or agencies in more than seventy countries, and thereby make a useful contribution to the economy of the country.

Some months ago, the government of Ghana announced that no licences to cocoa buying agencies in that country would be renewed. We had for many years a buying organisation there, which is consequently now being closed.

#### LEO

Our subsidiary company, Leo Computers Ltd., continues to progress. The computers employed on service work are earning their keep, and our activities in this direction are still expanding. The first Leo III is almost complete, and we are pressing ahead with the sales of this latest model. We are going on with the development of the computer business, though it may take several more years to achieve its full growth.

#### PENSION SCHEME

Under the National Insurance Act, 1959, a

new graduated State Pension Scheme came into effect in April, 1961. After careful deliberation with our Pension Consultants, it was decided not to contract out of the Government Scheme. The Company's Pension Fund, which provides an additional pension on retirement, will continue, as will the death benefit provided by the Company in connection with it.

#### STAFF

In conclusion I wish to express my appreciation and that of my colleagues on the Board, for the enthusiasm with which the staff have

carried out their work during the year. An example of this fine spirit was given, by the staff of our Outdoor Catering Department, at the official opening of the Esso Refinery at Milford Haven last November. On the eve of the opening, a violent gale laid waste our specially prepared catering arrangements, but with the splendid co-operation of the staff of the Esso Refinery, who made alternative accommodation available to us, our own staff completed the catering on schedule. I know stockholders will wish to join me in thanking the staff of the parent company and subsidiaries for their continued loyalty and support.

## FINANCE CORPORATION FOR INDUSTRY

### CONTINUED GROWTH IN ADVANCES

### NEW BUSINESS AMOUNTED TO £10M.

The sixteenth annual general meeting of Finance Corporation for Industry Limited was held on June 21st in the Conference Hall of The Chartered Insurance Institute, 20, Aldermanbury, London, EC2. The Lord Sinclair of Cleve, KCB, KBE (the Chairman), presiding.

The following is the Chairman's Statement which had been circulated with the report and accounts:

The accompanying accounts cover the year to March 31, 1961. During the period a further £19,550,000 was advanced to clients. Repayments during the year totalled £4,250,000 with the result that outstanding loans (less provisions) rose from £44,510,000 to £59,810,000—the increase being financed almost entirely by further borrowings from our Bankers.

New business entered into during the year amounted to £10 million but this is not yet reflected in the accounts. At March 31, 1961, the outstanding commitments had fallen to £14,500,000—a decrease which results from the taking up of instalments of loans previously negotiated. There were, however, several new projects under consideration at the date of the Balance Sheet.

As will be seen from the Profit and Loss Account, the amount of interest receivable less interest on advances from Bankers is £1,165,179, an increase of some £530,000. This increase reflects the growth in the total sums advanced to clients over the last two years. Other Income is a very small figure this year but this item in the accounts is largely unpredictable.

The charge for Taxation is substantially higher at £591,775. This year there is no relief, as there was last year, in respect of losses in previous years.

#### PROFIT AND LOSS ACCOUNT

Profit for the year after Taxation amounts to £563,126 and, together with the surplus brought forward at the beginning of the year, makes a total available for appropriation of £835,342. It has been decided to transfer £750,000 to General Reserve and it is proposed that a dividend of 6 per cent should be paid to the Shareholders, thus leaving a balance of £66,967 to be carried forward in the Profit and Loss Account.

We consider that none of the outstanding loans or commitments need give cause for

anxiety, and I hope that in the coming year there will be further opportunity for the facilities which the Corporation can provide being used profitably and to the benefit of the national interest.

#### CHAIRMAN'S ADDITIONAL REMARKS

Addressing the meeting, the Chairman said: My Lords and Gentlemen, the Report and Accounts have been in your hands for some three weeks and I propose with your permission to take them—and the Statement that goes with them—as read. (Agreed.)

The Directors' Report records the very deep regret of the Board at the death on August 19th last of Lord Weeks. Lord Weeks was one of the leading industrialists of his generation: he served his country with great distinction in the two world wars; and he had an outstanding record of public service—notably, after the second war, his contribution to the development of technological education. He was one of the original directors of this Corporation and succeeded Lord Bruce as Chairman in 1957. The Corporation owes much to his wisdom and leadership and his qualities of mind and heart were such that his memory will long be an inspiration to all who were privileged to work with him.

The Directors' Report also records the appointment of Sir Archibald Forbes to the Board. Sir Archibald was previously a Director of the Corporation from 1950 to 1953 when he resigned on his becoming Chairman of the Iron and Steel Board. His wide experience of industry and, in particular, his knowledge of the Iron and Steel Industry in which the Corporation is largely interested will be of great value to the Board.

On the results of the year there is very little to add to my Statement which accompanies the Accounts. As Lord Weeks explained last year we cannot disclose details of transactions with clients. It is, however, still true that finance in connection with developments in the Steel Industry constitutes the greater part of our business. In general these developments are proceeding satisfactorily—indeed in some cases they are ahead of schedule.

The amount of interest received less interest paid on advances from Bankers has shown a substantial increase. This in part arises from the increase in advances made to clients during

the year but it is also a reflection of the saving in our interest charges as a result of the amount paid in advance of calls by the Bank of England in 1958 and by the use of the Corporation's own resources.

Although the Board have no reason to question the security for the outstanding loans or commitments at present on our books it is in the nature of our business if we are to fulfil the purpose for which the Corporation was set up, that we assist the development of projects of national importance which cannot for one reason or another obtain at the time the necessary finance through normal channels. We therefore consider it wise that we should as and when we can seek to build up reserves. With the transfer of £750,000 from Profit and Loss Account this year the General Reserve now stands at £1,750,000.

We have several new projects under consideration at the present time. I have no reason to anticipate that the results of the current year will be less satisfactory than those now before you.

In conclusion—and on a personal note—I would like in the first place to express to my fellow Directors my warm appreciation of the help and support they have given me since I became Chairman and, secondly, on their behalf as well as on my own to convey to Mr Nelson and his Staff our sincere thanks for all that they have done for the Corporation during the past year.

The report and accounts were adopted.

The retiring directors, Sir Archibald Forbes, GBE, Mr John Anthony Pollen, Mr Charles William Allan Ray and The Lord Sanderson of Ayot, MC, were re-elected; the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths & Co., was duly fixed and the proceedings terminated with a cordial vote of thanks to the Chairman and Directors proposed by Mr C. N. Knight and seconded by Mr K. G. Drummond.

# MINERALS SEPARATION LIMITED

## MR. J. N. BUCHANAN'S STATEMENT

The fifty-sixth Annual General Meeting of Minerals Separation Limited will be held on July 12th at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

The following is an extract from the Statement by Mr J. N. Buchanan, the Chairman, which has been circulated with the Report and Accounts for the year ended December 31, 1950:—

The Gross Profits of the Group this year reached a new record of £1,331,219 as against £1,108,161 last year which in itself was the highest profit attained by the Company up to that time. In view of the general buoyancy of the revenue, we think it fair that shareholders should not be denied their share in this increased prosperity of the Company. We therefore propose a Final Dividend of 11d. per share, making with the Interim of 4d. per share already paid, a total amount of 1s. 3d. per share for the year. Over-all capital and reserves have risen from £408,158 to £534,510, an increase of £128,352, mainly due to last year's capital issue. The dividend this year is payable on the larger capital resulting from the Rights Issue made last year. It should be remembered that

we only had the use of this new capital for less than half of the year.

## DEBENTURES

We made an offer to purchase the outstanding Debentures at a discount in September last and the offer was accepted by all holders. The resulting credit of £48,310 you will see has been added to Reserve in this year's Balance Sheet.

## TAXATION

As reported last year, we had lodged an Appeal against the Provisional Assessment made upon us for 1958, which was based on capital gains resulting from the sale of some of our investments. This Appeal was heard in October last before the City of London Commissioners who discharged the Assessment.

## GENERAL REVIEW

For some years it has been our custom to attach to the Annual Statement a 10-year summary of Group Balance Sheets, Profits and Dividends. This year the summary covers 11

years so as to retain 1950 which is significant as the last year of the old capital. Those of you who have been shareholders for some years—and we are proud to know that many of you have been of that order—may remember that in our 1955 Jubilee Report I gave you a more comprehensive picture of the policy and progress of the Company over a period of some years than can readily be done in the relatively short period of one year. I propose to repeat that precedent and to give you a general review since 1956.

In those four years, our capital and reserves have grown from £2,662,000 to £5,341,000. This only takes in quoted investments at Balance Sheet figures; if market values were substituted the comparable figures would be £3,166,000 and £9,731,000.

As a large part of our assets are invested in unquoted securities, of which it is difficult to estimate the real capital value as against book value at any one date, it is not possible to give an accurate percentage distribution showing where all the capital is employed. We can, however, compare the revenue received from the four main divisions detailed as under.

1. Foseco (formerly Foundry Services).
2. Mercury Securities.
3. Investment Trust portfolio.
4. Other subsidiary and allied companies.

1. *FOSECO*. Last year about 53 per cent of our total revenue came from this source.

Minerals Separation first acquired 20 per cent of the Ordinary Capital of Foseco in 1944, another 30 per cent in 1953, a further 10 per cent in 1956 and finally, 20 per cent in 1959, when the original 15 year contract and pooling arrangements came to an end. We therefore now hold 80 per cent of the issued Ordinary Capital of Foseco. It was not until the end of the war in 1945 that Foseco could seriously begin to expand their opportunities in countries outside the United Kingdom. Moreover, old-standing Agency agreements entered into in earlier years hampered growth in some countries, particularly in the USA. Until these difficulties were dealt with, full use could not be made of the Foseco methods and organisation. It was not, therefore, until the early '50s that material progress was reflected in rising Group turnover. Such turnover amounted to over £1,000,000 for the first time in 1952. By 1955 £2,000,000 was recorded, by 1957 £3,000,000 and by 1959 £4,500,000. Last year Group turnover rose to £6,000,000. Despite the ever-increasing costs, the profit margins have, overall, remained satisfactory.

**2. MERCURY SECURITIES.** Although the dividend received from our holding in this company accounted for only about 5 per cent of our gross revenue, the market value of our holding at the end of the year was about £3,800,000 and at the time of writing this Report it is still higher. As stated in past years, our policy has been to maintain a holding of about 15 per cent in the Ordinary issued capital of Mercury Securities. In view of the substantial rise in the market valuation, the income return on our holding is small. It is, moreover, in our opinion necessary at all times to keep a reasonable balance between the various sections of our assets. For these reasons, while we intend to maintain a substantial interest in Mercury Securities, we no longer feel that we should be bound by a rigid 15 per cent or any other definite percentage.

3. INVESTMENT TRUST PORTFOLIO.  
Last year this contributed about 25 per cent  
of our gross revenue.

**4. OTHER SUBSIDIARIES AND ALLIED COMPANIES.** These companies together contributed about 17 per cent of our gross income last year.

As I emphasised in my Jubilee review in 1955, the essential factor that we look for in acquiring interests in subsidiary and allied companies is good management. In the following review I have included after each company the name of the individual mainly responsible for the conduct of the particular company concerned. Their names are all outstanding in their particular fields and their success has increased our confidence that the principle underlying our policy is sound.

(a) ANGEL HILL INVESTMENTS. (*Mr I. W. Adler and Mr J. O. Adler.*) This group, which combines Modern Engineering (Bristol), Modern Concrete (Bristol) and A.T.A. Industrial Company, specialises in structural steel, large span buildings, the fabrication of A.T.A.

hyperbolic shells, and are the sole UK licence holders for the patent roof construction based on the Silberkuhl system. Although competition was severe and in some cases, therefore, the margin of profit was lower, this was compensated for by increased turnover. Over-all, results for all the companies were good and the 1961 order book has started in good shape.

(b) J. W. JACKMAN & COMPANY. (Mr. F. W. Neville.) The recession in the Foundry industry was felt by Jackman towards the end of 1959 and early in 1960, but despite a poor start, the output for 1960 was better than for 1959, although here again the profit margin was somewhat lower. The value of orders in hand at the end of the year was satisfactory.

