The present state of the political parties in Venezuela puts the government party, *Accion Democratica*, far in the lead. In the elections at the end of 1946 they obtained about 80 per cent of the votes. The largest opposition party is the Copei, a Catholic Socialist party which, according to the government, has recruited most of the country's reactionary forces. Also of some importance is the *Union Republica Democratica*, which works with the Communists, but which seems to be a magnet for pre-revolutionary personalities. The Communists themselves are divided into two camps, one meant to be more extreme than the other. Both oppose the government party.

The government party is essentially a "popular" party, drawing its support from the still very young industrial working classes. It does not believe in a strictly working-class party, but plans a coalition of those groups who will promote the industrialisation of the country, extensive land reforms, better standards of living, health and culture for the people, and the building of political democracy.

Record of Two Years

Its government's progress during its first two years of office has been impressive. In education rural schools were increased from less than twenty to about 150. The number of students in primary schools has increased from 281,000 in 1945 to 420,000 in June, 1947. On housing it has spent 30 million bolivars (£2,500,000) building houses for 4,000 working-class families, mainly in the interior and in the oil fields. The trade unions have increased from 200 with perhaps 20,000 members in 1945, to 900 with more than 125,000 members now. The Minister of Labour estimates that the cost of living is now 140 per cent of what it was in October, 1945, but that wages have risen by about 175 per cent over the same period. A new labour code is being drawn up for submission to the first session of the parliament under the new constitution.

In industry the government has concentrated on increasing the revenue from oil production. It first stepped up the output from the Venezuelan oilfields; then, in order to expand the oil industry, it issued a decree that oil companies, which had hitherto done most of their refining in the Dutch islands of Aruba and Curaçoa, should after a certain date refine their petroleum in Venezuela instead. Later it issued another decree that 50 per cent of the oil companies' profits were to be reinvested in Venezuela, either in houses or other social benefits for the workers, or in establishing new industries in the country.

The government has been most conscious of its socialist principles in land reforms. Soon after it came into power it took over a number of the big estates in the country from officials of previous regimes, who had acquired them by graft and similar means. These confiscated estates have been used for a widespread

agrarian programme. Nor has the government been entirely doctrinaire in its reforming zeal. In some cases the land has been turned over free to the farm workers; in some it has been sold; while in others the government has instituted co-operative farms which, by the end of 1947, will total about 200,000 acres.

A special drive has been made to reduce the country's dependence on food imports. During the previous dictatorships land ownership was concentrated in the hands of very few people, and former agricultural land was turned into grazing or woodlands. Other land fell out of cultivation when its owners or tillers moved to the more prosperous oilfields. The result was that Venezuela, which is primarily an agricultural country, imported large quantities of agricultural staples. The government is now trying to get the land back into cultivation and to cur down these imports. It plans to make the country self-sufficient in sugar, at least, by 1949. Trade union organisation among the farm workers has also been encouraged, a novel development in South America, and 350 out of the 700 new unions which were established since 1945 are composed of agricultural workers.

Immigration is also being greatly stimulated. Venezuela now has a commission in Europe recruiting suitable immigrants, who are divided into two classes. The first are given homes and subsistence for a limited period and are then guaranteed work; the second are left to themselves from the start.

In spite of these achievements, the government's political opponents accuse it of spending a great amount of money without anything visible to show for it; of acting in an undemocratic manner—particularly in its dealings with the *Union Republica Democratica*, which it has to some extent suppressed; and of being simply another military dictatorship (young officers hold two of the seven seats on the government committee). Nevertheless, the *Accion Democratica* party represents the most hopeful social development in Latin America at the present time.

(To be continued)

Communism in India

[FROM OUR BOMBAY CORRESPONDENT]

IN the present disturbed state of the sub-continent, with fighting in progress in Kashmir, near the borders of Soviet Russia, the question of Indian Communists' strength assumes more than academic interest. There seems to be an impression in certain quarters in the West that Communist influence here has grown considerably of late, and that, if the present administrations were unable to hold their own against the mounting confusion, Communism might seize power.

Such a view is not shared even by the most pessimistic observers here. The worst I have heard is that Communists might form the next government but one; but even then only in the event of the present Congress-controlled administration losing its grip of the situation. The most optimistic view was given to me by a Left-wing professor, who was candid enough to admit that real Left-wingers were not strong enough for anything but "demonstrational purposes." That, however, was before the recent trouble began.

Communism is not a new phenomenon in India. Its followers have been active for at least a quarter of a century, and although the British Government of India kept the party virtually underground during the period between the wars, they could not prevent fairly close contact with Moscow. The New Delhi of the Viceroy was always ultra-suspicious of the intentions of every politically conscious Indian who asked for a passport; had anyone been foolish enough openly to ask for an endorsement for Russia, he would have been promptly labelled as an anarchist of the most sinister type. All this official hysteria about Soviet Russia was particularly foolish, because it gave Russia and Communism unearned prestige among Indians opposed to British rule. Indian Communists made full use of their "martyrdom" to work their way into practically every Indian political party.

Pioneers of Trade Unionism

They could not exert a very powerful direct political influence, but they undoubtedly played an important part in swinging the Indian intelligentsia's outlook towards the Left. The Communists have also been pioneers in the organisation of Indian labour into trade unions. Here they had an almost clear field because, except for Mahatma Gandhi's work, few Indians took any constructive interest in this aspect of social progress. Only in the past two or three years have the main Indian political parties awakened to the "white-ant" tactics of the Communists inside their own organisations, and to the danger of the Communist-organised trade unions.

The issue between the Communists and Indian nationalists became clear-cut when the Communists in this country gave full support to the war effort despite the Congress decision that it was not India's war. When the Congress leaders were released from detention in 1944 plans were laid to expel all Communists from Congress and to organise Congress-controlled trade unions. Congress is now free of Communists, but the fight for the control of labour is still in progress.

A very brief diary of Communist activities during the present year gives a clear indication of the way this party is assisting industrial and agrarian unrest. The year opened with country-wide raids on Communist Party offices to seize copies of the party weekly, "People's Age," and a pamphlet allegedly disclosing "Operation Asylum," a military top secret document, containing details of measures to be taken to ensure order when the Indian Interim Government assumed power late in 1946. Notable features of these police raids were the number of trade union officials arrested and union offices searched. The Madras Government (a Congress ministry) took a most serious view of the situation and promulgated a public safety ordinance providing for detention without trial. Large numbers of arrests were made not only in Madras City, but in rural areas like Malabar District. Premier Prakasam accused the Communists of fomenting agrarian trouble and of rendering life and property unsafe.

In Bombay City, trade union and Communist Party offices and the homes of Communist leaders were raided on several occasions, while in Bombay's Satara District there was a string of arrests among Communists leading an anti-moneylender campaign. A woman Communist, Mrs Godaveri Parulekar, who led the Warli jungle tribe in violent attacks on landlords and their

property in Thana District, was detained. More than 50 Communist committees were known to exist in the city.

During the first half of the year there were serious agrarian disturbances in Travancore, the Malabar and Kistna districts of Madras and in Hyderabad State. The Travancore affair almost reached the proportions of a revolution. Ex-soldiers were armed with all kinds of vicious-looking home-made weapons and incited to seize land by force. In Madras and Hyderabad food shortages provided good opportunities for fomenting unrest.

Many of the Communists arrested in the early part of the year were released during the general gaol delivery of political prisoners as part of the independence celebrations.

Strikes and Rioting

The year has seen a large crop of strikes—many of them illegal—called by Communist-controlled trade unions. These often led to disorder, as at Dhanbad power house (which supplies the East Indian coalfields), which was attacked by a large mob of whom five were killed during police firing. During September Communist textile unions in Bombay called a strike of drawers—in key men in the weaving sheds. The result was a loss of some 20 million yards of cloth at a time when Indian textile production was seriously below the country's needs.

The textile strike, with its crippling effect on the national economy, did not prevent P. C. Joshi, General Secretary of the Communist Party of India, offering full support to Pandit Nehru as head of India's national government.

The Communist programme in India, according to S. A. Dange, who has returned from a tour of eight months in Europe, is to stop the troubles in the Punjab, to expose and demolish the influence of the Rashtriya Sevak Sangh (militant organisation of the extremist Hindu Mahasabha), and to support a Leftist government under Nehru. This programme is not quite as harmless as it looks. The key is the destruction of the RSS, which is rapidly increasing in membership now that Congress has come to the end of its period of agitation. It attracts young Hindus who are still in search of excitement and, of course, those who have been infected by Hindu-Muslim enmity. Many observers believe that the RSS will become the private army of Hindu reaction—i.e., the interests working to make the Indian Dominion into a Hindu theocratic state. The establishment of such a state and caste system would automatically rule out progress along the lines of democratic government and trade unionism.

Troubles in Store for Congress

As for support to Nehru, this is nothing less than an attempt to split the present Congress central government. The Communists and the other Leftist parties, including the Congress Socialists and Roy's Radical Democrats, believe the rumours that tension exists between the somewhat Socialistic Nehru and his deputy prime minister, Sardar Vallabhbhai Patel. The Leftists regard Patel as a reactionary—he led the movement to expel the Communists from Congress—and they are afraid he will lean too heavily on the side of the Sikhs and the RSS. Communist periodicals are now attacking the Sikh princes, led by the Maharaja of Patiala, for starting the riots in northern India.

By painting Patel as the archetype of big business—an unjust allegation—the Communists hope to attract support for a Leftist government from the moderate middle-class element who are now thoroughly frightened by the ferocity of the disturbances and angered by the country's rampant black markets. The weakness of this plan is the smallness of Nehru's personal following. Though he has long been a national hero, he has left the business of party management to others, and particularly to Sardar Patel, who controls the Congress machine, including the provincial governments.

Thus there is little likelihood of an overnight Communist revolution. But there is plenty of room for trouble in the industrial and agrarian spheres, especially if continued disturbances prevent the central government from initiating a vigorous economic policy.

In India, as elsewhere, the Communists enjoy the advantage that few politicians and labour leaders are prepared to emulate their unremitting work among the masses. Except for Congress the Communists—not more than 60,000 in all—are probably the best organised party in India. They frequently have technical troubles with the law—their union records can rarely be made to support their membership claims—but their influence is sufficiently strong to force employers and government to negotiate with them, whatever legal traps may have been laid.

THE BUSINESS WORLD

Third Act Mystery

IN the City and in the investment markets the dominant influence this week, overshadowing even the Budget itself, has been the abrupt departure of Mr Dalton. Bewilderment at the surrounding circumstances has now largely subsided; and one by one the extravagant rumours which went the rounds have been discredited as it became clear that the simple explanation which seemed too astonishing to be believable was in fact the whole explanation. But if the seeming enigma of Mr Dalton's five-minute lapse has been resolved, the enigma of its consequences for the City is still sorely troubling every investment adviser. At the outset almost everyone instinctively felt, and after a week's reflection still feels, that an important new factor has thrust itself into the investment background, but nobody can yet see how the picture itself will be changed. In this first judgment, the City is certainly right. However true it may be that financial policy is, and obviously ought to be, the policy of the Government as a whole, it is absurd to suppose that the departure from the Treasury of so dynamic and forceful a personality as Mr Dalton can make no perceptible difference, and that would be true even if his successor were not known to be a man of contrasting temperament and outlook.

To City eyes Mr Dalton has been, more clearly than any Chancellor for many years, the central actor on the Westminster stage. He has given, moreover, a particularly boisterous performance, playing constantly to the City gallery and watching with much greater care than Chancellors generally show its every gesture of response, as well as the reception among the wider audience which it represents. It is true that some of the more knockabout turns—such as the Profits Tax Parody on Sound Finance (as expounded by a former economist), the Bonus Issues Illusion (mulcting the wrong taxpayer for offering to somebody else a fictitious profit from a non-existent bonus) and the Soak the Speculator duty—were especially designed to appease the pit by scoring off the gallery. But, these shafts notwithstanding, the first two acts of the unfinished drama were a source of real satisfaction, not to say profit, to many at least among the attentive City. So much so, indeed, that the threat of tragedy in the third act, after the Arctic Winter interlude, still left some incorrigible optimists hoping for a happy ending. But now, by misadventure, it falls to a different star, a true tragedian, to play the closing scenes. It is not to be expected that his interpretation will be the same, still less that he will essay the same versatility, impishness and the same engaging inconsistency.

But if the City assumes that the new star will or could rewrite the whole meaning of the play at the end of the third act, it is a poor judge both of plays and playwrights. Many of the forecasts, the hopes and fears, now current are certainly misplaced. It is foolish to suppose that vital parts of Mr Dalton's policy will now be suddenly jettisoned (to drop at last an exacting metaphor) and others drastically reversed. The naïvety of that view should have been apparent even before Sir Stafford Cripps's speech, with its rather cautious assurances, on Monday. The City, and many others too, have been so carried away by their own intense conviction of the tragic inadequacies of financial policy that they have been in danger of forgetting the circumstances of Budget day, of arguing as if a Chancellor had left the Cabinet because his policy

was no longer acceptable to his colleagues. It is a purely fortuitous coincidence that the departure comes at a time when what has been regarded as the characteristic Daltonian policy, was already in process of change, and there is no reason to suppose that Mr Dalton himself was obstructing the change—such as it is. Indeed, in some important respects, the very opposite may have been true.

To assess the probable changes in the investment background requires a nicely discriminating approach. Daltonian policy was compounded of three main elements—one strongly negative and two strongly positive—which are unlikely to be affected uniformly. On the crucial issue—handling of the Budget in face of steadily rising inflationary pressure—his policy consisted in resisting all advice to use the fiscal machine as a weapon of disinflation—until last week's timid swan-song demonstrated the accuracy of the summer forecast that the twelfth hour would strike this autumn. In Mr Dalton's mind, as other evidence testifies, the foundation of this policy was a faith in the efficacy of physical controls; in other minds it rested partly upon this same faith, but especially upon an ill-reasoned but sincerely held party conviction that the people must never again be burdened by the halter of "capitalistic" instruments of financial control. Finance, though entrusted to so forceful a Chancellor, was therefore relegated to the back seat, and the driving force of physical control and direction took the front seat at the wheel.

In the past two years the prime mobiliser of these chosen forces—chosen, it seems, by the Chancellor as well as by the Cabinet as a whole—has been Sir Stafford Cripps. If he were a less objective and a less intellectual character than everyone knows him to be, it would be a safe bet that he would flatly decline to swap the new engine of physical controls for the financial model which his colleagues have long believed, almost as an article of faith, to be obsolete. And, given his intellectual integrity, it is equally safe to assume that he would not try to shift Finance from the back seat merely because he happens now to be Chancellor. It is easy, therefore, for him to affirm at the outset that there will be continuity of policy, for in this sphere continuity implies a lack of emphasis on purely financial policies; and that, one may presume, is welcome to a newcomer to the Treasury and to one, moreover, who has had none of the drilling in principles of finance which gave his predecessor so great (but so widely neglected) an advantage. All he has to do is to endorse and carry through Mr Dalton's Budget, while reserving judgment about the next one; for the fact that this is an interim Budget affords a plausible excuse, if one were sought, for changing policy in a few months' time without appearing to do so.

This Sir Stafford has done, and the terms of his reservation about next April's budget are at first glance more reassuring than might have been expected from him after so short a time for reflection. His assertion that this emergency budget was never intended to cover the full range, and his emphasis on the dangers of inflation, might seem to presage much more drastic financial action next April. But closer examination reveals the same strands of thought as emerged in his grim speech in the Debate on the Address. Then, capital cuts were

needed partly "to bring about a measure of deflation"; now, he still finds the primary source of inflation in the excessive capital programme—not, be it noted, in excessive consumption which now, as then, Sir Stafford appears anxious to maintain for fear of secondary repercussions on production. Secondly, while there is a hint of a tentative approach towards the central truth that financial measures are needed to relieve the pressure on physical controls, the impression left is still that when Sir Stafford contemplates the more drastic measures which may be needed, he is thinking more of physical than of financial action. Defence of the food subsidies and emphasis upon voluntary savings are hardly the obvious approaches to a tougher budget. Austerity Cripps plainly has no wish to adopt his predecessor's pose as distributor of largesse; but the mere fact of his translation to the Exchequer certainly does not mean that his prescription for deepening austerity is the same prescription as most economists and the City now advocate.

For the immediate future, the inflationary menace looks only a shade less grave than it did a week ago; and the chances of achieving the export targets by means of an ever-growing array of directional controls which pull against the tides of surplus spending power are not perceptibly brighter. It may be different, however, on a slightly longer view. There was always the possibility, even without the change in Chancellorship, that the practical demonstration of the way in which the chosen instruments are being obstructed by the failure of financial policy would eventually provoke an important change in emphasis. The interim budget, mild though it is, was a first step, which in principle marks a big retreat from the standpoint tenaciously held only a few months ago. The second step, now that the force of inertia has been overcome, could be a longer one. If these views are already taking root in the Cabinet as a whole, the objective Sir Stafford will not be slower than his colleagues to grasp them, and he has not Mr Dalton's back-seat tradition to inhibit him.

What of the remaining ingredients, the positive elements, in Mr Dalton's policy? The first was a doctrinaire dislike of profits, and a prejudice against investors and "capitalists" as a class—a prejudice which construed equality of sacrifice into penal measures against them whenever fiscal policy suggested that any burdens at all had to be imposed upon the main body of taxpayers. Pure politics, not reasoned principles of finance, dictated the nature and direction of the imposts. Sir Stafford

may be less vindictive, but he is probably no less doctrinaire. If a more austere budget lies ahead, the City would be wise to assume that it will not fare much better under the new Chancellor than under the old.

In one respect, from the narrowest market standpoint, it is likely to fare worse. The third ingredient in Mr Dalton's policy, the cheaper money drive, was not only a positive policy but one which was peculiarly personal to him. Labour philosophy may bar high interest rates and the use of the interest weapon as a primary means of economic control; but it certainly did not demand extravagant efforts to establish abnormally low rates regardless of cost and in face of huge natural forces. Mr Douglas Jay, who, though trained in economics, is scarcely a moderate in such matters, was shocked to discover last spring that bank deposits had been expanded by some £800 millions in twelve months. Still less has it been pleasing to back-bench supporters to find a Socialist Chancellor ably filling the role of the speculators' and stockbrokers' best friend. The new Chancellor has naturally paid lip-service to the cheap money policy, and has denied its inflationary significance. But to buttress it now, on the very eve of the issue of the new Transport stock, would require very vigorous positive action, and most people had doubted whether even Mr Dalton's effrontery and tenacity would suffice to achieve it. It is hard to see the austere Sir Stafford as commander-in-chief of a regiment of "departments" operating lavishly with newly created money. It is still harder to see him in the role of the tub-thumping auctioneer of the street markets. Neither he nor his City advisers have ever rashly given hostages to fortune. He has no commitment to displace Goschen from his distinctive niche in financial history. He is not called upon to notice that Consols now stand roughly where they did when his predecessor first went into action. But if he does notice it, he will surely also notice what has happened to bank deposits.

In short, the City speculators have no reason to welcome this change at the Treasury. But, on a somewhat longer view, though much in the wider field of economic strategy remains uncertain, there is room for hope that a realistic financial policy has by this personal accident been brought a little nearer. That will serve the long-run interests of the community, and of investors incidentally. But the Daltonian legacy of differential burdens upon them—especially upon the equity shareholder—is likely to run its full Parliamentary term.

Trade Under the New Tariff

TO assess the exact consequences for the future of world trade of a tariff agreement between 23 nations, which has involved 106 sets of bilateral negotiations between the parties over a period of six months, and is now set down in an agreement containing 34 Articles and two volumes of Schedules weighing eight pounds, is an impossible task. The Agreement arrives at the very time that Britain is adopting bilateral trading practices as a matter of self defence; but despite this and all the other impediments to the free flow of international commerce, multilateral trade relationships still extend over a large part of the world and account for a significant share of world commerce. The extreme complexity of these relationships means that the balance of gain and sacrifice cannot be worked out by any process of simple arithmetic; formal figuring alone would require the mathematician's apparatus of simultaneous equations, but calculations of this sort will be far less important, in the end, than the effects of the agreement as a whole upon the quantum of world trade. World trade could increase and leave some countries poorer, but that is hardly a consequence which is likely to apply to Britain.

Until acceptances have been received from countries which

account for 85 per cent of the external trade of the signatories, the Agreement does not enter into full force, but it is being applied provisionally by eight countries (Australia, Belgium, Canada, France, Luxemburg, Netherlands, the United Kingdom and the United States) from January 1st next year. It remains in force at least until January 1, 1951. There are twenty schedules (the "Benelux" countries and Syria and Lebanon are each covered in a joint schedule and not separately), which record the concessions on duties and preferences, and which apply multilaterally—that is, they are all to be accorded to each of the signatories. Some of these concessions provide for a reduction of rates of duty; others for the "binding" of existing rates (that is, a promise that they shall not be increased); others again for the reduction of margins of preference either by specific undertaking or as a consequence of the reduction of general rates of duty.

The broad effect of these changes between concessions by and advantages to Britain is summarised in the Government's Report* in a series of tables. In the first place, Britain has under-

* "Report on the Geneva Tariff Negotiations." Cmd. 7258.

taken, in respect of a first category of goods, either to continue duty-free entry or to "bind" the existing *ad valorem* duties, or, where the existing duties are specific, not to increase them to such an extent that they would be higher *ad valorem* than they were before the war (not, it would seem, a very burdensome concession in these days of greatly increased prices). Britain imported goods in this first category in 1938 to the extent of £63.1 million from the 22 countries divided as follows:—

Specific rates	Present Range of Duty				Duty free	Total
	31% or over	21% to 30%	11% to 20%	Up to 10%		
0.2	1.0	1.7	10.7	11.1	38.4	63.1

This represents the range of imports on which duties will be stabilised at least until 1951. These undertakings are of some value in promoting expansionary tendencies in world trade, for they limit the area in which sudden and frustrating increases of tariffs can be applied. In a second category, Britain has undertaken to reduce current *ad valorem* duties affecting goods of which British imports from the 22 countries in 1938 totalled £19.8 million. These changes are summarised below:—

Reduced by	Present Rates				Total
	31% or over	21% to 30%	11% to 20%	10%	
Less than quarter	1.1	3.1	4.3	1.9	8.5
Quarter to less than half	1.5	0.6	3.8	3.4	7.8
Half or more	...	...	0.1	...	3.5
	2.6	3.7	8.2	5.3	19.8

Those specific duties which have been bound against any increase themselves represent a reduction in *ad valorem* rates (owing to higher prices) and certain reductions in specific duties have also been agreed. Further, some specific rates of British duty have been reduced. British imports from the participating countries in 1938 covered by this third category of concessions amounted to £10.6 million. This should be added to the total of £19.8 million in the table above to measure the volume of trade (£30.4 million at 1938 prices) which stands to benefit from the effective reduction in the British tariff. It is a useful contribution towards freer trade, but before any hats are thrown into the air it is worth recalling that total British imports from non-Empire sources in that year amounted to £548 million, dutiable and undutiable. The new agreement touches only 5½ per cent of this.

The agreement will be closely examined for evidence of how far Britain has moved, under the pressure of American doctrine, towards the "elimination of preferences." The United Kingdom has agreed to the reduction by other Commonwealth countries of preferences accorded to British goods; many of these are on "a relatively small scale," but there are some reductions of one-third or even one-half, and in "a few cases" margins have been completely eliminated. The total value in 1938 of the goods imported into British countries from the other countries represented at Geneva (excluding the United Kingdom itself from both sides) was £37.4 million, on which concessions are distributed as follows:—

Imports Into	£ million		
	Margins Reduced by less than 35%	Margins Reduced by 35% or more	Margins Eliminated
Canada	10.5	4.5	6.6
Australia	3.3	0.9	1.1
New Zealand	0.8	1.2	0.5
South Africa	...	1.3	0.7
India and Pakistan	0.4	0.2	0.7
Newfoundland, S. Rhodesia, Burma and Ceylon	4.2	0.1	...
Colonies	...	...	...
	19.6	8.2	9.6

In 1938, the value of British goods affected by these changes of preference amounted to £36 million, or 17 per cent of the total value of £207 million for British goods exported to Commonwealth countries. The case of Canada is clearly the most important in this list; and in return, Canada has reduced many preferential rates of duty in favour of Britain, and has bound many others against increase. By a separate exchange of letters, the two countries have modified the Anglo-Canadian trade agreement of 1937, in order to free each Government from the obligation to maintain given margins of preference, but the preferences remaining after the entry into force of the general agreement will be continued. Any special rates lower than the British preferential tariff which Canada has accorded to Australia, the British West Indies, New Zealand or South Africa are not automatically extended to British or Colonial imports into Canada, but they will not be extended.

The concessions on the margins of preference enjoyed by the United Kingdom in the Colonies were made primarily to the United States. They operate as soon as possible, and not later than the end of 1949, but they may be made inoperative if "at any time" the quantity of general purpose synthetic rubber "required to be consumed in the United States under internal quantitative regulations" exceeds 25 per cent of the total American consumption of natural, synthetic and reclaimed rubber. During the first nine months of this year, American rubber consumption (of all types) totalled 1,041,587 tons, of which general purpose synthetic totalled 346,972 tons or precisely one-third. If the consumption of GRS was reduced to 260,000 tons and reclaimed rubber increased from 213,000 tons to 300,000 tons, the stipulated 25 per cent would not have been exceeded. Thus the concessions on Colonial preferences do not automatically guarantee the increased consumption of natural rubber in the United States. This result is a testimony rather to the tough character of American bargaining, than to the pure pursuit of freer world trade. The position regarding tin ore is more satisfactory, for the Malayan export duty is not to be suspended until the United States ceases to subsidise the Texas smelter.

It is clear that substantial concessions have been made by Britain and other Commonwealth countries by reduction and elimination of imperial preference margins. Evidently, these were necessary to secure a multilateral agreement, and it is claimed that they "do not by any means involve an abandonment of the essential structure" of imperial preference—with some reason, since 70 per cent of the trade in 1938 remains unaffected. The next table shows the 1938 value of British exports to Commonwealth countries which were entitled to guaranteed preferences, and the reductions which have now been agreed:—

	Total Value of Preferences Guaranteed to UK 1938	Reduced by less than 35%	Reduced by 35% or more	Eliminated	Unaffected
Canada	£ mn. 16	% 27	% 11	% 18	% 44
Australia	35	17	3	1	79
New Zealand	21	11	24	2	63
South Africa	15	...	8	3	89
India & Pakistan	7	21	2	13	64
	94	15	10	8	70

The counterpart of these concessions is to be found in tariff reductions from foreign countries to Britain or to the Commonwealth countries concerned. The importance of Canada in this list is again apparent.

Such, very briefly summarised, are the main heads under which concessions have been made by Britain and Commonwealth. What has been conceded in return? The value of 1938 trade now to be covered by "bindings" of rates is

of participating in the issue by leaving nearly two months for acceptance. The issue has been underwritten by a group comprising Morgan Grenfell and Co., Baring Brothers, N. M. Rothschild and Sons, and M. Samuel and Co., for a commission of 1s. 6d. per share. Big issues are rare enough, and those made without the collateral support of officially sponsored organisations like Finance Corporation for Industry are even rarer. The Shell issue, therefore, is something of a challenge for the London capital market, which in its heyday would have taken an operation of this sort in its stride, to rise to the occasion.

For this reason alone—quite apart from its intrinsic merit—it deserves success. Certainly, any qualification to success would reflect seriously on the future willingness of British investors to furnish the resources from which major industrial projects in this country and overseas could be financed. It is fashionable to belittle and denigrate this most important function of the London market, and to suggest that the role of private finance has been permanently replaced, or at least greatly modified, by the financial second cousins of the Exchequer. But the mobilising of private savings through the capital market played an important part in making the City great and added immeasurably to Britain's prosperity in happier times. The extent to which this function has been compromised by the division of the world into different currency areas is illustrated in the Royal Dutch issue itself, with its rigid stipulations governing the acceptance by British holders of the new Royal Dutch shares.

Finance Bill Points

A quick survey of the Finance Bill clears up a few uncertain points, particularly on the incidence of the new pool-betting duty and the disallowance of one-half of advertising expenses for income-tax purposes. The pool-betting duty (10 per cent) will be paid by the operator of the totalisator, and the distribution of stake money will be subject to the deduction of the manager's percentage (which is limited to a maximum of 6 per cent) and also to the deduction of pool-betting duty. This means that distributions will normally be 84 per cent of the total stake money.

The new treatment of advertising expenses will not apply to expenditure incurred in advertising "in the United Kingdom" in a newspaper or periodical "certified by the Board of Trade to be a technical or trade journal or to circulate wholly or mainly outside the United Kingdom." The Treasury may also provide by order that advertising expenses "of such classes, or incurred in such circumstances, as may be prescribed . . ." shall be excluded from the computation of advertising expenses for tax purposes. The precise significance of this second method of exception is not clear—it was not hinted at by any reference in Mr. Dalton's Budget speech. Cinema advertising (including slides) and hoardings and posters (save on the trader's premises) are covered. Perhaps the most notable omission from the definition is advertising expenditure on circulars.

More Dollars from Wool?

The multilateral character of the Geneva tariff agreements published last Tuesday may offer Britain some advantages in the short period. Indeed, the concessions granted by the United States on Empire produce may prove indirectly to be more beneficial to Britain than some of the direct tariff reductions on British goods. The rubber market was obviously disappointed by the modest reduction in the percentage of United States synthetic rubber to be used in the manufacture of tyres and inner tubes; but it is hoped nevertheless that there will be some increase in the shipments from Malaya to America. The 50 per cent reduction of United States tariffs on New Zealand and Australian meat and butter is at the moment of only academic interest. The entire exportable surpluses of these two commodities has been purchased by the United Kingdom up to 1950 under a long-term contract. In view of the present low level of British rations, it is unlikely that Britain would agree to any diversion of meat or butter supplies to the American market even though it would be a means of earning dollars.

The American concession of a 25 per cent reduction in the duty on Dominion wool (Australian, New Zealand, and South African), on the other hand, may offer better prospects of getting more dollars into the Empire pool. The current duty is 34 cents a lb. and in spite of it, imports of foreign wool, largely Australian, into America have been very large. In any case consumption of wool in the United States has expanded greatly since the end of the war from a monthly average of 52 million lb. in 1944 to over 62 million lb. in 1946, and of this latter quantity 82 per cent was imported. Since January, however, American wool consump-

tion, particularly of the type used for apparel, has been declining, and by July it had fallen below 40 million lb. a month. The amount of wool used in America has been relatively lower than in Britain or other European countries, but the present downward trend is probably a reaction to the high level of activity over the past year and the huge re-stocking demand rather than a complete reversion to the prewar level of consumption. Granted the maintenance of a high national income in the United States, the demand for wool should expand, particularly for higher quality products in which Australian and South African merino wool is used. Moreover, at the present high wool prices, a duty of about 26 cents a lb. should not be an unduly high obstacle for Dominion supplies to surmount.

In wool, there undoubtedly appears to be scope for an expanding Empire trade with America, but it would be unwise to assume that imports into the United States will be maintained at the same high level as in 1946-47. So far this season, American buyers at the wool auctions have been little in evidence and their purchases have been selective. Admittedly much of the wool offered has not been fully suitable for the American market, but there is nevertheless a marked difference compared with a year ago, when American purchases were being made very freely.

"Grave" Situation on Rail

The shortage of railway wagons is now regarded as a critical factor in this winter's production drive. This is no recent discovery, but its importance has been underlined this week by the fact that Sir Stafford Cripps, pre-occupied as he must be with his new duties as Chancellor of the Exchequer, took occasion on Tuesday to deal exclusively with the problem at his fortnightly press conference, when he declared that the position is now "extremely grave."

There are at present 54,000 fewer wagons on rail than at this time last year and over 80,000 fewer than in 1945. The number of wagons coming forward for heavy repair is causing most concern. Although "within a few months" the monthly rate of repair will be raised by 16,000—an increase which will overtake the numbers coming forward—it is estimated that there will still be a deficiency of 100,000 wagons this winter.

Sir Stafford's urgent appeal for a more rapid turn-round of wagons—to be backed, if need be, by a swingeing increase in demurrage charges—is in striking contrast to the almost buoyant tones which were to be heard in the debate on railway services two weeks ago. "A fortnight ago" said the Parliamentary Secretary to the Ministry of Transport on that occasion, "we passed the peak of wagons needing repair; the curve has now started to turn downwards." Mr. Callaghan then went on to adduce from the fact that the railways dealt with 13.6 million ton miles of traffic in the first 36 weeks of this year, compared with 11.2 million in the corresponding period of 1938, proof that the railways were not suffering from "creeping paralysis" (a phrase recently used by the Transport Correspondent of the *Financial Times* and erroneously attributed to *The Economist* in a BBC news broadcast).

The flat contradiction in these two statements must deepen the misgivings of those who are already aware of the present slow rate of repair of railway rolling stock and who doubt the likelihood, on any reasonable view, of a substantial reduction in the accumulation of railway equipment now awaiting repair. The shortage of railway wagons is, indeed, only one aspect—though perhaps the most important—of the *malaise* from which the railways are suffering. Shortage of staff and materials, psychological unsettlement as January 1st approaches and long-deferred renewals are creating the most acute operational problems, which cannot be offset merely by a cut in passenger services. The only solution is more materials and a higher rate of output in the repair shops. And the latter needs more men (for which the wagon repairers have no priority) and much re-organisation in the shops.

Note Issue's Big Fall

The improving trend of the note circulation, discussed in these columns three weeks ago, has taken a quite abnormal leap forward in the past week. A decline is customary at this time of the year, for this is the week in which the circulation normally reaches its pre-Christmas low point. But this time there has been a fall of no less than £12 million, probably the largest decline that has ever occurred except after a major holiday or special outflow. It carries the total circulation down to £1,348 million, fully £15 million less than at this date last year, and brings the reflux since

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA · PAKISTAN · BURMA · CEYLON
MALAYAN UNION · STRAITS SETTLEMENTS
BRITISH NORTH BORNEO · SARAWAK
INDONESIA · SIAM · FRENCH INDO-CHINA
CHINA · HONGKONG
JAPAN · PHILIPPINE COMMONWEALTH

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

Manchester Branch: 82, Mosley Street, Manchester, 2

West End (London) Branch: 28, Charles II Street, LONDON, S.W.1

New York Agency: 68, Broadway, New York

Associated Banking Institution in India—The Allahabad Bank Ltd.

THE CHARTERED BANK OF
INDIA, AUSTRALIA AND CHINA
(Incorporated by Royal Charter 1853)

The krone derives its name from the Latin 'corona'—a crown. Today the word is chiefly associated with the krone of Denmark and Norway and the krona of Sweden.

krone

For many years Barclays Bank have fostered the growth of Anglo-Scandinavian trade through their comprehensive foreign banking service, strengthened by close links with the leading Scandinavian banking houses. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

BARCLAYS BANK
LIMITED
54, LOMBARD STREET, LONDON, E.C.3.

STABILITY IN CHANGING CONDITIONS

A customer of the Three Banks Group has the comforting knowledge that however rapidly trade conditions may change either at home or overseas, he has at his disposal the combined skill and wide experience of a Group in touch with financial and business interests in all parts of the world, and the benefits of a Banking Service that is adaptable, individual and complete in every detail.

the summer's holiday peak to £72½ million, in contrast with only £28 million for the similar period of 1946. Obviously, the pre-Budget spending must have been even larger than had been supposed. It is now certain, as Mr Dalton implied in his Budget speech, that the Christmas requirements will be accommodated without the necessity of any increase in the fiduciary issue—for the first time since 1940. Thanks to the rapid return of currency in recent weeks, the reserve of notes and coin in the Bank's banking department has been raised to no less than £103.9 million, which is comfortably beyond the all-time record established in 1934. Last year's Christmas currency demands, measured from the third week of November, totalled nearly £65 million, only a little less than the peak demands experienced in 1943. Even if this year's needs are on a comparable scale, it will be seen that the reserve at Christmas would still stand at substantially more than £35 million. In 1940, when a pre-Christmas increase in the fiduciary issue was last avoided, the reserve was allowed to fall to £14 million—and it dropped to only £9,000,000 before the fiduciary increase of the following spring.

Whether it will be possible, as Mr Dalton hoped, actually to reduce the issue in the New Year, when the Christmas currency has returned, is less certain. Obviously the authorities are unlikely to effect a reduction unless there is no real danger that the issue would have to be raised again to cover next summer's holiday needs. If, however, the circulation shows the same secular trend next year as it has done this, a reduction will certainly be possible, for this year's August peak was, for the first time since before the war, below the level of the previous Christmas peak. At this stage, it would be dangerous to attempt any firm prophecy. The influences upon the movement of the note circulation are always rather difficult to determine, and it is an open question how far the acceleration of the downward movement in recent months reflects a natural decline in the public's need for currency. There can be little doubt that recent rumours that the authorities were contemplating a new issue of notes in order to catch the black marketeers have precipitated a reduction in these abnormal holdings. Also, it is never possible to be sure that some of the large quantities of sterling notes known to be held abroad are not being smuggled into the country; there have been some detected cases recently.

Finally, there is the curious fact that the large wave of pre-Budget spending had no expansionary impact upon the note circulation. To some extent this may mean that the spendings come from personal savings accumulated during the war in notes; but it seems much more probable that an important counter-influence, such as the unloading of black market currency, has been prevalent. As for the threat to the black marketeers, Sir Stafford Cripps's statement this week was couched in somewhat ambiguous terms. He said that the Government had considered the question of an exchange of notes, but "was not yet ready to take this step"—which plainly leaves the spivs guessing. It is a moot point whether it will accelerate or retard the reflux of black market money.

Canada's Dollar Crisis

The difficulties in the Canadian balance of payments position have now reached the proportions of a crisis. This is evident from the fact that Canada's gold and US dollar reserves have fallen since the beginning of this year from \$1,245 million to \$500 million. At this rate of decline only a few more months will elapse before the gold reserve is completely exhausted. In these circumstances it is hardly surprising that Canada should have shown some concern about the maintenance of the arrangements under which Britain continues to draw on the Canadian line of credit up to 50 per cent of its net deficit with Canada, meeting the balance of 50 per cent in US dollars. The arrangement may seem harsh to Britain. It appears even harsher and more onerous to Canada. Canada's reserve position has now reached a point at which urgent remedial steps must be taken. The first of these has been the raising of a \$300 million credit from the Export-Import Bank of Washington. The Canadian Finance Minister, Mr Abbot, has explained that this step is a departure from the normal practice of borrowing in the open market, which Canada has followed in the past. He added that the possibility of floating loans in the United States market will be investigated in the near future. The credit from the Export-Import Bank is to be regarded as temporary financing, and will be repaid in four yearly instalments.

The next relief measure is the decision to pay a premium of \$7 for each ounce of gold produced by Canadian mines in excess of their production for the year ended June 30th last. This is intended to stimulate the production of gold, the readiest US

dollar-earner. It should also extract from reserves at the mines some of the gold which has been held back in anticipation of a new devaluation of the Canadian dollar. As far as gold mining is concerned, the subsidy which carries the price for additional newly-mined gold to \$42 per ounce is tantamount to a partial devaluation of the Canadian currency. It remains to be seen how this step can be reconciled with Canada's obligations under the rules of the International Monetary Fund.

The third part of the Canadian monetary defence programme is a wide range of import and travel restrictions aimed at economising US dollars. In addition, a 25 per cent excise tax has been imposed on a wide range of durable consumer goods, the intention being to discourage domestic consumption of these goods and divert them as exports to the United States. The possibilities of expanding exports to the United States have been considerably increased by the tariff agreement announced this week. Some of the more spectacular concessions given in the new US schedule, such as, for example, the 50 per cent cut in the duty on imported motor-cars, emerged from the negotiations between Canada and the United States. Even with all these measures Canada will be hard put to it to maintain her flow of exports to Europe and avoid exhaustion of her small remaining dollar reserve. The European Recovery Programme will, however, come to the rescue if the US Congress can be induced to appropriate funds for expenditure by Europe outside the United States. Canada would be the main beneficiary of such appropriations.

Agreement with Iraq

The terms of a supplementary financial agreement between the Governments of the United Kingdom and of Iraq were published this week. The new arrangements arise from the renegotiation of the five-year financial agreement signed last August on the eve of the suspension of convertibility of sterling. That unexpected development nullified the greater part of that agreement under which it had been arranged that Iraq's sterling balances, amounting to about £60 million, should be liberated over a period of five years. The immediate free release under that agreement was to be of £9,000,000 for the first year, plus a further £9,000,000 in respect of outstanding confirmed credits and repayment of advances by the Iraq Petroleum Company. The new agreement is trimmed to the prevailing dollar austerity. It covers only the period to June 30th next, and provides that over this period Iraq shall restrict her gross payments to scarce currency countries to the equivalent of £5,750,000 a year. In so far as this is not forthcoming out of Iraq's own hard currency earnings, the balance will be made good by allowing Iraq to draw on sterling balances to the necessary extent. Although a small amount of Iraq oil is sold against dollars, it is probable that the larger part of the £5,750,000 in question will have to be provided out of the sterling area dollar pool. Since Britain is running a large current surplus with Iraq, it is more than probable that any such dipping into the dollar pool will be financed by drawing down accumulated balances and not out of current sterling earnings.

Anglo-Irish Trade

The commercial and financial negotiations between Great Britain and Eire have ended in what appears to be a mutually satisfactory agreement. The communique summarising the results of the talks gives greater definition to British than to Irish commitments, but the significance of that contrast should not be exaggerated. Existing supplies of coal to Eire are to be maintained and in addition "a substantial quantity of reasonable quality" is to be exported in 1948. This will be part of the Marshall coal which Britain has undertaken to export to Europe in 1948. Increased supplies of textile raw materials, machinery and fertilisers have also been promised by Great Britain. The announcement makes no mention of the rates of delivery of exports of foodstuffs from Eire to Britain but envisages increases in the prices paid by Britain for cattle, meat and eggs. Prices paid for Irish flax have also been raised.

The financial discussions were mainly concerned with the inevitable dollar problem and with the extent to which Eire's dollar requirements could be satisfied by using accumulated sterling balances. It was agreed that the Government of Eire would make considerable reductions in its direct dollar expenditure, though the exact size of the dollar budget will depend largely on the amount of non-dollar wheat which Eire will be able to import during the coming year. On the most pessimistic assumptions Eire's dollar purchases for the period October 1, 1947, to June 30, 1948, should not exceed its dollar earnings by more than

the equivalent of £14 million. It has therefore been agreed that this should be the limit of Eire's drawings from the dollar pool for this period. The figure will be reduced in so far as imports of non-dollar wheat can be substituted for the imports from the Western Hemisphere on which Eire is at present compelled to budget.

The agreement, especially the rate of authorised releases of accumulated balances for conversion into dollars, appears to be decidedly favourable to Eire. In so far as it results in a larger flow of foodstuffs from Eire, it will no doubt have compensating advantages for Britain. It can certainly be said that the atmosphere in which the talks were held contrasted pleasantly with that which has all too often surrounded Anglo-Irish negotiations in the past. To go back to 1932, when Mr De Valera suspended payments on the Land Annuities and set loose the economic war between the two countries which for some years was to bring trade between them down to damagingly small proportions, is to return to another era.

Ships, Strategy and Subsidies

Maritime opinion on this side of the Atlantic is not unduly perturbed by the energetic lobbying in Washington on the future of the American merchant navy. Basically the problem is one of strategy, for in peacetime it is sound economics for America to import shipping services. Experience between the wars showed that no amount of subsidisation or "flag reservation" could sustain an American fleet in competition with other nations, although this policy did have the effect of undermining the maritime strength of potential allies. Sooner or later the Administration must answer the problem of how it is to maintain an adequate cargo fleet in operation and preserve a shipbuilding industry capable of rapid expansion in an emergency.

No final decision, however, seems to have been taken—a fact which probably accounts for a certain agitation which can be detected in maritime circles in the United States. It is noticeable that the Geneva tariff negotiations excluded any discussion of flag discrimination (a term which is differently interpreted on opposite sides of the Atlantic), but Congress has taken little positive action to indicate its post-war policy. The Ship Sales Act of 1946, as an interim measure, was a useful compromise between the world's

obvious need of ships, the apparent defence requirements of the Western Hemisphere and the self-interest of the shipping industry in America. Even so, the sale of tankers to foreign flags was first started, then stopped and has now been resumed again. About a year ago there was effective agitation for the return of cargo ships on charter to the Ministry of Transport. Recently the Harriman Report on the Marshall Plan supported the suggestion that ships to carry relief cargoes should be handed over to European operators. At the same time, it criticised the shipbuilding programme being carried out by those nations, and in particular by Britain. Only a week later, however, President Truman's Advisory Committee on the Merchant Marine has disarmed this criticism by calling for urgent State-aid for a four-year programme, which includes the provision of £150 million for 46 passenger liners. It explains that although the United States has 45 per cent of the world's ocean-going ships, they are mainly emergency types and unsuitable for highly competitive commercial operation. What is sauce for the goose is undoubtedly sauce for the gander. Thus the American shipping problem remains; its solution will call for exceptional measures on the part of the Administration, and they will have inevitable repercussions on the maritime strength of other nations—unless, indeed, it is possible to recognise the incompatibility of full strategic safeguards with economic commonsense.

End of Utility Cloth Subsidy

One of the few measures announced in the Budget speech last week to combat inflation by absorbing the public's purchasing power was the abolition of the subsidies on utility cloth and footwear. The subsidies on cloth apply only to utility cotton and wool apparel fabrics, for the subsidy on household textiles such as sheets and towels was removed last June and such goods as utility curtain cloth and upholstery cloth have never been subsidised. There are nearly 70 specifications for utility wool cloth and nearly 200 for utility cotton cloth, with a separate rate of subsidy for each one—an eloquent indication of the difficulties which beset the administrator who tries to achieve a balance between subsidising the consumer and meeting the reasonable demands of the producer for an increase in prices to cover his rising costs.

It is estimated that when the subsidies are removed at the end

ABRIDGED PARTICULARS

ROYAL DUTCH COMPANY

For the Working of Petroleum Wells in the Netherlands Indies
(N.V. Koninklijke Nederlandsche Maatschappij tot Exploitatie van Petroleumbronnen in Nederlandsch-Indië)

OFFER TO SHAREHOLDERS

(other than Preference Shareholders)

of Florins 302,174,400 Shares to Bearer in Shares of 1,000 fl. each and Sub-shares of 100 fl. each, in the proportion of 1 new Share or Sub-Share for every 2 Shares or Sub-shares now held, at par; i.e., 1,000 florins per share and 100 florins per Sub-share. The Offer will be open for Acceptance up to and including 30th December, 1947, and the subscription price is payable in full on 15th January, 1948, in sterling at the following rates:

£93 12s. 8d. per Share of Fls. 1,000.
£9 7s. 4d. per Sub-share of Fls. 100.

NOTE: These prices represent the equivalent of par at approximately the official buying rate of Netherlands florins ruling on 19th November, 1947 (viz., Fls. 10.68-£1). They will be adjusted by reference to the rate ruling on 14th January, 1948, if it differs from the rate mentioned above.

The new shares will rank for the full amount of any dividend declared in respect of the financial year ending 31st December, 1948. The new shares will rank for the full amount of any dividend declared in respect of the financial year ending 31st December, 1948. The new shares will rank for the full amount of any dividend declared in respect of the financial year ending 31st December, 1948.

MESSRS. N. M. ROTHSCHILD & SONS, New Court, St. Swithin's Lane, London, E.C.4, are authorised by the Company to receive acceptances on the terms contained in the full particulars for the above mentioned new Shares of Fls. 1,000 each or sub-shares of Fls. 100 each against surrender of coupon number 88 from shares or sub-shares or coupon number 2 from the Company's Provisional Receipts 1946.

Subscriptions will only be received from Authorised Depositories or Temporary Recipients who will be required to certify:

(1) That the beneficial owner(s) is/are not resident in the Netherlands;
(2) That the coupon(s) are detached from Deposited Securities.
And further as regards coupon(s) No. 88:

(3) That the beneficial owner(s) is/are not resident outside the Scheduled Territories, or that the relative shares or sub-shares have been held continuously within the Scheduled Territories since a date prior to 20th September, 1944, and within the Scheduled Territories with the Netherlands Share Registration Department.

(4) That the relative shares or sub-shares have been registered with the Netherlands Share Registration Department. The necessary authority under the Exchange Control Act, 1947, has been given by the Bank of England for the acceptance of subscriptions from residents and non-residents, provided that in the latter case the subscriptions accord with the terms of the offer and payment is made by the debit of appropriate types of non-resident sterling accounts.

Acceptances, which may be lodged during usual business hours (Saturdays excepted) at any time up to the close of business on 30th December, 1947, must be made on the special form to be obtained from Messrs. N. M. Rothschild & Sons, New Court, St. Swithin's Lane, London, E.C.4, and be accompanied by the appropriate coupon(s).

The Company reserves the right to withdraw this offer notwithstanding the receipt of acceptances at any time up to midnight on 30th December, 1947, if unforeseen circumstances should arise which in the opinion of the Company would prejudice the issue. Acceptances will be provisional only until then.

Payment of the subscription price of Fls. 1,000 per share or Fls. 100 per sub-share must be made on 15th January, 1948, in sterling to Messrs. N. M. Rothschild & Sons, New Court, St. Swithin's Lane, London, E.C.4.

Failure to pay the subscription price on that date will render the acceptance liable to cancellation. Interest at the rate of 5 per cent. per annum will be chargeable on any sums which may be accepted after that date.

Acceptances must be presented personally by an Authorised Depository or Temporary Recipient and must NOT be sent by post. The offer has not been underwritten. A brokerage of 5/- per share or 6d. per sub-share in respect of acceptances for which payment is duly made will be paid to the Authorised Depository or Temporary Recipient presenting them.

A similar offer to Shareholders is being made in Amsterdam, Brussels, Zurich and Paris. Application will be made for quotation for the new Shares on the Stock Exchanges of London, Amsterdam, Rotterdam, Brussels, Zurich and Paris.

The Stock Exchanges of London, Amsterdam, Rotterdam, Brussels, Zurich and Paris. Application will be made for quotation for the new Shares on the Stock Exchanges of London, Amsterdam, Rotterdam, Brussels, Zurich and Paris.

Full particulars including a translation of the explanation contained in the Prospectus published by the Company in Amsterdam on 20th November, 1947, together with the necessary forms of acceptance can be obtained from

N. M. ROTHSCHILD & SONS
NEW COURT, ST. SWITHIN'S LANE, LONDON, E.C.4.

of this year and non-subsidised cloth begins to appear in any quantity in the shops some time in 1948, manufacturers' prices will have been raised by 35 to 40 per cent. This is equivalent to an increase of, say, 4d. to 7d. a yard on the price of cotton cloth and about 7s. 6d. on a £5 worsted suit. For footwear, increases of the order of 3s. to 10s. a pair are anticipated.

Mr Dalton estimated in his April Budget that these subsidies would cost about £33 million. Their abolition, therefore, represents only a small cut in the public's purchasing power. But their removal is to be welcomed on other grounds beside those of financial policy. The growing importance of the export drive in recent months has made a subsidised utility scheme increasingly difficult to administer and has created a growing number of anomalies. Two of these are worth mention. In wool, the attempt to keep prices of utility tissues down necessitated control of the price and quality of wool tops for the home market at a time when firms were actively discouraged from seeking more profitable business in the export market. Similarly in cotton, the higher margins obtained by converters by selling at face prices for export led to a complicated agreement with their yarn suppliers to share the higher profit since export opportunities for yarn spinners were limited by the needs of the home market.

But though it may be true that the abolition of subsidies on cloth will simplify the price structure up to the manufacturing stage, it also raises the whole problem of wholesale and retail margins. Higher manufacturers' prices would mean higher retail margins where, as in most cases, these are calculated on a percentage basis. There is no reason why the distributive trades should automatically reap the benefit of higher costs of production, although they may be able to argue that a reduced turnover of goods for the home market must increase the incidence of overhead costs. The distributors, however, will have a full opportunity of putting their case at their forthcoming discussions on wholesale and retail margins with the Board of Trade.

Misleading Profits Statements

A business note in *The Economist* of November 8th under this heading discussed some recent cases in which companies' preliminary profits statements had failed to give an adequate indication of changes in various provisions which came to light only later in the full accounts. The note coupled with these cases the name of British Celanese, in a way which made it appear that last year the profits statement of that company had been misleading because it brought in undisclosed EPT credits. This statement is not accurate, and it does an injustice to the company which calls for correction. There was an occasion in 1944 when the company's statement fell well short of the ideal; but the last statement could hardly be more complete or more helpful to shareholders in disclosing the trading position of the company, for it gives in detail, with comparative figures for the previous year, each source

of income, provisions and amounts written off under five headings, the tax charge, and credits from provisions made in previous years.

Indian Jute Problems

The partition of India was fully expected to raise delicate problems for the raw jute industry because, whereas about 80 per cent of the Indian crop is grown in Eastern Bengal—now Pakistan—about four-fifths is consumed in Calcutta, in the Dominion of India. The decision of the Pakistan Government to levy a duty on the export of raw jute across its land frontiers will undoubtedly vitiate the joint export policy which has been followed by both Dominions. It is, however, difficult to appraise the situation at present, and the jute industry is awaiting the reaction of the Indian Government. There has been for some time a duty on raw jute exported through Calcutta; two-thirds of the revenue collected was distributed by the former Central Government to the jute growing provinces. Since August 15th, however, no such payments have been made, although the seaborne export duty continued to be levied. Evidently Pakistan is attempting to recoup its loss of revenue by collecting the duty at its frontier.

The higher price which the Calcutta mills will have to pay for raw jute should not cause them any hardship at present, for the world demand for sacking material is acute. Australia urgently requires jute bags for its bumper wheat crop, Brazil for coffee, Argentina for grain, and West Africa for cocoa, while sacking is also needed for the southern hemisphere wool clips. There is no proper substitute for jute, and if sufficient bags are not forthcoming, transportation of these and other goods will be seriously hampered.

If the Government of India decides to continue the seaborne export duty, overseas jute spinners—in particular Dundee—might be at a serious disadvantage. But such a move would in all probability encourage the use of Chittagong as an export port—where presumably no seaborne duty is levied—although it is not well equipped to handle large quantities. Moreover, the Pakistan Government is openly encouraging the erection of new jute spinning and weaving mills within its frontiers; already six firms have registered in Eastern Bengal as jute mill companies, though shortage of machinery will no doubt hamper their development. On the other hand, the Dominion of India is attempting to increase its jute acreage, but even if rapid expansion were possible, production would be unlikely to reach 1,000,000 tons a year, which is the approximate supply which the Calcutta mills require.

The problem is delicate and it will require statesmanship to find a workable solution. But its implications reach far beyond the frontiers of the Indian continent. In view of the present world food shortage, every effort will have to be made to cover current requirements of sacking material so that importing countries do not suffer dire hardship while crops lie wasting in the southern hemisphere.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Mitchells and Butlers; Associated Equipment; Tube Investments; Thomas W. Ward.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (a) Net yields are calculated after allowing for tax at 8s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

Hollerith Electrical Punched Card equipment needs no relaxation. Day in, day out, its efficiency contributes to the complete accuracy of your accounting problems.

'SOUND IN WIND AND LIMB'

THE attention of firms engaged in the manufacturing, distributive, or publishing worlds, is invited to this announcement made by one who, it will be seen, is possessed of reasonable confidence in himself.

Though over sixty years of age I am sound in wind and limb recently having recovered from an illness of nine months' duration which caused retirement from the Board of one of London's leading firms of Advertising Practitioners. Pension conditions preclude me from partnership or service with Advertising Practitioners, but with completely restored health I seek an outlet for my energy.

I believe there are a number of well-established businesses where production costs could be lowered either by improved processes and layout or by improved conditions for workers resulting in increased output.

Forty-five years' experience of selling and distribution, covering a wide range of products as well as many years' practical study of statistics and market research fit me, so it seems to me, for an administrative post carrying responsibility.

Scope for initiative and indefatigability is of more importance than remuneration. An appointment where the monetary reward is based on proved results would be especially welcome.

At the moment few firms are faced with the problem of finding markets though the sellers' market rapidly approaches its demise.

Unimpeachable evidence as to integrity and ability to produce results will be made available to any forward looking reader of this advertisement who communicates with Leslie Harwood, 33 Thurlow Street, S.W.7.

The World's most Versatile WRITING INSTRUMENT

Biro is invaluable to business men.

Biro is the perfect instrument for taking shorthand notes.

Biro is indispensable for writing out of doors. It writes clearly on wet paper and never smudges.

Writes on a ball bearing with a smooth gliding action. Sufficient ink for months of use without refilling. A boon to left handed writers. Does not leak at any altitude.

RETAIL PRICE 34/10 including tax

A FIRST CHOICE for the Investor

INVESTING in National Savings adds brightness to your future and strengthens the Nation's resources. And now the transaction is made more simple by a new service offered by your Bank. Whether you want to make a block purchase of National Savings Certificates, or whether you wish to invest a regular monthly sum for as long as you like, you have only to sign a Banker's Order form. The Bank will do the rest—without trouble to you, and without charge. In ten years' time each 10s. Certificate will be worth 13s.—an increase equivalent to a taxable yield of £4.16.8%. To the surtax payer the Savings Certificate is even more profitable. You can now hold 1,000 units of the new issue, in addition to permitted existing holdings of Certificates of earlier issues. So call on your Bank Manager to-day.

PHILIP HILL & PARTNERS LIMITED

announce an issue by

BEECHAM GROUP LIMITED

of

1,500,000 $4\frac{1}{2}$ per cent. Redeemable Cumulative Preference
Shares of £1 each at par

Applications from Shareholders in Beecham Group Limited if made on the special pink forms provided will be given preferential consideration on allotment.

The Subscription List will open and close on Wednesday, the 26th November, 1947.

The Prospectus shows (inter alia):

(1) Beecham Group Limited was incorporated on 23rd January, 1928, under the name of Beechams Pills Limited and changed its name to Beecham Group Limited in 1945. As a result of a vigorous policy of expansion, it now controls 111 Companies and overseas Branches. The home turnover of the Group is now made up (approximately) as to Food Products, 50 per cent., Cosmetics and Toilets, 17 per cent., Pharmaceuticals, 32 per cent. and Veterinary Products, etc., 1 per cent.

(2) Particular attention has been paid to the Group's export business, which has been expanded in nearly every part of the world under the management of Beecham Export Corporation Limited, a wholly owned subsidiary. In the last four years the profits earned from export and overseas trade (before taxation) have risen by over 50 per cent. to a new high level of £644,745 for the year ended 31st March, 1947. This side of the business is being actively developed and for the first half of the current financial year there has again been an increase in turnover and profits compared with the same period in 1946.

(3) The combined profits of the Company and its subsidiaries for the year ended 31st March, 1947, as shown by the Auditors' Report, amounted, before U.K. taxation, to £2,241,916. After providing for estimated taxation on the present basis, including the Budget proposals as announced by the Chancellor of the Exchequer on the 12th November, 1947, the net profits amount to £713,780, which is equivalent to a gross amount, before U.K. income tax at 9/- in £, of £1,297,782.

Of this sum the annual preferential dividend payable upon the 10 per cent. Cumulative Preferred Shares of the Company absorbs the gross amount of £200,000, which leaves a balance of £1,097,782 before deducting the annual dividend on the 300,000 5 per cent. Redeemable Cumulative Preference Shares, which are to be redeemed on the 31st March, 1948.

(4) The gross amount required to pay the annual dividend on the 1,500,000 $4\frac{1}{2}$ Per Cent. Redeemable Cumulative Preference Shares to be offered is £67,500.

(5) The proceeds of the present issue will be utilised as to £300,000 towards repayment on the 31st March, 1948, of the 300,000 5 per cent. Redeemable Cumulative Preference Shares, and as to the balance for the general purposes of the Company.

Copies of the Prospectus, on the terms of which alone applications will be considered, and forms of application are now obtainable from:

COMPANY MEETINGS

BLYVOORUITZICHT GOLD MINING COMPANY, LIMITED

(Incorporated in the Union of
South Africa)

PROGRESS DESPITE DIFFICULTIES

PROPOSED SHARE ISSUE

MR W. M. FRAMES'S SURVEY

The annual general meeting of the Blyvooruitzicht Gold Mining Company, Limited, was held, on the 14th instant, in Johannesburg. Mr W. M. Frames, chairman, presided.

Moving the adoption of the report and accounts, the chairman said that despite interruptions to its operations occasioned by strikes of European miners, the serious shortage of European employees and delays in delivery of machinery and plant, the company had made good progress in equipping its mine and expanding the scale of operations.

Net profit for the year had been £1,635,336. Dividends declared during the year had absorbed £1,010,625, provision for taxation had been £562,768, provision for mineral lease consideration had accounted for £32,289, and provision for outstanding liabilities in respect of silicosis compensation had amounted to £991.

CAPITAL EXPENDITURE

Expenditure charged to capital account during the year had totalled £996,011, principal amounts being in respect of the sinking of a circular ventilation shaft, the extension of reduction works and ore transport arrangements, the erection of further dwelling-houses and quarters for Europeans, and a compound and hospital accommodation for native employees.

The company had received formal notification during the year from the Secretary for Mines that the Governor-General had approved the leasing to the company of an area in extent of 213.7282 morgen, equal to approximately 307 claims adjoining the northern boundary of the existing mining area. The terms on which this lease was being granted provided that an additional area would be incorporated in and worked conjointly with the principal area, and that had involved an adjustment of the formula governing the lease consideration payable to the state. The revised formula reflected a proportionate increase, taking into account the additional area leased—the increase being approximately 1.8 per cent.

TAXATION POSITION

For the first time the company had incurred liabilities in respect of mineral lease consideration and formula taxation. In the past, allowances in respect of capital expenditure had been more than sufficient to extinguish those liabilities. The company would derive an immediate benefit, both as regards the mineral lease consideration and taxation, by reason of the concession made in relation to the redemption of post production capital expenditure and the reduction in the formula tax equal to a remission of 10 per cent., announced by the Minister of Finance in his Budget speech in February last and subsequently enacted by Parliament.

Post production capital expenditure was now redeemed at a rate of $22\frac{1}{2}$ per cent. of the unredeemed balance at the end of each year. For a period, the increased redemption allowance would result in lower lease consideration and tax payments, but shareholders would appreciate that the time would arrive when capital expenditure would to a great extent be redeemed, and liabilities to lease consideration and tax would then be heavier.

SILICOSIS COMPENSATION

Fresh legislation had been enacted during the last session of Parliament in regard to the compensation of silicotics by the gold-mining industry and other dust-producing industries. That legislation, namely, the Silicosis Act No. 47 of 1946, consolidated previous miners' phthisis Acts and provided for substantially increased awards to beneficiaries. The new Act had come into operation on August 1, 1946, and at that date the present value of additional outstanding liabilities resulting therefrom had been actuarially determined to be £8,000,000.

Those additional liabilities were recoverable from the profits of scheduled mines over a period of 20 years and eight months from the date on which the Act had come into force. As the proportion of those liabilities to be borne annually by each of the scheduled mines was assessed *pro rata* to taxable incomes during the penultimate accounting period, the company would not incur any assessment for additional outstanding liabilities until the financial year 1948-49.

LARGER TONNAGE MILLED

Ore milled had totalled 356,000 tons, an increase of 156,400 tons compared with the figure for the preceding twelve months. That increase, though substantial in itself, had fallen short of what the company had hoped to achieve, principally due to late deliveries of essential equipment, a temporary breakdown of the motor driving one of the hoists at No. 1 shaft, and the strikes of European miners in October and November last year and in February and March of the current year.

The yield, at 16.989 dwt. per ton milled, represented an increase compared with the previous year of 3.247 dwt. per ton, accounted for by the fact that an increased portion of tonnage milled had been derived from stoping operations.

DEVELOPMENT DETAILS

Development during the year had totalled 26,972 ft., of which 7,567 ft. had been advanced at No. 2 shaft. Total footage had been 6,343 ft. less than that accomplished during the previous year. The decrease had been due partly to the interruption of development operations by the strikes already mentioned, but more particularly to the necessity of maintaining a balance between production and development operations in relation to labour and other available resources. Of the 7,567 ft. developed from No. 2 shaft, all but 234 ft. had been in country rock and constituted necessary work to prepare the No. 2 shaft area for normal reef development. Development sampled on the carbon leader had totalled 10,190 ft., all of which had been classed as payable, the average value being 48.4 dwt. per ton over a reef width of 11 inches, equal to 532 inch-dwt. Inch-dwt. sampling results had showed a decline from the average of 758 inch-dwt. obtained in development in the previous year.

Payable ore developed had amounted to 630,000 tons, valued at 9.9 dwt. per ton. That was 758,000 tons less than the tonnage developed in the previous year and the estimated value had been 4.2 dwt. per ton lower. The available ore reserve as re-estimated at June 30, 1947, had been 5,853,000 tons of an average value of 14.2 dwt. over an assumed stoping width of 45 inches. The reserve thus showed an increase of 284,000 tons, the value being 0.6 dwt. per ton lower.

NOS. 2 AND 3 SHAFTS

Progress had been made with the equipment of No. 2 shaft for production. Cross-cuts to the reef had been advanced on all the first five levels and excavation for the main and intermediate pumping stations was proceeding. Since the end of the financial year the carbon leader had been intersected on the fourth and fifth levels, and driving east

and west had been commenced. On the fourth level over a distance of 195 ft. sampled, the average value had been 513 inch-dwt., and on the fifth level over a distance of 135 ft. sampled, the average value had been 431 inch-dwt. Those exposures strengthened the belief that values to the west were again improving after traversing the slightly lower-grade zone in which had been done the greater part of the development during the past year.

Satisfactory progress had been made with the sinking of No. 3 circular shaft, which was to serve as a ventilation upcast for the mine workings. A total of 1,717 ft. had been sunk during the year, and by the end of June the shaft had reached a depth of 1,991 ft. below the collar. At the end of October sinking had progressed a further 644 ft. to a depth of 2,635 ft. It was hoped that that shaft would be in commission by September, 1948, when, with the increased ventilation and removal of delays for blasting intervals at Nos. 1 and 2 shafts, the 80,000 tons per month objective should be attained.

SURFACE PLANT

Construction work on the surface plant and equipment had made steady progress. Extension of the reduction plant to a nominal capacity of 80,000 mill tons per month was well advanced.

The deep borehole which had been sunk at the site in the southern portion of Farm Blyvooruitzicht had been completed during the year and the sampling results obtained from the original and the two deflected intersections of the carbon leader at depths of 8,983 ft. and 8,986 ft. had been published. An intersection had been obtained at a depth below the surface corresponding approximately to the calculated position of the reef, which indicated that there was no major reef dislocation between the main shafts and the southern boundary. The average of two complete core recoveries—in the second deflection there had been a loss of reef through grinding—had been 7.3 dwt. over a corrected width of 35 ins., or 256 inch-dwt.

STRIKE OF EUROPEAN MINERS

At the last annual general meeting he had referred to the strike of European miners at the company's property, which, starting on October 22nd of last year, had been still in progress at the date of the meeting. Settlement had been ultimately effected by the strikers voluntarily agreeing to the original proposal that the matters in dispute be submitted to arbitration, and the strike had ended with the return of the men to work on December 2nd. The arbitrator subsequently issued an award:

That there had been no sufficiently justifiable claim to warrant the increased contract rates demanded by the men, and the increase sought should not be granted. The strike of European miners during February and March of the current year, which had affected most of the Witwatersrand mines, arose from an internal dispute in the Mineworkers' Union and had in no way involved the mine management.

EXPANSION PROGRAMME

Additional capital funds had been raised in 1945 for the purpose of attaining an output capacity of 40,000 tons milled per month, of sinking a ventilation shaft and of expanding production at the mine as rapidly as possible to a monthly milling capacity of 80,000 tons. The estimated cost of that had been £2,491,655. Construction work on the programme had been pressed forward as rapidly as conditions had permitted, but delays in delivery of equipment and shortage of skilled labour and of materials had considerably retarded progress of work. The major items of the programme would, however, be installed by the end of 1947, with the important exception of an 8-ton winder ordered early in 1945 for delivery in January, 1946.

It was now hoped that that winder would be installed early in 1948 and that thereafter

there would be a steady increase in output until full capacity of plant, namely, 80,000 tons a month, was reached in the last quarter of 1948. With the completion of that programme in sight the board had had under consideration the question of a further expansion of operations at the mine. Of the £2,623,688 raised in 1945, there had remained a balance of £626,277 on hand at June 30th last. After allowing for that sum it was estimated that a further amount of about £1,100,000 would be required to complete the present programme.

That additional expenditure was due to unforeseen increases in the cost of items of equipment, to increased construction costs and to the inclusion of additional items subsequently found necessary, particularly the provision of houses for European employees. After full consideration, the company's technical advisers were of the opinion that it would be advisable to fix the next expansion target at a milling capacity of 120,000 tons a month, and they recommended that the necessary plant and equipment be ordered and steps taken to increase the output to that figure as soon as possible.

PROPOSED WORKS

In order to obtain that increase in the capacity of the mine and to maintain output at that higher level, it would be necessary not only to increase the capacity of the reduction plant, but also to provide additional accommodation for European and native employees, and to increase various workshops, as well as the winding capacity of the main shafts. In addition to those surface arrangements, it would be necessary to proceed with the sinking of two underground vertical shafts from the sixth level, in the neighbourhood of Nos. 1 and 2 main shafts. It was proposed to sink those shafts to a sufficient depth to enable them to haul the ore from the 22nd level. They would each be approximately 2,500 ft. deep to the bottom of the shaft. The vertical depth from the surface of No. 1 shaft to the main haulage on the 22nd level would be approximately 7,225 ft.

It was also proposed to equip five incline shafts, which would be sunk from the sixth level to the 14th level, with the necessary winding and other appliances. Those shafts would be used initially for rapid development of the reef and for hauling the ore from development and stoping operations until the underground vertical shafts came into full operation. They would also form an important portion of the ventilation system of the mine.

PROJECTED NEW ISSUES

That programme would involve, according to the company's technical advisers, an estimated expenditure of £3,724,000, which, when added to the amount still to be spent to complete the 80,000-ton programme, increased total capital requirements to a figure of approximately £4,800,000. The directors had decided that it would be in the best interests of the company to finance that expenditure by the issue of shares to shareholders. The terms and conditions of the proposed issue were still under discussion, but it would be communicated to shareholders as soon as possible and an extraordinary general meeting to consider and approve the scheme would be convened early in 1948.

Recently, a number of inquiries had been received regarding the subdivision of shares into shares of lower denomination. The board felt that, as it would not be practicable to undertake that work in conjunction with the proposed issue of shares to shareholders, a decision in that matter should be deferred until the new issue had been completed.

A report of the proceedings at the meeting would be published in the press and copies would be circulated to shareholders at the earliest convenient date.

The reports and accounts were adopted.

NOURSE MINES, LIMITED

(Incorporated in the Union of South Africa)

STRIKES AFFECT RESULTS

MR W. M. FRAMES'S SPEECH

The annual general meeting of Nourse Mines, Limited, was held, in Johannesburg, on the 14th instant, Mr W. M. Frames, chairman, presided.

In moving the adoption of the report and accounts the chairman said that the limited supply of labour had continued to restrict operations which had also been adversely affected by the strike of native employees during August, 1946, and by another strike of European miners during the early part of 1947. By cutting down the amount of development, however, it had been possible to maintain mill tonnage at very much the same figure as that recorded during the previous year. Net profit for the year had been £62,321. Capital expenditure had amounted to £12,960, provisions in respect of silicosis outstanding liabilities had totalled £12,651 and dividends declared during the year had absorbed £58,775.

RIISING COSTS

In his address to shareholders last year he had emphasised the importance of maintaining a high rate of development in order to restore a normal balance between ore reserves and the rate of milling. During the year, however, it had become necessary to curtail development in order to maintain production. Working costs had continued to rise, largely on account of the increasing prices of stores, higher cost of living allowances and increases in silicosis compensation.

The position had been aggravated further by the strikes of native and European employees, with the result that the profit had been reduced to the small margin of 0.174 pennyweight per ton milled. Had a certain proportion of the available labour not been diverted from development to stoping, that profit margin would have been reduced still further. Total development accomplished had been 21,078 ft., compared with 28,747 ft. during the previous year.

RESULTS AT DEPTH

Disclosures on the main reef leader in the deeper levels of the mine had continued to be good, and new blocks of ore which had been taken into the reserves were again above the average value for that reef. The south reef had been prospected in those deep levels by means of systematic drilling, and although results had been generally disappointing, a small payable zone had been indicated between the 50th and 51st levels. In the upper levels the exploration of pyritic quartzites by means of drilling had been continued, but the results had only confirmed the experience of neighbouring properties that values in that horizon were very erratic. Drilling was, however, being continued.

Payable ore developed during the year had totalled 533,900 tons, averaging 5.5 dwt. per ton, which was a decrease of 174,500 tons and 0.2 dwt. in value compared with that developed during the previous year. Those decreases could be attributed partly to the smaller amount of reef development accomplished, partly to the increased proportion of exploration on lower-grade reefs, namely, main reef and south reef, and partly to the increase in working costs, which had had an adverse effect on payability.

ORE RESERVE

The available ore reserve at June 30, 1947, had been estimated at 2,389,600 tons, averaging 4.9 dwt. per ton over a width of 46 ins. Compared with the previous year there had been very little change. It was satisfactory to note, therefore, that in spite of the smaller amount of development accomplished the ore reserve position had been more or less maintained.

Mining operations had now ceased on the neighbouring Geldenhuis Deep property, and there had therefore been an increase in the amount of water to be handled. The new pumping arrangements should be capable of dealing with the larger volume of water even in the peak period, which usually occurred during January and February of each year.

The sinking of the No. 3D incline shaft had been resumed during February, 1947, and by the end of the financial year the bottom of the shaft was nearing the 52nd level. Since then the shaft had been sunk a further 104 ft., and at the end of October had reached a depth of 78 ft. below the 52nd level. That represented a vertical depth of about 7,017 ft. below the surface.

TAXATION CHANGES

During the year certain changes had been made in gold-mining taxation with effect from January 1, 1947. There had been a downward adjustment of the tax formula, with the result that, given the same ratio of profit to recovery, the 1947 rate of tax was equivalent to 90 per cent. of that calculated under the 1946 formula. In addition, the capital redemption allowance had been increased and 22½ per cent. of the balance of all unredeemed capital expenditure at the end of each year was now allowed for purposes of amortisation.

Fresh legislation had been enacted during the last session of Parliament in regard to the compensation of silicotics by the gold-mining industry and other dust-producing industries. That legislation, namely, the Silicosis Act No. 47 of 1946, consolidated previous miners' phthisis Acts and provided for substantially increased awards to beneficiaries. The new Act had come into operation on August 1, 1946, and at that date the present value of additional outstanding liabilities resulting therefrom had been actuarially determined to be £8,000,000. Those additional liabilities were recoverable from the profits of scheduled mines over a period of 20 years and eight months, and, as shown in the accounts, the company's proportion for one year and eight months ending March 31, 1948, had been £4,653.

A report of the proceedings at the meeting would appear in the press and shareholders could obtain copies on application to the secretaries in Johannesburg or London.

The report and accounts were adopted.

CONSOLIDATED MAIN REEF MINES AND ESTATE, LIMITED

(Incorporated in the Union of South Africa)

MR W. M. FRAMES ON LABOUR AND TAXATION

The annual general meeting of Consolidated Main Reef Mines and Estate, Limited, was held in Johannesburg on the 11th instant.

Mr W. M. Frames, the chairman, presided, and in moving the adoption of the report and accounts said that underground operations had continued to be restricted by the shortage of labour, and had been seriously affected by another strike of European miners during January, February and March. Much of the loss in tonnage from mining had been, however, made up by drawing on ore from the surface dump. Ore milled at 2,310,000 tons had been lower by 208,000 tons than in the previous year, while the yield per ton had been higher by 0.254 dwt.

The resulting increase in revenue per ton had been, however, more than offset by a rise of 2s. 6d. per ton in working costs. Consequently the profit per ton had been down to 3d. compared with the previous year, and due to that and to the lower tonnage milled the working profit had decreased by £52,951 to £245,371. Net capital expenditure had amounted to £5,349, pro-

visions in respect of silicosis outstanding liabilities had totalled £21,990, transfer to contingency reserve had been £8,700, and dividends declared during the year had absorbed £249,520.

DEVELOPMENT FIGURES

Tonnage mined had been much the same as that achieved during the preceding year, in spite of the disruption of operations caused by the strike of miners during the third quarter of the financial year under review. The amount of development accomplished had also been adversely affected by the strike, and although there had been an increase of 7,586 feet compared with the previous year, the footage during the third quarter of the year had been only 16,915 feet, compared with an average of 24,427 feet during each of the other quarters. Payable ore developed had been estimated to amount to 1,101,000 tons, averaging 3.8 dwt. per ton, representing an increase of 334,900 tons and 0.1 dwt. in value compared with the previous year. Exposures on the main reef leader had continued to be satisfactory in the upper levels, but very little ground remained to be explored in the north-western corner of the property, which had been the main source of higher-grade ore.

PAYABLE AREAS LOCATED

Work on opening up the unexplored area in the north-eastern corner continued, and development had disclosed some payable areas. Further blocks of low-grade but payable ore had been opened up to the west of Bantjes Dyke, but the values in the main reef and main reef leader continued to be disappointing in the lower levels. In the south reef appreciable tonnages had been exposed in the north-western corner of the mine, and in the north-eastern corner results continued to be satisfactory. Development in the Bird Reef had again disclosed substantial tonnages of low-grade ore. During the year Number 6 shaft had been dewatered and re-equipped. There had been a certain amount of development done on Kimberley Reef from that shaft, and a few payable blocks had been exposed. Those new blocks and some others which had been developed many years ago had now been included in ore reserves for the first time.

Results so far had fully warranted the expenditure incurred, and development and shaft-sinking continued. Further prospecting of the Kimberley Reef had been carried out by sinking boreholes from the surface in the western area of the mine and near the eastern boundary. Results had been disappointing, except in the area between Number 6 shaft and the eastern boundary, where two payable intersections had been made.

Available ore reserve had been recalculated at June 30, 1947, to be 4,974,000 tons, averaging 3.7 dwt. per ton over a stoping width of 55.8 inches. Compared with the previous year that represented a decrease of 206,000 tons, the width being lower by 0.9 inch, and the average value higher by 0.1 dwt.

TAXATION CHANGES

During the year certain changes had been made in gold-mining taxation with effect from January 1, 1947. There had been a downward adjustment of the tax formula, with the result that, given the same ratio of profit to recovery, the 1947 rate of tax was equivalent to 90 per cent. of that calculated under the 1946 formula. In addition, the capital redemption allowance had been increased and 22½ per cent. of the balance of all unredeemed capital expenditure at the end of each year was now allowed for purposes of amortisation.

Fresh legislation had been enacted during the last session of Parliament in regard to the compensation of silicotics by the gold-mining industry and by other dust-producing industries. That legislation, the Silicosis Act, Number 47, of 1946, consolidated previous miners' phthisis Acts and provided for substantially increased awards to beneficiaries. The new Act had come into operation on August 1, 1946, and at that date the present value of additional outstanding lia-

bilities resulting therefrom had been actuarially determined to be £8,000,000. Those additional liabilities were recoverable from the profits of scheduled mines over a period of about 20 years, and the company's proportion for one year and eight months ending March 31, 1948, had been £10,090.

THE LATE MR A. A. AURET

Shareholders would join the board in recording the company's deep sense of loss in the death in February last of Mr A. A. Auret, who had been associated with the direction of the company's affairs since its inception in 1896—a period of over 50 years.

A report of the proceedings at the meeting would be published in the press and shareholders could obtain copies from the secretaries in Johannesburg or London.

The report and accounts were adopted.

MODDERFONTEIN EAST, LIMITED

(Incorporated in the Union of South Africa)

MR W. M. FRAMES'S REVIEW

The annual general meeting of Modderfontein East, Limited, was held in Johannesburg on the 11th instant.

Mr W. M. Frames, the chairman, presided and in moving the adoption of the report and accounts said that output of the mine had continued to be restricted by the limited supply of European and native labour and had been seriously curtailed during January, February and March, 1947, by another strike of European miners.

Total ore milled had decreased by 79,000 tons as compared with the figure for the previous year to 1,420,000 tons. Revenue had been lower by 8d. per ton milled and working costs had risen by one shilling per ton with the result that the working profit had been lower by £151,925 at £488,976. Provisions made in respect of silicosis outstanding liabilities had totalled £25,102, provision for taxation had accounted for £175,162, provision for lease consideration had amounted to £53,469 and dividends declared during the year had absorbed £255,971.

INCREASE IN DEVELOPMENT

Development accomplished had totalled 11,463 feet which was 704 feet more than that for the previous year. Payable ore developed, however, had decreased by 307,300 tons to 485,000 tons, averaging 3.2 dwt. per ton. That might be attributed partly to a decrease in the quantity of payable ore developed by internal development and stoping operations and partly to a decrease in the percentage of payability disclosed in new areas. The lower percentage of payability had been mainly due to poor results obtained in exploration of the north-eastern portion of the mine. Although 2,855 feet had been sampled in that area no payable tonnage had been disclosed. Work in development ends immediately to the north of Number 5 shaft had now been suspended, but it was intended to carry out further exploration of the area by penetration in a south-easterly direction from existing workings situated in the most northerly corner of the property.

AVAILABLE ORE RESERVE

That programme would, however, entail a certain amount of preliminary work in order to ensure adequate ventilation. It would therefore be some time before that work could be undertaken. The remainder of development during the year had been largely confined to the south-eastern corner of the mine where some small payable blocks of ore had been disclosed. The available ore reserve had been estimated at June 30, 1947, to be 5,216,000 tons averaging 3.4 dwt. per ton over a stoping width of 43.2 inches.

Compared with the estimate made a year previously the available ore reserve had been 138,000 tons less, the average value and stoping width being lower by 0.1 dwt. and 0.3 inch respectively. The rate of depletion of available reserve had been, however, considerably greater than that decrease would indicate, as 379,000 tons previously included under the heading of shaft and safety pillars had been transferred to available reserves.

During the year certain changes had been made in Gold Mining taxation with effect from January 1, 1947. There had been a downward adjustment of the tax formula with the result that, given the same ratio of profit to recovery, the 1947 rate of tax was equivalent to ninety per cent. of that calculated under the 1946 formula.

In addition, the capital redemption allowance had been increased and 22½ per cent. of the balance of all unredeemed capital expenditure at the end of each year was now allowed for the purpose of amortisation.

SILICOSIS COMPENSATION

Fresh legislation had been enacted during the last session of Parliament in regard to compensation of silicotics by the gold mining industry and other dust-producing industries. That legislation, the Silicosis Act Number 47 of 1946, consolidated previous miners' phthisis acts and provided for substantially increased awards to beneficiaries. The new act had come into operation on August 1, 1946, and at that date, the present value of additional outstanding liabilities resulting therefrom had been actuarially determined to be £8,000,000.

Those additional liabilities were recoverable from the profits of scheduled mines over a period of about 20 years and the Company's proportion for one year and eight months ending March 31, 1948, had been £19,451.

A report of the proceedings at the meeting would be published in the Press and shareholders could obtain copies on application to the Secretaries in Johannesburg or London.

The report and accounts were adopted.

THE VICTORIA FALLS AND TRANSVAAL POWER COMPANY, LIMITED

RECORD SALES

MR ARTHUR E. HADLEY ON

EXPROPRIATION

The annual general meeting of The Victoria Falls and Transvaal Power Company, Limited was held at Winchester House, Old Broad Street, London, on the 18th instant, the chairman and managing director, Mr Arthur E. Hadley, C.B.E. presiding.

The report and accounts for the year 1946 were presented. The profit for the year amounted to £600,275 compared with £582,050 in the previous year. A further £150,000 had been added to reserve fund bringing the amount to £1,900,000. The sum carried forward was £423,940 compared with £351,790.

A dividend of 19½ per cent. had been paid for the year on the ordinary stock and the full 10 per cent. on the participating preference stock.

The units sold during the year constituted a record of upwards of 4,168 million. All the seven large power stations have operated at their full capacity after allowing for spare plant. Notifications of additional power requirements continue to be received indicating further expansion ahead. To meet future requirements important extensions are in hand or under consideration at two of the principal power stations, and a large exten-

sion to the transmission system is in hand. These are for the purpose of meeting general growth of load and the development of the gold mining industry in the Orange Free State.

EXPROPRIATION TERMS

The company was granted a licence in 1910 after it had already been at work for some years. Under this licence the Government retain the right to expropriate the undertaking in the Union at the end of the year 1950 after giving two years' previous notice. The terms of expropriation are defined as the existing fair value at the time of expropriation of the assets employed in supplying power in the Union, and this value has to be agreed between the parties, or failing agreement, by arbitration under South African Law.

Some years later, in 1922 the Government of the Union established a body called the Electricity Supply Commission, which was authorised to supply electricity throughout the Union, and to acquire existing undertakings subject to the terms of their licences, and thus the Commission became the prospective purchaser of the undertaking in the Union.

Since that date the company has worked in close and friendly co-operation with the Commission, who under the terms of the Act which established it, have financed the additional power stations required, and large expenditure for transmission in the extension of the company's original licensed area. The close co-operation was shown by the action of the Commission in entrusting to the company the engineering design and purchase of those assets and ceding to it all the obligations for the supply to the additional area, together with the operation of the plant, which they financed.

NEGOTIATIONS PROCEEDING

With the report for 1945 he had mentioned that at that time no authoritative communication had been received on the subject of expropriation, but later the South African Government issued a statement to the effect that at the proper time it would take into consideration the question of expropriation. This statement was duly notified by the board in the Press, and confirmed their view that notice of intention to expropriate would be given at the end of 1948.

Since then the Commission had indicated to the company that it would like to take over the undertaking at an early date instead of waiting until the end of 1950. The company had therefore started conversations with the Electricity Supply Commission with the object of arriving at an arrangement fair to both sides, and which the board would consider to be in the interests of the stockholders.

It would be a *sine qua non* of any arrangement come to with the Commission that the interests of the staff and employees of the company, both in Africa and London, were to be fully safeguarded. The Commission had authorised him to give the assurance that if and when it takes over the company's undertaking it will ensure that all the staff and employees then in the service of the company who elect to transfer from its service to the Commission, will enjoy conditions of service, including pension rights, which will be in every respect at least as favourable as those they would have enjoyed had they remained in the service of the company.

The chairman concluded with an expression of thanks to the staff and employees for their loyal and able services during a difficult and strenuous year.

The report and accounts were adopted, and the retiring directors, Dr. Bernard Price, O.B.E., and Mr. R. E. Shott, and the auditors, Messrs. Cooper Brothers and Company, were re-elected.

BRITISH SUGAR CORPORATION, LIMITED

RECORD BEET HARVEST

The eleventh annual general meeting of the British Sugar Corporation, Limited, was held, on the 18th instant, in London, Lt.-Col. Sir Francis Humphrys, G.C.M.G., G.C.V.O., K.B.E., C.I.E., the chairman, presiding.

The following is an extract from his circulated statement for the year to March 31, 1947:—

The cautiously optimistic forecast of the beet harvest for 1946-7 which I made last year was more than justified by the results, which proved to be a record in the corporation's history. The tonnage of beets brought to the factories reached the enormous total of 4,522,140 tons—nearly one million tons above the average—and the sugar manufactured, in terms of white sugar, amounted to 556,731 tons, sufficient to provide a weekly ration of 8 ozs. for a whole year to 47,000,000 persons.

A GRATIFYING RESULT

For this gratifying result, which was achieved during the severest winter this country has experienced since our industry was started more than 20 years ago, we are indebted to the splendid team work shown by growers, hauliers, railwaymen and factory staffs, who toiled day and night in the snow and frost and succeeded in harvesting 99 per cent. of the crop in a campaign which extended into March.

The amount paid by the Corporation in cash to 47,000 growers exceeded £20,000,000, giving an average of £49. 10s. an acre on a total cropped acreage of 415,000. The average sugar content was slightly lower than that of last year, the decline being almost wholly due to the deterioration of beets delivered after the middle of January. The Excise Duty which accrued to the Exchequer was £8,935,000, which is £914,000 more than last year. On the other hand, the deficiency payment received from the Exchequer was £2,749,780 against £3,972,226, and that would have been entirely eliminated had the corporation been permitted to take the Cuban price as at January 1, 1947, into account as the fair price for its sugar. An anomalous position has also arisen in respect of values placed upon the corporation's by-products, sugar-beet pulp and molasses.

VALUE OF INDUSTRY

Whatever may have been the position up to 1939, it would be misleading to suggest that in present circumstances the deficiency payment is a measure of cost to the taxpayer of the home-grown sugar industry. Indeed, never has the value to the country of the home-grown sugar industry been greater than it is today. Our industry occupies a high place as a dollar saver, since the sugar produced at home last season would have cost us no less than 72,000,000 dollars if it could have been bought at Cuban official prices. The Government's long-term plans for the industry aim at an expansion of the prewar acreage and an increase in factory capacity.

The appointment by the corporation of an agricultural development officer has proved a step in the right direction and has encouraged the increased production of mechanical aids for reducing the agricultural labour demand at the peak periods of the year.

The profit for the year was £267,850 and the board recommended a dividend of 4½ per cent. less tax. Estimates for the current season's crop were for about 3,000,000 tons of beets with a somewhat higher average sugar content than last year.

The report was adopted.

THE FINANCIAL NEWS, LIMITED

A SATISFACTORY YEAR

The fiftieth ordinary general meeting of The Financial News Limited was held, on the 11th instant, in London.

The Rt. Hon. Brendan Bracken, M.P., the chairman, in the course of his speech said: During the year under review there have been few changes in the company's balance sheet. Under the heading of Investments, other holdings stand at £65,772, a reduction of £10,000 on the year before. This reduction represents the sale of our interest in Moody's Economist Services Limited.

The consolidated profit before taxation amounts to £122,924, an increase of £14,255. We have received a dividend at the rate of 20 per cent. from our shareholding in The Financial Times, compared with one of 17½ per cent. in the previous year.

Consolidated earnings on the company's ordinary share capital amount to some 96 per cent. In recommending a final dividend at the rate of 35 per cent. which together with the interim dividend of 25 per cent. makes a total of 60 per cent. for the year, we are therefore proposing the distribution of less than two-thirds of our earnings.

SUCCESS OF ASSOCIATED COMPANIES

Of the companies in which we are interested, *The Investor's Chronicle* has experienced a most satisfactory year. *The Economist*, of which we hold half the share capital, has also enjoyed a steady increase in circulation and its profits have expanded. Both these journals were forced, in common with all other weekly periodicals, to suspend publication for two weeks in March owing to the fuel crisis. This lamentable product of planning will long be remembered.

The Financial Times continues to prosper. In July of this year it was compelled to make a cut of one-eighth of its circulation, and since then, the circulation has had to be pegged. I must again apologise to the many who wish to buy *The Financial Times* and who cannot obtain copies. We share their grievances, for *The Financial Times*, despite its austere contents, steadily grows in popularity. We could increase our circulation by more than one-third if newsprint were available.

I dealt at some length last year with the investment which we have made with George Newnes and C. Arthur Pearson Limited and The Financial Times Limited, in the printing business of W. Speaight & Sons. Your board believe that this interest will advantage our publications and revenues. The prevailing shortage of paper supplies, and the growing difficulties of obtaining delivery of new printing plant and machinery are a great obstruction of our plans for development.

Though all the newspaper businesses in which we are interested are making very satisfactory profits, shareholders must be mindful of the fact that our prosperity is linked with the fortunes of British producers and traders. The seller's market is dwindling. Kaleidoscopic governmental policies have greatly handicapped our industrialists and traders in export markets, and there is no sign of any effective reduction of the controls that are stifling Britain's recovery.

Until enterprise is unchained Britain's economy will falter. The academic target-setters and their countless controllers in Whitehall can never restore prosperity to our country. I have never shared the willingness of some company chairmen to prophesy. I confess I know not what the future holds in store for us. All I can say is that our newspapers have plenty of contented readers and advertisers. We have large published and much larger unpublished reserves. We are, therefore, well prepared for times of adversity.

The report was adopted.

GOVERNMENT RETURNS

For the week ended November 15, 1947, total ordinary revenue was £42,470,000, against ordinary expenditure of £38,378,000 and issues to sinking funds £310,000. Thus, including sinking fund allocations of £9,899,891 the surplus accrued since April 1st is £247,256,000 against a deficit of £509,944,000 for the corresponding period a year ago.

AGGREGATE ASSETS
at 31st March, 1947
£87,034,037

Established over 80 years.

BANK of NEW ZEALAND
Incorporated with limited liability in New Zealand

Represented at over 240 points
in New Zealand and at Melbourne,
Victoria; Sydney, New South Wales;
Suva, Fiji; Apia, Samoa.

Head Office: WELLINGTON, N.Z.
London Office: 1, Queen Victoria St., E.C.4
O. M. Samuel, Manager. P. L. Porter, General Manager

UNIVERSITY OF LONDON

A course of five lectures entitled "Les origines économiques de la Révolution française" will be given (in French) by Professor Ernest Labrousse (Professor in the Faculty of Letters, University of Paris) at 4.45 p.m. on December 1st, 3rd, 4th, 5th and 8th at the London School of Economics, New Theatre (East Wing), Houghton Street, Aldwych, W.C.2. At the first lecture the Chair will be taken by Professor R. H. Tawney (Professor of Economic History in the University of London). Admission free, without ticket.

JAMES HENDERSON, Academic Registrar.

LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(UNIVERSITY OF LONDON)

Applications are invited for appointment to Lectureships and Assistant Lectureships in Economics. Salary scales £500-£850 per annum and £400-£500 per annum respectively, with superannuation benefits and family allowances. Starting salary and date of taking up appointment by arrangement. Candidates are invited to give in their application the names of three referees and an indication of any special interests in the field of economics.

Applications should be received not later than January 1, 1948, by the Secretary, London School of Economics, Houghton Street, Aldwych, London, W.C.2, from whom further information may be obtained.

BRITISH INSTITUTE OF MANAGEMENT

The British Institute of Management invites applications from persons of outstanding ability, preferably with industrial experience and knowledge of management practice and theory, for a limited number of executive posts in the fields of Intelligence and Research; Publications and Publicity; and Education. Salaries according to experience and qualifications.—Apply by letter only to the Director, 17, Hill Street, W.1.

ASHRIDGE, BERKHAMSTED, HERTS

(Principal: GENERAL SIR BERNARD PAGET, G.C.B., D.S.O., M.C.) Ashridge is a residential College for education in citizenship and provides an open forum for discussion.

Course 49—Week-end December 12-December 15, 1947. Youth in the Modern World.

Subjects: Educational Problems of the Adolescent: Eric Farmer Esq., M.A.; Social Environment: Arthur Radford Esq., B.Sc.; Religious Education: The Rev. W. S. L. Fleming, M.A.; Youth Leadership: At what do we aim?: The Countess of Eldon.

The Course assembles Friday evening and disperses early Monday morning. Inclusive fee: £3 3s.

Application for enrolment should be made to the Bursar, Ashridge, Berkhamsted, Herts. Telephone: Little Gaddesden 3191.

WORKING MEN'S COLLEGE

CROWDALE ROAD, N.W.1

Free Public Lecture Thursday, December 11th, at 9 p.m. Mr. F. Elwyn-Jones, M.P. (one of the Prosecutors), on "The Nuremberg Trials."

50 CAREERS FOR YOUNG PEOPLE. A treasury of facts and essential information for parents, 216 pages, cloth bound, 7/6d. net. Obtainable from all booksellers, or from Vawser and Wiles Ltd., 555, Lea Bridge Road, Leyton, E.10.

B.A. (Oxon) Public Administration: Economics: Statistics, 18 months' accounting experience. Seeks opening in industry.—Box 608.

STATISTICAL and all Computing work undertaken by latest type Comptometer Calculating Machine.—Phone Welbeck 6151.

STENOGRAPHER. Own Machine. Highest Refs. Hr., Day or Week (Cent. Ldn. only). Phone: PARK 4988 before 11.30 a.m.

AN alternative to a London Office—Finders Special (V.I.P.) telephone-secretarial service. Operates day and night, and weekends.—Write Finders, 77, Dean Street, W.1, for details, or ring GERrard 9050.

SALMON FISHING. Splendid stretch to let about two miles long on the Blackwater, near Fermoy, February to end of May. High and low water beats. House newly renovated adjacent.—Box 607.

CHRISTMAS HOUSE PARTY in Surrey. Professional and University people. Vacancies for others wanting pleasant company, interesting conversation, good food.—Box 606.

Printed in Great Britain by ST. CLEMENTS PRESS, LTD., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22 Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111 Broadway, New York, 6.—Saturday, November 22, 1947.

Full particulars may be had on application.

REFUGEE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000

ASSETS EXCEED £97,000,000

CLAIMS PAID EXCEED £181,000,000 (1946 Accounts)

THE SOCIETY OF CIVIL SERVANTS invites applications for the full-time post of General Secretary at a salary within the range of £1,100 x £50—£1,400. Commencing salary will be determined according to qualifications.

The appointment is subject to a period of probation appropriate to the experience and qualifications of the selected candidate and terminating not later than 31st May, 1948. During the period of probation the selected candidate will serve under the present General Secretary and on the satisfactory completion of probation will become General Secretary. The post is permanent and pensionable. Applicants will be required to undergo a medical examination.

The General Secretary is the principal salaried officer of the Society, which has a membership of about 23,000 in the middle and higher grades of the Service. He is responsible for the conduct of negotiations on the Society's behalf and for the supervision of the Society's office and is representative on the National Whitley Council. Negotiating ability is essential; knowledge of the Civil Service and experience of staff association work are very desirable, but applicants without such knowledge and experience will be considered if their other qualifications are exceptionally suitable.

Candidates should give particulars of age, sex, educational qualifications, present and previous employments, and experience of Civil Service conditions and Whitley machinery. Applications, which should include names and addresses of three persons to whom reference can be made together with copies of any testimonials, should be addressed to the General Secretary, 1, Sanctuary Buildings, Westminster, S.W.1, not later than 17th January, 1948.

ASSISTANT SECRETARY (ORGANISING) required by the Society of Civil Servants, representing 23,000 members in middle and higher grades. Negotiating as well as organising ability essential. Knowledge of Civil Service and experience in staff association or Whitley work desirable but not indispensable.

The Society may appoint at the same time another Assistant Secretary primarily for negotiations for which knowledge of the Service and experience of staff association work are more necessary.

Salary scale for these posts according to qualifications and experience, but starting pay not less than £500 p.a., rising to not less than £750 p.a. Appointments become permanent and pensionable on satisfactory completion of a year's probation. A medical examination will be necessary.

Apply by 17th January, 1948, to the General Secretary, 1, Sanctuary Buildings, Westminster, S.W.1, stating age, qualifications, present and previous employment, the names and addresses of three references and enclosing any testimonials.

IF you require staff advertise in "WOMEN'S EMPLOYMENT" Appointments Section. Published 1st and 3rd Fridays. Widely bought for forty-eight years by trained women seeking posts. 25 words 5/-; 50 words 7/6; Women's Employment, Terminal House, S.W.1.

GRADUATE (Economics), Research experience, also experience of Information and Advisory work. Accomustomed to handling large masses of material. Now seeks suitable appointment.—Box 605.

EXPERIENCED shorthand-typist available for weekend and evening work.—Fulham 6150.

OFFICERS (2) shortly becoming redundant, seek appointments with U.N. Enterprise(s) in Germany. Fully conversant with property control, Laws 52 and 53, and present economic situation in Germany also commercial experience and common sense. Contract appointments or custodianships considered. Fluent German.—Box 609.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

The Limits of Planning

THE Government have done very well to hold Gravesend. The result is significant, since both sides accepted the challenge to make a test case of it, and inevitably it will depress the Conservatives and cheer the Government and their supporters. The Conservative candidate rested his campaign on that generalised dissatisfaction which Oppositions always use against Governments; but he selected for particular emphasis the strangling effect of the economic controls. Battle was joined quite specifically on this issue; Mr Churchill's letter repeated the theme of "set the people free," and visiting Cabinet Ministers took up the cry of controls *versus* chaos as their best means of recapturing the initiative. It is evidently believed in party circles, on both sides, that this is a question on which the public can be roused.

Unfortunately, as presented on the public platform, it is almost entirely a false issue. Each side, as usual, is so intent on caricaturing the views of the other that it overlooks the spectacle it makes of itself. If the Labour Party, in its enthusiasm to mock at Mr Churchill, rushes itself into the position of defending controls as such and deriding freedom in principle, it is asking for trouble. But Mr Churchill commits the same fault. His new doctrine of an assured and planned basis for the national life, with a superstructure of economic freedom, is a most appealing one. But he forfeits the support it would otherwise bring him by implying that everything but the old-age pension could be abolished tomorrow. The sensible man who is neither for nor against controls in principle, who thinks we had too few of them in the 1930's and that we have too many of them now, finds it harder day by day to agree with either party.

While the opinions of politicians continue to run to extremes—extremes more violent than they really intend—there has been a significant approach towards agreement in non-political public opinion on the subject of the controlled economy. On the one hand many of the staunchest pre-war defenders of *laissez faire* have been converted to the view that there are several legitimate objectives of state intervention. Almost everybody nowadays (like Mr Churchill himself) admits the necessity of planning to the extent that is necessary to ensure an adequate standard of living for every citizen. This policy of the National Minimum is now so generally accepted that people are apt to forget how very novel it is. Secondly, there is general agreement that the state must accept responsibility for striving to avoid the alternation of boom and slump. And thirdly hardly anybody in these days, when the balance of payments has become a popular spectre, would refuse to concede that the state must deliberately control the external relationships of the national economy. These three agreed objectives of state intervention—Social Security, Internal Stability and External Stability—would not satisfy the more ardent planners. But for most people they are enough to be going on with.

But while there has been a movement of opinion towards planning-in-principle, there has been an equal movement of growing doubts about planning-in-practice. Actual experience of the planned economy in the last two years has not been very pleasant or very encouraging.

Which is the stronger movement of opinion would be difficult to say. But it is quite clear that it depends on practical performance whether or not the British community is to turn back in disgust towards *laissez faire* as soon as external circumstances permit it to do so (as they do today).

One lesson which, one might have thought, would have been truly learned in the last two years is that of the limitations of what is often called "physical" control. A "physical" control is one which directly controls the supply of some tangible commodity. Food rationing is the *beau idéal* of a physical control, and perhaps it was the technical success of the basic food rationing scheme which deluded so many people into attaching their faith to a generalised policy of physical controls. But it has become increasingly clear that the further the state goes with physical controls the more difficulty it encounters. For one thing, physical controls are very expensive in manpower. Moreover, there are comparatively few other commodities that are as simple to ration as the basic foods—other things are not universally consumed in equal portions at regular intervals. A democratic state, confronted with all the difficulties of a complex rationing system, wavers backwards and forwards between the two extremes of being too autocratic to please the electors and too lenient to make the system work. The central detailed control of complex economic relationships is now seen to be a far more difficult thing than was previously realised.

If, therefore, the state, as trustee for the community, is to make solid progress in meeting its responsibilities, it will be very well advised to retreat as rapidly as circumstances permit from physical controls. It is perfectly possible to be a convinced adherent of the doctrine of the purposively directed economy and yet to hold that the primary need is to abolish as many buff application forms as quickly as possible. A very large part of the appeal of financial methods of pursuing economic policy, to which there has been a notable rallying in recent months, is that they would achieve its objects with much less human friction and individual inquisition. To centralise decisions on matters of detail is to choke the system with paper and the citizen with frustrated rage. If purposive direction and political democracy are to work together, then the main method must be, first of all to secure the maximum possible dispersion of decisions, and then to influence them by such all-pervasive methods as taxation and credit control.

Can the Big Four Bargain?

ONE decision—and one only—is needed to prevent the London conference of Foreign Ministers from following the Moscow conference of last spring into deadlock and frustration. It is that the four Ministers should negotiate and not debate. In Moscow everything that could be said about their respective attitudes on Germany was said in long debating speeches. And those speeches seemed more often directed to the outside world than to the conference table. Mr Molotov appealed to the Russian people and the German nationalists; M. Bidault appealed to all Frenchmen who want German coal and to all neighbours of Germany who fear its revival; Mr Bevin appealed to the British taxpayer; and Mr Marshall—still quite new to his job—firmly read out papers which seemed addressed to the recording angels.

Perhaps this set piece had to be staged; the Moscow Conference was only the first serious attempt to interpret what had been drafted at Potsdam, and to thrash out the problems of Germany's immediate future. But now, if the Foreign

The state should seek its ends by trying to influence the economic weather, not by trying to ration raindrops.

This, one would have thought, was the clear lesson of the last two years. But it has not been learned. And that leads to a second category of doubts about the practical possibility of the planned economy. The planning, the control, the purposive direction—call it what you will—must, in a democratic state, be done by political parties. But what if the political parties show themselves to be technically incompetent for the purpose? No economic policy is right at all times; expansion is just as necessary at one time as contraction at another; and the most essential skill required of the economic planner is to know when to reverse his engines. Yet political parties are not equipped with reversing gear. It was the turn of the Tories in 1931 to show with what stubbornness they could defy the facts and pursue a policy of contraction in the middle of deflation. But their performance has been at least equalled by that of the Labour Party since 1945. Their sacred cow is the trade union doctrine that it is always right for the pay-package to grow and never right, in any circumstances, for it to shrink, or even for its growth to be halted. The Labour Party has even done what seemed incredible six months ago, it has agreed to the conscription of labour in peacetime, rather than question this sacrosanct dogma. Clearly, if it is unsafe to let Tories out of gaol in a slump, the Labour Party ought to be locked up in times of inflation. Nor can the philosophical onlooker, eager to believe in the practicability of the principle of the controlled economy, comfort himself with the resolve always to vote Tory in boom years and Labour in times of slump. Unfortunately Parliaments last too long, and the Tories whom he might vote into office at the height of the boom would still be there when the slump came, while the Socialist Parliament, born in the slump, would still be merrily expanding at the height of the boom.

It would be mere defeatism to allow these doubts to accumulate into an abandonment of the whole attempt. Having formed the resolve to be master of its economic circumstances, as it is of physical environment, mankind is not now going to turn back. Nor must it ever be admitted that the task cannot be accomplished by methods of freedom and tolerance. But it is obviously a problem of far greater complexity than was ever imagined by the blithe theorists of social democracy. And those who believe in the objects would be well advised to concentrate their attention on the practical logistics of the problem rather than on rushing forward to do battle on the windy heights of abstract principle.

Ministers do the same thing over again, they will expose themselves to the suspicion of not wanting to agree. In fact, it would be a great relief to learn that the doors had been bolted and the blinds drawn at Lancaster House, so that the four statesmen could really begin to haggle. For haggling is a process that is best left unreported. If it is not to go on indefinitely, someone has to change his stance and someone has to get the upper hand. In the present tense situation neither Mr Marshall nor Mr Molotov is likely to give such a performance in public. Ever since last March they have been wrestling fiercely with the world looking on; and if the world has the impression that Mr Marshall now has slightly the better grip, that is all the more reason why Mr Molotov should not publicly admit the fact. But supposing that there is genuine readiness to stand back and parley, how would negotiation start? What possibilities of agreement did the Moscow conference leave open?

The most difficult and fundamental problem before the Moscow conference was that of reparations. The Russians

refused to discuss the economic unification of the four zones, which was agreed on at Potsdam, unless their claim was conceded to take \$10 billion worth of reparations, most of it out of current German production. The British and the Americans rejected this ultimatum on the grounds that the food, money and goods with which they had been priming the pump of German industry would simply be swallowed up by reparations deliveries to Russia. The recovery of Germany would be delayed at the expense of the American and British taxpayer. It is not true that Mr Marshall and Mr Bevin turned down reparations out of current productions absolutely. But they insisted that three things must happen first: German exports must have risen to a level at which they paid for the minimum imports needed to keep the bodies and the souls of the workers together and to keep industry working efficiently; then the money spent in keeping their zones alive in the past, present and future must be repaid from German production; and Germany must be got working as one economic unit, pooling the resources, food, trade and manpower of the four zones. Here then was a chance of negotiation. Mr Bevin and Mr Marshall, it is true, did not come half-way to meet their Russian colleague; but they did advance. Mr Molotov stayed put, and there is no evidence that he has since become more mobile.

Even more revealing were the discussions on the control of the Ruhr. This subject arose in several different contexts, in connection with frontier and security problems as well as with arguments about unification. To the Russian demand that the Ruhr should be put under four-Power control, Mr Bevin replied that other key sectors of industry in eastern Germany should also come under joint control—a proposal that Mr Molotov clearly was not prepared to consider. Here, perhaps, there was no room for negotiation, because each statesman obviously disliked the idea of the other interfering and "snooping" in the key sectors of his zone—which is a measure of the distrust that divided them. But there was room for negotiation about the Ruhr when the question of the Saar's future came up. To the French claim, supported by the British and Americans, that this territory should be attached to the French economy, the Russians refused an answer so long as the future of the Ruhr was left open, and so long as the British and Americans refused their final approval to Poland's territorial gains in the east. For tactical as well as diplomatic reasons Mr Molotov might have seized the chance to please the French and get some *quid pro quo* over the Ruhr. Instead he chose to be completely intransigent, and Mr Marshall got only a completely negative response when he suggested efforts to ensure that the Polish-German frontier should not be a barrier to the passage of food and goods between east and west. Here, too, there was room for negotiation, instead of the blunt confrontation of papers.

Over the political shape of Germany, too, there were chances for negotiation, greater here than anywhere else. British and Russian ideas about Germany's form of government were not

fatally far apart. But discussion of these ideas, useful as it was in clearing delegates' heads and in providing material for Russian propaganda in Germany, contributed nothing to agreement about economic unity. Negotiation about the powers to be given to a central government, about the advisory council which would draw up a constitution, was futile so long as the economic foundations of the new Germany remained unplanned. Perhaps it was because it was futile that it went quite well.

*

What exactly does this economic unity mean—this phrase from the Potsdam agreement which lies at the root of the argument? It means the end of the zones as trading and producing units; it means free passage of persons, goods, money across the whole country, one export and import plan, one system of taxation and one measure of currency reform; it means the delivery of food from the east to the industrial west, and of fertilisers and steel from the west to the farms and industries of the east. It means knitting up again the highly specialised and interlocking industries on which German recovery depends; joining up the business, professional and trade union structures of the zones which each Power has shaped according to its own ideas.

Obviously the process of unification would be long and difficult. Not least the Germans would find complicated the adjustments and changes that renewed contact between east and west would bring. But these things would not have been difficult two years ago. Those who were chiefly responsible for delaying unification at that time knew perfectly well that delay meant the hardening of differences and the deepening lethargy of German production and enterprise.

Why, then, did the delay occur? The chief cause was Russian anxiety to take from the eastern zone reparations urgently needed for their own reconstruction, and Russian determination to establish in and around Berlin effective and well-disciplined political forces. With these German forces, steady pressure in the Russian interest could be kept up against any central government and against any unfriendly political movements in the west. This intention has been so frankly avowed that there can be no reasonable doubt about it.

To place the initial responsibility for Germany's continued division on Mr Molotov's shoulders is not to deny that many things have since had to be done in the west which make unification almost insuperably difficult. Every step taken to avert that collapse has been greeted in the east as a step away from unification: the fusion of the British and American zones (with the door left open to the eastern zone); the export-import plans; the raising of the level of industry; and finally, most decisive of all, the decision to include needs and resources of Western Germany in the Marshall Plan. These developments have now gone so far that it is difficult to see how economic unification could now be welcomed by the Americans and the British unless Germany as a whole were allowed to play its part in the Marshall Plan.

In the eastern zone, likewise, there have been developments open to exactly the same interpretation. Its Sovietisation has probably gone much further than is generally realised; it is doubtful whether it has food surpluses to offer the west and whether the arrangements made with European neighbours could be fitted into new export plans for a united Germany. Politically and economically the Russian zone is better organised for a rump existence than is Bizonia.

To sum up, therefore, three things are clear: that differences in the economic structure and trade relations of the eastern and western zones of Germany have hardened since the Moscow conference; that each occupying Power has strengthened its political hold and economic stake in its zone; that the possibilities of negotiation are smaller and harder to grasp than they were last April. Nothing said or done in the first three days discussion at Lancaster House has yet revealed any new disposition to nego-

British Railways

THIRTY-TWO days remain before the British Transport Commission takes over the railways, London Transport and the canals. On January 1st, the four main line companies, which were the product of the 1923 grouping, vest in the Commission, together with a number of joint lines and smaller railway undertakings. The separate systems of the LMS, LNER, Great Western and Southern will disappear. On New Year's Eve, the toast will be: "The main lines are dead; long live British Railways." Thereafter the Commission, working through its agent, the Railway Executive, will be responsible for running, unifying and improving the railways of this country. It will operate London Transport through the agency of the London Transport Executive—a body which will take over ready made the undertakings of the London Passenger Transport Board, and whose problems are small compared with those which face the Railway Executive. The Docks and Inland Waterway Executive has been set up, though its exact scope has yet to be defined. The Commission has also to set up a Road Transport Executive, and it may eventually create an Hotels Executive.

These are the agencies which will be responsible, under the authority and direction of the Commission, for providing an "adequate, economical and properly integrated system of public inland transport." Integration—which is the only economic justification for the Transport Act—is obviously a long way off, and the Commission has yet to take the first formal step towards it by appointing a Road Transport Executive. A task of this tremendous magnitude can only be carried out by stages, but the Commission starts upon it at a critical moment. The risk of a breakdown in rail transport, brought on by eight years of over-use and under-maintenance of permanent way and rolling stock, will be very real this winter. Consequently, the Commission, in taking over the railways and reshaping them into an "economical and properly integrated" system, must avoid, as far as it possibly can, putting additional strain on an already overburdened railway system. But these immediate considerations, important though they may be, are outweighed by the fact that a scheme introduced now for the railways will determine their future organisation for as long as the Transport Act remains on the Statute Book; small modifications may be possible, but on the essential decisions there will be no chance for second thoughts. It is no exaggeration to say that if the Commission fails to choose the best form of organisation for the railways at the outset, an efficient and economical system of public inland transport may never be obtained.

The Act provides for the taking over of the railways by the Commission, but it gives the latter a free hand, subject, how-

ever to the approval of the Minister of Transport, to devise a scheme for operating them. One possible scheme might have been for the main-line systems to continue broadly on their present basis, with the Railway Executive wielding general direction over them, and the Commission, remote in its ivory tower, thinking out its programme for the co-ordination of transport and intervening only on broad policy matters. But it is quite clear that the Commission has no intention of delegating its powers to this extent. It conceives its duty to be to exercise a collective directorial supervision over the Executives; it will assume, very roughly, the powers of the railway boards of directors, plus the job of co-ordinating all forms of transport. According to this theory, the Executives, as agents of the Commission, should then be appointed on a functional, or technical, basis. That is in fact the method on which the Railway Executive has been appointed (though it is worth noting that the London Transport and Docks Executives do not pursue this functional idea to nearly the same extent). Apart from Sir Eustace Missenden, the chairman, the six full-time members of the Railway Executive are assigned to the six functions of commercial matters; operation; civil engineering and signalling; mechanical engineering; labour questions; and estate management, stores and purchases. In addition, two part-time members represent agriculture and industry respectively.

The Railway Executive (whatever may be said about the other Executives) thus has a dual character. It is a body intended to wield collective responsibility for the management and operation of the railways. But it has been appointed on the principle of separate technical direction of the principal components of railway operation. For example, Mr Riddles will not be merely a member of an Executive exercising general functions of management; he will be the ultimate source of authority and point of reference on all matters connected with mechanical engineering on British Railways. Precisely the same point applies to all the other full-time members of the Executive, with the exception of the chairman. Obviously there must be a source of final decision on these matters, to which the technical staffs who have the day-to-day job of running the railways can turn. Each of the railways has had its Chief Mechanical Engineer, its operating manager and its commercial manager. But these officers have not been the repository of the ultimate power of management. That function, which requires the broader view and the ability to arbitrate between different, and often conflicting, technical viewpoints, has reposed in the General Manager, who has been responsible in turn to the directors.

The first comment on the form which has been chosen for the Railway Executive must therefore be that it appears to give

undue prominence to the central functions of technical supervision (necessary and important though these are) and too little weight to the general functions of management. The only non-technical appointment is that of the chairman himself. But no one person can be expected to manage the whole of British Railways, and particularly in the early stages, the general functions of management will be all-important. To take only one example, can the Railway Executive, composed of chief technical officers of widely different experience and outlook, be expected to produce here and now collective decisions on the right way to organise railway operation in new regional groups? Who does the thinking on such questions now and in the future?

This question of management is of the most vital importance. There is a strong case for saying that the main line groups had already reached, or exceeded, the limits of size for effective management. The Railway Executive will have to produce some new technique of management if it is to succeed in handling its much larger problem even as successfully as the four main line companies—let alone do better. The technical members of the Executive will be extremely busy men, with more than enough on their own departmental plates. The Chairman will be concerned, on the one hand, with making sure that the railways work, and with reconciling differences of technical opinion among the members, and on the other hand with the carrying out of the general policy laid down by the Commission to its Executive agent. It is doubtful if these manifold duties will leave him with any opportunity for thinking on broad lines about railway operation and services—of suggesting ways of doing things better or cheaper, and of developing new ideas for the technical members to put into practice. An attempt might be made to fill this gap by setting up an advisory or secretarial body working in apposition to the chairman. But can the supreme function of management be made subordinate?

So much for the organisation at the centre, with its problems and its potential shortcomings. The next problem is how its decisions are to be translated into effective action on the railways, and whether the dangers of over-centralisation can be avoided. A plan for six railway regions is being introduced on January 1st to replace the existing main line groupings. The regional scheme (illustrated on the accompanying map) is provisional, though here, again, first decisions once taken may not be easy to change very radically. In the first place, the Scottish lines at present operated by the LMS and LNER will be grouped into a single operating and administrative unit, run from Glasgow. Secondly, the LNER (which is already organised in separate operating divisions) is to be divided into a North-Eastern Region north of Doncaster, and an Eastern Region south of Doncaster, taking in the Eastern Counties system. These two regions will be run from York and Liverpool Street respectively. Fourth, the Southern Region will take over the Southern Railway's system virtually intact, including the North Cornwall and Devon lines. This Region will be run from Waterloo. The Western Region, with headquarters at Paddington, includes broadly the Great Western system. The sixth region, to be called the London Midland Region (run from Euston), is a large and rather straggling one; it is based on the old London and North Western and Midland systems, but on the one hand it includes part of the Great Central, and on the other hand it skirts Manchester, to which a deep salient is driven from the Eastern Region by the other part.

In assessing the merits of any grouping scheme, a distinction has to be rigidly drawn between what looks tidy and logical on paper and what works most effectively in practice. A map-maker's solution may be an operating nightmare, for rail transport does not move in areas, but along lines. As a provisional

scheme of organisation, these six regions have the appearance of being reasonable. But it will be observed that they follow the existing main-line structures very closely. Regional management is preserved on the LNER, but not introduced on the LMS system. The cross-connections of the Southern and Great Western systems in Devon and Cornwall are not resolved. These are questions which second, and even third, thoughts may be needed. Essentially, however, a system of regional decentralisation, working to the Executive, is to be a permanent feature of the railway organisation.

Where the exact frontiers of the Regions are to be drawn is less important at this stage than the introduction of an effective chain of responsibility between the Regions and the Executive in London—indeed, four of the Regions will themselves be supervised from London. The intention is to match in the Regions the technical division of functions which has been created in the Executive. Each Region will have, say, an officer in local charge of mechanical engineering matters, who will receive his instructions directly from, and will be answerable to, the member of the Executive in charge of mechanical engineering. Similar arrangements will be made, in each of the Regions, for each of the functions represented on the Execu-

tive. The chain of responsibility will flow directly from each functional member of the Executive to his technical subordinate in each of the Regions.

Once again, however, the problem arises of the general management and oversight of the regional technical officers. There will be no regional manager, as such, whom the Executive can charge, in its collective sense, with matters of broader policy. Instead, each Region is to have a Chief Regional Officer, whose functions will be largely to co-ordinate the work of the separate technical staffs on the basis of the separate instructions which they receive from the individual members of the Executive. The CRO will provide a cross link between the technical officers. But how far will he be able to exercise authority over them? Suppose that a Regional officer in charge of operation receives instructions, from the member of the Executive responsible, to provide a new service, but is told by the officer in charge of motive power that it cannot be done. Who resolves the conflict? Does the CRO have no overriding powers? Is each of the technical officers at liberty to go back to his superior at the Executive whenever a difference arises? If so, the position of the CRO will be invidious indeed, because although he has the responsibility for co-ordinating their work, he will have no direct authority over the technical staffs in his Region. He would not even be *primus inter pares*, because,

moment, defeated, and now that the Hungarian peace treaty is signed, the Soviet troops have withdrawn and all the Russians can maintain are lines of communication to Austria. To crown the uneasiness of the political situation, the last Communist Minister has withdrawn from the Austrian Government and concessions on Russia's part would have to be made to a very largely anti-Communist administration. These factors have all made the Russian "security stake" in Austria greater than ever before.

At the same time, the problem of Russia's holdings in Austria has been complicated by the Austrian Government's decision to depreciate the currency. All schilling holdings which were not in deposit banks before November 12th are to be devalued by 66½ per cent. If the Russians were to insist that their schillings should be exempt, they might then hold sums equal to about one-third of the new depreciated currency. Yet it is not thought likely that they will accept the application of the law on any other basis. If the Russians do refuse the reform for their zone, Austria would have a divided currency to add to its other divisions.

This is the melancholy background of the present discussions. It is hard to believe that they can end in compromise or that the Austrians will "get their four elephants out of the boat."

* * *

German Recovery Curve

For the time being the Ruhr miners are holding production steadily at figures of over 280,000 tons a day. For the last ten days the average has been 282,500 tons. Two months ago the daily average was well under 220,000 tons a day. Political uncertainty and the expected resentment about dismantling have not checked a quite remarkable recovery, the main threat to which is now shortage of rail and road transport and the fact that there is not enough water in the Rhine to take the coal barges to Rotterdam. About 120,000 tons of coal a week are piling up at pithead. It is an exasperating fact in the pattern now forming for the winter that the better the rest of the bizonal economy works, the worse the transport position becomes. To give only one example, which the Americans have emphasised recently in their "Economic Data on Potsdam Germany": although their coal stocks have risen fast, consumption of coal by the railways is nearly thirty per cent higher than it was in 1938, partly because of deterioration in equipment and partly because of theft and pilferage.

In handing over management of the Ruhr mines to the new German Board, the British North German Coal Control can congratulate itself on a fine finish to its work. In Bizonia the railways hold 24 days' supply of locomotive coal against eight days' supply last year; iron and steel works should have a month's supply in hand; power stations have a five weeks' margin of stocks to safeguard them against winter interruptions in supply. With over 2,000 recruits entering the mines each week, there is a net gain of 1,000 men a week. If food supplies can be maintained and the incentives scheme developed to its third stage—that of buying more tasty food with part of the currency earned by coal exports—then the Ruhr should get well through the first part of the winter. But there is still the most disquieting evidence of German incompetence and dishonesty in distributing food, characteristics which must not be allowed to appear in the distribution of coal.

Mr Morrison's Apologia

On a sticky wicket the Government can never do wrong in putting Mr. Morrison in to bat. The Lord President of the Council has a gift of sweet reasonableness, of man-to-man persuasion, of willingness to believe the best of his audience, worth a few thousand votes at any series of by-elections. If anyone can persuade the disgruntled floating voter that he did, after all, back the right horse in 1945, he is the man. His Sunday afternoon speech at Sheffield was a model of its kind. His summary of world events in their bearing on the British economic problem, and the consequent placing of that problem in perspective against the difficulties of other nations, was not only convincing, but just—which is not by any means the same thing. His plea for a sense of responsibility among both workers and politicians, and particularly the press, was precisely what the national situation calls for; and the examples of irresponsibility which he gave were well worth a place in the pillory. "It is surely," said Mr Morrison, "the height of political irresponsibility to demand severe measures and then, when they are taken, to make political capital out of the austerities they entail." It is indeed this propensity on the part of the Opposition which goes so far to reconcile people to the continued existence of the Labour Government. Timid, doctrinaire, class-conscious and administratively incompetent as

it may be, there is no reason to suppose on balance that the Conservatives would do much better.

When, however, Mr Morrison holds up the Government's programme for dealing with the balance of payments problem, and the autumn Budget, as adequate measures for clearing up the economic situation, and asks "what more do the critics want?" it is really time to remind him—and the floating voter—that there has been plenty of criticism which does not follow the pattern which he deplores. It is not the swing of the terms of trade against Great Britain which has prevented the Government from framing and executing a wages policy. It is not the cessation of American relief to Europe which has forced it to neglect administrative problems in favour of a steamroller legislative programme of ill-drafted nationalisation measures. It is not the bad weather which continues to inflate the Budget with £400 million worth of food subsidies. It is not the admitted but excusable miscalculations in the original capital programme which keep the Bevans and the Shinwells in office. One need not deny the reality of external disasters; the Government has a temperamental propensity to react to those disasters too little and too late.

* * *

How Much Can the Public Know?

It was very apparent in the House of Lords on Wednesday that their Lordships know very little about the Coal Board. The debate on the Coal Board in particular and on nationalisation in general was initiated by Lord Teynham, and the recent contributions of their Lordships towards the improvement of various nationalisation bills might have led one to expect some valuable criticisms and suggestions on how to improve the administration of existing and future boards. Such expectations were disappointed. In view of the number of lords who sit on various boards, their collective wisdom appeared to be markedly difficult to elicit.

One reason for this backwardness is not far to seek. To criticise and to make useful suggestions involves knowing many more facts than are at present available to the public. In the absence of these facts one speaker after another tramped through the well worn arguments for greater decentralisation and greater local responsibility, and got nowhere. The absence of information was, however, well appreciated, for in spite of constant repetition that a public board must be protected from the rigours of parliamentary question time, the need to give opportunities for Parliament to debate developments in the coal and other nationalised industries was stressed by several speakers. Lord Knollys made the interesting suggestion that if and when the Public Accounts Committee sets about its examination of the Coal Board's annual accounts, not only should the officers of the Ministry of Fuel and Power be summoned to appear, but also members and executives of the Coal Board.

Such an arrangement would certainly improve the contact between the House of Commons and the public boards. But the skill with which those "in the know" can hoodwink those who are not is too well known for it to be possible to put more than a little faith in this suggestion. And if so, what can be done to enlighten the country about its large new offspring, who are such essential breadwinners, but so coy about how they win that bread? It is, no doubt, still too early for the Coal Board to know clearly what it is doing, and the Ministry of Fuel and Power know even less—probably too little. But soon some very important decisions must be taken about the responsibilities of these new boards in explaining their policies and actions. Why, for example, was the longer working week in the mines with its heavy overtime costs allowed to take precedence of the miners' implementation of their side of the five-day week agreement? Or, to cite another issue, what is known about the effect on costs of the huge programmes of mechanisation now being embarked on? Surely the public ought to know?

* * *

Emergency Powers

The debate on the Emergency Laws (Transitional Provisions) Bill, which was considered in committee by the House of Commons last week, inevitably dealt with a miscellaneous variety of subjects. Among the various powers the continuation of which is provided for, those of compulsory billeting attracted a certain amount of attention, but the villain of the piece was Defence Regulation 58A embodying the power of direction of labour under which the new industrial conscription order has just been issued. This was of course an easy target for the Opposition who were able to exploit the notion of slavery and the slave state with a good deal of dramatic effect. Moreover, the power of direction is scarcely more popular among the Labour benches. Nevertheless, in view of the present obvious maldistribution of

labour, it was scarcely to be expected that the Government should surrender their power of direction, even if the use to which they put it can only be extremely guarded.

The maldistribution of labour is of course one of the most prominent symptoms of the distortion in the economic life of the nation brought about chiefly by inflationary pressure. Price controls and other regulative restrictions, however successful they may be in war time over a very large area, cannot be extended indefinitely. It is natural (if only for psychological reasons) that in peace time the territory over which the price mechanism works with some degree of freedom should become extended, and when this libertarian tendency is reinforced by the pressure of excess of money chasing a restricted supply of goods during a period of full or over employment, the maldistribution of limited labour resources becomes inevitable. But even if in these circumstances the power of direction must be conserved, it is doubtful how far it can in fact be employed at all effectively, particularly when no effort is made to correct maldistribution through a properly planned wages policy and when a capital programme far exceeding the volume of real savings is being attempted.

It is these awkward facts, rather than any abstract consideration of the Government's powers of compulsion, which must cause disquiet when considering the Registration for Employment Order. For though the intention of the Government to make use of this dangerous instrument only very sparingly may be quite sincere, the time may come when in the fruitless endeavour to correct increasing maldistribution, powers of compulsion may prove an irresistible temptation to a harassed administration endowed with insufficient courage to attack the malady rather than the symptom. That is why the cry that the liberty of the individual is in danger, however convenient it may be for party purposes, cannot be dismissed as mere humbug.

* * *

Czech Front Holds Firm

The result of the conference at Brno of the Czech Social Democrats is a reverse for the Communist attempt to break the National Front, but not a swing to the Right. By electing Mr Lausman, hitherto Minister of Industry, to be Chairman in place of the Vice-Premier, Mr Zdenek Fierlinger, the party showed its determination to remain independent, and to concentrate on building up its position for the elections next May. Mr Fierlinger was ousted because he is more of a diplomat than a reliable party man; and as the Social Democrats intend to try to continue collaboration with the Communists within the National Front, it is important for them to have a reliable party man in the leadership. Mr Lausman, who is almost as far to the Left as Mr Fierlinger, was thought to be a safer choice to guard the party's independence, and organise its ranks for the elections. Czech politics are very much an affair of rival party machines.

Both Mr Lausman and Mr Fierlinger resigned their posts in the Government, the former in order to give his whole time to party work, and the latter because his post as vice-premier had been given to him in the first place as head of the Social Democrats. Their places have been taken by Madame Jankovcova, who is on the Left of the Social Democrat Party, and by Mr Tymes, a centre man.

The Brno conference also removed from the central executive Mr Even Erban, the able young secretary-general of the Trades Union Council, for the reason that he is more of a Communist than a Social Democrat. This may well be taken as a step to the Right, though it leaves an executive committee which contains no outstanding Right-wing member except Mr Mayer, the Minister of Food.

Mr Erban's removal from the party executive does not entail resignation from his key position in the Czech trade union organisation. It will, therefore, not affect the fight which the Social Democrats are taking up inside the unions against Communist tactics of intimidation. In this fight the party is in a relatively weak position, since the Communists are strongly supported by the Czech workers, while the Social Democrats—with not much more than one-third of the Communist membership—tend to be a party of white-collar workers and intellectuals.

In the struggle to maintain the National Front on a basis of independence and equality, the decisions taken at the Brno conference have been of great importance. Hence the angry tone of the Communist comment. The party, which failed under Mr Fierlinger to secure a "Socialist bloc" inside the Front, now stands for the type of coalition which made Czechoslovakia a bright spot in Central Europe until a few months ago. The National Socialists, who, after the Slovak Democratic Party, had been marked down for disintegration by the Communists, are much heartened by the results of Brno.

Empire Talks

One of the characteristics held in common by the two great centres of the English speaking world—Washington and London—is a remarkable inability to mobilise all their potential political and economic resources. The United States, far from seeing in the British Commonwealth a friendly, reliable security system ready to carry a share of the burden of world order, can still hardly bury memories of the tradition of George III and Lord North. Great Britain, flanked by great Dominions which have grown to complete maturity in the last forty years, is haunted by an equal though opposite anachronism. So deeply ingrained in the British mind is it that a powerful Mother Country must do nothing to interfere with its "dependencies"—must not, in fact, behave like Lord North—that today when the Mother Country is no longer so powerful and the Dominions, no longer dependent, are anxious to aid their embarrassed parent, she holds back, fearful of engaging their help for fear of contravening their sovereignty.

This can be the only possible explanation of the British Government's steady failure to draw the Dominions into closer consultation as issue after issue has arisen in which Britain and the Dominions have an equal interest. It is now nearly six months since the Marshall offer was made. It was bound to affect the Commonwealth in a number of vital ways. Britain's possible relations with Europe needed to be seen in a Commonwealth perspective. The extent to which the Dominions might become suppliers under the plan and thus, by acquiring dollars, fend off their own crisis, called for immediate exploration. And the role of the Dominions as sources of supply raises the larger question of the extent to which Dominion output—Australian wheat and meat, New Zealand dairy produce, South African coal, Canadian minerals—might be expanded in the four year Marshall period. Above all, since Mr Bevin launched his idea of an Empire Customs Union on the world in the middle of the Marshall and Geneva negotiations, it would have seemed essential to consult with the Dominions sometime—preferably before making the announcement—on the relationship between the new idea of a union, the old relations of the Commonwealth and how both could fit into the Marshall picture.

It may be that all these issues have been discussed. It may be that the Prime Ministers' offices in London and in each Dominion are in constant confident touch with each other. But this does not appear to be the case, and only the occasion of a Royal Wedding has brought sufficient Empire statesmen to Downing Street to warrant the announcement this week of "informal Commonwealth discussions." In a crisis like this, can the British afford such a surprising disregard of their real resources?

* * *

The Canadian Crisis

The Canadian economic dilemma, which has forced upon the Dominion a programme of import restrictions and austerity hardly less sweeping in scope, though naturally less severe in degree, than those adopted in this country, is no more peculiar to Canada than the British dilemma to Britain. Both arise from the situation generally described, in convenient but misleading shorthand, as the dollar shortage; a situation which at bottom consists in an acute shortage, everywhere but in the United States, of goods. If there were no dollar goods available at all no one would talk of a dollar shortage; the talk would be of unqualified famine and disaster. Canada has ever since the war ended pursued a policy—generous because clear-sighted—of remembering the goods and forgetting the dollar sign, in the best tradition of lease-lend and mutual aid; and it is now paying the penalty of living, as its Finance Minister recently put it, beyond its customers' means. It supplied goods to Britain on credit while itself paying cash to the United States; and the latter's comparative slowness to realise the extent of the New World's responsibilities for the survival of the Old has now placed Canada in the awkward position of having nothing but uncollectable debts with which to meet its US dollar obligations. It is a position bearing a considerable resemblance to that of Great Britain after the First World War.

It is a worse position, in that Canada's economic resources are vastly less than were Britain's a quarter of a century ago. Comparative population figures alone would demonstrate that. On the other hand, public understanding of the difficulties is much greater. In the long run the dilemma can only be resolved by a recovery of world production outside the dollar area. It is to Canada's advantage, discounting all sentiment and on the most realistic economic grounds, to maintain its connection with the British market for farm produce. Whether it gets paid directly in British goods or indirectly in the goods of Britain's customers is immaterial. Britain can seize certain export opportunities offered

by the Canadian ban on American imports—if its production rises to the occasion. But all the geographical realities dictate that Canada shall in the future as in the past have an export surplus to Britain and an import surplus from the United States, and that the balance shall be struck by the recovery of world-wide multilateral trade.

* * *

National Assistance—Second Reading

Mr Bevan's opening speech in the second reading of the National Assistance Bill set the tone of the debate that followed. He concentrated on the provisions of the Bill obliging local authorities to set up residential hostels for the aged and infirm, and the imagination he showed in describing their present plight and future prospects struck a responsive note among those who listened.

But the poor law is by no means solely concerned with old people, and it was a pity that neither Mr Bevan nor Mr Griffiths, who wound up the debate, made it clear how the same piece of machinery—the National Assistance Board for cash provision and the local welfare authorities for accommodation and welfare—can be responsible for the same mixed bag of people as are now the concern of the poor law and yet inherit none of its stigma. "The workhouse is to go," said Mr Bevan. Yet there must be a workhouse—by whatever name it is called—if local authorities are to fulfil the obligation imposed on them by the Bill, and now imposed by the poor law, to provide accommodation for sudden and urgent need. Further, Mr Bevan cannot surely believe that every old person at present resident in a workhouse can be suitably accommodated in the small homes of 25 to 30 persons that he advocated. The Bill itself has a special reference to the "difficult" person. Does he also believe that his new "mixed" home, containing people of mixed incomes, will necessarily make for a happy community? Class barriers may have broken down sufficiently by the time that a new generation of old age pensioners comes along—and it is certainly unlikely that circumstances will allow the present generation to benefit much by the Bill's provisions—but at present it is naive to assume that the middle class pensioner will settle down happily with the present institution inmate.

There is another difficulty about the proposed new hostels, desirable though they certainly are. They will be expensive to run, in money and in manpower. They will also be vote catching. There is, therefore, a danger that local authorities will be too lavish over them and will consequently have to economise on other items of their welfare expenditure. In other words, by bringing in the not-so-poor and the fairly-well-off within its scope, the Bill may work to the disadvantage of the really poor who under the present poor law have a priority. If there is not enough to go round, is it not likely to be the poor who will suffer?

* * *

Something New Out of Africa?

The holding of the first conference of African Governors, which ended last weekend, together with the introduction of the Overseas Resources Development Bill, has focused public attention on Africa. The new plans for colonial development are, it is true, intended to apply throughout the colonial empire, but it is clear that they will be mainly concerned with the African dependencies, which after all contain half the colonial empire's population.

But if the people of this country are beginning to think, as there are signs that they are, that the development of Africa is a solution for their own present difficulties, they should be rapidly disabused. If we cannot buy raw materials and food in dollar countries, let us grow them in Africa—so runs the argument. Stories of great tracts of undeveloped, untouched land, of a huge untapped labour force and of low costs of production are readily believed. But, as emerged quite clearly from a House of Lords debate last week, and as Mr Creech Jones emphasised in a standing committee of the House of Commons this week, the new development schemes are being undertaken primarily in the interests of the colonial territories. The East African groundnut scheme, it is true, owes its origin to the shortage of fats, and the priority given to this scheme in the way of equipment and transport facilities, and the speed with which it was begun, have no doubt coloured the purpose of the new phase in African development. But even if it were mainly directed towards helping the United Kingdom rather than the colonies, it would clearly only be as a long-term objective rather than to meet the immediate crisis. Not even East African groundnuts can increase British food supplies before 1949. Nor are other forms of development

likely to be easy. There is no mass of willing Africans waiting for jobs. As Lord Altrincham pointed out in the Lords debate, not only is African labour scarce, it is also inefficient. Its productivity is very low, and the main purpose of the new Colonial Development Corporation is to raise this productivity, to prevent the Africans from taking more out of their land than they put into it, with a consequent steady fall in the level of subsistence—in fact, to maintain and improve the African standard of living, not the British.