(c) LEIGH KNIGHT (BRADFORD). (*Mr M. B. Leigh.*) This company had a good year with results rather better than those of the year before. Their order book is in good shape and their general prospects remain good.

(d) **HOWARD POTTERY.** (Mr *D. K. Bailey.*) During the course of the year Howard Pottery sold a subsidiary, Kirkhams Limited. The integration of Sudlow, which was acquired last year as mentioned in my Report, has proved rather slower and more difficult than had been foreseen with the result that profits for the year were a little lower than we had expected.

(c) VOSPER. (*Commander Peter Du Cane.*) This is a public company whose report is readily available. Although the company showed a loss for 1960, this is essentially a business in which it is necessary to take a view over a period longer than one year. The company maintains a research and development team and other skilled labour. These all enjoy a very high reputation and it would in our view be foolish to reduce their number and efficiency merely because at times the company's order book was low. As their Chairman states in his report, this is now better balanced and they have grounds for reasonable optimism for the coming year.

(f) SHERMIN INVESTMENTS. (*Embracing Medical Supply Association.*) (*Mr Peter Sherwood.*) In 1960 Medical Supply Association made a good start under its new management. There was a substantial increase in the production and profits. The company became the sole distributors in the UK for the American Steriliser Company of Erie, Pennsylvania, the largest manufacturers in the world of sterilising and operating theatre equipment. In partnership with them a new company has been formed in the UK to manufacture these goods in which Medical Supply Association has a 40 per cent holding. During 1960, Medical Supply Association also acquired all the share capital of W. H. Bailey & Son, a company that, amongst other activities, is contractor to the Ministry of Health for a range of products including surgeons' gloves. Considerable success was achieved in the sale and distribution of the products of Air Shields, Inc., of Harboro, Pennsylvania, for whom Medical Supply Association act as agents in this country. M.S.A. also became the sole distributors in the UK for the American Cystoscope Makers, Inc., the leading manufacturer in the world of all endoscopic instruments. The year 1961 has started with considerable increase in turnover for the first quarter.

**PERSONNEL.** It remains only for me to thank those in all the above companies and those here in our Head Office, whose successful work during the year is shown in the results we put before you today.

LAMBERT BROTHERS  
LIMITED

## ANOTHER SUCCESSFUL YEAR

The fifty-eighth annual general meeting of Lambert Brothers Limited was held on June 22nd in London.

The following is a résumé of the statement issued to the Stockholders by the Chairman, Mr R. Rattcliff Steel.

I am pleased to be able to report upon another successful year's trading by your Company. I have stated in past years that we derive much of our prosperity from the activities of our Shipowner friends who in turn depend on the state of the freight market for their success. Shipping during 1960 again had to contend with many difficulties. Although some improvement in the level of freights was maintained over much of the year the effect of the continuing surplus of available tonnage in both tanker and dry cargo sections of the industry combined with the rising costs of operation has prevented any marked return to prosperity for shipowners. We must hope these difficulties will be resolved with the passage of time.

The Consolidated Accounts for 1960 show a net profit of £284,726 after charging United Kingdom Taxation £205,469. The profit for the previous year contained a taxed provision of £67,500 no longer required; thus a true comparison of the net trading profits shown is £284,726 for 1960 and £244,159 for 1959.

In these circumstances the Board feels justified in recommending the maintenance of the final dividend at 17½ per cent making with the increased interim dividend of 7½ per cent a total of 25 per cent against 22½ per cent for 1959. It is proposed to increase the General Reserve by £50,000 to £900,000 and to carry forward on Profit and Loss Account £602,481.

It is further proposed to make a distribution of  $1\frac{3}{4}$  per cent out of Realised Capital Accretions.

All sections of the business have contributed to the not unsatisfactory result of the year's trading. The Temple Steamship Company had a better year, the fleet being fully employed at somewhat improved rates. Lambert Brothers (Insurance) Limited continues to expand its sphere of operations in the Marine and Non-Marine fields at home and overseas. The development of new ideas has further increased the prestige of the Company. The London & Overseas Insurance Company Limited, under the management of our Insurance subsidiary, has made a good recovery from a period of poor results. The finances are in a sound condition and the Directors' confidence in the future has been shown by the recommendation of an increased dividend.

I have mentioned in previous statements that the activities of the Group are devoted to the provision of a comprehensive service to our worldwide clientele in shipping and other spheres. Our aim is to expand this service constantly to meet the needs of our friends not only by the setting up from time to time of new sections but also by welding the whole organisation into a co-ordinated team working together in the interests of the Company and our clients. This is achieved by the wholehearted effort of our most efficient staff. The loyalty of our friends is the measure of our success in this.

The report was adopted.

### SUMMARY OF GROUP BALANCE SHEETS, PROFITS AND DIVIDENDS, 1950 TO 1960

[illegible]

# KUALA LUMPUR-KEPONG AMALGAMATED LIMITED

## MR H. F. COPEMAN ON GROUP'S EXPANSION

The fifty-fourth annual general meeting of Kuala Lumpur-Kepong Amalgamated Limited was held on June 15 in London, Mr Harold F. Copeman (chairman and managing director) presiding.

The Chairman stated at the Meeting:

In amplification of my statement issued with the Report, I have to advise you that the total crop harvested from all the estates in the Group amounted to 23,204,265 lb for the eight-month period from 1st October last to 31st May, which shows an increase of just over 100,000 lb over the comparable period in the previous year. I think it is desirable to point out, however, in giving you these figures, that they will not agree with any figures you may be given in the next Annual Report, because of the different accounting dates of the new subsidiaries; I give them merely as an indication of progress.

Although this is a rubber producing Company, we have in the past had a fairly large income from tin in respect of the areas leased off to mining companies. Over the past two or three years this income has been negligible, in view of the incidence of the tin restriction scheme. Operations have, however, been resumed, and I hope to see a considerable increase in receipts, at any rate for the next few years.

I am, however, a little surprised at the delays which occur in applications to the Government for variations of leases. In the case of one of the areas leased for tin, application has been made by the mining company for a variation of the lease (which was granted only for dredging purposes) to allow open cast mining in view of the improved methods and the prospects of recovering a greater amount of tin. It is eight months since the application was made and we are still waiting to hear the result. This delay is somewhat inexplicable when we consider the recent reports about tin areas rapidly being depleted, the considerable amount of new prospecting that is being done and, above all, the urgent need of Malaya for the revenue accruing therefrom. This application if granted will improve to a small extent our revenue from tin.

Another matter of delay in regard to mining arises from an application for conversion from an agricultural lease to a mining lease, which was made some seven months ago, in respect of an area we had sold for Iron Ore Mining, the sale being subject to conversion of the lease. The latest news of this is that it is expected to come before the State Council later this month. If this application is successful, it will mean an accretion of approximately £140,000 to our cash balance, a welcome addition in view of the large replanting programme still ahead of us.

We have had one or two inquiries as to the dividend policy and in reply I have said that the policy as expressed in the circular of the 31st October last to the shareholders of Kuala Lumpur and its present subsidiary companies still stands: that is to say, that we propose to pay an interim dividend in September next. It is anticipated that this interim dividend will

be 5% net, which is equivalent to just over 8% gross. It will be appreciated that the fall in the price of rubber will affect the dividend policy of all Plantation Companies.

### GROUP EXPANSION

In his circulated statement to shareholders the Chairman stated:—

Before dealing with the activities for the year under review it may, I think, be of interest to our many new shareholders if I briefly review the expansion of our Company, particularly in the course of the past few years.

Early in 1957, we held our fiftieth annual general meeting and a short review of the fifty years' working accompanied the report and accounts for that year. During those fifty years the issued capital was increased from its initial figure of £180,000 to £462,250 and the planted area from 1,582 to 9,683 acres. The following year a small increase was shown both in capital and acreage. At the annual meeting held in 1959 we reported an increase in the issued capital to £685,665 and in area to 13,628 acres, following on the acquisition of the balance of the capital of the Sungei Chermang Rubber Company in which we held a large minority shareholding and which is now in voluntary liquidation.

In August, 1959 offers were made for the capital of the Jeram and Tamiang companies, followed in November of the same year by an offer to the stockholders of Eastern Sumatra, with its wholly owned subsidiary, Sungei Kahang. As a result of those offers we now hold 84.1 per cent of the Jeram share and debenture capital, 97.9 per cent of the Tamiang capital and 100 per cent of the capitals of the Eastern Sumatra and Sungei Kahang companies, and our issued capital was increased to £1,398,796 and the planted area to 33,770 acres.

It is interesting to recall that the Jeram company also has a history of expansion prior to its acquisition by this Company. In 1955 Jeram purchased the Seventh Mile Estate of 1,257 acres, in 1957 Coalfields Estate of 1,139 acres and at the end of 1958 Tuan Mee estate of 1,484 acres. With those acquisitions and with new plantings Jeram increased its planted area from 2,441 to 6,707 acres.

Bringing the history of Kuala Lumpur up to date, offers were made on October 31st last to the members of the Caledonian (Selangor), Glen Muar, Kepong (Malay), Kuala Kangsar and Tanjong Malim companies, following on which our issued capital has been increased to £3,438,157 and the planted area controlled in the East to 83,395 acres. With the exception of 8,703 acres in Sumatra all the areas to which I have referred are in Malaya, but one must not overlook the Kepong subsidiary, Oban (Nigeria) Rubber Estates with 6,886 planted acres, and the other shareholding interests in plantations in Nigeria.

With the acquisition of Kepong and the other companies in the latest amalgamation Kuala

Lumpur's name was changed to Kuala Lumpur-Kepong Amalgamated Ltd.

### ACCOUNTS

The extent of our interest in the main subsidiary companies is given in the report and I need only add that Kepong Plantations, Buntar and Oban are subsidiaries of Kepong (Malaya) and that, following on a reduction of the capital of Eastern Sumatra, the Sungei Kahang company is now a direct subsidiary of Kuala Lumpur-Kepong Amalgamated. It will be appreciated that the accounts now submitted to you cover only the companies in the group at September 30th last and take no account of the latest amalgamations. In addition to the profits which have accrued from the estates directly owned, we have taken into account the following:

**Jeram.** A dividend of 9d. per share gross, equivalent to 37½ per cent.

**Tamiang.** A dividend of 15 per cent free of tax equivalent to 24½ per cent gross.

**Eastern Sumatra.** A dividend of 35 per cent gross the profits from which this dividend was paid included the profits of the Sungei Kahang company. In addition to that dividend, account is also taken of a capital distribution of £20,000 from profits realised by the sale of investments.

I take this opportunity of reporting that a remittance of £27,513 has recently been received from Indonesia, being the remittable profit for 1957.

**Kuala Lumpur.** It will be recalled that, in view of the offer made on October 31st last to acquire the shareholdings of other companies, an interim dividend was paid on December 5th and it was stated at the time that no final dividend would be paid. The reason for that was, of course, that the shares issued in respect of the offers were made *pari passu* with the existing shares of Kuala Lumpur excepting that they carried no entitlement to that dividend.

### ESTATES

Since the close of the financial year a number of my co-Directors and myself have been to the East. We took the opportunity of visiting the estates of the Group, and indeed I visited all our estates in Malaya and the Bukit Maradja estate in Sumatra. It was not possible in the time at my disposal to examine every estate thoroughly, my aim being to obtain a general picture of all the estates and to meet the staff. I am able to report that we found them all, on the whole, in good condition and efficiently managed.

### POLICY

The acreage statement annexed to the report shows that out of nearly 75,000 acres held in Malaya, there are nearly 29,000 acres of old rubber; this means that 39 per cent of our Malayan rubber has still to be replanted. It is essential, if full competitive power is to be available against the synthetic products, that this old

rubber be dealt with as quickly as possible. The rate of rejuvenation must, however, depend upon the finances available and in that connection it must be borne in mind that the replanting of any given area involves expenditure which gives no return for some six to seven years. It may well be that this period will be shortened by as much as two years, if some of the new clones now under test by the Rubber Research Institute should live up to their promise. The period of immaturity can also be reduced by the use of selected clonal seedlings and advantage will be taken of the best material that may be available from time to time.