All this will take time, and it will certainly not always succeed. But it would be a great pity if the new and imaginative phase of development were hindered at the outset by misconceptions in this country about its purpose. These misconceptions might lead the Africans to believe that another scramble for Africa is taking place—a scramble for groundnuts, tobacco and cotton, in which Western weapons of tractors and rolling stock are being introduced merely to secure a British victory.

Navigation by President İnönü

The basic question in Turkish home politics now is whether this is the moment to extend "democratic practices" (meaning two-or-more party politics) or whether to do so is to invite the quarrels that rack other democracies. Last week's congress of the government party—the Republican People's Party—discussed little else. Its participants labelled it a turning point in Turkish politics. In fact it is scarcely that. President İnönü knows exactly how far he means to go, and how best to get there; and there are likely to be few or no sharp "turnings" on the way.

What happened at the Congress is proof of his determination slowly to divest Turkey of the one-party system and to put in its place the representative government that will make of himself the last dictator; but at the same time to keep his hands on, or very near, the helm for a further indefinite period. It will be remembered that he permitted the formation of an official opposition—the Democratic Party—in January, 1946. The cork once out of the bottle, this party received more support than he, and most people, expected. He therefore moved with the flow of public opinion. When, in the early months of last summer, the Democrats failed to get the seats and the voice they had expected, and looked like retiring in dudgeon he reacted at once. In a speech on July 12th he promised to proceed more quickly along the road to democracy. There followed some pressure from the younger men within his own party for a change in the diarch leadership he had hitherto countenanced. He agreed with it and replaced the old premier, M. Peker, by a more malleable figure, M. Saka. At the current party congress, a meeting of rural representatives as well as of deputies, the pressure has tended to come rather from the right than from the left wing of his supporters, and he has steered ably enough between two groups.

The whole scene suggests that Turkey is, politically speaking, extraordinarily stable. Political criticism, particularly in the press, is permissible to a degree unheard of two years ago, and seems to satisfy human needs and fulfil its purpose. The opposition grumbles about "undemocratic laws," but can seldom put its finger on recent instances of their working. There is fear of Russia, but custom has reduced it to sober and reasonable dimensions. No one could call the Turks jittery. Their mood and their politics present the strongest contrast to the situation in Greece. In Turkey there is no prospect of party conflict any more acid than that of parties in Britain: there is no sign of quarrels on Greek or even French lines, because there are no conflicting ideologies. There is no question of American aid going to one side or another; in Turkey, it goes to the Turks. They have some difficult economic problems ahead, connected partly with their own economic management and partly with world prices. But who has not? And in the home political field both Russian pressure and American aid are unifying factors. In a word, they assist the President in promoting his long-term plan.

* * *

Interim Aid for Asia

The Interim Aid Bill in Washington is now running into trouble reminiscent of the controversy over strategy during the war between the "Europe Firsters" and the "Pacific Firsters." In opening the Senate debate on the bill Senator Vandenberg expressed regret that it did not include any interim aid for China, but declared that the State Department would shortly submit a separate plan for aid to China. There has now been a move in the House of Representatives to make a big cut in the alloca-

tions for Europe and insert \$60 million for China. The moving spirit in the campaign for this aid in the Lower House is the ex-missionary Representative Judd, and behind him is China-born Henry Luce, who recently sent Mr Bullitt, former ambassador to Russia and France and a fervent anti-Communist, on assignment for *Life* to write "A Report to the American People on China." Mr Bullitt begins his report, published six weeks ago, with the thesis that "to prevent the domination of China by any nation which might eventually mobilise the 450 million Chinese for war against us is a vital interest of the US," and goes on to recommend a three-year programme of aid to cost a total of \$1,350 million, of which "perhaps \$75 million" should be provided immediately.

The new drive for priority for China is a very natural outcome of the American political situation. The advocacy of aid to Europe has been put mainly on an anti-Communist basis, sometimes to the exclusion of the idea of a positive reconstruction of world economy; and if indeed the motive for aid is to be the rescue of countries from submergence by Communism, it is only logical that the two countries in which Communists are actually waging armed civil war against the recognised Government—that is to say, Greece and China—should have the first claim on American assistance. Further, there is the traditional American idea, still very widespread, that the interests of the United States are more deeply involved in trans-Pacific than in trans-Atlantic affairs and that China is a special American responsibility.

Since the failure of Mr Marshall's attempt to mediate between the Chinese Government and the Communists, the American Government has lacked a consistent policy towards China. Official Washington, while apprehensive of a Communist victory, has been unwilling to pour out the not unlimited resources available for subsidy into a country where funds or supplies seem to be so easily diverted from their proper purposes. American public opinion has had painful qualms of conscience about intervention in the Chinese civil war on behalf of a notoriously corrupt regime which has so far lacked any satisfactory democratic basis. But the endless repetition of Moscow propaganda slogans against American imperialism by the Chinese Communists in recent months has left no doubt that China would be drawn into the Soviet bloc if the present Nanking Government were to be super-

seded by a Communist-controlled coalition, and the situation is now such that support can hardly be withheld much longer unless the United States is ready to write off China as a lost cause.

* * *

China on the Fence?

Apart from the possibility of a Kuomintang defeat in the civil war (due to economic exhaustion and inability to pay the troops, even more than to lack of armaments), there is the danger for the United States that, even while retaining control of a great part of China, the Nanking Government, without effective American support, may seek to save what it can by a direct agreement with Moscow and may incline towards the Russian orbit in world affairs. This course is all the more tempting for Nanking because on the subject of Japan some very sharp conflicts of interest have arisen between China and the United States and the Chinese find themselves aligned with the Russians on several points at issue. With the fear of Russia on the one hand and the sense of a certain common interest on the other, the Kuomintang leaders have been wondering what is to be gained by close attachment to Uncle Sam, who no longer provides the necessary, but only moral injunctions against graft. They do not of course trust the Russians, but since Yalta they do not trust the Americans either, and support for a pro-Russian course is said to be strongest among the ultra-nationalists of the extreme Right, for whom all foreigners are about equally loathsome and the only hope for a weak China lies in trimming between Great Powers, strategic retreats and "selling space for time." The condition for an understanding with Russia is probably Nanking's complete withdrawal from Manchuria and an arrangement on the lines of the former Ho-Umezu agreement by which Chinese relations with Japan were regulated after the creation of "Manchukuo."

Washington appears to have assumed that Nanking cannot come to terms with Russia and must in any case follow the American line internationally. But China's attitude towards the American proposals for the making of the Japanese peace treaty has not borne out this assumption. The United States in July proposed that the treaty be drafted by the eleven nations represented on the

BOOKS ARE ALWAYS IN SEASON

Far Eastern Commission working by a simple two-thirds majority without Great Power veto. Russia has refused to have anything to do with treaty-making on this basis and has claimed that the Council of Foreign Ministers is alone entitled to prepare the treaty. China has advanced a compromise whereby the eleven nations would take part in the preliminary conference, but the Great Powers would have the right of veto—a proposal which, if adopted, would defeat the American aim of circumventing the veto. There is now a hint that, if the United States and other Western nations go ahead on the treaty without Russia, China as well as Russia will stay out, and a treaty unsigned by either of Japan's continental neighbours would hardly be worth making.

Civil Defence in the Future

Mr Attlee has announced the Government's preliminary plans for a permanent civil defence organisation. This will consist partly of civilian static and mobile services and partly of military mobile columns trained in Civil Defence duties. The civilian nucleus is to be composed of part-time volunteers, attached to and developed from the regular police, fire and medical services, while the military mobile columns will provide a reserve for reinforcement of local services where necessary. The scheme is rightly flexible, and appears to concentrate on building up a nucleus of skilled volunteers rather than on creating a large organisation manned by a full-time staff.

This is the only sensible course to pursue. So long as this country stands in danger of unprovoked attack from the air, there must be a nucleus of trained men capable of dealing with any emergency and of expanding quickly. But it would be a mistake at this stage to take elaborate and detailed precautions. To start building gigantic deep shelters and making extravagant preparations would be, to say the least of it, premature, until the technique of defence against the atom bomb has been more fully worked out. It would also be a sign both of political defeatism about the prospects for world peace and of economic unrealism about what this country can afford at the present juncture. Moreover, experience has shown that the dangers which must be guarded against and the measures which must be taken cannot be accurately foreseen in advance of war. Too rigid a prepared structure might be an actual disadvantage if the emergency ever occurs.

In any future war the civil defence services should have the advantage of a hospital and medical service which is already properly integrated. Good as its work was, the Emergency Hospital Scheme had a hard task in the last war in view of the lack of co-ordination in hospital provision. The fire services too will be better co-ordinated. But these gains may be no more than straws in the wind compared with the greater horrors that may be rained from the air.

Housing—What is Temporary?

In spite of the headlines the number of permanent houses completed during the month of October is nothing very splendid.* In the sense that it adds up to more—very little more—than in any preceding month, it is a "record"; but in the more spectacular meaning of that word, it is a record of which no one can be glowingly proud. Progress has no more than been maintained.

The only surprising feature of the returns is the sharp rise in the number of temporary houses completed, which had been dropping slowly through the year. This minor boom is a welcome counterweight to the sorry story of delay, bad estimation and muddle which was revealed in the debate last week on the Housing (Temporary Accommodation) Bill, when the House of Commons agreed to an additional £20 million above the £200 million already approved, for winding up the temporary housing programme.

Criticism centred on the aluminium houses which provide just over a third of the total programme of 156,000, and cost some £1,600 each. However admirable their internal planning and fittings, £1,600 is a formidable sum to pay for a box. Mr Durbin attempted to defend the price by saying how permanent and solid the box really was, but this, as he appreciated, is a dangerous line of defence. A permanent landscape of boxes is a grim prospect.

The rise in cost of the temporary houses from the original estimate of £800 each is mainly due to two factors. First, complete ignorance on the side both of the Ministry of Works and of industry on how the details of what was virtually a new industry would work out. There was gross under-estimation and innumerable changes of specification, while both manufacturers

* Housing returns. Cmd. 7261 and Cmd. 7262.

and Ministry juggled with this new toy. And secondly, delay in the preparation of sites made it impossible to carry out a smooth process of delivery from factory to site, and all sorts of costs for storing, double transport and handling had to be incurred. This

chapter is now almost over. Only 24,000 still remain to be completed, and the mistakes and reproaches of the last three years will soon be forgotten. The next chapter will open ten years hence. Will lexicographers have to invent a new definition of the word temporary?

How Much Newsprint is Healthy?

If consumption per head of newsprint could be interpreted in terms of national literacy, Great Britain, according to figures recently submitted by the Newsprint Association of Canada to a Select Committee of the United States House of Representatives, has relapsed from the position of senior wrangler to that of near-moron, so great has been its cut in newsprint supplies. No country, except Japan, has suffered proportionately so large a fall in whatever mental nourishment the newspapers may be said to provide.

The reductions in consumption of newsprint per head shown in the diagram reflect the economic difficulties in which the countries of Europe now find themselves. Those with direct access to timber supplies can allow themselves a modest increase. Of these Sweden is the outstanding example. Those who have no substantial domestic supplies to draw on, are obliged by the dollar shortage to curtail imports of newsprint—and Great Britain most drastically of all. The situation in Europe is in marked contrast to that in the Western Hemisphere, for with the exception of Peru and Newfoundland consumption has increased in all the countries of North and South America. Of the British Dominions only New Zealand shows a slight reduction: Australia, South Africa and India have all increased consumption. (Full figures

are given in the *Records and Statistics Supplement*.)

Although compared with other countries Great Britain cannot be said to be at starvation level, the present stringency is quite incompatible with the requirements of a country with its national and international responsibilities. For the saving of £1,000,000, the people are being cut off from crucial sources of information. Some Ministers are known to regret the over hasty decision, announced last July. When will they have the courage to reverse it?

Letters to the Editor

Peace in Our Time

SIR,—Your assessment of the chances of direct war between the two Arch-powers seems to one reader at least impressively accurate. But you do not refer to a more probable danger, in which a series of Civil Wars might break out in Europe. These wars would certainly attract both Arch-powers to the support of their respective friends or parties, and even if that support were quantitatively small, it would be enough to make them long, bitter and insanely destructive. France and Italy, in particular, appear to be in much the same state as the Spanish Republic of 1934-36. The prospects of getting outside support are just sufficient to make it worth while to either side, on a very short-sighted view, to begin open Civil War. Once it had begun, the other party in turn would get just enough assistance to prolong the war for years.

The trouble is that a prolonged indirect war fought in other people's countries would not seem a critical commitment of resources to either of the Arch-powers, and to support an attacked party might appear (as it does at present in Greece) urgently necessary against the small direct cost. And many people in Europe are fools enough to start something of the kind.

The Left, however, might pause to think that up till now, in every civil conflict which has occurred in Europe in a country not under direct Russian occupation, they have invariably lost, and the Russians have seldom supported the Left once the Left has begun to lose. In this dilemma, a spell of "strong" government by either party, if only it is strong enough and stable enough to last some years, would be the lesser evil for Europe as a whole. If that is so, the case for a foreign policy of pure opportunism is very strong.—Yours faithfully,

C. R. COOK

5 Vineyard Hill Road, Wimbledon, S.W.

SIR,—In your leading article of November 22nd you rightly declare that "there is a special task for Mr Marshall to perform in Britain," and urge him to state "whether he really believes that security can be organised by the collective effort of the United Nations. Just before the present General Assembly met, Mr Marshall addressed our sister body, the American Association for the United Nations, in New York. His speech had been previously agreed with President Truman, and may be taken as a carefully considered statement of policy. He began by taking a realistic view of the grave difficulties now facing the United Nations, and went on to say:

"We do not look upon the United Nations as a handy instrument for obtaining temporary national advantage. We have no desire to slip back upon the road to international anarchy . . . There is a danger that our hopes of two years ago will give way to scepticism. The great moral and political forces of the world must somehow be brought to bear with full effect through the General Assembly. . . ."

Mr Marshall then gave an eight-point explanation of US policy in support of the United Nations. His policy, he said, was to live up to all the obligations pledged in the Charter; to make all public acts consistent with the Charter; to refer all otherwise insoluble problems to the United Nations; to work "persistently and loyally" for the aims of each of the United Nations special agencies; to improve United Nations machinery where necessary (Mr Marshall held that at present there was no need for major revisions); to conclude the remaining peace treaties; to act together against aggression; to act together to ensure economic conditions necessary for international stability. He concluded: "The US delegation at this Assembly seeks not a United States success but a United Nations success."

If Mr Marshall reiterates his support for the United Nations during his visit to Britain, the effect will certainly be a healthy one. But we should bear in mind that he has already gone on record to the same effect.—Yours faithfully,

United Nations Association,
11 Maiden Lane, W.C.2

ANDREW BOYD

First Lord of the Treasury

SIR,—The interesting suggestion in "Notes of the Week" that Sir Stafford Cripps should be appointed First Lord of the Treasury with the Chancellor of the Exchequer as his lieutenant deserves consideration for more than one reason. In co-ordinating financial with economic policy the new Department would act as arbitrator between the Treasury and other Departments

in the case of differences of opinion where the Treasury has now the last word, not always the right word.

Advantage might also be taken of the change of transfer from the Treasury the control over the Civil Service which it now exercises through combination of the functions of Head of the Treasury with those of Head of the Civil Service in the Permanent Under Secretary. This duality of authority is open to the objection that it extends the supremacy of the Treasury beyond its proper sphere and may create something of an inferiority complex in other departments. A financial curb over other departments by the Treasury is, of course, essential, but occasions may arise when the Treasury itself needs a curb.—Yours faithfully,

GEOFFREY BRACKEN

Larchfield, Churt, Surrey

Purse Strings of Uno

SIR,—In your note you state that "It is almost impossible for students of foreign affairs to get detailed summaries of what is said and done in Uno meetings." I should like to assure you that very considerable efforts have been made to make United Nations material readily available in this country. Nobody will regret more than those whose job it is to organise an effective United Nations document service, if present arrangements do not meet all requirements.

The student of foreign affairs in this country can find up-to-date comprehensive accounts of United Nations activities in the *Weekly Bulletin*, published by the United Nations Department of Public Information and sold through H.M. Stationery Office, who are also the agents for all printed United Nations documents and other publications. United Nations documentation in mimeographed form is also available through the Information Centre. A complete set of United Nations documents can always be consulted by the public in the Centre's library.

From The Economist of 1847

November 27, 1847

JANE EYRE: *An Autobiography*. Edited by Currer Bell. Smith, Elder and Co., Cornhill.

Of all the novels we have read for years, this is the most striking and, we may add, the most interesting. Its style as well as its characters are unhackneyed, perfectly fresh and lifelike, and the whole is as far removed from the namby pamby stuff of which fashionable novels are made, as from the cold, unnatural and often disgusting productions of the French press. It is thoroughly English—even somewhat provincial—which latter leads, in some of the scenes, to a certain raciness decidedly agreeable. It must be said that the drawing in some cases approaches to coarseness, and that in others the art employed in the construction of the story is too evident; but these are venial faults, and worse than these may be forgiven an author who inspires his reader with such an interest in his heroes and heroines as we feel for Jane Eyre, Mr Rochester, her elderly lover, and in fact for all the characters introduced into the book. . . . Here is the portrait of the *genius loci* of Lowood, Mr Brocklehurst, who, as principal subscriber and manager of the school, has been informed, or rather misinformed, by Mrs Reed of the character of Jane Eyre. . . .

[Here follows an extract of well over a column in length.]

Our limits prevent the insertion of the remainder of this scene, nor can we make room for other extracts we had marked; we must confine ourselves to a short allusion to the story. Fortunately for Jane Eyre, Miss Temple, the superintendent, is in every respect the reverse of Mr Brocklehurst, truly religious, kind-hearted, just and highly accomplished, possessing, besides, the manner of a gentlewoman; she gains the confidence of the hitherto ill-treated orphan, who under her kind rule becomes a strong, vigorous-minded girl, remains eight years in the establishment . . . and then by advertising obtains the situation of governess in the family of Mr Rochester. . . . Here the romance and mystery of the story begin, but we must leave our readers to find it all out for themselves, and will only repeat that the story is artistically managed, the characters boldly and vigorously drawn, and the whole calculated to interest and enchain the reader.

The problem of how to get the not unbulky United Nations material across the Atlantic economically, especially during the crowded days of the General Assembly, has been the subject of most painstaking investigation. Certain improvements are contemplated for 1948. The magnitude of the problem may be illustrated by the fact that the airmail freight for one copy of the United Nations Budget Estimates stands at 29s. "Purse-strings" will thus continue to control the distribution of United Nations documents.—Yours faithfully,

W. TANZER, Acting Director,
United Nations London Information Centre
Russell Square House, Russell Square, London, W.C.1

Wages and Profits

SIR,—In assessing your article "Wages and Profits" (November 15th) and your note on the Budget debate in the current issue I feel that two qualifications should be borne in mind.

The Note gives the 1945 distribution of net incomes as £5,000 million below £500 per annum and £1,400 above that level. A more detailed consideration of Table 10 of the National Income White Paper (Cmd. 7099) shows that £3,449 million are accounted for by those earning under £250 per annum; people living on such a low level of wages at present costs can hardly be accused of reckless spending. It is more likely that Mr Morrison's "loose money" is contained in the £2,454 million earned by the £250-£1,000 group, far in excess of the £775 million total of the groups above £1,000 per annum. This contention is borne out by a comparison with the 1938 figures, which show increases over the seven years as follows:—

Under £250 p.a., £833 million increase.
£250-£1,000 p.a., £1,711 million increase.
Above £1,000 p.a., £410 million increase.

Such statistics in themselves are not conclusive, but they are indicative of the trends. Nevertheless, it is dangerous to draw 1947 conclusions from 1945 incomes, inflated as they were by wartime influences.

In your otherwise excellent article "Wages and Profits" you base your assumptions partly on average earnings. Would not a truer picture be obtained by analyses of the movements of the various wage levels as well as of the average? Without some knowledge of the distributions about the mean it is difficult to arrive at any truly objective conclusions.—Yours faithfully,

66 Wood Green, Wednesbury JOHN C. CLEWS

Tariffs and Trade

SIR,—In your article on "Tariffs and Trade" you take bicycles as an example of the British manufacturer ignoring divergences in taste and argue that in America "the utilitarian British bicycle is not popular, at any price." In the Boston area, where I spent

the past year, I noticed many British bicycles in use. People who had used both American and British bicycles, for example on holiday trips in the country, referred to the British product as much nicer to ride, and I heard of cases where boys who were saving up to buy bicycles preferred the British product in spite of its much higher price.

I would suggest that there is a definite market in America for utilitarian bicycles; this includes things like 3-speed gears and chain cases which are not to be found on American models. For this market the standard American products are inferior substitutes which can only compete with the British through much lower prices. The market for bicycles as toys may be larger but it is one in which the British manufacturer could only compete by selling a model built on a small scale for export to this one market at prices below those of the standard models of American makers.—Yours faithfully,
M. LINDSAY.
Balliol College, Oxford

Steelworks in the Making

SIR,—We have read with much interest your well-informed article on the progress which is being made in erecting the new continuous strip plant of the South Wales Steel Company. We agree with you that the future of this plant is fundamentally important, both to the tinplate industry itself and to the many other industries which directly or indirectly depend for distribution of their products on availability of tinplate supplies. We were, however, concerned to see that for your estimate of tinplate production in pre-war years you quote the production figures for 1938, i.e., 612,000 tons.

We have long been concerned at the use of the output figures for this particular year, insofar as they appear to be completely untypical of tinplate output in pre-war days. This will be seen from the figures for other pre-war years, which are as under:—

						Tons
1934	...	...	...	...	...	748,000
1935	...	...	...	...	...	708,300
1936	...	...	...	...	...	814,800
1937	...	...	...	...	...	957,800
1939	...	...	...	...	...	919,400

The effect of quoting the 1938 figures instead of, say, a pre-war average of 750,000 tons per year, is that the statistics tend to mask the decline in tinplate production which has taken place during the past few years, and to disguise the very damaging effect of this decline on both the home and export trade. The fall in production is due in the main to shortage of labour supplies in the tinplate industry, and there is little indication that the position will materially improve until such time as the South Wales development plans reach their maturity.—Yours faithfully,

JOHN RYAN,
Vice-Chairman, The Metal Box Company, Ltd.

Books and Publications

Facing the Facts

"The British in Asia." By Guy Wint. Faber and Faber. 12s. 6d.

BASED on an obviously discerning personal experience, and philosophical in its balanced appreciation of South Asian problems, Mr Wint's book is laced with a catholic range of pertinent quotations and livened by a dry and sometimes wicked humour. By the ingenious use of juxtaposition, by setting traditional Asia alongside British and Russian Asia, and the spiritual beside the political and economic aspects of Asia's changing scene, Mr Wint achieves a commendable balance over the whole vast field of his study without undue sacrifice of detail. The first and second parts of the book, self-contained and describing contrastingly the British and Russian Empires in Asia, form the background to an examination of future trends in Asia generally, with special reference to those parts of the British Empire which are now—or are about to become—self-governing states.

The substance of his thesis is this, that by reason of the political circumstances of the day in Britain itself, our Empire in Asia, established by private enterprise and left virtually to its own resources, grew up to be an Indo-British Empire, based upon India's manpower, and directed mainly to meet India's needs. In this light he sees in the new Indian Dominions the heirs to a South Asian security bloc, coterminous with the defence zone of British India, and traces possible combinations of world and regional

security organisations within which such a bloc could play its contributory part, thus gaining respite for the newly enfranchised territories to set their own houses in order. And what a task awaits them! Mr Wint concludes sadly, "This may be a gloomy book, but it is difficult to see where its thesis is wrong." But if any success is achieved in steering South Asia through its present troubles, it will be because men like Mr Wint are prepared to face gloomy facts without losing faith in man's ability to overcome them, and to strive after solutions to seemingly insoluble problems. Fortunately—and Mr Wint has not missed the point—youth in Asia seems filled with a spiritual energy and optimism in strange contrast to the apathy in Europe. These remain their strongest shield against the national and sectional jealousies that threaten to destroy the co-operation through which alone they can achieve greatness.

The Parents' Charter

"Women and Children First." By W. H. Wallace. Oxford University Press. (Geoffrey Cumberlege.) 345 pages. 15s.

THIS is the sort of book which the reader mentally punctuates now with loud cheers, now with heated explosions of disagreement. The cheers predominate; and, cheering or disagreeing, one is invariably interested. It is a study of Australia's population problem, by a practising gynaecologist who is also an alert

and imaginative citizen and has evidently retained a human rather than a professional attitude to life. If his book were merely another presentation, however neat and convincing, of the known but inadequately publicised facts about net reproduction rates, the economic disadvantages of sparse population and small national units, the strategic needs and particular economic circumstances of Australia, and the possibilities of immigration, it would interest comparatively few English readers. But it is vastly more than this. It is possibly the most far-ranging, wise and sympathetic study extant of the reasons why babies do not get born, or, if born, are unwanted; reasons just as applicable in Great Britain as in Australia. Dr Wallace ranges from postwar employment problems to maternity frocks, from housing (inadequate) to home helps (unobtainable), guided partly by his own common sense and imaginative sympathy but mostly by what he has learned directly from the patients asking him for contraceptive advice; and follows his analysis with recommendations—some of these revolutionary, some trivial, but in psychological matters the trivial may count disproportionately high—on what should be done to make families of four or more the desired and usual thing instead of the unwanted exception.

He has a not uncommon obsession—namely, that it is the "competitive economic system" which makes early marriage difficult, housing scarce, and education expensive, and, in general, in the words of the song, fills the butchers' shops with large blue flies. He is enthusiastic, and understandably so, about Russian maternity grants and children's allowances; he never wonders how Russian women feel about raising six children in a single room. There is also, one suspects, even in the spacious conditions of Australia and under any economic system whatever, a certain impracticality in the simultaneous demand for marriage loans; child endowment to cover the whole "basic cost" of rearing each child; free education from kindergarten to university; higher sickness and unemployment insurance; adequate housing, complete with labour-saving devices, for all; a national domestic help service, with higher wages and better living conditions; crèches, day nurseries, community centres and rest homes; improved medical services, improved hospitals, and "a campaign to glorify, enthroned and reward motherhood"—all accompanied by "extensive developments of primary, secondary and tertiary industry, thus increasing production in every sphere," by "expansion of our export trade," and (believe it or not) by lower taxation.

But to hint at the need for priorities and posterities in this cloud-cuckoo agenda is not to condemn any one of its items, still less the spirit which it embodies. As the inspiration for a campaign extending over the next fifty years or so, Dr Wallace's programme and his title are alike to be commended.

Half the Equation

"The United States and the Near East." By E. A. Speiser. Geoffrey Cumberlege. Oxford University Press. 263 pages. 9s. 6d.

THE "American Foreign Policy Library," that commendable enterprise under the editorship of Mr Sumner Welles, has now succeeded its volume on "The United States and Britain" by a companion work on the "United States and the Near East." The sequel is opportune; there are few zones in the world in which Anglo-American relations so badly need re-examination and clarification. The choice of author also seems sound; Mr Speiser

knows his Near East well and writes with a scholar's background and respect for facts. Nevertheless, for the English reader at least, this book is a disappointment. Its English publishers warn the reader that it is "concerned with the outlines of the Near East problem, with recent history and very largely with British policy, rather than with American policy itself." The warning is timely; it is not until the last chapter, when there are only 17 pages to go, that the question of American policy as such is broached. But not even then are the fundamental questions answered—what are America's interests in the Near East? How do they relate to those of Britain and other powers? What recognition and support can they expect from American public opinion and government? The result is a book oddly like one of the Near East's own river systems, which finds its only outlet in a Dead Sea.

Apart from the brevity and superficiality of his treatment of oil (surely a key motif in any Near Eastern study?), the most surprising lacuna in Mr Speiser's book occurs in his depiction of the Palestine problem. There is entirely lacking any recognition, leave alone analysis, of the part played in it by American Jewry and American politicians. It may be argued that to the American reader that chapter of the tragic story ought to be sufficiently familiar not to need retelling, though Mr Hecht's advertising and the fate of the Stratton Bill scarcely suggest that public education is complete. All the same, to omit it altogether is rather like performing *Rigoletto* without *La Donna è Mobile* on the grounds that everyone has heard the tune before.

These faults of Mr Speiser's treatment are so obvious that they must necessarily form a prominent part of any criticism of his book. At the same time it must be admitted that they apply only to the smaller portion of his volume. The rest, to which he has chosen to devote the larger part of his space, is a useful, careful, objective, if sometimes inelegant, historical narrative and cultural depiction of the Near East. Unfortunately, even when spiced with a little grated geopolitics, such ingredients do not add up to a meal.

World Stocktaking

"The World's Wealth." By W. G. Moore. Pelican Books. 250 pages. 1s.

DESPITE its title, this is not a book on economics, though a good deal of economics is implicit in its pages. It is a brilliantly carried out survey of the resources—animal, vegetable and mineral—from which man gets his living; a geographer's work, based on the consideration of climatic zones, of rainfall, prevailing winds, soils, the geological past, and their results in terms of mineral deposits, vegetation, transport routes and human settlements, but illuminated by a lively concern with today's and tomorrow's resultants.

Mr Moore is a Socialist, primarily, one feels, by reason of the geographer's natural disgust at the narrow time-horizon of the individualist. His passages on soil erosion, robber lumbering, competitive drilling for oil, and other similar manifestations of the individual profit motive, attack *laissez-faire* at its weakest point, and very effective they are. It is not, however, from his politics, explicit or implicit, that his book derives its value, which lies rather in the presentation, eminently readable without being meretricious, condensed without being sketchy, up-to-date without being ephemeral, of a great mass of facts the knowledge of which should be part of the essential mental furniture of all good citizens of the world.

AMERICAN SURVEY

Position of Labour—II

(From Our US Editorial Staff)

IF he can hold his gains, Mr Walter Reuther's decisive sweep in the United Auto Workers' elections puts him in the line of succession to Mr Philip Murray, the President of the Congress of Industrial Organisations (CIO). At last year's convention of the CIO Mr Murray's reluctant willingness to serve again was compounded of pressures of which the strongest was the importance of bridging the split between the left and right wings of the organisation. On the CIO headquarter's staff, Mr James Carey, the secretary, is an important right-wing figure, but a man without a union since he lost the presidency of the CIO Electrical Workers in a fight in which the left won a victory that it has since been able to maintain. Mr Lee Pressman, the organisation's counsel, is a similarly controversial personality, with strong left-wing support countered by vigorous right-wing antagonism. (Among other things, he is credited with having killed the chances of introduction into Congress last session of a labour bill that would have provided a milder alternative to the Taft-Hartley Act.)

Last November, of the CIO's big three unions, the Electrical Workers were controlled by the left; the Auto Workers were balanced on a knife-edge between left and right; the Steel Workers alone had no internal problems. So Mr Murray, head of the Steel Workers, disregarded reasons of health and remained president of the federation. Now, the Auto Workers' Union, the largest of the Big Three, has a unified higher command, with the near-Communists, for the present at least, dismissed to the side lines.

A somewhat comparable emergence of an heir presumptive occurred at the Convention of the American Federation of Labour. At the time of the United Mine Workers' reunion with the AFL, the possibility was canvassed that, age and health to the contrary notwithstanding, Mr John L. Lewis might be the one to take over from Mr Green, the present president. But the antagonism that subsequently developed between Mr Lewis and Mr Tobin of the Teamsters raised doubts. And when Mr Lewis, at the recent San Francisco convention, withdrew from the AFL's executive council because of its willingness to comply with the Taft-Hartley Act, terming it a "debased, denatured board" of "fat and stately asses," the likelihood of succession turned to Mr George Meany, the secretary-treasurer.

Of course, his defeat at San Francisco may not have exhausted Mr Lewis's capacity for dissidence. In political judgments he may be almost reliably wrong. But he is gratefully regarded by many trade unionists as the man who makes economic deliveries: it was he, after all, who started the CIO; it was he who concluded the crucial negotiations with General Motors when the UAW was in its infancy. Hence the interest in Mr Reuther's preconvention charge that Mr Lewis has been conniving with UAW left-wingers. The charge bore the earmarks of campaign oratory; yet the miscellaneous make-up of District 50 of the United Mine Workers would suit it to be the embryo of a national movement—a third, make-weight force. One factor limiting Mr Lewis's activities, however, must not be lost sight of. He will not go beyond what the Mine Workers can be led to regard as reasonable.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

Mr Reuther's decision, just before the October 31st deadline, to register under the Taft-Hartley Act, apparently reflects an increasingly general intention among labour leaders to make use of the National Labour Relations Board after all. It is estimated that there are some fifty to sixty thousand local unions in the country, most of them related to the 105 major units of the AFL, the 40 such units of the CIO or the Railway Brotherhoods. Many unions have no immediate occasion to file, either because they are operating under long-term contracts or because their products do not enter into interstate commerce and hence are outside the jurisdiction of Federal agencies. By the filing date, 66 national or "international" (i.e., US-Canadian) unions had signed from the AFL, 14 from the CIO and 30 independents. The major hold-outs are the Miners on the AFL side, and the Steel, Maritime and Furniture Unions on the CIO side.

*

Within the past few weeks business at the NLRB has looked up. For the first two months after the Act took full effect on August 22nd, the devising of new administrative procedures and the answering of queries took most of the time of the Board itself, and the Counsel. (The two are quite different entities, these days—the Board reversed the Counsel on his first major ruling, concerning whether the officials of the national federations had to file before their member internationals could be in compliance.)

Many of the cases now being heard are leftovers, charges of unfair labour practice on which the preliminary work had been done before the new law was enacted, or union petitions for plant elections. A number of the cases are bringing up the complicated problem of the position of a non-complying union. In October, the Board heard two cases charging unfair labour practice, filed before August 22nd by unions now not in compliance. The reason given for hearing these cases was recognition of a legal obligation on the part of employers to bargain collectively. One case, brought by a CIO union, concerned discouragement of union activity, including one dismissal by the employer on that ground, and an effort on his part to get employees to prefer the AFL; the company was ordered to desist and reinstate the employee. The other case, brought by an AFL union, where the employer had refused to bargain collectively, ended in a decision by 3 votes to 2 ordering the employer to bargain and giving the union thirty days to get into compliance.

Early in November, however, the Board refused to two non-complying unions places on the ballot in collective bargaining elections. This principle, laid down on requests filed before the Act became effective but announced as applying to future cases as well, makes it clear that the intent of the Act is to leave the non-complying union with only its own economic strength to rely on in gaining recognition from an employer. It also offers opportunity for an "intervenor" or rival union which is in compliance, to ask for an election, and, if the Board grants the request, to appear on the ballot as the sole alternative to no union. What the procedure will be when the request for an election comes from an employer is as yet undecided.

Two further cases, now moving from trial examiners to the Board, concern whether an employer's obligation to bargain collectively includes bargaining when companies desire to institute pension or retirement plans. The examiners have recommended requiring the companies to bargain, accepting the union attorneys' contention that pensions and lay-offs are

not unrelated. Both these cases concern the Steel Workers, whose decision not to file non-Communist affidavits has just been reaffirmed by the Union's Executive Board; if, in the event of a decision favourable to the Union, the Board requires filing as a condition of the award going into effect, the union is going to feel a considerable squeeze.

These cases are of particular importance also because of labour's current emphasis on "fringe" issues as contrasted with demands for straight wage increases. The labour attitude on the wages—prices—cost-of-living proposals made by Mr Truman at the opening of the Congressional session is forming slowly—the CIO Board meets in the first week of December; so does the executive council of the AFL—but it is certainly unlikely that labour will do anything in the immediate future

calculated to make wage control measures attractive to the public.

On the other aspect of the President's message, support of the labour movement for the Marshall Plan—except among left-wingers—is far more specific than is usual in connection with general foreign policy issues. Labour's own men have been in Europe; they appreciate the part that American trade unionists could play in refuting charges of American intent to achieve capitalist domination of the Continent. In the trades associated with munitions, the military are doing a certain amount of briefing of the unions on strategic positions. And the sophistication which union leaders have acquired in recent years from dealing with Communists in their own ranks gives them a vivid appreciation of current diplomatic problems.

Physical versus Fiscal Controls

(From Our US Editorial Staff)

THE special session of Congress was called for two purposes: to consider foreign aid and to curb the inflation which is now raging. The two objectives are clearly very closely inter-related because the European demand is superimposed on a very high domestic demand, itself chiefly responsible for the powerful upward pressure on prices. The Administration, in devising a programme to curtail inflation, had the choice of two broad alternative courses. One was to try to sit on the lid of the boiling demand for goods and services by such direct methods as the use of rationing, price and wage controls and allocations. The other was to try to reduce the pressure under the lid by curtailing spendable money income to reduce the unprecedented domestic demand for goods. The latter course was that which the Paris conference of 16 nations primarily prescribed for Europe in its commitments for budgetary and monetary reform and with which, as a prescription for Europe, both the Administration and the American public apparently heartily agree.

The President's message to Congress seemed to indicate that the former course has been chosen, though there are very brief passages suggesting some attention to the latter. The number of words is not a sure indication of where the emphasis is to be placed, but in terms of number of words and number of legislative proposals, sitting on the lid received predominant prominence. The much less publicised, but not less significant highly inflationary action of the monetary authorities in the same week in expanding the credit base to support long-term US Government bonds at a yield of less than 2½ per cent seems to bespeak the same decision.

The choice which the Administration seems to have made was no doubt dictated by politics. It clearly was an effort to put the Republicans on the spot. They had primary responsibility for the abolition of price, rationing and other controls last year, and the position they then took has not been thoroughly vindicated by subsequent events. The choice likewise represents an attempt to throw to the Republican Congress the onus for restrictionism and to avoid the necessity for the Administration itself to give the economy a cathartic by using remedies it already has in its power. With the election approaching, the Administration is itself loth to reduce purchasing power, but presumably it is perfectly happy to try to place on the Republicans the blame for less availability of goods and for large black markets if they will pass the legislation, or the blame for higher prices, continuing inflation and greater difficulty of getting goods for Europe if they do nothing.

But in time the desire to try to sit on the lid instead of reducing spendable income is in all likelihood going to prove to be an unfortunate one both in economic and in political issues. The Republican Congress is wholly apt to refuse to impose sufficient curbs to make the lid-sitting effort successful. Whatever it does do will require months during which inflation may spiral onward. More than that, it is dubious whether controls could be effectively administered in this country in peacetime; the great diversity and the lack of that feeling of peril which marked the war years make an effective degree of success

very doubtful, especially if the basic cause of the upward pressure on prices is not to be reduced. The alternative course of reducing spendable income could be pursued immediately without the delays of trying to get legislation. The Administration has adequate powers to go a long way—probably the whole way.

The excess of demand over the available supply of goods and services, which constitutes inflation, is made up of expenditures for consumption and expenditures for investment goods. The monetary authorities can clearly reduce the expenditures for investment goods by cutting down the amount of funds available to finance such expenditures. For such a course they have available powers to curtail bank reserves by open market operations, by increasing reserve requirements, by retiring public debt held by the Federal Reserve through application of the large Treasury cash balance and the budgetary surplus which, on present revenues, will amount to more than \$5 billion in the first quarter of next year. By reducing investment outlay, the strain on goods and labour could be lessened. This course could be strengthened again by restraints on consumer credit and on the use of credit in commodity trading, for both of which the President has asked and both of which Congress seems ready to grant—though neither is absolutely essential for the purpose. A really vigorous effort to stimulate saving, which has fallen to a very low level as increasing proportions of income have been turned to consumption, would also be a part of this course.

In addition to such curtailment of expenditures in the private sector of the economy, the Government could curtail its own outlays to the minimum. Some reductions, or at least deferments of expenditures, could certainly be made in a budget which is a multiple of its prewar size, without any curtailment of any essential activity, either domestic or foreign. It would be an essential part of such a programme that Government receipts should be maintained at their present high levels, and on this the Administration is apparently still of the same mind as it was when two tax reduction measures were successively vetoed last year.

To a degree, the Administration has been pursuing a monetary course to restrain inflation by increasing short-term interest rates, putting bank reserves under pressure, and curbing the capital markets. But, simultaneously with the President's message, a point was reached where the Reserve Board was faced with a direct clash between anti-inflationary measures, and support of the long-term Bond rate of 2½ per cent on Treasuries.

THE ECONOMIST BY AIR

Readers of *The Economist* in the United States and Canada can receive their copies within a day or two of publication for an annual subscription of \$24. They should apply to The Publisher.

The Economist, 22, Ryder Street, St. James's, London, S.W.1.

Courage was lost, and the Board proceeded to support the cheap money structure by open-market operations, thus adding directly to bank reserves, and the credit base for future expansion.

This week, the Governors of the Reserve system have joined with leading bank officials to deplore continuing inflationary trends, and to urge all member bank officials to exercise "extreme caution" in loan policies. Bank loans, on this view, should be made only for "productive purposes." In so far as bankers are already rather more cautious than in earlier months of 1947, this appeal may have some effect, but the relative weakness of such methods has already been stressed by Mr Marriner Eccles in his capacity as chairman of the Reserve Board.

The truth seems to be that political thought has lagged badly behind economic developments. During the war, monetary and budget methods to control inflation were not very relevant, since capital investment and government outlays were, for all practical purposes, regarded as untouchable. And during under-employment in certain prewar years, low interest rates and plentiful credit were desirable in order to stimulate investment. At present, neither war nor unemployment exists, but the theory and concept of earlier periods still dominate many minds.

The possibility still exists that the Administration intends to move more vigorously to curtail demand. Mr John W. Snyder, secretary to the Treasury, this week told the House Banking Committee that new Bond issues were planned to "mop up" purchasing power. He also made a flat demand for consumer credit curbs, and reinforcement of bank reserve requirements. But the Administration altogether seems very reluctant to press these steps to a conclusion, and unless the present course is changed abruptly, the Administration must move in a direction which will lessen materials available for foreign aid, and make a further contribution to the cause of "boom and bust."

American Notes

The Interim Aid Bill

The Interim Aid Bill, authorising \$597 million of relief for France, Italy and Austria, got off to a flying start with the unanimous approval of the Senate Foreign Relations Committee and the impressive appeal of Senator Vandenberg for measures to ward off "winter hunger, winter cold, and the lurking tyranny that feeds upon such disaster." The Bill, he said, was recommended not only by its appeal to the traditional American humanities, but by self-interest, not the self-interest of imperialism or war, but a self-interest which knows that America cannot prosper indefinitely in a broken world. He specifically denied that the relief measure or the Marshall Plan were declarations of economic war and underlined the "grievous need for a restoration of east-west trade and friendship in a live-and-let-live world." His tribute to the "amazing documentation and scrupulous screening" of the estimates by the State Department is the measure of the skill with which the Department has handled the programme.

Senate agreement this week is in no doubt, even if it does not come in time to make Thanksgiving a European as well as an American festival. In the House, the Bill approved in committee would cut \$100 million from European aid and give \$60 million to China; influential magazines like the Luce group, and influential politicians like Governor Dewey, have been taking the line that unless China receives aid within two months the anti-Soviet struggle will be lost; and that Asia is a more important battlefield than Europe. In conference the Senate view is likely to prevail, but there is bound to be some delay in a tight timetable while the State Department presses its belief that substantial aid to China now would in truth be "Operation Rathole" and jeopardise European recovery.

The Senate amendments to the State Department draft are minor, but they are interesting indications of the way the wind is blowing. One provides that up to 25 per cent of the funds may be spent outside the United States and that petroleum and its products should be procured outside as far as possible. The post-Unrra relief measure limited "off-shore aid" to 6 per cent. Another provision that the Act implies no availability of specific commodities is a reflection not only of general shortage-mindedness, but specifically of the belief of the Herter Committee that the Italian grain quota cannot be met.

Both the Senate Foreign Relations Committee and Mr Vanden-

berg have insisted that the present Bill is a relief measure, not a "little Marshall Plan," and that its acceptance did not commit Congress to a long-term programme. Yet in one particular the Marshall Plan will, as Senator Vandenberg put it, be a "lengthening shadow" of interim aid. The relief Bill contains a provision that relief supplies shall be sold at reasonable prices and the proceeds held in a special account to be disposed of according to agreements between the United States and the recipient countries. This probable condition of long-term aid is to be tested at once. The interim aid Bill does, in fact, in its provisions for supervision, publicity and management of funds, bridge the gap between the old methods of relief, incorporated in the post-Unrra measure, and the new ideas which are to make the Marshall Plan distinctive.

Congress and Tariffs

Tariff spokesmen in Congress have wasted no time in declaring their determination to resist the Geneva agreements and to oppose renewal of the Trade Agreements Act, which becomes due for renewal next June. Mr Harold Knutson, chairman of the House Ways and Means Committee, and other Republican Congressmen declare that American industry has been "sold down the river," while the American Tariff League can mobilise some powerful support from a number of disgruntled trade groups, including wool growers, textile manufacturers, leather and steel specialists, and marginal metal producers. Expiration of the Trade Agreements Act (which forms the specific authority for every tariff adjustment since 1934) would not bring an abrupt close to the agreements recently announced, since the executive branch of government holds the right to declare the term of any pact—usually for three years. But Congress, which must also ratify the final charter for establishment of an International Trade Organisation, will determine longer-term policy.

Enthusiasm in the State Department itself may have gone some way to reinforce opposition in Congress. Official declarations have stressed the fact that the US tariff is now back to the 1913 level—"the lowest tariff of modern times"—while the reductions achieved in the Geneva agreement are described as "quite unprecedented in scope and volume." But spokesmen have been careful to add that no very substantial adjustments need be faced by US industry for some time to come.

From this side of the Atlantic, it can only be said that the American tariff remains as a still-formidable barrier when assessed in relation to the fully competitive manufacturing industry of the United States, and its predominance in world trade. Perhaps the most relevant argument put forward by the tariff spokesmen is that the US government has sharply under-stated the potential benefits of the agreement to foreign countries by measuring import possibilities on a prewar standard. The very sharp rise in national income does, indeed, suggest a somewhat wider market, if it can be assumed that domestic activity is sustained at relatively high levels. But there is no apparent ground for any suggestion that American industry altogether would be threatened, or that manufactured imports would form more than a very modest fraction of domestic output.

The strength of vocal protests in the near future may conceal the fact that outright opposition to tariff adjustments is now less formidable than in the past. Despite a great deal of clamour, for example, the Republican Party over recent months has carefully avoided any formal demand for the abandonment of the Administration's powers to reduce tariffs, and the fight for renewal of the Trade Agreements Act next year will quite probably centre on the long-established demand that Congress should hold the power to approve, or to reject, each agreement. It was presumably to meet this damaging type of amendment that the State Department agreed earlier this year to concede the right of any individual business to appeal through the Tariff Commission on the ground of "substantial injury" suffered as the result of new concessions.

Global Price Supports?

With wheat reaching a record Chicago price of \$3.14 a bushel, the time was ripe for the Secretary of Agriculture to ask Congress for authority to stimulate food production abroad. Congress itself, by permitting 25 per cent of interim aid to be spent abroad, has given a green light. In his statement Mr Anderson pointed out that to continue to expect the United States, which before the war supplied less than 5 per cent of world grain exports, to continue to supply more than 50 per cent, was too great a gamble on the weather in one country. To avoid a "collision with

America's own domestic shortages" as well as the risk of land exhaustion, the Administration is asking for a revolutionary extension of powers in peacetime.

The main proposal is that the Commodity Credit Corporation should have authority to enter into contracts for agricultural expansion at planting time with foreign nations, buying the surpluses for relief. In addition, the CCC might contribute farm production materials, and technical aid. Mr Anderson mentioned the Near East, the Far East, parts of Africa, and Latin-America as regions which might grow more food if they had technical assistance, adequate and assured prices, and better supplies of consumer goods.

This bold proposal of Mr Anderson's holds out the only effective promise of relieving a world hunger which looks like becoming endemic. The price supports which in the past in the United States were associated with acreage cuts and the slaughter of little pigs are to implement a policy of world abundance. Mr Henry Wallace's derided "quart of milk for every Hottentot" speech came close to prophecy—the only change being to substitute "from" for "for."

Despite Mr Anderson's assurances, the plan can hardly avoid raising prices, with awkward repercussions on Britain's long-term contracts. But the greatest difficulty is likely to be the conciliation of American farmers. A \$3 guarantee for foreign wheat, for example, might, if prices fell sharply, leave the foreign grower better off than the American farmer, whose wheat is "supported" at present at the quite irrelevant figure of \$2.10. The Administration may have to reconsider its plan for cutting the level of domestic price supports.

In the special case of Argentina, which at present receives between \$5 and \$6 a bushel and pays its farmers only a fraction of this figure, Mr Anderson's reference to other incentives is significant. Argentina itself has suggested that it would accept a more reasonable price for wheat in return for assurances of supplies of American manufactures at reasonable, rather than "grey market," prices. The allocation and export price controls requested by the President may prove very useful in persuading Argentina to make a fuller contribution to world food needs.

Commodity Controls

In his renewed demand for closer government controls over the commodity exchanges, Mr Clinton P. Anderson, the Secretary of Agriculture, is no doubt reinforced by the knowledge that the alleged evils arising from "commodity speculation" can at most times attract the denunciation of many spokesmen for both parties, and that with prices rising so sharply, and crop prospects for 1948 so uncertain, speculative activity assumes a steadily more menacing appearance as the elections come nearer. Since the farm vote could quite possibly carry the Republican Party to victory next year, it seems obvious that all commodity controls will be held to a minimum; it is thus all the more significant that government forces seem to be pressing so steadily for price control and allocation powers.

At the moment, Mr Anderson is insisting upon new Federal controls covering sugar, coffee, cocoa, pepper, hides and wool and a general revision of the Commodity Exchange Act to permit the direct regulation of margins. The present Federal authority is the Commodity Exchange Administration which holds no power whatever over margin regulations, though it can impose limits upon open commitments and "speculative transaction," and can investigate, and take steps to prevent, "market manipulation."

Mr Anderson's proposals (for which he carried on a vigorous campaign during the Spring commodity boomlet) are now fiercely opposed by the National Association of Commodity Exchanges on the ground that free markets are thereby endangered. These pleas, however, would now carry more weight, had the various exchange authorities taken a more determined line in recent months. It is true that Mr Anderson's remedies can do nothing to remove the basic supply deficiencies and it may well be true that the influence of purely speculative transaction is generally exaggerated. But last autumn's brief panic in the cotton market, and this year's tremendous growth in futures dealings in Chicago, can hardly be regarded as the reflection of a healthy market. The case for complete freedom in dealings, and for nominal margins only, is seriously weakened when a combination of sustained demand through government purchasing, and a succession of adverse crop reports tilt the scales almost entirely in favour of the less attractive type of speculator.

Where the exchange authorities themselves seem to have a valid case for argument is in their contention that such Federal

controls tend to stay far beyond the period needed; that they tend to become rigid and inflexible, and thus to act as a brake upon genuine covering operations. Moreover, there is little real evidence that the commodity speculator is a damaging influence upon the national economy under conditions of normal supply and demand. The reverse, indeed, is often true. But the Secretary of Agriculture seems to have left the door open for a compromise arrangement.

"Big Inch" Profits

A recent successful issue on Wall Street by the Texas Eastern Transmission Corporation, brought to a close the long and stormy controversy surrounding the postwar fate of "Big Inch" and "Little Inch," the petroleum pipe lines, covering more than 2,800 miles from Texas through to the industrial north-east, and terminating near Philadelphia, and Linden, New Jersey. The corporation will supply natural gas from the oilfields for commercial and domestic use.

This operation is important, first of all because it marks a new phase in the rapid development of the natural gas industry, and secondly, because it marks defeat for a number of pressure groups which at one time seemed likely to doom this valuable wartime asset to a condition of stand-by maintenance, or possibly even to abandonment and complete neglect. All sorts of competing interests have tried to stop the use of Big Inch and Little Inch. Anthracite miners and owners joined with the State of Pennsylvania in predicting ruin and desolation for the coal industry, the coastal tanker industry opposed operations, the oil industry joined in with divided counsel, and finally the Southern States concerned demanded that the natural gas should be left for local industry at the expense of the north-east. But the pipe lines are now secure.

Texas Eastern Corporation has brought considerable profits to the purchasing syndicate since its first modest capitalisation of 150,000 no par value shares, for which the purchasers contributed \$1 per share. Since then, Dillon Read, the investment bankers, have raised \$120 million in Bonds, and have sold 3,564,000 new shares at \$9.50 each. The original 150,000 shares, split into 1,050,000 new shares of no par value (costing their owners scarcely more than 14 cents each) now have a market value of more than \$9 apiece. These not ungenerous rewards for private enterprise have brought a certain amount of excitement and criticism. But there seems to be no disposition on the part of any authority to interfere with the operation. The War Assets Administration believes itself to be fortunate; it has secured \$143 million for a property which cost \$146 million, and WAA has not often realised a price so near to construction cost. Texas Eastern itself is an established, and even a prosperous, concern, regulated by the Federal Power Commission, which estimates its 1948 earnings at \$1.40 per share. And the Army-Navy Petroleum Board retains the right to renew its former authority under emergency conditions. From the ground floor, at least, the horizon for Texas Eastern is certainly rosy.

Shorter Notes

The revulsion against heresy hunting in Government Departments has been sharp. After Mr Truman issued a statement that the civil rights of Government workers must be respected during loyalty probes, the State Department gave way on the seven employees it had discharged as security risks. They are to be permitted to resign without prejudice, and the Department promises that in future its employees will have the right of appeal to the new Loyalty Board. Eight screen writers who refused to tell the Committee on un-American Activities whether or not they were Communists may be less fortunate. Twentieth Century-Fox has ordered the dismissal of any of its employees in this group, and other film companies may follow suit.

The dollar value of gross national product is still rising, the level for the September quarter being an annual rate of \$232 billion, against \$229 billion in June, and \$203 billion for the whole of 1946. Most of this gain represented price advances, with the physical volume of output showing no decisive change. A slight rise in home capital outlay, and a further jump in consumption expenditures, outweighed a fairly sharp contraction (from \$10.5 to \$7.7 billion) in net foreign purchases of US goods and services.

THE WORLD OVERSEAS

Who will Save the Republic?

(From Our Paris Correspondent)

IT would be hard to resist the conclusion that the latest French political crisis is one more nail in the coffin of the Fourth Republic. At a time when the nation was cracked with social conflicts; when news of riots and disorders was daily reaching Paris; when in one important nationalised factory the technicians confessed they had been fabricating incendiary bombs to use against the police; when companies of gendarmerie were being disbanded for failing to maintain public order, and when all industry was being paralysed by swiftly extending strikes, the only excuse for a change of leadership should have been a desire for the rapid strengthening of executive authority. What, in fact, took place in Paris last week was a lamentable wobble in high quarters, caused by the rising fear of Communist violence, an embarrassed reaction following the results of the municipal elections, and ultimately a half-hearted shift to the right.

On the eve of an international conference of the highest importance to France, the world was treated to a spectacle of ludicrous indecision and weakness, which must inevitably diminish the prestige, authority and influence of its representatives in London.

The political eruption originated inside the parliamentary group of the MRP (Popular Republicans), who found themselves bewildered and divided after their *dégringolade* of October. A resolution was passed advocating a "strong and stable government." By this some meant a move towards Gaullism, the others suggested that the famous "third forces," anti-Communist and anti-Gaullist alike, could provide a re-invigorated leadership. Confused in purpose and intent, the resolution nevertheless decisively weakened M. Ramadier, at a time when there was no evident alternative, and, before most of the MRP had realised that it would involve moving one of their own men into the Hotel Matignon. In fact, there is a curious parallel between the MRP, decisively beaten at the elections, immediately afterwards assuming leadership, and the SFIO forming a homogeneous Socialist government immediately after legislative elections last year, when they were proved weaker than either Communists or MRP. In both cases the inversion of the normal rules of democracy and the rebuff to the sovereign electorate is remarkable; but in the earlier case there were many people who, not themselves Socialists, felt France had something to gain by being given a united and coherent leadership. In the present combination Ministers are, if possible, more at variance on political and economic issues even than their predecessors.

M. Ramadier Betrayed?

The MRP having struck the first blow, it was left to the left wing of the Socialist party, dismayed by the accelerating strike movement and the successes of de Gaulle's RPF, to propose strengthening their authority and restoring their own self-confidence by another appeal to their venerable leader. In a remarkable address, not to a representative French body but to a lunch party of British and American journalists, the Secretary-General of the Socialist Party, Guy Mollet (exhibiting a tact which induced the representative of a leading British newspaper to compare him with Mr Harold Laski), announced that M. Blum was ready to succeed M. Ramadier. At this moment M. Ramadier was grappling with a situation which was rapidly becoming revolutionary. The Marseilles episode had dangerously impaired the authority of the state. It had become obvious that the Communists were bent on bloodshed, and that martyrs must be laid on the Cominform altar in order to vilify M. Ramadier as—to quote a current Communist phrase—"a hired assassin" and "American stooge." M. Ramadier is notoriously a tenacious man, but no prime minister could have hoped to restore order within a democratic framework and without recourse to dictatorial methods, unless he had the backing of his own team.

There has been a good deal of speculation in Paris as to whether or not M. Blum wanted to succeed M. Ramadier. His gratuitously violent abuse of the Gaullists suggests that, consciously or unconsciously, he organised his own defeat. The task

of governing within the next few weeks will be an ungrateful one, and it would be unfair to blame the ageing and frail Socialist leader for hesitating to head a government whose first task would be to break—perhaps by force—a strike movement, which, even if it is officered by professional politicians for partisan ends, is manned by industrial workers, with genuine grievances.

The present government is not expected, in "informed quarters" to enjoy a very long lease of life: though in this paradoxical political scene prognostications are often unwise. In any case, there is no doubt at all that the overwhelming vote of confidence which the Assembly gave Robert Schuman does not reflect any overwhelming confidence. The agreement was purely anti-Communist and involves no solidarity on any positive issue. Characteristic of the prevailing state of mind, was the statement by the Socialist secretary, Charles Lussy, that his party would refrain from asking for any particulars about policy or programme (the General also says he has no programme), as in the present emergency "for the salvation of the Republic and the safeguard of public order" the abandonment of authority must immediately cease.

So, with a mandate to "save the Republic," Robert Schuman takes over with a government which is regarded by many as a stage on the road from an ailing Fourth Republic towards the new Gaullism. M. Schuman has entrusted the control of the nation's economy and finances to a Gaullist "sympathiser," M. Rene Mayer an excellent and irrepressible administrator. Colonies and agriculture move to MRP control, while the Socialists retain the hardest of the immediate tasks: the restoration of order and social appeasement. It is they who will have to induce the workers to return to their jobs, without being able to give them any assurances about the financial and economic methods by which the government proposes to redress their grievances.

Time Against the Communists

Events here are now moving rapidly and within a few weeks or even days, this unfortunate coalition, torn by internal suspicions and dissension (already apparent in the great difficulty that M. Schuman had in distributing portfolios) will be put to the test. The criterion of success will be whether it can settle the strikes, keep the franc this side of disaster, and above all, avert civil war.

It would be unjust to deny tribute to M. Schuman for unhesitatingly accepting the challenge. This austere and reserved doctor of law, well versed in the intricacies of state finance, has never imposed himself as a forceful or dramatic personality. But the fact that, at a time of crisis he has not shirked the highest responsibility entitles him to respect. For his government and for the Republic, it is the time factor which counts: the Communists have not much longer to go. Already the machinery by which they control the trade unions and enforce political pliancy is creaking. Secret ballots on the strikes issue have challenged their authority. The prestige of the party's leadership has been gravely impaired by Maurice Thorez's prolonged stay in Moscow. The party retains immense powers to obstruct, to sabotage and to wreck the national economy, not only through its control of the unions but also through command of key posts particularly in nationalised industries. But a wave of resentment against the methods by which the Communist minority exercises its power is gaining force.

There is no reason to suppose that a democratic Government working within the structure of Republican law, should be disqualified from taking advantage of this resentment to reimpose order. But if, as at present seems the case, the Republicans lack resolution and unity of purpose, the opportunity will fall to the extreme right, whether the present Gaullist leaders intend it or not. Already in the town halls and *mairies* of the provinces, Vichy names are reappearing. Who can be certain that, when these people take possession of the higher offices of state, the time will not have come for a Pétainist revenge, with the rupture of the constitution, and the dissolution of the trade unions and political parties by ex-Nazi mercenaries?

Colombia—A Liberal Republic

(By a Special Correspondent)

COLOMBIA is politically one of the most stable nations in Latin America. For half a century or more it has not had a revolution—though there have been some attempts—and during that time it has become the custom, unusual in South America, for a president to fill out his term of office. Twice in the last two decades the political pendulum has swung, and both changes were made with comparatively little fuss.

Colombia is now passing through another period of change. For sixteen years, until 1946, the country had been in the hands of the Liberal Party, who had brought about a number of fundamental economic and social reforms. During the first administration of Dr Alfonso Lopez, from 1934-38, they established a social security system, encouraged the growth of a trade union movement, and stimulated the industrialisation of the country. But in the presidential elections in the middle of 1946 the Liberal vote was split and a Conservative Party leader, Sr Ospina Perez, was put into the presidential chair.

The Conservative Party in Colombia is very closely associated with the Catholic Church. It ran the country for most of the period after the coming of independence and continuously between the last revolution at the turn of the century and 1930. It includes a wide variety of opinion, from a species of Catholic Socialism to the most dark reaction.

The Liberal Party is also divided. One reason why Colombia has been able to maintain the two-party system is because the Liberals have included within their ranks all rebel ideologies. On the right was the group led by Dr Eduardo Santos, president from 1938-42 and publisher of the country's most important daily newspaper. This group stood for more conservative economic policies, was not very friendly towards the labour movement, and not quite so devoted to economic nationalism. The left-wing group was led by Dr Lopez who, during his first administration, gained the unquestioned loyalty of the labour movement and of most of the left wing of the party. During Dr Lopez's second term, however, from 1942-46, he failed to go further along the road which he had taken during his first period in office, and the Left began to look elsewhere.

Demagogue or Saviour?

Interest centred on Jorge Eliecer Gaitan. Gaitan was a member of parliament and an old Liberal stalwart who in 1944 launched a campaign against what he called the "Liberal oligarchy," that is, most of the politicians who had been dominating the Liberal Party for a decade and a half, and who—said Gaitan—had come to regard it as their own personal property.

Gaitan himself is a controversial figure. His enemies class him as a demagogue with messianic tendencies. His most rabid supporters regard him as the saviour of his country. More moderate supporters believe he is a man who from conviction or convenience is in revolt against the stodginess and self-satisfaction which brought about the downfall of the Liberals, and that he is willing to carry further the reform programme which won the Liberal Party the votes and loyalty of the people for four consecutive elections from 1930 to 1942.

No matter what his motives may be, Gaitan has fundamentally changed the Liberal Party. Pushing his campaign against the "Liberal Oligarchs," he launched his own candidature for president in 1946 against the official nominee of the Liberal Party, Dr Gabriel Turbay. Gaitan continued his policy of splitting the Liberal vote in the congressional elections in early 1947 and pulled far ahead of his rivals in the party.

The result was the surrender, at least for the time being, of the right-wing group of the Liberal Party. The Liberal members of Congress combined to elect Gaitan unanimously Leader of the Party. He has already taken advantage of this situation to launch his campaign for the 1950 presidential election.

Meanwhile a Conservative administration remains in office. Under the Colombian constitution, the powers of the president

are vast, and the Liberals are fearful of the result of having their rivals in office for four years.

So far, however, the Ospina Perez regime has been moderate. Its opponents talk noisily about its "persecution" of the labour movement and other similar matters, but most of the alleged "persecution" seems to rise more from the stupidity of those in opposition than from any particular malice on the part of the government. The present regime is still a coalition. Liberals have continued in the cabinet even after the rise of Gaitan to the leadership of the party—with his blessing. As for the Communists, the few seats they obtained in the 1944 congressional elections were all lost to Gaitan's party in 1947, and they have now split into three groups.

There are two principal Trade Union organisations—the *Confederación de Trabajadores de Colombia* (CTC) sponsored by the Liberal Party, and the *Union de Trabajadores de Colombia* (UTC) sponsored by the Jesuits. The UTC, which was only established a year ago, is making good progress, but groups within the UTC are chafing at the close control of the Jesuits; they are trying to form a united front with anti-Communists of the CTC against doctrinaires of both organisations.

The coalition government has made no striking moves in any direction. Like all Latin American regimes since the end of the war, it has been faced with a difficult economic situation. The price of coffee, the country's principal product and almost sole export, has kept up well, but prices of manufactured goods which

the country must import—principally from the United States—have continued to rise rapidly. The upshot of this has been that dollars have been drained out of the country, and the government was forced in the middle of this year to institute strict exchange control, which is working a little better than in some other Latin American countries. Whether respect for the law in Colombia is stronger, or for some other reason, the dollar black market is certainly not as flagrant as it is in Peru or Chile.

To a large extent Colombia's economic future will depend for some time to come on the price of coffee. Although there is a growing industrial movement, particularly around Medellin, it is not yet sufficient to offset the effects of a sudden drop in the price of coffee. Politically, it is certain that there will be a predominantly Conservative administration until 1950—unless Sr Ospina Perez should die, in which case he would be succeeded by Dr Eduardo Santos, elected by the Liberal parliament as his "first alternate." Sr Gaitan's hold on the Liberal Party seems firm, at least for the moment, and he will almost certainly be the candidate of that party in 1950. Indications are that the country is still predominantly Liberal in sympathy and there may be interesting developments between now and the 1950 poll.

(To be continued)

Greece and American Aid

(By a Special Correspondent in Greece)

CIVIL war in Greece today overshadows every aspect of the people's life and the country's economy. In Athens, the words "civil war" are not used; it is referred to euphemistically as "the troubles," "the disturbances," "the problem of restoring order." This ju-ju has not been effective, for by whatever name you call it, the problem remains—grave, unsolved and a drain upon the resources of the country.

Greek rebels are fighting throughout the mainland down to the northern coast of the gulf of Corinth, and, to a smaller extent, both in the interior of the Peloponnese, and in certain parts of the island of Crete. The highest figure given for their numbers is 15,000-20,000. The Greek army and militia number 150,000 with an additional 50,000 government defence forces or national guards. But rebel activity remains unchecked; more and more of the wealth of the country, and of the aid that is going into Greece, is being drained off into the civil war.

It is reliably estimated that since the war, and up to the spring of 1947—that is before the present American Mission for Aid to Greece started its work—£250 million worth of supplies had been put into Greece by Anglo-American aid and Unrra. Yet Greek economic conditions have improved little and very little progress indeed has been made in reconstruction. Before the Americans took over, the Greek budget deficit was estimated at £72,500,000, which represented about three times the amount of currency in circulation at that time. The cost of the army in this estimate was £45 million (as against £10 million before the war).

Against this background the American Mission started its work this summer. It arrived in Greece to give help and to advise the Government on the best way to make use of the \$350 million which Congress had voted for one year only. The work of the Mission is planned to finish by the end of June, 1948. Of the \$350 million, \$150 million have been earmarked for expenditure on military and defence purposes, \$80 million on reconstruction, \$50 million on food, \$20 million for agricultural purposes and livestock, and \$50 million for the stabilisation of the Greek currency. But some alterations in this programme have already been made, and President Truman reported to Congress on November 10th that already funds assigned to reconstruction have had to be transferred to the military programme.

The American staff for their gigantic task is small—in the civilian branch 140 including secretaries, and a total of 81 officers and men in the military and naval branch; but many other people, including employees of US contracting firms as well as military engineers, are also taking part. There is a feeling that time is short, and work must get under way if it is to be anything like finished by June next year. Contracts to a total value of \$82,400,000 have already been placed with American engineering firms for work to be done on Greek railways, roads, bridges and ports. The total has been divided up into \$64 million on railways, highways and bridges; \$17½ million on repairs to the ports of Piraeus, Salonika and Volos and clearing the Corinth canal; and \$900,000 for steel for the repair of 14 bridges. The contracts have been given on a cost-plus basis, and the total for each item has been divided into the amount that will be spent in dollars in the United States, and the amount to be expended in drachmae in Greece. For instance, the amount to be spent on the repair of roads and highways is divided into \$10,300,000 for dollar expenditure, and \$38,700,000 for local expenditure in drachmae.

The American ships bringing supplies into the Piraeus ever since August are a sign that, on the military side, the Americans mean business. \$53 million worth of military supplies have already arrived from the USA. There has also been a steady delivery of food, for both the military and civilian population; in July they received \$9,000,000 worth, in August \$17½ million, and in September \$14½ million.

The Americans are also helping with Greek export problems. A programme has been drawn up for the year ending June 30, 1948. It estimates Greek exports for this year at a total of \$93,760,000, of which the main categories are as follows: tobacco, \$40,000,000; currants, \$18,200,000; sultanas, \$10,560,000; olives, \$4,000,000; hides, \$3,000,000; and minerals, \$3,000,000.

Steps are already being taken to carry out this programme by trade treaties with many European countries. In some cases agreement has already been reached, in others it is still under discussion. Before the war, most of Greece's trade (about \$200 million) was with Germany, so that now Greece has had to look

elsewhere for markets for her exports. Trade agreements have been, or are being made with Great Britain, Italy (\$12 million), Switzerland (\$4,500,000), Sweden, the Anglo-US zones of Germany, and Czechoslovakia.

The figures represent the most optimistic view of Greek export possibilities. It is by no means certain that all available surpluses will reach the export market, but a foreign trade administration has been established as part of the Ministry of National Economy, and an American has recently been appointed as its chairman. He is to help in the administration of the new scheme of foreign exchange certificates, which has been launched to help Greek exporters and act as a check on imports. Under this scheme exporters selling foreign exchange at the banks receive in addition to the drachma value a certificate for the equivalent sum in foreign exchange. Importers, when applying for an import licence, must produce a certificate for the amount of foreign exchange they wish to buy. These certificates are negotiable on the Stock Exchange and the temporary exchange rate for the certificates has been fixed at 5,000 drachmae to the pound sterling and 3,000 drachmae to the dollar. The system subsidises the exporters at the expense of the importers, who have for some time past been making notoriously high profits because internal prices in Greece are much higher than world market prices.

At the best of times only 20 per cent of Greece is suitable for grain cultivation, and the civil war is steadily reducing the crop-growing area. Immediately before the war Greece's normal wheat harvest produced about 900,000 tons towards the annual consumption of 1,600,000 tons. This year the harvest is only 450,000 tons. Greece has asked the International Emergency Food Council for an allocation of 700,000 tons of bread grains. The danger is not that the Government supporters in Greece will starve this winter—for it seems certain that American food will continue to go in—but that this decline in grain production will become a permanent factor in the Greek economy.

In tackling all these problems, one of the most serious difficulties the Americans face is inflation. Prices have risen a lot since the arrival of American aid this summer. The official price of food is 150 times that of 1938, of clothing 229 times, and the general average 158 times. These estimates were made several months ago, and are already well outstripped by further rises in prices. Free and black market prices are, of course, higher still, and are more representative of prices actually paid. It was thought that the arrival of the American Mission might bring about a solution of the wages problem; but no agreement has yet been reached, and there is still imminent danger of a strike of Government employees, who, until the cuts now being carried out, constituted 20 per cent of all employed people in Greece.

Gold continues to be used—though illegally—for all major transactions whether commercial or merely the payment of a tailor's bill. Prices are quoted in gold sovereigns and paid for in drachmae against the gold quotation for the day of payment. The value of the gold sovereign has risen to 193,000 drachmae as against the 20,000 drachmae paid for £1 on a traveller's cheque. All those who can are busy changing available possessions into gold. It is rumoured that there are 10,000,000 illegal gold sovereigns in Greece today, with 20,000 changing hands each day. If this seems a large figure, it is not an impossible one, for gold was literally showered into Greece during the war to finance underground operations against the Germans, and this only added to the gold that was already in circulation in Greece before the war. An American was heard recently to complain, "But if we have sufficient confidence in the country to put 350 million dollars into it, why don't the Greeks have enough belief in themselves to stop using gold?"

The reply of the ordinary Greek is made in the light of past history and future expectations; seen against present needs the sum of \$350 million looks like the one swallow that does not make a summer. Thus most Greeks are thinking along lines of long-term insecurity. There is no end in sight to the civil war. Already \$9,000,000 of the American aid programme has been transferred from civilian to military aid. Even the end of the civil war would not of itself mean the end to inflation. There will be aid from the US for one year; American influence on policy and planning, if not on politics until June, 1948, . . . and then what?

"Hello, old boy, I'm speaking from Warnes. Not a hope over Christmas, I'm afraid. Did all they could, of course, but they're booked up about ten times over. Pretty disappointing, but there's one consolation. I've managed to book for just after the Christmas rush . . ."

THE BUSINESS WORLD

New Union Nemesis

THE first report issued in Johannesburg by the judicial managers, who were only appointed on October 28th to handle the affairs of New Union Goldfields, following the resignation of its chairman Mr Erleigh, and his co-managing director, Mr Milne, is a workmanlike document produced in commendably short time. New Union Goldfields was incorporated in South Africa in 1934. On October 8th this year Mr Hersov, the chairman of Anglo-Transvaal Investment, took over the chairmanship of New Union from Mr Erleigh at the latter's urgent request. The disclosure at the time of the appointment of the judicial managers that New Union had borrowed from associated companies sums in excess of its borrowing powers amounting to approximately £5,000,000 had given them a clear brief on which to work. In addition to their own observations, they have also made public what the auditors had discovered during the preceding five months, and the balance sheet of the company at June 30th accompanies their statement with suitable annotations to bring the picture up to date. For the rest, the judicial managers do not mince their words in listing some of the methods by which the previous co-managing directors have sought to enrich themselves and their friends.

New Union's early activities were confined to three digging claims in the district of Pietersburg, Transvaal, and it also owned over two thousand base metal claims. The 5s. shares were quoted around 6s. in 1938—a figure to which they have rapidly returned in recent weeks from 32s. earlier this year. Up to 1941, the company had been only moderately successful; profit came mainly from mining operations and the issued capital had been raised from the original £140,000 to £320,000. But in the next six years its growth was phenomenal and over 120 additional companies were floated and many others acquired. Conditions were propitious. Industry was flourishing under the spur of heightened wartime demand; and easy money conditions enabled the company rapidly to extend its interests all over South Africa. When the annual meeting was held last February, the capital of the parent company stood at £1,500,000, a further issue of capital was mooted, the market capitalisation approached £10,000,000 and a list of the group's interests resembled a classified business directory.

It is understandable, on that occasion, that Mr Erleigh should have been enthusiastic in his references to the great expansion and variety of the group's interests. During 1945-46, revenue from the production of metals, coal and by-products totalled £1,000,000 and the turnover of industrial enterprises was around £4,000,000. But later events show only too clearly that this industrial edifice was of less importance to the principals of the group than the intricate financial web which they had spun, with all its opportunities for profitable share dealing. Mr Erleigh, therefore, probably felt even more at home in describing New Union's interlocking interests with the full range of other mining houses interested in the new enterprises of the Orange Free State and the Eastern and Far Western Rand. He pointed, too, to the growing diamond interests within the group's orbit and to the plans to exploit the coal resources of South Africa in conjunction with Anglo-Transvaal. Cement, cinemas, air transport, hotels, country clubs, electrical equip-

ment, timber, confectionery, cold storage, footwear, foundries, rubber manufacturing and many other lines of business were given as lesser appendages to the list of the companies under the group's sway.

NEW UNION FINANCES ANALYSED

	1,354,000	1,500,000	1,500,000	

(¹) Of which profits from share transactions, £1,395,388. (²) Includes: £40,000 options granted to third parties; £125,451 legal costs on behalf of company; and £45,669 in settlement of claims against Mr N. S. Erleigh personally, auditors do not consider satisfactory explanations have been given for charging these to the company. (³) Including bonus of 5 per cent. (⁴) Payment deferred although charged in the accounts. (⁵) Of total of these three items: unquoted shares at cost, £1,884,412; quoted shares at cost, £2,651,389 (value at June 30th, £2,810,819); the present value is much less. (⁶) Certain shares are held by company arising from these loans; value of these at June 30th, £780,844 in respect of Mr. Erleigh and £362,969 in respect of Mr Milne.

This vastly expanded structure was built on the back of South Africa's war and postwar boom and it is not surprising that its collapse has coincided with signs of postwar recession. Yet the real cause of disaster lies more obviously in the reckless financial activities of the directors who were only too willing to dabble in speculative propositions with the plentiful financial resources at their command. By June 30th the financial position

was critical; it needed only the general slide in security values since then to set the seal on the group's difficulties.

As nemesis had clearly overtaken New Union, Mr Erleigh, in the face of growing rumour, appealed to Anglo-Transvaal Investment to come to the rescue, though he had, according to Johannesburg report, long been out of sympathy with the less speculative endeavours of that group. But why, it has been asked, was the Anglo-Transvaal board willing to take over Mr Erleigh's tottering structure, whose impending fall was the gossip of the exchanges, without first ascertaining the extent of its difficulties? Can Anglo-Transvaal have been just as much in the dark as the public about the true financial state of the company? It appears so, for soon after taking over New Union it confirmed both the payment of the 30 per cent dividend—an increase of 5 per cent—and the proposed issue of new shares. Only on October 28th, some three weeks later, was it apparent that Anglo-Transvaal had discovered the true weakness which others had only been guessing at, and as a result both the dividend and the new issue were held in abeyance. It is interesting to note that the negotiations for the take over were carried on by Mr S. G. Menell for Anglo-Transvaal and that Mr A. S. Hersov (the chairman) was in America at the time. On the other hand it is significant that the other big mining finance houses have also considered it in their general interest to save New Union from collapse, so that by supporting the action of Anglo-Transvaal something might be saved from the wreckage and at least their joint enterprises safeguarded. A policy of consolidation is now to be applied to the interests of New Union.

The expected—yet surely doubtful and distant—benefits of this step will also be shared by American Anglo-Transvaal through its one-third participation in any new interests acquired by Anglo-Transvaal. Early in October much was made of the advantages to South Africa which would result from this linking of American capital with the Rand and also of the gains

which would accrue to American Anglo-Transvaal from its interest in New Union. It is doubtful whether the American backers are very satisfied with the present spectacle of judicial managers presiding over a salvage operation to rescue what can be saved of their first enterprise.

Many competent observers at first interpreted the intervention of Anglo-Transvaal in an optimistic light. But what seemed at first to be a story of over-ambitious expansion capable of being nursed to success, turns out, in the light of the latest revelations, to be far more serious. None can say what will remain after the inter-company indebtedness of New Union has been disentangled, for the judicial managers are not likely to complete their task for some years. The rather obvious tendency on the part of the "shops" to play down the seriousness of the affair has been set aside completely by the incriminating charges which have been laid by the judicial managers against Mr Erleigh and Mr Milne.

As matters stand at present, the balance-sheet of the group, even when taken in conjunction with the auditors' report and the statement of the judicial managers, gives only a rough measure of the group's difficulties. There has been much conjecture about the identity of the main creditors among the associated companies; on this, the latest accounts of Rooderand (one of the New Union group) throw some light, though it is not very clear. At the balance-sheet date (June 30th) New Union was a debtor to the extent of some £1,800,000 directly and indirectly to that company. Since then, New Union appears to have repaid all but £335,000 of this debt, though the position is rather obscure. An analysis of the balance-sheet of New Union on June 30th and the subsequent adjustments to it gives a global impression of the sums involved. The assets have been itemised in the accompanying table and can be examined in order. Items (d), (e) and (f) had a total value of £4,536,000 on June 30, 1947, but the current value will be considerably less owing to the intervening fall in Stock Exchange values and to

No fewer than 3,000 islands go to make up the beautiful chain known collectively as the Bahamas. Of these only a few are inhabited—among them Watling Island where Columbus first made landfall on his voyage of discovery in 1492. The best known of the islands is New Providence where Nassau, the capital and one of the Empire's most inviting playgrounds, provides wonderful bathing and big game fishing with a climate which combining as it does a northern sky with a southern sea, has earned for the Bahamas the name of the "Isles of June." During the war a Royal Air Force training base was established in Nassau. Later, when it became important to secure a steady flow of aircraft to the Allied Forces in Europe and Africa, the island proved an important link in the famous Atlantic "plane ferry" service.

Full and up-to-date information from our branch in Nassau covering local conditions and commercial trends in the Islands is readily obtainable on request.

THE BANK IS INTERESTED

It is interested in its customers, in their affairs and in their business ventures; it is ready, by direct assistance and friendly counsel, to help those affairs forward, for it recognises that the prosperity of the Bank is to be found in the prosperity of its customers. It is, therefore, good business to keep in touch with your Bank. The Manager at any branch of the Westminster Bank will be glad to discuss with you any problem in which the services of the Bank can usefully be employed.

WESTMINSTER BANK
LIMITED

the deterioration in the value of unquoted investments. Many of these securities must consist of a heterogeneous collection of shares with problematical value and marketability, and it would be premature to give them more than a nominal value pending the disentanglement of the group's affairs. Items (h) and (i) will certainly prove to be intractable. Item (g) will have to be sorted out by the courts, for against these borrowings by directors—£298,622 net by Mr Erleigh and £171,831 net by Mr Milne—securities valued on June 30th at £1,143,813 remain deposited with the company. Item (i) has been inflated by the use of the cash balances of associated and subsidiary companies; since June 30th it has been reduced to £400,000 by the repayment of amounts due and the net indebtedness to associated companies has apparently fallen from £7,445,000 to around £5,000,000.

Two associated companies, Rooderand and West Rand Development, both recently taken out of Mr Erleigh's hands by Anglo-Transvaal, have received different treatment since they were taken over. Rooderand has been heavily supported by the mining houses and the shares have risen sufficiently to warrant proceeding with the new issue planned some time before the New Union disclosure, though these plans have this week suffered a setback by the Treasury's refusal to give consent to the issue in this country. West Rand Development, on the other hand, has been given over to a different set of judicial managers. The fate of a large number of other companies obviously lies in the hands of the judicial managers of New Union.

Little can usefully be added to the stern words of the auditors on the activities of Mr Erleigh and Mr Milne over the past six months or so. The facts of inside share dealings financed by unauthorised borrowings from different companies in the group, and the retention of the resulting profits by the principals make an unsavoury story. A curious sense of morality has become identified with certain aspects of mining finance. Much of it is beyond reproach, but when it is bad, it can be very, very bad. It is all too common for sharedealing activities to be regarded as

part of the game. Perhaps it is on this easy construction of personal responsibility that Mr Milne saw fit to continue his activities. Thus he salvaged four companies with interests predominantly in the Orange Free State to form the Union Free State Group and until last week had continued to be their chairman; he has also applied on behalf of certain creditors of New Union to have them represented as additional judicial managers of New Union.

There are indeed some unpleasant morals to be drawn from this case both by investors and by mining finance houses. The whole technique of creating options and rights of vendors, on which the financial development of the South African gold mining industry has been based, presupposes the right to acquire shares on the cheap—though not, of course, with other people's money—and it is not always easy to distinguish a fair consideration for the generous discounts and advantages which have become customary for both companies and associated individuals to receive as vendors. Some financial recognition of the mining risks which are involved can be justified. But this has created an atmosphere in which share market operation has been elevated far above the economic tasks of the mining industry. The less reputable elements in the industry will always be able to carry the speculators with them, so long as they are manufacturing their booms. More thoughtful investors, however, have long been disturbed by these practices, for they are bringing into disrepute the entire range of mining finance, good and bad alike. Messrs. Erleigh and Milne could hardly have got so far as they did unless speculators, in the hope of profit, had not relaxed their standards of what is desirable. They have only themselves to blame. Many of them are now nursing heavy losses. Let them seek what consolation they can from the following passage from the auditors' report: "Profits amounting in all approximately to £270,000 which arose on certain share dealings carried out by the company and which in our opinion belong to the company, were paid to or credited to the personal accounts of Mr Erleigh and Mr Milne in equal proportions."

Business Notes

Gilt-edged Adrift

The City, in its second thoughts on Sir Stafford Cripps's reaffirmation and defence of cheap money, seems to have made up its mind that the differences from Daltonian policy are likely to be more marked than the similarities—at least in the field of technique and short-term tactics. At all events, the gilt-edged market has this week had its worst tumble since the spectacular cracks which developed during the summer. On two successive days there were falls of 1 to 1½ points, carrying prices of the irredeemable stocks back to the levels at which they stood before Mr Dalton, in his Mansion House speech, tried to whip up speculative interest afresh. Even more significant, perhaps, than this fresh break in the undated stocks has been the weakness of the medium-dated issues and short bonds, which in the previous week or so had been relatively resistant to the sagging trend. On Tuesday, however, when the real slide in the market began, the declines spread right through the list.

The market has been busily conjuring up rival theories to explain this new collapse, and early this week a much-favoured explanation alleged a definite decision by the authorities to launch the Rail compensation stock on a round 3 per cent yield basis. This notion, indeed, gained so much credence that at one time the suspicious-minded were beginning to wonder whether some leakage of information had occurred. But in fact there is no need to seek subtle or sinister explanations. Even Mr Dalton would have found it very difficult—and might have deemed it inexpedient to try—to push prices much above the levels to which his hint to speculators had levered them. At around 90, the irredeemables were beginning to look very vulnerable; even with the champion of cheaper money still in the saddle, the only hope of holding such prices lay in the possibility of a tough Budget, from which the Government shied away. After this Budget, the prospect, even with Mr Dalton, would have been uncertain. But now there

is a Chancellor who, in his first speech as such, implicitly condemns the primary Daltonian technique—the use of Departmental support—and who is obviously temperamentally unfitted to an attempt to lift the market by the only other short-term technique which is available—the technique of ballyhoo.

Some of these home-truths have begun to sink into the market's consciousness. But what frightened it so suddenly this week was not merely the bleakness of the prospect but the fact that the new circumstances might be crystallised this very week-end, which is the moment for giving notice of redemption of the 3 per cent Conversion Loan next March. Up to the moment of writing, no formal announcement has appeared. But it will be surprising if the market's fear—of an immediate Conversion issue—proves to be justified. A very high proportion of the £302 million of 3 per cent stock has certainly already found its way into Departmental floating debt would not involve more than a technical infringement of Sir Stafford's maxim that Departmental purchases cause inflation has already occurred. But, for that very reason, the absence of any replacement issue—and the postponement, therefore, of any crystallisation of the new situation—would be only a very minor bull point. The yield basis for the Transport stock and may even be a full 3 per cent if a very long date is chosen. And this is certainly what wise financial policy would dictate.

New Chancellor and Old Policy

It was hardly to be expected that this week's shortened debate on the Finance Bill would shed much further light on the Government's financial policy or upon the prospect that the new Chan-

cellor might later take a firmer line than his predecessor. On Tuesday Sir Stafford Cripps and Mr. Glenvil Hall both stood squarely on the ground mapped out in the Budget speech. Yet, in principle, Sir Stafford came very near to accepting the essence of the formidable body of expert criticism which the Government has been facing in this context for months past. He agreed that physical controls—

can be jeopardised by black market activities arising from inflationary pressure, and that same principle can, of course, apply to the market in consumer goods where in the same way rationing and other physical controls may be weakened by too great inflationary pressure. It is to assist this proper direction of the national effort . . . that financial measures are necessary to uphold economic planning.

The critics' case could scarcely have been put more succinctly. Yet, despite these admissions, the Government still believes—or professes to believe—that its proposals are adequate to hold the inflationary pressures in check, and pretends that they will suffice to prevent any conflict between the economic and the financial sides of policy. "I hope," declared Sir Stafford, apparently in a new role of Pooh-Bah, "that those who are responsible for these two sides of the policy of the Government will be able to work in as good amity as we [Mr Dalton and he] were able to do."

As for cheap money, Sir Stafford's latest defence—pointing interestingly the contrast between his temperament and Mr Dalton's—puts negatively the very fallacy which Mr Dalton always perpetrated positively. The ex-Chancellor always contended that a rise in interest rates would be inflationary; the new Chancellor contends that a fall in interest rates is deflationary. The fallacy in this argument, in either of its forms, of course lies in its failure to consider the effects of changing interest rates both upon the general volume of spending (and indirectly therefore on prices) and upon the main elements in the Government's own expenditure. Meanwhile, as a curious addendum to his illuminating comments last week on the vexed question of Departmental support for gilt-edged, Sir Stafford now admits that there have been such supporting purchases yet solemnly declares that "they were never any major factor in the price position of securities."

*

On the detailed Budget proposals, very little of significance emerged. But Sir Stafford, in an attempt to defend the principle of the profits tax, was entrapped into a misinterpretation of figures recently given in *The Economist* and quoted by Mr Ascheton. Sir Stafford seemed to suggest that *The Economist's* figures for the year 1946-47, when grossed up by the amount of EPT and compared with the similar figures for the last prewar year, could be regarded as a measure of the volume of profits which will be subject to taxation this year. But in fact, as the article in question made plain, these figures relate not to profits earned in 1946-47, but to those shown in company accounts issued during that period from which EPT had already been deducted. It is unsafe, therefore, to assume that they afford any accurate guide to the current level of profits. They may, or they may not. But the whole point of *The Economist's* exercise was to compare what had happened to different forms of income since 1938. What happens in future rests largely on the Chancellor. On the broad principle of profits taxation, Mr Dalton's attitude always was that EPT was a thoroughly undesirable form of taxation, particularly in peacetime, but that after its disappearance it might be necessary to find a substitute. An impartial approach to this problem would admit that taxation which falls specifically upon the equity shareholder—that is, upon the return from risk-bearing and even upon that from business enterprise—is scarcely the most appropriate substitute. But Sir Stafford, despite his approach towards the critics' view of the proper role of finance, persists in treating the whole problem on the level of party politics, by declaring simply that the Opposition "would rather protect the pocket and attack the stomach," whereas he took the opposite view.

Odeon Consolidation under Fire

Mr J. A. Rank has been on the defensive this week, following his announcement of the intention of Odeon Theatres to purchase the entire share capital of General Cinema Finance Corporation. General Cinema Finance Corporation is a private company which controls General Film Distributors, and also, through the Metropolis and Bradford Trust, the Gaumont British Picture Corporation. The essence of the present plan is for Odeon Theatres—a public company which was originally exclusively

concerned, and is still very largely concerned, with the exhibiting side of the film business—to acquire complete control of a company of which the share capital is largely held by Manorfield Investments (which is the apex of control of the Rank organisation) and has substantial interests in film production. Mr Rank has claimed that this move will give Odeon Theatres a guaranteed supply of films, though in the latest report of Odeon Theatres it was already claimed that the company was obtaining great benefit from a working arrangement with the Rank producing interests.

Now it is apparently decided, without consulting the shareholders, further to tighten this connection by a controlling financial link. It is relevant here to point out, without overstressing the fact, that the original prospectus for the public issue of debentures and ordinary shares made by Odeon Theatres in 1937 stated in bold type that it was not the intention of the company under any circumstances to engage in the production side of the industry. Companies do, of course, change their policies, but if they are wise they take the precaution of consulting their shareholders. In 1944 Mr Rank was already suggesting to Odeon shareholders that a greater interest in film production might be necessary in order to ensure continuity of supplies, and he referred to an investment in British and Dominion Film Corporation, which had this object. Now he has gone a stage further in proposing that Odeon Theatres should acquire General Cinema Finance Corporation, for which Mr Rank claims that he has secured approval of more than 90 per cent of the ordinary shareholders. This, of course, is not a difficult feat, for the equity of Odeon Theatres is small in relation to the capital invested by the public in the other securities of the company, and it is largely controlled by or on behalf of Mr Rank. At the annual meeting of Odeon Theatres this year Mr Rank congratulated himself and his investment advisors on having successfully raised from the public over £13 million of prior charge capital for the Odeon group at an average of 3½ per cent. But these operations must have owed at least some part of their success to the understanding that the investment was primarily in the exhibiting side of the Rank organisation and to a minor extent only in film production. It is at least doubtful, given the more speculative nature of film production, whether large sums would have been forthcoming at such a low rate of interest if the prospectuses had laid the same stress on the acquisition of film producing by Odeon Theatres that Mr Rank is now expressing.

* * *

Mr Rank's Reply

In replying to criticisms occasioned by the tone and uninformative character of his initial statement, Mr Rank has shown himself somewhat sensitive and not wholly convincing. In the first place, although he states that the deal will be financed from the resources of Odeon Theatres, at June 28th, the date of the latest accounts, the Odeon Theatres group had net current liabilities (consolidated) amounting to £1,849,115. The finance of the film industry is something of a law unto itself, but in view of this large apparent deficiency of working capital, can the purchase of the share capital of General Cinema Finance Corporation, which, according to Mr Rank, will involve the sum of over £1,000,000, be financed without a further appeal to the capital market? Presumably the deal is not a mere matter of exchange of shares. It is worth noting that out of the £1,225,000 capital of General Cinema Finance Corporation, consisting of £1,175,000 £1 preferred and £50,000 in deferred shares, Mr Rank himself says he is directly or indirectly interested in 631,870 preferred shares and 478,497 rs. deferred shares and that he is selling these at the price which he paid for them. This is not an argument which would sway Odeon Theatres shareholders so effectively as the knowledge of what assets they were acquiring from the deal. If it is merely a matter of putting Odeon Theatres in a position to dictate what type of films it requires for exhibition, surely Mr Rank, through his private interest in General Cinema Finance Corporation and through his other investments on the producing side, could have ensured that, with the monopoly weapon of his great exhibiting circuits to bargain with, he would be able to obtain the films of his desire.

Odeon Theatres shareholders outside the inner conclave of the group require as a minimum to be given the latest statement of accounts of the General Cinema Finance Corporation. At present they are completely in the dark about the quality of that company viewed as a long-term investment. No one would call in question the acumen and energy with which Mr Rank has built up his interests in the film industry. But he holds a substantial vendor interest in the company which he proposes Odeon Theatres should

acquire. It is a business ranging beyond the exhibiting sphere. It may involve new capital for Odeon Theatres. And even without recourse to new capital, it is surely desirable that shareholders and representatives of the prior charge capital should be consulted before any irrevocable step is taken. It is not enough for Mr Rank to wave the flag of the national film industry in defence of his latest move, though he of all people is entitled to be its chief standard bearer. And it would be dangerous for him to suppose that the Rank Organisation is something apart from the public companies, with their millions of publicly subscribed capital, which are the main sources of earning power of the group. It is recognised that existing production facilities must be fully used and extended to make up the leeway in the supply of foreign films caused by the 75 per cent *ad valorem* duty. The President of the Board of Trade has again been in consultation with British producing interests about it this week. Mr Rank's objects are understandable; but his method of presenting the case for a closer participation by Odeon Theatres in film production falls short of what is necessary and desirable.

* * *

On Not Building Houses

One by one—but all too slowly—the Government spokesmen are beginning to approach the truth that finance has a part to play in the effort to solve Britain's economic problem. Until only a few months ago every one of them would have contended that the volume of priority work done—the amount of building, re-equipment, electricity plant installation and so forth—was governed almost wholly by the volume of resources “provided” for such purposes in the planners' programmes and allocated to them by the physical controls. But now Mr Morrison has discovered “a real link between the money you don't save and the house that doesn't get built.” He was speaking at a “Silver Lining” savings meeting, in the course of which he also gave a novel and colourful, but on the whole quite apt, classification of the varieties of money—ranging from speculators' “hot” money to the “cool, calm and collected” money of those who soberly do their savings duty.

Mr Morrison should continue his essays in simple economics. He will find the next step in logical progression to be both illuminating and salutary—and perhaps unpalatable. Since voluntary savings are demonstrably unable to release all the resources which capital projects and exports now require, those unbuilt houses, unerected plants and unexported goods are even more directly linked to the taxes which are not levied and the subsidies which are paid. But this last point, unhappily, seems likely to prove the *pons asinorum* of Socialist economics. Mr Morrison, in the very same breath, re-affirmed the Government's determination to maintain real wages.

At first glance, the latest figures suggest that the Silver Lining drive is succeeding in arresting at last the depressing trend of net savings. In the week to November 15th gross receipts, at £19.3 million, were the best since end-July. Apparently reflecting the end of Budget forestalling, withdrawals and repayments declined by £1,200,000 from the high level reached in the pre-Budget week. Hence the week's net savings, at £5,500,000, were the best since early May. This looks heartening, but unfortunately the figures relate to a week in which the cheques for £100 million of war damage value payments were posted and in which the Exchequer's actual disbursements on this account totalled £52 million. Properly construed, therefore, the figures really disclose a large net dis-saving. For the first thirty-three weeks of this financial year net savings totalled £89.2 million in contrast with £199.1 million in the similar period of 1946-47; they are running at more than 60 per cent below the target rate. Moreover, in the financial year to date £56½ million of 3 per cent Defence Bonds has been repaid at maturity. These repayments are not included in “encashments” for the purpose of computing the so-called net savings, nor do the figures take into account the interest portion of the sums disbursed on encashments of Savings Certificates.

* * *

“Selective Priorities” in Steel

After questions on Thursday last week Mr Marquand made a statement on steel supplies which for obscurity would be hard to match. The statement purported to deal with the situation which has been created by the grant of special priority for steel required for the expansion of fuel and power supplies—famously known as the “Prime Minister's List.” It has been

evident for several months past that these programmes were absorbing an inordinate amount of steel and might jeopardise the competing programmes for the expansion of exports or saving of imports. To accord to the latter the same priority which at present attaches to “PML” might, in Mr Marquand's words, “create a position in which the priority element in steel would exceed the non-priority element, with the result that the priority label would tend to become meaningless.”

The plain meaning of this muddy prose is that the priority classes, hurriedly set up in the fuel crisis of last winter and since unchanged, have been taking too large a share of current steel production. What that share is has never been disclosed, but estimates range between 30 per cent and 40 per cent of total output, excluding sheet steel. The machinery for allocation of steel has for some time been under review; Sir Stafford Cripps, who reported several weeks ago that a good start had been made in wringing out the inflation from the excessive supply of “M” forms, has this week disclosed that the new system will not be in operation before the spring. When the new scheme is working it will gradually be possible (to quote Mr Marquand again) “to reduce bulk priority allocations without detriment to the carrying out of the programmes concerned.” It has been decided “to introduce concurrently” (presumably with the new system, though Mr Marquand did not make this clear) “a strictly limited system of selective priorities” so that schemes for export expansion or import saving will not be held up for lack of particular quantities or qualities of steel.

If this means that the existing “PML” priorities are to be tapered off, as Mr Marquand appeared to suggest, it will be generally welcome, though much will depend on how far one batch of priorities for the expansion of fuel and power is supplemented or replaced by another batch for export programmes. But since there are no figures of allocations, nor of supplies of steel provided under bulk priorities, the new system does not carry the matter very much further so far as the non-priority—though still essential—user of steel is concerned. Is it really necessary that these important matters should be discussed on the plane of official metaphysics and not in words of meaning? And what is the objection to the disclosure of the quantities of steel which are involved? Without them it is impossible to decide whether the scheme is good or bad or whether the allocation machinery is working well—until it becomes only too obvious that it is not.

* * *

Anglo-Swedish Payments

The supplementary monetary agreement signed between the governments of Sweden and the United Kingdom this week is of exceptional importance, both on monetary and commercial grounds. It was only last July that a first supplementary agreement had been signed between the two countries. This agreement amended the basic agreement of March, 1945, under which no specific provision had been made for a mutual undertaking to hold one another's currencies. The supplementary agreement of last July froze up to the end of 1949 the balance of £25 million which had been accumulated by Sweden, and further provided that each central bank would be prepared to hold the other's currency up to £5,000,000 or its equivalent, any excess over that figure being convertible into gold. Within a few weeks of that agreement being signed, sterling had ceased to be convertible and the new arrangement had to be further amended. The terms of this new amendment have been announced this week. The two central banks have now agreed to sell their currencies against the currency of the other until a limit of £8,000,000 or its equivalent has been reached, after which sales will be against gold. The convertibility provision does not, however, come into operation until May 1, 1948, and until that date the Swedish Riksbank may be called upon to accumulate sterling balances in excess of this ceiling of £8,000,000 in its number one account at the Bank of England. This is in addition to the £25 million which remains immobilised in the number two account and in the account of the Riksgaldskontoret until the end of 1949. Balances held by each central bank will be covered by a reciprocal exchange guarantee on terms to be agreed between them.

The wording of the agreement appears to suggest that the guarantee will follow the Anglo-Belgian pattern and provide protection for changes in value between the two currencies concerned and not against depreciation in terms of gold. Under the new agreement Sweden remains a member of the transferable account group of countries but it is interesting to note that the freedom to make sterling available for payments outside Sweden and the sterling area applies only to “such countries as may be agreed between the contracting governments.” In other words, the

principle of "administrative transferability" enters into the Swedish agreement almost as obtrusively as in the agreement with Belgium.

The Anglo-Swedish negotiations have been as urgently concerned with trade matters as with the machinery of payments. The two governments have agreed that their objective should be to bring payments between the two monetary areas into balance and to encourage commercial exchanges at the highest possible level without involving either in any loss of gold. Under the general plan Sweden has agreed to lift restrictions on a wide range of goods imported from the sterling area and the United Kingdom Government has undertaken to do all it can to encourage exports to Sweden. Sweden, for its part, has agreed to facilitate the export to the United Kingdom of timber, pulp, paper, iron ore and certain other products. The two governments hope that payments between the two monetary areas in 1948 may be raised from the present annual level of some £30 million to about £50 million in each direction. This is the most interesting experiment yet made in attempting to achieve bilateral equilibrium in payments with a non-sterling country and much interest will focus on the result. The experiment has certainly begun on the right lines by setting a goal of mutual trade well above the figure of that now being transacted.

Companies Act in Operation

On Monday next, the first batch of provisions of the new Companies Act will enter into force under a Board of Trade Order. During the final stages of the Bill in the House of Lords, it was indicated that the new Act would be brought into effect in stages, beginning with concessions and alleviations and those provisions which place duties on the Board of Trade rather than the business community; the accounting provision (on which an announcement is shortly expected) would be brought into effect after giving notice of not less than six months, while the detailed provisions would be left until the new Act had been consolidated—a step which is foreshadowed in the King's Speech.

The provisions which come into force on December 1st relieve companies from the need to disclose previous nationalities of directors (Section 27), from having to give distinctive numbers to fully paid shares (Section 69), and provide easier means of altering the Memorandum of Association (Sections 76 and 77). The new powers conferred on the Board of Trade under Sections 42 to 45, permit it to investigate the affairs of companies on application by shareholders (not less than 200 or holders of not less than one-tenth of the issued shares) or by special resolution of the company or Court Order, or on the Board of Trade's own volition in circumstances suggesting fraud or misconduct or lack of reasonable information to shareholders. This power of investigation will now extend to the whole group of companies of which the company under investigation may be a member.

Sections 46 to 48, which contain the new powers of investigation of beneficial ownership of shares—which were inserted into the Act in substitution for the original clauses requiring disclosure of beneficial ownership by registered holders of shares—also come into operation. These powers may be exercised on the Board's volition where it finds good reason to do so, or on a *bona fide* application by shareholders.

Motors and the New Tariffs

The motor industry, from which a great contribution is expected towards the export drive, does not appear to have derived any noteworthy benefit from the Geneva tariff agreements, and it has to face the consequences of a number of concessions which may benefit its foreign competitors. Among the latter, the reductions of preferences on British motor vehicles imported by New Zealand and India—in the latter case they will eventually be eliminated—will expose the British motor industry more directly to the winds of international competition. Certain reductions in the Australian tariffs on motor bodies and panels have been secured, though the preferences on imports of chassis is being reduced.

But the "biggest blow" to British car manufacturers is the change in the basis of duty on cars valued up to £400 fob imported into South Africa from £1 3s. per 100 lb. weight to 20 per cent *ad valorem*. The industry calculates that for a typical small British car this will treble the duty—one well-known model which now pays £23 will in future pay £70. The only change in the United States tariff is a reduction in the duty on trucks and buses from 25 per cent to 12½ per cent which is not likely to prove of great advantage to British manufacturers, in view of the superiority of the typical American heavy-duty vehicle. The new import

restrictions introduced by Canada will also have an adverse effect.

Mr L. P. Lord's speech to the shareholders of Austin Motors this week showed that, despite fiscal and industrial difficulties, the group is going ahead with its plans for developing a large export trade to the United States. The chairman hoped to be able to ship "many thousands" of cars next year; they would not provide much direct profit (they will, of course, spread the overheads at Longbridge over a larger volume of production) but the company should bring back "many millions of dollars." It will not be merely the shareholders who wish the company well in a task which it has undertaken with such confidence—at the very time, indeed, when the chairman anticipates the possibility that "invaluable export markets . . . may remain open to us for no longer than the next nine to twelve months." Meanwhile, the difficulty of seizing these fleeting opportunities for export trade is increased by the failure to increase production to the level of installed capacity—a failure which arises from shortage of materials of all kinds, and is enhanced by the inevitable difficulties arising from the change over of models which is now in progress at the Austin works.

Credit Control in USA

First on the list of President Truman's ten points for an anti-inflationary programme was legislation "to restore consumer credit controls and to restrain the creation of inflationary bank credit." The proposals have not yet found specific and detailed form, but there have been recent indications of the manner in which they will crystallise. The control of consumer credit, that is of the terms on which hire purchase facilities were granted, lapsed at the beginning of this month. In the present economic situation a large extension of consumer credit would have damaging inflationary effects and the administration is likely to demand at least a restoration of the powers of control wielded until November 1st by the Federal Reserve system. The demands for additional restraints on the creation of bank credit are likely to take the form of raising the ceilings to which the Federal Reserve Board is now entitled to lift the reserve requirements of member banks of the Federal Reserve system. These ceilings for demand deposits are now 26 per cent for banks in central reserve cities (the figure actually in operation is 20 per cent), 20 per cent for banks in reserve cities and 14 per cent for country banks (the actual requirements for the last two categories are at these ceilings). According to a statement made this week by Mr Snyder, Secretary to the Treasury, Congress will be asked to adjust these ceilings to a single figure of 25 per cent for all member banks, irrespective of their location. In addition, the maximum reserve requirement against time deposits, which is now 6 per cent for all banks, is to be raised to 10 per cent. With these added powers at the disposal of the Federal Reserve authorities considerable deflationary pressure could be brought to bear on the credit situation. The banking position is highly amenable to control since excess reserve balances are at present at a comparatively low level.

These designs make it evident that the United States are about to apply orthodox measures of monetary control in neutralising the additional inflationary impact of any assistance to Europe. The general lines of policy were marked out with great clarity in a joint statement issued this week by the Board of Governors of the Federal Reserve system, the Controller of the Currency, the Federal Deposit Insurance Corporation and the National Association of Supervisors of State Banks. The statement said that the country was experiencing a boom of "dangerous proportions" and urged banks to curtail all loans that helped speculation in real estate, commodities or securities. It added that bank credit, under existing conditions, "should be confined to financing what will help production rather than merely increase consumer demand." The contraction of credit thus foreshadowed is already producing its effects. This week there has been a general upward adjustment of all commercial bank loan rates by around ½ per cent. The margin between British and American short money rates promises to widen further and the question must soon arise whether, despite the insulation of the London and New York markets, the former can completely divorce itself from the trends so clearly under way on the other side of the Atlantic.

Middle Witwatersrand Inquiry

The Johannesburg Stock Exchange has now issued a report following its inquiry into dealings there in Middle Witwatersrand shares on November 3rd, several hours before the announcement

GOOD BUSINESS!

In spite of first appearances, there are more orders shown here for 1947 than for 1946. The 1947 "file" takes up only a fraction of the space formerly necessary, because the firm in question decided to turn over to Micro-filming order records. By using the automatic Commercial Recordak camera they can get 3,000 of these on a 100 ft. roll of 16 mm. film.

Can photography aid your business?

DISCOVERY OF BRITAIN 1947

Yes, it's Britain's turn to be discovered! Cinema audiences in most countries are getting a good look at British folk, maybe for the first time, as a result of the much increased showing of British films abroad.

It seems they're glad to know us. The way we walk, talk, dress—where we work, what we play, the way we live. These are the commonplaces of life, but they are what men and women have in common. Sometimes they emerge from a nation's literature, sometimes they take a hundred years to find their way across land and sea and other barriers.

Good films, being invitations to friendly voyages of discovery, are helping in this urgent task of wiping out the 'blind spots,' the ignorance and insularity and the silly fears which follow from all these. Once there was talk of 'a far-away country' and 'people of whom we know nothing.' But such phrases need to be erased from every language. Films are one of the best means, ready to hand, of taking the blinkers off the human race and of spreading this knowledge and understanding of which we are all in such need.

J. ARTHUR RANK ORGANISATION LIMITED

of the exceptional bore-hole results on the company's properties that day. While the report exonerates the members of the Johannesburg Stock Exchange, this is not quite the point, for it was not suggested that any member was implicated. Had the inquiry been pursued into the whole range of dealings on that day, the findings might have provided a more conclusive answer to the suspicions that some persons were able to act with advance information of the bore-hole values. It will be remembered that the price of the shares on the London Stock Exchange rose from 13s. 3d. at the opening on November 3rd to 19s. before the news of the phenomenal values of 1,652 inch-dwts. was announced. This rise was engendered solely in sympathy with the advance in the price of the shares on the Johannesburg Exchange during the day. No action was taken by the London Stock Exchange, for Middle Witwatersrand shares are dealt in here under the old Appendix 34E, which allows reciprocal dealings in shares quoted on Empire exchanges.

If irregularities did in fact occur, their expurgation would be essentially a domestic matter for the Johannesburg Stock Exchange, and it would be impolitic to press the matter further from London. But is not the liaison between the two exchanges intimate enough to convey something of the dissatisfaction which is felt in Throgmorton Street and to translate it into further action in Johannesburg? Investors in London have recently had their full share of shocks from South African mining circles, and they have good cause to remember the past two months on account of the New Union affair alone. Many observers had been intrigued by the timely diversion of attention from the New Union revelations caused by the sudden rise in the shares of Middle Witwatersrand. The report of the Johannesburg Stock Exchange authorities tries to have it both ways, for while it declares that no member in Johannesburg acted improperly, it goes on to say that the committee has taken such action as it considers necessary with a view to preventing a similar occurrence in future. Exactly what is to be prevented? Was mischief done and, if so, who was responsible? This brief and disappointingly uninformative report will not succeed in allaying the suspicion that this is a case where a flagrant breach of trust occurred and improper use was made of the facilities of a recognised stock exchange. It is to be hoped that the Johannesburg Stock Exchange does not regard the matter as closed.

Strength of Sterling

There has been a welcome hardening in free sterling rates in New York in the last few days, a paradoxical development given the continuing evidence of the British balance of payments difficulties. The paradox must be explained largely in terms of technical factors. During the period that preceded the suspension of convertibility of sterling there can be no doubt that sterling was oversold. In a few cases this overselling was actual bear speculation which took the form of forward sales by overseas operators to others who were prepared to buy at a discount. Such sales were probably substantial in August, when the three-months quotation for forward sterling in New York was at a discount of 1 cent per month on the spot quotation. These forward sales are now being covered and this helps to explain the shortening of discount of forward sterling, which has come down to under 2 cents for 3 months. Another form taken by the overselling of sterling was the hastening of genuine authorised purchases of dollars in anticipation of the normal timetable and, conversely, the delaying of purchases of sterling. The effect of these can be compared with that of more speculative operations, since a considerable amount of sterling which in the normal course would have been bought a few weeks ago, is being acquired now at the eleventh hour.

The impact of purchases of sterling on the rate in New York is accentuated by the fact that sterling working balances maintained by American banks and other institutions have run down to almost negligible proportions. This absence of a normal cushion of sterling balances makes itself felt when substantial sterling payments have to be made on American account. It has recently become a normal experience for London banks to be asked by the American banks for which they act as agents to sell them sterling at shorter delivery than the two days which have to elapse before sterling acquired through official purchases from the Bank of England is made available. In the New York market the rate for sterling has this week hardened to 4.03½-4, showing how close the market rate is pressing against the official range of 4.02½-4.03½. This range of open market quotations shows clearly that buyers predominate. If this behaviour of the rate for authorised operations in sterling can be trusted as a guide to the prevailing trend of sales and purchases of dollars it

follows that the encroachment on the British gold reserves should now be running at a decidedly slower pace than a few weeks ago. Even if sterling working balances are not being built up by non-sterling countries, the mere attempt to meet current requirements of sterling together with the covering of short positions that were opened in the crucial July and August period, should be bringing their belated relief to the sterling position.

Nickel and the Tariff Agreement

The International Nickel Company has announced a reduction in its price for refined nickel in the United States of 1½ cents to 33½ cents a lb. The new price will become operative on January 1st, when the Geneva Tariff Agreement will be provisionally introduced by the eight "key countries," which include the United States and Canada. Already last April Mr Robert C. Stanley, chairman of the International Nickel Company, told the shareholders that if the United States import duty on nickel were reduced, the company would pass on the reduction to consumers. At Geneva the United States agreed to cut its import duty on refined nickel by 50 per cent—from 2½ cents to 1½ cents a lb. Hence the adjustment in the United States price. It is not, however, intended to change the nickel price for the rest of the world, and in Britain nickel will therefore remain at £190 per long ton. But this will hardly affect the normal relationship between the American and world nickel prices. Even before the war the United States used to pay slightly less, and it was only in the autumn of 1945 that the American price was adjusted to the world price level with an increase from 31½ cents to 35 cents to meet the increased production costs which took place during the war.

The United States has, of course, always been the world's leading market for nickel, and its position has assumed further importance since 1945 by the virtual disappearance of German, Japanese and Russian markets. Thus the reduction in the American import duty is of great significance to the Canadian producers, although the United States has in the past imported duty free about one-third of its nickel requirements, in the form of ore, matte and oxide. The reduction in price will hardly have any immediate repercussions, but it may play an important part if demand should slacken. In 1946 consumption of nickel in the United States established a new peacetime record of 71,500 tons in spite of the strikes in the American steel and motor car industries. This year a peak of nearly 90,000 tons may be reached, while consumption in the rest of the world, despite the closing of the three important prewar markets, is described as most satisfactory.

The heavy accumulation of stocks which overshadowed the market in 1945 has been absorbed, and Canadian production, which was limited to 50 per cent of capacity until the autumn of 1946, now exceeds 80 per cent of its maximum potential. As a result, world output of nickel this year is expected to exceed 148,000 tons, compared with 125,000 tons last year and 120,000 tons in 1939. If the present trend of consumption is maintained, the wartime peak, established in 1943, may be surpassed next year. After the first world war it took ten years before the wartime rates of production and consumption were regained. The great progress which is being made in the industrial application of nickel alloys, together with the increased use of nickel in coinage, may materially help the current expansion in demand.

Scottish Banking Results

It is seldom that the accounts of individual banks call for any special comment, but for a variety of reasons the statements of two of the Scottish banks, the Royal and the Commercial, are of unusual interest. The Royal has this year brought its accounts into line with established practice by publishing comparative figures for the first time and by consolidating deposits with drafts outstanding, and loans with advances. The distinctions here had lost any real meaning and the loss of information is insignificant, but it is a pity that the bank did not at the same time differentiate between money at call and transit items. For lack of this distinction, it is impossible to determine net deposits, but the gross figure has risen during the year by some £12 million, or over 10 per cent. The corresponding rise for the Commercial is some 8½ per cent, to £107.8 million, these figures comparing with increases of some 5½ per cent for the London clearing banks for the year to mid-October. Even allowing for the fact that favourable balances in one or two very large accounts can distort the

total figures of a Scottish bank, it seems clear that industry north of the border has obtained its full share of expansion in the past year.

In the case of the Royal the bulk of the new money has gone into longer dated investments, which are up by over £6,000,000. The date of the accounts, October 11th, saw gilt-edged only a trifle above the lowest of the recent fall, and this fact may account for the adoption of a rather less precise wording in the report. The expression "a valuation of the bank's investments at October 11, 1947 is in excess of the sums at which they appear in the annexed State of Affairs" is substituted for the assurance—customary at least since 1932—that all investments were taken in at or under the prices ruling at the date of the accounts. For the rest, there is a rise in money market assets, partly offset by a modest drop of £1,000,000 in the holding of deposit receipts, while advances show an expansion of some 12 per cent, or £3,250,000. The Commercial Bank, evidently pursuing a different policy, shows a very modest increase in money market assets and a slump from £12 million to £7,000,000 in TDRs. In consequence, it is able to show a substantially larger proportionate increase in investments, while advances have risen by 26½ per cent, or rather more than those of the clearing banks over a corresponding period. Investments in this bank amount to 63.5 per cent of gross deposits, compared with 52.1 per cent for the Royal; their valuation basis is described, as for many years past, in a form of words essentially the same as that now adopted by the Royal Bank. The accounts are made up to October 25th, by which time a further material recovery in gilt-edged prices had occurred.

The feature of the Commercial Bank's report is, however, the payment of a dividend in excess of that ruling before the war. Last year it split its "A" shares and paid up, out of undisclosed reserves, 1s. for every 5s. previously subscribed. It is now paying 15 per cent on 6s., compared with 16 per cent on 5s. before the war. This increase of one-eighth in the actual payment will rapidly compensate the shareholders for the ultra-cautious reduction in the dividend to 15 per cent during the war period.

* * *

Larger Exports in October

The increase in exports last month was encouraging; the total for October is £108 million compared with £99 million in September, and is only £2,000,000 less than the peak figure for July. This expansion was primarily due to considerably larger shipments of vehicles and machinery—which together accounted for one-third of total exports—and to increased exports of textiles, particularly rayon and woollen goods.

The value of exports of vehicles, locomotives and ships (£19.4 million) was nearly £3,000,000 above the previous record in July, owing to a significant expansion in the sales of merchant ships abroad. The number of new cars sent abroad last month totalled 14,786 and exceeded the record figure for September by 1,600; the chief markets, however, were not in the dollar countries but

in Belgium, India and South Africa. Similarly, exports of bicycles (136,400) also reached a record level, for the second month in succession, with India and South Africa as the main destinations. Although shipments of machinery showed an increase of £1,000,000 on the month, the total of £16.8 million was slightly below the July figure, and they are now taking second place to the vehicle group. India and South Africa were the principal markets. Exports of silk and rayon goods reached a record level of £2,800,000, going mainly to Australia, New Zealand, South Africa and Canada. Wool manufactures (£5,700,000) were the highest since 1928, and some 5 per cent went to the United States. Exports of cotton goods were slightly smaller than in September, but apart from that month they were the highest attained since the war.

It is impossible to assess from these figures for a single month the degree of progress towards the achievement of the export targets. But it is evident that the vehicle group is making good progress, although current reports suggest that at least a temporary limit may have been reached to any further export expansion. The tonnage of machinery exported was 64 per cent above the prewar level compared with the volume target for next June of 125 per cent. Tonnage and volume are not, of course, identical, but they can be used as a rough approximation. There is still a long way to go before next year's targets are achieved—if indeed they can be achieved. Expansion in exports of machinery, textiles, electrical goods, chemicals and rubber manufactures will have to be considerably larger than at present to justify optimism about Britain's trade position.

Shorter Notes

The note circulation this week shows another large contra-seasonal fall, by £7,600,000, following the abnormal decline by £12 million in the previous week. The fourth week in November normally marks the beginning of the Christmas currency demands, with an expansion of some £3,000,000 to £4,000,000 in the circulation. One partial explanation may be that much "Christmas" spending has this year already occurred, being merged into the Budget forestalling rush. Another factor, possibly even more important, may be the disgorging of black market notes for fear of the calling in of the existing issue.

*

Demand for wool is still strong both in Britain and the Dominions. America has resumed purchases in Australia although no definite reports of quantities are yet available. In the United Kingdom, prices for greasy merinos have tended to be steady at their upper limit whilst those for fine, medium and even coarse crossbreds have risen. The demand for British-grown wool has also shown no signs of weakening and speciality wools are being purchased almost regardless of price.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Dorman Long; Furness Withy; Tate and Lyle; Bass Ratcliff and Gretton.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7.6 per cent). (i) To latest redemption date. † Free of tax.

REPORT BY THE COURT OF DIRECTORS OF

The ROYAL BANK of SCOTLAND

To the ANNUAL GENERAL COURT OF PROPRIETORS, on Wednesday, 26th November, 1947

The Court of Directors now submit to the Proprietors the annexed Abstract Statement of the Affairs of the Bank at the Second Saturday of October, 1947, with relative Profit and Loss Account, certified by the Auditors.

The Net Profits of the year, after providing for all bad and doubtful debts, contingencies and taxation, amounted to ... £621,338 4 2

Dividend for half-year paid at Midsummer at the rate of 17 per cent. per annum, required ... £361,250 0 0

Less Income Tax ... £162,562 10 0

It is now proposed to pay a Dividend at Christmas for the second half-year at the rate of 17 per cent. per annum, which will require ... £361,250 0 0

Less Income Tax ... £162,562 10 0

There has been transferred to Property Maintenance Reserve Account ... £30,000 0 0

Contributed to Staff Pension Fund ... £75,000 0 0

And added to Rest, the Balance of ... £118,963 4 2

The Rest now amounts to £4,449,319 5s. 0d.

A valuation of the Bank's Investments at 11th October, 1947, is in excess of the sums at which they appear in the annexed State of Affairs.

The Directors record with regret the resignation of Mr. Herbert William Haldane, who had been an Ordinary Director since 1917.

In virtue of the powers conferred upon them by the Royal Bank of Scotland Act, 1873, the Court of Directors, on 29th October, 1947, elected Mr. Septimus Erik Houstoun, Chartered Accountant, Glasgow, and Mr. Ronald Mackintosh Robertson, Edinburgh, as Ordinary Directors. Mr. Houstoun and Mr. Robertson hold office until this General Court only, but are eligible for re-election.

The Governor, the Deputy Governor, the Extraordinary Directors and the Senior Ordinary Director (The Right Hon. Lord Bradbury of Winsford, G.C.B., LL.D.) retire at this time and are eligible for re-election.

Auditors also fall to be appointed for the ensuing year, and Mr. George James Gregor, C.A., and Mr. S. W. Murphy, C.A., offer themselves for re-election.

By Order of the Court of Directors,

J. M. THOMSON,
Cashier and General Manager.

T. BROWN, Chief Accountant.

AUDITORS' REPORT

As Auditors appointed by the Proprietors of THE ROYAL BANK OF SCOTLAND, we have checked the Cash on hand at Head Office, Glasgow and London (City Office), verified the cash with London Bankers, the Securities for money at call and short notice, the Government Securities and other investments, and examined the details of the other Assets and of the Liabilities set forth in the foregoing Abstract State of Affairs; and we now certify that in our opinion said Abstract State is a full and fair Balance Sheet, properly drawn up, and exhibits a true and correct view of the state of the Bank's Affairs, as shown by the books, at 11th October, 1947.

GEO. JAMES GREGOR, C.A., Auditor.
S. W. MURPHY, C.A., Auditor.

EDINBURGH, 6th November, 1947

THE BRITISH LINEN BANK

DIVIDEND OF 16 PER CENT.

The annual court of proprietors of The British Linen Bank was held on the 25th instant, at the head office in Edinburgh.

The Earl of Airlie, the governor, who presided, in the course of his speech, said:—

You would be gratified at the announcement that His Grace the Duke of Hamilton had accepted election as deputy governor of the bank. We feel that we have been fortunate in securing his interest in the bank's affairs.

RESULTS FOR PERIOD

As stated in the report which has been in your hands for some time it was found convenient to change the date of the bank's annual balance from January 15th to September 30th. The accounts now submitted for your approval therefore cover a period of eight and a-half months. It will be appreciated that the change in the balance date renders it impracticable to make an exact comparison of the results for the period with those of a full year, as seasonal factors have some influence on the figures. It will be noted from the balance sheet that the item "deposits and other accounts"—in which we now include drafts in accordance with general practice—exceeds £70,000,000, showing an increase of about £1,500,000 over the January total. On the other side advances have risen by practically the same amount to over £10,000,000, the industries able to take advantage of increased borrowing being mainly those concerned with agriculture and the building and engineering trades.

Net profit for the period amounted to £174,223. A dividend at the rate of 16 per cent. per annum for the half-year to July 15th has already been paid, and it is proposed to pay a dividend at the same rate for the period to September 30th. An increased allocation to the staff pension fund of £39,000, and the transfer of £50,000 to contingency fund, are recommended, leaving £7,000 to be added to the carry forward.

BANKING SERVICES

We are glad to take this opportunity of thanking the staff for their loyal co-operation. The scope of banking services has been considerably widened in recent years, and the calls made on the staff grow more onerous and complex. To the daily routine of meeting customers' ordinary needs in great volume and variety, there has been added the detailed working of the complicated Exchange Control Regulations, including the recent requirements of the deposit by the public of certain classes of securities. While the banks have perhaps not always been accorded full recognition of the part they have taken in the encouragement of the National Savings movement, their services have again been called upon in a special campaign to maintain the volume of savings.

In view of the special efforts being made to develop export trade, reference may be made to the facilities available to our customers in this connection. At the head office, the principal Glasgow office and London City office there are foreign departments fully equipped to handle every description of overseas business, and the managers at our branches throughout Scotland are always ready, in any matter in which the bank can be helpful, to give guidance to customers in their business problems.

The report was adopted.

Mr Anthony William Tuke, deputy chairman of Barclays Bank, Limited, was elected a director in place of Mr Lionel Gurney Buxton, who did not seek re-election. The remaining directors were re-elected.

AUSTIN MOTOR COMPANY, LIMITED

EXPORT EFFORTS INTENSIFIED

The thirty-third ordinary general meeting of the Austin Motor Company, Limited, was held, on the 26th instant, at Birmingham, Mr L. P. Lord (chairman and managing director) presided.

The chairman, in the course of his speech, said:—

At our last meeting in December, 1946, I said that we approached a future full of uncertainties, but in spite of many warnings few of us then believed that this country could fall to its present deplorable condition in such a short space of time.

Let us hope that this phase will pass quickly and that a solution to our national difficulties will soon be found.

FINANCE AND TAXATION

Our present financial position as disclosed by the balance-sheet is satisfactory. There are two items on which you may like me to comment.

The first is depreciation. The sum of £383,387 is provided for depreciation. This amount is calculated at such rates as to write off the book value of each type of asset over the period of its anticipated life.

I must point out, however, that when the time comes for plant to be replaced by a more modern type, the cost of replacement at current price levels is considerably more than the original cost of the old plant. Provision has to be made for this excess cost by a policy of building up reserves and so conserving the resources of the company.

The second item is taxation. No doubt you will be wondering what effect the new taxation on profits, announced in the autumn Budget, will have on the year under review. The total additional payment is estimated at £66,000. This, of course, covers seven months only, from January 1st to July 31, 1947.

When considering the increased gross profit it must be borne in mind that this was achieved in spite of the fact that your cars were sold during the year at substantially lower prices than those of equal specification produced by your competitors.

The question of quality is often raised. I need hardly assure you that not only are Austin products fully up to prewar standards in every detail, but that in many instances they are better.

PRODUCTION

Production for the last six months has been running at the rate of 1,950-2,050 vehicles a week, but I am sorry to say that during that time no increase in rate has been possible owing to shortages of supplies of all kinds.

The present capacity of your factory is 3,400 vehicles per week, working two shifts. If the Government carry out their promise to give priority in supplies to the motor industry and to allocate materials to individual firms on the basis of past performance, this output should be reached in a few months. If they do not, invaluable export markets which may remain open to us for no longer than the next nine to twelve months may be closed, or partly closed, and a great opportunity lost.

During the year under review 36,401 vehicles were exported through our subsidiary, the Austin Motor Export Corporation, comprising 30,765 cars and vans and 5,636 commercial vehicles, to a total value of £11,250,197.

Over two hundred main distributors now hold the Austin franchise and they, together with our resident overseas representatives, cover every territory open to trade with Great Britain.

As you will have seen from the directors' report, we have acquired a controlling interest in Ruskin Motor Bodies, Limited, of Melbourne, Australia. This was done because

for some time now the production of bodies in Australia has not been keeping pace with the shipments of chassis from Longbridge. Members of our production staff are at present in the Ruskin factory, and we hope by rearrangement and by new tooling and assembly methods to increase the output considerably. The equipment for producing the A40 "Devon" and "Dorset" bodies is now being installed.

All over the world the market for our light cars is being consolidated and the new A40s have been extremely well received. Our range of commercial vehicles also continues to gain in popularity and demand. This side of our activities has proved most valuable during the last few years, and the new 25-cwt. models and ambulances recently announced have been welcomed everywhere.

AMERICAN AND CANADIAN MARKETS

As dollars are the prime necessity today, I will deal particularly with the American market. I have been to the United States twice in the last six months, the first time to examine the market and the second time to put into effect the programme on which your board decided.

There is no doubt that an important market exists for British cars of new design, above and below the American mass production range.

Our displays of the new A40s, "Sheerline" and "Princess" saloons in New York, Chicago and Los Angeles, however, were received enthusiastically, and unless anything unforeseen happens we can reasonably hope to ship many thousands of cars to the United States during 1948. An American subsidiary, called "The Austin Motor Company, Ltd. (England)," has been incorporated and office accommodation and warehouse space have been taken in New York City. This subsidiary will act as our distributor in the United States and all dealers will be signed up direct with it.

It would appear that the latest excise duty proposals and import restrictions will reduce the Canadian market very considerably. Through the Geneva Tariff Conference proposals the motor industry will suffer serious setbacks, chiefly in South Africa, Belgium and Luxembourg, and in the Empire by the reduction of United Kingdom preferences.

CURRENT FINANCIAL YEAR

The selling prices of the new A40 Devon and Dorset saloons have been fixed lower than the previous 10 h.p. This is in continuation of our policy of reducing prices at the earliest possible moment and passing on to our customers the benefits of any economies we may effect. Although the cost of the material for the new models is considerably higher than that of their predecessors, we believe that the reductions in cost consequent upon increased output will justify the lower selling prices. If the Government fail in their promise to deliver more material, or if wages and costs of materials rise, then the present low prices cannot be held, and a sharp increase will have to be announced. This would not reduce the home market demand, but would be disastrous in the export field.

From what I have said, you will realise that this current year is one of changes, of new models, of varying conditions in export markets, of old markets drying up and new outlets being explored with a desperate sense of urgency, but with an acute consciousness of stifling controls at home.

Your works at Longbridge are in better shape than at any time in our history, your staffs and workpeople are applying themselves to their tasks with commendable zeal, and real enthusiasm, and I feel sure you will all join with me in expressing to all of them our sincerest thanks and good wishes. The report and accounts were adopted.

DALGETY AND COMPANY, LIMITED

RECORD WOOL FIGURES

The sixty-third annual general meeting of Dalgety and Company, Limited, will be held in London on the 4th proximo.

The following is an extract from the statement of Sir E. Lionel Fletcher, C.B.E., the acting chairman, circulated with the report and accounts for the year to June 30, 1947:—

The company's business during the period under review has been well maintained, and all sections have contributed to the improved results. The operations of both the Wool and Produce and the Stock and Station departments have been satisfactory, attributable to a continuation of improved seasonal conditions, the higher prices ruling for wool, and buoyant markets for both fat and store stock. It is to be hoped that the favourable conditions may continue to enable primary producers to build up their depleted flock numbers and to ensure good cereal crops. The Merchandise department has also done remarkably well, despite the many difficulties experienced by all branches in obtaining supplies of most commodities.

Both Australia and New Zealand have enjoyed a prosperous year, and present indications point to another good season, but the difficulties of the transition from war to peace are far from over. There seems to be yet no solution to the dollar crisis, and the general economic conditions throughout the world make it impossible to foresee the future trend of events, so that I feel sure you will agree it is a wise course to conserve our resources.

ALL EXPECTATIONS SURPASSED

With regard to Wool—the chief business of your company—I can only say that the results of the season under review have surpassed all expectations. Australian growers received the largest wool cheque in the long history of the industry, and whilst the results in New Zealand were less spectacular, they too were eminently satisfactory. I am pleased also to be able to report that production in the Commonwealth showed some recovery from the low level of the previous season when, as a result of the severe drought in 1944-45, the wool clip was the smallest for many years.

New Zealand registered a small decline in production, though the baleage was higher, due to lighter packing. The combined total of sales sold in Australia and New Zealand was, however, only a little above the appraisal figures for 1945-46, due mainly to the shipment for sale overseas of certain wools, chiefly slipes, previously appraised in New Zealand. Our own sales in the countries of origin were well maintained and amounted to 589,367 bales, or 38,370 bales more than in the previous year, and this, coupled with the high level of values ruling, materially increased our earnings on wool.

STRONG DEMAND

It is at all times dangerous to attempt to forecast the future course of values, and more than ever so now with world affairs in the condition they are at present, but I can only say that since the new season opened there has been a further sharp advance in prices, the chief reason for this being much increased buying by the Home Trade, coupled with continued strong support from the Continent.

We are recommending the payment of a final dividend of 5 per cent. on the ordinary shares, which, with the interim dividend of 3½ per cent. paid in May, represents a distribution for the year at the rate of 8½ per cent. similar to that of last year. We also recommend a bonus of 1 per cent.

ROYAL BANK OF SCOTLAND

HIGHLY LIQUID POSITION

SCOTLAND'S PART IN ECONOMIC RECONSTRUCTION

THE DUKE OF BUCCLEUCH'S REVIEW

The Annual General Court of Proprietors of the Royal Bank of Scotland was held in Edinburgh on 26th instant, His Grace the Duke of Buccleuch and Queensberry, P.C., G.C.V.O., governor of the bank, presiding.

The governor said:—I assume it is your pleasure that the annual report and balance sheet, with auditors' report, which have previously been circulated, shall be taken as read.

Before dealing with the ordinary business of the meeting, I have to refer to changes in the court of directors. Mr Herbert William Haldane, chartered accountant, Edinburgh, who had been a director since 1917, retired at October 11, 1947, and the board have placed on record their high appreciation of the valued service he has rendered to the bank throughout these thirty years and their warm regard for him as a colleague. The court of directors on October 29, 1947, elected Mr Septimus Erik Houstoun, chartered accountant, Glasgow, and Mr Ronald Mackintosh Robertson, Edinburgh, as ordinary directors, and we consider ourselves fortunate in securing their services for the bank. Mr Houstoun and Mr Robertson hold office till this court but are eligible for re-election.

The directors are pleased again to submit what in their opinion is a very satisfactory statement. It may be observed that there are slight changes in presentation this year; the shillings and pence are omitted from the balance sheet and the space thus saved has been utilised in showing the comparative figures for the previous year.

DEPOSITS AND OTHER LIABILITIES

Looking at the liabilities first, I should explain that this year the total of the Deposits and other credit balances, conforming to what is now almost universal practice, includes Drafts Outstanding, which formerly appeared as a separate item. The Deposits again constitute a new record in the history of the bank, amounting to £131,001,902—and thus showing an increase of £11,963,000 over the comparable figures of last year. Our notes in circulation at £9,428,922 show a slight contraction on last year's total. It seems a natural trend and is comparable with what occurred shortly after the conclusion of the first World War.

Acceptances and endorsements of foreign bills and other obligations are little changed on the year at £4,327,928. Bound up as it largely is with foreign trade, this is an item which we should be glad to see increased and we would welcome enquiries in this connection from friends and connections at home and abroad.

LIQUID ASSETS AND INVESTMENTS

On the assets side the highly liquid position of the bank is again emphasised in the balance sheet. Cash, balances with the Bank of England and other banks, money in London at call and short notice, etc., amounting altogether to £31,563,148, represent over 22 per cent. of our liabilities to the public. Our treasury deposit receipts at £9,000,000 are £1,000,000 down on last year, this being in accordance with the general experience. Treasury bills, on the other hand, show an

increase of about £500,000, and there is a slight fall in commercial bills.

British Government securities at £67,041,959 show an increase of £6,000,000 on last year, and the market value is again considerably in excess of the value at which these investments stand in our books—a remark which also applies to our Dominion, Colonial and other investments. A further £100 per share has been called up on the 333 shares we hold in the Industrial and Commercial Finance Corporation, Limited, thus doubling the figure represented by this item.

It will be observed that advances on cash credit and current accounts and loans on stocks and securities have been combined this year, and the total, £29,771,180, shows a welcome increase of £3,200,000 over the comparable figures for last year. The increase is well spread over agriculture, trade and commerce, and while it is no doubt due partly to the increased level of prices, there have been increasing signs of a demand for accommodation for development. The bank is prepared, as always, to give most careful consideration to proposals which conform to sound banking principles.

PROFITS AND APPROPRIATIONS

I now come to the profit and loss account, in which we show an increase of £10,000 over last year's profit, which the directors consider a satisfactory result keeping in mind the additional sum to be provided for taxation and the ever-increasing total of charges of management. Following our usual practice, full provision has been made for contingencies and all bad and doubtful debts.

The directors recommend that a dividend for the half-year, payable at Christmas, at the same rate as formerly—17 per cent. per annum—be declared; that £30,000 be carried to property maintenance reserve account and £75,000 to the staff pension fund, both allocations being similar to those of last year; and that the remaining £118,963 after these appropriations be added to the rest or reserve, raising it to £4,449,319.

ECONOMIC SITUATION

Since I addressed you a year ago the outward signs of the economic situation have undergone a noticeable change. In some respects the position has been aggravated by contemporary happenings but, in the main, it cannot be said that our present difficulties are due in any great degree to the sudden emergence of unfavourable events. Rather is it—and this was bound to take place sooner or later—that simple economic laws have begun to assert themselves. As a nation, we have become impoverished as a result of our sacrifices in two wars, and we no longer have the resources, as we had before, to command to the same extent the fruits of other lands.

We now have to pay for what we want, and that we can only do by producing what other countries need from us. Assistance from the outside—although, properly applied, it can be very helpful—will not provide a lasting solution. The remedy—and it will not be easy of achievement—lies largely in

our own hands and, in the light of this simple truth, it is to be regretted that, at a time which calls for whole-hearted unity of purpose, our productive efforts should so frequently be hampered by difficulties of our own making. We cannot, of course, ignore the influences which in recent years have disturbed our everyday existence, but the effect of these would largely be overcome if, based on good will and mutual understanding, there were more in evidence a better appreciation of the simple fact that the welfare of each of us is inseparably bound up with the prosperity of the nation as a whole.

SCOTLAND'S PART

One takes hope from the fact that, even if somewhat gradually, the needs of the situation are now becoming better understood and, so far as Scotland is concerned, we must see to it that she is equipped to play once again a leading part in the rehabilitation of our commercial greatness. One is glad to note in this direction an enlivening of the national conscience which augurs well for the future, and one sincerely trusts that, while the urgency of the export drive may impede for a time the development of certain old and new industries, the efforts of the Scottish Council (Development and Industry) and others will meet with the success they deserve.

UNEXCELLED QUALITIES OF CRAFTSMANSHIP

The day will come when, owing to the competition of other countries, our prospects in the markets of the world will largely depend on the superior attractiveness and quality of the goods which we have to offer, but, given the will, there can be no doubt that in the native skill of our workers there are qualities of craftsmanship which are unexcelled in any other country. Mindful of our great traditions, the aim must be to ensure that our products will set a standard by which all similar wares are judged.

AGRICULTURE AND AFFORESTATION

While, as I have said, certain developments in our industrial set-up may have to wait on the more immediate need to attain our export targets, there is one home industry—agriculture—which is of vital importance to us at the present time, and it is gratifying to note that during the present session of Parliament a Bill will be introduced to provide for the improvement and development of agriculture in Scotland. It is not always realised that in Scotland more people are employed in agriculture than in any other industry, and, on this score alone, it merits every attention. But overruling all other considerations at the present time is the need to grow our food supplies within our own borders to the greatest possible extent, not only for the purpose of easing the foreign exchange position during the present period of stringency, but for ensuring also that the nation's food supplies may be safeguarded so far as possible by our own efforts.

Recent events have emphasised how essential it is that in matters of food we should strive to look after ourselves as much as we can but, nevertheless, it is to be hoped that in the planning which is contemplated every attention will be given to the framing of a fair and equitable long-term policy. The

bank, in keeping with its policy over the years, is always ready to meet the reasonable requirements of its farming customers. Another matter of special importance to Scotland is an effective programme of afforestation. While this may not appear so very urgent at the present time, it is none the less a development which we must continue to pursue to the fullest possible extent. It is in itself a most important industry, which will give useful employment to many and, looking ahead, we can be sure that the fruits of our labour in this particular direction will in many ways prove of the greatest value to the nation in future years.

THE THREE BANKS

Our Associated Banks, Glyn, Mills and Company and Williams Deacon's Bank, Limited, continue to make good progress, and their businesses, like our own, show every evidence of healthy development along sound lines. Many of you, I have no doubt, will have observed the series of advertisements appearing in the Press setting forth the services which the three banks are in a position to offer and stressing the close liaison which exists in the conduct of their affairs. The services of our three banks are at the disposal of the customers of any one of them, and none need hesitate to make use of these extended facilities at any time.

TRIBUTE TO OFFICIALS AND STAFF

To Mr Thomson the general manager, the assistant general manager and the officials and staff at head office, London City and West End offices, Glasgow, Dundee, and all the other branches, the directors again desire to express their thanks for their services and loyal support during the year. Our managers at the London City office and Dundee have recently retired under the bank's superannuation scheme after long and valued service, and the directors feel sure that the high standards of service set by them in these important offices of the bank will be maintained by their successors.

I now beg to propose that the report, containing a statement of the accounts and balance sheet, be approved, and that out of the profits of the year a dividend at the rate of seventeen per cent. per annum for the half-year, under deduction of tax, be declared in conformity therewith.

The report was approved, and the governor, deputy-governor, extraordinary directors and the retiring ordinary directors were re-elected and auditors were re-appointed for the ensuing year.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

The annual general meeting of shareholders of Johannesburg Consolidated Investment Company, Limited, was held, on the 25th instant, in Johannesburg.

Mr K. Richardson, who presided, in the course of his speech said:

It is my privilege to submit for your consideration and approval the directors' report and the accounts for the year ended June 30,

1947. Although the conditions prevailing during the year under review were, in many respects, unsettled, the company experienced a successful year, and the profit, which amounted to £1,672,794, showed an increase of £517,488 over the corresponding figure for the previous year. An amount of £762,207 was provided for taxation, and of the remaining £910,587 your directors have transferred £300,000 to reserve fund, which now stands at £4,600,000. In addition, they deemed it necessary, in view of present conditions, to set aside £100,000 to provide for increases in the benefits payable by the company's pension funds and for voluntary pensions not covered by such funds. Dividend No. 55 of 3s. 6d. per share plus a bonus of 1s. per share, less United Kingdom income-tax at the standard rate of 9s. in the £, absorbed £488,812, and after these appropriations the balance of undistributed profits carried forward showed an increase of £21,775 to £337,505.

The book value of the assets totals £12,222,753, whilst current liabilities and provisions, together with the provision for United Kingdom income-tax, 1948-49, amount to £3,335,248, thus leaving an excess of assets over liabilities of £8,887,505.

The company's holdings in stocks and shares, including those in subsidiary companies, at £7,561,633 were increased by £159,375, which is accounted for by the excess of purchases over the book value of investments sold and depreciation written off. The reduction in the book value of shares in subsidiary companies is due to the transfer to the main heading of stocks and shares of the book value of the company's holding in Phoenix Colliery, Limited, which no longer falls within the definition of a subsidiary company. As stated in the directors' report, stocks and shares are included in the balance-sheet at or below cost and in no case above the market value at June 30, 1947, or in the case of unquoted investments, above the valuation by the directors, who have also revalued certain holdings below both cost and market value. The aggregate market value of the company's investments is substantially in excess of the value shown in the balance-sheet.

A strong liquid position has been maintained, the excess of current assets over current liabilities and provisions at £1,494,324 showing an improvement of £423,494 when compared with the corresponding figure for 1946.

The operations of the gold mining industry were adversely affected by a continued shortage of European and native labour, and the tonnage mined in 1946 at 56,927,500 tons showed a further decline of nearly two million tons compared with the previous year. The production was, in round figures, 11,918,000 ounces of fine gold, which compares with 12,213,000 ounces, reflecting a reduction of 295,000 ounces.

Working costs continued to rise owing to various causes, notably increased cost of living allowances, higher costs of stores and the fact that the mines were not able to work at full production because of the labour shortage. The effect on the profits of the industry of the reduction in tonnage crushed and the increased costs was a reduction of £5,577,000 to a total of £26,329,000 in the working profit earned for the year 1946.

The report was adopted.

GOVERNMENT RETURNS

For the week ended November 22, 1947, total ordinary revenue was £43,540,000, against ordinary expenditure of £59,003,000 and issues to sinking funds £180,000. Thus, including sinking fund allocations of £10,079,891 the surplus accrued since April 1st is £231,614,000 against a deficit of £530,932,000 for the corresponding period a year ago.

Britain in Europe

THE quick passage of the American Interim Aid Bill through the Senate offers some hope that not only emergency measures but the Marshall Plan itself may be enacted before too long. And the chance that the Plan may soon come into being makes the question of its administration a matter for urgent consideration.

The problem was first posed when Mr Marshall on June 5th asked the European nations to plan their recovery jointly, but at the Paris Conference, where the British delegation inevitably took the lead, the question of closer co-operation was shelved. The nations did not come prepared to sacrifice national sovereignty—for example, by permitting their estimates of need to be examined critically—and the British, anxious above all to produce a report speedily, did not press the issue. Nor was the British Government particularly anxious to give a lead towards the joint planning and administration of European recovery. Behind many plans for closer integration—for example, the scheme for the mutual convertibility of European currencies—seemed to lurk the chance that Britain would be asked to mortgage more of its shrinking supply of dollars. Similarly, plans for the scrutiny of national needs held the possibility that Britain's neighbours might find the percentage of aid it sought too high. No decisive lead towards greater economic integration was, therefore, given and in the Report even the proposal to keep some sort of multi-national body in being to supervise the Plan was inserted only as a result of American pressure. In Washington, too, where the chief responsibility for explaining the Paris Report fell to the British delegates, the issue of the continuing organisation was not pressed. The United States Administration and Congress have, therefore, been left to make up their own minds on this point. All are agreed that there will be an American agency of some sort. The question is: with whom in Europe will it deal?

A number of influential groups inside and outside Washington would like to see the Sixteen establish a joint agency among themselves to advise and assist the Americans in the scrutiny of national requests, in the establishment of priorities and in the allocation of supplies. No exactly comparable agency has yet existed, but the idea is that the spirit which animated the wartime Combined Boards—in admittedly different circumstances—should guide the work of the new agency. The argument for such a body is that, on the one hand, it could vastly reduce the possibility of direct American intervention and give Europe the chance to work out its own priorities and allocation. On the other hand, it could be a means of moving towards that larger conception of European unity with which Mr Marshall first made his offer and which, some Americans argue, is in the long run the only issue great enough to ensure continuing American support through the four years of the plan.

An opposite view has also emerged, particularly in Congress, and the influential Herter Committee has put its weight behind an American approach to Europe on a completely separate national basis. Each nation would work out with the United States the amount of aid it was to receive, and the only common denominator in all these bi-national

negotiations would be the American agency, on which would therefore fall the task of determining priorities and co-ordinating allocations. Between this scheme, which represents direct American intervention, and the opposite hope that the Europeans would set up their own multi-national agency, the Americans, it seems, have still to make up their minds, and it may be that a determined expression of opinion from Europe might influence them. What, then, ought the attitude of the European nations—and of Britain at their head—to be?

*

There should be no mistake about it. The decision is a difficult one and the risks attending any policy are great. The immediate advantages appear to lie with the strictly national approach. It can be argued that a bilateral negotiation with the United States will secure a larger share of Marshall aid for Britain than could be obtained by any other method of allocation. Out of the first appropriation the British have asked for \$2.2 billion, the French for \$1.7 billion, Western Germany has been put down for \$1.1 billion. These sums account for three-quarters of the total, and it is open to doubt whether the Sixteen would have agreed to so large a proportion of the total going to three only of their number if any scrutiny of national requirements had taken place at Paris; but the British Government is convinced that any smaller allocation would confront Britain with the possibility of economic collapse.

The political risks of a joint scheme seem equally great at a time when large Communist parties are creating such uproar in France and Italy. The conflicting economic claims of the Commonwealth and of Western Europe to the British market could perhaps be worked out, at least so long as supplies remain a greater anxiety than markets. But how long will this be? In the longer term, might not more attractive prospects for Britain lie in moving towards closer association with the English-speaking peoples of America and the Commonwealth and in remaining a resolutely extra-European Power?

These doubts and hesitations have admittedly been deepened by reports reaching this country in recent months on the attitude of many Americans to the British dilemma. On several occasions, the British have been warned that they must "take their place in the queue" with the implication that that place might not be a very high one. The fact that Britain alone could give a lead in Europe, that the existence of both a Commonwealth and a sterling area gave Britain special commitments, and that these commitments were a factor of stability in an unstable world—none of this appeared to have made much impact on the American official mind. Thus at a time when bold and courageous thinking in Britain could have matched the generosity of the Marshall offer, the British were thrust back upon a defensive state of mind.

Yet even if the reasons for the timidity of present British thinking can be understood, the timidity itself is no less dangerous. It is dangerous, in the first place, because it leaves the United States with no alternative but to shoulder directly the major burden of intervention in the affairs of Western Europe. If the nations will not seek agreement among themselves, the only possible arbiter is America. Thus the kind of intervention that can most attract Communist attack seems inevitable. Nor is it certain that Britain can obtain even its limited aim of securing higher priority, if it negotiates directly with America and by-passes its European neighbours. The Americans may be as unresponsive as they have been in the last six months to a special British claim, and once the unity of the Sixteen is split, the other nations will be exercising all the ingenuity they possess to ensure that their own shares are enlarged. Instead of dealing with a responsible European organisation, the Americans may find themselves struggling with a rabble of queue-breaking clients.

These possibilities are all the more unfortunate in that the almost certainly spring from a British misconception of how European multi-national agency would work. Haunted by the United Nations, they are thinking in terms of voting strength and see their priorities fixed by a majority which exclude themselves but includes Iceland. But a functioning multi-national agency need not work according to such a rigid formula. Such bodies as the Middle East Supply Centre and Unrra are not strictly comparable, since in both Anglo-American preponderance was great, yet they worked nevertheless on the basis, not of voting, but of a mixture of economic reality and political good sense. In Unrra, for example, the Russians agreed that Greece should receive three times as much aid as the Ukraine. It is possible, even likely, that a European agency might show some of the same flexibility, particularly if American influence pointed in the same direction. And it is at least arguable that Britain might find its special needs as favourably considered by a Europe hungry for British coal as by an American agency impatient with a Socialist Government.

*

But it is in the longer run, in the perspective of history, that British timidity and hesitation are likely to reap their most dangerous harvest. Geographically, Britain is now an extension of the European Continent, and it is isolationism, no less crass than that of which the Middle West is accused, to believe that a purely extra-European existence is open to Britain in the twentieth century. It is indeed a profound contradiction in British thinking to imagine that America can be drawn into a Europe from which the British wish to cash out. The one withdrawal will ultimately entail the other, and then no dreams of an "English-speaking association" will alter the fact that the British Isles are on the wrong side of the Atlantic.

Economically, the sixteen sovereignties of 1938 are already an anachronism, and since it now seems almost certain that a separated Western Germany must somehow be absorbed in Western Europe, the need for a wider economic integration is immediate. British fears that the creation of a wider market might expose their industrial structure to difficult competition is in reality an argument for precisely that policy, for if Britain is to maintain its position as an exporter, it is common knowledge that something must be done to reverse the mounting trend of its *costs of production*. Another decade of economic protectionism may reduce Britain to a position in which over-costly British goods can no longer find foreign markets, and then of what assistance will its carefully fostered isolation prove to be?

It is not necessary to have the poet's eye or the historian's mind to feel that the year that lies ahead, 1948, centenary of Europe's year of revolution, will prove a turning point in history, one of those periods when a nation, when a whole civilisation perhaps, is offered the opportunity of resolving its conflicts and its instabilities and of moving forward to new frontiers of creativeness and freedom. Whatever criticism may legitimately be made of American policy in the past, or whatever doubts may still be held in reserve for the future, the fact remains that in considering a gift of three and a-half billion dollars to their neighbours in time of peace the Americans are making a departure from settled national policy so startling and so generous that of them at least it can be said that the new challenge has called forth a new response. The trouble lies in Europe. Are narrow interests, old parochialism, legitimate but outdated national policies to stand in the way of any new approach to Europe's needs? And if Britain, once the most far-sighted and enterprising member of the Western community, to take the lead in re-establishing the worn-out pattern of the past?

France in Confusion

AFTER the events of the past week it is obvious that parliamentary democracy in France will have a hard fight for its life. Any democratic system must be able to rely, as a minimum, on three things—on a certain underlying conformity of aim among the various social classes; on respect for parliamentary procedure and hence willingness to accept the vote in parliament as the ultimate arbiter of disputes; and on an equal willingness not to carry unsolved disputes out to the violent arbitration of the streets. In France at present, the largest political party—the Communist Party—flouts each of these three pre-conditions. The subservience of its leaders to Russian foreign policy—dramatically underlined by Thorez's return from Moscow in the middle of this week's turmoil—cuts the party off from even a minimum unity of purpose with the rest of the nation, since it is willing to jeopardise economic recovery to serve the diplomacy of a foreign Power.

As for any acceptance of parliamentary procedure, Communist tactics in the Chamber resemble nothing so much as the methods by which the hundred-odd Nazi deputies brought the Reichstag to an ignominious standstill in the last days of the Weimar Republic. Amid screams of insult—all turning now on who did or did not collaborate with the Germans—the singing of revolutionary songs, forced occupation by Communists of both the rostrum and the hall, parliamentary debate in France has been in virtual abeyance for a week. It may be that if the other parties had shown more restraint, the excesses of the Communists could have been checked, but of their intention to reduce the Assembly to an impotent "talking shop"—worse, a singing shop—there can be no doubt. And the total disorganisation of parliamentary procedure within the Chamber has been accompanied by the fomenting of strikes which, however genuine the economic grievances they exploited, have been purely political in character, designed to bring down the Government and reduce the French economy to a state in which it is unfit to participate in the Marshall Plan.

*

Must the conclusion therefore be that we are witnessing 1922 and 1932 all over again? Is Schuman the Bruening of one more collapsing parliament? Is it only a short step now to the taking over of the French Republic by extremists of the Right who will be ready to crush working-class opposition, sweep away democratic institutions and provide—though at what cost!—the authority without which the violent conflicts of French society must tear the community to pieces? No one would risk the prophecy today that the passing of power to the Right, in the person of General de Gaulle, is either impossible or unlikely. But it is perhaps still possible to say that it is not absolutely certain. The Communists seem to have shot their bolt. In the pattern of strikes in the last weeks, the Communists' first hope was that if they could foment local strikes on the wage issue, the example would prove contagious and nationwide strikes in various branches of industry would become general. The technique was more or less successful in the coalfields and the steel industry but failed when the railwaymen did not follow the local strikers' lead. The Communist-dominated CGT then called a general railway strike and set up a National Strike Committee. But still the trains continued to run—even the trains which should not have been there to fetch M. Thorez from the frontier on his return from Moscow.

In other industries, the answer to the strike appeal has been sporadic. The public services are only partially disabled and many workers in a crucial and symbolic sector, the public utilities, after dimming the lights for twelve hours, have returned to their power stations. The Communist majority in

the CGT can still outvote the Moderate wing—the *Force Ouvrière* which, led by Léon Jouhaux, stands for non-political trade unionism—by eight to one, but the number of workers who, in the security of a secret ballot, vote to return to work suggests that the hierarchy of the CGT is getting out of touch with the rank and file. And in the last week, acts of sabotage of all kinds, but particularly on the railways, have produced a general revulsion, for workers as well as "fascist beasts" travel on trains. A wave of political strikes designed to paralyse the country's administration must either be successful or else its sponsors are left worse off than they were, with their bluff called and their weapon broken. The dynamics of the French situation may therefore turn against the Communists now that a great mass of workers is beginning to show a willingness to stay at work.

Another hopeful factor is the still tentative and unorganised state of the extreme Right. General de Gaulle's strategy is obviously to wait until the implementation of the Marshall Plan gives him some economic elbow room and the next elections give him a comfortable majority of the votes. But the timing is important. The French remain a libertarian people, and the memory of their dictators from Napoleon to Pétain is not exorcised. If aid under the Marshall Plan were to begin to restore a reasonable economy, it is not certain that the vote would be for the extremes. If Communism slackens and economic hope increases, the General may find himself with every advantage save that desperate situation he needs in order to become France's "saviour."

It is above all the fact that economic assistance—possibly on a massive scale—is on the way that distinguishes France today from the hopeless Germany of 1932. No moderate Government can survive the degree of economic maladjustment prevalent in France today. But it is just possible that it may not be asked to do so. The present wave of strikes, which have genuine economic roots, should not be allowed to mask the fact that between whiles the French have been working hard and well, with industrial production in October well above the level of 1938 in key sectors such as coal, steel, electricity, building materials, and a number of heavy industries. In production at least—distribution is another matter—France is suffering more from the maladjustment of the world economy than from any lack of effort on its own part. Hence there is hope that the Marshall Plan, by ending some of these maladjustments, will allow French production to reap its reward in better distribution, in rational prices and restored finances.

But to seize these chances of saving the Republic, M. Schuman's Government (or any other coalition which may succeed him) must face an incredibly delicate and difficult winter. The Communists' momentum has probably been broken. But they retain an enormous nuisance value. They will offer every provocation to an exasperated Government to strike not only at them, but through them at the whole idea of trade union organisation and at the working class itself. The aim of any moderate Government now should be to foster and strengthen at all cost the growing moderate wing of the CGT, to be scrupulous in its defence of the legitimate rights of the workers, and to seek a *ralliement* of all trade unionists who are sick and tired of Communist excesses, but rightly suspicious of a strike-breaking Government.

In this context, the Emergency Laws which are being passed by the Assembly in the teeth of hectic Communist filibustering, give grounds for uneasiness. M. Schuman has proposed six laws to Parliament, only one of which has been passed so far. The first Act calls to the Colours 80,000 additional men. In

view of the sabotage and the strikers' violence in towns all over France there can be little quarrel with this, nor can there be much objection to the third Bill—imposing heavy penalties for sabotage or violence against non-strikers. But the second, fourth and fifth, which lay down penalties for "interfering with the right to work," could easily become instruments breaking the right to strike. These laws have embarrassed M. Jouhaux and the moderates within the trade union movement. Had the Communists fought a parliamentary battle with force and reason on these points, they could probably have swung the Socialists away from the Government. Instead they chose to reduce the Assembly to a bear garden.

The second difficulty facing any moderate Government is the reality of the workers' grievances. The misery in the great cities of France has now reached such a pitch that even without Communist fomentation a strike wave would have been inevitable. The root of the evil is food prices and the black market. Between July and October, it is estimated that retail food prices have risen (1938=100) from 974 to 1309 and the rise was even sharper in November. Wages have never bought so little, not even in the trough of the Occupation. In these conditions a revision of wage rates is inevitable and it would almost certainly be the course of wisdom on the part of the Government, in its negotiations with the CGT, to concede—to M. Jouhaux if possible—the immediate increase of the minimum wage from 7,000 to 10,800 francs a month and to recognise that if further startling advances in the cost of living occur, further wage adjustments will be necessary.

Admittedly such a policy entails the risk of giving the final spin to inflation, but the policy of increasing wages—the Communists' only sound plank—could be combined with a new effort at stability in the crucial sector of food. Many economists now argue that industrial prices should be allowed to rise again to absorb part of the new wage increases and that the Govern-

ment should concentrate its efforts and its rigours in bringing sanity back to the food market. Draconian measures against black marketeers have been passed by the Assembly, but have remained in abeyance. They should now be used to disgorge the hoarded food held by peasants and wholesalers alike and thus to allow increased supplies to reduce the skyrocketing prices in the towns. The Government would better assert its authority by imposing hard labour on the largest black market operators than by passing anti-strike laws which could give the Communists an opportunity later to restore their authority. Incidentally, the distribution of the food provided by American interim aid could be made a useful adjunct of the Government's policy for food.

Yet having searched the dark skies of France for a break in the clouds and having found a timid ray of light here and there on the horizon, one has to admit that these possibilities open to moderate government depend upon its own coherence, energy and vision. And it is here that pessimism must grip any honest observer of the French scene. Although for the time being, the Communists have succeeded in creating a solid majority against them, it is a negative coalition and M. Schuman (or any successor to M. Schuman) will have the greatest difficulty in holding together a team which includes the Left wing of the Socialists, the wary conservatism of many MRP members, and is under constant pressure from General de Gaulle's group on the extreme Right. Save on the question of quelling the Communists, what issue unites these men? On what methods of government can they agree? Can they even accept the basic principle that in the bitter months ahead some attempt shall be made to ensure that France's hardships are evenly spread and borne? It is the likelihood that no figure or group in the Centre has either the vision or the leadership to make centre government viable that leads even France's warmest friends to "despair of the Republic" and to look over their shoulders apprehensively at the waiting General.

Transport Next Year and After

AN article in last week's issue of *The Economist* on "British Railways" analysed the scheme which the British Transport Commission has framed for the Railway Executive. Its conclusions, unfortunately, were more than a little sceptical. It found that the scheme lays too much emphasis on technical direction of British Railways from the centre, and makes too little provision for the general function of management, which alone is capable of stimulating, guiding and sometimes restraining the technical specialists. This view seems to be widely shared by commentators on the scheme, and it has not been overthrown by subsequent statements on behalf of the Commission which have sought to show that the Commission itself will exert the functions of management, following the principle of the existing boards of railway directors, while the Executive, apart from its specialist character, will be able to view questions of railway administration and policy from a broad, and not merely a technical, angle.

This comes close to saying that management will reside in two bodies, one of which happens to be the master and the other the servant. But there are several quite distinct aspects of the management problem. Technical management is required in each of the Regions, and all of the Regions have in turn to be brought under a common technical supervision exerted by the Executive. General management, at the level roughly equivalent to the railways' general managers, but shorn of almost all of the latter's powers, will repose in the Chief Regional Officers. But their functions will be co-ordinating rather than originating, and it remains to be seen how far they will be supported by the collective authority of the Executive. As for the

Executive, the scheme exposes it to the mortal danger of remaining a collection of technical experts, and not a body of collective views and authority. At the apex, the Commission will be responsible for the broadest policy; at the base of the pyramid, the local technical staffs will be in charge of day-to-day working. The gap is in the middle; there is no intermediate layer of general management linking broad policy to the running of the railways.

Discussion is now turning on the extent to which this primary defect might be remedied. Can the Executive be expanded to include general as well as functional members? Not under the present Act, for that limits the size of each Executive to a chairman and not more than eight other members, and the Railway Executive already has its full statutory quota. But sooner or later this problem will have to be solved. It may be that, as in France (where this same problem of decentralisation and regional control arose after the nationalisation of the railways in 1938), the Chief Regional Officers may ultimately be established on a parity with members of the Executive, thereby providing them with effective power ultimately derived from the Chairman. Or it may be that the Railway Executive should be enlarged and divided, for certain purposes, into general and functional sub-Executives.

In terms of day-to-day working, this will not be an immediate problem on January 1st; it is likely to be far less important than the physical difficulties on the railways, but for which the momentum of the existing railway organisations would keep the services going with fair efficiency. But defects on the management side will become more serious when the real tasks

for which the Commission and Executives were set up begin to be tackled. Nationalising the railways is easy, in the sense of exchanging a Government-guaranteed stock for the existing railway capital. The railways could go on much the same as before. The scheme shows that it is intended that they should go on as before for a considerable time ahead. With the single exception of the Scottish region (which is as much a question of politics as of transport), all the existing systems remain intact. Even the Great Central line from Marylebone, which the Commission's own map suggested would come under the London Midland Region, will (contrary to what was said here last week) remain under the control of the Eastern Region. There need be no complaint about the absence of drastic changes; it will be quite enough to take over the railways on January 1st and keep them going during the remainder of the winter.

But quite soon after that the Regions will have to evolve new ways of handling traffic more efficiently. The Regional principle is a good one for exerting effective control over permanent way and motive power. When eventually all the joint lines and penetrating lines are allocated to the Region through which they run, there should be a real opportunity for the rearrangement of locomotive sheds, for standardisation of practice on permanent way, and for more effective traffic control. These will be some of the advantages which may emerge from the railway side of the nationalisation of transport, quite apart from what may happen to co-ordination of all forms of transport in the wider sense. But these gains—even if they come at all—will be slow to fructify, and they will require a great deal of capital expenditure on interconnections and traffic control systems. The task is to make the most efficient use of railways which grew a century ago from the forces of competition, but which have been allowed very often to degenerate into duplicate systems. Many of their old services have been kept on the time-table as a matter of tradition rather than of economic need. This is not an argument for cutting down services as a whole, but for concentrating—and increasing—them along the routes where they serve and attract the bulk of the public, and it is an argument against running services on particular routes merely because a line was built there a hundred years ago and trains have been running on it ever since.

For these tasks, there must obviously be some centralisation of technical management. But for others it is more doubtful whether centralisation is right. Commercial management is one of them. Centralisation may be important for the development of passenger and freight traffic in the country as a whole, but the regional commercial officers must be left with a very large measure of autonomy if the commercial relations of British Railways with its customers are to be fruitfully developed. A large measure of devolution will also be required on operating questions. All these problems will have to be considered as

they arise, but there is little doubt that they would be simpler to solve if the Chief Regional Officers were armed with effective authority.

★

The discussion of the past ten days has turned almost exclusively on the future management of the railways. But it is necessary to remember that this is only one element, though a most important one, in the problem of co-ordination of transport, which is the Commission's ultimate duty. The Commission can only proceed by stages. It has to take over the railways, London Transport, and the canals on January 1st. And it has been left with discretion when to take over road transport undertakings. The railway scheme obviously takes little or no account of co-ordination of railways and roads—inevitably it could not do so. On the road side, two quite separate problems arise. The road passenger industry already consists of large integrated undertakings, with some of which, it is reported, the Commission has lately been discussing arrangements for taking over. On the other hand, the road haulage industry is a sprawling affair comprising 48,000 licensees, most of them small operators, with 140,000 vehicles. It is presumably the difficulty of coping with so many separate cases, and of satisfying the complicated procedure which must be followed in each of them, that has led to the belief that the sections of the Act dealing with road haulage may not become effective for a long time to come. At any rate, the first step towards implementing them—the appointment of a Road Transport Executive—has yet to be taken. Until that happens, co-ordination can only remain a dead letter. All the preliminary work, like the study of flows of road and rail traffic, the planning of zonal collecting and delivery arrangements, the development of road feeder services to railway centres, the closing of country stations and branch lines and their replacement by road services—all the factors which arise in the welding of the road and rail systems to provide optimum loading of vehicles, the cheapest form of transport for particular traffics, and the cutting out of duplicate services—will remain unstudied. There must be no mistake that this is the real task: unless it is solved, it will never be possible to provide an efficient unit of transport service for each purpose at the lowest real cost.

Associated with these problems is that of charges and rates for transport. Many would agree that Part V of the Transport Act, which deals with charges, is the least tangible part of the Act. The Commission is enjoined to prepare and submit a charges scheme in respect of the services and facilities which it provides, and to do so within two years of the passing of the Act, "or such longer period as the Minister may allow." The power of extension will almost certainly be required, for it is quite improbable that the Commission will be in a position by

The Gap between

..... inadequate capital and the provision of essential income for dependants may be bridged by the capital and income benefits secured through the Family Provision Scheme

EQUITY & LAW

G/47

August 6, 1949, to recast the charging systems at present employed by the railways and the road hauliers. How is the present system of merchandise classification to be modified, if at all? Will the present 21 classes be the right ones for a co-ordinated rail and road transport system? Are the present differentials per ton-mile in favour of longer hauls sufficient to encourage through traffic and to divert short-distance haulage, where possible, to the roads? Will the Commission be able to introduce new economies in handling charges—the “terminals” which are now so relatively costly, partly because so little has yet been done to mechanise the work in the depots? And what of the mass of exceptional rates which are the product of road competition and account for as much as three-quarters of the merchandise revenue of the railways? Road competition had eroded the old system of classification, even in cases where it had some force of logic and reflected differences in the cost of handling different classes of goods. Is the right course to

Last Chance in Palestine

R IOT and murder in the Holy City have given a swift foretaste of the lawlessness that may be expected to result from the United Nations' attempt to convert Palestine into a Jewish “State” from an armchair at Lake Success. As a matter of coldly reasoned tactics, it would be foolish for an Arab resistance movement to start trouble now, while the British are still in charge. But no such organised resistance movement yet exists; Arab cohesion is loose, and the Arab leaders can incite, but scarcely yet control, the mass of their followers, who can only too easily get out of hand. So they will react in their fashion, which will be neither very wise nor very efficient. But for the moment it is not the Arabs but the United Nations who are on trial. It must be said that if the members of the Assembly had wanted to set the Middle East aflame, no more likely way of doing it could have been found than the conduct of its Palestine Committee, culminating in last Saturday's vote for partition.

What was, in fact, voted at Lake Success on Saturday? It is necessary to look back a little. Since it came into power, the British Labour Government has made a series of attempts, sometimes with American help, sometimes in the teeth of American opposition, to secure Arab and Jewish agreement on a plan for Palestine. It is worth emphasising that the form of these plans, particularly their avoidance of the word “partition,” was chosen in deference to the fact that partition was then rejected by the Zionists as well as by the Arabs. At the same time, the immigration provisions of the White Paper of 1939 were suspended; and since the final White Paper quota of 70,000 became exhausted in 1945, nearly 270,000 more Jews have been admitted to Palestine. Several offers were made to the Zionists to discuss a substantial increase even in this immigration rate, provided that they would call off illegal immigration and co-operate with the Mandatory Power in suppressing terrorism. The Zionists always refused.

It must be recorded for history that this continuing intransigence was due to a stubborn and monumental miscalculation by the Zionist leaders, who based their whole policy on the assumption that Britain could not “give up” Palestine. This allowed them to believe that non-cooperation, and illegality, and murderous attacks on the very forces which were responsible for their presence and prosperity in Palestine would never lead to a withdrawal of these forces.

The Labour Government has taken the view—which may, perhaps, be criticised on practical grounds, but is difficult to challenge as correct international behaviour—that, failing an agreed plan which could be submitted to the Trusteeship Council or other appropriate organ of Uno, the future of Palestine must be referred to the United Nations and could not be

abandon classification by the class of goods to be carried, except of the broadest kind, and then to fix the rates as between road and rail so that local traffic is attracted to the former and through and bulk traffic to the latter?

No one can possibly know the right answers to these questions at present; on the railway side there is insufficient material to answer them (largely because there is no satisfactory analysis of railway costs available), and on the road side there is no material at all. And the whole level of charges has been made far more onerous than it should be by requiring the Commission not merely to provide out of revenue for the depreciation and renewal of its physical assets, but also to make “proper provision for redemption of capital.” So, in addition to keeping its physical assets intact, the Commission is bound under the Act to redeem its financial capital too. The economics of co-ordination will have to be very great indeed to offset this ludicrous double burden, which will satisfy no one except the Treasury.

decided unilaterally by Britain. The issue was, therefore, referred, only in the most general way, to the Assembly. Perhaps it would have been better to make it quite clear there and then that Britain would not accept responsibility for enforcing a policy against either the Arabs or the Jews; but here again the desire not to prejudge the deliberations was correct.

When the majority and minority plans of the Special Committee of investigation were published, Britain duly announced its attitude on enforcement and its determination to withdraw. This statement was practically ignored by the Assembly, which appointed a sub-committee to work out a plan of partition on the basis of the majority report, and, almost as an afterthought and a sop to the Arabs, another to draw up a plan based on the minority report. The latter, after the resignation of an embarrassed Colombian delegate, consisted entirely of representatives of Middle East States, India and Pakistan. With the help of its British expert it did some intelligent work. Its conclusions would have provided an answer to the accusation that the Arabs were unconstructive, if anybody had paid any attention to them, but they were ignored. All attention was concentrated on the Partition Sub-Committee, which included four pro-Zionists, together with the Jewish Agency delegation, which was practically allowed to function as a member. In the end, the sub-committee retained the substance of the majority plan.

Indeed, they made the prospect of Arab-Jewish agreement still more remote by making revisions of the boundaries which, on balance, definitely favoured the Jews, who had already been given more than they deserved by the previous plan. These revisions have been done so recklessly that in scores of instances Arab villages have been separated from their lands. The only concession to common sense made by the sub-committee was its adherence to a separate regime for Jerusalem.

During these proceedings, Sir Alexander Cadogan had to remind the Assembly several times that British troops would not be available to enforce any partition scheme not agreed between the Arabs and Jews. There followed an attempt by the US-Zionist combination to involve the British in enforcing partition “by the way.” This was circumvented, and the British Government has stuck to its position that withdrawal really means withdrawal, and non-enforcement exactly what it says. Also defeated was an attempt to have the date of termination of the Mandate fixed by the United Nations, which might have had the effect that the British would still be compelled to maintain law and order while the UN commission was carrying out its partition scheme.

The Zionists then tried to secure a United States guarantee of enforcement, but here the Americans let them down. The

aid of American forces was firmly refused. At the same time the Americans treated with the most astonishing levity the possibility of Arab resistance. Since no American soldiers were involved, it was easy to dismiss the Arab side of the matter with airy references to Arab disunity. The sub-committee finished its work with a haste in keeping with the tragic unreality of its whole approach, the American whip was sent round, and the Assembly accepted the modified partition scheme with something over the requisite two-thirds majority. A commission consisting of five members, appointed by Bolivia, Czechoslovakia, Denmark, Panama and the Philippines will go to Palestine to take over authority from the Mandatory, on a date to be negotiated, and will attempt to carry out the partition scheme. How the Commission can hope to succeed is clear to no one. Its authority in law is, to say the least, doubtful; the lack of any effective force except the Jewish militia to back it will probably deprive it of what prestige it may enjoy as a representative of the United Nations. Its one hope of doing its job at all is its right to invoke the Security Council's aid in enforcing partition. But quick and effective action by that body is always subject to veto: that is why the Russians insisted that the Commission's appeal should be to the Council and not to the Assembly.

Is it too late to avoid the drastic consequences of the intrusion of America's internal politics into the Middle East? The position of the British Government is that it will lay down the Mandate at the wish of the Arabs and the Zionists, and on the recommendation of the United Nations, to say nothing of the insistent desire of the British people. In so doing, it will refuse to involve itself in further conflict with the Arabs or the Jews by enforcing a policy to which either does not agree. Consequently, it will hand over authority neither to an Arab nor to a Jewish body but to the United Nations, which has appointed a Commission for this purpose. The details of withdrawal will now be negotiated with this Commission, including the disposal of assets and liabilities, and the future of British and other foreign economic interests in the country. This position is unassailable. There would now be no support in Britain, except from a few Zionists, for any second thoughts.

NOTES OF THE WEEK

Cutting the Coat?

The White Paper on capital cuts (Cmd. 7268), which is discussed in an article on page 928, contains no surprises. Investment, which for the year 1948 was originally forecast at £1,600 million, is to be cut down by stages, reaching an estimated annual rate of £1,320 million by the end of the year, the total saving for the year being £180 million. The two chief categories contributing to this reduction are construction (houses and factories) and plant and machinery, and it is the latter which will have to bear proportionately the bigger cut. How exactly this cut is to be applied to non-governmental programmes is not very clear. The Government has rightly shown itself reluctant to reintroduce licences for the acquisition of plant and machinery and is therefore relying for the present on its powers of persuasion. As a first step new instructions have been issued to the Capital Issues Committee. On the constructional side, the building of new factories is to be suspended for at least six months and extensions now in progress which have not yet reached the steel erection stage will be reviewed with the object of postponing at least half. But when it comes to housing the knife has been used far less drastically. The 260,000 houses under construction are all to be completed, as well as the 90,000 in tenders approved but not yet started. And even after the cuts it is expected that the Government's original target of 750,000 houses will be reached early in 1949.

While it would be difficult to raise objections to any of the actual cuts imposed, the programme as a whole must be condemned as both inadequate and unbalanced. No hint is conveyed in the White Paper of the inflationary pressure exerted by a capital programme so greatly outrunning the volume of real savings—a cloud to which no silver lining is apparent, when the total of national savings is still about £100 million less than this time last year. Nor can the pruning of capital investment to the

But as the day for facing these facts draws nearer, there are signs that the Zionists and their American sponsors are beginning to understand what they have taken on. It is still not out of the question that the Americans may yet, at this desperately late hour, take courage to restrain the Zionists and insist on a solution which will give moderate Arab opinion some incentive to keep the peace around the pipe lines. There have already been Zionist overtures to the British Government, betraying a realisation that, without British support, American encouragement is little better than incitement, which may do them more harm than good. Perhaps there may be here the beginning of a process which might lead to some arrangement in Palestine which the Arabs would accept. This must, however, involve a drastic revision of the whole partition scheme. For it must again be emphasised that, from the most moderate point of view, the boundaries laid down in this scheme are iniquitous. Quite apart from the ruthless dissection of Arab lands, it concentrates almost the whole economic potential of Palestine—a creation not only of Jewish but also of British and Arab effort—in the Jewish “state,” leaving an impoverished rump of Arab agriculture to await ultimate absorption by one or other of its neighbours. Arab resistance to this basic feature of the scheme is a foregone conclusion.

In other respects, the scheme has some good features, and the Arabs might be induced to see that partition is only a name for something which might just as well have been called a federal union. It does not seem impossible that the Uno Commission, faced on the spot with the certainty of Arab non-co-operation and sabotage, could exercise its right to invoke the Security Council. If that happened, there would still be a hope that the Americans would have a change of heart, and the Powers, with Britain, reconsider their approach. The trouble is that the Commission must first attempt its task, and this may involve further bloodshed. Time is now short; the British will be out in eight months' time, and nothing but a fresh approach by the Americans to a problem vitally affecting their economic and strategic interests can justify the slightest modification in the attitude of the British Government.

tune of only £180 million really be regarded as a satisfactory contribution to the solving of the national economic crisis. Housing, the one item which offered an opening for substantial retrenchment, has been pruned, it is true, but merely to the measure imposed by the world timber shortage. In refusing to cancel, or at any rate greatly to curtail, the building of houses not yet started, the Government has missed a great opportunity of showing that it is strong enough to follow the national interest even when it hurts their supporters. A certain amount of snipping has been done, and that in the circumstances must be counted as all to the good, but the national coat has not yet been cut according to the cloth. And yet the drain of another £48 million from our gold reserves during November should have been recognised as the red light. Must it once more be a case of “too little and too late”?

* * *

Mr Molotov Has His Way

To the ordinary newspaper reader it seems that the Foreign Ministers at Lancaster House are getting nowhere. The direction in which they are moving only becomes visible when tactics and motives are disentangled from the news. So far the tactical advantage lies overwhelmingly with Mr Molotov. He manoeuvred Mr Bevin and Mr Marshall into a political discussion although they and their advisers were convinced that economic matters should come first. He then turned what was intended to be a discussion on procedure into a debate for and against setting up a German central government now—before the peace conference even begins work.

By the middle of this week he had got his western colleagues into a position where they sat contemplating helplessly the following argument: all want a central government sooner or later, but they disagree about when it should be set up, what territory

it should control and who should be in it. So why not, the argument runs, agree now that there shall be a central government and leave discussion of the details till later? Mr Bevin and Mr Marshall know that if they refuse to commit themselves in this general way, Mr Molotov's stock in Germany as defender of the unity of the Fourth Reich goes up; if they do commit themselves they may later find themselves quite unable to accept Russian ideas of what sort of a central government Germany should have and of how the frontiers should lie. And they would then be tempted to go back on their agreement that a government should be formed. As it is, the discussion has gone on long enough for the Germans to be impressed by Mr Molotov's case, and for the politicians of the Russian zone to pose as the patriotic leaders of their country. Who would have thought such skilful use could have been made of discussion on an item which is called "preparation of the German peace treaty (frontiers and procedure)"? And all that the Ministers were supposed to be doing was to try to knock out of the Moscow drafts the bracketed passages recording their disagreements.

If this question of a German central government becomes crucial, it may be M. Bidault who will do the vetoing for a change. Neither logic nor national interest will allow him to consent to the establishment of a German government until he has assurances about the Saar, the Ruhr and the control of German recovery. And there are many reasons why Mr Marshall should, now or later, come to the support of M. Bidault. Mr Bevin's tactical intentions remain obscure.

* * *

Motives As Before

Now for the motives. Mr Bevin and Mr Marshall—and perhaps M. Bidault too—must have continually in mind this question: how will a unified Germany be able to play a part in the Marshall Plan? Clearly, if the resources of western Germany are to be removed from its sphere, the plan would have to be recast. And it is scarcely conceivable that Mr Molotov would allow a central German Government even to consider playing a part in the plan. Yet the opportunity to state this dilemma frankly and firmly was missed when Mr Molotov, early last week, taunted his colleagues with having in mind plans for the reorganisation and government of western Germany in case the conference should fail. Instead of saying "Yes, of course we have; and so has the eastern zone," they protested innocence with an injured air. With the battle of the Marshall Plan raging in France and Italy and Greece, it is almost ludicrous to see the Ministers cautiously avoiding all mention of the principal stake in their diplomatic game. One consequence of this evasiveness is that the Germans of the west watch impatiently for a clear sign of what British and American policy is to be.

As for Mr Molotov's motives, they seem clear. He probably wants agreement, but not desperately. Therefore he is using this first stage of the conference to lay before the world everything in the Russian case that appeals to Germans. He knows that when economic matters come up Germans will not rejoice to hear of his demand for reparations from current production. And when the awkward question of the eastern frontier arose, he just refused to discuss it. If the conference should fail, then the Russians will come out of it well in German eyes. The eastern zone, in the heart of which lies Berlin, would have a flying start in any bid for German popular favour. And that, in the long run, is probably what Mr Molotov wants—a Germany controlled by Berlin, with the Communists and extreme-left Socialists of his favoured party making life as uncomfortable for west German democrats as it has been made in Hungary, Czechoslovakia and Poland. Mr Molotov's determination and single-mindedness are exemplary.

* * *

Dilemma for Good Germans

The democratic parties of western Germany have been speaking much more frankly and emphatically about Russian and German Communist manoeuvring than have Mr Bevin and Mr Marshall. They have resisted from the first the campaign organised in the eastern zone to get a group of "representative" Germans stating their views to the Foreign Ministers' Conference. When a dozen prominent Germans were called together in Berlin ten days ago by Dr Friedensburg (a Christian Democrat) to discuss how a group representing all Germany could be sent to London, Dr Schumacher had the former Reichstag President, Paul Loebe, expelled from the Social Democrat Party's foreign policy committee for attending the meeting, and declared in an

official statement that it was impossible "to find a common German point of view with the quislings of a foreign Power." Strong language, perhaps, to come from the British zone, but quite understandable in anyone who finds nauseating the ability of the east German Communists to be stridently nationalist in one breath and completely silent about Mr Molotov's defence of the eastern frontier in the next.

It stands to reason that the Social Democrats and Christian Democrats, representing the majority of western Germany, would be taking the first step towards political suicide if they allowed themselves to be led by the Communist-controlled Socialist Unity Party (SED) of the Russian zone, even under a nationalist banner. The dangers of the course now set by the east German politicians have also been seen by Jakob Kaiser, leader of the Christian Democrats in the Soviet zone, who has refused to take part in the national congress which the SED is organising in Berlin this weekend. So far he has been the one man in the zone able to maintain a firm opposition to the SED; but now he stands in danger of being called a bad German because he refuses to take sides in the east-west quarrel.

The dilemma which now faces non-Communist Germans has come earlier in Germany's post-war history than was feared or expected; and Mr Molotov has spared no efforts at the London conference to make it clear. If they join in the agitation for the German case to be heard now, for a central government to be set up as soon as possible, and for the peace treaty to be freely negotiated between victors and vanquished, they must do so wholeheartedly and in full co-operation with the eastern Communists—otherwise they will become not leaders but followers. Yet if they do so, they may well run headlong into the objections that the Americans and British and French present against approving a political settlement until there is agreement on economic unification. At the end of that path lies the mobilisation of German opinion in all four zones against the western Powers, and under Russian leadership.

On the other hand, if they stand aloof from the agitation the following might happen: the Russians in London might win the case for a central government in Berlin and the credit would go to their supporters in the eastern zone. When the men of the west came to take part in negotiations for the formation of this government they would face triumphant delegates from the east, exulting in the success of their *Realpolitik* and in the power of their nationalist feeling. It is difficult to escape the conclusion that the Germans of the west would fear and distrust German unity on these terms; but it needs great moral courage for a German to say so. And the example has yet to be set by Mr Bevin or Mr Marshall.

* * *

By-election Results

The three by-elections last week must have disappointed those who interpreted the results of the municipal elections as portending any rout of the Socialist vote. The Government maintained its record of no lost seats since the general election, and the trend against Labour, though it exists, is not yet so strong that a Tory victory at a general election would be certain. At Gravesend, where the possibility of a Labour loss was widely entertained, the percentage of the total votes cast that went to the Labour candidate only fell from 52.45 per cent to 51.75 per cent, though in the absence of a Liberal candidate in the by-election the Conservative percentage rose from 35.33 per cent to 48.25 per cent, a rise very nearly equivalent to the percentage of 12.22 returned by the Liberal candidate at the general election. At Edinburgh (East), where a by-election had already intervened in October, 1945, the change from the proportions of the general election was rather greater, the Labour percentage falling from 56.40 per cent to 50.33 per cent. The Conservative percentage also fell from 37.32 per cent to 34.34 per cent, and in this case there was a Liberal candidate in the by-election who polled 10.10 per cent, whereas there had been none in the general election. In Howdenshire the Conservatives retained the seat and increased their percentage from 55.92 to 64.03. The Labour percentage fell from 29.23 to 25.50, and the Liberal percentage from 14.85 to 10.47. The Liberal candidates in both by-elections forfeited their deposits.

The interpretation of these results affords ground for some interesting speculations about the Liberal vote. A cursory analysis seems to suggest that at Gravesend a substantial proportion of the Liberal vote went over to the Conservatives, while at Edinburgh the accession of a Liberal candidate drew votes away from Labour rather more than from the Conservatives.

The Liberal vote, where there are no Liberal candidates, is the core of the "floating vote" and these by-elections suggest that at present it is floating away from the Government. This indication, taken in conjunction with the municipal elections, show that there is a definite swing over of public opinion to the Conservatives, though they do not indicate that the Government has yet become really unpopular. Indeed, the swing-over appears almost surprisingly small, considering that the Government has been in office for over two years, and has been forced to revert to a policy of austerity, which must have displeased a large number of electors. But that may best be explained by the wholly negative character of the Opposition, which has failed to produce any alternative policy. Perhaps, after all, the Government's position could best be illustrated by the remark of King Charles the Second to his brother: "No one is going to kill me, James, to make you King."

* * *

Criminal Justice

The Criminal Justice Bill was debated in the House of Commons on Thursday and Friday of last week and received its second reading without a division. It was clear from the debate that Members did not intend to approach the Bill in any party spirit, which is all to the good. Substantially the main provisions in the Bill do no more than enable the criminal law and the prison authorities to catch up with public opinion. The most satisfactory thing about the debate was the Home Secretary's definite assurance that opportunity will be given to incorporate in the Bill any view which the majority of members take on the subject of capital punishment, and that the vote on that occasion will be free.

The details of the debate do not add very much to the views formed when the Bill was first introduced. The Bill is not revolutionary. Its provisions provoked no violent attacks even from those who believe that one remedy, be it corporal punishment or its abolition, is the one answer to any particular sort of crime. On the contrary, the debate was marked by a broad reasonableness on every side. The Bill is a compendium of desirable reforms, and as such it deserves the support that it has and will receive. The only danger is that, when passed, it may tend to lull the official mind into a state of self-satisfaction, of feeling that everything connected with criminal law was tidied up in 1947 and that the whole subject may, therefore, be put away in the pigeon-hole marked "no action before 1957." There are gaps in the Bill, as various members pointed out. Clumsy and archaic legal procedure, uncertainty of thought and lack of imagination over sexual offences, the problem of the associations that a high-spirited but non-criminal child may pick up if sent to a remand home. All these problems still remain.

On the question of the abolition of the death penalty the debate was not at all conclusive. It looks as though very many Members, wisely, are reserving their final judgments until the time comes when the issue can be debated and decided by itself.

* * *

Italy: Another Greece?

On the whole, the Italian Government has been having an easier passage than the French. The Christian Democrat administration of Signor de Gasperi is firmly buttressed on its own votes and on those of the Right, who have no de Gaulle to detach them. The economic policy pursued by Senator Einaudi—one of deflation at home by contracting bank credit and of devaluation abroad to bring the lira into line with its true value—has had some immediately beneficial effects in falling prices and greater incentives to foreign trade (although the more distant economic and political results of increasing unemployment have yet to make themselves felt). There is thus no feeling in Italy, as in France, of a crumbling coalition and a faltering financial control.

Yet all is not well. The Communists, and the Nenni-Socialists who work with them, have resorted to strikes with increasing energy in the last weeks, and the strategy of these strikes reveals one weakness in the Italian situation which France is spared. The big strike of the week took place in Milan, where the Communist party disputed the Government's right to dismiss the mayor (who, the Government claimed, had shown too much leniency to Left-wing demonstrators). Not only was a day's general strike successfully held, but a "Citizens' Committee" forced the town hall and maintained a disciplined and soldierly occupation for twenty-four hours. The Government's reply—to move troops northwards and to hedge on the removal of the offending mayor—settled none of the issues, and the Com-

munists jubilantly threatened another general strike, while Genoa, Turin and Venice made plans to follow suit.

All these cities are strong Communist centres. They contain the greatest concentrations of Italian industry, and any occupation of the Northern plain cuts Italy off from Western Europe. And it is precisely some sort of occupation that many Italians are beginning to fear. Italy, unlike France, has a frontier on the Russian world, and when some deputies in the Italian Assembly recently expressed their fear that infiltration across the Yugoslav frontier might turn Italy into "another Greece," they were stating the Government's chief anxiety. The North is as vital as it is vulnerable, and many Italians would feel happier if these were not the days scheduled for the withdrawal of all British and American troops save for the small garrisons at Trieste.

* * *

Slovakia's Duel with Prague

There is a slight lull in the struggle for power in Czechoslovakia, which is less noisy but no less tenacious than that now raging in France and Italy. Since November 18th Slovakia has had a new provisional cabinet—or Board of Trustees—which contains representatives of the two minor parties—Slovak Social Democrats and Freedom Party. The Communist demand for the "trusteeships" of food, agriculture and justice, though supported by the trade unions and by a stormy meeting of bogus "farmers' delegates" in Bratislava, was successfully rejected. The first two remain in the hands of the Slovak Democrats, and the third is held by a non-party expert. But it would be premature to say that the Democrats have emerged victorious from this trial of strength with Prague just because they have only one less trusteeship than in the last board and because the Communists have gained no trusteeships of importance. Attached to the board are two new commissions, consisting of representatives of the four Slovak political parties. One will deal with the food situation, the other with the purging of "anti-state elements." Until more is known of their personnel and activities, judgment on the outcome of the crisis, between Communists and Democrats, should be suspended.

It is also not clear what changes have taken place in the distribution of power in Slovakia between the Prague government and the Bratislava Board of Trustees. The original proposals of Dr Gottwald, the Prime Minister of the Republic, aimed at loosening the Board's connection with the Slovak National Council, or provisional legislature. Henceforth a President of the Board was to be appointed only on the recommendation of the Prague Government. If two successive recommendations were rejected by the Slovaks the right of appointment would be exercised by Prague. Moreover, the Prague Government should be empowered at any time to inform the Slovaks that any member of the Board had lost the confidence of the Czechoslovak Government, and if such a member were not relieved of his duties he would be dismissed by Prague.

To what extent these proposals, which would render the Slovak representative assembly powerless against Prague, have been carried out is not clear. That the Communist Party is not satisfied with the outcome of the crisis is shown by a statement of the general council of the trade unions, which protests at the reluctance of "certain parties" to admit its representatives to the National Front's discussion on the crisis, and "refuses to accept responsibility for the solution." The trade unions "adopt a reserved attitude" to Dr Buza the new "trustee" of justice. If food supplies to the towns do not improve, and "enemies of the Republic" are not "rigorously dealt with" by the new Board, the trade unions will "have to mobilise the workers for further action." Clearly the Communists intend to go on using their most powerful extra-parliamentary weapon to secure their political aims.

* * *

Defence of India's Frontiers

The departure of Field-Marshal Sir Claude Auchinleck from India after 44 years' service in the Indian Army has fortunately not involved a breakdown of all co-ordination between the armed forces of India and Pakistan. The Joint Defence Council is to remain and will indeed be strengthened by the participation of two Cabinet Ministers instead of one from each side. This common military organisation is now perhaps the most important factor for completing the process of partition without military clashes and for ensuring the future joint defence of the two Dominions at the natural frontiers of the Indian sub-continent. To carry on joint planning in such matters at a time when Indian troops have been in action against the irregulars who have invaded

Kashmir, with the collusion of the Pakistan authorities, has obviously been a difficult task, and it is no discredit to "the Auk" that he has had to abandon it.

Pakistan has been complaining that it has not received its due share of supplies and munitions in the division of the former Indian Army, and it would not be surprising if India were reluctant to transfer materials which might be used for the invasion of Kashmir. On the other hand, anyone thinking in terms not of India-Pakistan conflict, but of joint defence of the old North-West Frontier, which is now the western frontier of Pakistan, must give priority for military equipment to the units actually stationed on it, that is to say, to Pakistan. The British Supreme Commander has had to cope with this dilemma, and has been suspected on the Indian side of partiality for Pakistan; it is at any rate at India's wish that the Supreme Commander's Headquarters has been dissolved. But the problem of providing an adequate defence of the "North-west Frontier" without giving to Pakistan what seems to Indians an undue military advantage over India still remains for the Joint Defence Council to solve.

The new Indian military leaders, who have been trained to think of India's front line of defence as based on Peshawar and Quetta, are probably well aware of the dangers which would arise, not only for Pakistan, but for India, from a complete breakdown of Indo-Pakistan military co-operation and a general upheaval in the trans-Indus border region. The question of Kashmir is closely bound up with the general problem of external frontier defence, for Kashmir is the most northerly section of the frontier and is potentially of great strategic importance. The principality of Chitral, which was a tributary of Kashmir, has joined Pakistan, thus prolonging Pakistan territory to the north between Kashmir and Afghanistan; beyond Chitral there is a tract of high mountains where a long narrow strip of Afghan territory extends along the left bank of the Oxus as far as the border of Chinese Sinkiang and barely separates Kashmir from the Soviet Union. Some of this north-western Kashmir territory now appears to be *in de facto* union with Pakistan by decision of local chiefs, but the situation is very confused and there is more than a possibility that, if no comprehensive agreement about Kashmir is reached between Delhi and Karachi, the northern border region may relapse into anarchy and offer pretexts for a foreign intervention.

Damages for Injury

The text was published at the end of last week of the Government's Law Reform (Personal Injuries) Bill which has been introduced into the House of Lords, where it may expect to receive thoroughly informed consideration before it descends to the Lower House. It sets out to achieve two important reforms in the law relating to the right to recover damages for injuries caused by another's negligence. The first relates to what is known as the defence of common employment. If a number of men are employed by the same employer, the nineteenth century judges assumed (why it is difficult now to see) that each man had accepted the risk that he might be injured whilst at work on the common task by the carelessness of any other employee with whom he was working and, having accepted this risk, in consequence he had no right to recover damages for injury if he were so hurt. No one now has any desire to defend such a rule of law. It has long since ceased to have any real relation to the conditions in industry. The Bill will remove the right of any employer to rely on any such defence in the future, and the only comment that need be made is that it seems a pity that the Government have decided to defer the operation of this provision until the whole of the new legislation relating to compensation for industrial injuries is brought into force.

The second reform is one made necessary by the establishment of a state scheme for industrial accident compensation. Now a workman injured at work has a choice of alternative remedies. He can claim workman's compensation in the form of a weekly sum, in which case all he has to show is that the injury arose out of and in the course of his employment. Alternatively, he can sue for damages, a capital sum, in which case he has to show that his employer was negligent. Both claims, of course, now lie against the same individual. But when the weekly compensation for industrial accidents is payable by the state, a different set of circumstances will exist and, were the law not altered, the workman would be able both to draw his compensation and, where he could prove negligence, sue his employer for damages. The Bill meets this situation in two ways. It cuts down the range of cases in which an employer can successfully be sued for negligence. It also provides that where damages are recovered from

an employer, the court shall diminish the amount actually awarded to the workman by one-half of the value of any state industrial pension rights accruing to him in the five years after the accident.

This proposal is, of course, a compromise, and therefore logically vulnerable. What the Bill does is, in effect, to credit to the employer that portion of the pension rights of his workman for which the state has paid. There would seem to be an equally strong case for suggesting that this half of the value of the pension rights should still be paid by the negligent employer, but should go, not to the workman, but to, say, some central fund for research into those industrial diseases which still levy an indirect toll on the employees in many trades.

Labour in Trinidad

The strikes and violence that were once a common feature of West Indian life, but were virtually in abeyance during the war, revived a year ago in Trinidad, where four strikes occurred during the months of November, December and January. Once again a report (Colonial No. 215) has been made to the Secretary of State on their causes and recommendations put forward for preventing their recurrence.

Once again—is there any area of the world whose economic and social conditions have so frequently been the subject of inquiry, official and unofficial, as the West Indies? Mr Dalley, the trade unionist who made this latest inquiry, himself refers to the appalling housing conditions (housing is too polite a word) described in turn by the Royal Commission of 1897, the Olivier Commission of 1930, the Forster Commission of 1937, and the Royal Commission of 1938-39. Owing to his terms of reference he confined himself mainly to the causes and courses of the strikes last year, the part played by the trade unions and the best way of strengthening the trade union movement; but he recognised that the improvement of economic and social conditions is far more important in preventing strikes and violence than better trade unions, desirable though they are. Nigeria has its Zik, Jamaica has its Bustamante, Trinidad has its Uriah Butler, and he, it appears from this report, is the most fantastic personality of the three. The Forster Report described his activities as potentially dangerous, and the account given by Mr Dalley of his activities during the strikes and in the trade union movement in general shows that his influence was not waning a year ago—if anything it had increased. The villages surrounding the oilfields—on the oilfields themselves housing is of a high standing—"places without any apparent regulation or control or observance of elementary rules as to structure, space or sanitation . . . make an ideal recruiting ground for 'Butlerism.'" The West Indian labourer, ignorant and illiterate, desperately poor, badly fed and housed, and under-employed, makes an excellent recruit.

There are, however, some grains of comfort from this report. Deplorable as the recrudescence of strikes last year was, there were at least no lives lost, which is some progress compared with ten years previously. The trade union movement is at least on a sounder footing than it was. The housing situation is at least now being tackled. But has any real progress been made with the fundamental problem, common to virtually all the West Indian islands: how are their rapidly increasing populations to find subsistence and employment? Until the curse of unemployment and underemployment is lifted, all other action in preventing strikes is a mere palliative.

* * *

The Revised School Programme

The mammoth proportions of the housing programme compared with the schools' programme—or indeed any of the other programmes—is demonstrated by comparing the manpower involved in each. By June next year it is estimated that 525,000 men will be involved in building houses, whereas a mere 23,000 will be busy on work for the schools. The Government have decided to leave this labour force unaffected by any cuts until next June. Thereafter, instead of increasing the labour force, as had been originally planned, it is expected to keep it constant. Since education authorities have not yet set in motion sufficient schemes to absorb the full quota of 23,000, school building work will increase rather than diminish over the next six months.

In the present situation this appears a somewhat paradoxical policy, but the Government are caught on the point of a three-pronged dilemma. First, owing to the decision to raise the school-leaving age last April, they are faced with the prospect of an extra 390,000 children in the schools in the fourteen to fifteen age group;

secondly, having committed themselves to a large housing programme, it is only reasonable to expect that the children in the new housing estates should be educated; thirdly, the rise in the birthrate itself means that more young children are pressing into the schools at the bottom. Faced with these triple demands the Ministry of Education has been able to fight a successful action in defence of its manpower quota and its first-line schemes. Its losses in the skirmish are the proposals for nursery schools and classes, school meals and community centres. These are regrettable, but considering the overwhelming need for compression they have escaped lightly.

Given—and it is a large gift—the decisions on housing and on raising the school leaving age, the present policy in schools is probably right. At the beginning of this year 29 per cent of the classes contained more than 40 pupils, and in some areas the position is now worse. The next move of the Ministry seems to be towards providing better technical education and part-time education in County Colleges, but these must await the situation at the end of next year.

* * *

Uno on Vacation

Englishmen who feel exasperated at the part played by Liberia and Haiti in the decision to divide Palestine can now imagine what the Russians and their voting *bloc* may feel about the session of the Uno Assembly now drawing to a close. The experience of being outvoted by six to one on every major question must have left even Mr Vyshinsky sore; and not a few delegates have been feeling that the American *bloc* of voters has shown itself as blatantly dutiful as the Russian. The system under which Liberia's vote is as good as that of the Soviet Union recalls the age of pocket boroughs when Old Sarum's representative cast as good a vote as the member for Liverpool.

As the delegates disperse they leave some dangerous loose ends and some hard travelling for their representatives. Eleven governments have had to provide members of the Greek frontier commission now starting work in Salonica. Nine governments have to send their men on a journey to Korea, where they may well stay till the spring. Fifty-seven men have to be found to form a "little assembly" which will keep a perpetual watch on situations and problems threatening peace. It too may have to travel. Each of these itinerant or static bodies is boycotted by the Russians and their sympathisers: the travellers in Greece will not be allowed into Yugoslavia, Albania and Bulgaria, and the travellers in Korea are most unlikely to get more than a peep from the American into the Russian zone. The patient diplomats and ex-civil servants who have to spend the winter in this one-sided way may console themselves with this thought: that their presence in such storm centres as the Greek frontier and Korea will have a restraining influence and will ensure that some facts are kept flowing steadily back to a world headquarters.

Their travels may well prove more enjoyable than the first task given to the "little assembly." That body, created—so the Russians believe—to by-pass the veto-stricken Security Council, has to find by next July a way of getting six (or maybe nine) new members into Uno. The Assembly's political committee had resolved that Eire, Portugal, Transjordan, Italy, Finland and Austria would be suitable members; but when it asked the Security Council to reconsider these applications, Mr Gromyko repeated his refusal to accept Italy unless the ex-enemies, Bulgaria, Rumania and Hungary, were accepted at the same time. The right of veto in this question, given up by the United States, Britain and France, was maintained by Russia.

Yet, when all has been said and counted, the diplomatic laurels for the session go to the Russians. After a full-scale American offensive on the Uno front they remain in the organisation. And over Palestine they have had the astuteness and realism to support the United States in a policy which has already turned the Arabs against both the British and the Americans.

* * *

Socialists on the Tight Rope

The fourth International Conference of Socialist Parties ended in Antwerp on Monday without producing any surprises. The ambiguous phraseology of the resolutions on political and economic problems made it clear that such public meetings cannot be expected to co-ordinate an effective international socialist strategy at the moment. To the extent that the world is divided into two camps, the parties from eastern and western Europe find themselves committed to opposite sides. For the Polish and Hungarian Socialists "eastern democracy" is

at least an advance on the pre-war regimes, and they fear that an American victory in a cold or hot war would subject them to a new white terror. However much they deprecate the clumsy and provocative tactics of the Communists, they feel that the course of events in France and Italy justifies their insistence that Socialism is threatened today mainly from the Right. On the other hand, the value they put on continued contact with the western parties was shown by their acceptance of a majority decision to admit the German Social Democratic Party, and of plans to make further collaboration more effective. The Czech Social Democrats took throughout a much more moderate line than their Polish colleagues, and the Italians walked the same tight-rope as the Czechs.

The western parties showed for the first time a realistic appreciation of the importance of the Marshall Plan and of the sacrifices it demands from the American people. The Dutch, chafing under the necessity for one-sided compromises which the presence of the eastern parties enforced, have canvassed views about a regional conference restricted to parties approving the Marshall plan. The Belgian and French parties have at last been reconciled to indefinite delay in reviving a formal Socialist International.

The presence of delegates from the British Commonwealth, Latin America, and eastern Asia, emphasised the trend towards regionalism as the basis of future developments. Socialism is too loose and indefinite a concept to permit the co-ordination of political strategy among parties which face different problems in widely diverse social contexts.

*

No Time for Decision

The same lack of candour and courage in discussion of the Marshall Plan showed itself in the counsels of the World Federation of Trade Unions, when its Executive Bureau met in Paris last week. The Americans, represented by the Congress of Industrial Organisations, pressed the executive to declare its support for the Plan, while the American Federation of Labour has been urging the British TUC to support a special international trade union conference on American aid to Europe. It was agreed not to place the issue on the agenda at Paris, but to defer discussion until the spring, by which time, presumably, the flow of American aid should have begun and the question of trade union co-operation will be to some extent academic. At the same time, the TUC decided to refer the question of a Marshall Plan conference to its economic and international experts, who will report to the General Council this month.

These timid tactics of playing for time may prevent any immediate clash within the WFTU, but they will scarcely resolve the fundamental cleavage between East and West. The Federation has been one of the few international bodies in which western and eastern countries could find some common meeting-ground. Owing largely to the efforts of its first President, Lord Citrine, to ensure that its activities should be directed towards industrial and not political purposes, it has so far ridden the storm. But political divisions have made themselves felt, and a crisis in the Federation's affairs cannot be long delayed.

The position of British trade unionists is particularly unenviable, especially in view of their close links with the AF of L and the British Government's interest in American aid. They would like to join in the AF of L initiative "without prejudice" to their relations with the WFTU. At the same time, they have to consider their own left wing, which would sharply oppose any move to side-track the Federation, let alone to withdraw from it.

* * *

The Manchester County Scheme

The prospects for an effective reform of local government are brightening. The committee of local authorities in and around Manchester, which has been examining the desirability of setting up a regional authority for the whole conurbation, has reported strongly in favour of the idea. True, the committee's report does not bind its members—much less those local authorities in the region who refused to participate in its deliberations. It is highly encouraging, however, to find local authority delegates taking a bold and practical initiative.

The "Manchester County" proposed by this report would embrace 72 existing local authorities, including 7 county boroughs, which would lose their status. Its population would be 2,630,000 and its rateable value £19 million. Although termed a county, the committee view it as a new type of local authority. It would be indirectly elected by the local authorities comprising it (which

would all become county districts), and the county districts would get stronger powers than in a normal county. These concessions to existing interests were necessary to get the scheme adopted. It is to the committee's credit, however, that it recognises that the existing authorities would need a lot of regrouping to fit into the new pattern; and, subject to this being done, the proposed division of functions between the new county and its districts has much to recommend it. The county would have sole responsibility for water supply, sewage disposal, fire service, police, and public assistance, whilst a large number of services—including education, health, and town and country planning—would be planned by the county, but administered in detail on agency terms by the districts. Finance is not adequately treated in the scheme.

Apart from the undemocratic concept of indirect election, these proposals deserve, and will get, the close attention of the Local Government Boundary Commission who—it is much to be hoped—will be encouraged to go to the Government for a fresh mandate. The Manchester scheme will inevitably attract the hostility of all except the largest county boroughs, which have already split the Association of Municipal Corporations on this issue. However, the attitude of non-county boroughs inside the Association, and of leading county boroughs such as Manchester itself, shows increasing acceptance of the principles behind the Manchester scheme. This scheme is by no means suited to all areas, and its effect on surrounding counties—for it would take from Cheshire almost half its population and rateable value—needs examining in a wider context. What it does offer is the best idea to date for the government of Britain's more populous areas.

* * *

Nuts and Potatoes

During the war the Ministry of Food was generally showered with praise, but more recently it has become the object of criticism, both fair and unfair. This change in public attitude is perhaps inevitable as food supplies become more scarce and shopping made more difficult. Nevertheless, credit should be given when it is due. The public outcry against the Ministry's selling nuts at a free auction and allowing prices to rise sharply is misguided. Nuts, however desirable as Christmas fare, cannot be considered an essential foodstuff, and the sale of such foods should be left to the mercy of market forces. At least it would help to mop up part of the excess purchasing power—although, with nuts, the effect will be very small. No case can be made out for rationing such commodities at present except by price.

But this is not the whole story. The free auction system has certainly many advantages. Yet if the Ministry of Food remains the sole importer of the goods offered, artificial market conditions could be created in this country unless the Government's purchases reflect the world supply position. For example, if the Ministry purchased only small quantities of nuts, when there was a superabundance in the world, British prices could rise many times above the world level and the Government could make exorbitant profits at the expense of the public. For this reason alone, it is surely incumbent on the Ministry of Food to publish the amount of profit it has made at the recent auctions—it may have been as much as £1,250,000—and how this money is to be used. Will such profits be offset against the food subsidy grant, or will they be used as subsidies additions to the £400 million a year?

On potatoes Mr Strachey is surely on less certain ground. He has had to admit that the maintenance of the potato ration at 3 lb. per week could not be guaranteed, but his defence of the late introduction of rationing on the grounds of the inadvisability of storing new potatoes is nonsense. Had rationing been introduced in August or September the Ministry could have made certain that in these two months of very heavy potato consumption only the non-storing potatoes were disposed of. It is precisely because rationing was delayed until the peak consumption months had passed that the present ration cannot be maintained, unless supplies are forthcoming from abroad.

* * *

Petrol Anomalies

The last week of basic petrol has ended, without success for the repeated onslaught on the Government's decision. There is no point in re-hashing the arguments for suspension or retention—would other means of obtaining equal savings have been sought more energetically had motorists generally been TUC members?—but administration, the granting or withholding of supplement-

tary petrol by the Regional Petroleum Offices, is another matter. Presumably the Offices have received some general directives in the light of which to "consider each case on its merits." Presumably; but why have these never been made public? They might at least have sieved out some of the fruitless applications which have helped to put the Offices' work anything up to nine weeks in arrears; and no excuse for secrecy has been shown, or is indeed conceivable. Certainly whatever directives have been given have been far too wide, as is shown by the divergences of principle noted in different parts of the country, and by discrimination between next door neighbours applying to different authorities and even between families living in the same house and requiring petrol for the same purpose. If, as seems likely, the suspension of the basic ration is to continue for years rather than months, a less arbitrary code should be devised. At present the freedom, convenience and even livelihood of every applicant appear to depend on the disposition of the official concerned.

As for Mr Gaitskill's refusal to relax, on Christmas Day only, the ban on the use of saved-up basic petrol, it carries to perhaps the highest point yet the Government's cherished doctrine of equal misery. "Many families," said the Minister, "manage to get on at Christmas without this particular form of spirit." Because many do, all must; and petrol two months in the tank must evaporate uselessly, lest envy be generated in the bosom of the habitual pedestrian. Connoisseurs will rank this gem even higher than Dr Summerskill's ban on large banquets on the grounds that they upset the uninvited housewife, and to outdo Dr Summerskill at this sort of thing is a real achievement. In the total economic perspective the holding or banning of a few banquets, and even the use or sterilisation of a few million horsepower, may be trifles; but the repeated and deliberate appeal to spite and envy should lie heavily on the consciences of a Government professing to hold an idealistic view of human nature.

Shorter Notes

The creation of a new Treasury secretary for economic affairs embodied in the Ministers of the Crown Bill is a step in the right direction, since it will relieve the Chancellor of the Exchequer, the Cabinet Minister responsible for economic policy as a whole, of a certain amount of Parliamentary work. But it can hardly be regarded as in itself a satisfactory solution to the problem of re-organising the economical and financial functions of the Treasury, which requires division at the ministerial rather than the under-secretaries' level. What is needed is the detachment of the First Lordship from the Prime Minister's office and its transformation into the chief economic ministership. The First Lord would then have as his lieutenants the Chancellor of the Exchequer and the President of the Board of Trade, both of whom should retain their seats in the Cabinet.

*

Mr Chuter Ede is quite right in consistently refusing to take steps to suppress the activities of Fascists in general and of Sir Oswald Mosley in particular. The worst way of dealing with a harmful political movement in this country is to deny it freedom of speech, for it wins more credit from its alleged martyrdom than from its avowed aims and principles. In any case, Sir Oswald Mosley's movement was thoroughly discredited during the war; its revival now as a new "Union movement" can hardly bring Fascism in this country, it is not likely to come from a man who has been proved a failure. As for the Fascist meetings in the East End, unmitigated nuisance as they must be to those who live in the neighbourhood, equal blame must be given to the Communist organisations which make political capital out of them and refuse to allow them to die a natural death.

*

A settlement has been reached in the month-old Savoy strike after the publication of the report of the Court of Inquiry which showed that the causes of the dispute went far beyond the dismissal of a grillroom waiter. The report comments on the bad relations between the management and the union members of the staff, and criticises both parties. It blames the Savoy management for its refusal in the first instance to grant recognition to the union—this was forced upon it by strike action earlier this year—and for its subsequent failure to implement the National Arbitration Tribunal's findings and offer reinstatement to Mr Piazza. At the same time, the report agrees that the management's suspicions of some of the union officials were justified, and strongly criticises the procedure and lack of secrecy surrounding the ballot.

THE NAME SPENCE IS A
household word in the world
of heavy chemicals. SPENCE
dates back to 1846 and its
chemicals have always been re-
spected for their high and con-
sistent quality. Recently some
interesting new products have been
introduced, including materials
for pharmaceutical specialities. An
abridged booklet will gladly be
sent to you giving a brief survey of
SPENCE products, including:

*Alum, Aluminium Sulphate, Aluminium
Chloride, Aluminium Nitrate, Alumina
White, Activated Alumina, Calcium
Carbonate, Detergents, Pharmaceutical
Alumina, Sodium Aluminate, Sul-
phuric Acid, Titanium salts, Silica, etc.*

Letters to the Editor

Side-stepping the Issue

SIR,—While sympathising with your criticisms of the Government's record of pursuing a ruthless single-track "cheap money" policy, I would suggest that your attitude towards the Interim Budget was a little doctrinaire on two points in particular—the closing of the inflationary gap by lifting interest rates, and the abolition of subsidies and "spreading" of the purchase tax.

There is a strong argument, for which I claim no originality, that, since interest rates would have to rise impossibly high to close the gap, a significant rise from present levels would, without effecting a cure of the original disease, lead to further serious complications of disequilibrium and distortion by virtue of the indiscriminate of its impact. In parenthesis, might not a more severe control of credit facilities to sterilise bank deposits along the lines of wartime practice be a better instrument? This is, of course, not to condone a further expansion of credit to support the gilt edged market (which, as you observe, was rendered less likely with the advent of the new Chancellor), nor to oppose a slight rise consequent upon abstention from further "rigging."

My second point is that the removal of subsidies, and/or any far reaching extension of the imposition of purchase tax, would have been not only a bold, but a hazardous, move in the inflationary game. It might, by provoking demands by the trade unions for all-round wage increases, have been, not courageous and unpartisan, but unwise and disastrous. Labour's conviction of the reality of the crisis is, surely, not yet so overwhelming that the process of chipping at working-class purchasing power can be otherwise than gradually and subtly performed.

Your views on both these points may well be right and the counter arguments—by no means an exhaustive list—tentatively advanced, may be easily demolished; but I feel that your various recent articles on financial policy would have gained in conviction what they abandoned of their somewhat unqualified treatment of a controversial subject.—Yours faithfully, P. M. FOSTER
12 Tenison Avenue, Cambridge

SIR,—While it cannot be denied that the reduction of Government spending must be deflationary in its effects if all other factors remain constant, it does not seem to be absolutely certain that any substantial reduction in food subsidies would, in fact, ease the present inflationary pressure. For in this case one force would come into play which is not within the Government's control.

The immediate result of a reduction in, or abolition of, food subsidies would be a sudden sharp rise in the price of food. Now even if one assumes that wage-earners could be persuaded not to demand officially or unofficially a rise in wages to meet the increased cost of living, the fact that the disinflationary policy leads initially to a rise in prices rather than to a slackening of demand for goods and services might cause one important factor in the situation to change, namely, the relation between the stock of money held by the public and its income, or more precisely the variable "k" in the Cambridge formula $p = \frac{M}{kR}$. Money would be drawn from the inactive to the active stock; businesses and households would work with smaller balances.

In general, there would be a readjustment individually in the distribution of real income; the amount chosen to be held in the form of ready value being reduced as compared to the amount devoted to immediate consumption or to additions of real wealth.

Thus, while less money would chase the now notorious "too few goods," it would chase them faster. It might well be then that the operation of this change in the public's "k" would so delay or nullify the deflationary effects of the reduction of food subsidies that it would be impossible to continue to hold the wage level. In attempting to influence the economic weather by sowing a cooling zephyr the Government and the country might well reap a whirlwind.—Yours faithfully,

W. A. MAGOWAN

31 Upper Addison Gardens, London, W.14.

Europe's Grain Requirements

SIR,—May I use the hospitality of your columns to draw attention to the Report of the European Economic Co-operation Committee in so far as estimates of grain imports and costs of these imports are mentioned?

On page 29, Volume II, of that Report it is stated that cost of requirements are based on a single price, this price being for food the USA price ruling on July 1, 1947. Consequently the estimate for imports of 20 million metric tons of grain is given at 1,720,000,000 dollars for the period 1947-48, i.e., roughly \$86 per metric ton. For 1948-49 the import requirements are increased to 25 million metric tons, yet the costs are estimated at 2,400,000,000 dollars, i.e., roughly \$96 per metric ton. There seems to be no explanation for that difference which involves the sum of \$250 million. Though all these estimates have a theoretical value only, it would perhaps be interesting to have some comment on the basis of calculation.—Yours faithfully, F. J. WEALE
39 Belmont Avenue, East Barnet, Herts

[We understand that there is no error in the table mentioned. In calculating the grain figures for 1947-48 allowance was made for the lower price of wheat obtainable under the Canadian contract.—EDITOR.]

Bank Nationalisation in Australia

SIR,—May I comment on Mr Alan Wood's letter?

No reasonable opponent of this Bill would wish to deny the Australian central bank adequate powers to control general credit conditions. Such authority is obviously necessary if a central bank is to perform its function efficiently. It is, however, extremely doubtful whether any parts of the 1945 legislation other than Section 48 could be successfully challenged on constitutional grounds. If, as Mr Wood contends, the banks have been chafing beneath the yoke of the controls imposed in 1945, it is a reasonable presumption that they have left these restrictions unchallenged in the Courts for the past two years only because their legal advisers consider such a challenge would be unavailing.

I find it hard to take seriously the suggestion that the banks, even at a loss to themselves, might restrict credit and cause unemployment in order to bring about a change of government. Passing over the fact that this sinister possibility did not occur even to Mr Chifley when he was drafting his 1945 legislation, one need only mention that, if the private banks were to be so foolish as to restrict advances through base political motives, then the Government-owned Commonwealth Bank of Australia, with the resources of the nation behind it, would have a golden opportunity of expanding its own business.

However, even if one grants all Mr Wood's contentions, there remains a gaping hiatus in his argument. If it is *intra vires* for

From The Economist of 1847

December 4, 1847

AFTER all that we have said from time to time, in this journal, on the subject of "fixing the price of gold," we had indulged a hope that the fallacy on which such a notion is based would not be attempted to be revived. In this fair expectation, we have been disappointed. On Thursday night, Mr Urquhart, in his speech in the Currency debate, not only returned to the charge, but attributed to it the most extravagant effects which any one of that school, either as a writer or a speaker, has yet done. Not only the whole of our present national distress, not only the present depression of trade, not only the present derangement of the money market, but every recurrence of similar disasters since 1819, were all attributable to "fixing the price of gold" in that year. The failure of the harvest in 1845 and 1846, the huge speculations in railways during the last three years, all go for nothing: the cause of every evil is to be traced to the return of cash payments in 1819. Nay, more—not alone our commercial prosperity, not alone our monetary system, are placed in constant jeopardy, but our political safety is endangered by "fixing the price of gold." The Bank of England had to go upon its knees to the Bank of France in 1839, because we "fix the price of gold"; the Bank of England was unable to return the obligation to the Bank of France in 1847, because we "fix the price of gold"; France was therefore obliged to throw herself into the arms of Russia, and finally the Bank of England was obliged to do the same—all because we "fix the price of gold." And thus the Bill of 1819 endangers the balance of power in Europe: the solitary fact that our law has declared that our coin of a sovereign should uniformly contain 5 dwts. 3½ gns. of standard gold, threatens the peace of Europe.

the Federal Government to acquire the banks (and this remains to be proven) then it cannot be *ultra vires* for the same body merely to control banking activities. If Mr Chifley is nervous about the adequacy of his 1945 legislation, why does he resort immediately to nationalisation instead of confining himself to closing the alleged loopholes, constitutional or otherwise, in the controls established in 1945? In no other country in the world has it been found that the only way to endow the central bank with proper authority is to nationalise the whole banking system.

The positive arguments against the Bill can be stated briefly. It lacks the mandate of the people. In fact, it is being forced through in the teeth of opposition from all sections of the community other than that of organised labour. The Liberal and Country Parties fought the Victorian elections on this issue alone and defeated the Labour Party hands down. An investigation of public opinion carried out by the Sydney *Daily Mirror* and the Ashby Research Service indicated that only 24.5 per cent of the Australian population favoured the nationalisation of banking,

whereas 64.5 per cent expressed outright opposition. With Mr Chifley himself as the sole dissident, the Australian Royal Commission on Banking in 1937 reported against nationalisation. Banking, even more than most industries, calls for widely-dispersed decisions based on human qualities which cannot be defined in directives from a central authority. It is an industry which is best conducted in Australia as elsewhere on a competitive basis.

The Australian Government has brushed all these considerations aside and turns a deaf ear to appeals for the issue to be decided by a referendum. There are now rumours that it will try to evade the testing of the Bill's constitutional validity by staging a *coup d'état* and acquiring the banks before they can take legal action. Against this background, is it really not surprising that most Australians do see "hidden purposes" behind the Bill and derive scant reassurance from their Prime Minister's dogmatic attitude.—Yours faithfully,

Station Avenue, Walton-on-Thames

FRANK B. POWELL

Books and Publications

Before the Die is Cast

"Germany: Bridge or Battleground." By James P. Warburg. Heinemann. 15s.

Any solution which permits Britain, France or the United States to do one thing in western Germany while the Russians do something else in eastern Germany is no solution at all.

THIS is the central point of Mr James Warburg's argument. His book was written just before the meeting of the Foreign Ministers in Moscow last March. The failure to reach agreement on Germany at that meeting, the political trials in eastern Europe, the formation of the Cominform and the increasing anti-Communist campaign in America have already given his views a certain remoteness. The present Conference of the Foreign Ministers in London is widely regarded as a means of ending

the farce of German unity, rather than as a means of attaining real union, and hopes are set on making a success out of Bizonia or Trizonia, the contemplated fusion of the three western zones, as soon as co-operation with Russia is written off.

In these circumstances, Mr Warburg's book is in the nature of a last appeal to reason. It is an appeal by a man who is singularly well qualified for his task. He was one of President Roosevelt's original brain-trusters, and during the war was a Deputy Director at the Office of War Information in charge of "psychological warfare" in Europe. He is both an economist and an expert on the German problem, and he has had first-hand experience as a visitor to all four zones since the end of the war.

The first part of the book follows the series of changes and modifications in allied policy which led up to Potsdam and beyond. Mr Warburg then proceeds to an objective study of the

four different zones as he saw them functioning in practice, and a description of the four-power political manoeuvres during 1946. Venturing into the field of abstractions, he attempts to characterise the German nation, its way of life and institutions. He shares the widely held view that its disease is authoritarianism, and is of the opinion that any long-term remedy must come from within the nation itself. The last, and most interesting, section of the book deals with the future. Mr Warburg holds that there must be a short-term policy, giving priority to German industrial revival as an essential condition of European revival, and a long-term policy in which the new Germany must be fitted into its proper place in a world organisation. He rejects the idea that any policy which has the effect of splitting Germany into two is either morally justifiable or economically practicable. The criticism may be made, indeed, that Mr Warburg tends to minimise the intransigence of Russian foreign policy, which has been so gravely intensified since his book was written.

The book is, however, one which should be read as widely as possible before the die is cast for, or against, a politically and economically united Germany. It is a lucid and compelling exposition of one point of view on the choice which now faces the four Foreign Ministers in London; and not only the Foreign Ministers, in Mr Warburg's view.

Foreign policy is no longer simply a function of government. More and more it is becoming a function of peoples.

It should be added that an appendix to the book contains a highly valuable selection from documents bearing on allied policy towards Germany, including the Morgenthau Plan. These include the author's own recommendations on policy which he has submitted to the President and the State Department at various times.

The Growth of Physical Science

"The Growth of Physical Science." By the late Sir James Jeans. Cambridge University Press, 1947. 364 pages. 12s. 6d.

SIR JAMES JEANS corrected the proofs of this book shortly before his death last year, so it must be supposed to be the last of his long line of "popular science" best-sellers. As such, it will come as something of an anticlimax, since the subject-matter lacks the exciting novelty of the earlier books, and the wide field he covers gives little opportunity for Jeans's gifts of sustained clarity of exposition. His aim, described in a modest preface, was to provide an account in non-technical language of the development of the main lines of physical science, including mathematics and astronomy, from the earliest times up to the present. About half the book is devoted to Greek, Alexandrian and Arabic science, and the beginnings of European science in the fifteenth and sixteenth centuries—that is, up to the time of Leonardo, Galileo and Copernicus, when science was beginning to free itself from the paralysing influence of Plato and Aristotle. The next chapter—"The Century of Genius"—dominated as it was by the extraordinary character of Newton, is perhaps the best in the book. The great period of consolidation was in the two centuries after Newton, until by the end of the nineteenth century the Victorian physicists believed they had at last fitted the cornerstone of the structure. In the last chapter Jeans describes the crumbling of this structure, and sketches the much more shadowy scaffolding which is replacing it.

To give a readable account of the complexities of modern

physics in 60 pages is a task beyond even Jeans, and the reader coming fresh to it will probably be bewildered; there is no lack of better accounts, by Jeans himself among others. However, the book is intended as a history and not as a textbook, and, leaving aside this last chapter, the result is wholly successful, if at times a little pedestrian in style.

There are many interesting and unfamiliar biographical details, and Jeans exhibits a considerable and up-to-date scholarship. He sticks strictly to the scientific facts and does not deviate into speculations on the deeper motivation, economic or otherwise, of periods of scientific advance, beyond pointing out such material advantages as the invention of printing and the introduction of instruments to supplement the human eye and hand. In fact, the only moral which stands out from this book is that Plato and Aristotle were "two major disasters."

Indian Industry

"Indian Industry Today and Tomorrow." By E. Da Costa. Longmans New Era Series No. 2, 1947. 166 pages. 4s. 6d.

In this small book Mr Da Costa tries to analyse realistically the problems confronting the planning of industrial development in India. He writes vivaciously, genuinely tries to avoid unwarranted assumptions and preconceptions, and at times reveals an aptitude for a pretty turn of phrase. Unfortunately he often fails to carry his arguments to their logical conclusions.

Accepting the need for planning, he undertakes a critical review of the targets set by the Bombay Plan, which he considers only as a first approximation. He then discusses the main obstacles to the attainment of the targets, and suggests amendments to them. He concludes that, if the difficulties are squarely faced, rapid industrialisation and corresponding developments in other spheres can be achieved on a scale at least as great as that contemplated by the Bombay Plan. But he holds that the latter is over-optimistic in one respect. Even the most rapid industrialisation and general development will not provide additional demand for labour sufficient to cope with existing under-employment and the present rate of population growth.

Mr Da Costa's realism is shown, for instance, by his attitude to the population problem, by his recognition that external help of various types will long be necessary, and by his insistence upon the urgent need to train Indian managers and skilled workers. But his realism does not go far enough. For instance, he fails to tackle the fundamental problem of how in peacetime to secure the necessary determination to accomplish a task no less difficult than that undertaken during war. Again, although he recognises the need to choose between the production of capital and consumption goods, and the difficulty of limiting the consumption of the poverty-stricken masses, this does not prevent him from advocating vast capital expenditure and generous exports to other Eastern countries. How?

Shorter Notice

"The United Nations Association Yearbook, 1947." Hutchinson. 296 pages. 25s.

This is a useful book of reference. It contains a collection of Uno documents, including the Charter, as well as a list of the Governments of all member states, a summary of the Secretary-General's first report, and an account of the activities of the United Nations Association.

AMERICAN SURVEY

New Channels for Trade

(From Our US Editorial Staff)

CONGRESSIONAL interest in the Marshall Plan and in anti-inflation measures all but stifled any immediate response to the Geneva agreement on tariffs, and the publication of the schedules of revisions in American tariffs. The explosions now being heard from various US industries thus seem to have been set off by a delayed fuse.

As a result, they have coincided with the opening of the Havana Conference. While Mr Clayton, as head of the US delegation there, was welcoming the "last lap on the road to an international trade organisation" a spokesman for the American Tariff League was lamenting the much wider scope of the "escape clause" in the present tariff structure. This clause, strengthened as a result of pressure from Senator Vandenberg and the Republican Party, permits any government to withhold or modify concessions made, if there is any question of "serious injury" to a domestic industry. The Tariff League holds that the multilateral nature of the new agreement "would bring a chain reaction of retribution among twenty countries" if the US Government seeks to protect an injured national. And in Congress, indignant members are now looking ahead to the debate on renewal of the Trade Agreements Act next Spring.

Unquestionably, the list of concessions given and received at Geneva is imposing. The State Department's analysis of the effects of the agreement on US products (Department of State publication 2983, Commercial Policy Series 109) estimates that concessions made by other participating countries with respect to products of which the United States was their principal supplier would, in 1939, have affected \$1,192 million of American exports, and that the benefits of lessened restrictions on other products approximate another \$220 million.

On the opposite side of the ledger, the United States made concessions on products which in 1939 accounted for 78 per cent of its total imports, dutiable and free, and amounted to \$1,766.5 million; of this total \$1,336.7 million came from countries participating at Geneva. Total dutiable imports in 1939 were \$906.5 million; concessions were made on 70 per cent of the total, with 85 per cent of that amount, or \$543.1 million, coming from the participants. Existing rates of duty were "bound" on 20 per cent of the dutiable imports affected, and were reduced by up to a quarter on 10 per cent of the total, by proportions ranging from 25 to 35 per cent on 27 per cent of the total, and by proportions ranging from 35 to 50 per cent on 43 per cent of the amount. The status of 85 per cent of the imports in the duty-free category, \$1,341.2 million in 1939, was "bound"; 70 per cent of these products came from the participating countries.

On many schedules, this list of changes, to become effective on January 1st, represented an exercise to the full of the power, given to the Executive when the Reciprocal Trade Agreements Act was renewed in 1945 to reduce tariff rates by as much as as half the existing rate. Its net effect is to reduce US tariffs practically to the level of the Underwood Tariff of 1913; the State Department emphasised the continuity with that period in calling the new agreement "the first major step to be taken by important nations to revise the trend toward trade restriction and economic nationalism which has persisted throughout the world since the first World War." It can be justifiably claimed as evidence that the US Government has seen, and accepted, the implications of its creditor position.

But the meaning of this great revision in American tariffs in

terms of specific goods and countries can be analysed only to a very limited degree. Present trade, while large in value by historical comparisons, includes great price inflation. More than that, it is extremely distorted as a result of the war, both as to products and countries. Nor is analysis by pre-war content very helpful, since whatever conditions reconstruction may provide are likely to differ basically from any past period.

Furthermore, after the other war, Americans were chary about imports. Now, everybody knows that it will be quite some time before competitive imports amount to much, and there is a rather strong feeling that imports of the stockpiling variety, critical materials of one sort or another, would be a very good thing.

And after the other war, Americans were keen on exports. Now, exports look like a price that probably must be paid for certain considerations, many of them, at least in the short run, non-economic in character. Even for the long pull, doubts are spreading, linked to the new attitude toward strategic imports and reflecting the new consciousness that even the resources of a half-continent are not inexhaustible. (Striking among these is the case increasingly made against farm exports by farmers newly conscious of soil conservation and correspondingly dubious of shipping fertility out of the country.)

The questions uppermost in people's minds concern the diversion, by export, of goods from domestic consumption, and the resulting effect on inflationary pressures. Misapprehensions about the volume of exports, and their destination, are almost as common as interest in the subject. Here are some of the main questions:—

1. What is the relation of current exports and imports to gross national product, and how does it compare with pre-war?

On this question, charts prepared by the Department of Commerce reinforce earlier evidence given by the Office of International Trade which showed quite recently that relatively few industries show exceptional gains in exports when measured against the current volume of output. Exports, as a percentage of gross national product ranged from 4 to 5 per cent in most pre-war years and reached a high point during 1944 (at the peak of Lend-Lease shipments) when they amounted to rather more than 10 per cent. There followed a decided slump through 1945 and 1946, and even now the figure of just above 8 per cent, though above the average of the 1930's, is not very far above the rate prevailing before the 1930 slump. Imports, of course, have lagged badly, though at about 4 per cent of GNP they are about on a line with the level prevailing through many of the pre-war years. This evidence does not, of course, offset the charge that exports have put a tremendous pressure on some prices during 1947.

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

2. How much of the recent increase in the value of US exports represents increased shipments, and how much increased prices per unit shipped?

The answer to that query follows:—

U.S. TOTAL TRADE
(1936-38=100)

	January, 1946	Over Nine Months to:	
		September, 1946	September, 1947
Exports—U.S. Merchandise:—			
Value.....	316	493	447
Quantity.....	204	262	231
Unit value.....	155	188	194
Imports for Consumption:—			
Value.....	186	224	234
Quantity.....	111	107	110
Unit value.....	168	209	212

3. In particular, how does recent trade with the sixteen "Marshall countries" compare with the pre-war position? On Department of Commerce figures, this is the answer:—

U.S. BALANCE OF MERCHANDISE TRADE WITH THE "MARSHALL COUNTRIES" AND GERMANY
(In Billion Dollars)

	1936-40 Average			Nine Months of 1947		
	Exports	Imports	Exports Balance	Exports	Imports	Exports Balance
Trade with all countries, Trade with Marshall area.....	3.2	2.5	0.7	10.9	4.2	6.7
Per cent "Marshall area" trade to Total.....	1.2	0.5	0.7	3.7	0.5	3.2
	37.5	20.0	100.0	34.0	11.9	47.7

These figures emphasise our normal dependence on European markets, and the distortion of the trade balance which has followed in the slow recovery from wartime losses.

4. How large a proportion of US exports actually goes to Europe?

Mr Dewey's purpose in calling attention to the fact that there is also China to be considered may have contained a measure of domestic motive, but it is true that discussion of the Marshall Plan has persistently pushed the rest of the world off the front page. Here are the figures:—

UNITED STATES EXPORTS AND IMPORTS BY CONTINENTS
(In Millions of Dollars)

Continents	Exports		Imports	
	1936-38 9-month Average	Jan.-Sept. 1947	1936-38 9-month Average	Jan.-Sept. 1947
Total.....	2,225.0	10,950.6	1,866.7	4,192.1
North America:—				
Northern.....	346.5	1,596.6	264.9	807.0
Southern.....	202.7	1,238.6	185.8	786.1
South America.....	205.5	1,780.6	244.0	876.6
Europe.....	932.1	4,027.4	531.2	594.9
Asia.....	373.9	1,458.3	561.1	774.8
Oceania.....	68.0	234.1	30.1	126.1
Africa.....	96.2	615.0	49.6	226.6

Under the new agreement, the channels for trade have been broadened and deepened. The new schedules show by how much. But chains are still up across most harbours. And in many ports of former export, the Plimsoll Line rides high along the hulls.

American Notes

Senator Vandenberg's Triumph

That the Senate, at least, has met Mr Marshall's deadline of December 1st on interim aid is due almost wholly to the efforts of Senator Vandenberg. On his insistence that the estimates of the State Department had been cut to the bone, the Senate re-

pulsed, by 56 votes to 30, an attempt to impose a cut of \$200 million, and on December 1st passed the bill by the overwhelming majority of 83 to 6. This is only the first of a series of hurdles to be surmounted before food and fuel start to flow once more. The debate in the House, which began this week, is likely to be longer and stormier than the Senate deliberations. Part of the cut tentatively approved in committee last week has been restored, but the diversion of \$60 millions of aid to China still leaves European aid short of something more than that amount. The final Bill probably will be written in conference between the Senate and the House not long before Christmas, and it will still have to be implemented by appropriation Bills, although the Reconstruction Finance Corporation will probably be authorised to make an advance of \$100 million, as it did in the case of Greece and Turkey. The grant to China, demanded by Senator Taft and Governor Dewey, and not frowned on by Senator Vandenberg, is likely to remain—perhaps as the price of compromise—even if the Senate persuades the House to grant the full \$597 million requested by the Administration.

Europe is becoming familiar with the tortuous procedure, the opportunities for delay, and the hairbreadth escapes which give the routine passage of any aid Bill so striking a resemblance to the Perils of Pauline. The Interim Aid Bill has, so far, provided fewer thrills than its predecessor, the post-Unrra relief measure. What is even more significant is the degree to which Senator Vandenberg has been left to carry the Congressional burden single-handed. At critical moments in the debate, Administration Democrats have faded away, leaving the Republican veteran to deal with dissidents not only in his own, but in the President's party. He has discharged this unprecedented responsibility triumphantly; but that he should have had to assume it remains a confession of Democratic weakness in the Senate. It also involves the Administration in a responsibility which it is less certain has been discharged: that of keeping Senator Vandenberg informed on the policies which he is expected to support. He has complained, for example, that the harnessing of anti-inflation measures to interim aid was a surprise, and an unwelcome one.

* * *

Curbs on Inflation

Over the past fortnight Congressional committees have listened to enough evidence from authoritative spokesmen to suggest that the Administration had on hand a cut-and-dried plan for anti-inflationary measures and, from a more practical viewpoint, was determined to enforce it. Mr John Snyder, Secretary of the Treasury, testifying before the House Banking and Currency Committee, declared himself to be fully in favour of the restoration of "standby price control powers," asserted that the sterilisation of gold imports from the monetary system was "very definitely under consideration," and reaffirmed previous statements concerning the advisability of providing the dollars needed for Marshall Aid before providing for any tax relief whatsoever.

The House Committee also listened to evidence given by Mr Chapman, Under-Secretary of the Interior, who declared that a voluntary petroleum "conservation programme" was being worked out with the co-operation of the industry, and that a priority list already established would place "pleasure motoring" below the essential requirements of the services, public utilities, homes without other means of fuel, farms and petrol-using industry. Though there is no suggestion that American motorists in common with their British cousins will be called upon to forego a basic ration, there is enough evidence of austerity for American ears to assume a distinctly darker shade, as the various government experts continue to demonstrate the urgency of present problems.

To Mr Marriner Eccles, the chairman of the Federal Reserve Board of Governors, however, has quite naturally fallen the role of star witness in the task of persuading Congress that moral restraints are not enough. Mr Eccles declared that his evidence represented "one of the most important statements ever made by the Federal Reserve Board," and he minced no words in declaring that the country had passed the stage where an inflationary movement might be prevented.

As a programme, Mr Eccles recommended longer working hours, without any increase in wage rates, the elimination of support for farm prices, a heavy Budget surplus, voluntary price control by business and (jointly with Mr Snyder) a nation-wide bond sales campaign to mop up purchasing power. But his most controversial proposals were reserved for his own field of banking

48 degrees below freezing is the coldest weather ever recorded in Great Britain. Even in the severest winter weather, motor oils treated with Santopour remain fluid and easy-starting. Santopour is one of a range of new oil chemicals manufactured by Monsanto which, when scientifically added to motor oils by manufacturers and blenders, improve the performance and increase the efficiency of your engine.

SERVING INDUSTRY...
WHICH SERVES MANKIND

controls, where he proposed a reinforcement of margin requirements over banking reserves. In line with the suggestions put forward fully eighteen months ago by the Reserve Board, Mr Eccles said that the Board desired not so much a general reinforcement of bank reserves as the establishment of a "special secondary reserve" in the form of cash or short-term government securities. Because of the cumbersome nature of this form of credit regulation, and because of its general interference with policy, this latter recommendation is resisted more stoutly by the commercial banks than any proposal for a simple raising of present reserve margins. And for that reason it is unlikely to be accepted by the present Congress.

* * *

Eccles versus Snyder

The most interesting part of this evidence, however, was the disclosure that (not for the first time) there is an open clash between Mr Eccles and Mr Snyder over the issue of banking controls. For the Treasury, Mr Snyder confined his opposition to the blunt and unqualified declaration that a special reserve requirement for the commercial banks would not prove to be an effective measure. Mr Eccles took the opportunity of reminding his listeners that the Reserve Board was established by Congress, and that he did not speak for the Administration. Indeed, he lashed the record of both parties in reasserting the folly of price decontrol in 1946, and the subsequent lack of "alternative measures," and went on to declare that Federal sponsorship of residential construction had brought "unconscionable profits" to an industry which was quite largely responsible for inflationary trends.

Despite this clash of evidence, Mr Eccles declared that he spoke both for the Treasury and the Reserve Board in reaffirming the desirability of maintaining the "established 2½ per cent rate on long-term Government securities." Where Mr Eccles differs from the Treasury is in his insistence that the expansion of bank credit will be extremely difficult to control, unless new powers are granted, more especially since the Board itself has been obliged to reverse its very modest process of credit contraction purely in order to protect quotations for long-term Government Bonds.

In fact, the divergence of testimony now apparent seems likely to give Mr Truman the worst of both worlds, since Congress is in no mood to grant powers to one agency, so long as they are opposed directly by another branch of government. And in the meantime, the discussion of inflationary curbs could bring a new wave of forward buying and other speculative activity. For the time being, the Administration seems to be relying upon the fact that the heavy tax payments due in January will bring a substantial contraction of banking funds. This is no doubt true because current Budget estimates, which are themselves an extremely conservative approach to probable revenues, suggest an actual cash surplus of more than \$5 billion for the year to June 30th next, nearly all of which will be gathered in the next few months. But against this, the banking system still has formidable reserves available, and Mr Eccles himself declares that gold imports may well reach \$3 billion over 1948, with some concentration during early months before Marshall Aid becomes fully operative.

If the position is really so dangerous as Mr Eccles alleges, it is difficult to understand why the various agencies concerned could not have agreed to the reinforcement of existing controls up to the limits they now possess without new authority. These measures would include the sterilisation of gold imports, a modest rise in reserve requirements in some banking areas, and a higher re-discount rate. Last but not least, the declaration of a firm and agreed policy for new controls might well have some deterrent effect at this stage of a boom. In the absence of these measures, Congress can scarcely be blamed for refusing to be stampeded into early action.

* * *

Eisenhower's Nomination

With the nomination of General Bradley to succeed General Eisenhower as Chief of Staff, the mystery surrounding the General's political ambitions cannot last long. The campaign to place his name before the Republican Convention has been going on busily without benefit either of a platform, a public assurance that he is willing to run, or even the certainty that he is a Republican, for as long as he remains Chief of Staff his lips are sealed. The General's own willingness to remain in Washington until April suggests that the curb was not altogether unwelcome; it imposes, and excuses, a strategy not unlike that of Governor Dewey, who has been almost equally

reticent about his intentions and his views. The Republican contenders this year, in fact, are almost equally divided between those who feel that silence is golden and those like Mr Stassen who feel that a candidate should hold nothing back.

The nomination of General Bradley is both expected and welcome. It promotes a man who is popular both with the Congress and the Army, and who has done a Herculean job since the end of the war in bringing order and decency into the Veterans' Administration. The announcement, however, amounts to a gentle nudge to General Eisenhower. His departure from Washington and assumption of civilian status is now likely to take place early in the new year rather than next spring. He will then be forced to take a stand on the campaign being waged on his behalf. His supporters feel that he is not only the ideal solution of a probable deadlock between Senator Taft and Governor Dewey, but argue that he will have the enormous advantage of standing apart from the Republican record in Congress over prices and labour legislation.

* * *

A Third Wage Round?

The anti-inflation programme which emerges from the debate on the President's proposals is likely to be both too little and too late to halt another round of wage increases. The American Federation of Labour, in its monthly survey, says that workers' living costs have increased substantially, with no likelihood of a decline in view, and that the unions must therefore seek new wage increases. The Congress of Industrial Organisations announced this week that it would seek new wage rises for its 6,000,000 members. One of its unions is already celebrating its first victory. The Amalgamated Clothing Workers have won their third wage increase since the war: a 12½ cent an hour increase from the men's clothing industry with an additional week's paid vacation. The fact that the price of men's suits will rise by two or three dollars in the spring points the obvious moral. The members of the Amalgamated are among the best-paid and the most strongly entrenched union members in the country. Their initiative is almost certain to be followed by the United Automobile Workers, which can reopen negotiations in February, and in which Mr Reuther's "right wing" victory is no omen of a less aggressive front towards the employers; by the steel union, which can file its demands early in April; and by the oil and electrical manufacturing unions.

It would be wrong to accuse the unions of reckless self-interest. Mr Potofsky, head of the Amalgamated, deplored the necessity for new pay increases to keep pace with the cost of living, and urged that what was really needed was price control to eliminate "this constant sparring to make ends meet." It is possible to point out that factory workers have enjoyed a rise of real earnings of a quarter since 1940. But at the end of 1944 real earnings were more than 140 of the 1940 level; during 1945 there was a drastic drop in real earnings which has never been recovered, and from the beginning of 1946 to July, 1947, there was a steady drift downward. Recent price spurts, which have brought the consumers' index to 163.8 of 1935-39, will have continued this trend. The treatment of price controls by Congress last year gives the unions every excuse for lack of faith that the price line will be held this winter. In these circumstances, no exercise of "labour statesmanship" can be expected to halt the demand for a third round of wage rises.

Shorter Note

An investigation of market dealings by the Commodity Exchange Authority has revealed a list of operators extending from government officials, and many professional classes, through to students, and housewives. Farmers have not unnaturally taken an active part, but housewives were listed on September 17th with a bull account of 7 million bushels in wheat, and with a "short interest" of 3.7 million. The possibility of indirect control of these domestic activities has not escaped the vigilance of CEA.

THE WORLD OVERSEAS

Austria: The Cost of Indecision

(By a Special Correspondent)

SO long as Austria is one of the fronts in the Russian-American cold war its material and moral reconstruction will be held up. Under present circumstances American aid is undoubtedly keeping Austria alive, but until a peace treaty is concluded, in spite of the wide authority of its central government, it cannot plan or think as a unified nation should. Not only does Austria suffer from the present extraterritorial administration of the Zistersdorf oilfield and of the 250 or so other Soviet-run concerns in Vienna and the eastern provinces, but equally from the demoralising effects of the present uncertainty. The country cannot be welded together either administratively or spiritually until the dispute between the Allies is settled. The Austrians say that the Russians are to blame and that they must be got out regardless of Potsdam and regardless of cost. Certainly Austria would be a very much happier and more prosperous country if the Russians left. But such an approach is hardly realistic. It is this very one-sidedness which, by stimulating the Russians to defence of their interests against what they see as an alliance of Austria with the western powers, has made the Russian occupation bear much more heavily on the country and so made a solution more difficult. The Austrian government is by no means incompetent, but only a strong government with a determined neutral point of view and a positive will to unite the people could overcome the demoralisation and disruption which this situation is causing. As there is no likelihood that such a government will or could be formed, another breakdown of the treaty negotiations and a further period of waiting will do a lot of harm.

Socialism Postponed

The government is still hampered by an Allied Control which can hold up, sometimes veto, and in many ways render ineffective its measures. This uncertainty as to the conclusion of a treaty has discouraged it from getting ahead with any positive economic programme. Not only was the currency reform, intended to curtail the black market, long delayed owing to doubts of its reception by the Allies and of the wisdom of its introduction during the occupation, but other false elements in the economic situation have still to be cleared up before proper reconstruction can get under way. Moreover the general economic plan towards which the Socialist Party and the British element of the Allied Commission have been pressing the government, if not quite such an impossibility as is sometimes claimed, may be postponed so long as there is no decision on what resources are to stay in Austrian hands, or on what authority the government is to have over the remainder.

The uncertainty of the present situation is one of the worst results of the Russian occupation. The Russians control their interests in Austria through a combine known as *USIWA* (embracing the 250-odd confiscated concerns); through a Soviet oil administration; a petrol distributing firm, *OROP*, constituted under Austrian law; an extraterritorial branch of the Soviet State Bank; and a branch of the State Transport organisation. They have not conducted these organisations, or the individual firms (sometimes Russian-administered, sometimes with a single Russian representative among the directors) which they embrace, according to Austrian law. Price fixing, foreign trade, trading within the combine, returns—all are conducted independently and without the knowledge of the Austrian authorities.

The Russian Case

Roughly the Russian argument is that until the Austrian government recognises the Soviet claims they will not recognise Austrian law. Taxes, apart from local taxes and those whose object is patently social, are paid by the *USIWA* concerns to the Russian bank, to be blocked for the eventual use of the Austrian government once the question of principle is settled. The Russians have

been hardened in their attitude by their suspicion that the government, especially the Ministry of Planning and Property Control, is doing its best to get them out, and by their knowledge that public opinion is against them.

The illegally high prices and terms of payment demanded (with or without *USIWA*'s knowledge) by the Russian concerns help to force up the general price level, and their foreign trade is conducted in the interests not of Austria as a whole, but only of their own combine. This is bad enough, but because as far as all official facts and figures go the Russian concerns might not exist, it has become general to treat them as entirely and permanently distinct from Austrian economy and to reckon their exports as necessarily a dead loss. Few care to make the distinction between the present situation and the burden which would be represented by a permanently installed and integrated Russian combine, operating, apart from the guarantees which the Russians demand against nationalisation and confiscation of their profits, as does any foreign owned firm on Austrian soil. Yet, seen in this light, much of the damage being done is a by-product of the present battle, and must be added to the cost of waiting for a settlement.

Is Partition Inevitable?

To counter the loss of a greater or lesser degree of control over their main industrial area, the Austrians, with American support plan to build up industry in the western zones. Planning apart, firms which moved from the eastern provinces during the war have naturally chosen not to go back, while others, with factories in both eastern and western zones, have done what they could, even by shifting machines across the Russian demarcation line, to favour the latter. But, although Austria has pitched its demands under the Marshall plan high, foreign aid is still only just enough to keep the country fed, and with labour and accommodation concentrated mainly in the east any such process must be a very gradual one. Its main significance at the moment is that the Russians are made to feel that the other zones are being favoured in the matter of raw material allocations, and that every precaution must be taken to make the demarcation line watertight. With zonal frontiers otherwise virtually abolished, the frontier of the Russian zone is thus the one barrier left within Austria, and the distinction between the east and the west is becoming sufficiently marked to give rise to loose talk of a possible split.

The Westward Pull

It is doubtful whether Austria can stand much talk of this kind. For social and geographical reasons—Vorarlberg province, for example, is connected to the rest of the country only by a railway, the telephone and a pass that is snowed up for half the year—Austria is at the best of times loosely knit together, and local feeling often proves stronger than national. The central government has laboriously worked to assert its authority over provincial governments whose independence was greatly strengthened by the watertight zones of the first year of occupation. Nevertheless the national feeling that has grown up is mainly anti-Russian. The possibility of partition has a loosening effect on all the ties that hold Austria together, so that in Tirol, Vorarlberg, and Salzburg (at least) responsible officials are thinking what course to pursue if the eastern provinces break off. Already there are economic forces pulling Austria in different directions: Vorarlberg trades almost entirely with Switzerland; Tirol and the British zone mainly with Italy; the American provinces want closer economic relations with *Bizonia*; and the Russian combine naturally trades chiefly with the countries of the Soviet bloc. Although no one wants the country to break up, the seeds of disintegration will be there as long as the present uncertainty continues.

Rumblings in Malaya

(By a Special Correspondent)

ENTERING Malaya by land from the north, the outward face of British colonial administration presents a scene of neat "English" hedges and excellent roads. By comparison with the neighbouring countries—derelict Burma, war-torn Indochina and ill-kempt Siam—Malaya seems a very green and pleasant land.

But beneath the surface, the picture is less rosy. Though two years have passed since liberation, lawlessness appears to be increasing. Armed robberies and even shooting have almost ceased to be news unless they are distinguished by some spectacular aspect. In the towns on the mainland law and order appears to be improving, but no road is really safe. Armed guards are posted in the Singapore banks and Europeans are warned not to promenade along Singapore's brightly illuminated waterfront after sundown. The present garrison of 35,000 British troops in the peninsula, as compared with a pre-war establishment of three battalions and contingents of Indian and Colonial troops (a total of 9,000), is presumably held in readiness for a local emergency as well as for possible needs further afield.

The delay in settling Malaya's constitution, besides prolonging the inevitable post-war unrest, has stimulated a remarkable growth of political consciousness. The over-riding political issue in Malaya is, and will continue to be, whether it shall be a predominantly Malay or Chinese country. In 1941 the racial composition of the Peninsula (excluding Singapore island) was estimated at 2,100,061 Malays; 1,778,331 Chinese; and 684,364 Indians. Taking the peninsula as a whole, Singapore included, the Chinese total 2,379,211 as against 2,278,588 Malays. Malaya has thus become the only country in Asia where natives are outnumbered by aliens and the only country outside China where Chinese are in a racial majority. The existing "Malayan Union" was framed before liberation in the Colonial Office without prior consultation with any of the communities concerned. The avowed object was to place immigrant Chinese and Indians on political "equality" with the native Malays. Before this constitution was introduced Sir Harold MacMichael was sent out to impose new treaties on the Malay rulers, robbing them of their sovereignty and their statehood.

In the storm of protest which followed, Malay nationalism, hardly existent before the war, was born. It led to the foundation of the United Malays National Organisation (UMNO) with the slogan "We want protection, not annexation." The arrival of Mr Malcolm MacDonald as Governor-General marked a return to Britain's established pro-Malay policy and in the new constitutional proposals for a "Federation of Malaya" worked out by collaboration between British civil servants and UMNO representatives, the Malays have tried to ensure that Malaya should remain a Malay land. The Order-in-Council, bringing this draft federal constitution into force, is expected to be tabled in January when a debate is also likely to take place in the House of Commons.

Left Demand for Independence

These new proposals are now under fire from the Leftist parties on the ground that they are designed to perpetuate the colonial status of Malay and to prevent the realisation of the "Independence" which Mr MacDonald has promised as Malaya's ultimate goal. The chief weight of the opposition comes from the All-Malaya Council of Joint Action (AMCJA), a coalition of Chinese, Indian and Eurasian parties under Chinese and Eurasian leadership, and the Malay Nationalist Party sponsored *Pusat Tenaga Rakyat* (Putera). The alternative programme put forward jointly by AMCJA and Putera for a Federation having what virtually amounts to Dominion status has many attractive features, but the Malays on the whole are well satisfied with UMNO's draft federal constitution.

In spite of bazaar talk that the Communists are operating a complete government from their stronghold in the hills, UMNO appears to be the strongest Malay organisation. It insists that British "protection" is essential for Malay survival, at least for an interim period, but they doubt whether the Government will in the long run be sufficiently firm in resisting Chinese immigration or sufficiently generous in their Malay educational policy to make Malay democracy workable. On the other hand, many responsible Malays who are attracted by the paper programme of AMCJA-Putera hesitate to join them because of the Japanese origins, and anti-royalist and anti-British inclinations,

and close connections with the Indonesian Republic of some of its member groups.

But with their small numbers, internal schism is a luxury that the Malays cannot afford if they are to survive. The Leftists' aim to split and weaken the Malays is clear enough. In their present stage of development, an elected central legislature, as recommended by the AMCJA-Putera plan, even though providing for a Malay majority for some years to come, must end in an overwhelming defeat for the Malays. UMNO is criticised, with reason, as the representative of the Malay aristocracy, but its 52-year-old leader, Dato Onn, who is also the *mentri besar* of Johore, is by far the ablest and most experienced Malay statesman. Although his colleagues, being government officials, are to some extent handicapped for party work, Onn is planning a five-year Malay economic development scheme, which, with a substantial fighting fund, should make a strong appeal to the realistic Malays and offset the political manoeuvring of the Left.

Pan-Indonesian Dreams

Malays of whatever party are all still primarily concerned with the spectre of foreign domination in their own land. In the British Government's view, Malaya, the "country without a nation," must federate if it is to survive. The Leftists agree because they see in this the quickest way to achieve their own ends. Most Malays would agree, too, if they could overcome their fear of immigrant domination. This is still so real that extreme nationalists in UMNO have talked of partition, and it is easy to see the attraction of an exclusively Malay State, comparable with Pakistan, for those who feel, and not without good reason, that even the forthcoming Federation does not in fact provide sufficient security. It might have been better if the Straits Settlements had been excluded intact as a Chinese preserve, thus leaving the Peninsula Malays with a numerical majority.

The Malays see behind the Chinese immigrant some 400 million Chinese in China, and behind the Indian immigrant some 400 million Indians in India. Small wonder that they turn instinctively towards the 75 million Indonesians who, with the peoples of British Borneo and the Philippines, are predominantly people of their own racial group. By adopting for its national banner the red-white colours of Indonesia (with a yellow—for royalty—globe pierced by a kris), UMNO has given a clear indication of the direction of Malay aspirations. At heart all Malay nationalists dream ultimately of one great Pan-Malaysian or Pan-Indonesian nation.

Politics on the Equator

[BY A SPECIAL CORRESPONDENT]

GILBERT AND SULLIVAN would have loved Ecuador. Its politics are as topsy-turvy as *Iolanthe*, while its ruthless customs and quaint colourfulness are reminiscent of *The Mikado*. It is a republic where the "normal" procedure is not normal at all, but where the accepted method of changing presidents is by revolution. During the last fifty years or more, only one president of Ecuador has taken office as an elected chief executive and given up his post four years later to an elected successor. All other presidents have either gone in or out of office by a *coup d'état*. There have been sixteen constitutions since 1830.

Ecuador is not a purely capitalist country. The great mass of the population lives on a subsistence economy with infinitesimal purchasing power. Landholdings are large; the people are indordinately poor; tradition is very strong; and the Catholic Church is all-powerful. Although, since 1895, the country has had governments which were predominantly "Liberal," or even further to the Left, they have retained power only on the tacit understanding that they would touch none of the basic problems of the nation. Liberals, Radicals, even Socialists or Communists are accepted, provided they confine their activities to Guayaquil, Quito and one or two other towns. They would not be tolerated

if they began to organise effective agitation by the Indian masses for agrarian reform and education.

There is, of course, another side of the picture. Along the coast, there is a good deal of commercial agriculture, particularly in sugar cane. Oil fields, too, are being exploited, and in the city of Quito and one or two other towns a textile industry is beginning, the largest plant employing about fourteen hundred workers. In these centres, Quito, Ambato and other towns and cities of the interior, as well as in Guayaquil and its coastal hinterland, the first beginnings of a labour movement have grown up. Its leaders claim—somewhat optimistically—that there are one hundred thousand members in the *Confederacion de Trabajadores del Ecuador*. In this movement the mutual benefit society type of organisation has not yet been very clearly differentiated from the trade union, and there are many hybrids brought together indiscriminately in the CTE.

The CTE, like most Latin American labour groups, is dominated by certain political elements. At the moment it has a Socialist majority in its executive committee and a Communist minority. There is considerable rivalry between the two Left groups in the unions, though there are many Socialists sympathetic to the Communists. The Socialists obtained about one-third of the seats in Congress at last summer's elections. The Communists gained only one seat.

Last Word with the Right

A little to the right of the Socialists is the Radical-Liberal Party, the traditional left-wing group of Ecuador. It dominated the Left until the thirties and is now somewhat of a catch-all. Most presidents profess themselves *Liberales*, though usually they are careful not to hold a liberal party membership card. On the other side of the fence is the Conservative party, the strongest group of all, though seldom in office. Closely linked with the Church, it is much better disciplined than the Liberals, and usually has the last word in any crisis. Its support for Velasco Ibarra in 1944 was decisive in making the revolution a success. Its failure to support Col. Mancheno in August of this year seems to have been decisive in ending his very short term of office.

In recent years Ecuadorian politics have lived up to their reputation. From 1940 to 1944 the President was Dr Carlos Arroyo del Rio. He was in office during the short war with Peru in 1941 which resulted in an arbitration award giving a large piece of Ecuador to Peru. This won Dr Arroyo the undying dislike of most of his politically conscious countrymen. Attempts to oust the doctor reached fruition in May, 1944, when all parties, supported by a faction of the army, joined in a revolutionary attempt which put back into office Dr Jose Maria Velasco Ibarra, dismissed about ten years before. He had been a Conservative in 1934, but during his exile in Chile and Argentina, as a result of close relations with the Left, he had won a reputation as a great Leftist and democrat.

Most of the fighting in the revolt of May, 1944, was done by the members of the Left parties, and they entered the cabinet with representatives of the Liberals and Conservatives. A new constituent assembly was called, nominated by the Left, and produced a very advanced basic constitution. No sooner was the ink on it dry, however, than Dr Velasco Ibarra began to criticise its terms loudly, and, in March, 1946, he threw the Leftists out of his government, put some of them in gaol and sent others scurrying into exile. In August he called elections for yet another constituent assembly. The Left abstained, so the assembly was completely and absolutely controlled by the Conservatives. They wrote a new basic constitution, slightly more conservative, and the sixteenth of that ilk.

Dishing the Left

But this was no sooner promulgated than Dr Velasco Ibarra began to be unhappy about it, too. He quarrelled particularly with the council of state which was set up as a watch-dog over the constitution when Parliament was not in session. This quarrel forced the resignation of Col. Carlos Mancheno, Minister of War, and the president's right hand man. Mancheno stayed out of the government until July, 1947, when he suddenly re-entered the cabinet. The President's quarrel with the council of state was apparently at an end. Meanwhile, in the next elections held under the new constitution, the Left gained a large majority, and the President then began to refer to himself once more as a "Liberal," having for the last year classified himself as a "Conservative," and stressed his Catholicism.

But suddenly, in August, it was announced that the President had been sent off to Colombia in a military aircraft, and that Man-

cheno had proclaimed himself provisional President instead. After a short period of confusion, the Conservatives denounced the new regime, and counter-revolts started in several of the garrisons south and north of Quito. Within ten days they had gained control of the country, and eventually they appointed as President Dr Carlos Arosemena, a newcomer, who so far remains in office.

The exact significance of these events is not clear, but there appears to have been a revolution of more purpose than the usual Ecuadorian fireworks. Some of the Socialist Party were fascinated by the revolution in Venezuela of October, 1945, which led to wide social reforms in that country, and it is interesting to note that the short-lived Mancheno regime attempted to set up a government on the Venezuela pattern. It tried to attack some of the fundamental problems facing the country: illiteracy, bad health conditions, grinding poverty, unlimited dirt. It was, perhaps, because of this attempt that the Mancheno regime lasted so short a time. However that may be, unless some government does start dealing with these problems, Ecuador will continue to be economically and socially backward, and its politics will continue to tickle the fancy of all those who like Gilbert and Sullivan brought to life.

Stalled at Geneva

[BY A CORRESPONDENT]

THE famous fifth freedom of the Chicago Civil Aviation Conference of 1944 has frustrated the efforts of yet another conference on international flying. Last week a meeting at Geneva attended by 28 of the 44 member states of the International Civil Aviation Organisation broke up after failing in its purpose of preparing for the ICAO Assembly next June the agreed draft of a multilateral agreement on international commercial flying. There was general agreement that an attempt to draw up a comprehensive multilateral agreement which left nothing to bilateral negotiation would be premature. On the scope of this limited agreement, however, two conflicting views emerged.

On the one hand, Britain, France and the United States held that the draft agreement should provide for the automatic exchange of third, fourth and fifth freedoms, the fifth being subject to conditions which would permit long-distance services to operate on a sound commercial basis. Of these freedoms the third and fourth permit a country's aircraft to carry traffic to or from that country, while the fifth is the right of aircraft on long-distance routes to carry traffic between intermediate points on those routes. The importance of the fifth freedom lies in the fact that its unconditional acceptance could put the intermediate countries at a strong disadvantage compared with the countries operating the trunk routes. More crudely stated, it could give unlimited and one-sided advantages to American airlines.

It has accordingly been modified since first formulated. Its most important modification is contained in the Bermuda Agreement between England and America last year. Under it the volume of traffic between intermediate points on a trunk route must be related to the volume of through traffic. And the volume of intermediate traffic is subject to subsequent scrutiny and control at the request of either party. Thus the right to fifth freedom traffic is accepted in principle. But the amount of such traffic is governed by bilateral negotiation.

This modification has been incorporated in agreements since made by both England and America. It seemed to offer a working solution pending the stage when a comprehensive agreement could be reached. But the view of Italy, India, Egypt, Canada, Australia and other countries was that fifth freedom rights should be the subject of bilateral agreements. They considered, however, that the exchange of the third and fourth freedoms should be automatic. In other words, it was proposed that there should be no fifth freedom as of right, but only after negotiation. This view prevailed on November 23rd when a resolution was adopted permitting a State unilaterally to deny fifth freedom rights. The basis of a generally acceptable multilateral agreement was then destroyed, and after a few days the meeting came to an end.

The world-wide and uniform regulation of civil flying has thus been again postponed. States will continue to negotiate their commercial rights bilaterally and piecemeal. At the next ICAO meeting no progress will have been registered except, as usual, on semi-technical matters of comparatively limited importance. Meanwhile, there is a certain irony in the collaboration of England and America on a matter which formerly divided them. But these two countries can claim that their attitude has the benefit of experience.

THE BUSINESS WORLD

The Capital Cuts

FOUR months have elapsed since the Prime Minister announced the broad measures which the Government was taking to meet the economic crisis. Six weeks have passed since Sir Stafford Cripps described in somewhat greater detail the composition of the capital cuts of £200 million on which the Government had then decided. These are comparatively long intervals, during which the play of political forces and the voice of determined Ministers have obviously made themselves felt. The Government's White Paper,* which now makes its belated appearance, shows many of the marks of compromise. It is an essay, like the "Economic Survey for 1947," in what has come to be known as "democratic planning," which is in danger of becoming a synonym for planning at half-cock on the basis of inadequate statistics.

No one disputes the need to make cuts in capital expenditure, and no one in his senses will fail to deplore the necessity for doing so. The problem is not merely "how much," but also "where" and "when." Wholesale slashing of capital expenditure would be wasteful, because so much has already been started; and it would be most threatening to the future survival of Britain as a major economic power. The economic necessity of the moment is to bring total demand for real resources within the limits of available supplies. The test that the Government's policy on capital expenditure has to meet is, therefore, whether it makes an effective contribution to this end. The arithmetic of the case suggests that it does not. But arithmetic is not all. Are cuts being made in those projects which are slow to bring their return (projects, in other words, which at this stage of a boom would formerly have been postponed owing to a rise in the effective rate of interest) and spared for projects which can make a relatively quick contribution to national output?

This distinction bears most closely on the question of house building, which is in the charge of a determined Minister. If any one element in the capital programme is regarded as being immutable, then it follows that the other elements must suffer a disproportionate part of the cuts. But it is necessary first to show exactly what is meant by the cut of £180 million—the revised figure which Sir Stafford Cripps publicly disclosed at the end of last week. That figure is the reduction in the expenditure on new investment work at home which the Government

propose for the year 1948 as a whole, compared with the total hitherto estimated for that year (not 1947) of £1,600 million. It represents a reduction of 11 per cent in a figure composed partly of ascertainable fact, but largely of "informed guess-work." Moreover, this reduction is expected to accrue very largely in the second half of next year; by the end of 1948 gross investment is expected to be flowing at £1,320 million per annum, but the average for the year is £1,420 million.

ESTIMATED GROSS INVESTMENT IN THE UNITED KINGDOM (£ Million)			
	Mid-1947: Estimated Annual Rate	1948: Original Forecast	End 1948: Estimated Annual Rate
Construction.....	850	825	700
Plant, machinery and vehicles	610	680	525
Shipbuilding and miscell.....	90	95	95
Total	1,550	1,600	1,320

A further point needs clarifying. These are figures of gross investment; that is, they include expenditure on repairs and maintenance, as well as new additions to capital, which are net investment. The official guess about the proportions between the two classes—repairs and maintenance of existing capital, and new additions—is 50:50, roughly the same division which has been adopted in the National Income estimates for 1946. But both this division, and the total of gross investment, are very speculative. There are, indeed, indications that expenditure on gross investment has been running appreciably higher than the figure for mid-1947 given above and that net investment represents a lower proportion of the gross total than the White Paper assumes. The Government wisely admits the fallibility of its figures, but it holds, nevertheless, that it must have a plan. Yet in some important sectors of industry, like coal and steel, the investment programme for 1948 has not been worked out. And in those sectors of private industry for which capital programmes have been worked out, the Government has perforce to rely on enlisting the co-operation of industry over much of the field which is not directly covered by building licences or steel allocation.

Hence the capital programme for 1948 is a mixture of fact and token figures, to be enforced by physical controls (within the very narrow limits in which these can be made effective) and

by suasion. The cuts have been expressed in global money terms at £180 million, but their application in detail rests, not on budgetary or financial control, but on the allocation of limited supplies of key materials, like timber and steel, and upon the achievement of manpower targets which are set forth, not for the end of 1948, but for June, 1948. It is, therefore, extremely difficult to relate the prospective fall in gross investment in 1948, compared with what it might otherwise have been in that year, to the release of labour at present employed in various programmes of capital works.

This difficulty is most marked in housing. By June, 1948, it is estimated that the labour force for all housing purposes will be approximately 525,000, compared with the present level (not mentioned in the White Paper) of 569,000. But there is particular reason for regarding statistics of the house building labour force with distrust, and there is no guarantee either that a fall of this order will take place, or that if 44,000 workers are released from house building they will not be siphoned off into other repair and maintenance work—which would mean no net release of building manpower for work in other industries. Housing is, on paper, the prime source from which labour and materials could be released for other construction work. But in fact the programme cannot be sharply cut for three reasons: a vigorous Minister; the large pool of houses under construction (to which resources have already been committed) or under contract (where presumably they have not); and the limitations imposed on other construction work by shortage of steel. The Government aims at having 210,000 houses under construction in the middle of 1948, and 140,000 a year later, and at completing 140,000 new houses next year. There are at present 260,000 houses under construction (of which 100,000 are roofed) and 90,000 under contract. The achievement of these programmes depends on an increase in the rate of completion (which was in any event to be expected in 1948) and on a limitation on the number of approvals for new building. Here the White Paper becomes quite non-committal. What is the rate of new approvals which is needed to secure that 210,000 houses will be under construction next June and 140,000 a year later? Over the period to mid-1949, approvals ought to average about 6,000 a month, which is less than half of the recent rate. And the target figure of 140,000 houses under construction in mid-1949 is still compatible—so far as can be judged from the White Paper—with the completion of 200,000 houses in 1949.

It is not easy to translate these figures into money terms (indeed, the reluctance of the White Paper so to express them is in itself a matter for comment), but they do not suggest any material fall in the devotion of real resources to housebuilding during the next 18 months. In fact, if timber supplies are easier in the middle of next year, it seems possible that the programme may again be expanded in 1949. In any case, the estimate of 140,000 for completions next year may well be lower than the actual achievement, and there is little restraint—apart from the overriding shortage of timber—on the Minister of Health to keep the approval of new building down to the level required to secure the mid-1949 target. On this most important sector of the programme, the evidence in the White Paper is far from clear, and the conclusion is downright woolly.

*

How does industry fare in this battle of doubtful figures and Departmental claims? Here the limiting factor is steel. Projects well under way and capable of contributing most to exports will be favoured, with preference for those in development areas. For the rest, no new industrial building or extensions will be started for "at least six months"; new projects which have not reached the stage of erecting steelwork will be "reviewed" with the object of postponing "at least half." Many of these projects are sponsored by Government Depart-

ments. Their pruning is measured in the White Paper by targets of manpower set for the middle of 1948, and most of these show increases and not reductions. Moreover, the re-employment of such labour as may be displaced is not discussed in any detail. If labour does not move from construction trades to match the extent of the cuts in materials, "alternative employment for those displaced should be available in some of those occupations where there is an acute shortage of labour." This is a self-evident conclusion, but it is hardly a policy. And what happens if, as the White Paper notes with some fear, the volume of maintenance and small works increases in 1948 to take up the displaced manpower from major projects? This volume must, indeed, "continue to be strictly controlled," but in maintenance and small works physical controls are not very effective and financial pressure is the only practical instrument. It is worth noting, in any case, that the prospective reduction in manpower from cuts in the construction programmes for industrial building, agricultural building, civil aviation, education, fuel and power, health, police and prisons, the Post Office, transport and roads, Government building, defence, and other building work licensed by the Ministry of Works amounts to a mere 7,000—from 392,000 employed in June to 385,000 set for next June.

Clearly, no major release of manpower is to be expected on balance by next June from the curtailment of new construction work, even though this is a sector where the physical controls, within their limitations, can be made to work. In plant and machinery, on the other hand, controls have been largely removed, though the Government can influence the programmes of state-owned industries and public utilities. Investment in machinery by private industry is not controlled, save to the extent that specialised machinery can be earmarked for export and denied to home industry—which raises the associated problem of the efficiency of the export controls. The "general purpose" plant (such as electric motors and pumps) is impossible to control, and the Government "will rely for the present on the good sense of industry following a policy lead." Given a vague directive of this kind, the difficulty for the private industrialist—and it is a genuine one—is to make any useful distinction between what is profitable to him and what may be desirable in the larger public interest.

The investment programme in plant, machinery and vehicles is analysed in detail below:—

ESTIMATED GROSS INVESTMENT IN PLANT, MACHINERY AND VEHICLES
IN THE UNITED KINGDOM

(£ Million)			
	Mid-1947: Estimated Annual Rate	1948: Original Forecast	End 1948: Estimated Annual Rate
Specialised plant:—			
(a) Utilities, coal and steel	135	590	180
(b) Private sector	65		50
Other machinery	275	90	240
Road vehicles	135		55
Total	610	680	525

Without a division of the figure of £590 million "originally forecast" for plant and machinery next year, it is quite impossible to judge what the revised programme means in terms of capital projects in the private sector which have already been announced, but are now due for modification. On the railways, the full programme of 600 locomotives and 48,000 new wagons is to proceed, but the building of coaching stock and the overtaking of arrears of renewals (as distinct from current maintenance) are to be curtailed. These decisions sound reasonable. A major revision in the electricity generating programme should speed up the installation of new plant next year and in 1949, at the expense of reducing the capacity to be installed in

later years; the remaining production is to be turned over to exports—another instance of the short commons on which British industrial capital will have to live during the next few years. The same point arises in connection with specialised industrial plant, where “production represented by 60,000 tons of steel” is to be turned over to export, and with road vehicles for business use. For coal and steel, the plant programmes have yet to be worked out. On shipbuilding, the Government has resisted American criticisms, and is going ahead with a contracted programme within the (unstated) supplies of steel. A start will be made on the oil refining programme, but cuts in telephone work will mean a loss of efficiency which will be felt “for some years.”

Future of the Sterling Area

THE financial agreements recently negotiated with three members of the sterling area (or of the “Scheduled territories” as now defined by the Exchange Control Act), namely South Africa, Eire and Iraq, provide some guidance to the changes in the character and operation of the sterling area mechanism that may have followed the suspension of convertibility of sterling. The agreements are the forerunners of others that remain to be negotiated with other members of the sterling area. All three were negotiated after the suspension of convertibility. In part they are designed to record the agreements reached among the countries concerned to economise dollars to the largest possible extent. But the more interesting features of the agreements are those which refer to the allocations of hard currencies to these countries out of the sterling area pool and which determine how far this recourse to the pool can be financed out of the accumulated sterling balances held by these countries.

As these three agreements have been negotiated since the suspension of convertibility, they should be studied for the light they may throw on the nature of sterling area relationships under the new ordinance. Throughout its long and somewhat ill-defined history the sterling area has always been a wholly voluntary association of countries which, for obvious reasons of convenience and self-interest, found it desirable to maintain their currencies stable in terms of sterling, to keep their external cash reserves in London, and to treat London as a banking intermediary in their dealings with non-sterling countries. Needless to say, the system developed because sterling was an internationally acceptable currency which in case of need could always be converted into other currencies, or even, if required, into gold. In other words the convertibility and world-wide acceptability of sterling were of the essence of the sterling area system.