With a view to diversification it is proposed to replace some of our old rubber with oil palms. Preliminary reports indicate that soil conditions on one of our larger estates are satisfactory and it is hoped to make a start before the end of this year. One advantage of oil palms is that they mature in three to four years.

### GENERAL

So far as concerns the future, it is generally agreed that world consumption of rubber over the next ten years will steadily increase; it is obviously in our interest that as much as possible of the demand must be met by natural rubber. That demand, however, will only be met to the utmost by natural rubber if the price is competitive with synthetic, and that can only be done, so far as one can see at present, by increasing the yield per acre, which in its turn means a progressive replanting policy. One is sometimes apt to forget that in ten years hence the rubber replanted in the late 1930's will be over 35 years old and past its prime. It is essential, therefore, that all companies build up and maintain ample liquid resources so as to ensure that replanting can continue even if profits should be seriously reduced.

As you are aware, our principal interests are in Malaya. Up to the present every encouragement has been given to the plantation industry by the Malayan Government. Having attained self-government it would not be unnatural if first thoughts tended towards their own nationals rather than towards expatriates. It is only proper to say that there has been so far no undue bias against the European and so long as that continues we shall be able to play as valuable a part in the economic welfare of the country as in the past.

### DIRECTORATE

Since our last general meeting Mr Marshall, Mr Scott and Mr Simpson have joined the Board and, in accordance with the Articles of Association retire from office. Mr Douglas and Mr Calver also retire from office. I take this opportunity to thank them for all their support and advice and cordially recommend their re-election.

In conclusion, I have also to express our thanks to our Local Agents, Visiting Agents, Managers and Staff for their hard work and loyal co-operation throughout the year. I would pay a special tribute to Mr Holms who, for very many years was manager of Eastern Sumatra's estate in Sumatra. For the past few years he has been the General Manager and Visiting Agent of our Agents in Sumatra and has now retired after over 35 years in Sumatra. His services, particularly since the war, have been extremely valuable and we wish him a long and happy retirement.

The report and accounts were adopted.

## THE "SANITAS" TRUST, LIMITED

### RECORD SALES

The thirty-fifth annual general meeting of The "Sanitas" Trust Limited, will be held on July 11th in London.

The following are extracts from the circulated statement of the chairman, Mr Charles Sweeny:

I am pleased to report the complete reorganisation and augmentation of our sales staff at home and abroad; a substantially increased advertising and sales programme and the introduction of a new system of parcels discounts; a general overhauling and re-equipping of our accounts and administrative services; the repackaging and presentation of a large number of our established lines and, perhaps most important of all, the considerable amount of research has been done throughout the year on the creation of new lines, which it is intended to introduce to the market very shortly.

These changes have been carried through comparatively smoothly and overall sales of your Company's products during the past year have exceeded the record set up in 1957.

### TRADING RESULTS

The Consolidated Trading Profit for the year (including Investment Income of £97,547) amounts to £507,558 after all charges except Taxation. This compares with £483,045 for last year and is, in fact, rather better than the previous highest Profits earned by your Company in

1957. Your Board consider this quite satisfactory, especially in view of the fact that a substantially increased advertising programme has been carried out, the benefits of which do not immediately accrue. Operating expenses have also increased during the year, and a new Pension Scheme has been introduced.

Provision for Tax requires £237,673, after taking credit for provisions in prior years no longer required, amounting to £10,926, leaving a Net Profit for the year of £269,885 available for dividends and Reserves. This figure compares with £251,418 last year. Your Directors recommend a final dividend of 30 per cent. The total dividend for the year of 45 per cent compares with the equivalent of 34.6 per cent paid in the previous year on the capital as increased by the Bonus Issue of 3 for 10. In addition, your Directors recommend a Bonus Issue on the basis of one Ordinary Share of 2s. each, credited as fully paid, for every ten held.

The year under review has seen some substantial changes within the framework of your Company, but your Board are confident that these changes have improved our overall efficiency and prospects. We shall continue to press for more sales and we intend allocating increasing sums to advertising, both at home and abroad. This expenditure should have a cumulative effect on sales and is really a long-term investment.

In this year your Company has achieved record sales and profits which, though very satisfactory, makes the future more than usually difficult to foretell. Your Board are quietly confident that in the forthcoming year your Company should continue to enjoy a further overall improvement.

## BANCO DI NAPOLI

Head Office: NAPLES, ITALY

The Annual General Meeting of the General Council of the Banco di Napoli was held on April 24, 1961.

The volume of Deposits, Savings Accounts, and Current Accounts at December 31, 1960, amounted to Lire 693,737,108,663 which represents an increase of 18.87 per cent over the 1959 figures.

Net profits reached the figure of Lire 806,387,509. After distribution, the capital and reserves of the Banco di Napoli amount to Lire 19,545,941,443.

Board of Directors.—Chairman: H. E. Prof. Ep. Corbino. Vice-Chairman: Ing. Costantino Cutolo, Cav. del Lav. Gen. Manager: Dott. Stanislao Fusco, Cav. del Lav.

### BALANCE SHEET AT DECEMBER 31, 1960

| LIABILITIES                              |                | Lit.              |  | ASSETS                                 |                 | Lit.              |  |

# WIGGINS TEAPE GROUP

(WIGGINS, TEAPE & CO. LIMITED)

Makers of Gateway Papers

## ANNUAL REPORT AND ACCOUNTS OF THE WIGGINS TEAPE GROUP FOR 1960

The Wiggins Teape Group produce in their own mills and factories a wide variety of papers and paper products. Some of the more important uses are:

### PAPERS FOR EVERY OFFICE REQUIREMENT

Writing, ledger, airmail, copy, duplicating, blotting, translucent for photocopying, base for punched cards, index and ivory boards. Papers for continuous stationery and office forms.

No carbon required paper for copies without carbons. Personal and commercial envelopes and stationery.

### PAPERS FOR PUBLICITY

Coated Art and chromo, gummed, letterpress, offset and gravure papers. Cover papers.

### PAPERS FOR THE DRAWING OFFICE

Gateway Natural Tracing, details, cartridges.

### SPECIALISED AND SECURITY PAPERS

Sensitized Cheque, stamp base, money order base, map and chart papers. Recorder papers. Carbonising base. Pasting base.

### PACKAGING AND HOUSEHOLD PAPERS

Glassine, greaseproof, pure vegetable parchment, glazed imitation parchment, tissue, M.G. Sulphite, foil backing, 'Bakewell' household parchment. Printed, waxed and laminated flexible packaging materials.

### TISSUES

Carbonising facial and hygienic (hard and soft), including converted products.

### INDUSTRIAL BASE PAPERS

For Photographic, dyeline, ferro, plastic, laminates, abrasive, filter, saturating and many other purposes.

All other qualities of paper handled by our Merchants Organisation.

### DISTRIBUTION CENTRES—

United Kingdom: Belfast, Birmingham, Bristol, Cardiff, Edinburgh, Glasgow, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham.

Overseas: Dublin, Cape Town, Port Elizabeth, Durban, Bloemfontein, Johannesburg, Salisbury, Ndola, Nairobi, Lagos, Karachi, Bombay, Madras, Calcutta, Singapore, Kuala Lumpur, Hong Kong, Tokyo, Melbourne, Adelaide, Sydney, Perth, Wellington, Auckland, Christchurch, Buenos Aires, New York, Beirut and AGENCIES throughout the World.

### SALIENT POINTS

|                                                                |             |

| Total Capital Employed (including Debentures and Loans) ... .. | £39,932,409 |

### EXTRACT FROM STATEMENT BY MR. L. W. FARROW, C.B.E., CHAIRMAN

**STATE OF TRADE—PRODUCTION AND SALES:** I am glad to report that the production of the Mills of the Wiggins Teape Group increased by a rather better percentage than the average of the mills in this country. This was matched by an equally satisfactory Group turnover.

**EXPORTS:** In our Organisation we place considerable emphasis on exports and during this past year have continued to pursue our overseas trade with the utmost vigour through the means of our twenty-seven overseas selling branches, our eighty agents, and our overseas technical sales staff based on London. Last year I reported that our 1959 export sales from this country were a record. I am pleased to report that in 1960 we increased our export tonnage by no less than 21 per cent. over 1959.

**SELLING PRICES AND COSTS OF PRODUCTION:** In view of the increases in the costs of raw materials, power, wages, repairs and salaries, the prices of some of our products were increased towards the end of the year. Notwithstanding the increase in the quantity of paper made and its effect on the costs of production, the increases in costs to which I have referred more than offset this effect, the result being that our average margin of profit per ton showed a small decline from that of 1959.

**NEW DEVELOPMENTS:** The new No. 6 paper machine at our Dartford Mill and the reconstructed No. 5 paper machine are producing satisfactory paper and are contributing satisfactorily to our Group profits. The further developments referred to in my Statement last year are in the process of construction and the plants should come into operation over the next eighteen months,

beginning with the paper machine at our Hele Mill in Devonshire, which should start production in the autumn of this year. When in full operation, these new projects should make a substantial contribution to our overall results.

**ASSOCIATION WITH BRITISH-AMERICAN TOBACCO COMPANY LIMITED:** In November last we announced the proposals for a merger of certain of the Group's papermaking interests with those of British-American Tobacco Company Limited.

For some time it has been the intention of your Board to expand the Group's papermaking interests overseas. This association with British-American Tobacco Company Limited, who already had papermaking interests overseas, will undoubtedly enable the plans of your Board to be realised much more quickly than they could otherwise have been. In addition, the proposed subscription by British-American Tobacco Company Limited for 1,800,000 shares will provide the money we shall have to put up for our share of the cost of capital developments of the joint venture during the next few years.

**PROSPECTS FOR THE CURRENT YEAR:** The sales of the Group for the first four months show further expansion but the profits are running at about the same rate as those for the similar period of 1960. On the 1st July, 1961, a further reduction of duties on imported paper will take place. This is bound to have an adverse effect on the prices of certain of the home produced papers. However, only certain of the Group's operations are affected. Subject to no unforeseen circumstances occurring, we can look forward to another successful year.

# AB SEPARATOR

Stockholm, Sweden

(International Manufacturers and Suppliers of ALFA-LAVAL Farm Separators, Milking Machines, Dairy Plant, and DE LAVAL Industrial Separators, Plate Heat Exchangers and Industrial Plant)

## INCREASED DEMAND FOR ALFA-LAVAL AND DE LAVAL PRODUCTS

International sales of the Alfa-Laval/De Laval Group of Companies to outside customers in 1960 increased to a new high of 795.1 million kronor (approx. £55.2 million) from 753.4 million kronor (approx. £52.3 million) the previous year. The order book at the end of the year was greater than at any time in the Company's history.

Swedish sales accounted for 241.8 million kronor (approx. £16.8 million) (220.4 million kronor, approx. £15.5 million, in 1959) an increase attributable, as also in 1959, mainly to the continued success of the Olofström subsidiary company, which specialises in motor-bodies and parts supplied under contract to the Volvo Motor Company, as well as household equipment, pressed steel parts for separators and plate heat exchangers, a type of industrial heat transfer device.

The demand for the Company's products in 1960 has been very strong both in Sweden and in the world market. In particular, the demand for separators and plate heat exchangers for industrial and marine applications has been considerable.

Increased sales were achieved in most of the Company's traditional markets, especially Japan, Finland, the German Federal Republic and Eastern Europe.

### COMPLETE INSTALLATIONS IN DEMAND

A great number of complete plants have been sold abroad for refining of edible oils and fats using special processes developed by the Company and which include separators and plate heat exchangers.

Among major deliveries completed in 1960 there was a dairy plant for a daily output of 300,000 litres (66,000 gals.) to New Delhi, in

augured in December, 1960, and a similar plant for 100,000 litres (22,000 gals.) of milk a day to Cairo, inaugurated in July, 1960.