The war brought considerable changes to the system. It caused most of the neutral countries which previously adhered to it to withdraw. To what remained it gave, for the first time, a statutory definition. For the first time also, it gave the sterling area arrangements a tinge of discrimination. This was inevitably introduced by the need to erect a system of exchange control between sterling and non-sterling currencies, and by the obvious advantages of leaving payments free, whether for current or for capital purposes, within the sterling area itself. In all other essentials, however, the war left the sterling area machinery unaffected. The individual countries continued to bank with London. They remitted their foreign exchange earnings to the central sterling area pool and, in turn, depended on that pool to supply them with the hard currencies they required. All members of the sterling area naturally understood the need to economise in their hard currency expenditure. Their

The broad conclusions from the White Paper can be stated simply. It seems only too probable that industrial capital is to be the residuary legatee. Housing comes first, and may indeed increase its calls on labour if timber supplies should increase. The claim that the programme will make a very large contribution to the capital equipment of the country compared with what was accomplished in more normal times before the war seems very doubtful. At least, it is by no means proved in the White Paper. There is an overwhelming probability that the creation of new industrial capital, which alone can provide the backbone of a healthy British economy, is being reduced to a dangerously low level. In short, the cuts as a whole are too small, and they are likely to be concentrated on what ought not to be cut.

relations with the sterling area dollar pool were, therefore, based on a gentleman's agreement, in which of course their good behaviour was to some extent guaranteed by the fact that the allocation of materials and shipping during the war was essentially under inter-Allied control. With the end of the war the position continued unchanged except that some of the countries, notably Egypt and Iraq, were given specific quotas of hard currencies instead of retaining the automatic right they had until then enjoyed to dip into the sterling area dollar pool.

Even during the war the essential elasticity and voluntary character of the sterling area system remained its basic characteristic. There was no compulsion on members to remit their earnings of dollars and other foreign exchange to the central pool, although in fact they all did so. Each member retained complete autonomy in the operation of its own exchange control. There was no complete pooling of gold reserves. South Africa maintained her own substantial independent reserve and small amounts of gold were also held by other members of the sterling area, including Australia and Eire. The only attempt made to obtain conformity in the sterling area arrangements was that of the Anglo-American financial agreement, which endeavoured to dictate what arrangements should be made between the British Government and the other members of the sterling area regarding the funding and release of accumulated sterling balances. These arrangements were to be so designed “that any discrimination arising from the so-called sterling area dollar pool will be entirely removed and that each member of the sterling area will have its current sterling and dollar receipts at its free disposition for current transactions anywhere.” This clause has, of course, met the fate of many others in the agreement and the events of August 20th last have gone far to nullify it. This also applies to the guidance given in the Anglo-American financial agreement regarding the manner in which accumulated sterling balances are to be treated. In no case has it yet been found possible to induce any sterling area country holding large sterling balances to accept the writing down of its claim. The only conceivable exceptions to this are the free gifts of £20 million and £10 million respectively made by Australia and New Zealand.

The agreement with South Africa which was announced last October makes some interesting departures from the general principles which, until then, had been deemed to characterise sterling area relationships. The most important in this respect is the provision that from the date of ratification of the agreement, which should be early in January, 1948, the Union of South Africa will bear full responsibility for its own dollar expenditure. Until now South Africa has undertaken to sell certain annual quotas of newly mined gold to Britain, the figures for 1946 and 1947 being around £80 million each. In exchange

for this South Africa has had access to the sterling area dollar pool, and has used this to a considerable extent, namely \$50 million in the half-year to June 30, 1947. By the new agreement South Africa is to make an immediate gold loan of £80 million, which will replace the present gold sales contract, but at the same time will sever the link between South Africa and the sterling area dollar pool. Since South Africa retains direct responsibility for its dollar expenditure, it will presumably retain independent control of its dollar earnings.

The other feature in the agreement with South Africa which appears to pull away from preconceived ideas of sterling area relationships is that exchange of information is to be provided between the two governments on the movements of capital between the Union of South Africa and other parts of the sterling area. The two governments have also undertaken to consult on the measures which may be necessary to control or prevent movements of capital from the United Kingdom to the Union of South Africa. Even though this control will apply only to movements “which are not required for any useful economic purpose in the Union” it will, if implemented, drive a first wedge into the principle of complete freedom for capital movements within the sterling area.

The agreement with Eire which was announced on November 13th was mainly concerned with commercial matters, but also dealt with Eire's dollar requirements. Under the agreement it was decided that the Government of Eire, with a view to conserving the dollar resources of the sterling area, would effect a substantial reduction in its drawing of dollars from the dollar pool. For the first time Eire was allocated a quota of hard currencies, albeit one which was not strictly defined. It was laid down that for the period October 1, 1947, to June 30, 1948, Eire's drawing of dollars from the dollar pool would equal no more than £14 million, plus Eire's dollar earnings. This indicated the extent to which Eire would be allowed to finance her dollar purchases by drawing on sterling balances. The interesting feature of this definition is that it appeared to hint at the possibility of Eire's maintaining control of its direct dollar earnings. This, however, is not the correct interpretation of the formula. In effect, Eire will continue to put its hard currency

income into the pool, but it has, by this agreement, acquired a guarantee that it will be allowed to withdraw from the pool whatever sum is paid in plus the equivalent of £14 million.

The same principle makes its appearance in the agreement with Iraq, which was signed a fortnight later. Under this agreement, Iraq is given a hard currency quota equivalent to £5,570,000 per annum, which is to include Iraq's own earnings of hard currencies. In effect the greater part of this quota will have to be provided out of Iraq's sterling balances, since that country's direct dollar and other hard currency earnings are much smaller than this figure.

The main lesson taught by these three post-convertibility agreements with sterling area countries is that, despite the shock of August 20th, despite the dire pressure on the central gold reserve, the sterling area remains, in essence, what it always has been—a voluntary association of countries bound to act as they do by ties of self interest (given its widest interpretation) and not by a rigid set of rules. The three agreements show some departure from previous practice and to that extent reveal the essential flexibility of the sterling area conception and mechanism. There must have been grave temptation, given the extremity of Britain's position and the pressure put on an exiguous reserve to try to flog the sterling area into a more cohesive team, transforming into defined obligations what its members have hitherto done voluntarily. It is reassuring to see from the evidence of these agreements that this temptation has been successfully resisted. The sterling area is, in many respects, a monetary counterpart of the political relations of the Commonwealth. The strength of both lies in the looseness of the bonds that hold them together. An apparent price may sometimes have to be paid for the looseness and lack of definition of these systems. In political terms it meant a neutral Eire during the war, and the weakness of Allied control over the Western approaches. In monetary terms the complete autonomy of the sterling area members may, for a time, involve the need to control the free flow of funds within the area. But few can doubt that the prospect of an enduring sterling area, assuming of course, a sterling which commands confidence, is dependent on the voluntary co-operation of its members.

Business Notes

Repaying Conversion Three Per Cents

Notice of redemption of the £302 million of 3 per cent Conversion Loan, 1948-53, on March 1st next—the earliest optional date—was duly given at the end of last week and, as had been generally expected, no offer of conversion into any new or existing stocks has been made. But although the announcement thus sets at rest the fears which so upset the gilt-edged market ten days ago, it has entirely failed to arrest the downward trend. This week's further decline in prices becomes, indeed, the more striking when viewed in the light of the recent revision of earlier estimates of the amount of maturing stock which has already found its way into official hands. Before the announcement, it had been widely assumed that the official holdings accounted for at least two-thirds and perhaps for fully three-quarters of the total; but last week-end it was reported—and the report is believed to be well-founded—that the internal holdings amounted to no more than £120 million. It seems possible, however, that this last estimate did not take into account holdings of ever that this last estimate did not take into account holdings of public bodies which, though not technically agencies of the British Government, are known none the less to follow an investment policy which conforms to that of the Treasury. This applies particularly to the various Currency Boards, some of which are known to have had substantial holdings of the 3 per cent stock. Well-informed observers in the market are now disposed to put the official holdings, in this wider sense, at roughly one-half, and perhaps rather more than half, of the total.

The potential support for the gilt-edged market as a result of this operation may, therefore, be somewhat larger than was at first supposed. But even if the outside holding at the date of the announcement was still as large as £150 million, it would be easy

to exaggerate the prospective benefit to the gilt-edged market as a whole. A proportion of the outside holdings certainly comprises those of the banks and other financial institutions which have been running the bond as a “short,” and if these institutions elect to reinvest in advance of redemption, their operations will hardly provide any direct support for the medium and longer-dated stocks. The authorities themselves are, of course, ready buyers of the maturing stock on the exiguous redemption yield basis (hardly more than three-quarters per cent) which, virtually as a three months' bill, it now commands. But, unless the authorities are determined to exert the maximum leverage on the market position by deliberate further creation of money, they are likely to regard any such investment demand as this as an opportunity for effecting further sales of their own holdings of short bonds. Meanwhile, for the more speculative type of gilt-edged operator, there is still scope in the discounts at which the Rail Transport stocks are quoted—despite the large switching from short bonds which was noticeable recently.

The chances that reinvestment demands created by this repayment will significantly alter the prospect for the Transport compensation stock are therefore quite slender. After this week's further falls in the market, a redemption yield of rather more than 3 per cent can be obtained on dated stocks with a maximum life of 18 to 28 years (3 per cent Savings Bonds, 1967-75, yield to final redemption, £3 os. 4d. per cent at 100%). Unless the trustee and other private holders of the maturing stock come rapidly into the market, it seems clear that further official support will be needed even to establish firmly a 3 per cent basis for the Transport stock operation. Meanwhile, on Wednesday next week, when the end-year three-week Stock Exchange account

opens, operations "for the account" of Rail stocks will be conducted in terms of the new Transport stock to be issued on January 1st; dealings will therefore be free of stamp and fee. And, on the previous day, details will be published of the arrangements for the exchange of railway securities into the new Transport Stock.

A New CIC Directive

A revision of the last formal "Memorandum of Guidance" to the Capital Issues Committee was long overdue, for no fresh instructions had been transmitted by the Treasury since the end of hostilities. Sir Stafford Cripps has therefore inevitably made the announcement of the investment cuts—fully discussed in an earlier article this week—an occasion for issuing a supplementary memorandum. It is a brief and rather inconclusive document, in that it refrains from substituting any list of priorities for those set out in the 1945 White Paper [Cmd. 6645]. In a negative sense, however, the new instructions are fairly definite and clear. In effect, the Committee is enjoined to refuse permission for capital outlays unless they fall into one of two categories. The exceptions are, first, outlays which promise "a considerable return" in increased exports or saving of imports from "difficult" sources and, secondly, those for basic industries such as agriculture, coal and steel production. By implication, therefore, the new instruction excludes certain categories from the list of eligible outlays set forth in 1945, when it was said that consent would "usually" be given to issues—among other listed objectives—for the development areas, for public utilities and housing associations, transport, catering and a miscellaneous category which, though not specifically defined, included such objectives as manufacture of personal clothing and household furnishings.

Much more important than these oblique indications of priorities is the procedure by which the control is to be enforced. In the past, the Committee was expected to seek and heed the advice of the appropriate Government department when dealing with applications, but now this provision is reinforced and tightened up. The Committee is told bluntly "not to recommend consent, except to the extent to which they are definitely assured by the terms of the Departmental reports that the scheme is in full accord [italics not in original] with the revised general programme of capital investment." Neither the memorandum nor Sir Stafford Cripps's statement makes any reference to the position of issues required for purely financial purposes as distinct from fresh capital outlay. Presumably, therefore, permission will ordinarily be granted, as in the past, for issues required for the renewal or replacement of maturing obligations and also, subject to the normal criteria of the state of the new issue market, to optional conversions.

The new memorandum, like the old, does not refer to the position of the banks, but Sir Stafford Cripps stated that, "as regards bank advances . . . the banks will be asked to observe the intentions of the new memorandum." Up to the moment of going to press no such request had apparently been made, and some circles were wondering whether the banks were to be brought more formally within the ambit of the control than they have been hitherto. Both at the outbreak of war and in 1945, however, the authorities requested the banks to adhere in their advances policy to the principles and spirit of the capital issues control, and Sir Stafford acknowledged that in doing so they had rendered "most valuable help in restricting credit facilities to conform with the general policy of the Government." There seems no reason to suppose that the authorities are contemplating any more restrictive arrangements now. It would be quite impracticable and wholly unreasonable, for example, for the banks to be expected to seek the approval of the appropriate Departments when dealing with the generality of applications for advances. Presumably it will be left to their discretion to do so only in those instances in which they feel the need of official guidance to enable them to construe the regulations in any particular case.

Sharing of Stock Exchange Commissions

Important amendments to the rules governing the sharing of brokers' commissions have been passed by the Stock Exchange Council subject to confirmation on December 22nd. Their effect is that rebates of commission will not be made as from the beginning of 1949 to accountants, solicitors, the trustee departments of banks and insurance companies, and the Public Trustee. In addition, the registration fee for inclusion on the register of agents is

to be raised from £3 3s. to £52 10s., while the annual fee for attachés is to be raised from £3 3s. to £26 5s.

Thus the proposal amounts to restricting the qualification for inclusion on the register of agents, and also to the exclusion of small agents by raising the registration fees to effective instead of nominal levels. These steps will enable a revision of the agents' registers to be made for the first time for many years. It is stated that proposals are designed to restrict the sharing of commissions to those agents who can be regarded as originating sources of new business for the Stock Exchange, and to exclude from the system those agents whose business in the past has been relatively small or which would have flowed automatically to the House. Evidently the move can also be regarded as an attempt to put the stockbroker on the same sort of footing, so far as the sharing of fees is concerned, as a member of any other profession. A number of important issues arise from the proposals, and the Council has been wise to allow three weeks for their consideration. Some of these issues must be deferred for later discussion in *The Economist*.

Advertising Tax Withdrawn

Sir Stafford Cripps is to be congratulated upon his decision to drop the budget proposal to "tax" expenditure on advertising by the device of disallowing a proportion of it from ranking as a charge in the computation of taxable profits. *The Economist* has never shared the quite widespread view that a tax on advertising is objectionable in principle; but it is quite clear that the system actually proposed would have been difficult to administer, and the exemptions which alone could have prevented it from hampering necessary advertising would have involved arbitrary decisions. It was arguable, too, that the effective rate of tax was excessive. More important, however, than these considerations is the probability that the plan would not in fact have achieved the primary objects which the Government had in view—the saving of labour and materials employed in advertising, and the avoidance of incitement to consumers to try to buy goods which are in short supply.

The Chancellor has acted wisely, therefore, in accepting the offer, made through the FBI, to work out a plan to achieve these ends by a voluntary scheme. The working committee which is to be charged with this task will represent the Association of British Chambers of Commerce, the National Union of Manufacturers, the various advertising associations and the principal associations of the press. This retreat from fiscal action will impose no burden on the revenue in the current year, but for the year 1948-49 the hypothetical loss will be £10 million, thus further whittling down the very moderate addition to tax revenue for which the autumn budget provided. In this matter the new Chancellor has perhaps shown a greater flexibility of mind than his predecessor might have done, but his retort to Mr Oliver Stanley's rather double-edged congratulation to him on this issue plainly shows that this action is not a preliminary to any general reversal of Daltonian policies.

Heavy Gold Sales

The monthly Treasury statement on sales of gold and purchases of dollars from the International Monetary Fund shows that in November these totalled £63 million, of which £48 million represented gross sales of gold and the balance a further purchase of \$60 million from the IMF. These are unexpectedly large figures and indicate a persistence of the dollar gap at a figure little different from what it was in the previous month. If to the £63 million dip into final reserves there is added the £10 million withdrawn from the Canadian credit between November 1st and 30th, the rate of dollar drain for the month will be found to be somewhat higher than the figure of \$70 million a week at which Mr Dalton said it was running in September and October. The details of gold sales and dollar purchases from the IMF since the suspension of convertibility are as follows:

	Gross Gold Sales	Dollar Purchases from IMF	Total
September	20	15	35
October	35	30	65
November	48	15	63
Three months	103	60	163

If to the September figure is added the £37½ million withdrawn from the US line of credit on August 20th for meeting future

commitments, it will be found that the dollar drain in these three months has been fairly constant.

Since the gold reserve was stated to be about £600 million towards the end of August, the present total, allowing for purchases of South African and other newly mined Empire gold, should now be somewhat in excess of £500 million. Within the next few weeks this reserve will receive an £80 million reinforcement from the South African gold loan, but it will thereafter be deprived of regular accretions from newly mined South African gold. The British purchases of dollars from the IMF have now reached \$240 million and exceed by \$25 million the amount of exchange Britain can acquire without incurring expense other than the initial and once-for-all ½ per cent service charge (namely \$208 million, being the equivalent of Britain's gold subscription to the IMF, plus \$7,000,000, the amount of sterling bought from the IMF by the Netherlands). The total quota of foreign currency Britain can purchase against sterling during any twelve-month period is one-quarter of its quota, namely \$325 million. Three-quarters of this has thus been exhausted in three months. The "ruinous" rate, as Mr Dalton described it, at which the dollar drain was running more than a month ago shows no sign yet of falling. And there is no "convertibility" scapegoat on which to heap the blame.

Odeon Purchase Doubts

The reticence of Mr Rank on the financial position of General Cinema Finance Corporation following continued criticism of the purchase contemplated by Odeon Theatres has been in no way mitigated by the sharp rise in the price of the ordinary shares of Odeon Theatres this week or by the publication of the net profit figures of Gaumont British Picture Corporation for 1946-47. At one time it was suggested in the market that dealings in the shares of Odeon Theatres should be unofficially suspended, but this drastic step was not taken and no doubt buying of the shares, of which some ninety per cent are held within approachable reach of Mr Rank, was intended to allay any doubts about their fundamental strength. The Gaumont British figures which show net profit to have risen from £469,509 to £557,673 are useful as far as they go, but they do not disclose the trading profit. And at this week's meeting of Provincial Cinematograph Theatres, which is controlled by Gaumont British, Mr Rank stated that owing to higher costs and smaller attendances a lower rate of earnings was to be anticipated; only a much reduced provision for taxation enabled the company to show a higher net profit for the year and the full accounts of Gaumont British are likely to show a similar pattern.

But even the disclosure of the trading position of public companies controlled by General Cinema Finance Corporation would be no substitute for the information required of General Cinema Finance Corporation itself, which is known to play an important role in the general finance of the Rank organisation as a whole. Mr Rank has remained firmly silent on this point. Is this a case where it might become reasonable to invoke one of the powers of the Board of Trade (under Section 43 of the Companies Act which came into effect last Monday) to appoint an inspector if it appears to the Board that there are circumstances suggesting that the members of a company have not been given all the information with respect to its affairs which they might reasonably expect?

This course has already been suggested by some critics of Mr Rank's proposal and if he remains unwilling to disclose what Odeon shareholders will be acquiring and denies them an up to date consolidated balance sheet and profit and loss account for General Cinema Finance Corporation pressure for a Board of Trade investigation may well increase. The determination of Mr Rank to carry through the deal and to say so little about it is beginning to suggest that the supply of films for the Odeon group may be only one—and perhaps not the main—factor in the plan.

Coal Exports at Last

It is good though belated news that coal exports to Europe are to be resumed, even though a regular export programme cannot yet be started. The Ministry of Fuel and Power has this week given the National Coal Board discretion to ship occasional cargoes to the other 15 countries which met in Paris on the Marshall offer. Thus, although the arrangements may be tentative, one of the biggest steps in the economic and political reconstruction of Europe is now coming into operation. Europe may now entertain serious hopes of coal from Britain—provided that the longer week in British coalfields, coupled with new recruitment, produces a steady expansion in output to meet the 10 million tons which Britain hopes to export in 1948. Meanwhile, some progress is being made in supplying coaling stations with bunkers, which should steadily relieve the dollar cost of bunkering with coal from the United States.

Coal production for the week ended November 29th totalled 4,263,200 tons, compared with 4,245,300 tons a week earlier. Open-cast production was slightly higher at 206,800 tons, contrary to the anticipated seasonal trend, but deep-mined output increased by 16,300 tons from 4,040,100 to 4,056,400 tons, despite the additional loss of 14,500 tons by stoppages and breakdowns compared with the previous week. The coal allocations are based on an estimated weekly production, in weeks free from statutory holidays, of 3,900,000 tons. Over the last few weeks, since overtime working got into its stride, there has been a weekly margin of 300,000 to 400,000 tons, a portion of which has already been earmarked for overseas bunkers. Bunker coal must obviously continue to take priority over other exports owing to its value as a dollar saver.

The Ministry of Fuel and Power has wisely underlined the possibility that exports to Europe will at first be small and irregular. It will be time to talk of a coal export programme when overtime working has been running longer, when winter sickness among miners and the effect of statutory holidays is known—and, most important, when the full effects of transport difficulties can be measured in terms of movement of coal from the pit heads.

Inter-European Clearing

The suggestion made by the committee of European Economic Co-operation that part of the task of economic rehabilitation should be the rebuilding of the machinery for multilateral payments within Europe, has now taken definite, though as yet modest shape. Following the issue of the Paris report, a special committee on payments agreements held two meetings, the outcome

of which was an agreement for multilateral monetary compensation which was signed in Paris on November 18th by the Belgian Government (acting also for Luxembourg) and the French, Italian and Dutch governments. In this agreement the signatories undertook to carry out multilateral compensation every month. The first of their meetings to discuss the machinery of these clearing arrangements was held at the Bank for International Settlements in Basle. This institution is to be entrusted with the function of agents for compensation. At this meeting observers attended on the part of Denmark, Greece, Norway, Sweden, Switzerland, the United Kingdom and the United States. Four of these countries (Denmark, Norway, Sweden and the United Kingdom) signified their adhesion in principle to this agreement as "occasional members."

The machinery of multilateral compensation which will begin to function at the beginning of 1948 will operate on the basis of monthly information which is to be sent to the BIS both by permanent and occasional members regarding their mutual current payments. The BIS will collate this information and will then study what compensations are possible as between the balances that will have accrued to the members.

All members will normally be represented at the monthly meetings at which the compensations are to be arranged. The permanent members have undertaken to accept the clearing instructions given at these meetings. The occasional members will follow the guidance from Basle only if it suits them to do so, but they have undertaken to make their decisions known within 48 hours. They have, moreover, allowed it to be known that they enter the scheme with every possible sympathy and readiness to help. If Britain has been deterred from becoming a full member immediately it is because recent experience has somewhat damped its ardour for any scheme which involves automatic transferability of sterling between non-sterling countries, or which places in the hands of an extraneous authority the power to decide what sterling shall accrue to other countries.

The compensation scheme is not to be endowed with any specific allocation of dollars. The basis of the scheme is still to be found in the bilateral pacts between various European countries under which payments are effected in gold or dollars as soon as certain limits in their respective holdings of currency balances are passed. These limits have, in some instances, been raised, as may be seen from the terms on which payments between Britain and the European countries have been renegotiated. But the ultimate obligation to pay in gold remains and will come into operation whenever the new monetary compensation puts into the hands of any member country more of the currency of the others than it has undertaken to hold. It follows that the agreement will operate smoothly only if inter-European payments are maintained in comparative equilibrium. The inclusion of any country which is persistently a debtor or creditor towards the rest of the members would soon wreck the scheme.

* * *

A BIS "Come Back"

One of the more interesting aspects of this highly important development is the return of the Bank of International Settlements to the business of inter-Central Bank clearing, a sphere from which it was thought that the BIS had been banished by the bigger and more streamlined International Monetary Fund. The IMF, however, is not in a position to handle a purely regional scheme of this kind and is in any case too far removed from the field of operations to intervene with the required speed and efficiency. This will be by no means the first international clearing scheme that will have been operated by the BIS. From the early years of its foundation the BIS operated a gold clearing for a number of central banks. The intervention of the BIS in the European monetary compensations is to be purely in the guise of an agent. It will not keep the clearing accounts nor will its directives be other than those which are reached by normal majority decision at the monthly meetings in Basle at which all the signatories of the agreement will be represented. The success of the clearing will depend first on the extent to which inter-European payments can be maintained in rough equilibrium, and secondly, on the margin of elasticity which will be provided by the member countries' reserves of gold and dollars. To this extent the success of the scheme can be said to depend on adequate aid from the United States through the European Recovery Programme even though no part of that aid is made specifically available for underpinning a multilateral compensation arrangement of this kind.

Royal Dutch Rights

The Dutch regulations which prevent foreign holders of Royal Dutch shares subscribing for the new shares out of the proceeds of sales in Holland of rights to the issue seem to have a dual purpose. It appears that the object is first to collect as much additional foreign exchange as possible from the issue, and secondly to ensure that foreign holders contribute their full quota of new capital. It is intended that only part will be subscribed by resident holders of the shares and by sales either of securities or Royal Dutch rights in Holland by non-residents. Sales in Holland of rights or other securities by non-residents must be re-invested in non-international securities. The view of the Netherlands is understandable, but the measures have had a bad reception in international financial circles, especially in the United States and Switzerland, where Royal Dutch shares have an extensive currency. As a consequence of the regulation, a high discount has been established in the price of rights on the exchanges outside Holland. In New York discounts have risen to 75 per cent on the rights and 60 per cent on Royal Dutch shares.

To prohibit the use of the proceeds of the sale of rights by foreign holders of Royal Dutch to purchase international securities is certainly one way of canalising foreign capital into the Dutch domestic capital market, and the Dutch authorities have taken full advantage of the possibilities presented by the new issue. Nevertheless, foreign holders seem to be shy of the alternative offered them, for although the value of the rights is substantially higher in Amsterdam, it is probable that the inducement offered will not be sufficient to bring many foreign sellers to avail themselves of it. At the present time Holland does not present any outstanding advantage as a temporary lodging place for money from hard currency areas, and with the additional risk of having funds there frozen indefinitely, foreign holders of Royal Dutch rights have reason to be more willing sellers in other centres. As it is, certain international centres, London among them, are providing facilities for holders of Royal Dutch shares to subscribe for the new shares, and that should assist the success of the Dutch part of the issue.

Canada's Import Ban

Latest news from the Anglo-Canadian commercial talks in Ottawa suggests that serious difficulties have been encountered. The British negotiators are primarily bent on saving dollar expenditure. There have, therefore, been attempts to cut some of the less essential foods that Britain had contracted to buy from Canada, including the processed foods allowed under the "token" import scheme. The Canadians have countered with the contention that the food programme must be seen as a whole and that if Britain tampers appreciably with any part of it the rest, and in particular the wheat contract, may have to be reconsidered. No doubt the goodwill and generosity which have marked all financial and commercial negotiations between the two countries in the past will again intervene and provide a satisfactory compromise. But never before have these qualities had to surmount such obstacles. Britain must curtail her net deficit with Canada, of which 50 per cent is payable in US dollars, and Canada, for its part, must cut its deficit with the United States, which has recently been running at an annual rate of over \$800 million and is pressing against a gold reserve of no more than \$500 million.

To reconcile these two needs without unduly strangling Anglo-Canadian trade would tax the ingenuity of any set of negotiators. There is one aspect of Canada's recent defensive measures against the dollar shortage which, however, appears less than helpful in dealing with the Anglo-Canadian problem. That is in the non-discriminatory application of the import prohibitions that were announced on November 18th. The restrictions on imports include outright prohibition of a wide range of goods, most of them already produced in Canada. It includes such items as jewellery, confectionery, typewriters, radios, washing machines and furniture. For the time being motor vehicles have been included in this list, although it is the intention of the Canadian Government to replace the outright prohibition of motor vehicle imports by a restrictive quota system. The quota system will be based on prewar trade, but will allow some flexibility. The prohibitions, however, are to apply to imports from all countries. In other words, in an effort

to keep out American goods, Canada will also be keeping out British goods and will thus tend to accentuate the very difficulties with which Canada and Britain are now faced. This is so clear a case of non-discrimination acting in a negative and restrictive sense that it should not be difficult to persuade the US Administration, for whom no doubt the gesture was primarily intended, that this is an occasion on which the theory of non-discrimination might be relaxed a little.

* * *

Towards the Export Target

The Board of Trade is to be commended for issuing statistics showing the progress of different industries towards their export targets. In the accompanying table the volume index for the main exports is shown for the three months August-October, compared with the mid-1948 target and with the third quarter of this year. The export values in the fourth quarter of 1946 are also given. A three months' moving average has been adopted for greater accuracy and to show the trend more clearly.

The progress made so far has been slight. The full effects of the new drive may not be apparent for some time to come, but June is only eight months ahead. Exports of metals and metal goods showed no change during the period August to October, in spite of an appreciable increase in shipments of vehicles. This latter gain was offset by smaller exports of machinery—which forms one of the spearheads of the new drive—iron and steel and other metal manufactures. The vehicle group has so far made satisfactory progress, but the motor-car industry is entertaining serious doubts about future expansion, as many overseas markets are being closed to "non-essential" goods. Exports of machinery will have to expand by a third over their present volume to achieve their target; in this they may be aided by the new capital cuts, but nevertheless theirs is a stupendous task.

In the textile group, all categories except woollen and worsted goods showed an increase compared with the third quarter, but the gap between the present volume of textile exports and the mid-1948 targets is even greater than in the case of metals. Moreover, the discouraging labour recruitment and the unwillingness of the cotton workers to work a longer week suggests no chance

of a rapid expansion in exports except at the expense of the home market. Among the other export items, paper and cardboard alone were almost at their target level—in the third quarter they were above it—but they form a small proportion of total imports.

EXPORTS OF MAIN MANUFACTURES

Description	Value of Exports, 4th Qtr., 1946	Volume Index Numbers, 4th Qtr., 1946=100		
		3rd Qtr., 1947	Aug.-Oct., 1947	Target Mid-1948

Disappointments in Rubber

Empire rubber producers express sharp disappointment with the modest value of the concession obtained from the United States in the limitation of American synthetic rubber consumption. The Rubber Growers' Association has this week made a formal protest to the British Government, which, in substance, complains that, under the new tariff agreement, American consumption of general purpose synthetic rubber (GRS) is more likely to increase than decline. Hitherto the minimum propor-

OVERSEAS TRADE

Exports are vital to our national prosperity and the Bank will, as in the past, provide the requisite finance for their production and distribution. Technical information for overseas traders will also be available regarding Exchange, market conditions and commercial requirements abroad.

COMPLETE WORLD-WIDE BANKING SERVICE

With the immense strength of its combined resources and experience, the Three Banks Group is exceptionally well-equipped to fulfil the many varied functions of a modern Banking Service. Although the Group serves the interests of many large and important concerns, it is careful to preserve the personal touch that has been a tradition of each of its members during two centuries.

WILLIAMS DEACON'S BANK LIMITED
Founded 1771 Manchester, London and Branches

tion of GRS to be consumed in the United States has been technically fixed at one-third of total consumption of GRS and natural rubber together and in practice this proportion has also been the maximum; the tariff agreement provides for a new arrangement by which the proportion of synthetic rubber is to be 25 per cent of total consumption of natural, synthetic and reclaimed rubber. The RGA maintains that the inclusion of special purpose synthetics and reclaimed rubber in the latter provision will result in a higher consumption of GRS in America. Clearly, this does not necessarily follow; but equally it does not follow that the consumption of natural rubber will be greatly increased.

The Batt Report on American synthetic rubber production which appeared in July, recommended the 33½ per cent minimum for GRS consumption as the lowest rate of consumption consistent with national strategic requirements. But American rubber manufacturers are still using more than that proportion. In September, United States consumption of GRS represented 40 per cent of total GRS and natural rubber consumption, compared with 60 per cent for the year 1946. On the other hand the proportion of GRS to total rubber consumption (including special synthetic and reclaimed rubber, as stipulated by the tariff agreement) in the same month was 29 per cent. There is thus some scope for a reduction in the rate of GRS consumption, and although such a reduction need not necessarily be in favour of natural rubber, there is a fair chance that it will be at least in part. Admittedly, Britain has not improved on the Batt Report, and America in effect has conceded little or nothing, but it has obtained a certain safeguard against a sudden reversal of American synthetic rubber policy, for what that may be worth.

To charge the British negotiators, as the Rubber Growers' Association has done, as being "unequal to their task," seems a little harsh, at least without full and detailed knowledge of the negotiations which took place. America was known to be a hard bargainer over limiting synthetic production, and criticism has to be tempered by proper appreciation of the opposition's strength. The Association, however, may legitimately complain that rubber producers were not consulted in the preparation of the British Government's brief. Until the tariff agreements are discussed in Parliament, the Board of Trade is refraining from comment.

"Spivs" and Currency

The strong contra-seasonal trend of the note circulation continues. After the phenomenal decline of £12 million in the note circulation a fortnight ago, there was last week a further reflux of £7,600,000, and this week's Bank return shows only a fractional expansion, by £2,200,000. This, of course, is the season at which the volume of notes begins to be strongly affected by the demands for currency for Christmas expenditure, and in the corresponding week last year the withdrawal of notes amounted to £9,700,000. Thus, although the recent rapid fall in the note issue has been arrested, the normal seasonal expansion is scarcely discernible in the published figures. In consequence of the public's rush to do much of its Christmas shopping before the autumn Budget, it is probable that the Christmas demands now are less than they were at this time last year, but it is not to be supposed that a seasonal drain of currency from the banks is not in fact taking place for these purposes.

Now, therefore, it is generally agreed that the movement of the note circulation as a whole is at present dominated by quite abnormal influences, and this week various colourful explanations have provided good "copy" for the popular press. Unfortunately, there is no means of disproving these theories statistically, for reliable statistics of the distribution of currency in the hands of the public do not exist—not even in official quarters. But such information as is available suggests that there is no reason whatever to assume that smuggling of notes into Britain from abroad has been on anything approaching the scale which popular rumour has lately implied. There is no doubt that continental holders of sterling notes have taken fright at the possibility that the British authorities might follow European precedent by decreeing a note exchange in the early future; and such fears have certainly intensified the efforts to smuggle notes into the country. But it seems certain that successful smuggling could account for only a small part of the abnormal reflux of currency

to the banks; and it is also significant that the returning notes have not included any unusual proportion of the denominations above one pound which were commonly held abroad. The preponderant movement has consisted of one pound notes.

In the absence of further information and further experience of the movement, the primary influence must be presumed to be the return of notes already held in this country from black marketeers and others who have reason to hide the scale of their operations and profits from the authorities. The exchange of notes which such circles fear, would necessarily be a difficult and expensive operation in these days of shortage of paper and plant capacity, but Sir Stafford Cripps's answer in the House of Commons on November 18th, when he said that the authorities were "not ready to take the step of replacing" the existing note issue, was cunningly phrased so as to leave the "spivs" guessing. Normally, their efforts to get rid of note holdings might be expected to take the form of demands for durable luxury goods and valuables, but there are evident limits to the scale on which such operations can be completed, and recently there have been signs that notes have been paid into the banks in substantial quantities through carefully selected intermediaries who are able with impunity to cloak the operations of those for whom they act.

Still More Money

Although last month's war damage disbursements are now being reflected—though very pallidly—in the savings figures (which in two successive weeks have been the best since last May), there has been no perceptible effect upon the gilt-edged market. Any advantage the market may have reaped from the distribution of this £100 million has been wholly overshadowed by the repercussions of the departure of the high priest of cheaper money. But although the market effects have been small, the consequential money creation upon which the gilt-edged speculators had based such high hopes has indubitably occurred. The latest banking figures, those for November, reveal by far the biggest rise in net bank deposits since the end of the aggressive phase of the Daltonian campaign. The month's increase is £73.5 million, making an expansion of no less than £127 million in two months—despite the Treasury's still very heavy reliance upon external finance (by sales of gold and drafts on the Canadian credit) during this period.

To some extent, the expansion results merely from the abnormal glut of credit on make-up day—reflecting, in particular, the sudden large reflux of currency from circulation—which raised the cash holding by £19 million and the cash ratio from 8.23 to 8.45 per cent. On the other hand, up to that date, only a little more than half the war damage orders had been presented and cleared: the Exchequer outgoings on this account in the five weeks to November 22nd (three days after the make-up) were only £57 million. This explains why November's expansion in the banks' Treasury deposit receipts, the principal counterpart of the growth in deposits, was no more than £48½ million. Including the further call for the current week (when there were again no maturities), the total TDR issue has been raised by £120 million. It is virtually certain, therefore, that there has been a further substantial expansion in deposits since make-up day.

New demands for credit from non-Governmental sources were smaller during the month than in October: bank advances rose by £19.9 million, or £7½ million less than in October, a slackening which must be attributed to repayments effected out of the war damage monies. At their new high level of £1,195.7 million, however, they are still fractionally larger than the TDR holding (which they surpassed in October, for the first time for five years).

Consolidated Accounts Next July

The Government is wisely allowing a liberal interval of seven months before it brings into full legal force the provisions of the new Companies Act relating to the publication of accounts. The date now fixed on which these provisions will be brought into full operation is July 1, 1948. A note last week described the many provisions which became operative on December 1st; they include sections 42-45, which extend the powers of the Board of Trade to investigate the internal affairs of companies, and sections 46-48, which enable the Board of Trade to investigate the ownership of shares.

Experience during the past year has shown that the process of consolidating accounts for the first time, which is one of the

main provisions to be enforced on July 1st next, is presenting major accounting problems for some industrial companies. Some of them, such as Furness Withy whose interests constitute a most intricate labyrinth, have succeeded, albeit after much delay, in presenting a consolidated balance sheet, but the group have yet to publish a consolidated profit and loss account. Others, such as Courtaulds, have voluntarily provided both consolidated balance sheets and profit and loss accounts, but in the case of the profit and loss account the synchronisation of the financial years of the subsidiaries has resulted in a distortion of the profit figures. It will be a year or two before the accounts of the holding companies can be made up so that true comparisons can be drawn between consecutive years, but it is certainly important for companies to know that they must take the necessary steps without delay to provide at least a consolidation for the latest year.

Raw Materials and Exports

Following Mr Marquand's unsuccessful efforts to explain clearly two weeks ago the new system of steel priorities, Sir Stafford Cripps issued last week an "explanatory statement" to clear up, what he has euphemistically called "a fairly widespread misunderstanding" on the allocation of raw materials to enable manufacturers to fulfil their export targets.

For end products, such as vehicles, each manufacturer's approved programme for materials will lay down the proportion to be sent abroad. In fixing the allocation of the product for the home market, account will already have been taken of the part it plays indirectly in the export drive. This is quite clear, and responsible critics of the scheme have never questioned the possibility of devising a logical scheme for allocating raw materials to manufacturers of end products, though such a scheme would be immensely detailed and complicated.

The position of the sub-contractor, however, remains as obscure as before. "If the main contractor," says the statement, "is able to back his orders with material sub-allocation to the sub-contractor, the latter may assume that he is working to an approved scheme." This is acceptable as an exposition of "M form theory" though it is not quite so self-evident in practice. Is the sub-contractor to have no initiative in seeking business and, conversely, is this the only formula provided for ensuring that materials do not stray into non-priority users, however essential these may be?

Another source of misunderstanding on the question of diverting goods from home to export markets has been the position of manufacturers of capital equipment working to a long-term order book. It has now been made quite clear that not only future orders for the home market, but existing ones as well, must be diverted to export so that targets may be achieved in 1948. There is a welcome air of urgency about this decision, but a rapid

switch of capital equipment from home to export markets is possible only in those cases where specifications are the same. In many industries producing specialist machinery this coincidence between home and export specification is rare.

Shorter Notes

At a meeting of Shell "Transport and Trading" on December 2nd, proposals were approved by the shareholders to raise the capital of the company by £10 million to £40 million as a preliminary to the new issue of 9,648,544 £1 ordinary shares to shareholders for which letters of rights are being posted in time for dealings to begin on December 10th.

Mr N. S. Erleigh and Mr J. Milne, former co-directors of New Union Goldfields, were arrested on November 28th on charges of theft, and the hearing of the charges began on December 3rd in the Johannesburg Magistrates' Court. The proceedings have been postponed until February 3rd next year.

The Board of Trade has announced that the Raw Cotton Commission will commence its duties of buying, importing into the United Kingdom, holding and distributing raw cotton, on January 1, 1948. The chairman will be Mr H. O. R. Hindley, chairman of the Northern Divisional Board of the National Coal Board. The other eight members include two officials from the Cotton Control—one as an independent member—two cotton spinners, two trade union representatives, one cotton merchant and one officer from the Cotton Board as part-time member. Another independent member and one or more additional part-time members are to be appointed later.

Rayon production in October reached a new record of 20.1 million lb., compared with 18.7 million lb. in September and 17.4 million lb. in October last year. Exports of rayon yarn in the third quarter gained at the expense of supplies to the home weaving, knitting and tyre industries.

The Argentina linseed harvest is reported to be disappointing. It is expected that the entire crop will be converted into oil in Argentina.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Wall Paper Manufacturers; Montague Burton; Combined Egyptian Mills; Associated Equipment Company.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption															

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent. will be redeemed at the earliest date (these are marked 'c'), and those paying 3 per cent or less will be repaid at the latest date (these are marked 'f'). (n) Net yields are calculated after allowing for tax at 8s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. † Notice given for repayment on March 1, 1948.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7.6 per cent). (i) To latest redemption date. † Free of tax.

WALTER SPENCER AND COMPANY

INCREASED PROFIT

MR. E. RANSOM HARRISON'S ADDRESS

The eleventh annual general meeting of Walter Spencer and Company, Limited, was held on the 3rd instant at the Royal Victoria Station Hotel, Sheffield, Mr. E. Ransom Harrison, F.S.A.A. (chairman of the company), presiding.

The Secretary (Mr. T. Pragnell, A.C.A.) read the notice convening the meeting.

The following is the address to the shareholders by the chairman circulated with the report and accounts for the year ended September 30, 1947.

I am giving, as in previous years, with the report and accounts a brief review of the company's activities during the past year, with notes on the accounts for the benefit of all shareholders and particularly those who are not able to attend the annual meeting. The substantial increase in the profit is very gratifying and has been achieved in spite of great difficulties which include the intermittent supply of coal, gas and power.

GOODWILL WRITTEN DOWN

You will observe that we have utilised the capital reserve amounting to £4,805, together with the sum of £5,188 from the profit and loss account, to write down the goodwill and trade-marks to the nominal value of £1. We have provided £9,000 for forward taxation, which covers our full liabilities on the profits under review, but we have not taken full credit for the E.P.T. repayable for the year ended September 30, 1946, as for this item, together with the allowance for deferred repairs, has not yet been agreed. It will be observed that a considerable sum has been spent in new plant, some of which has already been working and has contributed to the improved results.

It is our policy, wherever possible, to make the conditions of work for our employees as efficient as we can, and your directors have further schemes in hand which will incorporate the replacement of boilers and furnaces, with a view not only to substantial reductions in the amount of fuel consumed but also to increased efficiency. This will take approximately two to three years and in the meantime temporary measures are being taken with these objects in view.

SATISFACTORY ORDER BOOK

A substantial increase has taken place in the turnover for the year, special attention having been paid to the export trade, and our order book is in a very satisfactory state. The future is being looked forward to with every confidence, but beyond this it is impossible to forecast the conditions which may prevail; a satisfactory fuel position is, of course, essential.

Your directors feel that they are justified in recommending a final dividend of 10 per cent., less income-tax, making with the interim dividend of 5 per cent., less income-tax, paid on May 28 last a gross dividend of 15 per cent., less income-tax, leaving a sum to be carried forward of £5,059. The relations with the staff and workpeople are of a most cordial nature and your directors wish to place on record their appreciation of the services and co-operation rendered by them.

The reports and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr. Oscar S. McNery, was re-elected; and the auditors, Messrs Hart Moss Copley and Company, having been appointed the proceedings terminated.

ASPRO, LIMITED

SATISFACTORY RESULTS—INCREASED PROFITS

MR EWART F. NORRIS'S STATEMENT

The twelfth annual general meeting of Aspro Limited was held, on the 3rd instant, at Winchester House, Old Broad Street, London, E.C. Mr Ewart F. Norris, the chairman, presided.

The secretary, Mr F. E. Stapley, read the notice convening the meeting and the report of the auditors.

The following are extracts from the chairman's statement:—

The net profit for the year ended June 30, 1947 (after charging £125,000 for profits taxes but before provision for income tax) is £593,557, or approximately £170,000 more than the previous year.

Bringing into account the £46,672 carried over from 1945/46, the total available profit is £640,229. After providing £280,000 for the future liability to income tax calculated on the year's profits (following the precedent established last year) and £56,375 for the preference and interim ordinary dividends, there remains a balance of £303,854 to be dealt with as resolved by the general meeting.

DIVIDEND AND ALLOCATIONS

Your directors have pleasure in recommending (a) a final dividend on the ordinary stock of 35 per cent., less tax, making a total for the year of 50 per cent., less tax (as against a total of 35 per cent. last year), and (b) a transfer of £140,000 to general reserve, which will then stand at £600,000. This leaves a balance of profit of £67,604 to be carried forward to the next account.

They believe that these proposals constitute a fair compromise between the need to combat inflation and the rights of shareholders to benefit from increased profits. I would also point out that a dividend of 50 per cent. on the ordinary stock represents only 18 per cent. on the capital actually employed in the business at June 30, 1947, excluding the preference stock.

BALANCE SHEET ITEMS

The reduction of some £380,000 in net current assets is mainly due to the acquisition of our controlling interest in Ivers-Lee (Great Britain) Limited, already reported in a letter to stockholders dated May 7, 1947. As expected, this company incurred a small loss during its first financial year, but orders for its specialised packaging service are steadily coming in and prospects are considered excellent. Other long-term investments during the year include shares in the company owning our South African Associated Company's premises and in Aspro A.G. Vienna (both wholly owned) and a substantial interest in Aspro (Ireland) Limited.

The amount of the excess profits tax refund is well covered by this expenditure on development and the part collected has therefore been included this year with other cash balances.

The substantial increase in stock-in-trade is largely due to the building up of consignment stocks overseas.

It was considered desirable to have an up-to-date inventory of our plant, machinery and equipment prepared and valued by experts and this was done as at December 31, 1946. The adjustment of book values to "going concern" values is reflected in the attached balance sheet and the ascertained surplus of £54,865 has been treated as a capital reserve.

In conformity with the policy of fully mobilising our resources, to which I referred

in my last statement, we are actively engaged in consummating our plans for opening up new markets for "Aspro" abroad (additional to those dealt with above) and also for developing our new Ivers-Lee business with the assistance of our organisations throughout the world. Negotiations are in progress for acquiring a controlling interest in an engineering concern on which the Ivers-Lee company will have first call for the manufacture of packaging required to meet the demand at home and abroad. A new stomach tablet ("Trisco") has been produced and successfully tested on the market through a subsidiary company and arrangements are being made for sales abroad.

SHORTAGE OF FOREIGN CURRENCY FOR INDUSTRIAL INVESTMENT ABROAD

One of the difficulties we have to face is the shortage of foreign currency for industrial investment abroad. While we gladly acknowledge the sympathy and helpful attitude of the Government officials concerned (within the limits imposed by the regulations) we view with some misgiving a short-term national policy which involves a serious risk of missing present but fleeting opportunities to capture foreign markets and thus to contribute in restoring Britain's lost overseas investments.

I should like to say a few words about the renewed rumours of legislation to control the advertising of proprietary medicines. This company is prepared to give its full support to any action taken against advertising claims that cannot be substantiated, or other abuses. We have been able to maintain a great demand for our own product and in this we have been considerably assisted by our modern and economic working methods and policy of service to the customer.

THE AUTUMN BUDGET

Addressing the meeting, the chairman said: The autumn Budget presented to Parliament since my statement was made affects the company's affairs in several important respects. The increase in purchase tax is necessarily passed on to the consumer and is causing some disturbance in the channels of distribution during the transition period. The proposed tax on advertising would involve a relatively substantial charge on a business like ours but one which we might hope to absorb without undue difficulty while still maintaining a reasonable volume of publicity. The effect on the current year's operating results of the increased rates of profits tax on both distributed and non-distributed profits (including the retrospective charge from January 1, 1947, which it was too late to provide for in the accounts now submitted) should be offset by the fact that the first six months of 1946/47 had to bear the heavier excess profits tax. On the whole, therefore, we can look forward with confidence in our ability to complete another successful year and also to continue the policy of preserving the fair balance between profits distributed and those put to reserve which is responsible for the company's sound financial position.

The negotiations to which I referred in my statement for the acquisition of a controlling interest in an engineering concern have been brought to a successful conclusion and arrangements have been made by which the whole undertaking will be acquired for the sum of £145,000 which will be provided equally by Ivers-Lee (Great Britain) Limited and this company.

MITCHELLS AND BUTLERS, LIMITED

VERY SATISFACTORY YEAR'S TRADING

MR ROBERT H. BUTLER'S REVIEW

The sixtieth annual general meeting of the ordinary stockholders of this company was held at the White Horse Hotel, Birmingham, on Thursday, the 4th instant, under the presidency of Mr Robert H. Butler.

The chairman, in moving the adoption of the report and accounts, said:—

Ladies and gentlemen, I am pleased to say we have had a very satisfactory year's trading. It has again been a very difficult one and the severe winter contributed its own special problems. We are fortunate in having our own generating station which enabled us to keep the Brewery running during the crisis. We had at no time to stop brewing entirely, although we had to curtail our output considerably in those difficult weeks. I should like to express my thanks to all those who cheerfully carried on under such adverse conditions.

2 PER CENT. BONUS REPEATED

Turning to the figures of the balance sheet, you will recall that I deemed it advisable last year to caution stockholders that they must not look upon the 2 per cent. bonus as an annual increase in dividend. Nevertheless, I feel that we are justified in repeating it this year.

An increase in the profits tax was anticipated and we have made the necessary provision in the accounts. I am sorry that the Chancellor also decided to impose a further heavy burden upon the trade in his Supplementary budget by increasing the duty on beer, wines and spirits. The beer duty was 80s. on the standard barrel in Mr Neville Chamberlain's budget of 1933 is now more than four times this amount, the new figure being 325s. 5d. and the duty on spirits has more than doubled in the same period. While the trade has borne without complaint a great weight of taxation during the country's difficult times it can rightly claim that at the earliest moment it should be granted some relief. In this connection I would like to quote a declaration of the late Sir William Butler. When addressing the stockholders in 1937, he said, "I can understand that people who do not appreciate a study of the balance sheet the full amount of capital employed in the business might consider that a concern which can declare a dividend of 23 per cent. on its ordinary stock does not appear to require any relief of taxation, but rather may be looked upon as making an abnormal profit. This, however, is an erroneous view, for the percentage of profit ought to be calculated on the whole of the capital employed in obtaining the profits; in that way, it will be seen that trading capital includes not only stock capital, but reserves which are mainly derived from surplus profits not taken out of the business but again 'ploughed in' in the trading operations of the company. The percentage of profits so calculated in our own case cannot be considered otherwise than a very reasonable commercial return on the total capital employed."

Sir William's remarks apply with even greater force today, as our balance sheet illustrates.

NEARLY £5 MILLION "PLOUGHED BACK"

In 1920 our policy of "Fewer and Better," which had started about two years previously, began to be operative, and from that date to 1947, quite apart from large sums charged as depreciation, we have expended on capital account almost exactly £5 million, and during that time only £1½ million new capital in the form of cash has come into the business. Practically the whole of this £1½ million has been absorbed in providing additional working capital necessitated by the increase in

our business, higher taxation, wages and other expenses. You will see then that almost the whole of the £5 million has been provided out of reserves built up by our policy of conservative distribution of profits, and I think you will agree that the charge so often made by members of the Government that insufficient profit is "ploughed back" into business, cannot be laid at our door.

This new profits tax has, of course, reduced this year the amount we have been able to put to reserves, and will continue to do so, so long as it remains in force.

We continue, wherever possible, to develop our policy of removing licences in connection with new grants, and I am pleased to say that at the 1947 Brewster Sessions we secured a number of important grants of full licences in areas outside Birmingham and Coventry, all of which were confirmed. We are looking forward to the day when these licensed houses can be built, as they are needed for the public residing in the areas. Stockholders will readily appreciate that as regards our most important areas, Birmingham and Coventry, no applications can be made by us for new grants until the respective licensing planning committees have made further progress in their difficult duties.

NECESSITY FOR LICENSED PREMISES ON NEW BUILDING ESTATES

I would like once again to emphasise the necessity for erecting special buildings on the large building estates now being developed at the same time as the dwelling houses which they are designed to serve. I refer, of course, to shops, licensed houses and other special buildings indispensable to the life of a community, and I feel that the demand by the public is so great in a number of cases that the local authorities concerned, together with the appropriate ministry, should be prepared to authorise the erection of temporary buildings to meet this demand.

I referred last year to the setting up of Licensing Planning Committees in Birmingham and Coventry under the Licensing Planning (Temporary Provisions) Act, 1945. In accordance with the spirit underlying that Act, we, in conjunction with other brewers, have had several meetings with these Licensing Planning Committees and various schemes for the redistribution of licences are under discussion.

SHELDON AREA

In particular I would like to mention the Sheldon area, comprising a number of large building estates now being developed by the Birmingham Corporation; these estates when completed will have a population of more than 53,000. The Birmingham Licensing Planning Committee have been in consultation with the Birmingham and Midland Counties Wholesale Brewers' Association as to the number and nature of the licensed houses which would be required to serve these large estates and through the co-operation of all concerned I am very glad to be able to state that agreement has now been substantially reached in this most important matter.

WOLVERHAMPTON BUILDING ESTATES

The Wolverhampton Corporation who are contemplating development of several of their large building estates, have also invited the association to state their views as to the best method of providing licensed houses for these estates. The association have met the appropriate sub-committee of the Wolverhampton Corporation and have outlined the policy they suggest should be adopted.

I am very gratified to feel that our relations with these various authorities are so satisfactory, as I feel strongly that the policy of co-operation between the trade and Licensing Planning Committees, Licensing Justices and Local Authorities is one which will fully repay us all in terms of the betterment of licensing conditions and service to the public.

PREPARATIONS FOR RECONSTRUCTION AND REDEVELOPMENT

I think you should know that although we cannot yet do much towards the carrying out of our post-war reconstruction and redevelopment plans, we are not standing idly by waiting for the day when we can start. We are making our preparations now. In order to be ready for future trade expansion a considerable amount of work has to be done in the brewery, bottling department, and maltings, to bring these departments up to date by the extension of mechanisation, with its consequent saving of labour. We fully realise that considerable capital expenditure will be involved in carrying out the large-scale plans which this will necessitate, and we are making provision accordingly. Your board is determined that in the forward march of the industry which will continue when restrictions are lifted, this company, with its great record of progress, will occupy a prominent place.

PROBLEM OF EXPORTS

You will already be aware that the Government, in order to increase exports to hard currency areas, has made an order requiring that about 50 per cent. of the whisky drawn from bond is to be exported. Naturally, this has curtailed our supplies to our houses and customers. In addition to this, we have been invited to export some of our beers, and we are studying this side of the business very thoroughly. During the war we had some experience of exporting to our Forces serving overseas, but prior to this we had no experience; we are newcomers to the commercial export market, and may in the future considerably expand our trade in this direction. In this connection, however, there will be no further curtailment of our supplies to the home market as the Government are granting us extra materials to produce beer for export.

Considerable difficulties still face us, both in connection with our home trade and our export trade. Supplies of timber and other materials for casks, cases, bottles and almost everything we require are becoming even more difficult to obtain.

You may be interested to know that the managerial system is no innovation so far as this company is concerned. In point of fact 60 years ago our published accounts showed that we were managing public houses at that time. It is, of course, well known now that we have grown to be probably one of the largest direct sellers to the public, by means of this system, in the country. Through our managed houses has grown the improved public house with its provision for social and recreative needs of the public and the supply of food. Also it may not be very well known that as owners of more than 300 tenanted houses we can claim to have extensive knowledge of the running of this type of house. Through our inspectors we are in daily touch with their trading conditions and ensure that the rentals of each of the houses we let are such as to enable the tenant to get a very adequate living. We take care to see that his supplies are fair and reasonable and at no time have we discriminated between tenanted and managed houses to the detriment of the former. We believe in fostering to the best of our ability a happy relationship between all sections of employees, whether they be at the brewery, in the managed houses, or the tenanted houses.

Mr D. Davey Cole seconded the adoption of the report and accounts, which was carried unanimously.

FURNESS, WITHY AND COMPANY, LIMITED

PROBLEM OF SHIPBUILDING COSTS

The fifty-sixth annual general meeting of Furness, Withy and Company, Limited, was held on the 2nd instant, in London.

Sir Ernest H. Murrant, K.C.M.G., M.B.E., the chairman, in the course of his speech, said: In view of the unavoidable delay in the presentation of the accounts, your directors adopted the unusual course of declaring the dividend on the ordinary stock at the time that stockholders would normally look for it. Accordingly a dividend of 8 per cent. per annum, less tax, was paid on September 17th. After making full provision for taxation in the United Kingdom and abroad, there is a total credit balance of £1,033,996. Your directors make the following recommendations:—That £142,056 be provided for the inauguration of a pension fund for employees in the U.S.A.; that £100,000 be transferred to deferred repairs account; that £250,000 be set aside for depreciation and that £33,968 be transferred to fleet replacement account, leaving £202,721 to be carried forward.

The total of assets, namely £32,315,223, is, without doubt, considerably less than the actual value of those assets today, a statement which may appear gratifying but which I suggest must be viewed in the light of existing circumstances and future possibilities. No subsidiary company has incurred a loss. All have very satisfactorily served the purposes for which they were acquired or formed. Their dividend distributions have not been extravagant, on the contrary our traditional policy of combining sound finance with development and expansion, which has served the company so well in the past, has been consistently maintained.

A SERIOUS MATTER

Most people will have read a series of statements in recent months regarding the excessive costs and delays involved in building new ships. The seriousness of these statements should not be underrated. In my address in September 1945 I referred to contracts having been placed for the construction of five new ships. It will no doubt be a surprise to stockholders to learn that of those five ships only two have yet been delivered and we have so far only received the final bill for one. We have paid on account of the other sums which very clearly indicate that the final costs will be very considerably in excess of the estimates on which the contracts were based.

Tracking down the causes for the delays and increased costs is an endless and exhausting business; there are reasons and explanations beyond my powers of description, but the more one attempts to trace the various causes the more one becomes convinced that one is following an endless chain—a chain which I suggest must be broken somewhere before there is any real hope of arresting the current course of events, which in the long run must do great harm to both the shipping and shipbuilding industry.

DELAYS IN DELIVERIES

At the present time the various shipping companies which are embraced by our consolidated accounts have contracts outstanding for 14 ships; in each case we have a firm estimate—to use a contradiction in terms—of the cost which, however, is subject to increases in certain eventualities, and we have an estimate of the date of delivery, but if the past is any guide to the future, it is a certainty that the ultimate actual cost will be considerably in excess of the estimate, and even if estimated deliveries are maintained, it will be well into 1950 before all the ships which have been contracted for are finally ready to put into commission.

It is a matter about which one cannot afford to be indifferent. Shipowners do not want to have their industry ruined by high prices for new ships, any more than shipbuilders want to have their industry ruined by the absence of orders for the same reason. But only industries which can make, sell and consume their products on a short-term basis can go on indefinitely absorbing ever-increasing costs and passing them on to the user or consumer. In a long-term business like shipowning, which involves building ships to operate for 20-25 years, it is obvious that one cannot rely upon continually passing on to the users, through freights and passage money, the consequences of each new ship costing more than the last—the chain is bound to break somewhere sooner or later.

THE OUTLOOK

I do not imagine any stockholder will expect me to attempt any forecast of the future prospects. There are altogether too many uncertainties and too many things, both under control and out of control, to justify any expression of opinion. Step by step, however, the shipping industry is gradually reaching towards a greater measure of self-administration, although control by licence and direction still remains with the Ministry of Transport in order to ensure the fulfilment of essential import and export programmes. How long it will be necessary to continue working to a planned economy, it is impossible to forecast, but present indications would seem to suggest that for various reasons, including currency problems, a complete reversion to freedom of initiative and enterprise is likely to be deferred for a longer period of time than had been hoped.

In the meantime, and in spite of all the difficulties arising out of increased construction costs, increased operating costs, exchange problems and restrictions of every description at home and abroad, great progress is being made in the reconstruction of the British Merchant Marine.

TONNAGE POSITION

It is difficult to say precisely what the actual tonnage position is in comparison with 1939, owing to the presence on the U.K. Register of a number of vessels which are returnable to the United States, but assuming the returnable tonnage to be of the order of 1,750,000 G.R.T., then the comparison would be 16,056,000 tons in 1939, as against 14,023,000 tons in the spring of 1947, all figures referring to ocean-going ships of 1,600 G.R.T. and over.

To close the gap between these two comparative figures—a gap which is at present largely filled by the returnable ships—there are under construction in British yards for British owners some 320 ships of all kinds, totalling 1,562,000 G.R.T. If one excludes from these figures a number of small craft, in order to make the figures comparable, it can be said that some 1,500,000 tons of ocean-going ships are under construction for British owners, apart altogether from those which had been ordered and on which construction work has not yet commenced.

Not all of this new construction is in replacement of war losses; part must be reckoned as replacing natural obsolescence, but the whole picture reflects no mean achievement by an industry which suffered greater war devastation than any other, and an industry which incidentally contributes more to the country's exports than any other. Whatever the future may hold, your directors feel that your company has foundations on which we may continue to build with every confidence, and in the belief that we shall still find a reasonable amount of incentive to justify our efforts.

The report was adopted.

THE WALL PAPER MANUFACTURERS, LIMITED

EXPORT ACHIEVEMENTS

The forty-eighth annual general meeting of The Wall Paper Manufacturers, Limited, was held, on the 27th ultimo, at the Midland Hotel, Manchester. Mr Alan V. Sugden (Chairman of the company) presided.

In the course of his remarks, the Chairman said: The provision made for taxation in the past year was adequate to cover the additional charges framed in the Autumn Budget, and continued:

I make no apology for our increased dividend. Most of our stockholders are small people and in many cases with fixed incomes based on investments whose dividends are subject to heavy taxation. They are consumers and, like all other consumers, find everything they have to buy costs more. With higher wages, higher salaries, higher prices all round them, why should shareholders be expected to forego similar consideration? Are they expected to be above such mundane considerations, or are they singled out to live a life of exceptional purity, the only class with parsons and pensioners which is not to join in the mad scramble for debasing the value of our money?

A new burden has now been laid on their income prospects in the higher rate of profits tax levelled on dividend distribution.

It is plainly the duty of directors—in fact, they are expressly charged as such—to serve and watch over the interests of shareholders, amongst other things, by endeavouring to earn such profits as they reasonably can, and out of those profits to pay such dividends as seem proper, having regard always to the future prosperity and efficiency of the business.

HOME AND EXPORT SUPPLIES

Since the directors' report was published more has become known of the effects of the cut made in supplies of paper for home trade, and the resulting figure is 29 per cent in weight of consumption in 1939. No account is taken of the arrears accumulated during the five years in which wallpaper was not produced, nor of the increased demand for the article, which has resulted from a higher standard of living in working-class homes consequent upon higher wages. Considering that home morale is very much dependent on cleanliness, a point recognised by one Ministry at least by directing us to divert a proportion of our output to mining villages, it does not appear that the Government has any clear understanding of the psychology of the inhabitants of this island or perhaps favours dirt for its relation to austerity and the wearing of the hair shirt. The anticipated decline in our wallpaper interest emphasises the wisdom of the board over the last decade and more in spreading risks and widening the scope of remunerative development in other directions. It is to these other interests that we now look with some confidence to make good the mutilation inflicted upon wallpaper manufacture.

The target figures for export in the Cripps Plan for the paper group of industries was 116 per cent. of 1938 in value by mid-1948 and 140 per cent. at the end of 1948.

The Company's wallpaper exports for the final year covered by the accounts was 330 per cent. of 1938 value. This magnificent achievement has resulted in some contraction in current export orders as immediate demands have been satisfied in many markets. Even with this decline in orders, it is anticipated that the export achievement for the current year should be not less than 200 per cent. of 1938. Very serious efforts are being made to open up new markets besides developing existing ones, and market research continues incessantly.

The report was adopted.

BANK OF LONDON AND SOUTH AMERICA, LIMITED

LORD WARDINGTON'S REVIEW

Extracts from the address to the stockholders of The Bank of London and South America, Limited, by the chairman, The Rt. Hon. Lord Wardington, circulated with the balance-sheet. Copies of the full address are obtainable from the head office of the bank at 6, Tokenhouse Yard, London, E.C.2.

The sustained high level of export prices for nearly all commodities has resulted in another good year for the Latin American Republics, although it has not been so uniformly prosperous as 1946. The period of building up large reserves of gold and foreign exchange came to an end with the arrival there early in 1947 of exceptionally heavy imports, and a general policy of retrenchment is now being followed pending some solution to the inter-related problems of a world-wide shortage of dollars and the restricted convertibility of sterling, the two currencies most widely used for international trade.

BOOM IN IMPORTS

This boom in imports brought with it additional business to your bank in financing shipments not only from the United Kingdom but also from the U.S.A.; furthermore, in conjunction with the active export trade, the continued buoyancy of internal business in Latin American countries has—within the bounds of existing legislation for confining credit to productive purposes—maintained the local demand for banking facilities generally. An undercurrent of labour unrest still prevails in many of the Republics, related largely to the high cost of living, since the inflationary trend still shows but few signs of abatement despite price controls and various other combative measures. Unfortunately, the unfailing remedy for inflated prices—a larger offer of consumer goods for sale—which it was hoped the increased arrivals of foreign merchandise would permit, has not yet become possible, because a large part of this year's imports into Latin America consisted of capital equipment whilst most countries there are for the time being limiting their purchases of consumer goods to bare essentials.

No revaluation of currency has occurred during the year in any of the countries where the bank is established, and the rates of exchange used for closing our books at September 30th show only fractional changes from last time. Certain governments are now permitting to some extent what were formerly not officially recognised quotations, but transactions allowed at these higher free rates have only a limited application.

RESULT OF YEAR'S OPERATIONS

A profit of £373,902 has been made after providing for legal reserves in South America and for taxation on the year's profit, and after making an appropriation to reserve for bad and doubtful debts, out of which full provision for such debts has been made. This result compares very favourably with the profit of £341,588 for the twelve months ended September 30, 1946. Of our net profit of £373,902 the interim and final dividends less income tax absorb £133,320; a transfer of £240,000 is being made to contingency reserve and the balance carried down to next year's profit and loss account is being increased by £582 to £180,051.

Having surveyed conditions in each of the countries in which the bank is established,

the chairman continued: Particularly in the more advanced countries there is normally a very large demand in Latin America for imported consumer goods, and, notwithstanding the growth of local industries, there should for some time be a wide opening for British products, especially as Germany and Japan—both important prewar suppliers to Latin America—remain out of the market. On the other hand, a universal extension of Britain's own Spartan policy of austerity and restricted imports would undoubtedly cause still further contraction of world trade generally.

EXPORT TARGETS

The export targets for textiles in 1948 set by H.M. Government raise hope that Britain's important position in this line of trade with Latin America may be re-established, although sight must not be lost of the difficulty in finding buyers owing to import restrictions in so many countries. Our Manchester and Bradford agencies are well equipped to deal with any increased business which may accrue. Prospects for Britain's other leading prewar export to South America, namely, coal, are not so promising. Bearing in mind Britain's present meagre food rations, it may be apposite to recall that we formerly shipped each year approximately 2,500,000 tons of coal to the River Plate to pay for a large part of our meat supplies, but one must regard with some doubt the chances of regaining the major part of this reciprocal trade at the present rate of coal output. Particularly is this so in the long-term view because of the increase in oil production in South America and the extensive schemes there for hydro-electricity.

During the year British trading interests have been actively engaged in renewing and widening their connections in Latin America and many business men have made extensive tours in the area. Among these may be mentioned the Petroleum Equipment Mission to the Caribbean Area, the Agricultural Mission to the pastoral countries, and the floating exhibition of British products which called at several South American ports. All such visits provide opportunities for the fruitful exchange of views and do a great deal to promote friendly relations.

IMPORTANCE OF QUALITY

In their reports to me, one or two of our branch managers refer to the quality of post-war British products; some isolated cases have evidently occurred where goods have not reached the high standard for which British brands have a well-deserved reputation abroad, and I am sure that manufacturers will make a special point of investigating any specific complaints of this kind which may come to the notice of their agents. Among other competitive factors which have already been stressed by returning visitors are the need for guaranteed delivery dates and firm quotations.

Summarizing the overall situation, it may reasonably be said that Latin America remains in a relatively favourable position. Although the internal fiscal condition of some of the Republics leaves room for improvement, disequilibrium in the Budget and germane matters are not so out of hand anywhere that they could not be remedied by wise statesmanship, and there are no fundamental economic problems in any way comparable with these afflicting the older nations of Europe.

IDEAL BUILDING AND LAND DEVELOPMENT COMPANY, LIMITED

HOUSE BUILDING DIFFICULTIES

The thirteenth ordinary general meeting of this company was held, on the 2nd instant, in London, Sir Thomas Keens, D.L., the chairman, presiding.

The following is an extract from his circulated statement:—

The consolidated profit and loss account shows a trading profit of £110,883, and after adding thereto income from investments and transfer fees, and deducting the usual management expenses, there remains a net profit of £103,273, against £95,089 last year. This result the directors think most favourable in view of the ever-increasing restrictions.

The board recommend the payment of an ordinary dividend for the past year of 5 per cent., less income-tax. If a dividend of or exceeding 5 per cent. is paid on the ordinary shares, the preference shareholders are entitled to an additional dividend of $\frac{1}{2}$ per cent., less tax, in respect of their shares.

The situation as regards the building industry has not improved since the last annual meeting of the company, and the outlook remains obscure. The general feeling in the industry is one of frustration with difficulties at every turn, some of which are unavoidable, but many avoidable, due to Government action in placing ideologies first and relegating to the background the solution of the problems.

We have considered it prudent to turn our attention to activities outside the United Kingdom, and our efforts have been directed to South Africa. We have unanimously agreed that it is in the interests of the company for us to acquire property investment and also to carry out housing and development work in South Africa.

The report was adopted.

THE STRAND HOTEL, LIMITED

DOLLARS AND THE HOTEL INDUSTRY

The fortieth ordinary general meeting of this company was held, on the 4th instant, in London, Major M. Gluckstein (the chairman), presiding.

The chairman, in the course of his speech, said: I do not claim to be stating anything new in emphasising the dollar-earning potential of the hotel industry: those dollars which are so priceless to the national economy we are told, and rightly so, that unless the Treasury is kept supplied with them we shall starve! Why then, is the industry denied the opportunity of making more fully its contribution to the national effort? If it is thought that the public would resent a smartening up and refitting of hotels; or that it would be jealous of preferential treatment of the industry, in order to attract overseas visitors, then surely—it is for the Government to make known the value of hotels as a ready medium of earning dollars, in the same way as they explain other necessities in their "export" policy.

Every business man knows that despite our desperate financial straits there are some economies we cannot afford to suffer, and there are seeming extravagances which bring tribute. A show of prosperity is more likely to bring reward than a display of shabbiness. And who denies that given facilities we could give material help to the country in its fight to improve the present standard of life; here is an opportunity for imagination and vision to play a part. We know we have the support of the Tourist Board and hope they will drive home to the Ministers concerned the fact that, without help of the kind I have indicated, the industry will not be the benefit to the country that it should be in this time of emergency.

The report and accounts were adopted.

NEEPSSEND STEEL AND TOOL CORPORATION, LIMITED

MR S. C. GOODWIN'S REVIEW

Mr. S. C. Goodwin, J.P. (chairman) presided on the 2nd instant at the twenty-seventh annual ordinary general meeting at the registered office, Neepsend, Sheffield. In the course of his address he said that despite difficulties caused through shortage of materials, fuel and labour, the results showed an improvement over those of the previous year. Surplus and reserves of the parent company totalled £429,876 against £403,956. Current assets totalled £708,915 against current liabilities and provisions £282,586, an excess of current assets of well over £400,000, thus placing the company in a very satisfactory position. Net revenue from dividends, interest, etc., after deduction of taxation, amounted to £110,906, very similar to that of last year. The directors recommended the transfer to general reserve of £25,000, bringing that reserve up to £325,000.

Consolidated statement of corporation and subsidiary companies showed surplus and reserves £722,885 against £661,377. Current assets of the whole group amounted to £1,282,636, against current liabilities and provisions of £432,947, showing an assets excess of £849,689. It would be seen that the Neepsend Group was in a very sound position financially. The consolidated profit and loss account showed trading profits £314,724 against £165,517 in the previous year.

In the last quarter of the financial year production was seriously disorganised due to shortage of fuel and materials, which in some instances necessitated the temporary close-down of certain departments and consequent loss of turnover.

If they could be left without interference to carry on their many occupations, then he had no fear for the future.

The report was adopted.

DICTOGRAPH TELEPHONES, LIMITED

SUBSTANTIAL PROGRESS

The eleventh ordinary general meeting of Dictograph Telephones, Limited, was held, on the 4th instant, at Croydon, Mr Philip V. Summer (the chairman) presiding.

The following is an extract from his circulated statement:—

The year under review has been overshadowed by the national economic situation, but we are able to report substantial progress.

NOTICES

COUNTY BOROUGH OF SOUTHEAST-ON-SEA EDUCATION COMMITTEE

MUNICIPAL COLLEGE

Acting Principal: B. Thomsett, B.Sc. (Eng.), A.C.G.I., M.I.E.E. DEPARTMENT OF COMMERCE

APPLICATIONS are invited for the post of SENIOR ASSISTANT, to develop degree and advanced professional courses. Candidates should be a Graduate in Economics or Commerce and/or possess a professional qualification. Experience in business and teaching is desirable.

Salary in accordance with the Burnham Technical Scale, i.e., £600 to £750 with training allowance.

Full details of the post and form of application may be obtained from the undersigned on receipt of stamped and addressed foolscap envelope. Application to be returned to the Acting Principal of the College, Victoria Circus, Southend-on-Sea, within a fortnight of the date of this advertisement.

H. BOYES WATSON, Chief Education Officer. Education Office, Warrior Square, Southend-on-Sea. 25th November, 1947.

THE Civil Service Commissioners give notice that a Competition for one or more Clerkships in the House of Commons will be held in July, 1948, in conjunction with the Normal Open Competition for the Administrative Class of the Home Civil Service by Method 1 (written examination and interview); candidates who wish to enter for both Competitions must complete a separate application form for each.

Candidates must be at least 20 and under 24 years of age on 1st August, 1948; they can compete only if nominated by the Clerk of the House of Commons. Full particulars and forms on which application for nomination must be made can be obtained by writing to the Secretary, Civil Service Commission, 6 Burlington Gardens, W.1, quoting No. 2068. Completed application forms must be received by the Clerk of the House of Commons, House of Commons, S.W.1, not later than 31st January, 1948.

The exceptionally heavy demand for installations of Dictograph Telephone and Sound Equipment has continued. Record trading results are shown by the parent company, the rental and maintenance revenue having again considerably advanced. Our subsidiary company, Gramplan Reproducers, Limited, has had a satisfactory year.

Your directors feel that the time has arrived for the formation of a profit-sharing bonus scheme.

There is a combined trading profit of £85,935, being an increase of 75 per cent. on the comparable figure last year. The directors recommend a final dividend on the ordinary shares of 10 per cent., less income tax, making 16 per cent. for the year.

The increase we shall now endeavour to make in our export trade, whilst essential, is bound to result in some restrictions in our home trade; the Government has, however, indicated its appreciation, as during the war years, of the need to maintain service to our existing users. Whatever the immediate difficulties may be, your directors feel that the stabilising effect of the company's rental and maintenance income entitles them to look to the future with confidence.

The report was adopted.

CALCUTTA TRAMWAYS COMPANY, LIMITED

SERIOUS INTERRUPTIONS

The ordinary general meeting of the Calcutta Tramways Company, Limited, was held, on the 27th ultimo, in London.

Sir Geoffrey R. Clarke, C.S.I., O.B.E. (the chairman), said that during the year under review the successful working of the undertaking had been seriously interrupted in the first place by unrest amongst the company's employees, and from August until the end of the year by the communal rioting, which had often rendered it impossible to put a car on the road. The effect of those happenings was the reduction of £243,710 in the traffic receipts compared with those of the previous year, the greater part of which had occurred in the last five months of the year. Unfortunately, during that period no reduction in expenditure had been possible.

By the end of the year more normal conditions had returned to Calcutta. In order to show the company's appreciation of the manner in which its employees had carried on under difficult conditions, a new scale of wages was voluntarily introduced on January 1, 1947, under which every employee of the company had received a substantial increase.

Notwithstanding that, the Union of Tramway Workers had put up additional demands for bonuses and yet higher wages. A general strike of all employees, including the clerical staff, was declared on January 21, 1947, and had continued until April 15th, when a tribunal was appointed.

Difficulties had arisen in the interpretation of the award of the tribunal, and it had not been possible to ascertain the total cost to the company for the current year. In order to meet the estimated deficit it was necessary to conserve the company's liquid resources and to withhold the payment of a dividend on the ordinary shares.

The report was adopted.

GOLDEN HOPE RUBBER ESTATE, LIMITED

IMPROVED EARNINGS

The annual general meeting of The Golden Hope Rubber Estate, Limited, was held, in London, on the 4th instant. The directors' report presented for 1946-47 stated that the work of putting the estates in order had continued throughout the year and little remained of the more harmful weed growths which had spread during the Japanese occupation. Labour was sufficient for essential work and health was good. The year's crop was 4,135,104 lbs. of rubber.

The chairman, Sir Eric Macfadyen, said: The profit of £11,679 is based on production costs of the normal kind, exclusive of money spent on rehabilitation work, amounting to £28,616, which is a balance sheet item pending consideration of the company's war damage claim. In the current year it is hoped to produce about 5,500,000 lbs. of rubber and perhaps 500,000 lbs. of this would be sole crepe, as the manufacture of this grade has been resumed on the estate which produced it before the invasion; as a result, the company's earnings should show marked improvement. It is also joining with a number of other plantation owners for whom Harrisons & Crosfield (Malaya), Limited, are agents, in the formation of a local company to undertake latex concentration; this plant may not be in operation for another twelve months.

The company owns 9,408 acres planted with rubber. Areas totalling 35 per cent. to 40 per cent. of the whole, though still making their contribution to output, will require to be replaced by stages over the next ten years with either replantings or new plantings half of these areas would have been dealt with before now, but for the war. The programme will have to depend upon consideration of finance and labour.

The report was adopted.

A CHARTERED ACCOUNTANT is required as Assistant Managing Director of a large industrial company, to install and be responsible for the development of an effective form of Budgetary Control, Standard Costs and all office procedures. (Office staff 250.) A high salary will be paid to a first-class man with industrial and administrative experience. Applicants should send full details of their qualifications, experience, age and salaries to Box 621.

FIRST-CLASS position in London as Export Manager open to experienced man. Thorough knowledge of Paint Trade and World Markets essential. Write giving fullest details of experience and salary required, which will be treated in strictest confidence.—Box 620.

TO meet the growing demand for the services of the PRODUCTION DIVISION, Urwick Orr and Partners are seeking additional professional consulting staff. Qualifications in engineering or other industrial technology and some years responsible experience in production or factory management essential. University education desirable. Age 32-40 years. Persons who have applied within past year need not re-apply. Persons currently or recently serving with other management consulting firms cannot be considered.—Applications in writing to Company's offices at 7 Park Lane, London, W.1.

STATISTICIAN (male or female) required by large Manufacturing Organisation with headquarters in London. Candidates should possess a University degree or equivalent qualification in Economics or Statistics and should have had some practical experience of statistical investigation. They should have ability to diagnose and assess general economic trends and their relation to a particular industry. Some accounting knowledge is desirable.—Box 623.

INDIA—Leading firm of manufacturing pharmaceutical chemists with large and growing business in India both in ethical and publicly advertised medicinal preparations invite applications from Indians for executive position in Bombay Branch. Candidate appointed will be required to train for the position in London and should have suitable background and education. Indian experience preferred but not essential. Applicants should write giving full details experience and salary required to—Box 619.

GOVERNMENT RETURNS

the week ended November 23, 1947, ordinary revenue was £66,013,000, ordinary expenditure of £70,754,000, leaving a surplus of £4,739,000. The surplus accrued since April 1, 1946, £226,712,813 against a deficit of £96,583 for the corresponding period of 1946.

Germany: The Real Issue

THE Foreign Ministers have conferred for a fortnight, and the best that can be said of their efforts is that they have not yet been forced to break up the Conference. Of agreed solutions, there is no trace. After a week's disagreement on political issues, they have now turned to the economic field and the outlook so far is no more hopeful. A visitor from another planet, unskilled in giving diplomatic language its real, and hidden, meaning, would find this persistence of disagreement very puzzling. The main issue of the Conference, by common consent, is whether, and how, the unity of Germany shall be restored. All the delegates (except perhaps the French) vie with each other for the role of chief champion of German unity. All are convinced that Germany should become once more a political and economic unit. All are agreed that there should be a Central Government with effective powers. All are agreed that the removal of the present barriers to the free flow of goods and services is vital not only to German revival but to Europe itself. If German unity were really the main object and the first priority of each delegation, it is hard to see how agreement could be avoided. But in fact unity is now little more than a symbol or slogan. The delegates are carrying on a sort of diplomatic double talk. They speak of the necessity for Germany to be politically and economically whole. They are thinking about the danger that it might be wholly Communist, or wholly absorbed in the Marshall Plan.

The political discussions of last week turned, not on the desirability of central government, but on the kind of government it would turn out to be. The Western Powers believe, rightly or wrongly, that a Central Government established in Berlin at the present time would be under such strong Communist pressure that it would be not much more than a Soviet tool. Moreover, they believe that the political unification of the country would offer such opportunities to the Communist-controlled SED (the Socialist Unity Party) and its nationalist demagoguery that all Germany would be in an uproar. The Russians on their side believe that their control of the SED and their strategic position in Berlin would give nation-wide Communism a flying start. Both sides may be wrong—indeed, the Western Powers seem to be excessively defeatist about the political development of Germany. But that does not alter the fact that the approach of both sides to the proposal that Germany should be politically united is governed by the same expectation that a united Germany would be a seed-bed for Communism.

Now that the economic discussions have begun, it is equally necessary to distinguish between the forms and the substance of the debates. Officially, economic unity is the issue. To elaborate it, both sides have gone back to documents and proposals already months old. Mr Bevin's main points—that all German resources should be pooled for reconstruction, that there should be a common import-export programme, that the repayment of money spent by the Allies in maintaining Germany should take precedence over reparations, that a Russian share in the control of the Ruhr should be conceded only if joint control were also established over industries in the Eastern Zone—all these points were already

elaborated in March. Mr. Molotov goes back even further. His two central demands—that all four Powers should share in the control of the Ruhr and that \$10 billion should be paid in reparations from current production—have been fished up unchanged from the documents presented during the Paris discussions in July, 1946.

But since the days when the Foreign Ministers met in Paris and in Moscow, a profound change has occurred in the economic life of Europe. Mr. Marshall has made his offer of American aid to a united European recovery programme. The mere possibility of a Marshall Plan has created a climate for the talks on Germany so new that it can be only with really remarkable self-restraint that neither Mr. Bevin nor Mr. Marshall refers to it. The real issue before the Conference is not so much German economic unity in the abstract as the problem of what to do with a Germany half of which is in the course of being geared into the Marshall Plan, while the other half will be expected to wreck and oppose and sabotage that plan at every point.

Under these conditions, there are only two ways in which German economic unity could be secured by the agreement of all the occupying Powers. One would be that the whole of Germany should be excluded from the Marshall Plan, the other that the whole of Germany should be included. It is a little difficult to envisage what immediate economic difference would be made by Germany's exclusion from the Plan. If Russia had a say in the economic control of Western Germany, there might be an attempt—possibly in the supposed interests of a new joint import-export plan—to divert to other markets vital resources, such as coal, whose availability for the countries of the West was assumed in the Paris Report, and these diversions would be the greater if the Russians also got their way on reparations. But it is not in amendments of the figures in the Paris Report—important though these might be—that the effect of Germany's exclusion from the Marshall Plan would have to be sought, but rather in the blow that it would strike at the whole conception of the Plan. In its first year or two, it will inevitably take the form of dollar aid to a number of hard-pressed European states, and the exclusion of one might not harm—might even benefit—the other fifteen. But if the Plan claims to be more than a co-ordinated dole, the claim rests on what it can do, in a rather longer run, to promote the growth of a real community of interest, political and economic, in Western Europe, and for this the participation of Germany, or at least of Western Germany, is completely, and obviously, essential.

The exclusion of Germany would not bring any short-term reliefs to America and Britain to offset this retreat from longer-term ambitions. No saving of dollars or sterling would follow, since, with a quarter of the old Reich transferred to Poland and millions of Germans expelled from the lost lands, Eastern Germany certainly has no surplus of food to export to the Western Zones. In fact, if the Western Powers carried some responsibility for the whole of Germany, they might find themselves under a moral obligation to spend more, not less, in order to feed the hungry people in the Eastern Zone.

Nor would this extra assistance necessarily be temporary. The Russians demand that in return for conceding economic unity they should be given some guarantee that Germany will deliver reparations from current production. But at what point could the shattered German economy begin paying reparations? No longer self-supporting in food, needing every sort of outside assistance—even steel—for its recovery, Germany will have to devote the whole of its exporting capacity to the task of paying for the imports of food and raw materials it requires. Reparations would be possible only if the West were prepared to give larger and more permanent subsidies for German imports. Economic unity under these conditions would

mean bigger and more lasting doles, not the steady restoration of a viable German state.

The other method of combining German economic unity with the Marshall Plan would be to bring the whole of the reunited German state within the orbit of the Plan. But the imagination boggles at the task of devising a method by which the Russians would both keep a voice in German affairs and allow their own Zone to become an integral part of a Plan they believe to be aimed against them. At a time when such nations as Poland and Czechoslovakia are being encouraged as far as possible to divert their trade from the West and link their economies more closely with those of their Eastern neighbours, is it likely that Russian policy would commit a complete *volte face* in the case of Germany and cheerfully acquiesce in the power-house of Europe being restored to assist the Plan?

*

To state the dilemma bluntly seems to leave no hope of settlement, no margin for adjustment on either side. This is almost certainly the reason why Mr. Bevin and Mr. Marshall forbear from the provocation of mentioning the Plan. It can, after all, be argued that if muffling the issues leaves even the smallest opportunity for some completely new initiative, then the muffling is worth while. But it entails a danger—the danger that muffled differences may breed muddled ideas. It is a confusion at this stage to think of German unity as an absolute value, independent of the kind of unity achieved, and of the price paid for it. For instance, if the price to be paid for German economic unity today were a crippling or an abandonment of the Marshall Plan, that price would be too high. For the next five years, at least, Western diplomacy can have only one absolutely top priority—and that is to ensure the unquestioned success of the recovery plan for Western Europe. If German economic unity assists that end, well and good. But the touchstone of every concession made on the German issue, of any bargain offered or bait put out must be: will this move make it more or less difficult to revive the West? From this it follows inevitably that the only Russian concessions and initiatives which the Western diplomats can afford to accept are ones which go very much further than any Mr. Molotov in his first fortnight has seemed inclined to make.

The possibility that this phase in the endless bargaining between East and West will break down need not, however, too greatly disturb the Western Powers so long as they remember that it is not the final phase. Since the Marshall offer was made, a new factor has entered into the negotiations—the recovery of economic initiative by the West—and provided the Western Powers pursue their objective of Western economic revival with absolute single-mindedness, they will find that the opportunities for further parleying with the Russians will create themselves. Already Mr. Molotov is a little on the defensive when he leaves the safe ground of political unity and a Central Government. At one point he even proposed—and then withdrew—a postponement of the whole discussion. The defensiveness, the uncertainty will increase as the Marshall programme gathers momentum and restores men's hope. It follows that the Western Powers are likely to find themselves in a steadily improving position for negotiation with the Russians, provided they do not throw away their position at this stage, in what is virtually the first round. Their firmness in maintaining their basic position—that no concessions on Germany shall weaken the Marshall Plan—can and should be coupled with the utmost readiness to reconvene the Foreign Ministers' Conference at any time and even to propose themselves that a further meeting should take place six months or a year hence. It is useless to deny that East and West are involved in a struggle for the possession of the German soul; but the struggle is, should be and can remain a peaceful one.

Malthus at Manchester

COMPARED with the rather refreshing Couéism recently displayed by Mr. Herbert Morrison and Sir Stafford Cripps, the inspissated Malthusian gloom emitted by Mr. Churchill at Manchester last Saturday sounded, to say the least of it, a trifle depressing. Of the "broad plain truths" enunciated, the most paradoxical was the proposition that

Socialism, that is the substitution of state controls by officials instead of by private enterprise, will make it impossible for 48 million inhabitants to continue living in this island and at least a quarter of all who are alive today will have to disappear in one way or other, after enduring a lowering of standards of food and comfort inconceivable in the last fifty years.

Even when all due allowance has been made for the tactical pessimism of political prophecy—a perfectly legitimate instrument in the hands of the Opposition—this is going a little far. However cogent the grounds for acute anxiety afforded by the present crisis and however real the dangers which beset the economic life of the nation within the next few years, it is difficult to see what useful object can be attained by such gross exaggeration. It is, of course, conceivable—though it is not by any means, as far as can be foreseen, probable—that over a term of years world conditions may make it difficult to support the present large population in these islands; and it is undoubtedly true that, over the next few years at any rate, this country will be unable to feed itself adequately without the substantial outside assistance envisaged in the Marshall Plan. But these things have little if anything to do with Socialism. Until quite recently the food experts of the Western hemisphere, impressed by the record of the years after the first world war, were more impressed by the fear of early gluts than by the fact of present shortages. If the prevailing ideas have changed, it due to technical factors—to the realisation that the agricultural recovery of Europe (especially of Eastern Europe) will be delayed, to the disorganisation of food production in India and the Far East supervening upon the large increase in population, and to the growing fear that, after a series of bumper harvests in the United States and Canada, the drought cycle is about due to recur. The political colour of the British Government has had very little to do with it.

When all is said and done, there are as yet no valid reasons for any long-term pessimism about the feeding of Britain. To prophesy that Socialism will drive twelve million Englishmen out of the country by sheer hunger is scarcely a very helpful contribution to either the understanding or the solution of its present difficulties. These are mainly due to the inevitable dislocations and destruction caused by six years of universal warfare which have upset the whole balance of the world's economy,

and even if the Government's attempts to regain equilibrium have often been misguided and administratively inefficient, it may still be doubted whether any other Government, given the mood of the people on the morrow of a victorious but exhausting war—could have done much better.

Nor did Mr. Churchill carry much more conviction when he accused the Government of making "unfair and abusive use" of wartime controls. He did not, in fact, quote a concrete example of this kind of malpractice and he admitted that, as long as shortages exist, controls are inevitable. No clearer enunciation of this principle could well be imagined than the special pledge to the consumer contained in the Conservative Industrial Charter that controls would not be removed from any necessity of life until it is certain that it is within the reach of every family. The real charge which should be brought against the Government is not that of unfair use of controls, so much as of the failure to promote the essential conditions under which they can be relaxed, a failure due more perhaps to mistakes of wider economic judgment than to any positive affection for controls as such. The real reason why controls have had to be reinforced and extended is the maldistribution of labour and of resources brought about by the Government's policy or lack of it—Mr. Dalton's cheap money, Mr. Bevan's exaggerated housing drive and the timidity with which the whole Government regards any proposal to limit the rise of wage-incomes. These are the chief factors which have maintained and aggravated the existing inflationary pressure, and have driven Ministers to rely more and more on the wartime controls even when they are thoroughly disliked by their supporters—as was illustrated last week by the extremely small majority accorded to the conscription order. And this is where the real danger lies, in the invasion of fundamental liberties, not so much through deliberate policy, as by administrative action into which the Government is driven as the result of mistaken decisions or impolicy in quite other fields.

Mr. Churchill was evidently conscious of the fact that criticism alone was not enough. But of his six points of positive Conservative policy, all but one were framed in such general language that they could hardly be taken very seriously as an alternative programme. Indeed, four of them might almost equally well have been embodied in a manifesto of the present Government. On one point only was he specific, and that was the reduction of Government expenditure, for which he laid down a target of £500 million. That such a target could and should be achieved can readily be acknowledged—indeed, the target may be too modest. But whether its full implications have been duly weighed either by Mr. Churchill himself or by the Conservative Central Office may, perhaps, be doubted. For it

could only be accomplished by the almost complete cancellation of the food subsidies and by a drastic reduction in the foreign commitments and expenditure of the fighting services. And it remains to be seen whether these measures will ever find their way to embodiment in a Tory party programme.

★

It is this lack of belief in any practical alternative Opposition programme which explains, more than any other single factor, the limited dimensions of the swing-over to Conservatism displayed in the four recent by-elections. There has, of course, been a substantial increase in the Conservative vote, and a General Election held at this moment might even yield a small Conservative majority. But this Tory lead—if indeed it exists—is a very small result for thirty months of almost unrelieved disappointment and disillusion. Nor would it be proof against even a mild improvement in conditions between now and 1950. In 1945 the “floating vote” went pretty solidly to Labour and some of it has now floated away again. But the evidence still seems to show that the great body of electors who are not irrevocably tied to any party doctrine still find themselves in a dilemma that they cannot solve.

Confronted on the one hand by a party whose panacea for all the nation's present difficulties is contained in the blessed word nationalisation, and on the other by a party which, whatever progressive elements it may contain, is too often apt to become the puppet of monopolistic vested interests masquerading under the disguise of free enterprise, the floating voter may well find himself more than a little puzzled. His instinctive reaction in these circumstances may well be “a plague on both your parties,” but this, as he well knows, will neither solve his or the country's political problems. It might be expected that he would, therefore, turn to the third alternative, in the shape of the Liberal party, which, with its great progressive tradition, might be conceived as constituting the ideal middle way between

reaction and socialism so likely to appeal to the common sense of the British citizen. But it would appear that the law of political polarisation is acting in this country scarcely less strongly than in France or Italy. At Epsom last week one more Liberal candidate forfeited his deposit—the third within a fortnight. Whether or not the middle element of opinion ought to vote Liberal, it is not doing so. It is more difficult every month to avoid the very unpleasant conclusion that the multiplication of Liberal candidates does more to lower than to enhance the influence and efficiency of the party. If the Liberal candidate gets so few votes that he loses his deposit, the party becomes a laughing-stock. If the Liberal gets enough votes to avoid this fate, but not enough to come within striking distance of election, he has still succeeded merely in sterilising the Liberal vote and in absolving both Tory and Socialist from any necessity to consider it. Painful though it may be for the devoted labourers of the party machine to acknowledge the fact, it has become clear that, in all save a small minority of constituencies, Liberal candidates do more harm than good to Liberalism. It is better that Liberals should be forced to choose between the larger parties, and that the larger parties should be compelled to solicit their votes.

This conclusion is as negative as it is painful. The facts of the situation compel it for the moment. But no lasting health can be assured to British political life by such a state of affairs. There is very little doubt that a great mass of British electors, perhaps the majority, are not content to entrust the country's fortunes either to the trade unions or to the Tories. If they are compelled to choose between them, it will be a choice of evils, and no solid progress can be built on an electoral system that is a mere alternation of grievances. This is the central political problem of this post war generation, first of all to make articulate and coherent the vague philosophy of the middle vote, and then to construct for it an effective instrument of political activity.

Food for Sterling

THE dollar contracts for food are beginning to run out, and the effect can be expected to be felt before long. The official front is still resolutely sanguine, but the British consumer can get a glimpse of what may be in store for him when he reads of a delegation from the Ministry of Food getting into difficulties in its negotiations in Canada because it wants to reduce purchases of foods that are already all too scarce—and having to face the prospect of accepting a reduction in deliveries of wheat as well. The bare larder is coming into sight. Availability in the producing areas is still, of course, a problem; but it is being replaced as the most serious problem by lack of dollars. The more is the urgency of the need to redouble the search for any supplies of food that can be obtained, from anywhere in the world, in return for payment in sterling.

There is no watertight division between dollar and non-dollar sources. Some apparently soft currency deals turn out on investigation to involve a draft on dollars. The financial agreement with Belgium, for instance, provides that while Belgium will hold sterling up to an official maximum of £27 million, any sterling above that amount must be convertible. Even if the technical peculiarities of Belgium's relation to the sterling area are left out of account, supplies from Belgium above that limit might, from the dollar-saving point of view, just as well be bought direct from the dollar countries. Somewhere in the tangled web of the first Russian negotiations, where prices and British delivery dates offered successive stumbling blocks, lurked a similar difficulty; and not very surprisingly, the same considerations limited the dollar-saving usefulness of the projected

agreement with Poland, although in this latter case delivery dates may have been paramount. Elsewhere, however, no question of convertibility intrudes. Denmark, Holland and Ireland all have definitely available food surpluses which, though they can consume them at home, they would prefer to use for obtaining imports. To promise to supply the imports—of coal, for example—is not always as simple as it sounds. But if that obstacle can be surmounted, then the only remaining question is the price—in sterling. There may not be much food to be had for sterling alone. But there is food to be had for sterling that can be spent on coal.

The Danes, even after their much-publicised deal with Russia, have an estimated exportable surplus for the next twelvemonth of between 45,000 and 55,000 tons of bacon, and 40,000 to 50,000 tons of butter. Britain has already struck a bargain on Danish eggs; the Ministry of Food's negotiators met the Danish demand (which was based on higher production costs) for an increase in price from 17s. 6d. to 26s. per long hundred. On bacon, butter and cheese the negotiations broke down. The Danes, faced with the need to subsidise their farmers in order to get any exportable surplus at all, held out for prices which the Ministry would not pay. The situation in Holland is broadly similar, although the details naturally differ. Ireland would supply more meat, both canned and carcase, if the price were right; at the British figure the Irish prefer to eat the stuff themselves. Odd supplies of poultry, eggs, cheese and fruit are available in Central Europe—but always at higher prices than those of last year.

The total is not impressive. If all sources are taken together, it is probably no more than 20 per cent of British requirements, on the present ration scales, of the foods concerned. If the bacon ration were four ounces a week, with the rest to match, the Ministry of Food might well decide that the game was not worth the candle; that numerous small deals, struck at the cost of considerable diplomatic friction, at the risk of alienating Empire opinion, and at great administrative inconvenience, were in every sense uneconomic. But at present levels every crumb counts. Every home appreciates, as never before, the importance of a rasher when a rasher per head is a week's supply.

Tracking down and bargaining for small inconvenient parcels of this and that, here and there, is not a congenial job for any Ministry. The apparatus of state purchase, like a combine harvester, needs a large field for economical operation. The sickles and reaping hooks of private enterprise are more suitable instruments for getting into corners. In the past, many small supplies have been passed over simply because they could not be conveniently fitted into the pattern of long-term, large-scale procurement and distribution—a pattern which yielded magnificent results in the days of Lend Lease and Mutual Aid, when price control was still in operation in the great supplying areas of the Western Hemisphere, but which is proving less congruent with the very different conditions of 1947. Now that sixpenny lots cannot be neglected, there is a strong case for drastically narrowing the area over which Government trading is the sole instrument. But private enterprise, if it is to be given a chance to pick up such scraps of food as it can find, will have to be allowed to bid a price that persuades the producer to sell—and it will have to do so, not because it is private enterprise, but because (as the Ministry of Food has discovered) to offer an attractive price is the only way to get the food (and even then, sometimes, only if it can be turned into goods). If these extra supplies of sterling food are to be brought into the British larder, then either the subsidy payments will have to be increased, or else the price in the British market will have to be allowed to rise. It would be an over-simplification to pretend that there are no other difficulties such as the possible reaction on other suppliers if a very high price is paid for marginal amounts. But it is not very far from the truth to say that the major obstruction in the way of buying such sterling food as exists is the inability of the Treasury to make up its mind whether it would rather increase subsidies or prices. For this, if for no other reason, it is high time that the whole question of food price policy was brought out into the open and critically examined.

★

This is not the place to re-examine the general economic case against the food subsidies and the contribution that they make to inflation. What is relevant here is to point out that they achieve little or nothing in the way of better nutrition. Whatever purpose they may be thought to serve, it is not that of improving the standard of nutrition of the people, or of any section of the people other than old age pensioners and other beneficiaries from social security, pension funds and the like, many of whom could be provided for much more cheaply by an increase in their cash income. It is not price, but the ration, that today determines the volume of food that is consumed. The demand for eggs (at subsidised prices) is believed to show, in some areas, the first signs of falling short of the ration in those periods when it rises to three eggs a week; at the ration of one egg or less per week, the subsidy plays no part at all in determining demand. With the possible exception of milk, there is no reason to believe that other subsidised foodstuffs would present a different picture. The defence of subsidies on the ground that without them the masses would starve, that (to quote, alas, Sir Stafford Cripps) it is better to attack the purse than the stomach, is in present circumstances the result either of hopeless mental confusion or of a less pardonable dis-

ingenuousness. The subsidies, at present ration levels, support not food consumption but incomes in general, those incomes that so disastrously chase too few goods. Judged by the end-result, what the expenditure of £400 millions a year stimulates is not the demand for food, but the demand for beer, tobacco, electricity, transport, entertainment, betting, football pools and the whole apparatus of spivvory and the black market.

This, however, is something of a digression. Where the subsidies impinge on the subject that is under discussion in this article—the supply of sterling food—is not by being high or low, but by being—since the last Budget speech—fixed in amount. Or, to be perfectly accurate, it is the combination of limited subsidies with retail prices that must not be allowed to rise that causes the trouble. Either a subsidy stop or a prices stop might be sound or unsound policy, but either one by itself would be workable. A combination of subsidy stop with prices stop simply makes supplies unobtainable.

★

Possibly this does less than justice to His Majesty's Government. But appearances are against them, and until they explain themselves, the public can only judge by appearances. The recent breakdown of the Danish negotiations and the disappointing totals agreed on in the agreement with Ireland suggest that the British Government have taken as their guiding principle that, since prices to the consumer must henceforward reflect any increase in price to the producer, the latter must at all costs be prevented from rising. The old Cost-of-Living Index, the Red Flannel Standard, may be dead and discredited, but its ghost still gibbers in the corridors of Montagu House and Portman Square; and the hungry British public is, by its negotiators, represented as preferring to spend its money—sterling, not dollars—on almost anything rather than bacon, butter, cheese or milk. If the price of bacon rises because the expensive Danish product now forms part of the supply, consumers will indeed have less money to spend, after buying their week's ration; but the ration will be larger, or, at the least, safeguarded. Is the national stomach really so well filled that non-food expenditure should be given this assumed priority? Is Sir Stafford Cripps sure that he is defending the stomach, and not the purse? It would indeed be the height of absurdity if the end product of the subsidy system, originally devised so largely to maintain nutritional standards, were to be an all-round lowering of those standards even beyond what world shortage and dollar difficulties make necessary. But if the prices stop and the subsidy stop are both held sacrosanct, that is just what will happen; will happen, moreover, not only through the cutting off of possible European imports, but through a head-on collision with the Government's own home agricultural policy.

There are, fortunately, signs that the Government is aware of this paradoxical possibility. Sir Stafford Cripps's allusions in his speech in the Budget debate were rather enigmatic than otherwise, but a policy of concentrating subsidies on the most essential basic foods, while reducing or abolishing them on the rest, was at least adumbrated. If eggs, bacon, sugar, tea and oils and fats were all deprived of subsidy (to take one possible combination) there would become available a saving of some £115 million, which could be used either to keep the prices of wheat, butter, milk and some of the “protective foods” stable in the face of rising producer prices, or else to neutralise the high prices paid for marginal supplies.

As with state trading, so with subsidies, and so with price policy, the conclusion to be drawn from current events is that the time has come—came, indeed, long ago—to re-draw the frontier between the domain of rigid and detailed control and that of the normal price mechanism. The question is of degree, not of principle. The one certainly wrong policy is to take refuge from thought in mere immobility, like a mule standing with all four legs rigidly planted because it cannot make up its mind which to lift first.

Eastern Europe Since Truman

THE eight months which have passed since President Truman promised aid to Greece and Turkey have brought a marked tightening of the Russian and Communist grip throughout Eastern Europe. The series of pacts between Danubian States resulting from the recent journeys of Marshal Tito are its latest phase. With the Four-Power conference deciding whether Europe is to be finally divided between West and East, now is a good time to examine the recent development of the "iron curtain" countries which form the advanced base for Soviet policy in Germany.

In Yugoslavia and Bulgaria, at the beginning of this year, the opposition was already powerless and the governments were firmly controlled by the Communists. Since then the policy has been to exterminate the remnants of opposition and to deter Yugoslav and Bulgarian subjects from having even social relations with foreigners. This was the purpose of the series of trials, of which the most important were, in Bulgaria, those of the Agrarian Petkov (who was executed) and of the Republican ("Zveno") General Stanchev (who was sentenced to life imprisonment) and in Yugoslavia those of the liberal Slovene Professor Furlan (death sentence commuted to life imprisonment) and of the Serb left-wing Agrarian Dr Dragoljub Jovanovic (nine years' imprisonment). Study of the evidence published at the trials shows that, with the possible exception of General Stanchev, none of the accused was in any way dangerous to the regimes. Their only crimes were that, in parliamentary speeches or private conversation, they criticised the Communists, and that they sometimes met persons from the West. The new regimes have decided not to be content with the practice of the prewar dictatorships of the Right in Eastern Europe, which allowed hostile talk but suppressed all hostile activity. They have preferred the more "modern" and thorough totalitarianism of Moscow.

In Rumania the same result has been achieved, starting from a situation in which slightly more freedom existed. The opposition Peasant Party was suppressed and its leaders, including Dr Maniu, were arrested and sentenced to long imprisonment. At the same time the two important shades of opinion within the Government coalition which differed from the Communist Party—the Socialists and the "Tatarescu Liberals"—have been liquidated, the former by forced fusion with the other "workers' party," the latter by expulsion from the Cabinet by a vote of no confidence in parliament. In Poland Mr Mikolajczyk has fled. Some of his close collaborators have been arrested (after the Czechoslovak Government, to its shame, had handed them over) and the Peasant Party's name and organisation have been taken over by one of the numerous left wing rumps which the Communists have succeeded in detaching from it. Within the government, however, the Socialists have at least succeeded in maintaining their independence. Neither the rank and file of the Socialist Party, nor even all its present leaders, wish to merge themselves in a "workers' unity." This would simply mean the conquest by the Communist power clique of an organisation with sixty years' history of which it has some reason to be proud.

The situation in Hungary is similar, though things are, from the Communist point of view, still less advanced towards "the only true democracy." During the spring and early summer the once powerful Small Farmers' Party was successfully split and purged. At the August elections it received 25 per cent of the poll (in contrast to 60 per cent in 1945), and its present leadership is subservient enough to satisfy the Communist Rakosi. But about a third of the votes were given to three parties standing to the Right of the government coalition. Since then one of these, the Hungarian Independence Party, has been suppressed

and its leader Mr Pfeiffer has left the country. Within the coalition the Socialists remain, as in Poland, nominally independent. Their leader Mr Szakasits has recently made a speech against "fusion," arguing that, if this were carried through, "valuable masses" among the workers would not follow the Socialist party leadership, and thus workers' unity would, in fact, become weaker, not stronger.

The key country of the whole region is Czechoslovakia. There very far-reaching economic and social changes have so far been combined with very considerable political freedom. During the last two years the rule of law has, in fact, been restored. Yet the Czechs cannot yet afford to be complacent. The public humiliation inflicted on them by Moscow in July, when their Government was compelled at the last moment to withdraw its acceptance of an invitation to the Paris Conference on the Marshall offer, caused something like a panic. Since then there have been several signs that the Communists and their Russian patrons are planning the *Gleichschaltung* of Masaryk's republic. The draft five-year plan announced by the Prime Minister early in October makes it clear that the structure of Czech industry is to be transformed, at great economic risk, in order to make Czechoslovakia a source of supply to its eastern neighbours and to break its connections with the West. The political strategy of the Communist Party is more and more clearly determined by the desire to obtain a 51 per cent majority in Parliament, so that it may override the other parties which have been until now its loyal partners in the "National Front" created at the end of the war.

In this connection the position of the Social Democrats is of decisive importance. They have for more than a year shown increasing impatience with Communist policy. The Communist attacks on the person of their new chairman, Lausman, show that the party is still defending its independence. The foundation of the Cominform can hardly have reassured them, but it may be expected that pressure from the Communists for "fusion" will now greatly increase.

The recent crisis in Slovakia is another sign pointing in the same direction. The Slovak Democrat Party closely resembles the Small Farmers' Party of Hungary before it was purged. It is a hotch-potch of peasants, tradesmen, officials and professional men, many of whom can rightly be accused of having had friendly relations in the past with people who might fit into a rather wide definition of "Fascists." Intrigues of various members of the party with exiled right-wing nationalists are being exploited by the Communists to disrupt the party and to engineer a majority for themselves in Slovakia—at the 1946 general election they won 30 per cent and the Democrats 60 per cent). The struggle has ended for the time being in a draw, but it will be resumed. In their manoeuvres in both Slovakia and the Czech lands the Communists are making great use of extra-parliamentary pressure by the trade unions, which are under their firm control. They will not stop at civil war if their Kremlin patrons give the word. It should not be forgotten that, though Czechoslovakia is mostly surrounded by Soviet-occupied or Soviet satellite territory, it also has a frontier with the American zone of Germany. Czechoslovakia today is, as much as France and perhaps more than Italy, a vital sector in the west-east battle for Europe.

*

It emerges from this brief survey that, while their present regimes last, the Balkan countries at least are lost to the West. Political barriers seem likely, for the present, to prevent all but an insignificant trickle of trade westwards; Western cultural influence is rigorously excluded, and for Balkan citizens personal

contacts with Westerners are deadlier than the plague. Under their present regimes these countries are being rapidly sovietised. They are now in approximately the same stage as was Russia under the New Economic Policy of 1921. The old rulers—landowners, big industrialists and high-ranking bureaucrats—have been liquidated as a class, the "commanding heights" of the economy have been taken over by the State, and the Communist Party has a monopoly of political power. On the other hand in agriculture, and to a lesser extent in commerce, a middle class still exists. The next stage—the liquidation of this middle class by collectivising agriculture and by concentrating commerce in the hands of state-controlled co-operatives—has yet to come. But that it will come there is little reason to doubt. The fact that these countries have not yet adopted Stalinist institutions in every field should not be allowed to disguise the fact that they are closely and consistently copying the Soviet model.

Politically, then, Yugoslavia, Bulgaria, and Rumania are one-party states—and the same is true of Albania. There the secret police is supreme, and education consists of the unceasing repetition of moralising slogans. Economic policy is based on vast plans of construction, which dazzle on paper but the realisation of which depends on the skill of workers and engineers and on the proportion of national resources which can be directed from the maintenance of armies and police forces.

Those who believe that the Soviet Union had before 1941, by the use of mass industrialisation, collectivised agriculture and a penal labour force running into millions, "solved" the problem of rural overpopulation which was the curse of Eastern Europe between the wars as of the empire of the Czars, and that the Soviet Union as a "peace-loving socialist State" is bound to be generous in trade with "popular democracies," will be optimists for the future. Those who take a more

sceptical view of the Soviet past will doubt whether, even if peace lasts a generation and there are no internal political troubles, these vast economic problems can soon be brought near to "solution."

In Poland, Hungary and Czechoslovakia things have not, or not yet, gone so far. The western Powers can still hope to trade with them on a useful scale, and they can still keep contact with their democratic friends, provided that they do not compromise them; provided in particular that Americans resist the temptation to treat Socialists as "expendable," by forcing them into positions and tactics which they are neither strong nor determined enough to maintain. Yet, even so, it should be understood that this situation is anything but durable. At any moment the Russians and Communists can suppress the remaining liberties in these three countries; and as soon as they feel that suppression will not be dangerous to them, they will do so.

Unless something happens to loosen or break the Russian grip, the sovietisation of Eastern Europe, with its 80 million people, is certain. By the "Russian grip" is meant the presence of Russian armies in eastern Germany and Austria, and the control by Communists of the military and police systems of the East European countries. The grip will not be quickly broken by Western commercial or cultural influence, nor by protests at judicial murder. Even the attraction of a successfully working Marshall Plan would have little effect in countries held down by such overpowering force. In the short run, the grip will be broken only if the Kremlin can be convinced that to maintain it will bring more danger than advantage.

In the long run, the decisive factor may well be the national pride and independent spirit of the Poles and Czechs, far stronger and long in memory than anything the Soviet rulers have encountered in the republics of their Union.

NOTES OF THE WEEK

M. Thorez Licks his Wounds

When the concerted attack of the French Communists and trade unions began last month, it was compared in these columns to the Ardennes offensive launched by Hitler in December, 1944. Had it succeeded it would have prolonged indefinitely the battle joined in western Europe for and against the Marshall Plan; now that it has failed, the Communists fall back weaker than before but still strong enough to continue the struggle from prepared positions. There must be no premature jubilation, such as M. Bidault has allowed himself.

The calling off of the general strike by the *Confédération Générale du Travail* was timed to avoid a split between its moderates and extremists, and to deprive the French people and the world of the chastening sight of the general strike collapsing through weariness, dissension and perhaps even fear at the firmness shown by M. Schuman's government. Moreover, the strike had failed in its three main political objectives: to show working class solidarity against a centre government, to show interest in the Marshall Plan, and to provoke the Right into violence. General de Gaulle sat tight. M. Schuman took the powers he needed and used troops without allowing any shooting.

In a confused, individualist way French men and women have been making their choice between orderly protest and hooliganism, between the claims of the democratic republic and those of the Communist caucus in the trade unions. In hundreds of thousands of cases it has needed great personal courage to resist strike pickets, to carry on work in face of intimidation by such gangs as seized control of St. Etienne. But much work has gone on, if sporadically and in patches. Through all the violence and exasperation the men in the generating stations kept going, producing over 80 per cent of the normal power supply. M. Schuman owes his victory to the common sense of the common man.

It may be that the major Communist effort has yet to come; but it can hardly be delivered before the forces scattered in the abortive general strike have been rallied and regrouped. That delay should give time for the government to make further preparations against violence and to widen the split which is beginning

to appear in the central trade union organisation. But time is one of the things the French economy cannot afford. In spite of the assurances given to Mr Dulles by M. Monnet, there can be no doubt that serious damage has been done by a month's civil strife. Stocks and resources are low, transport has been working in fits and starts, and by the beginning of this week it was estimated that France had lost two million tons of coal, 400,000 tons of iron ore, and 175,000 tons of steel. Foodstuffs have gone bad in the ports and cargoes of raw materials have been delayed or diverted. All now depends on the success of M. Mayer's efforts to find a new level at which wages and prices can be balanced for the winter, and on M. Schuman's campaign against the black markets and the "saboteurs of the people's food."

* * *

Congress Against Time

It is difficult for men and women in Europe, waiting in desperate anxiety for food and supplies, to realise what a revolution has taken place in American thinking since March this year. To them, relief seems to be coming at a snail's pace, but to get a proper perspective they need to turn back to the American attitude to foreign aid in the spring and summer. In April and May, it took weeks of fantastic argument and endless debate to prod 400 million dollars' worth of aid for Greece and Turkey through Congress. Later—as late as August—it was seriously thought that once the British ended the convertibility of sterling, the remaining \$400 million of the Loan could not be unfrozen without specific Congressional approval. Today the whole tempo has changed. The \$400 million have been released by a simple exchange of letters between Mr Snyder and Sir Stafford Cripps; and the Bill asking for an appropriation of \$597 million for Interim Aid, after passing the Senate in record time, is apparently already certain to muster an overwhelming majority in the House of Representatives.

While admitting the phenomenal increase in America's sense of urgency, one may still ask whether events in Europe are not outstripping it. Few Americans are aware of how fast the mortal

flux of Britain's foreign reserves still continues. Few have gauged, except in general terms, the extent to which lack of food and dwindling supplies lie behind the success of the Communists' tactics of disruption. In France, the Government's only hope of fending off further disturbances as the winter advances lies in its ability to add something to the worker's diet. In Italy, too, the Government's anti-inflationary policy—described in a later article—cannot succeed unless increased supplies of raw materials arrive in time to absorb the growing numbers of unemployed. The latest round of disturbances has inevitably reduced the amount of deliveries—of coal or other raw materials—which can be made from domestic sources in both France and Italy. Their need for Interim Aid is now twice as urgent as it was before the strike wave began.

It is this extra need for speed which has yet to make its mark upon the mind of Congress. The determination of some Congressmen to cut the figures for Interim Aid, on the grounds that the calculations were faulty, reflects this lack of realism. Equally the likelihood that in return for unfreezing the remainder of the Loan, the Americans have insisted that Britain provide some £20 million in dollars for Germany betrays a complete misunderstanding of Britain's financial straits. The trouble in America is not that people refuse to learn. Few nations have learnt so much in so short a time. The trouble is that events outstrip knowledge, and that need is always one lap ahead.

The Parliament Bill

The Parliament Bill passed its third reading in the House of Commons on Wednesday. What will happen to it now, when it goes "to another place" remains to be seen. One thing, however, is already clear; the attempt to revive the controversy of Lords *versus* Commons as a living political issue has so far proved a complete failure. The spirit of 1910 has obstinately refused to be reincarnated and there have been few indeed to "applaud the hollow ghost," though it is, of course, conceivable that the actual rejection by the Upper House even of this dubious measure might strike some sparks of genuine public feeling. That it could cause anything approaching a conflagration is extremely improbable. In these critical days interest in House of Lords reform enjoys a very low priority, and taken in isolation from this dormant constitutional question, the Bill merely looks like a rather disingenuous piece of jugglery. As Sir Arthur Salter pointed out in committee it makes a big breach in three of our principal Parliamentary traditions; as a constitutional measure it has been smuggled in by a side door without previous discussion; it is retroactive, and it has been introduced with a special purpose of applying to a particular case, for the Government has completely failed to disguise the fact that its real and perhaps only *raison d'être* is the coming Iron and Steel Bill.

In these circumstances it was scarcely to be expected that the third reading debate would make any notable contribution to the philosophy of the Second Chamber. The Home Secretary endeavoured to defend the Bill on the ground that the machinery of Parliament was too slow for the exigencies of modern democracy, and that therefore delaying powers should be curtailed. But this argument will hardly carry much conviction when the spate of complicated and controversial legislation introduced by the present Government is considered. Mr Butler had an easy reply when he pointed out that the Bill solved nothing and only limited the suspensory power of the Upper House for opportunist motives. Whether the ideal limit for those powers should be one year or two, or even five, may be open to argument. The fundamental objection to the Bill lies not so much in what it does, though that may be mischievous enough, as in the way in which it does it. The casual introduction of constitutional changes is a vicious precedent, and one which might not always redound to the benefit of the "progressive" party.

Priorities in Overseas Development

The Committee stage of the Overseas Resources Development Bill was concluded last week after only four days' discussion; of these by far the greater part was taken up with the implications of the Minister of Food's entry into colonial development through the activities of the Overseas Food Corporation. On this the Opposition was on firm ground, and it was a pity that Mr Strachey quite unjustifiably twisted some of the arguments to make the issue appear as a contest between private enterprise and the public corporation.

The result of this distortion was that some of the points made by the Opposition were never answered. In spite of protestations by Mr Strachey and Mr Creech Jones, it seems certain that the Ministry of Food would never have entered the colonial picture

at all had it not been responsible for the inauguration of the East African groundnuts scheme. But what neither of them answered convincingly was the question of how priorities are to be determined. There is, first of all, the question of priorities of capital investment in this country and overseas. Can we, at this time, asked Sir Arthur Salter, afford capital investment, that is, export capital goods, to Australia and other Dominions (food projects in which are the main justification of the establishment of the Overseas Food Corporation under the Minister of Food), when we have no responsibility for them as we have for the colonies? In the colonies themselves, who is to settle a question of priorities between a public corporation and private enterprise or between the Overseas Food Corporation, responsible to the Minister of Food, in one colony and a public corporation, responsible to the Secretary of State, in another? It was pointed out in Standing Committee, and admitted by Mr Creech Jones, that the overriding priority given to the groundnut scheme had caused some dislocation to the normal economy of the area. Is the scheme's comparative success in recruiting African labour due to the fact that it has been drawn from the sisal plantations where it could have been producing sisal for export for dollars? Would it have been better to have allocated some of the railway equipment sent to East Africa to West Africa, where a shortage of rolling stock last year prevented 100,000 tons of groundnuts from being moved? When priority is given to a project initiated by the Ministry of Food's corporation, which means that the chief beneficiary is the British consumer, what will be the effect on local opinion in the colonies?

These queries do not detract from the virtue of the main principle of the Bill. But it does seem that the implications have not been fully grasped by the Government. In the colonies, no less than at home, planning does not end with the establishment of a public corporation.

Indo-Pakistan Agreement

In a world where diplomatic negotiations between the Great Powers are so continually at deadlock that any rapidly achieved agreement among independent states is a matter for astonishment, it is indeed good news that India and Pakistan have reached agreement on all outstanding issues relating to partition, including the division of the armed forces and their equipment. This settlement does not cover the dispute over Kashmir, which remains serious, nor points of economic conflict such as the export duty imposed by Pakistan on raw jute sent for manufacture in India. But, considering how much blood has been shed and how difficult the process of partition has been, the scope of agreement is remarkable. The number of disputable points would have enabled Mr Molotov to have stonewalled for ten years.

The speed of settlement reflects credit on all concerned, and even more on India than on Pakistan, for it is clear that India goes to the conference table as the stronger party. The Indian Government is under pressure from many of its supporters to press its advantages to extremes. For this reason it is now in a stronger position, in that it can present the agreement on military questions as its own work in direct negotiation with Pakistan without direction by a British Commander-in-Chief. One may, nevertheless, be sure that Field-Marshal Auchinleck made his contribution to the successful outcome before his departure, and the task of reconciliation.

The Kashmir problem is now the most intractable of the issues still dividing the two Dominions. Pakistan would probably like to withdraw from the adventure if it could, but there are signs that the situation is largely beyond control from Karachi. Not only would Pakistan's prestige be seriously compromised by any action to compel the raiders to evacuate Kashmir unconditionally, but such a finish to the Kashmir invasion would be only too likely to divert Pathan aggression against Pakistan itself. The overcrowded, poverty-stricken Frontier and its turbulent tribes have hitherto been kept quiet, if at all, by subsidies from Delhi; Pakistan cannot afford to keep up these payments, and is threatened with the creation of a "Pathanistan." The foreign Power which has supplied a number of up-to-date weapons to the Pathan tribesmen is believed to be interested in this development on the Frontier, which would fatally disrupt the settlement of the political succession in India reached under British auspices this year.

It is probable, therefore, that Mr Jinnah, by supporting the invasion of Kashmir, hoped to kill two birds with one stone: to annex Kashmir and to divert the aggressive energies of the Pathans away from Peshawar and the Punjab. The outcome has not been a happy one for Pakistan, for Indian troops have repelled

the invaders from Srinagar, while Pathan looting has turned many Kashmir Moslems against the Karachi Government. But if the tribesmen come back from Kashmir, where do they go next?

Far Eastern Cominform?

There have been several press reports of a conference of Far Eastern Communist parties supposed to have been held in Harbin (now under the control of the Chinese Communists) between November 20th and 27th. It is said to have resulted in the establishment of an organisation in Vladivostok corresponding to the European Cominform in Belgrade, and to have been attended by Communist delegates from the Soviet Union, Mongolia, China, Korea, the Philippines, Indonesia, Malaya and Burma, but not from Japan. In contrast, however, to the formation of the European Cominform, which was given full publicity from the Soviet side, there has been no similar publicity for the alleged Harbin conference and it seems doubtful whether any organisation similar to the European one has in fact been set up. But there can be no doubt that Communists are at present very active all over the Far East from Manchuria to Java, and there is no reason to suppose that the preoccupations of Mr Zhdanov and Mr Malenkov with the affairs of France and Italy are so exclusive as to make them miss any chances of causing trouble for Mr Marshall in Further Asia.

In this connection some figures recently published in Moscow by the magazine *Party Life* on the membership of Communist parties are of considerable interest. According to these figures the two largest parties outside the Soviet Union are those of Italy and China, with over two million members each. Next come the Czechoslovak party with 1,125,000, the French with 1,000,000, the Polish and Hungarian with 800,000 each, the Rumanian with 700,000, the Bulgarian with 500,000 and the Yugoslav with 400,000. Japan is credited with 100,000 party members, while poor, backward Britain only has 43,000 of these creatures. That Italy has the largest Communist party in the world outside Russia is a fact (assuming the figures to be correct) which is not generally recognised; that the Chinese Communists are numerous is perhaps better appreciated, seeing that they are able to carry on a civil war, but their place on the statistical list may nevertheless cause some surprise. There is a belief, widely held in this country and the United States, that the Chinese Communists are "not really Communists" because they do not socialise industries where there are no industries to socialise. But in their attitude to all possible Marshall Plans in east or west the Chinese Communists' attitude is all that any Cominform could desire.

Agricultural Criticism

The debate on agriculture in the House of Lords threw up few new facts. Some of the criticism pointed at the Government for giving insufficient attention to agricultural requirements is misdirected. Agriculture has been given a reasonably high priority in the capital investment programme. Increased allocations of steel for agricultural machinery were recently announced. The building of new houses is proceeding, if anything, faster in rural than in urban areas; and consultations now take place regularly between the local authorities and the National Farmers' Union on housing needs. For the Government, Lord Huntingdon was able to state that 30,000 Poles and European workers and 10,000 German prisoners remaining as civilians should be available for next year's harvest. This will fill two-thirds of the gap left by the repatriation of German prisoners. The remaining labour, however, must be recruited at home; and it is true enough that houses are not going up nearly fast enough to accommodate it. The problem might be overcome if only the Government would restore grants for the reconditioning of rural cottages; and, owing to the special need for labour over the next year caused by the removal of the Germans, there is a strong case for giving rural areas much more than their fair share of new houses as a temporary expedient.

Thus there are further steps the Government should take to expedite the programme of agricultural expansion. But its main defect is not that it is inattentive to agriculture, but that it is unselective in its methods of encouragement. The policy of relying on high prices to stimulate production will prove, in the long run, and perhaps in the short run, too, to be a blunder. Selective subsidies for the re-equipment of farms, the restoration of the reconditioning grant, a full and bold use of the Agricultural Land Commission (whose composition, under the chairmanship of Sir Frederick Burrows, was announced this week), and possibly

a temporary reintroduction of compulsory cropping orders to safeguard the supply of potatoes and cereals—these are some of the measures that would get results.

Welsh Progress

True to its promises, the Government has issued a compendious White Paper, setting out the work of its departments in Wales over the last year (H.M.S.O., Cmd. 7267, 2s.). This is the substitute attraction for the appointment of a Welsh Secretary of State, which was demanded a year ago by many of the Welsh contingent in Parliament and which, on the whole rightly, was refused by the Government. The White Paper is, speaking generally, a useful and detailed progress report, of considerable value to any serious student of Welsh affairs. It also suggests that co-operation between the departments over Welsh matters has been fairly effective. The primary aim of Government policy has been to restore Wales's economic prosperity—to stop the drift of labour to England, to diversify industry in the coalfields, to increase the volume of trade handled by the Welsh ports, to raise the prosperity of hill farming, to revive the slate industry in North Wales; and some progress has been made towards each of these objectives.

The volume of unemployment has been reduced during the year from 8 to 6 per cent—and many of those still not absorbed are unemployables, the sad legacy of the great depression of the 'thirties. During the year 39 factories in the Welsh development areas (half of them Government-financed) have been completed and occupied, and a further 145 schemes are under construction, though how these will fare under the capital cuts remains to be seen. After the programme is completed, Government factory building will be mainly confined to providing male employment in a limited number of different places.

Many other activities are recorded, such as a start on the clearance of derelict sites. Some of the Government's measures accord better with social than with economic criteria, and the desire to make amends to Wales for its sufferings of the past ranks high in the programme. But it would be churlish to make this a point of criticism. Wales badly needs the special attention it is receiving, and it is to be hoped that of the limited resources available, it will continue to get a fair share.

Income Tax in Malaya

The decision of the Governors of the Malayan Union and of Singapore to introduce an income tax against the advice of their Advisory Councils has caused a storm of protest among commercial interests in Malaya and a fall in Malayan rubber and tin shares on the London Stock Exchange. The fight is not a new one. In 1920, a war tax was converted into income tax and reimposed in 1921-22, but in 1922 a proposal to retain it for peace time purposes had to be dropped owing to the strong opposition. In 1941, income tax was again introduced for war-time purposes, but it had to be re-enacted annually, and the legislation lapsed with the Japanese occupation.

The proposed basis of tax is 20 per cent on companies' profits and a progressive rate of 3 to 30 per cent on individuals. By British standards it is not, therefore, a stiff tax—though stiff enough by other comparisons—and the long history of opposition to income tax shows that its critics are prompted more by fear for their pockets than, as they claim, by wounded pride, because the tax is imposed just before the new constitution, giving an appreciable measure of responsible government, comes into force. On economic grounds there is a great deal to be said in favour of the tax. Malaya, in common with other colonies, has always been cursed with revenue which fluctuated in accordance with world prices of its export commodities. It was more fortunate than most because it was more prosperous than most, and was consequently able in bad years to maintain its comparatively high standard of social services out of surpluses accumulated in good years. But neither in Malaya nor elsewhere is it justifiable that social services should be financed in this haphazard manner or that the burden of them should be met by indirect taxation on necessities. Including the Far Eastern territories, there are only ten colonies where no income tax is levied, and of these ten Hong Kong now has the necessary legislation. The business community may have a genuine grievance about war damage payments, and they have every right to ask that the introduction of an income tax should be accompanied by considerable pruning of the cost of Government service, which is very overloaded. But on the main issue they will show themselves short sighted and narrow minded if they persist in their opposition. Income tax in Malaya is twenty-five years overdue.

Union of Danubian Republics?

Marshal Tito has lately shown as much energy in burying the hatchet as he once showed in brandishing it. He has visited two ex-enemy countries, Bulgaria and Hungary, and is shortly to visit a third, Rumania. So, in the system of alliances covering the Soviet zone of Europe, the ex-enemies are to play their role side by side with the ex-allies Poland, Czechoslovakia and Yugoslavia which concluded alliances with one another and the Soviet Union last year.

Much of the speculation which has followed Tito on his journeys is irrelevant, whether or not he is a rival with Dimitrov for future presidency of some Balkan federation. That the initiative towards closer ties in eastern Europe should come from him is natural, for Yugoslavia is the only ex-ally country having a common frontier with all three ex-enemy Danubian states. If there was public diplomacy to be done, it was more befitting to the dignity of the world Communist hierarchy that the first gestures should be made by a small "people's democracy" than by the giant Soviet Union itself.

The Yugoslav pact with Bulgaria was drafted during the summer visit of Dimitrov to Tito in Bled, and now comes into force. It is the most important of the new alliances, because it affects an area which adjoins the "western imperialist sphere"—the northern frontier of Greece. The Yugoslav communiqué announcing the pact specifically stated that the two states would together oppose the activities of the United Nations border commission (whose staff have begun work). The Yugoslav pact with Hungary is of less immediate importance; but it is perhaps intended as a hint to Czechoslovakia that if it does not make quicker progress towards eliminating "reactionary western influences" in its political life, the sympathy shown by the "eastern popular democracies" and their Soviet patron for the Czechoslovak point of view about Hungary's northern frontier may cool.

A Hungarian pact with Rumania is expected to result from the recent visit of the Premier to Bucharest, undertaken in reply to M. Groza's trip to Budapest in the spring. Finally Yugoslav-Rumanian and Rumanian-Bulgarian pacts are promised. Here there are few political obstacles to be overcome and they therefore have less significance.

Is this system of alliances part of a blueprint for a future Union of Danubian Soviet Republics? Or for the incorporation of the Danubian states—with or without Poland and Czechoslovakia—in the Soviet Union? Prophecy is dangerous, but it seems unlikely that the blueprint stage will be passed until political bolshevisation—now nearing completion almost everywhere—has been followed by social and economic reconstruction on the Soviet model, which is still far off. But these pacts show to what an extent the Russians have consolidated in eastern Europe a political and military base for operations further west.

* * *

Germans in Blinkers

During the herring-chasing that has occupied the Foreign Ministers this week, Mr Molotov dragged one particularly savoury morsel across the path of negotiation, and incidentally misled the *Daily Worker* into voicing the complaints of German capitalists. It is alleged that big profits are being made out of the sale abroad of German coal: it is being sold at 32 marks a ton, but the Germans are paid only 12 marks. In other words, Bizonia's coal is fetching \$10 a ton, of which the Germans receive only the equivalent in marks of \$3.60. Mr Molotov scents a scandal.

In fact, the joint export-import agency of Bizonia and the parallel authority in the Soviet Zone use the same pricing methods: world prices in dollars or sterling are charged for exports, and the German manufacturer receives in marks the pegged 1938 price. In addition, both authorities have recently allocated to the Germans a small percentage of the foreign exchange earned so that they may purchase raw materials and incentive goods for their employees. So Mr Molotov can hardly have been interested in anything but the propaganda possibilities of his inquiry, which fitted neatly into a widespread campaign, managed from Berlin, by which German economists, industrialists and politicians in the West are being misled.

The leading economic journal of western Germany, the *Handelsblatt* of Duesseldorf, has been playing its part. Recently it demanded that the proceeds of exports should be handed to Germans for immediate use in importing raw materials. It alleged that not more than 10 per cent of export earnings come back to the German economy, that coal and timber alone were

earning \$20 million a month, and that import licences to the value of \$25 or \$35 million a month could be granted without more ado. This is to ignore the Category A imports of food, fertilisers and seeds which are presented gratis to the Germans at a cost of \$700 million a year; the *Berliner Zeitung* refers to them as "negligible quantities of rubbishy food." It ignores also the sum of nearly \$4,000,000 a month spent on miners' clothing. It overestimates the proceeds of coal and timber exports. Such dishonesty is not unusual in the German press.

It is true that there has been a great discrepancy between the totals of exports and imports. To the end of September exports for 1947 amounted to \$135½ million, while the value of non-essential (Category B) goods was only \$25½ million. But the blame for the discrepancy must be laid at the doors of the German economic authorities in Frankfurt, who have proved incapable of using fully the working capital placed at their disposal for imports. It is for them to draw up import schedules; the Allied agency merely assists procurement. Unfortunately, experienced and enterprising officials are rare, and the Frankfurt bureaucrats are caught in the toils of red tape.

The outcry against the British and Americans will grow as exports grow. For September they were up to \$28 million, 28 per cent of all contracts being with firms in American-occupied Bavaria, the black sheep of the states in most other economic matters. But that record figure will have to be multiplied six times before Bizonia's exports and imports will even look like balancing. And to achieve that result will need the full co-operation of German manufacturers, who must not be misled by mischievous rumours about Allied profiteering on the side. Propaganda against the occupation authorities in Bizonia is being given too much rope.

* * *

Land for the Services

The promised White Paper on the armed forces' requirements for land in Great Britain (Cmd. 7278. 4d.) does not specify the actual areas which are to be permanently retained for military training, airfields and associated purposes. The locations have not yet been finally settled. It does lay down the total area which will be required, which is put at just over a million acres. This compares with the training area of over eleven million acres held by the services during wartime and with that of 250,000 acres held before the war; and it represents less than 2 per cent of total land area. On the face of it, this seems a reasonable compromise. Two-thirds of the land is needed for actual training, mostly by the army; and it is expected that only 8 per cent of this land will be lost to agriculture (apart from, presumably, some interference with rough grazings). The arguments against training more men overseas are cogently stated.

While, however, it is difficult to criticise the total land needs of the services, now that at last they have been agreed, the detailed choice of locations still gives cause for anxiety. Only 40 per cent of the land wanted for training already belongs to the services, and, in addition, the public will encounter new obstructions, such as the stopping-up of roads on old training grounds. The procedure laid down for the selection of individual areas seems, it is true, to be eminently reasonable. It comprises, first, a regional consultation between the Ministry of Town and Country Planning and local interests and amenity societies, then an examination of the proposals by an inter-departmental committee, and finally (if there are objections) the holding of a local inquiry by an inspector of the Ministry. The inquiry can, however, be cut out for reasons of security—it is to be hoped this will not happen often. Despite the fairness of this procedure, there are signs that the services have an undue preference for certain areas, such as Wales, and too little inclination to take themselves to the remoter parts of Scotland. In addition, the Government's refusal to recognise as binding its wartime promises to reinstate certain dispossessed inhabitants is bad statesmanship. However, the White Paper does at least show that decisions over service training are not to be arbitrary and unexplained; and it is up to the Government to see that a like democratic spirit infuses the local inquiries and decisions.

1851-1951

Last year's decision to drop the project for a World Exhibition in London to commemorate the centenary of the Great Exhibition of 1851 was the only one possible. No successor to the Crystal Palace could find a place in the present capital programme.

Last week's announcement that there would, after all, be a token exhibition, a National Display "illustrating the British contribution to civilisation in the arts, science and technology" marks a brave determination not to be beaten by adversity. Whether it is a good decision or not depends on whether the hair-line distinction is unswervingly kept in view between the small-scale and the skimpy, between the token representative of genuine resources which cannot just now be spared for the shop-window, and the merely and wholly *ersatz*. Which the display will exemplify, time will show. Certainly it should be a guiding rule, for each of its component parts in London and elsewhere, that only the best is any use at all. For the second-best, however gallantly attempted, there should be no room. The temptation should also be resisted to cover up any shortages of contemporary achievement by overmuch reliance on the glorious past. In so far as the displays are genuinely concerned to show a century in perspective, the historical emphasis has its place; but it would be lamentable if the general effect were to be that of a beautifully composed and informative obituary notice.

Nothing in Mr Morrison's announcement in the House of Commons, or in the singularly harmonious debate which followed, suggests that anything but the highest standards both of quality and of contemporaneity would be aimed at. The danger is that under the really appalling difficulties which can be expected to characterise the period between now and 1951 those standards might be imperceptibly lowered, that those who have undertaken to put on a show somehow may feel that that show must go on, even if it is obviously turning into an amateur charade. With a project consisting not, as in 1851, of one central undertaking focused under a single guidance, but of a large number of widely dispersed activities, there is all the greater danger.

Shorter Notes

The British people's attitude to aliens is not as a rule so generous that the passage through Parliament of the Medical Practitioners and Pharmacists Bill should be allowed to take place without comment. During the war, by a defence regulation, doctors from certain territories—mainly refugees—were allowed

to practise in this country, under restricted conditions, without having to obtain British qualifications. The Bill regularises their position by enabling them, and certain other categories, to practise, without restrictions, when the defence regulation has lapsed. This is a liberal measure from which the usual trade union spirit is happily absent, and the British Medical Association is to be congratulated on agreeing to it. Will not the dentists now show a similar generosity?

*

The announcement that a small committee is to be set up to inquire into the black market in meat and poultry—in officialese "the methods by which livestock, poultry and meat . . . may be finding their way into consumption outside controlled channels"—is at least welcome evidence that the Ministry of Food is waking up to the menace of the black market in this country. It is doubtful, however, whether the committee will be able to make any really useful recommendations. So long as the food reaching people through the "controlled channels" gradually dwindles, so long will they tend to supplement their supplies outside them. In this country, the law cannot be enforced unless it commands virtually universal respect. And it is that which the law relating to food distribution is gradually losing.

*

Henceforth women are to be full members of Cambridge University. This once much debated issue was passed by the Regent House last week without a breath of protest. The only conspicuous bar to complete equality is the continued denial of proctorial status. Perhaps the necessary declension of the traditional title was more than the Vice-Chancellor could stomach. *Egredia procuratrix* would be going a little far.

*

Christmas currency demands have at last succeeded in largely outweighing the special influences now making for a contraction of the note circulation. In the week to Wednesday last the total expanded by £10.7 million, compared with an increase of £2.2 million in the previous week; but even this bigger movement was far smaller than that for the corresponding week last year—then the expansion was £22½ million.

TESTED and proved in every climate and condition, and treasured by millions throughout the world, here is the incomparable Parker "51."

Touch point to paper and it writes un-failingly—the patented ink-trap controls an even flow. The Parker "51" has a 14-ct. gold nib, superbly streamlined. Very little of the nib shows, as it is hooded against dirt and damage—all vital parts being fully protected.

The precision-fit cap of gleaming Lustraloy slips on securely without twisting. The patented filler is hidden within the barrel.

In Black, Dove Grey, Cedar Blue, and Cordovan Brown. 62/6 (plus Purchase Tax).

Letters to the Editor

World Court Without Work

SIR,—On my return from New York my attention has been drawn to the fact that in your issue of November 22nd certain observations appeared referring to the alleged slowness of the International Court of Justice in dealing with the Corfu Channel case. As these comments may be wrongly construed, and are in fact misleading, I think it only fair to point out that there is nothing in the procedure of the Court to cause any delay in the disposal of a case. The suggestion that the Court contributed in any degree to the alleged delay is both unjust and incorrect. A certain period of time elapsed between the filing of the British application instituting the proceedings on May 22nd and the appointment of the Albanian agent on July 23rd, but this delay was not attributable to the Court, nor had the Court any power under its rules to cause the Albanian Government to appoint an agent at any earlier date. In fact, the Court promptly made an Order on July 31st (which it could not do under its rules until the Albanian Government had appointed its agent) fixing time limits for the delivery of the Memorial and Counter-Memorial respectively.

Before making this Order the President consulted the parties, and the time limits took into account the fact that the written pleadings (which must inevitably precede the oral hearing) would require considerable time to prepare. The Government of the United Kingdom was allowed until October 1st to file its Memorial. As the time limits should obviously be equitably balanced as between the parties, it seemed fair and reasonable to allow a substantially equivalent length of time, i.e. until December 10th, to the Albanian Government to prepare its answer—the Counter-Memorial.

The truth is that a case can be tried as speedily before the International Court as before any other tribunal, the rate of progress before the case is actually heard depending to a great extent on the states concerned and not the Court.—Yours faithfully,
Royal Courts of Justice, London HARTLEY SHAWCROSS

Transport Next Year and After

SIR,—In the course of an interesting article on "Transport Next Year and After" you refer to the "mass of exceptional rates which are the product of road competition and account for as much as three-quarters of the merchandise revenue of the railways" (my italics). No comparisons more recent than 1935 appear to be available, but by that year the published figures of traffic at standard and exceptional rates showed that while road traffic might be the most important cause of new exceptional rates, the largest proportion of traffic charged at exceptional rates was still to be found in the lower classes (coal and heavy merchandise Classes 1 to 6). This indicated to my mind that there were then potent causes compelling the grant of exceptional rates other than the diversion of traffic to road—the particular circumstances surrounding the traffic in question. What has happened since we do not know, but the point does bear on the exercise by the Commission of the wide powers to draft charges schemes granted by Part V of the Act of 1947.

Ministers in debate repudiated suggestions that they should lay down any plan or principle of rate-making to which the Commission should work. On the Third Reading the Minister himself argued that the determination of rates and charges could best be

left to discussion between traders and the Commission before the Tribunal "as a watchdog for the public." Even if relieved from road competition by their rights to acquire long-distance haulage, the Commission will, I think, still be compelled by the representations of traders. In these circumstances I myself should expect to see a charges system reflecting not that greater simplicity to which the Minister looked forward, but one composed, even more than at present, of a mass of rates, each of them depending upon the pressures which the interests concerned could exert upon Commission and Tribunal.

Earlier in the same article you remarked upon the difficulties of coping with a business such as road haulage, "a sprawling affair consisting of 48,000 licensees, most of them small operators, and 140,000 vehicles." Nationalising such an industry would be a really heroic enterprise. The Minister, however, opening for the Government on the second reading, anticipated a transfer on a much more limited scale. The Commission, he thought, would need to acquire only 2,000 to 2,500 undertakings and 23,000 vehicles, excluding the 11,000 used by the railways for cartage and so on. This is a much less formidable proposal. But the Minister's figures, surely, are surprisingly small? If they are really correct, a long-distance business operating so few vehicles must have been run most efficiently indeed to inflict on their competitors all the damage with which they are credited.

I am omitting the "C" licensees, but here again we have no decent statistics to go upon. Once again all we know is the total number of vehicles—350,000 or so on "C" licences, a figure which includes all retail delivery vans and others engaged on purely local work. The licensing authorities ought to be able to ascertain readily enough the broad division between those public and private carriers who run long distances and compete with the railways and those who do not. The Lord President of the Council during the debate made the astonishing statement that "all the facts and the arguments are known or can be easily ascertained." As you, Sir, pointed out over a year ago, we know practically nothing from official sources. There is no possible excuse why we should continue to be left in ignorance and thus deprived of the opportunity for informed discussion of this most important question.—Yours faithfully,

The University, Birmingham

GILBERT WALKER

From The Economist of 1847

December 11, 1847

It is a remarkable sign of the changes which have taken place in society that some of the upper classes now occupy themselves with sewers and cesspools. They become auxiliary to scavengers—in some countries the punishment of felons. The mode in which this is brought about establishes a close connection between the extreme classes of society. The very poorest become, from foul drains, the prey of fever; from them fever, with its ghastly aspect, threatens the very opulent. They cannot hope to escape a general epidemic; at any rate they are called on to support the sick poor, and they thus become personally interested in the preservation of their health. Then the classes which look up to the superior classes for a share of honour and of wealth, active men of philanthropy and of business, who in former times would have been gallant squires to armed knights, first huntsmen or first falconers to great nobles, become as it were chief scavengers, and undertake tasks which, by the same aspiring class a century ago, would have been despised and loathed. "Mr. Chadwick in his zeal in this employment," we are told, "has been riding on his brown pony through countless miles of the London sewers." Thus are the most opulent and the most energetic connected with the most humble and the most helpless, and all are bound together by the chain of one common humanity. . . . The supposition that it is barely possible some better method may yet be found to dispose of the refuse of cities, which is both a useful manure and the bases of some manufactures, than by washing it into the river, should at least inculcate caution in present and future legislation. . . . It is especially necessary, we think, to be cautious when the community is afflicted by one disease [influenza], and is apprehensive of another [cholera], not to allow alarm to banish reason, and promote to a vast extent that interference of Government, which is obviously burdening it day after day with a responsibility too great for human beings.

History of *The Times*

"The Twentieth Century Test, 1884-1912." The Third Volume of the History of *The Times*. Printing House Square. 21s.

As a dramatic narrative of the decline and rise of a great newspaper, challenged by novel techniques and wealthy competitors, this volume of 850 pages is not quite successful. The central theme, which is the transition from the ponderous presidency of Buckle to the patient pressure and moody whip-cracking of Northcliffe, runs through eleven of the twenty-four chapters. But its development is interrupted by long chapters in which the world political scene between 1884 and 1912 is repainted from the work of such masters as George Saunders, the Berlin correspondent, Wickham Steed of Vienna, Valentine Chirol and Mackenzie Wallace in the London office. Those slices of history should have been assembled in one volume, together with the analysis of the paper's attitude to domestic politics which is so conspicuously missing from this volume. We would then have had a continuous study of public affairs and personalities, separated from the story of Northcliffe's intervention and of Moberly Bell's management.

This said, thanks must be given for fascinating reading matter, first-rate writing, lavish scholarship and the majestic margins of well-printed pages. Also for the candour with which intrigues are unravelled, personalities recreated and financial difficulties explained. It was the wrong kind of editorial control and the loss of £200,000 or more in Parnell's suit over the Pigott letters that together drove *The Times* into the arms of Northcliffe. Given Buckle's limited experience and austere character, and the temperament and tastes of Chirol, it was inevitable that *The Times* should let the newspaper revolution that was going on a quarter of a mile from Printing House Square pass it by. To Buckle, editor throughout this period, the important part of the heritage he received from Chenery was the institutional character of the paper and the political independence won by Delane and Barnes. He seems to have been unaware of the enterprise and ingenuity that his predecessors had devoted to the collection and reporting of news, the improvement of printing and the development of circulation. Consciousness of national responsibility became, and long remained, an excuse for turgid and inconclusive writing. Business was left to Bell—although Bell was not content to leave either news or views to Buckle—and the printer was the master of the make-up; he arranged the columns "as he found most convenient." Northcliffe never tired of reminding the "old gang," the "black friars," the men who believed that "news improved with keeping," that the now "stagnant" office had once set the pace to Fleet Street.

To read how Moberly Bell fought off the chief proprietor's scheme to associate *The Times* with the *Standard* and the *Daily Express* under Arthur Pearson, and how Northcliffe was brought in to conduct "Operation Scotland"—as the purchase of control was called—is to marvel at the devotion and ingenuity put into maintaining the standards and prosperity of the Thunderer that had ceased to thunder. A great deal was at stake. There was a

genuine risk that "X" would play fast and loose with what he was pleased to call "my hobby"; and once he had made up his mind that he could no longer achieve his main aims with the help of Buckle, Bell and Chirol—"the giant tortoises"—he had them all out within a few months; Bell worked to death at his desk.

A whole chapter is devoted to a fair and brilliant word portrait of Northcliffe as he appeared in Printing House Square in 1908. Its main strokes were done by the late Harold Child, prince of "fourth leader" writers. The editorial staff quickly recognised the power of their new chief, and the struggle that followed between him and them brought the best out in both sides. But he became less patient and scrupulous as time passed. As the portrait has it: "By 1912 Northcliffe's health, no less than his taste, forbade close reading." He insisted on the first steps being taken towards that clear simplicity of make-up that now marks *The Times* and revived the passion for news gathering by the most up-to-date methods. Without him "the twentieth century test" would not have been survived.

Yet the paper was full of excellent things, long before "X" was insisting that the manager should use a telephone and answer letters promptly. There was a remarkable expert staff of foreign correspondents, so well informed at their various posts that a diplomatic correspondent in London was superfluous. The present pattern of power politics was taking shape as *The Times* staff linked together in long despatches the moves of Russia and France in Asia, the weakening of China and the rise of Japan. Nathaniel Curzon was proud to be "our special correspondent"; and the deaf Bourchier used to have "selected state secrets" shouted into his tympanum by Ferdinand of Bulgaria.

Throughout the book the honours all go to the foreign department. Exceptions are the two first-rate and exciting chapters on the Jameson Raid and on the Parnell case. Buckle took the paper's policy gently from left of centre to right of centre, but it is not revealed in this volume what he thought of the trade unions, of Gladstone's demagoguery, of the social revolution, in fact of the immense changes that were taking place in the minds and circumstances of readers of *The Times*.

Shorter Notice

"Il Sistema Tributario e le sue Prospettive." By Sergio Steve, Rizzoli. Milan and Rome. 158 pages. 400 lire.

This study of the Italian taxation system comes as number four in a collection of economic and financial studies published under the auspices of the Bank of Italy. Its author is a Professor of Financial Science and Financial Law, who has been a member of the Economic Commission set up at the request of the Constituent Assembly. The book has therefore an authoritative value as a text-book, which analyses the traditional structure of the Italian system and the various expedients introduced to meet extraordinary expenditure; it indicates also the criteria followed by the present Government under the influence of the Einaudi school, to which the author belongs, to produce greater simplification, efficiency and equitable distribution of burdens. There can be no doubt of the author's competence, and the book will be of interest to those concerned with comparative study of taxation systems or with the financial structure of the Italian State.

AMERICAN SURVEY

The Power to Investigate

(From Our US Editorial Staff)

THE power to investigate, the power to hold public hearings, is perhaps the greatest of the implied powers exercised by Congress. Nowhere in the American Constitution is mention made of this major function, yet it is the basic process by which Congress prepares Bills for legislative action, reviews the executive action that ensues under the law, and even occasionally airs aspects of the state of the nation on which no legislation is in process. Hearings are now under way on European aid; they will start very shortly on the long-term aspects of the recovery plan; and at an only slightly later date they will be the means of scrutinising the results obtained under it. But Congressional action in committee on such sober subjects has been pushed into the background over recent months by two flamboyant shows, staged by the House Committee on Un-American Activities and the Senate War Investigations Committee. Both have given more comfort to gossip writers than to citizens who take at its face value Alexander Hamilton's anticipation of the Congress as "confidential guardians of the people's rights and liberties." Popular reaction to the spectacle has been sufficient to cause Bills to be introduced looking toward regularisation of the committee procedure.

When control of Congress shifted to the Republicans, there was almost audible smacking of lips as the chairmanship of the Special Committee to Investigate the National Defence Programme, formerly headed by President Truman, passed to Senator Brewster of Maine. It had been an expensive war, and it was assumed that, in spite of earnest efforts to avert scandal by preventing profiteering, the spending of huge sums by government had trailed a dismal fringe of corruption that could be turned to political account.

The result to date has been hardly to the credit of the investigators. The Senators' first attempt—to prove that undue influence in high places favoured the expensive plans of a promoter named Howard Hughes to build a new reconnaissance aircraft—backfired and hit the Committee chairman. The second blast, also aimed at Mr Hughes, found target in an air force procurement officer who had been called as witness. The resultant scandal almost made the public forget that the Senators had shot at a duck on the wing and hit their own decoy.

Meanwhile, the House Committee on Un-American Activities, chasing a different kind of bird, was creating similar dismay. The process of bringing Hollywood to Washington to face charges that Communist influence was permeating the industry first brought welcome publicity to the Committee's ambitious chairman; later it turned sour. If ten men were found who chose to invoke their constitutional rights and refuse to say whether they were Communists or not, twice ten details came to light to render even more questionable the loose procedure followed by Congressional investigators more eager for headlines than for facts. The public attitude toward the ten is represented by the sharp debate between the editors of the *New York Herald-Tribune* and the distinguished essayist, Mr E. B. White; the latter says, "The essence of our political theory in this country is that a man's conscience shall be a private, not a public, affair, and that only his deeds and words shall be open to survey, to censure and to punishment. The idea is a decent one and it works"; the former fear the political consequence of "protecting the individual to the point of destroying Western democratic civilisation."

The public attitude toward the investigators has taken the form of two Bills, both aimed at regularising procedures. Mrs Helen Gahagan Douglas (Democrat, of California), whose constituency includes Hollywood, has introduced HR4564, providing that all witnesses shall have the right to counsel, and

the right to make a statement at the close of their testimony that shall be part of the record; that persons whose reputations are brought into question by committee reports or statements of witnesses shall have a right to cross-examination of those responsible for the allegation; and that the right of the press to comment on Congress, or individual Congressmen, shall be maintained and newsmen not be called upon to answer for what they have written except by majority vote of the committee.

This Bill is clearly aimed at the Un-American Activities Committee. Senate Resolution 646, introduced last session by Senator McClellan (Democrat, of Arkansas) is equally clearly of moment to the Brewster Committee. The Reorganisation Act of 1947, which reduced the number of standing committees to 19 in the House and 15 in the Senate, frowns on Special Committees like the Brewster Committee. Unless extended at the new session, this committee's work is due to end on January 30th; Senator McClellan's proposal makes it clear that any investigation of "the practices, procedures, administrative processes, and efficiency of any department or agency of the Government or any corporation owned by the Government or in which the Government has a financial interest," was the business, not of Special *ad hoc* Committees but of a Joint Committee to be composed of members of the standing Senate and House Committees on Expenditure in the Executive Departments. The Senator is now said to be considering an amendment to his Bill requiring this Committee to set up certain rules of procedure.

★

Concurrently with public interest in the reform of investigatory procedures in the legislative arm of the Government, there is considerable discussion of the adequacy of such procedure in the armed forces. The first Congressional Special Committee on record was set up in 1792 to inquire into the defeat of General LeClerc by the Indians; the present inquiry into the defeat of General Meyers by his own greed will probably not be the last. But the General's irregularities could have been detected at closer range, and General Arnold has found it necessary to apologise for the slackness with which complaints against officers were treated within the Air Force organisation. It is probable that the function of the Office of the Inspector-General in the services will be reviewed. The position of the Air Force in this respect does not differ from that of the Navy, whose investigation of the Green Bowl Society—a fraternity at the Naval Academy at Annapolis which is alleged to be devoted to the service advancement of its members—had to be done by the Deputy Inspector-General because the Inspector-General was a member, or of the Army, whose inspections of various allegations of misconduct—General Lee's in Italy, for example—have been regarded by the public as so much whitewash.

But the setting up of new procedures of investigation is a thorny business, either in the Armed Forces or in the Congressional Committees. How can an Inspector-General operate without whitewash if his office is part of the chain of command? How can a special investigation division, outside the chain of

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From a Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

command and therefore presumably attached to the civilian Secretary's Office, know enough about the situation to judge wisely, even if it did not act as a private Gestapo, as some of the higher officers have suggested it might?

On the Congressional side, is there not a distinction between an investigating body of legislative origin and a court? It is in Committee that Congress does its work, thrashes out its differences and problems, and educates its new members. The difficulty of Senator Pepper's proposal that hearings be divided into two categories, those designed to get information from citizens as background for legislation and those designed to put him on trial for alleged misconduct, is revealed by the announcement that Representative Nixon (Republican of California), a member of the Un-American Affairs Committee, intends to introduce anti-Communist legislation on the strength of the recent hearings.

Congressional hearings provide a sounding board comparable to question time in the House of Commons. Throughout democratic history it has not been a primary function of members of the legislature to tread gingerly and spare feelings. At its best, the process is healthy, informative, and an essential part of the democratic process of resolving rival claims. At its worst it may be perverted and deformed, but the perversions and deformities are subject to correction at the ballot box. The fact that judicial qualities are not the only ones needed in "confidential guardians of the people's liberties" raises questions not only about the desirability of fixing procedures that might become straitjackets, but also about concentrating investigations in a standing committee. Successful investigations depend on the zeal of the investigators—plus the skill of their supporting staffs. As long as seniority determines committee chairmanships, it is pure chance whether Senator McClellan's proposed Joint Committee would have such zeal. The job done by the Senate War Investigating Committee under Mr. Truman could hardly have been expected from Senators Reynolds and Walsh, heads of the Military Affairs and Navy Committees at the time when Senator Truman moved for the appointment of a special committee. They had the necessary power, but not the necessary will.

Perplexities about how to get the right amount of investigation and the right amount of the right kind of publicity for it, are very real. With power in the right hands, there is no problem. That is why there is much to be said for letting popular reaction discipline the investigators. Yet in the interval until the voters' impact is felt, there is the possibility that individual citizens—some of them more, and some less, innocent—may get hurt.

American Notes

Amendments to the Aid Bill

The Interim Aid Bill has made extremely slow progress in the House of Representatives this week, where debates have shown once more how surely the Congressional power to amend can become the power to destroy. In this case, however, most of the damaging provisions were beaten off. One amendment defeated by 136 votes to 109, would have allowed shipments of relief goods only when they were not in short supply. As virtually no goods needed abroad are surplus in the United States, and certainly no grain and fertiliser, this would have made the Interim Aid Bill a dead letter. Similar amendments to prohibit the shipment of fertiliser and farm machinery were also defeated. The House accepted, however, several provisions on purchasing policy which reflected the general alarm over the inflationary effect of foreign aid. One would prohibit purchases for foreign relief in the United States at prices above the prevailing level; another directed that commodities should be bought in a manner calculated to ease the strain on American resources, and may be bought abroad (up to 25 per cent of the whole programme) when the price is not more than 10 per cent above the American price. The Senate version permits this "off-shore" purchasing, but does not include the price provision, which is evidently aimed at Argentine wheat.

Amendments were also accepted tightening American control over the relief funds, by striking out the provision permitting the opening of Italian and French credits, and an attempt was made to turn over administration from the State Department to a highly

reluctant Red Cross. The inclusion of "incentive goods" in relief was accepted only after Mr. Herter spoke authoritatively on the important role that cigarettes and nylons could play in the reconstruction of Europe. After this rough passage, Administration leaders now hope to secure approval of the full \$590 million Aid Bill on Monday.

Congress, however, has now gone far past the deadline of December 1st set by Mr. Marshall, however rapid the pace in comparison with earlier foreign aid bills. It still must face the House-Senate conference, and the actual appropriation of money will still have to be made when the Bill has passed. Its slow progress has delayed the presentation of the full Marshall Plan to Congress, and it will now be sent by the President just as Congress is preparing to disband. From the debate in the House it is clear that no matter how loudly the anti-Communist note is struck what will chiefly concern Congress is the effect on prices and the standard of living at home. It is from this source that the greatest restrictions on the Marshall Plan will spring.

* * *

The Battle for Controls

The Administration has at last laid before Congress a draft of the first instalment of its anti-inflation programme. It authorises the extension of export controls to March 31, 1950; priorities and allocations for scarce commodities like iron and steel, soap and a long list of foods; controls over transport; and the rationing of scarce foods. It includes the power to buy up the whole crop of certain products. This Bill is in the nature of Mr. Harriman's homework, for Senate Republicans have refused, with growing indignation, to buy "a pig in a poke." They have wanted to know precisely what was to be controlled, when, and how; and they have been particularly anxious to see what limitations on its powers the Administration would accept to support its protests that it was not really seeking a return to the "iniquities" of full war controls on prices and consumption.

The specifications in the Bill are a tactical defeat for the Administration. In the first place, while Mr. Truman has asked for a full panoply of powers, his emissaries have protested loudly that they would be used only in an emergency and against the selfish and thoughtless minority who refused to join in the operation of voluntary controls. Congress is thinking, too, in terms of voluntary controls—but without the ultimate powers to be invoked "just in case." In the second place, Congress is certain to be somewhat cynical over these powers as anti-inflationary. Does the power to allocate steel for Europe help to keep prices down at home? The fact seems to be that the Administration is trying, because of domestic politics, to shelter under the anti-inflation umbrella, the equally laudable, but less popular, devices for sharing American production with Europe under the Marshall Plan. It is significant that its first Bill presented to the special session really carries the authority to impose broad rationing between American and European demands rather than purely anti-inflationary measures.

In this it differs radically from Senator Taft's eight points. His programme has three main sections: the fiscal, in which he advocates cuts in government spending (and taxes), restraint on bank credit and consumer credit, and on government guarantee of house mortgages; an appeal for voluntary abstinence and harder work; and the cutting and rigid direction of exports. It appeared after Senate Republicans, convinced that Senator Taft's broadcast denunciation of the President's programme was a monumental blunder, had administered a sharp lesson in tact and tactics. It has been followed by a series of highly publicised "secret" meetings between House and Senate Republican leaders to work out the price policy they know they must have for victory in 1948. For Senator Taft to admit that meat rationing may become necessary by April is a measure of the diet of crow before the Republican Party.

Events have at last forced the Republican Party to push forward its own four-point programme for control of inflationary trends. They are now seeking higher gold reserve requirements for the

The NEED for SPEED

in present-day accounting routine

The Underwood Sundstrand Class 'D' Accounting Machine illustrated is an all-purpose, fully automatic machine, equipped with two cross-computing Registers, eight accumulating Registers and Front Feed Carriage, designed for comprehensive Accounting requirements demanding the simultaneous posting of a number of related records with the cross-computation of any series of New Balances and the automatic accumulation of a large number of inter-related totals.

Ideally suited to Comprehensive Pay Roll, Costing, Sales, Purchase, and Stores Ledger Accounting, these machines are the effective answer to the vital need for speed and accuracy to-day. Demonstration arranged without obligation.

Business in 1948

The year 1947 is closing with a final rebuff to the bearish interpreters of the postwar business boom. While it is true to say that the physical volume of production (as measured by the Federal Reserve Board) will for this year show only a modest improvement on the 1946 average, it has regained most of the setback which took place this spring and summer, and it is again very near a postwar peak. Commodity prices, too, are almost as high as they have ever been, unemployment is nominal only, and industry is no longer hag-ridden, as it was a year ago, by the fear of crippling labour disputes. Wage settlements have been expensive, but industry is preparing, apparently, to meet a third wave of wage advances early in 1948 without too much haggling on terms.

The business community seems to discount, to a surprisingly large degree, the continuing mood of anxiety on Wall Street, though it is only fair to say, in passing, that the investor does not necessarily reap a full reward at every stage in the journey towards a business peak. For most producers, there seems to be an underlying conviction that "postwar backlogs" are still sufficiently substantial to offset all but the mildest reaction from present trends, and in this belief they are fortified by the optimism which radiates from some Federal agencies.

The Department of Labour, for example, declares that a "tremendous demand for the products of American industry will keep the economy operating at record levels through 1948." Forecasts from this Department assert that a probable decline in exports will not exert any major influence on business activity, and that while consumer soft goods may meet with "unfavourable developments," the general emphasis will be on high demand for durable goods, with bright prospects for the service industries. A further expansion of employment is predicted, along with a sharp gain in labour productivity.

These forecasts go hand in hand with the now familiar warning that industry should reduce prices, rather than increase wages, and that recent developments suggest the possibility of a "wage-price spiral leading to collapse." But, in general terms, this authoritative prediction is undeniably bullish, and since it follows an equally bullish forecast made (and subsequently justified) some time ago, it is scarcely surprising that many industrialists disregard the storm warnings given by Mr Truman and by Mr Marriner Eccles, of the Federal Reserve Board.

* * *

Pattern and Prospect

In the light of these forecasts, it is interesting to note the pattern of developments over the first nine months of 1947, as published by the Department of Commerce:—

GROSS NATIONAL PRODUCT* (Billion Dollars)				
	1946 4th Qtr.	Changes Over 1947:—		
		1st Qtr.	2nd Qtr.	3rd Qtr.
Personal consumption.....	154.9	+ 3.1	+ 4.0	+ 4.0
Private investment.....	30.4	— 1.0	— 0.3	+ 1.3
Exports (net).....	5.2	+ 3.1	+ 2.2	— 2.8
Govt. purchases of goods and services	28.2	— 0.8	+ 0.1	+ 0.7
Gross national product.....	218.7	223.1	229.1	232.3

* Quarterly figures adjusted to annual rates.

The downward trend of the export surplus (or net foreign investment) has continued through the fourth quarter. So far as can be judged, however, private investment remains at an exceedingly high level, the figures for the September quarter concealing a dual upsurge for new equipment and for inventories. If, as the Department of Labour now alleges, labour productivity is due for a sharp advance during the coming year, it may mean that this

stimulus to business activity is less solid than it now appears to be. It is true that unemployment in October reached an all-time low point (other than in war periods) at 1,700,000, but it is also true that the process of re-equipment must by this time have reached a stage where the flow of durable goods, temporarily at least, could expand with an actual decline in workers' payrolls.

Similar doubts may be expressed on inventory levels where, as the Department of Commerce notes, industry is no longer fortifying itself against possible breakdown through shortages, so much as anticipating the gains in consumer expenditures to be expected from higher wages, veterans' bonus payments, more liberal credit terms, etc., plus some sort of "foreign market guarantee" through Marshall Aid. No decisive changes may be expected in the flow of Government purchases, so far as can now be foreseen. Consumer expenditures continue to reflect higher price-levels, a readier flow of durable goods, and quite probably, the anticipation of new wage claims ahead.

For the time being, the inflationary factors seem still to tip the scales in favour of activity remaining at very high levels in early 1948. The Christmas buying spree, for example, may well prove to be a formidable rival to that of 1946. But it would seem to be very foolish to indulge in more than a short-term forecast at the close of 1947. The weight of adverse factors is steadily increasing, and while the Federal government may be loth to break the movement by a forceful monetary policy, there are still signs that the banking and credit structure is slowly assuming a shape which has become all too familiar in earlier cycles.

The Attorney General's Little List

Certain cinemas have long found that the inviting word "banned" brings the customers rolling in. Banned books sell out their editions over night. Will the official label "subversive" add the same excitement to membership in certain organisations? Mr Clark, the Attorney-General, has just completed the thankless task of listing the subversive groups to which federal employees belong only at the risk of polluting their loyalty and losing their jobs.

It is hard to please everyone. Mr Clark has pointed the red (or black) finger at 91 organisations, including labour schools, the Communist Party, the Columbians, the Ku Klux Klan, American Youth for Democracy, and the Civil Rights Congress. The organisations in question have been given no say in court, and many hotly deny their guilt. Many, too, have long since shut up shop; these include the German and Japanese societies and some of the Communist-front organisations, which are as agile as chameleons in changing their protective colouring.

From the Right comes the cry that this is a "phony" list; the Committee on Un-American Activities has a little list of groups that never would be missed which is four times the length of Mr Clark's. It is evident that the black list is going to be fought over as fiercely as ever was Paris's apple, and that Mr Clark is going to be heartily sick of the whole business before he is through. Keeping the list up to date is a full-time task in itself; woe be it to the federal employee who "joins"—and the Americans are great joiners—on the strength of last month's list.

The idea of proving guilt by association is as dubious in theory as it is likely to prove complicated in execution. Mr Clark and Mr Richardson, head of the Loyalty Board, are to be congratulated for their insistence that discharges for disloyalty will be based as far as possible on individual merit, rather than on the black list.

* * *

Air Transport

The complete lack of any settled Federal policy for domestic air transport has brought a new round of controversy in Washington following the suggestion by Mr Averell Harriman, Secretary of Commerce, that his own Department shall in future take over "the development of a sound economic pattern for the national airlines." Mr Harriman declares that the CAB should in future confine its affairs mainly to "quasi-legislative and quasi-judicial" activities, leaving his own Department to "promote and foster business in general, and aviation in particular."

Among the criticisms of CAB listed by Mr Harriman is the alleged failure of that agency to keep pace with the numerous pleas by the industry for revisions of rates and routes. A special

commission which examined the position for President Truman some time ago, reported that at the close of summer, CAB had on hand more than 1,200 pleas by individual lines covering rates, routes, and mail subsidy payments, and that the only solution was a temporary embargo on development, pending the grant of funds by Congress for a generous expansion in staff and other control facilities.

Rather paradoxically, the current excitement in Washington comes at a time when Wall Street experts on the domestic lines seem to be taking a cautiously optimistic view of probable trends within the industry. Over 1946, when the initial postwar boom in passenger services was at its height, most aviation stocks were boosted to extravagant levels. The boom, however, proved to be short-lived, and was already fast waning when a series of disastrous accidents on domestic routes sharply underlined the issue of safety. The vigour of Federal investigation, however, seems to have brought about a revival of public confidence, and the industry itself has not been slow to emphasise that it holds a generally satisfactory record in terms of passenger mileage. Apart from passenger traffic, there has been a steady advance in cargo tonnage, more particularly for specialist machinery, apparel, drugs, furs, perishable fruit, and many types of luxury goods.

The domestic lines are expected to suffer a net loss in 1947, while the 1948 prospect is clouded by fears of a general business setback. But plans for fresh advances in mail and passenger rates, and the prospect of a steady advance in the volume of freight suggests that the industry may have seen the worst. There is evidence, at least, that operating costs have been cut sharply during recent months of relative depression.

So far Congress has made no thorough examination of recent reports on airline policy. But recent stress by the services has been on the vulnerability of the manufacturers in the face of sharp fluctuations in orders both on civil and military account. Congress may agree with Mr Harriman that the Federal government should take a much more direct interest in the financing and development of new types of aircraft for all users. Despite widespread criticism of CAB's civil policy, the service advisers seem likely to provide the most effective mainspring for the release of new funds in the necessary volume.

Embargo Against Russia

The anti-Russian feeling which has been counted upon to smooth the path of the Marshall plan through Congress is proving an awkward ally, hard to keep in its place. Members of both parties are demanding that in the name of consistency, if nothing more, the United States should cease selling heavy machinery to the Russians with one hand while providing Western Europe with the means of resisting Russian aggression with the other. The cry has been taken up with particular vigour by Mr Harold Stassen, who, after Mr Truman announced that he could see no reason for halting shipments to Russia, telegraphed a list of six reasons why the United States should give up "economic appeasement" of the nation that is everywhere openly opposing and sabotaging American efforts for peace and recovery.

Mr John Taber, head of the House Appropriations Committee, has expressed the view that if the United States would stop all shipments to Russia, Russia would long ago have agreed to a world peace. In fact, American exports to Russia are hardly so weighty a weapon. In the first nine months of this year they amounted to \$113 million, or about 1 per cent of American exports; and since July they have been more than offset by imports from Russia of such vital materials as chrome and manganese. American exports consisted of electrical machinery, mining and pumping material, machine tools, and locomotives.

Unquestionably these could be transferred to Western Europe; but the State Department is sorrowfully aware that the Soviet Union, through its control of Eastern Europe, has a much more damaging response in hand. Any version of the Marshall plan so far published assumes that Eastern Europe will continue, and greatly increase, its contributions of food and fuel to Marshall Europe. To declare a Russian embargo, and put the Soviet Union in the position of Japan before Pearl Harbour, instead of bringing the Russians to heel, would widen the breach and increase the cost of the Marshall Plan beyond anything now estimated.

In his foreign policy Mr Taber is showing the same penchant for cutting off his nose to spite his face that has been evident in his domestic economies.

THE WORLD OVERSEAS

Partition on the Spot

(From a Special Correspondent in Jerusalem)

THE reaction of the three interested communities in Palestine to the United Nations' approval of partition has been almost exactly what one would have expected. The Jews are pleased, the Arabs angry, and the British sceptical. But sentiments stop short of excess. There were frenzied Jewish rejoicings; now many Jews are finding imperfections in the plan. There were widespread Arab riots; they were neither as violent nor as lengthy as many officials expected. The average British official (the adjective is carefully chosen) first said, "The whole thing's damn silly"; on reflection his attitude is more, "Well, it's an admirable scheme on paper, but . . ."

Partition is a victory for the Jewish people, and was celebrated as such. But some of their leaders realise already that, unless they walk extremely warily, victory may be costly and its fruits bitter. It has already created new and difficult problems. The Zionist movement has in the past maintained surprisingly strict discipline amongst its adherents, most of whom are not by nature disciplined people. Now there is a slight cracking of that discipline. There is an immediate demand both from would-be immigrants waiting in Europe and also from lands where, in the past, Jews seemed reasonably secure, that the gates of Palestine be at once opened to them. But no appreciable increase in immigration is likely until the British administration is withdrawn; even when the Jews take over their part of Palestine it will still not—they say—be possible to bring in more than a

maximum of 5,000 a month. So the Jewish Agency, or the Jewish Government, will soon be appreciating some of the difficulties which for so long bedevilled the British.

Fears of persecution have led Jewish communities settled for generations in the Moslem countries of the Middle East and North Africa to send urgent appeals to the Agency that they should be immediately brought to Palestine. "We are hostages: our lives are in danger," is the tenor of the messages. This problem the Agency had not foreseen. They fully intend that at some future date these Middle East Jews should emigrate to Palestine (whether they want to or not), but there is no room for them yet; priority must be given to European Jews. What will happen if there are indeed pogroms in Aleppo, or Damascus, or Baghdad, or Tripoli, no one here is able to decide.

The new Jewish State faces even more complex internal situations, of which the most important are political. The executive of the Jewish Agency which, until a constitution is promulgated and elections held, will probably turn itself into a temporary government, is composed of nineteen members. Eight of them belong to the General Zionists, seven to Mapai (Palestine Workers' Party) and four to the strict orthodox Mizrahi Party. Seats are held in the Asefath Hannivharim (the elected assembly) and indeed on other representative bodies such as the Va'ad Leumi (national council) much in the same proportion, but with the addition of representatives of half a dozen smaller parties.

Since the Uno decision, two of these parties, the left-wing Socialists and left-wing Labour, both previously against partition and anti-Mapai, have announced their readiness to accept partition and to work with Mapai. This makes Mapai now far stronger than the General Zionists and can give official Jewish policy a strong leftish tendency.

The Mapai leaders, David Ben Gurion, chairman of the Agency Executive, Mosche Shertok and Mrs Golda Meyerson, are probably delighted with this development on a long-term basis. For immediate purposes, however, they are playing it down. They are at pains to point out that "Jewish Socialism" will be "for internal consumption only," and that they have no thought of any general "socialisation" of Jewish economy. This disclaimer is clearly aimed at pacifying their wealthy American supporters, who might be alarmed—and stop the flow of dollars—if they thought action would be taken in Jewish Palestine against private capital.

Incidentally, it has not yet been decided what name the new Jewish State will adopt. Zion is a popular suggestion; but, some Jews point out sadly, "you can't have a Zionist State, call it what you will, that doesn't include the city of Zion—Jerusalem." Eretz Israel, Israel, Palestine are other possibilities.

Faced though they are by these and a multitude of other problems, the Jews are exerting all their boundless energy and initiative—and, in financial matters, their guile—in hastening the construction of their state. It will be an authoritarian and ruthless state; but it will work.

Arabs Without a Plan

What can one say about the Arab State? The Palestine Arab leaders—the Mufti and the members of the Arab Higher Executive—know that unless they can reverse the United Nations decision by force of arms, partition will be inevitable. Yet they still refuse even to consider making plans to take over and administer their part of the country. Further, they refuse to allow any of the more reasonable, progressive young Arabs, who realise that something has got to be done, to make any plans of their own. The surprisingly complete observance of the three-day protest strike called by the Mufti shows that the Arabs follow the Mufti's orders. They dislike having the Jews in their "own land" and would be delighted to turn them out by force. But no Arab with his senses about him can believe that to be physically possible until, at any rate, very considerable assistance is furnished by the Arab States. It would, therefore, have seemed reasonable to make some attempt to keep what they have and to maintain their part of Palestine as a going concern, which it is, thanks to a maligned British Administration and also to Jewish initiative and Jewish money.

Nothing of the kind has happened. So far as can be seen, there will be no authority, no administration, not even leaders, to whom the departing British or the United Nations Commission can formally deliver the deeds of Arab Palestine. As transfer of authority must be made, opinion in British circles here is tending more and more to the idea of giving King Abdullah of Transjordan the baby to hold.

Can partition succeed? With good will on both sides the answer is obviously "yes." It is not an ideal solution: but it could be a solution and no one has produced a better or even a workable alternative. Unfortunately, there will be the very reverse of good will from the Arab side, and so it is possible that the 27 year-old conflict will continue—without a British administration to hold the ring and take the blame. The Jews will make a most determined effort to make a success of their state; Jewish leaders who had for years set their faces against partition have now accepted it *faute de mieux*. The danger is—if the Arabs finally accept the solution—that the Jews might use their state as a stepping off ground for peaceful penetration of the rest of Palestine. Jewish voices have already complained that partition violates their historical conception of a Palestine "on both sides of the Jordan." The extremists of the Revisionist Party and the terrorist organisations are for that reason flatly against it. Among even moderate Zionists there is equal determination that, come what may, Jerusalem must be returned to the Jews.

How implacable the Palestine Arabs' opposition to the division of "our own country" will remain depends mainly on the attitude of the neighbouring Arab States. Nationalism has a firm hold on the Moslem countries, but their dependence upon the Western Powers is still a factor capable of bringing about surprising changes in policy, which in their turn may alter the ideas of the Palestine Arabs.

Deflation in Italy

[BY OUR ROME CORRESPONDENT]

ON the stormy stage of current Italian affairs a new personage has come into existence to take his place beside the land-hungry peasants, the middle-class victims of monetary depreciation, and the bloated black marketeers—to mention some of the most frequently met types in the pantomime of the class war. The new personage symbolises the quandaries of a country living under capitalist forms but pervaded by collectivist sentiment, which constrains the Government to recede frequently into the background leaving the rights of property and the forces of sentiment to settle matters by a trial of strength (or often enough to leave them unsettled for fear on both sides of the consequences of the contest).

The symbolic figure is the workman whom his employer fears to lay off, but refuses to pay. There appear to be no statistics of the persons in this predicament, but to quote examples from sources at the opposite ends of the political gamut, the *Risorgimento Liberale* in October reported some thousands of employees of the Ansaldo works, Genoa, missing their pay because "the money had not come from Rome" (that is, from the Treasury), while the Communist *Unita* reports 13,000 workers of the Caproni engineering groups unpaid, except for an emergency gratuity of 5,000 lire per head, since the end of October. Officially the 1945 ban on dismissals, of which there was a counterpart in State subsidies to the wage-fund, has come to an end. In practice it remains in force by trade union imposition, but the subsidies are withheld.

The Government is committed to a policy of deflation. The economist, Luigi Einaudi, who is Vice Premier and Finance Minister and also Governor of the Bank of Italy (though he has delegated this last function for the moment) last week held the national congress of the Liberal Party spellbound with an hour's talk on the theory of inflation and of its cure by credit restriction. While, however, the economist Einaudi described with lucidity the financial consequences of putting the brake upon an inflation of bank advances, the statesman Einaudi passed over in prudent silence the question of how the credit-starved industries can lower their costs without provoking social explosions. A solitary Liberal in a Christian Democratic Government, he can with a good conscience leave this problem to the Ministers of Labour and of the Interior. These, in turn, though endeavouring to grapple with the multitude of problems which beset them, perhaps place their main trust in an automatic return to economic equilibrium through the operation of falling prices.

Communist Support for Shareholders

Among the paradoxes of the moment, political tactics have placed the organ of the Communist party in the unaccustomed position of upholding the cause of the shareholder while the Liberal Minister of Finance makes merry over the discomfiture of the bull market. "Falling prices on the Bourse, sudden losses etcetera, etcetera—these are attributed not only to the chaotic industrial situation but also to bear operations conducted by foreign groups wishing to buy up Italian industry cheap, with the connivance of the American (sic) Government of de Gasperi." Thus the *Unita*, in a report of noisy proceedings in the Milan Bourse on December 5th when a sudden drop in the price of a popular share occasioned physical attacks by irate investors upon supposed bear speculators. In his party speech two days earlier Senator Einaudi, recalling the various collapses of bull markets witnessed by himself since 1914, described these as "amusing for the onlooker but less amusing for those involved." In the Milan Bourse the misfortunes of the shareholder have been continuous since the summer, and the Government is accused of dull indifference to an organ essential for economic recovery. But it would be mistaken to regard the present events in Italy as the simple test of a deflationary policy: it is the test of such a policy in conditions which allow of its implementation at the banking end, but which is exceedingly difficult to work out in the labour market.

The deflationary measures of Senator Einaudi have included a raising of the official bank rate from 4 to 5 per cent. In his address to the Liberal Party the Minister expounded why, in a condition of high instability of money values, bank rate should be an instrument of only subordinate importance: why, therefore, he had taken recourse to regulations modelled upon the US Federal Reserve rules. The new discipline imposed upon the Italian Banks requires them to utilise 40 per cent of all deposits in excess of the total of last October 1st for purchase of State securities, or alternatively to place the sum on deposit with the Bank of Italy. The choice of a proportion was experimental, and there

was an undertaking to change it in either direction if the restriction upon new advances to industry proved to be too stringent, or not stringent enough.

In the absence of up-to-date statistics it can be inferred from market reports that the deflationary process has dried up demand for a vast range of products. There is little to choose between the atmosphere of the Stock Exchanges, that of the market in Biella woollen goods, and the wholesale markets for agricultural produce. After some months in which the recession of wholesale prices were unmatched by any movement in retail markets, in recent weeks there have been sharp drops in shop prices, sufficient to affect the outlook of the poorest housewife. In olive oil, the staple cooking medium, prices have been almost halved, helped by a bumper crop. Almost equally abrupt has been the cheapening of wine, and notably that of sugar. But economists are wary of building these phenomena into a logical pattern. The latest period has seen exceptionally heavy receipts of American aid, and it is well within the authorities' power to provoke price-slides in particular markets to induce a falling price mentality.

Two Million Unemployed?

The current criticisms of the Einaudi programme can be classified as purely political criticisms, economic criticisms of the end pursued, and economic criticisms of the means employed. The most vociferous political critics are the Communists, whose high policy is to frighten away foreign investors by such proceedings as the seditious outbreaks in Milan last November. Moreover the chief Communist prescription for the ills of industry lies in the institution of Factory Councils (*Consigli di gestione*) with a share in management of all concerns. To obtain legal recognition for these councils is one of the main professed purposes of their current campaign. Whatever advantages such a reform might have to the eye of the future social historian, no indication is given of how the Councils could solve the managerial problems of today. Abdication of the capitalist would, it is said, bring social peace, and the Fiat-Mirafiori Works, where such a Council is said to work on excellent terms with the traditional management, is held up as an example. But criticisms from this quarter clearly have no practical application to a policy which like that of the de Gasperi-Einaudi Government places its reliance upon supplies to be received under the Marshall Plan.

Criticisms of the end pursued by Senator Einaudi start off from a computation that 2,000,000 Italians are effectively unemployed, and that the resources for employing them—fuel and raw materials—are at least more abundant than in 1946. Therefore, it is argued, credit should be enlarged to take up the slack of unemployed men and resources. This criticism overlooks the widening gap between Italian prices and those of the foreign markets for which much of the production of 1946 was destined. (The present manufacturing cost of the Fiat 1100 car, it has been pointed out, is double the price at which this car is on sale in France.) "Expansionist" criticism of the Einaudi policy is apt simply to ignore the perils of inflation.

The most serious criticism of the Government's financial and economic policy would appear to be that which finds its methods to be incomplete. In the words of the organ of the Republican Party, which hopes shortly to enter the Government with a due share in the shaping of its policies: "If what was intended was a check to inflation and a subsequent recovery . . . then the purpose of the measures already taken should have been to prepare the way for more substantial measures, such as drastic restriction of public expenditure, elimination or reduction of market subsidies, sharp curtailment of luxury expenditure, etc." The Republican writer finds that these tasks have not been tackled, and therefore fears that the shock of the deflationary measures, administered to an organism whose deeper rooted defects are uncured, may provoke disturbance without producing a lasting effect.

Cost of Appeasement

By a self-denying ordinance the Government has, as a matter of fact, laid upon itself the obligation to gain parliamentary sanction for each recourse to Bank of Italy funds. None will believe that Senator Einaudi is neglecting the aim of balancing the Budget. Heavy and unpopular imposts are coming into force this year, in particular an extraordinary levy on capital, the incidence of which upon security-holders has been aggravated by the great fall in values since the assessment period (first quarter of 1947). But heavy credits for public works are the price which the Government is having to pay for settling a chain of disturbances in the impoverished South. The latest currency returns show the note circulation mounting sharply enough in October under the influence of a public expenditure which cannot be radically compressed.

The public life of Italy this winter is moving upon political and economic planes which elude one another. It would appear that either by a gradual process of economic improvement the present political moods must be rendered obsolete, or, alternatively, political tensions will disrupt the society for which the present economic remedies are designed.

Uno's Second Year

[FROM A CORRESPONDENT]

THE second annual Assembly of the United Nations opened with acrimony, and vituperation became its habit. In this, at least, the Soviet and their satellites dominated the session. The American press and public were, as might have been expected, goaded into varying degrees of resentment, and showed little understanding of the apparent fact that in Soviet eyes it was Britain and the United States which were showing themselves hard to handle. Smaller countries, watching the giants collide, had to exercise considerable ingenuity if they were to escape damage. It was a Scandinavian who reported feeling at times like the victim in the old tale of the kindly King who, before he went hunting, always took care to send a royal messenger to ask the rabbits which sauce they would prefer to be cooked in.

On the other hand, the small nations have been developing a degree of initiative and independence which they might not have exhibited had the great Powers been less intent on their slugging match. From the beginning they showed a firm intent to work a way out of the straitjacket with which continued use of the veto had surrounded the Security Council. Not only did they vote with the United States on the device of setting up a "little Assembly" in continuous session, with power to discuss and investigate, but they also passed three resolutions urging nations to make more use of the World Court which they also empowered to interpret the Charter. This latter brought from Russia an indignant charge that it was a device to by-pass the Charter, but the measure was passed.

The Arabs have shown themselves shrewd and tenacious, and their resentment has, in comparison with the Russian love of pounding lecterns and screaming into microphones, been muffled and polite. In committee hearings their questions have probed farther into politics than was sometimes comfortable. The Indians have seemed sobered by their new responsibilities, and the Latin Americans have not sought strength in bloc voting as they did last year, but—stirred to self-assertion by the Argentine's lively bid for a share of the power and prestige enjoyed by Brazil—have offered objections and sought solutions on their individual accounts. Unit voting has its ironic aspects, and those who see only one man saying "yes" and another saying "no" miss the visions of those who see the men silhouetted against the relevant maps.

The Ghost of Europe

The yawning gap no tongue could fill is, of course, the absence of half Europe from these councils. The founders and masters in earlier centuries of Western diplomacy are mostly absent, and the majority of those who run about the concrete *salles des pas perdus* are tyros at the game. The French, to be sure, are here, but tentative and shadowy. The Belgians are ably represented by a surviving diplomat of the old school, the Dutch and the Scandinavian countries do their best, but when did any one of them claim to speak for Europe? Nations which have throughout history played star roles at international meetings are absent—no Austrians, no Italians, no Germans, no Swiss, no Spaniards.

Only the ghost of Europe is here, and the peace, within which this organisation was framed to function, has not been constructed. Those two factors, with their implications, lie at the root of many of the phenomena which have alarmed the public during this session. Until they are corrected the United Nations will continue to lurch about, twisted out of proportion and continually in danger of being thrown off balance.

It was partly in an effort to correct this that the French-Swedish resolution was offered which will take the next Assembly to Europe. Many reasons for the move have been put forward, some in argument and some by way of rumour. It is said that European nations, sure now of American support for UNO, want to transfer the educative effect of its discussions to their own lands; that nations who find themselves short of trained diplomats can only send their best men to represent them if distances between the home capital and the Assembly are short; that the Russians feel their propaganda may have more success on the European stage, than in the fogs of Flushing Meadow; that the Arabs want to get away from what they believe to be the effect of New York's;

large Jewish population on the American press; that the non-dollar countries would like to save by holding the next Assembly in a country where hotel bills and travelling expenses would cost less, and would not have to be paid in dollars (that this argument did not seem valid to Britain is perhaps a measure of their proportional contribution to Uno's budget which would be charged with additional expense for the transport of documents and personnel away from headquarters); and, lastly, that the next Assembly will coincide in point of time with the American Presidential elections. None who hope to see the United Nations flourish think it wise to fling its still tender form into the pit of American party politics. Whatever the motives that moved the various nations, the vote to travel, which became three separate votes before it finished, overwhelmed the objections of Great Britain and the protestations of Russia that the change would cost too much.

In the American press, at least, the achievements of this Assembly have been subordinate to the battles. The record deserves better of its observers. The Secretary-General listed five problem areas as awaiting action when the Assembly opened. Attempts of varying intensity, and with varying success, were made to handle all of them. Palestine is still a problem, but it has been aired and worked over until all sore spots have been revealed. Spain goes on being Franco Spain, and as very little happened after the Assembly's censure last year, less should be expected as a result of the tepid resolution produced out of the compromise this autumn. The Greek situation, on the other hand, is to be treated by means of a Balkan Committee, which the Soviet will boycott. India's efforts to impel better treatment for her nationals in South Africa came to a vote, but foundered on the rock of traditional regard for Field Marshal Smuts. Of the new problem areas, Egypt stays on the agenda of the Security Council; Korea has been assured a United Nations committee to oversee her elections—though without benefit of Soviet collaboration—and Indonesia, scene of the only "shooting war" with which Uno has so far had to deal, is still enjoying "good offices."

Strains of Daily Discussion

With the creation of Balkan and Korean Commissions, and the "little Assembly," the chief points in the American programme have been achieved, but against the Soviet will and at the cost of its abstentions. On the always delusive surface, Russia's own programme seemed to rest heavily on resolutions of censure. The one against "war-mongers" was urged in and out of session until the war psychology which Russia deplored was almost fanned into flames by the vehemence of the deploring. In the face of what Secretary Marshall was moved to call Russia's "brazen and contemptuous propaganda," it was no small achievement on the part of other nations to comb the burrs out of the resolution and put it into such order that they could pass it without offending each other or alienating the Soviets.

Strains of other kinds developed in the course of the Assembly. Discussion time was saved by the use of simultaneous translation into five languages—a beguiling device which had been proved valuable in the meetings of committees, but which only made its way into full Assembly this year. The Assembly has called for a higher degree of efficiency on the part of the secretariat; no less pressing is the analogous problem of finding representative personnel that has the time, the strength, the mental agility and the devotion which international discussion at this stage seems to demand. In its last and delicate stages the Palestine negotiations were imperilled by the very human difficulty of securing the requisite patience and intelligence from weary delegates eager to leave, but asked to sit through day and night long sessions. The success of the "little Assembly" hangs on finding first-rate men who can spend a year in its service.

To those who have watched Uno bodies continuously at work the wonder is not that they accomplish what seems in moments of pessimism so little, but that they accomplish anything at all. Procedures, which to Anglo-Saxons are as simple and easy as their mother tongue, are by that very token alien and difficult for other peoples who cannot fairly be expected to grasp at once the mass of written rules and unspoken codes which the West has been developing through centuries of practice. The old days when men were conveniently classified as savages, barbarians or civilised, and behaviour according to their assigned status was expected of them, are gone. The new democracy proceeds on the assumption that they are all of one piece, and all like the assumer. If this be illusion, on it hangs the success of the whole undertaking. The resulting stresses and strains are what make earnest people say almost prayerfully that the greatest achievement of this Assembly is that it continued to exist.

Finland Works its Passage

[BY A CORRESPONDENT]

If ever a country worked its passage, it is Finland, and the growing self-confidence that comes from hard tasks successfully performed is reflected in the results of last week's municipal elections. As usual now, at least in Western Europe, they were fought largely on national, not local, issues. The main issue was whether Finland's collaboration with Russia should be on Communist or non-Communist terms and to what extent Communist principles should govern the country's internal affairs. The verdict went against the Communists. The Conservatives and Agrarians increased their seats by 28 to 536, and the Social Democrats by 27 to 269. The Communist representation fell from 234 to 203. This swing to the right can largely be explained by a return to the usual centre of political gravity in Finland—right centre. But considering the support that Communists get from the proximity of Russia, the elections reflect a conscious reassertion of Finland's independence.

The chief material factor in this attitude is the remarkable revival of production. Exports increase steadily. From January to September this year they amounted to 31,532 million marks,* while imports for the corresponding period amounted to 29,630.9 million marks. Finland thus has a favourable balance of payments to the extent of 1,901.1 million marks. On the other hand, the continued rise in prices makes the real increase in exports less than the apparent. The volume is now about 90 per cent of 1935; it has risen from some 60 per cent at the beginning of this year. Similarly, the need to pay in dollars for over a fifth of the imports introduces familiar complications. A series of American loans has so far supplemented export earnings: another \$5,000,000 was obtained last month. But, since Finland is not participating in the Marshall Plan, its chances of continued aid grow less. Yet the prompt delivery of reparations to Russia depends largely on obtaining from America equipment and material to produce them.

Reparation deliveries have so far been made in full. Indeed, figures for the last reparations year, which ended on September 19th, show that in that period they exceeded the stipulated amount, and reparations worth 127 million dollars—42.4 per cent of the total—have been delivered. The Russians have extended the period of payment from 6 to 8 years, and some of the fines incurred for slow delivery have also been remitted. But such gestures should not be allowed to obscure either the great burden reparations impose—they amounted to 15 per cent of total exports in the second quarter of this year—nor the manner in which they distort Finland's economy. The false valuation of goods at 1938 prices works strongly against Finland. So does the actual low value placed on many products: wooden schooners, for example, are said to be entered at only half their real value.

Appeasement of Russia

Prewar prices were also used in valuing German assets to which the Russians lay claim in Finland. Under an agreement concluded last February their total value is put at 6,000 million marks, of which deliveries of goods to Russia will account for half, and foreign currency holdings now surrendered for 460 million marks. The cession of the power station which serves the Petsamo nickel mines, the rebuilding of the Soviet Legation in Helsinki, the surrender of an old warship and similar services have also been taken into account. The acquisition by Russia of a controlling interest in several important firms completes the total.

So the curious process of unexpected concession and flinty bargaining continues. After long negotiations the Finns have been given the valuable right to use the main railway line through the Russian defended zone at Porkkala: the first train, two-thirds empty and with windows covered, made the journey a month ago. But important trade negotiations with Moscow last month proved inconclusive. It was widely rumoured—and officially denied—that the Russians would discuss trade only if wider political issues, such as a military alliance, were also on the agenda. The overt domination of Finland would end the American supplies that are essential to the reparations programme. And the loss of Finnish reparations, which are the most promptly delivered of all goods imported by Russia, would hamper Russia's reconstruction. This is one of the reasons why the Finns work with such admirable industry. So long as they fulfil their obligations Russia will delay any drastic action to the last possible moment.

A YEAR'S SUPPLY OF THE FINEST RAZOR BLADES IN THE WORLD

Here is a brilliant gift suggestion—a year's supply of Personna Blades, the most superb shaving instruments ever devised. Made by master cutlers from selected steel. Rendered rust-resistant by the Krauman process. Their extra keen edge is hollow ground. Each blade is leather-stropped and passes 17 rigid inspections before

it leaves the factory. Each blade is specially wrapped to keep it in perfect condition. The Personna Gift Box contains 50 double-edged blades, sufficient for at least 366 magnificent shaves. The special outer carton carries address space—no paper or packing necessary. Available at the best barbers, chemists, and stores, for 25/- a box.

PERSONNA Precision Blades Fine as a rare jewel

THE BUSINESS WORLD

Britain's Exchange Reserves

AN exchange of letters between the Chancellor of the Exchequer and the Secretary to the US Treasury, dated the 4th and 5th of December respectively, declared the \$400 million left in the US line of credit to be at the free disposal of the British Government. Technically, it would be wrong to say that this amount has been "unfrozen," for it had never in fact been frozen. The outward form of this immobilisation of the balance of the loan that remained unspent on August 20th was a voluntary undertaking by the British Government to desist from further drawings until consultations on the subject had been completed with the US Government.

As the suspension of convertibility of sterling was a breach of one of the basic conditions of the loan agreement, there could be no alternative but to stop drawing. Any other course would have laid the US Administration open to charges from Congress of serious dereliction of duty. For obvious reasons of prestige the initiative in stopping drawings had to come from the borrower and not from the lender.

The subsequent consultations between the two governments have been almost continuous. The US Treasury was at first inclined to require proof of the British Government's contention that the events of August 20th were of the "emergency and temporary nature" which had been attributed to them in Mr Dalton's letter of that day to Mr Snyder; the American authorities were then disposed to look for such proof in the convertibility provisions of the payments and monetary agreements subsequently negotiated by Britain. But the facts of the British situation and of the world shortage of dollars, which may have been perceived only dimly in Washington before August 20th, have since percolated into many recesses of the US administration and even of Congress. The search for a hard and fast interpretation of the "non-discriminatory" clause nine of the loan agreement was abandoned in favour of Mr Snyder's eminently satisfactory statement of September 19th that "when any two governments work out an agreement it must be kept flexible. This was the spirit of the original loan negotiations. . . . It is basic to an understanding of Section 9 of the agreement to appreciate that it was never intended to constitute a strait jacket on British trade."

The same satisfactory treatment has now been given to the convertibility clauses of the loan agreement. Sir Stafford Cripps, in his letter of December 4th to Mr Snyder, has reaffirmed "the intention of His Majesty's Government to adhere as closely as possible to the objectives of the (loan) agreement at all times and to implement these objectives fully at the earliest possible time." In his reply, Mr Snyder has made no attempt at clearer definition. The whole question of the return to convertibility is thus left to the good sense and judgment of the British Government. The \$400 million has been made available without any of the constrictions upon British policy which might have resulted from an effort to give greater precision to the two basic conditions of the loan agreement, namely, convertibility and non-discrimination.

The contrast is unmistakable between the trust, understanding and elasticity now shown by the US administration, and the rigid dogmatism and legalism which found expression in the loan agreement. The change is welcome evidence of a

new atmosphere, particularly at the US Treasury, where the facts of economic life in Europe are at last being understood.

*

Unfortunately, the release of the \$400 million does not materially alter the shape of the problem of Britain's balance of payments. In particular, it should be emphasised that the additional resources, although made available without conditions which might have hampered Britain in the commercial and financial negotiations now in progress, afford no grounds for any relief from current and prospective austerity. In the popular press this week it has been suggested that at least it may now be no longer necessary to make the further cuts in imports of food which are threatened in the New Year. But even such a relaxation as this would be more than could be warranted by the state of Britain's external reserves and the prospect of achieving the export targets.

It is true that the Government's calculations of the extent of necessary economy in overseas outlay did not assume the availability of this residual £100 million from the dollar loan. But, even on the official assumptions—that the 1948 export targets would be achieved and the savings in overseas expenditure duly effected—the prospective position twelve months hence was extremely grave. On these assumptions, it was expected that the ultimate reserve of gold and dollars would have fallen by end-1948 to only £270 million, which Sir Stafford Cripps describes as the "minimum operable level." Yet, even though the import cuts and export progress had by that time restored equilibrium to the balance of payments as a whole, there would still be a prospective gap of no less than £250 million per annum in the balance of payments in hard currencies. On such a prospect, it would be a matter of common prudence to treat the uncovenanted £100 million as a means of augmenting the exiguous reserves.

The prospect, on these official assumptions and calculations, is bleak. But experience to date scarcely justifies confidence that the official programme will in fact be realised. On the contrary, all the evidence pointed to the probability that the "minimum operable reserve" would be reached before next autumn. And the additional £100 million—of which £25 million has at once been drawn—represents less than two months' supply of dollars at the current rate of outgo. It will scarcely suffice to provide for the effects of the prospective error in the official estimates.

The latest official figure for the gold reserve—from the current issue of *Monthly Digest of Statistics*—is £591 million as at June 30th last, compared with £582 million three months earlier. By end-November this holding had been reduced by £103 million by reported sales of gold, but there will have been additional purchases of newly-mined gold, principally from South Africa under the gold purchase agreement which expires at the end of this year. It is generally understood that the amount secured from this source in the first six months of this year was rather less than half the minimum amount contracted for in the year as a whole. In the current half-year, therefore, the purchases may reasonably be estimated at around £50 million. On that basis, the gross holding of gold and dollars at

the end of this month, before allowing for the final month's sales (and excluding also any unspent dollars drawn from the residual amount of the US credit), would be £540 million.

These are not, however, the only liquid exchange resources prospectively available. To this total of £540 million there has to be added the £100 million of dollars now available in the US line of credit, the £80 million gold loan which Britain will receive from South Africa in 1948, and the further £20 million of dollars which may be acquired from the International Monetary Fund before mid-September next. There is also the residue of the Canadian credit, which had been reduced by end-November to £82 million. In any attempt to estimate the rate of exhaustion of the global reserves it is better, however, to leave this item out of account, first, because any expenditure in Canada has for some time past been financed only to the extent of one-half from the credit (the remainder being paid for in US dollars); and secondly, because the difficulties of Canada's own external problem make it uncertain whether even this proportion will obtain in future. Excluding the Canadian credit, the global reserves available or prospectively available in the period from end-November last to mid-September next amount to about £740 million, before allowing for the undisclosed off-setting claims and liabilities. To ensure, therefore, that the reserve does not fall below the "minimum operable level," the maximum sum available for all purposes is £470 million.

In the three months to end-November, as a table in last week's issue showed, sales of gold and purchases of dollars from the IMF aggregated £163 million. To this figure there has to be added the amount utilised during September from the final drawings on the US dollar credit notified before August 20th; this amount was understood to be £37½ million. In addition, during the three months roughly £30 million was drawn on the Canadian credit, so that in three months the total exhaustion of reserves was £230 million. Even if the demands for Canadian dollars are excluded, this is equivalent to an annual rate of no less than £800 million; moreover, it is significant that there was no perceptible diminution of the rate of outgo during the last month of the period.

If, therefore, the drain were to continue at this ruinous rate, the total available reserves would be exhausted in a little more than seven months from end-November. It is true, of course, that the import cuts so belatedly imposed have scarcely yet had time to bring any important relief. The latest trade figures, those for October, did indeed show a reduction of some 6 per cent in the burden of import costs from the record level at which they were running during the third quarter of the year. But, despite the good performance of exports in that month, the visible adverse balance of trade was still running at virtually £600 million per annum.

It is difficult to guess the extent to which this visible deficit is being abated by a surplus on invisible items, for not only are these notoriously difficult to estimate but the problem is now further complicated by the fact that both the Government's

import programmes and the official estimates of the invisible account are based upon an f.o.b. valuation for imports although these continue to be valued on a c.i.f. basis in the trade returns. The largest potential source of gain to the invisible account in 1947 lies in the prospect of a big reduction in Governmental overseas expenditure, which in 1946 was estimated at £300 million and for the current year was expected to fall to £175 million. If this rate of reduction has in fact been achieved, it is possible that invisible items taken as a whole (and with imports valued on a c.i.f. basis) are showing a net surplus of approaching £100 million per annum. This would suggest that the global deficit on the balance of payments is now running at rather more than £500 million—which probably represents a substantial improvement upon the rate of outgo during the summer, but is fully £150 million more than the figure estimated for 1947 in the *Economic Survey* (when it was affirmed that "it would be unsafe" to borrow more than £350 million net) and £100 million more than the estimated actual deficit last year. Such improvement as has occurred recently in the global deficit is, however, no clue to the state of the dollar account. Indeed, in the third quarter of this year exports to the hard currency area actually declined. Moreover, the latest indices of import prices show a renewed upward movement and, as usual, the rate of increase is faster than that in export prices.

Finally, it must be emphasized that Britain's own dollar expenditure does not determine the total demands on the central exchange reserves. There is little doubt that in recent months there has been some acceleration in the rate of drawings to meet the needs of the remainder of the sterling area. India is certainly incurring large dollar outlays, while its dollar income has shrunk to very small proportions. Among other sterling area countries, Iraq and Eire are also believed to be making substantial demands, following the recent assignment to them of specific quotas of hard currency. It seems virtually certain that the additional strain imposed from these sources has more than offset the relief from the economy measures which are being taken elsewhere, in particular in Australia and New Zealand. These measures, like Britain's own import cuts, will take time to show results.

Undoubtedly, the whole programme of dollar economies should in due course substantially reduce the rate of draft on the shrinking reserves, but it would be unwise to assume that any really large reduction will be possible in the immediate future. Until these measures take effect, and until there is much more positive evidence than is yet available that the export drive will make large progress in the hard currency area, the only safe assumption is that the central exchange reserve will fall to the minimum level some months sooner than the authorities envisaged when the latest import cuts were announced at end-October. Plainly, there is no justification whatever for treating the welcome restoration of the right to draw on the US credit as any excuse for relaxation of effort. On the contrary, a realistic survey of the exchange position, as it now presents itself, rather suggests the need for still more rigorous economy.

Rubber and Geneva

(By a Correspondent)

RUBBER is admittedly the most important potential dollar earning product of the sterling area. It is produced mainly in the Colonies and to a lesser extent in Dominions of the British Empire. Producers of the commodity were accordingly entitled to derive some degree of encouragement from the preliminary statement made in the House of Commons on October 29th that special attention had been given to the

need for the easier access of Colonial products to the American market and that the advantages secured for the benefit of Colonial trade were equivalent and corresponding to the tariff concessions made by His Majesty's Government and the Colonies; it added that they were indeed immediate advantages. The optimism of the producer was obviously shared by the market and the consumer—curiously enough, to a major extent

dollar reserves. The latest external trade figures of the Dominion suggest that imports from the United States will this year amount to \$1,800 million and exports to the United States to \$900 million. Allowing for the export of about \$100 million of newly mined gold, there will be a deficit of some \$800 million, which is about the rate at which the gold and US dollar reserves have been running out this year. Canada's trade with the sterling area provides the complementary part of this picture, namely exports of \$1,100 million, imports of \$300 million, leaving a surplus of \$800 million. If sterling were convertible, all would be well.

This pattern of Canada's external economic relations is sufficient explanation of the Dominion's studious desire to do nothing that will damage the prospects of a rebirth of the system of non-discrimination and multilateral trade and payments. Comments on Canada's defensive measures to combat the drain on gold and US dollar reserves have, perhaps, tended to belittle the element of conscious discrimination that enters into both outright import prohibitions and the quota restrictions. The items selected for outright prohibitions have been chosen with a view to excluding imports from hard currency countries and, in effect, more than 90 per cent of the trade affected will be imports from the United States. As for the quotas, the choice of the pre-war period as the basis of the permitted volume of imports will have the same discriminatory effect. For each country of origin the permitted quota will be 400 per cent of the basic figure in the case of textiles and 210 per cent in the other categories of imports. This will mean that a virtually unlimited ceiling will be placed on imports from Britain, which are now a small fraction of the pre-war figures, while drastic cuts will have to be made in imports from the United States.

This discrimination squares with Canada's commitments under the Geneva agreement on tariffs and trade, given the balance of payments difficulties that have caused discrimination to be invoked. But if so far, why not a little farther? Why not invoke the balance of payments difficulties to justify openly discriminatory application of the outright import prohibitions? Why stop in its tracks the modest flow of exports from Britain to Canada which falls under the ban? That trade has been doing good service in slowing down both the drafts on the Canadian credit and the accompanying and equal payments of US dollars to Canada. Evaluating at its highest Canada's desire to promote a system of multilateral trade and payments, it is still difficult to appreciate the reasons for outright prohibition of certain imports from sterling countries.

Improved Steel Allocation?

Steel consumers will be fortunate indeed if they escape much confusion and delay in obtaining their supplies when the existing steel allocation scheme is modified at the end of March. The existing system, as *The Economist* has on several occasions emphasised, has laboured under obvious defects for many months. The trouble is largely the inflation of "M" forms (which entitle the holder to obtain steel) compared with the supplies of steel available to honour the forms. There is a gap of 2,000,000 tons between the two, and it is hoped to squeeze out the inflationary froth by cancelling all old "M" forms on March 31st next year.

All orders for steel placed under old "M" forms will thereupon be cancelled, unless they have been previously validated by a new Iron and Steel Authorisation, the issue of which will start in January. During the first quarter each industry will have to decide which steel orders it wishes to validate, but it will not be able to validate orders for more steel than is actually allocated to it. Thus the "M" form account will be squeezed—or lopped—into balance. That is a desirable and overdue step. But to expect that this process will work with more than the roughest justice would be optimistic. Steel may be the limiting factor in next year's economic planning, but a lot of work has already been done in various industries on the assumption that steel for which "M" forms had been issued would eventually be forthcoming. Is this commitment of resources and factory space to be wasted? Or do the allocations for the first period of next year take into account the existing degree of over-issue by making the cuts less severe for those concerns which have already gone ahead—on the assurance of a legal document of entitlement—with projects for which steel would be required early next year?

It is satisfactory that bulk authorisation is to be extended, but the scheme does not go very far in linking the control of steel supplies to the end-uses for which they are required. And it is apparently proposed that authorisations which cannot be matched by supplies of steel in any one quarter will automatically lapse and will have to be revalidated. That is good deflationary practice, but experience with the "M" form system showed that

it does not work smoothly in steel—partly because it is not possible exactly to forecast when the steel will be required since other shortages may delay even the best planned project, and partly because the particular type of steel may not be available for delivery. If authorisations which cannot be fulfilled for such reasons as these have to go through the official mill each quarter, delays will multiply, and the hope that "a few officials" will be sufficient to supervise the smooth running of the scheme will be vain.

Mr Marquand was prudent enough to admit that the scheme sounds complicated and will involve "considerable work" for industry. The detailed instructions which are to follow will be formidable indeed. And it does not promise to show a great improvement on the existing scheme in getting steel to the right users—at least in the early stages.

Unilateral Devaluations

The basic principles of the Bretton Woods agreements have been under heavy fire recently. The fundamental conception of the International Monetary Fund agreement is that it will eliminate the anarchy of unilateral devaluation of currencies, but that all changes in parities, for which the agreement provides reasonable scope and elasticity, shall be brought about with the approval of the IMF. Within the last few weeks three members of the IMF, Greece, Italy and Poland, have devalued their currencies, not by straightforward open methods but by circuitous measures which for all their complications can be seen to defeat the spirit of the Fund agreement.

The case of Greece is the most blatant. It is also the most reprehensible because, in this case, the initiative or at least the encouragement must surely have come from the American officials who now direct Greek economic affairs. In order to overcome the handicap of excessively high prices for Greek exports (in other words to counter the gross overvaluation of the drachma), exporters have since the middle of October received in exchange for the foreign exchange proceeds of their exports drachmas calculated at the official rate of 20,000 to the £, plus foreign exchange certificates equal to the amount of the foreign exchange surrendered by them. These certificates have a free market and must be bought by Greek importers who when buying abroad have not only to pay drachmas at the official rate for the foreign exchange they require, but must also hand in an equivalent amount of foreign exchange certificates. A double offence against IMF principles is involved in this device. Not only is it tantamount to a unilateral devaluation of the currency, but the free market for certificates which has been tolerated and indeed used by the authorities, has provided cross rates, as between dollars and sterling for example, that have differed widely from the official parities.

Italy's Export Rate

The Italian devaluation varies a device which has long been in operation. Since early in 1946, when private trading with Italy was resumed, the practice of the Italian exchange authorities has been to allow the Italian exporter to sell in the free market half the foreign exchange proceeds of his sales and to apply the official rate only to the other half. The free "export" rate has fluctuated considerably and this year, as against an official rate of 222.70 to the dollar, has ranged between 520 and 920 lire. On November 28th a decree abolished this system and provided that the whole of the foreign exchange proceeds of Italian exports should be paid for at a rate calculated on the previous month's average free market rate. That free rate has been falling in recent weeks owing partly to the stringent deflationary policy being pursued in Italy. Thus the effective rate—the latest figure is 589.457 lire to the dollar, 1,961.30 lire to the pound and 149.32 lire to the Swiss franc—shows a higher exchange value for the lira than those produced by the 50/50 arrangements a few months ago.

The Polish measure is far simpler. The official rate stays at 400 zlotys to the pound, and so long as this remains on the statute books and in the parities notified to the IMF, all is presumably well. But it was announced last week that the Polish Government had established a new rate of exchange of 1,600 zlotys to the pound, which will apply to all such transactions as assistance from relatives abroad, allowances, inheritances and legacies.

One must wonder how these members of the International Monetary Fund reconcile their exchange policy with the obligation whereby "each member undertakes to collaborate with the Fund to promote exchange stability, to maintain orderly exchange arrangements with other members, and to avoid competitive

December

December is balance month. The last few days of the year make heavy demands upon the staff of the bank, for every account is "balanced" and checked. Modern office methods, involving the use of mechanised book-keeping systems and of photographic records in accountancy, have reduced the time spent in searching for the proverbially elusive penny, but even so, hard work by every officer is required at "balance time". You will soon have an opportunity of studying the balance sheet of the Midland Bank; it is clothed in conventional form, but behind its figures lies the story of great achievements for customers large and small.

exchange alterations." The three devaluations achieved by these devices may be wholly justified by prevailing convictions. But if so, why not approach the IMF with a request for a change in parities? This hole-in-corner method of devaluing brings into disrepute the one international instrument on which hopes of ordered international monetary relations can be placed.

* * *

Oil Bunkering Crisis

Although the oil supply situation is known to be serious, few people can have expected bunker supplies for ships to be gravely endangered, except perhaps in isolated cases where distributing facilities have temporarily broken down. But it is now announced by the Chamber of Shipping that some shipowners have been refused contracts for oil supplies in 1948. This means that next year shipowners will have to take pot luck at bunkering stations, paying 20 per cent more for spot oil than it costs at contract prices.

For some months it has been difficult to obtain oil bunkers in North American ports. Now it appears that contracts coming up for renewal are being refused. In the absence of details of the terms of such contracts, it is difficult to assess the extent of the anticipated shortage, but some measure of its adverse effect on British shipping may be judged from the fact that the Chamber of Shipping has seen fit to issue a statement. The majority of British steamships now burn fuel oil and the number of coal-burners has been steadily declining for some years, a process which has been accelerated by conversions from coal to oil fuel. There is a touch of irony in this new situation, for only a year ago owners of coal-burning ships were faced with the possibility of being unable to obtain bunkers. The more hopeful coal bunkering prospects may well be giving some shipowners cause to regret their decision to send ships to the yards for conversion to oil, while others will congratulate themselves on having specified dual firing for their new ships.

Means must, of course, be found to ensure adequate supplies of bunkers for the world's merchant ships if international commerce is not to come to a standstill. "Inland" priorities cannot be allowed to strangle the movement of dry-cargo ships, but the question arises whether this can be avoided without imposing some form of international control over the distribution of oil. Some shipowners have associated this bunkering problem with the proposed dissolution of the Petroleum Board, and are anxious that pooling should be retained until supplies of oil are sufficient to cater for a competitive market. These qualms will be set aside by the postponement of the dissolution of the Board; the immediate prospect of competition in the oil market was in any event quite limited. On the other hand, individual shipowners may well have been safeguarding their own position by ordering supplies in various parts of the world to a total figure far beyond their requirements. Nevertheless, until new pipelines and more tanker tonnage come into operation the problem of world distribution is likely to be acute. This can be deduced not only from the remarkable rise in forward rates for the time chartering of "free" tankers (despite the belated release of large numbers of T2 tankers from the United States), but also from the new leap in crude oil prices in the United States last week.

Brokers' Commission and Agents

By all accounts the Stock Exchange Council is likely to confirm on December 22nd the changes in the rules governing the sharing of commissions. The effect will be, in short, that after January 1, 1949, the only agents in the United Kingdom and Eire entitled to share commissions will be the banks, and a limited number of firms who are able to show, on close scrutiny, that they are habitually engaged in the promotion of Stock Exchange business, and who are not members of a professional body entitled to charge for their services in this connection. Solicitors and accountants, many of whom handle a considerable volume of investment business, will then have to give advice to their clients gratis, or raise *ad hoc* professional charges—or abandon the business. Broker critics of the proposals resist them, firstly, because they may prejudice the initiative which creates business, and, secondly, because even if business is not affected, the result will merely be to substitute banks or Provincial brokers for agents among other professions. This, they argue, is the weakness in the claim that the changes will bring more business direct to the House at full commission.

But the Council probably has more in mind than mere commission hunting. One of its aims is to raise the status of the Stock Exchange as a profession, in which the sharing of fees with other professions would be out of place. Much remains to be done in simplifying and rationalising the whole scale of commissions; sharing of commission with non-professionals is an evident obstacle to such rationalisation, especially in the delicate matter of increasing the net return to brokers at the lower end of the scale. For example, all bargains yielding less than £1 net represent a clear loss, but any attempt to increase the minimum commissions would attract criticism so long as commission sharing was allowed.

The proposed change in agency commissions is directly linked with the other proposal, which also comes up for confirmation on December 22nd, to raise the minimum figure for reduced commission under Rule 197 (1) and (4) from £2,500 to £5,000. There is some force in the view that a commission of £9 7s. 6d. is hardly adequate for investing so large a sum as £5,000 in gilt-edged securities. Yet strong opposition to the change has developed in the House, especially from Brokers who are particularly concerned in dealings in Gilt-edged—where the concession is most frequently invoked. The supporters of the increase point out that if the changes in the agency commissions are successful in bringing more direct business to the Stock Exchange, then more business than hitherto will attract the concession rate, which is not applicable to agency business. A direct order for, say, £5,000 which attracts the concession rate admittedly yields a smaller net sum to the Broker than an indirect order which is ineligible for the concession. The case against revision is mainly based on the view that since the commission scale requires overhaul and since a major obstacle will be removed by the new agency arrangements a piecemeal alteration to the £2,500 rule is untimely.

*

The scheme for the re-arrangement of the capital of the Stock Exchange outlined last March is to be put definitively to the proprietors in a somewhat amended form, to allow for the writing down of the £36 shares to 1s. No dividends are to be paid on these shares, and they will confer a purely contingent equity in the undertaking which could be valuable only in a dissolution. No consideration will be payable on a transfer. Each member will be obliged to hold one share, and those who hold a larger number will have only one vote. For each of their present shares the proprietors will receive two £4 cumulative redeemable annuities, and non-members will be required to hand over their 1s. shares to the council as part of the deal. The annuities will be redeemable at the option of the council at £100 after a minimum life of 5 years. There will be no limitations on dealings or holdings of the annuities.

* * *

Gold Scare in USA

A curious perverted type of gold scare is sweeping parts of the United States administration. It is a fear of continued gold imports and should be viewed as part of the apprehension with which all inflationary symptoms are now being watched in Washington. The reasoning behind this fear is that any foreign demand for American goods financed by dollars acquired through sales of gold to the United States, is twice accursed: firstly, because the impact of that demand on the prices of available goods has its customary inflationary effect; secondly, because the gold acquired by the US Government enters into the banking system, where it lays the basis for what may be a five to six-fold expansion of credit. The fear of this double inflationary impact of gold purchases by the United States has been reflected recently in the protests made from Washington to the Canadian Government concerning the latter's decision to pay a \$7 per ounce premium on all gold mined in Canada over and above the production in twelve months to June 30th last. The protest was not based on a quibble about the true interpretation of Canada's obligation under the Bretton Woods agreement; it merely took account of the far simpler argument that the Canadian programme would increase the gold flow to the United States and thus accentuate the inflationary forces already apparent in that country.

The fear of gold also made its appearance in Mr Snyder's statement regarding the freeing of the \$400 million balance in the American loan. In this he affirmed that "resumption of drawings against the line of credit at this time will permit the United Kingdom to continue the purchases in the United States necessary to maintain its present austerity programme and hence will not add to inflationary pressures in the

United States." The reasoning here, presumably, is that the resumption of drawings will merely allow the United Kingdom to maintain its purchases, it will not cause those purchases to be increased. Consequently, it will allow a corresponding reduction in the flow of British gold to the US Government.

This concern with the old visible symbol of gold as a factor in the credit situation is somewhat difficult to understand at this distance from Washington. The United States Government have at their disposal, through the Gold Reserve Act of 1934, all the technical apparatus required to sterilise any incoming gold. Beyond this, the powers of the Board of Governors of the Federal Reserve System to raise member bank reserve deposits are not fully extended, since reserve requirements against demand deposits of Central Reserve city banks are only 20 per cent compared with the figure of 26 per cent to which they could be raised under the existing legislation. The inflationary effect of foreign demand based on US assistance to other countries will not be determined so much by the form in which the dollars are procured—whether by gold sales or by credits—as by the accompanying measures, whether fiscal, physical or monetary, adopted to neutralise the inflationary forces to which that external demand has added its stimulus. Above all, it is surely strange that the US Administration should take exception to efforts made by the other countries to ease their dollar shortage by producing a little more of the one commodity, gold, which will produce dollars quite automatically. The attitude resembles that of one of the architects of the Republican party platform in the Roosevelt-Landon election of 1936, who stated that the party "favoured the orthodox automatic gold standard, but was fundamentally opposed to buying another ounce of foreign gold."

* * *

Writing Up Assets

Brush Electrical Engineering startled the City last week by announcing that it had written off £686,056 out of a trading deficit of £912,292 (compared with a trading profit for 1945 of £45,447) by revaluing its freehold land and buildings. The company has stated that the writing up of these assets should correctly be regarded as a counterpart of the writing down of assets which was an integral part of the re-organisation of capital undertaken in 1938. As such there is perhaps nothing unusual about the present action, but exception has been taken to writing up assets for the specific purpose of writing off a trading loss of any sort—especially one of these dimensions. Mr Alan P. Good, who has been managing director of the company since the latter part of 1946, has evidently been eager to clear up an unsatisfactory inheritance, for he has explained that the substantial trading loss for the year had already been sustained when he took over, and that subsequently the trading position has been greatly improved—for the first nine months of the current year the company has earned profits in excess of £200,000 and profits for the full year ending December 31, 1947, are expected to exceed this amount. Although these figures suggest that Mr Good has had a beneficial influence on the fortunes of the company, they do not mitigate the doubtful wisdom of using present inflated property values to bolster up assets to offset adverse trading results.

There have been other recent cases where assets have been written up for quite different reasons. For instance, Australian Mercantile Land and Finance has written up its fixed assets in the latest balance sheet from £285,100 to £559,300. Here the object has been to compensate for exchange differences on the conversion of overseas net assets in Argentina and Australia to sterling after revaluation. A similar step has been taken by New Zealand Loan and Mercantile. These actions appear quite justifiable, like that of the Estates and Agency Company, which in its latest balance sheet has revalued its estates in Ceylon and India at £865,600 compared with the valuation of £485,500 at June 30, 1946—possibly with adequate reason, though it is difficult to assess it from London. This company has voluntarily created a special reserve as part of the revaluation, equal to the amount of the difference, and this has dispelled any doubts about the company's position or intentions. Another case, that of Bartholemew (London), is to some extent open to the same criticism levelled at Brush Electrical Engineering, for here there has been a writing up of fixed assets by a substantial amount to take advantage of the present high level of property values.

An established tenet of conservative finance enjoins all companies to avoid the temptation of raising the book valuation of fixed assets in conformity with changes in market values. Departures from this principle are few, and they can be justified only by quite special reasons—among which the desire to write off trading losses cannot be included.

More Wage Claims

The Government's appeals to the trade unions to refrain from pressing claims for higher wages appear to be falling on deaf ears. Nobody expects that the TUC special committee, which has been investigating the whole question of wages, prices and profits, and will report to the General Council next week, will carry these problems much further forward. Yet wages questions are again looming ahead. This week the cotton spinners have tabled a claim for a general increase of 10s. a week for spinners, with a 5s. increase for spinners' assistants. The spinners will no doubt argue that the 10 per cent increase in production reported by Sir Stafford Cripps last week justifies this move, and that it is necessary to offer higher minimum wages in order to attract recruits to the industry. At the same time, any inflation in the costs of spinning would be passed on to the consumers of yarn and increase the difficulties of selling in overseas markets. What is more urgent in the spinning industry is the revision of the wage structure, which remains highly complicated and full of anomalies in spite of the recommendations for its simplification by the Evershed Committee of 1945.

The wage talks now going on between the railwaymen and the companies come in rather a different category, for they are in accordance with the recommendation of the recent Court of Enquiry. The railwaymen are still smarting under the Court's award of 7s. 6d. a week, instead of the £1 they demanded, but the Court emphasised that this increase should be regarded as an interim measure, pending an overhaul of the industry's wages structure. The main purpose of the present negotiations is therefore to devise some form of grading, which will remove some of the existing anomalies and provide an incentive for efficiency and promotion to more responsible work. The present minima would, it is understood, not be interfered with, but the differentials between the various grades would be much more marked. The grading of wages is a long process, as has been shown by experience in engineering and mining, and no rapid agreement can be expected. That is perhaps a good thing, for any further addition to transport costs at this stage would be highly damaging to industry generally. Yet both of these industries are suffering from shortage of labour, and both pay lower wages than many competing industries.

Trade in Latin America

Lord Wardington's statement for this year's meeting of the Bank of London and South America is, as usual, a mine of information for all who have trade and financial interests in the Latin American Republics. Speaking generally, the current year has been marked by a major change in the trend of the wartime years. The phase of accumulation by these countries of large reserves of gold and foreign exchange was abruptly terminated early in 1947 when the first really large consignments of imports from the United States began to arrive. This deluge of imports, to use Lord Wardington's phrase, first caused congestion of transport facilities and docks; then a severe depletion of monetary reserves; and later the inevitable imposition of drastic import restrictions. The bank itself has naturally shared in this expansion; its bills for collection have risen by £5,926,000 to £21,113,000, and its documentary and other credits, now shown separately for the first time, stand at £17,741,000. Profits have expanded substantially; but in Argentina, as in Brazil, local earnings are subject to a limit on remittances fixed in proportion to the capital locally employed. In both cases the bank is in negotiation with the Governments concerned on the application of these measures.

Lord Wardington's detailed survey of economic conditions examines each of the Republics in turn, but the high-lights are his comments on the situation in Argentina and Brazil. In Argentina, the Government's five-year plan, conceived primarily as a bulwark against postwar depression, is being vigorously implemented despite the continuance of intense inflationary pressure. So intensive a programme of industrialisation will, in Lord Wardington's opinion, profoundly affect the character of Argentina's import requirements in the future, which may tend more and more to relate to capital equipment as distinct from consumer goods. Already, however, social stresses are beginning to appear, in consequence of the repercussions upon the agricultural community, which receives for its products prices far below those at which they are resold in world markets by the Governmental buying and selling agency (the "IAPI").

Meanwhile, there has been a violent impact upon the Republic's external finances. In the first eight months of this year, imports from the United States totalled 1,292 million pesos, in contrast with only 377 million in a similar period of last year, and the export surplus for the eight months amounts to only 200 million pesos compared with the record figure, 1,607 million pesos, achieved in the year 1946 as a whole. But, despite this huge concentration of import demands upon America, Britain remained by far the best customer of Argentina, purchasing in the eight months 1,002 million pesos (almost twice the comparable 1946 figure), compared with United States purchases of 292 million pesos.

In Brazil the global balance of trade has this year swung from surplus to deficit. Brazilian imports from the United States have actually exceeded Argentina's heavy purchases there; but, thanks to the high prices realised for Brazilian coffee in the US market, the adverse balance with the United States has not deteriorated commensurately. Imports are now subject to stringent control; moreover, legislation is reported to have been drafted to introduce a general system of advance licences for nearly all imports and exports.

The Jute Riddle

More than a month has passed since Pakistan imposed an export duty equivalent to £6 5s. a ton on raw jute crossing its land frontiers—a move discussed in *The Economist* of November 22nd. But the jute trade is still uncertain about the full implications of Pakistan's action. Britain and other European countries have a large number of outstanding contracts, and at the moment it appears that the new tax will be levied on supplies already bought. Similarly, the joint allocation system is apparently still in force—at least neither of the two new Dominions has rescinded it. Nevertheless, if exports are re-directed through Chittagong in Pakistan, these quantities would presumably be "extra-allocation." The Government of India has protested to Pakistan about this "unilateral action" of imposing the new export duty, and has stated that it is "examining what parallel measures it should take to protect the interests of the Dominion of India." There for the present the matter rests.

The question is clearly one of relative bargaining power, although Pakistan's action was undoubtedly motivated in part by revenue needs. The Calcutta mills require the better types of jute grown in Pakistan, but must now pay an extra £6 a ton for them. If foreign buyers are able to use Chittagong as a port of shipment, they will presumably pay only the seaborne export duty, which is of the same amount; Pakistan may be deliberately encouraging the development of this port. But the facilities at Chittagong are limited, and even if it handled the maximum quantities, Pakistan would be unable to dispose of all its jute crop without using Calcutta. As neither side can hope to force the other into agreement without hurting its own interests, there would appear to be adequate grounds for an amicable settlement.

The world demand for jute cloths and bags is greatly in excess of supply, and the effect of the new tax on jute consumption will not be fully felt immediately. But the increase in price caused by the new tax will undoubtedly encourage the development of substitutes, such as Congo jute, rosella and some of the hemps. If the price is too high, it may even be cheaper to use coarse cotton cloth for sacking. Recently, raw jute prices have been high, in spite of an increased acreage and a heavier crop, because of the dislocation of up-country transport and the anxiety of Indian mills and shippers to cover their requirements. The transport situation has now improved, and as increased supplies come forward it is generally considered that prices will decline and at least partially offset the sharp increase caused by the new tax. The price of raw jute in the week ending November 15th was £88 ton (Daisee 2/3—good marks) for shipment c. and f. Dundee, having declined by £2 on the previous week, but in the first week of December it has risen to £93, allowance having been made for the new tax.

* * *

Is Copper Too High?

British manufacturers have maintained for some months past that the Ministry of Supply's home issue price for copper—£132 a ton delivered—is unduly high compared with the world level. The Government's selling price averages out the cost of purchases made at varying prices—though this is a principle about which argument is possible. But copper consumers should at least be

able to pass judgment on the buying operations of the Ministry of Supply, and this cannot be done unless reasonably full information is available. The statistics which are forthcoming are always inadequate and sometimes misleading. Recently Mr John Freeman, answering in Parliament for the Minister of Supply, stated that during the first ten months of 1947 some 230,000 tons of copper had been purchased by the Ministry at prices closely related to the New York export price of electrolytic copper, which during that period varied between £109 7s. and £132 a ton f.a.s.—purchases in a given period are not, of course, necessarily identical with imports. With copper there is considerable variation in quality and specification, and for that reason an average price is not very dependable—though surely it has more than "little significance," the phrase used by Mr Freeman. Had Mr Freeman quoted the average price at which purchases were made, the Ministry of Supply's case might not have appeared so unassailable.

Mr A. Chester Beatty in the annual report of Roan Antelope Copper Mines states that in the year ended June 30, 1947, the average selling price of blister copper rose from £57 19s. 9d. a ton to £80 10s. 8d. He added that as the company sells its entire output forward to the Ministry of Supply, the average price a ton receivable by the company in the first half of 1947-48 would be considerably higher than that for 1946-47, notwithstanding the fall in the world copper price. Mr Chester Beatty's disclosures may go some way towards justifying the Ministry of Supply's case. But the average imported c.i.f. value for electrolytic copper for the first 10 months of 1947 was £117. Moreover, since June the New York export price for electrolytic copper has been hovering around £120 a ton f.a.s. and even the more recent fluctuations have not materially altered this level. Does not this evidence point to the possibility that the British home issue price is too high?

Virgin copper stocks in Britain in 1947 have been equivalent, on the average, to between 2½ to 3½ months' supply, and stocks have been steadily built up from 82,000 tons at the end of January to 102,000 tons at the end of August, though they declined to 96,000 tons at the end of September. Consumption of virgin copper over the past 10 months has averaged 29,000 tons a month, while monthly imports have averaged slightly more than 31,000 tons; these figures would produce a net monthly increase in stocks of, say, 2,000 tons. The figures do not balance out exactly, but at least they suggest that supplies to British consumers are coming from fairly recent imports of copper and that stocks are being turned over at a sufficient rate to justify the trade's misgivings about the Ministry of Supply's price policy. Surely if the British copper price is not too high it must mean that the Ministry bought forward large supplies at the peak of the market and that next year at any rate a price reduction should take place.

* * *

Textile Shortage and Labour

The last two weeks have seen little progress in the negotiations on overtime working in the Lancashire cotton mills. Last week's meeting brought a reaffirmation from both employers' and operatives' representatives that overtime working must be introduced to step up production and ensure at least a modicum of supplies for the home market after export markets have had the lion's share. But this took matters no further than they were a fortnight ago when some spinning operatives in the Rochdale area refused to work overtime, against the advice of their unions, on the grounds that the small increase in output which overtime would bring could be achieved by other (unspecified) means. Up to the time of going to press, there was no indication that these workers had changed their mind.

This reluctance on the part of a section of the workers to put the need for maximum production well behind the advantages they are enjoying from the 45 hour week (which has now been in operation twelve months), points to a complete failure to appreciate the urgency of higher textile production and exports. This attitude, however, is not unique. It has a counterpart on the employers' side in the slow progress which has been made so far with the re-grouping of mills under the Cripps' re-equipment scheme.

The key role which textiles, especially cotton, can play in the export drive was emphasised last week by the Chancellor. If the volume of textile exports in 1947 was as high as in 1937, the export values of textiles could, as Sir Stafford recently observed, be increased by £300 million a year—sufficient to close half the gap in the balance of payments. Unfortunately, the volume of textile exports as a whole is only about 45 per cent of the prewar level—cotton and wool are running at 42 and 84 per cent of the 1938 volume respectively.

Last week, however, Sir Stafford was able to report an increase in cotton yarn production for the week ended November 8th to 16.61 million lb. compared with 16.5 million lb. needed in the average week to meet export allocations and to get the 10 per cent addition to home supplies to meet the clothing ration.

Output in the doubling and weaving section also showed an encouraging improvement in October. But the margin between the best levels of production in October and early November and what is needed was desperately small—and perhaps even non-existent if allowance is made for seasonal factors. The brunt of the cut in supplies for the home market can be expected to fall on fabrics for clothing and household purposes. In the wool industry, production will have to be increased by about 12 per cent if the present coupon ration is to be honoured. Production is expanding, and is now running about 5 per cent above the 1946 level; but a shortage of worsted goods is probable, since they are urgently wanted for export to hard currency areas.

* * *

Report on Weaving Machinery

The committee set up last year under the chairmanship of Sir Raymond Evershed to investigate the cotton textile machinery industry have now published their final report.* An interim report, which dealt exclusively with cotton spinning machinery, was discussed in a Business Note on May 31st. The final report deals with weaving, winding and warping machinery. In cotton textile manufacture, the warping and winding processes take place between the spinning and weaving stages and the committee are comparatively optimistic about the machinery makers' ability to meet any foreseeable demand for this type of equipment. Their main preoccupation has been the supply of weaving machinery, especially of automatic looms.

The committee have taken as their starting axiom that there is scope in the Lancashire weaving industry for a much wider use of the automatic loom. So great is the disparity at present between the supply of this equipment and the orders already placed by both the home and overseas markets, that they have been able to avoid the more debatable issue of exactly how many looms are required. As the Report points out, it matters little whether the high notional figure of 120,000 automatic looms to be installed over a five year period is taken or half that figure over a ten year period; in any event there is little prospect of producing the machines, given the present and prospective capacity of the machine making industry.

The committee have made one obvious and one ingenious recommendation. They have been attracted to the short term expedient of fitting automatic devices to semi-automatic looms. There are, of course, serious drawbacks to fitting precision attachments to old machines which were built for robustness rather than smooth running. But if Lancashire is to hit its export targets and if only a few new machines can be built for the next year or so owing to a shortage of labour and foundry castings, it may be advisable to mobilise scarce fabricating resources for adapting old machines. Their more revolutionary recommendation is to manufacture a few standard lines of automatic looms by mass-production methods in factory space specially allocated by the Government, with a high priority for labour and materials. The more progressive machine making firms should be brought in to manage the plant on agreed terms. On the quality of automatic looms, the committee are satisfied that those produced or capable of being produced by the British Northrop Loom Company in particular are at least as good as any being manufactured abroad.

Barclays (D. C. & O.)

Events this year, and especially of the past few months, have fully vindicated the judgment of Barclays Bank (Dominion, Colonial and Overseas), two years ago, that the time was ripe for a more vigorous development of the resources of the Colonies. But when it then backed this judgment by forming Barclays Overseas Development Corporation for this purpose, the bank presumably did not foresee that within so short a period a mammoth new Governmental corporation, with resources of £110 million, would be entering the same field. The proposed Governmental body, the Colonial Development Corporation, will have, moreover, as its first chairman, Lord Trefgarne, one of the original directors of the Barclays Company. In his statement for this year's meeting of Barclays (D. C. and O.), the new chairman of the

* Second and Final Report of the Committee of Investigation into the Cotton Textile Machinery Industry. HMSO, 4d.

bank, Mr J. S. Crossley, declares that the work of the Barclays Corporation will be complementary to rather than competitive with that of the new body.

It seems evident, however, that the bank remains in some doubt about the manner in which this relationship is likely to develop. It is in Africa—which will be a major sphere for the Governmental body—that the bank corporation expects to find its greatest scope and it is there, too, that Barclays (D. C. and O.) derives the major part of its business. Geographically, there is bound to be a large overlap, but Mr Crossley expects the official body to concern itself mainly with "a somewhat different type of business" from that of the bank undertaking. It is a pity that the nature of this probable difference could not have been more clearly indicated. Conceivably, what the bank has in mind is the possibility that the Government body will be predominantly interested in agricultural development; and in social and public works which may be necessary to ensure it, whereas the private body may find particular scope in the industrial field. As for the mode of operation of the two bodies, it is clear that the official Corporation will in many cases act as a principal in planning and carrying through development schemes, whereas the private body is intended merely to supply financial assistance for development projects.

Barclays Bank (D. C. and O.), as distinct from its Development Corporation (about whose recent activities no details are given), has just completed a year of marked expansion of its business, especially in South Africa. The total of its advances rose in the twelve months to end-September last by more than 50 per cent, to £77 million (which may be contrasted with the figure of £32.4 million in September, 1939). Even when viewed in the light of the boom conditions which have ruled in South Africa during the year, this is a surprising rate of growth; yet Mr Crossley stated that the bank's figures do not reflect the full increase in its activity during the period.

* * *

Australia's Bank Nationalisation Powers

The Bill for the nationalisation of the Australian banks had, as expected, a speedy passage through the Senate, and the Royal Assent was given with the minimum of delay on November 27th. Now, therefore, the struggle between the Government and the banks has shifted to the purely legal sphere. Even before the Bill became law, the banks were planning to seek an injunction to restrain the Government from implementing its powers, when conferred, before they had had an opportunity to challenge the validity of the legislation in the courts. But the need for any such precautionary measures was removed by a pledge from the Commonwealth Treasurer to refrain from taking any steps towards nationalisation until four clear days had elapsed after the passage of the Act. The banks' challenge to the constitutionality of the legislation is due to come before the High Court on December 15th, but, as the Court adjourns for the long vacation only four days later, the full hearing is not expected to take place until the New Year. Normally the Court re-assembles about the middle of February, but the Government is apparently taking steps to arrange for it to resume at the end of January.

Even at best, therefore, it will be some time before the issue can be decided, and there is of course the possibility that the matter may later be carried from the High Court to the Privy Council. To protect their position in the meantime, so as to ensure that they are not confronted by a *fait accompli*, the banks—acting in two groups, one comprising the purely Australian banks and one the Anglo-Australian banks—recently made a further attempt to secure an injunction. These applications, which came before a single judge sitting in the High Court, were, however, rejected on the ground that the Commonwealth Treasurer had expressed his willingness to give fourteen days' notice before taking any steps under the Act. There, for the present, the matter rests—with the banks still wondering whether the Government might not, even now, give such notice during the long vacation.

* * *

Rand Mining Costs

The rise in gold mining costs in South Africa since 1939 was the main theme of Mr Robert Annan's speech at the recent meeting of Consolidated Goldfields of South Africa. Costs per ton milled increased by more than 33 per cent between 1939 and 1946, while revenue per ton rose by only 10 per cent; the proportion of operating costs to total revenue has risen from 61 to 73 per cent over the same period. European labour costs have risen by 38 per cent, native labour by 24 per cent and materials by 27 per cent. Taking the Rand mining industry as a whole,

gross revenues have increased by slightly more than £7,000,000 a year, but wages for a reduced labour force have risen by £8,250,000 and supplies by £5,000,000. In contrast to these increases, the total amount absorbed by taxation and paid in dividends has been reduced by about £9,250,000.

These, of course, are average figures. Over the Rand as a whole, some mines are far from the average; many low grade mines, especially the older and deeper ones, are now working on very narrow margins, while a few fortunate ones, like "Blyvoor," which are working high grade ore, have a handsome margin of working profit. Some relief has been afforded to the industry by the 10 per cent reduction in taxation on gold mining profits as from the beginning of this year, and by the change in the method of calculating allowances for capital expenditure.

Mr Annan noted that the rise in costs has been slowing down in recent months. The link between high costs and lower dividends has been only too obvious over the last twelve months. In June, dividends were affected by the added factor of the March strike, and it was to be expected that the December declarations would show some improvement. The first batch of dividends, from the Consolidated Goldfields group, largely confirm this expectation. Robinson Deep and Simmer and Jack, two marginal mines with deep workings, have resumed payments, after going out of the dividend list last June, while Venterspost (one of the latest mines to begin production) has raised its payment from 3d. to 8d. for the current half year.

Small progress has so far been registered towards redressing the lack of balance between costs and revenue. Some look to a higher gold price for the solution of the Rand's problem, others to the slower process of deflation of costs, of which there are, as yet, few visible signs. Last August gold share prices fell to their lowest levels since 1939; yet more than £35,000,000 of new capital has been raised for South African gold mines in the last two years. Hope springs eternal on the Rand.

United Kingdom and Argentine Trust

The announcement by the United Kingdom and Argentine 1933 Convention Trust, that the liquidation of the Trust is to commence on May 1, 1948, is a reminder of the days when the balance of advantage in the Anglo-Argentine exchange was on the other foot. The Trust was formed in 1933 as part of a scheme to enable holders of blocked pesos—of which this country was then richly endowed—to exchange them into sterling and negotiable sterling securities. The original holdings of the Trust were £7,156,100 Argentine Government 4 per cent Sterling Bonds 1933 which had been issued under the 1933 Anglo-Argentine Trade Convention to holders of blocked pesos, and £5,367,075 British Government 3 per cent Conversion Loan 1948-53 the repayment of which was announced last week.

The Argentine bonds had been deposited in the Trust in exchange for £20 cash and £60 of "C" certificates of the Trust for each £100 bonds deposited, and the Conversion Loan had been purchased out of the funds realised from the sale of the three classes of certificates of the Trust. The "A" and "B" certificates of the Trust which were issued at the same time as the 3 per cent (maximum) "C" certificates have all been repaid, apart from £2,268,685 "B" certificates which are to be redeemed out of the repayment due from the 3 per cent Conversion Loan redemption next March. Thus there remain the 3 per cent "C" certificates, of which £5,367,075 are outstanding. The realisable assets of the Trust consist of £3,098,390 Conversion Loan, £3,410,300 Argentine 4 per cent sterling bonds (registered), £125,612 "C" certificates of the Trust and £78,968 cash in the income distribution account. It has been estimated by the Trust that these bonds should be sufficient to make a payment to "C" certificate holders as soon as possible after May 1, 1948, of approximately £66 in cash and £59 nominal in Argentine bonds for each £100 "C" certificates held after allowing for the expenses of liquidation, stamp duty and miscellaneous expenses.

A tangible measure of the success of this scheme, which was devised by Mr J. H. Clifford Johnston, is that the price of the "C" certificates this week has been around 125 compared with 55½ in 1933.

New Shell Dealings

Dealings in the new shares of Shell Transport and Trading opened on Wednesday. Until after January 15, 1948 (when the first call on the shares is due), the volume of subscriptions for the issue of 9,648,544 £1 shares will not be known, and the quota to be taken up by the underwriters, if any, must remain equally uncertain. Market estimates of the number of shares which may be left with underwriters have fluctuated widely, but most observers now seem to be thinking in terms of about 1,000,000 shares. But until January 15th no shares can be forthcoming from the underwriters, and hence none will be delivered until after that date. Under these unusual conditions it was logical to expect a plethora of buyers when dealings opened on Wednesday, and in fact the shares, quoted nil paid, rose in early dealings to 19s. 7½d. premium before settling down around 16s. 3d. premium. This is a firm level as it is known that many buying limits have been placed slightly below it.

At the official price of 16s. 3d. at which the issue attracts the new bonus duty, the company has incurred a liability of £784,000 which is quite a sizeable catch for the Treasury from its first excursion into these profitable bonus issue waters. The company may well have been relieved that the price in earlier dealings came under later pressure; immediately before the opening of dealings the price of the old shares cum rights rose to above £4 for the first time for many months.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Tube Investments; Peninsular and Oriental Steam Navigation; Turner and Newall; Amalgamated Anthracite Collieries; Ind Coope and Allsopp.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent. will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (n) Net yields are calculated after allowing for tax at 2s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. † Notice given for repayment on March 1, 1948.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2½ per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

Investing money WITHOUT ANXIETY

WITHOUT trouble to you, and without charge, your Bank is now able to make it easy for you to invest money towards your own future security—and your country's prosperity. Your signature on a Banker's Order form will ensure for you either a single purchase of a number of National Savings Certificates, or the regular monthly inflow of as many Certificates as you like—up to the total of 1,000 which you may hold. In ten years' time each 10s. Certificate will be worth 13s.—your £500 will have grown to £650 tax free—a very worthwhile investment indeed. To the surtax payer the Savings Certificate is even more profitable. See your Bank Manager about it today.

TRANSPORT ACT, 1947

Notice to holders of Securities of Railway, Canal and Inland Navigation Undertakings.

The British Transport Commission give notice that an announcement giving information on the points set out below has been published and copies are available for inspection at Offices of Banks.

1. Payment of the final interest and dividends on Securities of the Railway, Canal and Inland Navigation Undertakings to be transferred to the Commission on the 1st January, 1948.
2. Instructions to holders not to send Certificates of the old Securities for exchange until requested to do so by the Undertaking concerned.
3. The titles of the valued Securities of the said undertakings in respect of which British Transport Stock will be issued on the 1st January, 1948.
4. The extension of dividend mandates registered in respect of the old Securities to the British Transport Stock attributable thereto.
5. The use of certificates of the old Securities as representing the appropriate amount of British Transport Stock until such time as new certificates for that Stock have been issued.
6. The procedure to be followed on and after the 1st January, 1948, by holders of British Transport Stock who may wish to dispose of their holdings before new certificates have been issued to them.
7. The publication on the 2nd January, 1948, of the rates at which the calculation of the amounts of British Transport Stock attributable to holdings of old Securities will be made.
8. The titles of those Securities of the Undertakings which have not yet been valued with particulars of the payment of interest accruing after the 1st January, 1948, and the procedure to be followed on and after the 1st January, 1948, by those who may wish to dispose of their holdings.

British Transport Commission

London, 9th December, 1947.

THE CANADIAN BANK OF COMMERCE

AID TO EUROPE

The annual meeting of The Canadian Bank of Commerce was held, on the 9th instant, in Toronto.

Mr Allan E. Arscott, C.B.E., the president, in the course of his address to the shareholders, said: A very high level of business activity had been attained during the past year with correspondingly large pay rolls and new records in volume and variety of goods. However, export trade had absorbed a substantial part of the goods produced. Extent and nature of the damage resulting from the war was becoming more evident and it was clear that European countries could not reach complete recovery without help from abroad. Temporary assistance would have to be given them in the form of loans or outright gifts until they were producing, not only to fill their own needs, but surplus for export.

Having regard to our resources and population Canada had already rendered substantial aid to help restore the shattered economies of Europe but owing to drain on our United States dollar reserve we were faced with necessity of taking some action in regard to our unfavourable balance of trade. One favourable aspect of the present proposals regarding United States aid to Europe was that some of the necessary supplies might be purchased in other countries, which should help to adjust our trade balance. We must of necessity consider carefully the degree of support we are in a position to provide. In giving every possible aid to Great Britain and Europe we must continue to cultivate and develop foreign markets, the potentialities of which are great. In so doing, however, we must endeavour to keep prices on a reasonably competitive level.

Taking a long-range view progress made at the Geneva Conference in the matter of a freer world trade had been better than expected and if the tariff changes suggested there were fully implemented world trade, and therefore Canadian trade, would benefit materially. While we have numerous unsolved problems we must agree that we are singularly fortunate in view of the general material well-being in this country.

The sympathy of the people of this continent will go out to those less favoured in Great Britain and Europe who are again facing the rigours of winter with totally inadequate food, fuel and clothing. It is disappointing that the necessity arises for reimposition of restrictive measures which affect the course of business and personal affairs, but we must remember that there is an unusual situation in the world today from which we cannot stand aloof.

The general manager, Mr S. M. Wedd, presents the bank's annual statement outlining the major changes which occurred within the past fiscal year, chief of which was an increase in the bank's loans of \$108 millions, \$90 millions being in commercial loans in Canada. Interest-bearing deposits, mostly personal savings, were also much higher, rising \$73 millions to \$770 millions. Very active foreign trade of the past year is reflected by the increase in letters of credit from \$34 millions to \$46 millions. Senior representatives of the bank who had gone abroad during the past two years in order to obtain first-hand knowledge of post-war conditions and to re-establish connections interrupted by the war had reported continued widespread interest in Canada. Contacts they had made would benefit both the bank and the country as a whole. The number of shareholders had steadily increased and now totalled 13,070, of which over 3,000 were in United Kingdom and Possessions.

The report was adopted.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

INCREASED ACTIVITY IN ALL SECTIONS

MR JULIAN CROSSLEY'S VIEWS

The twenty-second ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) will be held at 29, Gracechurch Street, London, E.C., on the 19th instant.

The following is an extract from the statement of the chairman, Mr Julian S. Crossley, circulated with the report and accounts for the year to September 30, 1947:—

I will not attempt to deal with conditions in the different territories served by the bank or to record their events, but I cannot turn from the subject without referring to this year's Royal visit to South Africa. I was fortunate enough to have the opportunity of making a business visit to South Africa during February and March. This gave me the special privilege of being present at the time of Their Majesties' visit and of witnessing the spontaneous enthusiasm and warmth of their reception throughout the whole country.

PAST YEAR'S FIGURES

You will recollect that in the chairman's statement last year a new issue of "A" shares was foreshadowed and also the conversion of the Preference into "A" stock. Both these operations were satisfactorily concluded, and, as you will see from the balance-sheet, the bank's capital now comprises "A" stock and "B" shares only, and the premium received on the new issue has been added to the reserve fund. While deposits have remained at substantially the same figure as last year, our advances to customers have shown further marked expansion. The year's dividends cost an additional £47,000, the final dividend being payable on the increased capital. For a full year, and at present rates of dividend and income-tax, the additional cost would be double that figure. We are proposing to make the same appropriations of the surplus as last year by writing off £250,000 from the investment in the Development Corporation and placing £50,000 to deferred repairs to premises.

Our figures do not by any means reflect the full increase in the activity of the bank's business during the past year. This has been noticeable in all sections, but has been perhaps most marked in South Africa.

All our territories seem to have many problems in common, among which that of housing seems to be one of the most intractable at the moment. This applies not only to those who work in the bank; in certain places the bank's own premises are quite inadequate to our growing needs. Heavy expenditure is likely to be needed for this purpose as soon as building restrictions are relaxed. The housing problem, in fact, is not one of those shortages which afflict our staff in this country alone.

At the same time, the large increase in the potential resources which will now be available for this type of work will add further meaning and purpose to what we ourselves have set out to do. The field to be covered, in any case, is so great that for many years to come there is likely to be room in it for all. It seems likely, too, that the new Government Corporation will concern itself in the main with a somewhat different type of business and often, no doubt, on a larger scale than anything which we ourselves might wish to undertake. Moreover, it may be expected to act in many cases as a principal, whereas our Corporation is intended merely to supply financial assistance in various forms. We look forward confidently to much fruitful co-operation with the new Corporation.

THE PROFIT MOTIVE

It is reassuring to learn that the Government Corporation is to be operated on a commercial basis and, accordingly, that considerations of profit will not be overlooked. This question of profitability is not a trivial matter to be lightly dismissed because if the great work of colonial development is to be carried through it is likely, eventually, to need capital resources on a scale far in excess of that available from a Government Corporation. The motive of profit or gain has ever been one of the mainsprings of human activity, and, if conditions are not such as to offer a fair prospective return, it may be difficult to attract new capital into this field. While high profits may attract envious and sometimes critical comment, the ventures which end in total failure are often quickly forgotten except by those whose money is irretrievably lost.

Investors are, however, obliged to accept this risk of loss, frequently a very real one in newly developing countries, and they can hardly be expected to do so unless they also have the prospect of earning a good return on such undertakings as are soundly based and proved successful. A multiplicity of development corporations, whether Government sponsored or otherwise, can never be an effective substitute for the self-reliant individual who is prepared to risk his money and devote his skill in pioneering enterprise.

MUTUAL BENEFITS

When, some two years ago, we first approached the authorities in respect of the formation of our development corporation we could hardly have foreseen that this new enterprise would so quickly find itself so much in vogue as it is today. If there were any who at that time doubted the wisdom of this move we hope they will now feel reassured. The fact is that since then many things have happened to demonstrate the need for such a departure, not only in the interests of the overseas territories, which we had primarily in mind, but also in the interests of this country; the benefits should be mutual.

In the constantly shrinking world of today, when so many countries, obsessed with the problem sometimes euphemistically described as "dollar shortage," are turning, or being forced to turn, more and more in the direction of self-sufficiency, it is refreshing to have in view a clear object for a constructive policy and one which aims at an expansion, rather than a contraction, in economic activity. Such is the cause of "colonial development." Some headway has already been made in many fields, although it is in Africa that the greatest scope appears to exist, and, as it is here that our bank carries on the major part of its business, the fact has a special significance for us, which must be my excuse for reverting to the subject in this annual statement.

It would be misleading to raise expectations of the rapid production of great wealth, but if this work can be carried through with foresight and resolution it cannot fail to confer great benefits on the peoples concerned.

Much foresight and patience will be needed if the true aims of Colonial development are to be realised. Your bank is, I believe, exceptionally fortunate in being so well placed to implement this policy. If, in the process of carrying it through, something can be done to redress the economic balance of the Old World it must, in the long run, benefit the New World also, for the Old and the New are one.

DORMAN, LONG AND COMPANY, LIMITED

RAW MATERIAL AND TRANSPORT NEEDS: IMPORTANCE OF ENGINEERING INTERESTS.

The fifty-eighth ordinary general meeting of Dorman, Long & Co., Limited, was held, on the 11th instant, at Winchester House, Old Broad Street, London, E.C.

The Right Hon. The Viscount Greenwood, who presided, said:—

You will be aware of the vital part which the steel industry is playing, and must continue to play, in efforts to restore the National economy.

Dorman Long are making their contribution to increased production, and both managements and men are setting about the task with the greatest goodwill. It would be foolish to ignore, however, the difficulties which face us.

DEVELOPMENT PROGRESS

The company is engaged on a considerable development programme. I am pleased to be able to report that this programme is proceeding satisfactorily, having regard to all the circumstances, although not so rapidly as we would wish.

A good deal of civil engineering work has been done on the Lackenby site. It has not yet been possible to begin the actual work of construction, but it is hoped to commence the first building in the near future. As you know, certain plant for the universal beam mill can be obtained more quickly from the U.S.A. than from British makers, and we are at present receiving tenders submitted by American plant manufacturers.

Another major project involves the construction of two large new blast furnaces at the Cleveland Works which, with necessary improvements and extensions to existing services, will involve a capital expenditure of approximately £4½ million. This scheme is now being considered by the iron and steel board.

HEAVY COMMITMENTS

These developments, which are urgently required to improve the technical efficiency of the company's iron and steel works, will involve heavy commitments. Capital costs are at present high, and this underlines the need to make adequate provision for depreciation and to strengthen still further our reserves. An increase in dividend in present circumstances would be a short-sighted policy. Your board prefer to take the long view, which I am sure you will agree is the correct one, of building up the technical efficiency of the company's manufacturing resources and consolidating its financial stability.

The increase of £633,565 in the trading profits of the group has not come from any expansion of our output of steel, neither is it attributable to benefits arising from recent expenditures at the iron and steel works, as these have not yet had time to influence the trading results. The increased profits are attributable to expanding outputs and improved results in other departments of the company's activities, and in our important and rapidly growing subsidiary businesses at home and abroad.

It will be seen that in addition to the book value of investments in subsidiary companies shown in the parent company's balance sheet at £952,012 there is disclosed by the consolidated balance sheet an excess of value of £2,069,665, making a total of £3,021,677. I think it right to inform you, however, that this figure is much less than a valuation based on the earning capacities of the companies concerned.

IRON AND STEEL BOARD

We have now had twelve months experience of the iron and steel board, and I am

happy to be able to tell you that our relations with this important body have been cordial and helpful. The establishment of the board was welcomed by the iron and steel industry. There has been full co-operation between us with benefit to the nation and the industry.

The Government at one time proposed to introduce a Bill in the present session to transfer to public ownership important sections of the iron and steel industry. Wiser counsels prevailed because of the urgent need to secure undivided concentration on increasing output, and carrying through the industry's development plan. The results, as I have already mentioned, have been most gratifying and the Government have publicly expressed their appreciation. The production already achieved and the steady progress made with the industry's development plan show that through the Steel Board the Government and the industry can achieve what is required.

A realistic approach to the relations of the Government with the industry is most desirable. It should be practicable to devise proposals on a permanent basis which while maintaining the benefits of private enterprise and initiative so strikingly displayed in the steel industry, would give the Government effective control of general policy, a general control warranted by the particular relationship of the industry to the national economy both in peace and war.

AFRICAN INTERESTS

During the year important developments have been put in hand by our subsidiary company Dorman Long (Africa) Ltd. I had an opportunity early this year of paying an extended visit to the Company's interests in the Union and I was greatly impressed by the high quality of work the enthusiasm of the management, and the fine reputation which Dorman Long (Africa) enjoys, and deserves, in South Africa.

Our other subsidiary companies, Redpath Brown and Co., Ltd., the Tees Side Bridge and Engineering Works Ltd., and the British Structural Steel Co., Ltd., of Buenos Aires, have been actively occupied throughout the past year. They have large programmes of structural work on hand. In addition, the Tees Side Bridge Company have built large numbers of steel mineral wagons for the home railways and pylons for the electric power grid. The same company has most successfully embarked upon the construction of all-welded Thames dumb barges for some of the largest interests in the Port of London.

Our bridge building and structural engineering activities based on our iron and steel manufacturing resources are extensive. In this country, in South Africa and in South America we have in active operation no less than 12 large engineering works with modern equipment and first class resources. A policy of progressive development is being followed at all these works and we have every confidence in their ability to hold their own in the increasingly competitive conditions likely to prevail.

Many of you will be wondering what will be the effect on our prospects of the Government's policy to foster exports, to allocate steel supplies on a new basis, and to cut down drastically capital expenditure projects. By far the greater part of our extensive bridge and structural engineering activities is concerned with projects of the highest priority. We are, for instance, engaged upon the supply, fabrication and erection of the steel-work for several new power stations, and extensions to many others.

There are other important development programmes in which we are interested whose fulfilment is essential to achieving the Government export plans. There is good reason for believing that the demand for our products will continue high for a good many years.

The report was adopted.

ANSELLS BREWERY, LIMITED

OUTPUT AT HIGHEST PERMITTED LEVEL

The forty-seventh ordinary general meeting of Ansell's Brewery, Limited, was held, on the 5th instant, at Birmingham.

Mr A. E. Wiley (chairman and joint managing director) said that, despite the manifold difficulties and problems of the times, the board were able to show results which he was sure would be considered satisfactory. The trading income of the group for the year was £1,725,761 compared with £1,628,600 for 1946. The output of their products had been maintained at the highest level permitted by the materials available, consistent with the highest quality possible in the circumstances. The directors had paid interim dividends of 5 per cent, and 17½ per cent. No additions to those dividends were proposed.

A DIFFICULT YEAR

The year had been a difficult one not only with regard to supplies, but in many other ways. Owing to the coal crisis, the output had been reduced to negligible proportions early in 1947, which, of course, had meant considerable disappointment to their customers. Fortunately, however, they had been able to use the materials conserved in that period to augment the ration later in the year, when the very hot spell had made extra supplies most acceptable. On September 1 they had had to revert to their original ration, which action had unfortunately been misunderstood by many of their customers, but he could assure them that they had used all the materials allowed to them by the Ministry of Food.

The board were fully alive to the necessity of providing suitable accommodation in their licensed houses for catering, the requirements of each house calling for special study to meet the varying needs of the public. At the present time it was exceedingly difficult to obtain the necessary permit for the provision of extra food, but unless they were given facilities to develop in that direction at an early date, they might find they were unprepared when matters became easier.

SHORTAGE OF SUPPLIES

Mr Walter Scott, J.P. (joint managing director) said that they had had to concentrate on maintaining their products in such a way that their popularity had made it possible to collect the huge artificial value they had to carry by way of the beer duty, which had been increased seven times since the outbreak of war and now stood at 226 per cent. above 1939. It would, of course, be impossible for any brewer to satisfy in every respect the public's demands for a cheaper beer, a stronger beer and a larger quantity, because the Government controlled all those factors. It was true that, within the regulations, there was a limited degree of latitude for the brewer, but he was compelled to use 15 per cent. less material than in 1946 and not to exceed the average strength allowed. If, therefore, he elected to strengthen a portion of his beer, the duty, and consequently the price, went up and the quantity produced came down. On the other hand, if he produced a cheap beer, and thereby increased the quantity to try and meet the shortage, criticisms arose as to the quality. As the result of the autumn Budget, further hardship would have to be borne by the long-suffering beer-drinker.

Shareholders would probably agree, however, that their business was on the sound foundation that they served the public by supplying them with the maximum quantity of the best possible value and, in their stride, collected over £7¼ million for the Revenue.

The report was adopted.

TUBE INVESTMENTS, LIMITED

EXPORTS UP SIX TIMES OVER PREWAR

The twenty-eighth annual general meeting of Tube Investments, Limited, was held at Birmingham on the 11th instant.

Mr I. A. R. Stedford (the chairman) said that direct exports, at over £7,600,000, were double those of 1946 and more than six times the value of those in any prewar year. In volume they were 400 per cent. of the 1938/39 figures. Indirect exports brought the total to at least £1 million a month, and nearly 25 per cent. had been sold to hard currency countries. Some T.I. companies were exporting 75 per cent. of output and technical representatives had visited 27 overseas countries to find out what customers were wanting and thinking.

He could not promise that T.I. would be able to improve exports by very much, if at all, in the current year. The situation which had been developing recently could not be appreciated without considerable disquiet, for many of the normal avenues of overseas trade were being reluctantly closed to this country. It seemed beyond the scope of industry to do anything about it. The onus of getting these markets reopened was on the Government, and, while we appreciated their difficulties, the successful outcome of the country's present export drive was in no small degree dependent on their being able to do so.

NEW PLANT

Postwar modernisation and business expansion plans, which had already cost £7 million, were well advanced, owing to the early start made, and thus would be less seriously affected by the new limits set on capital expenditure. Many tube companies were already modernised, while others were well on the way. The Electrical Division's big new plant at Blythe Bridge was operating at full production; the Cycle Division had installed new plant and layouts, the factory at Newtown, Wales, having settled down as an efficient unit.

The Government's decision to give the cycle industry a high priority for the supply of raw materials because of its export potentialities had been greeted with satisfaction. This satisfaction was not due entirely to the fact that T.I. happened to be the world's largest cycle and cycle component producing unit, with the biggest and most valuable export business, but also because the British cycle industry as a whole had firmly established its roots in most of the international markets. Allowing for difficulties of comparison, on account of the differences in the types of cycles made, he believed that we in Britain could fairly claim to be producing bicycles of the best design at the lowest cost. The T.I. cycle companies had achieved new records, both technical and commercial, during the year.

SOUTH WALES ALUMINIUM COMPANY

The merging of the T.I. and Hawker Siddeley Aircraft Company light alloy activities had been indefinitely postponed owing to the present economic conditions, but T.I. had acquired a controlling interest in the South Wales Aluminium Company, whose modern rolling mills were in construction. The amalgamation of this scheme, with the plan of modernisation for Reynolds Rolling Mills, on the South Wales site would effect a saving of upwards of £1,250,000 in capital expenditure as well as considerable economies in manufacturing costs and manpower. The output, which would have a high export potential, would be about equal to that planned for both projects had they proceeded independently.

He believed this arrangement to be a realistic response to the Government's requirement to curtail capital outlay, while, at the same time, it would ensure that the country would have its share of modern plant with which to fight effectively in the

approaching struggle for world markets. T.I.'s final share in the enterprise would be some two million pounds. The production of light alloy tubes and extrusions, now concentrated at the Redditch factories under a new company, Reynolds Light Alloys, Limited, were showing good progress.

NEW SCIENTIFIC METHODS

New scientific methods of production technique were being applied throughout the group, first applications showing that well over a 20 per cent. increase in production could be achieved with the same number of operatives, equipment, working hours and expenditure of energy. Those who applied these methods would find that they would not need to call so heavily, as was contemplated on the country's resources for industrial reconstruction. T.I. did not claim to be the pioneers in applying the skill of outside technicians to the development of production organisation, but we had heard little about the experience of others. It should be given widest publicity. Organisation of production was no longer a matter mainly of commonsense. It has become a matter of science, and companies which neglected its benefits would surely be doing themselves and the country an ill service which neither could afford.

A comprehensive works pension and life assurance scheme had been adopted at an initial cost of some £700,000, and a plan for the selection and pre-training of future foremen had been introduced. The pensions scheme was an earnest of T.I.'s intention to implement their principles of labour relations, and he believed it to be money well spent. T.I. regarded long service employees as one of their greatest capital assets, and he hoped they would come to regard T.I. in the same light. It might seem to some that times were not propitious for such schemes. T.I. did not accept this view. He could see nothing in the present position to justify delaying a scheme which—far from stimulating expenditure—encouraged thrift.

DIVIDEND DECISION

We have been mindful of all considerations in deciding to recommend to you a final dividend of 12½ per cent., making a total for the year of 25 per cent. If a distribution at that rate can be maintained, I trust that stockholders will feel that their best interests have been served.

Since it has been my privilege to address you as chairman of your company, each of my reports upon our activities has had a background of crisis. This last year we have had the fuel and power crisis, and in the present year we find ourselves already with the first consequences of the dollar crisis.

THE FUTURE

I hesitate to contemplate any of the new sequences in the unfolding drama of Britain's fight for a decent life, against which I may be called upon to address you next year. But history shows that conditions have been as critical with us before, and if it should now be that even yet we have not reached the upward turn of our fortunes—that turning point will certainly come. We British are a virile and determined people, and given a chance are well able to earn our own living, and a good one too.

But what must be kept steadfastly in mind is the simple truth that the only help upon which we can rely absolutely is self-help. Britain only can save Britain, and that makes it essentially a personal matter to every one of us.

The report and accounts were adopted, and the final dividend of 12½ per cent. on ordinary stock, making a total of 25 per cent. for the year, was approved.

THE ECONOMIST, December 13, 1947

SECOND INDUSTRIAL TRUST, LIMITED

RECORD APPRECIATION

The thirty-sixth annual general meeting of the Second Industrial Trust, Limited, was held, on the 8th instant, in London.

Mr. L. A. Stride, the chairman, in the course of his speech, said:

The valuation of investments shows a satisfactory appreciation over book figures of £628,014 or 43½ per cent., the highest recorded in the history of the Trust. In May last we increased the dividend on the ordinary shares by ½ per cent. and now recommend that the final dividend be also increased by ½ per cent., making 8 per cent. for the year against 7 per cent. The report, with this recommendation, was in print when the then Chancellor of the Exchequer announced the doubling of the profits tax. I should like you to regard the increase in the distribution as in the nature of a bonus.

It is not yet possible to gauge the full effect on our revenue of the various nationalisation schemes, while the increase in the profits tax is bound to have adverse consequences.

One feature of the Interim Budget calls for vigorous protest. Retrospective legislation is always objectionable, but is particularly to be deprecated when taxation is involved. The increase of the profits tax purports to be imposed to discourage inflationary profits distributions, but it becomes a penal imposition when applied retroactively.

The general national outlook is still very unhappy. The difficulties of the post-war period are increasingly aggravated by inept and incompetent leadership and industry continues to be hampered by many perplexities as a consequence of new directions and controls.

The report was adopted.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

FACTORS AFFECTING REVENUE

The annual general meeting of this Company was held, on the 4th instant, in London.

Mr Robert Annan (the chairman) said that the gross revenue of New Consolidated Gold Fields, Limited, the operating company, at £1,417,387 was only £30,355 less than in the previous year. A dividend on the ordinary shares of 12½ per cent., less tax, the same as last year, had been declared.

The Consolidated Gold Fields of South Africa, Limited, recommended the payment of a dividend of 12½ per cent., less tax, on the ordinary shares which would leave the carry forward unchanged at £9,673.

Turning to the activities of the New Consolidated Gold Fields, Limited, during the year covered by the accounts, working costs had again increased and there was a sharp rise in the cost of living index in the first half of the current year. One of the most significant results of those conditions was the continued decline in developed ore reserves.

It should be remembered, however, that the low grade producers had now a very slender margin of profit which might fall below 10 per cent. of the revenue in some of the older and deeper mines. It was therefore imperative that every means must be used to reduce the burden of costs. The outstanding feature of the past year had been the great activity in the development of new mines.

They felt that it would be necessary in the near future to raise some further capital. It had not been possible to finalise their plans, but they hoped to be in a position to announce them before long.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS

For the week ended December 6, 1947, total ordinary revenue was £42,329,000, against ordinary expenditure of £72,305,000 and issues to sinking funds £470,000. Thus, including sinking fund allocations of £10,709,891 the surplus accrued since April 1st is £196,266,748 against a deficit of £554,362,020 for the corresponding period a year ago.

UNIVERSITY OF DUBLIN
TRINITY COLLEGE

The Board will proceed at an early date to appoint a LECTURER IN STATISTICS. Salary: £550/£25/£650 p.a. Candidate selected to take up duties if possible on May 1, 1948, but not later than October 1, 1948. Further particulars may be obtained from the Registrar, Trinity College, Dublin, and applications must reach him not later than March 1, 1948.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability).—DIVIDEND NOTICE.—PREFERENCE STOCK.—At a meeting of the Board of Directors held today a final dividend of Two per cent on the Preference Stock in respect of the year 1947 was declared payable on February 2, 1948, to stockholders of record at 3 p.m. on December 31, 1947.—By order of the Board, **FREDERICK BRAMLEY**, Secretary. Montreal, December 8, 1947.

AVELING-BARFORD, LIMITED
INVICTA WORKS, GRANTHAM, Lincs.

NOTICE IS HEREBY GIVEN that the Fifty-second Annual Ordinary General Meeting of the Company will be held at the Registered Office, Invicta Works, Granttham, Lincs., on Monday, the 15th December, 1947, at 3 o'clock in the afternoon to transact the following business:—

1. Read the Notice convening the Meeting.
2. Report the Board of Trade's consent to the accounts for the year ending 31st March, 1946, being presented to the Meeting.
3. Election of Director.
4. Election of Auditors.
5. Any other competent business.

By order of the Board,
5th December, 1947. **H. C. RYAN**, Secretary.

STATISTICIANS

THE ECONOMIST proposes to make two appointments to its statistical staff.

1. A general Statistician. The work will include preparation of material for the *Records and Statistics Supplement to The Economist*, compilation of reference material, organisation of information services and statistical research. An honours degree in statistics or subjects combined with statistics is desirable, and a wide knowledge of statistical sources is essential. Preference will be given to those who have had practical experience of the type of work.

2. An Investment Statistician. The work will consist of preparing statistics for publication relating to company profits and Stock Exchange investments. Applicants should have a good knowledge of accounting practice, but need not be qualified accountants. They should be able to analyse a company profit-and-loss account and balance sheet, and should have some knowledge of company law (including the new Companies Act) and taxation. Some knowledge of Stock Exchange practice is desirable.

The salary for both posts will depend on qualifications and experience. It will not be less than £450 and may be considerably higher if circumstances warrant.—Applications should be addressed to "Statisticians," 22 Ryder Street, London, S.W.1.

APPLICATIONS are invited from those qualified to take charge of the development programme of the International Wool Secretariat in India and Pakistan. The qualifications which are regarded as essential for this appointment are: some years' previous experience in a senior executive capacity in those Dominions and the ability further to establish and maintain business and social contacts in high governmental and industrial circles. A knowledge of the wool industry would be an additional recommendation. The salary and personal allowances will not be less than £2,000 per annum.

Further information on the Secretariat and on the nature of this appointment may be obtained on application to the Secretary, International Wool Secretariat, Dorland House, 18-20 Regent Street, London, S.W.1.

ACCOUNTANTS.—Robson, Morrow & Co., have vacancies on their staff for outstanding Chartered or Incorporated Accountants, not over 37, who have held appointments in industry, and who are interested in being trained in the installation of modern Industrial Accounting methods.—Send full particulars of age, education, qualifications, experience and present salary to 59, New Cavendish Street, London, W.1, marking envelope "Application."

BUYER required by large Birmingham manufacturers. Position calls for man age 30-40 with sound experience in normal and present markets.—Only applicants having held a similar position need apply, stating age, experience and salary required, to Box 625.

PERSONNEL AND WELFARE MANAGER required by well-known and old-established manufacturers in Birmingham employing approx. 1,000 people. Duties of the post are in the main those recommended by Industrial Welfare Society.—Write, giving age, salary required and full particulars of previous experience, to Box 627.

VACANCIES for Building Surveyors in West Riding and Newcastle areas. Salary according to age and experience. Apply—William Townson & Sons, Ltd., Park Hill Street, Bolton, Lancs.

TRANSLATIONS: Efficient and prompt service undertaken by specialists in technical literary and commercial work. Moderate terms.—Apply to P.W.E.A. (E) Translation Service, 11, Gillingham Street, S.W.1. Tel.: Victoria 9557.

Printed in Great Britain by St. Clements Press, Ltd., Portugal St., Kingsway, London, W.C.2. Published weekly by THE ECONOMIST NEWSPAPER, LTD., at 22 Ryder Street, St. James's, London, S.W.1. U.S. Representative: R. S. Farley, 111 Broadway, New York, 6.—Saturday, December 13, 1947.

THE NATIONAL BANK OF SCOTLAND LIMITED

Head Office: **EDINBURGH**
ESTD 1825
Branches throughout **SCOTLAND**
LONDON OFFICES: 37, Nicholas Lane, E.C.4; and
18/20, Regent Street, Piccadilly Circus, S.W.1.
Every description of Banking Service undertaken.

REFUGE ASSURANCE COMPANY, LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS £16,300,000
ASSETS EXCEED £97,000,000
CLAIMS PAID EXCEED £181,000,000
(1946 Accounts)

CIVIL SERVICE COMMISSION

Applications are invited for the post of Assistant Keeper Grade II at the Tate Gallery.

Candidates must be at least 21 and under 33 years of age on 1st January, 1948. The salary is on the scale £330 rising by annual increments of £25 to £600; allowance will be made for age in fixing the initial salary, one increment being added for each completed year of age over 23.

Candidates should be familiar with the history and practice of the Fine Arts and should preferably have a University degree with Honours, or a Diploma in Art subjects awarded by a University or by the Ministry of Education. Candidates must be British subjects. The appointment is permanent and subject to the usual Civil Service conditions. Application is open to both men and women. In accordance with normal Civil Service practice the salary scale for women will be somewhat lower.