### DESIGN AND DEVELOPMENT WORK

In the milking-machine field several new items have been brought out. Various new components of milking plants have been developed, simplifying the erection and operation of these plants. Considerable attention has been paid to milk cooling on farms and an entirely new type of milk cooler has been successfully marketed.

With the trend in the dairy industry towards still larger units the Company introduced, in 1960, a dairy separator for 10,000 litres (2,200 gals.) per hour, and this has been in great demand.

In the industrial section, a new larger type of nozzle separator for kaolin, yeast, fish oil, sugar juice, etc., has been produced, while special separators have been designed for the plastics industry and for washing and purification of gas-turbine oil.

New fields of application have been found for plate heat exchangers including cooling fresh water and lubricating oil on board ships.

The first "Centri-fish" plants have been installed for the production of fish oil and fish meal on board trawlers.

In the thermal field, a rotary thin-film evaporator, "Centri-Therm," designed on a new principle, has been successfully introduced for gentle and rapid concentration of heat-sensitive liquids in the food and beverage industries.

### AFFILIATED COMPANIES

*Olofström, Sweden.*—1960 dividend 1.6 million kronor (1959 dividend 1.4 million kronor) will be received by the parent company. The Olofström factories are being expanded.

The affiliated companies outside Sweden have maintained or increased their sales and in most cases improved their financial position.

In the EFTA countries the Alfa-Laval Group has manufacturing companies in England (Brentford, Middlesex), and Austria in addition to the factories in Sweden, while in the Com-

mon Market there are factories in Germany, the Netherlands, Italy and France. Outside Europe the Group has works in the United States, Canada, Argentina and the Union of South Africa. New factories will shortly be put into operation at Poona in India and São Paulo in Brazil.

The average number of persons employed within the Group during 1960 was 17,769 (16,786 in 1959) of which the companies outside Sweden employed on average a total of 9,038 (8,742).

### NEW MAIN ALFA-LAVAL WORKS IN SWEDEN

The move of the Stockholm plant to the new separator factory at Tumba, 25 kilometres (15 miles) south-west of the Swedish capital, started during the last months of 1960 and is expected to be completed this summer. For the Group as a whole, the manufacture of several types of large separators for industrial and dairy use is centred at the new Tumba Works.

### MAINTAINING DELIVERIES

The general shortage of labour affecting all industries in Sweden plus Swedish shortages of certain raw material, particularly stainless steel, has limited the Company's possibilities of meeting the growing order book at a reasonable pace from Sweden. To compensate for these difficulties the manufacture of certain separator types has been transferred as far as possible to the Company's factories outside Sweden.

### BOARD OF DIRECTORS DURING 1960

J. Wallenberg, Gösta de Geer, Nils Ericsson, Karl Granfors, Hans Ståhle, *Managing Director.*

### PROFIT AND DIVIDENDS

Net profit for 1960 amounted to 11,409,737 kronor which, together with 27,462,892 kronor brought forward from the previous year, produced a total of 38,872,629 kronor available for allocation.

It was proposed to distribute 10,800,000 kronor in the form of a dividend of 12 kronor a share and to carry forward the balance of 28,072,629 kronor.

The report and the accounts were placed before the Annual Meeting of shareholders held on Friday, 26th May, in Stockholm.

The spindle being carefully fitted to an Alfa-Laval dairy separator at the new Alfa-Laval Works at Stockholm-Tumba.

## ARTHUR BALFOUR & COMPANY

### 1960 A GOOD YEAR

The sixty-second annual general meeting of Arthur Balfour & Company Limited was held on June 19th at Sheffield, The Right Honourable The Lord Riverdale of Sheffield, DL, JP (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

I concluded by statement last year in a mood of cautious optimism. I am glad to say that the optimism was justified and we have had a good year. During 1960 the flat spots in our activity were few and slight and the whole of the twelve months were concerned with brisk production.

We had no untimely troubles during the year. No unexpected bad news came in from overseas. It is pleasant to record that in general, the decisions of previous years appeared to be justified and the work we had done on plant and organisation had a chance to show its worth and prove its value.

The increase in sales has been encouraging on a wide front, but particularly so in the case of the Alloy Tool Steels and Die Steels.

The high levels of operations had a favourable effect in reducing the overhead charges as a percentage of costs but otherwise the tendency was for profit margins to shrink rather than expand, particularly in the export trades.

Export markets revealed as usual some up and down effects, but overall our exports expanded, though to a lesser extent than the rise in home sales. We are however very proud of the high proportion of the products which we export. The contribution to Group results from overseas showed an advance on the previous year, but our efforts in this direction were not achieved at the expense of our home trade.

The profit of the Group before Taxation but after exchange adjustments is £542,906 compared with £329,921 for the previous year. Taxation absorbs £281,476 compared with £162,733. The Board recommend a total dividend of 12 per cent which compares with 9 per cent for the year 1959.

Commenting on the problem of rising costs, Lord Riverdale said:

We continue to do all we can to mitigate the effect of the increases, but despite all our efforts they must represent a threat to reasonable profit margins which would become rapidly more serious if the scale of output were to be reduced for any reason.

The year 1961 has opened quite well and our turnover for the first four months exceeded that of the same period in 1960. There was considerable talk of recession in the first two months and this stemmed particularly from the automotive industry, which appears to have recovered markedly. The general tone in the consumer industries, which are customers of the Group, is now relatively favourable.

Though we had an all time record turnover in the month of November, 1960, I should hesitate before attempting a long term forecast, but at this stage in this year I think we are unlikely to exceed these results, but with good fortune we should closely approach or hold the same level.

The report was adopted.

## COMPANY MEETING REPORTS

### PHILIP HILL INVESTMENT TRUST

#### AN ACTIVE AND SUCCESSFUL YEAR

The twenty-ninth ordinary general meeting of Philip Hill Investment Trust Limited was held on June 19th in London, Sir Brian Mountain, Bart (the chairman), presiding. The following is an extract from his circulated statement:

The year under review has been an active and successful one for the Group. The gross income from dividends and interest, including the increased dividend from the subsidiary Company of £250,000 (£100,000), has risen to £1,606,955 (£1,091,382). Directors' Fees, expenses of management and interest on the Debenture Stock amount to £230,174 (£177,484), leaving a net profit before taxation of £1,376,781 (£913,898). Taxation, after allowing for double

## THE ECONOMIST JUNE 24, 1961

taxation relief, absorbs £528,030 (£326,972), leaving the net profit of the Trust at £848,751 (£586,926).

Philip Hill, Higginson, Erlangers Limited, and its Subsidiary Companies have had a successful year. The consolidated profits before taxation have risen to £1,272,133 (£943,325).

These results enable the Board to recommend a final dividend on the increased Ordinary share capital of 7 per cent, less income tax, which, together with the interim dividend of 11 per cent, less income tax, paid last October on the old Ordinary share capital, would make a total distribution of 12½ per cent on the existing Ordinary share capital (equivalent to 25 per cent (22½ per cent) on the old Ordinary share capital) and will require £765,625 (£482,822).

Subject to unforeseen circumstances, your Board expects the results for the current year to prove satisfactory. The report was adopted.

## WILMOT BREEDEN (Holdings) LTD

The following information is condensed from the Annual Report for 1960 considered at the Twelfth Annual General Meeting held in Birmingham on 21st June, 1961.

|                                      | 1960       | 1959       |
|--------------------------------------|------------|------------|
| Net Income from all sources          | £1,367,083 | £1,654,552 |
| Taxation                             | 760,030    | 972,678    |
|                                      | 607,053    | 681,874    |
| Group Net Assets                     | 10,436,715 | 8,059,255  |
| Ordinary Share Capital               | 4,200,000  | 3,150,000  |
| Ordinary Dividend: Total (after tax) | 289,406    | 289,406    |
| Rate                                 | 11½*       | 15%        |
| Times covered                        | 2.3        | 2.6        |

\* On the increased capital.

The Group has 11,000 shareholders and 9,000 employees.

### Motor Car Division

The rapid fall in demand after June was accompanied by increased competition. To meet this, improved production methods are being developed and are already showing results. If the expansion of the car industry is shortly resumed, earnings should be restored to normal levels. However, the outlook for the industry during the latter part of the year remains uncertain.

### France

Expansion and reorganisation have proceeded rapidly. New capital of £600,000 subscribed by Wilmot Breeden (Holdings) Limited, together with £1,200,000 in the form of a French State loan and a non-repayable French State subsidy, have provided adequate finance. The holding of the parent company in its main French subsidiary has been increased to nearly 90%. Orders for components of Wilmot Breeden design are materialising as expected. The French companies should make an appropriate contribution to group earnings during 1961.

### Flight and Special Products

Orders for aircraft components, Truffo stainless steel pipe bends and fittings continue to rise. Development work is progressing on a new type of heat exchanger likely to have a wide application for diesel engines and gas turbines.

### Hydraulics

Sales of Telehoist tipping gears and Telesig screw pumps and valves are expanding. A new factory of 40,000 sq. ft. is planned in Cheshire to serve commercial vehicle customers who are establishing themselves in the North of England. Licences from the U.S.A. have been granted for the United Kingdom and Europe for the manufacture of Pegasus electro-hydraulic signalling valves and Hartmann hydraulic motors.

### Electronics

Sales of the marine products of the Ferrograph Company have increased and have established a worldwide acceptance. Their new marine radar has been introduced. This has a high performance and an attractive price, and brings an important type of navigational aid to the owners of smaller craft. The Wayne Kerr Company achieved a higher profit despite increased expenditure on research and development. A new type of computer has been developed, and has been well received both here and in the U.S.A.

### Australia

Sales continued to expand and produce a satisfactory profit. Recent credit restrictions have created more competitive trading conditions.

## COMPANY MEETING REPORTS

# 1960 Best operational year for GULF OIL

Gulf's 1960 Annual Report, recently mailed to shareholders, records net earnings of \$330,310,000 - an increase of 14% over the previous year.

Contributing significantly to earnings were the Company's United States operations which brought in \$198 million or 60% of total net income.

In all major scopes of activity, new records were established. World-wide, production was up 12.5%; crude oil processed rose 11%; and sales of refined products showed a 2.8% gain.

Financial and operating highlights of Gulf for 1960 and 1959 appear below.

If you'd like a copy of the complete Report, write to: Gulf Oil (Great Britain) Limited, 6 Grosvenor Place, London, S.W.1.

### CONSOLIDATED FINANCIAL DATA

|                                                                     | 1960            | 1959            |

# UNITED DRAPERY STORES

A GROUP OF COMPANIES  
COMPRISING OVER 750 RETAIL SHOPS  
DEPARTMENT STORES AND DISTRIBUTIVE BUSINESSES  
IN ALL PRINCIPAL TOWNS THROUGHOUT THE  
UNITED KINGDOM AND EIRE

*Extract from the Chairman's Statement from the Report  
and Accounts for the year ended 28th January, 1961.*

The Group trading profit for the year amounts to £10,102,689 which represents an increase of £1,077,855 over the previous year's profits. Our previously owned businesses have contributed £864,455 towards this satisfactory increase, the balance of £213,400 relating to profits of our new businesses brought into our accounts for the first time. It becomes increasingly difficult to acquire suitable additional businesses on reasonable terms. It is, therefore, especially gratifying to report in these circumstances this substantial increase in the profits of our existing businesses which has been brought about by a record increase in turnover.

The net profit attributable to the Group for the year amounted to £4,662,973 and is £817,019 higher than the previous year. In view of the excellent results of the second half of the year's trading your Board proposes a final dividend of 30%, which is an increase of 5% on last year's final dividend. This brings the total payment for the year up to 45%, less tax, against 37½% last year. When the Rights Issue was made in November, 1960, your Board forecast a final dividend of 25% which would have made the year's dividend 40%.

The book value of our freehold and leasehold premises has increased substantially and now exceeds £20 million. We continue to acquire, wherever possible, the freeholds of properties we occupy on lease. We have also developed a number of valuable sites owned by the Group in important shopping areas, including Cardiff, Sheffield and Croydon.

We own a large amount of property which is let to tenants outside the Group and our rents from this source last year amounted to approximately £400,000.