Forms of application, together with full particulars of the appointment, may be obtained from the Secretary, Civil Service Commission, Burlington Gardens, London, W.1, quoting No. 2072 to whom completed application forms should be returned not later than 15th January, 1948, for candidates in the United Kingdom, and 31st January, 1948, for candidates overseas. Candidates overseas, whose application forms may arrive later than 31st January, 1948, for reasons beyond their control, should write direct to the Secretary, Civil Service Commission, 6, Burlington Gardens, London, W.1 (giving full details of age, nationality, education, qualifications, experience and war service and quoting No. 2072) before that date, as well as completing and forwarding the application form.

THE NATIONAL COAL BOARD

Applications invited for two vacancies for Cost Accountants at Headquarters in London. Applicants should preferably hold a recognised accountancy qualification and have had experience of Costing in Industrial Undertakings. Knowledge of the Coal Industry or its ancillaries would be an advantage.

The appointment carries a salary scale commencing £675 p.a. plus location allowance and participation in a contributory Superannuation Scheme.

Applications, giving date of birth, full particulars of professional qualifications and experience, etc. (with dates), should be made within seven days of appearance of this advertisement to National Coal Board, Establishments (General) Branch, Hobart House, Grosvenor Place, S.W.1, marking envelope TT/36 in left-hand corner. Original testimonials should NOT be forwarded. Only candidates selected for interview will be advised.

STORE MANAGER with several years' experience in a modern retail Store and ability for Staff Management required by Managers of Holborn. A well-paid and progressive position. Apply Managing Director, A. W. Gamage, Ltd., Holborn, E.C.1, and mark envelope H.W.H.

STATISTICIAN, 27, Hons. degree Econ./Stats. (Cambridge), having gained extensive experience and responsible position in Government Department with large trading interests, seeks wider scope for enthusiasm and specialist talents in industry. Expert in large-scale survey technique; studied overseas industrialisation, travelled, languages; good knowledge home market.—Box 624.

STATISTICIAN and economist experienced in finance and investment seeks appointment: especially interested in research on price changes and market trends; possessing large collection of relevant information and data, and a general index of statistical matter collected from the press over last two years.—Box 628.

CHRISTMAS HOUSE PARTY in Surrey. Professional and University people. Vacancies for others wanting pleasant company, interesting conversation, good food.—Box 606.

ECONOMIST, 1943-46, for sale.—Offers Box 622.

Postal Tuition for B.Sc.ECON.

The London University B.Sc. Econ. Degree is a valuable qualification for statistical, research and welfare work in commerce and industry, and for teaching or administrative posts under Education authorities, etc. The degree is open to all, without University residence. You may prepare for the three examinations at home under the experienced guidance of Wolsey Hall (est. 1894): moderate fees, payable by instalments, if desired.

**Money's Revenge**

IT is said that President Truman, by appealing to Congress for the reinstatement of some of the wartime controls, helped the Labour Party to win the by-election at Gravesend. Now Mr Stalin has come along to help the Tories at Paisley by decreeing as thorough a piece of deflation as the world has ever seen. It is indeed a topsy-turvy world when state controls can be put on to save the free enterprise system and when the high priest of Communism can pay homage to the efficacy of market prices.

An article on a later page analyses what Mr Stalin's deflation means in the Russian context. It sheds a ray of light on the present state of the Soviet economy. But perhaps it is equally useful in illuminating the present state of the economy of the whole world. Russia is suffering from exactly the same disease as the rest of the world, the inflationary aftermath of a major war. Whether the Russian inflation is more or less severe than those of the Western countries it is impossible to say. But what is quite clear is that Mr Stalin has been much keener in his analysis of the trouble and much more forthright in the steps that he has taken than any economic statesman of the Western victors. Indeed, the only other Government that is conducting an equally purposeful campaign against inflation is that of Italy, under the leadership of Signor Einaudi, on whose experiment our Rome correspondent reported last week. The Russian measures certainly have plenty of brutal logic, and the logic at least is to be admired. Is there too much money chasing too few goods? Very well, let all money lose nine-tenths of its value. Once again Mr Stalin shows how little he cares for the doctrines of Marx when he sees the necessity for a definite economic policy. Nothing could well be less Marxian than the economics of the Five-Year Plan, which is a deliberate attempt to deprive the labouring masses of a far higher proportion of the fruits of their labour, for the sake of capital, than any private employer ever tried to do. And deflation equally, according to the Marxists, is a capitalist trick to cheat the workers. Indeed, Mr Stalin is much more of a capitalist than a socialist. His system is entirely devoid of any humanity; but it is equally free from muddled thinking. Unfortunately what Social Democracy is offering as a counter-attraction is a system that appears to eschew facts and logic as much as it dislikes brutality.

All over the world inflation is now the enemy of progress and balance and sanity. There is no secret (though there is much muddle) about the nature of inflation: it is an excess of demand for everything over the supply of everything. Nor is there any secret about where it came from. Wars always breed inflation, and big wars breed big inflations. Inflation springs from the wartime habit of disregarding money. For waging war it is an excellent habit, like other wartime habits such as the disregard of pain and destruction and carelessness about human life. In the early months of the late war much impatient vehemence was expressed, in these columns and elsewhere, at the slowness with which Mr Chamberlain and his colleagues were converted to the idea that money did not matter. Later the conversion was complete—so complete that Mr Greenwood could refer to pounds, shillings and pence as "meaningless symbols"

and even Lord Keynes could talk about the "humbug of finance."

But like so many of the habits of wartime, disregarded money eventually takes its revenge. For money cannot be wholly disregarded. It is so valuable a social invention that men go on using it. Nor can it be wholly deprived of its functions. Where it exists, it persists in attracting goods, and where it exists in excessive volume it persists in attracting too many goods. Industrious bureaucrats build walls to contain it, they dig ditches to drain it off. But the National Savings ditches get silted up, and the walls have to be built ever higher and wider. Whatever the efforts that are made to control it, a flood of money is never effectively contained. There is always something that it can be spent on, and every expenditure uses up some scarce resources. If the flood of money is held back from the essentials of life by price control and rationing, and diverted to inessentials the distortion of the economy is only the greater. The attraction of surplus money is so great that industry is sucked dry of its working capital and the flow of production suffers as a result. All this has happened many times before, and if they had been less confident in their ability to control economic forces the postwar governors of the world might have learned something from the lessons of the past. One of these lessons is that the public has never been prepared to admit, in the middle of an inflation, that anything was wrong with their incomes or their expenditures: "world-wide shortages" have always borne the blame, just as slumps are regularly blamed on "over-production." Both explanations, of course, are fallacious: what is wrong in an inflation is that demand is too large and in a deflation that it is too small.

*

The only people who have shown themselves clear in their heads about this problem are the extremists, the Soviets on the one hand and such "old-fashioned" Liberals as M. Gutt of Belgium or Signor Einaudi on the other. Those in between, including virtually the whole of the Conservative and Labour parties in England, and of "men of goodwill" everywhere, have been and still are very puzzled and confused.

The muddle-mindedness can be seen at its best on the subject of prices. It is very widely believed that rising prices and inflation are one and the same thing. But they are not. It is true that they are associated together, like scarlet fever and rising temperatures. But so far from being the same thing, the one is nature's cure for the other. Inflation is an excess of demand over supply, and one way in which the two can be brought into balance is by such a rise of prices that the available supply absorbs the demand. It is true that something of a vicious spiral is set up, the increased prices creating some new demand. But even with strong trade unions, it is a spiral that eventually slows down to a stop. Nobody in his senses would advocate an indefinite rise in prices as an end in itself. But it does at least bring the inflation to an end, whereas holding all prices down merely guarantees that it, and its harmful distortions, shall go on for ever.

There is another muddle about the effect that any attempt to get rid of inflation would have on the standard of living of the people. Sir Stafford Cripps, who can usually think straight, lent himself to this muddle when he said he would prefer to protect stomachs rather than purses. The object of any disinflationary policy—let it be admitted with all candour—is to reduce the money incomes, or at least the money expenditures, of the people. "The people" means all the people, and if the emphasis in this country is on the money incomes and expenditures of the wage-earners, it is only because they now engross so very large a proportion of the whole (after tax), and because their incomes are, by and large, the only ones which have risen in real value. But to say that the object is to reduce money incomes is not to say that it is to reduce the standard of living.

What is consumed at present depends on how much stuff there is to consume, and an effective disinflationary policy, by getting rid of some of the present choking distortions, would actually increase the amount of stuff to be consumed. There might indeed be less tobacco and beer consumed, there might be fewer gigantic crowds at football matches, carried there by motor coaches using imported petrol, there might be less squandering of money on trash. But would these reductions really be against the interest either of the country at large or of the working class? A disinflationary policy, sufficient to bring demand into relation with supply, would not deprive the wage-earners of anything that does them any good. It is really the purse after all, and not the stomach, that Sir Stafford is protecting.

A third muddle overhangs the rate of interest. What prices are to the flow of expenditure on consumption, the rate of interest is to the flow of expenditure on capital. The recent White Paper on the capital cuts showed that it is just as difficult to reduce the volume of capital outlay by measures of control and allocation as it is to reduce the total volume of consumption expenditure by rationing and controls. Yet a rise in the rate of interest is another of the sacred taboos, which only black-hearted reactionaries dare mention. It is the fashion to say that it would have little effect in cutting capital expenditures—but past experience is to the contrary.

*

Mr Stalin, when he sees what harm inflation is doing to his country, can take effective action against it. So can Signor Einaudi. The Americans, in their different way, can take what may perhaps be called effective inaction, for the sequel will certainly show that, by letting things rip, they will bring demand down into equilibrium with supply—indeed, probably far below it. But we poor British seem to be stretched so tight between a number of contradictory rigidities that we cannot move. Incomes must not be touched—there must be no "mucking about with the workers' pennies," irrespective (apparently) of what they buy. Prices must not go up. And the rate of interest must be kept down. Any one by itself would be possible; the three in combination simply do not make sense. The economy is being pulled to pieces, and the Government's various programmes, as they follow in rapid succession, are merely pasting white papers over the cracks.

Not for the first time, the Left of the western democracies—and the Right too, for that matter—may well be exhorted to pay less attention to the theory of Communism and more to the practice of Stalinism. Only in Russia and in America have there been really effective economic policies in recent years. And underneath all the ideological nonsense, underneath all the very real political and social differences, the two economies are strikingly similar. Stakhanovism, industrial purges, the Five-Year Plan and the devaluation of the rouble—what are those but somewhat stiff and over-formalised versions of the great capitalist virtues—a system of incentives to enterprise, of rewards for success and of sanctions for inefficiency, a first lien on the national income for productive capital investment, and the maintenance of sound money. These principles work, both in America and (apparently) in Russia, and the fact suggests that what makes an economic system effective is not whether it is planned or free, or half and half, but whether it is based on a realistic appreciation of the basic truths about the springs of human action and the origins of material wealth. The British people may wish to erect a superstructure different from either the Russian or the American. There is no reason why they should not do so. But they will not make much progress if they try to disregard these basic principles, if they build on humbug and substitute sentimentalities for realities. And their system will not work if they allow the place of economic policy to be usurped by the mere recital of mutually contradictory taboos.

What Next for Germany?

THE issue on which the Foreign Ministers' Conference finally broke down happened to be reparations; the Western Powers could not abandon their demand that the repayment of their credits and subsidies should be the first claim on any surplus German production, while the Russians were equally insistent that reparations should have the highest priority. But it is obvious from the course of the negotiations that the actual breaking point was less important than the fact that on neither side did the pre-conditions of agreement exist. It is quite clear that neither believed a word the other said. It is also clear that both sides were relating their claims and counterclaims to a wider issue than that of Germany alone. The struggle for established "spheres of influence" in Europe is in full swing and the boundary drawn through Germany and Austria is a front line which neither side regards as final. Until the balance between East and West has become far more clear than it is today, both sides will remain reluctant to alter the frontier by any voluntary withdrawal. Yet that is precisely what a genuine concession would mean. Settlements, after all, tend to reflect an already established balance of forces. They do not create one. Today, the pre-conditions of a settlement—an agreed and established balance of forces and general confidence that nobody is trying to upset it—do not exist.

This does not mean that they may not one day do so, perhaps sooner than the weary and disgruntled Foreign Ministers imagine. If some years pass without either Russia or America making any actual move that the other construes as aggression, the mood of total distrust may wane. In its place can grow a real desire for a *modus vivendi*. Equally, the success or failure of the Marshall Plan will determine in the next few years whether it will be Russia or the Western Powers that will retreat from the exposed positions they now occupy in Europe. When that basic uncertainty has been clarified, a German settlement will become practical politics. The Foreign Ministers are, therefore, right to adjourn the Conference and not to break off negotiations irrevocably. In this way they can maintain the principle that agreement is necessary, while admitting that for the moment it is beyond their grasp.

Yet even if the present breakdown in negotiations need not be taken too tragically, it presents the Western Powers with certain awkward and immediate problems in Germany. For instance, will they be able to maintain their isolated outpost in Berlin? The non-Russian sectors of the capital, completely surrounded by Russian-controlled territory, would prove excessively difficult to police, protect and provision if Russian hostility showed itself in direct pressure to dislodge

the British, the Americans and the French. Another problem which Russian action could render acute is the drift of population from East to West. Thousands of Germans have moved themselves out of the Russian zone in recent months. If the thousands were, under Russian pressure, to become hundreds of thousands, the Western zones would face insoluble problems in housing and feeding the multitudes. M. Bidault tried to raise the issue of Western Germany's over-population at the Conference, but without success. So far the situation is manageable. It would hardly remain so if the trickle of refugees were to become a flood.

*

But the most urgent problem raised by the breakdown of the Foreign Ministers' Conference is the question of a Central Government for Germany. It seems certain that the Russians will now establish in their zone a Government dominated by the Socialist Unity Party and claiming to be the Government not of the Eastern zone but of all Germany. The Western Powers will be denounced—as Mr Molotov has already denounced them—as the saboteurs of German unity, and the new Government, with its seat of authority in Berlin, the old capital of the Reich, will claim the loyalty of all Germans in every zone. If this challenge is presented—and everything suggests that it will be—should the Western Powers make any reply to it? Should they simply continue to run their zones without a genuine central authority in the hope that someday, somehow, unity will be reached and a genuine central Government established? Or should they organise an effective instrument of administration in the West and claim for it also the status at least of a provisional Government?

The arguments for making no change in the *status quo* in the Western zones are likely to be heard most strongly in France. The French dislike in principle the idea of a central administration for Germany and they cannot see why the present dismemberment of the German state should not continue. Outside France, many people who do not share the French repugnance for any German central authority nevertheless feel that the time for such an authority in the West has not yet come. They argue that to play the Russians at their own game will simply widen the breach between East and West and lead in Germany to a renaissance of the worst forms of competitive nationalism, the rival German "Governments" outbidding each other in the effort to secure the support of the other's subjects. They believe that, in the long run, the Germans will be more drawn to a policy which refuses to regard the partition of Germany

as anything but temporary, which does not perpetuate dismemberment by using it as the foundation for pretentious structures of government.

These are serious arguments. The peace of Europe is, heaven knows, so frail a fabric that no one would lightly add to the wear and tear it must sustain. The prospect of an auction of nationalism between rival German Governments, backed by rival groups of Powers, is the spectre that has haunted Europe since the meeting at Potsdam, and it looks no less baleful or grim now that it appears to be on the point of materialising. But have the Western Powers really any choice? The French preference for dismemberment overlooks what is likely to become the strongest factor in the whole case—the attitude of the Germans themselves. They can remain divided into zones only so long as they are in fact run on a "colonial" basis, by direct administration. No Western Power is prepared to sustain such a policy in the long run, and already the moves inside Germany, among the German parties themselves, are tending towards the creation of a genuine centre of authority in Frankfurt.

This tendency is not only politically inevitable. It is economically essential. Only if a single administration with sufficient economic powers comes into existence can anything like reasonable economic order be established in the West. The desperately narrow economic resources of Western Germany cannot be effectively and economically deployed, so long as effective power is split among a number of state governments. The crucial shortage of food, in particular, cannot be remedied so long as a more or less sovereign Bavaria refuses its produce to an equally sovereign, but unfortunately starving Ruhr. The internal necessities of the Western zones all press in the direction of effective central Government. Indeed, it can be argued that Germany is as short of government as it is of food.

*

The real issue, however, is not so much the technical need for unity in the Western zones as the problem of German sovereignty as a whole. Is there to be no reply to the Russian claim that a puppet government in their zone, ready to swallow reparations, ready to swallow the Oder frontier, representing at the best only one-third of the German population (and then only by a fiction)—that this Government is the sovereign and legitimate authority for all Germany? However weak the desire for effective unity may be today in some parts of Germany—particularly in such traditionally separatist states as Bavaria—no nation so far in history has abandoned the idea of national unity once it has realised it. Germany's late arrival at national unity has in many ways made the national spirit stronger among Germans than it is with other peoples who can take it for granted. Inevitably, national unity will be a rallying cry strong enough to outweigh most, if not all, of the temporary inconveniences of achieving it. If the claim of a Russian-controlled Government in Berlin to represent that unity were left unanswered, in time a majority of Germans might rally to it, whatever their reservations about its true nature might be—just as, in Italian eyes, the sins of the House of Savoy were washed clean when Victor Emmanuel became the only champion of Italian unity, or (to take a more ominously parallel case) just as South and Central Germany accepted the dominance of Prussia when Bismarck made it clear that that was the only road to German unity. To have two rival governments, both claiming to be the government of Germany, may be absurd and dangerous—but it is less absurd and less dangerous than to have only one, and that one under Communist control.

Does it therefore follow that the Western Powers should now do what Mr. Molotov accuses them of having plotted from the start—that they should set up a West German Government to rule a unified state of Western Germany? It is to be hoped that they will not do anything so foolish. The Western Powers

are not interested in creating a West German State. They are interested in restoring a united Germany, and any authority they set up to rule in whatever part of Germany they can control must be not a West German Government but the provisional Government of Germany. With two-thirds of the population, the richest industrial regions, the greatest ports, the greatest river and the most highly developed and industrious population, a provisional Government covering the Western zones would have far more genuine grounds for claiming authority over the whole nation than the rulers of the Soviet-controlled rump. And it should at all costs claim no less. If the Soviet claimant has the trump card of Berlin, the Frankfurt government will have at least three trumps—it will not have to pay reparations; it will not have to accept the Eastern frontier; and it will be allowed to talk back to its patrons. As the years go by, it can also hope to have the ace of trumps, a higher standard of living.

The recognition that a central authority established in Frankfurt was the provisional Government of Germany would clarify many problems of policy which might remain obscure if the error were made of thinking only in terms of a West German State. The policies to be pursued by the Western Allies should be quite simply those which they would pursue if the unity of Germany had in fact been secured. They should reform the currency; they should revive industry; they should put a stop—or at least a final limit—to the dismantling of plant; they should put as much responsibility as possible on the Germans for the control of their imports and exports; they should accept Germany as an integral part of the new Western Europe that is the aim of the Marshall Plan; they should progressively transfer to the Germans both the substance and the forms of sovereignty, reserving only safeguards against re-armament and possibly some permanent supervision of the Ruhr. These policies should be worked out in such a way that they could easily be extended to the whole nation and the intention to do so as soon as circumstances permit should be stressed at every point.

Yet having laid down with the utmost emphasis the need for a provisional German Government in the West, one is compelled to admit that the main obstacles to such a policy have not been removed, since they lie not in any Russian opposition but among the Western Allies themselves. Those who believe that the Western Powers came to the London Conference determined to set up a separate German Government, whatever concessions Mr. Molotov might offer, should perhaps consider how totally unready the Western Powers are to pursue such a policy. There is no agreement between the French and their Allies on such vital points as the status of the Ruhr or the safeguards to be imposed in return for greater economic centralisation. There is barely an agreement in principle that the French Zone should enter a unified Western region. Practical means of incorporation have not even been discussed. It has taken the British and the Americans ten weeks of sustained haggling in Washington to work out the financial details of their bizonal settlement—a delay which promises little for speedy decisions in the future. And none of the three Allies is very impressed with the ability and drive of the Germans to whom a little responsibility has been given and to whom more power must now be transferred. The truth is that however desirable a provisional German Government in the West may be, the Western Powers have thought out neither the principles nor the tactics of bringing such an authority into existence. So little did they prejudice the issue of the London Conference that they are now unable to deal speedily and effectively with its outcome. If there is a functioning provisional Government in Germany by Easter it will be in Berlin, not in Frankfurt; and for once the Western Allies, having shed their Russian colleague, will have only themselves to blame.

Will Graduates be Unemployed?

WILL there be a sudden slump in the prestige of university education next summer, because of a steep increase in unemployment among young graduates? Are too many arts students passing through the universities? Does a university education stimulate excessive hopes in the hearts of its beneficiaries? What can be done to persuade young men and women from the universities to go willingly into business, and business to take more arts graduates? After all that has been said over the past eighteen months about the importance of increasing the output of the universities it may come as something of a shock to find such questions necessary. What has happened?

It is, in part at least, a temporary problem. For something like six years the universities were very largely on a care-and-maintenance basis; two whole university generations have been almost completely lost to the country. It follows that there must be a shortage of university graduates even on the basis to which the country had accustomed itself before the war. And, indeed, it is a matter of common observation that there is a crying demand for young men and women who, after graduating, have had three or four years' practical experience—that is, for the men and women who would now have been available if there had been no interruption. But to say this is not to say that it will be easy for the professions or for business to cope with an unusually large wave of immediate graduates, of beginners. The universities are making an effort, as they are in duty bound, to make up for lost time, and the result is that several university generations are presenting themselves for jobs almost at once.

Whatever the cause, and however valid the reasons for hoping that the difficulty is temporary, the result is to illuminate one of the more permanent difficulties in university expansion. The impulsion to a growth in the size of the British universities came originally from the side of the scientists. There is no doubt about the increased demand for scientists and technicians and—subject to one or two qualifications made below—no difficulty is to be anticipated in placing the increased flow of graduates. But it was wisely held, by the Barlow Committee and by others, that if the universities are to expand they should expand all round. Moreover, the entrants have the same view; there has been no tendency to desert the arts for the sciences. The present difficulty concerns the increased numbers of arts graduates who may next year find themselves milling around on one side of the river looking for jobs while across it are a number of openings of which neither employers nor their potential applicants are yet aware.

The most recent statement of university numbers was given in answer to a Parliamentary question on December 1st:—

FULL-TIME UNIVERSITY STUDENTS, GREAT BRITAIN

	Academic Year 1938/39			Autumn Term 1947		
	Men	Women	Total	Men	Women	Total
Arts, including theology, fine art, law, music, commerce, economics and education	14,936	7,776	22,512	22,094	12,106	34,200
Pure science	5,909	1,858	7,767	11,193	3,327	14,520
Medicine and dentistry	11,623	2,013	13,636	12,389	3,175	15,564
Technology, including engineering, applied chemistry, mining, metallurgy, architecture, etc.	5,199	89	5,288	9,850	293	10,143
Agriculture, including forestry, horticulture and dairy-work	890	153	1,043	1,994	343	2,337
Grand Totals	38,557	11,689	50,246	57,520	19,244	76,764

There has thus been an overall increase in numbers of 53 per cent since 1938, which is an admirable achievement. The break-up of these global figures reveals some very sharp differences between faculties; the number of arts students has now

increased by some 50 per cent, whereas the numbers studying pure science and applied science have both doubled. Only in medicine has the increase been slight—a mere 14 per cent—partly because there was a much smaller wartime interruption. The proportion of arts students to the total has remained almost constant—it was 44 per cent in 1938/9 and has been 45 per cent this last term. But proportions matter less than absolute numbers. With 12,000 more arts students in the universities than in 1939, it is doubtful what immediate jobs they will be able to find in 1948, 1949 or 1950, when the ex-service bulge will be working its way out of the universities. For the present there is no anxiety about the scientists and technologists, for whom some universities report three jobs for every applicant. The chances for most arts graduates, however, show no such wide range of choice.

*

What are the main openings for arts graduates and what is the competition for them? University Appointments Departments report that the popularity of the civil service as a career is overwhelming, the international organisations are good seconds, and the various public corporations and bodies of a like kind can claim third place. Teaching, except for those who have committed themselves at an early stage for teachers' training grants, is unpopular; business comes a very long way down the list.

There are four reasons for the unpopularity of business. First, its unfamiliarity; many families have some direct or indirect contacts with business and industry, but the contacts are usually very local and their manifestations may be not at all glamorous, while "big business" is remote and unknown. Secondly, there are no regular entrance roads into the business circle, as there are into the civil service or teaching; instead of taking a public examination or doing a regular training, the new recruit must grope and feel his way by introduction, recommendation or wire pulling. Thirdly, the work that most business firms can give the new entrant in his first few years is less attractive than he can get in the public services; and though the further prospect may in fact be more attractive—both in pay and in character of work—it is uncertain and seems remote to the young man who is in a hurry, as ex-servicemen are apt to be. And fourthly, the lure of high finance and business enterprise, while it has long since lost the nineteenth century taint of "trade," has acquired another unwelcome flavour. To a generation bred in socialist doctrines to enter the palaces of capitalism is rank betrayal. The Appointments Departments also report a very strong bias against entering business, a bias persuasively supported by parents, who remember the depressions of the twenties and thirties, and think a job in the public services much safer.

Yet it is in business that the graduate is needed, and it is only in business that he can be placed in large numbers. While it is perfectly true that the civil service could do with a certain increase in the administrative grade, and that more future administrators are wanted in local government and in the new public boards, these demands are quantitatively small. It is no use relying on them to absorb a large increase in numbers. There are rather more openings in teaching, and the schools are anxious to recruit more graduates with good degrees. But the large area of new employment must be commerce and industry. Industry needs such recruits, even if it does not yet recognise the need; and from the point of view of the country it is urgently necessary not only that more men of

vision and broad ideas should swell the ranks of industry's High Command, but that more NCOs should be drawn from the universities. The industry of the country needs all the fresh blood and the challenge of new ideas that it can get in all its parts.

But to achieve this new infiltration, both undergraduates and industrialists will have to undergo a considerable conversion. Short of revelation through the dole, the conversion of the students is likely to be slow. Unemployment among students in Germany and Austria between the wars shows how difficult the adjustment of prejudices and standards can be—and, incidentally, how dangerous. The prospect for a changed attitude among employers is more hopeful, for they are likely to find a shortage of good recruits from the schools. Indeed, some employers are already beginning to feel anxious. As university education becomes more popular, and state scholarships make it less expensive, a higher and higher proportion of bright boys will go right through the educational system with a free secondary and university education. Employers who have, in the past, recruited at sixteen and eighteen will increasingly find that only the less bright are available and that the cream have passed out of their ordinary reach.

The need for a change of outlook is urgent. At the end of the academic year last July, employers had still a number of vacancies. Nevertheless, there was a hard core of about a thousand graduates who had difficulty in finding suitable work. Most of these are now absorbed. Next year there may well be fewer openings and there will certainly be a larger efflux from the universities. These difficulties are likely to be intensified in 1950. The Appointments Departments of the universities are already very concerned about the position, and the Federation of British Industries is convening a conference in the early spring to discuss this question between industrialists and the universities, and there are signs, although still far too few, that individual business concerns, for instance some of the banks, are revising their attitude. Even

so, any change which necessitates the admission of non-technical graduates to industry is bound to be slow. And it involves accepting not only more future directors, but the much more ordinary recruit who may never rise high, but yet has his contribution to make as a works or bank manager, or as a labour or welfare officer.

Some brief mention should be made of the prospects of science graduates. So far, all the expectations aroused by the Barlow Report on scientific manpower have been justified, and industry is clamouring for scientists. Nevertheless, even at this stage one word of warning is necessary. The Barlow Report dealt mainly in global figures, and the detailed inquiries into the demand for scientists in particular scientific fields which have followed have revealed large variations. Until the universities are told the detailed requirements, there is a real danger that some departments will over-expand and that employment difficulties will follow.

For the moment, however, it is the arts and not the science graduates who are causing anxiety. It would be a tragedy if the drive and enthusiasm which has gone into building up the universities after the war were to be cut short and spoiled because of a short-term lack of balance between supply and demand. There can be no doubt that the nation needs to provide higher education for about twice as many young men and women as before the war, if it is to maintain its status, both culturally and industrially. But it is equally necessary to face the prospect that the process of adjustment may be extremely uncomfortable, and all the more so if economic difficulties encourage industry to adopt a cautious attitude. If however parents, schools and universities are prepared to regard industry as the nation's bread winner and not as a slightly disreputable underworld, the pangs of the transition can be greatly reduced. It is up to those who both give and receive a university education to appreciate that flexibility of mind is as essential as the acquisition of a special skill, and for industry to appreciate that new men are needed for changed times.

China's Tepid War

IN London the Foreign Ministers have fought only with words and the war has remained cold. In China, with between four and five million men under arms on one side or the other, the argument is carried on with bullets. Yet the war can hardly be called "hot"—at least by the standards of the recent controversy with Hitler. The Chinese civil war, though not without bloodshed, is a strangely shapeless, non-committal and inconclusive affair, as indeed is indicated by the rarity of any event in it which can qualify as "news" at the level imposed on the British press by the present newsprint shortage. This does not mean, however, that China is not suffering grave devastation or that there is no risk of the struggle leading to international complications. The issue of aid for China is, in contemporary American politics, complementary with—and can also be competitive with—that of aid for Europe, while from the Communist side it is clear that the effort to obstruct such aid will be as determined in Asia as in Europe.

The war in China may be compared to a game of chess in which white has neither king nor queen, but has the possibility of winning the game in the ordinary way by checkmate, whereas black can only win—in the absence of a white king to be checked—by taking all white's pieces. The "Nanking" Government would lose the game if it lost its capital (or Shanghai), but the Communists cannot be decisively defeated by the loss of any place which they hold; the capture of their former headquarters at Yen-an by Government forces did not make any difference to them. Outside North Manchuria the Communist

power has an essentially guerilla character. As General Fu Tso-yi, Commander-in-Chief of the Government armies in North China, complains, the greatest asset of the Communists is their "ability to run away." Only by destroying their bands in detail can their power be broken and their interruption of roads and railways brought to an end. The Government troops, in spite of their superior numbers and equipment, have so far had little success in their campaigns of "mopping up" a highly mobile enemy, well-co-ordinated by a central directing authority, but dispersed over an area several times the size of the British Isles. On the other hand, the Communists lack strength for pitched battles and—again with the exception of North Manchuria—have not been able to capture any large city or to hold any important position against really determined Government attack. The result of warfare on these terms is a lack of clear-cut military decision on a national scale, though it would be misleading to speak of a stalemate because the situation is too fluid and the "fronts" are continually changing.

It is doubtful whether a mere increase of armaments on either side would have a decisive effect. Both sides have enough small arms for such fighting as they indulge in. The Government has the advantage in heavier weapons whenever the Communists give battle under conditions which allow scope to them. But for the pursuits in the countryside the Nanking troops can make little use of heavy armaments, even when they are competent to maintain and operate them. The Communist bands sleep in villages by day and march by night, giving few targets to superior

air power, or they lie concealed in loess caves or in the fields of *kaoliang*, a kind of sorghum which is a staple crop in North China and Manchuria and grows as high as a man. In this kind of warfare, bombers and tanks do not yield results comparable to the cost of their maintenance and supply services. For the Communists the provision of a quantity of heavy equipment and munitions, with suitable training of formations to use them, would mean a greater addition of fighting power, and in Nanking it is feared that such a striking force is indeed being prepared with Russian assistance in North Manchuria. But the Communists would be giving hostages to fortune if they turned over in any considerable degree from guerilla to positional warfare, nor would it be easy for the existing Communist military leadership, which has for so long been schooled in guerilla tactics. From a Russian point of view large-scale material aid to the Communists would destroy the semblance of non-intervention which the Russians have been able to keep up since their evacuation of Manchuria, and would provoke a renewal of American arms supplies to Nanking on a much more formidable scale than hitherto.

The question is not, however, merely—or perhaps even mainly—a military one. The Chinese Communists undoubtedly have a strong popular following, and in North China they have a record of local political power and administration independent of any Russian support. In Manchuria the situation is rather different, for there the Communists were not only helped into power by the friendly Russian occupation, but continue to stand in a special relation to the Russian authorities in Port Arthur and Dairen and in the management of the Manchurian trunk railways. But, in general, the Chinese Communists are not so obviously tied to the Soviet Union as their brothers in the Eastern European countries of the Russian bloc, and it has been possible for them to a certain extent to steal the old nationalist, anti-imperialist thunder of the Kuomintang. The Chinese man in the street has long been told, and is only too ready to believe, that all the troubles of his country are due to foreigners, and the sentiment engendered by this belief tends to be concentrated against the most conspicuous foreign nationality. Britain held this undesirable eminence only twenty years ago; after that, it was the Japanese, and since their unlamented exodus, the Americans have been in danger of qualifying—at any rate south of the Great Wall. A Chinese, when asked in 1945 whether British or American troops were the more popular in China, replied: "The British—there aren't any."

Certainly, it was impossible not to notice the presence of the Americans or the luxurious accessories of their military establishment, which evoked the resentful envy of the Chinese armed forces, and the well-meant American efforts to make the Chinese more efficient only aggravated the ill feeling. Most of the wartime and immediate postwar American immigrants have now gone home, but the charges of American imperialism and of Chiang Kai-shek's subservience to it are still good propaganda cards in the hands of the Chinese Communists. In a recent broadcast on the Shantung campaign the Communists explained that the Nanking Government's aim was to take the province and "sell it to the US imperialists as a base for aggression against China."

The reproaches against Chiang Kai-shek for his alleged "selling" of China to "US Imperialism" make it politically very difficult for him to accept American aid with any strings attached. On the other hand, without numerous and plainly visible strings, it will be difficult for the American Government, however convinced it may be of the need for bolstering up the Chinese Government, to justify to Congress large expenditure for China. It is above all the corruption and the maladministration of funds which make it so difficult to ensure that any assistance to

China achieves the ends for which it is intended, and there will inevitably be a strong American demand for strict supervision of the use of further money and supplies which may be provided. But how can there be such supervision without infringing China's jealously preserved sovereignty and exposing the Kuomintang leaders to the one accusation that is most dangerous to them—that of being the "running dogs" of a foreign Power?

That it will not be easy to solve this dilemma is indicated by the recent obstinacy of the Nanking Government on the question of foreign shipping on the Yangtse. The privilege of navigation on Chinese inland waters formerly enjoyed by the "Treaty Powers" was indeed an abnormality in international commercial relations, and it can well be understood that the Chinese have wished to abolish it along with extra-territoriality and other marks of an inferior status among nations. But for the time being China has not sufficient shipping to handle the Yangtse traffic, and the exclusion of foreign shipping since the end of the war with Japan has meant that goods which might relieve both world shortages and China's desperate needs for foreign exchange either cannot be transported at all, or are too costly by the time they reach Shanghai to be exported at commercial prices. Yet China would rather forgo the advantage to itself in a time of acute economic distress than make a temporary retrocession of "recovered" national rights. It is this spirit which makes it so peculiarly difficult for the Americans or anyone else to join in a "Marshall Plan" for China.

★

Meanwhile the currency inflation continues. The Chinese dollar, which was worth 130,000 to the American dollar on the Shanghai black market on December 3rd, was worth 132,000 three days later. The civil war aggravates the inflation in two ways: first, by the burden of military expenditure, which can only be financed by printing notes, and, secondly, by the disruption of internal communications and trade, which produces acute shortages of all kinds of raw materials and commodities, whether for the home market or for export. Regionally, the general economic effect of the civil war has been to depress North China and Manchuria, the zones of actual warfare, while China south of the Yangtse has remained more or less unaffected. The Communists have been able to prevent the revival of industry in Government-controlled areas in the North and North-east by cutting off supplies of coal and electric power and by blocking the movement of raw materials, but as long as the Government holds key points from Changchun southward, the Communists cannot do much themselves to organise the resources of the territory they control. If the Communists could drive the Government troops out of Manchuria altogether, they would be able to set up there a state with a viable economy, but Chiang Kai-shek has given first priority in his strategy to holding on to his advanced positions in Manchuria, contrary to advice given him from some quarters to cut his losses in Manchuria and concentrate his forces on North China. Chiang evidently believes that, if he cannot at present knock out the Communists, the next best course is to deny them territory adequate for a full separate state organisation—which would be the equivalent of a partition of China.

Chiang's base remains in the South, as it was twenty years ago, and he has recently taken steps to strengthen his position in Canton by removing from all positions of authority the "over-mighty subject" General Chang Fa-kwei, who is consoled with the empty honour of membership of the Strategic Advisory Committee. It may be that, if China is to be rebuilt with American aid, it will have to be done by groups of provinces, starting from Canton. It is only a prosperous South China that can in the long run give the Kuomintang the power and political attraction which would enable it to emerge victorious in its struggle to re-unify China.

NOTES OF THE WEEK

Should the Sixteen Meet?

Congress has approved the sum of \$597 million for immediate relief in Europe and China, and now the Appropriations Committee is engaged in an attempt to upset the allocations to separate nations proposed by the Administration. But the dispute over the appropriations will not alter the President's timetable, which is to have the Marshall plan before Congress when it assembles in the New Year. If the debates on Interim Aid are any guide, the plan will be approved probably more rapidly than anyone would have thought possible last summer, when even the holding of a special session seemed in doubt. At the same time, opposition to the idea, scepticism about the worth of the recipients, hesitations about pledging so sizeable a part of the American national income to foreign aid will all receive much more vigorous expression than they have done hitherto; and there is at least a chance that some difficult and politically embarrassing conditions may be attached to the American appropriations.

Whatever the course of the debate in Congress, it is clear that a new phase is opening in the European recovery plan, and one may ask whether Mr Bevin is right in maintaining that the time to reconvene the Paris Committee has not yet come. The answer must surely be that it would be little short of folly at this stage to take no further steps to concert the European end of the Marshall offer. In the first place, everything must be done to shorten the time of negotiation, for in Europe, time is running out. If the sixteen interested governments postpone all decisions on how they will negotiate their different national shares of the overall plan, on the principles they will adopt and the sort of conditions that are acceptable to them until such time as Congress has passed the Recovery Bill, precious weeks will be wasted. The Sixteen should be in a position to negotiate with Washington the moment there is something to negotiate about. And even if, in the first phase, joint negotiations through a single European agency are impossible, the Sixteen should at least decide that the various bilateral negotiations between America and the different nations shall take place simultaneously (in Washington, obviously) and be held together by a liaison committee of the Sixteen, whose purpose it would be to prevent blatant and demoralising competition at the receiving end.

The decision to proceed in such a way cannot be taken from one day to the next. If it is to be reached at all, negotiations in that sense should begin early in the New Year, and Britain should take the initiative in calling the Sixteen together.

There is another reason why initiative should come from Europe. Signs of activity and determination there will strengthen the hand of the Administration in its debate with Congress. A demonstration that the Sixteen are ready to act immediately and together, once the American aid is available, may be the decisive fact in persuading the doubters in Congress. It is beggars who sit and wait. Enterprising men in search of capital are out measuring the site the moment they scent the chance of a loan.

* * *

Trade Agreement with Russia

The news of the Anglo-Russian trade agreement, providing for an exchange of coarse grains for machinery, and of the clearing of the ground for further and larger deals, has been universally and naturally hailed as a good thing. And so, of course, it is. Britain needs coarse grains as badly as any other group of commodities imaginable—even wheat; it has a more general but equally urgent need to open up trade outside the dollar area; and since Russia's need for equipment to restore its devastated areas is equally obvious, it is easy and tempting to build, on this demonstration of mutual economic usefulness, hopes of some measure of political détente.

Second thoughts are not quite so uniformly cheerful. For one thing, the agreement is not yet signed, and there's many a slip. The Russo-Czech trade agreement, concluded in principle (with admirable political timing) last July, as a demonstration that Marshall aid had not been renounced in vain, was only actually signed, after many vicissitudes, five months later. For another, while actual prices still remain officially secret, it seems clear that on the more general questions involved, particularly the vexed issue of the 1941 agreement, the British have given way all along the line and weakened the country's future bargaining posi-

tion affecting a much larger volume of trade, to what may prove a very unfortunate extent. The duration of the agreement—five years—is from one point of view reasonable enough; it is only over a fairly long period, in the present state of production and stocks, that delivery of British equipment can be guaranteed. From another point of view it is a dangerous precedent. Britain is not Sweden, and neither this agreement nor any other likely to be concluded with Russia (until Mr Pollitt forms his government) will produce quite the uncomfortable distortion of its economy that the Russo-Swedish agreement has inflicted on the smaller party; but there are lesser degrees of distortion which might be unwelcome. And finally, the political implications of the deal are not entirely harmonious. The highest aim of Russian political strategy is to drive a wedge between Britain and America. At a time when voices, however irresponsible, are raised in Congress demanding a total ban on trade with Russia, Britain's action may be made to appear a defection from western solidarity; which would suit the Russian book very nicely. Russia has only itself to blame for the conviction, now deep-rooted in the western mind, that who sups with the Soviet should have a long spoon.

* * *

New Course for Czechoslovakia

Trade worth £25 million yearly each way is provided for in the five-year trade treaty between the Soviet Union and Czechoslovakia signed last week. The Russian share in Czech trade will rise from four to 15 per cent, and about 40 per cent of Czech exchanges will now be with the planned economies of eastern Europe. It is hoped to raise the proportion to a half. For the Czechs the treaty means not only assured supplies of raw materials for their heavy industries—making planned production possible—but also an assured market for the products of their engineering industries. They succeeded also in persuading the Russians to take some of the products of their light industries, the raw materials and outlets for which are still mainly found in the west.

It would be wrong to say that this development of trade with eastern Europe is being forced on the Czechs, or that it has an anti-western significance. It is welcomed by the National Socialist Minister of Trade, Dr Ripke, whose independent political outlook is well known and who would like nothing better than expanded trade with the west as well. But there Czechs increasingly see a ring of import restrictions, tariff barriers and quotas, with an American slump threatening and German competition looming on the horizon.

On the shorter view, Czechoslovakia's chief gain from the treaty is the assurance of grain deliveries. Drought and the end of Unrra left the country short of 800,000 tons of grain, and there is still a serious shortage of food, especially in Slovakia. In July it looked as if Russian offers of 400,000 tons, with supplies from elsewhere in eastern Europe (and perhaps America), would make possible reduced but ample bread rations. In fact, the Communists proclaimed that the ration would go up when the Russian grain arrived, thereby making it hard for the Government to get a share in international allocations. Unfortunately, while distribution was failing and farmers hoarding, the Russian grain was slow in arriving, owing to transport difficulties. It was only when political as well as economic crisis threatened that the Russians agreed to send another 200,000 tons, and to speed up deliveries. Now, at the one frontier station linking the two countries, grain is being unloaded from Russian-gauge wagons into Czech-gauge wagons, with press photographers assisting.

In time, if they succeed, the Communist planners in Prague and Moscow will reduce Czechoslovakia's present dependence on the West for most of its imports, especially raw materials for the textile and other light industries. The long-range purpose of the mutual aid and planning now developing in the East is to change the whole structure of the country's economy, with light industries contracting while heavy and chemical industries expand.

* * *

Disclosure of Information

There was a postscript to the Allighan case in Parliament last week when Mr Morrison introduced a motion to the effect that any person offering a payment, which is then accepted, to a member for the disclosure of confidential information should

incur the grave displeasure of the House and that the House should take such action as it thought fit. This was much milder than the original motion, which had been left over for further consideration. That had proposed that if a person offering payment was a representative of a newspaper or press agency, he, and any other representative of the newspaper or agency, should, if the House thought fit, be excluded from the precincts of the House for an indefinite period.

Yet, as members on both sides of the House pointed out, there are grave objections even to this milder motion. Mr Morrison's case appeared to be that journalists who offer bribes should not get off while members of Parliament are punished. In the Allighan case, the Editor of the *World's Press News* was severely reprimanded for a clear breach of privilege; he had printed an article by Mr Allighan which amounted to a gross contempt of the House. But the representatives of the newspapers who offered Mr Allighan and Mr Walkden money to disclose what went on at Parliamentary Labour Party meetings were left alone because they did not know that they were committing a Parliamentary offence. The Government, therefore, brought in this motion to put all journalists on notice that proceedings may be taken against them—not, under the new motion, against other representatives of their newspapers—if such offences occur again.

It is not only that difficulty may arise, as some of the opponents of the motion emphasised, in determining what, from the wording of the motion, will constitute an offence which can bring Parliamentary displeasure on the journalist concerned. The point is that in disclosing, for payment, what went on at private party meetings Mr Allighan and Mr Walkden were not found guilty of a breach of privilege but of dishonourable conduct, and in finding them guilty of dishonourable conduct the House was performing the same sort of function as any professional body performs in respect of its members charged with unprofessional conduct. No other profession seeks to penalise outsiders who have contributed to the dishonourable conduct of its members. Ought the Government, therefore, to have pressed this general motion against journalists instead of allowing each case to be decided on its merits? By attempting to formalise the offence, and refusing to allow the motion to be decided by a free vote, it laid itself open to the charge of wanting to extend Parliamentary privilege. It would have been far better to let the whole matter end with the punishment of Mr Allighan and Mr Walkden.

* * *

Parliamentary Seats

The redistribution of seats in the House of Commons proposed by the Boundary Commission contains few surprises. The general lines of its proposals had been determined by the revised instructions, issued earlier this year, which bade it modify the original search for mathematical equality of representation in favour of preserving, so far as possible, the unities of local government and community feeling. The resultant compromise leaves in being a number of constituencies that are both much larger and much smaller than the average. Under the new proposals, no constituency will have fewer than 40,000 or more than 87,100 electors; but there will be 87 small constituencies, mainly in rural areas, of under 50,000 electors and 44 large ones with over 70,000. Nevertheless, nearly three-quarters of the new electorates will fall into the 50,000-70,000 range, compared with less than two-fifths under the existing, and admittedly distorted, division of seats. This represents a substantial gain in fairness, and those theorists who think more might have been done should realise that it is difficult if not impossible to divide the population more equally without disrupting strong ties of local interest and sentiment, which add greatly to the effectiveness of representation.

The redistribution favours rural at the expense of urban areas, and Scotland and Wales at the expense of England. The latter point was settled for the Commission by the instruction that the elimination of twenty seats, which was thought to be necessary, should fall on England alone. Actually, Wales is to gain one seat by the division of Flintshire and England will lose 21 seats (on the purely provisional assumption that the City of London's representation will be reduced from two members to one). All two-member constituencies are divided or else, as in the case of Norwich and Blackburn, reduced to a single seat. A further point, which was already known, is that the full burden of this loss falls on the County of London, whose representation is cut down from 60 to 40 members. However, this still leaves London with exactly the same proportion of seats to electors as the rest of England and rather more generously served than other urban areas. The political impact of the proposed redistribution will be interesting. The reduction of seats inside the County of London, and the

comparative preference in representation given to rural areas, can be expected to work to Labour's disadvantage.

* * *

Royal Allowances

There was something reminiscent of the earlier decades of last century in the House of Commons debate on the civil list when over 160 Labour and Communist members voted for an amendment to reduce the provision to be made for Princess Elizabeth by £5,000. The matter was left to a free vote, and opposition to the Government's proposal was not unexpected in view of the minority proposals of the five members of the Select Committee, though its size must have given the Government rather an unpleasant shock. The additional allowance proposed by the Government was £25,000, which when added to the £15,000 which the Princess receives under the Civil List Act of 1937 would bring her total provision up to £40,000. In addition an allowance of £10,000 was proposed for the Duke of Edinburgh, making a total for the royal couple of £50,000. When the official expenses of the Heiress Presumptive, which were estimated by the Committee at £45,000, are taken into account, the provision made seems moderate enough, and in the circumstances Sir Stafford Cripps's suggestion that Princess Elizabeth should be relieved by Treasury Order of income tax on all but one-tenth of her annuity and the Duke of Edinburgh on four-fifths of his seems eminently reasonable.

It is difficult to feel much sympathy with those who voted for either of the amendments, but those who opposed the additional allowance *in toto* were at least straightforward. As Mr Benson pointed out, it was merely fantastic to quibble over £5,000, and there was something more than a little nauseating in the unctuous plea for royal austerity made by Mr Webb. It should not be forgotten that the King has proposed to pay into the Exchequer no less than £100,000 which he has saved during recent years from his Civil List income or sufficient to cover four years of the additional grant now approved for Princess Elizabeth. In the difficult and exacting task of public representation the present Royal Family has shown an admirable instinct for striking the golden mean between ostentation and parsimony. Here is no case for cheese-paring, and public opinion—whatever a hundred and sixty Labour members may profess to think to the contrary—will in this matter most decidedly "reject the lore of nicely calculated less or more."

* * *

Next Stage in France

It is not yet clear which has suffered most from the failure of the French strikes: the trade unions as such or the Communist Party that tries to control them. Trade union leaders without political axes to grind expect the loss of two million or more members when subscriptions become renewable in the New Year. The great *Confédération Générale du Travail* itself faces the possibility of a split between its most active, Communist-directed wings and the moderates and non-politicals led by M. Jouhaux. The national conference this week-end of M. Jouhaux's anti-Communist *Force Ouvrière* movement should show whether he can afford to move into the wilderness without his share of the income and property accumulated by the CGT. The strikes showed how inadequate are the funds of many French unions for any prolonged resistance; indeed, towards the end, some workers were living on advances from their pay for the next month.

Whatever the new balance of forces in the French labour movement may turn out to be, another general strike is unthinkable. In so far as it failed either to be general or lengthy, it was a failure for the Communist promoters; in so far as it did £300 million worth of damage to the French economy's capacity to work the Marshall Plan, it was a success. For the workers it was a failure by both standards, and they gained no concessions from the Government over wages and prices which could not have emerged from the discussions long ago promised for December 1st.

But if M. Schuman's government fails to keep wages and prices in some kind of stable relationship, and if it cannot appease the workers' sense of social injustice by drastic moves against the black market and the recalcitrant farmers, there will certainly be by the spring an uprising of despair against poverty and bad food. Before then the Communists might find it possible to stage "strategic strikes" in such key industries as transport, coal-mining and electricity production. Among the dockers and miners at least the rank and file are Communist almost to a man.

As no French Government can feel any certainty that its financial and fiscal measures will work—the latest set of proposals will come before the Assembly this week-end—M. Schuman has to prepare the Budget with one hand and the defence of public order with the other. A purge of the police forces is being planned on a

national scale, and the special security police (CSR), which was infiltrated by Communists soon after the liberation, is to be reorganised. Of the men mobilised a fortnight ago, only the older age groups are being released, and 80,000 of the men between 20 and 21 will be kept in metropolitan France to meet the next challenge.

M. Schuman will not find it easy to reconcile the cost of police and military preparations with the economy drive and increased taxation which stabilisation will demand. But the general opinion in Paris is that his Cabinet may survive to face the spring crisis.

* * *

M. Monnet's Warning

Considering the background of social and industrial conflict against which they were working, it is remarkable that M. Monnet and his collaborators were able after two months' work to produce this week a unanimous report on the economic state of France. Their conclusions point out to M. Mayer, the Minister of Finance, the hard, unpopular things that must be done if France is not to have, for the first half of next year alone, a deficit of almost 200 billion francs. This represents the difference between estimated industrial and agricultural production and services on the one hand (plus the surplus of imports over exports), and on the other hand the demands of the state collective bodies and private individuals for consumption and investment.

While the Monnet commission was adding up its asset column, which assumed full and uninterrupted coal production, the strikes were costing over 2½ million tons of coal; and the agreed revision of salaries and wages will add another 170 billion francs to the debit side. In other words, the gap between supply and demand may have been doubled by the troubles of the last six weeks.

The commission states quite bluntly that unless inflation can be dealt with, there will be neither social justice, nor better living conditions, nor indeed national independence. To maintain production at home France will need food, raw materials, and fuel to a value which will exceed its export possibilities by over \$2,000 million. Such requirements exceed by far the amounts now being discussed in Washington for interim and long-term American aid. If greater aid is not forthcoming, what are the alternatives? There is one that would make M. Schuman's position untenable and lead France straight into extremist hands—namely a huge cut in imports which would cause severe food shortage and unemployment. The other is internal stabilisation and a complete fiscal overhaul. It is along these lines that M. Mayer is expected to move, if the weight of the government's authority is sufficient to give impetus to his policy.

* * *

Financing Bizonia

After long discussions, the British and American Governments have reached a very satisfactory solution of the problem of financing essential imports into Bizonia. The problem has had three aspects since occupation began. The Germans are not producing enough to buy their own supplies of food and raw materials. These vital supplies can on the whole only be bought with dollars. And Britain, responsible hitherto—in dollars—for 50 per cent of the balance between German exports and German imports, has now no more dollars to spare.

The essence of the new agreement is that America will take over responsibility for about 80 per cent of the uncovered imports. The British Government will not be called upon to supply any goods for which dollars must be paid, although in 1948 it will finance various basic supplies to the extent of £17,500,000, a figure which might be raised by about another £4,000,000 if certain foodstuffs became available for sterling. The British have also undertaken to provide 33 ships to lift cargoes from America in November and December of this year and to shift 12 complete cargoes in the course of 1948.

The only circumstance in which the British may still be called upon to convert sterling into dollars is if the dollar reserves held by the Joint Foreign Exchange Agency—the Anglo American body controlling Germany's reserves of foreign exchange—fall below \$20 million. Under an old commitment the British would then be obliged to convert sufficient sterling to bring the balance back to \$20 million. However, the Americans have given an undertaking that the British will not in practice be called upon to convert more than £10 million in 1948.

Obviously there had to be a *quid pro quo* for the assumption by America of additional commitments in 1948 to the tune of \$400 million, and the British have agreed that the Americans should

now have a controlling voice both in the Joint Import-Export Agency and in the Joint Foreign Exchange Agency. In other words, the most important aspect of Germany's foreign relations and a vital field of its internal economy will now be under predominantly American direction. There is no reason to suppose that the American Administration is not genuinely anxious to work the new system in the closest collaboration with the British or that the British will find themselves relegated to a somewhat humiliating back seat. But much will depend upon the attitude of Congress, and it is disconcerting to see how very far the House of Representatives seems to be from understanding either the intentions of the Administration or the actual terms of the new agreement. After cutting the appropriations proposed for Interim Aid in the British Zone from £59,250,000 to £25,000,000, they explained their action by saying that British administrative costs were too high. Since Britain pays its own costs and they were not part of the financial agreement, the attitude of Congress seems not only ignorant but calculated to get right under the British skin.

Better News from Italy

The demonstration given in France that a Centre Government can remain master of an ugly situation without going outside the Constitution has been repeated this week in Italy. On December 10th the Communist-dominated Chamber of Labour for Rome called a general strike to protest against rising unemployment and to demand greater expenditure on public works. The Minister of the Interior, Signor Scelba, maintained order through the first day by an effective deployment of his police forces, and there were no riots and few effective demonstrations. By the second day it was clear that the strike was fizzling out and the Chamber of Labour called it off during the afternoon, claiming as the excuse that the Government had conceded its demand for the allocation of 10 billion lire for public works. In fact, the Government added a billion lire to work already planned, and the Municipality promised to expand its own programme.

The Communists then tried to indict the Government for its use of the police during the strike, but the motion was rejected in the Chamber by 216 to 111, the largest majority yet obtained by Signor de Gasperi. This larger measure of support reflects the fact that the Republicans and the Moderate Socialists have at last decided to join the Government. Three Socialists and two Republicans have received portfolios, and one of the abler Socialists, Signor Tremelloni, has taken over the key Ministry of Industry and Commerce. These changes draw the Government back to a centre position from which in the last nine months it has dangerously strayed.

The reshuffle is all the more welcome in that the strike in Rome was a genuine danger signal. Signor Einaudi's deflationary policy is having its inevitable consequence in rising unemployment, and however favourable some of the economic consequences may be, the political and social effects are growing worse. The entrance of Socialists into the Cabinet may offer some guarantee that the "underprivileged" do not pay the whole price of restored financial equilibrium.

* * *

Placing the Responsibility

An important point was brought up during the first day's discussion by the standing committee on the National Assistance Bill. In the clause setting up the National Assistance Board and placing upon it responsibility for dealing with applications for assistance, Colonel Elliot tried to have an amendment accepted which would incorporate the 24-hour service principle of the present Poor Law. Under this law a clear personal responsibility is placed on the relieving officer to deal with cases of sudden or urgent need at all hours of the day and night. If he fails to discharge this responsibility, he can be prosecuted. He can only give relief in kind, until the case has been submitted to the public assistance committee, but this personal obligation to be available and to give relief at all hours has been one of the outstanding virtues of the existing Poor Law.

It is quite true that the new Bill places a general responsibility on the National Assistance Board to give relief in cases of sudden and urgent need and allows it to dispense with compliance with the regulations in so doing. This provision goes a long way towards incorporating the main principle of the Poor Law. But it is not the same thing as the personal responsibility imposed on the relieving officer. Mr Griffiths, Minister of National Insurance, justified his refusal of the amendment by the plea, first, that the Board was at present considering whether its officers

should be available after office hours and at week ends and, secondly, that through the break up of the Poor Law various classes, such as the sick, the mad, and homeless children, would become the responsibility of other authorities.

But this second plea assumes that people readily fall into the categories prescribed for them. Can a person who finds himself suddenly and urgently in need, or can his relatives, decide which social service agency is responsible for him? And whereas, under the Poor Law, on the word of a relieving officer a doctor is bound to go to a patient and a hospital is bound to take in a case—the latter obligation has unfortunately been breaking down in recent years through the shortage of beds—no such obligations are incorporated in the National Health Service Act. People in distress must not be shuttled from one social service agency to another, each disclaiming responsibility for them. Personal responsibility must be assumed for what is a very personal service, and the point should be pressed again on the report stage of the Bill. Otherwise, as a Labour member emphasised in committee, there is a danger that some people may be worse off as a result of the so-called abolition of the Poor Law than they were under it.

Requisitioned Land

The Requisitioned Land and War Works Bill was read a second time in the House of Commons on Tuesday and the second reading was carried by 251 votes to 108. The Bill is one of the worst recent examples of legislation by reference. As drafted, it consists almost entirely of a string of verbal amendments to the main Act of 1945. The main purpose of this Bill is to extend until December, 1952, the term within which the Services may decide what land and what rights over land they need to retain, and the main criticism in the second reading debate was that the Services were an unconscionable time in making up their minds in any case, and that the more time they were given the more they would use.

The use of land for Service purposes is an extremely thorny problem. The Government were undoubtedly helped in the debate by the facts and arguments already made available in the recent White Paper on the subject. As Mr Shinwell, still a novel figure in the rôle of Secretary of War, was able to

CLOCK

The **CURRENT** way of telling the **TIME**

say in the course of the debate, the eleven million acres of wartime requisitioned land had already shrunk to one million and only 14 per cent of the present total was good agricultural land. The problem has at least been reduced in dimensions; the baby is a little one.

The Bill is needed for practical reasons, and to do justice to the landowner over the question of the basis of compensation. It is probably unfair to accuse the Services of undue delay. The last two years have not provided a calm background against which to run the foundations of Service training rapidly back to pre-war size. But one thing in this connection is essential. The Government and the Service departments must face the fact that practically every acre of land they wish to retain is wanted by someone else, for good reasons. The Service claim may be the better one, but it must be one capable of justification, and justification to the general public. There may be excellent reasons for a firing range in Dovedale; the War Office should learn that the reasons must be produced at the same time as the proposal, not be released reluctantly afterwards in the manner of one throwing a bone for a bad-tempered dog.

* * *

Palestine Bloodshed

With the exception of Czechoslovakia, the five member nations of Uno's Palestine Commission have still not been able to produce their representatives. A certain reluctance of individuals to serve on it is understandable; and its eventual arrival in Palestine will undoubtedly be the signal for fresh disturbances. Until the Commission is formed, the British Government cannot arrange with it details of the transfer of authority. Meanwhile, the casualties in Palestine mount steadily. Exact figures are not yet available, but it is probable that there have been well over 100 killed and scores of wounded since partition was first declared three weeks ago.

Arab violence is still sporadic and unorganised, and is believed to be contrary to instructions received from the Mufti's headquarters in Beirut. But there is danger that the Mufti may for once find himself carried along by, rather than directing, events. Jewish reactions, at first defensive, have turned to reprisals, which have taken the form of indiscriminate slaughter of Arabs in bus

TI

and Britain's true wealth

TI's direct exports have surpassed pre-war records by well over one hundred per cent. For the past financial year the figure stood at more than three and three-quarter million pounds.

A significant thing about this large sum is the fact that less than a fifth of it represents the cost of materials, while over three million pounds is overseas payment for British workmanship.

TI have embarked on a big reconstruction scheme at home which is aimed at the fullest possible use of British skill and experience. They know that Britain has enough of those two commodities to meet her own needs and the needs of half the world besides.

TI is a team of engineering industries which serve in more ways than may be realised. The component companies have made their own reputations in the fields of precision tubes, bicycles, electrical appliances and cables, wrought light alloys, pressure vessels, metal furniture and paints—the whole is TI.

Tube Investments Ltd., The Adelphi, London, W.C.2.

queues or in villages. Responsibility for the worst of these outrages has been claimed by the Irgun, which announced on December 1st that, while partition was "illegal," the Irgun itself would "cease to exist inside the new Jewish state." At the moment it appears to be still acting independently of the Haganah, though it has been made clear by the Tel Aviv press that a policy of reprisals has been envisaged also by the latter as part of its "defence" operations.

The effect of such reprisals, if persisted in, can only be to excite the Arabs beyond all control and so to involve the British forces in fighting both Arabs and Jews as they withdraw—a development probably less welcome to the Arabs than to some extreme Zionists. For Britain, the ugliest incident so far was that involving the Arab Legion, on December 13, near Lydda. A small Jewish convoy was stoned by an Arab mob, one of the drivers was wounded, and his lorry crashed out of control into an Arab Legion camp. The Arabs say a bomb was thrown, the Jews deny it, but in the upshot the Legionaries opened fire and 14 Jews were killed. Mr Bevin told the House of Commons last week that this British-offered force is to be withdrawn with the British forces and returned to Transjordan. An article on page 1008 shows that embarrassment would be avoided if this were to be done sooner.

Developments inside the Jewish camp are confused. Dr Weizmann has been counselling moderation and friendship with Britain, but he represents a Centre party which will be dominated by a rather left-oriented Labour bloc in the new Jewish Government. Dr Moshe Shertok, the Haganah leader, who is being suggested as the first Jewish "Defence Minister," took a more up-to-date line when he is reported as having told the press in Jerusalem: "The basic tenet of our foreign policy must be friendship with Russia, whose stand in the United Nations will never be forgotten." Dr Shertok himself is included with other Jewish Labour leaders as an ally of the "Anglo-Saxon armies now poised against the Soviet Union" in the November issue of the clandestine bulletin of the Stern Gang, hitherto considered a Right-wing Fascist group. The new line of these terrorists is indistinguishable from that of the Communists, attacking the Truman doctrine and the Marshall Plan, and exalting the "Eastern democracies" and the 2,000,000 Jews of Eastern Europe. This document chimes in surprisingly with statements by Arab leaders which would otherwise be dismissed as propaganda. For instance, Hussein Pasha, the President of the Egyptian Senate, declared in Cairo last Saturday that Russia supported the partition of Palestine because it would make possible the dispatch of 300,000 Rumanian Zionists to the Jewish state as a Communist fifth column.

* * *

Arab Arms and Jewish Loans

Outside Palestine, the Arab Governments have been moving on expected lines. Arab tactics will be infiltration, non-co-operation, sabotage, and guerilla warfare, maintained and supported from Egypt, Syria, and Iraq, and probably also Transjordan. One report quoted an Arab League official as saying that the Arab States had "informed Britain" that they intended to send forces into Palestine as soon as the British withdrawal was completed. Some unvarnished statements, which it would be dangerous to dismiss as mere words, have been made by Arab leaders. Jamil Mardam Bey, the Syrian Prime Minister: "It is likely that the Arab States, if all else fails, will invade Palestine with regular armed forces. . . . The struggle between Arabs and Jews will develop into full-scale war." Salih Jabr, the Iraqi Premier: "We Arabs will resist partition by all possible means, and we are ready to make all sacrifices necessary, including the cancellation of the oil concessions."

When the moderates and responsible statesmen speak thus, it is unnecessary to record the doings of the wilder groups which are now recruiting volunteers for Palestine. The only question is whether events in Palestine itself will not move rather faster than their tactical plans foresee. There have already been attacks by Bedouin on American pipe-line camps in Transjordan, and in Amman the offices and cars of the Trans-Arabian Company were smashed and set on fire—incidents which were certainly not wanted by King Abdullah.

In Washington, the American Zionists have intensified their pressure for American armed support. The beginnings of "non-intervention" may perhaps be read into the recent announcement of the State Department that the licensing of shipments of arms to the "troubled areas" of the Middle East have been discontinued. But the US Zionists, including such figures as Senator

Brewster and Mr Bartly Crum, have made it clear that they intend that the new non-intervention shall follow the Spanish precedent and not prevent supplies of surplus war materials and arms reaching the Palestine Jews from America.

These developments must be in the highest degree embarrassing for the US Government, which juridically is bound, as a result of the Assembly's decisions, not to take independent action outside the Security Council. The latter, which has not yet gone beyond putting Palestine on its agenda, has been called upon by Dr Weizmann in a public speech to station a token international military force in Palestine. Other US Zionists have returned to the idea of an international security force as a means of legalising the dispatch of armed Jewish volunteers to the Holy Land. On the financial side, the Jews of America have been asked by Eliezer Kaplan, treasurer of the Jewish Agency, to subscribe \$283 million in 1948 to launch the Jewish State. This is more than twice as much as has ever been subscribed before by American Jewry.

* * *

Films Bill

The text of the Cinematograph Films Bill has now been published. The Bill is needed this year because the Cinematograph Films Act of 1938 is due to expire in 1948, and in any case conditions in the film industry have changed sufficiently over the ten years to demand some alteration to an Act ten years old. In substance the main change proposed by the Bill is to replace a rigid system of fixing the quota of British films that an exhibitor must show each six months by one which is flexible. The original scheme of the 1938 Act provided that an exhibitor was bound to include in his programmes over six months a fixed number of "long" films (films over 3,000 feet in length) of British production. The same rule governed all exhibitors. The amount of the quota was laid down by the Act and there have been occasions over the last ten years when it was impossible for an exhibitor to comply with it. Henceforward the Board of Trade will fix the quota for each six months three months ahead. Further, theatres are divided into three grades; the small theatre, taking less than £100 a week on the average, the circuit theatre, one of a chain of more than 200 theatres in the same ownership, and the remainder, which in fact will be less than a quarter of the total number of theatres in Britain. The small theatre is exempt from the quota provisions. The circuit theatre, called a "special quota theatre," will almost certainly have a higher quota to observe. Further, a provision is included in the Act to prevent the large circuits from growing any larger. Licences may be refused where the applicant is already the owner of 200 theatres. The Bill also abolishes the "renters quota," which was in effect a provision that the film renter, or middleman, had also to handle a quota of British films. The burden of finding sufficient British films to meet the quota now falls on the exhibitor alone.

*

The remaining provisions of the Bill are designed to clear up minor points in which experience has shown the 1938 Act to be defective. A public performance for quota purposes is more closely defined. The rentals of all films are to be charged separately. A British film, save by special permission, ceases to rank as such for quota purposes four years after it was first registered. For the first time the Board of Trade is given power to apply the Act, with or without modifications, to the showing of sub-standard films, that is, to films smaller than the standard width of 35 mm. A more important point in the Bill is that the Cinematograph Films Council is given greater rights to be consulted and its composition is changed. Hitherto it has consisted of 21 members, eleven appointed as independents, ten by various sections of the trade. Under the Bill independent members are to be cut down to five and the numbers representing film makers and film employees respectively are increased in each case from two to four.

From the point of view of the trade the Bill will be welcomed, if only because it makes the whole scheme more flexible and strengthens the machinery by which the trade can bring pressure to bear on the Board of Trade over its six-monthly task of fixing the quotas. From the point of view of the public the Bill, like the 1938 Act, is in effect permissive. It gives the British film its chance. It does not—nor could it—compel the British film maker to make good films or better films, sensible films or silly films. The public can, in the long run, have its way, by making bad films bad box office. The Bill will clear some, but not all, of the obstacles out of the way of making that preference effective.

Letters to the Editor

Side-stepping the Issue

SIR,—Surely a "disinflationary" policy is better analysed in terms of "savings" and "investment" rather than those of the Cambridge Equation. I agree with Mr Magowan that to cut the food subsidies would probably result in pressure for increased wages; but he goes on to maintain that there were no such pressure, the cut would be inflationary because "money would be drawn from the inactive to the active stock." Let us assume that when the subsidies are cut, there are no wage increases, no changes in taxation, that food prices are pegged at a level allowing for the cut, and that there is an inelastic demand for food.

At first, Government savings are increased by the amount of the subsidy, "s"; consumer expenditure on food is, in the limiting case, increased by "s"; but the "income effect" of the price increase will reduce demand for other goods for which demand is more elastic in response to income changes. Thus the amount spent on them will decrease, but by an amount less than "s," "x" (< s); insofar as x would have been productive of revenue, revenue decreases by an amount "y" (< x). In the result Government savings are increased by s-y while consumer savings are decreased by s-x. Total savings are increased by x (< s)-y (< x). Employment will be reduced in those occupations for whose product demand has fallen, but in "over" full employment the unemployed will be absorbed by the undermanned industries; or insofar as the products are imports for which demand has fallen, the balance of trade will benefit: in any case total "savings" will increase, which is surely "disinflationary."

Thus though "money would be drawn to the active stock," it would only be consumers' money, and the effect would be offset by Government saving. Of course if we expect wages to increase, and consequently aggregate demand and wage costs, we must revise our estimates and admit that cutting the subsidies might defeat its own object. But it is possible that at the new price and income level, and when the price of food is higher than before in relation to other prices, we might be nearer the equilibrium of savings and investment and a less unfavourable balance at the optimum employment of resources.—Yours faithfully,

Sunnyside, The Green, Stevenon, Berks.

E. O. JONES

Polish Trade

SIR,—In your article, "Germany: the Real Issue," you state that "such nations as Poland and Czechoslovakia are being encouraged (by Russia) as far as possible to divert their trade from the West . . ." Yet, in "Poland's Foreign Trade" (June 14, 1947, page 944), you remark, "The Russians have encouraged the Poles to renew trade with the West. The reduction of the quotas of coal to be delivered to Russia has given the Poles a bigger export surplus to be diverted to the West. In addition the Poles have been enabled to draw on Russian gold to the amount of 29 million dollars for the payment of capital goods and raw materials which they may buy in hard currency countries."

For geographical reasons alone it is natural that Russia should have the greatest share of Poland's foreign trade, yet it has fallen from 90 per cent in 1945 to 57 per cent in 1946 and to only 31 per cent in the first half of 1947. In this last period Denmark came second with 11.7 per cent, Sweden third with 11.2 per cent, and the USA fourth with 8.6 per cent. Except for Czechoslovakia, whose economy is being increasingly integrated with that of Poland, the value of the trade agreements with the other countries of Eastern Europe (excepting the USSR and the Soviet Zone of Germany) in 1945-46 came to only 32 million dollars, while that with Sweden alone was for 100 million dollars, out of a total of 894 million dollars.

Obviously trade with the other Eastern European countries will increase as the economic agreements with Czechoslovakia and Yugoslavia this year show, but their value will still not be as important as that of the trade overseas and with the West.

During my visits to Poland last year and this I noticed the huge potential market there for the industrial products and consumer goods that can best be supplied by the West. From 1948 onwards there should be increasing surpluses of food over and above those already being exported; it is mainly to the West that these commodities will be sent, in addition to materials such as coal, zinc and chemicals. The international political atmosphere is still not very good, but I found amongst the

Polish officials with whom I came into contact a strong realisation of Poland's need for good trade relations with the countries of the West.—Yours faithfully,
The University, Birmingham

JOHN C. CLEWS

Cutting the Coat

SIR,—May I submit that the cuts in capital investments, far from being insufficient, will have the most serious consequences of slowing up the increase in National Income and Production? The real significance of these cuts can be gauged by comparing the estimated values of Net Investment as proposed with the corresponding estimates for 1938 adjusted for the rise in prices.

	1938*	1940/44*	1945/47	1947	1948†
Gross investment	1,900	...	...	1,550(1)	1,320(4)
Repairs and renewals	1,160	...	...	775	775(4)
Net investment	740(2)	Dr. 2,000—2,300(3)	1,500-1,400(4)	775	545
Phys. destruction (inland)	...	Dr. 2,200(1)	...	...	...

* At present value. † End of year.
(1) Oxford Bulletin for Statistics, Vol. 9, p. 230.
(2) CMD 7099, p. 19, with estimated adjustment for present values.
(3) CMD 6707, p. 14.
(4) CMD 7268, p. 5. It is assumed that in order to keep capital intact the 1947 rate of repairs and renewals will apply.

It will be seen from this that so far our Capital Investments have in no way been vast and over ambitious: less than one third of the internal disinvestment (including physical destruction) has been made good and it is now anticipated that only some 75 per cent of the prewar rate of net investment will be forthcoming in the next few years.

May I conclude by quoting an extract from *The Economist's* review (1945, p. 236) of Mr Kaldor's appendix to the Beveridge report on full employment: "By what is now virtually unanimous consent, the rate of capital formation in prewar Britain was at much too slow a rate. The amounts devoted to new production equipment were so inadequate that British industry was gradually falling behind in the race for productive efficiency." Surely, any bigger cuts would be plain disaster!—Yours faithfully,

K. ZWEIF

55 Combemartin Road, S.W.18

The American Constitution

SIR,—When a person wishes, for some reason or other, to refute a perfectly true statement, one fairly effective method he may adopt is to say bluntly that the statement is wrong and then

From *The Economist* of 1847

December 18, 1847

THERE is no denying that, in every country in the world, except in Ireland, Irishmen rank among the most useful and industrious classes of the community, are equally manageable and amenable to the ordinary laws of society, and, upon the whole, are careful and provident. In Ireland alone do the Irish show themselves a turbulent race, reckless of consequences, and apparently without the slightest interest in social order. . . . In every other country the Irish are found the most willing of labourers, with less attachment to any particular spot than almost any other people, and exhibiting no particular attachment to the occupation of land. While in Ireland they cling to the possession of a plot of ground, capable at the best of yielding a most scanty and uncertain subsistence, and are riveted to the spot with a tenacity equal to that with which they cling to life. And the more we enquire into the cause of this wide difference of the national character at home and abroad, the more we are convinced that the only solution of the question is that while abroad they find abundance of opportunity of obtaining subsistence otherwise, at home they have no other resource but the land, and that its possession becomes with them simply a question of life or death. It is to the entire absence of employment at regular wages in the south and west of Ireland, that that extraordinary attachment to the soil and the miserable existence which it affords . . . is to be solely attributed.

expound it in slightly different words, thereby leading the unwary reader to believe that since the second statement is obviously right, the first one must be wrong. Mr Sheppard in a recent letter criticises *The Economist's* frequently expressed view that the professed purpose of the American constitution is to prevent action, and then in his own brief summary of the fundamentals of the constitution seems to show just how right *The Economist* is in its interpretation.

That the attempt of the framers of the constitution to reflect the will of the American people was based on the following three assumptions would probably be admitted by both Mr Sheppard and *The Economist*:

(1) The will of the American people is not necessarily reflected by the will of the majority of the American people of any particular time;

(2) The will of the majority of the American people is not necessarily reflected by the will of the majority of representatives

of the American people, which cannot, therefore, claim to reflect the will of the American people;

(3) In the interests of individuals and minorities the power of the majority of representatives, and of all other organs of government, must therefore be restrained by balancing them against each other.

In other words the constitution sets up a series of hurdles (ranging from Presidential vetoes, through two-thirds majorities, to power to declare any act "unconstitutional") in the hope that any proposal which manages to clear them all may be said to have the full support of that elusive body, the "American people." To admit, as Mr. Sheppard does, that this procedure has "sacrificed some mobility of action" and at the same time to deny that its professed purpose is to "prevent action" is to adopt a verbal argument at which even a hard-pressed politician might shy.—Yours faithfully,

A. R. SINCLAIR

Old Fashioned Liberalism

"Free Trade—Free World." By Oswald Garrison Villard. Robert Chalkenbach Foundation. 278 pages. \$3.

THERE is only one really important tariff in the world today: that of the United States. In a sense, even that tariff is a comparatively minor factor in the world economic situation; because that situation cannot be immediately and adequately dealt with by the two-way flow of trade which makes for normal prosperity. Europe has not now the material wherewithal to exchange for enough American goods to save itself from starvation and collapse, even were the whole world one vast free trade area. The New World, of which the United States is the powerhouse, is the one region both developed and undevastated; and Europe can no more stand in a normal trading relation to it than can the Ukraine to the rest of Russia or Essen and Hamburg to their surrounding countryside. Even if all tariffs, all transfer difficulties, all differences even of sovereignty were abolished, the basic problem would remain; the problem confronting any community a substantial section of which has temporarily lost the power of self-support; the problem of the Special Areas, of the *Régions Sinistrées*, of the Dustbowl. It transcends ordinary commercial considerations; for those who have power in some measure to solve it, it is a question partly moral—what are our obligations to our fellow-men in distress?—partly political in the widest sense—how much is it worth to us not to be islanded in chaos? On this major question the further problems of ways and means, the techniques of loan or grant, procurement and transfer, would still be superimposed even in a free-trade, one-currency area. As things are, yet another layer of difficulty is added, that of foreign exchange and the articulation of different government control systems. If the United States tariff were abolished tomorrow, the dimensions of the problem would only shrink by whatever amount represents the value in American goods of Europe's exportable surplus. Qualitatively, it would remain the same. The call on American altruism and far-sightedness would be sooner and more easily satisfied, but it would be no less urgent.

For this reason, Mr Garrison Villard's hard-hitting Free Trade tract is in some ways rather a pity. Reading his pages uncritically, one would suppose that a rapid scaling-down and eventual extinction of tariffs is all that is needed to restore world prosperity and lasting peace. He quotes Cobden and Bastiat, Henry George and Walt Whitman; he deals faithfully with Messrs. Hawley and Smoot, the Tariff Commission, and the soap-box autarkists who want to "keep American dollars at home." He makes his case with plenty to spare; and he says little that does not need saying and even repeating. He makes a few egregiously naive comments on British policy (according to him, the 1947 crisis alone was responsible for the British exit from India and Burma) but no more than is unfortunately to be expected of any American commentator, however sympathetic. "Free Trade—Free World" would, in fact, have done a power of good had it been published a dozen years ago. Even so, it would have suffered from its author's oblivious neglect of the whole formidable Keynesian analysis, so easily distorted to anti-liberal ends. As a long-run recipe for world equilibrium and progress, free trade remains undisciplined by any of the avaricious which have displaced it. As a cure for the present crisis, and particularly the crisis of the "dollar gap," it is about as much use as Swedish drill to a man whose broken leg has not been set.

Local Authorities

"Local and Regional Government." By G. D. H. Cole. Cassell 15s.

PROFESSOR COLE has now tried his very able hand at the reform of local government. He postulates that what Britain needs is both larger units and smaller units of provincial administration—the former to plan major services on an effective basis, the latter to revitalise the life of local communities. Few would deny this general thesis, or Mr Cole's supplementary argument that the present administrative divisions along rural and urban lines are archaic. There are no units that are truly regional; and few that are truly local (for parishes have insufficient powers). Most local authorities fall betwixt and between Mr Cole's criteria. Should they then disappear? But on closer inquiry this would be found to be impractical. The author realises this, though he does not say so; and his final picture envisages the co-existence of small, medium-sized, large and very large units of local government, with the medium-sized ones—termed "town-and-country incorporations"—forming the real cornerstone of the edifice. Practice is thus, and necessarily so, at odds with theory.

Mr Cole's whole structure is, however, so complex and flexible as to be decidedly wobbly. Each "incorporation" would normally consist of one or more towns, large or small, and its rural environs—thus Devon might be divided into 12 of these units, Norfolk into 16, Kent into 15. This idea is a good one. Below the incorporations would be parish or neighbourhood councils, above them would be counties (reduced in number by amalgamations), and above the counties would be regional planning units. There might be thirteen such regions. The structure would differ inside the five large conurbations of Greater London, Greater Birmingham, Greater Manchester, Merseyside and Tyne-side, each of which would possess a regional authority of its own with considerable powers. The division of functions inside each region would be extremely flexible. Thus, counties would still be active administratively in rural areas, but might do little when the incorporations were mostly on the large side.

Administrative map-making is a fascinating but difficult business, and it is greatly to Mr Cole's credit that he demonstrates in detail how his ideas might work out in a number of areas. Experimental map-making of this sort is the way to bring to life these problems of administrative structure. It does, of course, expose the author to many criticisms, petty and major. The major criticism of Mr Cole is that he is too pure a theorist to make a successful administrative reformer. In his desire to cultivate every aspect of technical efficiency and popular democracy, he goes on multiplying his units and varying their relations, to the confusion of both the harassed administrator and the puzzled elector. He forgets the virtue, or rather the practical necessity, of simplicity in this matter. Nevertheless, many of the author's particular notions are sound; and the whole is as stimulating and readable as the subject permits.

Practical Propaganda

"Talk of Propaganda." By Ian Harvey. Falcon Press. 116 pages. 5s.

DIRECTION, Timing, Vitality, Colour. Domination, Concentration, Repetition. Theme, Presentation, Co-ordination, Disposition.

Mansion House, Doncaster, built by James Paine of Pontefract in 1746

CENTURIES OLD ABBEYS, churches, castles, mansions of imposing exteriors... furnishings and decorations, priceless heirlooms of craftsmen of the past—these are the historic background of the Yorkshire of to-day with its thousands of craftsmen skilled in so many trades. This tradition is to be seen throughout Yorkshire, among its people, in its cities and towns, in its industries, and is the solid foundation upon which "The Yorkshire Post" is established.

Owned, edited and published in Yorkshire it is indeed part of Yorkshire life, yet with that breadth of outlook which causes its viewpoints to be studied and quoted throughout the world.

NO OBLIGATION TO BUY

THE export drive has entered a decisive phase. Time presses. So long as our imports exceed our exports, the steady rise in world prices makes harder still the great production task that faces management and labour.

Yet this is not all. The final battle is still to be fought in the export markets. Our production must be sold.

The battle for output at home must not overshadow the need for planning overseas selling campaigns. Our goods must be sold at a price that pays us, not dumped. They must be sold, too, in markets where they will earn the currencies we must have. And, if we are to gain lasting prosperity, the buyer must be kept sold.

The J. Walter Thompson Company is well placed to help British exporters in winning acceptance for their products overseas. Long experienced in advertising on an international scale, it has completely staffed offices in all

important markets, as well as associate and correspondent organizations working under JWT guidance. A special International Department in the London office offers advertisers objective marketing information from trained and experienced men-on-the-spot.

The British manufacturer who employs the J. Walter Thompson Company has the advantage of dealing with a single organization working in many territories. And he has the assurance that his advertising in each market will be planned and produced by experts thoroughly familiar with the habits of those who are going to buy his goods.

International Department
J. WALTER THOMPSON COMPANY LTD
40 Berkeley Square, London, W.1
(Tel. Mayfair 9496). And 29 offices abroad, serving the United States, Australia, Canada, South Africa, India, Argentina, Brazil, Chile, Mexico. The JWT office in Belgium is in full operation: for the present, 12 correspondent offices cover other European countries and Egypt.

MADRAS GOVERNMENT

Practical proposals for mediation between East and West and the solving of present economic problems

BRITISH DECLARATION OF INDEPENDENCE

by

HENRY DRUMMOND-WOLFF

with a foreword by

The Rt. Hon. LORD ALTRINCHAM

P.C., K.C.M.G., K.C.V.O., D.S.O., M.C.

The Author, who has wide knowledge of trade and finance, puts forward in this book practical proposals for the restoration of the economic position of this country—a position which the Government itself declares to be an extremely grave one.

Cardhouse in the clouds

It's the drawing-room table steadiness of the Short flying boat that keeps his cardhouse from collapsing. He's never been so happy as on this wonder-trip over oceans and continents to the home he's only heard about. Maybe, to-night they'll let him stay up, to stroll on the promenade deck and watch the sun sinking into the sea.

Baby sister's thinking of retiring; and shortly the cabin will be quickly transformed into a sleeper, with baby tucked away like a fledgling in the nest. Mother and father will enjoy their excellent dinner, knowing that all is well.

Air-pleasure travelling on the big scale is a Short speciality, and flying boats operate from Great Britain to Australia, New Zealand, Africa, India, and China. Also in Scandinavia (D.N.L.) and South America (A.L.F.A.). Your travel agent has all details and will take bookings.

It's fun to fly by flying boat!

Shorts THE FIRST MANUFACTURERS OF AIRCRAFT IN THE WORLD

In the manner of a thoroughly competent sergeant-instructor, Mr. Harvey sets out a short course in Practical Propaganda for the beginner. He has had some experience of commercial advertising, and emphasises that political propaganda must follow the same basic principles. But this little book is written for the party propagandist, not for the businessman. In fact, it is addressed quite frankly to the Conservative Party. Mingled with the purely technical advice—which is thoroughly sound, and written with a pleasantly light touch—there are passages of rather pontifical philosophy, dropping at times into platitude: "A party that has neither philosophy nor principles is inevitably an opportunist party. . . . A political creed that pretends to be what it is not, or offends against moral and ethical standards, is an immoral one." The discriminating reader will skip these passages, and will concentrate on the very useful sections which deal with poster design, election leaflets, press relations, and slogans. Although the final chapter is devoted to showing that "The Case for Propaganda" is that it will enable the Conservative Party to regain power, there is much in this book that will be of value to Socialists, Liberals, Independents and all who are concerned with any cause which must capture and retain the support of the public. It is illustrated with shrewdly chosen examples of good and bad posters and press advertisements.

Political Thought and Political History

"Western Political Thought." An Historical Introduction from the Origins to Rousseau. By John Bowle. Cape. 21s.

THIS is a good and useful book. It is written modestly, as an introduction to a large subject, and with the intention of bringing the reader to the master-works described in the text. Mr Bowle, however, does more than parade a string of racehorses and give the bystanders short accounts of their pedigree and form. He relates the thought of an age to its general context in political and social history and explains why problems of universal interest took at different times their particular shapes. Mr Bowle's historical comments (including his footnotes) are vivid and exact. Unlike so many otherwise excellent writers of the older school such as Janet (whose work might find a place in the bibliography), Mr Bowle sees as well as hears political thought. Thus: the huddle of scholastic controversy, of shaven-pated, uniformed religious in the tortuous ways of the medieval cities, produced minds which could twist the legacy of the alien Greek genius to their ends, and impose between the outlook of antiquity and the Renaissance a web of thought which conditioned speculation until well into the seventeenth century.

This visual imagination serves Mr Bowle well in his chapters on the primitive background and the Temple State. Throughout the centuries with which these chapters deal there is very little political thought to be heard, but much wisdom to be learned by watching the early hunters or the slow irrigation of Mesopotamian fields. Mr Bowle does not forget what he has seen. It would indeed be impossible for an intelligent writer to make this survey of the past without reaching some conclusions of his own. Mr Bowle has taken the first lesson of politics from the far-off primitive societies and the river cities of the Middle East. The lesson is that "no community can continue healthy—least of all a huge modern society—without some objective, some pattern of belief." Therein lies the great problem of our own age. Mr Bowle realises the existence of this problem; he does not make the mistake of thinking that the present dangerous situation is mainly one of disintegration and anarchy. He finds it possible to discern the elements of a new synthesis; for this reason in particular, at a time of much weariness and pessimism, his account of the rise of the western tradition of political thought deserves a wide circle of readers.

Colonial Policy of the US

"America's Colonial Record." By John Collier. Fabian Publications Limited. 36 pages. 1s.

THERE has been no up-to-date treatment of American colonial problems available to the British reader since the publication in 1937 of Colonel Theodore Roosevelt's "Colonial Policy of the United States" (a book rather surprisingly omitted from Mr Collier's useful bibliography). A postscript bringing the story up to the present day is therefore overdue and perhaps few Americans are so competent to present it as Mr Collier, whose long and distinguished record as Commissioner of Indian Affairs has given him experience and authority in this field.

In this small pamphlet he deals in some detail with the Philippines, Puerto Rico and the Pacific Islands; rather more summarily with Hawaii, Alaska, the Panama Canal Zone, the Virgin Islands

and the American Indians. In all these sections there is a good deal of up-to-date information which is not otherwise easily available on this side of the Atlantic. At the same time, it is perhaps permissible to wonder whether, if read in detachment from other treatments of the subject, this pamphlet may not give a somewhat distorted picture. It is not merely that Mr Collier's general sympathies are patently on the side of the colonial underdog and that this sometimes leads him to present as fact matters which are still subject for debate (e.g., President Roxas' role as a "collaborationist" in the Philippines or the political orientation of the Hukbalahaps). A rather more serious weakness of his necessarily compressed story is that it foreshortens the narrative of pre-war developments in American colonial policy and thus is likely to encourage the rather smug frame of mind exemplified in the Fabian Society's foreword with its complaint that "objective appraisals of American policy by themselves seem to have been far sparser [than British] and have claimed a far less willing public."

In short, this is a valuable, if occasionally one-sided, supplement to earlier accounts of the history of American colonial development. If taken by itself, however, it may merely stimulate the *Schadenfreude* which animates too much contemporary British discussion of American policy.

Prosperity Decade

"Prosperity Decade." By George Soule. The Pilot Press, 1947. 365 pages. 25s.

THIS volume, the eighth in an admirable series, *The Economic History of the United States*, addresses itself to that most dramatic of economic decades in America, the Twenties. The story of war production, Harding corruption, Coolidge prosperity and Hoover crash, is a tragedy which moves through its sequence of promise, depravity, *hubris* and nemesis with an Aeschylean force. Indeed, so compelling is the movement of this tragedy that it has imposed itself on the minds of a great many contemporaries as the only pattern for a postwar American decade and has been in no small part responsible for the diffused conviction that the same relentless cycle of boom and bust is fated for the heirs of Roosevelt as befell the successors of Wilson. For victims of such imaginings a reading of Mr Soule's deflationary volume is heartily to be recommended.

Mr Soule starts with the minimum of preconceptions, chases almost no analogical hares, and draws only the most cautious and incontrovertible of morals. Let others, one feels him say, put in the colour and the drama of the period; I will measure its forces with the yardstick of statistics and subject its legends to the X-rays of economic theory. The result is a scrupulously dispassionate survey of the economic movements of the period, the first rounded appraisal to be offered within a compass small enough to be manageable and large enough to do justice to all the main developments. Mr Soule's own political position as an American liberal is no secret, but he is always just to the Business Man's decade, brings out its real achievements in productivity and mounting prosperity, and, when he finally comes to the problem of the crash, rejects any facile scapegoat interpretation. He finds the disaster inherent in all that had gone before, and above all in the rigidity of an economic order which prided itself, more than anything else, on its infinite flexibility. The Greeks would have had a word for that; it is a mark of Mr Soule's restraint, not of his impercipient, that he has none.

Shorter Notice

"The Truth About Publishing." By Sir Stanley Unwin. Allen and Unwin, Limited. 352 pages. 8s. 6d.

THE fifth edition of this standard work differs little from the fourth (1946), except that the profit and loss account of a 7s. 6d. novel printed in 1,500 copies at 1939 rates has been supplemented by the equally gloomy figures for 3,000 copies of an 8s. 6d. novel produced in 1947. There are few references to the feverish conditions of recent years, which have so favoured publishing that it has become a field of mushroom growths: the book is the more useful and salutary now because it is confined to the solid business foundations on which a serious publisher must build. Here an entrant to the book trade, and an old hand too, can learn from an acknowledged master what a publisher should know about book-production, dealing with authors, copyright, marketing (especially for export), advertisement, valuation of stocks. Sir Stanley Unwin is sometimes irritated by the unreasonableness of authors, agents or the Government, but his judgment is sure. Perhaps in the next edition he will tell us whether the disaster of Leipzig has shaken his advocacy of a central clearing house for English book-publishers, which would give that many-headed trade a single neck.

AMERICAN SURVEY

A Republican Foreign Policy?

(From Our US Editorial Staff)

THE *Baltimore Sun* remarked two weeks ago that the strangest phenomenon in American politics during the last year has been the slowness of the conservative mind in realising that division between the United States and Russia must cost the United States a great many dollars. Among the very people, as it said, who had least hope of any durable co-operation between the two countries there has been such stubborn unwillingness to accept the inevitable cost that during the last two weeks members of the conservative Congress quibbled and wrangled over the already belated winter relief for Western Europe. Although many of the leaders in the fight for the European Recovery Programme would certainly be considered conservatives, it is true, as the *Sun* says, that nearly all the opposition comes from the Right and from that part of the Right where fear and hatred of Russia is most extreme.

The Republican Party, to which the majority—but by no means all—of the opposition conservatives belong, is in a difficult position, having power without responsibility—control of Congress but not of the Executive. In such circumstances a party always seems disorganised and without a policy. After a success in next year's elections a foreign policy would no doubt emerge, but by that time the fate of the Marshall Plan will be settled. At this moment the most recent hint of a Republican foreign policy is in a "Resolution on Foreign Affairs" adopted on April 1, 1946, which deplores the incoherence and inefficiency of the Administration and then states that:

The United Nations Organisation has been overwhelmingly approved by the people of the United States. It is a mechanism which can maintain peace and security only if the states of the world show faith in it, make use of it, and vitalise it by positive acts of co-operation.

The Republican National Committee, therefore, demands:—
(a) That the State Department be so reorganised that it may possess cohesion and unity of purpose; that only those persons who believe in the American way of life and are loyal to the American Government shall be employed in the Department.

(b) That the President and the State Department demonstrate their trust in the United Nations Organisation and in our own hemisphere organisation, and consult with other states before acting in matters of interest to a number of states.

(c) That only Americans known for their devotion to our form of government be appointed to the various posts of representation in the United Nations Organisation, and that they be given time and facility for study and the preparation of their positions. Let the United States act in the councils of the United Nations Organisation in a manner commensurate with our world position and prestige, and give thereby direction, constructive purpose and vitality to the United Nations Organisation.

(d) That our Administration leadership demonstrate through the United Nations Organisation on behalf of such nations as Poland the same zeal which is now so evident with respect to oil-rich Iran.

That this is still thought to be an adequate and comprehensive expression of the Party's view of foreign affairs seems likely, since the *Republican News*, the official organ of the Republican National Committee, which appears every two months, published a number for November and December which recognised in only one sentence that a world existed beyond the borders of the United States: "Mr. Truman proposed totalitarian methods at home to curb totalitarianism abroad." Though the National Committee and its chairman, the shadowy Mr Carroll Reece, have no more foreign policy than this to offer, Republicans

should have the choice of a variety offered by the candidates for the Presidential nomination.

In domestic affairs, it seems that Senator Taft speaks for the National Committee, as this body usually endorses and repeats what he says. Perhaps their silence on foreign affairs is therefore an acceptance on behalf of the Party of the high-minded evasiveness of his statement at Tacoma in September. He said on that occasion: "In my opinion, current foreign policy as far as possible should not be a subject of partisan debate, and the Republicans have not made it so." Such a remark may save him the necessity of formulating his own foreign policy but it did not stop him attacking the Marshall Plan—surely current foreign policy, if anything is—or voting for the amendment to reduce the amount of Interim Aid.

Governor Dewey cannot be said to have developed a foreign policy, though he has adopted a few unrelated attitudes. But as it is his habit to follow public opinion rather than try to lead it, he is unlikely to give his party anything to work with until, if he is nominated, he has had a chance (in Senator Pepper's phrase) to wear his ears out dragging them along the ground. General Eisenhower is, and must remain until he leaves the War Department, as coy about his beliefs as he is about his candidacy.

Only Governor Stassen has announced a detailed foreign policy, which is integrated with a domestic policy and which is neither a copy nor a negation of the Administration's position. Two weeks before Mr Marshall spoke at Harvard he suggested in a speech in Iowa that the United States should, for the next ten years, devote 10 per cent of its tangible production to a carefully planned rebuilding of the world economy. He has now accepted the Marshall Plan but the political restrictions which he advocates (such as guarantees that participating countries shall not nationalise their industries) have only found support among those whose enthusiasm for the Plan itself is lukewarm.

There seems nothing, in fact, in what any of the candidates have said which can be thought to be a Party policy or can be developed into a Party policy during the debates on the European Recovery Programme. It is in Congress itself that policies must be sought and there appear to be three. One—the old, and pure, isolationist theory—is still represented but not in great strength. Representative Clare Hoffman (Michigan) spoke for it during the debate on the Interim Aid Bill. Diplomacy, whether open or secret, and, indeed, all contact with the outside world is, for the pure isolationists, immoral. But they are no longer of great importance.

The majority of the Republicans in Congress are divided between the other two policies. One, weaker in the Senate, but strong in the House of Representatives, consists of those conservatives about whom the *Baltimore Sun* complained—the wild men from the isolationist desert, as the *New York Times* calls them. Russia is anathema to them—but foreign aid is

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

In general terms, Mr Eccles renewed his outspoken opposition to all opponents of his plan. The Treasury, he said, had given no "precise basis" for opposing proposals which, so far from being personal to himself, enjoyed unanimous support from the economic advisers of the Reserve Board. The unanimous opposition of the Federal Reserve Advisory Council (representative of commercial banks within the Reserve System) was described as

a natural reaction from "any vested interest or group." Not more than a week ago, Mr Eccles was also declaring that the Board would not raise rediscount rates or withdraw from support of the Government Bond market "without a directive from Congress." But he has since admitted that the time for an adjustment of the rediscount rate may be coming very near.

The argument which Mr Eccles was chiefly concerned to make, however, was that his own plan would be far less drastic than a simple increase of the legally prescribed bank reserve requirements, and that it could simultaneously protect Government Bond values, while also contracting credit and raising interest rates on commercial loans and non-Government securities. By demanding that commercial banks hold a secondary (and additional) reserve of Treasury Bills and short-term certificates or Notes, and that this secondary reserve should range up to 25 per cent against demand, and 10 per cent against time deposits, the authorities would be given some manœuvring power on the pattern of short-term rates. Commercial rates could be allowed to harden, while rates on Government Bonds would be sustained by the fact that short-term Treasuries would possess a "premium value" as a secondary reserve for banks. Similarly, the Federal Reserve Banks could keep up the price of longer-term Treasury bonds by buying them in the open market without fear of causing an automatic increase in member total bank reserves as now occurs. For the new reserves created could be sterilised by adjusting the "secondary reserve."

The weakness of the argument seems to lie in the assumption that the Reserve Board is faced with the direct choice between, on the one hand, complete stability of long-term rates, and, on the other, complete disorganisation in the securities markets, with a damaging addition to Budgetary costs, and the release of imponderable deflationary forces. To avoid even moderate changes Mr Eccles is prepared, apparently, to enforce an extremely cumbersome system of controls which would give the Reserve Board something like a straitjacket for the discipline of the commercial banks. To the powerful opposition already shown by bankers, there is now joined the plain distrust of the Secretary of the Treasury, Mr John Snyder. But Mr Eccles, at least, has prepared his case for submission to Congress, and it is at least ingenious. There is no present suggestion that Mr Snyder has been at equal pains to solve the dilemma posed by the simultaneous effort to contract credit, and maintain a rigid pattern of interest rates.

Mr Lewis Takes Another Walk

Having failed to carry the American Federation of Labour with him in defiance of the Taft-Hartley Act, Mr John L. Lewis has curtly announced the disaffiliation of the Mine Workers from the AFL. He is to be a guerilla once more—the role that suits him best. The new labour law has proved as disintegrating an influence in labour circles as its most reactionary supporters could have wished. Hopes—and fears—that Mr Lewis would use his triumphant return to the AFL to build a single labour movement, with commensurate political power, have been frustrated by his inability to work in harness with the "stately asses" of the AFL.

The practical effect of the Act may nevertheless be to provide Mr Lewis with new allies. The National Labour Relations Board, following the clear meaning of the law, has declared that a union which does not file anti-Communist and financial affidavits can have no place on the ballot even when the employer requests an election. In particular, it has absolved the Remington-Rand Company from dealing any longer with the United Electrical Workers, the largest Communist-dominated union in the country. Mr Denham, the General Counsel, has, indeed, warned the company that it deals with the union "at its peril," laying itself open to charges of violating the law; and Remington-Rand, which was one of the bitterest and most violent opponents of labour organisation in the early days of the New Deal, has enthusiastically broken off relations with the UEW. The way is open either for a raid by a complying union or for a "no union" vote by UEW members. Both seem likely to precipitate labour troubles of exactly the kind the Act was ostensibly designed to stop.

Unions with over 3,000,000 members are still refusing to sign the anti-Communist provisions of the Act. They include Mr Murray's steelworkers, as well as the mineworkers. It is difficult to avoid the suspicion that Mr Lewis believes there will be good fishing in these troubled waters for the man who has consistently defied and outwitted the authors of the Taft-Hartley Act. His own hatred of Communists has never stood in the way of temporary alliances with the extreme left; the CIO itself was built upon such an alliance. And Mr Lewis counts upon the years

ahead to show that his resistance to the temptation to comply with the Taft-Hartley Act was right.

Pan-American Defence

By an almost unanimous vote, the Senate some days ago responded to an urgent appeal from President Truman and his service advisers to ratify the Inter-American Treaty of Reciprocal Assistance, signed at Rio de Janeiro on September 2nd. Before this vote, the Treaty had been ratified only by Mexico and the Dominican Republic, and formal approval is needed from at least ten other signatory nations. The Senate vote may now accelerate measures for hemisphere defence.

Ratification of the new Treaty (which can provide no more than a political framework for mutual defence measures) is expected to revive service demands for similarly speedy action by Congress on the draft for an "Inter-American Military Co-operation Act." This would authorise the US Government to supply arms to other American states, to supervise the training of their armed forces, and to standardise the equipment and organisation of army, naval, and air forces throughout the continent. This programme was first put forward by President Truman in May, 1946, and his appeal was repeated last Spring. Although it has twice received the specific endorsement of House Committees (under both Republican and Democratic rule) it has been buried in the general pressure of summer appropriation debates and has not received further consideration. Beyond this, the President's service advisers are seeking the establishment of an Inter-American Defence Council by which the general staffs of the nations concerned could enjoy constant consultation, and overall direction of strategic plans. This co-operation already exists, in some measure at least, between the United States and Mexico, Brazil, and Canada.

One of the issues which made for a certain Congressional wariness in the last session was that of appropriations. The Military Co-operation Act itself would provide no more than a nominal sum, mainly for training purposes. But the service departments long ago marked up as much as \$400 million of "obsolete" war stores for transfer to South American countries, and most of the actual cost of co-operation would be masked by inclusion in the general defence votes. Political opposition to the programme has not been especially strong. But there is a constant under-current of criticism based on the view that the US Government would be obliged to uphold existing regimes whatever their character, and that substantial assistance might breed rivalry between the South American countries themselves.

Immediately, however, the programme for mutual defence will, presumably, receive a new impetus from events in Europe. It will be assisted, too, by the new mood of conciliation in Buenos Aires and Washington. No longer fearful of Nazi intrigue, the State Department believes that it can rely unflinchingly upon Señor Perón in the political clash with the Soviet Union. The world-famous "Blue Book" denunciation of the Argentine government in February, 1946, is almost forgotten. There remains only a modest and gentlemanly disagreement on the current price of wheat.

Shorter Notes

Spokesmen for all major commodity exchanges have left no doubt that they will mobilise all possible support in their endeavour to prevent the Government from gaining new powers for margin trading. Some diverting comments have enlivened the general discussion. The New York Cocoa Exchange seeks exemption because it acts "as a thorn in the side of foreign monopolies," and one speaker claimed that a "British Government cartel" was holding up prices by curtailing output. For the New York Cotton Exchange, it has been claimed that higher margins will simultaneously be without effect and "hurt cotton growers without any justification."

In the pantomime of American politics there has never been a stranger spectacle than that of Mr Henry Wallace booming Senator Taft for the Presidency. Mr Wallace was asked whether a third party, with which he is still toying, would not open the way to a victory for Taft and reaction. Under Senator Taft there would be, he responded, the best chance of reversing the present "get tough" policy toward Russia. In this *schadenfreude* there is the grain of truth that the Russian sympathisers derive their most real comfort from the do-nothing policy of those who speak most harshly of the Soviet Union.

THE WORLD OVERSEAS

Stalin's Switch in Social Policy

(By a Special Correspondent)

LAST Sunday the Soviet Government announced a series of financial and economic measures which, taken together, amount to a significant modification of its social policy. The long decree, signed by Mr Stalin for the Government and by Mr Zhdanov for the Party, consists of three sets of measures: the currency reform, the abolition of rationing, and the new policy on prices and wages. The three sets of measures are, of course, interconnected and complementary. They are calculated to achieve two parallel objectives: firstly, to mop up surplus purchasing power and thus to end the inflationary trend, to which the war gave a powerful stimulus though the trend had been apparent even earlier; and secondly, to redistribute the remaining purchasing power between the various classes of Soviet society, in accordance with the new social and political demands of the post-war era.

It is difficult to gauge the scope of the Russian inflation. The total amount of currency in circulation is not known. Several years before the war the Gosbank ceased to publish currency statistics, which came to be treated as a defence secret. Even if the secrecy were now to be lifted—and this is not the case—it is doubtful whether the central planning authorities have any exact knowledge of the volume of circulation. The Russian peasant is a habitual hoarder of money. As in all countries with a numerous peasantry, money in Russia has in recent years flowed from the town to the countryside where it lay hidden in chests and "money boxes." The peasants of the former occupied areas also hoarded roubles issued by the Germans, just as they had hoarded old Tsarist roubles long after the victory and consolidation of the Soviet regime. Whatever the volume of the circulation, it has been inflated to an extent which, if tolerated, might have undermined the very foundations of Russia's planned economy. This has now been, for the first time, officially admitted.

Under the reform all cash holdings are exchanged at the rate of ten old roubles to one new one. This would seem to imply that the rouble had lost about nine-tenths of its previous value. In fact, the devaluation was much worse during the war and immediately after it, when the shortage of consumers' goods was at its worst. Throughout 1946 and 1947 the Government was engaged in a strenuous fight against inflation. The problem was tackled from the goods end and the money end simultaneously. The supply of goods was increased. Policy on wages and prices became distinctly deflationary.

Postwar Deflation

The policy was not unsuccessful. Prices on the so-called free markets and in State-owned "commercial" shops were steadily forced down. Again, no exact measurement of the downward trend is possible, because price indices are not published in Russia. An approximate idea of the trend is provided by a private calculation, based on many reports from Russia. From these it appears that in 1944 the so-called commercial prices were roughly forty or fifty times higher than the prices for rationed goods. This enormous gap, it must be remarked, was not between rationed and unrationed goods, essentials and luxuries, but between the same categories of goods—bread, meat, butter, etc.—which could be bought on and off the ration. (One kilo of wheat bread on the ration cost three roubles, while its "free" price was about 120 or 150 roubles.) The fantastically high "commercial" prices were technically also "controlled" by the Government. In actual fact, however, their level was dictated by the varying degrees of scarcity and by the level of prices which prevailed in the completely free and permitted peasant trade at the *bazaars*. (At times the commercial prices in Governmental shops and co-operatives were even higher than the *bazaar* prices.) In the middle of the war, when transport and distribution of food were disrupted, the spontaneous rise in prices was even higher than in 1944. In 1946, however, the gap between the "commercial" and "free" prices and the prices for rationed goods rapidly narrowed, until the former were "only" three, five or six times higher than the latter. In the course of 1946 the commercial prices in Governmental

shops were reduced at least three times—by the end of the year they were roughly 50 per cent lower than at its beginning. On the other hand, the extremely low prices for goods bought on the ration were raised by 200-300 per cent in September, 1946.

A Cash-Minded People

In its struggle against inflation the Government suffered a severe, though only temporary, set-back because of last year's disastrous drought, which accentuated the scarcity of foodstuffs. At present the worse effects of that reverse have apparently been lived down, and the Government has felt able to carry the anti-inflationary campaign to a radical conclusion.

The reform hits ruthlessly the holders of cash. Owners of saving deposits have been treated more mercifully. Deposits below 3,000 roubles undergo no "revaluation"—their owners receive one new rouble for one old one. Larger deposits are to be revalued at the rate of two and three old roubles to one new rouble. All State loans issued prior to 1947 are consolidated into a single loan, at the rate of three to one. Current accounts of co-operatives and kolkhozes are to be recalculated in a way that will make co-operatives and collective farms lose 20 per cent of their nominal assets. However, deposits of individual savers represent only a small fraction of the total purchasing power. The Russians are still a cash-minded people. By hitting the owners of cash with so much ruthlessness, the reform therefore effects a very drastic reduction of the total purchasing power.

It is only after having killed nine-tenths of the money that might chase the goods, that the Government has ventured to abolish rationing. As elsewhere, the abolition of rationing in Russia entails, of course, "rationing by the purse." Before that sort of "rationing" begins to operate, the Government has made sure that some purses should not bulge excessively while others are too thin. Therein lies perhaps the main interest of the reform, which might be described as a "capital levy," only with very strict qualifications. In Russia, money can be invested as "capital" only in state loans and in very primitive commerce, the forms of which are highly unsettled. What the reform has in common with a capital levy is that it reduces the purchasing power that has been accumulated from past earnings without directly affecting future incomes. To this extent it smacks of the *uravnilovka* (the tendency to level out earnings) that has for many years now been anathema in Russia. The reform has, as it were, knocked out the "Soviet millionaire," the social figure that was extolled during the war, the peasant-trader, who grew fat on the *bazaar*. It has also struck heavily, though perhaps less severely, the privileged men in the towns: the Stalin prize winners, the miraculous Stakhanovites, all those who managed to climb up to a queer Oriental prosperity amid the truly appalling misery of wartime.

Gross Inequalities Ended

The main effect of the reform is a redistribution of purchasing power, primarily between towns and countryside, in favour of the town. In the towns, the highest stratum of the privileged bureaucracy and intelligentsia has been shorn of some of its power to snatch scarce goods and amenities of life from the mass of employees and workers. It would, however, be an exaggeration to say that Soviet policy has now gone back to the *uravnilovka*, the egalitarian principles of the early years of the Soviet regime. What is being redressed is a social balance that has been gravely upset by the war. The reform eliminates the gross inequalities that have spontaneously grown up until recently, and that, moreover, the rulers could not but tolerate or even encourage. Having now done away with these anomalies, the Government continues to base the plans for the economic development of the country on the accepted system of incentive wages and salaries.

This conclusion emerges clearly from a brief analysis of the new wages and prices policy embodied in the reform. "While the currency reform is being effected"—says the decree signed by Stalin and Zhdanov—"the wages of workers and employees, as

well as the incomes of peasants from deliveries to the State, and other earned incomes of all sections of the population, will not be affected by the reform. They will be paid in the new currency at the previous rates." The purchasing power of workers and employees will thus be relatively strengthened, by comparison with the purchasing power of the peasantry. But the differential scales of wages and salaries remain in force. The reform of wages adopted early this year (see *The Economist* of March 22 and 29, 1947) provided for a drastic extension of incentive wages: it raised the minimum rates of output per worker by 20 to 25 per cent, and

it replaced time rates by piece rates in those branches of industry and in agriculture where time rates had still been prevalent. The Stakhanovite has forfeited cash and savings which would have given him an enormous start over his less fortunate or less industrious fellow-workers in the competition for scarce goods; but he is still able to recoup himself and to maintain a relatively high standard of living if he goes on beating records in output. The present reform is likely to make the system of incentive wages more, and not less, effective than it has been hitherto.

(To be continued)

Persia's New Government

(By a Special Correspondent Recently in Persia)

MR QAWAM-ES-SULTANEH, who was last week unseated from the Persian Premiership by an almost unanimous vote of his Cabinet, had made an international name for himself. He had won it first as the negotiator who caused the Russians to quit Azerbaijan in 1946, and secondly as the tight-rope walker who kept Moscow guessing while for eighteen months he postponed Persia's decision upon a Russo-Persian oil agreement. Dr Sardar Hikmet, who succeeded him on Tuesday, is of lesser known. He was, through Qawam's influence, president of the 1947 Majlis; he was also, until recently, a member of Qawam's Democratic Party. His secession from it, with thirty followers, brought about Qawam's fall. He is of a different stamp from Qawam—less decisive, less apt to play a lone hand, far more of a fatherly figure whose strong suit is his aptitude for conciliating a team. How he fares as Premier will greatly depend upon his choice of colleagues.

Mr Qawam's premiership was remarkable on two counts. The first was that it produced the nearest approach to a party (as the word party is understood in the west) that has yet been seen in Persia. All normal "parties"—except the *Tudeh* (Mass) group which takes its orders from Moscow—are mere splinter followings of this politician or that. Qawam's Democrats, who

were in September some 70-80 strong in a Majlis of 130 members, for a time showed considerable party loyalty. They consisted largely of the old landowners and professional politicians, but they were men who had realised, under the impact of the struggle with Russia, that social reform must be undertaken if Communist propaganda were to be defeated. Hence the veneration of planning. Hence, also, the sheets of paper which are their much vaunted Seven-Year Development Plan.

Mr Qawam's other strong suit was his handling of Russia. This was masterly. His account of the drumming to which he was subjected in Moscow during his visit there in February-March, 1946, was given only in the last days of his stewardship—only, that is, when his long-fought action had failed. Confronted with such pressure, many of his countrymen would have quavered. He decided that he was equal to handling it. The tactics which he adopted over a period which was spun out until October, 1947, were baffling, not only to foreigners but to many Persians and, what was more, to the Russians. No one was sure what intentions were hatching behind his wholly opaque spectacles. But, over the period, more and more Persians grew distrustful of his aptitude for compromise. His opponents preached that he had done some deal with Russia.

Guaranteed by the Government of Jamaica

In fact, he was to prove them wrong. Sensing the temper of the country, he left the final decision on the Russo-Persian oil agreement, which he had signed subject to Majlis consent, to a free vote of that body. The Majlis, as is well known, turned it down. He was left to explain the situation to the Russians. They countered with a fierce attack on him for breaking both his original agreement to get the concession considered by the Majlis in seven months, and for his failure to produce the goods in the end.

Corruption and Party

One of his troubles was the corruption he had countenanced. All inhabitants of the Middle East reckon to make money whenever they enjoy a spell of Government office. But, even when allowance is made for this universal practice, Qawam's interpretation of the word "perquisites" shocked his countrymen. It is said the only cement which bound his party together was the income its members drew from the monopolistic export licences which he gave out in return for party loyalty. This and other like drains on the exchequer stimulated criticism, first from those who were not benefiting by the transactions and, towards the end, even from those who were.

A pertinent ground for their criticism was that Qawam's rapacious ways with the public funds precluded any expenditure on the development schemes which abound, not only in his Seven Year Plan, but also in a bulky American report on development possibilities. This report Qawam had ordered this year from the Morrison-Knudsen firm of consulting and contracting engineers, in the hope that an American-sponsored plan would help Persia to obtain a generous loan from the International Bank. It ranges from expensive projects such as the piping over hill and dale, at a capital cost of \$70 million, of the waste natural gases from the Anglo-Iranian oil field to heat and light Teheran, through agricultural schemes involving wholesale transfers of population, to cheap and admirable suggestions for increasing crop yields by such simple reforms as teaching an intelligent peasantry to sow roots in rows instead of broadcast, and to use their manure for fertiliser instead of for fuel. It would, if adopted as a whole, cost \$600 million, which is far more than Persia can pay, or is likely to be able to borrow. But Mr Qawam never made, nor instructed anyone else to make, any attempt to break it down into the stage-by-stage propositions which are the pre-requisite of action and, it goes without saying, of any international loan. The plan lay on his table, handy for fondling while the Prime Minister was being interviewed. For his critics, this was not enough.

Keeping Russia Guessing

His capacity for keeping the Russians guessing had come to be his one remaining claim to power. This disappeared when the Russians issued their angry note of protest on November 20th about the abortive oil agreement. Immediately Mr Qawam's sins of omission and commission in home policy came home to roost. Throughout the first days of December, he was forced to travel about with a strong escort of police. Faced with the secession of Mr Hikmet and others, he made one last bid to retain the initiative. Baulked of a chance to rally Parliament because his opponents refused to attend and provide a quorum, he addressed the nation in a broadcast and the rump of his party in a fighting speech on December 1st and 3rd respectively. In both of these he appealed to politicians to set aside secondary issues and personal interests, and to co-operate in order to keep in being a party which offered the only way of combating the "internal dangers" with which the country was beset. Presumably in order to deflect the attention of patriots from north to south, he included in the broadcast a claim to the oil-producing island of Bahrein. But tempers were already too high for him. All but one of his cabinet colleagues then present in the capital complained that he had broadcast without consulting them, and resigned with a unanimity that suggests organisation from without. The Shah had never liked Qawam. Perhaps he was the organiser.

The legacy that he leaves to Dr Hikmet is not an enviable one. Russian propagandists are warning to a fresh offensive. Their objective is plain—the establishment in Teheran of a government favourable to Russia. This Mr Hikmet's team will not be. The problem that faces him, therefore, is how to keep a jump ahead of Communist propaganda, which does not fall on deaf ears in a country where the rich are so rich and the poor so poor. Mere lipservice to planning is not enough. Teheran is far too full of young thinkers who are content to say that they are on the Premier's "supreme planning council." It is far too

empty of men ready to roll up their sleeves and get down to the small local improvements which are the only way to get change started in a country so enormous and so lacking in good communications. The only men at present to be seen getting on with these unobtrusive and unspectacular jobs are a handful of Labour Department officials, who have been fired by an enthusiastic chief into trying to see that Persian-owned industries (and not just simply the foreign-owned concerns like the Anglo-Iranian Oil Company) apply the new Labour Law.

Politics and Trade in Singapore

[FROM A RESIDENT CORRESPONDENT]

BRISKER markets in tin and rubber have encouraged Malaysians to hope that the country will now pursue trade and forget politics. Its constitutional problems if not solved have at least been settled, and energy can be diverted to more useful channels.

The christening of the new constitution will not be a jolly party, and, unless a fairy godmother with a gift of abundant rice can appear, the general attitude will be resigned acquiescence. A one-day Malayan-wide hartal was arranged in protest by the All Malayan Council of Joint Action for October 20th, the day when Parliament reassembled. It is quite possible that if his sickness had not delayed the Governor-General's broadcasts the hartal would have been called off. As it was, too many were committed and face-saving had to be considered. The hartal was observed widely, but by no means unanimously. Daily paid labourers, taxi-drivers, trishaw riders and petty shopkeepers observed the one-day stoppage of work; the banks, the European business houses and the monthly paid salariat did not. In the Singapore municipality the senior and junior staffs and the peons were almost 100 per cent on duty. Among the labour force, of 7,961 there were 5,538 (69.5 per cent) out; Chinese, 787 out of 1,115 (70.6 per cent); Indians, 3,305 out of 4,416 (74.5 per cent); Malays, 1,415 out of 2,355 (60.1 per cent); and others 31 out of 75 (41.3 per cent). The Fire Brigade, and the Town Electric Power Station were 100 per cent present. The Town Cleansing Department was almost 100 per cent absent. The main transport company, the Singapore Traction Co., was at a complete standstill. Of the 157 private buses, only 57 operated. Throughout Malaya the same features were apparent. The lowest-paid labourers and shopkeepers observed the hartal.

Nevertheless trade prospects are improving. The trade in rice which affects Malaya most closely, and to the price curve of which nearly everything conforms, has fallen slightly in Singapore, where the movement of rice from one area to another has now been freed. While the Government takes the opportunity to release more articles from the list of controls, prices trend downwards and in some cases, such as a section of wharf labourers and timber-cutters, even wages have declined.

The reason for the fall in labour costs, apart from the slight fall in the price of rice, is the increase in the number of labourers. Many have been released from the Services, and many Indonesians have arrived from Java to join their compatriots who were conscripted by the Japanese for labour in Malaya. Their health leaves much to be desired, and they are incapable of anything in the nature of heavy labour. In general, however, there is an improvement in health, and output per man is rising slightly. Labour is recovering from its debilitation, but housing difficulties hamper progress.

During the first six months of this year 119 million yards of cloth cotton goods, valued at \$158,000,000 were imported; more than in any previous year. Dealers have speculated on shortages in this and neighbouring countries, particularly the Netherlands East Indies, and have secured permission to re-export on condition that Malayan prices are not raised by any fictitious scarcity. There is a surplus of textiles and the black market will move some of the store to Java to be bartered for rice, which can be smuggled readily enough from the neighbouring Dutch islands.

The country is getting down to work; its two props, tin and rubber, carry a heavy burden, and anxiety is felt that they may have to carry additional burdens in the battle for dollars, and that Malayan economy may be squeezed. If unprofitable bargains are made, the now smouldering fires of politics will be fanned into flames and there will be loud outcries against colonialisation and economic imperialism.

Greater Transjordan?

(BY A SPECIAL CORRESPONDENT)

THE chaos that seems to promise in the Arab half of Palestine is causing minds to turn towards Transjordan. The partition planners recognised that the share of the country falling to the Arabs is not economically a viable unit. They therefore devised a plan which was not so much a partition as a political split plus an economic union. Supposing the Arabs will not recognise either, is not the solution for the dangling Arab portion to join up with a neighbour?

Transjordan, immediately adjoining Palestine, looks by comparison a monument of efficiency and calm. It is also Arab. Its cultivable parts, which are its western highlands, and its share of the Jordan valley, are very like the Palestinian hills across the

way. Why not, says the superficial observer, join up the two and make one kingdom? The solution looks plausible, but on a short term basis it is in fact easier said than done.

The Royal Hashimite Kingdom of Transjordan, founded in 1946—it was previously a British mandated territory—is not a viable economic unit either. The reasons for its establishment as an independent kingdom were political, not economic. It is, in a good harvest year, prosperous enough, but it is not self-supporting. The very considerable deficit in its balance of trade is offset chiefly by a grant-in-aid from Britain of some £2,000,000 per annum, which pays for its army, the Arab Legion (or strictly

speaking, for that part of the Legion which is used for defence, as opposed to the fraction used for internal police work).

TRANSJORDAN TRADE (£ P. '000)

	1944	1945	1946
Imports.....	3,173	4,999	8,116
Exports.....	1,457	2,049	2,044
Re-exports.....	336	784	650
Balance.....	-1,380	-2,166	-5,422

Profits on transit trade go nowhere towards offsetting such a deficit. The rest of the unbalance in Transjordan's international payments (which are impossible to compute precisely because it shares a currency with Palestine) can only be accounted for by immense profits from smuggling. It is a smuggler's paradise. It enjoys a lower tariff than any of its neighbours, and its desert frontiers are impossible to guard. Who would not slip a few packets of Players into his robe when twenty cost eight piastres in Amman and twelve in Jerusalem? Many a larger article changes hands at the same profitable rate. If Transjordan is not a viable unit except on this basis, Transjordan plus the Arab part of Palestine would not be viable either. Only by continued subsidy from somewhere could it maintain even a relatively modern way of life.

There are also at present political obstacles to fusion, the chief of which is that the Palestinian Arabs greatly dislike King Abdullah of Transjordan. They consider him to be an ambitious old man, whose sole idea is to secure himself a bigger kingdom. The hill Arab peasants and many educated Palestinian Arabs prefer the Mufti as a leader. All the members of the Arab League also dislike the King's ambitions, with the single exception of his Hashimite cousins in Iraq. Anomalously enough, the Zionists are among his few backers. They have given him presents over years because they feel that he, with his British team of advisers, is the only element which will quickly produce a stable Government on Israel's eastern frontier.

Where Does Britain Stand?

Where does Great Britain, who is the financier of King Abdullah's army and the backer of his currency, stand in all this? To the Palestinian Arabs, the British appear to be furthering the Jewish Agency's schemes by their support for Abdullah. To remove this impression it would be as well to return to Transjordan forthwith the contingent from the Arab Legion which has of late been borrowed for use in Palestine, and placed under the command of the British Commander-in-Chief, in order to assist the security forces there. The Legionaries who glower over the sand-bags in Jerusalem and elsewhere have saved the British Government a wealth of money and home manpower; but the longer they stay, the more they suggest British sponsorship of King Abdullah's advance guard—sponsorship in the teeth of all other Arabs. It would also be as well, in order to remove the same impression, to make an early statement about the future of Transjordan's currency—at present the Palestinian pound and piastre.

It may be that fusion of Transjordan and Arab Palestine will be the ultimate way out of the latter's difficulties. But it would be imprudent to force through such a solution until more Arabs want it. Perhaps they will begin to do so after a dose of the disorganisation that the Mufti's regime promises to bring.

WILL CARROTS WARD OFF WINTER ILLS?

There are certain foods which help to guard us against colds, coughs, influenza and other winter ailments. They are those which contain a good amount of 'protective' vitamin A. Your butter and margarine ration provides a certain amount of it, and so do carrots, tomatoes, and spinach. The 'sunshine' bone-building vitamin D is also necessary for the body's welfare. This is found in fish, and to a lesser degree in fats. For a really rich concentration of A and D together Crookes Halibut Oil is the handiest way of ensuring that your body gets sufficient. **FREE: Why not get to know the vitamin-value of the foods you eat every day. Our free illustrated booklet tells you this in an easy interesting way. Write to The Crookes Laboratories Ltd., Dept. F193, Park Royal, London, N.W.10.**

THE BUSINESS WORLD

Home Rails and Market Prospects

BEYOND question, the exchange of home rail stocks against the new British Transport Stock which takes place on January 2nd will be the biggest market operation since 5 per cent War Loan was converted to 3½ per cent in 1932. Already the influences of this operation have spread far and wide through the investment market; for several months past it has been dominated by the prospect, and the choice of terms which the Treasury makes for the Transport Stock will undoubtedly determine the course of investment policy in all fixed-interest securities during the opening months of the New Year.

An outline of the method by which the new issue will be effected was given in last week's issue of *The Economist* and there is nothing of consequence to add to what was then said about the technical arrangements. But there is still room for speculation on two major issues connected with Transport Stock. The first of these obviously is the terms of the exchange. And the second is the repercussion of these terms on the rest of the investment market. There is an astonishing degree of unanimity about the terms of the new Transport Stock. Scarcely a single informed observer in the City would question the high probability that it will carry 3 per cent. But before we try to read the Treasury's mind on this question, it is desirable first to see what the Transport Act provides, and secondly to glance back briefly to what Mr Dalton said the Treasury might do when he was discussing the question of compensation exactly a year ago.

The conditions under which the Transport Commission may issue Transport Stock are laid down in Section 89 of the Act. Two extracts from the Section are relevant:

The Commission shall create and issue such stock as is required for the purpose of satisfying any right to compensation. . . .

The British transport stock which is to be created and issued in satisfaction of a claim to compensation of any amount shall . . . be such stock as is, in the opinion of the Treasury, equal in value at the date of the issue to that amount, regard being had to the market value of government securities at that date.

The procedure which has been laid down for January 1st and 2nd next year conforms with these requirements. January 1st is the date of issue, and each compensation claim—that is, each holding of railway stocks—must be satisfied by an allotment of Transport Stock of equivalent value, which the Treasury will fix, having regard to the level of gilt-edged stocks on that same day. If the Treasury decides to issue the new stock at par, each claim will be settled by transport stock of identical nominal value; or, should it be issued at a discount, by a proportionate increase in the nominal amount of Transport Stock, and conversely for a premium. The amount of each holding of new stock will be calculated "in accordance with holding of new stock will be calculated." On that day, stock-rates to be published on January 2nd. Home rail brokers will have to work their slide rules hard. The compensation stocks are transferable in multiples of £1. The compensation to which they are entitled varies from £3 2s. 6d. per £100 of nominal of LNER deferred, to £142 7s. 6d. for each £100 of Great Western 5 per cent debentures, and the compensation terms are in many cases taken to one-sixteenth of one per cent. For broken holdings, therefore, some awkward calculations of

the total value of compensation will be involved. If on this complication there is superimposed an issue of Transport Stock at a discount or a premium, brokers will certainly earn their commissions for their arithmetic alone.

Let us now go back to Mr Dalton's observations about Transport Stock in December last year. They may still have some relevance to the Treasury's intentions on January 1st, and they certainly have an intriguing historical interest:

I reply to the question put by the Right Hon. Member about redeemable stock, by saying that, of course it will be a dated stock. . . . It is certainly thought that it should not be an irredeemable stock. I accept the argument that it should not be an irredeemable stock but that it should be dated. . . . I would expect it to be within this century. . . . For the purpose of calculation it is assumed that it will be a 2½ per cent stock issued at par. . . .

There, perhaps, it is better to leave Mr Dalton's assumptions about the rate of interest on the Transport Stock, from which he proceeded to build up his case that the nationalisation of the railways would be a bargain for the State because it would cut the annual capital cost from £40 million to £22½ million. The merits of this case, such as they were, have been swept aside by the course of events in the market. The question is not whether the Transport Stock will carry 2½ per cent and be issued at par, but whether it will be possible for the Treasury to place a really long-dated issue at 3 per cent without having to concede a small discount. Moreover, the distinction which appeared to be present in Mr Dalton's mind a year ago between a redeemable stock and a dated stock suggested that he was then thinking in terms of a one-way option stock like 2½ per cent Treasury Stock, of which the "tap" had been open for about seven weeks when he spoke. It is unlikely that the arithmeticians of the Treasury, when they survey the market scene on January 1st, will be tempted to repeat that inauspicious experiment.

Some ingenious people have been busy recently trying to find gaps in the pattern of redemption dates in twenty years' time—the early 'seventies seem to have exercised a particular fascination for them—when the refunding of £1,000 million of Transport Stock could be carried out with a minimum of market disturbance. On that footing, they have been inclined to argue that, given a modicum of "preparation," the market might be receptive to a 2½ per cent stock, possibly at a small discount. By this means, faces would be saved and the shame of 3 per cent would be avoided. But the new Chancellor has shown no disposition to intervene in the market to carry out any such intention. On the present level of gilt-edged prices, the yields even on twenty-year stock are only fractionally below 3 per cent. It is surely more probable that a responsible view of the Transport Commission's financial problems for several decades ahead would dictate the issue of a stock with the longest possible date, even if that meant paying 3 per cent—as it would—and conceding an initial discount at the date of issue—as it might. There is no directly comparable stock in the gilt-edged list which carries 3 per cent with a life of 30 to 40 years. Three per cent Redemption Stock 1986-96 is the nearest comparison, but this is a "small" stock of only £65 million, and its present price of 99½ and a redemption yield of £3 os. 9d. is not neces-

sarily indicative of the value of a "big" stock with a somewhat shorter life. The authorities, if they chose to fix a 30 or 40 year life for Transport Stock, would be in no danger of repeating the costly mistakes which were made with London Transport 4½ and 5 per cent stocks, which were saddled on the Board for minimum periods of 30 to 50 years. They should ask themselves very seriously whether, taking the average of the years, a nationalised transport undertaking is likely to fund its capital at anything cheaper than 3 per cent or a little more. The answer, given the size of the Commission's obligations, is obvious.

If 3 per cent can be accepted as a plausible assumption for the new Transport Stock, what consequences will follow for the market? One major difference will obviously arise, for many railway stockholders who would have sold a 2½ per cent stock as soon as it was issued to them might be ready to keep a 3 per cent stock. Another class of investors—mainly institutional—have been using railway stocks for many months past as a profitable back door into the gilt-edged market, at discounts sometimes ranging up to 10 per cent compared with the take-over prices. They are not likely to be sellers on balance, though they may have to switch if the new stock does not fit their requirements. Others have bought railway stocks with the simple intention of getting a certain profit within a few months, and are now fairly ready sellers at discounts of 3½ per cent or so. And, finally, there is the small railway stockholder who from inertia or ignorance has taken no steps to avert the fall in income which he will experience from January 1st onwards.

To resolve the pull of these various forces is impossible. Last week's free selling of railway issues was comfortably absorbed—it was, of course, banked up until the opening of dealing free of stamp in the Christmas Account—and the reinvestment demand for industrial ordinary shares produced steady and occasionally sharp increases in prices. The rise in the *Financial Times* index of industrial ordinary shares from 119.2 twelve days ago to the present level of 123.3 is symptomatic of this wave of buying. But it is important to remember that the buying occurred in a market already short of industrial shares to the point of embarrassment. Several weeks ago, many dealers made a logical calculation of the prospective trend of markets on the basis of the economic crises of August and of the desperate remedies introduced by Sir Stafford Cripps at the end of October. Unfortunately for them, buying pressure began to reassert itself in the middle of November, and they never had an opportunity to recover stock, which they had sold.

Then came the first signs of improving coal output, and the abatement of fears about the possibility of industrial breakdown this winter. The technical conditions were ripe for recovery, and buyers returned in force, undismayed by the doubling of the Profits Tax.

But the present position is arbitrary and artificial. Given a closed market, the replacement of risk stocks by gilt-edged securities spreads its yeasty effects throughout the market. In the days when equity earnings were untrammelled by controls and discriminatory taxes, industrial shares experienced the support of cheap money only in an indirect form. Then the process of adjustment was confined largely to fixed interest securities and preference shares, and yield differentials, after a period of adjustment, settled down to match the new level of gilt-edged prices. But that is no longer so. The ambitions of the Government may be limited to nationalising a 20 per cent sector of the British economy, but that sector certainly accounts for more than 20 per cent of the interest and activity of the Stock Exchange in non-Government issues. Great slabs of neo gilt-edged securities are being created (with coal, cables, electricity and gas still to come) and there is nothing materially to augment the supply of new industrial securities, except for outstanding cases like Steel Company of Wales and "Shell." A reduction, and possibly a permanent reduction, in the yield differentials between gilt-edged and industrial securities is in progress. The increasingly institutional character of industry, coupled with the present levels and uncertainties of the Profits Tax, are tending to rule out the opportunities for the display of investment expertise and initiative. Controls have bred monopolies, but timid monopolies on good behaviour—at least so far as the distribution of profits is concerned. And the result is a curious hybrid, the static equity which is losing its individual character and is in danger of becoming a mere hanger-on to the gilt-edged market.

That, at any rate, seems to be the likely trend so long as the present conditions of market control and ill-suppressed inflation last. But it is not a condition which is natural, or even necessarily permanent. The day may return when relative degrees of risk again have some meaning in the market, when a limit can at last be set to the wholesale creation of quasi gilt-edged securities, and when some industries will undergo the healthy purge of making losses. Then the science, or art, of investment may again have something of its old meaning. But many days are likely to pass after January 2nd before it does.

The Odeon Affair

MR RANK'S promised statement to the shareholders of Odeon Theatres appeared too late for comment in last week's issue. Unfortunately, this article has to be written before, though it will appear after, the extraordinary general meeting on Friday. The content of the controversy will be familiar enough to readers of *The Economist*. Briefly, Mr Rank has attempted to call in aid the resources of Odeon Theatres, the largest public company in the group, to redress the financial position of General Cinema Finance Corporation. The first intimation of the scheme was a bare announcement that Odeon Theatres would acquire the capital of GCFC. Criticism of this proposal stung Mr Rank into making a tart rejoinder—much newspaper comment had been "completely misinformed" and some "mischievous." But the criticism has brought into the open one of the least meritorious financial schemes to be disclosed for some years. Odeon shareholders now know what they are getting, and it is not an impressive bargain. It seemed likely when this issue went to press that

the purchase would be approved by Odeon ordinary shareholders, of whom Mr Rank and his associates form an overwhelming majority. If so, preference shareholders will ponder the fact for a long time to come.

The purchase has been represented to Odeon shareholders as a most desirable transaction from their point of view. It would give Odeon a controlling interest in Metropolis and Bradford Trust (which controls Gaumont British, and through it, Gainsborough Pictures), all the shares of General Film Distributors, one-third of the shares of Denham and Pinewood Holdings (the other two-thirds are already held by Odeon and Gaumont British), the capital of Eagle-Lion Distributors, shares in various film producing companies, and shares in Universal Pictures of America. These holdings will be "consolidated" and "simplified"—and shareholders will no longer be "interested in the results only of sections of the total activities." "It is," says the circular to shareholders, "a matter of constant anxiety to Mr Rank and those who advise him to

see that no one section is treated more favourably than others." But it does not explain very lucidly how the discrimination between the "sections" arises. The assumptions seem to be that all "sections" of the Rank group must sink or swim together; that since the supply of American films is curtailed by the import duty of 75 per cent, the British film producing companies must increase their output—GFD and its associated companies are intending to produce 38 first feature films next year; and that Odeon and Gaumont British must share these films equitably. (What happens to this argument, incidentally, if the acceptance of American films is made a condition of Marshall aid?) Then follows a simple syllogism. If Odeon does not acquire control of General Cinema Finance, the directors of that company could hardly avoid giving more favourable treatment to Gaumont British, "in which they have such a substantial interest"—is there, incidentally, no danger of the converse now happening? But GCFC would be forced to restrict production unless it got more finance—which Odeon would not put up unless it acquired a "substantial interest" in GCFC.

Thus, the *raison d'être* of the purchase proposition is to enable General Cinema Finance Corporation to enlarge its film production, already threatened by restriction owing to overstrained bank accommodation. Mr Rank has looked about what he has called "my organisation" for a new source of finance for film production, and Odeon Theatres, an obvious choice for this role, lay conveniently to his hand, for 90 per cent of the equity of this company was within Mr Rank's instructible reach. But Mr Rank had not reckoned with the reaction of the public, nor with the doubts of Odeon preference shareholders about the effects of the scheme on their security.

The profit and loss account of General Cinema Finance Corporation (analysed in the accompanying table) shows that on the producing side losses have been mounting during the last three years, and reached £1,667,070 for the year to September 28, 1946. Information from subsidiaries for 1946-47 indicates that "a small profit" has been made in the latest year, but it is not clear whether this is a profit on production, comparable with the loss shown for 1945-46, or whether it should be compared with the net loss of £474,777 shown in the table, after adding in other revenue and deducting interest and taxation. There are signs of improvement, but certainly not enough to warrant any enthusiasm on the part of Odeon Theatres shareholders. Production losses in the past three years are

attributed in large measure to the high cost of prestige films like "Caesar and Cleopatra" and to the initial cost of establishing the distribution of films overseas—part of which in present circumstances is of doubtful value. Neither of these costs is likely to recur; but how much of what has been spent in the past will produce an income in future?

Nor is the consolidated balance sheet likely to sway an outside shareholder of Odeon Theatres in favour of the scheme. In any case, it excludes Metropolis and Bradford Trust, and its information is 15 months old. Was it, in particular, impossible to give any broad indication of subsequent balance sheet changes? The biggest item is £5,876,525 for completed and uncompleted films, "less amounts recovered to date and provisions." The statement argues that the prospective shortage of films should make this large item more valuable. But shareholders require something more explicit than this to judge whether it may contain a contingent profit or a contingent loss. Obviously the figures have made unpleasant reading for bankers of the group, as they now do for Odeon shareholders. The bankers have quite reasonably asked for more security if they are to extend their facilities to the amount of a further £2,000,000 to finance additional production. The statement says that "Odeon will make itself responsible for this finance." If Odeon Theatres does not come to the rescue of General Cinema Finance, that company would be bound to restrict its production, which represents a large part of the film production of the country. Thus the dilemma as posed by the Odeon directors is that either they arrange the security or their supplies of films will be restricted.

But it is not certain that the minority shareholders will see it that way, or that the alternatives will seem so clear-cut to the owners of the debenture and preference capital of the Odeon Theatres group who did not subscribe their money to finance film production. They may not feel certain that £2,000,000 is the limit of Odeon's contribution. In any case to saddle Odeon Theatres with the debts of General Cinema Finance without first acquainting all the shareholders of the company with the facts was a course to which minority shareholders had every right to object. It in no way mitigates the shock provided by the figures that shareholders should be told that the acquisition will represent an important step towards the consolidation and the simplification of the Rank organisation. The rescue of the producing interests of the group from a serious financial predicament may be of great importance to Mr Rank, but when

it demonstrably entails the linking of a weak private company with the main public company of the group, he must expect the proposals to stand the full scrutiny of investors. In view of last week's disclosures, it becomes the more inexplicable that Mr Rank should have regarded the scheme in the first place as if it simply represented an arrangement between two private companies of his organisation, and that he should have attempted to get approval for it as such.

It is not necessary to rehearse in detail the financial position of GCFC as it stood fourteen months ago. The accompanying

(f) After deducting unpaid purchase consideration for Metropolis & Bradford Trust shares of £1,130,444, due May, 1948. (g) Dividend paid to March 31, 1943.

table tells its own story, but one or two features of it deserve highlight. What is the current level of loans and overdrafts, shown at £4,389,455 at September 30, 1946? Have the advances of £2,249,107 been repaid to D. and P. Studios in whole or part by the delivery of films? What difference to the consolidated assets statement would be made by the inclusion of Metropolis and Bradford Trust and Denham and Pine-

wood Holdings? All in all, a purchase at par of shares in a company which lost £1,667,070 on film production in 1945-46 (almost equal to the consolidated net profit of the Odeon group for 1946-47) and which has a deficiency of current assets approaching £1,000,000 according to its latest balance sheet, does not represent an impressive bargain for Odeon shareholders.

Mr Rank has done well to make public some impression of the true position. But the outside shareholders of Odeon will reflect that the bulk of the equity of Odeon Theatres is held by Mr Rank or by persons close to him, and when it came to a vote, there could be little doubt of the result. If the ordinary shareholders of Odeon Theatres approve the purchase, that will reflect the power of Mr Rank, rather than the intrinsic merits of the scheme. In fact, they will be taking over voluntarily what is now plainly revealed as a weighty burden of extra liabilities in return for an intangible and arguable *quid pro quo*. There may be a genuine desire on the part of the controlling interests to see a fuller integration of the intricate interlocking interests of the group (which are shown on the preceding page). But if the film producing ambitions of the group had not been over-reached (like those of Gaumont British some years earlier), would there have been the same emphasis on integration? The labyrinth winds its way through the portfolios of many investors who are not connected directly with the Rank Organisation, and had no desire to be. This is especially true of the debenture and preference capital of Odeon Theatres. These outside investors will not relish the burden of supporting the liabilities of General Cinema Finance Corporation, especially since these consist largely of bank loans the service of which has to be met even before that on the debenture capital.

One general lesson for outside shareholders in controlled companies emerges from the affair. Mr Rank's presentation of the case for the acquisition of GCFC by Odeon has, by its initial lack of disclosure and tact, done nothing to enhance the investment status of Odeon debentures and preference securities. Holders of these securities may be wrong in holding the impression that Mr Rank would rather have kept to himself the precise reasons for the deal, but they will hold it all the same. There may be few parallels in British company finance to the intricate system of personal control which Mr Rank has built up in his group, but where they exist, preference shareholders will not be slow to take warning of what may happen when things go adrift. The Odeon affair has done a disservice to company finance which will extend well beyond the sphere of Mr Rank's interests.

Business Notes

Coal Exports at Last

It is welcome news that the regular export of coal is to be started from January 1st. Mr Gaitskill's winter budget provided for 112,000 tons a week for bunkers and the bare minimum of exports. This figure is to be increased to 200,000 tons a week, of which two-fifths will represent exports to countries which participated in the Marshall aid talks in Paris and to others where coal exports would secure a "good return" in food, raw materials or dollar saving.

Output has improved so much in recent weeks that the new export programme was a matter of commonsense and duty. At the same time, an additional 20,000 tons a week are to be provided for domestic consumers, though they should be devoted as far as possible to meeting really hard cases. Partial steps are also being taken to remedy the acute shortage of metallurgical coke. Another 20,000 tons of coal a week are to be fed to the coke ovens which will go some way, though not the whole way, towards meeting the present acute shortage of supplies. It must be asked, given the present carbonising capacity, whether this increase is the most that can be done towards increasing the supply of blast

furnace coke, which at present is restricting the production of pig iron.

The upward trend of output lies at the back of Mr Arthur Horner's hopes that Britain should be in a position to produce 250 million tons of coal and resume the prewar scale of exports within two years. Mr Horner's words carry weight, for while he is to some extent *parti pris*, he is not given to making incautious predictions. Indeed, this time last year, he was a Cassandra among many coal optimists. But it would be easier to share the growing optimism about the coal situation were it not for the alarming trend of prices, which will be raised by a further 2s. 6d. a ton from January 1st. The increase of 25s. in the price of bunker coal for foreign-going ships and for markets, in spite of Europe's pressing needs for coal. The British export price is now 75s. and freight to Western Europe would add say 15s. Even the c.i.f. price of about 90s., however, is slightly cheaper than American coal of less suitable quality. But Polish coal, it is reported, will sell at 20s. to 25s. below the National Coal Board's level, and it is small wonder that ship owners are seeking an increase in freight rates for coal-fired ships.

"Bull" Coal Output and Prices

The tradition of pre-Christmas "bull" weeks in the mines has been repeated this year. Last week's output of 4,356,200 tons (of which 4,175,400 tons were deep mined and 180,800 tons opencast) was the highest for 1947, and, indeed, a record since the week of August 17, 1940. The figures are encouraging, and, even allowing for lower output over Christmas and the New Year, the miners should be able to produce the 10½ million tons now needed to reach the much-publicised target of 200 million tons—by stretching the year an extra week to January 3rd. The real test will come in the early part of 1948, when it will be clearer whether the men are capable of sustained effort and whether improved recruitment and increased mechanisation are taking permanent effect. Absenteeism, which is now below last year's rate, is likely to rise, once the Christmas incentive has been removed, and the influenza season begins. On the other hand, output per manshift, which was 1.12 tons overall and 2.92 tons at the face in the first week of December, compared with 1.06 tons and 2.82 tons in the same week of 1946, should improve further.

The recovery in recruitment is one of the most hopeful signs, although the original target of 730,000 men by the end of 1947 has proved impossibly high. In the fortnight to December 6th, there was a net increase of 2,000 men, and when the flow of European Voluntary Workers begins, it should be possible to build up the industry's labour strength towards its prewar level of 750,000 or more. Despite the colder weather and rising coal consumption by electricity and gas undertakings and by industry, there were 16,652,000 tons in stock at the end of the first week in December, compared with less than 10 million a year ago. But hard weather early in the New Year would soon eat into stocks.

The increase of 2s. 6d. per ton in pithead prices for internal consumers arises mainly from the recent wage agreement, and also from overtime working. It is estimated that wages have added 1s. 7d. a ton to the price, while overtime payments have contributed 10d. These increases will be passed on, directly or indirectly, to consumers, and in some instances the price of gas has been raised by 1d.-1½d. a therm. In all, since 1939, there has been an increase of 26s. per ton in pithead prices, 6s. 6d. of which have been added by the Coal Board. They can only be offset by further improvements in output, by higher productivity and by greatly increased efficiency. The shape of the negotiations on the wage structure in the industry ought to be determined by these questions.

Canadian Dollars and Food

The new financial and commercial agreement between Britain and Canada was published as this issue of *The Economist* was going to press, and detailed comment on it must be deferred until next week. The new agreement covers a period of three months only. It therefore conforms to that new standard which symbolises the hand-to-mouth character of the world's present way of economic life. In this particular instance the short-term character of the agreement can be justified by the fact that within three months definite information should be available about the likely magnitude and form of Marshall aid for Europe. The provision of Marshall dollars for "off-shore" purchases in Canada would, of course, alter the whole picture of Europe's and Canada's particular balance of payment difficulties. The \$300 million left in the Canadian loan to Britain is to be frozen for the time being. As against this, new facilities of \$45 million will be made available over the next three months. The existing arrangements under which half the net deficit of Britain to Canada is paid in US dollars is superseded by the new agreement. Under this agreement British purchases in Canada will amount to at least \$145 million over the next three months. The \$100 million balance between this figure and the \$45 million that will be sold on credit must be covered either by British exports to Canada or by payment in US dollars. The recent restrictions on imports into Canada, involving quotas based on prewar imports, leave ample scope, however, for the required expansion in British exports to that market. The incentive to concentrate on these particular exports is now defined in the clearest possible terms, for in so far as they fall short of the new target, the whole of the deficit must be made good in US dollars.

Canada at first proposed that the total payment for British supplies should be made in US dollars or gold, and that the new contract prices for livestock products should be raised to world levels. Canada also asked that consideration should be given to the fact that the British contract price for wheat is still well

below the Winnipeg "free" price. The problem of higher prices for livestock products has been solved by Britain agreeing to an increase sufficient only to meet higher costs of feeding stuffs, and not to conform to world levels. The contract quantities have not been reduced, but actual shipments of beef, bacon and cheese are expected to be appreciably below the targets fixed.

Lower Fiduciary Issue?

The remarkable changes in the trend of the note circulation, which began to attract public attention about the middle of last month, still goes on, and the public's net demand for additional currency during this Christmas season is likely to be the smallest for many years. Signs of an important downward tendency were, indeed, apparent during August and September, when the seasonal return to the banks of supposedly "holiday" currency was almost 50 per cent larger than in 1946. Since then the movement has been greatly intensified. This week, as last, the total has risen fairly sharply—but in both weeks, as the accompanying table shows, the expansion has been only about half that for the comparable period of last year. This contrast in the experience during the Christmas currency season—which is usually measured from the date of the third Bank Return in November—does not, of course, imply that holiday spending has this year been correspondingly smaller.

CHANGES IN ACTIVE CIRCULATION £ mn.			
	1945/46	1946/47	
Christmas peak	1380	1428	
32 Weeks to August peak	+11	-6	
7 " end-Sept.	-32	-45	
4 " end-Oct.	+3	-16	
Week to Nov. 5/6	+3.3	+3.0	
" " 12/13	+0.6	-3.6	
" " 19/20	-2.3	-12.1	
" " 26/27	+2.6	-7.6	
" " Dec. 3/4	+9.7	+2.2	
" " 10/11	+22.5	+10.7	
" " 17/18	+18.8	+9.7	
" " 24/25	+11.2	?	
Total at Dec. 17/18	1417	1363	

Taking all these factors together, it seems quite clear that the special influences which produced so large a decline in the circulation during October and November have been operating just as strongly this month. Even those who are best-placed to discern the causes of currency movements are still unable to form definite conclusions about this new trend. The dominant influence, it is generally agreed, is fear of a coming exchange of the present series of notes into a new series; but, beyond this, it can only be surmised that the principal source of the reflux of notes is the domestic black market (including other types of tax-evaders). The sheer bulk of currency, even when in the form of £5 notes, makes it most improbable that any really large sums—measured by the standards of the size of the total reflux—are being smuggled in from abroad.

How far these special movements will continue it is, of course, impossible to say; but at least they are not likely to be reversed. In consequence, the early weeks of the New Year will probably witness the first reduction in the Bank of England's fiduciary issue since early in 1939. In 1946 the active note circulation expanded by £48 million; and by the August peak of this year the total was still £31 million above the comparable 1946 level; yet next week's Bank return seems likely to show a figure some £60 million below the peak reached twelve months ago. The reserve of unused notes at the Bank now stands at the unprecedented pre-Christmas level of £87 million, and will be strongly reinforced by the return of notes immediately after the holiday. This explains why the Treasury, when renewing on December 10th the Bank's authority to issue £1,450 million of fiduciary currency, granted an extension for one month only, instead of for the customary six months. Evidently, the limit is likely to be reduced—probably to £1,400 million—when the month expires.

Stock Exchange Scheme Challenged

The failure of the scheme of reorganisation for the Stock Exchange to secure the necessary three-quarters majority at the proprietors' meeting on Tuesday is an unexpected *contretemps*.

It had been generally expected, after the result of the referendum last March, that there would be no hitch in the final approval of the scheme, but several of the 300 proprietors who were present at the meeting (out of a total of 4,000) offered criticism on the ground that the compensation offered for Stock Exchange shares under the scheme was inadequate, and that the minimum life of five years which has been fixed for the annuities was too short. The first point of criticism is not substantial, since the prospect of higher dividends on the shares than had been paid in recent years would in any case have been virtually nil. As for the second line of argument, the short minimum life should be less of a threat to holders of annuities if in the future interest rates continue to rise rather than fall.

The scheme, however, should not depend upon points of comparative detail raised by a determined minority, for it involves the end of the system of dual control, and that step would, in principle, command the support of an overwhelming majority of members and proprietors. It is strongly to be hoped that the result of the poll on Thursday (which was not available when this issue of *The Economist* went to press) will reverse the vote by show of hands on Tuesday.

First Results of Direction

The Ministry of Labour has grounds for satisfaction with the smooth working and first results of the Control of Engagement Order. Mr Isaacs, in a review of the first month's operation of the Order, claims that it has fulfilled expectations. There has certainly been a remarkable increase in the labour force of the undermanned manufacturing industries, and the fears that the Order would lead to widespread use of the powers of direction have so far proved unjustified. In October, only 10 workers were explicitly directed under the Order. The Ministry issued a total of 101 directions between October 6th and October 31st, but of these 84 were to mining and seven to agriculture under the schemes already in existence.

The increase of 95,000 in the numbers in civil employment during October, which compares with an average monthly increase of 55,000 during the first nine months of the year, must be largely attributed to the effects of the Order. Its first results suggest that it has led to greater stability and reduced wastage in the labour force. Many people, who had not previously been seeking employment, entered industry—presumably to anticipate the possibility of direction. The increase in the number of placings by Employment Exchanges, from 203,000 a month between June and September, to 321,000 in October however, was not so great as the Ministry of Labour expected. Moreover the number placed in "first preference" industries—they totalled 39,036, or 12 per cent of all placings—is not very large, and the increase in the labour force of these undermanned industries cannot be wholly attributed to direct Government intervention. In all, "first preference" industries (they include agriculture, coal, steel and textiles among others) gained 15,700 in October, compared with an average monthly increase of 3,900 in the previous three months. Some increases are spectacular. Cotton spinning, which had been increasing by 300 a month gained 2,400 in October, while cotton manufacturing, which had been losing 300 workers a month gained 1,300. Recruitment in the wool textile industry rose from an average of 800 to 3,100, and ironfounding, which had been losing men at the rate of 200 a month, increased by 1,600.

Two satisfactory features of the October returns are the increases of 50,000 in the number of women employed, and of 10,000 in the number of foreign workers, which suggests that some of the trade union prejudices are being broken down. But nothing seems to be capable of shaking the objections of certain sections of the Amalgamated Engineering Union to foreign labour.

Monetary Fund's Gold Edict

Canada's proposal to subsidise domestic gold production has been made the occasion for the fullest declaration of policy yet propounded by the International Monetary Fund on the vexed subject of gold subsidies. After pointing out that every member which proposes to introduce measures to subsidise the production of gold must consult the IMF on the subject, the statement lays it down that "in the view of the Fund, a subsidy in the form of a uniform payment for all or part of the gold produced would constitute an increase in price which would not be permissible if the total price paid by the member for gold were thereby to become in excess of the parity plus the prescribed margin." As for other methods of subsidising gold production, they will be judged "upon the circumstances in each case." But members

are reminded of their obligation under Article IV Section 4 (a) to collaborate with the Fund to promote exchange stability and are told that subsidies on gold production, whatever their form, are inconsistent with this Article if they lead to widespread doubts on the uniformity of the monetary value of gold in all member countries. Members are further told that "subsidies which do not directly affect exchange stability may, nevertheless, contribute directly or indirectly to monetary instability in other countries and hence be of concern to the Fund."

In accordance with these newly defined principles, Canada's original proposal for a uniform subsidy of \$7 per ounce on all gold produced in excess of the output for the twelve months to June 30th last, would clearly have been out of order. An alternative method has therefore been devised which is said by the IMF to be "not inconsistent with the Fund's general policy." The new scheme, which operates from December 1st, retreats from the principle of the uniform payment per ounce; the subsidy will depend upon the costs of each mine, and will represent half the amount by which costs exceed \$18 per ounce. This payment, instead of being made only upon any output beyond that of the year to end-June last, will be made on any increase over two-thirds of that output. Perhaps the IMF feels that this abstruse formula has sufficiently blurred the issue to ensure that the opponents of subsidies will not perceive the objections in principle. Yet the scheme as it now stands offers a positive encouragement to the inflation of costs. And for some Canadian mines the indirect cost subsidy will probably yield twice as much as would have been provided by the direct subsidy of \$7 per ounce.

Financial Separation in India

The Indo-Pakistan agreement published last week-end provides for the financial counterpart of the political separation of the two Dominions. Any satisfaction at the smooth manner in which such explosive issues as the partition of public debts and assets have been settled must be mitigated by the knowledge that the financial and economic partition of what hitherto has been an integral unit must in any case tend to impoverish each part. That, however, is part of the price that had inevitably to be paid for political separation. The Dominion of India takes direct responsibility for the entire public debt, but Pakistan's share, which is to amount to 17½ per cent of the debt, will be met in 50 annual and equal instalments to India, beginning in August, 1951. Pakistan's share of the sterling balances is to be in the ratio of the note circulation in the two Dominions. The currency systems will remain common to India and Pakistan until March 31, 1948, and for six months thereafter Indian notes and coins will continue in free circulation in Pakistan. Preparations for partitioning the currency will begin immediately, and placed at the disposal of Pakistan for overprinting Pakistan notes and minting new coins. Pakistan will be paid from sterling balances for Indian rupee coins and notes surrendered to India as the new Pakistan currency enters into circulation.

This separation of currency will involve the setting up of separate central banking organisations and opens up vistas of an exchange rate between the two currencies. Since both Dominions will remain in the sterling area they should find it possible, given some similarity of fiscal and monetary policies, to maintain stability in the relative values of their currencies. The separation must also extend to the operation of exchange control, and it has already been announced that as from January 1, 1948, a system of separate accounting for foreign exchange earnings and expenditure of the two Dominions will be established. Detailed instructions are to be issued to the banks with the object of ensuring that foreign exchange may only be bought from or sold to a bank in the Dominion in which the applicant resides. The new arrangements do not involve restrictions on the transfer of funds from one Dominion to another.

How Much Steel for Cars?

This week the confusion about the allocation of steel for the motor industry in the first period of 1948 has become worse confounded. There had already been a public difference of opinion between the industry and the Ministry of Supply about the number of cars to be made in 1948 from the proposed allocation of steel. The industry took the view that the maximum rate of production would be only 260,000 cars a year, compared with a capacity of about 400,000, whereas the Ministry asserted that production should actually expand beyond the current rate of production of 312,000 cars a year.

This discrepancy in estimates seems to have been discussed at a recent meeting of the National Advisory Council of the Motor Industry, the body which advises the Ministry on motor-car production problems. On Monday, the Minister of Supply announced in Parliament that in the view of the National Advisory Council the steel allocation for the first six months of 1948 should enable the industry "to approach" the mid-1948 target for cars, which would mean "approaching" an annual rate of 315,000 cars for export and 50,000 for the home market. But on Tuesday Sir Stafford Cripps informed the House in a written answer that revised export targets and production programmes would have to be worked out for the steel-consuming industries next year. Whether this statement applies to the motor-car industry remains to be seen. It certainly does nothing to clear up the confusion.

This public argument about next year's car production programme is, of course, a direct consequence of the weakness of the steel allocation system. It seems probable that the motor-car industry fared rather better under the "M" form procedure than was intended, with the result that some motor manufacturers have been able to accumulate stocks of steel, and therefore could maintain their production, temporarily at least, above the level of, say, 260,000 cars a year which the prospective steel allocation appears to justify. So, by drawing on stocks, it may be that, for a few months, car production might exceed a rate of 300,000 a year—but not for long, unless the industry's steel quota is increased.

The motor-car industry is not the only example of the confusion which arises in trying to match steel allocations to production programmes. There seems every likelihood that confusion will continue under the new allocation system, unless indeed the present cabalistic method of allotting steel to industries is replaced by a clear, published statement of the tonnages which each important industry can expect to receive in each authorisation period.

Cutlery and Craftsmanship

The report of the Cutlery Working Party,* published this week, is a slim, but forthright document. Its authors have

* Board of Trade Working Party Reports: Cutlery: HMSO, 1s.

marshalled a certain amount of statistical information about the structure of the industry, its manpower position and its export record. But little effort has been made to use this material as a basis for any prognostications about the postwar pattern of the cutlery industry or for compiling a manpower budget or a mechanisation programme, and there is a certain air of "take it or leave it" about the recommendations.

A few basic facts about the industry are incontrovertible. In 1944, 60 per cent of the establishments in the cutlery trade employed five workers or fewer. A recent report by the Inspector of Factories found that out of 313 factories, only 36 could be regarded as satisfactory. The industry therefore includes a very large number of small firms, the traditional "small masters" of the cutlery trade. Most of them work in small, ill-ventilated, rented quarters, and eke out a living only by working long hours for a small return. This is an appalling state of affairs, though it is probably no worse than certain sections of the pottery and jewellery trades. In any event, the facts were well known already. They came to light over a year ago in a report by the Cutlery Wages Council and the working party have added little that is new.

The working party recommend the establishment of a tripartite Cutlery Board with terms of reference which will be familiar from earlier reports. The Cutlery Board, it is suggested, should be the means of preventing small, marginal firms from price-cutting and lowering working standards. These have been the main causes, in the working party's view, of the industry's present dilapidated condition. They consider that the Board should be empowered to compel producers to comply with Orders defining the functions of the Board and that it should prepare and enforce a Fair Business Practices Code.

These are wide powers indeed. Their object is quite clearly to force out small inefficient firms which cannot maintain minimum working conditions. That in itself would be an obvious remedy for some of the present evils. But a recommendation to give such sweeping powers to a body (whose employers' representatives would be elected by the trade association on which many small firms would have only a weak voice) would sound more effective if the report made specific recommendations about the scope for increased mechanisation, lower prices of cutlery, and greater standardisation and longer runs of production for good quality cutlery. This recommendation to give the Board

Is Australia your market?

Do the people of Australia buy your products? Or do you buy theirs? Whichever is the case, the Commonwealth Bank of Australia is able to give you considerable assistance. Guaranteed by the Commonwealth Government, the Bank has 330 branches throughout Australia and New Guinea; it has an unrivalled first-hand knowledge of Australian produce and Australian requirements; it is, therefore, unusually well equipped to facilitate trade between this country and the Commonwealth. The Managers of the London branches welcome enquiries from those whose interests lie in the Australian market.

COMMONWEALTH BANK OF AUSTRALIA

8 Old Jewry, London, E.C.2. Australia House, Strand, London, W.C.2.

The original peso circulated widely throughout the Americas and was also known as the Spanish dollar or "piece of eight." It is now the monetary unit of several South American countries.

peso

For many years Barclays Bank have fostered the growth of Britain's trade with South America by providing a comprehensive foreign banking service reinforced by the establishment of a Representative's Office in Buenos Aires. Today, when the expansion of our export trade is vitally important, Barclays Bank offer a complete foreign service, together with such other banking facilities as customers may require.

BARCLAYS BANK
LIMITED

54, LOMBARD STREET, LONDON, E.C.3.

The Rand bi-yearly dividend season has been nearly completed with the announcement of the December dividends of four more of the mining groups. These confirm the impression made by those of the Consolidated Goldfields Group which were analysed in *The Economist* last week. On the whole, payments have been up to expectations, and they suggest that the growing disparity between costs and revenue has at last been arrested. In most cases profits have increased owing to the absence of labour trouble and the reduction in mining taxation which was made earlier in the year. But mines working low grade ore have shown only a small improvement. The absence of a payment by Randfontein for the second half-year in succession is disappointing, but the heavy cost of capital expenditure during the period has more than offset the improvement in operating results. In the Central Mining-Rand Mines Group, Blyvooruitzicht has made a record payment of 2s. 6d., bringing its total for the year up to 4s. 9d. compared with 2s. 6d. paid in 1946. This fulfils the expectation aroused by the steady increase in tonnage milled

during the past year, and is encouraging in the light of the further expansion planned in milling capacity. Some of the older mines such as Nourse and Modderfontein "B" have done well to return to the dividends paid in December, 1946; in the case of Nourse this was double the distribution of last June. Other mines in this group, such as East Rand Proprietary and Durban Roodeport Deep, have made conservative distributions compared with the estimates of their net earnings.

The market reaction to the December dividends has been unenthusiastic. The improvement registered in share prices since August has not been caused by hopes of increased dividends arising from lower costs, but rather to wishful thinking on the prospect of an increase in the price of gold. The present low yield basis of the producing companies, as well as the inflated values of the development companies, can be justified only on the assumption that sooner or later this will actually happen.

Shorter Notes

After prolonged consideration the Government have decided that the new cold reduction plant for sheet steel, which forms part of the steel development scheme in South Wales, should be sited at Margam, adjacent to the new hot strip mill. Certain work now being done at the Orb works of John Lysaght and Co. will be transferred to the new cold reduction plant. The Steel Company of Wales have announced their intention to keep the Orb works in a high state of productive efficiency. The decision to attach the cold reduction plant alongside the new hot strip mill (of which particulars were given in *The Economist* of November 15th) is to be welcomed. It should provide greater productive efficiency than a separate plant in another locality.

Lord Greenwood's speech at the Dorman Long meeting last week reported that the company's considerable development programme is proceeding satisfactorily, though less rapidly than the company would wish. Much civil engineering work has been done at the Lackenby site and the company is now receiving tenders from American machinery manufacturers for certain plant which will be required for the new universal beam mill. Lord Greenwood made a plea for "a realistic approach" to the relations of the Government with the steel industry and suggested that the enterprise of the steel industry could be married to effective Government control of its general policy.

The Board of Trade's index for retail sales rose by 7 per cent to 161 in October (1942=100), a figure already equal to last year's December record. October was the first month of a new coupon period and the last before the autumn Budget. It is apparent that

the usual autumn spending was at a rate exceeding that of 1946. In spite of this, stocks were maintained. The indices for future months will show what restraining effect, if any, the budget has had on consumption expenditure.

Contrary to most industrial groups, Tube Investments is well satisfied with the progress of its postwar expansion schemes. These have already called for the expenditure of over £3,500,000 and they are nearly completed. Thus the company is not dismayed by the cuts proposed in the Government's capital programme for 1948. It drew up its plans towards the close of the war and made an early start towards expanding its capacity before the rise in construction costs had become acute. Allowing for the difficulties of comparison due to different types, Tube Investments now claim to be producing bicycles of the best designs at a lower cost than overseas competitors.

The reorientation of Swedish trade announced in the new import programme should benefit this country. Imports next year are to amount to just under 4,000 million kroner compared with about 5,000 million this year. But hard currency imports which now account for 2,800 million kroner are in proportion to suffer a much greater cut to 1,465 million. About two-thirds of all imports will come from sterling and soft currency areas. Talks are at present being held with Russia, Italy and Belgium. Details of the new Anglo-Swedish agreement are expected soon. There is every reason to believe that the negotiators have availed themselves of the opportunities presented by the new situation.

The Argentine Government has raised the price of wheat to farmers from 17 pesos to 20 pesos a quintal. The new price is equivalent to approximately £15 a ton and represents one-third of the price at which Argentina recently sold wheat to Brazil. The Chicago wheat price is approximately £30 a ton.

A record trade union membership of 8,714,000 at the end of 1946 is reported by the Chief Registrar of Friendly Societies. This represents an increase of 901,000, or 11.5 per cent over 1945, and is well above the previous peak reached at the end of 1920. Although membership has been increasing rapidly, however, the trend towards concentration has not proceeded very far. Over the last six years, the total number of trade unions has been reduced only from just over 1,000 to 753. The lop-sided character of trade union structure is shown in the fact that 372 unions, or 49.4 per cent of the total number, cater for less than one per cent of the total membership, whereas two-thirds of the members are enrolled in 17 unions, accounting for only 2.3 per cent of the total number.

SECURITY PRICES AND YIELDS

A fuller list containing 370 securities appears weekly in the *Records and Statistics Supplement*. Notes on the following company reports also appear in the Supplement: Joseph Lucas; Carreras; H. & G. Simonds; United Dairies.

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent. will be redeemed at the earliest date (these are marked 'a'), and those paying 3 per cent or less will be repaid at the latest date (marked 'f'). (b) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. † Notice given for repayment on March 1, 1948.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2 1/2 per cent free of income tax. Yield worked on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

COMPANY MEETINGS

THE COMMERCIAL BANK OF SCOTLAND, LIMITED

PERIOD OF RECURRENT CRISES

THE EARL OF MAR AND KELLIE'S REVIEW

The annual meeting of the shareholders was held, on the 18th instant, in the North British Station Hotel, Edinburgh. The Earl of Mar and Kellie, the governor of the bank, presided.

The governor made reference to the loss the bank had sustained during the year through the deaths of Mr James Younger, D.L., LL.D., one of the extraordinary directors, and of Mr David Johnstone Smith, LL.D., C.A., one of the ordinary directors. Mr Johnstone Smith, he said, was an ordinary director for 27 years, and his wide knowledge and wise counsel were a great asset to the board.

In submitting the report the governor said:

I am pleased to preside at another annual meeting of the shareholders, but it is with some regret, which I know is shared by your directors and officials, that for the first time in 100 years we have been unable to hold the meeting in the bank's head office in George Street. Increasing business requirements have now taxed to the utmost our accommodation there, and I am afraid it will be some time before it will be possible to meet our present needs by a further building programme.

In the year which has elapsed since I last had the pleasure of addressing you we have witnessed many changes in the industrial and economic spheres. In some respects it has been a period of recurrent crises; and the fuel shortage, the severe winter, and the exhaustion of the American Loan have focused attention on our serious economic position.

It is quite clear that these difficulties did not steal upon us suddenly, but it may be that we had been living dangerously so long as to be unable to distinguish the warning signals and appreciate the full effects on our national life in time of peace of low productivity and shortage of foreign exchange. Our approach to the problems of reconstruction may have been conditioned by ideas developed during the inter-war period; and increased purchasing power, low interest rates, and a high level of public expenditure may have led us to believe that we were a wealthy nation well circumstanced to enjoy the reward for having endured the shortages and restrictions and successfully emerged from the dangers of the war years. We have failed to appreciate to the full the tremendous problem of re-equipment which had to be faced at a time when industry was struggling to meet the demand for consumer goods in this country, and at the same time allocate an ever-increasing proportion for export. We have had difficulty in reconciling ourselves to the realisation that, although to all appearances we may be living in a period of financial plenty, we must accept an even more austere standard of life if we are to establish our export trade at a level which will enable us to buy overseas the basic foods and materials necessary for the maintenance of even our present standard of living.

NATION AWAKENING TO SERIOUSNESS OF CRISES

There are indications that the nation is awakening to the realisation that we are engaged in a battle for our national survival as deadly as any which has yet been experienced. Provided we can achieve a resolute approach to our problems, in the same spirit of high endeavour which characterised the national effort during the perils of the war years, who can doubt that we shall successfully overcome our difficulties and recover

our high place in the world economy? The issue is clear: there is demanded of each of us the acceptance of the fact that the food and other materials which the country needs must be bought by the labour and savings of the individual, and at least for the time being many of the minor comforts and luxuries we had hoped to enjoy must be postponed in favour of the paramount need for increased exports. The problem of national reconstruction is a challenge to all, and on the individual rests a great responsibility. The recovery by Britain of her high place among the nations of the world may be the most potent factor in inducing a recovery of international prosperity and promoting harmony among the nations. Honest work and saving to prevent inflationary tendencies until goods are again available to meet home market demands are essential factors in early recovery. This bank, in association with all other British banks, is assisting the great voluntary Savings Movement, which for thirty years has co-ordinated and developed agencies for the mobilisation of the small savings of the people.

RESPONSIBILITY OF INDUSTRIAL LEADERS

Much of the responsibility for the successful re-establishment of our economic potential will fall upon our industrial leaders. It is on their skill, prudence and enterprise that we depend for the solution of the problem of increasing productivity. They are required to ensure that their commodities are produced on an unprecedented scale and at prices which will command a ready sale in the world markets. They must be accorded the loyal support and co-operation of all, and I am glad to have this opportunity of giving the assurance that the bank will afford them all the assistance in its power. Over a long period we have built a tradition of service of which we are proud. Our varied services and our accumulated experience will be made readily available to all who have need of our assistance.

BALANCE SHEET ITEMS

I would now ask you to consider with me the balance sheet of the bank for the past year. You will find record figures under nearly all headings, and the total of over £130,000,000 is more than £10,000,000 higher than the figure submitted at our last meeting, and almost twice as much as the comparable figure submitted at the meeting seven years ago in 1940.

You will recollect that at our last meeting it was resolved that the "A" shares, which were £4 each, £1 paid, be divided into four "A" shares of £1 each, 5s. paid, and that the uncalled liability on the sub-divided "A" shares be reduced by the sum of 1s. per share from a transfer of £350,000 from the contingency fund. The effects of this re-adjustment are reflected in the figures now submitted and the paid-up capital, amounting to £2,600,000 is £350,000 more than last year. The reserve fund, to which has been added £100,000 from this year's profits, now amounts to £3,800,000, and is £1,200,000 in excess of the paid-up capital.

Notes in circulation, amounting to over £12,230,000, are higher on the year by over £1,200,000, indicating that the sphere of the bank's influence is widening, besides providing evidence of the enlarged amount of currency in circulation.

Deposits and other credit balances, amounting to over £107,800,000 are more by over £8,500,000. These figures have been achieved notwithstanding the withdrawal of

increasing sums required to finance the renewal of machinery and plant and the acquisition of stocks of materials, and constitute a new record in the bank's long history.

The increase of over £650,000 in the item acceptances and engagements, which amount to over £3,390,000, provides an indication that the bank is assisting its customers in their participation in the revival of international trading and we hope to see a further development of this section of the bank's business.

Turning now to the assets side; the first five items, representing cash, balances with other banks, money at call and short notice in London, British Government Treasury Bills, and British Government Treasury Deposit Receipts, aggregate over £39,000,000, and are £2,700,000 less than last year; but British Government Securities stand at over £67,900,000 and are over £8,700,000 more than last year. These resources, of a liquid character, amount to almost £107,000,000—equivalent to 89 per cent. of our liabilities to the public in respect of notes in circulation and deposits.

The market value of our investments is greater than the figure appearing in the balance sheet and the investments have been carefully selected with regard to maturity dates.

At over £17,600,000 our advances show an increase on the year of £3,700,000, evidence of the support we are according to our customers in their efforts to re-establish their normal businesses and adapt them to meet the changing conditions. We will welcome the opportunity of further active participation in these efforts to improve and expand industrial and commercial enterprise and our support will be readily afforded wherever there exists character, integrity, and the will to succeed.

YEAR'S PROFIT

We may now consider the results of the operations of the year, and you will observe that the profit shows an increase of over £20,000. This may be considered satisfactory in so far that the increase has been achieved during a period when interest rates on British Government Securities and Treasury Deposit Receipts have been maintained at a low level, and we have been called upon to meet steadily increasing charges. It should be kept in mind, however, that since the report and accounts now before the meeting were completed, there has intervened the new Budget proposal increasing profits tax retrospectively. Such retrospective legislation adds materially to the difficulty in assessing and providing for taxation. The year's profit is arrived at as usual after making provision for contingencies, but in future years this additional taxation will no doubt be reflected in the available profit. Out of the sum available the directors have allocated £100,000 to reserve fund; £50,000 to the fund for deferred repairs and renewals to property; £50,000 as an addition to the funds of the pension trust, and £25,000 to the widows' fund.

THE DIVIDEND

Interim dividends on the "A" shares of 7 1/2 per cent. and on the "B" shares of 5 per cent., less income tax, were paid in July last, and it is now proposed that a further distribution of 7 1/2 per cent. on the "A" shares (making 15 per cent. for the year—a rate equivalent to 18 per cent. on these shares before the capital adjustments approved at our last meeting), and 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income tax, be approved. After payment of these dividends and allocations the carry forward to next year's account amounts to £86,108.

THE STAFF

We have, during the year, been much concerned with the problem of re-settlement of the staff. We have found it difficult, in face of the serious housing shortage, to maintain, in the interests of experience and advance-

ment, the free movement of staff between our various offices. I am pleased to report, however, that after consultations with the staff association we have introduced a house purchase scheme and a system of disturbance allowances, which will in some measure provide a solution to the problem, and alleviate the burden falling upon those members of the staff who through force of circumstances have no option but to purchase houses for their own occupation at the current inflated prices, or who, because of a transfer to a new appointment require to make a change of residence.

The directors desire to express their appreciation of the assistance of the staff association who have very willingly collaborated in dealing with these matters.

The governor then moved the adoption of the report and the motion having been seconded by Mr Douglas Mure Wood was put to the meeting and carried.

At the close of the meeting cordial votes of thanks were accorded to the directors and the staff for their services during the year and to the governor for presiding.

The report and accounts were adopted.

S. SMITH AND SONS (ENGLAND), LIMITED CONTINUED PROGRESS

The thirty-third ordinary general meeting of S. Smith and Sons (England), Limited, was held, on 17th instant, at Cricklewood, London, N.W., Sir Allan Gordon-Smith, K.B.E., D.L. (the chairman), presiding.

The Chairman, in presenting the accounts, pointed out that these were now produced in a revised form so as to give a clear and reasonably simple picture of the year's trading of the Smith group of companies.

He told shareholders that the items which were of the greatest interest to them were the consolidated profit and loss account and the consolidated balance-sheet. The profit in the consolidated profit and loss account showed an increase of £280,000 in the year's trading, while the net profit was £317,000 against £206,000. Of this some £208,000 was ploughed back into the business compared with £93,000 distributed to shareholders.

He stated that the reason that it was necessary to retain a large portion of the company's profits in the business was to meet:

1. The expansion in trading.
2. The ever-increasing cost of the replacement of machinery and plant.

The Chairman referred to the progress of the four divisional companies.

Smith's Motor Accessories, Limited, had increased their turnover by the further development of the two new lines—car-heaters and car-radio, both of which were being fitted as standard to a number of British cars.

The Aircraft Division, Smith's Aircraft Instruments, Limited, had also made progress, and the most noteworthy achievement was the introduction of the new Smith's all-electric automatic pilot, which has been accepted by the Government as standard equipment.

Smith's English Clocks, Limited, where greater progress had been made than in any other division, now had a total turnover amounting to 33 per cent. of the company's sales. Some twelve factories are making different types of clocks and watches in various parts of England, Scotland and Wales. The present rate of production is three million clocks per annum, and the target five million. A large portion of these are exported.

The Chairman briefly referred to the progress of the new division. Smith's Industrial Instruments, Limited, and to the amalgamation of Henry Hughes and Son, Limited, and Kelvin Bottomley and Baird, Limited, under the name of Kelvin and Hughes, Limited. The new company would be the largest manufacturer of marine and similar equipment in this country.

The report was adopted.

THE NATIONAL BANK OF SCOTLAND, LIMITED

RECORD FIGURES

The one hundred and twenty-second annual general meeting of the proprietors of The National Bank of Scotland, Limited, was held, on the 18th instant, in the bank's head office.

The Most Hon. the Marquess of Zetland, K.G., P.C., G.C.S.I., G.C.I.E., the governor, in the course of his speech said:

The balance-sheet as at November 1st presents for the first time in the bank's long history totals of over 100 million, or to be more precise, £105,000,000, nearly £8,000,000 higher than twelve months ago. In the ordinary course it would have been a reasonable expectation to have looked for some improvement in our net profits, but the additional burden imposed by the Supplementary Budget through the increased Profits Tax, which has been fully provided for, has disappointed this hope. Because of present uncertainties you will, I am sure, agree with the wisdom of continuing the policy of strengthening the bank's resources, and of the balance of £369,000 available for appropriation, it is recommended that there should be transferred to investment reserve £85,000, to heritable property account £20,000, to trustees for officers' pension scheme £50,000, and to staff widows' fund £10,000. Dividends will again absorb £107,800, and a balance of £96,000 will be left to be carried forward.

DEPOSITS AGAIN HIGHER

As to the balance-sheet, it will be noticed that deposits once again are substantially higher, and at their new record figure of over £88,000,000 show an increase of over £7,600,000. Although some part of this increase may be explained by continuing inflation from Government spending, yet it is fair to claim that in part it represents a continuing growth in the bank's general business and connections.

I need not emphasise the substantial ratio of the funds preserved in readily liquid form to meet all possible contingencies, but I would draw your attention to the growth in advances to customers, which at over £17,000,000 also constitute a record. I have more than once in the past from this chair expressed the readiness and willingness of the bank to assist in the promotion of our country's industry and commerce, and the increases in advances from £10,000,000 in 1945 to £12,600,000 in 1946 and now to £17,100,000 are evidence enough that these were no empty words.

THE EXPORT DRIVE

We must all hope for the success of the export drive, for our economic future is inextricably bound up with it. But it would be foolish to close our eyes to the nature of difficulties with which it is attended. Many years ago when a gentleman of the name of Robert Lowe was Chancellor of the Exchequer, he experimented with a tax on matches, which led some witty person to pen these lines:

"Ex luce lucellum, we all of us know;
But, if you can't sell 'em, how then,
Mr Lowe?"

We may ask ourselves a similar question in connection with our export drive, for all the information which reaches me is to the effect that the sellers' market which followed on the cessation of hostilities is rapidly becoming a thing of the past.

There are many reasons for that. For one thing, since we are ourselves restricting our imports, we cannot complain if other countries are following suit. In the buyers' market with which we are now confronted, the factors that count are price, quality and punctual delivery. So far as price is con-

cerned, we see a constant increase in the cost of production; wages are rising, the cost of coal, materials and transport shows continual growth, while taxation takes its ever-increasing toll. Moreover, we no longer enjoy what used to be regarded as the necessary foundation of a successful export trade, namely, a flourishing home market. The absence of it reflects not only on price, but on the quality of the products of our factories, for new lines of goods are no longer, as in the past, being tried out at home before being exported abroad.

IMPORTANCE OF HOME MARKET

This weakness in our economy has in its turn a direct bearing upon another of the ills to which I have referred in my addresses to you during the past two years, for a starved home market, whether as a result of the restriction of imports or of too great a diversion of our production to the export trade, is the greatest single factor in adding to the inflationary pressure from which we are suffering. You may seek to reduce it by curtailing the spending power of the public by additional taxation—at best a disagreeable and discouraging palliative—and by persuading all to save and invest their savings by lending them to the State. But, if you are to be successful in your appeal to the public to save and lend, the terms of your offer must be such as to appeal to the business instinct as well as to the patriotism of the mass of the people.

Moreover, as I was at pains to point out in my address to you two years ago, the State no more than the individual who is constantly borrowing, can escape the hard fact that sooner or later it will have to settle with its creditors, and it is difficult to avoid the conclusion that a certain lack of confidence in the future financial stability of the country, combined with the low rate of interest offered on their savings, has been a factor in the disturbing falling off in the response to the savings campaign.

REMEDY FOR ECONOMIC ILLS

All of this points to the inescapable conclusion that the real remedy for our economic ills is a steady increase in our productive capacity which will put an ever-increasing stream of goods in our own shops and so provide the necessary buttress to our export trade. We have been assured by spokesmen of the Government themselves that if everyone puts forth 10 per cent. more effort our troubles would be over. That may well be, but an example as well as exhortation is called for on the part of the Government.

Rigorous economy in all Government Departments and a drastic curtailment of Government expenditure, combined with a gradual reduction, in place of increases in, the burden of taxation, would do more than anything else to put fresh heart into all workers and managements alike, and to stimulate them to renewed endeavour. Failing this, we shall inevitably be faced with the further risk of having to devalue sterling in order to adjust our prices to the requirements of the external market.

Nor must we forget that half Europe lies prostrate from the effects of the war and that the other half has sealed itself off. So long as peace carries, so long as other nations are impoverished, so long also shall we feel the effects ourselves. The United States of America see the needs of Europe and the plan which bears Mr Marshall's name can do much to assist recovery, but the only and ultimate solution of our difficulties will be found in working and producing for our own salvation.

The report was adopted.

THE ENGLISH, SCOTTISH AND AUSTRALIAN BANK, LIMITED

NATIONALISATION THREAT

The fifty-fifth ordinary general meeting of the English, Scottish and Australian Bank, Limited, was held, on the 17th instant, in London, Sir Frederick W. Young, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1947:—

There is a matter of major concern which promises to threaten the high future prospects of Australia, namely, the Federal Government's proposal to nationalise Banking.

In the Bill the banks to be nationalised are referred to as "private banks," which is somewhat a misnomer. I prefer to use throughout this address the name by which these banks are commonly known in Australia, namely, the "trading banks."

As the trading banks have conscientiously co-operated with the Government through the Central Bank, before and since the Act of 1945, it is manifest that the nationalisation issue has been raised not on the grounds of economic necessity, but to implement partisan ideology.

The people rightly see in the proposal to establish a banking monopoly a threat to their fundamental freedoms, leading to a totalitarian system of Government which is the very antithesis of the democratic ideals developed by the British peoples through the centuries. The Bill has aroused violent controversy at a moment when the united effort of the people is essential for the restoration of sound and prosperous peace-time conditions. Fortunately the Federal Government's powers are limited by the terms of the Australian Constitution—they are not absolute sovereign powers such as a Government in a unified state possesses.

For the reasons given above, action has been taken by this bank in co-operation with all the other trading banks to test the validity of the proposed legislation on constitutional grounds. Following upon the issue, on behalf of the trading banks, of writs for injunctions, it is satisfactory to report that, by agreement between Counsel for the Government and the banks, no steps will be taken by the Government to give effect to the terms of the new legislation until the case has been heard in the High Court of Australia, and this is expected to take place in December.

UPSURGE OF PUBLIC OPINION

Following the declaration of the Federal Government's intention, I made a flying visit to Australia, when I witnessed an unprecedented upsurge of public opinion wholly opposed to the nationalisation proposal, and this in itself is a striking tribute to the leading part which the trading banks have played in the wonderful record of Australia's economic development. It was obvious that the Government did not dare to submit the Bill to a referendum; indeed, they are racing against time to defeat the people of Australia by hastening the acquisition of the banking businesses and establishing the Government monopoly to such a point that the process cannot easily be reversed, no matter how decisively the electors may vote against them at the next General Election, to be held at the latest in 1949.

Under the Bill the terms of compensation are to be negotiated between the parties concerned and, failing agreement, the matter is to be referred to a Federal Court of Claims, which is to be created under the Bill, and the decisions of which are to be final without right of appeal. The members of this Court are to be appointed by the Federal Government.

I am by no means unhopeful that the Government's proposals can be successfully resisted—in any case the value of our bank's surplus assets is such that I think I am justified in warning shareholders against sacrific-

ing their holdings, and I would remind them that under the Constitution the Federal Government can only acquire our business and assets on "just terms."

The liquidity of the bank's position shows little variation from last year. The total of cash, bank balances, etc., special account with Commonwealth Bank of Australia, and bills receivable, represent 10s. 11½d. in the £1 of the item deposits, current accounts, etc., as against 10s. 9½d. at July 1, 1946. With the inclusion of investments the respective years' figures are 12s. 7½d. and 15s. 7d.

The increase in the gross profit for the year has been accompanied by a rise in expenses, but the net profit after taxation shows an increase of £45,594. This has enabled the directors to recommend the payment of a slightly higher dividend and at the same time to increase the carry forward by £25,920.

The report was adopted.

LAKE VIEW AND STAR, LIMITED

BENEFIT OF GOLD TAX ABROGATION

The thirty-seventh ordinary general meeting of Lake View and Star, Limited, was held, on the 11th instant, in London, Mr. G. Goldthorpe Hay (the chairman) presiding.

The chairman, in the course of his speech, said: The profit from mining is £458,284 which compares with £311,817. We recommend a final dividend of 35 per cent. (viz. 1s. 4½d. per share gross and 9.24d. net), making with the interim dividend of 12½ per cent. paid in May, a total dividend for the year of 47½ per cent. (viz. 1s. 10.8d. per share gross and 12.54d. net) compared with 40 per cent. last year. The balance of profit carried forward is £36,136.

Three months ago the payment of the Gold Tax in Australia was abrogated and the industry is therefore now relieved of all taxation in Australia in respect of its profits from mining. This relief from taxation must, by and large, be a good thing for the industry and an incentive to increased production. Australia is now placing at the disposal of the United Kingdom the whole of its output of gold, and it will be a matter of satisfaction to you to know that our company is, I believe, the largest individual gold producer in Australia.

INCREASED TONNAGE MILLED

The tonnage milled at 585,650 tons shows an increase of over 200,000 tons while the ore reserve position as 3,883,800 tons showed only a decrease of 65,300 tons at the close of the year.

I should have liked to attempt to give you an indication of the possible results for the year. Unfortunately there are still too many indeterminate factors affecting our operations, primarily, of course, the outcome of the present arbitration proceedings. On the other hand, we now have the benefit of the abrogation of the gold tax, but increased wages and higher cost of stores may well offset this otherwise substantial relief. The price at which we sell our product remains the same, whether costs fall or rise. The very fact that other industries can raise wages, etc., and still make the same, or greater, profits has a general tendency to encourage higher wages and higher cost of commodities, in other words, to move to the disadvantage of the gold producing industry. But this is the price we pay for the pre-eminence of gold as a medium of exchange and in certain other directions the gold mining industry has advantages denied to others.

The report was adopted.

AVON INDIA RUBBER COMPANY, LIMITED

INCREASED TURNOVER

MAJOR R. F. FULLER'S STATEMENT

The fifty-eighth ordinary general meeting of the Avon India Rubber Company, Limited, was held, on the 16th instant, in Melksham, Wilts., Major R. F. Fuller, D.L. (chairman), presiding.

The following are extracts from the chairman's circulated statement:—

Before providing for taxation and contribution to the pension fund, the net profit for the year is £342,257, which compares with £342,304 in the previous year.

You will appreciate that we feel justly proud not merely of maintaining but of considerably increasing our turnover in spite of the many difficulties resulting from the fuel crisis. Our margin of profit, however, has been affected by rising prices of raw materials, with manufacturing costs increasing as a result of higher remuneration of labour and the conversion of our boilers to oil fuel firing. This conversion, which your directors deemed prudent to make, was effected early in the present year, principally during holiday periods. Thanks to this, factory output did not suffer, and full employment for all workers has been maintained throughout the year.

The total of current assets exceed current liabilities by £490,721, an increase of £61,906 over the previous year.

The policy of factory extension and modernisation has been continued, and is indicated by the cost of the additions to our fixed assets, amounting to £148,373 during the year. Some retardation of our future plans in this direction must necessarily take place in view of the national situation, but while we await the brighter days to come everything possible will be done to maintain the plant at maximum efficiency.

EXPORTS

Restrictions on the export of certain of our products have now been modified, but trade with an increasing number of countries outside the British Empire is rendered difficult because of their restriction of imports. Nevertheless, with conditions remaining much as they are now we have every hope of fulfilling our export target.

The contributory pension and the assurance scheme which I mentioned last year was brought into operation in April of this year and has been warmly welcomed by the employees. Over 96 per cent. of those eligible joined. The company's contribution to the fund amounts to £12,185, and is a tangible tribute which we are glad to pay to the loyal and efficient service rendered by all employees.

The year upon which we have now started has commenced well and, as I have said, our exports, which increased last year, are the subject of still further efforts for expansion to meet the national emergency. We hope the home market requirements of our products, which are so vital in many fields, will not have to suffer too heavily in the endeavour to equalise the national balance of trade. I must confess to a little anxiety as to supplies of certain of our raw materials. Raw rubber is the least of our worries, but tyre fabrics, steel bead wire and certain chemicals are not so readily available as we should like.

We had hoped that national conditions would have justified a small increase of dividend to the ordinary shareholders, but in view of the considerable uncertainties of the future we still think it wise to conserve our liquid resources.

The report was adopted and a final dividend of 7 per cent. on the ordinary shares, making 10 per cent. for the year, was approved.

UNITED DAIRIES, LIMITED

INADEQUATE PROFIT MARGIN

CONTINUAL RISE IN COSTS

MR LEONARD MAGGS ON THE POSITION

The thirty-second ordinary general meeting of United Dairies, Limited, was held, on the 12th instant, in London, Mr Leonard Maggs (chairman and managing director), presiding.

The chairman, in the course of his speech, said:—

As mentioned in the report, your Board would have liked to synchronise the closing dates of the accounts of the parent company and of the subsidiary companies at either March 31st or June 30th, in order to present consolidated accounts for the group, but they were advised that under the taxation laws this would involve the group in much higher taxation. Because of this a similar statement to that prepared last year is given, showing the combination of the assets and liabilities of the parent company at June 30th with those of the subsidiary companies at March 31st.

ASSETS EXCEED £12,900,000

From his statement you will see that the total net assets of the group, including goodwill, are £12,937,438, and the reserves, including undivided profits, £6,080,638. The current assets of the parent company, including Government securities (£2,263,409) and tax reserve certificates (£1,189,225), are about £850,000 more than last year.

The proceeds from the issue of additional capital in August, 1946, have been brought into these accounts, and the premium—that is the excess of the issue price over the par value, less the expenses of the issue (a net figure of £1,378,674) has been carried to reserves and undivided profits.

As mentioned in the report, the shares of certain companies previously held by subsidiary companies have, during the year, been transferred to the parent company at book value, and these transactions, with the purchase of important businesses since June, 1946, account for the increase in the parent company's investments in subsidiary companies from £1,536,289 to £3,365,051.

I should like to draw your attention again to the item appearing as provision for deferred repairs in the consolidated statement of assets and liabilities of subsidiary companies: this, at £791,130, compares with £764,761 at the end of last year. Nothing out of revenue was added to the reserve during the year: the increase is due to reserves held by businesses acquired during the year.

I had hoped that it would be possible to deplete this reserve rapidly by carrying out very necessary and overdue repairs to premises, plant and equipment, but unfortunately this has not been possible, due to restrictions on building work and shortages of many materials. This amount is temporarily available as working capital. The amounts placed to the credit of the fund in past years have been allowed in computing the company's liability for excess profits tax. Normally, unless expended within a given period, the sum accrued would become assessable for excess profits tax; but it must be assumed that there will be an extension of the period because of the national circumstances.

LARGER NET PROFITS

There was an increase in the net profits of the group from £587,190 last year to £884,004 this year, after provision for all taxation, including taxation on the profits under review. The provision for taxation is less than last year, due to the abolition of the excess profits tax at December 31, 1946. It is now proposed to pay a final dividend

on the Ordinary stock of 10 per cent. actual, less tax, making 15 per cent. for the year.

The same practice as before has been adopted this year, of bringing in from the subsidiary companies only sufficient revenue to maintain the recommended distribution, and the profit left with the subsidiary companies for the year is £507,436, which amount appears as an addition to reserves and undivided profits on the consolidated statement of assets and liabilities of subsidiary companies.

Of each £1 sterling of sales by the group of milk, milk products and other products, 14s. 7½d., was paid for the milk, other goods for resale, and raw materials for production of other goods. Of the 5s. 4½d. left, 2s. 5½d. was absorbed by wages and 1s. 10½d. by other costs, including provision of all containers, leaving £1s. 0½d., of which the Government requires in taxation 7d., so that there remains 5½d. for dividends and development out of each £1 sterling of sales. This sum of 5½d. will presumably be further reduced as a consequence of the proposed increase in profits tax to operate retrospectively. This is an overall summary of the position, having regard to the widespread activities of the group.

INADEQUATE RETAINABLE PROFIT

The result of our milk business is less satisfactory: the net retainable profit earned in relation to turnover during the year was not more than 1.5 per cent. I include in this calculation the subsidiary activities of the milk business—for instance, the trade in other goods purchased for resale, and, in the case of the Scottish companies, the bakery side of the business.

The amount received by the company in London today to cover processing, wastage, provision of bottles and bottling, delivery, collection and cleansing of empty bottles, booking up and giving of credit, is 1.625d. per pint bottle, or about 1½d. If this figure is compared with that applicable to any other service, and full regard paid to the work that has to be done, it will be acknowledged without any reservation that to be able to perform the services we do within the margin prescribed is indicative of a high order of efficiency.

Owing to the inadequacy of this margin, and the reduction in the quantity of milk available, there has been some talk of curtailing retail deliveries of milk by reducing the number of calls to be made in the week. Milk is produced by the cows on every day of the week, and must be cleared every day to the primary handling points. If there is no outlet to the consumer on, say, Sundays, there will be a hold-up of traffic, and we shall be confronted by the same sort of situation as is disorganising other industries through the introduction of the five-day week.

I think it will be agreed that the margins I have quoted provide a relatively small sum for the service of the capital invested, and for the creation of reserves for the healthy development of the undertaking.

HIGHER REPLACEMENTS COSTS

The proposed distributions represent 42 per cent. of the total retainable net profits, the balance of 58 per cent. being retained for the purposes mentioned. In this connection I think it appropriate to mention that in the Ministry of Food costings upon which the margins to the milk industry are based no account is taken of the greatly increased cost of replacement of buildings, plant, and

other equipment used in the business. The allowances granted to us in this respect, which should provide the fund for ultimate replacement, coincide with those permitted for taxation purposes and are calculated in the main on pre-war values.

You will realise how substantial is the increase in present-day prices of equipment compared with pre-1939 prices, and I particularly draw your attention to this point because when we carry out the much-needed re-equipment the annual charge for depreciation will considerably increase. Much of our existing equipment was installed before 1939, and part of it is completely written off, while of the remainder a substantial proportion was purchased at prices much below those ruling now. Accordingly, the charge for wear and tear or depreciation is relatively low to what it will be in the future.

The costs of milk handling still continue to rise, and, as must be quite apparent to you from all the recent press announcements, there is considerable doubt whether the volume will be maintained, let alone increased. Present production of milk is undoubtedly hampered by shortage of suitable feeding stuffs for the herds, and future production is threatened by the Government's present price for beef, which is diverting to the butchers a large number of heifers which should be going into dairy herds.

I do hope that before long the Government will take steps to rectify the present unbalanced relation between the prices payable to producers for beef and for milk, and that adequate supplies of feeding stuffs will be made available to milk producers. I am confident that if these conditions are fulfilled, and steps taken to improve the dairy herds of the country in order to raise the average yield of cows, a greatly increased milk production will be available, although it may be some years before it is achieved.

WAGES

Apart from the adverse effect on costs of any decline in throughput consequent upon shortage of supplies, there are other causes operating to increase costs. Wages today in the industry are very much higher than they were in 1939, without taking into account the shorter working week. In the milk industry in England and Wales a statutory minimum remuneration is prescribed by a wages council. This wages council, and its predecessor, the trade board, has made 14 awards since July 1, 1939, all in an upward direction.

In July this year the working week was reduced from 48 to 45 hours, and higher rates awarded for work on Saturday afternoons and Sundays. This was the heaviest single addition to costs of all the wage increases yet granted. It is not reflected in the accounts under review, neither is the further increase in rates awarded in October. In common with other industries, we are wondering whether a state of stability is ever going to be reached.

In July last there was an advance of 1d. per quart in the price of milk to the public. The only increase in the distributive margin to the trade was one-sixteenth of a penny per quart, and that only for the limited period of four months, from the beginning of the present month until the end of next March. Except for this meagre amount the whole of the additional price now paid by the public goes to the Government to reduce the amount of the subsidy paid to milk producers, and as a contribution towards the cost of free and cheap milk to certain priority consumers.

INDUSTRY STILL CONTROLLED

The war has now been over for more than two years, yet the milk industry, in which I include the manufacture of milk products, as well as the distribution of liquid milk, continues to be controlled by the Ministry of Food. The Ministry has received from this company, as well as from other businesses in the industry, a very full measure

of co-operation. At the outbreak of war, and during the war, we, in common with other businesses, lent to the Ministry a number of highly competent officials. With the cessation of hostilities these highly skilled men naturally desired to return to their former activities, and many have done so. Some have, however, continued to make themselves available to give advice to the Ministry from time to time, thus fully maintaining the co-operative attitude of the industry. Nevertheless the change in personnel which has occurred has inevitably left the Ministry poorer, and with less experienced staff than hitherto.

It was noteworthy that during the war period, whatever the extent and nature of the disturbances caused by enemy action, a regular daily service of milk to the consumer was maintained. I well remember the observations of a Cabinet Minister on the heavy night bombing of London in 1940—that after the uproar and tumult of the night the regular appearance of the milkman in the morning seemed to bring matters into proper focus. The work done by the milk roundsman and depot staffs in those times was beyond praise, and was made possible by the efficiency of the organisation behind them.

AUTUMN AND WINTER DELIVERIES

I have been disturbed for some time about the inequality of distribution of supplies of liquid milk during the autumn and winter months, the period of low production. Shortages are of two kinds—those of a seasonal variety, which are met by a change in the entitlement to consumers, and those which occur intermittently. In shortages of the latter kind the Minister of Food, averse to reducing the entitlement for some reason or other, such as the belief that the shortage will be of brief duration, usually issues an announcement that there will be a local shortage. At these times, even within the same locality, one dairyman may be short of requirements to the extent of 10 per cent. or more, while another may have a shortage of 5 per cent. or less. You will wonder how this could come about. The explanation is in the flow of milk to the market. Some milk goes from farms direct to the retail distributor, while the rest goes from the farms to the depots and thence to the retail distributors. In a sense the depot milk passes through a junction, and therefore can serve more than one distributor, whereas milk passing direct from producer to retailer is going along a single track and is incapable of redirection.

It is, of course, recognised that some milk should flow direct from the producer to the retailer, but it would be foolish, so long as milk production is inadequate to meet demands, unduly to increase the quantity of milk going direct on the ground of the prospect of some minor and theoretical reduction in costs, or because of a mistaken idea that the quality of the milk when it reaches the consumer will be improved.

There have been inequalities of distribution this year, and these inequalities will doubtless become greater in the future if the policy of milk direction adumbrated by the Ministry is not balanced with reason. I do not wish to be unduly critical of the Ministry: I do realise the difficulty of its task and the problems with which it is faced from time to time, but it should not be unmindful of the fact that within the milk distributive industry there exist a number of skilled and experienced men, the whole of whose business life has been devoted to the handling of problems associated with the distribution of liquid milk, and whose knowledge and experience is always available when it is sought.

MILK PRODUCTS

In regard to milk products, such as milk powder, condensed milk, cheese, butter, etc., manufacture is still under the control of the Ministry of Food, which fixes the quantity of milk to be utilised for each product. The quantity of milk available for manufacture is, of course, the excess of production over the

quantity allotted for liquid consumption on the basis of the weekly entitlement to consumers. During the past year the amount available for manufacture has greatly declined, and as I cannot foresee (and sincerely hope there will not be) any material fall in the demand for liquid purposes, the only prospect of getting more milk for home manufacture seems to lie in the increased production of milk on the farms.

As I have already indicated, the Government's present policy in regard to prices for beef may well lead to a reduction in the size of herds at no distant date, with a consequent decline in the total volume of milk production.

CHEESE AND "LACTA"

It will not have escaped your notice that during this year we have been permitted to make a limited quantity of Stilton cheese. Considering the specialised nature of this product, and the length of time since we were last allowed to manufacture, the quality of our cheese was most gratifying.

Healthy progress has been made in the promotion of the sales of our infant milk food, "Lacta," but the recent Government restrictions on the sale of infant foods is now having an adverse effect on the sales.

With the reduced requirements of Government departments for our mashed potato powder there has been more available to the public under our brand name, "Diploma." Until recently sales have been confined to the London area, but it has now been found possible to make a certain amount available to the provinces. The reception given by the public to this product, which when properly reconstituted is indistinguishable from freshly mashed potato, is most encouraging.

RESTRICTIVE SCHEMES

There is another matter to which I think reference should be made. In the pressing emergencies of war the Government thought it necessary, and the industry concurred, to introduce restrictive schemes respecting the service of the delivery of milk. These schemes are frequently alluded to as rationalisation schemes, although the word is not truly appropriate. They are still in force, despite the fact that they were first introduced as a war-time measure only. In effect, these schemes compel a consumer to take his milk from the particular retailer permitted to operate within the area of the consumer's residence, and only in exceptional circumstances is any modification possible. At the time of the introduction of these schemes a number of consumers were forced to register with and accept their supply of milk from a distributor other than the one who had hitherto supplied them. Consumers who received milk from Co-operative Societies were not obliged to make any change.

The conditions which made these schemes essential in war-time also necessitated reduction in the service which had previously been available to a consumer. Present-day conditions regarding labour and materials available are not much different from those prevailing during war-time, so it seems that, at least for a further period, the consumer must forgo the right of choice of supply, and we on our part cannot give to the harassed housewife the proper and full service to which she is entitled. It had been our hope that as the war emergency receded there would have been restored to the consumer the right of choice of milkman, and that it might have been possible to raise the standard of service at the very least to that which was available before the war. At the present time the prospect of achieving this ambition seems to have become less bright.

A MISCONCEPTION

The forced curtailment of service, and the hardship thereby inflicted upon the con-

sumer, have not been of any advantage to the distributive organisation. Such reduction in expenditure as might be attributable to it has been absorbed by the rise in costs from other causes. From time to time people without knowledge of the real facts refer to unnecessary and costly distributive services given before the war, and extravagant advertising practices indulged in by the trade in those times. This is largely nonsense. Those who talk about the overlapping of delivery rounds of milk do not take the same view in relation to several shops of a like nature in one market place, although all are maintained in order that the consumer may have a right of choice of source of supply.

Extravagant estimates are made of the savings resulting from rationalisation schemes, but, as I have remarked on an earlier occasion, the bulk of these economies arise from the enforced curtailment of service to the consumer. In my view, progress should be along the lines of improvement of service rather than otherwise. There are many things which today we must go without, but our ultimate aim should be a return to that freedom when the housewife can buy what she may require in such quantities as she may desire at such times as convenient and from whom she may elect as her suppliers.

It is to be regretted that there is no immediate prospect of the end of these rationalisation schemes, but we must look forward to the day when, with the coming of better times, they can be swept away, and the present restrictive and burdensome impositions on the consumer removed.

STEADY AND CONTINUOUS PROGRESS

So far as this organisation is concerned, consumers may rest assured that in the future, as in the past, it will be our aim to develop and improve methods of processing, bottling and distribution of milk, and to increase our service to the consumer to the highest possible standard. Apart from the interruption of war, a glance back over the years reveals steady and continuous progress by the industry in the handling and distribution of liquid milk.

This undertaking, I am proud to say, has been in the forefront of these developments, and has spent a very large sum of money in improving the methods of handling and treatment of liquid milk and manufacture of milk products, and on research in relation to those activities. It possesses today one of the finest, if not THE finest, research laboratories and libraries in the world dealing with liquid milk and milk products. Its aim throughout has been to make available to the public clean and safe milk, rich in nutritive qualities, and no expense has been spared to achieve this aim.

In the wide areas from which milk supplies have been drawn it has endeavoured to establish close co-operation with the farmers, and to give them every assistance and encouragement in order to ensure that milk should be of good quality.

Some time ago a committee was appointed by the Minister of Food to examine and report to him on matters relative to the distribution of liquid milk. There may be good reasons why such a committee should be composed of people who, so far as I can judge, have had no practical experience in the industry, although where committees of a similar nature (sometimes termed "working parties") have been set up to consider other industries they have usually been constituted in the main, if not entirely, of persons with knowledge of and experience in the industry concerned. There is a large fund of skill and knowledge available in the milk industry on which the committee appointed by the Minister of Food can draw if it desires information or advice, but I should add that up to the present time the industry has not been unduly called upon in this regard.

The report and accounts were unanimously adopted.

CRITTALL MANUFACTURING COMPANY, LIMITED

LARGE DEMAND FOR EXPORT OF METAL WINDOWS

SIR VALENTINE CRITTALL'S ADDRESS

The twenty-third annual general meeting of this company was held, on the 11th instant, in London, Sir Valentine Crittall, J.P. (chairman and managing director), presiding.

The chairman, in the course of his speech, said:

To get a true perspective of what I am sure you will agree is a remarkable result for the past year, I must divide the profit into two parts: (a) That which we have received from our investments; (b) That which is the result of our trading. The net profit figure of £215,811 includes income from investments at home and overseas of £61,445, leaving a balance of £154,366 attributable to our manufacturing and selling activities. We have had the advantage of a large and steady demand for our products, but the difficulties, particularly in the matter of material supply, have been considerable. In one direction we have been fortunate in that the company possesses its own generating plants at three out of four of its factories. This means that we were free of the power cuts of last winter and are able to carry on at present without staggering our working hours. It is interesting to note that the power which we generate ourselves costs us no more than that which we buy from the grid. Since last winter we have installed generating equipment at the one factory where we were previously dependent on outside supply. We have also converted much of our heating equipment from coal to oil burning.

Another direction in which we were more favoured than most people was the adoption of the 44-hour week in the engineering industry. In most cases this meant a conversion from 47 hours to 44 hours. For many years we have worked a five-day 45-hour week and consequently the change involved only the absorption of one hour into our wage cost against the more general three hours. It is nice to feel that early piety is sometimes rewarded.

DIVIDEND DECISION

In view of the very satisfactory result for the period, shareholders could reasonably expect an increase in dividend, and I may say that until the Chancellor imposed his increased profits tax I had intended to ask the board to recommend an increase of five per cent. In view of this taxation, however, and the appeal which accompanied it, we have decided to leave the dividend as before, and I am sure shareholders will not fail to appreciate the increased carry-forward and the all-round strength of our financial position.

We have concentrated during the period on improving our manufacturing methods and have installed a great deal of new plant and equipment. We regard it as nothing less than a national duty to fight rising costs with more efficient production. The success of this policy depends not only on the sustained efforts of our technical and administrative staff but also on the close co-operation of our work-people. That this has been freely given can be measured by a substantial increase in piecework earnings over the period, and it is gratifying to note that the costs of most of our products show little increase over the period in spite of all-round increases in materials, freights, etc.

We believe that the service we have received from our staff and workpeople is deserving of tangible recognition, and besides extending the staff pension scheme we propose to introduce a works pension scheme on the same lines as that which covers our

staff. The benefits of this scheme, taken in conjunction with the national scheme which comes into effect in the middle of next year, will provide a decent standard of living at retirement and a life insurance during employment with the company.

EXTREME IMPORTANCE OF EXPORTS

In view of the extreme importance of export at the present time you will expect me to tell you what are its possibilities for the metal window industry. The fact that the architectural profession all over the world uses the catalogues of British window makers as textbooks is an indication that metal windows are still universally regarded as an essentially British institution. Wherever metal windows are made, men from British window factories will be found, and there is an export market, provided steel is made available, more than to replace any falling off in home demand. This company, in common with other British manufacturers of windows, has spent a vast amount of time and money in establishing agencies and selling organisations in many overseas markets. I have spent a large part of my working life blazing the trail. I cannot remember when we did not have an export business, and in the ten years before the war we exported over 10 per cent. of our production.

During the war building was at a standstill almost everywhere, and the end of the war has brought a world-wide resumption of building on a large scale. In anticipation of this we have had a force of salesmen visiting the markets where we previously did business and exploring further window possibilities in every corner of the globe. The orders received are encouraging, and for six months past we have been exporting at the rate of nearly five times our pre-war value. There are indications that this figure can be very materially increased. So far we have been supplying the standard windows required for short-term building programmes, but our salesmen's efforts in connection with permanent building are now coming into fruition and we shall be supplying quantities of more expensive windows.

AVAILABILITY OF STEEL

In the early part of the year under review our export business was restricted, because of the claims of housing, to four per cent. of the steel we received. This restriction has now been eased, but we are in the dark as to our export target until the amount of steel available for this business is known. Fortunately metal windows are not heavy users of steel. Darlington rolling mills, doubled in capacity since the war to provide steel for the windows required in national housing, can easily supply up to the capacity of the industry if billets are made available.

The claims of the metal window industry to be allowed to carry out its export plans are that a world-wide demand exists for our goods, that we have designed types of windows to meet climatic requirements in many countries, the sale of which is established and is increasing, and that the demand is permanent. The success of export generally will, of course, depend on whether other countries are prepared to take our goods. At the moment there are import restrictions in many countries, and it must be assumed that some of these can, and will, be removed by negotiation.

One other factor is essential for the success of an export drive. It is that there shall be no reduction in the total volume of manufacture, as this would inevitably result in an

increase of cost and thereby handicap our ability to export. What is essential is that we should be told what steel we are to receive. Without this knowledge we cannot continue our export drive. We must grasp our opportunity now or risk the loss of the market for this essentially British product for all time.

Crittall-Hope Metal Windows (South Africa), Limited, have had a most successful year, the trading profits being increased by £44,626 to £138,931, their best result so far. This enabled the South African company to declare a dividend of 20 per cent.

Last year I mentioned aluminium as a raw material for metal windows. It has played a not inconsiderable part in the year under review. We have made the windows for upwards of 11,000 houses, and have been glad to use aluminium to eke out our steel supplies.

REPAIR OF RAILWAY WAGONS

It is a far cry from making metal windows to repairing railway wagons. In view of the urgent need for wagons, we have undertaken this work at our Witham works. The L.N.E.R. co-operated by sending us wagons at the beginning of November, and during the first month we have returned to service, repaired to the full satisfaction of the railway company, 148 wagons. They are now going out at the rate of 70 wagons a week. That these wagons go out fully loaded with our own goods is a consideration which will not be lost on other manufacturers with siding accommodation.

This job was not undertaken because we wanted work, nor is it very attractive from the profit point of view, but we were anxious to demonstrate that, where there are urgent requirements beyond the capacity of the regular channels of production, the manufacturing capacity of the country can be used as it was during the war. I suggest that the necessity for the direction of labour, if it involves sending workers into other areas, can often be obviated by taking the job to the man rather than the man to the job, and that to break up well organised and efficient manufacturing organisations simply to transfer so many hands into other industries or districts, when the job can often be transferred as a whole, must inevitably detract from a national efficiency which has certainly been vastly improved by war conditions.

THE OUTLOOK

In considering the immediate future I can only say that in the period since the closing of the account output has been maintained on the same basis as last year, and this position is assured until the end of the calendar year. From then on uncertainty exists as we do not know whether steel supplies will be maintained at the current rate. The all-round cut in capital expenditure, mainly in the building trade, is designed to release material and labour for export. We require at least 40 per cent. of our 1947 steel for our 1948 export and if, on top of this, 350,000 houses are to be completed in 1948, it would appear that although many of these are well advanced, industries engaged on components such as metal windows cannot be expected to play their part with less material than they have used in 1947. I see no valid reason to expect that we shall not receive the steel we require. So much for next year.

To see beyond this one needs, first of all, confidence that the country will come through its present difficulties. Our problem is not only to rectify our position in relation to other countries but to play a leading part in organising world recovery. I believe that this will be done, and that as the economic position improves, the possibility of tackling a huge building programme to repair the devastation of the war and to make up for building time lost during the war, can be undertaken. This should provide a steady market for the products of this company for a long time ahead.

The report and accounts were adopted and the proceedings terminated with a vote of thanks to the chairman, directors and staff.

GAUMONT-BRITISH PICTURE CORPORATION, LIMITED

DIVIDEND AGAIN 12½ PER CENT.

MR J. ARTHUR RANK'S STATEMENT

The twentieth annual general meeting of the Gaumont-British Picture Corporation, Limited, was held, on the 18th instant, at 142-150, Wardour Street, London, W., Mr J. Arthur Rank, JP, the chairman, presiding.

The following is an extract from the statement of the chairman, circulated with the report and accounts for the year to March 31, 1947:—

Trading profits of the consolidated group of companies for the year under review (including a period of 14 months to March 31, 1947, in the case of the Provincial Cinematograph Theatres group in order that its financial year will in future coincide with that of the corporation) amounted to £2,623,664, compared with the record profit of £3,002,648 established last year.

Theatre takings during the period were well maintained, but increased costs of operating our circuits, mainly on account of higher wages, general overhead expenses and larger outlays for the repair and maintenance of our many properties have combined to bring about a decline in trading profits.

A reduced contribution is included in respect of the music halls of General Theatre Corporation, Ltd. (sold at the end of December, 1946, after nine months trading for our account in the period under review) and from film production. On the other hand, income from subsidiary companies not consolidated and from associated companies has increased from £129,354 to £220,772.

TAXATION POSITION

Charges against trading profits are of the usual character and are set out individually in the profit and loss account. The increased provisions for depreciation arise mainly on account of the two months' extension of the accounting period of the subsidiary group previously mentioned. In the aggregate provisions for taxation on the profits of the year have fallen from £1,579,590 in 1946 to £1,250,115 in the present accounts.

The combination of circumstances which has brought about this substantial reduction are the reduced rate of excess profits tax which came into effect on January 1, 1946, the replacement of this tax a year later by the profits tax, and the lower profits of the period. In the present accounts provision has been made for the increased rate of profits tax in accordance with the recent Budget proposals.

Final agreement on outstanding matters affecting our taxation liabilities has not been reached, although material progress has been made in that direction, as will be appreciated by the fact that it has been possible for an amount of £150,000 to be released during the year from provisions for current taxation in the accounts of Provincial Cinematograph Theatres, Ltd., representing sums set aside in previous years in excess of requirements as now estimated. This amount has been transferred to the general reserve of that company.

RESULT OF YEAR'S WORKING

After deduction of all charges against trading profits and necessary adjustments in respect of profits attributable to shareholders held outside our group, also profits of the period remaining undistributed by the subsidiary companies concerned, the net profit of the corporation amounted to £557,673. The net profit last year amounted to £469,509. With the addition of the balance of £134,870 from last year the surplus available is raised to £692,543.

Out of this surplus your directors have transferred to general reserve a sum of £190,000 and have written off £8,396

expenses in connection with the recent increase of share capital. They recommend a final dividend for the year of 7½ per cent. upon the issued ordinary and "A" ordinary shares, which, together with interim distribution of 5 per cent., maintains last year's distribution of 12½ per cent. This final dividend (which takes into account 2,450,000 new "A" ordinary shares of 5s. each, being the maximum number required under the offer of March 18, 1947, to the ordinary shareholders of Associated Provincial Picture Houses, Limited), has been provided for in the present accounts and will require £149,016 net.

The foregoing appropriations, together with the preference dividend and the interim dividend on the ordinary shares, absorb a total of £528,224 and leave a balance of £164,319 to be carried forward, against £134,870 brought in.

ISSUED CAPITAL

In the consolidated balance-sheet the issued share capital of the corporation remains unchanged. The "A" ordinary share capital had been increased by the addition of 3,500,000 such shares shortly before the close of the financial year, but at that date no new shares had been allotted. It will be recalled that the primary object of this increase was the acquisition by the corporation of all the issued ordinary shares of Associated Provincial Picture Houses, Limited. Approximately 97 per cent. of such shares have since been acquired on the terms of the offer.

The surplus realised on the sale of our music halls is reflected in a new capital reserve, and an addition of £261,321 to the undistributed profits of subsidiary companies represents the surplus arising from the sale of an investment held for many years in Moss' Empires, Limited.

It will be observed that the accumulated total of group reserves, including undistributed profit and reserves for future taxation, has increased from £3,055,886 in 1946 to £4,152,941 at the date of the accounts, not including excess profits tax postwar refunds of the consolidated group, estimated at £268,000 after deduction of income-tax.

VALUATION OF ASSETS

On the other side of the consolidated account it will be seen that our theatres, studios and other property, plant, etc., have a revised book value of £18,835,979. The transaction mainly responsible for the decrease indicated by the new book value was the sale of our music halls at the end of December last. This transaction involved the addition of two cinemas to the circuit of the subsidiary company concerned. Other properties and sites have been acquired during the year. It will also be seen that our interests in associated companies have undergone considerable expansion during the year.

The Corporation has acquired at par a 50 per cent. interest in the issued share capital (£1,500,000) of Overseas Cinematograph Theatres, Limited, and in this undertaking we are associated with Odeon Theatres, Limited. One-third of the issued share capital of Gaumont-Kalee Seating, Limited, has been acquired and our holding of shares in Denham and Pinewood Holdings, Limited, has been increased to one-third of the issued share capital of that company.

In regard to the year now current cinema attendances have not been maintained at the high level of recent years and costs of operation and management have steadily increased. Although considerable improvement has taken place recently in theatre business we must anticipate a lower level of trading profits this year.

The report was adopted.

CONSOLIDATED AFRICAN SELECTION TRUST, LIMITED

STRONG FINANCIAL POSITION

The twenty-third annual general meeting of this company will be held in London on the 22nd instant.

The following is an extract from the statement by the chairman (Mr A. Chester Beatty), circulated with the report and accounts:—

The accompanying accounts show that the combined profit for the year ended June 30, 1947, for this company and its wholly owned subsidiaries was £1,165,675 before providing for taxation and depletion. In addition, there has been brought back to the credit of the appropriation account £200,000 set aside in past years to meet contingent tax claims. This sum is not now required in the tax reserve as a result of the settlement with the Revenue of certain outstanding tax questions.

The directors' report shows that a surplus of £717,548 is available for distribution after providing for taxation and without taking into account the amount brought forward, and it also sets out three amounts totalling £170,000 to be placed to special reserves. These include special allocations for replacements of plant and for development. After allowing for these allocations to reserves, the directors recommend a final dividend of 1s. 9d. which, with the interim dividend of 1s. paid in June last, makes a total dividend payable out of current profits of 2s. 9d. In addition they recommend the payment of a special dividend of 9d. which is rendered possible by the release of the amount no longer required in the taxation reserve, mentioned above. These dividend payments of 2s. 9d. and 9d. a unit will involve a total net distribution of £583,874.

RESERVES

The combined replacements reserves now total about £580,000, of which approximately £300,000 is available for our Gold Coast mines. The existing plants have been in operation for a considerable number of years and an extensive programme will be required over the next few years to bring them up to date. Your directors therefore deem it prudent to make a special allocation to these reserves on this occasion.

The reserves for development in the Gold Coast and Sierra Leone stand at a combined figure of about £180,000 and will be utilised for the extensive prospecting and development programmes now in progress.

In January, 1946, a Government ordinance was issued in Sierra Leone setting up a Mining Workers' Wages Board specifically to deal with rates of pay for workers engaged in mining undertakings. This board, which is composed of representatives of the mining employers, including Sierra Leone Selection Trust Limited, and of their employees, with three independent members appointed by Government, made recommendations for substantial increases in the rates of pay of unskilled mining labour. These new rates were immediately adopted for our African staff. Shortly afterwards we completed an examination of the pay of our skilled employees, and laid our proposals for increased rates before the Mining Workers' Wages Board. They were approved and have now been introduced.

The period under review was remarkable for a high volume of world diamond sales from which your companies benefited under their sales contracts.

While world diamond sales have receded somewhat from the very high levels reached in 1946, indications for the current year's trading are satisfactory.

We may note with satisfaction that your company remains in a strong financial position and is prepared to extend its interests in the diamond business whenever suitable opportunities arise.

The report was adopted.

HORROCKSES, CREWDSON AND COMPANY, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

The annual general meeting of Horrockses, Crewdson and Company, Limited, was held, on the 17th instant, at the registered office, Yarn Works, Preston, Lancashire. Lieutenant-Colonel Thomas Marshall Brooks (the chairman) presided.

The following is the directors' report circulated with the notice and accounts:—

DIRECTORS' REPORT

The directors submit the audited accounts for the year ended August 31, 1947.

The combined net profit of the company, and its subsidiary companies for the year, after deducting all working expenses, but before taking account of taxation, amounts to £298,829 as compared with £182,536 for the previous year.

The liability for excess profits tax, profits tax and income tax at 9s. in the £ on the profits of the year amounts, in all, to £188,563 against £74,015 last year. The relief in respect of pre-war losses which was enjoyed last year has been totally utilised, and tax has had to be borne this year on the whole of the profits earned. After deducting provision for taxes on this basis there remains a combined net profit of the company and its subsidiary companies of £110,266 compared with £108,521 last year. From this amount it has been considered desirable to set aside further amounts to meet income tax liabilities of recently acquired subsidiary companies to put them on the same basis as the parent company, i.e., to provide up to, and including, 1948-49. This provision absorbs £25,360.

It will be remembered that there was an addition to the profit taken up by the parent company last year of £52,000 in respect of a release from the income tax reserve by reason of additional relief granted in the Finance Act No. 2, 1945; there is no comparable release this year.

After allowing for profits retained by subsidiary companies, the net profit taken up by the company for the year is £69,473 as against £87,499 last year. Out of this amount £9,000 has been set aside to cover the net additional tax arising from the increase in the rate of profits tax included in the Budget proposals introduced on November 12, 1947.

Your directors recommend a dividend of 10 per cent. and a bonus of 5 per cent. requiring £41,030 after deduction of tax, and leaving £100,031 to be carried forward against the amount of £80,588 last year.

ANALYSIS OF DISBURSEMENTS

Stockholders may be interested in the following analysis of the company's disbursements. In respect of each £1 which the parent company receives from its customers on account of its manufacturing and selling activities, there have been the following expenditures:—

	s. d.
The raw materials (including dyeing and finishing charges) have cost	9 10
Wages and salaries, etc., paid to all our employees amounted to	4 11
The costs of running our factories, including power, light, heat and all the other services; the cost of maintaining our plant and machinery in good order, and the cost of selling and distributing our products, amounted to	2 11½
(This figure excludes wages and salaries, which are already stated at 4s. 11d.)	
Debenture service requires	3½
The total of these expenses is	18 0
And the balance remaining out of the £1 is therefore	2 0

Of this figure, 1s. 4d. goes to the Government in national taxation, and the balance of 8d. remains at the disposal of the company available for reserves and for the payment of dividends on the ordinary stock of the company.

The directors regret they must report little improvement during the year in the direction of increased production, added to which there is a very real danger of further fuel shortages and cuts in electric power in the coming winter. It would seem prudent, therefore, to maintain our undistributed profits in the most liquid form, and we have consequently this year made no transfers to reserves, but have increased the amount of carry-forward in the profit and loss account.

The combined trading profit shows an increase on last year which, in view of the loss of four weeks' production due to shortage of coal, can be considered satisfactory. This improvement is to a substantial extent due to the progress which has been made by our subsidiary companies, and confirms our opinion that they would prove a valuable addition to the profit-earning capacity of the group as a whole.

Our subsidiary, Horrockses Fashions, Limited, in its first full working year has shown results which are most encouraging—its fashion gowns have been well received by the trade, not only in this country but in export markets, and credit is due to those of our staff who have been responsible for their production. It is apparent that cotton dresses in good quality, tastefully designed and styled, have a very promising future.

Investments in subsidiary companies have increased during the year and now stand at £375,750, mainly due to the acquisition of the Hoghton Spinning and Manufacturing Company, Limited. This unit has in some measure counterbalanced the shortage of operatives in our other mills, to which reference was made in the report last year.

FACTORY IN NORTHERN IRELAND

In accordance with the board's policy of transferring idle plant to areas where labour is available, we are pleased to report that we have concluded a satisfactory arrangement with the Government of Northern Ireland whereby a most modern factory is being erected at Newry, County Down. It is hoped that machinery will be installed there before the end of 1948.

Your directors are also able to report that negotiations are at present proceeding which, if successful, will result in the extension of our activities abroad, particularly in the Dominions.

All sections of the industry are generally agreed that as efforts to persuade workers to enter Lancashire cotton mills have not brought the desired results, the present labour force is totally inadequate to meet the urgent necessity of increased production. The only alternative, apart from the temporary expedient of longer working hours, is to increase the output per man-hour by re-deployment of labour with consequent higher wages per operative, and by the installation of more automatic machinery. Unfortunately, owing to circumstances entirely outside our control progress in this direction has been slow. This is largely due to the difficulty of obtaining the necessary materials and also to long standing prejudices against such developments. Until a solution of these problems is found the national need for more exports can only be

met at the expense of consumers at home. So long as a sellers' market remains, orders are not difficult to obtain, but we must be prepared for the day when we shall be called upon to meet acute competition from overseas. The Minister of Economic Affairs recently drew attention to this fact and emphasised the importance of maintaining, and even improving, the standard of quality of British manufactures.

IMPORTANCE OF FREE CHOICE OF COTTON

It is patent that the basis of quality in any product must be the raw material used in its manufacture; all the efforts and experience of management and operatives are of little or no avail if the foundation is wrong. It was the free choice of the cotton we purchased, coupled with the inherent skill of our workers, which over the years built up the goodwill your company enjoys in many markets. It is surely in the interest, not only of ourselves but of the nation, that the choice of cotton must remain with the buyer, and not be left in the hands of those who have no knowledge whatever of the purpose and ultimate destination of the goods for which it is required.

We therefore feel that we must again, as last year, stress the overwhelming importance of our being afforded the same facilities as were offered to us prior to the war through the services and experience of the Liverpool Cotton Market. If the Raw Cotton Commission cannot secure this result, and quickly, grave consequences for the cotton industry must be apprehended. The fact is, that we find it impossible in some instances to obtain the cotton we require, and we do not believe it is generally realised that inferior cotton will not only lead to a serious loss of production, but will adversely affect the earnings of our workers and render abortive the general adoption of new schemes of re-deployment which, in the experimental stages carried out under the direction of the Cotton Board, have so far proved highly successful.

We are sure the stockholders will wish us to record our thanks once again to the management and employees for their support and loyal co-operation in meeting the many difficult problems which have arisen during the past year.

The report and accounts were adopted, the dividend of 10 per cent. and 5 per cent. bonus, less tax, were sanctioned. The retiring directors, Mr Thomas Manners and Mr Henry Crewdson Howard, were re-elected, and the auditors, Messrs Price, Waterhouse and Company, were reappointed.

HOLOPHANE, LIMITED

SATISFACTORY PROGRESS

The twenty-second ordinary general meeting of Holophane, Limited, was held, on the 18th instant, in London, Mr H. Guy Campbell presiding.

The following is the report of the directors for the 12 months ended June 30, 1947: In the year under review the volume of business again progressed satisfactorily over that of the preceding year. The net profit amounted to £34,003, from which has to be deducted the provision for taxation of £22,677, after allowing for the recently announced increase in profits tax, leaving a balance of £11,326. This, together with the amount of £20,993 brought forward from last year, makes available the sum of £32,319.

The directors propose to write off from goodwill and patents the sum of £571, which expenditure was incurred during the year.

The directors recommend the payment of a final dividend of 7½ per cent., making, together with the interim dividend of 7½ per cent. paid in May, 15 per cent. for the year under review. Provision has been made for this, subject to confirmation, in the accounts presented, leaving the sum of £23,498 to be carried forward.

Building licences have been obtained and the work is in progress for repairing the war damage to our premises and for improving the technical laboratories, demonstration and show rooms, workshops and offices.

The value of orders outstanding on the company's books has substantially increased since last year, but although there has been some improvement, supplies of materials still restrict the company's activities.

Export business has increased and every effort is being made to increase it still further to meet the national need.

The report and accounts were unanimously adopted.

THE ROVER COMPANY, LIMITED

EXPORT PLANS

The fifty-second ordinary general meeting of the Rover Company, Limited, was held on the 18th instant at Birmingham.

Mr E. Ransom Harrison, F.S.A.A., the chairman, presided.

The following is an extract from his circulated statement:—

Last year I told you that we had finally cleared up our outstanding war contracts, and since then we have been devoting ourselves entirely to car production, together with maintaining our spare parts and service departments in their fullest capacity. During the latter part of 1946 our car production was gradually increasing and the position seemed to be improving as time went on. However, during the first three months of 1947 we were faced with the fuel crisis and as a result our output suffered and it was not until April that we got our production again running smoothly. Shortly after this the scarcity of materials became more apparent, and in almost every department we found difficulties in obtaining supplies.

NEED FOR ADEQUATE SUPPLIES

During the year a considerable part of our output has been sent abroad, and our cars have been well received by our overseas customers. The motor trade has been asked to increase still further its total output, and to allocate an even bigger percentage for export. We have made plans to meet the Government's wishes, but if the target is to be achieved it is essential that there should be adequate supplies of materials, and that negotiations should be successfully concluded for the reopening of the export markets closed to British cars. Our policy of producing cars of quality remains unchanged.

The necessity for export has meant that sales to the home market have been drastically reduced and, as I stated last year, we have the very greatest sympathy with those of our customers who have been waiting so long to obtain delivery. As most of you know, the allocation of cars for the home market is a very small one, but we do our best to allocate the cars available on the fairest basis. We do feel that we can be of some service to present Rover owners by keeping a well-equipped service department available to keep customers' old cars on the road, and we have been extremely busy in this department throughout the whole of the year. We have endeavoured to build up our stocks wherever possible so that during the coming year we shall be able to give the best possible help, both in the service and the spare parts departments. Our net profit amounts to £134,101 and the proposed dividend of 15 per cent and bonus of 5 per cent, both less tax, amounting to £70,226, leave a balance to be carried forward of £71,300.

The report was adopted.

RHOKANA CORPORATION, LIMITED

GREATER OPERATING PROFIT

The twenty-fifth annual ordinary general meeting of Rhokana Corporation, Limited, was held, on the 18th instant, in London.

Mr S. S. Taylor, C.M.G., D.S.O. (Deputy Chairman and Managing Director), who presided, in the course of his speech, said: There have been a number of changes in our investments in Rhodesian undertakings during the year. Our holding in the stock of Nchanga Consolidated Copper Mines, Limited, has been increased by £340,000. During the year we also subscribed £250,000 for half of the ordinary shares in Rhodesia Copper Refineries, Limited. The net result as compared with last year is that the figure shown for investments in Rhodesian undertakings has been increased by £950,000.

The profit on operating account is £770,000 greater than last year and the amount of £2,887,000 is carried to the profit and loss account. The amount credited in respect of the gross dividend from Mufulira Copper Mines, Limited, for the year ended June 30, 1946, is £227,500, an increase of £130,000 over the amount received from the same source in the previous year. Since the close of our financial year Mufulira Copper Mines, Limited, have declared a dividend for the year ended June 30, 1947, and we have received the gross sum of £325,000.

DIVIDEND RECOMMENDATION

The balance of the profit and loss account carried to the appropriation account is £3,221,880 as compared with £2,200,400 last year. The estimated amount for taxation on the profits for the year is £1,563,642. Your directors have decided to appropriate £600,000 to general reserve. Our policy is to provide out of profits funds sufficient to cover capital expenditure on buildings, plant and machinery, shaft equipment, etc.

Your directors recommend a final dividend of 60 per cent. representing 12s. per unit of stock. The final dividend as recommended together with the amount already paid as an interim dividend on the ordinary and "A" stock amounts to 85 per cent for the year or 17s. per unit of stock. The rates of dividends paid by the Corporation do not represent true returns on the capital invested in the business. The actual rate of return on the capital invested in the business is only a small fraction of the rate paid on the nominal capital.

SHORTAGE OF COAL SUPPLIES

During the year we, like the other Northern Rhodesian Copper Companies, have suffered severely from the strike in July and August, 1946, and from the shortage of coal supplies. We venture to hope that the first of these causes of interference with production will be non-recurring, but we are still suffering from the second. We were, however, able to take steps to minimise the loss in production caused by the inability of Rhodesia Railways Limited, to supply sufficient transport for coal from the Wankie Colliery. We purchased coal in the United States and in the Union of South Africa and imported it through Lobito Bay, and we adapted sections of our plant for wood burning. We were thereby able to so reduce the effect of the lack of Wankie coal that the loss of production due to that cause was limited to 2,000 long tons. That, however, is a substantial amount. If we had been able to produce it it would have brought us in considerable profit at the prices of copper prevalent last year. Further that copper if produced would have been delivered to the Ministry of Supply under our contract and would have saved expenditure of dollars on the corresponding amount of copper from sources outside the sterling area.

The report was adopted.

BRAZILIAN WARRANT COMPANY, LIMITED

COFFEE OUTLOOK

The annual general meeting of the Brazilian Warrant Co., Limited., was held, in London, on the 12th instant.

Mr Archibald K. Graham, the chairman, in the course of his speech, said: I have a letter from Mr Whitworth, who has been unavoidably prevented from being with us today. The figures before you belong entirely to the period when he was in the chair, and I had hoped to stress this fact in his presence as they provide a better tribute to his care of your business than any words of mine. The real position is even better than what appears on the surface, as during that period profits unremitting from the branches in Brazil or undeclared in dividends from the subsidiaries have been ploughed back and fully used in the interest of the business.

It is estimated that the stocks of coffee amount to over 13 million bags, and that the 1947-8 crop will probably only yield some 15 million bags. The reason for this poor outturn is a combination of bad harvesting weather and the alarming spread of the "broca." The power of the consuming markets is difficult to assess. Taking a long view, we know that Europe is urgently in need of coffee, and it is surely not unduly optimistic to look for a revival from the trend of 1947 to a pre-war activity.

As regards cotton, on the consumption side the statistical position appears to be very strong as figures published have given a world production of not more than 21½ million bales with an average pre-war consumption of 28½ million bales, so that the Brazilian crop, whatever it is, should find a ready market at a remunerative price.

The report was adopted.

LONDON AND RHODESIAN MINING AND LAND COMPANY, LIMITED

IMPROVED REVENUE

The ordinary general meeting of The London and Rhodesian Mining and Land Company, Limited, was held, on the 16th instant, in London, The Rt. Hon. Viscount Elibank, D.L., the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to June 30, 1947:—

In a period when expenses on all sides show a persistent tendency to rise, it is particularly satisfactory to record an appreciable reduction during the year under review in our administration costs, while at the same time revenue has markedly improved due to the larger profit obtained on realisation of investments, which, however, is not likely to be repeated during the current year.

As a result the profit of £97,391 earned this year exceeds that in the preceding period by £17,373. The dividend was maintained at 5 per cent. and, after making the substantial provisions of £50,000 for taxation, £8,757 for depreciation and £10,750 to write down the book values of certain investments, we are enabled to carry forward £37,437.

Our ranching business has again given satisfactory results this year. The cattle have increased in numbers and the policy of improving the strains by importation of pedigree British bulls has been continued.

Southern Rhodesia is today going through a degree of publicity which must have tremendous repercussions on the Colony's future. If, however, its economy is not carefully guided—and guarded—and if the inflationary tendency of rising costs and wages is not restrained, it may lead to a situation similar to that in which we are placed in this country, namely a vicious spiral.

The report was adopted.

SCOTTISH AUSTRALIAN COMPANY, LIMITED

LARGER PROFITS AND DIVIDEND

The annual general meeting of the Scottish Australian Company, Limited, was held, on the 16th instant, in London.

Mr J. Norman Eggar, the chairman and managing director, in the course of his speech, said: When I addressed you a year ago I had just returned from visiting all our properties in Australia. It must be a source of satisfaction to all of us that the hopes I expressed as to the immediate future have been realised, and that we have been able to increase our profits and our dividend.

GOOD RAINS AT ALL STATIONS

At the end of June last our total of sheep was 8,994 stud and 368,217 flock, and our wool clip, scoured and greasy, was only 8,904 bales, compared with nearly 12,000 bales in 1942. This diminution of sheep numbers has caused us no little anxiety, and I am therefore very thankful to be able to tell you that as a result of good rains just at the right time almost all our stations report a very good recovery. Indeed, we have just had advices of quite remarkable lambings at Fernlee and Corrella-Warraweena, and other stations, so that I hope I may say with confidence that the long period of constantly diminishing numbers of sheep is over, and that the process of building up our flocks has begun. It is indeed fortunate that the lambings have been good, for the cost of purchase would be exorbitant.

The quality of our wool has been maintained at a high level. The London wool auctions were resumed in September, 1946, and in the year I am reviewing we were able to ship most of our New South Wales wool here, and very good prices were realised; of the wool from our Queensland properties, the bulk was sold or appraised in Brisbane and also sold very well. In fact, the proceeds from the sale of wool have been £66,000 more than in the previous year, despite the reduced clip.

This current year practically all our wool has been shipped to London, and, on the advice of our brokers, wool which was free from burr and seeds was scoured locally, and the result has been eminently satisfactory. The reduction in the contributory charge on wool from 5 per cent. to 3 per cent. will make a considerable difference to us.

THE CURRENT YEAR

As to the current year, I can only tell you that weather conditions everywhere are far better than we have had for years. Lambings are good, wool prices are excellent, and the revenue from sales of cattle should be very steady. The price of wheat is bound to be higher than in previous years in view of the acute world shortage. The immediate outlook is, therefore, encouraging.

Referring to the profit and loss account, you will see that an increase of £67,000 on wool and livestock account has been the main source of the very satisfactory increase in our profit. In point of fact, the wool proceeds were almost entirely responsible for this increase, the livestock account having returned only a few hundred pounds more than last year. Lambings were down by 23,000, but as I have said, we anticipate an improvement in this respect during the current year.

Receipts from wheat and other crops reflect the failure of the wheat crops, but in addition to the back payments from the Wheat Board, revenue under this heading was greatly assisted by the excellent hay and lucerne crops harvested at Texas.

The report was adopted and a dividend of 7½ per cent. on the Consolidated Ordinary stock, less income tax, was approved.

J. BROCKHOUSE AND COMPANY, LIMITED

FURTHER PROGRESS

The fiftieth general meeting of J. Brockhouse and Company, Limited, was held at West Bromwich on the 17th instant.

Mr E. B. Burton, the chairman, said that the company continued to make satisfactory progress notwithstanding serious obstacles; in fact, it had been a year of difficulties on a scale previously unknown, and it was with feelings of satisfaction that the directors placed before the shareholders accounts showing a successful year's trading. The fuel crisis had seriously affected their production plans; several of their factories had been closed, some for several weeks.

Certain of their products were exported directly, and they were making every effort to increase that portion of their trade. Their order book was in a very satisfactory state; in fact, at an all-time peak. New products referred to at the last meeting had been well received.

The trading profits had increased from £219,897 to £556,371, a very remarkable increase in view of the difficult times.

Mr J. L. Brockhouse, M.A. (managing director), said that he did not think that it was always appreciated what an additional burden the circumstances of the times placed upon those engaged in industry. Planning was a continued nightmare of disappointments and frustrations shared by the staff and the workpeople. In this company they had pursued a forward policy, building all the time for the future; indeed, they might be criticised for sacrificing present profit for future business.

The report was adopted and the proposed final dividend of 12½ per cent., making 20 per cent., less tax, for the year, approved.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

PROGRESS DESPITE DIFFICULTIES

The annual general meeting of the Birmingham Small Arms Company, Limited, was held, on the 18th instant, at Birmingham.

Sir Bernard Docker, K.B.E., the chairman, in the course of his speech, said: In spite of abnormal trading conditions and unprecedented difficulties in the supply of the raw materials of our industry, we have earned a trading profit of £497,796. We have also received £291,493 in respect of E.P.T. recovery. We are able again to recommend the payment of a dividend of 7½ per cent. on the ordinary stock.

Cycle and motor production continues to be hampered by shortages of material and labour, but the output for the period under review is higher than for any period prior to 1940.

The Daimler Company and the Lanchester Motor Company are still severely hampered by shortages of materials and supplies. Although the motor trade is making a notable contribution to the export trade of the country, it is granted no priority for staff, materials or other essentials. We are making every effort to meet orders as quickly as possible, but the delays and restrictions to which we have to submit make trade difficult and depressing.

Our Jessop-Saville Company, producers of the highest-grade steel, have maintained output at a higher level than in the previous year. The pre-eminence of Jessop gas turbine steels is attracting the attention of engineers and designers. For the Tool Group the year has been one of reorganisation and progress.

Your company is fully equipped to take advantage of the vast opportunities which should present themselves, but this depends upon controls, restrictions, orders and the like, over which we have no control.

The report was adopted.

JOHN I. THORNYCROFT AND COMPANY, LIMITED

SATISFACTORY RESULTS

The forty-sixth annual general meeting of John I. Thornycroft and Company, Limited, was held, on the 10th instant, in London, Sir John E. Thornycroft, K.B.E. (governing director and chairman), presiding.

The following is an extract from his statement circulated with the report: The total dividend recommended this year on the ordinary shares amounting to 22½ per cent., should be divided by approximately four, to obtain the true rate of interest on the shareholders' investments, and we trust all shareholders will refute any statements (made with a view to mislead) that they are receiving an unduly high rate of dividend. The Chancellor of the Exchequer's disapproval of the issue of bonus shares prevents this position being rectified; in fact, the reputed high rate of dividend is used as an argument by responsible Ministers as a reason why consideration cannot be given to just claims in settling war contracts.

Addressing the meeting, the chairman said that shipbuilding, with present difficulties in obtaining materials and equipment when required, could only be described as heartbreaking, and there were no signs yet of any improvement.

With regard to the commercial vehicle business, during the year all outstanding contracts had been agreed with the Ministry of Supply, and the final settlements had been brought into the accounts. August 1st there were sufficient orders in hand which should utilise the full capacity of the works for at least 18 months.

From the Marine and Industrial motor and small craft section of the business over 75 per cent. in value of the new work output has been for export.

The report was unanimously adopted.

TRINIDAD LEASEHOLDS, LIMITED

BRIG. R. S. G. STOKES' REVIEW

The thirty-fourth ordinary general meeting of Trinidad Leaseholds, Limited, was held in London, on the 11th instant, the chairman, Brig. R. S. G. Stokes, C.B.E., D.S.O., M.C., M.Inst.M.E., presiding.

The following is extracted from the chairman's statement circulated with the report and accounts for the year ended June 30, 1947: Since the issue of my statement to shareholders, dated December 5, 1946, accompanying the last annual report, considerable changes have occurred in the affairs and outlook of the company. The scale of refinery operations has advanced substantially, through the processing of additional imported crude for account of another company; operational charges in the field have been increased owing to the heavier royalty payments imposed in 1946; we have benefited from a series of increases in the market price of oil products; company control has been reorganised in preparation for a return to unit company marketing while preliminary arrangements have been completed for the strengthening of trading position in the United Kingdom.

The throughput of our refineries for the year totalled 15,306,205 barrels, of which 11,340,097 barrels were Trinidad oil. Compared with the previous year, the total throughput shows an increase of approximately 2,000,000 barrels, due to the processing of imported crudes on behalf of the Texas Petroleum Company. This class of business, the acquisition of which is contingent on long-term relief from import duties on crude oil, represents a dollar-earning activity of considerable importance.

The report and accounts were adopted. At a subsequent extraordinary general meeting resolutions to subdivide the share into shares of 5s. each and thereafter to convert them into stock were carried.

GOVERNMENT RETURNS

For the week ended December 13, 1947, total ordinary revenue was £48,948,000, against ordinary expenditure of £36,555,000 and issues to sinking funds £160,000. Thus, including sinking fund allocations of £10,869,891 the surplus accrued since April 1st is £208,499,123 against a deficit of £556,762,917 for the corresponding period a year ago.

By Appointment
Suppliers of Aga Cookers to H.M. The King

Why the Aga Cooker and Water Heater is *not* a luxury, for the family or for the nation

THE AGA COOKER was the revolutionary engineering invention of Dr. Gustaf Dalen, the Swedish Physicist and Nobel Prizewinner. To-day it is wholly British made, and embodies many improvements. Like for like, the Aga Cooker and Water Heater cooks more food and heats more water to each cwt. of fuel than any other appliance. Though it burns continuously and is therefore ready for immediate use day and night, the Aga is guaranteed not to exceed a certain maximum consumption of fuel. Moreover, the Aga is the most labour-saving

cooker and water heater on the market. These facts should dispel any lingering impression that the Aga is a luxury product for the well-to-do. The Aga conserves the nation's fuel, relieves the load on gas and electricity undertakings, reduces the family's fuel bill and saves labour.

THE AGA FOR EXPORT

In the national interest Aga Heat Ltd. have decided that until further notice their entire production of Heavy Duty Cookers will be exported, as well as an increasingly high percentage of the

production of domestic models. Aga Heat Ltd. have recently opened a second works at Ketley in Shropshire, exclusively to serve the export trade.

THE AGA HOME PRIORITIES

(1) Farmers (2) Doctors

In production allocated to the home market, Aga Heat Ltd. have decided to give absolute priority to Farmers and Doctors, who in Aga's opinion most urgently require in the national interest the saving of fuel and labour as well as the domestic convenience which the Aga affords.

To Men of Good Will

THE Christmas present which President Truman has given the world—a Bill proposing that over \$17 billion should be spent on European recovery in the next four years—deserves, more than many actions which have been so described, the epithet of "the most unsordid act in history." As the elected head of the most powerful and—in many senses—most impregnable nation on earth, he has asked his people to forsake all narrow views of their own security and prosperity and, at the height of their post-war flood of spending, to forgo many immediate benefits in order to make sure that the recovery of their neighbours will not lag too far behind their own. Moreover, he has proposed that a great part of the assistance thus offered should not take the traditional form of loans but should be grants-in-aid on an unprecedented scale. All this may indeed be enlightened self-interest, but the degree of enlightenment is so infinitely in advance of any yet shown by a great nation in time of peace that it may well be questioned whether it comes into the category at all. It is true, of course, that a Presidential Message is not an Act of Congress and the chances of the Bill's emasculation as it goes through both Houses and their Committees are great. But this possibility makes it all the more necessary that the European nations should recognise the generosity of the Administration's project and respond to it with a readiness for action as keen and radical as the American initiative is bold.

The President's proposals appear to be sane and generous throughout. The actual figures proposed—\$6,800 million for the first fifteen months and \$17,000 million for the four year period—appear lower than those proposed in the Paris Report, which were \$8,050 million and \$22,440 million respectively. But the difference is not so great in practice, for the President estimates that, in the first period, \$1,285 million can be found—from such sources as unexpended balances with the Export-Import Bank—without resort to the United States Treasury; during the four years, the dollars available from other sources (including the International Bank) are estimated at \$4,100 million. A part of the allocations for Germany, amounting to \$822 million, which would in any case have to be met by the occupying Power, has also been excluded from the sums specifically requested by the President for the European Recovery Programme. Moreover, the Message proposes that if at any time during the four year period the estimates prove inadequate, he will return to Congress and ask for more. This is only one example of the very sensible degree of flexibility which runs all through the proposals. Another instance is the decision to ask Congress to allow the dollars made available by the Bill to be spent, up to a certain percentage, in countries other than the United States.

The same flexibility and good sense mark the proposals for the administration of the Plan. The President has rejected both the proposal that the administration should be in the hands of a bi-partisan Board representing Congress and also that it should be entrusted to some established Government department. An entirely new Agency will be set up, the Economic Co-operation Administration, which, headed by an Administrator with a deputy, will work independently of other agencies.

except in so far as its decisions impinge on American foreign policy—in which case it will act under the direction of the State Department. Since most of its activities will in fact closely affect American foreign policy, it is likely that the Agency will be under the fairly continuous review of the Secretary of State. An Ambassador-at-large is to be the responsible official in Europe, and he will act as the United States representative for any agency the European nations may set up. The President clearly believes that in the actual working of the Plan much must be left to the discretion of the new agency's Administrator. For instance, he does not feel that it would be wise on Congress's part simply to vote allocations of dollars to the different nations, to earmark supplies in America, and to leave the Sixteen in a competitive scramble to get the best share they can of those supplies. The President clearly sees the Administrator as the rationing agent who will marry supplies to demand and therefore presumably establish priorities and secure allocations. This work is too detailed and variable to be fixed by Congressional legislation. Thus it seems that one of the most delicate activities in the whole Plan will be the Administrator's sole responsibility. The actual method of allocating particular sums to particular nations has not yet been definitely laid down, but it will presumably follow the pattern established in connection with Interim Aid according to which separate allocations for each nation were proposed by the President to Congress, which then passed them with some modifications. But even if the general framework within which the Administrator has to work is fixed for him by Congress, his responsibility to prevent competitive buying and to secure orderly allocations will clearly give him a determining role in this, the crucial sector of the Plan.

The importance of this work is enhanced by the fact that some of the supplies most urgently needed in Europe are scarce there and particularly scarce in the United States. The President holds out no hope of satisfying the demands put forward in the Paris Report for such vital commodities as wheat, scrap and semi-finished steel, agricultural machinery and fertiliser. Part of the European demand must remain unsatisfied and the urgent question will be which claimants should be satisfied first and with what amount. This question—vital to the smooth working of the whole plan—will be the Administrator's responsibility in the first place and he will presumably work out his priorities with the European governments separately or through any organ of co-operation they see fit to set up on their side.

This problem of the supply and allocation of inevitably scarce materials is the central issue of the Plan and offers far more difficulty than any of the much discussed and much-feared "conditions" which the United States Government was expected to impose. The conditions actually proposed by the President are almost entirely non-political. There is no question of banning Socialism or arresting plans for nationalisation. The general conditions—which may be brought together in a single Act to be signed by all the participating nations—are simply those which the sixteen nations adopted as their aims at Paris. No one should shrink from commitments to increase local production to the maximum, to make the best use of national resources, to reduce tariffs and increase inter-European economic co-operation and to secure the stabilisation of local currencies. Two provisions, however, need closer examination. The first is that the nations should be ready to create stock piles of strategic raw materials for later sale to the United States. There should be no difficulty about this proposal in its present form, which clearly provides that any materials so delivered to the United States shall be paid for in dollars. The Sixteen will not thereby suffer any reduction in their capacity to earn dollars. On the contrary, steady purchases of raw materials by the United States might be one factor in stabilising world trade when the four years of the Plan are over.

The second provision is that in return for outright gifts of food and other supplies from the United States, each Government should pay equivalent amounts of its own currency into a special account, which would be spent on objectives to be agreed between the United States and the Government concerned. This proposal needs more careful scrutiny than can be given it in a general article. Wrongly conceived, it might lead to a potentially dangerous degree of direct American intervention in the affairs of other countries. It is true that the President makes no mention of the American "trustees" to oversee the use of the funds which were proposed at one point by the Herter Committee. It is also true that among the objectives proposed are the wholly laudable ones of reducing the currency in circulation and retiring the internal public debt of the country concerned. But this provision is clearly more controversial than the others and its implications need to be closely examined both in the United States and Europe.

*

The President has offered Congress and the World the outline of a good, workable scheme. He has avoided rigidity. He has realised that in an adventure on this scale, it is essential to leave scope for national growth, for developments which spring from the problems themselves and for flights and expansions beyond the goals now set which may be achieved by men's energy and inventiveness and vision once the scheme is fairly launched. The question which the European nations must ask themselves now is whether their own performance is likely to match the courage and generosity shown by the American Administration.

It is no use postponing this question on the grounds that Congress has not yet spoken and that the Sixteen must therefore wait and see. The problem is not static and the attitude of Congress is something which the European nations themselves can influence profoundly in the next three or four months. At present, the Americans most committed to the idea of a Marshall Plan and ready to support it most warmly are growing perturbed at the apparent inactivity in Europe. Since the Paris Conference ended, it looks in America as though nothing more had been done by the Sixteen. There has been no publicity on either side of the Atlantic for the work the technical experts are supposed to be doing on such vital matters as a Customs Union or the stabilisation of currencies and the little that has leaked out has been on the whole discouraging. Now that the President's Message has appeared, the time for inactivity, real or supposed, has passed, for there are now a number of specific points which the Sixteen can and should consider together.

The general figure of the aid likely to be available is known. The shortages which will appear in certain categories have been notified. The method of negotiation and the type of administration to work the Plan have been laid down, and the nature of the conditions outlined. It is now almost a matter of the European nations' own choice whether the scheme which finally emerges has within it the seed of a more co-operative European order or simply repeats the nationalist formulas of the past. The very flexibility of the American scheme is an invitation to activity and initiative in Europe. The reasons for hesitation are, of course, obvious. Since there is not enough to go round, all nations must sacrifice something of their full demands and they are all apparently certain that they can obtain more and safeguard their own plans better if they do not attempt to work out and impose upon themselves a rationing system but wait for the Americans to impose it for them. But surely this view, which in any context would be an act of abdication, is rendered really fantastic by the fact that for two years after the end of the war a rationing body in the shape of the European Coal Organisation was able to function effectively even though it included nations from the "Eastern fringe." It would be a deplorable confession of failure if the sixteen supposedly like-minded participants in the Marshall Plan were to demonstrate

that, faced with the need to fix new priorities, they were incapable of agreement among themselves. Indeed, if they cannot achieve at least this, one can abandon straight away any hopes that the development of the Plan will carry them towards a more co-operative ordering of Western society.

Above all, inactivity at this point in Europe, slowness, a waiting on events, will affect the whole course of the discussions in America. If Mr Bevin had not acted immediately after Mr. Marshall's speech at Harvard, there might have been no Plan. If at this point the entirely new and generous initiative of the

Interim Progress Report

BEFORE the event, rumour had said that Sir Stafford Cripps was preparing for last Thursday's debate on the capital White Paper a speech designed to raise the alarm about the rate at which the country's last reserves of gold and dollars are running out. But report also had it that his speech had been discussed in Cabinet, and it may be that there is more than a grain of truth in Mr Lyttelton's remark that Sir Stafford had been persuaded to toe the current line of modified optimism. In any event, though the speech had all the accustomed lucidity, it contained nothing that was new, except for some fresh additions to the statistical collections (which are commented on elsewhere in this issue). It was an interim report, with just enough items of good news to be an interim progress report.

Sir Stafford followed conventional practice in dividing his remarks into two separate sections, on home and foreign economics. On the home front, the speech was definitely disappointing, in spite of the fact that it is in this section that there is cheering news to report from several industries, and most notably from coal. The speech was disappointing because once again the opportunity was missed to relate the various fragments of policy to a coherent whole. It is a remarkable fact that Labour, the party of planning, has been less ready to set the whole of its economic policies into a coherent framework than was the Coalition Government, when Keynes's influence was paramount at the Treasury and spoke through the mouths of Sir Kingsley Wood and Sir John Anderson. The wider economic horizons have vanished from Budget speeches since the General Election, and they have not effectively reappeared anywhere else. The "Economic Survey" of last February was an ineffective document at best, and the basis on which it was composed was immediately undermined by the fuel crisis.

The Government are still dodging the fundamental economic issue. Reduced to its simplest terms, this is whether the community is or is not trying to do too much and letting a number of mutually incompatible programmes jostle each other out of

American administration is not matched by a gesture as radical and courageous in Europe, the psychological impulse, the *élan*, the movement of hope which will alone carry through so great an undertaking to its conclusion will be lacking, and it needs very powerful wings indeed to carry a body such as Congress towards the heights. The "peace on earth" which the Marshall Plan begins to make possible is not a peace for the laggards or the envious, or the selfishly-nationalist. It is a peace which can be wrung from destiny only by "men of goodwill." And this Christmas, the greatest question for Europe is whether in fact it can produce such men.

achievement. There were signs in the debate that the Labour Party is aware of the issue and is rendered uneasy by the virtual unanimity with which the economists of the country—those of them that are not committed to any party—answer the question. This uneasiness was shown by the repetition from the Labour benches of remarks to the general effect that "the economists are always wrong"—a generalisation for which there is considerably less evidence than for the view that "politicians are always afraid of the truth." The economists may, indeed, be wrong. But they will not be proved wrong by simply ignoring their contentions in public and half-admitting them in private. It is no answer to take an oratorical tour, as Sir Stafford did, round the different departmental policies, to explain each within its own context, to establish that there is some liaison between them and then to assert that they add up to a policy. The questions to be asked and answered are these: are the demands being made upon the nation's productive resources larger than they can supply?; if so, what can best be dispensed with?; and if not, is the distribution of demands the best that can be achieved? Not until these questions have been convincingly answered can the Government be acquitted of the charge that they lack an economic policy. So far as the public knows, their only reliance for any improvement of the present state of affairs is on increased production. That is why any evidence of increased output is seized on with such glee. That the production of coal, of steel, of several textiles and engineering products is going up is very gratifying. But it is very difficult to believe that output can possibly increase enough to solve the national economic problem. It will run into one of the limiting factors long before that—into a shortage of manpower, or of transport, or of imported raw materials. The truth is that, with one or two glaring exceptions, it is not shortfalls in supply that are chiefly responsible for the present distortions but excesses of demand. Why should it be so easy to see that inflation is rampant in every country, and so difficult to admit that it is also at work here?

On the external side, Sir Stafford was far more grim, but far less open to criticism. In domestic affairs, there is, after all, an alternative policy, and criticism is valid until the Government have at least met its claims. But in external affairs, where the dangers are far more threatening, there is no alternative policy that differs more than in shades of emphasis from the policy the Government are pursuing. The shades of emphasis nevertheless have their importance. They are all grades of anxiety—the facts prevent them from being anything else—and if there is any criticism of this part of Sir Stafford's speech it is that, while he presented all the raw material for an alarming conclusion, he forbore to draw it, in deference either to the Christmas spirit or to a Cabinet resolution. The figures are easily summarised. The country will enter 1948 with gold and dollar reserves of £500 million, to which Sir Stafford could see early accretions, all from borrowings of different kinds, of £250 million, making a total of £750 million. Of this total, however, at least £250 million must be set aside as the irreducible minimum working balance without which Britain cannot conduct her own trade or serve as banker to the sterling area. The available resources are therefore £500 million at the most. The rate of exhaustion of these reserves has lately been running at about £60 million a month. Even if all the targets are achieved, it will still be running, by the end of 1948, at the rate of £25 million a month. In other words, at the present rate, the available reserves will all be gone by September. Even if the rate forecast for the end of the year could be attained at once, the available reserves would all be gone by the summer of 1949. This more optimistic forecast can really be dismissed. It would require the export targets not merely to be attained, but to be attained a year early. It would require a perfect degree of forbearance and self-control on the part of the countries of the sterling area. It would require an assurance—which cannot be given—that no capital will leak out of the sterling area at the seams. It is much nearer the truth to say that the Government's plans deliberately envisage the exhaustion of the available

reserves by the end of 1948—and if anything goes wrong with the plans, the date of exhaustion will come earlier.

What then? It seems probable that there will be Marshall dollars for Britain in the period that ends on June 30, 1949, though it is by no means certain. What is certain is that they will be smaller in amount than the £650 million or so entered in the Paris Report. But in 1949 the dollar deficit will still be running at £25 million a month, that is, at \$1,200 million a year. Where are all these dollars coming from, and for how long? When and how will independence be reached? There may be no alternative to the policy the Government are pursuing, or at least no very different alternative. It may be the only possible policy to wait and see what results from the great debate in Congress. But at least the Chancellor of the Exchequer ought to make it very plain to the public that he is gambling on Marshall aid (for all his protestations to the contrary) and that the stakes are very high indeed.

There is one matter on which it would be reassuring to see some action being taken. This is a matter which occurs in every Ministerial speech, tucked away in some corner. Last Thursday, Sir Stafford gave it three sentences

We have either reached, or are reaching, a buyers' market condition in many lines of goods. This means that the price factor becomes more and more important. We are already losing sales overseas in some of the most desirable markets because of our price-level, and we must, therefore, do everything in our power to prevent it rising and, indeed, to bring it down.

These are strong words—but every time Sir Stafford speaks to this effect prices take another upward jump. The prices of British exports have risen by one-sixth in a year, and the latest rise of 2s. 6d. a ton in the price of coal will push them up still faster. What does Sir Stafford think puts prices up at this rate? Lack of patriotism? Or lunar suction? They are being driven up by inflation and by little, or nothing, else. Does Sir Stafford really mean it when he says "we must do everything in our power" to bring prices down?

Canada's Problem—I

Canada's Exchange Controls

(From Our Canadian Correspondent)

THAT Canada could not avoid being critically involved in the world financial crisis should have been obvious to all, at least since the suspension of the convertibility of sterling in August. Nevertheless the measures taken by the Canadian Government in the middle of November came as a considerable shock to the public. The new dollar-saving programme was announced on the radio by Mr Abbott, the Finance Minister, on November 17th. On December 5th Parliament assembled in special session; the session had ostensibly been called to consider the new trade agreements, but everybody knew that the chief item of business would be the new controls.

Mr Abbott's programme for strengthening the country's dollar position consisted of eight points:

- (1) A loan of \$300 million has been arranged from the Export-Import Bank of the United States, maturing in from three to five years.
- (2) Canadian residents who wish to travel for pleasure in the United States are limited to \$150 a year.
- (3) A long list of goods is placed under an import ban.
- (4) A number of the same goods, which happen to use substantial quantities of materials or components from the United States, are subjected to a 25 per cent excise tax when manufactured in Canada.
- (5) Taxes are reduced on tea, coffee, sugar, electricity and gas—these reductions are not part of the dollar-saving pro-

gramme, but were introduced at the same time in order to lower prices in these fields and thus to make the higher prices in other fields more acceptable.

(6) Four groups of commodities are placed under import quotas.

(7) All metals and all metal products not included under the foregoing restrictions are to be subjected to individual import permits, and the same permit system is to be applied to moving picture films.

(8) A bonus of \$7.00 an ounce on additional gold mined in Canada was announced (but never came into effect).

Several of these measures need little explanation or comment. The loan from the Export-Import Bank was not easy to arrange; borrowing from the United States—perhaps from any creditor surrounded by would-be borrowers—is only easy so long as one does not need the money. The restrictions on pleasure travel have approximately restored the position that existed immediately after the war; during the war no pleasure travel at all was permitted, but such a stiff control is very unpopular both in the United States and in Canada, and it was relaxed immediately after the end of the war; later it was rescinded altogether.

The most important immediate savings in US dollars are to come from the banned imports. The list is long and varied, but most of the items can be brought under the following headings:

toilet articles; kitchen ware; plumbing supplies; household appliances and fixtures; radios; cameras; automobiles (later placed on the import-permit list and still later to be put under import quota); furniture and pianos; dressed furs and fur coats; jewellery; most pulp and paper products; and fresh fruits and vegetables (other than certain staples placed on the quota list). Imports of all these articles from all countries are banned. The Minister of Finance explained the cutting off of imports from non-dollar countries as well as from dollar countries as follows:

The plan does not involve discrimination against imports from some countries in favour of the same goods imported from other countries. Prohibitions apply to imports from all countries. . . . In selecting items to be restricted we have, of course, endeavoured to pick those which we must pay for in US dollars and we have tried to interfere as little as possible with the export trade of those countries which are short of gold and foreign exchange.

The principle of non-discrimination, which is perhaps all too familiar to the British public, is quite new to the Canadian public, although it has been mentioned in speeches about the international trade talks at Geneva and the proposed International Trade Organisation. Hence the exclusion of goods coming from Great Britain and other non-dollar countries has come as a shock and there have been vigorous protests. In reply, the Government originally indicated that less than \$10 million worth of goods from non-dollar countries was affected, and later they transferred a number of articles from the banned list to the quota list, which permits imports from non-dollar countries. Apart from automobiles, most of the commodities thus transferred are foods such as coffee extracts, canned fruit, dry vegetables, jelly powders, candy and chewing gum, etc. Nevertheless, the list of goods subject to import ban still shows some anomalies both in what it does contain and in what it does not. For instance, small imports of American whisky are still coming into Canada because the Government obviously does not want to ban the much larger imports of Scotch whisky. The Government has indicated that it is willing to consider softening the blow of banning imports from all countries by private traders, either, as indicated above, by putting the goods on quota, or by making Government bulk purchases from non-dollar areas. For example, tomatoes from the Bahamas are to be brought in under special arrangements.

If it were not for the administrative difficulties involved, the Government would, no doubt, have been happy to put more goods on the quota list and less on the banned list. The quotas, fortunately, allow ways and means of discriminating against imports from the United States in a non-discriminatory rather than an indiscriminate manner. The trick lies in choosing a pre-war period as a base for the quotas. Four groups of goods are put on quotas, the first three at 200 per cent of the value of pre-war imports, the last (textiles) at 400 per cent. Since the soft currency countries are not able to ship enough goods to fill their quotas, they are not restrictive and no machinery is being set up to implement them. On the other hand, imports from the hard currency group are severely restricted because the value of their post-war sales to Canada has been far more than double their pre-war sales. For example, in the textile and clothing group, it is quite out of the question for the United Kingdom and other soft currency countries to fill their quota—even at post-war prices. Arrangements have recently been going forward to secure a great increase in Canadian imports of British textiles; in 1946 the yardage of cotton goods shipped to Canada was scarcely one-tenth of the pre-war amounts. On the other hand, each importer from the United States has been told that for the coming year his imports must be cut down to slightly less than a third of his imports in the year ended June 30, 1947.

The new 25 per cent excise tax was imposed on a number of goods that can no longer be imported: on electric appliances, on electric refrigerators, on electric or gas stoves (it was later

removed on the stoves, and it was never placed on electric washing machines because they were considered "necessaries" under present conditions), on a wide range of sporting goods, and on musical instruments. A graduated tax on motor-cars was announced, running from 25 per cent on cheaper cars, with small amounts of American content, to 75 per cent on expensive cars. In announcing the new excise taxes the Minister of Finance said they were designed to prevent an expansion in the domestic production of these goods, imports of which from other countries had been banned. Expansion of production would involve imports of materials and components and would, therefore, to some extent, nullify the Government's attempt to conserve US dollars. This explanation was not entirely convincing because some of the goods concerned, and some of the manufacturers concerned, used practically no US imports. It then emerged that the Government was also interested in "mopping up" excess purchasing power; but this scarcely makes sense when applied to such a narrow group of goods. Finally, it is rumoured that the Government put on the tax to save the feelings of US exporters who find their Canadian market cut off, and who dislike the idea of the Canadian competitors being free to take the whole of it. This makes even less sense. The new excise tax is undoubtedly going to run into trouble in Parliament.

★

The import quotas and the import bans, together with the associated excise taxes, can be regarded as temporary interferences with imports to bring trade between Canada and the United States more nearly into balance in the immediate future. The two remaining items on the Government's agenda have longer-run significance. They are designed to remould trade into a position where the temporary restrictions and interferences can be removed.

The first of these two measures is the assistance to the gold mining industry. The Government originally announced that they intended to introduce a subsidy of \$7.00 an ounce on additional gold mined over and above the current rate of production in each mine. This brought down two storms of protest: one was from the gold mining industry which claimed that the subsidy was not enough to bring much increase of production; the other was from Washington. The US authorities are troubled by heavy gold imports which they have not been able to "sterilise" and the International Monetary Fund dislikes anything that savours of tampering with the price of gold. In the face of these storms the Government have taken back their original proposal and have now announced a new one. They will subsidise each Canadian gold mine to the extent that its production cost exceeds two-thirds of what it was in the year ending June 30, 1947, and to half the extent that its cost of production exceed \$18.00 an ounce. The new plan has been approved by the International Monetary Fund.

The final item on the Government's agenda is its proposal to restrict imports of metals and metal products not otherwise affected by the programme (also moving picture films). While this is another restriction, it is intended to be used in a more positive fashion. No controls under this item are as yet in force. The Minister of Reconstruction, Mr C. D. Howe, will introduce them gradually, industry by industry, after consultation. He intends to introduce restrictions which, while not interfering with capital developments that are nearly completed, will postpone other developments which are largely dependent on US dollars and will divert capital expenditures to Canadian rather than American channels. In these discussions he will bring strong pressure on the industries concerned not only to reduce their imports from the United States but also to increase their exports to the United States.

There is nobody in Canada better fitted than Mr Howe to make this sort of approach to Canadian-American industry—persuasion with a threat of government controls held in the back-

ground. During the war his Department of Munitions and Supply was not only successful in mobilising a prodigious industrial effort in Canada but it was also successful in "integrating" the Canadian war production programme with the American and in persuading the American authorities, under the so-called Hyde Park Agreement, to buy a lot of goods in Canada, thereby relieving its wartime stringency of US dollars. On the other hand Mr Howe was not uniformly successful during the war in purely domestic controls and restrictions.

His wartime control of new construction, in many ways, resembles his proposed control on the use of capital goods; and not long after the end of the war it broke down. There were no general rules. Each applicant was considered on his own merits and this led to all sorts of anomalies both between individual firms and between different parts of the country. Mr Howe's proposed operations should be viewed with mixed feelings.

(This is the first of three articles)

The Rate for the Job

Whoever is Heir or Heiress Presumptive to the Throne should have the rate for the job.—The Rt. Hon. Arthur Greenwood, M.P., in the House of Commons, December 17, 1947.

THE trouble all started when the Labour Party, returning to office in 1955 under a new Prime Minister, after five years in opposition, decided to cut the Civil List to a quarter of what it had hitherto been. The events of 1947 had been carefully noted at Buckingham Palace and in particular the sentence from Mr Greenwood's speech, which has been printed at the head of this article, had given rise to many reflections. Indeed, it is not too much to say that it had opened up a whole new line of thought. The rate for the job? Why not, indeed? And why not secure it in the orthodox manner, sanctified by a century of trade union struggle and beloved of the Labour Party itself? In private, resolutions had been made and plans laid.

So when the attack was resumed in the House of Commons, everything was ready. The first step was to organise. A meeting was called and, with complete unanimity and great enthusiasm, the National Amalgamated Society of Operative Monarchs, Princely Houses and Regal Assistants (NASOMPHRA) was set up. From the start it was recognised that solidarity is the essential strength of any form of direct action, so steps were taken to organise a branch of NASOMPHRA in every Palace or Castle, with a Shop Stuart in charge. When this had been done, the demands of the union were formulated. The first was for prewar rates of pay with a Cost of Reigning bonus and Royal Family Allowances. The second demand was for a 40-hour week. Overtime at the rate of time-and-a-half was to be paid for all hours in excess of 40 per week. Moreover, double pay was demanded when Royalty were compelled to work on Public Holidays, such as Coronations, Royal Weddings and the like. Thirdly, crowns, orbs, sceptres and other tools of the trade were to be at the cost of the employer. These demands, it will be noticed, contained nothing extraordinary or immoderate; indeed, they were the ordinary stock-in-trade of the trade unions. Only one of the usual demands was omitted—for promotion by seniority—since this was already the custom of the trade.

Moderate though they were, the demands were refused outright by the Cabinet, on the ground that they did not recognise the union. If this particular trade wished to organise, they said, it would be welcomed into the Transport and General Workers Union; there was no need for a breakaway organisation, and trade union discipline must be preserved. This reply had, however, been anticipated by NASOMPHRA, which responded by calling on its members to refuse to work overtime. At first, this had comparatively little public effect. There was considerable delay at the Palace in dealing with documents, but the public had been so little used to anything but delay in dealing with documents in other parts of the administrative machine that a bit more attracted no notice. The first time that the ban on overtime excited any general comment was at the ceremonial opening of Parliament. The lunch hour being reached in the

middle of the Gracious Speech, His Majesty immediately stopped reading, pulled out a packet of sandwiches and asked that somebody should switch on "Workers' Playtime."

It became apparent, however, that the overtime ban was not succeeding in its object, so strike notices were handed in. This was a very different story. From zero hour onwards, no documents were signed. Parliamentary Bills neither received, nor were denied, the Royal Assent. Appointments were not confirmed; commissions were not sealed. Exhibitions remained unopened; factories uninspected; prizes undistributed. A Royal Personage persisted in getting married at a registry office, without notifying either time or place. The sudden cessation of the flow of authorised biographies threatened to ruin half the publishing trade. The King, however, in his inexperience of these affairs, did commit one grave blunder. He had very properly refused to open all written communications from his Ministers, holding that this would be blacklegging. But when the Prime Minister presented himself at the Palace, he was not refused admittance, the King confining himself to refusing to receive him royally but merely asking him in for a drink, as man to man. This gave the Prime Minister the chance he had been looking for, to proffer some advice, which the King could not constitutionally reject. And advice was what the Prime Minister proffered, with all his Welsh eloquence and with considerable embroidery. The King was almost overwhelmed, as the House of Commons so regularly is. All he could do was to say that he was not rejecting any advice, he would think it over—if the Prime Minister would let him get a thought in edgewise.

Clearly another such interview had to be avoided at all costs. It was decided to throw a picket line round the Palace. Reinforcements were summoned from the princely houses of Europe. The Society of Authors declared a sympathetic strike, saying that if royalties were at stake, they could not stand aside. The comradeship solidarity was most impressive and next time the Prime Minister's car was seen approaching, a minor Italian prince lay down in the road to prevent its entry. The Prime Minister, remembering the old proverb "let sleeping dogs lie," was forced to retreat.

Gradually the strike had its effect. What finally brought it to an end was the fact that the Government could make no appointments and distribute no patronage. Trade Union leaders could neither be ennobled nor dispatched to govern colonies. In short, the whole fabric of Labour government was in danger of dissolving. The Cabinet gave way all along the line, saving their faces only by the condition that the NASOMPHRA should be affiliated to the Trades Union Congress. This was done willingly. His Majesty, as President of NASOMPHRA, has now sat for some years on the General Council of the TUC and when the Congress meets next year at Brighton, it will be his turn to be Chairman. The Speech from the Dome is looked forward to with keen anticipation; the title has been announced as "What a Rate! What a Job!"

NOTES OF THE WEEK

Parliament Adjourns

The Christmas recess will provide a short but welcome breathing-space for the overburdened legislator. Though the pace has not been quite so desperately hot as during last session, private members' time has again been sacrificed, and the amount of legislation that has gone through the various stages during the past two months is voluminous enough to satisfy all but the most extreme appetites. Apart from the Budget, the only piece of new legislation of a really controversial nature introduced to date is the notorious Parliament Bill which has gone through the full procedure in the Lower House, and now remains to meet whatever fate lies in store for it elsewhere. But the continuation of war legislation conferring upon the Government far-reaching emergency powers, including that of the direction of labour, has caused some searchings of heart not only among the Opposition, but also among the Labour benches. And over the Royal allowances in a free vote, the party followed not the Prime Minister, but its own chairman, leaving the Government in the very undignified position of carrying its proposals by the Opposition vote.