We were actually committed to £1,695,000 for capital expenditure at 28th January last, but in addition to this our development programme will cost an additional £2½ million, making a total of over £4,000,000 of which we estimate £3,000,000 will be spent in the current year. The amounts ploughed back into the business, together with the amounts written off as Depreciation and Amortisation, are now at the annual rate of over £2,750,000 and any expenditure on capital account in excess of this will be provided out of our present surplus of current assets.

As already announced, to bring the Company's Issued Share Capital more into line with the real capital employed, it is our intention to capitalise the sum of £4,612,298 from Share Premium Account and to issue to Stockholders one new fully paid Ordinary Stock Unit for every two existing Ordinary Stock Units held.

The turnover of the Group for the first quarter of 1961 shows a substantial improvement over the same period last year. This is especially satisfactory as we are comparing current sales figures with a period which covered the last three months of unrestricted hire purchase sales a year ago.

Our interests are well spread, our policy of expansion will continue and I am hopeful that, in the absence of unforeseen circumstances, I shall again next year be able to present a satisfactory report.

A Copy of the 34th Annual Report and Accounts can be obtained on request from:

The Secretary: 364-366, KENSINGTON HIGH STREET, W.14.

## HIGHLANDS & LOWLANDS PARA RUBBER CO. LTD.

In the statement presented at the Annual General Meeting on June 20th in London the Chairman, Mr T. B. Barlow said:

### RECORD PROFIT

The profit for 1960 of £1,451,000 is our record and is the result of hard work by our managers, staff and labourers, whom we thank. The issued capital has been increased to £2,373,826 after the acquisition in 1961 of the Sembilan and Edinburgh Companies consisting of 4,563 acres of rubber.

The interim dividend of 3d. and the proposed final of 7d. per 2s. stock unit less tax require £590,100. The Malayan Government takes in quit rent, net cesses, export taxes and income tax more than half the profit and nearly 50 per cent more than the dividends.

Appropriations of £262,000 to Replanting Reserve and £554,200 for Taxation leave an increased carry forward of £152,800.

Current Assets exceed Current Liabilities by nearly £1,500,000.

### ESTATES

The rubber crop of 23,979,000 lb made an average profit of 9.8d per lb and with a yield of 775 lb per acre, the return was £32 per acre. The palm oil and kernel crop of 10,600 tons gave a combined profit of £29 per ton or £33 per acre and was responsible for over 20 per cent of our profit.

With 27 per cent of our planted area still immature we can count on steadily increasing crops and lower costs of production.

### MALAYA

Under the leadership of Tunku Abdul Rahman, the Prime Minister, the last twelve months have been a time of happiness, peace and prosperity in Malaya, and priority has been given to planning and preparation for rural development. Tun Abdul Razak, the deputy Prime Minister, is in personal charge of the campaign which he is prosecuting with drive and energy. One of the most important events of 1961 has been the publication in Malaya of the Government's second Five Year Plan for the years 1961-65. The broad object of the Plan is to maintain and accelerate the economic progress of the Federation and lay the foundations of higher living standards for everyone, especially those in the rural areas.

The Minister of Finance has stated that spending will be governed by money available.

Rubber replanting—both by estates and smallholdings—is acknowledged by the authors of the Plan to have been "perhaps the outstanding economic achievement of the last five years." The vital importance of the replanting programme to the economic future of the Federation is recognised, and the Plan stresses the need for a continuation of the rate of replanting achieved in recent years. To this end an allocation of \$165 million of public investment is proposed, of which \$120 million is for commitments for grants under the existing scheme but only \$45 million for continued grants up to 1965.

### OUTLOOK

With rubber at 26d. per lb there will be less incentive to build factories for synthetic pro-

duction; and with palm oil at over £80 a ton we enjoy a fair degree of diversification. While we cannot expect the unusually high profits of the last two years, under present market conditions a reasonable and substantial return may be expected from our estates.

The report and accounts were adopted.

## AUGUSTINE INVESTMENTS LIMITED

### RECORD TURNOVER

The fiftieth annual general meeting of Augustine Investments Limited was held on June 16th in London, Mr R. E. Brook, C.M.G. (the chairman), presiding.

The following is an extract from his circulated statement:

Our turnover for 1960 was a record and our trading profit would also have been a record but for the setback in the broadcast relay field referred to in the Preliminary Announcement made in April.

Fortunately, the earning capacity of the Group's underlying assets remains virtually unimpaired and though our profits before tax are some £43,000 lower than last year this affords no reason for affecting the dividend and the Board therefore recommend maintenance at 25 per cent, less income tax, for the Final Dividend which will make a total for the year of 37½ per cent, less income tax.

The fortunes of the Optical Division continue to prosper and both turnover and profit reached record levels. Expansion in this field has been actively pursued by the opening or purchase of six new practices during 1960, all of which are now operating to our satisfaction. The Board feel that they have cause to be fairly optimistic as regards 1961.

The Printing Division, too, had an excellent year with record turnover and substantially increased profits. We look forward to another successful year in 1961, during which we hope to acquire further printing interests.

Commenting on the decision to sell their interests in the Viewline relay system, Mr Brook said: During the year it gradually became evident that in most of Oxford, which was the principal centre of endeavour, off-air reception from B.B.C. and I.T.V. was such that the relay system, though fundamentally sound, could offer little if any advantage to subscribers. It was a grave disappointment for us to find that more money than we were prepared to provide would have been necessary to make the system succeed within the foreseeable future.

Striking a more hopeful note, since the end of the year under review the Group has agreed to advance £50,000 as a secured loan with the option of conversion into equity to a group of companies engaged in the manufacture of fibre glass products, plastics and research into the application of transistors.

Your Company this year celebrates its Golden Jubilee. In the course of its existence it has experienced many changes, not least in the nature and scope of its activities, but the last six years have seen a striking improvement in its fortunes and the Board retain their confidence in the future.

The report was adopted.

## SPICERS LIMITED

(Paper Makers, Paper Merchants, and  
Manufacturing Stationers)

### THE FUTURE AN EVER WIDENING PROSPECT

The seventy-third Annual General Meeting of Spicers Limited was held on June 21st in London, Sir Richard E. Yeabsley, CBE, JP, FCA (the chairman), presiding. The following are extracts from his circulated statement:

I am glad to be able to report a further improvement in the affairs of your Company during the year 1960.

An important event that has happened since I made my Report last year is the recent purchase of Percy Boyden & Co. Limited and its subsidiaries. With the management of the Boyden Group still in the capable hands of Mr Boyden we look forward to increasing profits in the years ahead.

The profits of the Group for 1960 were £955,919 as compared with £783,920 for 1959. The trend for the past two years has been consistently upwards. The 1960 figures include the post-acquisition proportions of the profits of two companies purchased during the year (Ihlee & Sankey Limited and Windebank & Co. Limited) but not of the Boyden Group, and also interest on the short-term investment of part of the proceeds of the sale of British Waxed Wrappings Limited. Group sales were £25 million. Every unit with insignificant exceptions contributed not only to the increase of sales but also to the improvement in profits. After charging taxation the Group net profit is £382,561 compared with £430,197 for 1959. Your Directors recommend a final dividend of 8½ per cent, making a total distribution for the year of 12½ per cent (1959, 10 per cent).

### INCREASE OF AUTHORISED CAPITAL

After reviewing the Group's world-wide interests, the Chairman referred to the need for additional finance for further expansion and said: We wish to be in a position to take appropriate action without delay when the time is opportune. In this connection we consider that steps should be taken to increase the Authorised Capital. A further letter will be sent to stockholders on this subject later in the year.

With regard to the current year to date, hire purchase and credit restrictions have already somewhat weakened the home market. Nevertheless, sales and profits for the first quarter of this year have been maintained at slightly above the 1960 level. There may, however, be temporary setbacks which would have an adverse effect on the profits for the current year. On the other hand, the Group results for 1961 will include *inter alia* nine months' profits of the Boyden Group, so that subject to any unforeseen deterioration in trading conditions the results for 1961 should show a further improvement on those for 1960.

The purchase of the Boyden Group does not bring to an end our plans for the expansion of your business. We are continually seeking new products, methods and opportunities, both at home and abroad within the present pattern of the Group and also in other fields broadly within the paper trade. Taking a long term view, the future of the paper trade in general and your own business in particular, is good. There is an ever widening prospect. The report was adopted.

## ODHAMS PRESS

### ANNUAL GENERAL MEETING

#### CHAIRMAN'S SPEECH

The Forty-first Annual General Meeting of Odhams Press, Limited, was held on June 16th, at the Connaught Rooms, Great Queen Street, London, W.C.

Sir Christopher Chancellor, C.M.G., chairman, said:

Ladies and gentlemen, the Directors' Report and Statement of Accounts for the year ended December 31, 1960, have been circulated and I will comment briefly upon them. The profit of the Group for 1960, after all charges other than taxation, was £4,503,602. This was a good result, although in comparing it with the 1959 profit of £2,955,867 it must be remembered that there was a printing stoppage in 1959 and that only nine months of the trading figures of George Newnes, Limited and Longacre Press, Limited, were included in the 1959 Accounts.

In this connection it is worthy of note that in 1960 the profit of George Newnes, Limited, before taxation was more than £2 million—a remarkable contribution to the prosperity of the Odhams Group of Companies and a notable achievement by Mr. Charles Morris, the Chairman of George Newnes, Limited, and his highly-skilled colleagues.

Turning to the assets position of the Group, it will be seen that additions to plant during the year amounted to approximately £750,000. This money was spent mostly at Watford, where our subsidiary Company, Odhams (Watford), Limited, operates a splendid modern photogravure printing works.

During the year, with the assistance of N. M. Rothschild and Sons, the Company made a successful issue of £3,500,000 6 per cent Unsecured Loan Stock. This enabled us to reduce the loan from Lloyds Bank, Limited, from £4 million to £2 million. It will be observed in the Group Balance Sheet that Tax Reserve Certificates were increased to £2,136,373.

#### STAFF RETIREMENT PROVISIONS

The Board gave much thought to the problem of retirement provisions for the Group's staff in the light of the introduction of the Graduated National Scheme. We have decided to "contract in" to the National Scheme for the general body of employees but at the same time to maintain unimpaired all the benefits accruing to the staff from the established pension schemes within the Group.

Moreover, our arrangements for senior employees have been extended and all employees now have the opportunity to augment their pensions by making voluntary contributions on favourable terms.

The year 1960 was the last operating year of Odhams Press, Limited, as an independent organisation. Now it is a subsidiary of Daily Mirror Newspapers, Limited. This marks a momentous change.

#### THE DIRECTORATE

In our report we pay a tribute to the services of the four Directors, including my predecessor as Chairman, Mr. A. C. Duncan, who retired to make way for new appointments to the Board. They gave long and faithful service to the Company. Naturally, they regretted the change in the status and ownership of the Company which they had served for so many years. But for many of the younger men and women in

## COMPANY MEETING REPORTS

Odhams this change will, I hope, bring new and greater opportunities.

Four Daily Mirror Group Directors, Messrs. Atkins, McKay, Rogers and Ryder, were appointed to the Odhams Press Board at the beginning of March and I would add that at the Board Meetings over which I have presided during the past three months I have found the newly-constituted Board a progressive and harmonious team.

This is the first and last Annual General Meeting of Odhams Press, Limited, over which I am privileged to preside. At the end of this meeting I retire from the Chairmanship and from the Board, and it is the intention of the Board to elect Mr. Hugh Cudlipp, Joint Managing Director of the Daily Mirror, as my successor. I have had a very short time at Odhams, which I joined in October, 1959; but I have made many friends in this brief period and it is with sadness that I say goodbye to them—especially to my two colleagues, the Joint Managing Directors, who have been my close companions for the past year. I wish them all a happy and successful future as members of the great publishing

## THE ECONOMIST JUNE 24, 1961

ing and printing group of which Odhams Press now forms a part.

#### ALTERATION OF ARTICLES

We are seeking authority at this meeting to alter the Articles of Association of the Company so as to remove the limit of nine which has hitherto governed appointments to the Board. This will facilitate the promotion to the main Board in the first instance of four Odhams executives who have given exceptional service to the Company.