Though some useful but by no means perfect measures have made good progress towards the Statute Book, like the Overseas Resources Development Bill, which has concluded its committee stage in the Commons, and the Local Government Bill, the National Assistance Bill and the Criminal Justice Bill, which have reached the committee stage, the session in general has not added greatly, if at all, to the Parliamentary reputation either of the Government or of the Opposition, with one notable exception. In the debate on the lamentable Garry Allighan affair, the level on both sides of the House sometimes rose above the pedestrian mediocrity to which the public has now become accustomed; but the only figure who has really stood out and undoubtedly succeeded in gaining the respect of the Opposition no less than that of his own party is Sir Stafford Cripps. The new Chancellor of the Exchequer has shown both insight and courage in refusing to prophesy smooth things. Inheriting a Budget from his predecessor in the most unexpected circumstances, he was faced with an exceedingly difficult situation, and it was hardly to be expected that at this stage he would even hint at any variation of policy from that of his predecessor. But the fact that he is now responsible for the co-ordination of the Government's economic and financial policy is certainly to be welcomed. Whether he will be able to grasp the nettle as firmly as the country's situation demands still remains to be seen.

Meanwhile, of the chief measures forecast in the King's Speech for the present session, all but three have now seen the light. There remain to be produced those dealing with Deprived Children, Electoral Reform and the nationalisation of the gas industry. The first of these, which will presumably embody the recommendations of the Curtis Report, should be greatly welcomed, nor will the abolition of plural voting, which is expected to be contained in the second, arouse very deep controversy—except in the case of the University seats. For the nationalisation of the gas industry, it is, of course, possible to make out in theory a respectable case; but would not the Government be well advised to make a success of coal and transport before adding another item to its already overcrowded plate?

Glad Food Tidings?

The abundance of food in the shops, extra rations of meat, sugar and sweets over the Christmas period, and the timely announcement of the restoration of the cuts in butter and bacon in the New Year may instil a spirit of optimism in the British people. Have they, moreover, not been told by Mr Herbert Morrison that they are rounding Recovery Corner? Have they not learnt that coal exports are being increased, and that even the domestic consumer is to receive a little more?

It is unseasonable to sound a note of warning this week, but it is unfortunately still far from certain that, so far as the home consumer is concerned, rock bottom has been reached and left behind. As regards food, which touches the people most nearly, it cannot be assumed that the present and prospective rations are likely to be maintained. To take the Canadian agreement first—the negotiations hinged on the question of which country's dollar reserves should take the strain, Canada's or Britain's. The British Government wanted to prune its dollar purchases of less essential

foodstuffs such as beef, bacon, cheese and eggs. But British purchases from Canada earn American dollars for Canada. In Canada's interests the British stomach has been spared, and the Treasury has agreed to maintain the contracts. The burden of the new agreement has been shifted to Britain's all too slender dollar and gold reserve. Not only have British food purchases not been pruned, but only £11½ million can be paid out of the Canadian loan in the next three months; the remainder (estimated at £25 million) is to be met in either US dollars or gold or by increased exports. Hitherto, one half of Britain's trade deficit with Canada was financed by the Canadian credit. No solution to the basic question has been discovered; the new agreement merely gives a three months' breathing space.

The expansion in Australian agricultural output looks promising. Britain has purchased 80 million bushels of wheat from this year's bumper crop—discussed in a Business Note on page 1056. Probably less than a quarter will be available for the current season's consumption, but it effects a significant economy in dollar expenditure. Greater quantities of eggs, meat and dairy produce are also anticipated from the southern dominions, but apart from eggs, British rations are unlikely to be affected. The problem of feeding Britain is partly one of fitting in supplies from the northern and southern hemispheres to maintain a steady flow. Will there be Danish supplies of butter when the New Zealand supplies begin to tail off, or will the ration be allowed to jump back to two ounces? The need to find European food supplies is obvious. If enough coal is available as a medium of exchange, this should be easier. And the British Government can no longer quibble about prices, unless export prices of coal are also brought into the discussion.

Bargaining with Coal

The prospect of coal being used as a barter commodity for bilateral trade negotiations in Europe will certainly strengthen Britain's bargaining power. Some 10 million tons are expected to be available next year, and of this quantity six million tons will be earmarked for the 16 countries participating in the Marshall Plan. The surplus-producing area in Britain is at the moment the North-East Coast, so that the countries of North-West Europe are likely to benefit first. With Ruhr output well below its prewar level, European demand will for some time greatly exceed British supply, and the only rival suppliers in reasonably large quantities are the United States and Poland.

The official export price, ranging from 75s. a ton according to quality, is indeed high; but, with freight charges added, it is still cheaper and of better quality than American coal delivered to Europe. Moreover, Britain is not asking for payment in dollars, but in indigenous products such as timber and woodpulp from Sweden; flax, steel, zinc and copper from Belgium and the Belgian Congo. Exchange of these commodities for coal would represent a saving in dollars both for Britain and for the other negotiating countries.

Next month, Denmark will probably be made an offer in return for food, and so, too, will the Netherlands. The quantities available to each, and no doubt the actual price, will depend on the quantity and price of the goods offered in return. If British coal supplies are restricted to Western Europe, half prewar quantities could be offered—in any case, the minimum quantity is theoretically in the region of a third of the figure for 1938.

The problem confronting the British Government is how to choose between the various commodities offered, such as 10,000 tons of woodpulp from Sweden and 50,000 tons of butter from Denmark. It is easy enough to pick out the more basic requirements to be met, but at what stage will raw materials give way to food? Is the Planning Board really constructing indifference curves to ensure optimum satisfaction?

Some countries in Europe have, of course, already purchased several months' supply of American coal, and others have entered into trade agreements with Poland. In either case, their demand for British supplies will not be effective until stocks need replenishing or the agreements renewing. Apart from the gain to its prestige, the main advantage to Britain from the resumption of coal exports lies in the possibility of reopening more normal trade relations with Europe and at the same time contributing to its recovery. As Europe's largest single market, Britain is in a position to improve the prospects of multilateral trade by means of bilateral negotiations.

Communists versus Socialists

Heresy-hunting is never a very dignified or productive sport, and it might be disastrous for its electoral prospects if the Labour Party were to switch all its venom from the Conservatives to the Communists. Yet Mr Pollitt has certainly asked for it, and Mr Morgan Phillips, who has called on all Labour Party members to "go out on a great campaign against Communist intrigue and infiltration inside the Labour movement," had no alternative but to accept the challenge.

In the new line, announced by Mr Pollitt a few days ago, the British Communists are, somewhat belatedly, falling in behind the Cominform, Thorez and the Moscow radio. The effect will be to damage the Government where it is most vulnerable—in the rank and file of the trade unions. Thus the Communists threaten to fight for immediate wage advances, at a time when the Government is endeavouring to stem the tide of inflation. They will "organise more effective mass work in the factories and working-class organisations than ever before" to "rouse the workers to a consciousness of the dangers that face them." In other words, through the shop stewards and union officials, they intend to encourage strikes and damage production since, in Mr Pollitt's own words,

the production increases will not be utilised for the benefit of Britain or the people, but will be subordinated to the general aims of the Marshall policy . . . to force Britain to its knees.

Mr Phillips, in his manifesto, points out that the Communists carry no weight with the electorate, but that they can do damage within the trade unions. So far, the Communists, especially among the miners, have been "good boys" and have discouraged strikes and encouraged production. The miners are apparently, though somewhat illogically, to be exempt from the general Moscow orders to make trouble, but the Communists are fairly strong in the engineering industry and in transport, and can have more than the nuisance value to which their numerical strength entitles them. This raises the question which has already become a practical issue in two other countries, whether the trade union movement can in fact tolerate a Communist element in its bosom any longer. In France the CGT has recently split on this very issue, and in the United States Mr Walter Reuther, head of the United Automobile Workers, has swept the board of Communists. Will Moscow or Mr Pollitt in the end force the British trade union movement to follow suit?

Last Chance for France's Moderates

One factor often forgotten in the recent troubles in France is the extent to which the workers and the poorly-paid salariat—in other words, all sections of society below the line of the comfortable *bourgeoisie*—have borne the brunt of France's economic disasters. The rise in prices which has ruined them has made the fortune of peasants and landowners, business men and speculators, and one reason why Communist propaganda fell on ears so ready to listen was that day by day in town or in the countryside the impoverished workers and petty *bourgeois* could see the flaunting wealth of those whom their miseries made richer every day.

It says much for the moderation and good sense of the French working class that, even against this background, the extremism of Communist tactics has been recognised and rejected. M. Léon Jouhaux has split the *Confédération Générale du Travail* and has taken his *Force Ouvrière* out into the wilderness of a fund-less and office-less existence. It will, of course, take months for the new independent movement to gather strength and to organise itself, since the levers of power lie with the CGT, but the first reactions of the workers have not been unfavourable. The white-collar workers in particular may be expected to follow M. Jouhaux's lead. Nevertheless, the extent to which the *Force Ouvrière* can establish itself as a genuine, independent and moderate centre of working-class strength depends less upon M. Jouhaux's leadership than upon events beyond his control.

The decisive event will be quite simply whether anything can be done to stabilise the cost of living and reduce the price of food. The workers, under great provocation, have shown capacity for statesmanship. The question is now whether a similar steadiness and moderation will be shown by the French *bourgeoisie*. The omens are not favourable. The selfishness and shortsightedness which have been shown in the last two years

by all those in France who have been profiting by the abnormal condition of the French economy gives little hope that a sudden change of heart will put an end to their possibly unconscious, but nevertheless perpetual, sabotage. M. René Mayer, the Minister for Finance and Economic Affairs, has, however, now directed his challenge straight at them. The proposals which he has put forward for stabilising the French economy are discussed in detail in a Note on page 1054. Their essence is that all who have profited by the inflation—business men, speculators, peasants, landowners—should now disgorge, either by heavy taxation or by contributions to a new 3 per cent loan. It is estimated that these steps will withdraw one-sixth of the present purchasing power from circulation and help to produce a budget balanced at 900,000 million francs.

But will the new taxpayer pay? The reaction of the Gaullist group, representing the extreme element, has been significant. They demanded a dissolution and new elections, doubtless to allow the potential taxpayers to express their refusal to pay at the ballot-box. But if this reaction proves typical of the whole mass of enriched French men and women, then there is no hope at all for moderate government in France.

Poland's Socialists Stand Fast

The tenacity of Europe's Social Democrats in the most unfavourable political situations, so notably demonstrated in the chronic French crisis, was shown again at the 27th Congress of the Polish Socialist Party (PPS) last week in Wrocław—once known as Breslau.

It will be remembered that the Polish Socialists, in return for a pact of unity and common electoral lists, obtained almost an equal share with the Communist Polish Workers' Party (PPR) in the government formed last February, its Secretary-General, Mr Cyrankiewicz, becoming Premier. The success of Socialist-consolidation of the PPS organisation, alarmed the Communists, who publicly demanded the formation of a single workers' party. When, in his May Day speech, Mr Cyrankiewicz firmly rejected the idea of fusion, the Communists made a series of indirect attacks on the Socialist position. For example, a prolonged campaign was conducted against inefficiency in the Socialist-dominated co-operative movement; and the Socialist Youth was made to join a national youth federation under Communist leadership. Indirect pressure of this type has achieved some successes, but attempts to infiltrate the party itself or to suborn its leaders were frustrated.

In other East European countries similar Communist tactics had produced various results during the last few months. The Hungarian Socialist Party was reduced in influence by electoral fraud; in Rumania the Socialists are completing arrangements for fusion with the Communists; in Czechoslovakia the replacement of Mr Fierlinger by Mr Lausman at the Brno Congress was a decisive and public rebuff to the Communists.

It was in this atmosphere that the Polish Socialists met last week. Mr Gomulka, the Communist Vice-Premier, as the fraternal delegate of the PPR, told them that, although opposition to fusion remained firm among the Socialist leaders, those leaders must be prepared to surrender to a clear demand for fusion from their own rank and file—a statement oddly recalling the strategy of the "United Front from below," which enjoyed its little hour of Comintern favour twenty years ago.

The congress debates can have afforded Mr Gomulka little comfort, for the rank and file did not oblige. Greatest applause greeted Mr Cyrankiewicz's assertion that the PPS is and will be indispensable to the Polish nation, and that his party will not play the moon to somebody else's sun. Speaking on economic affairs, Mr Rapacki claimed that both parties made unique and complementary contributions—the PPS providing the humanism and regard for the individual, the PPR providing the revolutionary élan. Both in the congress and the press conferences, the Socialist leaders emphasised by omission their desire to retain the friendship of western Socialists, though their interpretation of events in France has confirmed their conviction that collaboration with the Communists is the right policy.

Indeed, while the strong affirmation of the Socialist Party's independence may have impressed Western observers more than anything else, it is important to appreciate the sincerity with which its leaders justify their policy of the united front. To them it is correct in principle, not merely an opportunist response to Communist pressure or geopolitical isolation. In an international situation with possibilities of war Poland and the Soviet Union,

and Socialists and Communists in Poland, sink or swim together. If the leaders of the Polish Communists realise that this conviction dominates the attitude of their Socialist colleagues, the PPS may manage to survive the "cold war."

Health Service Negotiations

Almost a year of negotiations between the medical profession and the Minister of Health has apparently only left the position exactly where it was when the results of the British Medical Association's plebiscite of doctors became known last December. The main points then at issue were (1) the abolition of the sale and purchase of medical practices; (2) the right to refuse to allow doctors to join the public service in an area considered to be over-doctored; (3) the salaried element in a general practitioner's remuneration; and (4) the right of a doctor to have an independent hearing in the event of his dismissal from the public service.

When negotiations were resumed last February between the Minister and the profession, Mr Bevan did not refuse all possibility of amending legislation. Yet the upshot of the negotiations is that he has refused to give way on all the four main points at issue. It should be noted that the first three concern general practitioners only. On the objections raised by specialists to the Health Service Mr Bevan showed himself far more willing to make concessions, both when the National Health Service Bill was proceeding through Parliament and in the negotiations that have since been taking place. Thus he now agrees that there should be no limitation on specialists' fees for private patients in at least some of the private beds available in state hospitals. On the other hand, he cannot agree to the BMA's wish, incorporated in a House of Lords amendment but later turned down by the Commons, that the payment of a basic salary to a general practitioner, instead of capitation fees only, should be the exception, depending on the Medical Practices Committee's view of local and individual circumstances, rather than the rule.

There is little wonder, therefore, that the BMA leaders are feeling somewhat sore. If only Mr Bevan had reserved his firmness for the first two points at issue, on which he has a stronger case than has the BMA, and relented over the basic salary and over the proposal that a dismissed doctor should have the right

to appeal to the court, instead of to a tribunal of the Minister's own creation, he might have won the BMA over—at least part of the way. As it is, its Council, which will shortly take another plebiscite of doctors to find out how many are willing to join the Health Service, is advising them to refuse. The result of last year's plebiscite (54 per cent against negotiations with the Minister) was inconclusive, and it may be that the proposed remuneration of general practitioners, now announced and by no means ungenerous, will win over some waverers to the Minister. As against this, Mr Bevan has in the course of the last year become clearly identified as the leader of the pro-Socialist group in the Cabinet, which lends weight to the BMA's claims that, his protestations and reasonableness notwithstanding, he wishes eventually to introduce a full-time salaried state medical service. Neither party to the dispute shows up well after all these months of discussions and only six months before the health service is due to begin.

The LCC's Health Services

Since last summer the local health authorities—county councils and councils of county boroughs—have been drawing up schemes for the health services for which they will be responsible when the National Health Service Act comes into force next July. Unfortunately, they have to a large extent been planning in the dark, for the two other parts of the Health Service—the hospital and specialist service and the general medical service—are also unorganised, and it is impossible, so essential is it that the three parts should be closely co-ordinated, for one part to be completed without those responsible for it knowing how the other services will turn out. For instance, how can local health authorities complete their plans for a maternity and child welfare service without knowing what specialist services and how many maternity beds will be provided by the regional hospital boards? How can they plan health centres, when they do not know either what sort of health centres they are expected to set up or how many general practitioners will be willing to work for them? How can they estimate the demand for the services to be provided, now that a free health service is to be substituted for one in which payment is roughly according to means?

To those who are struggling to moderate their smoking, we suggest that the transition can be made smooth and pleasurable by a change to Rothmans Pall Mall de Luxe—a delectable blend, too good for chain smoking.

Rothman of Pall Mall

THE BEST-KNOWN TOBACCONIST
IN THE WORLD

All these gaps in the data are very apparent in the London County Council's plan. The Council's area is to be divided into nine main divisions, which in their turn will be sub-divided into about 165 health service areas. These will have about 225 health centres from which it is hoped that eventually all the personal health services to be provided by the LCC will be run. At about 170 of them provision will also be made for group practice by general practitioners. But the concentration of the health services in health centres is a very long-term plan. In present conditions the LCC is, probably wisely, remaining content for the most part to use the existing facilities provided by the boroughs and voluntary organisations, supplementing them by new provision where they are clearly inadequate. Even so, the annual cost of the interim plan is estimated at £2,000,000 for a full year from next July. The total for all local health authority services was originally estimated at £12 million. Thus London County, with a population of only 3,000,000, is taking up one-sixth of the estimate for the whole of England and Wales. It looks as if the £12 million was a serious under-estimate, and that the net annual additional expenditure to be borne by the Exchequer in respect of the whole national health service will be far more than the £95 million originally contemplated.

Oil Warning

The warning from the Ministry of Fuel and Power that last season's coal crisis may be matched this winter by an oil shortage is qualified as nothing to get "unduly alarmed" about. To advise those industrialists who already have the necessary permits to hold up conversion from coal to oil, or to review current authorisations, is not, says the Ministry, "panic action," but mere reasonable precaution. All should be well. This may be so, but once bitten, twice shy—"undue alarm" about coal was being similarly deprecated a twelvemonth ago. The Ministry has, this time, considerably more excuse for any miscalculation it may have made. Coal is a domestic matter; information about output, stocks and transport is under the Ministry's eye and consumption under its control. Oil, decidedly not a domestic product, has a less readily ascertainable output, and the Ministry must compete for supplies—and for the all-important tankers to carry them in—with the whole world, and notably with America, whose recent shift from the ranks of the exporters to those of the importers may in the long run ease the world's dollar problem, but in the short run piles fresh difficulties on the struggling economies of Europe.

But if there is excuse for miscalculation there is, none the less, reason for misgiving. With all its faults, the old competitive system did have the priceless advantage of averaging out errors. Those private businesses which overestimated the probable future availability of fuel would be matched by others which underestimated it, and the net error either way would be consequently reduced. In the semi-directed economy of today, any lack of information or error of judgment on the part of a very small group of public officials—who have not even, as the private business man had, the free movement of prices to serve as a pointer—can be diffused throughout the country's economic life either by direct orders and prohibitions or by a more or less strong advisory pressure. The averaging effect is lost. In a comparatively small way, and, it may be hoped, only to the extent of a warning, last week's announcement confessed and exemplified the chief weakness of an over-centralised economic system. But it is probably too much to hope, that the Government may take it as an indication that they, too, should possibly reconsider some of their conversion plans.

Threat to the Sudan's Future

The Egyptian Government is doing all it can to delay the association of the Sudanese with the government of their country. It has presented a number of amendments to the proposals of the Sudan Administration Conference and, in his covering letter to the Governor-General, the Egyptian Prime Minister states that his government will not agree to the Sudanese proposals unless the amendments are accepted.

The Sudan Administration Conference proposed—and Britain agreed—that the present northern advisory council and the Governor-General's Council should be replaced by a Legislative Assembly, containing 60 elected and 10 nominated members, and an Executive Council of which at least half should also be Sudanese. The powers of the Legislative Assembly were to be limited for the first three trial years to debating legislation

initiated by the Executive Council. The Governor-General was to retain the full power of veto, and in particular the power to resolve disagreements between the Legislative Assembly and the Executive Council. The appearance of these proposals, which were thoroughly practical and took into account the lack of trained Sudanese administrators and legislators, put the Egyptian Government in an awkward position. It had either to show itself opposed to Sudanese development or to agree to measures which will strengthen the anti-Egyptian Independence Party (the *Umma*).

The amendments which Egypt proposes are briefly—full electoral rights for all Sudanese, regardless of education or political development; a demand for Egyptian representation on the Executive Council; the extension of the Legislative Assembly's powers to enable them to suspend for one session Government legislation with which they disagree; complete control by the Legislative Assembly of the budget; the Governor-General's powers to be drastically curtailed; and all legislation to be submitted to the British and Egyptian Governments for approval.

Egypt has thus got round its difficulty by agreeing in principle to the development of Sudanese self-government, while at the same time insisting on more liberal measures, some of which are so impractical as to make the new constitution unworkable. They would, in fact, bring the Sudan more closely under the control of the Egyptian Crown.

* * *

Yet one or two of the Egyptian amendments are sensible and should be favourably considered by both the British and Sudan Governments—particularly that which gives the Legislative Assembly the power to suspend legislation for one session. This is a moderate suggestion, which would lift the Legislative Assembly above the level of a rubber stamp, and which should instil a sense of responsibility from the beginning. But the amendment which insists that all legislation should be referred back for approval to the two condominium Powers, rather than to the Governor-General, would strangle efficient administration. It would also discredit the authority of the Legislative Assembly and tighten foreign control over the country.

So far commentary in the Sudan on the Egyptian move has been subdued. The pro-Egyptian Party (*Ashigga*), on the whole, consider that the Egyptian Note does not go far enough—though towards what is not made clear; while *Sayed Sir Abdel Rahman el Mahdi Pasha*, the leader of the Independence Party (*Umma*) and son of the Mahdi, has not yet committed himself.

Neither Britain nor the Sudan can accept the Egyptian amendments without further discussion, and it is unfortunate that the rumours of a conference between Sudan, Britain and Egypt have not yet been confirmed. They should, in any case, be referred for comment to the northern advisory council, the only authoritative body of Sudanese at present in existence. But this means still more delay, and it is a pity that Egypt did not agree to the original Sudanese proposals, at least as an interim solution. As it is, the tactics of the Egyptian Government and its continued claim to rights over the Sudan belie its avowed good intentions. Meanwhile, the Sudan Government would be well advised to carry on with its preparations for the new constitution. Any further delay arising from British attempts to propitiate the Egyptians may provoke the Independence Party into a premature attempt to set up a government of national resistance, equally unfriendly to London and Cairo.

India's Whitest Elephant

The withdrawal of the Pakistan garrison from Razmak, the fortified camp in Waziristan, removes the grip of large-scale state authority from one of the most intractably barbaric and turbulent regions of the world. The maze of rugged, barren, mountains which lies to the west of the middle Indus is not economically an attractive possession for anyone, and the tribes that inhabit it have such a fierce love of independence that it might seem neither expedient nor morally justified for any external power to interfere with them. Unfortunately the peoples of the frontier are hardly capable of enjoying independence within definite boundaries; the poverty of their highland valleys and the immemorial traditions of freebooting in the plains of India debar them from being good neighbours if merely left alone, and their own internal factions invite foreign intrigue.

British policy in India has vacillated between the idea of containing them by a defensive line in the plains and the alternative

of controlling the tribes by advanced garrisons far up in the hills. Lord Curzon as Viceroy favoured the former course, but it is the latter which has prevailed for the last two decades, and Razmak was the most striking symbol of it—a fortress so isolated that its normal provisioning involved armed convoys on the scale of active warfare. In evacuating it Pakistan has gone back to the Curzon policy; got rid of a military commitment which would be a great strain on its limited resources, and incidentally increased the mobility of its armed forces in case of trouble on its eastern boundary—which the Karachi Government, even with its agreements for military co-ordination with India, cannot yet regard as completely safe. The question is whether the process of taking the lid off the Frontier is one which can be halted at

any predetermined point. Its effect must be to produce among the tribes an impression that the Pakistan regime has not inherited the strength which has so long held them in check and to encourage them to encroachments threatening Pakistan with disintegration. In any case a zone of territory inhabited by warlike people with no constituted authority responsible or recognised in international law can easily become a threat to peace, even to world peace.

* * *

In the long run there is no reason why Pakistan should not have a viable economy and be able to support an efficient military force. But at present it faces great economic difficulties, even more serious than those of India, which are far from negligible. Both Dominions have recently held industrial conferences to work out overall plans for the future of industry in their respective territories. For India this is largely a question of restoring the rate of growth of an industrial system which has fallen into a decline during the last two years; for Pakistan it means creating

industries almost from scratch in what have hitherto been primary producing areas, and creating them with the primary aim of reducing economic dependence on India—a purpose in which India can hardly be expected to co-operate with much enthusiasm. As far as the North-West Frontier is concerned, however, there have been signs that Delhi recognises its joint stake in the borderland beyond the Indus and will help to sustain a burden which may become increasingly heavy.

Hail and Farewell

The passing of the railway companies at the end of the year cannot fail to arouse some feeling of regret, even among those who are wedded to the dogma of nationalisation. To the "Railwayman," a peculiarly British species, the moment is particularly tragic. His Augustan age ended with the amalgamations of 1923; but ever since that date he could enjoy the variety—gradually decreasing, it is true—of the four great companies and some joint lines. But now, when even the Great Western, the London, Midland and Scottish, the Southern and the North-Eastern are to be replaced by the monotony of "British Railways," his prospects are indeed melancholy. But "Railwaymen" apart, the dead hand of uniformity is something to be dreaded by a far wider public. Though the companies according to the proverb had neither a bottom to be kicked nor a soul to be damned, they still were in a sense a spiritual entity, and *esprit de corps*—the product of rivalry rather than competition—which may so easily be lost in this merger, counts for a good deal more than the calculators, sophisters and economists of the Labour Party have been willing to reckon—a fact of which many members of the staffs of the expiring companies are today somewhat painfully aware. It is to be hoped, therefore, that the Transport Commission will not insist on imposing an abstract uniformity, even of colour and shape of rolling stock, on the main groups composing the national system.

At this moment of parting it is only fit that a due tribute be paid to that much abused personality, the railway director, who is now due to vanish from the scene and will, "like an unsubstantial pageant faded, leave not a wrack behind." Whatever the defects of the system which he represented, he played an important part in the activity of the companies, and on the whole he played it well. His departmental committees provided a valuable check on what the French call the "professional deformation" of the technician, and it is by no means certain to what extent the Transport Commission or the Railway Executive, as they are now constituted, will be able to find an effective substitute to perform this valuable function. It is in many ways regrettable that no members of the old railway boards have been called on to participate in the activities of the new national organisation, and though from the political point of view this is understandable, it is surely a great pity that the wealth of experience which they represent should be so wholly wasted.

Last, but not least, the railwayman will certainly miss the directors' personal touch, and their interest in the innumerable non-professional activities which go to make up his social life. In this connection it is pleasant to record that the boards of two of the companies with directors' personal funds have contributed as a parting gift a very considerable sum in donations to various railwaymen's social institutions—an admirably graceful and appropriate gesture.

Letters to the Editor

Palestine Bloodshed

SIR,—I understand an editorial note in your current issue states "Doctor Moshe Shertok, the Haganah leader, who is suggested as Jewish Defence Minister, took a more up to date line when he was reported as having told the press in Jerusalem that 'the basic tenet of our foreign policy must be friendship with Russia'."

Please note I am neither a doctor nor a Haganah leader. The suggestion that I may become Defence Minister is absurd to anyone slightly familiar with functions I normally discharge. Finally, I have not been in Jerusalem for sometime and have never made the statement attributed to me.—Yours faithfully,

MOSHE SHERTOK

(New York—by cable.)

[We offer our apologies both to Mr Shertok and to Dr Sneh, to whom the note on p. 996 of *The Economist* referred. The name of the latter was changed during proof-correction to the name of the former, under the impression that a printer's error had been made. The remark about the foreign policy of the Jewish State should have been attributed to Dr Sneh.—EDITOR.]

Malthus in Manchester

SIR,—In your issue of December 13th on page 948 you refer to the Conservative Party as "a party which, whatever progressive elements it may contain, is too often apt to become the puppet of monopolistic vested interests masquerading under the disguise of free enterprise." Such an outmoded and unwarranted statement has little to do with the facts and is surely not worthy of *The Economist*. A feature of the Conservative Party, which is well known to anyone closely concerned with its workings, is the absence of any influence organised by corporations, interests or monopolies as such.

Moreover, an important section of the "Industrial Charter" deliberately includes specific proposals for dealing with such monopolistic evils as may exist.—Yours faithfully,

R. A. BUTLER

Conservative Research Department,
24 Old Queen Street, London, S.W.1

From *The Economist* of 1847

December 25, 1847

FREE TRADE ASSOCIATION OF BORDEAUX—FRENCH WINES.

SIR,—I . . . have to express to you my most sincere thanks . . . for the goodness you have had to publish . . . the several letters and the note which we sent to you on the subject of the wine duties in England. . . .

Agreeably to your request, I will now, and with the greatest pleasure, furnish you all the information in my power concerning French wines and the wine trade . . .

Of the different sorts of wines produced in France.—The variety of wines produced in France is almost infinite; for the difference is complete, not only from province to province, but frequently from parish to parish, and even from one field to another.

As a consequence of the difference of climate, our wines are more or less rich in alcohol, according as the places where they are grown are more or less to the south, and the climate more or less dry.

Our wines most fit for export are Bordeaux, Champagne, Burgundy, Marseilles, Roussillon, and Languedoc wines.

Of all these, Bordeaux wines are the most easy to keep, and the longest sea voyages, so far from injuring them, greatly improve their quality. In each of the descriptions of French wines very good sorts are found fit for the middle classes of our country at moderate prices, and we think that gradually, if not immediately, they might also be largely consumed by similar classes in England . . .

Burgundy is a very good red wine, possessing much flavour and delicacy, but contains a little more alcohol than Claret. It does not keep near so well, nor can it bear so well sea voyages. Marseilles wine is much warmer than Bordeaux, and red also. Very fine sorts besides (namely, Ermitage), are to be found in the vineyards of the banks of the Rhone. They keep extremely well.

Roussillon wines are extremely warm, of a deep red colour, containing much alcohol. The finest sorts are really very good, and would suit the English taste.

Languedoc wines are very warm, but of a very low quality. Their colour is red.

The superior sorts of Bordeaux, Burgundy, Ermitage wines might be, no doubt, if the duties were greatly reduced, consumed in large and increasing quantities by the middle and rich classes of England.

The lower sorts of the above, and also Marseilles and Languedoc wines, might supply the consumption of the labouring classes in your country as they do in ours. . . .

I have the honour to be, Sir, your most obedient, faithful servant,

ANO. LALANDE, Secretary.

Bordeaux, December 10, 1847.

divided: the former occupied areas (Zone One), Moscow and Leningrad (Zone Two) and the northern and Far Eastern coastal regions (Zone Three). The prices in the formerly occupied areas are the lowest; those in the coastal areas are the highest. The difference between the extremes is 10-15 per cent. Since all prices have been brought down roughly to the low "ration-level," the reform seems to be extremely favourable to consumers, especially to workers and employees with low incomes.

This, however, is only partly true. If the new prices were to be compared solely with the prices that existed immediately before the abolition of rationing, then the conclusion would have to be drawn that the standard of living of the Soviet people has infinitely improved. The essentials remain almost as cheap as, or are even slightly cheaper than they were while rationing was in force; and other consumer goods which could be bought only at "commercial" prices have now become obtainable for roughly one-third of those prices. The picture, however, appears less rosy if it is seen in the light of the very low "ration-prices" which were in force before the increase of September, 1946. A glance at the table below will perhaps make this involved comparison somewhat clearer. The first column in the table gives the present uniform prices in Government shops in Moscow and Leningrad ("Zone II") which differ only slightly from the last "ration-prices." The second column shows earlier ration-prices before September, 1946, while the last column illustrates approximately the "commercial" and "free" prices in the second half of 1946.

PRICES IN RUSSIA

Goods	New Prices in Zone II (roughly equal to the last 'ration-prices')	Ration-prices up to Sept., 1946	Commercial Prices, 1946 (approximately)
	roubles	roubles	roubles
Rye bread per Kg.	3.00	1.00	20
Wheat bread "	7.00	2.30	100
Beef "	30.00	8.00—14.00	70.00—100
Sugar "	15.00	5.00—5.60	60.00
Butter "	64.00	23.00—26.00	200.00—220.00
Milk 1 litre	3.00—4.00	6.50	20.00
Eggs, per ten "	12.00—16.00	50.00—70.00	50.00—70.00
Vodka 1 litre	60.00	60.00	60.00
Cigarettes "	6.30	3.00—6.00	20.00—25.00
Man's suit, non-worsted	430.00	300.00—600.00	1200.00—1500.00
Leather shoes	260.00	200.00	600.00

The new prices compare very favourably with those shown in the third column and very unfavourably with those shown in the second. The present reform is, nevertheless, likely to be popular. The consumer has already forgotten the very low prices for rationed goods which he paid more than a year or two years ago. He took the blow of higher prices last year and is now grateful for the relief that the reform has given him. It should be added that last year's blow was greatly softened through the stepping up of all wages below 900 roubles (per month) by 10-35 per cent, an increase which did not, however, catch up with the rise in prices. On the other hand, when the prices for rationed goods were at their lowest, often the rations were not honoured; and, consequently, the comparison between the present and the lowest ration prices is somewhat unreal.

On balance, the position of workers and employees has considerably improved, though their standard of living is still low. The prices given in the table above should be compared with the average wages and salaries of 500-900 roubles per month. If allowance is made for the value of the lodgings and the social services with which the Russian worker is provided free, or for a very low payment, then the average weekly earnings of the Soviet worker should now represent the purchasing power of £3-4 in this country. This comparison is only a rough estimate, and does not reflect the differences between the amenities available in the two countries.

It is evident that some foodstuffs, like meat and butter, and some industrial goods (shoes) are less accessible to the mass of Russian unskilled workers, even after the abolition of rationing, than they are to workers of the same category in this country. But the skilled worker and the Stakhanovite who earns up to 3,000-5,000 roubles a month may now, after the abolition of rationing, feed and perhaps even clothe better than his British counterpart.

Incentives Intensified

The general improvement in the living standard of the working class, as a whole, is thus accompanied by a widening of the discrepancy between the living standards of various groups of workers. Those with low wages will probably be able to live

slightly better than hitherto, while the earners of higher wages will be able to live much better. This is part of the Government's deliberate policy to intensify the incentives to higher production.

The whole reform explains itself in the light of the campaign, recently initiated, for the fulfilment of the Five-Year Plan in four, instead of in five, years. As the first two years of the Plan have already passed, the programmes of production for three years would have to be carried out in the next two years. The speeding-up of the tempo is in part explained by the fact that some initial targets of the Five-Year Plan had been set too low. Last March, for instance, *The Economist* suggested that this may have been the case with the targets set for the coal industry. This has been officially confirmed by Mr Malenkov. "In July, 1947," stated Mr Malenkov in his speech to the Cominform, "the USSR approached the prewar level in the output of coal, copper, aluminium, nickel, electric power, tractors, lathes and other machines. Eighteen months of work on the Plan have shown that the Soviet Union has the resources to advance a number of industries even faster than anticipated. Some initial targets of the Plan for separate industries are now being increased." However, the speeding-up of the Five-Year Plan would hardly have been possible without some sort of a "new deal" for the working classes. Anybody who has come in contact with Russian workers after the war could easily feel that they resented the peasants' wartime prosperity. This created a certain antagonism between town and countryside, which, although it was politically inarticulate, could not have been ignored by the Government.

Can Prices Be Stabilised?

The effectiveness of the latest reforms depends on the administration's ability to stabilise the new level of prices. This in its turn depends on the supply of consumers' goods to government and co-operative shops and on the degree of efficiency of the Government-controlled trade. The good harvest should have secured a steady supply of foodstuffs, provided that transport and distribution work properly. The prospects for industrial consumers' goods is less certain, though in recent months much more emphasis has been placed on the output of consumers' goods than at the beginning of the Five-Year period.

On the other hand, much has been done in the course of the past year to make the supply of goods to consumers less dependent on the *bazaars* than it had been before. One hundred thousand new state-owned and co-operative shops—many of them run by associations of war invalids—have been opened in the course of the last year. *Bazaar* trade by peasants is still permitted; and price restrictions do not apply there. It is only in the context of the currency and price reforms that the meaning of last year's persistent campaign for the revival and extension of co-operative trade has become quite clear. Only through the network of the newly opened shops can the Government hope to keep prices down. Yet, the *bazaar*-trader remains in action, a virtual competitor with the Government-controlled trade; and the level of prices in the provinces will up to a point depend on whether the Government-controlled shops or the *bazaars* are better supplied with goods, especially foodstuffs.

Between Town and Country

Much of the further outlook depends also on the peasantry's reaction to the reform. The Government has delayed the revaluation of the rouble until the end of the whole agricultural campaign, until its last phase, the delivery by the peasants of agricultural produce to the Government, is completed. If the reform had been carried out in the middle of that campaign it might have caused trouble. The measures by which the Government has sought to enhance incentives to higher output in the towns may have weakened such incentives in the countryside. The difference between the new prices in the town and in the countryside may also act as an irritant. The Government has apparently been aware of the dilemma; and it has given the peasants an emphatic assurance that their incomes from next year's harvest will not be reduced by any new conversions or other financial measures.

What has, in a sense, been impressive in all the reforms now carried out is the Government's ability to manoeuvre between the two basic classes of Russian society: the workers and the peasants. Repeatedly the Government has had to swing now to the one side and now to the other. The pro-*muzhik* policy has, as a rule, been of a rightist shade. Policies favouring the industrial workers have had a leftist colouring. At present, social policy has steered leftwards.

THE WORLD OVERSEAS

Stalin's Switch in Social Policy—II

(By a Special Correspondent)

LAST week it was argued that the latest Russian currency reform has, on balance, enhanced the purchasing power of the townspeople as against that of the peasants. The old rouble has been exchanged for the new one at the rate of ten to one. Wages and salaries have remained stationary. However, currency and wages must now be analysed in the light of the new structure of prices, which forms part of the reform.

The price structure presents a complicated and confusing picture. It should be noted, first, that the abolition of rationing in Russia does not really mean any abolition of price controls. Over a wide field of Soviet trade these remain in force. The Government controls the entire wholesale trade and most of the retail trade, too; and it fixes the prices. Part of the retail trade in foodstuffs and other consumers' goods is carried on by collective farms, individual members of the collective farms and by members of co-operatives. In that sector of the trade prices have at no time been subject to any control. It is impossible to say what proportion of the retail trade is carried out in the private sector,

except that during the war that proportion was high and that now it has shrunk considerably.

Until last week two levels of prices existed in Government-controlled trade: very low prices for goods bought on the ration and very high "commercial" prices for all sorts of goods, the unrationed ones as well as the rationed ones, if they were bought "off the ration."

Official policy since the end of the war aimed at closing the wide gap between the two categories of prices. The "commercial" prices were steadily forced down. In September, 1946, the ration prices were raised by 200-300 per cent. At present the "commercial" prices have been abolished altogether. All state-owned shops are now to sell their goods at single prices which have been fixed roughly at the level of the latest (the increased) ration prices. There will be a difference in the prices of some industrial goods that will be sold to rural consumers, about 10 per cent dearer than to townspeople. Prices of foodstuffs will also vary slightly between the three zones into which the whole country has been

The Danish Socialists Return to Office

[FROM OUR COPENHAGEN CORRESPONDENT]

YOUNG men have taken over the Government in Denmark. The third generation of Social Democrats has formed the new Cabinet. Its head is the 44 year old Hans Hedtoft. In most key posts are equally young men. No one will envy them the circumstances under which they have come to power. It is true that they gained considerably at the elections in October, but their chief opponents, the former Prime Minister, Mr Knud Kristensen's Agrarians, whom they had defeated in the Lower House through a vote of non-confidence on the South Schleswig question, also gained. The only bright spot for the new Premier is that the strength of the one party with which he cannot collaborate—the Communists—was halved (from 18 to 9 seats). But the basis for a stable coalition Government has not been found. Denmark goes from one minority Government to another. The old one was theoretically Liberal, but had to increase restrictions. This one, although Social Democrat, will certainly not be able to go in for nationalisation, nor for very much more planning than there was before. No Government in Denmark can today carry out a policy in strict accordance with its ideals. Everyday economic problems—production and export, lack of coal, feeding-stuff, raw materials for industry and agriculture—are the overwhelming questions for any Government.

Severe Test Ahead

The new Government will, if it is lucky, have just enough time to conclude a series of new trade agreements, preferably with Great Britain, but also southwards and eastwards, before the next big economic question is at its door. For on March 1st all workers' agreements expire. The trade unions have already stated their claims. With increased wages, longer summer holidays and shorter working hours, they mean an increase of roughly 25 per cent. The employers' union flatly refuses any increase. For many years before the war the Social Democrat Government, which had been in power for 15 years, always managed to get labour disputes settled through the state mediator; in emergency cases the mediator's proposal was made law. Mr Hedtoft, pressed by the Communists—who, although considerably weakened in Parliament, are still very powerful in the trade unions—will find it more difficult to interfere. Prices have definitely risen, and the workers may be entitled to some increase. But, on the other hand, too big an increase will hamper the export trade. This wage dispute will be the new Government's real test.

Immediately after the war the Social Democrats issued a programme, "The Future Denmark" (written by the present Minister of Trade, the 33 years old Mr Jens Krag), which advocated planned economy and nationalisation on the same lines as the Labour Party in Great Britain. The party lost heavily at the 1945 elections, and the programme has now definitely been put aside. The party realises that the time is not yet ripe for greater revolutions. While the leader of the Communists, the very clever politician, Mr Aksel Larsen, continues to cry: "Take it from the rich and give it to the poor," the Social Democrats have realised that there are not very many rich men in Denmark today, and that they, or at least most of them, are doing a good job for production. Increased production is the slogan now, and the Social Democrats realise what outstanding work industry has done in transforming the Danish community to what it is today. Eighty years ago Denmark was almost entirely an agricultural State. Today industry employs more than 50 per cent of the workers. There is, of course, still a difference of opinion between Social Democrats and Liberals on how the good (and evil) things are to be distributed amongst the population, but the Social Democrat Party is today more Liberal than Socialist. Denmark need not expect any great Socialist experiments—and this is not only due to the fact that it is a minority Government which is in power. The new Minister of Finance, Mr H. C. Hansen, will never follow the revolutionary line of fiscal policy which his colleague in Sweden, Mr Wigforss, took immediately after the war.

Family of Labour Governments

With the return to power of the Danish Labour Party, the three Labour Governments of Scandinavia are a happily reunited family. The old tradition from the days of Nygaardsvold (Norway), Per

Albin Hansson (Sweden), and Th. Stauning (Denmark) can be taken up again. Their efforts will now be concentrated more on showing the ability of their system to work under changed circumstances rather than on new Marxist experiments. The general Scandinavian tendency is towards further practical cultural co-operation—of limited scope and purpose. There are frequent meetings of Ministers and high officials of the Northern countries to discuss professional and economic questions. Plans have been discussed for giving citizens of one Scandinavian country the same rights in others, for providing standard university degrees and the exchange of students and teachers, and for unifying social legislation so that workers may have the right of employment anywhere in Scandinavia. A nordic customs union has also been discussed, whereas there is some difference of opinion on the idea of a west European customs union. Denmark feels that owing to its close trade relations with Great Britain its place should be within a western European union, if one comes into being. But Norway and Sweden are more reluctant. Even the idea of a nordic defence union was once on the agenda—whether it was practicable or not—but seems now to be barred owing to Russian objections.

The Scandinavian Foreign Ministers always meet before the meeting of Uno to discuss common procedure. So they did in the old days of the League of Nations. But it was rather a shock when Denmark had recently to agree to elect a member to the five-man Commission of Palestine, Norway having refused and Sweden being ineligible because it had been a member of the investigation committee. Many Danes felt that, although this had to be considered as a public duty, Denmark had already sufficient foreign problems to deal with, among which the South Schleswig question stands out. Yet the importance of this question is greater for home affairs than for foreign. It was the former Prime Minister's desire for an "active" policy on South Schleswig and his demand that the frontier question should be solved by a plebiscite that caused his downfall. Resentment at this was recently expressed in his attack on the efficient Foreign Minister, Mr Gustav Rasmussen, a career diplomat. Mr Rasmussen was alleged to be a "doublecrosser" during a scene almost without parallel in the Danish Parliament. The reason for this outburst probably lies in the fact that, since Mr Rasmussen remains Foreign Minister in the new Socialist Government, his policy appears to have changed. In so far as the attack was personal, however, it may be said that his personal views are the same. But the policy he has to express for his new masters necessarily differs from Mr Kristensen's personal opinions. Quite apart from the rights and wrongs of the politics of South Schleswig, Mr Rasmussen certainly deserves credit for prevailing on the countries concerned to reduce, by one third, the 200,000 German refugees in Denmark at the liberation.

Americans Still in Greenland

When Denmark was liberated in May, 1945, three Allied Forces were on Danish soil. The Russians were on the Baltic island of Bornholm, the British in Jutland and on the islands, and the Americans in Greenland. The two former left as soon as their tasks were over. Not so with the Americans. They had occupied Greenland in 1941 (before the United States entered the war—but in agreement with the Danish Minister to Washington) to protect it "against the present dangers for the American continent." The Danes feel that this danger is now over, and Mr Rasmussen, the Foreign Minister, has opened negotiations to get the agreement terminated. The Americans still possess four bases in Greenland, and are unwilling to withdraw as they do not believe that Denmark will be able to maintain the necessary bases. Equally Danish official circles realise that Denmark, physically and economically, will not be able to maintain the bases—although some experts say that it could be done with a mere 800 men.

The Danes certainly do not feel that they are "inside the Iron curtain"—and they have no reason to feel it—but they realise that in some ways Russia has taken the place of Germany before the war. And in the Greenland question especially they feel they are between Scylla and Charybdis. What many Danes want—feeling is that the United Nations should do so. But it will take time for Uno to assume this responsibility. For the moment Denmark plays for time.

Denmark is—as the war proved—in a very difficult geographical position. It has suffered from German aggression several times during the last century, and a primitive feeling would be that Denmark—like France—should first of all look for security. But for the sake of political and economic stability in Europe many Danes now seem to follow the line of the British Labour Government: that the rebuilding of Germany is the most urgent problem for Europe today.

AMERICAN SURVEY

D-Day for the Plan

(From Our US Editorial Staff)

MORE productive than most mountains, the Administration, after labours which have earned the admiration of all who have watched the State Department's lights burning until three or four in the morning, has brought forth what may be a volcano, but is certainly no mouse. President Truman takes time to make courageous decisions but always seems to make them in the end. The European Recovery Programme, as it finally reached Congress on Friday, shows little evidence of the efforts made to emasculate it by those, within and without the President's circle, who either did not believe in it or were fearful of its effect on the elections next year. The fate of the Interim Aid Bill cannot have given him any great encouragement. If the statesmanship of the Senate, under the wise leadership of Senator Vandenberg, was a heartening surprise, the antics of the House were depressing. The final compromise on appropriations allotted \$522 million to France, Italy and Austria and earmarked \$18 million for China.

The debate in the House of Representatives on emergency aid is a useful, if gloomy, guide to the fate of the Marshall Plan—for it is in the House that its fate will be decided. The Senate Foreign Relations Committee will no doubt report a Bill differing from the draft which the Administration has offered, but the changes will not destroy its essential flavour. Nor will the full Senate amend all the strength out of it. But Representative Eaton did not have enough control of the Foreign Affairs Committee of the House of Representatives to avoid either the reduction of the amount of interim aid asked for or the introduction of China. On the floor of the House there was no leadership at all.

The questions which must be decided during the next three months are: Will any European Recovery Programme be passed? Will the financial authorisation be so reduced that it is left as only a relief programme? Will its administration be made unworkable by restrictive amendments? There is room for alteration to the President's suggestions without destroying the Marshall Plan—but not a great deal. The Administration's draft Bill has obviously kept close to the recommendations of the Harriman Committee. Amendments in Congress—those, that is, which are intended to be constructive—will be based on the Herter Committee's various reports and, in particular, on their draft Bill. Each side, as is only natural, will be backing its own team of experts.

There is no doubt that something called the European Recovery Programme will complete the obstacle race through Congress, though the votes in both Houses on the Interim Aid Bill may be deceptive, since only the irreconcilable opposition has come out into the open. The vote of 313 to 82 in favour of the bill in the House when it came out of conference with the Senate is valuable but misleading. The sponsors of ERP avoided a roll-call on the first vote in order to take one on the agreed Bill. They hoped for, and got, a larger majority than they would have done three days before. They wanted the largest possible majority, partly to encourage Europe to hang on and partly as a precedent.

The most serious danger will come from reductions in the amount authorised or appropriated year by year, beginning with the \$6.8 billion asked for to cover the first fifteen months after Interim Aid. There is little room for any cuts without severing the arteries of the whole plan. The State Department, in their explanation of their estimates, gave a stern warning that they had left no fat and that further austerity in Europe would be self-defeating. They have already reduced Mr Marshall's

original "something less than seven and a-half billion for the first period and between sixteen and twenty billion for the whole four years," but the reduction is more apparent than real. The Stabilisation Fund has been postponed for action at a later date and through other channels, thereby removing \$3 billion from the immediate struggle. On the first appropriation \$822 million has been scheduled for the Army "for the prevention of disease and unrest in Germany." Had it been included, the total would have been very close to \$7½ billion. It remains to be seen whether the Army will be any more successful in getting money than the State Department. While Interim Aid to France, Italy and Austria lost 15 per cent in the House Appropriations Committee the request by the Army for funds for occupied countries was cut by over 50 per cent.

If recent experience is any guide, there will be attempts to make cuts when the authorisation Bill is before the House—which may be successful—but the worst damage will be done by the Appropriations Committee. In theory, but no longer in practice, the Bill which authorises a programme settles its content. The Appropriations Committee should only decide whether the funds requested for carrying it out are adequate or excessive and vote what it considers the right sum. In fact, thanks to the tradition of having parsimonious and influential old men as Chairmen of the Appropriations Committee of the House, it has become a policy-making body with supreme powers. By refusing funds it can destroy a programme agreed and authorised by the House in full session. If it seems strange that the House should meekly allow one of its Committees to arrogate to itself such powers, it should be remembered that the Committee does a great deal of hatchet work for the House which the House prefers not to do itself.

The most curious spectacle—and the most perilous for the Marshall Plan—during the debates on the emergency aid was that of the House howling down an amendment designed to restore a part of the sum which it had itself authorised a few days before. The cuts the Appropriations Committee had made were largely at the expense of the Export-Import Bank, and the Committee's Chairman, Representative John Taber, announced that France and Italy should spend all their available funds on food and fuel and take no notice of their external obligations. Before the Economic Co-operative Act of 1948 becomes law there will be many irresponsible adventures of this kind, any one of which may cripple European recovery.

Amendments—some of them offered with the greatest goodwill—which may make the programme administratively unworkable will be produced in hundreds. Even in the Senate some of them may escape Senator Vandenberg's firm grip. The 30 votes given in favour of an amendment to reduce the amount of interim aid to \$400 million is probably, however, the maximum which any suggestion obviously intended to affect the efficacy of the programme will get. In the House there are many kinds of

"AMERICAN SURVEY" is drawn from three sources. Articles described as "From Our US Editorial Staff" are the work of a small group of regular correspondents, resident in the United States. Articles with some such attribution as "From an Industrial Correspondent" or "From A Correspondent in Ohio" are from outside contributors. Everything printed without attribution is prepared in London.

amendment which may get a majority. The biggest fight will come over the form of administration. The Herter Committee is a House Committee, and it has recommended an Emergency Foreign Reconstruction Authority with a board of directors working with a Foreign Aid Council. In contrast to this cumbersome mechanism the President has asked for an independent agency with an Administrator at its head. Although the House will want to stick to its own Committee's guns, there will probably be a compromise at this point, but there will be a long and bitter fight, particularly in an election year, over the appointments. If the President has his way and there is a single head, Mr Clayton would be the obvious choice. As he would probably prefer not to accept such a long and difficult job ex-Senator LaFollette is the likely alternative. He would have the advantage of knowing the problem intimately, as he was responsible for the drafting of the Harriman Committee's Report and therefore for much of its quality.

It is doubtful whether the House will give up without a struggle its favourite idea of trustees in each participating country to look after and dispose of the funds in local currency to be created as counterparts of the aid received, or whether they will look favourably upon the suggestion that strategic materials for stockpiling should be paid for by the United States instead of being supplied in the future against grants given during the next four years. Apart also from these foreseeable alterations to the Administration's programme, there are the unpredictable amendments of which, during the debate on interim aid, the proposal that the American Red Cross should be made responsible for the whole programme was an example.

Any measure which starts on its way through Congress seems, to the outsider, doomed to disaster or decay. Yet, over the last fifteen years, there have been few important ones which have not triumphed in the end—after moments when they have been given up by even their most ardent supporters. This time Mr Truman has given Congress all the material it needs to make up its mind and two weeks in which to study the material before the Committee hearings begin. The Bill has been admirably drafted and the State Department's supporting evidence is clear, simple and precise. Many of their recommendations run counter to established prejudices, but they avoid the pitfalls of complication which would have made the programme even harder to carry out than it must inevitably be. The future of Europe is now in the hands of Congress.

American Notes

Congress Goes Home

When the Special Session closed last week-end President Truman had gained no more than the briefest consideration—and dismissal—of the domestic anti-inflationary programme for which he appealed in mid-November. But, despite this rebuff, which was certainly no more than expected, Presidential strategy has been well justified, and Congress has done some very useful work. The adjournment was accompanied by a barrage of favourable press comment upon the skill and timing of the Administration's proposals for the longer-term plan for Europe (discussed more fully on the previous page) and the usual last-minute compromise between House and Senate on issues of first-class importance had resulted in a successful vote for Mr Truman on the Interim Aid Bill. The House Appropriations Committee has succeeded in scaling down the relief total from \$597 million to \$540 million, and in reducing the army vote for foreign relief by \$100 million; but the bulk of the funds has been voted, and aid for China, which at one time threatened a severe cut in the vote for Europe, has been held down to a nominal \$18 million.

On the domestic programme, the President has not succeeded so well. The Republicans' anti-inflation Bill authorises the continuance of export controls, some powers of allocation for commodities in short supply, continuing regulation of transport, and, in its most contentious clauses, provision for voluntary agreements between government, industry and agriculture, including price-fixing arrangements that would otherwise fall under the ban of the Sherman anti-Trust Act. Presumably, it covers also proposals to restore higher gold reserve requirements for the Federal Reserve Banks.

This admittedly modest reinforcement of existing authority would be wholly acceptable to the President but for the provisions providing release from the restraints of anti-trust action. Mr Truman has stated publicly that he will not accept any such measures, a declaration which could only mean that he was then prepared to veto the present Bill. If he does so, however, he will scarcely do more than to solidify Republican opposition next session, and he is most unlikely to secure any further powers—at least at this stage. His political position is the more difficult in view of the support given earlier to price-fixing agreements by Mr Averell Harriman, Secretary of Commerce. While "monopoly price-fixing" is the current obsession of organised labour (and thus of a formidable section of Democratic Party voters), the President would be risking a great deal by renewing his formal opposition to a measure by which he retains some safeguards and which will scarcely alter the actual position prevailing for a long time past.

Commodity "Gamblers"

Apart from many other pressing duties Congress has now taken upon itself the task of "cleaning" the commodity markets, where the volume of dealings has recently been double that of 1946, and at the highest level recorded since the ill-fated commodity boom of 1919-20. Two committees are expected to begin hearings if possible before the regular session opens on January 6th.

President Truman and Mr Clinton Anderson, Secretary of Agriculture, have been pressing Congress for some time to grant new regulatory powers to the Commodity Exchange Administration. But the legislators showed little interest until quite recently when disquieting rumours began to circulate on the extent of commodity dealings by Mr Edwin Pauley, a personal friend of Mr Truman, and now special assistant to the Secretary of the Army. Mr Pauley (whose earlier activities have shown a remarkably close link between private interests and public office) has revealed extensive holdings in the grain markets. He has since explained that those interests were taken before his assumption of office, and that subsequent dealings have done no more than to reduce his holdings "at great personal loss." On this showing, Mr Pauley's transactions were unwise, but they were certainly not so black as his accusers allege, and by no means beyond the boundaries of the law.

Up to this stage the Republicans were making all the running, largely on the initiative of Mr Harold E. Stassen, the Presidential candidate. And this may explain the apparent reluctance of the Senate, until a few days ago, to widen the scope of the inquiry beyond Mr Pauley's own personal transactions. This wider investigation will now take place, and it is reported that "inside dealings" will involve at least one former member of the Cabinet and Congressmen of both parties.

The national press will no doubt be enlivened in the near future by sensational charges against individuals. And it is clearly desirable that a complete investigation should now be made. There are, none the less, many real dangers in such a political witch-hunt. The revelation of substantial profits from speculative deals can always be relied upon to produce a great deal of irrelevant evidence, and a degree of public indignation which, however righteous, lacks an automatic corrective in the form of some discriminatory knowledge concerning the economic function of the exchanges. Determination to "fix the blame" and condemn the speculator can result in measures which impair the flexibility, and thus the general value, of commodity trading. The private interests who refused so stubbornly to impose more than nominal margin requirements on futures trading may pay on heavy price for a few speculative successes in the bull market of 1947.

Third Party Plunge?

The Progressive Citizens of America have at last formally endorsed the formation of a third party and have asked Mr Henry Wallace to head the ticket. Mr Wallace has not said yes, and he has not said no (though all his recent speeches show him as absorbed with the idea as a child with a new toy); but the suggestion alone has split the PCA, already a Liberal fragment, from top to bottom. Its vice-chairman, Mr Bartley Crum, has resigned; so has its co-chairman, Mr Frank Kingdon; and the Amalgamated Clothing Workers, which provide its main union base, have indicated that they will withdraw from the American

Labour Party if it becomes Mr Wallace's vehicle in New York State.

The prospects of a successful third party have never seemed more remote. If Mr Wallace accepts PCA's invitation, it can hardly be with any illusions that he will end up in the White House. On purely technical grounds, the attempt to get a third party on the state ballots should have begun months ago. According to the temper of the observer, therefore, Mr Wallace's adventure becomes either a Don Quixote foray, or, as one figure in the American Labour Party has charged, the instrument of Communist political blackmail against Mr Truman's foreign policy.

The question is, if Mr Wallace insists on tilting at windmills, just how much of a nuisance value will he have? The Democrats take it with some seriousness; it is less than a fortnight since Mr McGrath, the new party chairman, extended an olive branch to Mr Wallace. The Congress of Industrial Organisations, which in the past has given Mr Wallace steady support, is visibly alarmed lest a third party should draw off enough votes in New York and California to ensure not only a Republican victory in those crucial states, but to encourage the Republicans to run even more conservative candidates—for Congress as well as the Presidency—than they would otherwise have adopted.

The PCA plunge may, in the end, unite rather than split the Liberal vote. PCA itself is, after all, only that section of the progressives who were willing to accept Communist support. Given the CIO's big push against Communists in its ranks, Mr Wallace's supposed ability to swing crucial segments of the vote in the big cities may never materialise. He may, indeed, score his greatest effect in the Middle and the Far West where pacifism, however disguised, exerts its strongest pull and the lunatic fringe is most evident. From the speed with which many of Mr Wallace's fellow-travellers are deserting the ship, it appears that the fear of a Wallace candidacy may prove a substantial contribution toward ranging all but the irreconcilable firmly behind Mr Truman.

Education for Survival

The Commission appointed by the President in July, 1946, to examine the status and functions of higher education has just made public its first report on the objectives that higher education ought to serve. Five other volumes are to follow. This is a document highly critical of American educational achievements: it demonstrates again many Americans' admirable capacity for criticising their own institutions more mercilessly than any foreigner could do.

The Commission holds that the chief goals of education, which must be achieved if democracy is to survive in this atomic age, are to educate for a fuller realisation of democracy in every phase of living, to educate for international understanding and co-operation, and to educate for the application of creative imagination and trained intelligence to the solution of social problems and the administration of public affairs. It finds that higher education in America has fallen short of these objectives through what it teaches, by insulating education from life, by allowing over-specialisation in its curriculum and leaving the general ends of good citizenship to take care of themselves; and by restricting the numbers of those who can take advantage of a higher education. In part this is a matter of discrimination as expensive as it is senseless; it ranges from the frank denial of opportunity to the negro in the South to the more genteel quota system practised against Jews and negroes at more emancipated centres of learning.

American education is already big business. The Commission would make it bigger. The belief that an intellectual elite is all that is necessary in a democracy, however, is specifically repudiated. In 1900 about 500,000 were enrolled in colleges or universities, about 4 per cent of the population, age 18-21; in 1940 the numbers had risen to 1,500,000, or 16 per cent. This year the total rises to the staggering figure of 2,354,000 if one includes the million veterans making up the deficit of the war years. The Commission would raise the number to 4,600,000 by 1960, through elimination of discrimination, making education free through the first two years of college, and expanding scholarships. It urges a redoubled programme of adult education.

Ends are less subject to dissent than means; and it is when the Commission publishes its detailed findings on how to eliminate discrimination, how to reconcile Federal funds with academic freedom, how to attract capable teachers, and how to reorganise the curriculum that the fur will begin to fly. Four Southern members have already dissented from the report's finding on discrimination. The full report of the Commission is bound to be an invaluable source of information on present practices and

their correction. One hopes it will be as enlightening on the fundamental democratic problem of how quality is to be reconciled with quantity.

Long-Range Budget

As national income mounts steadily, the apostles of tax reduction become still more clamorous in their demand that any Bill for Marshall Aid shall be within limits determined at least in some measure by the need for concessions to the domestic taxpayer. The Treasury maintains its formal opposition to these demands, but it presumably realises that some ground must be conceded, and it has admitted that industry might be curbed in the future by a belief that rates are unduly onerous or unfairly distributed.

This short-term debate will be sharpened over the next few weeks as the cash surplus reaches its seasonal peak, and as earlier Budgetary estimates are outmoded by the still rising flow of revenue from all sources. The Treasury, however, is more concerned with the longer-term impact of fiscal policy, and it is on this plane that some of the most useful work has been accomplished over recent months. For example, the Committee for Economic Development (an influential body of private business men and economists), while suggesting that short-term tax adjustments may be desirable, places most emphasis upon the need for a long-range Budget, based on the presumption that tax rates can be stabilised for long periods.

These estimates provide for a Federal Budget of about \$30 billion a year in the 1950s, and CED has elaborated a long-term tax schedule designed to ensure that, in years of relatively full employment, there may be a cash surplus of about \$3 billion devoted to debt retirement, while in years of indifferent business a modest deficit would exert a stabilising influence. Rates would be maintained, despite the precise effect on the Budget in any one year, corporation taxes would be reduced quite sharply, and some further relief would accrue to middle-class incomes. On excise taxes, CED makes the radical suggestion that yields be cut by about 50 per cent. In many respects, its recommendations differ sharply from those put forward by a House Committee, under the leadership of Mr Roswell Magill, a former Treasury expert. The House Committee would apparently raise rates, even through periods of depression, in an effort to maintain a Budget balance, and would increase excise duties.

The report of the Magill Committee may contain some useful hints for present inflationary conditions, but it seems altogether to ignore the need for a decisive reversal of policy at a later stage. Apart from debate concerning the precise level of the Federal Budget, the main criticism attaching to the CED report would seem to lie in the implicit assumption that what it terms a "long-range planning and self-regulatory stabilising programme" is in itself sufficient to ensure an automatic regulator over the entire economy. Prewar evidence, and probably recent experience, tends to suggest the need for a more positive as well as a more flexible approach. The CED has none the less performed a valuable service if it succeeds in persuading Congress that fiscal policy will in the future need a far more constructive attitude than a simple debate on tax relief.

Shorter Notes

In its first 1948 forecast, the Department of Agriculture estimates winter wheat output at 839 million bushels, against an actual crop of 1.1 billion this year. The 1947 total for winter and spring-sown wheat was 1.4 billion bushels. Acreage is higher than in 1947, but the Department (assuming "normal weather" from now on) predicts a fall in yield from 18.4 to 14.3 bushels per acre.

The bituminous coal industry is showing some alarm over a new demand by Mr John L. Lewis, head of the United Mine-workers, for an annual pension of \$1,200 for all workers in the industry reaching the age of 60 and with 20 years' service record. Apart from costs (and some unofficial estimates suggest a figure as high as 40 cents a ton on present output), it is alleged that about 10 per cent of the labour force now reaches the proposed retiring age in each year. The strategic position reached by Mr Lewis and the favourable terms of his present contract find reflection in his statement that a refusal "might create a national emergency."

THE BUSINESS WORLD

Films and the Future

TO outward appearance, there is nothing very sensational about the Cinematograph Films Bill. It has been under discussion for the past twelve months, in anticipation of the expiry of the 1938 Act next year. Like its predecessors, it is a ten-year measure, of an interim, administrative character. It breathes no hint of the crisis in the British film industry—of the cessation of the supply of American films from which exhibitors have earned the bulk of their profits in the past, or of the serious financial predicament of the film producing side of the Rank Organisation. In this sense, the Bill might be described as four months out of date, for since last August, when all imported films began to be taxed at the rate of 75 per cent of their anticipated net proceeds, exports of films from America to Britain have been stopped by the American producers. The troubles of the British film producing industry—or of a major section of it—have been publicly disclosed only within the last week or two, but they date back many months earlier. The two main questions to ask of this Bill are whether it represents a useful advance on the two earlier Acts, and whether it goes far enough in recognising the urgent needs of the British cinema industry today.

The main changes in the line of descent from earlier legislation are concerned with the quota arrangements. The renter's quota goes, and to that few will not say good riddance. The renters' quota required the film renters—these are the distributing organisations that come between the producers and the exhibitors—to buy or make for distribution in the British market a given proportion of British films to the total they handled—the 1938 Act provided for a gradual rise in the renters' quota from 15 per cent to 30 per cent. Of course, the war upset these quota arrangements; the British film industry in 1946-47 made only 107 "long" films (that is, films over 3,000 feet, which include features and second features) which was only four more than in 1938-39 when the present arrangements started. In any event, the renters' quota was responsible for the making of a number of films in Britain which could hardly be fairly described as British films. A growing British film industry could not do without the exhibitors' quota; but it should not lament the disappearance of the renters' quota, particularly at a moment when the British film industry can make full use of the technical resources and studios in this country.

But some important and desirable modifications are to be made in the exhibitors' quota arrangements. Instead of the separate quotas for "long" and "short" films which were provided under the 1938 Act, the new Bill proposes separate quotas for "first feature" films (it has already been seen that these are not identical with "long" films) and for other films. The "first feature" quota will be calculated on the number of days on which "long films" are shown, and will lay down a percentage of days when the "first feature" must be British. To be a "first feature," a film must be either the only long film exhibited, or if there are more than one, that which carries the biggest daily rental, or if the long films are of equal rental, the one which is shown last. This is an ingenious method of increasing the length and quality of British films; it will encourage the production of "features" and not merely "longs," for many of the latter were merely supporting films of dubious quality.

The second part of the quota arrangements governs the show-

ing of "short" films and "longs" other than those shown as "first features." This quota will be governed by the total footage of such films played in a quota period. There are two important procedural changes for both quotas. First, the quota periods are to become six-monthly instead of yearly; secondly, the quota percentages (of days for "first features" and footage for others) are not being laid down in the Act, but will be determined from time to time by the Board of Trade, and will have to be passed by affirmative resolution of both Houses of Parliament. This method will ensure a degree of flexibility which the earlier Acts hopelessly lacked. There may be some room for argument whether six months is not too short a period, having regard to the length of time which is taken both in producing and exhibiting films. But better a review every six months than a hard and fast series of percentages laid down ten years in advance by statute.

Yet while these general quota provisions will apply to a majority of cinemas by number, they will not apply to those cinemas which cater for the poorest public or the biggest public. Of the 4,750 cinemas in this country, it is reckoned that perhaps 2,000 are of good modern standard. The rest are small, locality, houses which deserve none of the superlatives of the industry and show old films of poor quality. Any of these small houses which takes no more than £100 a week (after deducting entertainment duty) will in fact be relieved of all quota obligations. Thus, to take a simple example, a small house which opens on six days a week and sells 450 seats a day at an average price of 9d. will not be bound to observe the two quotas.

Of the 2,000 cinemas at the other end of the scale, half are under the control of the Associated British, Odeon and Gaumont British circuits. The Bill provides that cinema groups of more than 200 cinemas—each of these groups exceeds that size, Associated British by 250, Gaumont by 100 and Odeon by 50—will be liable to higher quota rates. These will rank as "special quota theatres." So will "first run" houses which show films before general release—the West End shopwindows controlled to a large extent by American film companies. Moreover, the Board of Trade may in future refuse to license any further cinemas which may be acquired by these large groups—thus giving statutory force to an informal understanding which Sir Stafford Cripps reached in March last year with the three big groups. The Bill also provides that "special quota theatres" may be required to show up to six British films as first features, after they have been certified as suitable for such exhibition by a selection committee to be appointed by the Board of Trade. This again writes into legal form an undertaking given by the three major circuits in March, 1946, in order to secure an outlet for worthy British films from independent studios.

These steps can all be taken as more or less agreed measures—in many respects they follow suggestions made by the British Film Producers Association about the revision of the present Act. It is most desirable that, from the beginning of the new Act, the quota provisions shall be effectively enforced. The special arrangements which have been made under the Bill to suit different classes of films and different types of cinemas are most comprehensive. They even include the fixing of lower quotas for those cinemas whose competitive position *vis à vis*

the big circuits prevents them from getting enough British films to fill the normal quota. Every interest is catered for; the quota changes will be made with a three months' margin of notice; the rigidity of quota percentages fixed in advance by the Act has been avoided. It follows therefore that the new Bill should be made to work, and should be seen to work.

But granted these merits, does the Bill go far enough? It is in many of its details rather retrospective in character—and, let it be said at once, not necessarily the worse for that, because a ten-year view of the film industry's progress and problems is a useful safeguard against ill-considered decisions. There is scarcely another industry in which it is possible to go so violently wrong and to run into financial trouble so quickly, and the State should not be expected to come to the rescue of the trade. But in the quota arrangements laid down under the Bill, the Government clearly contemplate the continued expansion of the British film producing industry, and in particular a growing output from the studios controlled by Mr J. Arthur Rank. Yet this group has been in serious financial difficulties in its film producing business. An outline of its problems was given here last week. On Friday last, the shareholders of Odeon Theatres adopted without a dissentient vote the proposals of their directors to acquire the shares of General Cinema Finance Corporation at par. That company had committed, at the end of September, 1946, no less than £5,876,525 in completed and uncompleted films and story rights at cost, less amounts recovered to that date and provisions. At last week's meeting, Mr Rank gave no further information about the changes in this item during the past fifteen months, or of the movement in secured loans which totalled £6,638,562, in September, 1946.

The importance of the film output of the Rank Organisation to the new Bill can be stated quite simply. In 1946, as Mr Rank has shown, General Cinema Finance presented 19 films to the

public; in 1947 the figure is 28 and the company "will have strained its financial resources as a result." For 1948, it is planning 38 feature films, but these cannot be made without additional money; this can be provided by Odeon, and according to the directors must be provided if that company is to get enough British films to fill its screens. There is no merit in arguing the details of the case put forward by the Odeon directors; the shareholders have heard Mr Rank and given him their approval. But if Mr Rank's estimates of output this year are accepted, there will still be a great shortage of feature films to provide programmes of anything like the length and variety of those which have been lavished on cinema audiences for twenty years. The corollary of strained finance at the producing end, and of the willingness of shareholders primarily interested in the exhibiting end to rally to Mr Rank's support, ought to be shorter programmes for the cinemas. The Board of Trade might be inclined, in view of the present shortage of films, to set its sights for the new quotas too low. But in fact the only way of killing two birds with one stone—to make British film producers turn out more films and to prevent the reissue of American films already in this country (a manoeuvre by which the American renters escape the 75 per cent duty)—is to put the various quotas as high as possible. The effect will be to shorten the average length of programmes simply because there are not enough British films to go round.

On the wider issues of monopoly in film production and exhibition, the Bill has nothing to say, apart from the new legal safeguards which have already been described. It is questionable, however, whether a reduction from 11 to 5 in the number of independent members of the Cinematograph Films Council is the best way of ensuring a continuous and disinterested watch over the activities of the industry. At present the Council consists of 11 independent members, two representatives of British film makers (to be increased to four under the Bill), two represen-

Mute witnesses to the stormy history of early trading ventures in West Africa, the castles of the Gold Coast form a notable feature of the coastline of the Colony. Built by Danes, Portuguese, Dutch and English they served both as headquarters for their countries' trading organisations and as strong points against hostile tribes and jealous commercial rivals. Today many of them are in ruins, while those that have been preserved are mainly in use as Government offices, as in the case of Cape Coast Castle, built by the English in 1662, or as rest houses or prisons.

Although gold, which attracted the early European merchants, is still an important source of wealth to the Colony, its predominance has been strongly challenged by the growth of the cocoa industry which now provides about half the world's total production. Full and up-to-date information from our branches in the Gold Coast covering the cocoa industry and other commercial activities of importance is readily obtainable on request.

(DOMINION, COLONIAL AND OVERSEAS)
HEAD OFFICE: 54 LOMBARD STREET, LONDON, E.C.3

SAFE AS HOUSES

But are they? Is *your* house safe, in the sense that it is the best place to keep your cash? How much wiser it is to open an account at the Westminster Bank, where your money

will have complete protection, yet always be readily accessible. The process is simple and the account can be opened with a modest sum. The Manager of your local branch will be glad to tell you of the many ways in which the Westminster Bank can be of service to you.

WESTMINSTER BANK LIMITED

tatives of the film renters, four of film exhibitors, and two (also to be increased to four) of persons employed by British film producers. It may be argued that 21 was too large a body; but 19 is only slightly smaller. It must be remembered that the Council has a statutory duty to keep under review the progress of the cinematograph film industry in Great Britain, with particular reference to the development of that branch which is engaged in the making of films—in other words the very section whose voice is to be increased from four to eight members. These provisions should be examined with some care, for they appear to weaken what is otherwise a sensible Bill, by reducing the influence of the well-informed amateur on the development of the industry.

British Rubber and American Demand

THE rubber growers have won the first round of their fight with the Board of Trade over the American "concession" in the new Geneva Tariff Agreement, details of which were given in an article in these columns a fortnight ago. Mr Harold Wilson, the President of the Board of Trade, admitted last week in Parliament that a "misunderstanding" arose in the later stages of the Geneva negotiations. From the outset the United States' delegation made it clear that they wanted to secure reductions in colonial preferences granted to British goods, and Britain finally agreed to such reductions on condition that they could be suspended if any legislation was passed in the United States requiring an increase in the consumption of general purpose synthetic rubber. Mr Wilson stated that there was no time for full consultation about the drafting of the condition—though he admitted that it was in the hands of the negotiators for two days before signature—and that a few days after the close of the conference, it became clear that the clause did not in fact provide for the result which was intended.

The clause makes the concessions in Colonial preferences inoperative if internal regulations in the United States should require the quantity of general purpose synthetic rubber consumed to exceed 25 per cent of total US rubber consumption, comprising natural, general purpose synthetic, special purpose synthetic and reclaimed rubber. America's domestic formula fixes the level of general purpose synthetic consumption at 33½ per cent of total natural and general purpose synthetic rubber consumption. The inclusion of special purpose synthetic and reclaimed rubber under the Geneva formula would have allowed the United States to keep within the tariff agreement without increasing natural rubber consumption, for example

Recent events have shown that there is a high degree of public interest in the continuity and financial stability of British film production. It implies no disrespect of the energy and sincerity of purpose which Mr Rank has applied to the expansion of the film industry to hold that independent production has its own important values and must be given its opportunities. These the Bill goes some way to provide. But even Mr Rank's organisation has seriously strained its financial resources, and the provision of funds to producers outside his orbit of companies will not be encouraged by recent disclosures of what has happened to his own group. The provision of finance and the question of monopoly are interlinked. They are not considered in this Bill, but sooner or later they may require Government intervention.

by reducing the quantity of general purpose synthetic and increasing that of reclaimed rubber. The American authorities have agreed to suspend the undertaking "as there was not full accord." Neither the concession on colonial preference nor the condition regarding US synthetic rubber consumption has been relinquished; each has been held over pending the re-negotiation of a mutually satisfactory formula.

The Government's admission of error has been frank. It has made a mistake and fortunately has taken speedy action towards remedy. The outcome of the new negotiations now remains to be seen. This time, perhaps, full consultation will be maintained with the rubber-growing industry. The US Government has apparently already decided that synthetic production will continue; the point at issue therefore is simply the determination of the appropriate level of synthetic output, but the prospective price of natural rubber may have an important bearing on this. The American Services have favoured a minimum capacity for producing synthetic rubber of 300,000 tons of general purpose synthetic rubber (GR-S) a year. For their part, the rubber manufacturers favour only 100,000 tons a year; but American industrialists have no desire to place themselves again at the mercy of what they call the "Anglo-Dutch Cartel"—memories of the prewar restriction schemes are too vivid, and they regard synthetic rubber production as a useful counter-weapon. If the long-term price of natural rubber were likely to average, say, 1s. 6d. or even 2s. a lb., American rubber manufacturers would very soon agree with the Services to the higher minimum limit of synthetic output. Shilling rubber might be a "mental barrier," as was suggested in Parliament last week, but even this will be open to argument in the United States.

The American Government's selling price for synthetic rubber is still 18½ cents a lb. (11d.) and industry is requesting a reduction to 15 cents. Figures for production costs of GR-S have been published from time to time, though they are not regarded as wholly satisfactory by the plantation rubber industry. It is generally believed that a substantial tonnage of GR-S is being produced at 14 cents a lb. (about 8½d.), to which should be added perhaps 2 cents a lb. to cover amortisation charges. If these figures are correct—and there is room for argument about the way they are drawn up—the idea of shilling rubber is surely more than a "mental barrier."

America is the rubber-growers' main market. In the first nine months of 1947 its consumption of natural rubber was estimated at 397,000 tons or 49 per cent of the world's total. In the same period American industry also used 432,000 tons of synthetic and 213,000 tons of reclaimed rubber. Over the year, the consumption of natural rubber has been increasing as shown in the chart on page 1052, but there would obviously be scope for further expansion if competitive conditions were to obtain. Unfortunately, rubber growers have not championed the cause of free competition in the past. Their prewar history does not reveal them as the stalwart advocates of the free play of competitive forces. Yet even now if natural rubber were to sell consistently for any length of time below the price of general purpose synthetic, it would have more effect in swaying American industrial opinion in its favour than months of negotiations.

Admittedly, rubber growing costs have increased, and some elements of cost are likely to remain high. A large proportion of the Malayan rubber trees are old stock; about 70 per cent were over 21 years old last December, according to a Malayan Government report and only 12.7 per cent of the total acreage had been planted with high yielding stock. The economic life of a rubber tree cannot be precisely stated but it is generally reckoned that trees take seven years to reach maturity and yield their optimum output between 13 and 17 years, after which their yield tends to decline. Replanting, which was retarded by the Japanese invasion, must be undertaken over large areas, and will take time and capital.

The second rigid element of cost is wages. High wages in Malaya have resulted from the shortage of rice and from the general effects of inflation. Adequate supplies of rice will probably not be available for some years, but it should be possible within that time to increase the official ration and to reduce the fantastic costs of rice imports. In 1938 Malaya imported 650,000 tons of rice mainly from Burma and Siam, and neither of these two countries—not, indeed, any in South-East Asia—has yet been able to restore its domestic production and to resume exports on the prewar scale. But even under more

normal conditions wage costs will still be sticky, especially in these areas where nationalism is growing fast.

Economies in rubber planters' costs must therefore be sought in other directions. More efficient disposition of labour could reduce the labour cost per unit of output; so, too, would a reorganisation of management and supervision. It may in some cases be possible to reduce administrative costs by appropriate amalgamations. These and other avenues will have to be explored. It will not necessarily be price that has to accommodate itself to costs, but more probably costs to price. And it must always be remembered that European plantations in Malaya are not the only producers.

Malayan smallholders have always been a potential competitive threat to the estates; the rubber industry in the Netherlands East Indies, similarly, is largely native, and there a greater measure of independence may be gained by the Indonesians. Again there are other areas, such as Ceylon, which were developed as alternative sources of rubber during the war, though their competition is likely to be effective only when prices are high. But the production costs of smallholders' rubber are very low, and a falling price may well induce a greater supply. Output of the Netherlands East Indies is still on a relatively small scale and recovery has been retarded by political unrest, but given more stable conditions the expansion of production might be surprisingly rapid. In that event, Malaya's present position as the world's leading rubber producer would be challenged. On a purely competitive basis, it may well be that native production in both Malaya and Indonesia will in the end prove to be a more powerful market factor than the supplies or costs of the rubber estates.

The new negotiations with America will be assisted rather by proving the efficiency of natural rubber production, even under the present difficult conditions, than by suggesting that rubber prices are now too low. It would take more than that to sway the American Government from its "infant industry" claim for synthetic rubber. A low price for natural rubber is the best guarantee against the excessive development of American synthetic rubber production, for sooner or later, American rubber manufacturers would question the advantages of over-expansion, on grounds both of price and quality. It must be hoped that these long-term considerations will be remembered in the forthcoming negotiations and in the debate in Congress on synthetic rubber policy in the New Year. The willingness of the American authorities to reopen the agreement is a fair assurance in itself that the Administration would wish to see some immediate expansion in the use of natural rubber in the United States. But a rubber plantation industry which is concerned about its position in say, ten years' time, will be wise not to take American goodwill as the long-term solution of its problems.

Business Notes

The Dollar Drain

Sir Stafford Cripps's speech last week on the economic position has hardly contributed to the seasonal good cheer which other ministers have lately been so busy disseminating. But the note of realism, however unseasonable, is welcome—and not less so for the contrast it presents with the booming optimism which is used to flow from the Treasury. Reading between the lines, it seems evident that the Chancellor is beginning to share the general doubts about the possibility of achieving the 1948 export targets. About the course of domestic production, it is true, he remains quietly confident. But he is obviously afraid that the combination of import restrictions abroad and rising British costs will drastically narrow the available markets. The conditions of a buyers' market have been reached in many lines of goods, and the price factor is becoming increasingly important. Already, Sir Stafford declared, Britain is losing sales in some of the most desirable markets because British costs are not competitive. The latest rise in the price of coal will intensify this

particular difficulty, yet the Government still does not draw the obvious conclusion—that the only way to combat this tendency is for it to impose much more vigorous disinflationary measures than any it has yet contemplated.

Meanwhile, very little headway has been made in the effort to narrow the critical hard currency deficit in Britain's trade. "Search as we may, there are still large quantities of foodstuffs and raw materials for which there is no other source than the Western Hemisphere"—and dollar prices are still rising. Finally, the increasing stringency of import restrictions abroad is not only blocking the expansion of British exports but is also greatly aggravating the authorities' task in their efforts to use the instrument of bilateral trade pacts as a means of switching British purchases from hard to soft currency areas.

Against such a background as this, the reduction which Sir Stafford was able to reveal in the rate of dollar outgo is hardly impressive. But, on this matter of the gold and exchange statistics, the Chancellor is to be congratulated upon being much

more informative than his predecessor. In the four weeks to September 20th, when dollar expenditure was still strongly influenced by the demands which piled up before convertibility was suspended, the net drain on gold and dollar reserves was running at more than \$90 million per week. In the following four weeks, the weekly average dropped to \$65 million and since October 18th has been running at "rather less than" \$55 million. This is, of course, a very much smaller drain than that experienced at the height of the August run on sterling; but to get a true perspective it needs to be remembered that the current rate is still equal to no less than £715 million per annum. Unfortunately the Chancellor gave no indication of the division of this expenditure between Britain's own requirements and those of the overseas sterling area though he remarked that the latter's demands, if continued at the present rate, would involve "a very heavy drain." Nor did he attempt to forecast the pace at which the drain upon reserves will slacken when the cuts in imports and other dollar economy measures begin to take full effect. Instead, he simply reiterated that there is "absolutely no chance of our arriving anywhere near a balance . . . with the United States" and apparently envisaged a residual hard currency deficit of about £300 million per annum for the Sterling Area as a whole.

Living on Capital

Sir Stafford's analysis of the reserves available to meet this dollar drain confirm almost exactly the estimates given in *The Economist* a fortnight ago. At the end of December the gold and dollar reserve is expected to stand at £500 million, after allowing for this month's \$100 million draft on the residue of the US credit and after bringing in the remainder of the gold purchased from South Africa under the current agreement. On the assumption that gold sales for December absorb £60 million (compared with the November figure of £63 million for gold sales and purchase of dollars from the International Monetary Fund), this would mean that South African gold has contributed £50 million during the second half of this year.

In the New Year, according to Sir Stafford's figures, the reserves will or could be augmented by an additional £250 million, comprising a further £75 million from the US credit, £70 million from the Canadian credit, £80 million from the new gold loan from South Africa, and £25 million of dollars purchased from the IMF. In fact, the possible accretion is likely to be substantially less than this. Under the new Canadian agreement, which runs for three months, the future of the Canadian credit (of which, on Mr Abbott's recent statement, £79 million was outstanding at December 8th) has been left very much in doubt. During the coming three months Britain will be entitled to only \$45 million, and whether the remainder of the credit will later become available will evidently depend principally upon the progress of the Marshall Plan and its repercussions upon Canada. If Sir Stafford's figures are adjusted on this point, the total gold and dollar reserves prospectively available in the New Year are rather under £690 million. In October Sir Stafford himself emphasised that the lowest figure to which they could be allowed to sink was £270 million, so that the maximum which is now available to stem the current dollar drain is only a little over £400 million—equal to about seven months' supply at the recent reduced rate of outgo.

It is hard to reconcile these figures with the Chancellor's protestations that economic policy as a whole is not based upon the assumption that Marshall aid will be forthcoming. No one has explained more forthrightly than Sir Stafford did last week the danger of living on capital. After opposing recent suggestions that Britain ought to mobilise its remaining overseas investments for sale abroad in order to relieve the current pressure upon the nation's food, the Chancellor reiterated the importance of minimising the strain on the gold reserve. "No one," he declared, "is in greater danger of losing his independence of action than the man who has no reserves upon which to fall back." In principle, therefore, the Government hopes to use any Marshall aid, not to ease the burden upon the standard of living, but to buttress long-term plans for reinforcing the ultimate reserves. This is indeed a righteous attitude; but surely the facts of the dollar drain, and the Government's inability to show how it may be reduced, belie the hopes upon which it is founded.

Meanwhile, policy still appears to be based on the assumption that Britain's balance of payments as a whole can be restored to approximate equilibrium during 1948. The imports for the year are estimated at £1,600 million (incidentally, this represents a surprisingly small reduction from the "programme" rate of

£1,700 million projected last summer), and in addition there will be governmental expenditure of £100 million, compared with an original estimate of £175 million for 1947. At the target rate, exports would provide £1,550 million and invisible income a further £130 million (including £70 million net from overseas investments).

Agreement with Canada

Except in one detail, the terms of the agreement on trade and financial arrangements between Britain and Canada follow the inevitably prophetic outlines that were sketched in last week's issue of *The Economist*. The one correction that must be made to that forecast is that the figure of \$145 million due to Canada by Britain over the first three months of 1948 is a net and not a gross figure. It is the deficit due to Canada after allowing for estimated British exports to that market. This deficit will be met as to \$45 million by drawings from the Canadian credit and as to \$100 million in US dollars. From Britain's point of view the terms of financing imports from Canada have, therefore, deteriorated somewhat. Instead of one-half the deficit being financed in US dollars, the proportion so payable in the next three months will be 69 per cent.

On the import programme, also, the British negotiators had to accept larger commitments than good dollar husbandry seemed to justify. But since the wheat contract was at stake, the concessions on livestock products had to be made. As a result Britain will be eating rather more bacon and otherwise living rather better than it can afford for the next three months. After that, Mr Marshall will perhaps have come to the rescue of both countries—both of them beset with the common difficulty of a shortage of US dollars. As was explained, in the official statement issued in London after the signature of the agreement, "from the United Kingdom standpoint, our shortage of hard currency limits the extent to which we can afford at this time to make payments in dollars for goods supplied from Canada. From the Canadian standpoint the dollar shortage and other factors limit the extent to which the balance of the credit provided to the United Kingdom by Canada under the financial arrangements of 1946 can be drawn on to make supplies available to the United Kingdom."

There are a number of possible escapes from this seeming impasse. The first is a substantial increase in British exports to Canada, and on this score the official announcement states that the British Government "will take all possible steps to encourage exporters to take advantage of the improved opportunities in Canada." The second is contraction of the Canadian deficit with the United States. That, also, is under way—but since the Canadian gold and dollar reserve is down to \$500 million there is little room for manoeuvre. The third is the expectation that Marshall aid dollars will be made available for purchases outside the United States. It is fairly evident that many bets have been laid on this particular hope. All the more disconcerting is the apparent proposal that all Marshall aid other than emergency assistance shall be made available through Export-Import Bank loans. Loans from this institution are tied loans and could not be made available for "offshore" purchases unless the United States went through the farcical procedure of buying Canadian wheat and then reselling it to Europe. If such help from the United States is not forthcoming the arrangement for financing British imports from Canada after March 31st next will have to be cut to a much more austere pattern than that of the present short-term agreement.

End of French Inflation?

There have been many battles of the franc. None has been more crucial, more charged with significance for the political as well as economic future of France than that which opened on Friday of last week with M. René Mayer's disclosure of the Government's anti-inflationary programme. Success in carrying out the programme is essential if the victory which the Government has just gained over the Communist-inspired strikes is to be consolidated. But success must be rendered much more difficult by the damage which those strikes have inflicted on French production and by the increased inflationary potential they have left as their legacy. As in all previous battles of the franc, it is the budgetary deficit that has been marked as the first and fundamental objective to be captured. Last week, M. Jean Monnet, head of the Planning Commission, defined the basic issue with the brutal clarity of which he is so good an exponent. "Between our

present difficulties and the future of recovery and development, there stands the barrier of monetary instability"—an observation and a warning which loses none of its point for having so often been made in the past.

The budget for next year is to be balanced on the basis of expenditure of 900,000 million francs, or some 150,000 million francs in excess of the total for 1947. This does not include capital expenditure for which special funds have been established to be financed in part by the franc proceeds of US interim aid and grants under the longer term European Recovery Programme. The rest of the capital expenditure is to be met by a special levy on individual incomes and industrial, commercial and agricultural profits exceeding 750,000 francs (£1,500) a year. The levy is intended to hit with special severity agricultural incomes which hitherto have largely escaped their rightful share of taxation. The levy will be payable once only. Taxpayers liable to it will be offered the alternative of subscribing to a 10 year tax-free loan bearing interest at 3 per cent. The levy is expected to bring in 150,000 million francs.

To cover the increased ordinary expenditure, reliance is being placed on a wide array of measures, including a poll tax on the "idle of both sexes" and increased taxation on cabarets and night clubs. There will also be steep increases in the prices of coal, electricity, gas and transport, all of which have been supplied by nationalised industries at increasingly heavy losses to the Government. Other parts of the anti-inflationary programme are a freezing of wages and prices for six months, restrictions on the prices of restaurant meals, and plans for substantial increases of food imports (the latter brandished as an inducement to the farmers to unhoard part of their accumulated stocks).

If the plan is to be realised it will call for a tightening up of the fiscal administration such as has proved beyond the grasp of successive French Governments. Even if it is realised, the plan can hardly avoid the ultimate necessity for an adjustment of the exchange value of the franc, for nothing in the designs of M. Mayer holds the promise of a deflation of costs and prices which alone could justify the maintenance of the present official rate.

Coal Board's First Year

The National Coal Board's progress report on its first year is good, as far as it goes. It shows that the Board has been

active, and to a large extent successful, both in carrying through measures to secure immediate increases in output and in preparing its long-term plans for development. Each of the Divisional Boards has now completed its reconstruction schemes, which will be reviewed and co-ordinated by the central planning staff, so as to ensure their even development. Improvements in mechanisation, with the extension of coal-cutting and conveying machinery and the introduction of mechanical underground haulage, should begin to make an increasing contribution to efficiency in 1948. The drift mining projects, which will yield an immediate return in terms of output, are being pushed ahead and, more experimentally, schemes for fluorescent lighting at the coal face are being introduced in certain pits. The Board is beginning to deal with the problem of dirty coal, and two large users, the Great Western Railway and the Central Electricity Board, have expressed their satisfaction at the reduction in the proportion of unsuitable coal. Eventually, when the schemes for centralised washeries are completed, it is hoped to raise the proportion of coal prepared mechanically from the present level of under 50 per cent to about 70 per cent.

The results of 1947 have proved better than anyone dared to guess six months ago. Output, it is estimated, will be the highest since 1942, and in the 50 weeks of 1947 seven million more tons have been produced than in the same period of 1946. Absenteeism is well below last year's level, while output per manshift is back at its prewar level. The improved output is attributed in part to technical improvements and in part to the improved spirit within the industry. The net intake of manpower at 25,000, which brings the total labour force to 719,000, is disappointing when compared with the Government's target for 1947 of 730,000, and with the high rate of recruitment during the year. In all, 90,000 men have entered the industry, compared with 76,000 in 1946 and 48,000 in 1945. Next year, as the abnormally high wastage of Bevin boys drops, and as the recruits both from British and overseas sources settle down and become trained, the labour force should become more stable and productive. The immediate problem is to raise the proportion of productive to non-productive workers.

The report is incomplete; it lacks the results of the review of the price structure and any detailed information about costs. Lord Hyndley has expressed regret that it is necessary to increase coal

TRADE WITH THE EAST

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA provides a complete banking service, backed by nearly a century's first-hand experience of Asiatic economic conditions, for every financial operation connected with TRADE, INVESTMENT AND TRAVEL IN THE EAST. The Bank's branch system, under British management directed from London, serves

INDIA • PAKISTAN • CEYLON • BURMA
SINGAPORE AND MALAYAN UNION
BRITISH NORTH BORNEO AND SARAWAK
INDONESIA • FRENCH INDO-CHINA • SIAM
THE PHILIPPINE REPUBLIC
HONGKONG • CHINA • JAPAN

Merchants and Manufacturers planning to establish, renew or extend business relations with the East are invited to consult the Managers in London or Manchester.

Incorporated with Limited Liability in Victoria

Established 1858

prices again, but he claims that British prices are in line with world prices and are not an obstacle to export. There is no indication that the Board intends to tackle the problem of rising costs in the coalfields, or whether it proposes to enforce a national uniformity of regional costs and prices. For this vital information the public will have to wait for a second, financial, instalment of the Board's report.

Exports Up but Volume Down

The recovery in exports made some further headway in November and the visible deficit dropped to £32 million—the lowest since last February. The monthly deficit has fallen steadily over the past three months from the peak of £77 million reached in August. The actual value of exports in November (£102 million) was £6,000,000 less than in October, but when account is taken of the shorter working month, the daily rate is the highest attained since the war. On the basis of a notional working month of 26 days, exports during the past nine months had been as follows:—

	£ mil.		£ mil.		£ mil.
March	82½	June	101	September	99
April	89½	July	106	October	104
May	80½	August	97	November	106½

Apart from the seasonal decline in August and September, there has been a steady improvement since last March. Reckoned in terms of volume, however, the recent trend has been unimpressive; the index of volume for November is provisionally estimated at 112 per cent of 1938 compared with 120 per cent in October and 126 per cent last July, which was the peak month.

Exports of the vehicle group fell by nearly £4,000,000 in November, though shipments of motor cars and bicycles were only slightly lower than October's record figures. The decline arose mainly from smaller exports of ships and rolling stock. Machinery exports were approximately maintained at the previous month's level and are again the biggest item of exports, reckoned by value. The average daily export rate for textiles was 6 per cent higher than in October, although the total for the month was £500,000 less. There were heavy reductions in the shipments of iron and steel and chemicals, drugs and dyes.

Imports declined during November, the total of £138 million being £23 million less than in October. Arrivals of food and tobacco were reduced by £17 million on the month; in particular much smaller quantities of grain and meat were imported. Retained imports of food, drink and tobacco were the lowest since September, 1946. The decline in imports of raw materials and manufactures appears to have been due to the shorter month, and not to any deliberate cuts.

Australian Wheat Purchases

The unseasonable rains which have played havoc with the recent Test Matches in Australia have also caused widespread destruction to the wheat crop throughout the eastern states. In many areas the standing grain has been flattened and in others disease is spreading. It is almost certain that the expectations of a 220 million bushel harvest will no longer be fulfilled. Reports suggest that the crop may total only 180 million bushels, but it is obviously too early as yet to make any accurate estimate.

The United Kingdom has purchased under contract 80 million bushels, of which half is intended to cover Britain's own requirements and the other half those of the colonies and other dependent territories. The price for the twelve months' period is 13s. 7d. a bushel f.o.b. Australian port which compares with 15s. 5d. a bushel Chicago and 10s. a bushel for wheat purchased under the revised Canadian contract. The Australian Wheat Board desired to fix the price quarter by quarter, but the Australian Government agreed with the Ministry of Food to fix annual prices, since a large quantity was involved and Britain was providing all the shipping. Even with a reduced crop of 180 million bushels, Australia will be faced with a serious storage problem and it will be vital to avoid any congestion at the ports.

India has purchased 25 million bushels of wheat and flour at an average price of 14s. 10d. a bushel f.o.b. Australia. Although Australian wheat was not used for direct bartering, the Indian food mission nevertheless promised to obtain for Australia increased supplies of jute, textiles, castor-seed, linseed and linseed oil. An additional 5 million bushels of wheat will be made available to both Britain and India if the total Australian wheat crop exceeds 210 million bushels of fair average quality. In both cases a clause in the contracts permits the price to be reviewed if any of the countries enter into an international wheat agreement.

If the total crop turns out to be below 200 million bushels, there will be little wheat available for European or other countries, as some 80 million bushels will be consumed in Australia.

The purchase price, although below the Chicago quotation, is not low, but it is a sterling payment and will be welcomed on that ground. If Britain is to replace dollar foodstuffs with supplies from sterling sources, encouragement must be given to the expansion of production in countries such as Australia, which has already done much to help Britain's food problem. It is, however, open to doubt whether large scale agricultural development in North Australia, which a Ministry of Food mission is to examine on the spot, will be practicable.

Stock Exchange Commissions

Two important decisions relating to commissions were taken by the Stock Exchange Council at its meeting on December 22nd. In the first place, the Council rejected the amendment to its rules and regulations passed on October 27th, subject to confirmation at this week's meeting, by which the amount below which full commission would be charged was to be raised from £2,500 to £5,000. There had been little public sympathy for this change and perhaps even less enthusiasm among brokers. And the reaction of the larger clients, mainly institutional investors, during the period which the Council had wisely allowed to test the reaction of opinion to the proposed change, was frankly adverse. But the Council has confirmed the amendments—which will not come into effect until January 1, 1949—to abolish the rebates of commission on Stock Exchange business hitherto conceded to accountants, solicitors, trustee departments of banks and insurance companies and the Public Trustee, and to increase the annual registration fees for agents from 3 to 50 guineas and for attachés from 3 to 25 guineas. These amendments were discussed in *The Economist* on December 6th and 13th.

Although the Council deliberated for over two hours before rejecting the one and confirming the other, it has taken the course generally expected. Whatever the pros and cons of the matter may be, especially of the retention of the right to share commissions by the banks—this discrimination in favour of the banks has been found unpalatable in many quarters—the test of the amendments from the brokers' point of view will be the effect on the amount of new business initiated. Experience will show whether the volume of new business which reaches the London Stock Exchange direct will be increased by these changes or whether the business formerly undertaken by the dispossessed agents will flow towards the provincial stock exchanges or will be placed through the banks, who will retain their one-third share of commissions.

Coal-to-Oil Queue

Mr Robens, on the heels of his Minister's favourable review of the coal position, admitted last week that the coal-to-oil conversion programme is again out of gear. It started too slowly to alleviate the coal shortage last winter; then it accelerated; and now, when coal output is rising, the programme has to be curtailed owing to the prospective shortage of fuel oil in 1948. Too many schemes have been authorised, so, once again, the Government is resorting to a system of priorities. It will be the task of the Petroleum Board to form the uncompleted schemes into a queue so that they come into operation "as additional supplies of oil become available." Last April, consumption of fuel oil under the programme had reached an annual rate of only 1,100,000 tons instead of the 2,000,000 tons planned; today, the programme accounts for 2,200,000 tons out of a total fuel oil consumption of 3,500,000 tons, and new authorisations made under the impetus of the coal crisis (until they ceased abruptly in August) imply a consumption rate of 5,500,000 tons by the end of 1948.

This progressive increase in demand is impossible to meet. The immediate problem is transport and the long term problem costs; both have been directly affected by the increase in demand for oil all over the world. In particular, American demand, which represents three-quarters of the world total, has increased by 70 per cent over 1938. The United States of America is now a net importer of oil.

The British tanker fleet, now at prewar strength, is inadequate to cater for this country's increased oil requirements. The coal-to-oil conversion programme alone will call for the services of some 60 additional tankers. Mr Robens hoped that the return to service by the US Maritime Commission of the remaining half of the 300 tankers it laid up at the end of the war would

ease the tanker situation in the second half of 1948, but it has to be borne in mind that a large proportion of this tonnage was built for the war in the Pacific and is not very suitable for trade with western European ports.

Design for Glass

The working party report on the hand-blown domestic glassware industry has been published this week.* This section of the domestic glassware industry may be differentiated from the hand pressing and machine sections, which have a similar though not identical range of products. Stemware, that is wine and spirit glasses, is made exclusively by the hand-blown section, but there is a wide range of tumblers, mugs, trinket sets and the like which all three sections produce in common. A good proportion of the hand-blown ware is decorated, usually by cutting or engraving. In short, this is the section which has made British crystal glass (there are several Scottish firms) famous throughout the world.

Many of the glass-blowing section's problems are reminiscent of those of the pottery industry. There is the same concentration in a few areas, the same technical backwardness and poor factory conditions, a similar struggle for survival by family businesses against foreign imports dumped at low prices (at least before the war), and the same reluctance by labour to enter an industry which has a tradition of long hours in ill-lit, badly ventilated workshops.

The working party plunges straight into the short-term problem. The report considers that steps should be taken to prevent dumping by foreign firms, and that the current level of import duties should be maintained. Before the war imported glass and fancy ware (which includes hand-blown glassware) accounted for half the consumption in the British market. This gap could be filled, an export level attained and advantage taken of the higher purchasing power of the better paid workers, in the opinion of the working party, by encouraging the industry to expand production to three times its prewar level. They would attract workers to the industry by imaginative recruitment methods, better technical training and opportunities for advancement and the use of teams of European Voluntary Workers. Encouraging these teams, or "chairs" as they are called in the industry, would lead, it is argued, to the establishment of self-contained glass-making units within firms which would not interfere with the promotion of British workers.

A three-fold expansion of production could be accompanied, in the working party's opinion, by the mechanisation of certain processes, drawing upon American and Swedish experience, and by improved factory layout and increased research. There are the usual recommendations on standard methods of costing, hall-marking of goods and the provision of statistics, but the working party wisely refrained from burdening this small section of the glass industry, which employs only a few thousand workers, with a recommendation for a development council.

It is quite clear from the report that if the hand-blown crystal glass industry is ever to break away from the hampering tradition of "English" glass design, so dear to purchasers of crystal in the American market, and so obtain a foothold in the overseas market in glass of contemporary style, that time is now. The industry is short of cutters and decorators. These were transferred to other employment during the war, while actual glassmakers were retained. There is an opportunity here for introducing economy of style while maintaining the industry's reputation for quality. There is little doubt that the glassmakers could improve on next year's export target and hold the improvement in the long run.

Shipbuilding Costs

Some popular fallacies on the subject of shipbuilding finance were exploded by Sir William Crawford Currie at the Peninsular and Oriental Steam Navigation meeting last week. One misconception was that the initial allowances under the Income Tax Act, 1945, are some form of free gift from the Exchequer; Sir William pointed out that they are simply an advance instalment of the wear-and-tear allowance which would normally accrue between the sixteenth and twentieth years of a ship's life and that they in no way help to make "an economic unit out of an expensive ship." In fact, these allowances have been granted to assist in making good the omission during the war years of depreciation allocations on the scale necessary to replace tonnage. The chairman referred to a suggestion that the Government

* Board of Trade Working Party reports: Hand-blown Domestic Glassware. HMSO. 1s.

Tonnage Replacement Account could be used to offset the present high cost of tonnage, and stated that this reserve would not be used for writing down the present high cost of tonnage until it was known at what level the cost of new construction was likely to be stabilised. It was the intention of the company to write down the cost of more expensive ships to that level by applying this reserve, but this will only be done should a lower level of building costs be realised. In the meantime, the company will follow the principle of allowing for depreciation on the full cost of construction.

The present inflated costs of construction are a source of anxiety to shipowners, who are generally sceptical of being able to earn a corresponding level of net revenue to match them, especially over a period of years. They are not misled by the present buoyancy of freights and cargoes, as the conservative dividend policy of P & O well testifies. As a measure of the rise in shipbuilding costs, Sir William stated that whereas in 1915 the cost of dry cargo liners averaged £12-£15 per gross registered ton, the figure had risen just after 1920 to £30-£36 and was at the present time between £55 and £66.

Dissatisfaction about Tin

The recent controversy between the Malayan rubber growers and the British Government about the American "concession" has been quickly followed by sharp criticism from the Malayan tin industry, which is charging the Colonial Office with "apparent misrepresentation" about the increase in prices. Malayan producers now receive £500 a ton instead of £423 and Nigerian £477 a ton instead of £405 15s. Malayan producers are dissatisfied with the new price, and they complain that the Colonial Office advised the Malayan Union Government that the Malayan Chamber of Mines in London, which negotiated on prices with the Ministry of Supply, "accept the position and do not object to the proposed announcement." The Malayan Chamber of Mines emphatically states that it told the Ministry that it was unable to agree to the new price, and it has registered a protest. Presumably these sharp words are being investigated officially.

As to the new prices, the European producers in Malaya consider them "inadequate," but their real case rests on the high costs of the Chinese section of the industry. Even at £500 a ton the Chinese producers, it is said, will be making a loss and sooner or later they will not be able to maintain their present scale of output. Nigerian producers, on the other hand, seem to be content. The Ministry of Supply hold that the new price would give a profit to the majority of Malayan producers and consider it to be the highest level at which consumers would be willing buyers. The Ministry, however, will be prepared to reconsider the matter if the contract price paid by the United States for Bolivian ore turns out to be higher, though no retrospective payments will be made.

Progress in Savings?

So often this year has it been necessary to draw attention to the depressing trend of small savings that a better performance recently ought not to pass without comment. The last discussion in these columns (on November 15th) proved to have been written at the very nadir of the contra-seasonal decline. In the week to November 1st, influenced perhaps by the rush to forestall the so-called emergency budget, net savings totalled only £1,573,000—computed, as usual, without allowing for interest paid out on encashed savings certificates, for accrued interest, or for redemptions of Defence Bonds at maturity. But in each of the three following weeks the total, similarly computed, steadily improved—and it was not until the week to December 13th (the period covered by the latest returns) that the customary influence of Christmas began to assert itself, as the following figures show:—

	1946-47		1947-48	
	Weekly Net Cash Receipts	Cumulative Total	Weekly Net Cash Receipts	Cumulative Total
Average of 31 weeks	6.0	...	2.6	...
Week to—				
Nov. 1 (31st)	4.7	186.5	1.6	79.9
" 8 (32nd)	7.2	193.7	3.8	83.7
" 15 (33rd)	5.3	199.1	5.5	89.2
" 22 (34th)	6.2	205.2	6.3	95.5
" 29 (35th)	6.2	210.5	6.4	101.9
Dec. 6 (36th)	6.1	216.5	7.3	109.2
" 13 (37th)	1.1	217.6	3.6	112.8
Average of 37 weeks	6.0	...	3.0	...

For three successive weeks, therefore, the figures were the best since the opening weeks of the financial year, when new subscriptions were being swollen by the delayed effect of the last-minute rush for the old series of savings certificates and by the raising of the limit upon individual holdings of the new. And in the first week of this month the total at last hit the target rate, which is £1,000,000 a day for the full leap year, with no let-up for Sundays and holidays.

Unfortunately, it would be premature to acclaim this progression as the latest "success" story. The reversal of the dreary trend is very welcome, especially as it was carried so close to Christmas. But it is noteworthy that the change synchronised with the first distribution of the war damage "value" payments, to a total of £100 million. Moreover, the Treasury started in mid-September to pay out this year's batch of post-war credits to elderly folk, since when some £41 million has been disbursed, of which £16 million related to the seven weeks covered by the above table. In the same seven weeks a further £17 million of 3 per cent Defence Bonds were redeemed at maturity (as distinct from the prior encashments which are allowed as a deduction in the official figures), making total redemptions of £68 million in the current financial year (to December 13th). Unless reinvested, all these receipts are equivalent to dis-saving; and to compute the true net savings by "small" savers a high proportion of the Defence Bond redemptions and Post-war Credits, and some portion of the War Damage receipts, ought to be ranked, on a strict reckoning, against the official figure of "net" savings.

The overall picture, therefore, is still highly depressing, and for the present the change of trend must be regarded as inconclusive. But if the public wants to minimise the risk of having its money surpluses forcibly extracted from it by additional taxation or dissipated by further rises in the real cost of living, it will need to keep up the recent rising progression, even after the flow of Governmental monies ceases. Even if the target rate were to be hit in every remaining week of the financial year, the year's official total would still be almost 40 per cent below the figure of £366 million which Mr Dalton "wrote into" his budget last April. Since then the inflationary gap has widened further, and will widen even more sharply if the export drive makes real headway.

* * *

More Floating Debt

The early part of this financial year, as Mr Dalton constantly pointed out, was marked by an abnormally large reduction in the nominal total of floating debt, but, in spite of the huge rate of external borrowings and of finance by sales of gold, the Treasury will enter the year's main revenue season with a total of "active" debt very little different from what it was at the outset. At March 31st last the total floating debt stood at £6,954.6 million, the highest level ever touched; by June 30th it was down to £6,529.2 million, a decline of no less than £425 million. But, as is now well known, by far the greater part of this movement resulted simply from the "clawing back" of unspent notes, which, except for such items as the recovery of the NAAFI surplus monies, took the form merely of transfers between Government departments. Of the revenue ostensibly collected in the first quarter of the year, roughly £200 million appears to have comprised purely nominal receipts, and the amount may even have been larger. Its counterpart in the Government accounts was apparently a cancellation of departmental ways and means advances rather than of internally-held "tap" Treasury bills, for the former item dropped during the quarter from the high level of £613.5 million to £369.9 million, and it is noteworthy that the subsequent recession has been small.

This suggests that the decline which occurred in the ensuing two months in other forms of floating debt held outside the banking system was attributable to the reduction in overseas holdings of sterling rather than to further juggling with the revenue accounts. To analyse these changes, it is necessary to take dates other than the quarter-ends, because of the difficulty otherwise of estimating the distribution of Treasury bills between "tap" and "tender." This has been done in the following table, which divides the total floating debt into the portions taken up by Governmental bodies and other special quarters (including, in particular, overseas monetary authorities) and those taken up in the first instance by the domestic banking system and the discount market. The division of the tender issue of bills between the discount market and other tenderers assumes that the market applies for an amount equal to the total bills offered each week; the result is probably a moderate under-estimate, but

any error when comparing the figures at different dates will not be large. Apart from this, it should be emphasised that the figures do not estimate the amount of bills held by the discount market at the given dates, but only the amount of the then outstanding issue which was allotted to the market in the first instance.

DISTRIBUTION OF FLOATING DEBT
£ [million]

	April 5, 1947	June 22, 1947	Aug. 23, 1947	Dec. 13, 1947
<i>Issued to "Special Quarters" :-</i>				
Ways & Means—Bank of England	19	10	10	...
—Departments	593	342	337	325
Top Treasury Bills	2,704	2,614	2,468	2,569
Non-market Tender Bills	1,123	1,231	1,161	1,144
	4,445	4,197	3,976	4,038
<i>Issued to Banking Quarters :-</i>				
Market Tender Bills*	1,056	949	1,019	1,106
Treasury Deposit Receipts	1,443	1,444	1,350	1,368
	2,499	2,393	2,369	2,474
Total Floating Debt	6,944	6,590	6,345	6,512

* Thirteen weeks' cumulative total of estimated allotments to the discount market at the tenders.

It will be seen that in the first period the aggregate of bills issued to special quarters actually rose slightly, whereas in the ensuing two months which culminated in the suspension of sterling convertibility it dropped by more than £200 million. A large part of this movement must have reflected the reduction in overseas sterling balances or their conversion into cash, but other influences were probably further "clawings-back" and direct and indirect support for the gilt-edged market.

Total "special" holdings, it will be noted, reached their nadir at the time of the convertibility suspension, at almost £470 million below the high figure of early April; during this period the "active" portion of the debt declined by only £130 million. Since end-August, however, these trends have been reversed. Despite the continued heavy recourse to external sources of finance, the total floating debt has risen by almost £170 million, mainly in consequence of heavy disclosed outlays for "below-line" items by the Exchequer, especially the war damage payments. As a result, there has been a large expansion in that portion of the debt which is financed through the banking system, and its total now, despite the decline of £430 million in aggregate floating debt over the whole period, is a mere £25 million less than it was at the beginning of the financial year. The recent growth in tap bills must be attributed primarily to the sales of gold, but in view of probability that the preparations for the redemption of the 3 per cent Conversion Loan have involved a net intake of gilt-edged securities (involving corresponding releases of departmentally-held bills), it is possible that there has been some recovery in overseas bill holdings, although this presumption is not supported by the further fall in non-market tender bills.

* * *

Miles Aircraft

The original injunction to postpone the hearing of the application to force the liquidation of Miles Aircraft, which was granted by the courts in November, has been extended for a further period of three weeks. In September Mr S. R. Hogg was appointed manager to reorganise the affairs of the company, following the unexpected disclosure that the company was working at a loss; he is now given further time to complete his scheme for submission for the approval of creditors and shareholders. The original petition for the compulsory liquidation of the company was made in November on behalf of the smaller creditors by Titanine, Limited, producers of industrial lacquers, to whom Miles Aircraft owe a sum of £5,837 for goods sold and delivered. The larger creditors, which include Blackburn Aircraft, De la Rue Extrusions, Smiths Aircraft Instruments and Sperry Gyroscope, rank for sums together exceeding over £200,000 and have consistently opposed the idea of liquidation.

It has been stated that the trading loss of Miles Aircraft for ten months of the year ending December 31, 1947, has amounted to £630,000. This is a measure of the manager's problem. In a circular issued on November 1st, Mr Hogg expressed his confidence that he had a fair chance of restoring the fortunes of the company, and at the same time he enjoined all creditors to be patient and to await his scheme. But by his action in promising to pay only those from whom he had personally ordered goods

Merry-go-round

To take solid particles out of gravy or keep back leaves from tea, the housewife uses a strainer. The chemist, who often has to remove fine sediments from liquids, employs a funnel lined with a piece of porous paper. The pores are large enough to let the liquid through but too small for the solids, which are thus retained and 'filtered off'. Quite frequently however, the specks of suspended matter are so minute that they either choke the pores of the filter or pass straight through. It is, for example, useless to try to remove bacteria from contaminated water by filtration through paper. When particles of such extreme fineness have to be separated from a liquid, recourse must be had to a centrifuge, such as is shown in the illustration. The sample placed in a special cup is whirled round and round at perhaps two or three thousand revolutions a minute. Like holiday makers on a roundabout, the particles are swung outwards with gathering force, and eventually all are pressed to the bottom of the cup. The centrifuge is then stopped and the clear liquid is poured off, leaving the solid. Both solid and liquid can then be examined. The centrifuge is an invaluable piece of equipment in biochemical and bacteriological investigations. The British chemical industry was quick to harness this natural force in its efforts to provide better service to other manufacturers.

JUST LIKE HIS DAD!

In more and more schools, lessons on dull or difficult subjects now 'come alive' on the screen. *Heredity in Animals* is the title of a recent educational film on biology. Other subjects successfully filmed for classroom use include geography, botany and even history.

Most of us can remember only too well the bad old days when many children were unfairly held back because they found it difficult to learn from words alone. It was no good for the teacher to ask 'Do you see?' There was nothing for them to see. So they had either to be labelled dunces or to pretend to understand when they didn't. The teacher of today wants all his pupils to have an equal chance, whether they learn best from words or pictures. That is why the new educational films now being made in Britain are being welcomed by educationists all over the world.

Learning without tears? Perhaps it will never be that. But the educational film is helping more and more children to say 'I SEE'—and really mean it.

J. ARTHUR RANK ORGANISATION LTD.

and services since September 26, 1947, when he was appointed, Mr Hogg roused certain small creditors to take action in the Courts. In its present application Titanine has the support of creditors ranking in all for £62,000. Although debts owed to this group of creditors were obviously incurred before the date of Mr Hogg's appointment, and they are acutely conscious of the discrimination against them, there can be little advantage to either small or large creditors in forcing the liquidation of the company at this stage. The manager remains busy on his scheme, and has received interim protection from the Courts.

Coal Compensation Progress

The Minister of Fuel and Power recently gave a statement of the progress made to date in settling the compensation to be paid to individual colliery companies taken over last January under the Coal Industry Act. The Central Valuation Board has now been constituted and is to commence its work next month, but contrary to what had been commonly thought, the District Valuation Boards have not yet been formed, although negotiations have been proceeding to find appropriate professional and technical men to serve on them. Thus, although most of the individual collieries have filed claims for their share of the global sum of £164 million which is to be distributed under the Act, the case for extending the interim income period which has recently been canvassed by the chairmen of several colliery companies, seems to have been strengthened by this revelation of slowness in setting up the necessary machinery. Negotiations with the Boards themselves are bound to be protracted. Colliery owners consider it extremely unlikely that the two year period specified under the Act will be long enough for the apportionment of the global sum among them and the issue of the Nationalisation stock.

Yet the Minister probably thinks otherwise. He has stated that the claims submitted by the companies are already being examined with the object of constituting the necessary "compensation units" prescribed by the Act, to pass to the District Valuation Boards. Presumably the Ministry of Fuel and Power in conjunction with the Coal Board and their advisers are perusing these claims and this necessary preliminary to the deliberation of the Valuation Boards should at least send them off on a good start. In any case, this is the first intimation from official sources that things are moving, even if tardily, towards the final distribution of the compensation award. Progress in future may be more rapid than some colliery companies have hitherto anticipated.

Mr Gaitskell has also announced that provisional interim income revenue payments to date amount to over £3,000,000. These payments represent approximately fifty per cent of the number of possible claims, and independent accountants are in the process of investigating the remainder. By the end of March,

1948, the Government expects to have paid out some £10 million as cash compensation for consumable stores. The delay in payment for stocks of colliery products and of consumable stores and spares has caused no little annoyance to the companies, who naturally did not contemplate a delay of a year or more before they would be paid for. The first payments are expected to be made early in the New Year. The Government has also intimated that compensation to be paid for the ancillary properties belonging to the colliery companies is still under consideration and that it will be some time before a final figure is decided.

Shorter Notes

The poll of Stock Exchange proprietors taken on December 18th, as a first stage in procuring their consent to the proposed change in the Deed of Settlement resulted in 2,436 votes being cast in favour and 454 against. This gives the necessary 75 per cent majority which had not been forthcoming at the meeting of proprietors held two days earlier. It is understood that, owing to the general desire to extend the life of the annuities, action will be taken to do so after March 1st.

The recent improvement in the weather in the United States, it is hoped, will make good the damage done to the winter wheat crop during planting. The first official forecast for 1948 estimates the winter wheat crop at 838,705,000 bushels compared with 1,096 million bushels in 1947; earlier trade estimates put the prospective crop as low as 700 million bushels. The planted area of 58,648,000 acres is surprisingly large, particularly in view of the late start in the winter wheat belt caused first by drought and then by rains. The 1947 area was 54,493,000 acres.

An annual review of the tea industry and tea shares published by a leading firm of brokers has made a welcome reappearance after an enforced gap of eight years. Its publication happily coincides with a revival of interest in tea shares on the Stock Exchange. Detailed statistical information on tea companies is given for three years, and the review has been usefully rearranged to meet present-day market requirements.

The Pakistan Government has announced that the recently imposed export duty of £6 5s. a ton on raw jute crossing its land frontiers is payable on all shipments made after November 14th. Despite this announcement jute prices have tended to harden.

SECURITY PRICES AND YIELDS

Owing to the holiday period, the usual list of 370 securities in the *Records and Statistics* Supplement does not appear this week. Notes on the following company reports appear in the Supplement: Gaumont British; Glaxo Laboratories; Lancashire Cotton Corporation; Tate and Lyle.

Prices, Jan. 1-Dec. 22, 1947		Name of Security	Price, Dec. 17, 1947	Price, Dec. 22, 1947	Net Yield, Dec. 22, 1947 (m)	Gross Yield, Dec. 22, 1947	Prices, Jan. 1-Dec. 22, 1947		Last Two Dividends	Name of Security	Price, Dec. 17, 1947	Price, Dec. 22, 1947	Yield, Dec. 22, 1947

Redemption yields on stocks optionally or finally redeemable within the next five years are worked out on the assumption that they will be repaid at the earliest date. Redemption yields on other dated stocks assume that stocks paying over 3 per cent will be redeemed at the earliest date (these are marked 'e'), and those paying 3 per cent or less will be repaid at the latest date (marked 'l'). (n) Net yields are calculated after allowing for tax at 9s. in the £. (f) Flat yield. * Assumed average life 17 years 6 months. † Notice given for repayment on March 1, 1948.

(a) Interim. (b) Final. (c) Whole year. (d) Int. paid half-yearly. (e) To earliest redemption date. (f) Also a capital bonus of 2 1/2 per cent free of income tax. Yield worked out on 15 per cent basis. (h) Fifteen months to March 31, 1947 (yield basis 7-6 per cent). (i) To latest redemption date. † Free of tax.

COMPANY MEETINGS

SINGER MOTORS, LIMITED

ONE-CAR POLICY

The tenth ordinary general meeting of Singer Motors, Limited, was held, on the 19th instant, in London.

Mr A. E. Hunt, chairman and managing director, in the course of his speech, said:

The result for the year, after crediting estimated Excess Profits Tax recoverable and providing for taxation, is a credit of £33,344. The ordinary dividend is 5 per cent., less tax. The results, compared with the previous years, should not be taken as indicating any further set-back in getting back into car production after the war period. For the last three months of the past financial year car manufacture was running at a small profit. Since then improvement in numbers produced weekly has continued, and, although we have not yet attained our maximum weekly production, we have in recent weeks reached about 75 per cent. or 80 per cent. in spite of material supply difficulties.

NEW MODELS WELL RECEIVED

Our policy is to have one car in the place of the Super 10 and the Super 12. The new model has been remarkably well received. The design is up to date and special care has been directed to achieving the greatest measure of facility in production. The price will be commensurate with quality and performance and costs prevailing at the time of production, and it would be idle to promise a date when it will be available.

We will continue our efforts to reach maximum production whilst putting forward every effort in preparing and planning for the new car, and at the same time try in every way to achieve the high export target set by the Government, but I must emphasise the vital factors of an adequate and even supply of materials and the reopening of certain export markets now closed. In spite of the problems yet to be faced, we view with quiet confidence the future of your company.

EXPORT DRIVE

There is now the national requirement that a major portion of motor-car production must be for the export markets. We, as members of the motor industry, will do all in our power to continue and expand our assistance in the export drive, but this presents a serious problem when export markets are closing, mostly for the reason that other countries, like ourselves, face monetary exchange difficulties. It is understood allocation of material will be linked with the export of manufacturing programmes which cannot fall below a certain minimum if losses are to be avoided. It is greatly to be hoped that the Government may be able to solve this difficulty in association with other countries.

The trend of increased cost of supplies has not been arrested and as regards restrictions for shortage of supplies this has a particular detrimental effect on costs. The chairman referred last year to the unreal level of selling prices. We cannot yet see any improvement in the over-all factors on which prices have to be based.

On the subject of standardisation generally, our view is that a much wider field of standardisation in components and accessories is necessary, as well as a general reduction in models, and you may have seen in the press that the motor industry is collaborating in these directions and that a reduction in models has already been achieved. By more standardisation in accessories, components and certain units, benefit to production generally would be obtained, as well as a reduction in costs, but at the same time individuality must not be lost. This could be achieved by individual manufacturers building round a smaller variety of standard components, and still having their own special bits.

The report was adopted.

AGAR, CROSS AND COMPANY, LIMITED

LARGER TURNOVER AND PROFITS DIVIDEND INCREASED TO 8 PER CENT

The forty-first ordinary general meeting of this company was held, on the 18th instant, in London, Mr Stuart C. Sheppard presiding in the absence of Mr Donald Moir, M.Inst.C.E., M.I.Mech.E. (the chairman of the company) owing to indisposition.

The following is the statement of the chairman which was circulated with the annual report and accounts:

The measure of optimism expressed in my statement which accompanied last year's accounts has been justified by the results now presented to you. Because of the uncertainty of deliveries from the various countries with which we trade, many difficulties have been encountered in maintaining a constant flow of merchandise to feed your Argentine organisation, but, I am glad to say, these difficulties have been overcome and the volume shipped outwards, aided by purchases of locally manufactured goods, has made it possible to reach a record year's sales in your company's history.

A direct result arising from the larger turnover is an increase in profits for the year to £374,718, against last year's figure of £143,059. Before arriving at the profit of £374,718 provision has been made for all contingencies, including the back contributions payable over a period of years in respect of pension schemes instituted for the staffs of the London and New York Offices. British income tax and profits tax require no less than £270,000, or £193,000 more than last year. As before, no provision for excess profits tax is necessary.

The balance-sheet figures call for no special comment other than to point out that they reflect the increased volume of business.

Your board recommend a dividend at the rate of 8 per cent. on the ordinary stock, as against 5 per cent. for the previous year. They would have liked to have been more generous, but are strongly of the opinion, in view of the uncertainties of world outlook, the pressing need to build up reserves depleted during depression years and the shortage of cash for trading purposes, that a conservative policy should be pursued.

THE SUBSIDIARY COMPANY

Your subsidiary company earned sufficient profit to pay a dividend equal to that of last year, but due to extension plans the cash has been retained in the business.

It has long been the desire of your board to establish a pension fund to care for the staffs in their retirement, but unfortunately adverse conditions in the past have prevented this from being brought to fruition. The problem has now been simplified by the introduction by the Argentine Government of a State Pension Fund, which, in general terms, provides for the staff in Argentina, and, therefore, only the staffs in London and New York have had to be dealt with. The totals of back-service costs of the London and New York schemes, although payable over a period, have been charged this year, and the amounts involved are shown under the balance-sheet heading "deferred liabilities."

Throughout the war years your Argentine organisation was ably administered by a management which had long and faithfully served the interests of your company. Increased business, however, necessitated a re-organisation. I am pleased to report that early in the year Mr George Sidney Houlgrave was appointed to the post of general manager in Argentina. Mr Houlgrave has as second in command Mr David Smith and already they have given ample proof of their worth.

Your director resident in Argentina, Mr James Asher, has during the year completed fifty years' continuous service with your company and I am glad to say that his vast experience and wise counsel continue to be of inestimable value to his colleagues.

Mr V. C. Fisher, a director and your London manager, accompanied by Mr H. Wilfrid Lilly, your New York manager, visited Argentina during the year and reported favourably on the new management and expanding organisation.

THE OUTLOOK

The future of your business I find difficult to forecast. Present prospects are good and sales are well maintained. Shipments both from Britain and U.S.A. are on an ever-increasing scale. Import Permit restrictions imposed by the Argentine Government have to a certain extent helped legitimate traders, like ourselves, but the necessity for accelerating deliveries to comply with permit expiry dates is putting a strain on your company's cash resources and we are being forced temporarily to have recourse to our banking friends. World exchange restrictions are making financial operations ever more difficult and although Argentina is still a sellers' market, the complexities of business make it impossible to see far ahead. Nevertheless, I can assure you that you have a virile organisation constantly watching the ever-changing trend of events and the safeguarding of your interests.

I tender the thanks of the board to the staffs of your company in London, Argentina and New York for their loyalty and hard work which have made this year so successful.

The report and accounts were unanimously adopted; the retiring directors were re-elected; and the auditors were reappointed.

A special resolution was passed amending the articles of association, and the proceedings terminated with votes of thanks to the chairman, directors and the staff of the company at home and abroad.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

The fourteenth ordinary general meeting of this company was held, on the 16th instant, in Dublin.

The following is an extract from the statement of the chairman (Mr J. P. Colbert) in moving the adoption of the report and accounts:

I propose to comment firstly on the balance-sheet, which deals with a total of £1,009,456. In arriving at this total we have, as you may note from the balance-sheet, deducted from the total book value of our loans and advances and our investments the total amounts specifically set aside as reserves in each case. Thus, the total book value of our assets is considerably in excess of the figure shown in the balance-sheet. I may add that the specific reserve provisions against bad and doubtful debts and against depreciation of investments are greater than we are likely to need in the foreseeable future. As regards the investments in particular (which figure in the balance-sheet at £739,581), the global market value, according to the most recent Stock Exchange markings for the listed securities, shows a comfortable margin in excess of the global book value, i.e., even before allowing for our investment reserve.

Our gross profit, at £79,800, shows a decline of £1,272 on the high record figure reported last year. The net profit for the year is £68,252. We propose to pay a dividend for the eighth year in succession, the proposed rate being 3 per cent. (subject to tax), as in the two preceding years. This would absorb £16,453, representing a distribution of 37 per cent. of the net profit for the year after charging tax.

As regards the issuing house department of our activities, the turnover during the year was £478,750. We have at present a considerable number of new proposals.

The report and accounts were adopted.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

ANNUAL GENERAL MEETING

The twenty-second ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held, on the 19th instant, at 29 Gracechurch Street, London, E.C.3.

Mr Julian Stanley Crossley (the chairman) presided.

With the concurrence of the stockholders present, the report and accounts and statement by the chairman, which had been previously circulated, were taken as read.

The chairman referred to the sudden death of Mr Edwin Fisher and the retirement of Mr J. R. Leisk and Sir Harold Snagge, and welcomed to the board Captain Derek Fitzgerald and Mr Anthony William Tuke.

The chairman then moved the adoption of the report of the directors and statement of accounts, and the payment of a final dividend of 4 per cent. actual on the "A" stock and "B" shares, less income-tax at the standard rate of 9s. in the £ in each case.

The motion was seconded by Mr A. C. Barnes, deputy-chairman, and carried.

Sir Ernest Oppenheimer, Mr Ernest Langley Jackson, Captain Derek Fitzgerald and Mr Anthony William Tuke, retiring directors, were re-elected.

On the motion of Sir Frank Newson-Smith, seconded by Mr W. R. Rhodes, the auditors, Messrs Deloitte, Pleader, Griffiths and Company; Price, Waterhouse and Company; Peat, Marwick, Mitchell and Company, and Cooper Brothers and Company, were reappointed.

A vote of thanks to the staff, proposed by Viscount Portal of Hungerford, K.G., G.C.B., O.M., D.S.O., M.C., and seconded by Mr Joseph Nissim, and a vote of thanks to the chairman for presiding at the meeting, proposed by Mr T. M. Bland, were unanimously accorded.

BRUSH ELECTRICAL ENGINEERING COMPANY, LIMITED

ORDERS EXCEED DELIVERY RATE

The annual general meeting of the Brush Electrical Engineering Co. Ltd., was held, on the 23rd instant, at Loughborough, Sir Ronald W. Matthews, the chairman, presided.

The following is an extract from his circulated statement. The unsatisfactory results for the year ended December 31, 1946, arose in great part from declining turnover, coupled with expanding overheads arising from the rebuilding of a peace-time staff, and the report also disclosed that a not unsatisfactory profit had been made on trading up to September 30, 1947. He therefore proposed to confine his observations chiefly to a survey of the prospects.

Last year he had referred to the decisions made on redesign with consequent retooling and new shop layout, feeling that they would ensure the financial well-being of the company. Those remarks had proved correct, although the adverse effects during 1946 had been greater than anticipated and the benefits of reorganisation had not been felt to any marked degree until early 1947.

The total order book was in the neighbourhood of 7,500,000, which would provide some 18 months' work at the rate of output which they were now achieving. That order book was naturally not spread equally over the whole of the company's departments; in some they had two or three years' work ahead of them and in others were able to give reasonably good deliveries. Nevertheless it was a gratifying fact that in spite of the substantial increase in output which had been achieved over the past twelve months orders were still coming in at a faster rate than that at which the company were delivering.

The report was adopted.

BIRMID INDUSTRIES LIMITED

INCREASED DEMAND

The ordinary general meeting of Birmid Industries, Limited, was held, on the 19th instant, at Birmingham, Mr Cyril C. Maudslay (the chairman) presiding.

The following is an extract from his circulated report:

The outstanding event of the year was undoubtedly the quite unforeseen and disastrous two weeks' shutdown in February last due to Government action in cutting off electric power for that period. This meant that all production and practically all revenue ceased, whereas expenses inevitably continued at a high level. The adverse financial effect of this stoppage was, of course, very serious and the consequences thereof have continued to some degree ever since.

Dealing now with the various sections of our products, all of them are of peculiar importance in the present grave economic position of the nation, in that all the factories under the control of Birmid Industries, Limited, are engaged in the fabrication of raw materials into a semi-finished condition and are, therefore, basic industries of fundamental importance to practically all sections of engineering and, to a large extent, of building, and thus form the foundations upon which these great industries rest. In consequence, the demand for our various products has steadily increased during the past year.

WIDE RANGE OF PRODUCTS

The present output from our various light alloy foundries, both sand and die, is at a higher level than at any time since the war ceased. More gratifying still is the ever-widening range of products in which our cast and wrought light alloys are employed. These remarks apply to the light alloy sand and die foundries at Birmingham; Aluminium Casting Company at Smethwick; Sterling Metals at Coventry and Nuneaton, and Perry Barr Metal Company at Oscott, and also to the rolling mills of Birmetals at Woodgate. In addition to the large demands of the automobile and heavy vehicle industry, both the aluminium and magnesium foundries, as also the rolling mills, supply increasing quantities of our products for agricultural tractors, mining machinery, electrical machinery, textile machinery, the food industry, the building trades, and so forth.

In the iron foundries of Midland Motor Cylinder Company and Dartmouth Auto Castings of Smethwick and of Sterling Metals, Coventry, we have one of the largest production groups of high-grade castings, chiefly for the automotive industry, in Great Britain. Their manufactures are chiefly cylinder blocks and heads, with, in addition, the lighter types of iron castings for the motor trade, such as exhaust manifolds, brakedrums and the like, and sundry light castings for many other trades, in which type of castings Dartmouth Auto Castings particularly specialise.

The rolling mills at Woodgate have also made a particularly gratifying changeover from war to peace production and our proprietary corrosion-resisting alloy "Birmabright" now forms a very large proportion of our output in the form of sheet, strip and sections. Time tends to prove more and more the outstanding suitability of this alloy for marine constructions for which it was originally evolved, but it is also highly suitable for many purposes in general engineering, as it has very attractive properties of work-hardening and deep-drawing, and takes a very high finish where decorative articles are required.

Our order books are very full, but with many of our raw materials the demand is much greater than the supply.

The report was adopted.

CARRERAS LIMITED

FUEL CRISIS AND INCREASED DUTY

The forty-fourth annual general meeting of Carreras, Limited, was held, on the 22nd instant, in London, Sir Edward Baron, chairman and managing director, in the course of his speech, said: During the first few months of the period under review, our production and sales continued to maintain and even surpass the high level achieved at the close of the previous year, despite the ever-present difficulties regarding supplies of materials for packing and wrapping.

However, the fuel crisis came upon us without warning, and, in common with most other manufacturers in London, we were forced to cease production entirely for three whole weeks. The next blow which befell us was the unprecedented increase in the tobacco duty last April. This was a staggering imposition and its effect was both immediate and far reaching.

To meet the trend of consumer demand we reintroduced a brand which some years ago had a wide popularity and a great reputation for high quality. I refer to Turf, which, in its new form, selling at 10 for 1s. 3d. not only maintains its former reputation, but I venture to say challenges comparison with any other cigarette in the same class. The demand for Craven "A," Craven Plain and Piccadilly No. 1 continues at a reasonably satisfactory level, taking all the circumstances into account.

EXPORT MARKETS

Our overseas trade continued at a most satisfactory level until certain countries, especially those in the sterling areas, became involved in economic difficulties similar to our own. At first the tendency was to place wholesale restrictions upon imports, but I am glad to say that wiser counsels have since prevailed and in some instances cigarettes and tobacco, among other semi-essentials, can now be shipped in limited quantities. We are hopeful that as time goes on the position will improve still further, and in the meantime new markets are constantly being explored. Our Canadian subsidiary is progressing favourably under its energetic and capable management and has more than held its own against keen competition.

We have had whole-hearted support from our employees throughout this troublesome twelve months, and it gives me considerable gratification to tell you that we have again paid them a bonus of six weeks' wages, plus long service awards.

We are very pleased at being able to maintain the dividend for the year at 35 per cent., as well as increasing our carry-forward, and incidentally our working capital, by a further £182,000. The fact that our financial position remains unimpaired, and is, in fact, stronger than twelve months ago, gives us additional cause for satisfaction when we reflect upon the storms we have had to weather. I should like to emphasise once again that our consistently conservative policy in the past has so buttressed our internal resources that we have successfully withstood the strains and stresses to which the present economic crisis has subjected us.

I trust that you will be satisfied with what has been accomplished. We know our products are first class, our relations with our employees were never better, and our financial position is extremely sound. This combination, therefore, gives us confidence to meet and overcome the present difficult times.

The report was adopted.

GOVERNMENT RETURNS

For the week ended December 20, 1947, total ordinary revenue was £51,753,000, against ordinary expenditure of £65,609,000, and issues to sinking funds £240,000. Thus, including sinking fund allocations of £11,109,891 the surplus accrued since April 1st is £94,402,638 against a deficit of £572,592,268 for the corresponding period a year ago.