It is the intention, if the change in the Articles is approved, to elect Mr. J. D. L. Gammie, Mr. H. Kamlisch, Mr. H. D. Rochez and Mr. C. E. S. Wood to the Odhams Board. I congratulate them and thank them for their outstanding services; and on behalf of the Board I pay a sincere and grateful tribute to all the men and women who by their skill and hard work have contributed so successfully to the progress and expansion of the Group.

The report and accounts were unanimously adopted and the proposed alteration to the Articles of Association was approved.

## THE ECONOMIST JUNE 24, 1961

## THRELFALL'S BREWERY COMPANY

### MR F. CORNWALL ON AN EXCELLENT YEAR'S TRADING

The seventy-fourth annual general meeting of Threlfall's Brewery Company, Limited, was held on June 15 in London.

Mr F. Cornwall (Chairman and Managing Director) presided and, in the course of his speech, said:

I feel sure you will agree that the year's results, as shown in detail in the Accounts, are excellent.

The substantial growth in our Profits with increased Dividends to the Stockholders has been continuous for many years, which to a large extent is the result of our policy of ploughing back into the properties part of the Profits which have been retained over the years for that particular purpose. We have thus been able to embark upon large expenditure of a Capital nature in this direction without recourse to seeking new money from the Stockholders who are, in consequence, now deriving the benefit from such a policy, and your Company is today in a very sound and strong financial position.

## COMPANY MEETING REPORTS

Capital Expenditure during the year under review has been heavy. There is no doubt the spread of this expenditure throughout the areas in which we are established has increased and consolidated our trade.

#### INCREASED DEMAND

Despite the unfavourable weather conditions experienced last summer and autumn when a fall in sales might have been expected, this did not happen. It was, therefore, most gratifying to find that the demand for our products was not only sustained, but enhanced. The results before you today are conclusive proof that your Company has had its share of the overall increase in the sale of beers throughout the country. I also cannot help feeling that the excellent quality of our Beers also contributed in no small degree to this position.

Your Board, however, do not propose to be too complacent in regard to the great changes which have, and are, taking place in the industry. Competition is keener than ever before, and will, in all probability, become more intensified. I personally, however, cannot visualise in the near or even distant future, people in industrial areas like Liverpool and Manchester departing from the traditional British drinks of

Mild and Bitter Beers and Stout, brewed with top quality materials and sold at prices well within the reach of the general public. As the figures submitted to you today must indicate, the requirements, and assumedly the desire, of our many customers appear to have been met. I must point out, however, that there are factors which must, in the immediate future, receive the consideration of the Directors, such as the increasing costs of materials, wages, Rates and Taxes, and Repairs, which in the past have been borne by the Company without any change in the price structure, and this position must, I fear, be reviewed at an early date, particularly as shortly the wages of a large number of our Hotel employees will be increased under the Catering Wages Act, the additional cost being in the region of £70,000 per year.

Referring now to the Accounts, the Gross and Net Profits are the highest we have ever achieved. The Profit from Trading and other income of £1,392,524 exceeds that of last year by £131,751, slightly more than 10%. The Net Profit of £612,253, after providing for taxation, also shows an increase of £45,134. These record Profits enable the Board to recommend once again an increase in the Ordinary Stock Dividend, making 20% for the year.

The report was adopted.

## ALLEN WEST & COMPANY BRIGHTON

Incoming orders increased by 20.9 per cent and output increased by 12.8 per cent

New building for technical and other staff departments nearing completion

Record volume of work on hand

Proposed increase of Authorised Capital and Rights Issue

Overseas interests continue to progress

From the Annual Report and Statement of the Chairman, Mr. M. W. H. Lancaster, on the year ended 31st January, 1961.

SOUTH AFRICA • RHODESIA • CANADA

## HENDERSON'S TRANSVAAL ESTATES

The forty-ninth Annual General Meeting of Henderson's Transvaal Estates, Limited will be held on July 12th in London.

The following is an extract from the circulated statement of the Chairman, Sir Joseph Ball, KBE:

Although the past year has been dominated very largely by political events and by tension in Africa, so far the only material effect of these factors on shareholders of this Company has been to depress the price of the Company's shares on the London and Johannesburg Stock Exchanges.

At the time of preparing this statement, the shares of your Company stand at 7s. 9d., to give

a dividend yield at that price of 11½ per cent, and yet operations on our mines have continued most successfully; income from our investments has increased; we have sold certain surface and mineral rights at a substantial profit; and on our recently increased capital, which is now £732,000, we are paying an all-time record dividend of a gross amount of £160,000.

The market value of quoted securities fell by £200,000 over the year, notwithstanding an increase in book value of £66,000. At the end of May, however, the market value at £1,555,000 was still well above the book value of £1,135,000, although there has, I regret, been a further decline in values since the date of the balance-sheet. If only the Government in South Africa would introduce a realistic moderation in its racial policy, the present detrimental effect on the confidence of investors would, I am sure, be very largely overcome.

#### APPOINTMENTS

### QUALITY CONTROLLER

An important vacancy exists in a Unit of the Company, manufacturing food and beer cans on modern high speed plant.

Minimum educational requirement is G.C.E. "A" Level in Mathematics, whilst the holder of a Statistical, Economics (with statistics as special subject) Degree or equivalent qualification would be preferred.

Experience in Quality Control is essential, particularly in high speed flow production.

The successful candidate will hold a key position in the Company's expansion programme, which should lead to future personal advancement.

Apply for further particulars, giving brief details of experience etc. to:—

The Senior Personnel Officer, Reads Limited, Orrell House, Orrell Lane, Liverpool, 9

and quote reference G/119/Mis.

MARKET INFORMATION and STATISTICS DEPARTMENT of a leading London Advertising Agency, requires an Assistant. The man or woman chosen will probably have an Economics or Market Research background, and should have the ability to make a critical analysis of Economic and Market Research reports. Please write giving details of personal history and salary required to the Personnel Manager, Pritchard, Wood and Partners, 197 Knightsbridge, S.W.7.

### THE UNIVERSITY OF MANCHESTER

Applications are invited for the post of LECTURER IN INDUSTRIAL RELATIONS in the Faculty of Economic and Social Studies. Salary on a scale £1,050 to £1,850 per annum, initial salary according to qualifications and experience. Membership of F.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than July 15, 1961 to the Registrar, The University, Manchester. 13, from whom further particulars and forms of application may be obtained.

### NORTHAMPTON COLLEGE OF ADVANCED TECHNOLOGY

St. John Street, London, E.C.1.

#### DEPARTMENT OF SOCIAL AND INDUSTRIAL STUDIES

Owing to expansion in the work of the Department additional lecturing staff will be required from September 1961, or as soon as possible thereafter.

Candidates for appointment should have the appropriate University qualifications and industrial or related experience. The work will involve developing and organising postgraduate studies and teaching at both undergraduate and postgraduate levels. Emphasis will be on quantitative or statistical methods in investigating problems in the organisation and planning of industrial effort. Outside consultancy is encouraged, subject to College Committee approval.

(1) READER in Industrial Sociology: To conduct and to supervise research into the structure and operation of industrial organisations, having regard to management theory and practice.

(2) SENIOR LECTURER in Industrial Engineering, specialising in the quantitative aspects of management practice.

(3) SENIOR LECTURER in Social and Experimental Psychology, specialising in the structure, characteristics and norms of human groups and their inter-relation and control.

SALARY SCALES: Reader: £1,858 by increments of £50 to a maximum of £2,154 p.a. Senior Lecturer: £1,588 by increments of £50 to a maximum of £1,801 p.a.

Further particulars and forms of application obtainable from the Secretary of the College, St. John Street, E.C.1.

J. S. TAIT, B.Sc., Ph.D., M.I.E.E., M.I.Tech.E., Principal.

ACTON SOCIETY TRUST wishes to appoint a Director to be responsible to the Trustees for all the work of the Society. Good academic record, proven research ability and knowledge of industry essential. Minimum starting salary for the right person £5,000. Applications to the Chairman, Acton Society, 39 Welbeck Street, London, W.1.

For further appointments and other classified advertisements see page 1424

### AUSTRALIAN NATIONAL UNIVERSITY

CANBERRA

#### RESEARCH SCHOOL OF PACIFIC STUDIES

Applications are invited for appointment to the CHAIR OF INTERNATIONAL RELATIONS. Salary £4,700. Reasonable travel and removal expenses are payable. One year's study leave, with travel allowance, will be granted after each three years' service. The Professor of International Relations, as Head of the Department, will be expected to encourage and supervise postgraduate research into the political, economic and social relationships between nations, especially in the Asian and Pacific regions. It is not essential that an applicant's own field of research has been directed. However, the University would be especially interested in applicants prepared to give this broad regional emphasis to their own work.

Further particulars should be obtained from the Secretary, Association of Universities of the British Commonwealth, 36 Gordon Square, London, W.C.1.

Applications close on August 1, 1961. Notwithstanding this notification the Council of the University retains the right to fill the Chair by invitation at any stage.

### UNIVERSITY OF LONDON

Chair of Sociology at London School of Economics

The Senate invite applications for the Chair of Sociology tenable at the London School of Economics (salary not less than £2,600 a year plus £100 London Allowance). Applications (10 copies) must be received not later than July 18, 1961, by the Academic Registrar, University of London, Senate House, W.C.1, from whom further particulars may be obtained.

O. & M. ANALYST-COMPUTER PROGRAMMER. A vacancy exists in our Group Organisation and Methods Department, which is responsible for the installation of three I.C.T. Computers.

The work will include systems studies in Production Planning, Material Control, Stock Control and Invoicing. The agreed systems will then be programmed for either a 1202 or a 1501 Computer.

Experience of this type of work is desirable but we are willing to train applicants with suitable technical and academic qualifications. An adequate salary will be paid dependent upon the qualifications and experience of the applicant. Age between 22-35 years.

Please send full details to the Staff Establishment Officer, Rubery, Owen & Co. Ltd., Booth Street, Dursley, S. Staffs.

### THE UNIVERSITY OF HULL

SECRETARY TO THE APPOINTMENTS BOARD

Applications are invited from graduates of a British University, preferably with industrial, administrative or teaching experience, for the above full-time post, tenable from August 28, 1961, or as soon as possible thereafter. Salary: £1,000 by £50 to £1,300 per annum, with pension according to qualifications and experience. Further particulars may be obtained from the undersigned to whom applications (6 copies) should be sent by July 10, 1961.

W. D. CRAIG, Registrar.

### THE UNIVERSITY OF LEEDS

DEPARTMENT OF ECONOMICS AND COMMERCE

Applications are invited for appointment to two Research Fellowships and two Research Scholarships in Industrial Management in the Department of Economics and Commerce. The value of Research Fellowships will be up to a maximum of £1,500 a year and of a Research Scholarship £850 a year plus fees. Candidates should have good honours in 2 subjects which would enable them to pursue their proposed researches in the field of industrial management. For Research Fellowships, evidence of research ability would also be an advantage.

Applications (three copies) stating date of birth, qualifications and experience, together with the names of two referees, should reach the Registrar, The University of Leeds, by not later than August 31, 1961.

ORDERS for advertisements in *The Economist* are accepted on condition that they are liable to rejection at the discretion of the Editor; that while every effort will be made to publish an advertisement on a specified date, no guarantee is given; and that white on black, reverse black or large sizes of black-faced type may be stippled or lined at the Editor's discretion.

### SECRETARIAL ASSISTANT

Major building society, national in scope and reputation, seeks young university graduate for appointment as a Secretarial Assistant. Some business experience preferable. Ability to write on financial and other topics essential.

Salary in the region of £1,200 p.a.; good conditions of service; excellent potential prospects.—Write Box No. 1522

UNIVERSITY OF DURHAM. Applications are invited for the post of ASSISTANT APPOINTMENTS OFFICER. The person appointed will be chiefly concerned with students and graduates in Arts and cognate subjects. Possession of a degree and experience of work in a field or fields in which Arts graduates are commonly employed are both essential. Teaching experience would be useful. The starting salary will be within the range £1,050 — £1,550 (on the scale £1,050 — £50 — £1,400 — £55 — £1,450 (max) — £1,850) together with membership of the F.S.S.U. and Family Allowance. The appointment will date from September 1, 1961, or such later date as may be arranged. Further particulars of the post may be obtained from the Appointments Officer, 10 Kensington Terrace, Newcastle upon Tyne, 2, with whom 12 copies of applications should be lodged not later than July 15, 1961, in envelopes marked "Private, A.A.O." (Candidates outside the British Isles may submit one copy only.)

### THE UNIVERSITY OF MANCHESTER

Applications are invited from graduates or holders of a suitable professional qualification for a post as TUTOR in the Department of Social Administration. The duties are concerned with the National Training Scheme for Hospital Administrators and experience in the organisation of training schemes will be an advantage.

The appointment will be for three years in the first instance and the salary will be within the scale £900 — £50 — £950, or £1,050 — £50 — £1,150 (interim bar-line) — £1,250 according to experience and qualifications. Further details and application forms may be obtained from the Registrar, The University, Manchester 13, to whom applications should be submitted by 10th JULY, 1961.

# COMPANY AFFAIRS

## Wiggins Teape's Debenture

INEVITABLY the fall in gilt-edged prices has unsettled the market in industrial prior charges. Last week the issue by Rolls-Royce of £12 million 6½ per cent debenture, 1981-86, at 99 failed badly and it is now quoted at 1½ discount, with a gross redemption yield of about 6.7 per cent. BICC's 6½ per cent debenture, which in the middle of May stood at a premium of 1½ on the issue price of 99, is also at a discount of 1½ per cent offering the same yield. Over the last month or so, yields on redeemable debentures have risen from 6½-6¾ per cent to 6¾-6½ per cent; yields on irredeemable debentures by about the same amount to 6½-6¾ per cent; and yields on preference shares from 6¾-6½ per cent to 6½-7 per cent. Even so some of the preference shares look over-valued. Steel prior charges continue to command small premiums on their issue prices but these are by no means as big as they were when dealings first began. Against this sombre background, Wiggins Teape has announced a £5 million debenture issue before the autumn. If the company were to come to the market immediately it would have to face the possibility of a 6½ per cent stock at 3 to 4 points discount; no doubt the directors would like to delay the fixing of terms for a time in the hope that gilt-edged will recover from their current worst.

The company's appetite for new money is big. About £3.6 million was raised by a rights issue in January, 1960, and, as a consequence of the joint venture with British American Tobacco, to expand paper making interests overseas, Wiggins Teape will receive about £5½ million in the next two and a half years from BAT's subscription for 1.8 million shares. The proceeds of the rights issue however did little more than to cover the cost of the purchase of British Waxed Wrapping while the proceeds of BAT's subscription will do no more than cover Wiggins Teape's share of the cost of the joint venture. Elsewhere, however, the group, which had a cash flow of £2.4 million last year, is expanding rapidly: capital projects amounting to £3 million are now under way and the recent rise in sales has been reflected in the increase in working capital from £17 million to £20½ million.

Last year gross profits rose sharply from £4½ million to £6 million, reflecting an improvement in results from new developments and the inclusion of profits from six, against three, converting companies. The second half year's contribution to profits of £2.7 million was smaller than the first half's of £3.3 million and from the statement of the chairman, Mr L. W. Farrow, it is clear that as the months went past profit margins

were progressively squeezed; indeed the increase in prices towards the end of the year was not sufficient fully to offset the rise in costs that had already taken place. Another reduction of duties on imported paper next month is likely to squeeze margins further but the chairman says that only some of the group's operations will be affected. Sales for the first four months of the current year have risen and profits are running at about the same rate as they did in the corresponding period of 1960. There is the possibility that as a result of new plants being brought into production total sales and profits will rise this year even though margins may be lower. On the dividend as increased from the equivalent of 12½ per cent to 14 per cent the £1 shares at 62s. yield 4½ per cent.

## Rolls-Royce

THE failure of Rolls-Royce's debenture issue had nothing to do with the trading prospects of the company. These, to judge from the confident tone of Lord Kindersley's statement, are rather better than for some time past. What shareholders will hope for is that better returns will be earned on aero-engines, whose development in recent years has absorbed massive amounts from profits. Last year the development charge rose to £7½ million; and this figure excludes research and development carried out for British and foreign governments. Thus, as the table shows, an increase of 12 per cent in sales, of which half were exports, resulted in a relative small increase in the trading surplus. But this year, though development

|          | Group sales | Development expenditure | Trading surplus         | Profit margin |
|----------|-------------|-------------------------|-------------------------|---------------|
|          | £'000       | £'000                   | (excl. Royalties) £'000 | %             |
| 1956.... | 79,872      | 3,006                   | 4,605                   | 5.8           |
| 1957.... | 91,175      | 4,331                   | 4,701                   | 5.2           |
| 1958.... | 95,390      | 5,837                   | 3,865                   | 4.0           |
| 1959.... | 96,559      | 5,660                   | 3,902                   | 4.0           |
| 1960.... | 108,347     | 7,758                   | 4,252                   | 3.9           |

expenditure will remain at a high level, engine production is already running at a higher rate and the company has received substantial new orders for engines and spare parts. In his statement Lord Kindersley restates his objection to the budget proposal limiting to £2,000 the tax allowance which a buyer can claim on a car used for business purposes. He claims that this may jeopardise the future of Rolls-Royce cars, which now account for only about 10 per cent of total sales.

Despite the £12 million in new money arising from the debenture issue Rolls-Royce may still have to have recourse to bank loans this year. Heavy development

THE ECONOMIST JUNE 24, 1961

expenditure, the spending of nearly £6 million on capital account and another rise in working capital commitments resulted in a net bank overdraft of £9 million at the end of last year, so that the debenture issue effectively leaves Rolls-Royce with no more than £3 million in cash. But the net cash flow may rise above the 1960 level of £5½ million (excluding development expenditure) this year. The increase in the dividend from 10 to 11 per cent came as something of a surprise last month, but it is clear from the report that in raising the payment the directors have taken into account not only the vast sums ploughed back by the company in the past but the better prospects ahead. For the current year the interim dividend is to be doubled to 5 per cent, so as to reduce the present wide disparity between it and the final payment; on an 11 per cent dividend the £1 shares at 43s. 10½d. yield 5 per cent.

## United Steel

UNITED STEEL is more broadly based than any other steel company in this country and its trading experience mirrors that of the industry as a whole. Investors in steel equities will find little to cheer them in its interim report. Shareholders were warned in January that profits before tax in the year to September, 1961, were likely to fall by between 10 to 15 per cent and now they are told that in the 24 weeks to mid-March trading profits after depreciation fell by 11½ per cent to £9½ million, compared with £10½ million for the same period in 1959-60. Sales were higher, but as the chairman, Sir Walter Benton Jones, had made clear at the annual meeting, "substantial increases in costs with no price adjustments" have occurred.

The directors add to the gloom by saying that they do not expect that the rate of activity in the first half of the financial year will be maintained as demand for certain products has slackened. They say, too, that the rise in costs has been such that even allowing for the one per cent increase in steel prices the fall in profits will be bigger than they first thought. They do, however, repeat their earlier forecast that a final dividend of not less than 7½ per cent will be paid on the capital as increased by the £10 million rights issue in December and by the proposed one-for-four scrip issue. After this report, the £1 shares fell to 55s. 7½d., to yield 4.4 per cent on the indicated dividend of 12.3 per cent on the enlarged capital.

## Bleachers' Association

THIS big group of finishers struck a guarded note of confidence by raising its ordinary dividend from 15 to 17½ per cent, though trading profits were only moderately higher at £1,789,000, against £1,674,000. Bleachers' finishing subsidiaries contributed nothing to this improvement. Though profits were maintained in the first half of the financial year to March 31st, the textile revival began to fade

THE ECONOMIST JUNE 24, 1961

and profits earned by these branches over the whole year fell by 15 per cent. Moreover, the chairman, Mr Philip Wright, implies in his review that the group will not commit itself to a costly programme of re-equipment unless severe restrictions are clamped on imports of finished cloth and made-up garments from low-cost producers.

In following a policy of diversification, the group seems to have chosen wisely. Midland Leather is one of the leading tanners of leather for shoe uppers. It has therefore avoided the troubles that have affected tanners of sole leather and it has shared in the boom in shoe sales. Bleachers' profits also include eight months' earnings from George Longden, a newly-acquired subsidiary in the building trade, whose results have been better than expected, while Bleachers' interest in Bolton Engineering was raised from 51 to 87½ per cent in the financial year.

At 22s., the 10s. shares yield 8 per cent. So far this year, turnover of the finishing branches is comparable with that of a year ago. But although the non-textile subsidiaries are likely to make further progress, their higher profits may be offset by lower profits from finishing.

## London and Overseas Freighters

THE main point of interest in Mr Basil Mavroleon's statement to the shareholders of London and Overseas Freighters is about the agreement with the Russian government. Nine of the company's tankers will be employed for the next three or four years carrying Russian oil, guaranteeing LOF a minimum income in a seemingly difficult period. Immediate prospects in freight markets in Mr Mavroleon's opinion are no brighter than they were a year ago, but the company will not be the loser on the Russian agreement if freight rates rise, as the charter is linked to the "going" market rate. The agreement was concluded at a time when all but three of earlier long-term charters with LOF had expired. In earlier years these charters held profits up in the face of falling spot freight rates but, as they expired, profits slumped. In the year to March 31st the trading surplus was more than halved, falling from £3 million to £1.4 million, and gross profits dropped from £1.7 million to £307,000. A tax credit, however, raised net earnings to £489,000, to cover the ordinary dividend of 17½ per cent 1½ times; but only 40 per cent of the ordinary capital now ranks for the dividend as last year 12 million shares held by the Mavroleon family and its associates were converted into restricted shares which will not rank for dividends for another three years at least.

In the current financial year LOF will receive two of the five tankers scheduled under its modified building programme. Arrangements have been made to substitute two dry cargo ships for the tanker still on

COMPANY AFFAIRS

order in Holland and it is hoped to arrange similar substitutions for two tankers on order in Sweden. In this way it is hoped to make LOF's fortunes less dependent upon tankers. At 12s. the 5s. ordinary shares yield 7½ per cent.

## Wine in the West

THE recent record of John Harvey shows what new energies can do for the old wine trade. Few companies can have done so well in their first three years as a public company as this old-established Bristol wine and sherry firm and it was not surprising that nearly 300 shareholders attended last week's annual meeting at a Bristol hotel. They were able to sample the company's wines and all the shareholders have received through the post a half-bottle of port and packets of Bath Oliver biscuits. This gesture marks the beginning of a campaign to add to Harvey's share in the market for port. Three branded table wines are also to be introduced in the autumn.

The chairman, Mr G. E. McWatters, told shareholders that the past year had seen the sources of Harvey's supplies from Spain and Portugal consolidated and with that achieved the company would now concentrate on developing the merchandising and advertising sides of the business. Good results have already been attained, for sales of Bristol Dry sherry doubled last year following a promotional campaign which put the emphasis on serving the sherry chilled in warm weather.

Various acquisitions have provided the company with new springboards for expansion: in London and Birmingham more retail outlets have been obtained and the recent acquisition of Cater Stoffell and Fortt has provided John Harvey with an

| Years to Feb. 28                    | 1959    | 1960    | 1961    |
|-------------------------------------|---------|---------|---------|
|                                     | (£'000) | (£'000) | (£'000) |

\* Adjusted for scrip issue.

interest not only in Bath Oliver biscuits but in licensed grocers' shops, restaurants and a banqueting hall. Expansion has in fact already been so rapid that an extension is being added to the large bottling and warehousing plant which was opened last year at Whitchurch, just outside Bristol.

At 39s. 6d. the 5s. shares are 5s. 6d. below the peak, but they yield only 2.6 per cent. This is discounting a good deal even in the expanding world of John Harvey. No doubt some part of the sharp rise in the price of the shares can be attributed to buying on the possibility that John Harvey would be taken over, possibly by one of the big brewing groups. Indeed, Mr McWatters confirmed that there had been approaches, though he said no formal offers had been made. It is clear, however, that he and his fellow-directors want to try to preserve John Harvey's independence and to pursue their own policies of expansion.

## London Stock Exchange

|                |         |         |         |
|----------------|---------|---------|---------|
| FAST DEALINGS: | May 29  | June 12 | June 26 |
| LAST DEALINGS: | June 9  | June 23 | July 7  |
| ACCOUNT DAY    | June 20 | July 4  | July 18 |

LAST week's disappointing trade figures led to sharp falls in prices of both gilt edged and equities. These were particularly marked on Monday when anxiety about the balance of payments and possible government action to deal with it was accompanied by the reaction to the South African government's latest measures to curb a capital outflow. Generally, however, selling in all sections of the market was not heavy but the jobbers marked prices down sharply. At the lower levels some buyers reappeared. Thus on Tuesday and Wednesday the *Financial Times* index regained 8 of the 17.4 points lost at the end of last week and on Monday. Thus based on prices over the week to Wednesday *The Economist* indicator fell by 11.1 to 391.2.

Gilt-edged prices moved erratically ahead of Thursday's Bank rate decision; thus War Loan 3½ per cent fell a full point to a new low of 54. Long dated stocks generally showed similar falls but among medium dates losses were confined to around ½ and to about ½ in short dated stocks, which rallied on Wednesday.

The picture in the equity market has been broadly the same in most sections, with a late improvement in prices failing to offset the earlier sharp falls. But steel shares fell once more following the disappointing interim statement on Wednesday from United Steel, whose shares over the week lost 5s. 1½d. to 55s. 6d. Colvilles fell 4s. 4½d. to 69s. 6d. while other falls in this section ranged up to 3s. Among engineering shares Guest Keen fell a similar amount to 90s. Falls were particularly heavy in bank and hire purchase shares: Midland Bank now quoted ex the rights and scrip issues closed above the worst but still lost 7s. 7½d. to 80s. and after a gain of 2s. 6d. on Wednesday Barclays at 82s. 9d. showed a net loss of 5s. 3d. United Dominions Trust closed at 187s. 6d., a net loss of 18s. 9d.

One of the few shares to have registered net gains has been London Grocers following its results; both its ordinary and "A" shares rose by 1s. 1½d. to 24s. and 21s. 9d. respectively. There was some big selling of Debenhams which lost 4s. 3d. to 66s. 9d. while House of Fraser, still under the influence of its disappointing results, lost 5s. 1½d. to 59s. 7½d.

In the mining market, both tin and gold shares captured the limelight—but for very different reasons. On news that the buffer stock of tin was exhausted tin shares rose sharply; leading the advance was Tronoh, gaining 17s. 3d. to 82s. 6d. The curb on non-resident transactions in South African shares brought sharp falls and the London discount on Johannesburg prices widened to 20 per cent or more. Anglo American and Western Holdings both fell 7s. 6d. to 121s. 3d. and 111s. 3d. respectively while De Beers fell 6s. 3d. to 123s. 9d.

(1) For a rough conversion to basis of June, 1947, multiply throughout by 1.534. (2) The interim index of retail prices has been linked back to 1938 with the aid of calculations made by Professor R. G. D. Allen for the London and Cambridge Economic Service. (3) For a rough conversion to basis of June, 1947, multiply throughout by 1.561. (4) In general males under 21 and females under 18 years of age. (5) Surveys made twice a year; annual figures relate to October survey. (6) Index revised and rebased on 1958=100 (see *The Economist*, January 7, 1961, page 59). (7) Revised series. (8) The series has been revised by the Chamber of Shipping to reflect a more up-to-date pattern of tramp shipping movements and uses the average freights in 1960 as the basis of comparison; 1958 and 1959 figures on the old basis of 1952=100 have been linked to 1960=100 by multiplying by 1.348, freights in 1960 being considerably lower than they were in 1952.

## APPOINTMENTS

**FORMICA LIMITED**  
A Member of the De La Rue Group  
require a

## MARKET RESEARCH EXECUTIVE

to be directly responsible to the Market Research Manager, and be able to accept full responsibility for the department in a short time.

Candidates must have a degree in economics, a knowledge of statistics, have had at least four years' experience in market research, and have an interest in marketing problems. It is highly desirable that they should have had some experience in industrial market research and have a wide knowledge of British Industry.

Ideally they should be aged 30-35, having a pleasant personality, good qualities of leadership and administrative ability; able to analyse a problem, ask the right questions, get the answers, and present the results effectively.

The right person will be paid an attractive salary, together with the usual fringe benefits.

Write (quoting reference K 8654) giving details of age, education, experience and present salary to:

The Chief Personnel Officer,  
Formica Limited, De La Rue House,  
84-86 Regent Street, London, W.1.

## A CAREER AS A TAXATION SPECIALIST

A large firm of Chartered Accountants with an extensive practice in this country and overseas has vacancies on its staff for qualified accountants wishing to specialise in taxation. Opportunities for advancement in this department are good and in addition to a generous starting salary the firm operates a pension scheme.

Interested applicants are invited to send full particulars to Box No. 1514.

### COUNTY BOROUGH OF SOUTHAMPTON ORGANISATION AND METHODS— WORK STUDY OFFICER

Applications are invited for this appointment in Grade A.P.T. V (£1,310-£1,480). The officer appointed will be responsible to the Establishment and Organisation and Methods Officer already appointed and will undertake the investigation of manual operatives within the Council's service. Previous experience in Local Government an advantage, but not essential. Particulars and form of application obtainable from me. Closing date 30th JUNE, 1961.

A. NORMAN SCHOFIELD,  
Town Clerk.

Civic Centre,  
Southampton.

GRADUATE, qualified actuary or accountant, experienced or interested in investment analysis required by leading firm of Stockbrokers. Excellent salary and prospects for right applicant. Write giving details of age, qualifications, experience and previous employment to Box TE 718, c/o Hanway House, Clark's Place, E.C.2.

### PERSONAL ASSISTANT

Young chartered accountant, 20-25, as P.A. 6950.—W.C.2. Tel.: Munpower, WHI 0041.

## QUALIFIED ACCOUNTANT FOR MIDDLE EAST

Price Waterhouse Peat & Co. require a qualified accountant, preferably single, for appointment to the staff of their office in Addis Ababa. The climate in Addis Ababa is good and the initial tour will be for two years, the last two months of which will be on paid leave in the United Kingdom. Commencing salary after payment of taxation will be in excess of £2,000 per annum. Traveling expenses from and to the United Kingdom at the end of contract will be paid by the firm. Applications should be sent to Price Waterhouse & Co., 3 Frederick's Place, Old Jewry, London, E.C.2.

### NEWMAN DEMOGRAPHIC SURVEY

It is proposed to establish at the London Headquarters of the Survey a special unit to undertake the assessment of Catholic school needs in Local Educational Authority areas. Applications are invited from Catholics for the following appointment: Preference will be given to candidates (men or women) who have recognised qualifications in statistical method, but candidates with experience as Statistical Assistant will also be considered. The head of the unit will be responsible to the Director of the Survey for all stages of the work from initial discussions with Diocesan School Commissions and Local Authority Departments of Education to the preparation of final reports. Starting salary in range £750-£1,200 p.a.

### BEECHAM GROUP LIMITED has a vacancy for

A MARKET RESEARCH OFFICER in the Consumer Research Division to be responsible for devising surveys and seeing them through to the report stage. The successful applicant will probably be around 30 years of age. The Group offers exceptional opportunities for promotion in the various divisions of the Group Companies. Profit Participation and Non-contributory Pension Schemes are in operation. Write stating age, qualifications and experience, and enclosing references to MRM 133 to the Personnel Director, Beecham Group Limited, Beecham House, Great West Road, Brentford, Middlesex.

CHARTERED ACCOUNTANT, 26-35, required by leading firm of stockbrokers to take charge of Accounts and act as personal assistant to C. A. Partner. Experience of stockbrokers' accounts a decided advantage. Salary according to experience but not less than £1,500 p.a. plus profit-sharing, pension schemes and other benefits. Details and form of application, etc., to Box "H.O." c/o J. W. Vickers & Co. Ltd., 7 Great Winchester Street, London, E.C.2.

### ECONOMIST

A leading manufacturer in the durable consumer goods field, based in North London, requires an Economist for a senior position in the Sales Research Department. The position calls for a man aged 25-32, with good qualifications in economics or statistics, and preferably some previous research experience. The man appointed will be responsible for the Company's sales forecasting and for research on a wide range of marketing problems. The degree of responsibility and of future advancement will be commensurate with largely by his ability to contribute effectively to company marketing policy. Starting salary will be in the region of £1,400 which may be varied in the light of qualifications and experience. Candidates should apply with full personal history to Box No. 1520.

### UNIVERSITY COLLEGE, IBADAN, NIGERIA

Applications are invited for (a) Lectureship or (b) Assistant Lectureship in STATISTICS DEPARTMENT OF ECONOMICS AND SOCIAL STUDIES to commence October, 1961, if possible. Salary scales: (a) £1,200 x £1,500 (part) £1,250 x £1,500 p.a.; (b) £950 x £50 — £1,100 p.a. (or if over 28 or holding higher degree £1,050 x £50 — £1,150 p.a.). Passages paid £150 p.a. wife and up to five children under 11 years, on appointment, annual overseas leave, and termination. Children's car and outfit allowances. F.S.S.U. Part-furnished accommodation at rent not exceeding 7.7 per cent. of salary. Detailed applications (6 copies) naming 3 referees by July 31, 1961, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn Square, London, W.C.1, from whom further particulars may be obtained.

For other appointments  
see page 1427

### RHODES UNIVERSITY Grahamstown and Port Elizabeth,

Applications are invited for the following posts in the Port Elizabeth Division of the University, from January, 1962:  
(1) LECTURER IN GEOGRAPHY.  
(2) LECTURER IN FRENCH LANGUAGE AND LITERATURE.

If your  
family unit  
is economically  
viable—  
boy, you're a  
breadwinner!

Few of us can hope to be skilled hands at theoretical economics. But it's not hard to understand the simple facts behind Life Assurance. When you take out a life assurance policy you're joining financially with thousands of other men and women for the security of all. You save—and you provide protection for your family in case you're no longer there to do the breadwinning. Meanwhile, your money is expertly looked after. Money put into Life Assurance goes towards making a better life for everyone in Britain. It helps to provide valuable finance for industrial expansion, for new building, for all sorts of public projects.

You get a good deal from **LIFE ASSURANCE**

Issued by The Life Offices' Association, London, and Associated Scottish Life Offices, Edinburgh.

## GROWTH OF A NATION: In a series No. 3

Emancipating the Japanese;

### "OKU"-san

The Electrical Industry's rapid growth during the past decade has brought the Japanese "OKU-san" (housewife) to a high standard of home life. Higher incomes resulting from better economy have turned the housewife towards a new era of automation.

It's fine to go electrical for everything . . . and we're proud of the Electrical Industry's progress. The Nippon Kangyo Bank has played its part in serving this industry well, for "Kangyo" means "Industrial and commercial promotion". Make The Nippon Kangyo Bank your representative in Japan, in this phase of commerce and industry. Use its facilities freely!

## Nothing Succeeds Like Prosperity

Your Mark of Prosperity

Traditional experience in securities and finance qualifies Nikko Securities as outstanding in the field of Japanese finance. In close touch with the leaders of finance and industry, Nikko is thoroughly familiar with the various aspects of the industrial economy. The phenomenal growth and modernization of Japanese industry contributes to increased financial investments. Nikko's staff of experts, engaged in continuous research on domestic and international economic trends, provide reliable up-to-date data to pave the way to sound investments.

An international network of branches and correspondents offers convenient world-wide service.

Recent relaxation of investment regulations for foreign investors opens the door to a flourishing securities market at home and abroad. All indications point to a golden opportunity if you will consult Nikko . . . your long-established investment counsel.
